By default, Arm FVP uses the 172.20.51.0/24 network and runs a gateway at 172.20.51.254. This gateway also functions as a DHCP server for the GOS, allowing it to be automatically assigned with an IP address 172.20.51.1.

More details about Arm FVP user mode networking can be obtained from here: https://developer.arm.com/documentation/100964/latest/Introduction-to-Fast-Models/User-mode-networking

**Using Arm FVP User Mode Networking with Zephyr**  Arm FVP user mode networking can be enabled in any applications and it doesn’t need any configurations on the host system. This feature has been enabled in DHCPv4 client sample. See dhcppv4-client sample application.

**Limitations**

- You can use TCP and UDP over IP, but not ICMP (ping).
- User mode networking does not support forwarding UDP ports on the host to the model.
- You can only use DHCP within the private network.
- You can only make inward connections by mapping TCP ports on the host to the model. This is common to all implementations that provide host connectivity using NAT.
- Operations that require privileged source ports, for example NFS in its default configuration, do not work.
- If setup fails, or the parameter syntax is incorrect, there is no error reporting.

While developing networking software, it is usually necessary to connect and exchange data with the host system like a Linux desktop computer. Depending on what board is used for development, the following options are possible:

- QEMU using SLIP (Serial Line Internet Protocol).
  - Here IP packets are exchanged between Zephyr and the host system via serial port. This is the legacy way of transferring data. It is also quite slow so use it only when necessary. See Networking with QEMU for details.
- QEMU using built-in Ethernet driver:
  - Here IP packets are exchanged between Zephyr and the host system via QEMU’s built-in Ethernet driver. Not all QEMU boards support built-in Ethernet so in some cases, you might need to use the SLIP method for host connectivity. See Networking with QEMU Ethernet for details.
- QEMU using SLIRP (Qemu User Networking).
  - QEMU User Networking is implemented using “slirp”, which provides a full TCP/IP stack within QEMU and uses that stack to implement a virtual NAT’d network. As this support is built into QEMU, it can be used with any model and requires no admin privileges on the host machine, unlike TAP. However, it has several limitations including performance which makes it less valuable for practical purposes. See Networking with QEMU User for details.
- Arm FVP (User Mode Networking).
User mode networking emulates a built-in IP router and DHCP server, and routes TCP and UDP traffic between the guest and host. It uses the user mode socket layer of the host to communicate with other hosts. This allows the use of a significant number of IP network services without requiring administrative privileges, or the installation of a separate driver on the host on which the model is running. See Networking with Arm FVP User Mode for details.

- native_posix board.
  - The Zephyr instance can be executed as a user space process in the host system. This is the most convenient way to debug the Zephyr system as one can attach host debugger directly to the running Zephyr instance. This requires that there is an adaptation driver in Zephyr for interfacing with the host system. An Ethernet driver exists in Zephyr for this purpose. See Networking with native_posix board for details.

- USB device networking.
  - Here, the Zephyr instance is run on a real board and the connectivity to the host system is done via USB. See USB Device Networking for details.

- Connecting multiple Zephyr instances together.
  - If you have multiple Zephyr instances, either QEMU or native_posix ones, and want to create a connection between them, see Networking with multiple Zephyr instances for details.

- Simulating IEEE 802.15.4 network between two QEMUs.
  - Here, two Zephyr instances are running and there is IEEE 802.15.4 link layer run over an UART between them. See Networking with QEMU and IEEE 802.15.4 for details.

### 6.3.5 Monitor Network Traffic

**Host Configuration**

**Zephyr Configuration**

**Wireshark Configuration**

It is useful to be able to monitor the network traffic especially when debugging a connectivity issues or when developing new protocol support in Zephyr. This page describes how to set up a way to capture network traffic so that user is able to use Wireshark or similar tool in remote host to see the network packets sent or received by a Zephyr device.

See also the net-capture sample application from the Zephyr source distribution for configuration options that need to be enabled.

**Host Configuration**

The instructions here describe how to setup a Linux host to capture Zephyr network RX and TX traffic. Similar instructions should work also in other operating systems. On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

The net-tools project provides a configure file to setup IP-to-IP tunnel interface so that we can transfer monitoring data from Zephyr to host.

In terminal #1, type:
This script will create following IPIP tunnel interfaces:

<table>
<thead>
<tr>
<th>Interface name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>zeth-ip6ip</td>
<td>IPv6-over-IPv4 tunnel</td>
</tr>
<tr>
<td>zeth-ipip</td>
<td>IPv4-over-IPv4 tunnel</td>
</tr>
<tr>
<td>zeth-ipip6</td>
<td>IPv4-over-IPv6 tunnel</td>
</tr>
<tr>
<td>zeth-ip6ip6</td>
<td>IPv6-over-IPv6 tunnel</td>
</tr>
</tbody>
</table>

Zephyr will send captured network packets to one of these interfaces. The actual interface will depend on how the capturing is configured. You can then use Wireshark to monitor the proper network interface.

After the tunneling interfaces have been created, you can use for example net-capture.py script from net-tools project to print or save the captured network packets. The net-capture.py provides an UDP listener, it can print the captured data to screen and optionally can also save the data to a pcap file.

```
$ ./net-capture.py -i zeth-ip6ip -w capture.pcap
```

The net-capture.py has following command line options:

```
Listen captured network data from Zephyr and save it optionally to pcap file.
./net-capture.py \
   -i | --interface <network interface> 
       Listen this interface for the data 
   [-p | --port <UDP port>] 
       UDP port (default is 4242) where the capture data is received 
   [-q | --quiet] 
       Do not print packet information 
   [-t | --type <L2 type of the data>] 
       Scapy L2 type name of the UDP payload, default is Ether 
   [-w | --write <pcap file name>] 
       Write the received data to file in PCAP format
```

Instead of the net-capture.py script, you can for example use netcat to provide an UDP listener so that the host will not send port unreachable message to Zephyr:

```
nc -1 -u 2001:db8:200::2 4242 > /dev/null
```

The IP address above is the inner tunnel endpoint, and can be changed and it depends on how the Zephyr is configured. Zephyr will send UDP packets containing the captured network packets to the configured IP tunnel, so we need to terminate the network connection like this.

**Zephyr Configuration**

In this example, we use native_posix board. You can also use any other board that supports networking.

6.3. Networking
In terminal #3, type:

```
w west build -b native_posix samples/net/capture --DCONFIG_NATIVE_UART_AUTOATTACH_DEFAULT_CMD="\n"gnome-terminal -- screen %s""
```

To see the Zephyr console and shell, start Zephyr instance like this:

```
build/zephyr/zephyr.exe -attach_uart
```

Any other application can be used too, just make sure that suitable configuration options are enabled (see samples/net/capture/prj.conf file for examples).

The network capture can be configured automatically if needed, but currently the capture sample application does not do that. User has to use net-shell to setup and enable the monitoring.

The network packet monitoring needs to be setup first. The net-shell has net capture setup command for doing that. The command syntax is

```
net capture setup <remote-ip-addr> <local-ip-addr> <peer-ip-addr>
```

- `<remote>` is the (outer) endpoint IP address
- `<local>` is the (inner) local IP address
- `<peer>` is the (inner) peer IP address

Local and Peer IP addresses can have UDP port number in them (optional) like 198.0.51.2:9000 or [2001:db8:100::2]:4242

In Zephyr console, type:

```
net capture setup 192.0.2.2 2001:db8:200::1 2001:db8:200::2
```

This command will create the tunneling interface. The 192.0.2.2 is the remote host where the tunnel is terminated. The address is used to select the local network interface where the tunneling interface is attached to. The 2001:db8:200::1 tells the local IP address for the tunnel, the 2001:db8:200::2 is the peer IP address where the captured network packets are sent. The port numbers for UDP packet can be given in the setup command like this for IPv6-over-IPv4 tunnel

```
net capture setup 192.0.2.2 [2001:db8:200::1]:9999 [2001:db8:200::2]:9998
```

and like this for IPv4-over-IPv4 tunnel

```
net capture setup 192.0.2.2 198.51.100.1:9999 198.51.100.2:9998
```

If the port number is omitted, then 4242 UDP port is used as a default.

The current monitoring configuration can be checked like this:

```
uart:~$ net capture
```

```
Network packet capture disabled
Device   iface   iface   Local      Peer
NET_CAPTURE0 -  1  [2001:db8:200::1]:4242 [2001:db8:200::2]:4242
```

which will print the current configuration. As we have not yet enabled monitoring, the Capture iface is not set.

Then we need to enable the network packet monitoring like this:

```
net capture enable 2
```

The 2 tells the network interface which traffic we want to capture. In this example, the 2 is the native_posix board Ethernet interface. Note that we send the network traffic to the same interface that we are monitoring in this example. The monitoring system avoids to capture already captured network traffic as that would lead to recursion. You can use `net iface` command to see what network interfaces are available. Note that you cannot capture traffic from the tunnel interface as that would cause recursion loop. The captured network traffic can be sent to some...
other network interface if configured so. Just set the <remote-ip-addr> option properly in net
capture setup so that the IP tunnel is attached to desired network interface. The capture status
can be checked again like this:

```
uart:~$ net capture
Network packet capture enabled
          Capture          Tunnel
Device   iface   iface        Local          Peer
NET_CAPTURE0 2   1   [2001:db8:200::1]:4242 [2001:db8:200::2]:4242
```

After enabling the monitoring, the system will send captured (either received or sent) network
packets to the tunnel interface for further processing.

The monitoring can be disabled like this:

```
et capture disable
```

which will turn currently running monitoring off. The monitoring setup can be cleared like this:

```
net capture cleanup
```

It is not necessary to use net-shell for configuring the monitoring. The network capture API
functions can be called by the application if needed.

**Wireshark Configuration**

The **Wireshark** tool can be used to monitor the captured network traffic in a useful way.
You can monitor either the tunnel interfaces or the `zeth` interface. In order to see the actual
captured data inside an UDP packet, see Wireshark decapsulate UDP document for instructions.

### 6.3.6 Networking APIs

**Network APIs**

**BSD Sockets**

- Overview
- Secure Sockets
  - TLS credentials subsystem
  - Secure Socket Creation
  - Secure Sockets options
- Socket offloading
  - Offloaded socket creation
  - Dealing with multiple offloaded interfaces
- API Reference
  - BSD Sockets
  - TLS Credentials
Overview  Zephyr offers an implementation of a subset of the BSD Sockets API (a part of the POSIX standard). This API allows to reuse existing programming experience and port existing simple networking applications to Zephyr.

Here are the key requirements and concepts which governed BSD Sockets compatible API implementation for Zephyr:

- Has minimal overhead, similar to the requirement for other Zephyr subsystems.
- Is namespaced by default, to avoid name conflicts with well-known names like close(), which may be part of libc or other POSIX compatibility libraries. If enabled by CONFIG_NET_SOCKETS_POSIX_NAMES, it will also expose native POSIX names.

BSD Sockets compatible API is enabled using CONFIG_NET_SOCKETS config option and implements the following operations: socket(), close(), recv(), recvfrom(), send(), sendto(), connect(), bind(), listen(), accept(), fcntl() (to set non-blocking mode), getsockopt(), setsockopt(), poll(), select(), getaddrinfo(), getnameinfo().

Based on the namespacing requirements above, these operations are by default exposed as functions with zsock_prefix, e.g. zsock_socket() and zsock_close(). If the config option CONFIG_NET_SOCKETS_POSIX_NAMES is defined, all the functions will be also exposed as aliases without the prefix. This includes the functions like close() and fcntl() (which may conflict with functions in libc or other libraries, for example, with the filesystem libraries).

Another entailment of the design requirements above is that the Zephyr API aggressively employs the short-read/short-write property of the POSIX API whenever possible (to minimize complexity and overheads). POSIX allows for calls like recv() and send() to actually process (receive or send) less data than requested by the user (on SOCK_STREAM type sockets). For example, a call recv(sock, 1000, 0) may return 100, meaning that only 100 bytes were read (short read), and the application needs to retry call(s) to receive the remaining 900 bytes.

The BSD Sockets API uses file descriptors to represent sockets. File descriptors are small integers, consecutively assigned from zero, shared among sockets, files, special devices (like stdin/stdout), etc. Internally, there is a table mapping file descriptors to internal object pointers. The file descriptor table is used by the BSD Sockets API even if the rest of the POSIX subsystem (filesystem, stdin/stdout) is not enabled.

Secure Sockets  Zephyr provides an extension of standard POSIX socket API, allowing to create and configure sockets with TLS protocol types, facilitating secure communication. Secure functions for the implementation are provided by mbedTLS library. Secure sockets implementation allows use of both TLS and DTLS protocols with standard socket calls. See net_ip_protocol_secure type for supported secure protocol versions.

To enable secure sockets, set the CONFIG_NET_SOCKETS_SOCKOPT_TLS option. To enable DTLS support, use CONFIG_NET_SOCKETS_ENABLE_DTLS option.

TLS credentials subsystem  TLS credentials must be registered in the system before they can be used with secure sockets. See tls_credential_add() for more information.

When a specific TLS credential is registered in the system, it is assigned with numeric value of type sec_tag_t, called a tag. This value can be used later on to reference the credential during secure socket configuration with socket options.

The following TLS credential types can be registered in the system:

- TLS_CREDENTIAL_CA_CERTIFICATE
- TLS_CREDENTIAL_SERVER_CERTIFICATE
- TLS_CREDENTIAL_PRIVATE_KEY
- TLS_CREDENTIAL_PSK
- TLS_CREDENTIAL_PSK_ID
An example registration of CA certificate (provided in ca_certificate array) looks like this:

```c
ret = tls_credential_add(CA_CERTIFICATE_TAG,
      TLS_CREDENTIAL_CA_CERTIFICATE,
      ca_certificate, sizeof(ca_certificate));
```

By default certificates in DER format are supported. PEM support can be enabled in mbedTLS settings.

### Secure Socket Creation

A secure socket can be created by specifying secure protocol type, for instance:

```c
sock = socket(AF_INET, SOCK_STREAM, IPPROTO_TLS_1_2);
```

Once created, it can be configured with socket options. For instance, the CA certificate and hostname can be set:

```c
sec_tag_t sec_tag_opt[] = {
    CA_CERTIFICATE_TAG,
};
ret = setsockopt(sock, SOL_TLS, TLS_SEC_TAG_LIST,
      sec_tag_opt, sizeof(sec_tag_opt));
char host[] = "google.com";
ret = setsockopt(sock, SOL_TLS, TLS_HOSTNAME, host, sizeof(host));
```

Once configured, socket can be used just like a regular TCP socket.

Several samples in Zephyr use secure sockets for communication. For a sample use see e.g. echo-server sample application or HTTP GET sample application.

### Secure Sockets options

Secure sockets offer the following options for socket management:

**Related code samples**

**HTTP GET using plain sockets**

Implement an HTTP(S) client using plain BSD sockets.

**HTTP client**

Implement an HTTP(S) client that issues a variety of HTTP requests.

```c
#define TLS_SEC_TAG_LIST
  Socket option to select TLS credentials to use.
  It accepts and returns an array of sec_tag_t that indicate which TLS credentials should be used with specific socket.
```

6.3. Networking
**TLS_HOSTNAME**
Write-only socket option to set hostname.
It accepts a string containing the hostname (may be NULL to disable hostname verification). By default, hostname check is enforced for TLS clients.

**TLS_CIPHERSUITE_LIST**
Socket option to select ciphersuites to use.
It accepts and returns an array of integers with IANA assigned ciphersuite identifiers. If not set, socket will allow all ciphersuites available in the system (mbedTLS default behavior).

**TLS_CIPHERSUITE_USED**
Read-only socket option to read a ciphersuite chosen during TLS handshake.
It returns an integer containing an IANA assigned ciphersuite identifier of chosen ciphersuite.

**TLS_PEER_VERIFY**
Write-only socket option to set peer verification level for TLS connection.
This option accepts an integer with a peer verification level, compatible with mbedTLS values:
- 0 - none
- 1 - optional
- 2 - required
If not set, socket will use mbedTLS defaults (none for servers, required for clients).

**TLS_DTLS_ROLE**
Write-only socket option to set role for DTLS connection.
This option is irrelevant for TLS connections, as for them role is selected based on `connect()`/`listen()` usage. By default, DTLS will assume client role. This option accepts an integer with a TLS role, compatible with mbedTLS values:
- 0 - client
- 1 - server

**TLS_ALPN_LIST**
Socket option for setting the supported Application Layer Protocols.
It accepts and returns a const char array of NULL terminated strings representing the supported application layer protocols listed during the TLS handshake.

**TLS_DTLS_HANDSHAKE_TIMEOUT_MIN**
Socket option to set DTLS handshake timeout.
The timeout starts at min, and upon retransmission the timeout is doubled until max is reached. Min and max arguments are separate options. The time unit is ms.

**TLS_DTLS_HANDSHAKE_TIMEOUT_MAX**
TLS_CERT_NOCOPY
Socket option for preventing certificates from being copied to the mbedTLS heap if possible.
The option is only effective for DER certificates and is ignored for PEM certificates.

TLS_NATIVE
TLS socket option to use with offloading.
The option instructs the network stack only to offload underlying TCP/UDP communication. The TLS/DTLS operation is handled by a native TLS/DTLS socket implementation from Zephyr.
Note, that this option is only applicable if socket dispatcher is used (CONFIG_NET_SOCKETS_OFFLOAD_DISPATCHER is enabled). In such case, it should be the first socket option set on a newly created socket. After that, the application may use SO_BINDTODEVICE to choose the dedicated network interface for the underlying TCP/UDP socket.

TLS_SESSION_CACHE
Socket option to control TLS session caching on a socket.
Accepted values:
- 0 - Disabled.
- 1 - Enabled.

TLS_SESSION_CACHE_PURGE
Write-only socket option to purge session cache immediately.
This option accepts any value.

TLS_DTLS_CID
Write-only socket option to control DTLS CID.
The option accepts an integer, indicating the setting. Accepted values for the option are: 0, 1 and 2. Effective when set before connecting to the socket.
- 0 - DTLS CID will be disabled.
- 1 - DTLS CID will be enabled, and a 0 length CID value to be sent to the peer.
- 2 - DTLS CID will be enabled, and the most recent value set with TLS_DTLS_CID_VALUE will be sent to the peer. Otherwise, a random value will be used.

TLS_DTLS_CID_STATUS
Read-only socket option to get DTLS CID status.
The option accepts a pointer to an integer, indicating the setting upon return. Returned values for the option are:
- 0 - DTLS CID is disabled.
- 1 - DTLS CID is received on the downlink.
- 2 - DTLS CID is sent to the uplink.
- 3 - DTLS CID is used in both directions.
TLS_DTLS_CID_VALUE
Socket option to set or get the value of the DTLS connection ID to be used for the DTLS session.
The option accepts a byte array, holding the CID value.

TLS_DTLS_PEER_CID_VALUE
Read-only socket option to get the value of the DTLS connection ID received from the peer.
The option accepts a pointer to a byte array, holding the CID value upon return. The optlen returned will be 0 if the peer did not provide a connection ID, otherwise will contain the length of the CID value.

Socket offloading  Zephyr allows to register custom socket implementations (called offloaded sockets). This allows for seamless integration for devices which provide an external IP stack and expose socket-like API.

Socket offloading can be enabled with CONFIG_NET_SOCKETS_OFFLOAD option. A network driver that wants to register a new socket implementation should use NET_SOCKET_OFFLOAD_REGISTER macro. The macro accepts the following parameters:

- **socket_name** - an arbitrary name for the socket implementation.
- **prio** - socket implementation priority, the higher priority is, the earlier particular implementation is processed when creating a new socket. Lower numeric value indicate higher priority.
- **_family** - socket family implemented by the offloaded socket. AF_UNSPEC indicates any family.
- **_is_supported** - a filtering function, used to verify whether particular socket family, type and protocol are supported by the offloaded socket implementation.
- **_handler** - a function compatible with socket() API, used to create an offloaded socket.

Every offloaded socket implementation should also implement a set of socket APIs, specified in socket_op_vtable struct.

The function registered for socket creation should allocate a new file descriptor using z_reserve_fd() function. Any additional actions, specific to the creation of a particular offloaded socket implementation should take place after the file descriptor is allocated. As a final step, if the offloaded socket was created successfully, the file descriptor should be finalized with z_finalize_fd() function. The finalize function allows to register a socket_op_vtable structure implementing socket APIs for an offloaded socket along with an optional socket context data pointer.

Finally, when an offloaded network interface is initialized, it should indicate that the interface is offloaded with net_if_socket_offload_set() function. The function registers the function used to create an offloaded socket (the same as the one provided in NET_SOCKET_OFFLOAD_REGISTER) at the network interface.

Offloaded socket creation  When application creates a new socket with socket() function, the network stack iterates over all registered socket implementations (native and offloaded). Higher priority socket implementations are processed first. For each registered socket implementation, an address family is verified, and if it matches (or the socket was registered as AF_UNSPEC), the corresponding _is_supported function is called to verify the remaining socket parameters. The first implementation that fulfills the socket requirements (i.e. _is_supported returns true) will create a new socket with its _handler function.
The above indicates the importance of the socket priority. If multiple socket implementations support the same set of socket family/type/protocol, the first implementation processed by the system will create a socket. Therefore it’s important to give the highest priority to the implementation that should be the system default.

The socket priority for native socket implementation is configured with Kconfig. Use CONFIG_NET_SOCKETS_TLS_PRIORITY to set the priority for the native TLS sockets. Use CONFIG_NET_SOCKETS_PRIORITY_DEFAULT to set the priority for the remaining native sockets.

**Dealing with multiple offloaded interfaces**  As the socket() function does not allow to specify which network interface should be used by a socket, it’s not possible to choose a specific implementation in case multiple offloaded socket implementations, supporting the same type of sockets, are available. The same problem arises when both native and offloaded sockets are available in the system.

To address this problem, a special socket implementation (called socket dispatcher) was introduced. The sole reason for this module is to postpone the socket creation for until the first operation on a socket is performed. This leaves an opening to use SO_BINDTODEVICE socket option, to bind a socket to a particular network interface (and thus offloaded socket implementation). The socket dispatcher can be enabled with CONFIG_NET_SOCKETS_OFFLOAD_DISPATCHER Kconfig option.

When enabled, the application can specify the network interface to use with setsockopt() function:

```c
/* A "dispatcher" socket is created */
sock = socket(AF_INET, SOCK_DGRAM, IPPROTO_UDP);
struct ifreq ifreq = {
   .ifr_name = "SimpleLink"
};
/* The socket is "dispatched" to a particular network interface
* (offloaded or not).
*/
setsockopt(sock, SOL_SOCKET, SO_BINDTODEVICE, &ifreq, sizeof(ifreq));
```

Similarly, if TLS is supported by both native and offloaded sockets, TLS_NATIVE socket option can be used to indicate that a native TLS socket should be created. The underlying socket can then be bound to a particular network interface:

```c
/* A "dispatcher" socket is created */
sock = socket(AF_INET, SOCK_STREAM, IPPROTO_TLS_1_2);
int tls_native = 1;
/* The socket is "dispatched" to a native TLS socket implementation.
* The underlying socket is a "dispatcher" socket now.
*/
setsockopt(sock, SOL_TLS, TLS_NATIVE, &tls_native, sizeof(tls_native));
struct ifreq ifreq = {
   .ifr_name = "SimpleLink"
};
/* The underlying socket is "dispatched" to a particular network interface
* (offloaded or not).
*/
setsockopt(sock, SOL_SOCKET, SO_BINDTODEVICE, &ifreq, sizeof(ifreq));
```

In case no SO_BINDTODEVICE socket option is used on a socket, the socket will be dispatched according to the default priority and filtering rules on a first socket API call.
API Reference

**BSD Sockets**

**Related code samples**

**AWS IoT Core MQTT**
Connect to AWS IoT Core and publish messages using MQTT.

**Asynchronous echo server using poll()**
Implement an asynchronous IPv4/IPv6 TCP echo server using BSD sockets and poll().

**Asynchronous echo server using select()**
Implement an asynchronous IPv4/IPv6 TCP echo server using BSD sockets and select().

**Dumb HTTP server**
Implement a simple, portable, HTTP server using BSD sockets.

**Dumb HTTP server (multi-threaded)**
Implement a simple HTTP server supporting simultaneous connections using BSD sockets.

**Echo client (advanced)**
Implement a client that sends IP packets, waits for data to be sent back, and verifies it.

**Echo server (advanced)**
Implement a UDP/TCP server that sends received packets back to the sender.

**Echo server (simple)**
Implements a simple IPv4/IPv6 TCP echo server using BSD sockets.

**HTTP GET using plain sockets**
Implement an HTTP(S) client using plain BSD sockets.

**HTTP client**
Implement an HTTP(S) client that issues a variety of HTTP requests.

**Large HTTP download**
Download a large file from a web server using BSD sockets.

**Microsoft Azure IoT Hub MQTT**
Connect to Azure IoT Hub and publish messages using MQTT.

**Modbus TCP server**
Implement a Modbus TCP server exposing Modbus commands to control LEDs.

**Modbus TCP-to-serial gateway**
Implement a gateway between an Ethernet TCP-IP network and a Modbus serial line.

**Network management socket**
Listen to network management events using a network management socket.

**Packet socket**
Use raw packet sockets over Ethernet.

**SNTP client**
Use SNTP to get the current time from the host.

**SocketCAN**
Send and receive raw CAN frames using BSD sockets API.

**Socketpair**
Implement communication between threads using socket pairs.

**TCP sample for TTCN-3 based sanity check**
Use TTCN-3 to validate the functionality of the TCP stack.

**TagoIO HTTP Post**
Send random temperature values to TagoIO IoT Cloud Platform using HTTP.
**UDP sender using SO_TXTIME**  
Control the transmission time of a packet using SO_TXTIME socket option.

**Video TCP server sink**  
Capture video frames and send them over the network to a TCP client.

**WebSocket Client**  
Implement a Websocket client that connects to a Websocket server.

**mDNS responder**  
Listen and respond to mDNS queries.

---

**group bsd_sockets**

BSD Sockets compatible API.

**Defines**

**ZSOCK_POLLIN**  
zsock_poll: Poll for readability

**ZSOCK_POLLPRI**  
zsock_poll: Compatibility value, ignored

**ZSOCK_POLLOUT**  
zsock_poll: Poll for writability

**ZSOCK_POLLErr**  
zsock_poll: Poll results in error condition (output value only)

**ZSOCK_POLLHUP**  
zsock_poll: Poll detected closed connection (output value only)

**ZSOCK_POLLNVAL**  
zsock_poll: Invalid socket (output value only)

**ZSOCK_MSG_PEEK**  
zsock_recv: Read data without removing it from socket input queue

**ZSOCK_MSG_TRUNC**  
zsock_recv: return the real length of the datagram, even when it was longer than the passed buffer

**ZSOCK_MSG_DONTWAIT**  
zsock_recv/zsock_send: Override operation to non-blocking

**ZSOCK_MSG_WAITALL**  
zsock_recv: block until the full amount of data can be returned

**ZSOCK_SHUT_RD**  
zsock_shutdown: Shut down for reading
ZSOCK_SHUT_WR
zsock_shutdown: Shut down for writing

ZSOCK_SHUT_RDWR
zsock_shutdown: Shut down for both reading and writing

SOL_TLS
Protocol level for TLS.
Here, the same socket protocol level for TLS as in Linux was used.

TLS_PEER_VERIFY_NONE
Peer verification disabled.

TLS_PEER_VERIFY_OPTIONAL
Peer verification optional.

TLS_PEER_VERIFY_REQUIRED
Peer verification required.

TLS_DTLS_ROLE_CLIENT
Client role in a DTLS session.

TLS_DTLS_ROLE_SERVER
Server role in a DTLS session.

TLS_CERT_NOCOPY_NONE
Cert duplicated in heap.

TLS_CERT_NOCOPY_OPTIONAL
Cert not copied in heap if DER.

TLS_SESSION_CACHE_DISABLED
Disable TLS session caching.

TLS_SESSION_CACHE_ENABLED
Enable TLS session caching.

TLS_DTLS_CID_DISABLED

TLS_DTLS_CID_SUPPORTED

TLS_DTLS_CID_ENABLED

TLS_DTLS_CID_STATUS_DISABLED

TLS_DTLS_CID_STATUS_DOWNLINK

Chapter 6. Connectivity
TLS_DTLS_CID_STATUS_UPLINK

TLS_DTLS_CID_STATUS_BIDIRECTIONAL

AI_PASSIVE
    Address for bind() (vs for connect())

AI_CANONNAME
    Fill in ai_canonname.

AI_NUMERICHOST
    Assume host address is in numeric notation, don’t DNS lookup.

AI_V4MAPPED
    May return IPv4 mapped address for IPv6

AI_ALL
    May return both native IPv6 and mapped IPv4 address for IPv6.

AI_ADDRCONFIG
    IPv4/IPv6 support depends on local system config.

AI_NUMERICSERV
    Assume service (port) is numeric.

NI_NUMERICHOST
    zsock_getnameinfo(): Resolve to numeric address.

NI_NUMERICSERV
    zsock_getnameinfo(): Resolve to numeric port number.

NI_NOFQDN
    zsock_getnameinfo(): Return only hostname instead of FQDN

NI_NAMEREQD
    zsock_getnameinfo(): Dummy option for compatibility

NI_DGRAM
    zsock_getnameinfo(): Dummy option for compatibility

NI_MAXHOST
    zsock_getnameinfo(): Max supported hostname length

pollfd

fcntl

addrinfo
POLLIN
POSIX wrapper for ZSOCK_POLLIN.

POLLOUT
POSIX wrapper for ZSOCK_POLLOUT.

POLLERR
POSIX wrapper for ZSOCK_POLLErr.

POLLHUP
POSIX wrapper for ZSOCK_POLLHUP.

POLLNVAL
POSIX wrapper for ZSOCK_POLLNVAL.

MSG_PEEK
POSIX wrapper for ZSOCK_MSG_PEEK.

MSG_TRUNC
POSIX wrapper for ZSOCK_MSG_TRUNC.

MSG_DONTWAIT
POSIX wrapper for ZSOCK_MSG_DONTWAIT.

MSG_WAITALL
POSIX wrapper for ZSOCK_MSG_WAITALL.

SHUT_RD
POSIX wrapper for ZSOCK_SHUT_RD.

SHUT_WR
POSIX wrapper for ZSOCK_SHUT_WR.

SHUT_RDWR
POSIX wrapper for ZSOCK_SHUT_RDWR.

EAI_BADFLAGS
POSIX wrapper for DNS_EAI_BADFLAGS.

EAI_NONAME
POSIX wrapper for DNS_EAI_NONAME.

EAI_AGAIN
POSIX wrapper for DNS_EAI_AGAIN.

EAI_FAIL
POSIX wrapper for DNS_EAI_FAIL.
EAI_NODATA
    POSIX wrapper for DNS_EAI_NODATA.

EAI_MEMORY
    POSIX wrapper for DNS_EAI_MEMORY.

EAI_SYSTEM
    POSIX wrapper for DNS_EAI_SYSTEM.

EAI_SERVICE
    POSIX wrapper for DNS_EAI_SERVICE.

EAI_SOCKTYPE
    POSIX wrapper for DNS_EAI_SOCKTYPE.

EAI_FAMILY
    POSIX wrapper for DNS_EAI_FAMILY.

IFNAMSIZ

SOL_SOCKET
    sockopt: Socket-level option

SO_DEBUG
    sockopt: Recording debugging information (ignored, for compatibility)

SO_REUSEADDR
    sockopt: address reuse

SO_TYPE
    sockopt: Type of the socket

SO_ERROR
    sockopt: Async error (ignored, for compatibility)

SO_DONTROUTE
    sockopt: Bypass normal routing and send directly to host (ignored, for compatibility)

SO_BROADCAST
    sockopt: Transmission of broadcast messages is supported (ignored, for compatibility)

SO_SNDBUF
    sockopt: Size of socket send buffer

SO_RCVBUF
    sockopt: Size of socket recv buffer
SO_KEEPALIVE
sockopt: Enable sending keep-alive messages on connections (ignored, for compatibility)

SO_OOBINLINE
sockopt: Place out-of-band data into receive stream (ignored, for compatibility)

SO_LINGER
sockopt: Socket lingers on close (ignored, for compatibility)

SO_REUSEPORT
sockopt: Allow multiple sockets to reuse a single port

SO_RCVLOWAT
sockopt: Receive low watermark (ignored, for compatibility)

SO_SNДLOWAT
sockopt: Send low watermark (ignored, for compatibility)

SO_RC VTIMEO
sockopt: Receive timeout Applies to receive functions like recv(), but not to connect()

SO_SNDTIMEO
sockopt: Send timeout

SO_BINDTODEVICE
sockopt: Bind a socket to an interface

SO_ACCEPTCONN
sockopt: Socket accepts incoming connections (ignored, for compatibility)

SO_TIMESTAMPING
sockopt: Timestamp TX packets

SO_PROTOCOL
sockopt: Protocol used with the socket

SO_DOMAIN
sockopt: Domain used with SOCKET (ignored, for compatibility)

TCP_NODELAY
End Socket options for SOL_SOCKET level.
sockopt: Disable TCP buffering (ignored, for compatibility)

IP_TOS
sockopt: Set or receive the Type-Of-Service value for an outgoing packet.

IPV6_V6ONLY
sockopt: Don’t support IPv4 access (ignored, for compatibility)
IPV6_TCLASS
  sockopt: Set or receive the traffic class value for an outgoing packet.

SO_PRIORITY
  sockopt: Socket priority

SO_TXTIME
  sockopt: Socket TX time (when the data should be sent)

SCM_TXTIME

SO_SOCKS5
  sockopt: Enable SOCKS5 for Socket

SOMAXCONN
   listen: The maximum backlog queue length (ignored, for compatibility)

ZSOCK_FD_SETSIZE
   Number of file descriptors which can be added to zsock_fd_set.

fd_set

FD_SETSIZE

zsock_timeval

Typedefs

typedef struct zsock_fd_set zsock_fd_set

Functions

void *zsock_get_context_object(int sock)
   Obtain a file descriptor's associated net context.
   
   With CONFIG_USERSPACE enabled, the kernel's object permission system must apply
to socket file descriptors. When a socket is opened, by default only the caller has per-
mission, access by other threads will fail unless they have been specifically granted
permission.

   This is achieved by tagging data structure definitions that implement the underly-
ing object associated with a network socket file descriptor with '__net_socket'. All
pointers to instances of these will be known to the kernel as kernel objects with type
K_OBJ_NET_SOCKET.

   This API is intended for threads that need to grant access to the object associated with
a particular file descriptor to another thread. The returned pointer represents the un-
derlying K_OBJ_NET_SOCKET and may be passed to APIs like k_object_access_grant().
In a system like Linux which has the notion of threads running in processes in a shared virtual address space, this sort of management is unnecessary as the scope of file descriptors is implemented at the process level.

However in Zephyr the file descriptor scope is global, and MPU-based systems are not able to implement a process-like model due to the lack of memory virtualization hardware. They use discrete object permissions and memory domains instead to define thread access scope.

User threads will have no direct access to the returned object and will fault if they try to access its memory; the pointer can only be used to make permission assignment calls, which follow exactly the rules for other kernel objects like device drivers and IPC.

**Parameters**
- **sock** – file descriptor

**Returns**
pointer to associated network socket object, or NULL if the file descriptor wasn’t valid or the caller had no access permission

```c
int zsock_socket(int family, int type, int proto)
```
Create a network socket.

See POSIX.1-2017 article for normative description. This function is also exposed as socket() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

If CONFIG_USERSPACE is enabled, the caller will be granted access to the context object associated with the returned file descriptor.

**See also:**
- `zsock_get_context_object()`

```c
int zsock_socketpair(int family, int type, int proto, int *sv)
```
Create an unnamed pair of connected sockets.

See POSIX.1-2017 article for normative description. This function is also exposed as socketpair() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

```c
int zsock_close(int sock)
```
Close a network socket.

Close a network socket. This function is also exposed as close() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX close() function).

```c
int zsock_shutdown(int sock, int how)
```
Shutdown socket send/receive operations.

See POSIX.1-2017 article for normative description, but currently this function has no effect in Zephyr and provided solely for compatibility with existing code. This function is also exposed as shutdown() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

```c
int zsock_bind(int sock, const struct sockaddr *addr, socklen_t addrlen)
```
Bind a socket to a local network address.

See POSIX.1-2017 article for normative description. This function is also exposed as bind() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

```c
int zsock_connect(int sock, const struct sockaddr *addr, socklen_t addrlen)
```
Connect a socket to a peer network address.

See POSIX.1-2017 article for normative description. This function is also exposed as connect() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.
int zsock_listen(int sock, int backlog)
    Set up a STREAM socket to accept peer connections.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    listen() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_accept(int sock, struct sockaddr *addr,socklen_t *addrlen)
    Accept a connection on listening socket.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    accept() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

ssize_t zsock_sendto(int sock, const void *buf, size_t len, int flags, const struct sockaddr *dest_addr,socklen_t addrlen)
    Send data to an arbitrary network address.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    sendto() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline ssize_t zsock_send(int sock, const void *buf, size_t len, int flags)
    Send data to a connected peer.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    send() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

ssize_t zsock_sendmsg(int sock, const struct msghdr *msg, int flags)
    Send data to an arbitrary network address.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    sendmsg() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

ssize_t zsock_recvfrom(int sock, void *buf, size_t max_len, int flags, struct sockaddr *src_addr,socklen_t *addrlen)
    Receive data from an arbitrary network address.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    recvfrom() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline ssize_t zsock_recv(int sock, void *buf, size_t max_len, int flags)
    Receive data from a connected peer.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    recv() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_fcntl(int sock, int cmd, int flags)
    Control blocking/non-blocking mode of a socket.
    This functions allow to (only) configure a socket for blocking or non-blocking
    operation (O_NONBLOCK). This function is also exposed as fcntl() if CON-
    FIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic
    POSIX fcntl() function).

int zsock_ioctl(int sock, unsigned long request, va_list ap)
    Control underlying socket parameters.
    See POSIX.1-2017 article for normative description. This function enables querying or
    manipulating underlying socket parameters. Currently supported @p request values
    include ZFD_IOCTL_FIONBIO, and ZFD_IOCTL_FIONREAD, to set non-blocking mode, and
    query the number of bytes available to read, respectively. This function is also exposed
    as ioctl() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict
    with generic POSIX ioctl() function).
int zsock_poll(struct zsock_pollfd *fds, int nfds, int timeout)
    Efficiently poll multiple sockets for events.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    poll() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict
    with generic POSIX poll() function).

int zsock_getsockopt(int sock, int level, int optname, void *optval, socklen_t *optlen)
    Get various socket options.
    See POSIX.1-2017 article for normative description. In Zephyr this function supports a
    subset of socket options described by POSIX, but also some additional options available
    in Linux (some options are dummy and provided to ease porting of existing code).
    This function is also exposed as getsockopt() if CONFIG_NET_SOCKETS_POSIX_NAMES is
    defined.

int zsock_setsockopt(int sock, int level, int optname, const void *optval, socklen_t optlen)
    Set various socket options.
    See POSIX.1-2017 article for normative description. In Zephyr this function supports a
    subset of socket options described by POSIX, but also some additional options available
    in Linux (some options are dummy and provided to ease porting of existing code).
    This function is also exposed as setsockopt() if CONFIG_NET_SOCKETS_POSIX_NAMES is
    defined.

int zsock_getpeername(int sock, struct sockaddr *addr, socklen_t *addrlen)
    Get peer name.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    getpeername() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getsockname(int sock, struct sockaddr *addr, socklen_t *addrlen)
    Get socket name.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    getsockname() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_gethostname(char *buf, size_t len)
    Get local host name.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    gethostname() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline char *zsock_inet_ntop(sa_family_t family, const void *src, char *dst, size_t size)
    Convert network address from internal to numeric ASCII form.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    inet_ntop() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_inet_pton(sa_family_t family, const char *src, void *dst)
    Convert network address from numeric ASCII form to internal representation.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    inet_ntop() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getaddrinfo(const char *host, const char *service, const struct zsock_addrinfo *
    hints, struct zsock_addrinfo **res)
    Resolve a domain name to one or more network addresses.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    getaddrinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.
void zsock_freeaddrinfo(struct zsock_addrinfo *ai)
    Free results returned by zsock_getaddrinfo()
    See POSIX.1-2017 article for normative description. This function is also exposed as freeaddrinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

const char *zsock_gai_strerror(int errcode)
    Convert zsock_getaddrinfo() error code to textual message.
    See POSIX.1-2017 article for normative description. This function is also exposed as gai_strerror() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getnameinfo(const struct sockaddr *addr, socklen_t addrlen, char *host, socklen_t hostlen, char *serv, socklen_t servlen, int flags)
    Resolve a network address to a domain name or ASCII address.
    See POSIX.1-2017 article for normative description. This function is also exposed as getnameinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline int socket(int family, int type, int proto)
    POSIX wrapper for zsock_socket.

static inline int socketpair(int family, int type, int proto, int sv[2])
    POSIX wrapper for zsock_socketpair.

static inline int close(int sock)
    POSIX wrapper for zsock_close.

static inline int shutdown(int sock, int how)
    POSIX wrapper for zsock_shutdown.

static inline int bind(int sock, const struct sockaddr *addr, socklen_t addrlen)
    POSIX wrapper for zsock_bind.

static inline int connect(int sock, const struct sockaddr *addr, socklen_t addrlen)
    POSIX wrapper for zsock_connect.

static inline int listen(int sock, int backlog)
    POSIX wrapper for zsock_listen.

static inline int accept(int sock, struct sockaddr *addr, socklen_t *addrlen)
    POSIX wrapper for zsock_accept.

static inline ssize_t send(int sock, const void *buf, size_t len, int flags)
    POSIX wrapper for zsock_send.

static inline ssize_t recv(int sock, void *buf, size_t max_len, int flags)
    POSIX wrapper for zsock_recv.

static inline ssize_t sendto(int sock, const void *buf, size_t len, int flags, const struct sockaddr *dest_addr, socklen_t addrlen)
    POSIX wrapper for zsock_sendto.

static inline ssize_t sendmsg(int sock, const struct msghdr *message, int flags)
    POSIX wrapper for zsock_sendmsg.

static inline ssize_t recvfrom(int sock, void *buf, size_t max_len, int flags, struct sockaddr *src_addr, socklen_t *addrlen)
    POSIX wrapper for zsock_recvfrom.
static inline int poll(struct zsock_pollfd *fds, int nfds, int timeout)
  POSIX wrapper for zsock_poll.
static inline int getsockopt(int sock, int level, int optname, void *optval, socklen_t *optlen)
  POSIX wrapper for zsock_getsockopt.
static inline int setsockopt(int sock, int level, int optname, const void *optval, socklen_t optlen)
  POSIX wrapper for zsock_setsockopt.
static inline int getpeername(int sock, struct sockaddr *addr, socklen_t *addrlen)
  POSIX wrapper for zsock_getpeername.
static inline int getsockname(int sock, struct sockaddr *addr, socklen_t *addrlen)
  POSIX wrapper for zsock_getsockname.
static inline int getaddrinfo(const char *host, const char *service, const struct zsock_addrinfo *hints, struct zsock_addrinfo **res)
  POSIX wrapper for zsock_getaddrinfo.
static inline void freeaddrinfo(struct zsock_addrinfo *ai)
  POSIX wrapper for zsock_freeaddrinfo.
static inline const char *gai_strerror(int errcode)
  POSIX wrapper for zsock_gai_strerror.
static inline int getnameinfo(const struct sockaddr *addr, socklen_t addrlen, char *host, socklen_t hostlen, char *serv, socklen_t servlen, int flags)
  POSIX wrapper for zsock_getnameinfo.
static inline int gethostname(char *buf, size_t len)
  POSIX wrapper for zsock_gethostname.
static inline int inet_pton(sa_family_t family, const char *src, void *dst)
  POSIX wrapper for zsock_inet_pton.
static inline char *inet_ntop(sa_family_t family, const void *src, char *dst, size_t size)
  POSIX wrapper for zsock_inet_ntop.

int zsock_select(int nfds, zsock_fd_set *readfds, zsock_fd_set *writefds, zsock_fd_set *exceptfds, struct zsock_timeval *timeout)
  Legacy function to poll multiple sockets for events.
See POSIX.1-2017 article for normative description. This function is provided to ease porting of existing code and not recommended for usage due to its inefficiency, use zsock_poll() instead. In Zephyr this function works only with sockets, not arbitrary file descriptors. This function is also exposed as select() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX select() function).

void ZSOCK_FD_ZERO(zsock_fd_set *set)
  Initialize (clear) fd_set.
See POSIX.1-2017 article for normative description. This function is also exposed as FD_ZERO() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int ZSOCK_FD_ISSET(int fd, zsock_fd_set *set)
  Check whether socket is a member of fd_set.
See POSIX.1-2017 article for normative description. This function is also exposed as FD_ISSET() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

```c
void ZSOCK_FD_CLR(int fd, zsock_fd_set *set)
    Remove socket from fd_set.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    FD_CLR() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

void ZSOCK_FD_SET(int fd, zsock_fd_set *set)
    Add socket to fd_set.
    See POSIX.1-2017 article for normative description. This function is also exposed as
    FD_SET() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline int select(int nfds, zsock_fd_set *readfds, zsock_fd_set *writefds, zsock_fd_set *exceptfds, struct timeval *timeout)

static inline void FD_ZERO(zsock_fd_set *set)

static inline int FD_ISSET(int fd, zsock_fd_set *set)

static inline void FD_CLR(int fd, zsock_fd_set *set)

static inline void FD_SET(int fd, zsock_fd_set *set)

struct zsock_pollfd
    #include <socket.h>

struct zsock_addrinfo
    #include <socket.h>

**TLS Credentials**

**Related code samples**

**AWS IoT Core MQTT**
Connect to AWS IoT Core and publish messages using MQTT.

**Dumb HTTP server (multi-threaded)**
Implement a simple HTTP server supporting simultaneous connections using BSD sockets.

**Echo client (advanced)**
Implement a client that sends IP packets, waits for data to be sent back, and verifies it.

**Echo server (advanced)**
Implement a UDP/TCP server that sends received packets back to the sender.

**HTTP GET using plain sockets**
Implement an HTTP(S) client using plain BSD sockets.

**HTTP client**
Implement an HTTP(S) client that issues a variety of HTTP requests.

**Large HTTP download**
Download a large file from a web server using BSD sockets.

**Microsoft Azure IoT Hub MQTT**
Connect to Azure IoT Hub and publish messages using MQTT.

---

6.3. Networking
TagoIO HTTP Post
Send random temperature values to TagoIO IoT Cloud Platform using HTTP.

**group tls_credentials**
TLS credentials management.

**Typedefs**

typedef int sec_tag_t
Secure tag, a reference to TLS credential.
Secure tag can be used to reference credential after it was registered in the system.

---

**Note:** Some TLS credentials come in pairs:
- TLS_CREDENTIAL_SERVER_CERTIFICATE with TLS_CREDENTIAL_PRIVATE_KEY,
- TLS_CREDENTIAL_PSK withTLS_CREDENTIAL_PSK_ID. Such pairs of credentials must be assigned the same secure tag to be correctly handled in the system.

---

**Enums**

enum tlsCredentialType
tLS credential types.

**Values:**

enumerator TLS_CREDENTIAL_NONE
Unspecified credential.

enumerator TLS_CREDENTIAL_CA_CERTIFICATE
A trusted CA certificate.
Use this to authenticate remote servers. Used with certificate-based ciphersuites.

enumerator TLS_CREDENTIAL_SERVER_CERTIFICATE
A public server certificate.
Use this to register your own server certificate. Should be registered together with a corresponding private key. Used with certificate-based ciphersuites.

enumerator TLS_CREDENTIAL_PRIVATE_KEY
Private key.
Should be registered together with a corresponding public certificate. Used with certificate-based ciphersuites.

enumerator TLS_CREDENTIAL_PSK
Pre-shared key.
Should be registered together with a corresponding PSK identity. Used with PSK-based ciphersuites.
enumerator **TLS_CREDENTIAL_PSK_ID**

Pre-shared key identity.
Should be registered together with a corresponding PSK. Used with PSK-based ciphersuites.

### Functions

```
int tls_credential_add( sec_tag_t tag, enum tls_credential_type type, const void *cred, size_t credlen )
```

Add a TLS credential.

This function adds a TLS credential, that can be used by TLS/DTLS for authentication.

**Parameters**

- *tag* – A security tag that credential will be referenced with.
- *type* – A TLS/DTLS credential type.
- *cred* – A TLS/DTLS credential.
- *credlen* – A TLS/DTLS credential length.

**Return values**

- 0 – TLS credential successfully added.
- -EACCES – Access to the TLS credential subsystem was denied.
- -ENOMEM – Not enough memory to add new TLS credential.
- -EEXIST – TLS credential of specific tag and type already exists.

```
int tls_credential_get( sec_tag_t tag, enum tls_credential_type type, void *cred, size_t *credlen )
```

Get a TLS credential.

This function gets an already registered TLS credential, referenced by tag secure tag of type.

**Parameters**

- *tag* – A security tag of requested credential.
- *type* – A TLS/DTLS credential type of requested credential.
- *cred* – A buffer for TLS/DTLS credential.
- *credlen* – A buffer size on input. TLS/DTLS credential length on output.

**Return values**

- 0 – TLS credential successfully obtained.
- -EACCES – Access to the TLS credential subsystem was denied.
- -ENOENT – Requested TLS credential was not found.
- -EFBIG – Requested TLS credential does not fit in the buffer provided.

```
int tls_credential_delete( sec_tag_t tag, enum tls_credential_type type )
```

Delete a TLS credential.

This function removes a TLS credential, referenced by tag secure tag of type.

**Parameters**

- *tag* – A security tag corresponding to removed credential.
• **type** – A TLS/DTLS credential type of removed credential.

**Return values**

• **0** – TLS credential successfully deleted.
• **-EACCES** – Access to the TLS credential subsystem was denied.
• **-ENOENT** – Requested TLS credential was not found.

### IPv4/IPv6 Primitives and Helpers

- **Overview**
- **API Reference**

**Overview**

Miscellaneous defines and helper functions for IP addresses and IP protocols.

**API Reference**

*group* `ip_4_6`

IPv4/IPv6 primitives and helpers.

  Inter-process communication
AF_UNSPEC
   Unspecified address family.

AF_INET
   IP protocol family version 4.

AF_INET6
   IP protocol family version 6.

AF_PACKET
   Packet family.

AF_CAN
   Controller Area Network.

AF_NET_MGMT
   Network management info.

AF_LOCAL
   Inter-process communication

AF_UNIX
   Inter-process communication

ntohs(x)
   Convert 16-bit value from network to host byte order.

   Parameters
   • x – The network byte order value to convert.

   Returns
   Host byte order value.

ntohl(x)
   Convert 32-bit value from network to host byte order.

   Parameters
   • x – The network byte order value to convert.

   Returns
   Host byte order value.

ntohl1(x)
   Convert 64-bit value from network to host byte order.

   Parameters
   • x – The network byte order value to convert.

   Returns
   Host byte order value.

htons(x)
   Convert 16-bit value from host to network byte order.

   Parameters
   • x – The host byte order value to convert.
Returns
Network byte order value.

htonl(x)
Convert 32-bit value from host to network byte order.

Parameters
• x – The host byte order value to convert.

Returns
Network byte order value.

htonll(x)
Convert 64-bit value from host to network byte order.

Parameters
• x – The host byte order value to convert.

Returns
Network byte order value.

NET_IPV6_ADDR_SIZE
NET_IPV4_ADDR_SIZE

ALIGN_D(x)
CMSG_FIRSTHDR(mshdr)
CMSG_NXTHDR(mshdr, cmsg)
CMSG_DATA(cmsg)
CMSG_SPACE(length)
CMSG_LEN(length)

INET_ADDRSTRLEN
Max length of the IPv4 address as a string.
Defined by POSIX.

INET6_ADDRSTRLEN
Max length of the IPv6 address as a string.
Takes into account possible mapped IPv4 addresses.

NET_MAX_PRIORITIES

net_ipaddr_copy(dest, src)
Copy an IPv4 or IPv6 address.

Parameters
• dest – Destination IP address.
• src – Source IP address.

Returns
Destination address.
**Typedefs**

typedef unsigned short int *sa_family_t*
Socket address family type.

typedef size_t *socklen_t*
Length of a socket address.

**Enums**

definition enum net_ip_protocol*
Protocol numbers from IANA/BSD.

*Values:*

tenumerator IPPROTO_IP = 0
   IP protocol (pseudo-val for *setsockopt*()

tenumerator IPPROTO_ICMP = 1
   ICMP protocol

tenumerator IPPROTO_IGMP = 2
   IGMP protocol

tenumerator IPPROTO_IPIP = 4
   IPIP tunnels

tenumerator IPPROTO_TCP = 6
   TCP protocol

tenumerator IPPROTO_UDP = 17
   UDP protocol

tenumerator IPPROTO_IPV6 = 41
   IPv6 protocol

tenumerator IPPROTO_ICMPV6 = 58
   ICMPv6 protocol.

tenumerator IPPROTO_RAW = 255
   RAW IP packets

*enum net_ip_protocol_secure*
Protocol numbers for TLS protocols.

*Values:*

tenumerator IPPROTO_TLS_1_0 = 256
   TLS 1.0 protocol.
enumerator IPPROTO_TLS_1_1 = 257
TLS 1.1 protocol.

enumerator IPPROTO_TLS_1_2 = 258
TLS 1.2 protocol.

enumerator IPPROTO_DTLS_1_0 = 272
DTLS 1.0 protocol.

enumerator IPPROTO_DTLS_1_2 = 273
DTLS 1.2 protocol.

enum net_sock_type
Socket type.
Values:

enumerator SOCK_STREAM = 1
Stream socket type

enumerator SOCK_DGRAM
Datagram socket type.

enumerator SOCK_RAW
RAW socket type

enum net_ip_mtu
Values:

enumerator NET_IPV6_MTU = 1280
IPv6 MTU length.
We must be able to receive this size IPv6 packet without fragmentation.

enumerator NET_IPV4_MTU = 576
IPv4 MTU length.
We must be able to receive this size IPv4 packet without fragmentation.

enum net_priority
Network packet priority settings described in IEEE 802.1Q Annex I.1.
Values:

enumerator NET_PRIORITY_BK = 1
Background (lowest)

enumerator NET_PRIORITY_BE = 0
Best effort (default)

enumerator NET_PRIORITY_EE = 2
Excellent effort
enumerator **NET_PRIORITY_CA** = 3
    Critical applications

eumerator **NET_PRIORITY_VI** = 4
    Video, < 100 ms latency and jitter.

eumerator **NET_PRIORITY_VO** = 5
    Voice, < 10 ms latency and jitter

eumerator **NET_PRIORITY_IC** = 6
    Internetwork control

eumerator **NET_PRIORITY_NC** = 7
    Network control (highest)

**enum net_addr_state**
    What is the current state of the network address.
    *Values:*

    enumerator **NET_ADDR_ANY_STATE** = -1
        Default (invalid) address type.

    enumerator **NET_ADDR_TENTATIVE** = 0
        Tentative address

    enumerator **NET_ADDR_PREFERRED**
        Preferred address

    enumerator **NET_ADDR_DEPRECATED**
        Deprecated address

**enum net_addr_type**
    How the network address is assigned to network interface.
    *Values:*

    enumerator **NET_ADDR_ANY** = 0
        Default value.
        This is not a valid value.

    enumerator **NET_ADDR_AUTOCONF**
        Auto configured address.

    enumerator **NET_ADDR_DHCP**
        Address is from DHCP.

    enumerator **NET_ADDR_MANUAL**
        Manually set address.
enumerator NET_ADDR_OVERRIDABLE
    Manually set address which is overridable by DHCP.

Functions

static inline bool net_ipv6_is_addr_loopback(struct in6_addr *addr)
Check if the IPv6 address is a loopback address (::1).

Parameters
  • addr – IPv6 address

Returns
True if address is a loopback address, False otherwise.

static inline bool net_ipv6_is_addr_mcast(const struct in6_addr *addr)
Check if the IPv6 address is a multicast address.

Parameters
  • addr – IPv6 address

Returns
True if address is multicast address, False otherwise.

struct net_if_addr* net_if_ipv6_addr_lookup(const struct in6_addr *addr, struct net_if **iface)

static inline bool net_ipv6_is_my_addr(struct in6_addr *addr)
Check if IPv6 address is found in one of the network interfaces.

Parameters
  • addr – IPv6 address

Returns
True if address was found, False otherwise.

struct net_if_mcast_addr* net_if_ipv6_maddr_lookup(const struct in6_addr *addr, struct net_if **iface)

static inline bool net_ipv6_is_my_maddr(struct in6_addr *maddr)
Check if IPv6 multicast address is found in one of the network interfaces.

Parameters
  • maddr – Multicast IPv6 address

Returns
True if address was found, False otherwise.

static inline bool net_ipv6_is_prefix(const uint8_t *addr1, const uint8_t *addr2, uint8_t length)
Check if two IPv6 addresses are same when compared after prefix mask.

Parameters
  • addr1 – First IPv6 address.
  • addr2 – Second IPv6 address.
  • length – Prefix length (max length is 128).

Returns
True if IPv6 prefixes are the same, False otherwise.
static inline bool net_ipv4_is_addr_loopback(struct in_addr *addr)
Check if the IPv4 address is a loopback address (127.0.0.0/8).

Parameters
• addr – IPv4 address

Returns
True if address is a loopback address, False otherwise.

static inline bool net_ipv4_is_addr_unspecified(const struct in_addr *addr)
Check if the IPv4 address is unspecified (all bits zero).

Parameters
• addr – IPv4 address.

Returns
True if the address is unspecified, false otherwise.

static inline bool net_ipv4_is_addr_mcast(const struct in_addr *addr)
Check if the IPv4 address is a multicast address.

Parameters
• addr – IPv4 address

Returns
True if address is multicast address, False otherwise.

static inline bool net_ipv4_is_ll_addr(const struct in_addr *addr)
Check if the given IPv4 address is a link local address.

Parameters
• addr – A valid pointer on an IPv4 address

Returns
True if it is, false otherwise.

static inline void net_ipv4_addr_copy_raw(uint8_t *dest, const uint8_t *src)
Copy an IPv4 address raw buffer.

Parameters
• dest – Destination IP address.
• src – Source IP address.

static inline void net_ipv6_addr_copy_raw(uint8_t *dest, const uint8_t *src)
Copy an IPv6 address raw buffer.

Parameters
• dest – Destination IP address.
• src – Source IP address.

static inline bool net_ipv4_addr_cmp(const struct in_addr *addr1, const struct in_addr *addr2)
Compare two IPv4 addresses.

Parameters
• addr1 – Pointer to IPv4 address.
• addr2 – Pointer to IPv4 address.

Returns
True if the addresses are the same, false otherwise.
static inline bool net_ipv4_addr_cmp_raw(const uint8_t *addr1, const uint8_t *addr2)
  Compare two raw IPv4 address buffers.

Parameters
- addr1 – Pointer to IPv4 address buffer.
- addr2 – Pointer to IPv4 address buffer.

Returns
  True if the addresses are the same, false otherwise.

static inline bool net_ipv6_addr_cmp(const struct in6_addr *addr1, const struct in6_addr *addr2)
  Compare two IPv6 addresses.

Parameters
- addr1 – Pointer to IPv6 address.
- addr2 – Pointer to IPv6 address.

Returns
  True if the addresses are the same, false otherwise.

static inline bool net_ipv6_addr_cmp_raw(const uint8_t *addr1, const uint8_t *addr2)
  Compare two raw IPv6 address buffers.

Parameters
- addr1 – Pointer to IPv6 address buffer.
- addr2 – Pointer to IPv6 address buffer.

Returns
  True if the addresses are the same, false otherwise.

static inline bool net_ipv6_is_ll_addr(const struct in6_addr *addr)
  Check if the given IPv6 address is a link local address.

Parameters
- addr – A valid pointer on an IPv6 address

Returns
  True if it is, false otherwise.

static inline bool net_ipv6_is_ula_addr(const struct in6_addr *addr)
  Check if the given IPv6 address is a unique local address.

Parameters
- addr – A valid pointer on an IPv6 address

Returns
  True if it is, false otherwise.

cstruct in6_addr *net_ipv6_unspecified_address(void)
  Return pointer to any (all bits zeros) IPv6 address.

Returns
  Any IPv6 address.

cstruct in_addr *net_ipv4_unspecified_address(void)
  Return pointer to any (all bits zeros) IPv4 address.

Returns
  Any IPv4 address.
const struct in_addr *net_ipv4_broadcast_address(void)

    Return pointer to broadcast (all bits ones) IPv4 address.

Returns
    Broadcast IPv4 address.

bool net_if_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)

static inline bool net_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)

Check if the given address belongs to same subnet that has been configured for the interface.

Parameters
    • iface – A valid pointer on an interface
    • addr – IPv4 address

Returns
    True if address is in same subnet, false otherwise.

bool net_if_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)

static inline bool net_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)

Check if the given IPv4 address is a broadcast address.

Parameters
    • iface – Interface to use. Must be a valid pointer to an interface.
    • addr – IPv4 address

Returns
    True if address is a broadcast address, false otherwise.

struct net_if_addr *net_if_ipv4_addr_lookup(const struct in_addr *addr, struct net_if **iface)

static inline bool net_ipv4_is_my_addr(const struct in_addr *addr)

Check if the IPv4 address is assigned to any network interface in the system.

Parameters
    • addr – A valid pointer on an IPv4 address

Returns
    True if IPv4 address is found in one of the network interfaces, False otherwise.

static inline bool net_ipv6_is_addr_unspecified(const struct in6_addr *addr)

Check if the IPv6 address is unspecified (all bits zero)

Parameters
    • addr – IPv6 address.

Returns
    True if the address is unspecified, false otherwise.

static inline bool net_ipv6_is_addr_solicited_node(const struct in6_addr *addr)

Check if the IPv6 address is solicited node multicast address FF02:0:0:0:0:1:FFXX:XXXX defined in RFC 3513.

Parameters
    • addr – IPv6 address.

Returns
    True if the address is solicited node address, false otherwise.
static inline bool net_ipv6_is_addr_mcast_scope(const struct in6_addr *addr, int scope)
    Check if the IPv6 address is a given scope multicast address (FFyx::).

Parameters
• addr – IPv6 address
• scope – Scope to check

Returns
True if the address is in given scope multicast address, false otherwise.

static inline bool net_ipv6_is_same_mcast_scope(const struct in6_addr *addr_1, const struct in6_addr *addr_2)
    Check if the IPv6 addresses have the same multicast scope (FFyx::).

Parameters
• addr_1 – IPv6 address 1
• addr_2 – IPv6 address 2

Returns
True if both addresses have same multicast scope, false otherwise.

static inline bool net_ipv6_is_addr_mcast_global(const struct in6_addr *addr)
    Check if the IPv6 address is a global multicast address (FFxE::/16).

Parameters
• addr – IPv6 address.

Returns
True if the address is global multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_iface(const struct in6_addr *addr)
    Check if the IPv6 address is a interface scope multicast address (FFx1::).

Parameters
• addr – IPv6 address.

Returns
True if the address is a interface scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_link(const struct in6_addr *addr)
    Check if the IPv6 address is a link local scope multicast address (FFx2::).

Parameters
• addr – IPv6 address.

Returns
True if the address is a link local scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_mesh(const struct in6_addr *addr)
    Check if the IPv6 address is a mesh-local scope multicast address (FFx3::).

Parameters
• addr – IPv6 address.

Returns
True if the address is a mesh-local scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_site(const struct in6_addr *addr)
    Check if the IPv6 address is a site scope multicast address (FFx5::).

Parameters
• addr – IPv6 address.

**Returns**

True if the address is a site scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_org(const struct in6_addr *addr)

Check if the IPv6 address is an organization scope multicast address (FFx8:).

**Parameters**

• addr – IPv6 address.

**Returns**

True if the address is an organization scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_group(const struct in6_addr *addr, const struct in6_addr *group)

Check if the IPv6 address belongs to certain multicast group.

**Parameters**

• addr – IPv6 address.

• group – Group id IPv6 address, the values must be in network byte order

**Returns**

True if the IPv6 multicast address belongs to given multicast group, false otherwise.

static inline bool net_ipv6_is_addr_mcast_all_nodes_group(const struct in6_addr *addr)

Check if the IPv6 address belongs to the all nodes multicast group.

**Parameters**

• addr – IPv6 address

**Returns**

True if the IPv6 multicast address belongs to the all nodes multicast group, false otherwise

static inline bool net_ipv6_is_addr_mcast_iface_all_nodes(const struct in6_addr *addr)

Check if the IPv6 address is a interface scope all nodes multicast address (FF01:1).

**Parameters**

• addr – IPv6 address

**Returns**

True if the address is a interface scope all nodes multicast address, false otherwise

static inline bool net_ipv6_is_addr_mcast_link_all_nodes(const struct in6_addr *addr)

Check if the IPv6 address is a link local scope all nodes multicast address (FF02:1).

**Parameters**

• addr – IPv6 address

**Returns**

True if the address is a link local scope all nodes multicast address, false otherwise.

static inline void net_ipv6_addr_create_solicited_node(const struct in6_addr *src, struct in6_addr *dst)

Create solicited node IPv6 multicast address FF02:0:0:0:1:FFXX:XXXX defined in RFC 3513.

**Parameters**
• src – IPv6 address.
• dst – IPv6 address.

static inline void net_ipv6_addr_create (struct in6_addr *addr, uint16_t addr0, uint16_t addr1, uint16_t addr2, uint16_t addr3, uint16_t addr4, uint16_t addr5, uint16_t addr6, uint16_t addr7)

Construct an IPv6 address from eight 16-bit words.

Parameters
• addr – IPv6 address
• addr0 – 16-bit word which is part of the address
• addr1 – 16-bit word which is part of the address
• addr2 – 16-bit word which is part of the address
• addr3 – 16-bit word which is part of the address
• addr4 – 16-bit word which is part of the address
• addr5 – 16-bit word which is part of the address
• addr6 – 16-bit word which is part of the address
• addr7 – 16-bit word which is part of the address

static inline void net_ipv6_addr_create_ll_allnodes_mcast (struct in6_addr *addr)

Create link local allnodes multicast IPv6 address.

Parameters
• addr – IPv6 address

static inline void net_ipv6_addr_create_ll_allrouters_mcast (struct in6_addr *addr)

Create link local allrouters multicast IPv6 address.

Parameters
• addr – IPv6 address

static inline void net_ipv6_addr_create_v4_mapped (const struct in_addr *addr4, struct in6_addr *addr6)

Create IPv4 mapped IPv6 address.

Parameters
• addr4 – IPv4 address
• addr6 – IPv6 address to be created

static inline bool net_ipv6_addr_is_v4_mapped (const struct in6_addr *addr)

Is the IPv6 address an IPv4 mapped one.
The v4 mapped addresses look like ::ffff:a.b.c.d

Parameters
• addr – IPv6 address

Returns
True if IPv6 address is a IPv4 mapped address, False otherwise.

static inline void net_ipv6_addr_create_iid (struct in6_addr *addr, struct net_linkaddr *lladdr)

Create IPv6 address interface identifier.

Parameters
• `addr` – IPv6 address
• `lladdr` – Link local address

static inline bool net_ipv6_addr_based_on_ll(const struct in6_addr *addr, const struct net_linkaddr *lladdr)

Check if given address is based on link layer address.

Returns
True if it is, False otherwise

static inline struct sockaddr_in6 *net_sin6(const struct sockaddr *addr)
Get `sockaddr_in6` from `sockaddr`.
This is a helper so that the code calling this function can be made shorter.

Parameters
• `addr` – Socket address

Returns
Pointer to IPv6 socket address

static inline struct sockaddr_in *net_sin(const struct sockaddr *addr)
Get `sockaddr_in` from `sockaddr`.
This is a helper so that the code calling this function can be made shorter.

Parameters
• `addr` – Socket address

Returns
Pointer to IPv4 socket address

static inline struct sockaddr_in6_ptr *net_sin6_ptr(const struct sockaddr_ptr *addr)
Get `sockaddr_in6_ptr` from `sockaddr_ptr`.
This is a helper so that the code calling this function can be made shorter.

Parameters
• `addr` – Socket address

Returns
Pointer to IPv6 socket address

static inline struct sockaddr_in_ptr *net_sin_ptr(const struct sockaddr_ptr *addr)
Get `sockaddr_in_ptr` from `sockaddr_ptr`.
This is a helper so that the code calling this function can be made shorter.

Parameters
• `addr` – Socket address

Returns
Pointer to IPv4 socket address

static inline struct sockaddr_ll_ptr *net_sll_ptr(const struct sockaddr_ptr *addr)
Get `sockaddr_ll_ptr` from `sockaddr_ptr`.
This is a helper so that the code calling this function can be made shorter.

Parameters
• `addr` – Socket address

Returns
Pointer to linklayer socket address
static inline struct sockaddr_can_ptr *net_can_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_can_ptr from sockaddr_ptr.
This is a helper so that the code needing this functionality can be made shorter.

Parameters
- `addr` – Socket address

Returns
Pointer to CAN socket address

int net_addr_pton(sa_family_t family, const char *src, void *dst)
Convert a string to IP address.

Note: This function doesn’t do precise error checking, do not use for untrusted strings.

Parameters
- `family` – IP address family (AF_INET or AF_INET6)
- `src` – IP address in a null terminated string
- `dst` – Pointer to struct `in_addr` if family is AF_INET or pointer to struct `in6_addr` if family is AF_INET6

Returns
0 if ok, < 0 if error

char *net_addr_ntop(sa_family_t family, const void *src, char *dst, size_t size)
Convert IP address to string form.

Parameters
- `family` – IP address family (AF_INET or AF_INET6)
- `src` – Pointer to struct `in_addr` if family is AF_INET or pointer to struct `in6_addr` if family is AF_INET6
- `dst` – Buffer for IP address as a null terminated string
- `size` – Number of bytes available in the buffer

Returns
dst pointer if ok, NULL if error

bool net_ipaddr_parse(const char *str, size_t str_len, struct sockaddr *addr)
Parse a string that contains either IPv4 or IPv6 address and optional port, and store the information in user supplied sockaddr struct.

Syntax of the IP address string: 192.0.2.1:80 192.0.2.42
[2001:db8::2] 2001:db::42 Note that the str_len parameter is used to restrict the amount of characters that are checked. If the string does not contain port number, then the port number in sockaddr is not modified.

Parameters
- `str` – String that contains the IP address.
- `str_len` – Length of the string to be parsed.
- `addr` – Pointer to user supplied struct sockaddr.

Returns
True if parsing could be done, false otherwise.
static inline int32_t net_tcp_seq_cmp(uint32_t seq1, uint32_t seq2)
    Compare TCP sequence numbers.
    This function compares TCP sequence numbers, accounting for wraparound effects.

    **Parameters**
    - `seq1` – First sequence number
    - `seq2` – Seconds sequence number

    **Returns**
    - `< 0 if seq1 < seq2, 0 if seq1 == seq2, > 0 if seq > seq2`

static inline bool net_tcp_seq_greater(uint32_t seq1, uint32_t seq2)
    Check that one TCP sequence number is greater.
    This is convenience function on top of `net_tcp_seq_cmp()`.

    **Parameters**
    - `seq1` – First sequence number
    - `seq2` – Seconds sequence number

    **Returns**
    - True if seq > seq2

int net_bytes_from_str(uint8_t *buf, int buf_len, const char *src)
    Convert a string of hex values to array of bytes.
    The syntax of the string is “ab:02:98:fa:42:01”

    **Parameters**
    - `buf` – Pointer to memory where the bytes are written.
    - `buf_len` – Length of the memory area.
    - `src` – String of bytes.

    **Returns**
    - 0 if ok, <0 if error

int net_tx_priority2tc(enum net_priority prio)
    Convert Tx network packet priority to traffic class so we can place the packet into correct Tx queue.

    **Parameters**
    - `prio` – Network priority

    **Returns**
    - Tx traffic class that handles that priority network traffic.

int net_rx_priority2tc(enum net_priority prio)
    Convert Rx network packet priority to traffic class so we can place the packet into correct Rx queue.

    **Parameters**
    - `prio` – Network priority

    **Returns**
    - Rx traffic class that handles that priority network traffic.

static inline enum net_priority net_vlan2priority(uint8_t priority)
    Convert network packet VLAN priority to network packet priority so we can place the packet into correct queue.

    **Parameters**
- **priority** – VLAN priority

**Returns**
Network priority

static inline uint8_t net_priority2vlan(enum net_priority priority)
Convert network packet priority to network packet VLAN priority.

**Parameters**
- **priority** – Packet priority

**Returns**
VLAN priority (PCP)

const char *net_family2str(sa_family_t family)
Return network address family value as a string.
This is only usable for debugging.

**Parameters**
- **family** – Network address family code

**Returns**
Network address family as a string, or NULL if family is unknown.

struct in6_addr
#include <net_ip.h> IPv6 address struct.

struct in_addr
#include <net_ip.h> IPv4 address struct.

struct sockaddr_in6
#include <net_ip.h> Socket address struct for IPv6.

struct sockaddr_in6_ptr
#include <net_ip.h>

struct sockaddr_in
#include <net_ip.h> Socket address struct for IPv4.

struct sockaddr_in_ptr
#include <net_ip.h>

struct sockaddr_ll
#include <net_ip.h> Socket address struct for packet socket.

struct sockaddr_ll_ptr
#include <net_ip.h>

struct iovec
#include <net_ip.h>
struct msghdr
    #include <net_ip.h>

struct cmsghdr
    #include <net_ip.h>

struct sockaddr
    #include <net_ip.h> Generic sockaddr struct.
    Must be cast to proper type.

struct net_tuple
    #include <net_ip.h> IPv6/IPv4 network connection tuple.

Public Members

struct net_addr *remote_addr
    IPv6/IPv4 remote address.

struct net_addr *local_addr
    IPv6/IPv4 local address

uint16_t remote_port
    UDP/TCP remote port

uint16_t local_port
    UDP/TCP local port

enum net_ip_protocol ip_proto
    IP protocol

DNS Resolve

- Overview
- Sample usage
- API Reference

Overview  The DNS resolver implements a basic DNS resolver according to IETF RFC1035 on Domain Implementation and Specification. Supported DNS answers are IPv4/IPv6 addresses and CNAME.

If a CNAME is received, the DNS resolver will create another DNS query. The number of additional queries is controlled by the CONFIG_DNS_RESOLVER_ADDITIONAL_QUERIES Kconfig variable.

The multicast DNS (mDNS) client resolver support can be enabled by setting CONFIG_MDNS_RESOLVER Kconfig option. See IETF RFC6762 for more details about mDNS.
The link-local multicast name resolution (LLMNR) client resolver support can be enabled by setting the \texttt{CONFIG\_LLMNR\_RESOLVER} Kconfig variable. See IETF RFC4795 for more details about LLMNR.

For more information about DNS configuration variables, see: subsys/net/lib/dns/Kconfig. The DNS resolver API can be found at include/zephyr/net/dns_resolve.h.

**Sample usage**  See dns-resolve sample application for details.

### API Reference

#### Related code samples

- **AWS IoT Core MQTT**
  
  Connect to AWS IoT Core and publish messages using MQTT.

- **DNS resolve**
  
  Resolve an IP address for a given hostname.

- **TagoIO HTTP Post**
  
  Send random temperature values to TagoIO IoT Cloud Platform using HTTP.

---

**group dns_resolve**

DNS resolving library.

### Defines

**DNS\_MAX\_NAME\_SIZE**

Max size of the resolved name.

### Typedefs

```c
typedef void (*dns_resolve_cb_t)(enum dns_resolve_status status, struct dns_addrinfo *info, void *user_data)
```

DNS resolve callback.

The DNS resolve callback is called after a successful DNS resolving. The resolver can call this callback multiple times, one for each resolved address.

#### Param status

The status of the query: DNS\_EAI\_INPROGRESS returned for each resolved address DNS\_EAI\_ALLDONE mark end of the resolving, info is set to NULL in this case DNS\_EAI\_CANCELED if the query was canceled manually or timeout happened DNS\_EAI\_FAIL if the name cannot be resolved by the server DNS\_EAI\_NODATA if there is no such name other values means that an error happened.

#### Param info

Query results are stored here.

#### Param user\_data

The user data given in dns_resolve_name() call.
Enums

enum dns_query_type
   DNS query type enum.
   Values:

   enumerator DNS_QUERY_TYPE_A = 1
      IPv4 query.

   enumerator DNS_QUERY_TYPE_AAAA = 28
      IPv6 query.

enum dns_resolve_status
   Status values for the callback.
   Values:

   enumerator DNS_EAI_BADFLAGS = -1
      Invalid value for ai_flags field.

   enumerator DNS_EAI_NONAME = -2
      NAME or SERVICE is unknown.

   enumerator DNS_EAI_AGAIN = -3
      Temporary failure in name resolution.

   enumerator DNS_EAI_FAIL = -4
      Non-recoverable failure in name res.

   enumerator DNS_EAI_NODATA = -5
      No address associated with NAME.

   enumerator DNS_EAI_FAMILY = -6
      ai_family not supported

   enumerator DNS_EAI_SOCKTYPE = -7
      ai_socktype not supported

   enumerator DNS_EAI_SERVICE = -8
      SRV not supported for ai_socktype.

   enumerator DNS_EAI_ADDRFAMILY = -9
      Address family for NAME not supported.

   enumerator DNS_EAI_MEMORY = -10
      Memory allocation failure.

   enumerator DNS_EAI_SYSTEM = -11
      System error returned in errno.
enumerator DNS_EAI_OVERFLOW = -12
Argument buffer overflow.

enumerator DNS_EAI_INPROGRESS = -100
Processing request in progress.

enumerator DNS_EAI_CANCELED = -101
Request canceled.

enumerator DNS_EAI_NOTCANCELED = -102
Request not canceled.

enumerator DNS_EAI_ALLDONE = -103
All requests done.

enumerator DNS_EAI_IDN_ENCODE = -105
IDN encoding failed.

enum dns_resolve_context_state
Values:

enumerator DNS.Resolve_CONTEXT_ACTIVE

enumerator DNS.Resolve_CONTEXT_DEACTIVATING

enumerator DNS.Resolve_CONTEXT_INACTIVE

Functions

int dns_resolve_init(struct dns_resolve_context *ctx, const char *dns_servers_str[], const
struct sockaddr *dns_servers_sa[])
Init DNS resolving context.
This function sets the DNS server address and initializes the DNS context that is used by
the actual resolver. DNS server addresses can be specified either in textual form, or as
struct sockaddr (or both). Note that the recommended way to resolve DNS names is to
use the dns_get_addr_info() API. In that case user does not need to call dns_resolve_init()
as the DNS servers are already setup by the system.

Parameters

• ctx – DNS context. If the context variable is allocated from the stack, then
  the variable needs to be valid for the whole duration of the resolving.
  Caller does not need to fill the variable beforehand or edit the context
  afterwards.

• dns_servers_str – DNS server addresses using textual strings. The array
  is NULL terminated. The port number can be given in the string.
  Syntax for the server addresses with or without port numbers: IPv4 :
  10.0.9.1 IPv4 + port : 10.0.9.1:5353 IPv6 : 2001:db8::22:42 IPv6 + port :
  [2001:db8::22:42]:5353
• `dns_servers_sa` – DNS server addresses as struct sockaddr. The array is NULL terminated. Port numbers are optional in struct sockaddr; the default will be used if set to 0.

**Returns**
0 if ok, <0 if error.

```c
int dns_resolve_close(struct dns_resolve_context *ctx)
```

Close DNS resolving context.
This releases DNS resolving context and marks the context unusable. Caller must call the `dns_resolve_init()` again to make context usable.

**Parameters**
- `ctx` – DNS context

**Returns**
0 if ok, <0 if error.

```c
int dns_resolve_reconfigure(struct dns_resolve_context *ctx, const char *servers_str[],
const struct sockaddr *servers_sa[])
```

Reconfigure DNS resolving context.
Reconfigures DNS context with new server list.

**Parameters**
- `ctx` – DNS context
- `servers_str` – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4: 10.0.9.1 IPv4 + port: 10.0.9.1:5353 IPv6: [2001:db8::22:42] IPv6 + port: [2001:db8::22:42]:5353
- `servers_sa` – DNS server addresses as struct sockaddr. The array is NULL terminated. Port numbers are optional in struct sockaddr; the default will be used if set to 0.

**Returns**
0 if ok, <0 if error.

```c
int dns_resolve_cancel(struct dns_resolve_context *ctx, uint16_t dns_id)
```

Cancel a pending DNS query.
This releases DNS resources used by a pending query.

**Parameters**
- `ctx` – DNS context
- `dns_id` – DNS id of the pending query

**Returns**
0 if ok, <0 if error.

```c
int dns_resolve_cancel_with_name(struct dns_resolve_context *ctx, uint16_t dns_id, const char *query_name, enum dns_query_type query_type)
```

Cancel a pending DNS query using id, name and type.
This releases DNS resources used by a pending query.

**Parameters**
- `ctx` – DNS context
- `dns_id` – DNS id of the pending query
• **query_name** – Name of the resource we are trying to query (hostname)
• **query_type** – Type of the query (A or AAAA)

**Returns**
0 if ok, <0 if error.

```c
int dns_resolve_name(struct dns_resolve_context *ctx, const char *query, enum dns_query_type type, uint16_t *dns_id, dns_resolve_cb_t cb, void *user_data, int32_t timeout)
```

Resolve DNS name.

This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response.

**Parameters**
• **ctx** – DNS context
• **query** – What the caller wants to resolve.
• **type** – What kind of data the caller wants to get.
• **dns_id** – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
• **cb** – Callback to call after the resolving has finished or timeout has happened.
• **user_data** – The user data.
• **timeout** – The timeout value for the query. Possible values: SYS_FOREVER_MS: the query is tried forever, user needs to cancel it manually if it takes too long time to finish >0: start the query and let the system timeout it after specified ms

**Returns**
0 if resolving was started ok, <0 otherwise

```c
struct dns_resolve_context *dns_resolve_get_default(void)
```

Get default DNS context.

The system level DNS context uses DNS servers that are defined in project config file. If no DNS servers are defined by the user, then resolving DNS names using default DNS context will do nothing. The configuration options are described in sub-sys/net/lib/dns/Kconfig file.

**Returns**
Default DNS context.

```c
static inline int dns_get_addr_info(const char *query, enum dns_query_type type, uint16_t *dns_id, dns_resolve_cb_t cb, void *user_data, int32_t timeout)
```

Get IP address info from DNS.

This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response. This variant uses system wide DNS servers.

**Parameters**
• **query** – What the caller wants to resolve.
• **type** – What kind of data the caller wants to get.
• **dns_id** – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
• **cb** – Callback to call after the resolving has finished or timeout has happened.
• **user_data** – The user data.
• **timeout** – The timeout value for the connection. Possible values: SYS_FOREVER_MS: the query is tried forever, user needs to cancel it manually if it takes too long time to finish >0: start the query and let the system timeout it after specified ms

**Returns**
0 if resolving was started ok, < 0 otherwise

```c
static inline int dns_cancel_addr_info(uint16_t dns_id)
```
Cancel a pending DNS query.

This releases DNS resources used by a pending query.

**Parameters**
• **dns_id** – DNS id of the pending query

**Returns**
0 if ok, <0 if error.

```c
struct dns_addrinfo
#include <dns_resolve.h> Address info struct is passed to callback that gets all the results.
```

```c
struct dns_resolve_context
#include <dns_resolve.h> DNS resolve context structure.
```

**Public Members**

```c
struct sockaddr dns_server
```
DNS server information.

```c
struct net_context *net_ctx
```
Connection to the DNS server.

```c
uint8_t is_mdns
```
Is this server mDNS one.

```c
uint8_t is_llmnr
```
Is this server LLMNR one.

```c
struct k_mutex lock
```
Prevent concurrent access.
**k_timeout_t buf_timeout**

This timeout is also used when a buffer is required from the buffer pools.

**enum** `dns_resolve_context_state` *state*

Is this context in use.

**struct** `dns_pending_query` 

```c
#include <dns_resolve.h> Result callbacks.
We have multiple callbacks here so that it is possible to do multiple queries at the same time.
Contents of this structure can be inspected and changed only when the lock is held.
```

**Public Members**

**struct** `k_work_delayable` *timer*

Timeout timer.

**struct** `dns_resolve_context` **ctx**

Back pointer to ctx, needed in timeout handler.

`dns_resolve_cb_t` *cb*

Result callback.
A null value indicates the slot is not in use.

`void *` *user_data*

User data.

**k_timeout_t timeout**

TX timeout.

`const char *` *query*

String containing the thing to resolve like www.example.com.
This is set to a non-null value when the query is started, and is not used thereafter.
If the query completed at a point where the work item was still pending the pointer is cleared to indicate that the query is complete, but release of the query slot will be deferred until a request for a slot determines that the work item has been released.

**enum** `dns_query_type` *query_type*

Query type.

`uint16_t` *id*

DNS id of this query.
**uint16_t query_hash**

Hash of the DNS name + query type we are querying.

This hash is calculated so we can match the response that we are receiving. This is needed mainly for mDNS which is setting the DNS id to 0, which means that the id alone cannot be used to find correct pending query.

### Network Management

- Overview
- Requesting a defined procedure
- Listening to network events
- Defining a network management procedure
- Signaling a network event
- API Reference

**Overview** The Network Management APIs allow applications, as well as network layer code itself, to call defined network routines at any level in the IP stack, or receive notifications on relevant network events. For example, by using these APIs, application code can request a scan be done on a Wi-Fi- or Bluetooth-based network interface, or request notification if a network interface IP address changes.

The Network Management API implementation is designed to save memory by eliminating code at build time for management routines that are not used. Distinct and statically defined APIs for network management procedures are not used. Instead, defined procedure handlers are registered by using a `NET_MGMT_REGISTER_REQUEST_HANDLER` macro. Procedure requests are done through a single `net_mgmt()` API that invokes the registered handler for the corresponding request.

The current implementation is experimental and may change and improve in future releases.

**Requesting a defined procedure** All network management requests are of the form `net_mgmt(mgmt_request, ...)`. The `mgmt_request` parameter is a bit mask that tells which stack layer is targeted, if a `net_if` object is implied, and the specific management procedure being requested. The available procedure requests depend on what has been implemented in the stack.

To avoid extra cost, all `net_mgmt()` calls are direct. Though this may change in a future release, it will not affect the users of this function.

**Listening to network events** You can receive notifications on network events by registering a callback function and specifying a set of events used to filter when your callback is invoked. The callback will have to be unique for a pair of layer and code, whereas on the command part it will be a mask of events.

Two functions are available, `net_mgmt_add_event_callback()` for registering the callback function, and `net_mgmt_del_event_callback()` for unregistering a callback. A helper function, `net_mgmt_init_event_callback()`, can be used to ease the initialization of the callback structure.

When an event occurs that matches a callback's event set, the associated callback function is invoked with the actual event code. This makes it possible for different events to be handled by the same callback function, if desired.
**Warning:** Event set filtering allows false positives for events that have the same layer and layer code. A callback handler function **must** check the event code (passed as an argument) against the specific network events it will handle, **regardless** of how many events were in the set passed to `net_mgmt_init_event_callback()`.

Note that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened. The callback handler function can be shared between different layer events.

(False positives can occur for events which have the same layer and layer code.)

An example follows.

```c
/*
 * Set of events to handle.
 * See e.g. include/net/net_event.h for some NET_EVENT_xxx values.
 */
#define EVENT_IFACE_SET (NET_EVENT_IF_xxx | NET_EVENT_IF_yyy)
#define EVENT_IPV4_SET (NET_EVENT_IPV4_xxx | NET_EVENT_IPV4_yyy)

struct net_mgmt_event_callback iface_callback;
struct net_mgmt_event_callback ipv4_callback;

void callback_handler(struct net_mgmt_event_callback *cb,
                      uint32_t mgmt_event,
                      struct net_if *iface)
{
    if (mgmt_event == NET_EVENT_IF_xxx) {
        /* Handle NET_EVENT_IF_xxx */
    } else if (mgmt_event == NET_EVENT_IF_yyy) {
        /* Handle NET_EVENT_IF_yyy */
    } else if (mgmt_event == NET_EVENT_IPV4_xxx) {
        /* Handle NET_EVENT_IPV4_xxx */
    } else if (mgmt_event == NET_EVENT_IPV4_yyy) {
        /* Handle NET_EVENT_IPV4_yyy */
    } else {
        /* Spurious (false positive) invocation. */
    }
}

void register_cb(void)
{
    net_mgmt_init_event_callback(&iface_callback, callback_handler,
                                  EVENT_IFACE_SET);
    net_mgmt_init_event_callback(&ipv4_callback, callback_handler,
                                  EVENT_IPV4_SET);
    net_mgmt_add_event_callback(&iface_callback);
    net_mgmt_add_event_callback(&ipv4_callback);
}
```

See `include/zephyr/net/net_event.h` for available generic core events that can be listened to.

**Defining a network management procedure** You can provide additional management procedures specific to your stack implementation by defining a handler and registering it with an associated mgmt_request code.

Management request code are defined in relevant places depending on the targeted layer or eventually, if L2 is the layer, on the technology as well. For instance, all IP layer management request code will be found in the `include/zephyr/net/net_event.h` header file. But in case of an L2 technology, let's say Ethernet, these would be found in `include/zephyr/net/ethernet.h`. 

2270 Chapter 6. Connectivity
You define your handler modeled with this signature:

```c
static int your_handler(uint32_t mgmt_event, struct net_if *iface,
void *data, size_t len);
```

and then register it with an associated mgmt_request code:

```c
NET_MGMT_REGISTER_REQUEST_HANDLER(<mgmt_request code>, your_handler);
```

This new management procedure could then be called by using:

```c
net_mgmt(<mgmt_request code>, ...);
```

### Signaling a network event

You can signal a specific network event using the `net_mgmt_event_notify()` function and provide the network event code. See `include/zephyr/net/net_mgmt.h` for details. As for the management request code, event code can be also found on specific L2 technology mgmt headers, for example `include/zephyr/net/ieee802154_mgmt.h` would be the right place if 802.15.4 L2 is the technology one wants to listen to events.

---

**API Reference**

**Related code samples**

**DHCPv4 client**

Start a DHCPv4 client to obtain an IPv4 address from a DHCPv4 server.

**DNS resolve**

Resolve an IP address for a given hostname.

**IPv4 autoconf client**

Perform IPv4 autoconfiguration and self-assign a random IPv4 address

**Telnet console**

Access Zephyr shell over telnet.

---

**group net_mgmt**

Network Management.

**Defines**

```c
net_mgmt(_mgmt_request, _iface, _data, _len)
```

```c
NET_MGMT_DEFINE_REQUEST_HANDLER(_mgmt_request)
```

```c
NET_MGMT_REGISTER_REQUEST_HANDLER(_mgmt_request, _func)
```

**Typedefs**

```c
typedef int (*net_mgmt_request_handler_t)(uint32_t mgmt_request, struct net_if *iface,
void *data, size_t len)
```

Signature which all Net MGMT request handler need to follow.

**Param mgmt_request**

The exact request value the handler is being called through
**Param iface**
A valid pointer on struct `net_if` if the request is meant to be tight to a network interface. NULL otherwise.

**Param data**
A valid pointer on a data understood by the handler. NULL otherwise.

**Param len**
Length in byte of the memory pointed by data.

typedef void (*net_mgmt_event_handler_t)(struct net_mgmt_event_callback *cb, uint32_t mgmt_event, struct net_if *iface)
Define the user's callback handler function signature.

**Param cb**
Original struct `net_mgmt_event_callback` owning this handler.

**Param mgmt_event**
The network event being notified.

**Param iface**
A pointer on a struct `net_if` to which the event belongs to, if it's an event on an iface. NULL otherwise.

**Functions**

static inline void net_mgmt_init_event_callback(struct net_mgmt_event_callback *cb, net_mgmt_event_handler_t handler, uint32_t mgmt_event_mask)
Helper to initialize a struct `net_mgmt_event_callback` properly.

void net_mgmt_add_event_callback(struct net_mgmt_event_callback *cb)
Add a user callback.

void net_mgmt_del_event_callback(struct net_mgmt_event_callback *cb)
Delete a user callback.

void net_mgmt_event_notify_with_info(uint32_t mgmt_event, struct net_if *iface, const void *info, size_t length)
Used by the system to notify an event.

Note: info and length are disabled if CONFIG_NET_MGMT_EVENT_INFO is not defined.

**Parameters**

- mgmt_event – The actual network event code to notify
• **iface** – a valid pointer on a struct *net_if* if only the event is based on an iface. NULL otherwise.

• **info** – a valid pointer on the information you want to pass along with the event. NULL otherwise. Note the data pointed there is normalized by the related event.

• **length** – size of the data pointed by info pointer.

static inline void `net_mgmt_event_notify`(uint32_t mgmt_event, struct *net_if *iface)

int `net_mgmt_event_wait`(uint32_t mgmt_event_mask, uint32_t *raised_event, struct *net_if **iface, const void **info, size_t *info_length, k_timeout_t timeout)

Used to wait synchronously on an event mask.

**Parameters**

• **mgmt_event_mask** – A mask of relevant events to wait on.

• **raised_event** – a pointer on a uint32_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.

• **iface** – a pointer on a place holder for the iface on which the event has originated from. This is valid if only the event mask has bit NET_MGMT_IFACE_BIT set relevantly, depending on events the caller wants to listen to.

• **info** – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.

• **info_length** – tells how long the info memory area is. Only valid if the info is not NULL.

• **timeout** – A timeout delay. K_FOREVER can be used to wait indefinitely.

**Returns**

0 on success, a negative error code otherwise. -ETIMEDOUT will be specifically returned if the timeout kick-in instead of an actual event.

int `net_mgmt_event_wait_on_iface`(struct *net_if *iface, uint32_t mgmt_event_mask, uint32_t *raised_event, const void **info, size_t *info_length, k_timeout_t timeout)

Used to wait synchronously on an event mask for a specific iface.

**Parameters**

• **iface** – a pointer on a valid network interface to listen event to

• **mgmt_event_mask** – A mask of relevant events to wait on. Listened to events should be relevant to iface events and thus have the bit NET_MGMT_IFACE_BIT set.

• **raised_event** – a pointer on a uint32_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.

• **info** – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.

• **info_length** – tells how long the info memory area is. Only valid if the info is not NULL.

• **timeout** – A timeout delay. K_FOREVER can be used to wait indefinitely.
Returns
0 on success, a negative error code otherwise. -ETIMEDOUT will be specifically returned if the timeout kick-in instead of an actual event.

void net_mgmt_event_init(void)
Used by the core of the network stack to initialize the network event processing.

struct net_event_ipv6_addr
#include <net_event.h>  Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_ADDR_ADD, NET_EVENT_IPV6_ADDR_DEL, NET_EVENT_IPV6_MADDR_ADD and NET_EVENT_IPV6_MADDR_DEL when CONFIG_NET_MGMT_EVENT_INFO enabled and event generator pass the information.

struct net_event_ipv6_nbr
#include <net_event.h>  Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_NBR_ADD and NET_EVENT_IPV6_NBR_DEL when CONFIG_NET_MGMT_EVENT_INFO enabled and event generator pass the information.

Note:  : idx will be ‘-1’ in case of NET_EVENT_IPV6_NBR_DEL event.

struct net_event_ipv6_route
#include <net_event.h>  Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_ROUTE_ADD and NET_EVENT_IPV6_ROUTE_DEL when CONFIG_NET_MGMT_EVENT_INFO enabled and event generator pass the information.

struct net_event_ipv6_prefix
#include <net_event.h>  Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_PREFIX_ADD and NET_EVENT_IPV6_PREFIX_DEL when CONFIG_NET_MGMT_EVENT_INFO is enabled and event generator pass the information.

struct net_mgmt_event_callback
#include <net_mgmt.h>  Network Management event callback structure Used to register a callback into the network management event part, in order to let the owner of this struct to get network event notification based on given event mask.

Public Members

sys_snode_t node
Meant to be used internally, to insert the callback into a list.
So nobody should mess with it.

net_mgmt_event_handler_t handler
Actual callback function being used to notify the owner.

struct k_sem *sync_call
Semaphore meant to be used internally for the synchronous net_mgmt_event_wait() function.
uint32_t event_mask
   A mask of network events on which the above handler should be called in case those events come.
   Note that only the command part is treated as a mask, matching one to several commands. Layer and layer code will be made of an exact match. This means that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened.

uint32_t raised_event
   Internal place holder when a synchronous event wait is successfully unlocked on a event.

union net_mgmt_event_callback.
   A mask of network events on which the above handler should be called in case those events come.
   Such mask can be modified whenever necessary by the owner, and thus will affect the handler being called or not.

Network Statistics

- **Overview**
  Network statistics are collected if CONFIG_NET_STATISTICS is set. Individual component statistics for IPv4 or IPv6 can be turned off if those statistics are not needed. See various options in subsys/net/ip/Kconfig.stats file for details.

- **API Reference**

  **Overview**
  Network statistics are collected if CONFIG_NET_STATISTICS is set. Individual component statistics for IPv4 or IPv6 can be turned off if those statistics are not needed. See various options in subsys/net/ip/Kconfig.stats file for details.

  By default, the system collects network statistics per network interface. This can be controlled by CONFIG_NET_STATISTICS_PER_INTERFACE option.

  The CONFIG_NET_STATISTICS_USER_API option can be set if the application wants to collect statistics for further processing. The network management interface API is used for that. See Network Management for details.

  The CONFIG_NET_STATISTICS_ETHERNET option can be set to collect generic Ethernet statistics. If the CONFIG_NET_STATISTICS_ETHERNET_VENDOR option is set, then Ethernet device driver can collect Ethernet device specific statistics. These statistics can then be transferred to application for processing.

  If the CONFIG_NET_SHELL option is set, then network shell can show statistics information with net stats command.

  **API Reference**

net_stats_t rsterr
    Number of received bad TCP RST (reset) segments.

net_stats_t rst
    Number of received TCP RST (reset) segments.

net_stats_t rexmit
    Number of retransmitted TCP segments.

net_stats_t conndrop
    Number of dropped connection attempts because too few connections were available.
```
struct `net_stats_udp`

#include <net_stats.h> UDP statistics.

**Public Members**

- `net_stats_t drop`  
  Number of dropped UDP segments.

- `net_stats_t recv`  
  Number of received UDP segments.

- `net_stats_t sent`  
  Number of sent UDP segments.

- `net_stats_t chkerr`  
  Number of UDP segments with a bad checksum.

struct `net_stats_ipv6_nd`

#include <net_stats.h> IPv6 neighbor discovery statistics.

struct `net_stats_ipv6_mld`

#include <net_stats.h> IPv6 multicast listener daemon statistics.

**Public Members**

- `net_stats_t recv`  
  Number of received IPv6 MLD queries.

- `net_stats_t sent`  
  Number of sent IPv6 MLD reports.

- `net_stats_t drop`  
  Number of dropped IPv6 MLD packets.

struct `net_stats_ipv4_igmp`

#include <net_stats.h> IPv4 IGMP daemon statistics.

**Public Members**

- `net_stats_t recv`  
  Number of received IPv4 IGMP queries.
\textit{net_stats_t \texttt{sent}}
Number of sent IPv4 IGMP reports.

\textit{net_stats_t \texttt{drop}}
Number of dropped IPv4 IGMP packets.

\textbf{struct net_stats_tx_time}
\texttt{\#include <net_stats.h>} Network packet transfer times for calculating average TX time.

\textbf{struct net_stats_rx_time}
\texttt{\#include <net_stats.h>} Network packet receive times for calculating average RX time.

\textbf{struct net_stats_tc}
\texttt{\#include <net_stats.h>} Traffic class statistics.

\textbf{struct net_stats_pm}
\texttt{\#include <net_stats.h>} Power management statistics.

\textbf{struct net_stats}
\texttt{\#include <net_stats.h>} All network statistics in one struct.

\textbf{Public Members}

\textit{net_stats_t \texttt{processing_error}}
Count of malformed packets or packets we do not have handler for.

\textbf{struct net_stats_bytes \texttt{bytes}}
This calculates amount of data transferred through all the network interfaces.

\textbf{struct net_stats_ip_errors \texttt{ip_errors}}
IP layer errors.

\textbf{struct net_stats_eth_errors}
\texttt{\#include <net_stats.h>} Ethernet error statistics.

\textbf{struct net_stats_eth_flow}
\texttt{\#include <net_stats.h>} Ethernet flow control statistics.

\textbf{struct net_stats_eth_csum}
\texttt{\#include <net_stats.h>} Ethernet checksum statistics.

\textbf{struct net_stats_eth_hw_timestamp}
\texttt{\#include <net_stats.h>} Ethernet hardware timestamp statistics.

\textbf{struct net_stats_eth}
\texttt{\#include <net_stats.h>} All Ethernet specific statistics.

\textbf{struct net_stats_ppp}
\texttt{\#include <net_stats.h>} All PPP specific statistics.
Public Members

`net_stats_t drop`
Number of received and dropped PPP frames.

`net_stats_t chkerr`
Number of received PPP frames with a bad checksum.

struct `net_stats_sta_mgmt`
#include <net_stats.h> All Wi-Fi management statistics.

Public Members

`net_stats_t beacons_rx`
Number of received beacons.

`net_stats_t beacons_miss`
Number of missed beacons.

struct `net_stats_wifi`
#include <net_stats.h> All Wi-Fi specific statistics.

Network Timeout

- **Overview**
- **Use**
- **API Reference**

**Overview**
Zephyr’s network infrastructure mostly uses the millisecond-resolution uptime clock to track timeouts, with both deadlines and durations measured with 32-bit unsigned values. The 32-bit value rolls over at 49 days 17 hours 2 minutes 47.296 seconds.

Timeout processing is often affected by latency, so that the time at which the timeout is checked may be some time after it should have expired. Handling this correctly without arbitrary expectations of maximum latency requires that the maximum delay that can be directly represented be a 31-bit non-negative number (`INT32_MAX`), which overflows at 24 days 20 hours 31 minutes 23.648 seconds.

Most network timeouts are shorter than the delay rollover, but a few protocols allow for delays that are represented as unsigned 32-bit values counting seconds, which corresponds to a 42-bit millisecond count.

The `net_timeout` API provides a generic timeout mechanism to correctly track the remaining time for these extended-duration timeouts.

**Use**
The simplest use of this API is:

1. Configure a network timeout using `net_timeout_set()`.  

2. Use `net_timeout_evaluate()` to determine how long it is until the timeout occurs. Schedule a timeout to occur after this delay.

3. When the timeout callback is invoked, use `net_timeout_evaluate()` again to determine whether the timeout has completed, or whether there is additional time remaining. If the latter, reschedule the callback.

4. While the timeout is running, use `net_timeout_remaining()` to get the number of seconds until the timeout expires. This may be used to explicitly update the timeout, which should be done by canceling any pending callback and restarting from step 1 with the new timeout.

The `net_timeout` contains a `sys_snoded_t` that allows multiple timeout instances to be aggregated to share a single kernel timer element. The application must use `net_timeout_evaluate()` on all instances to determine the next timeout event to occur.

`net_timeout_deadline()` may be used to reconstruct the full-precision deadline of the timeout. This exists primarily for testing but may have use in some applications, as it does allow a millisecond-resolution calculation of remaining time.

### API Reference

**group net_timeout**

Network long timeout primitives and helpers.

**Defines**

`NET_TIMEOUT_MAX_VALUE`

Divisor used to support ms resolution timeouts.

Because delays are processed in work queues which are not invoked synchronously with clock changes we need to be able to detect timeouts after they occur, which requires comparing “deadline” to “now” with enough “slop” to handle any observable latency due to “now” advancing past “deadline”.

The simplest solution is to use the native conversion of the well-defined 32-bit unsigned difference to a 32-bit signed difference, which caps the maximum delay at INT32_MAX. This is compatible with the standard mechanism for detecting completion of deadlines that do not overflow their representation.

**Functions**

```c
void net_timeout_set(struct net_timeout *timeout, uint32_t lifetime, uint32_t now)
```

Configure a network timeout structure.

**Parameters**

- `timeout` – a pointer to the timeout state.
- `lifetime` – the duration of the timeout in seconds.
- `now` – the time at which the timeout started counting down, in milliseconds. This is generally a captured value of `k_uptime_get_32()`.

```c
int64_t net_timeout_deadline(const struct net_timeout *timeout, int64_t now)
```

Return the 64-bit system time at which the timeout will complete.

**Note:** Correct behavior requires invocation of `net_timeout_evaluate() at its specified intervals.
Parameters

- `timeout` – state a pointer to the timeout state, initialized by `net_timeout_set()` and maintained by `net_timeout_evaluate()`.
- `now` – the full-precision value of `k_uptime_get()` relative to which the deadline will be calculated.

Returns

the value of `k_uptime_get()` at which the timeout will expire.

```c
uint32_t net_timeout_remaining(const struct net_timeout *timeout, uint32_t now)
```
Calculate the remaining time to the timeout in whole seconds.

**Note:** This function rounds the remaining time down, i.e. if the timeout will occur in 3500 milliseconds the value 3 will be returned.

**Note:** Correct behavior requires invocation of `net_timeout_evaluate()` at its specified intervals.

Parameters

- `timeout` – a pointer to the timeout state
- `now` – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from `k_uptime_get_32()`.

Return values

- `0` – if the timeout has completed.
- `positive` – the remaining duration of the timeout, in seconds.

```c
uint32_t net_timeout_evaluate(struct net_timeout *timeout, uint32_t now)
```
Update state to reflect elapsed time and get new delay.

This function must be invoked periodically to (1) apply the effect of elapsed time on what remains of a total delay that exceeded the maximum representable delay, and (2) determine that either the timeout has completed or that the infrastructure must wait a certain period before checking again for completion.

Parameters

- `timeout` – a pointer to the timeout state
- `now` – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from `k_uptime_get_32()`.

Return values

- `0` – if the timeout has completed
- `positive` – the maximum delay until the state of this timeout should be re-evaluated, in milliseconds.

```c
struct net_timeout
```

Generic struct for handling network timeouts.

Except for the linking node, all access to state from these objects must go through the defined API.
Public Members

sys_snode_t node
Used to link multiple timeouts that share a common timer infrastructure.
For examples a set of related timers may use a single delayed work structure, which
is always scheduled at the shortest time to a timeout event.

Networking Context  The net_context API is not meant for application use. Application should use BSD Sockets API instead.

Promiscuous Mode

- Overview
- Sample usage
- API Reference

Overview  Promiscuous mode is a mode for a network interface controller that causes it to pass all traffic it receives to the application rather than passing only the frames that the controller is specifically programmed to receive. This mode is normally used for packet sniffing as used to diagnose network connectivity issues by showing an application all the data being transferred over the network. (See the Wikipedia article on promiscuous mode for more information.)

The network promiscuous APIs are used to enable and disable this mode, and to wait for and receive a network data to arrive. Not all network technologies or network device drivers support promiscuous mode.

Sample usage  First the promiscuous mode needs to be turned ON by the application like this:

```c
ret = net_promisc_mode_on(iface);
if (ret < 0) {
    if (ret == -EALREADY) {
        printf("Promiscuous mode already enabled\n");
    } else {
        printf("Cannot enable promiscuous mode for "
            "interface %p (%d)\n", iface, ret);
    }
}
```

If there is no error, then the application can start to wait for network data:

```c
while (true) {
    pkt = net_promisc_mode_wait_data(K_FOREVER);
    if (pkt) {
        print_info(pkt);
    }
    net_pkt_unref(pkt);
}
```

Finally the promiscuous mode can be turned OFF by the application like this:
ret = net_promisc_mode_off(iface);
if (ret < 0) {
   if (ret == -EALREADY) {
      printf("Promiscuous mode already disabled\n");
   } else {
      printf("Cannot disable promiscuous mode for "
            "interface %p (%d)\n", iface, ret);
   }
}

See net-promiscuous-mode for a more comprehensive example.

API Reference

Related code samples

Promiscuous mode

Enable promiscuous mode on all interfaces and print information about incoming packets.

group promiscuous

Promiscuous mode support.

Functions

static inline struct net_pkt *net_promisc_mode_wait_data(k_timeout_t timeout)
Start to wait received network packets.

Parameters
  • timeout – How long to wait before returning.

Returns
Received net_pkt, NULL if not received any packet.

static inline int net_promisc_mode_on(struct net_if *iface)
Enable promiscuous mode for a given network interface.

Parameters
  • iface – Network interface

Returns
0 if ok, <0 if error

static inline int net_promisc_mode_off(struct net_if *iface)
Disable promiscuous mode for a given network interface.

Parameters
  • iface – Network interface

Returns
0 if ok, <0 if error

Simple Network Time Protocol Library

• Overview
• API Reference
Overview

The SNTP library implements IETF RFC4330 (Simple Network Time Protocol v4). SNTP provides a way to synchronize clocks in computer networks.

API Reference

Related code samples

AWS IoT Core MQTT

Connect to AWS IoT Core and publish messages using MQTT.

SNTP client

Use SNTP to get the current time from the host.

group sntp

Simple Network Time Protocol API.

Functions

int sntp_init(struct sntp_ctx *ctx, struct sockaddr *addr, socklen_t addr_len)

Initialize SNTP context.

Parameters

• ctx – Address of sntp context.
• addr – IP address of NTP/SNTP server.
• addr_len – IP address length of NTP/SNTP server.

Returns

0 if ok, <0 if error.

int sntp_query(struct sntp_ctx *ctx, uint32_t timeout, struct sntp_time *time)

Perform SNTP query.

Parameters

• ctx – Address of sntp context.
• timeout – Timeout of waiting for sntp response (in milliseconds).
• time – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

Returns

0 if ok, <0 if error (-ETIMEDOUT if timeout).

void sntp_close(struct sntp_ctx *ctx)

Release SNTP context.

Parameters

• ctx – Address of sntp context.

int sntp_simple(const char *server, uint32_t timeout, struct sntp_time *time)

Convenience function to query SNTP in one-shot fashion.

Convenience wrapper which calls getaddrinfo(), sntp_init(), sntp_query(), and sntp_close().

Parameters

• server – Address of server in format addr[:port]
• timeout – Query timeout
• time – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

**Returns**

  0 if ok, <0 if error (-ETIMEDOUT if timeout).

```c
struct sntp_ctx
    #include <sntp.h> SNTP context.

Public Members

  uint32_t expected_orig_ts
          Timestamp when the request was sent from client to server.
          This is used to check if the originated timestamp in the server reply matches the one in client request.

struct sntp_time
    #include <sntp.h> Time as returned by SNTP API, fractional seconds since 1 Jan 1970.
```

**SOCKS5 Proxy Support**

- **Overview**
- **SOCKS5 API**
- **SOCKS5 Proxy Usage in MQTT**

**Overview**
The SOCKS library implements SOCKS5 support, which allows Zephyr to connect to peer devices via a network proxy.

See this [SOCKS5 Wikipedia article](https://en.wikipedia.org/wiki/SOCKS5) for a detailed overview of how SOCKS5 works.

**SOCKS5 API**
The SOCKS5 support is enabled by `CONFIG_SOCKS` Kconfig variable. Application wanting to use the SOCKS5 must set the SOCKS5 proxy host address by calling `setsockopt()` like this:

```c
static int set_proxy(int sock, const struct sockaddr *proxy_addr,
                     socklen_t proxy_addrlen)
{
    int ret;
    ret = setsockopt(sock, SOL_SOCKET, SO_SOCKS5,
                     proxy_addr, proxy_addrlen);
    if (ret < 0) {
        return -errno;
    }
    return 0;
}
```

6.3. Networking
SOCKS5 Proxy Usage in MQTT  For MQTT client, there is \texttt{mqtt\_client\_set\_proxy()} API that the application can call to setup SOCKS5 proxy. See mqtt-publisher sample application for usage example.

Trickle Timer Library

- **Overview**
- **API Reference**

Overview  The Trickle timer library implements IETF RFC6206 (Trickle Algorithm).
The Trickle algorithm allows nodes in a lossy shared medium (e.g., low-power and lossy networks) to exchange information in a highly robust, energy efficient, simple, and scalable manner.

API Reference

\textit{group trickle}

Trickle algorithm library.

Typedefs

typedef void (*\texttt{net\_trickle\_cb\_t})(\texttt{struct net\_trickle *trickle, bool do\_suppress, void *user\_data})

Trickle timer callback.
The callback is called after Trickle timeout expires.

\textbf{Param trickle}
The trickle context to use.

\textbf{Param do\_suppress}
Is TX allowed (true) or not (false).

\textbf{Param user\_data}
The user data given in \texttt{net\_trickle\_start()} call.

Functions

\textbf{Function net\_trickle\_create(}\texttt{struct net\_trickle *trickle, uint32\_t Imin, uint8\_t Imax, uint8\_t k)}

Create a Trickle timer.

\textbf{Parameters}

- \textbf{trickle} – Pointer to Trickle struct.
- \textbf{Imin} – Imin configuration parameter in ms.
- \textbf{Imax} – Max number of doublings.
- \textbf{k} – Redundancy constant parameter. See RFC 6206 for details.

\textbf{Returns}

Return 0 if ok and <0 if error.
int net_trickle_start(struct net_trickle *trickle, net_trickle_cb_t cb, void *user_data)
    Start a Trickle timer.
    
    **Parameters**
    
    • **trickle** – Pointer to Trickle struct.
    • **cb** – User callback to call at time T within the current trickle interval
    • **user_data** – User pointer that is passed to callback.
    
    **Returns**
    
    Return 0 if ok and <0 if error.

int net_trickle_stop(struct net_trickle *trickle)
    Stop a Trickle timer.
    
    **Parameters**
    
    • **trickle** – Pointer to Trickle struct.
    
    **Returns**
    
    Return 0 if ok and <0 if error.

void net_trickle_consistency(struct net_trickle *trickle)
    To be called by the protocol handler when it hears a consistent network transmission.
    
    **Parameters**
    
    • **trickle** – Pointer to Trickle struct.
    
void net_trickle_inconsistency(struct net_trickle *trickle)
    To be called by the protocol handler when it hears an inconsistent network transmis-
    sion.
    
    **Parameters**
    
    • **trickle** – Pointer to Trickle struct.

static inline bool net_trickle_is_running(struct net_trickle *trickle)
    Check if the Trickle timer is running or not.
    
    **Parameters**
    
    • **trickle** – Pointer to Trickle struct.
    
    **Returns**
    
    Return True if timer is running and False if not.

struct net_trickle

#include <trickle.h> The variable names are taken directly from RFC 6206 when applic-
able.

Note that the struct members should not be accessed directly but only via the Trickle API.

**Public Members**

uint32_t Imin
    Min interval size in ms.

uint8_t Imax
    Max number of doublings.
uint8_t k
    Redundancy constant.

uint32_t I
    Current interval size.

uint32_t Istart
    Start of the interval in ms.

uint8_t c
    Consistency counter.

uint32_t I_{max_abs}
    Max interval size in ms (not doublings)

net_trickle_cb_t cb
    Callback to be called when timer expires.

Websocket Client API

- Overview
- Websocket Transport
- API Reference

Overview  The Websocket client library allows Zephyr to connect to a Websocket server. The
Websocket client API can be used directly by application to establish a Websocket connection to
server, or it can be used as a transport for other network protocols like MQTT.
See this Websocket Wikipedia article for a detailed overview of how Websocket works.
For more information about the protocol itself, see IETF RFC6455 The WebSocket Protocol.

Websocket Transport  The Websocket API allows it to be used as a transport for other high level
protocols like MQTT. The Zephyr MQTT client library can be configured to use Websocket trans-
port by enabling CONFIG_MQTT_LIB_WEBSOCKET and CONFIG_WEBSOCKET_CLIENT Kconfig options.
First a socket needs to be created and connected to the Websocket server:
sock = socket(family, SOCK_STREAM, IPPROTO_TCP);
...
ret = connect(sock, addr, addr_len);
...

The Websocket transport socket is then created like this:
ws_sock = websocket_connect(sock, &config, timeout, user_data);

The Websocket socket can then be used to send or receive data, and the Websocket client API
will encapsulate the sent or received data to/from Websocket packet payload. Both the web-
socket_{xxx}() API or normal BSD socket API functions can be used to send and receive application
data.
If normal BSD socket functions are used, then currently only TEXT data is supported. In order to send BINARY data, the websocket_send_msg() must be used.

When done, the Websocket transport socket must be closed. User should handle the lifecycle(close/re-use) of tcp socket after websocket_disconnect.

```
ret = websocket_send_msg(ws_sock, buf_to_send, buf_len,
                        WEBSOCKET_OPCODE_DATA_BINARY, true, true,
                        K_FOREVER);
```

```
ret = send(ws_sock, buf_to_send, buf_len, 0);
```

### API Reference

**Related code samples**

**WebSocket Client**

Implement a Websocket client that connects to a Websocket server.

```c
 grop websocket
    Websocket API.

    Defines

    WEBSOCKET_FLAG_FINAL
    Message type values.
    Returned in websocket_recv_msg() Final frame

    WEBSOCKET_FLAG_TEXT
    Textual data

    WEBSOCKET_FLAG_BINARY
    Binary data

    WEBSOCKET_FLAG_CLOSE
    Closing connection.

    WEBSOCKET_FLAG_PING
    Ping message

    WEBSOCKET_FLAG_PONG
    Pong message

    Typedefs
```
typedef int (*websocket_connect_cb_t)(int ws_sock, struct http_request *req, void *user_data)

Callback called after Websocket connection is established.

**Param ws_sock**
Websocket id

**Param req**
HTTP handshake request

**Param user_data**
A valid pointer on some user data or NULL

**Return**
0 if ok, <0 if there is an error and connection should be aborted

** Enums **

enum websocket_opcode

**Values:**

enumerator WEBSOCKET_OPCODE_CONTINUE = 0x00

enumerator WEBSOCKET_OPCODE_DATA_TEXT = 0x01

enumerator WEBSOCKET_OPCODE_DATA_BINARY = 0x02

enumerator WEBSOCKET_OPCODE_CLOSE = 0x08

enumerator WEBSOCKET_OPCODE_PING = 0x09

enumerator WEBSOCKET_OPCODE_PONG = 0x0A

** Functions **

int websocket_connect(int http_sock, struct websocket_request *req, int32_t timeout, void *user_data)

Connect to a server that provides Websocket service.

The callback is called after connection is established. The returned value is a new socket descriptor that can be used to send/receive data using the BSD socket API.

**Parameters**

- **http_sock** – Socket id to the server. Note that this socket is used to do HTTP handshakes etc. The actual Websocket connectivity is done via the returned websocket id. Note that the http_sock must not be closed after this function returns as it is used to deliver the Websocket packets to the Websocket server.

- **req** – Websocket request. User should allocate and fill the request data.

- **timeout** – Max timeout to wait for the connection. The timeout value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.

- **user_data** – User specified data that is passed to the callback.
Returns

Websocket id to be used when sending/receiving Websocket data.

```c
int websocket_send_msg(int ws_sock, const uint8_t *payload, size_t payload_len, enum websocket_opcode opcode, bool mask, bool final, int32_t timeout)
```

Send websocket msg to peer.
The function will automatically add websocket header to the message.

Parameters

- `ws_sock` – Websocket id returned by `websocket_connect()`.
- `payload` – Websocket data to send.
- `payload_len` – Length of the data to be sent.
- `opcode` – Operation code (text, binary, ping, pong, close)
- `mask` – Mask the data, see RFC 6455 for details
- `final` – Is this final message for this message send. If final == false, then the first message must have valid opcode and subsequent messages must have opcode WEB_SOCKET_OPCODE_CONTINUE. If final == true and this is the only message, then opcode should have proper opcode (text or binary) set.
- `timeout` – How long to try to send the message. The value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.

Returns

<0 if error, >=0 amount of bytes sent

```c
int websocket_recv_msg(int ws_sock, uint8_t *buf, size_t buf_len, uint32_t *message_type, uint64_t *remaining, int32_t timeout)
```

Receive websocket msg from peer.
The function will automatically remove websocket header from the message.

Parameters

- `ws_sock` – Websocket id returned by `websocket_connect()`.
- `buf` – Buffer where websocket data is read.
- `buf_len` – Length of the data buffer.
- `message_type` – Type of the message.
- `remaining` – How much there is data left in the message after this read.
- `timeout` – How long to try to receive the message. The value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.

Return values

- `>=0` – amount of bytes received.
- `-EAGAIN` – on timeout.
- `-ENOTCONN` – on socket close.
- `-errno` – other negative errno value in case of failure.

```c
int websocket_disconnect(int ws_sock)
```

Close websocket.
One must call `websocket_connect()` after this call to re-establish the connection.

Parameters

- `ws_sock` – Websocket id returned by `websocket_connect()`.
static inline void websocket_init(void)

struct websocket_request
#include <websocket.h> Websocket client connection request.
This contains all the data that is needed when doing a Websocket connection request.

**Public Members**

cost char *host
   Host of the Websocket server when doing HTTP handshakes.

cost char *url
   URL of the Websocket.

*http_header_cb_t optional_headers_cb*
User supplied callback function to call when optional headers need to be sent.
This can be NULL, in which case the optional_headers field in *http_request* is used.
The idea of this optional_headers callback is to allow user to send more HTTP
header data that is practical to store in allocated memory.

cost char **optional_headers
   A NULL terminated list of any optional headers that should be added to the HTTP
   request.
   May be NULL. If the optional_headers_cb is specified, then this field is ignored.

*websocket_connect_cb_t cb*
User supplied callback function to call when a connection is established.

cost struct http_parser_settings *http_cb
   User supplied list of callback functions if the calling application wants to know the
   parsing status or the HTTP fields during the handshake.
   This is optional parameter and normally not needed but is useful if the caller wants
   to know something about the fields that the server is sending.

uint8_t *tmp_buf
   User supplied buffer where HTTP connection data is stored.

sizet tmp_buf_len
   Length of the user supplied temp buffer.

**Network Packet Capture**

- *Overview*
- *Sample usage*
- *API Reference*
Overview
The net_capture API allows users to monitor the network traffic in one of the Zephyr network interfaces and send that traffic to an external system for analysis. The monitoring can be setup either manually using net-shell or automatically by using the net_capture API.

Sample usage
See net-capture sample application and Monitor Network Traffic for details.

API Reference
Related code samples
Network packet capture
Capture network packets and send them to a remote host via IPIP tunnel.

group net_capture
Network packet capture support functions.

Functions

int net_capture_setup(const char *remote_addr, const char *my_local_addr, const char *peer_addr, const struct device **dev)

Setup network packet capturing support.

Parameters

• remote_addr – The value tells the tunnel remote/outer endpoint IP address. The IP address can be either IPv4 or IPv6 address. This address is used to select the network interface where the tunnel is created.

• my_local_addr – The local/inner IP address of the tunnel. Can contain also port number which is used as UDP source port.

• peer_addr – The peer/inner IP address of the tunnel. Can contain also port number which is used as UDP destination port.

• dev – Network capture device. This is returned to the caller.

Returns
0 if ok, <0 if network packet capture setup failed

static inline int net_capture_cleanup(const struct device *dev)

Cleanup network packet capturing support.

This should be called after the capturing is done and resources can be released.

Parameters

• dev – Network capture device. User must allocate using the net_capture_setup() function.

Returns
0 if ok, <0 if network packet capture cleanup failed

static inline int net_capture_enable(const struct device *dev, struct net_if *iface)

Enable network packet capturing support.

This creates tunnel network interface where all the captured packets are pushed. The captured network packets are placed in UDP packets that are sent to tunnel peer.

Parameters

• dev – Network capture device
• **iface** – Network interface we are starting to capture packets.

**Returns**
0 if ok, <0 if network packet capture enable failed

static inline bool net_capture_is_enabled(const struct device *dev)
Is network packet capture enabled or disabled.

**Parameters**
• dev – Network capture device

**Returns**
True if enabled, False if network capture is disabled.

static inline int net_capture_disable(const struct device *dev)
Disable network packet capturing support.

**Parameters**
• dev – Network capture device

**Returns**
0 if ok, <0 if network packet capture disable failed

Network Buffer Management

Network Buffer

- **Overview**
- **Creating buffers**
- **Common Operations**
- **Reference Counting**
- **API Reference**

**Overview** Network buffers are a core concept of how the networking stack (as well as the Blue-
tooth stack) pass data around. The API for them is defined in include/zephyr/net/buf.h.

**Creating buffers** Network buffers are created by first defining a pool of them:

```c
NET_BUF_POOL_DEFINE(pool_name, buf_count, buf_size, user_data_size, NULL);
```

The pool is a static variable, so if it's needed to be exported to another module a separate pointer is needed.

Once the pool has been defined, buffers can be allocated from it with:

```c
buf = net_buf_alloc(&pool_name, timeout);
```

There is no explicit initialization function for the pool or its buffers, rather this is done implicitly as net_buf_alloc() gets called.

If there is a need to reserve space in the buffer for protocol headers to be prepended later, it's possible to reserve this headroom with:

```c
net_buf_reserve(buf, headroom);
```
In addition to actual protocol data and generic parsing context, network buffers may also contain protocol-specific context, known as user data. Both the maximum data and user data capacity of the buffers is compile-time defined when declaring the buffer pool.

The buffers have native support for being passed through k_fifo kernel objects. This is a very practical feature when the buffers need to be passed from one thread to another. However, since a net_buf may have a fragment chain attached to it, instead of using the k_fifo_put() and k_fifo_get() APIs, special net_buf_put() and net_buf_get() APIs must be used when passing buffers through FIFOs. These APIs ensure that the buffer chains stay intact. The same applies for passing buffers through a singly linked list, in which case the net_buf_slist_put() and net_buf_slist_get() functions must be used instead of sys_slist_append() and sys_slist_get().

**Common Operations** The network buffer API provides some useful helpers for encoding and decoding data in the buffers. To fully understand these helpers it's good to understand the basic names of operations used with them:

**Add**
Add data to the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Requires that there is enough tailroom in the buffer. Some examples of APIs for adding data:

```c
void *net_buf_add(struct net_buf *buf, size_t len);
void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len);
uint8_t net_buf_add_u8(struct net_buf *buf, uint8_t value);
void net_buf_add_le16(struct net_buf *buf, uint16_t value);
void net_buf_add_le32(struct net_buf *buf, uint32_t value);
```

**Remove**
Remove data from the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Some examples of APIs for removing data:

```c
void *net_buf_remove_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_remove_u8(struct net_buf *buf);
uint16_t net_buf_remove_le16(struct net_buf *buf);
uint32_t net_buf_remove_le32(struct net_buf *buf);
```

**Push**
Prepend data to the beginning of the buffer. Modifies both the data length value as well as the data pointer. Requires that there is enough headroom in the buffer. Some examples of APIs for pushing data:

```c
void *net_buf_push(struct net_buf *buf, size_t len);
void *net_buf_push_mem(struct net_buf *buf, const void *mem, size_t len);
void net_buf_push_u8(struct net_buf *buf, uint8_t value);
void net_buf_push_le16(struct net_buf *buf, uint16_t value);
void net_buf_push_le32(struct net_buf *buf);
```

**Pull**
Remove data from the beginning of the buffer. Modifies both the data length value as well as the data pointer. Some examples of APIs for pulling data:

```c
void *net_buf_pull(struct net_buf *buf, size_t len);
void *net_buf_pull_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_pull_u8(struct net_buf *buf);
uint16_t net_buf_pull_le16(struct net_buf *buf);
uint32_t net_buf_pull_le32(struct net_buf *buf);
```

The Add and Push operations are used when encoding data into the buffer, whereas the Remove and Pull operations are used when decoding data from a buffer.
Reference Counting  Each network buffer is reference counted. The buffer is initially acquired from a free buffers pool by calling `net_buf_alloc()`, resulting in a buffer with reference count 1. The reference count can be incremented with `net_buf_ref()` or decremented with `net_buf_unref()`. When the count drops to zero the buffer is automatically placed back to the free buffers pool.

API Reference

**group net_buf**

Network buffer library.

**defines**

`NET_BUF_SIMPLE_DEFINE(name, size)`

Define a `net_buf_simple` stack variable.

This is a helper macro which is used to define a `net_buf_simple` object on the stack.

**Parameters**

- `name` – Name of the `net_buf_simple` object.
- `size` – Maximum data storage for the buffer.

`NET_BUF_SIMPLE_DEFINE_STATIC(name, size)`

Define a static `net_buf_simple` variable.

This is a helper macro which is used to define a static `net_buf_simple` object.

**Parameters**

- `name` – Name of the `net_buf_simple` object.
- `size` – Maximum data storage for the buffer.

`NET_BUF_SIMPLE(size)`

Define a `net_buf_simple` stack variable and get a pointer to it.

This is a helper macro which is used to define a `net_buf_simple` object on the stack and the get a pointer to it as follows:

```c
struct net_buf_simple *my_buf = NET_BUF_SIMPLE(10);
```

After creating the object it needs to be initialized by calling `net_buf_simple_init()`.

**Parameters**

- `size` – Maximum data storage for the buffer.

**Returns**

Pointer to stack-allocated `net_buf_simple` object.

`NET_BUF_EXTERNAL_DATA`

Flag indicating that the buffer's associated data pointer, points to externally allocated memory.

Therefore once ref goes down to zero, the pointed data will not need to be deallocated. This never needs to be explicitly set or unset by the `net_buf` API user. Such `net_buf` is exclusively instantiated via `net_buf_alloc_with_data()` function. Reference count mechanism however will behave the same way, and ref count going to 0 will free the `net_buf` but no the data pointer in it.
NET_BUF_POOL_HEAP_DEFINE(_name, _count, _ud_size, _destroy)

Define a new pool for buffers using the heap for the data.

Defines a net_buf_pool struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from the heap using k_malloc, so CONFIG_HEAP_MEM_POOL_SIZE must be set to a positive value. This kind of pool does not support blocking on the data allocation, so the timeout passed to net_buf_alloc will be always treated as K_NO_WAIT when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling net_buf_destroy() to complete the process of returning the buffer to the pool.

Parameters

- _name – Name of the pool variable.
- _count – Number of buffers in the pool.
- _ud_size – User data space to reserve per buffer.
- _destroy – Optional destroy callback when buffer is freed.

NET_BUF_POOL_FIXED_DEFINE(_name, _count, _data_size, _ud_size, _destroy)

Define a new pool for buffers based on fixed-size data.

Defines a net_buf_pool struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from a byte array of fixed sized chunks. This kind of pool does not support blocking on the data allocation, so the timeout passed to net_buf_alloc will be always treated as K_NO_WAIT when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling net_buf_destroy() to complete the process of returning the buffer to the pool.

Parameters

- _name – Name of the pool variable.
- _count – Number of buffers in the pool.
- _data_size – Maximum data payload per buffer.
- _ud_size – User data space to reserve per buffer.
- _destroy – Optional destroy callback when buffer is freed.

NET_BUF_POOL_VAR_DEFINE(_name, _count, _data_size, _ud_size, _destroy)

Define a new pool for buffers with variable size payloads.

Defines a net_buf_pool struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.
The data payload of the buffers will be based on a memory pool from which variable size payloads may be allocated.

If provided with a custom destroy callback, this callback is responsible for eventually calling `net_buf_destroy()` to complete the process of returning the buffer to the pool.

**Parameters**

- `_name` – Name of the pool variable.
- `_count` – Number of buffers in the pool.
- `_data_size` – Total amount of memory available for data payloads.
- `_ud_size` – User data space to reserve per buffer.
- `_destroy` – Optional destroy callback when buffer is freed.

```c
NET_BUF_POOL_DEFINE(_name, _count, _size, _ud_size, _destroy)
```

Define a new pool for buffers.

Defines a `net_buf_pool` struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through `net_buf_alloc`. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

If provided with a custom destroy callback this callback is responsible for eventually calling `net_buf_destroy()` to complete the process of returning the buffer to the pool.

**Parameters**

- `_name` – Name of the pool variable.
- `_count` – Number of buffers in the pool.
- `_size` – Maximum data size for each buffer.
- `_ud_size` – Amount of user data space to reserve.
- `_destroy` – Optional destroy callback when buffer is freed.

**Typedefs**

```c
typedef struct net_buf *(net_buf_allocator_cb)(k_timeout_t timeout, void *user_data)
```

Network buffer allocator callback.

The allocator callback is called when `net_buf_append_bytes` needs to allocate a new `net_buf`.

**Param timeout**

Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

**Param user_data**

The user data given in `net_buf_append_bytes` call.

**Return**

pointer to allocated `net_buf` or NULL on error.

**Functions**
static inline void net_buf_simple_init(struct net_buf_simple *buf, size_t reserve_head)
Initialize a net_buf_simple object.
This needs to be called after creating a net_buf_simple object using the NET_BUF_SIMPLE macro.

Parameters

• buf – Buffer to initialize.
• reserve_head – Headroom to reserve.

void net_buf_simple_init_with_data(struct net_buf_simple *buf, void *data, size_t size)
Initialize a net_buf_simple object with data.
Initialized buffer object with external data.

Parameters

• buf – Buffer to initialize.
• data – External data pointer
• size – Amount of data the pointed data buffer if able to fit.

static inline void net_buf_simple_reset(struct net_buf_simple *buf)
Reset buffer.
Reset buffer data so it can be reused for other purposes.

Parameters

• buf – Buffer to reset.

void net_buf_simple_clone(const struct net_buf_simple *original, struct net_buf_simple *clone)
Clone buffer state, using the same data buffer.
Initializes a buffer to point to the same data as an existing buffer. Allows operations on the same data without altering the length and offset of the original.

Parameters

• original – Buffer to clone.
• clone – The new clone.

void *net_buf_simple_add(struct net_buf_simple *buf, size_t len)
Prepare data to be added at the end of the buffer.
Increments the data length of a buffer to account for more data at the end.

Parameters

• buf – Buffer to update.
• len – Number of bytes to increment the length with.

Returns

The original tail of the buffer.

void *net_buf_simple_add_mem(struct net_buf_simple *buf, const void *mem, size_t len)
Copy given number of bytes from memory to the end of the buffer.
Increments the data length of the buffer to account for more data at the end.

Parameters

• buf – Buffer to update.
• mem – Location of data to be added.
• **len** – Length of data to be added

**Returns**
The original tail of the buffer.

```c
uint8_t *net_buf_simple_add_u8(struct net_buf_simple *buf, uint8_t val)
```
Add (8-bit) byte at the end of the buffer.
Increments the data length of the buffer to account for more data at the end.

**Parameters**
- **buf** – Buffer to update.
- **val** – byte value to be added.

**Returns**
Pointer to the value added

```c
void net_buf_simple_add_le16(struct net_buf_simple *buf, uint16_t val)
```
Add 16-bit value at the end of the buffer.
Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**
- **buf** – Buffer to update.
- **val** – 16-bit value to be added.

```c
void net_buf_simple_add_be16(struct net_buf_simple *buf, uint16_t val)
```
Add 16-bit value at the end of the buffer.
Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**
- **buf** – Buffer to update.
- **val** – 16-bit value to be added.

```c
void net_buf_simple_add_le24(struct net_buf_simple *buf, uint32_t val)
```
Add 24-bit value at the end of the buffer.
Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**
- **buf** – Buffer to update.
- **val** – 24-bit value to be added.

```c
void net_buf_simple_add_be24(struct net_buf_simple *buf, uint32_t val)
```
Add 24-bit value at the end of the buffer.
Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**
- **buf** – Buffer to update.
- **val** – 24-bit value to be added.
void net_buf_simple_add_le32(struct net_buf_simple *buf, uint32_t val)
Add 32-bit value at the end of the buffer.
Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be added.

void net_buf_simple_add_be32(struct net_buf_simple *buf, uint32_t val)
Add 32-bit value at the end of the buffer.
Adds 32-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be added.

void net_buf_simple_add_le48(struct net_buf_simple *buf, uint64_t val)
Add 48-bit value at the end of the buffer.
Adds 48-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be added.

void net_buf_simple_add_be48(struct net_buf_simple *buf, uint64_t val)
Add 48-bit value at the end of the buffer.
Adds 48-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be added.

void net_buf_simple_add_le64(struct net_buf_simple *buf, uint64_t val)
Add 64-bit value at the end of the buffer.
Adds 64-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be added.
void *netbuf_simple_remove_mem(struct net_buf_simple *buf, size_t len)
Remove data from the end of the buffer.
Removes data from the end of the buffer by modifying the buffer length.

Parameters
• buf – Buffer to update.
• len – Number of bytes to remove.

Returns
New end of the buffer data.

unsigned char netbuf_simple_remove_u8(struct net_buf_simple *buf)
Remove a 8-bit value from the end of the buffer.
Same idea as with netbuf_simple_remove_mem(), but a helper for operating on 8-bit values.

Parameters
• buf – A valid pointer on a buffer.

Returns
The 8-bit removed value

unsigned short netbuf_simple_remove_le16(struct net_buf_simple *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with netbuf_simple_remove_mem(), but a helper for operating on 16-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from little endian to host endian.

unsigned short netbuf_simple_remove_be16(struct net_buf_simple *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with netbuf_simple_remove_mem(), but a helper for operating on 16-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from big endian to host endian.

unsigned int netbuf_simple_remove_le24(struct net_buf_simple *buf)
Remove and convert 24 bits from the end of the buffer.
Same idea as with netbuf_simple_remove_mem(), but a helper for operating on 24-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.
uint32_t net_buf_simple_remove_be24(struct net_buf_simple *buf)
Remove and convert 24 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 24-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from big endian to host endian.

uint32_t net_buf_simple_remove_le32(struct net_buf_simple *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 32-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.

uint32_t net_buf_simple_remove_be32(struct net_buf_simple *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 32-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from big endian to host endian.

uint64_t net_buf_simple_remove_le48(struct net_buf_simple *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 48-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.

uint64_t net_buf_simple_remove_be48(struct net_buf_simple *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 48-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from big endian to host endian.

uint64_t net_buf_simple_remove_le64(struct net_buf_simple *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 64-bit little endian data.

6.3. Networking
Parameters

- buf – A valid pointer on a buffer.

Returns

64-bit value converted from little endian to host endian.

```c
uint64_t net_buf_simple_remove_be64(struct net_buf_simple *buf)
```

Remove and convert 64 bits from the end of the buffer.

Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 64-bit big endian data.

Parameters

- buf – A valid pointer on a buffer.

Returns

64-bit value converted from big endian to host endian.

```c
void *net_buf_simple_push(struct net_buf_simple *buf, size_t len)
```

Prepare data to be added to the start of the buffer.

Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters

- buf – Buffer to update.
- len – Number of bytes to add to the beginning.

Returns

The new beginning of the buffer data.

```c
void *net_buf_simple_push_mem(struct net_buf_simple *buf, const void *mem, size_t len)
```

Copy given number of bytes from memory to the start of the buffer.

Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters

- buf – Buffer to update.
- mem – Location of data to be added.
- len – Length of data to be added.

Returns

The new beginning of the buffer data.

```c
void net_buf_simple_push_le16(struct net_buf_simple *buf, uint16_t val)
```

Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in little endian format to the beginning of the buffer.

Parameters

- buf – Buffer to update.
- val – 16-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_be16(struct net_buf_simple *buf, uint16_t val)
```

Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in big endian format to the beginning of the buffer.

Parameters

- buf – Buffer to update.
• **val** – 16-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_u8(struct net_buf_simple *buf, uint8_t val)
```

Push 8-bit value to the beginning of the buffer.

Adds 8-bit value the beginning of the buffer.

**Parameters**

• **buf** – Buffer to update.

• **val** – 8-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_le24(struct net_buf_simple *buf, uint32_t val)
```

Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in little endian format to the beginning of the buffer.

**Parameters**

• **buf** – Buffer to update.

• **val** – 24-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_be24(struct net_buf_simple *buf, uint32_t val)
```

Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in big endian format to the beginning of the buffer.

**Parameters**

• **buf** – Buffer to update.

• **val** – 24-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_le32(struct net_buf_simple *buf, uint32_t val)
```

Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in little endian format to the beginning of the buffer.

**Parameters**

• **buf** – Buffer to update.

• **val** – 32-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_be32(struct net_buf_simple *buf, uint32_t val)
```

Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in big endian format to the beginning of the buffer.

**Parameters**

• **buf** – Buffer to update.

• **val** – 32-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_le48(struct net_buf_simple *buf, uint64_t val)
```

Push 48-bit value to the beginning of the buffer.

Adds 48-bit value in little endian format to the beginning of the buffer.

**Parameters**

• **buf** – Buffer to update.

• **val** – 48-bit value to be pushed to the buffer.
void net_buf_simple_push_be48(struct net_buf_simple *buf, uint64_t val)
    Push 48-bit value to the beginning of the buffer.
    Adds 48-bit value in big endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be pushed to the buffer.

void net_buf_simple_push_le64(struct net_buf_simple *buf, uint64_t val)
    Push 64-bit value to the beginning of the buffer.
    Adds 64-bit value in little endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be pushed to the buffer.

void net_buf_simple_push_be64(struct net_buf_simple *buf, uint64_t val)
    Push 64-bit value to the beginning of the buffer.
    Adds 64-bit value in big endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be pushed to the buffer.

void *net_buf_simple_pull(struct net_buf_simple *buf, size_t len)
    Remove data from the beginning of the buffer.
    Removes data from the beginning of the buffer by modifying the data pointer and
    buffer length.

Parameters
• buf – Buffer to update.
• len – Number of bytes to remove.

Returns
New beginning of the buffer data.

void *net_buf_simple_pull_mem(struct net_buf_simple *buf, size_t len)
    Remove data from the beginning of the buffer.
    Removes data from the beginning of the buffer by modifying the data pointer and
    buffer length.

Parameters
• buf – Buffer to update.
• len – Number of bytes to remove.

Returns
Pointer to the old location of the buffer data.

uint8_t net_buf_simple_pull_u8(struct net_buf_simple *buf)
    Remove a 8-bit value from the beginning of the buffer.
    Same idea as with net_buf_simple_pull(), but a helper for operating on 8-bit values.

Parameters
• buf – A valid pointer on a buffer.
Returns
The 8-bit removed value

uint16_t net_buf_simple_pull_le16(struct net_buf_simple *buf)
Remove and convert 16 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 16-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from little endian to host endian.

uint16_t net_buf_simple_pull_be16(struct net_buf_simple *buf)
Remove and convert 16 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 16-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from big endian to host endian.

uint32_t net_buf_simple_pull_le24(struct net_buf_simple *buf)
Remove and convert 24 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 24-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.

uint32_t net_buf_simple_pull_be24(struct net_buf_simple *buf)
Remove and convert 24 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 24-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from big endian to host endian.

uint32_t net_buf_simple_pull_le32(struct net_buf_simple *buf)
Remove and convert 32 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 32-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.
```c
uint32_t net_buf_simple_pull_be32(struct net_buf_simple *buf)
Remove and convert 32 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 32-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from big endian to host endian.
```
Parameters
- `buf` – Buffer.

Returns
Tail pointer for the buffer.

```c
size_t net_buf_simple_headroom(struct net_buf_simple *buf)
```
Check buffer headroom.

- `buf` A valid pointer on a buffer

Returns
Number of bytes available in the beginning of the buffer.

```c
size_t net_buf_simple_tailroom(struct net_buf_simple *buf)
```
Check buffer tailroom.

- `buf` A valid pointer on a buffer

Returns
Number of bytes available at the end of the buffer.

```c
uint16_t net_buf_simple_max_len(struct net_buf_simple *buf)
```
Check maximum `net_buf_simple::len` value.

- `buf` A valid pointer on a buffer

This value is depending on the number of bytes being reserved as headroom.

Parameters
- `buf` – A valid pointer on a buffer

Returns
Number of bytes usable behind the `net_buf_simple::data` pointer.

```c
static inline void net_buf_simple_save(struct net_buf_simple *buf, struct net_buf_simple_state *state)
```
Save the parsing state of a buffer.

- `buf` – Buffer from which the state should be saved.
- `state` – Storage for the state.

```c
static inline void net_buf_simple_restore(struct net_buf_simple *buf, struct net_buf_simple_state *state)
```
Restore the parsing state of a buffer.

- `buf` – Buffer to which the state should be restored.
- `state` – Stored state.

```c
struct net_buf_pool *net_buf_pool_get(int id)
```
Looks up a pool based on its ID.

Parameters
• id – Pool ID (e.g. from buf->pool_id).

Returns
Pointer to pool.

int net_buf_id(struct net_buf *buf)
Get a zero-based index for a buffer.

This function will translate a buffer into a zero-based index, based on its placement in its buffer pool. This can be useful if you want to associate an external array of meta-data contexts with the buffers of a pool.

Parameters
• buf – Network buffer.

Returns
Zero-based index for the buffer.

struct net_buf *net_buf_alloc_fixed(struct net_buf_pool *pool, k_timeout_t timeout)
Allocate a new fixed buffer from a pool.

Parameters
• pool – Which pool to allocate the buffer from.
• timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it’s still possible for net_buf_alloc() to fail (return NULL) even if it was given K_FOREVER.

Returns
New buffer or NULL if out of buffers.

static inline struct net_buf *net_buf_alloc(struct net_buf_pool *pool, k_timeout_t timeout)

Parameters
• pool – Which pool to allocate the buffer from.
• timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it’s still possible for net_buf_alloc() to fail (return NULL) even if it was given K_FOREVER.

Returns
New buffer or NULL if out of buffers.

struct net_buf *net_buf_alloc_len(struct net_buf_pool *pool, size_t size, k_timeout_t timeout)
Allocate a new variable length buffer from a pool.

Parameters
• pool – Which pool to allocate the buffer from.
• size – Amount of data the buffer must be able to fit.
• timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for net_buf_alloc() to fail (return NULL) even if it was given K_FOREVER.
struct net_buf *net_buf_alloc_with_data(struct net_buf_pool *pool, void *data, size_t size, k_timeout_t timeout)

Allocate a new buffer from a pool but with external data pointer.
Allocate a new buffer from a pool, where the data pointer comes from the user and not from the pool.

Parameters
- pool – Which pool to allocate the buffer from.
- data – External data pointer
- size – Amount of data the pointed data buffer if able to fit.
- timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for net_buf_alloc() to fail (return NULL) even if it was given K_FOREVER.

Returns
New buffer or NULL if out of buffers.

struct net_buf *net_buf_get(struct k_fifo *fifo, k_timeout_t timeout)

Get a buffer from a FIFO.

This function is NOT thread-safe if the buffers in the FIFO contain fragments.

Parameters
- fifo – Which FIFO to take the buffer from.
- timeout – Affects the action taken should the FIFO be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Returns
New buffer or NULL if the FIFO is empty.

static inline void net_buf_destroy(struct net_buf *buf)

Destroy buffer from custom destroy callback.
This helper is only intended to be used from custom destroy callbacks. If no custom destroy callback is given to NET_BUF_POOL_*_DEFINE() then there is no need to use this API.

Parameters
- buf – Buffer to destroy.

void net_buf_reset(struct net_buf *buf)

Reset buffer.
Reset buffer data and flags so it can be reused for other purposes.

Parameters
- buf – Buffer to reset.

void net_buf_simple_reserve(struct net_buf_simple *buf, size_t reserve)

Initialize buffer with the given headroom.
The buffer is not expected to contain any data when this API is called.
void net_buf_slist_put(sys_slist_t *list, struct net_buf *buf)

Put a buffer into a list.

If the buffer contains follow-up fragments this function will take care of inserting them as well into the list.

Parameters

• list – Which list to append the buffer to.
• buf – Buffer.

struct net_buf *net_buf_slist_get(sys_slist_t *list)

Get a buffer from a list.

If the buffer had any fragments, these will automatically be recovered from the list as well and be placed to the buffer’s fragment list.

Parameters

• list – Which list to take the buffer from.

Returns

New buffer or NULL if the FIFO is empty.

void net_buf_put(struct k_fifo *fifo, struct net_buf *buf)

Put a buffer to the end of a FIFO.

If the buffer contains follow-up fragments this function will take care of inserting them as well into the FIFO.

Parameters

• fifo – Which FIFO to put the buffer to.
• buf – Buffer.

void net_buf_unref(struct net_buf *buf)

Decrements the reference count of a buffer.

The buffer is put back into the pool if the reference count reaches zero.

Parameters

• buf – A valid pointer on a buffer

struct net_buf *net_buf_ref(struct net_buf *buf)

Increment the reference count of a buffer.

Parameters

• buf – A valid pointer on a buffer

Returns

the buffer newly referenced

struct net_buf *net_buf_clone(struct net_buf *buf, k_timeout_t timeout)

Clone buffer.

Duplicate given buffer including any data and headers currently stored.

Parameters

• buf – A valid pointer on a buffer
• **timeout** – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

**Returns**
Cloned buffer or NULL if out of buffers.

```
static inline void *net_buf_user_data(const struct net_buf *buf)
Get a pointer to the user data of a buffer.
```

**Parameters**

- **buf** – A valid pointer on a buffer

**Returns**
Pointer to the user data of the buffer.

```
static inline void net_buf_reserve(struct net_buf *buf, size_t reserve)
Initialize buffer with the given headroom.
The buffer is not expected to contain any data when this API is called.
```

**Parameters**

- **buf** – Buffer to initialize.
- **reserve** – How much headroom to reserve.

```
static inline void *net_buf_add(struct net_buf *buf, size_t len)
Prepare data to be added at the end of the buffer.
Increments the data length of a buffer to account for more data at the end.
```

**Parameters**

- **buf** – Buffer to update.
- **len** – Number of bytes to increment the length with.

**Returns**
The original tail of the buffer.

```
static inline void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len)
Copies the given number of bytes to the end of the buffer.
Increments the data length of the buffer to account for more data at the end.
```

**Parameters**

- **buf** – Buffer to update.
- **mem** – Location of data to be added.
- **len** – Length of data to be added

**Returns**
The original tail of the buffer.

```
static inline uint8_t *net_buf_add_u8(struct net_buf *buf, uint8_t val)
Add (8-bit) byte at the end of the buffer.
Increments the data length of the buffer to account for more data at the end.
```

**Parameters**

- **buf** – Buffer to update.
- **val** – byte value to be added.

**Returns**
Pointer to the value added
static inline void net_buf_add_le16(struct net_buf *buf, uint16_t val)
    Add 16-bit value at the end of the buffer.
    Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 16-bit value to be added.

static inline void net_buf_add_be16(struct net_buf *buf, uint16_t val)
    Add 16-bit value at the end of the buffer.
    Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 16-bit value to be added.

static inline void net_buf_add_le24(struct net_buf *buf, uint32_t val)
    Add 24-bit value at the end of the buffer.
    Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be added.

static inline void net_buf_add_be24(struct net_buf *buf, uint32_t val)
    Add 24-bit value at the end of the buffer.
    Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be added.

static inline void net_buf_add_le32(struct net_buf *buf, uint32_t val)
    Add 32-bit value at the end of the buffer.
    Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be added.

static inline void net_buf_add_be32(struct net_buf *buf, uint32_t val)
    Add 32-bit value at the end of the buffer.
    Adds 32-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be added.
static inline void net_buf_add_le48(struct net_buf *buf, uint64_t val)
Add 48-bit value at the end of the buffer.
Adds 48-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be added.

static inline void net_buf_add_be48(struct net_buf *buf, uint64_t val)
Add 48-bit value at the end of the buffer.
Adds 48-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be added.

static inline void net_buf_add_le64(struct net_buf *buf, uint64_t val)
Add 64-bit value at the end of the buffer.
Adds 64-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be added.

static inline void net_buf_add_be64(struct net_buf *buf, uint64_t val)
Add 64-bit value at the end of the buffer.
Adds 64-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be added.

static inline void *net_buf_remove_mem(struct net_buf *buf, size_t len)
Remove data from the end of the buffer.
Removes data from the end of the buffer by modifying the buffer length.

Parameters
• buf – Buffer to update.
• len – Number of bytes to remove.

Returns
New end of the buffer data.

static inline uint8_t net_buf_remove_u8(struct net_buf *buf)
Remove a 8-bit value from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 8-bit values.

Parameters
• buf – A valid pointer on a buffer.
**Returns**
The 8-bit removed value

static inline uint16_t net_buf_remove_le16(struct net_buf *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 16-bit little endian data.

**Parameters**
- **buf** – A valid pointer on a buffer.

**Returns**
16-bit value converted from little endian to host endian.

static inline uint16_t net_buf_remove_be16(struct net_buf *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 16-bit big endian data.

**Parameters**
- **buf** – A valid pointer on a buffer.

**Returns**
16-bit value converted from big endian to host endian.

static inline uint32_t net_buf_remove_be24(struct net_buf *buf)
Remove and convert 24 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 24-bit big endian data.

**Parameters**
- **buf** – A valid pointer on a buffer.

**Returns**
24-bit value converted from big endian to host endian.

static inline uint32_t net_buf_remove_le24(struct net_buf *buf)
Remove and convert 24 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 24-bit little endian data.

**Parameters**
- **buf** – A valid pointer on a buffer.

**Returns**
24-bit value converted from little endian to host endian.

static inline uint32_t net_buf_remove_le32(struct net_buf *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 32-bit little endian data.

**Parameters**
- **buf** – A valid pointer on a buffer.

**Returns**
32-bit value converted from little endian to host endian.
static inline uint32_t net_buf_remove_be32(struct net_buf *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with \texttt{net_buf_remove_mem()}, but a helper for operating on 32-bit big endian data.

\textbf{Parameters}
- \texttt{buf} – A valid pointer on a buffer

\textbf{Returns}
32-bit value converted from big endian to host endian.

static inline uint64_t net_buf_remove_be48(struct net_buf *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with \texttt{net_buf_remove_mem()}, but a helper for operating on 48-bit big endian data.

\textbf{Parameters}
- \texttt{buf} – A valid pointer on a buffer

\textbf{Returns}
48-bit value converted from big endian to host endian.

static inline uint64_t net_buf_remove_le48(struct net_buf *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with \texttt{net_buf_remove_mem()}, but a helper for operating on 48-bit little endian data.

\textbf{Parameters}
- \texttt{buf} – A valid pointer on a buffer

\textbf{Returns}
48-bit value converted from little endian to host endian.

static inline uint64_t net_buf_remove_be64(struct net_buf *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with \texttt{net_buf_remove_mem()}, but a helper for operating on 64-bit big endian data.

\textbf{Parameters}
- \texttt{buf} – A valid pointer on a buffer

\textbf{Returns}
64-bit value converted from big endian to host endian.

static inline uint64_t net_buf_remove_le64(struct net_buf *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with \texttt{net_buf_remove_mem()}, but a helper for operating on 64-bit little endian data.

\textbf{Parameters}
- \texttt{buf} – A valid pointer on a buffer

\textbf{Returns}
64-bit value converted from little endian to host endian.

static inline void *net_buf_push(struct net_buf *buf, size_t len)
Prepare data to be added at the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

6.3. Networking
Parameters

- `buf` – Buffer to update.
- `len` – Number of bytes to add to the beginning.

Returns

The new beginning of the buffer data.

```c
static inline void *net_buf_push_mem(struct net_buf *buf, const void *mem, size_t len)
```

Copies the given number of bytes to the start of the buffer.

Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `mem` – Location of data to be added.
- `len` – Length of data to be added.

Returns

The new beginning of the buffer data.

```c
static inline void net_buf_push_u8(struct net_buf *buf, uint8_t val)
```

Push 8-bit value to the beginning of the buffer.

Adds 8-bit value the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 8-bit value to be pushed to the buffer.

```c
static inline void net_buf_push_le16(struct net_buf *buf, uint16_t val)
```

Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in little endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 16-bit value to be pushed to the buffer.

```c
static inline void net_buf_push_be16(struct net_buf *buf, uint16_t val)
```

Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in big endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 16-bit value to be pushed to the buffer.

```c
static inline void net_buf_push_le24(struct net_buf *buf, uint32_t val)
```

Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in little endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 24-bit value to be pushed to the buffer.
static inline void `net_buf_push_be24` (struct `net_buf` *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.

**Parameters**
- **buf** – Buffer to update.
- **val** – 24-bit value to be pushed to the buffer.

static inline void `net_buf_push_le32` (struct `net_buf` *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.

**Parameters**
- **buf** – Buffer to update.
- **val** – 32-bit value to be pushed to the buffer.

static inline void `net_buf_push_be32` (struct `net_buf` *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.

**Parameters**
- **buf** – Buffer to update.
- **val** – 32-bit value to be pushed to the buffer.

static inline void `net_buf_push_le48` (struct `net_buf` *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.

**Parameters**
- **buf** – Buffer to update.
- **val** – 48-bit value to be pushed to the buffer.

static inline void `net_buf_push_be48` (struct `net_buf` *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.

**Parameters**
- **buf** – Buffer to update.
- **val** – 48-bit value to be pushed to the buffer.

static inline void `net_buf_push_le64` (struct `net_buf` *buf, uint64_t val)
Push 64-bit value to the beginning of the buffer.

**Parameters**
- **buf** – Buffer to update.
- **val** – 64-bit value to be pushed to the buffer.
• **buf** – Buffer to update.
• **val** – 64-bit value to be pushed to the buffer.

static inline void *\texttt{net_buf_pull}(struct netbuf *buf, size_t len)

Removes data from the beginning of the buffer.

**Parameters**

• **buf** – Buffer to update.
• **len** – Number of bytes to remove.

**Returns**

New beginning of the buffer data.

static inline void *\texttt{net_buf_pull_mem}(struct netbuf *buf, size_t len)

Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

**Parameters**

• **buf** – Buffer to update.
• **len** – Number of bytes to remove.

**Returns**

Pointer to the old beginning of the buffer data.

static inline uint8_t \texttt{net_buf_pull_u8}(struct netbuf *buf)

Same idea as with \texttt{net_buf_pull()}, but a helper for operating on 8-bit values.

**Parameters**

• **buf** – A valid pointer on a buffer.

**Returns**

The 8-bit removed value.

static inline uint16_t \texttt{net_buf_pull_le16}(struct netbuf *buf)

Same idea as with \texttt{net_buf_pull()}, but a helper for operating on 16-bit little endian data.

**Parameters**

• **buf** – A valid pointer on a buffer.

**Returns**

16-bit value converted from little endian to host endian.

static inline uint16_t \texttt{net_buf_pull_be16}(struct netbuf *buf)

Same idea as with \texttt{net_buf_pull()}, but a helper for operating on 16-bit big endian data.

**Parameters**

• **buf** – A valid pointer on a buffer.

**Returns**

16-bit value converted from big endian to host endian.
static inline uint32_t net_buf_pull_le24(struct net_buf *buf)
    Remove and convert 24 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 24-bit little endian data.
    Parameters
    • buf – A valid pointer on a buffer.
    Returns
    24-bit value converted from little endian to host endian.

static inline uint32_t net_buf_pull_be24(struct net_buf *buf)
    Remove and convert 24 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 24-bit big endian data.
    Parameters
    • buf – A valid pointer on a buffer.
    Returns
    24-bit value converted from big endian to host endian.

static inline uint32_t net_buf_pull_le32(struct net_buf *buf)
    Remove and convert 32 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 32-bit little endian data.
    Parameters
    • buf – A valid pointer on a buffer.
    Returns
    32-bit value converted from little endian to host endian.

static inline uint32_t net_buf_pull_be32(struct net_buf *buf)
    Remove and convert 32 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 32-bit big endian data.
    Parameters
    • buf – A valid pointer on a buffer
    Returns
    32-bit value converted from big endian to host endian.

static inline uint64_t net_buf_pull_le48(struct net_buf *buf)
    Remove and convert 48 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 48-bit little endian data.
    Parameters
    • buf – A valid pointer on a buffer
    Returns
    48-bit value converted from little endian to host endian.

static inline uint64_t net_buf_pull_be48(struct net_buf *buf)
    Remove and convert 48 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 48-bit big endian data.
    Parameters
    • buf – A valid pointer on a buffer
    Returns
    48-bit value converted from big endian to host endian.
static inline uint64_t net_buf_pull_le64(struct net_buf *buf)
Remove and convert 64 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 64-bit little endian data.

**Parameters**
• buf – A valid pointer on a buffer.

**Returns**
64-bit value converted from little endian to host endian.

static inline uint64_t net_buf_pull_be64(struct net_buf *buf)
Remove and convert 64 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 64-bit big endian data.

**Parameters**
• buf – A valid pointer on a buffer

**Returns**
64-bit value converted from big endian to host endian.

static inline size_t net_buf_tailroom(struct net_buf *buf)
Check buffer tailroom.
Check how much free space there is at the end of the buffer.

**Parameters**
• buf – A valid pointer on a buffer

**Returns**
Number of bytes available at the end of the buffer.

static inline size_t net_buf_headroom(struct net_buf *buf)
Check buffer headroom.
Check how much free space there is in the beginning of the buffer.
buf A valid pointer on a buffer

**Returns**
Number of bytes available in the beginning of the buffer.

static inline uint16_t net_buf_max_len(struct net_buf *buf)
Check maximum net_buf::len value.
This value is depending on the number of bytes being reserved as headroom.

**Parameters**
• buf – A valid pointer on a buffer

**Returns**
Number of bytes usable behind the net_buf::data pointer.

static inline uint8_t *net_buf_tail(struct net_buf *buf)
Get the tail pointer for a buffer.
Get a pointer to the end of the data in a buffer.

**Parameters**
• buf – Buffer.

**Returns**
Tail pointer for the buffer.
struct `net_buf` *net_buf_frag_last(struct `net_buf` *frags)

Find the last fragment in the fragment list.

**Returns**
Pointer to last fragment in the list.

void net_buf_frag_insert(struct `net_buf` *parent, struct `net_buf` *frag)

Insert a new fragment to a chain of bufs.

Insert a new fragment into the buffer fragments list after the parent.

Note: This function takes ownership of the fragment reference so the caller is not required to unref.

**Parameters**
- **parent** – Parent buffer/fragment.
- **frag** – Fragment to insert.

struct `net_buf` *net_buf_frag_add(struct `net_buf` *head, struct `net_buf` *frag)

Add a new fragment to the end of a chain of bufs.

Append a new fragment into the buffer fragments list.

Note: This function takes ownership of the fragment reference so the caller is not required to unref.

**Parameters**
- **head** – Head of the fragment chain.
- **frag** – Fragment to add.

**Returns**
New head of the fragment chain. Either head (if head was non-NULL) or frag (if head was NULL).

struct `net_buf` *net_buf_frag_del(struct `net_buf` *parent, struct `net_buf` *frag)

Delete existing fragment from a chain of bufs.

**Parameters**
- **parent** – Parent buffer/fragment, or NULL if there is no parent.
- **frag** – Fragment to delete.

**Returns**
Pointer to the buffer following the fragment, or NULL if it had no further fragments.

size_t net_buf_linearize(void *dst, size_t dst_len, struct `net_buf` *src, size_t offset, size_t len)

Copy bytes from `net_buf` chain starting at offset to linear buffer.

Copy (extract) len bytes from src `net_buf` chain, starting from offset in it, to a linear buffer dst. Return number of bytes actually copied, which may be less than requested, if `net_buf` chain doesn't have enough data, or destination buffer is too small.

**Parameters**
- **dst** – Destination buffer
- **dst_len** – Destination buffer length
- **src** – Source `net_buf` chain
- **offset** – Starting offset to copy from
- **len** – Number of bytes to copy
Returns

number of bytes actually copied

size_t net_buf_append_bytes(struct net_buf *buf, size_t len, const void *value, k_timeout_t timeout, net_buf_allocator_cb allocate_cb, void *user_data)

Append data to a list of net_buf.

Append data to a net_buf. If there is not enough space in the net_buf then more net_buf will be added, unless there are no free net_buf and timeout occurs. If not allocator is provided it attempts to allocate from the same pool as the original buffer.

Parameters

- buf – Network buffer.
- len – Total length of input data
- value – Data to be added
- timeout – Timeout is passed to the net_buf allocator callback.
- allocate_cb – When a new net_buf is required, use this callback.
- user_data – A user data pointer to be supplied to the allocate_cb function.

Returns

Length of data actually added. This may be less than input length if other timeout than K_FOREVER was used, and there were no free fragments in a pool to accommodate all data.

static inline struct net_buf *net_buf_skip(struct net_buf *buf, size_t len)

Skip N number of bytes in a net_buf.

Skip N number of bytes starting from fragment's offset. If the total length of data is placed in multiple fragments, this function will skip from all fragments until it reaches N number of bytes. Any fully skipped buffers are removed from the net_buf list.

Parameters

- buf – Network buffer.
- len – Total length of data to be skipped.

Returns

Pointer to the fragment or NULL and pos is 0 after successful skip, NULL and pos is 0xffff otherwise.

static inline size_t net_buf_frags_len(struct net_buf *buf)

Calculate amount of bytes stored in fragments.

Calculates the total amount of data stored in the given buffer and the fragments linked to it.

Parameters

- buf – Buffer to start off with.

Returns

Number of bytes in the buffer and its fragments.

struct net_buf_simple

#include <buf.h> Simple network buffer representation.

This is a simpler variant of the net_buf object (in fact net_buf uses net_buf_simple internally). It doesn't provide any kind of reference counting, user data, dynamic allocation, or in general the ability to pass through kernel objects such as FIFOs.
The main use of this is for scenarios where the meta-data of the normal `net_buf` isn’t needed and causes too much overhead. This could be e.g. when the buffer only needs to be allocated on the stack or when the access to and lifetime of the buffer is well controlled and constrained.

**Public Members**

`uint8_t *data`  
Pointer to the start of data in the buffer.

`uint16_t len`  
Length of the data behind the data pointer.  
To determine the max length, use `net_buf_simple_max_len()`, not `size`!

`uint16_t size`  
Amount of data that `net_buf_simple::__buf` can store.

```c
struct net_buf_simple_state
#include <buf.h> Parsing state of a buffer.
This is used for temporarily storing the parsing state of a buffer while giving control of the parsing to a routine which we don’t control.
```

**Public Members**

`uint16_t offset`  
Offset of the data pointer from the beginning of the storage.

`uint16_t len`  
Length of data.

```c
struct net_buf
#include <buf.h> Network buffer representation.
This struct is used to represent network buffers. Such buffers are normally defined through the NET_BUF_POOL_*_DEFINE() APIs and allocated using the `net_buf_alloc()` API.
```

**Public Members**

`sys_snode_t node`  
Allow placing the buffer into `sys_slist_t`.

```c
struct net_buf *frags
Fragments associated with this buffer.
```

`uint8_t ref`  
Reference count.
uint8_t flags
   Bit-field of buffer flags.

uint8_t pool_id
   Where the buffer should go when freed up.

uint8_t *data
   Pointer to the start of data in the buffer.

uint16_t len
   Length of the data behind the data pointer.

uint16_t size
   Amount of data that this buffer can store.

uint8_t user_data[]
   System metadata for this buffer.

struct net_buf_data_cb
   #include <buf.h>

struct net_buf_data_alloc
   #include <buf.h>

struct net_buf_pool
   #include <buf.h> Network buffer pool representation.
   This struct is used to represent a pool of network buffers.

Public Members

struct k_lifo free
   LIFO to place the buffer into when free.

const uint16_t buf_count
   Number of buffers in pool.

uint16_t uninit_count
   Number of uninitialized buffers.

void (*const destroy)(struct net_buf *buf)
   Optional destroy callback when buffer is freed.

const struct net_buf_data_alloc *alloc
   Data allocation handlers.

struct net_buf_pool_fixed
   #include <buf.h>
Packet Management

- **Overview**

  - Allocation
  - Buffer allocation
  - Deallocation
- **Operations**
  - Read and Write access
  - Data access
- **API Reference**

**Overview**  Network packets are the main data the networking stack manipulates. Such data is represented through the `net_pkt` structure which provides a means to hold the packet, write and read it, as well as necessary metadata for the core to hold important information. Such an object is called `net_pkt` in this document.

The data structure and the whole API around it are defined in `include/zephyr/net/net_pkt.h`.

**Architectural notes**  There are two network packets flows within the stack, TX for the transmission path, and RX for the reception one. In both paths, each `net_pkt` is written and read from the beginning to the end, or more specifically from the headers to the payload.

**Memory management**

**Allocation**  All `net_pkt` objects come from a pre-defined pool of struct `net_pkt`. Such pool is defined via

```
NET_PKT_SLABDEFINE(name, count)
```

Note, however, one will rarely have to use it, as the core provides already two pools, one for the TX path and one for the RX path.

Allocating a raw `net_pkt` can be done through:

```
pkt = net_pkt_alloc(timeout);
```

However, by its nature, a raw `net_pkt` is useless without a buffer and needs various metadata information to become relevant as well. It requires at least to get the network interface it is meant to be sent through or through which it was received. As this is a very common operation, a helper exist:

```
pkt = net_pkt_alloc_on_iface(iface, timeout);
```

A more complete allocator exists, where both the `net_pkt` and its buffer can be allocated at once:

```
pkt = net_pkt_alloc_with_buffer(iface, size, family, proto, timeout);
```

See below how the buffer is allocated.
**Buffer allocation**  The net_pkt object does not define its own buffer, but instead uses an existing object for this: net_buf. (See Network Buffer for more information). However, it mostly hides the usage of such a buffer because net_pkt brings network awareness to buffer allocation and, as we will see later, its operation too.

To allocate a buffer, a net_pkt needs to have at least its network interface set. This works if the family of the packet is unknown at the time of buffer allocation. Then one could do:

```c
net_pkt_alloc_buffer(pkt, size, proto, timeout);
```

Where proto could be 0 if unknown (there is no IPPROTO_UNSPEC).

As seen previously, the net_pkt and its buffer can be allocated at once via net_pkt_alloc_with_buffer(). It is actually the most widely used allocator.

The network interface, the family, and the protocol of the packet are used by the buffer allocation to determine if the requested size can be allocated. Indeed, the allocator will use the network interface to know the MTU and then the family and protocol for the headers space (if only these 2 are specified). If the whole fits within the MTU, the allocated space will be of the requested size plus, eventually, the headers space. If there is insufficient MTU space, the requested size will be shrunk so the possible headers space and new size will fit within the MTU.

For instance, on an Ethernet network interface, with an MTU of 1500 bytes:

```c
pkt = net_pkt_alloc_with_buffer(iface, 800, AF_INET4, IPPROTO_UDP, K_FOREVER);
```

will successfully allocate 800 + 20 + 8 bytes of buffer for the new net_pkt where:

```c
pkt = net_pkt_alloc_with_buffer(iface, 1600, AF_INET4, IPPROTO_UDP, K_FOREVER);
```

will successfully allocate 1500 bytes, and where 20 + 8 bytes (IPv4 + UDP headers) will not be used for the payload.

On the receiving side, when the family and protocol are not known:

```c
pkt = net_pkt_rx_alloc_with_buffer(iface, 800, AF_UNSPEC, 0, K_FOREVER);
```

will allocate 800 bytes and no extra header space. But a:

```c
pkt = net_pkt_rx Alloc_with_buffer(iface, 1600, AF_UNSPEC, 0, K FOREVER);
```

will allocate 1514 bytes, the MTU + Ethernet header space.

One can increase the amount of buffer space allocated by calling net_pkt_alloc_buffer(), as it will take into account the existing buffer. It will also account for the header space if net_pkt's family is a valid one, as well as the proto parameter. In that case, the newly allocated buffer space will be appended to the existing one, and not inserted in the front. Note however such a use case is rather limited. Usually, one should know from the start how much size should be requested.

**Deallocation**  Each net_pkt is reference counted. At allocation, the reference is set to 1. The reference count can be incremented with net_pkt_ref() or decremented with net_pkt_unref(). When the count drops to zero the buffer is also un-referenced and net_pkt is automatically placed back into the free net_pkt slabs

If net_pkt's buffer is needed even after net_pkt deallocation, one will need to reference once more all the chain of net_buf before calling last net_pkt_unref. See Network Buffer for more information.

**Operations**  There are two ways to access the net_pkt buffer, explained in the following sections: basic read/write access and data access, the latter being the preferred way.
Read and Write access  As said earlier, though net_pkt uses net_buf for its buffer, it provides its own API to access it. Indeed, a network packet might be scattered over a chain of net_buf objects, the functions provided by net_buf are then limited for such case. Instead, net_pkt provides functions which hide all the complexity of potential non-contiguous access.

Data movement into the buffer is made through a cursor maintained within each net_pkt. All read/write operations affect this cursor. Note as well that read or write functions are strict on their length parameters: if it cannot r/w the given length it will fail. Length is not interpreted as an upper limit, it is instead the exact amount of data that must be read or written.

As there are two paths, TX and RX, there are two access modes: write and overwrite. This might sound a bit unusual, but is in fact simple and provides flexibility.

In write mode, whatever is written in the buffer affects the length of actual data present in the buffer. Buffer length should not be confused with the buffer size which is a limit any mode cannot pass. In overwrite mode then, whatever is written must happen on valid data, and will not affect the buffer length. By default, a newly allocated net_pkt is on write mode, and its cursor points to the beginning of its buffer.

Let's see now, step by step, the functions and how they behave depending on the mode.

When freshly allocated with a buffer of 500 bytes, a net_pkt has 0 length, which means no valid data is in its buffer. One could verify this by:

```c
len = net_pkt_get_len(pkt);
```

Now, let's write 8 bytes:

```c
net_pkt_write(pkt, data, 8);
```

The buffer length is now 8 bytes. There are various helpers to write a byte, or big endian uint16_t, uint32_t.

```c
net_pkt_write_u8(pkt, &foo);
network_write_be16(pkt, &ba);
network_write_be32(pkt, &bar);
```

Logically, net_pkt's length is now 15. But if we try to read at this point, it will fail because there is nothing to read at the cursor where we are at in the net_pkt. It is possible, while in write mode, to read what has been already written by resetting the cursor of the net_pkt. For instance:

```c
net_pkt_cursor_init(pkt);
network_read(pkt, data, 15);
```

This will reset the cursor of the pkt to the beginning of the buffer and then let you read the actual 15 bytes present. The cursor is then again pointing at the end of the buffer.

To set a large area with the same byte, a memset function is provided:

```c
net_pkt_memset(pkt, 0, 5);
```

Our net_pkt has now a length of 20 bytes.

Switching between modes can be achieved via net_pkt_set_overwrite() function. It is possible to switch mode back and forth at any time. The net_pkt will be set to overwrite and its cursor reset:

```c
net_pkt_set_overwrite(pkt, true);
net_pkt_cursor_init(pkt);
```

Now the same operators can be used, but it will be limited to the existing data in the buffer, i.e. 20 bytes.

If it is necessary to know how much space is available in the net_pkt call:
net_pkt_available_buffer(pkt);

Or, if headers space needs to be accounted for, call:

net_pkt_available_payload_buffer(pkt, proto);

If you want to place the cursor at a known position use the function net_pkt_skip(). For example, to go after the IP header, use:

net_pkt_cursor_init(pkt);
net_pkt_skip(pkt, net_pkt_ip_header_len(pkt));

Data access Though the API shown previously is rather simple, it involves always copying things to and from the net_pkt buffer. In many occasions, it is more relevant to access the information stored in the buffer contiguously, especially with network packets which embed headers. These headers are, most of the time, a known fixed set of bytes. It is then more natural to have a structure representing a certain type of header. In addition to this, if it is known the header size appears in a contiguous area of the buffer, it will be way more efficient to cast the actual position in the buffer to the type of header. Either for reading or writing the fields of such header, accessing it directly will save memory.

Net pkt comes with a dedicated API for this, built on top of the previously described API. It is able to handle both contiguous and non-contiguous access transparently.

There are two macros used to define a data access descriptor: NET_PKT_DATA_ACCESS_DEFINE when it is not possible to tell if the data will be in a contiguous area, and NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE when it is guaranteed the data is in a contiguous area.

Let’s take the example of IP and UDP. Both IPv4 and IPv6 headers are always found at the beginning of the packet and are small enough to fit in a net_buf of 128 bytes (for instance, though 64 bytes could be chosen).

```c
NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE(ipv4_access, struct net_ipv4_hdr);
struct net_ipv4_hdr *ipv4_hdr;
ipv4_hdr = (struct net_ipv4_hdr *)net_pkt_get_data(pkt, &ipv4_access);
```

It would be the same for struct net_ipv4_hdr. For a UDP header it is likely not to be in a contiguous area in IPv6 for instance so:

```c
NET_PKT_DATA_ACCESS_DEFINE(udp_access, struct net_udp_hdr);
struct net_udp_hdr *udp_hdr;
udp_hdr = (struct net_udp_hdr *)net_pkt_get_data(pkt, &udp_access);
```

At this point, the cursor of the net_pkt points at the beginning of the requested data. On the RX path, these headers will be read but not modified so to proceed further the cursor needs to advance past the data. There is a function dedicated for this:

```c
net_pkt_acknowledge_data(pkt, &ipv4_access);
```

On the TX path, however, the header fields have been modified. In such a case:

```c
net_pkt_set_data(pkt, &ipv4_access);
```

If the data are in a contiguous area, it will advance the cursor relevantly. If not, it will write the data and the cursor will be updated. Note that net_pkt_set_data() could be used in the RX path as well, but it is slightly faster to use net_pkt_acknowledge_data() as this one does not care about contiguity at all, it just advances the cursor via net_pkt_skip() directly.
Dumb HTTP server
Implement a simple, portable, HTTP server using BSD sockets.

Dumb HTTP server (multi-threaded)
Implement a simple HTTP server supporting simultaneous connections using BSD sockets.

---

**group** net_pkt
Network packet management library.

### Defines

**NET_PKT_SLAB_DEFINE**(name, count)
Create a net_pkt slab.

A net_pkt slab is used to store meta-information about network packets. It must be coupled with a data fragment pool (**NET_PKT_DATA_POOL_DEFINE**) used to store the actual packet data. The macro can be used by an application to define additional custom per-context TX packet slabs (see net_context_setup_pools()).

**Parameters**

- **name** – Name of the slab.
- **count** – Number of net_pkt in this slab.

**NET_PKT_TX_SLAB_DEFINE**(name, count)

**NET_PKT_DATA_POOL_DEFINE**(name, count)
Create a data fragment net_buf pool.

A net_buf pool is used to store actual data for network packets. It must be coupled with a net_pkt slab (**NET_PKT_SLAB_DEFINE**) used to store the packet meta-information. The macro can be used by an application to define additional custom per-context TX packet pools (see net_context_setup_pools()).

**Parameters**

- **name** – Name of the pool.
- **count** – Number of net_buf in this pool.

**net_pkt_print_frags**(pkt)
Print fragment list and the fragment sizes.
Only available if debugging is activated.

**Parameters**

- **pkt** – Network pkt.

**NET_PKT_DATA_ACCESS_DEFINE**(name, _type)

**NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE**(name, _type)

### Functions

6.3. Networking
struct **net_pkt_get_reserve_rx_data**(size_t min_len, k_timeout_t timeout)
Get RX DATA buffer from pool.

Normally you should use **net_pkt_get_frag()** instead.

Normally this version is not useful for applications but is mainly used by network fragmentation code.

**Parameters**

- min_len – Minimum length of the requested fragment.
- timeout – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

**Returns**
Network buffer if successful, NULL otherwise.

struct **net_pkt_get_reserve_tx_data**(size_t min_len, k_timeout_t timeout)
Get TX DATA buffer from pool.

Normally you should use **net_pkt_get_frag()** instead.

Normally this version is not useful for applications but is mainly used by network fragmentation code.

**Parameters**

- min_len – Minimum length of the requested fragment.
- timeout – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

**Returns**
Network buffer if successful, NULL otherwise.

struct **net_pkt_get_frag**(struct **net_pkt** *pkt, size_t min_len, k_timeout_t timeout)
Get a data fragment that might be from user specific buffer pool or from global DATA pool.

**Parameters**

- pkt – Network packet.
- min_len – Minimum length of the requested fragment.
- timeout – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

**Returns**
Network buffer if successful, NULL otherwise.

void **net_pkt_unref**(struct **net_pkt** *pkt)
Place packet back into the available packets slab.

Releases the packet to other use. This needs to be called by application after it has finished with the packet.

**Parameters**

- pkt – Network packet to release.

struct **net_pkt_ref**(struct **net_pkt** *pkt)
Increase the packet ref count.
Mark the packet to be used still.
Parameters

- \texttt{pkt} – Network packet to ref.

Returns

Network packet if successful, NULL otherwise.

\begin{verbatim}
struct \texttt{net_buf} *net_pkt_frag_ref(struct \texttt{net_buf} *frag)
\end{verbatim}

Increase the packet fragment ref count.

Mark the fragment to be used still.

Parameters

- \texttt{frag} – Network fragment to ref.

Returns

a pointer on the referenced Network fragment.

\begin{verbatim}
void net_pkt_frag_unref(struct \texttt{net_buf} *frag)
\end{verbatim}

Decrease the packet fragment ref count.

Parameters

- \texttt{frag} – Network fragment to unref.

\begin{verbatim}
struct \texttt{net_buf} *net_pkt_frag_del(struct \texttt{net_pkt} *pkt, struct \texttt{net_buf} *parent, struct \texttt{net_buf} *frag)
\end{verbatim}

Delete existing fragment from a packet.

Parameters

- \texttt{pkt} – Network packet from which frag belongs to.
- \texttt{parent} – parent fragment of frag, or NULL if none.
- \texttt{frag} – Fragment to delete.

Returns

Pointer to the following fragment, or NULL if it had no further fragments.

\begin{verbatim}
void net_pkt_frag_add(struct \texttt{net_pkt} *pkt, struct \texttt{net_buf} *frag)
\end{verbatim}

Add a fragment to a packet at the end of its fragment list.

Parameters

- \texttt{pkt} – pkt Network packet where to add the fragment
- \texttt{frag} – Fragment to add

\begin{verbatim}
void net_pkt_frag_insert(struct \texttt{net_pkt} *pkt, struct \texttt{net_buf} *frag)
\end{verbatim}

Insert a fragment to a packet at the beginning of its fragment list.

Parameters

- \texttt{pkt} – pkt Network packet where to insert the fragment
- \texttt{frag} – Fragment to insert

\begin{verbatim}
void net_pkt_compact(struct \texttt{net_pkt} *pkt)
\end{verbatim}

Compact the fragment list of a packet.

After this there is no more any free space in individual fragments.

Parameters

- \texttt{pkt} – Network packet.
void net_pkt_get_info(struct k_mem_slab **rx, struct k_mem_slab **tx, struct net_buf_pool **rx_data, struct net_buf_pool **tx_data)

Get information about predefined RX, TX and DATA pools.

Parameters
• rx – Pointer to RX pool is returned.
• tx – Pointer to TX pool is returned.
• rx_data – Pointer to RX DATA pool is returned.
• tx_data – Pointer to TX DATA pool is returned.

struct net_pkt *net_pkt_alloc(k_timeout_t timeout)

Allocate an initialized net_pkt.

for the time being, 2 pools are used. One for TX and one for RX. This allocator has to be used for TX.

Parameters
• timeout – Maximum time to wait for an allocation.

Returns
a pointer to a newly allocated net_pkt on success, NULL otherwise.

struct net_pkt *net_pkt_alloc_from_slab(struct k_mem_slab *slab, k_timeout_t timeout)

Allocate an initialized net_pkt from a specific slab.

unlike net_pkt_alloc() which uses core slabs, this one will use an external slab (see NET_PKT_SLAB_DEFINE()). Do not use it unless you know what you are doing. Basically, only net_context should be using this, in order to allocate packet and then buffer on its local slab/pool (if any).

Parameters
• slab – The slab to use for allocating the packet
• timeout – Maximum time to wait for an allocation.

Returns
a pointer to a newly allocated net_pkt on success, NULL otherwise.

struct net_pkt *net_pkt_rx_alloc(k_timeout_t timeout)

Allocate an initialized net_pkt for RX.

for the time being, 2 pools are used. One for TX and one for RX. This allocator has to be used for RX.

Parameters
• timeout – Maximum time to wait for an allocation.

Returns
a pointer to a newly allocated net_pkt on success, NULL otherwise.

struct net_pkt *net_pkt_alloc_on_iface(struct net_if *iface, k_timeout_t timeout)

Allocate a network packet for a specific network interface.

Parameters
• iface – The network interface the packet is supposed to go through.
• timeout – Maximum time to wait for an allocation.

Returns
a pointer to a newly allocated net_pkt on success, NULL otherwise.
struct net_pkt *net_pkt_rx_alloc_on_iface(struct net_if *iface, k_timeout_t timeout)

int net_pkt_alloc_buffer(struct net_pkt *pkt, size_t size, enum net_ip_protocol proto, k_timeout_t timeout)

Allocate buffer for a net_pkt. Such allocator will take into account space necessary for headers, MTU, and existing buffer (if any). Beware that, due to all these criteria, the allocated size might be smaller/bigger than requested one.

Parameters
- **pkt** – The network packet requiring buffer to be allocated.
- **size** – The size of buffer being requested.
- **proto** – The IP protocol type (can be 0 for none).
- **timeout** – Maximum time to wait for an allocation.

Returns
0 on success, negative errno code otherwise.

struct net_pkt *net_pkt_alloc_with_buffer(struct net_if *iface, size_t size, sa_family_t family, enum net_ip_protocol proto, k_timeout_t timeout)

Allocate a network packet and buffer at once.

Parameters
- **iface** – The network interface the packet is supposed to go through.
- **size** – The size of buffer.
- **family** – The family to which the packet belongs.
- **proto** – The IP protocol type (can be 0 for none).
- **timeout** – Maximum time to wait for an allocation.

Returns
A pointer to a newly allocated net_pkt on success, NULL otherwise.

struct net_pkt *net_pkt_rx_alloc_with_buffer(struct net_if *iface, size_t size, sa_family_t family, enum net_ip_protocol proto, k_timeout_t timeout)

void net_pkt_append_buffer(struct net_pkt *pkt, struct net_buf *buffer)

Append a buffer in packet.

Parameters
- **pkt** – Network packet where to append the buffer
- **buffer** – Buffer to append

size_t net_pkt_available_buffer(struct net_pkt *pkt)

Get available buffer space from a pkt.

Note: Reserved bytes (headroom) in any of the fragments are not considered to be available.

6.3. Networking
Returns
the amount of buffer available

size_t net_pkt_available_payload_buffer(struct net_pkt *pkt, enum net_ip_protocol proto)
Get available buffer space for payload from a pkt.

Unlike net_pkt_available_buffer(), this will take into account the headers space.

Note: Reserved bytes (headroom) in any of the fragments are not considered to be available.

Parameters
• pkt – The net_pkt which payload buffer availability should be evaluated
• proto – The IP protocol type (can be 0 for none).

Returns
the amount of buffer available for payload

void net_pkt_trim_buffer(struct net_pkt *pkt)
Trim net_pkt buffer.
This will basically check for unused buffers and deallocate them relevantly

Parameters
• pkt – The net_pkt which buffer will be trimmed

int net_pkt_remove_tail(struct net_pkt *pkt, size_t length)
Remove length bytes from tail of packet.
This function does not take packet cursor into account. It is a helper to remove un-
needed bytes from tail of packet (like appended CRC). It takes care of buffer dealloca-
tion if removed bytes span whole buffer(s).

Parameters
• pkt – Network packet
• length – Number of bytes to be removed

Return values
• 0 – On success.
• -EINVAL – If packet length is shorter than length.

void net_pkt_cursor_init(struct net_pkt *pkt)
Initialize net_pkt cursor.
This will initialize the net_pkt cursor from its buffer.

Parameters
• pkt – The net_pkt whose cursor is going to be initialized

static inline void net_pkt_cursor_backup(struct net_pkt *pkt, struct net_pkt_cursor *backup)
Backup net_pkt cursor.

Parameters
• pkt – The net_pkt whose cursor is going to be backed up
• **backup** – The cursor where to backup *net_pkt* cursor

static inline void *net_pkt_cursor_restore(struct *pkt, struct *backup)

Restore *net_pkt* cursor from a backup.

**Parameters**

- **pkt** – The *net_pkt* whose cursor is going to be restored
- **backup** – The cursor from where to restore *net_pkt* cursor

static inline void *net_pkt_cursor_get_pos(struct *pkt)

Returns current position of the cursor.

**Parameters**

- **pkt** – The *net_pkt* whose cursor position is going to be returned

int net_pkt_skip(struct *pkt, size_t length)

Skip some data from a *net_pkt*.

*net_pkt*'s cursor should be properly initialized Cursor position will be updated after the operation. Depending on the value of pkt->overwrite bit, this function will affect the buffer length or not. If it's true, it will advance the cursor to the requested length. If it's false, it will do the same but if the cursor was already also at the end of existing data, it will increment the buffer length. So in this case, its behavior is just like net_pkt_write or net_pkt_memset, difference being that it will not affect the buffer content itself (which may be just garbage then).

**Parameters**

- **pkt** – The *net_pkt* whose cursor will be updated to skip given amount of data from the buffer.
- **length** – Amount of data to skip in the buffer

Returns

0 in success, negative errno code otherwise.

int net_pkt_memset(struct *pkt, int byte, size_t length)

Memset some data in a *net_pkt*.

*net_pkt*'s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

**Parameters**

- **pkt** – The *net_pkt* whose buffer to fill starting at the current cursor position.
- **byte** – The byte to write in memory
- **length** – Amount of data to memset with given byte

Returns

0 in success, negative errno code otherwise.

int net_pkt_copy(struct *pkt_dst, struct *pkt_src, size_t length)

Copy data from a packet into another one.

Both *net_pkt* cursors should be properly initialized and, if needed, positioned using net_pkt_skip. The cursors will be updated after the operation.

**Parameters**
• `pkt_dst` – Destination network packet.
• `pkt_src` – Source network packet.
• `length` – Length of data to be copied.

Returns
0 on success, negative errno code otherwise.

```c
struct net_pkt_t *net_pkt_clone(struct net_pkt_t *pkt, k_timeout_t timeout)
```
Clone pkt and its buffer.
The cloned packet will be allocated on the same pool as the original one.

Parameters
- `pkt` – Original pkt to be cloned
- `timeout` – Timeout to wait for free buffer

Returns
NULL if error, cloned packet otherwise.

```c
struct net_pkt_t *net_pkt_rx_clone(struct net_pkt_t *pkt, k_timeout_t timeout)
```
Clone pkt and its buffer.
The cloned packet will be allocated on the RX packet poll.

Parameters
- `pkt` – Original pkt to be cloned
- `timeout` – Timeout to wait for free buffer

Returns
NULL if error, cloned packet otherwise.

```c
struct net_pkt_t *net_pkt_shallow_clone(struct net_pkt_t *pkt, k_timeout_t timeout)
```
Clone pkt and increase the refcount of its buffer.

Parameters
- `pkt` – Original pkt to be shallow cloned
- `timeout` – Timeout to wait for free packet

Returns
NULL if error, cloned packet otherwise.

```c
int net_pkt_read(struct net_pkt_t *pkt, void *data, size_t length)
```
Read some data from a `net_pkt_t`.

`net_pkt_t`’s cursor should be properly initialized and, if needed, positioned using `net_pkt_skip`. Cursor position will be updated after the operation.

Parameters
- `pkt` – The network packet from where to read some data
- `data` – The destination buffer where to copy the data
- `length` – The amount of data to copy

Returns
0 on success, negative errno code otherwise.

```c
static inline int net_pkt_read_u8(struct net_pkt_t *pkt, uint8_t *data)
```
int net_pkt_read_be16(struct net_pkt *pkt, uint16_t *data)
Read uint16_t big endian data from a net_pkt.

net_pkt's cursor should be properly initialized and, if needed, positioned using
net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to read
• data – The destination uint16_t where to copy the data

Returns
0 on success, negative errno code otherwise.

int net_pkt_read_le16(struct net_pkt *pkt, uint16_t *data)
Read uint16_t little endian data from a net_pkt.

net_pkt's cursor should be properly initialized and, if needed, positioned using
net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to read
• data – The destination uint16_t where to copy the data

Returns
0 on success, negative errno code otherwise.

int net_pkt_read_be32(struct net_pkt *pkt, uint32_t *data)
Read uint32_t big endian data from a net_pkt.

net_pkt's cursor should be properly initialized and, if needed, positioned using
net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to read
• data – The destination uint32_t where to copy the data

Returns
0 on success, negative errno code otherwise.

int net_pkt_write(struct net_pkt *pkt, const void *data, size_t length)
Write data into a net_pkt.

net_pkt's cursor should be properly initialized and, if needed, positioned using
net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet where to write
• data – Data to be written
• length – Length of the data to be written

Returns
0 on success, negative errno code otherwise.

static inline int net_pkt_write_u8(struct net_pkt *pkt, uint8_t data)
static inline int net_pkt_write_be16(struct net_pkt *pkt, uint16_t data)
static inline int net_pkt_write_be32(struct net_pkt *pkt, uint32_t data)
static inline int net_pkt_write_le32(struct net_pkt *pkt, uint32_t data)
static inline int net_pkt_write_le16(struct net_pkt *pkt, uint16_t data)

size_t net_pkt_remaining_data(struct net_pkt *pkt)
Get the amount of data which can be read from current cursor position.

Parameters
• pkt – Network packet

Returns
Amount of data which can be read from current pkt cursor

int net_pkt_update_length(struct net_pkt *pkt, size_t length)
Update the overall length of a packet.
Unlike net_pkt_pull() below, this does not take packet cursor into account. It’s mainly
a helper dedicated for ipv4 and ipv6 input functions. It shrinks the overall length by
given parameter.

Parameters
• pkt – Network packet
• length – The new length of the packet

Returns
0 on success, negative errno code otherwise.

int net_pkt_pull(struct net_pkt *pkt, size_t length)
Remove data from the packet at current location.
net_pkt’s cursor should be properly initialized and, eventually, properly positioned us-
using net_pkt_skip/read/write. Note that net_pkt’s cursor is reset by this function.

Parameters
• pkt – Network packet
• length – Number of bytes to be removed

Returns
0 on success, negative errno code otherwise.

uint16_t net_pkt_get_current_offset(struct net_pkt *pkt)
Get the actual offset in the packet from its cursor.

Parameters
• pkt – Network packet.

Returns
a valid offset on success, 0 otherwise as there is nothing that can be done
to evaluate the offset.

bool net_pkt_is_contiguous(struct net_pkt *pkt, size_t size)
Check if a data size could fit contiguously.
net_pkt’s cursor should be properly initialized and, if needed, positioned using
net_pkt_skip.

Parameters
• pkt – Network packet.
• size – The size to check for contiguity

Returns
ture if that is the case, false otherwise.
size_t net_pkt_get_contiguous_len(struct net_pkt *pkt)
    Get the contiguous buffer space.

Parameters
    • pkt – Network packet

Returns
    The available contiguous buffer space in bytes starting from the current
cursor position. 0 in case of an error.

void *net_pkt_get_data(struct net_pkt *pkt, struct net_pkt_data_access *access)
    Get data from a network packet in a contiguous way.

    net_pkt’s cursor should be properly initialized and, if needed, positioned using
    net_pkt_skip. Unlike other functions, cursor position will not be updated after the op-
    eration.

Parameters
    • pkt – The network packet from where to get the data.
    • access – A pointer to a valid net_pkt_data_access describing the data to
      get in a contiguous way.

Returns
    a pointer to the requested contiguous data, NULL otherwise.

int net_pkt_set_data(struct net_pkt *pkt, struct net_pkt_data_access *access)
    Set contiguous data into a network packet.

    net_pkt’s cursor should be properly initialized and, if needed, positioned using
    net_pkt_skip. Cursor position will be updated after the operation.

Parameters
    • pkt – The network packet to where the data should be set.
    • access – A pointer to a valid net_pkt_data_access describing the data to
      set.

Returns
    0 on success, a negative errno otherwise.

static inline int net_pkt_acknowledge_data(struct net_pkt *pkt, struct net_pkt_data_access *access)
    Acknowledge previously contiguous data taken from a network packet Packet needs
to be set to overwrite mode.

struct net_pkt_cursor
    #include <net_pkt.h>

Public Members

struct net_buf *buf
    Current net_buf pointer by the cursor.

uint8_t *pos
    Current position in the data buffer of the net_buf.
struct net_pkt
#include <net_pkt.h> Network packet.
Note that if you add new fields into net_pkt, remember to update net_pkt_clone() function.

Public Members

intptr_t fifo
The fifo is used by RX/TX threads and by socket layer.
The net_pkt is queued via fifo to the processing thread.

struct k_mem_slab *slab
Slab pointer from where it belongs to.

union net_pkt,[anonymous] [anonymous]
buffer holding the packet

struct net_pkt_cursor cursor
Internal buffer iterator used for reading/writing.

struct net_context *context
Network connection context.

struct net_if *iface
Network interface.

Virtual LAN (VLAN) Support

• Overview
• API Reference
Overview  Virtual LAN (VLAN) is a partitioned and isolated computer network at the data link layer (OSI layer 2). For ethernet network this refers to IEEE 802.1Q

In Zephyr, each individual VLAN is modeled as a virtual network interface. This means that there is an ethernet network interface that corresponds to a real physical ethernet port in the system. A virtual network interface is created for each VLAN, and this virtual network interface connects to the real network interface. This is similar to how Linux implements VLANs. The eth0 is the real network interface and vlan0 is a virtual network interface that is run on top of eth0.

VLAN support must be enabled at compile time by setting option CONFIG_NET_VLAN and CONFIG_NET_VLAN_COUNT to reflect how many network interfaces there will be in the system. For example, if there is one network interface without VLAN support, and two with VLAN support, the CONFIG_NET_VLAN_COUNT option should be set to 3.

Even if VLAN is enabled in a prj.conf file, the VLAN needs to be activated at runtime by the application. The VLAN API provides a net_eth_vlan_enable() function to do that. The application needs to give the network interface and desired VLAN tag as a parameter to that function. The VLAN tagging for a given network interface can be disabled by a net_eth_vlan_disable() function. The application needs to configure the VLAN network interface itself, such as setting the IP address, etc.

See also the VLAN sample application for API usage example. The source code for that sample application can be found at samples/net/vlan.

The net-shell module contains net_vlan add and net_vlan del commands that can be used to enable or disable VLAN tags for a given network interface.

See the IEEE 802.1Q spec for more information about ethernet VLANs.

Virtual LAN  ________________________________________________

Setup two virtual LAN networks and use net-shell to view the networks' settings.

group vlan_api

VLAN definitions and helpers.

Defines

NET_VLAN_TAG_UNSPEC

Unspecified VLAN tag value.

Functions

static inline uint16_t net_eth_vlan_get_vid(uint16_t tci)

Get VLAN identifier from TCI.

Parameters

• tci – VLAN tag control information.

Returns

VLAN identifier.
static inline uint8_t net_eth_vlan_get_dei(uint16_t tci)
    Get Drop Eligible Indicator from TCI.

Parameters
    • tci – VLAN tag control information.

Returns
    Drop eligible indicator.

static inline uint16_t net_eth_vlan_get_pcp(uint16_t tci)
    Get Priority Code Point from TCI.

Parameters
    • tci – VLAN tag control information.

Returns
    Priority code point.

static inline uint16_t net_eth_vlan_set_vid(uint16_t tci, uint16_t vid)
    Set VLAN identifier to TCI.

Parameters
    • tci – VLAN tag control information.
    • vid – VLAN identifier.

Returns
    New TCI value.

static inline uint16_t net_eth_vlan_set_dei(uint16_t tci, bool dei)
    Set Drop Eligible Indicator to TCI.

Parameters
    • tci – VLAN tag control information.
    • dei – Drop eligible indicator.

Returns
    New TCI value.

static inline uint16_t net_eth_vlan_set_pcp(uint16_t tci, uint8_t pcp)
    Set Priority Code Point to TCI.

Parameters
    • tci – VLAN tag control information.
    • pcp – Priority code point.

Returns
    New TCI value.

Link Layer Discovery Protocol

- Overview
- API Reference
Overview  The Link Layer Discovery Protocol (LLDP) is a vendor-neutral link layer protocol used by network devices for advertising their identity, capabilities, and neighbors on a wired Ethernet network.
For more information, see this LLDP Wikipedia article.

API Reference

Related code samples

Link Layer Discovery Protocol (LLDP)
Enable LLDP support and setup VLANs.

 group lldp
LLDP definitions and helpers.

 Defines

 net_lldp_set_lldpdu(iface)
Set LLDP protocol data unit (LLDPDU) for the network interface.

 Parameters
  •  iface – Network interface

 Returns
<0 if error, index in lldp array if iface is found there

 net_lldp_unset_lldpdu(iface)
Unset LLDP protocol data unit (LLDPDU) for the network interface.

 Parameters
  •  iface – Network interface

 Typedefs

typedef enum net_verdict (*net_lldp_recv_cb_t)(struct net_if *iface, struct net_pkt *pkt)
LLDP Receive packet callback.
Callback gets called upon receiving packet. It is responsible for freeing packet or indicating to the stack that it needs to free packet by returning correct net_verdict.

 Returns:
  •  NET_DROP, if packet was invalid, rejected or we want the stack to free it. In this case the core stack will free the packet.
  •  NET_OK, if the packet was accepted, in this case the ownership of the net_pkt goes to callback and core network stack will forget it.

 Enums

6.3. Networking  2347
enum net_lldp_tlv_type
    TLV Types.
    Please refer to table 8-1 from IEEE 802.1AB standard.
    Values:

enumerator LLDP_TLV_END_LLDPDU = 0
    End Of LLDPDU (optional)

enumerator LLDP_TLV_CHASSIS_ID = 1
    Chassis ID (mandatory)

enumerator LLDP_TLV_PORT_ID = 2
    Port ID (mandatory)

enumerator LLDP_TLV_TTL = 3
    Time To Live (mandatory)

enumerator LLDP_TLV_PORT_DESC = 4
    Port Description (optional)

enumerator LLDP_TLV_SYSTEM_NAME = 5
    System Name (optional)

enumerator LLDP_TLV_SYSTEM_DESC = 6
    System Description (optional)

enumerator LLDP_TLV_SYSTEM_CAPABILITIES = 7
    System Capability (optional)

enumerator LLDP_TLV_MANAGEMENT_ADDR = 8
    Management Address (optional)

enumerator LLDP_TLV_ORG_SPECIFIC = 127
    Org specific TLVs (optional)

Functions

int net_lldp_config(struct net_if *iface, const struct net_lldpdu *lldpdu)
    Set the LLDP data unit for a network interface.

Parameters
    • iface – Network interface
    • lldpdu – LLDP data unit struct

Returns
    0 if ok, <0 if error
int net_lldp_config_optional(struct net_if *iface, const uint8_t *tlv, size_t len)
Set the Optional LLDP TLVs for a network interface.

Parameters
• iface – Network interface
• tlv – LLDP optional TLVs following mandatory part
• len – Length of the optional TLVs

Returns
0 if ok, <0 if error

void net_lldp_init(void)
Initialize LLDP engine.

int net_lldp_register_callback(struct net_if *iface, net_lldp_recv_cb_t cb)
Register LLDP Rx callback function.

Parameters
• iface – Network interface
• cb – Callback function

Returns
0 if ok, < 0 if error

enum net_verdict net_lldp_recv(struct net_if *iface, struct net_pkt *pkt)
Parse LLDP packet.

Parameters
• iface – Network interface
• pkt – Network packet

Returns
Return the policy for network buffer

struct net_lldp_chassis_tlv
#include <lldp.h> Chassis ID TLV, see chapter 8.5.2 in IEEE 802.1AB.

Public Members

uint16_t type_length
7 bits for type, 9 bits for length

uint8_t subtype
ID subtype.

uint8_t value[NET_LLDP_CHASSIS_ID_VALUE_LEN]
Chassis ID value.

struct net_lldp_port_tlv
#include <lldp.h> Port ID TLV, see chapter 8.5.3 in IEEE 802.1AB.
Public Members

uint16_t type_length
    7 bits for type, 9 bits for length

uint8_t subtype
    ID subtype.

uint8_t value[NET_LLDP_PORT_ID_VALUE_LEN]
    Port ID value.

struct net_lldp_time_to_live_tlv
    #include <lldp.h> Time To Live TLV, see chapter 8.5.4 in IEEE 802.1AB.

Public Members

uint16_t type_length
    7 bits for type, 9 bits for length

uint16_t ttl
    Time To Live (TTL) value.

struct net_lldpdu
    #include <lldp.h> LLDP Data Unit (LLDPDU) shall contain the following ordered TLVs as stated in “8.2 LLDPDU format” from the IEEE 802.1AB.

Public Members

struct net_lldp_chassis_tlv chassis_id
    Mandatory Chassis TLV.

struct net_lldp_port_tlv port_id
    Mandatory Port TLV.

struct net_lldp_time_to_live_tlv ttl
    Mandatory TTL TLV.

IEEE 802.1Qav

Overview Credit-based shaping is an alternative scheduling algorithm used in network schedulers to achieve fairness when sharing a limited network resource. Zephyr has support for configuring a credit-based shaper described in the IEEE 802.1Qav-2009 standard. Zephyr does not implement the actual shaper; it only provides a way to configure the shaper implemented by the Ethernet device driver.
Enabling 802.1Qav To enable 802.1Qav shaper, the Ethernet device driver must declare that it supports credit-based shaping. The Ethernet driver’s capability function must return ETHERNET_QAV value for this purpose. Typically also priority queues ETHERNET_PRIORITY_QUEUES need to be supported.

```c
static enum ethernet_hw_caps eth_get_capabilities(const struct device *dev)
{
    ARG_UNUSED(dev);
    return ETHERNET_QAV | ETHERNET_PRIORITY_QUEUES |
           ETHERNET_HW_VLAN | ETHERNET_LINK_10BASE_T |
           ETHERNET_LINK_100BASE_T;
}
```

See sam-e70-xplained board Ethernet driver drivers/ethernet/eth_sam_gmac.c for an example.

Configuring 802.1Qav The application can configure the credit-based shaper like this:

```c
#include <zephyr/net/net_if.h>
#include <zephyr/net/ethernet.h>
#include <zephyr/net/ethernet_mgmt.h>

static void qav_set_status(struct net_if *iface,
                            int queue_id, bool enable)
{
    struct ethernet_req_params params;
    int ret;

    memset(&params, 0, sizeof(params));

    params.qav_param.queue_id = queue_id;
    params.qav_param.enabled = enable;
    params.qav_param.type = ETHERNET_QAV_PARAM_TYPE_STATUS;

    /* Disable or enable Qav for a queue */
    ret = net_mgmt(NET_REQUEST_ETHERNET_SET_QAV_PARAM,
                   iface, &params,
                   sizeof(struct ethernet_req_params));
    if (ret) {
        LOG_ERR("Cannot %s Qav for queue %d for interface %p",
                enable ? "enable" : "disable",
                queue_id, iface);
    }
}

static void qav_set_bandwidth_and_slope(struct net_if *iface,
                                        int queue_id,
                                        unsigned int bandwidth,
                                        unsigned int idle_slope)
{
    struct ethernet_req_params params;
    int ret;

    memset(&params, 0, sizeof(params));

    params.qav_param.queue_id = queue_id;
    params.qav_param.delta_bandwidth = bandwidth;
    params.qav_param.type = ETHERNET_QAV_PARAM_TYPE_DELTA_BANDWIDTH;

    ret = net_mgmt(NET_REQUEST_ETHERNET_SET_QAV_PARAM,
                   iface, &params,
                   sizeof(struct ethernet_req_params));

    if (ret) {
        LOG_ERR("Cannot configure Qav for queue %d for interface %p",
                queue_id, iface);
    }
}
```

(continues on next page)
 Overview  Ethernet is a networking technology commonly used in local area networks (LAN). For more information, see this [Ethernet Wikipedia article](https://en.wikipedia.org/wiki/Ethernet). Zephyr supports following Ethernet features:

- 10, 100 and 1000 Mbit/sec links
- Auto negotiation
- Half/full duplex
- Promiscuous mode
- TX and RX checksum offloading
- MAC address filtering
- **Virtual LANs**
- **Priority queues**
- **IEEE 802.1AS (gPTP)**
- **IEEE 802.1Qav (credit based shaping)**
- **LLDP (Link Layer Discovery Protocol)**

Not all Ethernet device drivers support all of these features. You can see what is supported by the `net iface net-shell` command. It will print currently supported Ethernet features.

### API Reference

**Related code samples**

**Inter-VM Shared Memory (ivshmem) Ethernet**

Communicate with another “cell” in the Jailhouse hypervisor using IVSHMEM Ethernet.

**Packet socket**

Use raw packet sockets over Ethernet.

**UDP sender using SO_TXTIME**

Control the transmission time of a packet using SO_TXTIME socket option.
group ethernet

Ethernet support functions.

Defines

ETH_NET_DEVICE_INIT(dev_id, name, init_fn, pm, data, config, prio, api, mtu)

Create an Ethernet network interface and bind it to network device.

Parameters

- **dev_id** – Network device id.
- **name** – The name this instance of the driver exposes to the system.
- **init_fn** – Address to the init function of the driver.
- **pm** – Reference to struct pm_device associated with the device. (optional).
- **data** – Pointer to the device's private data.
- **config** – The address to the structure containing the configuration information for this instance of the driver.
- **prio** – The initialization level at which configuration occurs.
- **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- **mtu** – Maximum transfer unit in bytes for this network interface.

ETH_NET_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, prio, api, mtu)

Like ETH_NET_DEVICE_INIT but taking metadata from a devicetree.

Create an Ethernet network interface and bind it to network device.

Parameters

- **node_id** – The devicetree node identifier.
- **init_fn** – Address to the init function of the driver.
- **pm** – Reference to struct pm_device associated with the device. (optional).
- **data** – Pointer to the device's private data.
- **config** – The address to the structure containing the configuration information for this instance of the driver.
- **prio** – The initialization level at which configuration occurs.
- **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- **mtu** – Maximum transfer unit in bytes for this network interface.

ETH_NET_DEVICE_DT_INST_DEFINE(inst, ...)

Like ETH_NET_DEVICE_DT_DEFINE for an instance of a DT_DRV_COMPAT compatible.

Parameters

- **inst** – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to ETH_NET_DEVICE_DT_DEFINE.
- **...** – other parameters as expected by ETH_NET_DEVICE_DT_DEFINE.
 Enums

enum ethernet_hw_caps
    Ethernet hardware capabilities.
    Values:

    enumerator ETHERNET_HW_TX_CHKSUM_OFFLOAD = BIT(0)
        TX Checksum offloading supported for all of IPv4, UDP, TCP.

    enumerator ETHERNET_HW_RX_CHKSUM_OFFLOAD = BIT(1)
        RX Checksum offloading supported for all of IPv4, UDP, TCP.

    enumerator ETHERNET_HW_VLAN = BIT(2)
        VLAN supported.

    enumerator ETHERNET_AUTO_NEGOTIATION_SET = BIT(3)
        Enabling/disabling auto negotiation supported.

    enumerator ETHERNET_LINK_10BASE_T = BIT(4)
        10 Mbits link supported

    enumerator ETHERNET_LINK_100BASE_T = BIT(5)
        100 Mbits link supported

    enumerator ETHERNET_LINK_1000BASE_T = BIT(6)
        1 Gbits link supported

    enumerator ETHERNET_DUPLEX_SET = BIT(7)
        Changing duplex (half/full) supported.

    enumerator ETHERNET_PTP = BIT(8)
        IEEE 802.1AS (gPTP) clock supported.

    enumerator ETHERNET_QAV = BIT(9)
        IEEE 802.1Qav (credit-based shaping) supported.

    enumerator ETHERNET_PROMISC_MODE = BIT(10)
        Promiscuous mode supported.

    enumerator ETHERNET_PRIORITY_QUEUES = BIT(11)
        Priority queues available.

    enumerator ETHERNET_HW_FILTERING = BIT(12)
        MAC address filtering supported.

    enumerator ETHERNET_LLDP = BIT(13)
        Link Layer Discovery Protocol supported.
enumerator ETHERNET_HW_VLAN_TAG_STRIP = BIT(14)
VLAN Tag stripping.

enumerator ETHERNET_DSA_SLAVE_PORT = BIT(15)
DSA switch.

enumerator ETHERNET_DSA_MASTER_PORT = BIT(16)

enumerator ETHERNET_QBV = BIT(17)
IEEE 802.1Qbv (scheduled traffic) supported.

enumerator ETHERNET_QBU = BIT(18)
IEEE 802.1Qbu (frame preemption) supported.

enumerator ETHERNET_TXTIME = BIT(19)
TXTIME supported.

enum ethernet_if_types
Types of Ethernet L2.
Values:

enumerator L2_ETH_IF_TYPE_ETHERNET
IEEE 802.3 Ethernet (default)

enumerator L2_ETH_IF_TYPE_WIFI
IEEE 802.11 Wi-Fi.

enum ethernet_flags
Values:

enumerator ETH_CARRIER_UP

Functions

void ethernet_init(struct net_if *iface)
Initialize Ethernet L2 stack for a given interface.

Parameters

• iface – A valid pointer to a network interface

void net_eth_ipv4_mcast_to_mac_addr(const struct in_addr *ipv4_addr, struct net_eth_addr *mac_addr)
Convert IPv4 multicast address to Ethernet address.

Parameters

• ipv4_addr – IPv4 multicast address
• mac_addr – Output buffer for Ethernet address
void net_eth_ipv6_mcast_to_mac_addr(const struct in6_addr *ipv6_addr, struct net_eth_addr *mac_addr)

Convert IPv6 multicast address to Ethernet address.

Parameters

• ipv6_addr – IPv6 multicast address
• mac_addr – Output buffer for Ethernet address

static inline enum ethernet_hw_caps net_eth_get_hw_capabilities(struct net_if *iface)

Return ethernet device hardware capability information.

Parameters

• iface – Network interface

Returns

Hardware capabilities

static inline int net_eth_vlan_enable(struct net_if *iface, uint16_t tag)

Add VLAN tag to the interface.

Parameters

• iface – Interface to use.
• tag – VLAN tag to add

Returns

0 if ok, <0 if error

static inline int net_eth_vlan_disable(struct net_if *iface, uint16_t tag)

Remove VLAN tag from the interface.

Parameters

• iface – Interface to use.
• tag – VLAN tag to remove

Returns

0 if ok, <0 if error

static inline uint16_t net_eth_get_vlan_tag(struct net_if *iface)

Return VLAN tag specified to network interface.

Parameters

• iface – Network interface.

Returns

VLAN tag for this interface or NET_VLAN_TAG_UNSPEC if VLAN is not configured for that interface.

static inline struct net_if *net_eth_get_vlan_iface(struct net_if *iface, uint16_t tag)

Return network interface related to this VLAN tag.

Parameters

• iface – Master network interface. This is used to get the pointer to ethernet L2 context
• tag – VLAN tag

Returns

Network interface related to this tag or NULL if no such interface exists.
static inline bool net_eth_is_vlan_enabled(struct ethernet_context *ctx, struct net_if *iface)

Check if VLAN is enabled for a specific network interface.

Parameters
• ctx – Ethernet context
• iface – Network interface

Returns
True if VLAN is enabled for this network interface, false if not.

static inline bool net_eth_get_vlan_status(struct net_if *iface)

Get VLAN status for a given network interface (enabled or not).

Parameters
• iface – Network interface

Returns
True if VLAN is enabled for this network interface, false if not.

void net_eth_carrier_on(struct net_if *iface)

Inform ethernet L2 driver that ethernet carrier is detected.
This happens when cable is connected.

Parameters
• iface – Network interface

void net_eth_carrier_off(struct net_if *iface)

Inform ethernet L2 driver that ethernet carrier was lost.
This happens when cable is disconnected.

Parameters
• iface – Network interface

int net_eth_promisc_mode(struct net_if *iface, bool enable)

Set promiscuous mode either ON or OFF.

Parameters
• iface – Network interface
• enable – on (true) or off (false)

Returns
0 if mode set or unset was successful, <0 otherwise.

static inline const struct device *net_eth_get_ptp_clock(struct net_if *iface)

Return PTP clock that is tied to this ethernet network interface.

Parameters
• iface – Network interface

Returns
Pointer to PTP clock if found, NULL if not found or if this ethernet interface does not support PTP.

const struct device *net_eth_get_ptp_clock_by_index(int index)

Return PTP clock that is tied to this ethernet network interface index.

Parameters
• index – Network interface index
Returns
Pointer to PTP clock if found, NULL if not found or if this ethernet interface index does not support PTP.

static inline int net_eth_get_ptp_port(struct net_if *iface)
Return PTP port number attached to this interface.

Parameters
• iface – Network interface

Returns
Port number, no such port if < 0

static inline void net_eth_set_ptp_port(struct net_if *iface, int port)
Set PTP port number attached to this interface.

Parameters
• iface – Network interface
• port – Port number to set

static inline bool net_eth_type_is_wifi(struct net_if *iface)
Check if the Ethernet L2 network interface can perform Wi-Fi.

Parameters
• iface – Pointer to network interface

Returns
True if interface supports Wi-Fi, False otherwise.

struct ethernet_qav_param
#include <ethernet.h>

Public Members

int queue_id
ID of the priority queue to use.

denum ethernet_qav_param_type type
Type of Qav parameter.

bool enabled
True if Qav is enabled for queue.

unsigned int delta_bandwidth
Delta Bandwidth (percentage of bandwidth)

unsigned int idle_slope
Idle Slope (bits per second)

unsigned int oper_idle_slope
Oper Idle Slope (bits per second)
unsigned int traffic_class
    Traffic class the queue is bound to.

struct ethernet_qbv_param
    \#include <ethernet.h>

    Public Members

    int port_id
        Port id.

    enum ethernet_qbv_param_type type
        Type of Qbv parameter.

    enum ethernet_qbv_state_type state
        What state (Admin/Oper) parameters are these.

    bool enabled
        True if Qbv is enabled or not.

    bool gate_status[NET_TC_TX_COUNT]
        True = open, False = closed.

    enum ethernet_gate_state_operation operation
        GateState operation.

    uint32_t time_interval
        Time interval ticks (nanoseconds)

    uint16_t row
        Gate control list row.

    uint32_t gate_control_list_len
        Number of entries in gate control list.

    struct net_ptp_extended_time base_time
        Base time.

    struct net_ptp_time cycle_time
        Cycle time.

    uint32_t extension_time
        Extension time (nanoseconds)

    struct ethernet_qbu_param
        \#include <ethernet.h>
Public Members

int port_id
Port id.

denum ethernet_qbu_param_type type
Type of Qbu parameter.

uint32_t hold_advance
Hold advance (nanoseconds)

uint32_t release_advance
Release advance (nanoseconds)

denum ethernet_qbu_preempt_status frame_preempt_statuses[NET_TC_TX_COUNT]
sequence of framePreemptionAdminStatus values.

bool enabled
True if Qbu is enabled or not.

bool link_partner_status
Link partner status (from Qbr)

uint8_t additional_fragment_size
Additional fragment size (from Qbr).
The minimum non-final fragment size is (additional_fragment_size + 1) * 64 octets

struct ethernet_filter
#include <ethernet.h>

Public Members

denum ethernet_filter_type type
Type of filter.

struct net_eth_addr mac_address
MAC address to filter.

bool set
Set (true) or unset (false) the filter.

struct ethernet_txtime_param
#include <ethernet.h>

Public Members
enum ethernet_txtime_param_type type
    Type of TXTIME parameter.

int queue_id
    Queue number for configuring TXTIME.

bool enable_txtime
    Enable or disable TXTIME per queue.

struct ethernet_api
    #include <ethernet.h>

    **Public Members**

struct net_if_api iface_api
    The net_if_api must be placed in first position in this struct so that we are compatible with network interface API.

int (*start)(const struct device *dev)
    Start the device.

int (*stop)(const struct device *dev)
    Stop the device.

enum ethernet_hw_caps (*get_capabilities)(const struct device *dev)
    Get the device capabilities.

int (*set_config)(const struct device *dev, enum ethernet_config_type type, const struct ethernet_config *config)
    Set specific hardware configuration.

int (*get_config)(const struct device *dev, enum ethernet_config_type type, struct ethernet_config *config)
    Get hardware specific configuration.

int (*send)(const struct device *dev, struct net_pkt *pkt)
    Send a network packet.

struct ethernet_context
    #include <ethernet.h> Ethernet L2 context that is needed for VLAN.

    **Public Members**

atomic_t flags
    Flags representing ethernet state, which are accessed from multiple threads.
struct k_work carrier_work
    Carrier ON/OFF handler worker.
    This is used to create network interface UP/DOWN event when ethernet L2 driver
    notices carrier ON/OFF situation. We must not create another network manage-
    ment event from inside management handler thus we use worker thread to trigger
    the UP/DOWN event.

struct net_if *iface
    Network interface.

enum net_l2_flags ethernet_l2_flags
    This tells what L2 features does ethernet support.

bool is_net_carrier_up
    Is network carrier up.

bool is_init
    Is this context already initialized.

enum ethernet_if_types eth_if_type
    Types of Ethernet network interfaces.

group ethernet_mii
    Ethernet MII (media independent interface) functions.

Defines

MII_BMCR
    Basic Mode Control Register.

MII_BMSR
    Basic Mode Status Register.

MII_PHYID1R
    PHY ID 1 Register.

MII_PHYID2R
    PHY ID 2 Register.

MII_ANAR
    Auto-Negotiation Advertisement Register.

MII_ANLPAR
    Auto-Negotiation Link Partner Ability Reg.

MII_ANER
    Auto-Negotiation Expansion Register.
MII_ANNPTR
Auto-Negotiation Next Page Transmit Register.

MII_ANLPRNPR
Auto-Negotiation Link Partner Received Next Page Reg.

MII_1KTCR
1000BASE-T Control Register

MII_1KSTSR
1000BASE-T Status Register

MII_MMD_ACR
MMD Access Control Register.

MII_MMD_AADR
MMD Access Address Data Register.

MII_ESTAT
Extended Status Register.

MII_BMCR_RESET
PHY reset.

MII_BMCR_LOOPBACK
enable loopback mode

MII_BMCR_SPEED_LSB
10=1000Mbps 01=100Mbps; 00=10Mbps

MII_BMCR_AUTONEG_ENABLE
Auto-Negotiation enable.

MII_BMCR_POWER_DOWN
power down mode

MII_BMCR_ISOLATE
isolate electrically PHY from MII

MII_BMCR_AUTONEG_RESTART
restart auto-negotiation

MII_BMCR_DUPLEx_MODE
full duplex mode

MII_BMCR_SPEED_MSB
10=1000Mbps 01=100Mbps; 00=10Mbps

6.3. Networking
**MII_BMCR_SPEED_MASK**
Link Speed Field.

**MII_BMCR_SPEED_10**
select speed 10 Mb/s

**MII_BMCR_SPEED_100**
select speed 100 Mb/s

**MII_BMCR_SPEED_1000**
select speed 1000 Mb/s

**MII_BMSR_100BASE_T4**
100BASE-T4 capable

**MII_BMSR_100BASE_X_FULL**
100BASE-X full duplex capable

**MII_BMSR_100BASE_X_HALF**
100BASE-X half duplex capable

**MII_BMSR_10_FULL**
10 Mb/s full duplex capable

**MII_BMSR_10_HALF**
10 Mb/s half duplex capable

**MII_BMSR_100BASE_T2_FULL**
100BASE-T2 full duplex capable

**MII_BMSR_100BASE_T2_HALF**
100BASE-T2 half duplex capable

**MII_BMSR_EXTEND_STATUS**
extend status information in reg 15

**MII_BMSR_MF_PREAMB_SUPPR**
PHY accepts management frames with preamble suppressed.

**MII_BMSR_AUTONEG_COMPLETE**
Auto-negotiation process completed.

**MII_BMSR_REMOTE_FAULT**
remote fault detected

**MII_BMSR_AUTONEG_ABILITY**
PHY is able to perform Auto-Negotiation.
MII_BMSR_LINK_STATUS
   link is up

MII_BMSR_JABBER_DETECT
   jabber condition detected

MII_BMSR_EXTEND_CAPAB
   extended register capabilities

MII_ADVERTISE_NEXT_PAGE
   next page

MII_ADVERTISE_LPACK
   link partner acknowledge response

MII_ADVERTISE_REMOTE_FAULT
   remote fault

MII_ADVERTISEASYM_PAUSE
   try for asymmetric pause

MII_ADVERTISE_PAUSE
   try for pause

MII_ADVERTISE_100BASE_T4
   try for 100BASE-T4 support

MII_ADVERTISE_100_FULL
   try for 100BASE-X full duplex support

MII_ADVERTISE_100_HALF
   try for 100BASE-X support

MII_ADVERTISE_10_FULL
   try for 10 Mb/s full duplex support

MII_ADVERTISE_10_HALF
   try for 10 Mb/s half duplex support

MII_ADVERTISE_SEL_MASK
   Selector Field.

MII_ADVERTISE_SEL_IEEE_802_3

MII_ADVERTISE_1000_FULL
   try for 1000BASE-T full duplex support

MII_ADVERTISE_1000_HALF
   try for 1000BASE-T half duplex support
IEEE 802.15.4

- Introduction
- API Reference
  - IEEE 802.15.4 API Overview
  - IEEE 802.15.4 Management API
  - IEEE 802.15.4 Driver API
  - IEEE 802.15.4 L2 / Native Stack API
  - OpenThread L2 Adaptation Layer API

**Introduction**  IEEE 802.15.4 is a technical standard which defines the operation of low-rate wireless personal area networks (LR-WPANs). For a more detailed overview of this standard, see the IEEE 802.15.4 Wikipedia article.

The most recent version of the standard is accessible through the IEEE GET Program. You need to create a free IEEE account and can then downloading it.

We're currently following the IEEE 802.15.4-2020 specification. This version is backwards compatible with IEEE 802.15.4-2015, parts of which are contained in the Thread protocol stack. The 2020 version also includes prior extensions that were accepted into the standard, namely IEEE 802.15.4g (SUN FSK) and IEEE 802.15.4e (TSCH) which are of relevance to industrial IoT and automation. For recent developments in UWB ranging technology, see IEEE 802.15.4z which is not yet integrated into the standard's mainline.

Whenever sections from the standard are cited in the documentation, they refer to IEEE 802.15.4-2020 section, table and figure numbering - unless otherwise specified.

Zephyr supports both, native IEEE 802.15.4 and Thread, with 6LoWPAN. Zephyr's Thread protocol implementation is based on OpenThread. The IPv6 header compression in 6LoWPAN is shared among native IEEE 802.15.4 and the Bluetooth IPSP (IP support profile).
IEEE 802.15.4 API Overview  Gives an introduction and overview over the whole IEEE 802.15.4 subsystem and all of its APIs, configuration and user interfaces for all audiences.

Related code samples

802.15.4 "serial-radio"
Implement a slip-radio device for Contiki-based border routers.

802.15.4 USB
Implement a device that exposes an IEEE 802.15.4 radio over USB.

**group ieee802154**
IEEE 802.15.4 native and OpenThread L2, configuration, management and driver APIs.

The IEEE 802.15.4 and Thread subsystems comprise the OpenThread L2 subsystem, the native IEEE 802.15.4 L2 subsystem ("Soft" MAC), a mostly vendor and protocol agnostic driver API shared between the OpenThread and native L2 stacks ("Hard" MAC and PHY) as well as several APIs to configure the subsystem (shell, net management, Kconfig, devicetree, etc.).

The **OpenThread subsystem API** integrates the external OpenThread stack into Zephyr. It builds upon Zephyr's native IEEE 802.15.4 driver API.

The **native IEEE 802.15.4 subsystem APIs** are exposed at different levels and address several audiences:

- shell (end users, application developers):
  - a set of IEEE 802.15.4 shell commands (see `shell> ieee802154 help`)

- application API (application developers):
  - IPv6, DGRAM and RAW sockets for actual peer-to-peer, multicast and broadcast data exchange between nodes including connection specific configuration (sample coming soon, see [https://github.com/linux-wpan/wpan-tools/tree/master/examples](https://github.com/linux-wpan/wpan-tools/tree/master/examples) for now which inspired our API and therefore has a similar socket API),
  - Kconfig and devicetree configuration options (net config library extension, subsystem-wide MAC and PHY Kconfig/DT options, driver/vendor specific Kconfig/DT options, watch out for options prefixed with `IEEE802154/ieee802154`),
  - Network Management: runtime configuration of the IEEE 802.15.4 protocols stack at the MAC (L2) and PHY (L1) levels (see [IEEE 802.15.4 Net Management](#)),

- L2 integration (subsystem contributors):
  - see [IEEE 802.15.4 L2](#)
  - implementation of Zephyr's internal L2-level socket and network context abstractions (context/socket operations, see [Network L2 Abstraction Layer](#)),
  - protocol-specific extension to the interface structure (see [Network Interface abstraction layer](#))
  - protocol-specific extensions to the network packet structure (see [Network Packet Library](#)),

- OpenThread and native IEEE 802.15.4 share a common **driver API** (driver maintainers/contributors):
  - see [IEEE 802.15.4 Drivers](#)
  - a basic, mostly PHY-level driver API to be implemented by all drivers,
  - several "hard MAC" (hardware/firmware offloading) extension points for performance critical or timing sensitive aspects of the protocol
IEEE 802.15.4 Management API This is the main subsystem-specific API of interest to IEEE 802.15.4 application developers as it allows to configure the IEEE 802.15.4 subsystem at runtime. Other relevant interfaces for application developers are the typical shell, socket, Kconfig and devicetree APIs that can be accessed through Zephyr's generic subsystem-independent documentation. Look out for IEEE802154/ieee802154 prefixes there.

group ieee802154_mgmt
IEEE 802.15.4 net management library.

The IEEE 802.15.4 net management library provides runtime configuration features that applications can interface with directly.

Most of these commands are also accessible via shell commands. See the shell's help feature (shell> ieee802154 help).

Note: All section, table and figure references are to the IEEE 802.15.4-2020 standard.

Command Macros

IEEE 802.15.4 net management commands.

These IEEE 802.15.4 subsystem net management commands can be called by applications via Network Management macro.

All attributes and parameters are given in CPU byte order (scalars) or big endian (byte arrays) unless otherwise specified.

The following IEEE 802.15.4 MAC management service primitives are referenced in this enumeration:

- MLME-ASSOCIATE.request, see section 8.2.3
- MLME-DISASSOCIATE.request, see section 8.2.4
- MLME-SET/GET.request, see section 8.2.6
- MLME-SCAN.request, see section 8.2.11

The following IEEE 802.15.4 MAC data service primitives are referenced in this enumeration:

- MLME-DATA.request, see section 8.3.2

MAC PIB attributes (mac…/sec…): see sections 8.4.3 and 9.5. PHY PIB attributes (phy…): see section 11.3. Both are accessed through MLME-SET/GET primitives.

NET_REQUEST_IEEE802154_SET_ACK
Sets AckTx for all subsequent MLME-DATA (aka TX) requests.

NET_REQUEST_IEEE802154_UNSET_ACK
Unsets AckTx for all subsequent MLME-DATA requests.

NET_REQUEST_IEEE802154_PASSIVE_SCAN
MLME-SCAN(PASSIVE, ...) request.

See ieee802154_req_params for associated command parameters.
NET_REQUEST_IEEE802154_ACTIVE_SCAN
MLME-SCAN(ACTIVE, ...) request.
See ieee802154_req_params for associated command parameters.

NET_REQUEST_IEEE802154_CANCEL_SCAN
Cancels an ongoing MLME-SCAN(…) command (non-standard).

NET_REQUEST_IEEE802154_ASSOCIATE
MLME-ASSOCIATE(…) request.

NET_REQUEST_IEEE802154_DISASSOCIATE
MLME-DISASSOCIATE(…) request.

NET_REQUEST_IEEE802154_SET_CHANNEL
MLME-SET(phyCurrentChannel) request.

NET_REQUEST_IEEE802154_GET_CHANNEL
MLME-GET(phyCurrentChannel) request.

NET_REQUEST_IEEE802154_SET_PAN_ID
MLME-SET(macPanId) request.

NET_REQUEST_IEEE802154_GET_PAN_ID
MLME-GET(macPanId) request.

NET_REQUEST_IEEE802154_SET_EXT_ADDR
Sets the extended interface address (non-standard), see sections 7.1 and 8.4.3.1, in big endian byte order.

NET_REQUEST_IEEE802154_GET_EXT_ADDR
like MLME-GET(macExtendedAddress) but in big endian byte order

NET_REQUEST_IEEE802154_SET_SHORT_ADDR
MLME-SET(macShortAddress) request, only allowed for co-ordinators.

NET_REQUEST_IEEE802154_GET_SHORT_ADDR
MLME-GET(macShortAddress) request.

NET_REQUEST_IEEE802154_SET_TX_POWER
MLME-SET(phyUnicastTxPower/phyBroadcastTxPower) request (currently not distinguished)

NET_REQUEST_IEEE802154_GET_TX_POWER
MLME-GET(phyUnicastTxPower/phyBroadcastTxPower) request.

NET_REQUEST_IEEE802154_SET_SECURITY_SETTINGS
Configures basic sec* MAC PIB attributes, implies macSecurityEnabled=true.
See ieee802154_security_params for associated command parameters.
NET_REQUEST_IEEE802154_GET_SECURITY_SETTINGS
   Gets the configured sec* attributes.
   See ieee802154_security_params for associated command parameters.

Event Macros

IEEE 802.15.4 net management events.
These IEEE 802.15.4 subsystem net management events can be subscribed to by
applications via net_mgmt_init_event_callback, net_mgmt_add_event_callback and
net_mgmt_del_event_callback.

NET_EVENT_IEEE802154_SCAN_RESULT
   Signals the result of the NET_REQUEST_IEEE802154_ACTIVE_SCAN or
   NET_REQUEST_IEEE802154_PASSIVE_SCAN net management commands.
   See ieee802154_req_params for associated event parameters.

struct ieee802154_req_params
   #include <ieee802154_mgmt.h> Scanning parameters.
   Used to request a scan and get results as well, see section 8.2.11.2

Public Members

uint32_t channel_set
   The set of channels to scan, use above macros to manage it.

uint32_t duration
   Duration of scan, per-channel, in milliseconds.

uint16_t channel
   Current channel in use as a result.

uint16_t pan_id
   Current pan_id in use as a result.

union ieee802154_req_params.anonymous.anonymous
   Result address.

uint8_t len
   length of address

uint8_t lqi
   Link quality information, between 0 and 255.

struct ieee802154_security_params
   #include <ieee802154_mgmt.h> Security parameters.
   Used to setup the link-layer security settings, see tables 9-9 and 9-10 in section 9.5.
IEEE 802.15.4 Driver API  This is the main API of interest to IEEE 802.15.4 driver developers.

group ieee802154_driver
   IEEE 802.15.4 driver API.
   This API provides a common representation of vendor-specific hardware and firmware to
the native IEEE 802.15.4 L2 and OpenThread stacks. Application developers should never
interface directly with this API. It is of interest to driver maintainers only.

The IEEE 802.15.4 driver API consists of two separate parts:

- a basic, mostly PHY-level driver API to be implemented by all drivers,
- several optional MAC-level extension points to offload performance critical or timing
  sensitive aspects at MAC level to the driver hardware or firmware (“hard” MAC).

Implementing the basic driver API will ensure integration with the native L2 stack as well as
basic support for OpenThread. Depending on the hardware, offloading to vendor-specific
hardware or firmware features may be required to achieve full compliance with the Thread
protocol or IEEE 802.15.4 subprotocols (e.g. fast enough ACK packages, precise timing of
timed TX/RX in the TSCH or CSL subprotocols).

Whether or not MAC-level offloading extension points need to be implemented is to be de-
cided by individual driver maintainers. Upper layers SHOULD provide a “soft” MAC fall-
back whenever possible.

Note: All section, table and figure references are to the IEEE 802.15.4-2020 standard.

IEEE 802.15.4, section 7.4.2: MAC header information elements

enum ieee802154_ie_type
   Information Element Types.
   See sections 7.4.2.1 and 7.4.3.1.
   Values:

   enumerator IEEE802154_IE_TYPE_HEADER = 0x0

   enumerator IEEE802154_IE_TYPE_PAYLOAD

enum ieee802154_header_ie_element_id
   Header Information Element IDs.
   See section 7.4.2.1, table 7-7, partial list, only IEs actually used are implemented.
   Values:

   enumerator IEEE802154_HEADER_IE_ELEMENT_ID_VENDOR_SPECIFIC_IE = 0x00

   enumerator IEEE802154_HEADER_IE_ELEMENT_ID_CSL_IE = 0x1a

   enumerator IEEE802154_HEADER_IE_ELEMENT_ID_RIT_IE = 0x1b

   enumerator IEEE802154_HEADER_IE_ELEMENT_ID_RENDEZVOUS_TIME_IE = 0x1d

6.3. Networking
enumerator IEEE802154_HEADER_IE_ELEMENT_ID_TIME_CORRECTION_IE = 0x1e
enumerator IEEE802154_HEADER_IE_ELEMENT_ID_HEADER_TERMINATION_1 = 0x7e
enumerator IEEE802154_HEADER_IE_ELEMENT_ID_HEADER_TERMINATION_2 = 0x7f

static inline int16_t ieee802154_header_ie_get_time_correction_us(struct ieee802154_header_ie_time_correction *ie)

Retrieve the time correction value in microseconds from a Time Correction IE, see section 7.4.2.7.

Parameters
• ie – [in] pointer to the Time Correction IE structure

Returns
The time correction value in microseconds.

static inline void ieee802154_header_ie_set_element_id(struct ieee802154_header_ie *ie, uint8_t element_id)

Set the element ID of a header IE.

Parameters
• ie – [in] pointer to a header IE
• element_id – [in] IE element id in CPU byte order

static inline uint8_t ieee802154_header_ie_get_element_id(struct ieee802154_header_ie *ie)

Get the element ID of a header IE.

Parameters
• ie – [in] pointer to a header IE

Returns
header IE element id in CPU byte order

IEEE802154_HEADER_IE_HEADER_LENGTH
The header IE’s header length (2 bytes).

IEEE802154_DEFINE_HEADER_IE_VENDOR_SPECIFIC(_vendor_oui, _vendor_specific_info, _vendor_specific_info_len)

Define a vendor specific header IE, see section 7.4.2.3.

Example usage (all parameters in little endian):

```
uint8_t vendor_specific_info[] = {...some vendor specific IE content...};
struct ieee802154_header_ie header_ie = IEEE802154_DEFINE_HEADER_IE_VENDOR_SPECIFIC(
    {0x9b, 0xb8, 0xea}, vendor_specific_info, sizeof(vendor_specific_info));
```
IEEE802154_DEFINE_HEADER_IE_CSL_REduced(_csl_phase, _csl_period)
Define a reduced CSL IE, see section 7.4.2.3.

Example usage (all parameters in CPU byte order):

```c
uint16_t csl_phase = ...;
uint16_t csl_period = ...;
struct ieee802154_header_ie header_ie =
IEEE802154_DEFINE_HEADER_IE_CSL_REduced(csl_phase, csl_period);
```

Parameters
- _csl_phase – CSL phase in CPU byte order
- _csl_period – CSL period in CPU byte order

IEEE802154_DEFINE_HEADER_IE_CSL_FULL(_csl_phase, _csl_period, _csl_rendezvous_time)
Define a full CSL IE, see section 7.4.2.3.

Example usage (all parameters in CPU byte order):

```c
uint16_t csl_phase = ...;
uint16_t csl_period = ...;
uint16_t csl_rendezvous_time = ...;
struct ieee802154_header_ie header_ie =
IEEE802154_DEFINE_HEADER_IE_CSL_REduced(csl_phase, csl_period, csl_rendezvous_time);
```

Parameters
- _csl_phase – CSL phase in CPU byte order
- _csl_period – CSL period in CPU byte order
- _csl_rendezvous_time – CSL rendezvous time in CPU byte order

IEEE802154_DEFINE_HEADER_IE_TIME_CORRECTION(_ack, _time_correction_us)
Define a Time Correction IE, see section 7.4.2.7.

Example usage (parameter in CPU byte order):

```c
uint16_t time_sync_info = ...;
struct ieee802154_header_ie header_ie =
IEEE802154_DEFINE_HEADER_IE_TIME_CORRECTION(true, time_sync_info);
```

Parameters
- _ack – whether or not the enhanced ACK frame that receives this IE is an ACK (true) or NACK (false)
- _time_correction_us – the positive or negative deviation from expected RX time in microseconds

IEEE802154_TIME_CORRECTION_HEADER_IE_LEN
The length in bytes of a “Time Correction” header IE.

IEEE802154_HEADER_TERMINATION_1_HEADER_IE_LEN
The length in bytes of a “Header Termination 1” header IE.
IEEE 802.15.4-2020, Section 10: General PHY requirements

enum ieee802154_phy_channel_page
PHY channel pages, see section 10.1.3.

A device driver must support the mandatory channel pages, frequency bands and channels of at least one IEEE 802.15.4 PHY.

Channel page and number assignments have developed over several versions of the standard and are not particularly well documented. Therefore some notes about peculiarities of channel pages and channel numbering:

• The 2006 version of the standard had a read-only phyChannelsSupported PHY PIB attribute that represented channel page/number combinations as a bitmap. This attribute was removed in later versions of the standard as the number of channels increased beyond what could be represented by a bit map. That's the reason why it was decided to represent supported channels as a combination of channel pages and ranges instead.

• In the 2020 version of the standard, 13 channel pages are explicitly defined, but up to 32 pages could in principle be supported. This was a hard requirement in the 2006 standard. In later standards it is implicit from field specifications, e.g. the MAC PIB attribute macChannelPage (section 8.4.3.4, table 8-100) or channel page fields used in the SRM protocol (see section 8.2.26.5).

• ASK PHY (channel page one) was deprecated in the 2015 version of the standard. The 2020 version of the standard is a bit ambivalent whether channel page one disappeared as well or should be interpreted as O-QPSK now (see section 10.1.3.3). In Zephyr this ambivalence is resolved by deprecating channel page one.

• For some PHYs the standard doesn't clearly specify a channel page, namely the GFSK, RS-GFSK, CMB and TASK PHYs. These are all rather new and left out in our list as long as no driver wants to implement them.

Warning: The bit numbers are not arbitrary but represent the channel page numbers as defined by the standard. Therefore do not change the bit numbering.

Values:

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_ZERO_OQPSK_2450_BPSK_868_915 = BIT(0)
Channel page zero supports the 2.4G channels of the O-QPSK PHY and all channels from the BPSK PHYs initially defined in the 2003 editions of the standard.

For channel page zero, 16 channels are available in the 2450 MHz band (channels 11-26, O-QPSK), 10 in the 915 MHz band (channels 1-10, BPSK), and 1 in the 868 MHz band (channel 0, BPSK).

You can retrieve the channels supported by a specific driver on this page via IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_RANGES attribute. see section 10.1.3.3

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_ONE_DEPRECATED = BIT(1)
Formerly ASK PHY - deprecated in IEEE 802.15.4-2015.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_TWO_OQPSK_868_915 = BIT(2)
O-QPSK PHY - 868 MHz and 915 MHz bands, see section 10.1.3.3.
enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_THREE_CSS = BIT(3)
    CSS PHY - 2450 MHz band, see section 10.1.3.4.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_FOUR_HRP_UWB = BIT(4)
    UWB PHY - SubG, low and high bands, see section 10.1.3.5.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_FIVE_OQPSK_780 = BIT(5)
    O-QPSK PHY - 780 MHz band, see section 10.1.3.2.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_SIX_RESERVED = BIT(6)
    reserved - not currently assigned

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_SEVEN_MSK = BIT(7)
    MSK PHY - 780 MHz and 2450 MHz bands, see sections 10.1.3.6, 10.1.3.7.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_EIGHT_LRP_UWB = BIT(8)
    LRP UWB PHY, see sections 10.1.3.8.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_NINE_SUN_PREDEFINED = BIT(9)
    SUN FSK/OFDM/O-QPSK PHYs - predefined bands, operating modes and channels, see sections 10.1.3.9.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_TEN_SUN_FSK GENERIC = BIT(10)
    SUN FSK/OFDM/O-QPSK PHYs - generic modulation and channel description, see sections 10.1.3.9, 7.4.4.11.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_ELEVEN_OQPSK_2380 = BIT(11)
    O-QPSK PHY - 2380 MHz band, see section 10.1.3.10.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_TWELVE_LECIM = BIT(12)
    LECIM DSSS/FSK PHYs, see section 10.1.3.11.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_THIRTEEN_RCC = BIT(13)
    RCC PHY, see section 10.1.3.12.

IEEE802154_DEFINE_PHY_SUPPORTED_CHANNELS(drv_attr, from, to)
Allocate memory for the supported channels driver attribute with a single channel range constant across all driver instances.
This is what most IEEE 802.15.4 drivers need.
Example usage:

IEEE802154_DEFINE_PHY_SUPPORTED_CHANNELS(drv_attr, 11, 26);

The attribute may then be referenced like this:

... &drv_attr.phy_supported_channels ...

See ieee802154_attr_get_channel_page_and_range() for a further shortcut that can be combined with this macro.

Parameters
• **drv_attr** – name of the local static variable to be declared for the local attributes structure
• **from** – the first channel to be supported
• **to** – the last channel to be supported

**IEEE 802.15.4-2020, Section 15: HRP UWB PHY**

For HRP UWB the symbol period is derived from the preamble symbol period (T_psym), see section 11.3, table 11-1 and section 15.2.5, table 15-4 (confirmed in IEEE 802.15.4z, section 15.1). Choosing among those periods cannot be done based on channel page and channel alone. The mean pulse repetition frequency must also be known, see the ‘UwbPrf’ parameter of the MCPS-DATA.request primitive (section 8.3.2, table 8-88) and the preamble parameters for HRP-ERDEV length 91 codes (IEEE 802.15.4z, section 15.2.6.2, table 15-7b).

```c
enum ieee802154_phy_hrp_uwb_nominal_prf
    represents the nominal pulse rate frequency of an HRP UWB PHY

Values:

enumerator IEEE802154_PHY_HRP_UWB_PRF_OFF = 0
    standard modes, see section 8.3.2, table 8-88.

enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_4_M = BIT(0)
enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_16_M = BIT(1)
enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_64_M = BIT(2)
enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_64_M_BPRF = BIT(3)
    enhanced ranging device (ERDEV) modes not specified in table 8-88, see IEEE 802.15.4z, section 15.1, section 15.2.6.2, table 15-7b, section 15.3.4.2 and section 15.3.4.3.

enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_128_M_HPRF = BIT(4)
enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_256_M_HPRF = BIT(5)
```

- **IEEE802154_PHY_HRP_UWB_PRF4_TPSYM_SYMBOL_PERIOD_NS**
  Nominal PRF 4MHz symbol period.

- **IEEE802154_PHY_HRP_UWB_PRF16_TPSYM_SYMBOL_PERIOD_NS**
  Nominal PRF 16MHz symbol period.

- **IEEE802154_PHY_HRP_UWB_PRF64_TPSYM_SYMBOL_PERIOD_NS**
  Nominal PRF 64MHz symbol period.

- **IEEE802154_PHY_HRP_UWB_ERDEV_TPSYM_SYMBOL_PERIOD_NS**
  ERDEV symbol period.
IEEE802154_PHY_HRP_UWB_RDEV
RDEV device mask.

IEEE802154_PHY_HRP_UWB_ERDEV
ERDEV device mask.

IEEE 802.15.4 Driver API

define ieee802154_hw_caps
IEEE 802.15.4 driver capabilities.

Any driver properties that can be represented in binary form should be modeled as capabilities. These are called “hardware” capabilities for historical reasons but may also represent driver firmware capabilities (e.g. MAC offloading features).

Values:

define enumerator IEEE802154_HW_ENERGY_SCAN = BIT(0)

   Energy detection (ED) supported (optional)

define enumerator IEEE802154_HW_FCS = BIT(1)

   Frame checksum verification supported.

define enumerator IEEE802154_HW_FILTER = BIT(2)

   Filtering of PAN ID, extended and short address supported.

define enumerator IEEE802154_HW_PROMISC = BIT(3)

   Promiscuous mode supported.

define enumerator IEEE802154_HW_CSMA = BIT(4)

   CSMA-CA procedure supported on TX.

define enumerator IEEE802154_HW_TX_RX_ACK = BIT(5)

   Waits for ACK on TX if AR bit is set in TX pkt.

define enumerator IEEE802154_HW_RETRANSMISSION = BIT(6)

   Supports retransmission on TX ACK timeout.

define enumerator IEEE802154_HW_RX_TX_ACK = BIT(7)

   Sends ACK on RX if AR bit is set in RX pkt.

define enumerator IEEE802154_HW_TXTIME = BIT(8)

   TX at specified time supported.

define enumerator IEEE802154_HW_SLEEP_TO_TX = BIT(9)

   TX directly from sleep supported.
@note This HW capability does not conform to the requirements specified in #61227 as it closely couples the driver to OpenThread's capability and device model which is different from Zephyr's:

- "Sleeping" is a well defined term in Zephyr related to internal power and thread management and different from "RX off" as defined in OT.
- Currently all OT-capable drivers have the "sleep to TX" capability anyway plus we expect future drivers to implement it ootb as well, so no information is actually conveyed by this capability.
- The `start()`/`stop()` API of a net device controls the interface's operational state. Drivers MUST respond with -ENETDOWN when calling `tx()` while their operational state is "DOWN", only devices in the "UP" state MAY transmit packets (RFC 2863).
- A migration path has been defined in #63670 for actual removal of this capability in favor of a standard compliant `configure(rx_on/rx_off)` call, see there for details.

@deprecated Drivers and L2 SHALL not introduce additional references to this capability and remove existing ones as outlined in #63670.

enumerator IEEE802154_HW_RXTIME = BIT(10)
Timed RX window scheduling supported.

enumerator IEEE802154_HW_TX_SEC = BIT(11)
TX security supported (key management, encryption and authentication)

enum ieee802154_filter_type
Filter type, see ieee802154_radio_api::filter.

Values:

enumerator IEEE802154_FILTER_TYPE_IEEE_ADDR
enumerator IEEE802154_FILTER_TYPE_SHORT_ADDR
enumerator IEEE802154_FILTER_TYPE_PAN_ID
enumerator IEEE802154_FILTER_TYPE_SRC_IEEE_ADDR
enumerator IEEE802154_FILTER_TYPE_SRC_SHORT_ADDR

enum ieee802154_event
Driver events, see IEEE802154_CONFIG_EVENT_HANDLER.

Values:

enumerator IEEE802154_EVENT_TX_STARTED
Data transmission started.

enumerator IEEE802154_EVENT_RX_FAILED
Data reception failed.
enumerator IEEE802154_EVENT_RX_OFF
An RX slot ended, requires IEEE802154_HW_RXTIME.

Note: This event SHALL not be triggered by drivers when RX is synchronously switched off due to a call to stop() or an RX slot being configured.

enum ieee802154_rx_fail_reason
RX failed event reasons, see IEEE802154_EVENT_RX_FAILED.
Values:

enumerator IEEE802154_RX_FAIL_NOT_RECEIVED
Nothing received.

enumerator IEEE802154_RX_FAIL_INVALID_FCS
Frame had invalid checksum.

enumerator IEEE802154_RX_FAIL_ADDR_FILTERED
Address did not match.

enumerator IEEE802154_RX_FAIL_OTHER
General reason.

enum ieee802154_tx_mode
IEEE 802.15.4 Transmission mode.
Values:

enumerator IEEE802154_TX_MODE_DIRECT
Transmit packet immediately, no CCA.

enumerator IEEE802154_TX_MODE_CCA
Perform CCA before packet transmission.

enumerator IEEE802154_TX_MODE_CSMA_CA
Perform full CSMA/CA procedure before packet transmission.

Note: requires IEEE802154_HW_CSMA capability.

enumerator IEEE802154_TX_MODE_TXTIME
Transmit packet in the future, at the specified time, no CCA.

Note: requires IEEE802154_HW_TXTIME capability.

enumerator IEEE802154_TX_MODE_TXTIME_CCA
Transmit packet in the future, perform CCA before transmission.
**Note:** requires IEEE802154_HW_TXTIME capability.

**Note:** Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread specification 1.2.0, ch. 3.2.6.3).

```c
enumerator IEEE802154_TX_MODE_COMMON_COUNT
   Number of modes defined in ieee802154_tx_mode.

enumerator IEEE802154_TX_MODE_PRIV_START =
   IEEE802154_TX_MODE_COMMON_COUNT
   This and higher values are specific to the protocol- or driver-specific extensions.
```

```c
enum ieee802154_fpb_mode
   IEEE 802.15.4 Frame Pending Bit table address matching mode.
   Values:

   enumerator IEEE802154_FPB_ADDR_MATCH_THREAD
      The pending bit shall be set only for addresses found in the list.

   enumerator IEEE802154_FPB_ADDR_MATCH_ZIGBEE
      The pending bit shall be cleared for short addresses found in the list.
```

```c
enum ieee802154_config_type
   IEEE 802.15.4 driver configuration types.
   Values:

   enumerator IEEE802154_CONFIG_AUTO_ACK_FPB
      Indicates how the driver should set the Frame Pending bit in ACK responses for Data Requests.
      If enabled, the driver should determine whether to set the bit or not based on the information provided with IEEE802154_CONFIG_ACK_FPB config and FPB address matching mode specified. Otherwise, Frame Pending bit should be set to 1 (see section 6.7.3).

   **Note:** requires IEEE802154_HW_TX_RX_ACK capability and is available in any interface operational state.
```

```c
enumerator IEEE802154_CONFIG_ACK_FPB
   Indicates whether to set ACK Frame Pending bit for specific address or not.
   Disabling the Frame Pending bit with no address provided (NULL pointer) should disable it for all enabled addresses.

   **Note:** requires IEEE802154_HW_TX_RX_ACK capability and is available in any interface operational state.
```
enumerator **IEEE802154_CONFIG_PAN_COORDINATOR**
Indicates whether the device is a PAN coordinator.
This influences packet filtering.

**Note:** Available in any interface operational state.

enumerator **IEEE802154_CONFIG_PROMISCUOUS**
Enable/disable promiscuous mode.

**Note:** Available in any interface operational state.

enumerator **IEEE802154_CONFIG_EVENT_HANDLER**
Specifies new IEEE 802.15.4 driver event handler.
Specifying NULL as a handler will disable events notification.

**Note:** Available in any interface operational state.

enumerator **IEEE802154_CONFIG_MAC_KEYS**
Updates MAC keys, key index and the per-key frame counter for drivers supporting transmit security offloading, see section 9.5, tables 9-9 and 9-10.

The key configuration SHALL NOT be accepted if the frame counter (in case frame counter per key is true) is not strictly larger than the current frame counter associated with the same key, see sections 8.2.2, 9.2.4 g/h) and 9.4.3.

**Note:** Requires **IEEE802154_HW_TX_SEC** capability and is available in any interface operational state.

enumerator **IEEE802154_CONFIG_FRAME_COUNTER**
Sets the current MAC frame counter value associated with the interface for drivers supporting transmit security offloading, see section 9.5, table 9-8, secFrame-Counter.

**Note:** Requires **IEEE802154_HW_TX_SEC** capability and is available in any interface operational state.

**Warning:** The frame counter MUST NOT be accepted if it is not strictly greater than the current frame counter associated with the interface, see sections 8.2.2, 9.2.4 g/h) and 9.4.3. Otherwise the replay protection provided by the frame counter may be compromised. Drivers SHALL return -EINVAL in case the configured frame counter does not conform to this requirement.

enumerator **IEEE802154_CONFIG_FRAME_COUNTER_IF_LARGER**
Sets the current MAC frame counter value if the provided value is greater than the current one.
enumerator **IEEE802154_CONFIG_RX_SLOT**

Set or unset a radio reception window (RX slot).

This can be used for any scheduled reception, e.g.: Zigbee GP device, CSL, TSCH, etc.

The start and duration parameters of the RX slot are relative to the network subsystem’s local clock. If the start parameter of the RX slot is -1 then any previously configured RX slot SHALL be canceled immediately. If the start parameter is any value in the past (including 0) or the duration parameter is zero then the receiver SHALL remain off forever until the RX slot has either been removed or re-configured to point to a future start time. If an RX slot is configured while the previous RX slot is still scheduled, then the previous slot SHALL be cancelled and the new slot scheduled instead.

RX slots MAY be programmed while the driver is “DOWN”. If any past or future RX slot is configured when calling `start()` then the interface SHALL be placed in “UP” state but the receiver SHALL not be started.

The driver SHALL take care to start/stop the receiver autonomously, asynchronously and automatically around the RX slot. The driver SHALL resume power just before the RX slot and suspend it again after the slot unless another programmed event forces the driver not to suspend. The driver SHALL switch to the programmed channel before the RX slot and back to the channel set with `set_channel()` after the RX slot. If the driver interface is “DOWN” when the start time of an RX slot arrives, then the RX slot SHALL not be observed and the receiver SHALL remain off.

If the driver is “UP” while configuring an RX slot, the driver SHALL turn off the receiver immediately and (possibly asynchronously) put the driver into the lowest possible power saving mode until the start of the RX slot. If the driver is “UP” while the RX slot is deleted, then the driver SHALL enable the receiver immediately. The receiver MUST be ready to receive packets before returning from the `configure()` operation in this case.

This behavior means that setting an RX slot implicitly sets the MAC PIB attribute `macRxOnWhenIdle` (see section 8.4.3.1, table 8-94) to “false” while deleting the RX slot implicitly sets `macRxOnWhenIdle` to “true”.

**Note:** Requires **IEEE802154_HW_RXTIME** capability and is available in any interface operational state.

**Note:** Requires **IEEE802154_HW_TX_SEC** capability and is available in any interface operational state.

**Warning:** This configuration option does not conform to the requirements specified in #61227 as it is redundant with **IEEE802154_CONFIG_FRAME_COUNTER**, and will therefore be deprecated in the future.

**enumerator** **IEEE802154_CONFIG_CSL_PERIOD**
Enables or disables a device as a CSL receiver and configures its CSL period.

Configures the CSL period in units of 10 symbol periods. Values greater than zero enable CSL if the driver supports it and the device starts to operate as a CSL receiver. Setting this to zero disables CSL on the device. If the driver does not support CSL, the configuration call SHALL return -ENOTSUP.

See section 7.4.2.3 and section 8.4.3.6, table 8-104, macCslPeriod.

To offload CSL receiver timing to the driver the upper layer SHALL combine several configuration options in the following way:

i. Use `IEEE802154_CONFIG_ENH_ACK_HEADER_IE` once with an appropriate pre-filled CSL IE and the CSL phase set to an arbitrary value or left uninitialized. The CSL phase SHALL be injected on-the-fly by the driver at runtime as outlined in 2. below. Adding a short and extended address will inform the driver of the specific CSL receiver to which it SHALL inject CSL IEs. If no addresses are given then the CSL IE will be injected into all enhanced ACK frames as soon as CSL is enabled. This configuration SHALL be done before enabling CSL by setting a CSL period greater than zero.

ii. Configure `IEEE802154_CONFIG_EXPECTED_RX_TIME` immediately followed by `IEEE802154_CONFIG_CSL_PERIOD`. To prevent race conditions, the upper layer SHALL ensure that the receiver is not enabled during or between the two calls (e.g. by a previously configured RX slot) nor SHALL a frame be transmitted concurrently.

The expected RX time SHALL point to the end of SFD of an ideally timed RX frame in an arbitrary past or future CSL channel sample, i.e. whose “end of SFD” arrives exactly at the locally predicted time inside the CSL channel sample.

The driver SHALL derive CSL anchor points and the CSL phase from the given expected RX time as follows:

\[
\text{cslAnchorPointNs} = \text{last expected RX time} + \text{PHY-specific PHR duration in ns}
\]
\[
\text{startOfMhrNs} = \text{start of MHR of the frame containing the CSL IE relative to the local network clock}
\]
\[
\text{cslPhase} = \frac{(\text{startOfMhrNs} - \text{cslAnchorPointNs})}{(10 \times \text{PHY specific symbol period in ns})} \% \text{cslPeriod}
\]

The driver SHALL set the CSL phase in the IE configured in 1. and inject that IE on-the-fly into outgoing enhanced ACK frames if the destination address conforms to the IE’s address filter.

iii. Use `IEEE802154_CONFIG_RX_SLOT` periodically to schedule each CSL channel sample early enough before its start time. The size of the CSL channel sample SHALL take relative clock drift and scheduling uncertainties with respect to CSL transmitters into account as specified by the standard such that at least the full SHR of a legitimate RX frame is guaranteed to land inside the channel sample.

To this avail, the last configured expected RX time plus an integer number of CSL periods SHALL point to a fixed offset of the RX slot (not necessarily its center):
expectedRxTimeNs_N = last expected RX time
  + N * (cs1Period * 10 * PHY-specific symbol period in ns)
expectedRxTimeNs_N - rxSlot_N.start == const for all N

While the configured CSL period is greater than zero, drivers SHOULD validate
the offset of the expected RX time inside each RX slot accordingly. If the driver
finds that the offset varies from slot to slot, drivers SHOULD log the difference
but SHALL nevertheless accept and schedule the RX slot with a zero success
value to work around minor implementation or rounding errors in upper lay-
ers.

Configure and start a CSL receiver:

```
ENH_ACK_HEADER_IE
  | EXPECTED_RX_TIME (end of SFD of a perfectly timed RX frame
  | in any past or future channel sample)
  | CSL_PERIOD (>0) RX_SLOT
  v v v v
-----------------------------------------------[-CSL channel sample ]----+
                                            ^
                                            |
                                            +--------------------- loop ---------+
```

Disable CSL on the receiver:

```
CSL_PERIOD (=0)
  |
  v
  ---------------------
```

Update the CSL period to a new value:

```
EXPECTED_RX_TIME (based on updated period)
  | CSL_PERIOD (>0, updated) RX_SLOT
  | v v
  -----------------------------------------------[-CSL channel sample ]----+
                                            ^
                                            |
                                            +--------------------- loop ---------+
```

**Note:**

Confusingly the standard calls the CSL receiver “CSL
coordinator” (i.e. “coordinating the CSL protocol timing”, see section 6.12.2.2), although, typically, a CSL coordinator is NOT also an IEEE 802.15.4 FFD coordinator
or PAN coordinator but a simple RFD end device (compare the device roles outlined
in sections 5.1, 5.3, 5.5 and 6.1). To avoid confusion we therefore prefer calling CSL
coordinators (typically an RFD end device) “CSL receivers” and CSL peer devices
(typically FFD coordinators or PAN coordinators) “CSL transmitters”. Also note that at this time, we do NOT support unsynchronized
transmission with CSL wake up frames as specified in section 6.12.2.4.4.
enumerator IEEE802154_CONFIGEXPECTED_RX_TIME
Configure a timepoint at which an RX frame is expected to arrive.

Configure the nanosecond resolution timepoint relative to the network subsystem's local clock at which an RX frame's end of SFD (i.e. equivalently its end of SHR, start of PHR, or in the case of PHIs with RDEV or ERDEV capability the RMARKER) is expected to arrive at the local antenna assuming perfectly synchronized local and remote network clocks and zero distance between antennas.

This parameter MAY be used to offload parts of timing sensitive TDMA (e.g. TSCH, beacon-enabled PAN including DSME), low-energy (e.g. CSL, RIT) or ranging (TDoA) protocols to the driver. In these protocols, medium access is tightly controlled such that the expected arrival time of a frame can be predicted within a well-defined time window. This feature will typically be combined with IEEE802154_CONFIG_RX_SLOT although this is not a hard requirement.

The “expected RX time” MAY be interpreted slightly differently depending on the protocol context:

- CSL phase (i.e. time to the next expected CSL transmission) or anchor time (i.e. any arbitrary timepoint with “zero CSL phase”) SHALL be derived by adding the PHY header duration to the expected RX time to calculate the “start of MHR” (“first symbol of MAC”, see section 6.12.2.1) required by the CSL protocol, compare IEEE802154_CONFIG_CSLPERIOD.
- In TSCH the expected RX time MAY be set to macTsRxOffset + macTsRxWait / 2. Then the time correction SHALL be calculated as the expected RX time minus actual arrival timestamp, see section 6.5.4.3.
- In ranging applications, time difference of arrival (TDOA) MAY be calculated inside the driver comparing actual RMARKER timestamps against the assumed synchronized time at which the ranging frame was sent, see IEEE 802.15.4z. In case of periodic protocols (e.g. CSL channel samples, periodic beacons of a single PAN, periodic ranging “blinks”), a single timestamp at any time in the past or in the future may be given from which other expected timestamps can be derived by adding or subtracting multiples of the RX period. See e.g. the CSL documentation in this API.

Additionally this parameter MAY be used by drivers to discipline their local representation of a distributed network clock by deriving synchronization instants related to a remote representation of the same clock (as in PTP).

Note: Available in any interface operational state.

Note: Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread specification 1.2.0, ch. 3.2.6.3).

enumerator IEEE802154_CONFIG_ENH_ACK_HEADER_IE
Adds a header information element (IE) to be injected into enhanced ACK frames generated by the driver if the given destination address filter matches.
Drivers implementing the \texttt{IEEE802154\_HW\_RX\_TX\_ACK} capability generate ACK frames autonomously. Setting this configuration will ask the driver to inject the given preconfigured header IE when generating enhanced ACK frames where appropriate by the standard. IEs for all other frame types SHALL be provided by L2.

The driver shall return -ENOTSUP in the following cases:
- It does not support the \texttt{IEEE802154\_HW\_RX\_TX\_ACK},
- It does not support header IE injection,
- It cannot inject the runtime fields on-the-fly required for the given IE element ID (see list below).

Enhanced ACK header IEs (element IDs in parentheses) that either need to be rejected or explicitly supported and parsed by the driver because they require on-the-fly timing information injection are:
- CSL IE (0x1a)
- Rendezvous Time IE (0x1d)
- Time Correction IE (0x1e)

Drivers accepting this configuration option SHALL check the list of configured IEs for each outgoing enhanced ACK frame, select the ones appropriate for the received frame based on their element ID, inject any required runtime information on-the-fly and include the selected IEs into the enhanced ACK frame's MAC header.

Drivers supporting enhanced ACK header IE injection SHALL autonomously inject header termination IEs as required by the standard.

A destination short address and extended address MAY be given by L2 to filter the devices to which the given IE is included. Setting the short address to the broadcast address and the extended address to NULL will inject the given IE into all ACK frames unless a more specific filter is also present for any given destination device (fallback configuration). L2 SHALL take care to either set both address fields to valid device addresses or none.

This configuration type may be called several times with distinct element IDs and/or addresses. The driver SHALL either store all configured IE/address combinations or return -ENOMEM if no additional configuration can be stored.

Configuring a header IE with a previously configured element ID and address filter SHALL override the previous configuration. This implies that repetition of the same header IE/address combination is NOT supported.

Configuring an existing element ID/address filter combination with the header IE's length field set to zero SHALL remove that configuration. SHALL remove the fallback configuration if no address is given.

Configuring a header IE for an address filter with the header IE pointer set to NULL SHALL remove all header IE's for that address filter. SHALL remove ALL header IE configuration (including but not limited to fallbacks) if no address is given.

If any of the deleted configurations didn't previously exist, then the call SHALL be ignored. Whenever the length field is set to zero, the content fields MUST NOT be accessed by the driver.

L2 SHALL minimize the space required to keep IE configuration inside the driver by consolidating address filters and by removing configuration that is no longer required.

\textbf{Note:} requires \texttt{IEEE802154\_HW\_RX\_TX\_ACK} capability and is available in any interface operational state. Currently we only support header IEs but that may change in the future.

\textbf{Note:} Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread 2386 Chapter 6. Connectivity)
specification 1.2.0, ch. 3.2.6.3).

**Note:** Required for Thread 1.2 Link Metrics feature (see Thread specification 1.2.0, ch. 4.11.3.3).

enumerator `IEEE802154_CONFIG_COMMON_COUNT`

Number of types defined in `ieee802154_config_type`.

enumerator `IEEE802154_CONFIG_PRIV_START` = `IEEE802154_CONFIG_COMMON_COUNT`

This and higher values are specific to the protocol- or driver-specific extensions.

enum `ieee802154_attr`

IEEE 802.15.4 driver attributes.

See `ieee802154_attr_value` and `ieee802154_radio_api` for usage details.

Values:

enumerator `IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_PAGES`

Retrieves a bit field with supported channel pages.

This attribute SHALL be implemented by all drivers.

enumerator `IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_RANGES`

Retrieves a pointer to the array of supported channel ranges within the currently configured channel page.

This attribute SHALL be implemented by all drivers.

enumerator `IEEE802154_ATTR_PHY_HRP_UWB_SUPPORTED_PRFS`

Retrieves a bit field with supported HRP UWB nominal pulse repetition frequencies.

This attribute SHALL be implemented by all devices that support channel page four (HRP UWB).

enumerator `IEEE802154_ATTR_COMMON_COUNT`

Number of attributes defined in `ieee802154_attr`.

enumerator `IEEE802154_ATTR_PRIV_START` = `IEEE802154_ATTR_COMMON_COUNT`

This and higher values are specific to the protocol- or driver-specific extensions.

typedef void (`*energy_scan_done_cb_t`)(const struct `device` *dev, int16_t max_ed)

Energy scan callback.

typedef void (`*ieee802154_event_cb_t`)(const struct `device` *dev, enum `ieee802154_event` evt, void *event_params)

Driver event callback.
static inline int ieee802154_attr_get_channel_page_and_range(enum ieee802154_attr attr,
const enum ieee802154_phy_channel_page phy_supported_channel_page,
const struct ieee802154_phy_supported_channels *phy_supported_channels,
struct ieee802154_attr_value *value)

Helper function to handle channel page and range to be called from drivers’ attr_get() implementation.

This only applies to drivers with a single channel page.

**Parameters**

- `attr` – The attribute to be retrieved.
- `phy_supported_channel_page` – The driver's unique channel page.
- `phy_supported_channels` – Pointer to the structure that contains the driver's channel range or ranges.
- `value` – The pointer to the value struct provided by the user.

**Return values**

- `0` – if the attribute could be resolved
- `-ENOENT` – if the attribute could not be resolved

**IEEE802154_HW_CAPS_BITS_COMMON_COUNT**

Number of bits used by ieee802154_hw_caps type.

**IEEE802154_HW_CAPS_BITS_PRIV_START**

This and higher values are specific to the protocol- or driver-specific extensions.

**IEEE802154_CONFIG_RX_SLOT_NONE**

Configuring an RX slot with the start parameter set to this value will cancel and delete any previously configured RX slot.

**IEEE802154_CONFIG_RX_SLOT_OFF**

Configuring an RX slot with this start parameter while the driver is “down”, will keep RX off when the driver is being started.

Configuring an RX slot with this start value while the driver is “up” will immediately switch RX off until either the slot is deleted, see **IEEE802154_CONFIG_RX_SLOT_NONE** or a slot with a future start parameter is configured and that start time arrives.

**IEEE 802.15.4 driver utils**

static inline bool ieee802154_is_ar_flag_set(struct net_buf *frag)

Check if the AR flag is set on the frame inside the given Network Packet Library.

**Parameters**

- `frag` – A valid pointer on a `net_buf` structure, must not be NULL, and its length should be at least 1 byte (ImmAck frames are the shortest supported frames with 3 bytes excluding FCS).
IEEE 802.15.4 driver callbacks

enum net_verdict ieee802154_handle_ack(struct net_if *iface, struct net_pkt *pkt)

IEEE 802.15.4 driver ACK handling callback into L2 that drivers must call when receiving an ACK package.

The IEEE 802.15.4 standard prescribes generic procedures for ACK handling on L2 (MAC) level. L2 stacks therefore have to provide a fast and re-usable generic implementation of this callback for drivers to call when receiving an ACK packet.

Note: This function is part of Zephyr’s 802.15.4 stack driver -> L2 “inversion-of-control” adaptation API and must be implemented by all IEEE 802.15.4 L2 stacks.

Warning: Deviating from other functions in the net stack returning net_verdict, this function will not unref the package even if it returns NET_OK.

Parameters

• iface – A valid pointer on a network interface that received the packet
• pkt – A valid pointer on a packet to check

Returns

NET_OK if L2 handles the ACK package, NET_CONTINUE or NET_DROP otherwise.

void ieee802154_init(struct net_if *iface)

IEEE 802.15.4 driver initialization callback into L2 called by drivers to initialize the active L2 stack for a given interface.

Drivers must call this function as part of their own initialization routine.

Note: This function is part of Zephyr’s 802.15.4 stack driver -> L2 “inversion-of-control” adaptation API and must be implemented by all IEEE 802.15.4 L2 stacks.

Parameters

• iface – A valid pointer on a network interface

IEEE 802.15.4-2020, Section 6: MAC functional description

IEEE802154_PHY_SYMBOLS_PER_SECOND(symbol_period_ns)

The symbol period (and therefore symbol rate) is defined in section 6.1: “Some of the timing parameters in definition of the MAC are in units of PHY symbols.

For PHYs that have multiple symbol periods, the duration to be used for the MAC parameters is defined in that PHY clause.”

This is not necessarily the true physical symbol period, so take care to use this macro only when either the symbol period used for MAC timing is the same as the physical symbol period or if you actually mean the MAC timing symbol period.

PHY specific symbol periods are defined in PHY specific sections below.
IEEE 802.15.4-2020, Section 8: MAC services

IEEE802154_MAC_A_BASE_SLOT_DURATION
The number of PHY symbols forming a superframe slot when the superframe order is equal to zero, see sections 8.4.2, table 8-93, aBaseSlotDuration and section 6.2.1.

IEEE802154_MAC_A_NUM_SUPERFRAME_SLOTS
The number of slots contained in any superframe, see section 8.4.2, table 8-93, aNumSuperframeSlots.

IEEE802154_MAC_A_BASE_SUPERFRAME_DURATION
The number of PHY symbols forming a superframe when the superframe order is equal to zero, see section 8.4.2, table 8-93, aBaseSuperframeDuration.

IEEE802154_MAC_A_UNIT_BACKOFF_PERIOD (turnaround_time)
MAC PIB attribute aUnitBackoffPeriod, see section 8.4.2, table 8-93, in symbol periods, valid for all PHYs except SUN PHY in the 920 MHz band.

IEEE802154_MAC_RESPONSE_WAIT_TIME_DEFAULT
Default macResponseWaitTime in multiples of aBaseSuperframeDuration as defined in section 8.4.3.1, table 8-94.

IEEE 802.15.4-2020, Section 11: PHY services

IEEE802154_PHY_A_TURNAROUND_TIME_DEFAULT
Default PHY PIB attribute aTurnaroundTime, in PHY symbols, see section 11.3, table 11-1.

IEEE802154_PHY_A_TURNAROUND_TIME_1MS (symbol_period_ns)
PHY PIB attribute aTurnaroundTime for SUN, RS-GFSK, TVWS, and LECIM FSK PHY, in PHY symbols, see section 11.3, table 11-1.

IEEE802154_PHY_A_CCA_TIME
PHY PIB attribute aCcaTime, in PHY symbols, all PHYs except for SUN O-QPSK, see section 11.3, table 11-1.

IEEE 802.15.4-2020, Section 12: O-QPSK PHY

IEEE802154_PHY_OQPSK_868MHZ_SYMBOL_PERIOD_NS
O-QPSK 868Mhz band symbol period, see section 12.3.3.

IEEE802154_PHY_OQPSK_780_TO_2450MHZ_SYMBOL_PERIOD_NS
O-QPSK 780MHz, 915MHz, 2380MHz and 2450MHz bands symbol period, see section 12.3.3.
IEEE802154_PHY_BPSK_868MHZ_SYMBOL_PERIOD_NS
BPSK 868MHz band symbol period, see section 13.3.3.

IEEE802154_PHY_BPSK_915MHZ_SYMBOL_PERIOD_NS
BPSK 915MHz band symbol period, see section 13.3.3.

IEEE 802.15.4-2020, Section 19: SUN FSK PHY

IEEE802154_PHY_SUN_FSK_863MHZ_915MHZ_SYMBOL_PERIOD_NS
SUN FSK 863Mhz and 915MHz band symbol periods, see section 19.1, table 19-1.

IEEE802154_PHY_SUN_FSK_PHR_LEN
SUN FSK PHY header length, in bytes, see section 19.2.4.

struct ieee802154_header_ie_vendor_specific
#include <ieee802154_ie.h> Vendor Specific Header IE, see section 7.4.2.3.

struct ieee802154_header_ie_csl_full
#include <ieee802154_ie.h> Full CSL IE, see section 7.4.2.3.

struct ieee802154_header_ie_csl_reduced
#include <ieee802154_ie.h> Reduced CSL IE, see section 7.4.2.3.

struct ieee802154_header_ie_csl
#include <ieee802154_ie.h> Generic CSL IE, see section 7.4.2.3.

struct ieee802154_header_ie_rit
#include <ieee802154_ie.h> RIT IE, see section 7.4.2.4.

struct ieee802154_header_ie_rendezvous_time_full
#include <ieee802154_ie.h> Full Rendezvous Time IE, see section 7.4.2.6 (macCslInterval is nonzero).

struct ieee802154_header_ie_rendezvous_time_reduced
#include <ieee802154_ie.h> Reduced Rendezvous Time IE, see section 7.4.2.6 (macCslInterval is zero).

struct ieee802154_header_ie_rendezvous_time
#include <ieee802154_ie.h> Rendezvous Time IE, see section 7.4.2.6.

struct ieee802154_header_ie_time_correction
#include <ieee802154_ie.h> Time Correction IE, see section 7.4.2.7.

struct ieee802154_header_ie
#include <ieee802154_ie.h>
struct ieee802154_phy_channel_range

#include <ieee802154_radio.h> Represents a supported channel range, see ieee802154_phy_supported_channels.

struct ieee802154_phy_supported_channels

#include <ieee802154_radio.h> Represents a list channels supported by a driver for a given interface, see IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_RANGES.

Public Members

const struct ieee802154_phy_channel_range *const ranges
Pointer to an array of channel range structures.

Warning: The pointer must be valid and constant throughout the life of the interface.

const uint8_t num_ranges
The number of currently available channel ranges.

struct ieee802154_filter

#include <ieee802154_radio.h> Filter value, see ieee802154_radio_api::filter.

Public Members

uint8_t *ieee_addr
Extended address, in little endian.

uint16_t short_addr
Short address, in CPU byte order.

uint16_t pan_id
PAN ID, in CPU byte order.

struct ieee802154_key

#include <ieee802154_radio.h> Key configuration for transmit security offloading, see IEEE802154_CONFIG_MAC_KEYS.

struct ieee802154_config

#include <ieee802154_radio.h> IEEE 802.15.4 driver configuration data.

Public Members

struct ieee802154_config,[anonymous],[anonymous] auto_ack_fpb
see IEEE802154_CONFIG_AUTO_ACK_FPB
struct ieee802154_config.[anonymous].[anonymous] ack_fpb
  see IEEE802154_CONFIG_ACK_FPB

bool pan_coordinator
  see IEEE802154_CONFIG_PAN_COORDINATOR

bool promiscuous
  see IEEE802154_CONFIG_PROMISCUOUS

ieee802154_event_cb_t event_handler
  see IEEE802154_CONFIG_EVENT_HANDLER

struct ieee802154_key *mac_keys
  see IEEE802154_CONFIG_MAC_KEYS
  Pointer to an array containing a list of keys used for MAC encryption. Refer to secKeyIdLookupDescriptor and secKeyDescriptor in IEEE 802.15.4
  The key_value field points to a buffer containing the 16 byte key. The buffer SHALL be copied by the driver before returning from the call.
  The variable length array is terminated by key_value field set to NULL.

uint32_t frame_counter
  see IEEE802154_CONFIG_FRAME_COUNTER

net_time_t start
  Nanosecond resolution timestamp relative to the network subsystem's local clock defining the start of the RX window during which the receiver is expected to be listening (i.e. not including any driver startup times).
  Configuring an rx_slot with the start attribute set to -1 will cancel and delete any previously active rx slot.

net_time_t duration
  Nanosecond resolution duration of the RX window relative to the above RX window start time during which the receiver is expected to be listening (i.e. not including any shutdown times). Only positive values larger than or equal zero are allowed.
  Setting the duration to zero will disable the receiver, no matter what the start parameter.

struct ieee802154_config.[anonymous].[anonymous] rx_slot
  see IEEE802154_CONFIG_RX_SLOT

uint32_t csl_period
  see IEEE802154_CONFIG_CSL_PERIOD
  in CPU byte order

net_time_t expected_rx_time
  see IEEE802154_CONFIG_EXPECTED_RX_TIME

6.3. Networking
struct ieee802154_header_ie *header_ie
   Pointer to the header IE, see section 7.4.2.1, figure 7-21.
   Certain header IEs may be incomplete if they require timing information to be injected at runtime on-the-fly, see the list in IEEE802154_CONFIG_ENH_ACK_HEADER_IE.

const uint8_t *ext_addr
   Filters the devices that will receive this IE by extended address.
   MAY be set to NULL to configure a fallback for all devices (implies that short_addr MUST also be set to IEEE802154_BROADCAST_ADDRESS).
   in big endian

uint16_t short_addr
   Filters the devices that will receive this IE by short address.
   MAY be set to IEEE802154_BROADCAST_ADDRESS to configure a fallback for all devices (implies that ext_addr MUST also be set to NULL in this case).
   in CPU byte order

struct ieee802154_config.[anonymous].[anonymous] ack_ie
   see IEEE802154_CONFIG_ENH_ACK_HEADER_IE

union ieee802154_config.[anonymous] [anonymous]
   Configuration data.

struct ieee802154_attr_value
   #include <ieee802154_radio.h> IEEE 802.15.4 driver attribute values.
   This structure is reserved to scalar and structured attributes that originate in the driver implementation and can neither be implemented as boolean ieee802154_hw_caps nor be derived directly or indirectly by the MAC (L2) layer. In particular this structure MUST NOT be used to return configuration data that originate from L2.

   **Note:** To keep this union reasonably small, any attribute requiring a large memory area, SHALL be provided pointing to static memory allocated by the driver and valid throughout the lifetime of the driver instance.

Public Members

uint32_t phy_supported_channel_pages
   A bit field that represents the supported channel pages, see ieee802154_phy_channel_page.

   **Note:** To keep the API extensible as required by the standard, supported pages are modeled as a bitmap to support drivers that implement runtime switching between multiple channel pages.
**Note:** Currently none of the Zephyr drivers implements more than one channel page at runtime, therefore only one bit will be set and the current channel page (see the PHY PIB attribute phyCurrentPage, section 11.3, table 11-2) is considered to be read-only, fixed and “well known” via the supported channel pages attribute.

```c
const struct ieee802154_phy_supported_channels *phy_supported_channels
```

Pointer to a structure representing channel ranges currently available on the selected channel page.

The selected channel page corresponds to the phyCurrentPage PHY PIB attribute, see the description of phy_supported_channel_pages above. Currently it can be retrieved via the `IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_PAGES` attribute.

Most drivers will expose a single channel page with a single, often zero-based, fixed channel range.

Some notable exceptions:
- The legacy channel page (zero) exposes ranges in different bands and even PHYs that are usually not implemented by a single driver.
- SUN and LECIM PHYs specify a large number of bands and operating modes on a single page with overlapping channel ranges each. Some of these ranges are not zero-based or contain “holes”. This explains why several ranges may be necessary to represent all available channels.
- UWB PHYs often support partial channel ranges on the same channel page depending on the supported bands.

In these cases, drivers may expose custom configuration attributes (Kconfig, devicetree, runtime, …) that allow switching between sub-ranges within the same channel page (e.g. switching between SubG and 2.4G bands on channel page zero or switching between multiple operating modes in the SUN or LECIM PHYs.

**Warning:** The pointer must be valid and constant throughout the life of the interface.

```c
uint32_t phy_hrp_uwb_supported_nominal_prfs
```

A bit field representing supported HRP UWB pulse repetition frequencies (PRF), see enum `ieee802154_phy_hrp_uwb_nominal_prf`.

**Note:** Currently none of the Zephyr HRP UWB drivers implements more than one nominal PRF at runtime, therefore only one bit will be set and the current PRF (UwbPrf, MCPS-DATA.request, section 8.3.2, table 8-88) is considered to be read-only, fixed and “well known” via the supported PRF attribute.

```c
struct ieee802154_radio_api
```

`#include <ieee802154_radio.h>` IEEE 802.15.4 driver interface API.

While L1-level driver features are exclusively implemented by drivers and MAY be mandatory to support certain application requirements, L2 features SHOULD be optional by default and only need to be implemented for performance optimization or precise timing as deemed necessary by driver maintainers. Fallback implementations (“Soft MAC”) SHOULD be provided in the driver-independent L2 layer for all
L2/MAC features especially if these features are not implemented in vendor hardware/firmware by a majority of existing in-tree drivers. If, however, a driver offers offloading opportunities then L2 implementations SHALL delegate performance critical or resource intensive tasks to the driver.

All drivers SHALL support two externally observable interface operational states: “UP” and “DOWN”. Drivers MAY additionally support a “TESTING” interface state (see \texttt{continuous\_carrier}).

The following rules apply:

- An interface is considered “UP” when it is able to transmit and receive packets, “DOWN” otherwise (see precise definitions of the corresponding ifOperStatus values in RFC 2863, section 3.1.14, \texttt{net\_if\_oper\_state} and the \texttt{continuous\_carrier} exception below). A device that has its receiver temporarily disabled during “UP” state due to an active receive window configuration is still considered “UP”.
- Upper layers will assume that the interface managed by the driver is “UP” after a call to \texttt{start} returned zero or \texttt{-EALREADY}. Upper layers assume that the interface is “DOWN” after calling \texttt{stop} returned zero or \texttt{-EALREADY}.
- The driver SHALL block \texttt{start}/\texttt{stop} calls until the interface fully transitioned to the new state (e.g. the receiver is operational, ongoing transmissions were finished, etc.). Drivers SHOULD yield the calling thread (i.e. “sleep”) if waiting for the new state without CPU interaction is possible.
- Drivers are responsible of guaranteeing atomicity of state changes. Appropriate means of synchronization SHALL be implemented (locking, atomic flags, ...).
- While the interface is “DOWN”, the driver SHALL be placed in the lowest possible power state. The driver MAY return from a call to \texttt{stop} before it reaches the lowest possible power state, i.e. manage power asynchronously. While the interface is “UP”, the driver SHOULD autonomously and asynchronously transition to lower power states whenever possible. If the driver claims to support timed RX/TX capabilities and the upper layers configure an RX slot, then the driver SHALL immediately transition (asynchronously) to the lowest possible power state until the start of the RX slot or until a scheduled packet needs to be transmitted.
- The driver SHALL NOT change the interface’s “UP”/“DOWN” state on its own. Initially, the interface SHALL be in the “DOWN” state.
- Drivers that implement the optional \texttt{continuous\_carrier} operation will be considered to be in the RFC 2863 “testing” ifOperStatus state if that operation returns zero. This state is active until either \texttt{start} or \texttt{stop} is called. If \texttt{continuous\_carrier} returns a non-zero value then the previous state is assumed by upper layers.
- If calls to \texttt{start}/\texttt{stop} return any other value than zero or \texttt{-EALREADY}, upper layers will consider the interface to be in a “lowerLayerDown” state as defined in RFC 2863.
- The RFC 2863 “dormant”, “unknown” and “notPresent” ifOperStatus states are currently not supported. The “lowerLevelUp” state.
- The \texttt{ed\_scan}, \texttt{cca} and \texttt{tx} operations SHALL only be supported in the “UP” state and return \texttt{-ENETDOWN} in any other state. See the function-level API documentation below for further details.

\textbf{Note:} This structure is called “radio” API for backwards compatibility. A better name would be “IEEE 802.15.4 driver API” as typical drivers will not only implement L1/radio (PHY) features but also L2 (MAC) features if the vendor-specific driver hardware or firmware offers offloading opportunities.
Note: In case of devices that support timed RX/TX, the “UP” state is not equal to “receiver enabled”. If a receive window (i.e. RX slot, see `IEEE802154_CONFIG_RX_SLOT`) is configured before calling `start()` then the receiver will not be enabled when transitioning to the “UP” state. Configuring a receive window while the interface is “UP” will cause the receiver to be disabled immediately until the configured reception time has arrived.

Public Members

struct net_if_api iface_api
network interface API

Note: Network devices must extend the network interface API. It is therefore mandatory to place it at the top of the driver API struct so that it can be cast to a network interface.

enum ieee802154_hw_caps (*get_capabilities)(const struct device *dev)
Get the device driver capabilities.

Note: Implementations SHALL be isr-ok and MUST NOT sleep. MAY be called in any interface state once the driver is fully initialized (“ready”).

Param dev
pointer to IEEE 802.15.4 driver device

Return
Bit field with all supported device driver capabilities.

int (*cca)(const struct device *dev)
Clear Channel Assessment - Check channel’s activity.

Note: Implementations SHALL be isr-ok and MAY sleep. SHALL return -ENETDOWN unless the interface is “UP”.

Param dev
pointer to IEEE 802.15.4 driver device

Retval 0
the channel is available

Retval -EBUSY
The channel is busy.

Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.

Retval -ENETDOWN
The interface is not “UP”.

Retval -ENOTSUP
CCA is not supported by this driver.

Retval -EIO
The CCA procedure could not be executed.
int (*set_channel)(const struct device *dev, uint16_t channel)

Set current channel.

Note: Implementations SHALL be isr-ok and MAY sleep. SHALL return -EIO unless the interface is either “UP” or “DOWN”.

Param dev
pointer to IEEE 802.15.4 driver device

Param channel
the number of the channel to be set in CPU byte order

Retval 0
channel was successfully set

Retval -EALREADY
The previous channel is the same as the requested channel.

Retval -EINVAL
The given channel is not within the range of valid channels of the driver’s current channel page, see the IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_RANGES driver attribute.

Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.

Retval -ENOTSUP
The given channel is within the range of valid channels of the driver’s current channel page but unsupported by the current driver.

Retval -EIO
The channel could not be set.

int (*filter)(const struct device *dev, bool set, enum ieee802154_filter_type type, const struct ieee802154_filter *filter)

Set/Unset PAN ID, extended or short address filters.

Note: requires IEEE802154_HW_FILTER capability.

Note: Implementations SHALL be isr-ok and MAY sleep. SHALL return -EIO unless the interface is either “UP” or “DOWN”.

Param dev
pointer to IEEE 802.15.4 driver device

Param set
ture to set the filter, false to remove it

Param type
the type of entity to be added/removed from the filter list (a PAN ID or a source/destination address)

Param filter
the entity to be added/removed from the filter list

Retval 0
The filter was successfully added/removed.

Retval -EINVAL
The given filter entity or filter entity type was not valid.

Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.
Retval -ENOTSUP
Setting/removing this filter or filter type is not supported by this driver.

Retval -EIO
Error while setting/removing the filter.

```c
int (*set_txpower)(const struct device *dev, int16_t dbm)
```
Set TX power level in dbm.

**Note:** Implementations SHALL be *isr-ok* and MAY *sleep*. SHALL return -EIO unless the interface is either “UP” or “DOWN”.

**Param dev**
pointer to IEEE 802.15.4 driver device

**Param dbm**
TX power in dbm

**Retval 0**
The TX power was successfully set.

**Retval -EINVAL**
The given dbm value is invalid or not supported by the driver.

**Retval -EWOULDBLOCK**
The operation is called from ISR context but temporarily cannot be executed without blocking.

**Retval -EIO**
The TX power could not be set.

```c
int (*tx)(const struct device *dev, enum ieee802154_tx_mode mode, struct net_pkt *pkt, struct net_buf *frag)
```
Transmit a packet fragment as a single frame.

Depending on the level of offloading features supported by the driver, the frame MAY not be fully encrypted/authenticated or it MAY not contain an FCS. It is the responsibility of L2 implementations to prepare the frame according to the offloading capabilities announced by the driver and to decide whether CCA, CSMA/CA, ACK or retransmission procedures need to be executed outside (“soft MAC”) or inside (“hard MAC”) the driver.

All frames originating from L2 SHALL have all required IEs pre-allocated and pre-filled such that the driver does not have to parse and manipulate IEs at all. This includes ACK packets if the driver does not have the `IEEE802154_HW_RX_TX_ACK` capability. Also see `IEEE802154_CONFIG_ENH_ACK_HEADER_IE` for drivers that have the `IEEE802154_HW_RX_TX_ACK` capability.

IEs that cannot be prepared by L2 unless the TX time is known (e.g. CSL IE, Rendezvous Time IE, Time Correction IE, …) SHALL be sent in any of the timed TX modes with appropriate timing information pre-filled in the IE such that drivers do not have to parse and manipulate IEs at all unless the frame is generated by the driver itself.

In case any of the timed TX modes is supported and used (see `ieee802154_hw_caps` and `ieee802154_tx_mode`), the driver SHALL take responsibility of scheduling and sending the packet at the precise programmed time autonomously without further interaction by upper layers. The call to `tx()` will block until the package has either been sent successfully (possibly including channel acquisition and packet acknowledgment) or a terminal transmission error occurred. The driver SHALL sleep and keep power consumption to the lowest possible level until the scheduled transmission time arrives or during any other idle waiting time.

**Note:** Implementations MAY *sleep* and will usually NOT be *isr-ok* - especially
when timed TX, CSMA/CA, retransmissions, auto-ACK or any other offloading feature is supported that implies considerable idle waiting time. SHALL return -ENETDOWN unless the interface is “UP”.

**Warning:** The driver SHALL NOT take ownership of the given network packet and frame (fragment) buffer. Any data required by the driver including the actual frame content must be read synchronously and copied internally if needed at a later time (e.g. the contents of IEs required for protocol configuration, states of frame counters, sequence numbers, etc). Both, the packet and the buffer MAY be re-used or released by upper layers immediately after the function returns.

**Param** dev  
pointer to IEEE 802.15.4 driver device

**Param** mode  
the transmission mode, some of which require specific offloading capabilities.

**Param** pkt  
pointer to the network packet to be transmitted.

**Param** frag  
pointer to a network buffer containing a single fragment with the frame data to be transmitted

**Retval** 0  
The frame was successfully sent or scheduled. If the driver supports ACK offloading and the frame requested acknowledgment (AR bit set), this means that the packet was successfully acknowledged by its peer.

**Retval** -EINVAL  
Invalid packet (e.g. an expected IE is missing or the encryption/authentication state is not as expected).

**Retval** -EBUSY  
The frame could not be sent because the medium was busy (CSMA/CA or CCA offloading feature only).

**Retval** -ENOMSG  
The frame was not confirmed by an ACK packet (TX ACK offloading feature only).

**Retval** -ENOBUFFS  
The frame could not be scheduled due to missing internal resources (timed TX offloading feature only).

**Retval** -ENETDOWN  
The interface is not “UP”.

**Retval** -ENOTSUP  
The given TX mode is not supported.

**Retval** -EIO  
The frame could not be sent due to some unspecified driver error (e.g. the driver being busy).

int (*start)(const struct device *dev)

Start the device.

Upper layers will assume the interface is “UP” if this operation returns with zero or -EALREADY. The interface is placed in receive mode before returning from this operation unless an RX slot has been configured (even if it lies in the past, see IEEE802154_CONFIG_RX_SLOT).

**Note:** Implementations SHALL be isr-ok and MAY sleep. MAY be called in any interface state once the driver is fully initialized (“ready”).
### Param dev
- pointer to IEEE 802.15.4 driver device

### Retval 0
- The driver was successfully started.

### Retval -EALREADY
- The driver was already “UP”.

### Retval -EWOULDBLOCK
- The operation is called from ISR context but temporarily cannot be executed without blocking.

### Retval -EIO
- The driver could not be started.

```c
int (*stop)(const struct device *dev)
```

Stop the device.

Upper layers will assume the interface is “DOWN” if this operation returns with zero or -EALREADY. The driver switches off the receiver before returning if it was previously on. The driver enters the lowest possible power mode after this operation is called. This MAY happen asynchronously (i.e. after the operation already returned control).

**Note:** Implementations SHALL be isr-ok and MAY sleep. MAY be called in any interface state once the driver is fully initialized (“ready”).

### Param dev
- pointer to IEEE 802.15.4 driver device

### Retval 0
- The driver was successfully stopped.

### Retval -EWOULDBLOCK
- The operation is called from ISR context but temporarily cannot be executed without blocking.

### Retval -EALREADY
- The driver was already “DOWN”.

### Retval -EIO
- The driver could not be stopped.

```c
int (*continuous_carrier)(const struct device *dev)
```

Start continuous carrier wave transmission.

The method blocks until the interface has started to emit a continuous carrier. To leave this mode, `start()` or `stop()` should be called, which will put the driver back into the “UP” or “DOWN” states, respectively.

**Note:** Implementations MAY sleep and will usually NOT be isr-ok. MAY be called in any interface state once the driver is fully initialized (“ready”).

### Param dev
- pointer to IEEE 802.15.4 driver device

### Retval 0
- continuous carrier wave transmission started

### Retval -EALREADY
- The driver was already in “TESTING” state and emitting a continuous carrier.

### Retval -EIO
- not started
int (*configure)(const struct device *dev, enum ieee802154_config_type type, const struct ieee802154_config *config)

Set or update driver configuration.

The method blocks until the interface has been reconfigured atomically with respect to ongoing package reception, transmission or any other ongoing driver operation.

**Note:** Implementations SHALL be **isr-ok** and MAY **sleep**. MAY be called in any interface state once the driver is fully initialized (“ready”). Some configuration options may not be supported in all interface operational states, see the detailed specifications in *ieee802154_config_type*. In this case the operation returns **-EACCES**.

**Param dev**
pointer to IEEE 802.15.4 driver device

**Param type**
the configuration type to be set

**Param config**
the configuration parameters to be set for the given configuration type

**Retval 0**
configuration successful

**Retval -EINVAL**
The configuration parameters are invalid for the given configuration type.

**Retval -ENOTSUP**
The given configuration type is not supported by this driver.

**Retval -EACCES**
The given configuration type is supported by this driver but cannot be configured in the current interface operational state.

**Retval -ENOMEM**
The configuration cannot be saved due to missing memory resources.

**Retval -ENOENT**
The resource referenced in the configuration parameters cannot be found in the configuration.

**Retval -EWOULDBLOCK**
The operation is called from ISR context but temporarily cannot be executed without blocking.

**Retval -EIO**
An internal error occurred while trying to configure the given configuration parameter.

int (*ed_scan)(const struct device *dev, uint16_t duration, energy_scan_done_cb_t done_cb)

Run an energy detection scan.

**Note:** requires IEEE802154_HW_ENERGY_SCAN capability

**Note:** The radio channel must be set prior to calling this function.

**Note:** Implementations SHALL be **isr-ok** and MAY **sleep**. SHALL return **-ENETDOWN** unless the interface is “UP”.

**Param dev**
pointer to IEEE 802.15.4 driver device

**Param duration**
duration of energy scan in ms

**Param done_cb**
function called when the energy scan has finished

**Retval 0**
the energy detection scan was successfully scheduled

**Retval -EBUSY**
the energy detection scan could not be scheduled at this time

**Retval -EALREADY**
a previous energy detection scan has not finished yet.

**Retval -ENETDOWN**
The interface is not “UP”.

**Retval -ENOTSUP**
This driver does not support energy scans.

**Retval -EIO**
The energy detection procedure could not be executed.

```
net_time_t (*get_time)(const struct device *dev)
Get the current time in nanoseconds relative to the network subsystem's local uptime clock as represented by this network interface.

See net_time_t for semantic details.
```

**Note:** requires IEEE802154_HW_TXTIME and/or IEEE802154_HW_RXTIME capabilities. Implementations SHALL be isr-ok and MUST NOT sleep. MAY be called in any interface state once the driver is fully initialized (“ready”).

```
uint8_t (*get_sch_acc)(const struct device *dev)
Get the current estimated worst case accuracy (maximum ± deviation from the nominal frequency) of the network subsystem's local clock used to calculate tolerances and guard times when scheduling delayed receive or transmit radio operations.

The deviation is given in units of PPM (parts per million).
```

**Note:** requires IEEE802154_HW_TXTIME and/or IEEE802154_HW_RXTIME capabilities.

**Note:** Implementations may estimate this value based on current operating conditions (e.g. temperature). Implementations SHALL be isr-ok and MUST NOT sleep. MAY be called in any interface state once the driver is fully initialized (“ready”).

```
Param dev
pointer to IEEE 802.15.4 driver device

Return
current estimated clock accuracy in PPM
```

6.3. Networking 2403
int (*attr_get)(const struct device *dev, enum ieee802154_attr attr, struct ieee802154_attr_value *value)

Get the value of a driver specific attribute.

**Note:** This function SHALL NOT return any values configurable by the MAC (L2) layer. It is reserved to non-boolean (i.e. scalar or structured) attributes that originate from the driver implementation and cannot be directly or indirectly derived by L2. Boolean attributes SHALL be implemented as ieee802154_hw_caps.

**Note:** Implementations SHALL be isr-ok and MUST NOT sleep. MAY be called in any interface state once the driver is fully initialized (“ready”).

**RetVal 0**
The requested attribute is supported by the driver and the value can be retrieved from the corresponding ieee802154_attr_value member.

**RetVal -ENOENT**
The driver does not provide the requested attribute. The value structure has not been updated with attribute data. The content of the value attribute is undefined.

---

**IEEE 802.15.4 L2 / Native Stack API**
This documents the IEEE 802.15.4 L2 native stack, which neither applications nor drivers will ever access directly. It is called internally by Zephyr’s upper network layers (L3+), its socket and network context abstractions. This API is therefore of interest to IEEE 802.15.4 subsystem contributors only.

**group ieee802154_l2**
IEEE 802.15.4 L2 APIs.

This API provides integration with Zephyr’s sockets and network contexts. **Application and driver developers should never interface directly with this API.** It is of interest to subsystem maintainers only.

The API implements and extends the following structures:

- implements Zephyr's internal L2-level socket and network context abstractions (context/socket operations, see Network L2 Abstraction Layer),
- protocol-specific extension to the interface structure (see Network Interface abstraction layer)
- protocol-specific extensions to the network packet structure (see Network Packet Library),

**Note:** All section, table and figure references are to the IEEE 802.15.4-2020 standard.

---

**Defines**

**IEEE802154_MAX_PHY_PACKET_SIZE**
Represents the PHY constant aMaxPhyPacketSize, see section 11.3.
Note: Currently only 127 byte sized packets are supported although some PHYs (e.g. SUN, MSK, LECIM, ...) support larger packet sizes. Needs to be changed once those PHYs should be fully supported.

IEEE802154_FCS_LENGTH
Represents the frame check sequence length, see section 7.2.1.1.

Note: Currently only a 2 byte FCS is supported although some PHYs (e.g. SUN, TVWS, ...) optionally support a 4 byte FCS. Needs to be changed once those PHYs should be fully supported.

IEEE802154_MTU
IEEE 802.15.4 "hardware" MTU (not to be confused with L3/IP MTU), i.e. the actual payload available to the next higher layer.

This is equivalent to the IEEE 802.15.4 MAC frame length minus checksum bytes which is again equivalent to the PHY payload aka PSDU length minus checksum bytes. This definition exists for compatibility with the same concept in Linux and Zephyr's L3. It is not a concept from the IEEE 802.15.4 standard.

Note: Currently only the original frame size from the 2006 standard version and earlier is supported. The 2015+ standard introduced PHYs with larger PHY payload. These are not (yet) supported in Zephyr.

IEEE802154_SHORT_ADDR_LENGTH
IEEE 802.15.4 short address length.

IEEE802154_EXT_ADDR_LENGTH
IEEE 802.15.4 extended address length.

IEEE802154_MAX_ADDR_LENGTH
IEEE 802.15.4 maximum address length.

IEEE802154_NO_CHANNEL
A special channel value that symbolizes “all” channels or “any” channel - depending on context.

IEEE802154_BROADCAST_ADDRESS
Represents the IEEE 802.15.4 broadcast short address, see sections 6.1 and 8.4.3, table 8-94, macShortAddress.

IEEE802154_NO_SHORT_ADDRESS_ASSIGNED
Represents a special IEEE 802.15.4 short address that indicates that a device has been associated with a coordinator but did not receive a short address, see sections 6.4.1 and 8.4.3, table 8-94, macShortAddress.

IEEE802154_BROADCAST_PAN_ID
Represents the IEEE 802.15.4 broadcast PAN ID, see section 6.1.
IEEE802154_SHORT_ADDRESS_NOT_ASSOCIATED
Represents a special value of the macShortAddress MAC PIB attribute, while the device
is not associated, see section 8.4.3, table 8-94.

IEEE802154_PAN_ID_NOT_ASSOCIATED
Represents a special value of the macPanId MAC PIB attribute, while the device is not
associated, see section 8.4.3, table 8-94.

Enums

enum ieee802154_device_role

Values:

enumerator IEEE802154_DEVICE_ROLE_ENDDEVICE

enumerator IEEE802154_DEVICE_ROLE_COORDINATOR

enumerator IEEE802154_DEVICE_ROLE_PAN_COORDINATOR

struct ieee802154_security_ctx

#include <ieee802154.h> Interface-level security attributes, see section 9.5.

Public Members

uint32_t frame_counter
Interface-level outgoing frame counter, section 9.5, table 9-8, secFrameCounter.
Only used when the driver does not implement key-specific frame counters.

uint8_t key[16]
Interface-level frame encryption security key material.
Currently native L2 only supports a single secKeySource, see section 9.5, table 9-9,
in combination with secKeyMode zero (implicit key mode), see section 9.4.2.3,
table 9-7.

Warning: This is no longer in accordance with the 2015+ versions of the stan-
dard and needs to be extended in the future for full security procedure compli-
ance.

uint8_t key_len
Length in bytes of the interface-level security key material.

uint8_t level
Frame security level, possible values are defined in section 9.4.2.2, table 9-6.
Warning: Currently native L2 allows to configure one common security level for all frame types, commands and information elements. This is no longer in accordance with the 2015+ versions of the standard and needs to be extended in the future for full security procedure compliance.

uint8_t key_mode
Frame security key mode.
Currently only implicit key mode is partially supported, see section 9.4.2.3, table 9-7, secKeyMode.

Warning: This is no longer in accordance with the 2015+ versions of the standard and needs to be extended in the future for full security procedure compliance.

struct ieee802154_context
#include <ieee802154.h> IEEE 802.15.4 L2 context.

Public Members

uint16_t pan_id
PAN ID.
The identifier of the PAN on which the device is operating. If this value is 0xffff, the device is not associated. See section 8.4.3.1, table 8-94, macPanId.
in CPU byte order

uint16_t channel
Channel Number.
The RF channel to use for all transmissions and receptions, see section 11.3, table 11-2, phyCurrentChannel. The allowable range of values is PHY dependent as defined in section 10.1.3.
in CPU byte order

uint16_t short_addr
Short Address (in CPU byte order)
Range:
• 0x0000–0xfffd: associated, short address was assigned
• 0xfffe: associated but no short address assigned
• 0xffff: not associated (default),
See section 6.4.1, table 6-4 (Usage of the short address) and section 8.4.3.1, table 8-94, macShortAddress.

uint8_t ext_addr[8]
Extended Address (in little endian)
The extended address is device specific, usually permanently stored on the device and immutable.
See section 8.4.3.1, table 8-94, macExtendedAddress.
struct net_linkaddr storage *linkaddr
    Link layer address (in big endian)

struct ieee802154_security_ctx *sec_ctx
    Security context.

struct ieee802154_req_params *scan_ctx
    Pointer to scanning parameters and results, guarded by scan_ctx_lock.

struct k_sem scan_ctx_lock
    Used to maintain integrity of data for all fields in this struct unless otherwise document on field level.

uint8_t coord_ext_addr[8]
    Coordinator extended address.
    see section 8.4.3.1, table 8-94, macCoordExtendedAddress, the address of the coordinator through which the device is associated.
    A value of zero indicates that a coordinator extended address is unknown (default).
    in little endian

uint16_t coord_short_addr
    Coordinator short address.
    see section 8.4.3.1, table 8-94, macCoordShortAddress, the short address assigned to the coordinator through which the device is associated.
    A value of 0xfffe indicates that the coordinator is only using its extended address.
    A value of 0xffff indicates that this value is unknown.
    in CPU byte order

int16_t tx_power
    Transmission power in dBm.

defined net_l2_flags flags
    L2 flags.

uint8_t sequence
    Data sequence number.
    The sequence number added to the transmitted Data frame or MAC command, see section 8.4.3.1, table 8-94, macDsn.

uint8_t device_role
    Device Role.
    See section 6.1: A device may be operating as end device (0), coordinator (1), or PAN coordinator (2). If no device role is explicitly configured then the device will be treated as an end device.
    A value of 3 is undefined.
    Can be read/set via ieee802154_device_role.
`uint8_t ack_requested`
ACK requested flag, guarded by `ack_lock`.

`uint8_t ack_seq`
ACK expected sequence number, guarded by `ack_lock`.

`struct k_sem ack_lock`
ACK lock, guards `ack_*` fields.

`struct k_sem ctx_lock`
Context lock.
This lock guards all mutable context attributes unless otherwise mentioned on attribute level.

**OpenThread L2 Adaptation Layer API**  Zephyr's OpenThread L2 platform adaptation layer glues the external OpenThread stack together with Zephyr's IEEE 802.15.4 protocol agnostic driver API. This API is of interest to OpenThread L2 subsystem contributors only.

The OpenThread API is part of the Thread protocol subsystem and documented there.

### Thread protocol

- **Overview**
- **Internet connectivity**
- **Sample usage**
- **Thread related APIs**
  - OpenThread Driver API
  - OpenThread L2 Adaptation Layer API

**Overview**  Thread is a low-power mesh networking technology, designed specifically for home automation applications. It is an IPv6-based standard, which uses 6LoWPAN technology over IEEE 802.15.4 protocol. IP connectivity lets you easily connect a Thread mesh network to the internet with a Thread Border Router.

The Thread specification provides a high level of network security. Mesh networks built with Thread are secure - only authenticated devices can join the network and all communications within the mesh are encrypted. More information about Thread protocol can be found at [Thread Group website](https://www.threadgroup.org).

Zephyr integrates an open source Thread protocol implementation called OpenThread, documented on the [OpenThread website](https://openthread.io).

**Internet connectivity**  A Thread Border Router is required to connect mesh network to the internet. An open source implementation of Thread Border Router is provided by the OpenThread community. See [OpenThread Border Router guide](https://openthread.io/docs/border-router) for instructions on how to set up a Border Router.
Sample usage  You can try using OpenThread with the Zephyr Echo server and Echo client samples, which provide out-of-the-box configuration for OpenThread. To enable OpenThread support in these samples, build them with overlay-ot.conf overlay config file. See sockets-echo-server and sockets-echo-client samples for details.

Thread related APIs

OpenThread Driver API  OpenThread L2 uses Zephyr's protocol agnostic IEEE 802.15.4 driver API internally. This API is of interest to driver developers that want to support OpenThread. The driver API is part of the IEEE 802.15.4 Driver API subsystem and documented there.

OpenThread L2 Adaptation Layer API  Zephyr's OpenThread L2 platform adaptation layer glues the external OpenThread stack together with Zephyr's IEEE 802.15.4 protocol agnostic driver API. This API is of interest to OpenThread L2 subsystem contributors only.

Related code samples

OpenThread co-processor  Build a Thread border-router using OpenThread's co-processor designs.

group openthread

OpenThread Layer 2 abstraction layer.

Defines

OPENTHREAD_L2_CTX_TYPE

Functions

int openthread_state_changed_cb_register (struct openthread_context *ot_context, struct openthread_state_changed_cb *cb)

Registers callbacks which will be called when certain configuration or state changes occur within OpenThread.

Parameters

• ot_context – the OpenThread context to register the callback with.
• cb – callback struct to register.

int openthread_state_changed_cb_unregister (struct openthread_context *ot_context, struct openthread_state_changed_cb *cb)

Unregisters OpenThread configuration or state changed callbacks.

Parameters

• ot_context – the OpenThread context to unregister the callback from.
• cb – callback struct to unregister.
void **openthread_set_state_changed_cb** (otStateChangedCallback cb)

Sets function which will be called when certain configuration or state changes within OpenThread.

**Deprecated:**

Use **openthread_state_changed_cb_register()** instead.

**Parameters**

- cb – function to call in callback procedure.

---

**k_tid_t openthread_thread_id_get**(void)

Get OpenThread thread identification.

---

**struct openthread_context **openthread_get_default_context**(void)

Get pointer to default OpenThread context.

**Return values**

- !NULL – On success.
- NULL – On failure.

---

**struct otInstance **openthread_get_default_instance**(void)

Get pointer to default OpenThread instance.

**Return values**

- !NULL – On success.
- NULL – On failure.

---

**int openthread_start**(struct openthread_context *ot_context)

Starts the OpenThread network.

Depends on active settings: it uses stored network configuration, start joining procedure or uses default network configuration. Additionally when the device is MTD, it sets the SED mode to properly attach the network.

**Parameters**

- ot_context –

---

**void openthread_api_mutex_lock**(struct openthread_context *ot_context)

Lock internal mutex before accessing OT API.

OpenThread API is not thread-safe, therefore before accessing any API function, it’s needed to lock the internal mutex, to prevent the OpenThread thread from preempting the API call.

**Parameters**

- ot_context – Context to lock.

---

**int openthread_api_mutex_try_lock**(struct openthread_context *ot_context)

Try to lock internal mutex before accessing OT API.

This function behaves like **openthread_api_mutex_lock()** provided that the internal mutex is unlocked. Otherwise, it exists immediately and returns a negative value.

**Parameters**

- ot_context – Context to lock.

**Return values**

- 0 – On success.
• <0 – On failure.

```c
void openthread_api_mutex_unlock(struct openthread_context *ot_context)
```

Unlock internal mutex after accessing OT API.

**Parameters**

- `ot_context` – Context to unlock.

```c
struct openthread_state_changed_cb
```

#include `<openthread.h>` OpenThread state change callback

OpenThread state change callback structure

Used to register a callback in the callback list. As many callbacks as needed can be added as long as each of them are unique pointers of struct `openthread_state_changed_cb`. Beware such structure should not be allocated on stack.

**Public Members**

```c
void (*state_changed_cb)(otChangedFlags flags, struct openthread_context *ot_context, void *user_data)
```

Callback for notifying configuration or state changes.

- **Param flags**
  as per OpenThread `otStateChangedCallback()` aFlags parameter. See https://openthread.io/reference/group/api-instance#otstatechangedcallback

- **Param ot_context**
  the OpenThread context the callback is registered with.

- **Param user_data**
  Data to pass to the callback.

```c
void *user_data
```

User data if required.

```c
sys_snode_t node
```

Internally used field for list handling.

- user must not directly modify

---

**Point-to-Point Protocol (PPP) Support**

- **Overview**

- **Testing**

---

**Overview** Point-to-Point Protocol (PPP) is a data link layer (layer 2) communications protocol used to establish a direct connection between two nodes. PPP is used over many types of serial links since IP packets cannot be transmitted over a modem line on their own, without some data link protocol.

In Zephyr, each individual PPP link is modelled as a network interface. This is similar to how Linux implements PPP.
PPP support must be enabled at compile time by setting option CONFIG_NET_PPP and CONFIG_NET_L2_PPP. The PPP support in Zephyr 2.0 is still experimental and the implementation supports only these protocols:

- LCP (Link Control Protocol, RFC1661)
- HDLC (High-level data link control, RFC1662)
- IPCP (IP Control Protocol, RFC1332)
- IPV6CP (IPv6 Control Protocol, RFC5072)

See also the samples/net/sockets/echo_server/overlay-ppp.conf file for configuration option examples. For using PPP with GSM modem, see Generic GSM Modem for additional information.

Testing  See the net-tools README file for more details on how to test the Zephyr PPP against pppd running in Linux.

Wi-Fi Management

Overview  The Wi-Fi management API is used to manage Wi-Fi networks. It supports below modes:

- IEEE802.11 Station (STA)
- IEEE802.11 Access Point (AP)

Only personal mode security is supported with below types:

- Open
- WPA2-PSK
- WPA3-PSK-256
- WPA3-SAE

The Wi-Fi management API is implemented in the wifi_mgmt module as a part of the networking L2 stack. Currently, two types of Wi-Fi drivers are supported:

- Networking or socket offloaded drivers
- Native L2 Ethernet drivers

API Reference

group wifi_mgmt

Wi-Fi Management API.

Wi-Fi utility functions.

Utility functions for the Wi-Fi subsystem.

int wifi_utils_parse_scan_bands(char *scan_bands_str, uint8_t *band_map)

Convert a band specification string to a bitmap representing the bands.

The function will parse a string which specifies Wi-Fi frequency band values as a comma separated string and convert it to a bitmap. The string can use the following characters to represent the bands:
• 2: 2.4 GHz
• 5: 5 GHz
• 6: 6 GHz

For the bitmap generated refer to `wifi_frequency_bands` for bit position of each band.

E.g. a string “2,5,6” will be converted to a bitmap value of 0x7

**Parameters**

- `scan_bands_str` – String which spe.
- `band_map` – Pointer to the bitmap variable to be updated.

**Return values**

- 0 – on success.
- `-errno` – value in case of failure.

```c
int wifi_utils_parse_scan_bands(char *scan_bands_str, const char *ssids[], uint8_t num_ssids)
```

Append a string containing an SSID to an array of SSID strings.

**Parameters**

- `scan_ssids_str` – string to be appended in the list of scanned SSIDs.
- `ssids` – Pointer to an array where the SSIDs pointers are to be stored.
- `num_ssids` – Maximum number of SSIDs that can be stored.

**Return values**

- 0 – on success.
- `-errno` – value in case of failure.

```c
int wifi_utils_parse_scan_chan(char *scan_chan_str, struct wifi_channel *chan, uint8_t max_channels)
```

Convert a string containing a specification of scan channels to an array.

The function will parse a string which specifies channels to be scanned as a string and convert it to an array.

The channel string has to be formatted using the colon (:), comma(,), hyphen (-) and underscore (_) delimiters as follows:

- A colon identifies the value preceding it as a band. A band value (2: 2.4 GHz, 5: 5 GHz 6: 6 GHz) has to precede the channels in that band (e.g. 2: etc)
- Hyphens (-) are used to identify channel ranges (e.g. 2-7, 32-48 etc)
- Commas are used to separate channel values within a band. Channels can be specified as individual values (2,6,48 etc) or channel ranges using hyphens (1-14, 32-48 etc)
- Underscores (_) are used to specify multiple band-channel sets (e.g. 2:1,2_5:36,40 etc)
- No spaces should be used anywhere, i.e. before/after commas, before/after hyphens etc.

An example channel specification specifying channels in the 2.4 GHz and 5 GHz bands is as below: 2:1,5,7,9-11_5:36-48,100,163-167

**Parameters**

- `scan_chan_str` – List of channels expressed in the format described above.
• chan – Pointer to an array where the parsed channels are to be stored.
• max_channels – Maximum number of channels to store

Return values
• 0 – on success.
• -errno – value in case of failure.

Enums

enum wifi_security_type
IEEE 802.11 security types.

Values:

enumerator WIFI_SECURITY_TYPE_NONE = 0
No security.

enumerator WIFI_SECURITY_TYPE_PSK
WPA2-PSK security.

enumerator WIFI_SECURITY_TYPE_PSK_SHA256
WPA2-PSK-SHA256 security.

enumerator WIFI_SECURITY_TYPE_SAE
WPA3-SAE security.

enumerator WIFI_SECURITY_TYPE_WAPI
GB 15629.11-2003 WAPI security.

enumerator WIFI_SECURITY_TYPE_EAP
EAP security - Enterprise.
enumerator WIFI_SECURITY_TYPE_WEP
   WEP security.

enumerator WIFI_SECURITY_TYPE_WPA_PSK
   WPA-PSK security.

enumerator __WIFI_SECURITY_TYPE_AFTER_LAST

enumerator WIFI_SECURITY_TYPE_MAX = __WIFI_SECURITY_TYPE_AFTER_LAST - 1

enumerator WIFI_SECURITY_TYPE_UNKNOWN

enum wifi_mfp_options
   IEEE 802.11w - Management frame protection.
   Values:

   enumerator WIFI_MFP_DISABLE = 0
      MFP disabled.

   enumerator WIFI_MFP_OPTIONAL
      MFP optional.

   enumerator WIFI_MFP_REQUIRED
      MFP required.

   enumerator __WIFI_MFP_AFTER_LAST

   enumerator WIFI_MFP_MAX = __WIFI_MFP_AFTER_LAST - 1

   enumerator WIFI_MFP_UNKNOWN

enum wifi_frequency_bands
   IEEE 802.11 operational frequency bands (not exhaustive).
   Values:

   enumerator WIFI_FREQ_BAND_2_4_GHZ = 0
      2.4 GHz band.

   enumerator WIFI_FREQ_BAND_5_GHZ
      5 GHz band.

   enumerator WIFI_FREQ_BAND_6_GHZ
      6 GHz band (Wi-Fi 6E, also extends to 7GHz).

   enumerator __WIFI_FREQ_BAND_AFTER_LAST
      Number of frequency bands available.
enumerator WIFI_FREQ_BAND_MAX = __WIFI_FREQ_BAND_AFTER_LAST - 1
    Highest frequency band available.

enumerator WIFI_FREQ_BAND_UNKNOWN
    Invalid frequency band.

enum wifi_iface_state
    Wi-Fi interface states.
    Based on https://w1.fi/wpa_supplicant/devel/defs_8h.html#a4aeb27c1e4abd046df3064ea9756f0bc
    Values:

enumerator WIFI_STATE_DISCONNECTED = 0
    Interface is disconnected.

enumerator WIFI_STATE_INTERFACE_DISABLED
    Interface is disabled (administratively).

enumerator WIFI_STATE_INACTIVE
    No enabled networks in the configuration.

enumerator WIFI_STATE_SCANNING
    Interface is scanning for networks.

enumerator WIFI_STATE_AUTHENTICATING
    Authentication with a network is in progress.

enumerator WIFI_STATE_ASSOCIATING
    Association with a network is in progress.

enumerator WIFI_STATE_ASSOCIATED
    Association with a network completed.

enumerator WIFI_STATE_4WAY_HANDSHAKE
    4-way handshake with a network is in progress.

enumerator WIFI_STATE_GROUP_HANDSHAKE
    Group Key exchange with a network is in progress.

enumerator WIFI_STATE_COMPLETED
    All authentication completed, ready to pass data.

enumerator __WIFI_STATE_AFTER_LAST

enumerator WIFI_STATE_MAX = __WIFI_STATE_AFTER_LAST - 1

enumerator WIFI_STATE_UNKNOWN

6.3. Networking
enum wifi_iface_mode
    Wi-Fi interface modes.
    Based on [https://w1.fi/wpa_supplicant/devel/defs_8h.html#a4aeb27c1e4abd046df3064ea9756f0bc](https://w1.fi/wpa_supplicant/devel/defs_8h.html#a4aeb27c1e4abd046df3064ea9756f0bc)

Values:

enumerator WIFI_MODE_INFRA = 0
    Infrastructure station mode.

enumerator WIFI_MODE_IBSS = 1
    IBSS (ad-hoc) station mode.

enumerator WIFI_MODE_AP = 2
    AP mode.

enumerator WIFI_MODE_P2P_GO = 3
    P2P group owner mode.

enumerator WIFI_MODE_P2P_GROUPFORMATION = 4
    P2P group formation mode.

enumerator WIFI_MODE_MESH = 5
    802.11s Mesh mode.

enumerator __WIFI_MODE_AFTER_LAST

enumerator WIFI_MODE_MAX = __WIFI_MODE_AFTER_LAST - 1

enumerator WIFI_MODE_UNKNOWN

enum wifi_link_mode
    Wi-Fi link operating modes.
    As per [https://en.wikipedia.org/wiki/Wi-Fi#Versions_and_generations](https://en.wikipedia.org/wiki/Wi-Fi#Versions_and_generations).

Values:

enumerator WIFI_0 = 0
    802.11 (legacy).

enumerator WIFI_1
    802.11b.

enumerator WIFI_2
    802.11a.

enumerator WIFI_3
    802.11g.
enumerator WIFI_4
802.11n.

denumerator WIFI_5
802.11ac.

denumerator WIFI_6
802.11ax.

denumerator WIFI_6E
802.11ax 6GHz.

denumerator WIFI_7
802.11be.

denumerator __WIFI_LINK_MODE_AFTER_LAST

denumerator WIFI_LINK_MODE_MAX = __WIFI_LINK_MODE_AFTER_LAST - 1

denumerator WIFI_LINK_MODE_UNKNOWN

denum wifi_scan_type
  Wi-Fi scanning types.
  Values:
  
  enumerator WIFI_SCAN_TYPE_ACTIVE = 0
  Active scanning (default).

  enumerator WIFI_SCAN_TYPE_PASSIVE
  Passive scanning.

denum wifi_ps
  Wi-Fi power save states.
  Values:
  
  enumerator WIFI_PS_DISABLED = 0
  Power save disabled.

  enumerator WIFI_PS_ENABLED
  Power save enabled.

denum wifi_ps_mode
  Wi-Fi power save modes.
  Values:
  
  enumerator WIFI_PS_MODE_LEGACY = 0
  Legacy power save mode.
enumerator WIFI_PS_MODE_WMM
    WMM power save mode.

eenum wifi_operational_modes
    Wifi operational mode.
    Values:

    enumerator WIFI_STA_MODE = BIT(0)
        STA mode setting enable.

    enumerator WIFI_MONITOR_MODE = BIT(1)
        Monitor mode setting enable.

    enumerator WIFI_TX_INJECTION_MODE = BIT(2)
        TX injection mode setting enable.

    enumerator WIFI_PROMISCUOUS_MODE = BIT(3)
        Promiscuous mode setting enable.

    enumerator WIFI_AP_MODE = BIT(4)
        AP mode setting enable.

    enumerator WIFI_SOFTAP_MODE = BIT(5)
        Softap mode setting enable.

eenum wifi_filter
    Mode filter settings.
    Values:

    enumerator WIFI_PACKET_FILTER_ALL = BIT(0)
        Support management, data and control packet sniffing.

    enumerator WIFI_PACKET_FILTER_MGMT = BIT(1)
        Support only sniffing of management packets.

    enumerator WIFI_PACKET_FILTER_DATA = BIT(2)
        Support only sniffing of data packets.

    enumerator WIFI_PACKET_FILTER_CTRL = BIT(3)
        Support only sniffing of control packets.

eenum wifi_twt_operation
    Wi-Fi Target Wake Time (TWT) operations.
    Values:

    enumerator WIFI_TWT_SETUP = 0
        TWT setup operation.
enumerator `WIFI_TWT_TEARDOWN`
   TWT teardown operation.

enum `wifi_twt_negotiation_type`
   Wi-Fi Target Wake Time (TWT) negotiation types.
   
   * **enumerator `WIFI_TWT_INDIVIDUAL` = 0**
     TWT individual negotiation.

   * **enumerator `WIFI_TWT_BROADCAST`**
     TWT broadcast negotiation.

   * **enumerator `WIFI_TWT_WAKE_TBTT`**
     TWT wake TBTT negotiation.

enum `wifi_twt_setup_cmd`
   Wi-Fi Target Wake Time (TWT) setup commands.
   
   * **enumerator `WIFI_TWT_SETUP_CMD_REQUEST` = 0**
     TWT setup request.

   * **enumerator `WIFI_TWT_SETUP_CMD_SUGGEST`**
     TWT setup suggest (parameters can be changed by AP)

   * **enumerator `WIFI_TWT_SETUP_CMD_DEMAND`**
     TWT setup demand (parameters can not be changed by AP)

   * **enumerator `WIFI_TWT_SETUP_CMD_GROUPING`**
     TWT setup grouping (grouping of TWT flows)

   * **enumerator `WIFI_TWT_SETUP_CMD_ACCEPT`**
     TWT setup accept (parameters accepted by AP)

   * **enumerator `WIFI_TWT_SETUP_CMD_ALTERNATE`**
     TWT setup alternate (alternate parameters suggested by AP)

   * **enumerator `WIFI_TWT_SETUP_CMD_DICTATE`**
     TWT setup dictate (parameters dictated by AP)

   * **enumerator `WIFI_TWT_SETUP_CMD_REJECT`**
     TWT setup reject (parameters rejected by AP)

enum `wifi_twt_setup_resp_status`
   Wi-Fi Target Wake Time (TWT) negotiation status.
   
   * **enumerator `WIFI_TWT_SETUP_RESP_STATUS`**
     TWT setup accept (parameters accepted by AP)
enumerator WIFI_TWT_RESP_RECEIVED = 0
    TWT response received for TWT request.

denumerator WIFI_TWT_RESP_NOT_RECEIVED
    TWT response not received for TWT request.

denum wifi_twt_fail_reason
    Target Wake Time (TWT) error codes.
    Values:

denumerator WIFI_TWT_FAIL_UNSPECIFIED
    Unspecified error.

denumerator WIFI_TWT_FAIL_CMD_EXEC_FAIL
    Command execution failed.

denumerator WIFI_TWT_FAIL_OPERATION_NOT_SUPPORTED
    Operation not supported.

denumerator WIFI_TWT_FAIL_UNABLE_TO_GET_IFACE_STATUS
    Unable to get interface status.

denumerator WIFI_TWT_FAIL_DEVICE_NOT_CONNECTED
    Device not connected to AP.

denumerator WIFI_TWT_FAIL_PEER_NOT_HE_CAPAB
    Peer not HE (802.11ax/Wi-Fi 6) capable.

denumerator WIFI_TWT_FAIL_PEER_NOT_TWT_CAPAB
    Peer not TWT capable.

denumerator WIFI_TWT_FAIL_OPERATION_IN_PROGRESS
    A TWT flow is already in progress.

denumerator WIFI_TWT_FAIL_INVALID_FLOW_ID
    Invalid negotiated flow id.

denumerator WIFI_TWT_FAIL_IP_NOT_ASSIGNED
    IP address not assigned or configured.

denumerator WIFI_TWT_FAIL_FLOW_ALREADY_EXISTS
    Flow already exists.

denum wifi_ps_param_type
    Wi-Fi power save parameters.
    Values:
enumerator WIFI_PS_PARAM_STATE
   Power save state.

enumerator WIFI_PS_PARAM_LISTEN_INTERVAL
   Power save listen interval.

enumerator WIFI_PS_PARAM_WAKEUP_MODE
   Power save wakeup mode.

enumerator WIFI_PS_PARAM_MODE
   Power save mode.

enumerator WIFI_PS_PARAM_TIMEOUT
   Power save timeout.

enum wifi_ps_wakeup_mode
   Wi-Fi power save modes.
   Values:

   enumerator WIFI_PS_WAKEUP_MODE_DTIM = 0
      DTIM based wakeup.

   enumerator WIFI_PS_WAKEUP_MODE_LISTEN_INTERVAL
      Listen interval based wakeup.

enum wifi_config_ps_param_fail_reason
   Wi-Fi power save error codes.
   Values:

   enumerator WIFI_PS_PARAM_FAIL_UNSPECIFIED
      Unspecified error.

   enumerator WIFI_PS_PARAM_FAIL_CMD_EXEC_FAIL
      Command execution failed.

   enumerator WIFI_PS_PARAM_FAIL_OPERATION_NOT_SUPPORTED
      Parameter not supported.

   enumerator WIFI_PS_PARAM_FAIL_UNABLE_TO_GET_IFACE_STATUS
      Unable to get interface status.

   enumerator WIFI_PS_PARAM_FAIL_DEVICE_NOT_CONNECTED
      Device not connected to AP.

   enumerator WIFI_PS_PARAM_FAIL_DEVICE_CONNECTED
      Device already connected to AP.

6.3. Networking
enumerator WIFI_PS_PARAM_LISTEN_INTERVAL_RANGE_INVALID
  Listen interval out of range.

enum net_request_wifi_cmd
  Wi-Fi management commands.
  Values:

  enumerator NET_REQUEST_WIFI_CMD_SCAN = 1
     Scan for Wi-Fi networks.

  enumerator NET_REQUEST_WIFI_CMD_CONNECT
     Connect to a Wi-Fi network.

  enumerator NET_REQUEST_WIFI_CMD_DISCONNECT
     Disconnect from a Wi-Fi network.

  enumerator NET_REQUEST_WIFI_CMD_AP_ENABLE
     Enable AP mode.

  enumerator NET_REQUEST_WIFI_CMD_AP_DISABLE
     Disable AP mode.

  enumerator NET_REQUEST_WIFI_CMD_IFACE_STATUS
     Get interface status.

  enumerator NET_REQUEST_WIFI_CMD_PS
     Set power save status.

  enumerator NET_REQUEST_WIFI_CMD_PS_MODE
     Set power save mode.

  enumerator NET_REQUEST_WIFI_CMD_TWT
     Setup or teardown TWT flow.

  enumerator NET_REQUEST_WIFI_CMD_PS_CONFIG
     Get power save config.

  enumerator NET_REQUEST_WIFI_CMD_REG_DOMAIN
     Set or get regulatory domain.

  enumerator NET_REQUEST_WIFI_CMD_PS_TIMEOUT
     Set power save timeout.

  enumerator NET_REQUEST_WIFI_CMD_MODE
     Set or get Mode of operation.

  enumerator NET_REQUEST_WIFI_CMD_PACKET_FILTER
     Set or get packet filter setting for current mode.
enumerator NET_REQUEST_WIFI_CMD_CHANNEL
   Set or get Wi-Fi channel for Monitor or TX-Injection mode.

enumerator NET_REQUEST_WIFI_CMD_MAX

enum net_event_wifi_cmd
   Wi-Fi management events.
   Values:

   enumerator NET_EVENT_WIFI_CMD_SCAN_RESULT = 1
      Scan results available.

   enumerator NET_EVENT_WIFI_CMD_SCAN_DONE
      Scan done.

   enumerator NET_EVENT_WIFI_CMD_CONNECT_RESULT
      Connect result.

   enumerator NET_EVENT_WIFI_CMD_DISCONNECT_RESULT
      Disconnect result.

   enumerator NET_EVENT_WIFI_CMD_IFACE_STATUS
      Interface status.

   enumerator NET_EVENT_WIFI_CMD_TWT
      TWT events.

   enumerator NET_EVENT_WIFI_CMD_TWT_SLEEP_STATE
      TWT sleep status: awake or sleeping, can be used by application to determine if it can send data or not.

   enumerator NET_EVENT_WIFI_CMD_RAW_SCAN_RESULT
      Raw scan results available.

   enumerator NET_EVENT_WIFI_CMD_DISCONNECT_COMPLETE
      Disconnect complete.

enum wifi_mgmt_op
   Generic get/set operation for any command.
   Values:

   enumerator WIFI_MGMT_GET = 0
      Get operation.

   enumerator WIFI_MGMT_SET = 1
      Set operation.
enum wifi_twt_sleep_state
    Wi-Fi TWT sleep states.
    Values:

    enumerator WIFI_TWT_STATE_SLEEP = 0
    TWT sleep state: sleeping.

    enumerator WIFI_TWT_STATE_AWAKE = 1
    TWT sleep state: awake.

Functions

const char *wifi_security_txt(enum wifi_security_type security)
    Helper function to get user-friendly security type name.

const char *wifi_mfp_txt(enum wifi_mfp_options mfp)
    Helper function to get user-friendly MFP name.

const char *wifi_band_txt(enum wifi_frequency_bands band)
    Helper function to get user-friendly frequency band name.

const char *wifi_state_txt(enum wifi_iface_state state)
    Helper function to get user-friendly interface state name.

const char *wifi_mode_txt(enum wifi_iface_mode mode)
    Helper function to get user-friendly interface mode name.

const char *wifi_link_mode_txt(enum wifi_link_mode link_mode)
    Helper function to get user-friendly link mode name.

const char *wifi_ps_txt(enum wifi_ps ps_name)
    Helper function to get user-friendly ps name.

const char *wifi_ps_mode_txt(enum wifi_ps_mode ps_mode)
    Helper function to get user-friendly ps mode name.

const char *wifi_twt_operation_txt(enum wifi_twt_operation twt_operation)
    Helper function to get user-friendly twt operation name.

const char *wifi_twt_negotiation_type_txt(enum wifi_twt_negotiation_type twt_negotiation)
    Helper function to get user-friendly twt negotiation type name.

const char *wifi_twt_setup_cmd_txt(enum wifi_twt_setup_cmd twt_setup)
    Helper function to get user-friendly twt setup cmd name.

static inline const char *wifi_twt_get_err_code_str(int16_t err_no)
    Helper function to get user-friendly TWT error code name.

const char *wifi_ps_wakeup_mode_txt(enum wifi_ps_wakeup_mode ps_wakeup_mode)
    Helper function to get user-friendly ps wakeup mode name.

static inline const char *wifi_ps_get_config_err_code_str(int16_t err_no)
    Helper function to get user-friendly power save error code name.
void wifi_mgmt_raise_connect_result_event(struct net_if *iface, int status)
   Wi-Fi management connect result event.
   Parameters
   • iface – Network interface
   • status – Connect result status

void wifi_mgmt_raise_disconnect_result_event(struct net_if *iface, int status)
   Wi-Fi management disconnect result event.
   Parameters
   • iface – Network interface
   • status – Disconnect result status

void wifi_mgmt_raise_iface_status_event(struct net_if *iface, struct wifi_iface_status *iface_status)
   Wi-Fi management interface status event.
   Parameters
   • iface – Network interface
   • iface_status – Interface status

void wifi_mgmt_raise_twt_event(struct net_if *iface, struct wifi_twt_params *twt_params)
   Wi-Fi management TWT event.
   Parameters
   • iface – Network interface
   • twt_params – TWT parameters

void wifi_mgmt_raise_twt_sleep_state(struct net_if *iface, int twt_sleep_state)
   Wi-Fi management TWT sleep state event.
   Parameters
   • iface – Network interface
   • twt_sleep_state – TWT sleep state

void wifi_mgmt_raise_raw_scan_result_event(struct net_if *iface, struct wifi_raw_scan_result *raw_scan_info)
   Wi-Fi management raw scan result event.
   Parameters
   • iface – Network interface
   • raw_scan_info – Raw scan result

void wifi_mgmt_raise_disconnect_complete_event(struct net_if *iface, int status)
   Wi-Fi management disconnect complete event.
   Parameters
   • iface – Network interface
   • status – Disconnect complete status

struct wifi_band_channel
   #include <wifi_mgmt.h> Wi-Fi structure to uniquely identify a band-channel pair.
Public Members

**uint8_t**

*band*

Frequency band.

**uint8_t**

*channel*

Channel.

**struct wifi_scan_params**

`#include <wifi_mgmt.h>` Wi-Fi scan parameters structure.

Used to specify parameters which can control how the Wi-Fi scan is performed.

Public Members

**enum wifi_scan_type**

*scan_type*

Scan type, see `enum wifi_scan_type`.

The *scan_type* is only a hint to the underlying Wi-Fi chip for the preferred mode of scan. The actual mode of scan can depend on factors such as the Wi-Fi chip implementation support, regulatory domain restrictions etc.

**uint8_t**

*bands*

Bitmap of bands to be scanned.

Refer to `wifi_frequency_bands` for bit position of each band.

**uint16_t**

*dwell_time_active*

Active scan dwell time (in ms) on a channel.

**uint16_t**

*dwell_time_passive*

Passive scan dwell time (in ms) on a channel.

**const char **

*ssids[1]*

Array of SSID strings to scan.

**uint16_t**

*max_bss_cnt*

Specifies the maximum number of scan results to return.

These results would be the BSSIDS with the best RSSI values, in all the scanned channels. This should only be used to limit the number of returned scan results, and cannot be counted upon to limit the scan time, since the underlying Wi-Fi chip might have to scan all the channels to find the *max_bss_cnt* number of APs with the best signal strengths. A value of 0 signifies that there is no restriction on the number of scan results to be returned.

**struct wifi_band_channel**

*band_chan[1]*

Channel information array indexed on Wi-Fi frequency bands and channels within that band.

E.g. to scan channel 6 and 11 on the 2.4 GHz band, channel 36 on the 5 GHz band:
This list specifies the channels to be considered for scan. The underlying Wi-Fi chip can silently omit some channels due to various reasons such as channels not conforming to regulatory restrictions etc. The invoker of the API should ensure that the channels specified follow regulatory rules.

```
chan[0] = {WIFI_FREQ_BAND_2_4_GHZ, 6};
chan[1] = {WIFI_FREQ_BAND_2_4_GHZ, 11};
chan[2] = {WIFI_FREQ_BAND_5_GHZ, 36};
```

struct wifi_scan_result

```
#include <wifi_mgmt.h>
```

Wi-Fi scan result, each result is provided to the `net_mgmt_event_callback` via its info attribute (see `net_mgmt.h`)

**Public Members**

- `uint8_t ssid[WIFI_SSID_MAX_LEN]`  
  SSID.

- `uint8_t ssid_length`  
  SSID length.

- `uint8_t band`  
  Frequency band.

- `uint8_t channel`  
  Channel.

- `enum wifi_security_type security`  
  Security type.

- `enum wifi_mfp_options mfp`  
  MFP options.

- `int8_t rssi`  
  RSSI.

- `uint8_t mac[WIFI_MAC_ADDR_LEN]`  
  BSSID.

- `uint8_t mac_length`  
  BSSID length.

```
struct wifi_connect_req_params

#include <wifi_mgmt.h>
```

Wi-Fi connect request parameters.

**Public Members**
const uint8_t *ssid
  SSID.

uint8_t ssid_length
  SSID length.

uint8_t *psk
  Pre-shared key.

uint8_t psk_length
  Pre-shared key length.

uint8_t *sae_password
  SAE password (same as PSK but with no length restrictions), optional.

uint8_t sae_password_length
  SAE password length.

uint8_t band
  Frequency band.

uint8_t channel
  Channel.

define wifi_security_type security
  Security type.

define wifi_mfp_options mfp
  MFP options.

int timeout
  Connect timeout in seconds, SYS_FOREVER_MS for no timeout.

struct wifi_status
  #include <wifi_mgmt.h> Generic Wi-Fi status for commands and events.

struct wifi_iface_status
  #include <wifi_mgmt.h> Wi-Fi interface status.

Public Members

int state
  Interface state, see enum wifi_iface_state.

unsigned int ssid_len
  SSID length.
char ssid[WiFi_SSID_MAX_LEN]
  SSID.

char bssid[WiFi_MAC_ADDR_LEN]
  BSSID.

enum wifi_frequency_bands band
  Frequency band.

unsigned int channel
  Channel.

enum wifi_iface_mode iface_mode
  Interface mode, see enum wifi_iface_mode.

enum wifi_link_mode link_mode
  Link mode, see enum wifi_link_mode.

enum wifi_security_type security
  Security type, see enum wifi_security_type.

enum wifi_mfp_options mfp
  MFP options, see enum wifi_mfp_options.

int rssi
  RSSI.

unsigned char dtim_period
  DTIM period.

unsigned short beacon_interval
  Beacon interval.

bool twt_capable
  is TWT capable?

struct wifi_ps_params
  #include <wifi_mgmt.h> Wi-Fi power save parameters.

  Public Members

enum wifi_ps_wakeup_mode wakeup_mode
  Wi-Fi power save wakeup mode.

enum wifi_ps_mode mode
  Wi-Fi power save mode.
unsigned int timeout_ms
    Wi-Fi power save timeout.
    This is the time out to wait after sending a TX packet before going back to power save (in ms) to receive any replies from the AP. Zero means this feature is disabled.
    It's a tradeoff between power consumption and latency.

enum wifi_ps_param_type type
    Wi-Fi power save type.

enum wifi_config_ps_param_fail_reason fail_reason
    Wi-Fi power save fail reason.

struct wifi_twt_params
    #include <wifi_mgmt.h> Wi-Fi TWT parameters.

Public Members

enum wifi_twt_operation operation
    TWT operation, see enum wifi_twt_operation.

enum wifi_twt_negotiation_type negotiation_type
    TWT negotiation type, see enum wifi_twt_negotiation_type.

enum wifi_twt_setup_cmd setup_cmd
    TWT setup command, see enum wifi_twt_setup_cmd.

enum wifi_twt_setup_resp_status resp_status
    TWT setup response status, see enum wifi_twt_setup_resp_status.

uint8_t dialog_token
    Dialog token, used to map requests to responses.

uint8_t flow_id
    Flow ID, used to map setup with teardown.

uint64_t twt_interval
    Interval = Wake up time + Sleeping time.

bool responder
    Requestor or responder.

bool trigger
    Trigger enabled or disabled.

bool implicit
    Implicit or explicit.
bool announce
    Announced or unannounced.

uint32_t twt_wake_interval
    Wake up time.

struct wifi_twt_params.[anonymous],[anonymous] setup
    Setup specific parameters.

bool teardown_all
    Teardown all flows.

struct wifi_twt_params.[anonymous],[anonymous] teardown
    Teardown specific parameters.

enum wifi_twt_fail_reason fail_reason
    TWT fail reason, see enum wifi_twt_fail_reason.

struct wifi_twt_flow_info
    #include <wifi_mgmt.h> Wi-Fi TWT flow information.

Public Members

uint64_t twt_interval
    Interval = Wake up time + Sleeping time.

uint8_t dialog_token
    Dialog token, used to map requests to responses.

uint8_t flow_id
    Flow ID, used to map setup with teardown.

enum wifi_twt_negotiation_type negotiation_type
    TWT negotiation type, see enum wifi_twt_negotiation_type.

bool responder
    Requestor or responder.

bool trigger
    Trigger enabled or disabled.

bool implicit
    Implicit or explicit.

bool announce
    Announced or unannounced.

```c
uint32_t twt_wake_interval
    Wake up time.

struct wifi_ps_config
    #include <wifi_mgmt.h> Wi-Fi power save configuration.

    Public Members

    char num_twt_flows
        Number of TWT flows.

    struct wifi_twt_flow_info twt_flows[8]
        TWT flow details.

    struct wifi_ps_params ps_params
        Power save configuration.

struct wifi_reg_domain
    #include <wifi_mgmt.h> Regulatory domain information or configuration.

    Public Members

    bool force
        Ignore all other regulatory hints over this one.

    uint8_t country_code[WIFI_COUNTRY_CODE_LEN]

struct wifi_raw_scan_result
    #include <wifi_mgmt.h> Wi-Fi raw scan result.

    Public Members

    int8_t rssi
        RSSI.

    int frame_length
        Frame length.

    unsigned short frequency
        Frequency.

    uint8_t data[CONFIG_WIFI_MGMT_RAW_SCAN_RESULT_LENGTH]
        Raw scan data.

union wifi_mgmt_events
    #include <wifi_mgmt.h>

struct wifi_iface_status iface_status
struct wifi_twt_params twt_params

struct wifi_mode_info
#include <wifi_mgmt.h> Wi-Fi mode setup.

Public Members

uint8_t mode
Mode setting for a specific mode of operation.

uint8_t if_index
Interface index.

denum wifi_mgmt_op oper
Get or set operation.

struct wifi_filter_info
#include <wifi_mgmt.h> Wi-Fi filter setting for monitor, promiscuous, TX-injection modes.

Public Members

uint8_t filter
Filter setting.

uint8_t if_index
Interface index.

uint16_t buffer_size
Filter buffer size.

denum wifi_mgmt_op oper
Get or set operation.

struct wifi_channel_info
#include <wifi_mgmt.h> Wi-Fi channel setting for monitor and TX-injection modes.
Public Members

uint16_t channel
Channel value to set.

uint8_t if_index
Interface index.

enum wifi_mgmt_op oper
Get or set operation.

struct wifi_mgmt_ops
#include <wifi_mgmt.h>
Wi-Fi management API.

Public Members

int (*scan)(const struct device *dev, struct wifi_scan_params *params, scan_result_cb_t cb)
Scan for Wi-Fi networks.
    Param dev
        Pointer to the device structure for the driver instance.
    Param params
        Scan parameters
    Param cb
        Callback to be called for each result cb parameter is the cb that should be called for each result by the driver. The wifi mgmt part will take care of raising the necessary event etc.
    Return
        0 if ok, < 0 if error

int (*connect)(const struct device *dev, struct wifi_connect_req_params *params)
Connect to a Wi-Fi network.
    Param dev
        Pointer to the device structure for the driver instance.
    Param params
        Connect parameters
    Return
        0 if ok, < 0 if error

int (*disconnect)(const struct device *dev)
Disconnect from a Wi-Fi network.
    Param dev
        Pointer to the device structure for the driver instance.
    Return
        0 if ok, < 0 if error

int (*ap_enable)(const struct device *dev, struct wifi_connect_req_params *params)
Enable AP mode.
    Param dev
        Pointer to the device structure for the driver instance.
    Param params
        AP mode parameters
**Return**

0 if ok, < 0 if error

`int (*ap_disable)(const struct device *dev)`  
Disable AP mode.  

**Param** `dev`  
Pointer to the device structure for the driver instance.  

**Return**  
0 if ok, < 0 if error

`int (*iface_status)(const struct device *dev, struct wifi_iface_status *status)`  
Get interface status.  

**Param** `dev`  
Pointer to the device structure for the driver instance.  

**Param** `status`  
Interface status  

**Return**  
0 if ok, < 0 if error

`int (*get_stats)(const struct device *dev, struct net_stats_wifi *stats)`  
Get Wi-Fi statistics.  

**Param** `dev`  
Pointer to the device structure for the driver instance.  

**Param** `stats`  
Wi-Fi statistics  

**Return**  
0 if ok, < 0 if error

`int (*set_power_save)(const struct device *dev, struct wifi_ps_params *params)`  
Set power save status.  

**Param** `dev`  
Pointer to the device structure for the driver instance.  

**Param** `params`  
Power save parameters  

**Return**  
0 if ok, < 0 if error

`int (*set_twt)(const struct device *dev, struct wifi_twt_params *params)`  
Setup or teardown TWT flow.  

**Param** `dev`  
Pointer to the device structure for the driver instance.  

**Param** `params`  
TWT parameters  

**Return**  
0 if ok, < 0 if error

`int (*get_power_save_config)(const struct device *dev, struct wifi_ps_config *config)`  
Get power save config.  

**Param** `dev`  
Pointer to the device structure for the driver instance.  

**Param** `config`  
Power save config  

**Return**  
0 if ok, < 0 if error
int (*reg_domain)(const struct device *dev, struct wifi_reg_domain *reg_domain)
Set or get regulatory domain.
  **Param dev**
  Pointer to the device structure for the driver instance.
  **Param reg_domain**
  Regulatory domain
  **Return**
  0 if ok, < 0 if error

int (*filter)(const struct device *dev, struct wifi_filter_info *filter)
Set or get packet filter settings for monitor and promiscuous modes.
  **Param dev**
  Pointer to the device structure for the driver instance.
  **Param packet**
  filter settings
  **Return**
  0 if ok, < 0 if error

int (*mode)(const struct device *dev, struct wifi_mode_info *mode)
Set or get mode of operation.
  **Param dev**
  Pointer to the device structure for the driver instance.
  **Param mode**
  settings
  **Return**
  0 if ok, < 0 if error

int (*channel)(const struct device *dev, struct wifi_channel_info *channel)
Set or get current channel of operation.
  **Param dev**
  Pointer to the device structure for the driver instance.
  **Param channel**
  settings
  **Return**
  0 if ok, < 0 if error

struct net_wifi_mgmt_offload
#include <wifi_mgmt.h> Wi-Fi management offload API.

**Public Members**

struct ethernet_api wifi_iface
Mandatory to get in first position.
A network device should indeed provide a pointer on such net_if_api structure.
So we make current structure pointer that can be casted to a net_if_api structure
pointer. Ethernet API

const struct wifi_mgmt_ops *const wifi_mgmt_api
Wi-Fi management API.
Protocols

CoAP

- **Overview**
- **Sample Usage**
  - CoAP Server
  - CoAP Client
- **Testing**
  - libcoap
  - TTCN3
- **API Reference**

**Overview**  The Constrained Application Protocol (CoAP) is a specialized web transfer protocol for use with constrained nodes and constrained (e.g., low-power, lossy) networks. It provides a convenient API for RESTful Web services that support CoAP's features. For more information about the protocol itself, see IETF RFC7252 The Constrained Application Protocol.

Zephyr provides a CoAP library which supports client and server roles. The library is configurable as per user needs. The Zephyr CoAP library is implemented using plain buffers. Users of the API create sockets for communication and pass the buffer to the library for parsing and other purposes. The library itself doesn't create any sockets for users.

On top of CoAP, Zephyr has support for LWM2M “Lightweight Machine 2 Machine” protocol, a simple, low-cost remote management and service enablement mechanism. See Lightweight M2M (LWM2M) for more information.

**Supported RFCs:**

- RFC7252: The Constrained Application Protocol (CoAP)
- RFC6690: Constrained RESTful Environments (CoRE) Link Format
- RFC7959: Block-Wise Transfers in the Constrained Application Protocol (CoAP)
- RFC7641: Observing Resources in the Constrained Application Protocol (CoAP)

**Note:** Not all parts of these RFCs are supported. Features are supported based on Zephyr requirements.

**Sample Usage**

**CoAP Server**  To create a CoAP server, resources for the server need to be defined. The .well-known/core resource should be added before all other resources that should be included in the responses of the .well-known/core resource.

```c
static struct coap_resource resources[] = {
    {.get = well_known_core_get,
     .path = COAP_WELL_KNOWN_CORE_PATH,
    },
,...
```

(continues on next page)
An application reads data from the socket and passes the buffer to the CoAP library to parse the message. If the CoAP message is proper, the library uses the buffer along with resources defined above to call the correct callback function to handle the CoAP request from the client. It's the callback function's responsibility to either reply or act according to CoAP request.

```c
coap_packet_parse(request, data, data_len, options, opt_num);
...
coap_handle_request(request, resources, options, opt_num,
                    client_addr, client_addr_len);
```

If CONFIG_COAP_URI_WILDCARD enabled, server may accept multiple resources using MQTT-like wildcard style:

- the plus symbol represents a single-level wild card in the path;
- the hash symbol represents the multi-level wild card in the path.

```c
static const char *const led_set[] = {
  "led", "+", "set", NULL
};
static const char *const btn_get[] = {
  "button", "+", NULL
};
static const char *const no_wc[] = {
  "test", "+1", NULL
};
```

It accepts /led/0/set, led/1234/set, led/any/set, /button/doo/1, /test/+1, but returns -ENOENT for /led/1, /test/21, /test/1.

This option is enabled by default, disable it to avoid unexpected behaviour with resource path like '/some_resource/+/#'.

**CoAP Client** If the CoAP client knows about resources in the CoAP server, the client can start prepare CoAP requests and wait for responses. If the client doesn't know about resources in the CoAP server, it can request resources through the .well-known/core CoAP message.

```c
/* Initialize the CoAP message */
char *path = "test";
struct coap_packet request;
uint8_t data[100];
uint8_t payload[20];

coap_packet_init(&request, data, sizeof(data),
                 1, COAP_TYPE_CON, 8, coap_next_token(),
                 COAP_METHOD_GET, coap_next_id());

/* Append options */
coap_packet_append_option(&request, COAP_OPTION_URI_PATH,
                          path, strlen(path));

/* Append Payload marker if you are going to add payload */
coap_packet_append_payload_marker(&request);

/* Append payload */
coap_packet_append_payload(&request, (uint8_t *)payload,
                           sizeof(payload) - 1);
```

(continues on next page)
Testing  There are various ways to test Zephyr CoAP library.

libcoap  libcoap implements a lightweight application-protocol for devices that are resource constrained, such as by computing power, RF range, memory, bandwidth, or network packet sizes. Sources can be found here libcoap. libcoap has a script (examples/etsi_coaptest.sh) to test coap-server functionality in Zephyr.

See the net-tools project for more details

The coap-server sample can be built and executed on QEMU as described in Networking with QEMU.

Use this command on the host to run the libcoap implementation of the ETSI test cases:

```
sudo ./libcoap/examples/etsi_coaptest.sh -i tap0 2001:db8::1
```

TTCN3  Eclipse has TTCN3 based tests to run against CoAP implementations.

Install eclipse-titan and set symbolic links for titan tools

```
sudo apt-get install eclipse-titan
cd /usr/share/titan
sudo ln -s /usr/bin bin
sudo ln /usr/bin/titanver bin
sudo ln -s /usr/bin/mctr_cli bin
sudo ln -s /usr/include/titan include
sudo ln -s /usr/lib/titan lib
export TTCN3_DIR=/usr/share/titan
git clone https://gitlab.eclipse.org/eclipse/titan/titan.misc.git
cd titan.misc
```

Follow the instruction to setup CoAP test suite from here:

- https://gitlab.eclipse.org/eclipse/titan/titan.misc

After the build is complete, the coap-server sample can be built and executed on QEMU as described in Networking with QEMU.

Change the client (test suite) and server (Zephyr coap-server sample) addresses in coap.cfg file as per your setup.

Execute the test cases with following command.

```
ttcn3_start coaptests coap.cfg
```

Sample output of ttcn3 tests looks like this.

```
Verdict statistics: 0 none (0.00 %), 10 pass (100.00 %), 0 inconc (0.00 %), 0 fail (0.00 %), 0...
Test execution summary: 10 test cases were executed. Overall verdict: pass
```
CoAP client
Use the CoAP library to implement a client that fetches a resource.

CoAP server
Use the CoAP library to implement a server that exposes CoAP resources.

group coap
COAP library.

Defines

COAP_REQUEST_MASK

COAP_VERSION_1

COAP_MAKE_RESPONSE_CODE(class, det)
Utility macro to create a CoAP response code.

Parameters

• class – Class of the response code (ex. 2, 4, 5, ...)
• det – Detail of the response code

Returns
Response code literal

COAP_CODE_EMPTY

COAP_TOKEN_MAX_LEN

GET_BLOCK_NUM(v)

GET_BLOCK_SIZE(v)

GET_MORE(v)

COAP_WELL_KNOWN_CORE_PATH
This resource should be added before all other resources that should be included in the responses of the .well-known/core resource.

Typedefs

typedef int (*coap_method_t)(struct coap_resource *resource, struct coap_packet *request, struct sockaddr *addr, socklen_t addr_len)
Type of the callback being called when a resource’s method is invoked by the remote entity.
typedef void (*coap_notify_t)(struct coap_resource *resource, struct coap_observer *observer)

Type of the callback being called when a resource's has observers to be informed when an update happens.

typedef int (*coap_reply_t)(const struct coap_packet *response, struct coap_reply *reply, const struct sockaddr *from)

Helper function to be called when a response matches the a pending request.
When sending blocks, the callback is only executed when the reply of the last block is received. i.e. it is not called when the code of the reply is ‘continue’ (2.31).

Enums

enum coap_option_num
Set of CoAP packet options we are aware of.
Users may add options other than these to their packets, provided they know how to format them correctly. The only restriction is that all options must be added to a packet in numeric order.
Refer to RFC 7252, section 12.2 for more information.
Values:

enumerator COAP_OPTION_IF_MATCH = 1
If-Match.

enumerator COAP_OPTION_URI_HOST = 3
Uri-Host.

enumerator COAP_OPTION_ETAG = 4
ETag.

enumerator COAP_OPTION_IF_NONE_MATCH = 5
If-None-Match.

enumerator COAP_OPTION_OBSERVE = 6
Observe (RFC 7641)

enumerator COAP_OPTION_URI_PORT = 7
Uri-Port.

enumerator COAP_OPTION_LOCATION_PATH = 8
Location-Path.

enumerator COAP_OPTION_URI_PATH = 11
Uri-Path.

enumerator COAP_OPTION_CONTENT_FORMAT = 12
Content-Format.
enumerator COAP_OPTION_MAX_AGE = 14
Max-Age.

enumerator COAP_OPTION_URI_QUERY = 15
Uri-Query.

enumerator COAP_OPTION_ACCEPT = 17
Accept.

enumerator COAP_OPTION_LOCATION_QUERY = 20
Location-Query.

enumerator COAP_OPTION_BLOCK2 = 23
Block2 (RFC 7959)

enumerator COAP_OPTION_BLOCK1 = 27
Block1 (RFC 7959)

enumerator COAP_OPTION_SIZE2 = 28
Size2 (RFC 7959)

enumerator COAP_OPTION_PROXY_URI = 35
Proxy-Uri.

enumerator COAP_OPTION_PROXY_SCHEME = 39
Proxy-Scheme.

enumerator COAP_OPTION_SIZE1 = 60
Size1.

enumerator COAP_OPTION_ECHO = 252
Echo (RFC 9175)

enumerator COAP_OPTION_REQUEST_TAG = 292
Request-Tag (RFC 9175)

enum coap_method
Available request methods.
To be used when creating a request or a response.

Values:

enumerator COAP_METHOD_GET = 1
GET.

enumerator COAP_METHOD_POST = 2
POST.
enumerator COAP_METHOD_PUT = 3
   PUT.

enumerator COAP_METHOD_DELETE = 4
   DELETE.

enumerator COAP_METHOD_FETCH = 5
   FETCH.

enumerator COAP_METHOD_PATCH = 6
   PATCH.

enumerator COAP_METHOD_IPATCH = 7
   IPATCH.

enum coap_msgtype
   CoAP packets may be of one of these types.
   Values:

   enumerator COAP_TYPE_CON = 0
      Confirmable message.
      The packet is a request or response the destination end-point must acknowledge.

   enumerator COAP_TYPE_NON_CON = 1
      Non-confirmable message.
      The packet is a request or response that doesn’t require acknowledgements.

   enumerator COAP_TYPE_ACK = 2
      Acknowledge.
      Response to a confirmable message.

   enumerator COAP_TYPE_RESET = 3
      Reset.
      Rejecting a packet for any reason is done by sending a message of this type.

enum coap_response_code
   Set of response codes available for a response packet.
   To be used when creating a response.
   Values:

   enumerator COAP_RESPONSE_CODE_OK = ((2 « 5) | (0))
      2.00 - OK

   enumerator COAP_RESPONSE_CODE_CREATED = ((2 « 5) | (1))
      2.01 - Created
enumerator COAP_RESPONSE_CODE_DELETED = ((2 « 5) | (2))
    2.02 - Deleted
enumerator COAP_RESPONSE_CODE_VALID = ((2 « 5) | (3))
    2.03 - Valid
enumerator COAP_RESPONSE_CODE_CHANGED = ((2 « 5) | (4))
    2.04 - Changed
enumerator COAP_RESPONSE_CODE_CONTENT = ((2 « 5) | (5))
    2.05 - Content
enumerator COAP_RESPONSE_CODE_CONTINUE = ((2 « 5) | (31))
    2.31 - Continue
enumerator COAP_RESPONSE_CODE_BAD_REQUEST = ((4 « 5) | (0))
    4.00 - Bad Request
enumerator COAP_RESPONSE_CODE_UNAUTHORIZED = ((4 « 5) | (1))
    4.01 - Unauthorized
enumerator COAP_RESPONSE_CODE_BAD_OPTION = ((4 « 5) | (2))
    4.02 - Bad Option
enumerator COAP_RESPONSE_CODE_FORBIDDEN = ((4 « 5) | (3))
    4.03 - Forbidden
enumerator COAP_RESPONSE_CODE_NOT_FOUND = ((4 « 5) | (4))
    4.04 - Not Found
enumerator COAP_RESPONSE_CODE_NOT_ALLOWED = ((4 « 5) | (5))
    4.05 - Method Not Allowed

enum coap_content_format
Set of Content-Format option values for CoAP.
To be used when encoding or decoding a Content-Format option.
Values:

enumerator COAP_CONTENT_FORMAT_TEXT_PLAIN = 0
text/plain;charset=utf-8

eenumerator COAP_CONTENT_FORMAT_APP_LINK_FORMAT = 40
application/link-format

eenumerator COAP_CONTENT_FORMAT_APP_XML = 41
application/xml

eenumerator COAP_CONTENT_FORMAT_APP_OCTET_STREAM = 42
application/octet-stream

eenumerator COAP_CONTENT_FORMAT_APP_EXI = 47
application/exi

enumerator COAP_CONTENT_FORMAT_APP_MERGE_PATCH_JSON = 52
    application/merge-patch+json

enumerator COAP_CONTENT_FORMAT_APP_CBOR = 60
    application/cbor

enum coap_block_size
    Represents the size of each block that will be transferred using block-wise transfers [RFC7959]:
    Each entry maps directly to the value that is used in the wire.
    Values:

enumerator COAP_BLOCK_16
    16-byte block size

enumerator COAP_BLOCK_32
    32-byte block size

enumerator COAP_BLOCK_64
    64-byte block size

enumerator COAP_BLOCK_128
    128-byte block size

enumerator COAP_BLOCK_256
    256-byte block size

enumerator COAP_BLOCK_512
    512-byte block size

enumerator COAP_BLOCK_1024
    1024-byte block size

Functions

uint8_t coap_header_get_version(const struct coap_packet *cpkt)
    Returns the version present in a CoAP packet.

Parameters

• cpkt – CoAP packet representation
**Returns**
The CoAP version in packet

```c
uint8_t coap_header_get_type(const struct coap_packet *cpkt)
```
Returns the type of the CoAP packet.

**Parameters**
- `cpkt` – CoAP packet representation

**Returns**
The type of the packet

```c
uint8_t coap_header_get_token(const struct coap_packet *cpkt, uint8_t *token)
```
Returns the token (if any) in the CoAP packet.

**Parameters**
- `cpkt` – CoAP packet representation
- `token` – Where to store the token, must point to a buffer containing at least COAP_TOKEN_MAX_LEN bytes

**Returns**
Token length in the CoAP packet (0 - COAP_TOKEN_MAX_LEN).

```c
uint8_t coap_header_get_code(const struct coap_packet *cpkt)
```
Returns the code of the CoAP packet.

**Parameters**
- `cpkt` – CoAP packet representation

**Returns**
The code present in the packet

```c
uint16_t coap_header_get_id(const struct coap_packet *cpkt)
```
Returns the message id associated with the CoAP packet.

**Parameters**
- `cpkt` – CoAP packet representation

**Returns**
The message id present in the packet

```c
const uint8_t *coap_packet_get_payload(const struct coap_packet *cpkt, uint16_t *len)
```
Returns the data pointer and length of the CoAP packet.

**Parameters**
- `cpkt` – CoAP packet representation
- `len` – Total length of CoAP payload

**Returns**
Data pointer and length if payload exists NULL pointer and length set to 0 in case there is no payload

```c
int coap_packet_parse(struct coap_packet *cpkt, uint8_t *data, uint16_t len, struct coap_option *options, uint8_t opt_num)
```
Parses the CoAP packet in `data`, validating it and initializing `cpkt`. `data` must remain valid while `cpkt` is used.

**Parameters**
- `cpkt` – Packet to be initialized from received `data`. 6.3. Networking 2451
• **data** – Data containing a CoAP packet, its `data` pointer is positioned on the start of the CoAP packet.
• **len** – Length of the data
• **options** – Parse options and cache its details.
• **opt_num** – Number of options

**Return values**

• **0** – in case of success.
• **-EINVAL** – in case of invalid input args.
• **-EBADMSG** – in case of malformed coap packet header.
• **-EILSEQ** – in case of malformed coap options.

```c
int coap_packet_set_path(struct coap_packet *cpkt, const char *path)
```

Parses provided coap path (with/without query) or query and appends that as options to the `cpkt`.

**Parameters**

- **cpkt** – Packet to append path and query options for.
- **path** – Null-terminated string of coap path, query or both.

**Return values**

**0** – in case of success or negative in case of error.

```c
int coap_packet_init(struct coap_packet *cpkt, uint8_t *data, uint16_t max_len, uint8_t ver, uint8_t type, uint8_t token_len, const uint8_t *token, uint8_t code, uint16_t id)
```

Creates a new CoAP Packet from input data.

**Parameters**

- **cpkt** – New packet to be initialized using the storage from `data`.
- **data** – Data that will contain a CoAP packet information
- **max_len** – Maximum allowable length of data
- **ver** – CoAP header version
- **type** – CoAP header type
- **token_len** – CoAP header token length
- **token** – CoAP header token
- **code** – CoAP header code
- **id** – CoAP header message id

**Returns**

0 in case of success or negative in case of error.

```c
int coap_ack_init(struct coap_packet *cpkt, const struct coap_packet *req, uint8_t *data, uint16_t max_len, uint8_t code)
```

Create a new CoAP Acknowledgment message for given request.

This function works like `coap_packet_init`, filling CoAP header type, CoAP header token, and CoAP header message id fields according to acknowledgment rules.

**Parameters**

- **cpkt** – New packet to be initialized using the storage from `data`.
- **req** – CoAP request packet that is being acknowledged
• **data** – Data that will contain a CoAP packet information
• **max_len** – Maximum allowable length of data
• **code** – CoAP header code

**Returns**
0 in case of success or negative in case of error.

```c
uint8_t *coap_next_token(void)
```

Returns a randomly generated array of 8 bytes, that can be used as a message's token.

**Returns**
a 8-byte pseudo-random token.

```c
uint16_t coap_next_id(void)
```

Helper to generate message ids.

**Returns**
a new message id

```c
int coap_find_options(const struct coap_packet *cpkt, uint16_t code, struct coap_option *options, uint16_t veclen)
```

Return the values associated with the option of value `code`.

**Parameters**

- **cpkt** – CoAP packet representation
- **code** – Option number to look for
- **options** – Array of `coap_option` where to store the value of the options found
- **veclen** – Number of elements in the options array

**Returns**
The number of options found in packet matching code, negative on error.

```c
int coap_packet_append_option(struct coap_packet *cpkt, uint16_t code, const uint8_t *value, uint16_t len)
```

Appends an option to the packet.

Note: options can be added out of numeric order of their codes. But it's more efficient to add them in order.

**Parameters**

- **cpkt** – Packet to be updated
- **code** – Option code to add to the packet, see `coap_option_num`
- **value** – Pointer to the value of the option, will be copied to the packet
- **len** – Size of the data to be added

**Returns**
0 in case of success or negative in case of error.

```c
int coap_packet_remove_option(struct coap_packet *cpkt, uint16_t code)
```

Remove an option from the packet.

**Parameters**

- **cpkt** – Packet to be updated
- **code** – Option code to remove from the packet, see `coap_option_num`

**Returns**
0 in case of success or negative in case of error.
unsigned int coap_option_value_to_int(const struct coap_option *option)
Converts an option to its integer representation.
Assumes that the number is encoded in the network byte order in the option.

Parameters
• option – Pointer to the option value, retrieved by coap_find_options()

Returns
The integer representation of the option

int coap_append_option_int(struct coap_packet *cpkt, uint16_t code, unsigned int val)
Appends an integer value option to the packet.
The option must be added in numeric order of their codes, and the least amount of bytes will be used to encode the value.

Parameters
• cpkt – Packet to be updated
• code – Option code to add to the packet, see coap_option_num
• val – Integer value to be added

Returns
0 in case of success or negative in case of error.

int coap_packet_append_payload_marker(struct coap_packet *cpkt)
Append payload marker to CoAP packet.

Parameters
• cpkt – Packet to append the payload marker (0xFF)

Returns
0 in case of success or negative in case of error.

int coap_packet_append_payload(struct coap_packet *cpkt, const uint8_t *payload, uint16_t payload_len)
Append payload to CoAP packet.

Parameters
• cpkt – Packet to append the payload
• payload – CoAP packet payload
• payload_len – CoAP packet payload len

Returns
0 in case of success or negative in case of error.

int coap_handle_request(struct coap_packet *cpkt, struct coap_resource *resources, struct coap_option *options, uint8_t opt_num, struct sockaddr *addr, socklen_t addr_len)
When a request is received, call the appropriate methods of the matching resources.

Parameters
• cpkt – Packet received
• resources – Array of known resources
• options – Parsed options from coap_packet_parse()
• opt_num – Number of options
• addr – Peer address
• **addr_len** – Peer address length

**Return values**

• **0** – in case of success.
• **-ENOTSUP** – in case of invalid request code.
• **-EPERM** – in case resource handler is not implemented.
• **-ENOENT** – in case the resource is not found.

```c
static inline uint16_t coap_block_size_to_bytes(enum coap_block_size block_size)
```

Helper for converting the enumeration to the size expressed in bytes.

**Parameters**

• `block_size` – The block size to be converted

**Returns**

The size in bytes that the `block_size` represents

```c
int coap_block_transfer_init(struct coap_block_context *ctx, enum coap_block_size block_size, size_t total_size)
```

Initializes the context of a block-wise transfer.

**Parameters**

• `ctx` – The context to be initialized
• `block_size` – The size of the block
• `total_size` – The total size of the transfer, if known

**Returns**

0 in case of success or negative in case of error.

```c
int coap_append_descriptive_block_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
```

Append BLOCK1 or BLOCK2 option to the packet.

- If the CoAP packet is a request then BLOCK1 is appended otherwise BLOCK2 is appended.

**Parameters**

• `cpkt` – Packet to be updated
• `ctx` – Block context from which to retrieve the information for the block option

**Returns**

0 in case of success or negative in case of error.

```c
bool coap_has_descriptive_block_option(struct coap_packet *cpkt)
```

Check if a descriptive block option is set in the packet.

- If the CoAP packet is a request then an available BLOCK1 option would be checked otherwise a BLOCK2 option would be checked.

**Parameters**

• `cpkt` – Packet to be checked.

**Returns**

true if the corresponding block option is set, false otherwise.
int coap_remove_descriptive_block_option(struct coap_packet *cpkt)
Remove BLOCK1 or BLOCK2 option from the packet.
If the CoAP packet is a request then BLOCK1 is removed otherwise BLOCK2 is removed.

Parameters
• cpkt – Packet to be updated.

Returns
0 in case of success or negative in case of error.

int coap_append_block1_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append BLOCK1 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Block1 option

Returns
0 in case of success or negative in case of error.

int coap_append_block2_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append BLOCK2 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Block2 option

Returns
0 in case of success or negative in case of error.

int coap_append_size1_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append SIZE1 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Size1 option

Returns
0 in case of success or negative in case of error.

int coap_append_size2_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append SIZE2 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Size2 option

Returns
0 in case of success or negative in case of error.

int coap_get_option_int(const struct coap_packet *cpkt, uint16_t code)
Get the integer representation of a CoAP option.

Parameters
• cpkt – Packet to be inspected
• code – CoAP option code

**Returns**

Integer value \( \geq 0 \) in case of success or negative in case of error.

```c
int coap_get_block1_option(const struct coap_packet *cpkt, bool *has_more, uint8_t *block_number)
```

Get the block size, more flag and block number from the CoAP block1 option.

**Parameters**

• cpkt – Packet to be inspected
  • has_more – Is set to the value of the more flag
  • block_number – Is set to the number of the block

**Returns**

Integer value of the block size in case of success or negative in case of error.

```c
int coap_get_block2_option(const struct coap_packet *cpkt, uint8_t *block_number)
```

Get values from CoAP block2 option.

Decode block number and block size from option. Ignore the has_more flag as it should always be zero on queries.

**Parameters**

• cpkt – Packet to be inspected
  • block_number – Is set to the number of the block

**Returns**

Integer value of the block size in case of success or negative in case of error.

```c
int coap_update_from_block(const struct coap_packet *cpkt, struct coap_block_context *ctx)
```

Retrieves BLOCK{1,2} and SIZE{1,2} from cpkt and updates ctx accordingly.

**Parameters**

• cpkt – Packet in which to look for block-wise transfers options
  • ctx – Block context to be updated

**Returns**

0 in case of success or negative in case of error.

```c
int coap_next_block_for_option(const struct coap_packet *cpkt, struct coap_block_context *ctx, enum coap_option_num option)
```

Updates ctx according to option set in cpkt so after this is called the current entry indicates the correct offset in the body of data being transferred.

**Parameters**

• cpkt – Packet in which to look for block-wise transfers options
  • ctx – Block context to be updated
  • option – Either COAP_OPTION_BLOCK1 or COAP_OPTION_BLOCK2

**Returns**

The offset in the block-wise transfer, 0 if the transfer has finished or a negative value in case of an error.

```c
size_t coap_next_block(const struct coap_packet *cpkt, struct coap_block_context *ctx)
```

Updates ctx so after this is called the current entry indicates the correct offset in the body of data being transferred.

**Parameters**
• **pkt** – Packet in which to look for block-wise transfers options
• **ctx** – Block context to be updated

**Returns**
The offset in the block-wise transfer, 0 if the transfer has finished.

```c
void coap_observer_init(struct coap_observer *observer, const struct coap_packet *request, const struct sockaddr *addr)
```
Indicates that the remote device referenced by `addr`, with `request`, wants to observe a resource.

**Parameters**
• **observer** – Observer to be initialized
• **request** – Request on which the observer will be based
• **addr** – Address of the remote device

```c
bool coap_register_observer(struct coap_resource *resource, struct coap_observer *observer)
```
After the observer is initialized, associate the observer with an resource.

**Parameters**
• **resource** – Resource to add an observer
• **observer** – Observer to be added

**Returns**
true if this is the first observer added to this resource.

```c
void coap_remove_observer(struct coap_resource *resource, struct coap_observer *observer)
```
Remove this observer from the list of registered observers of that resource.

**Parameters**
• **resource** – Resource in which to remove the observer
• **observer** – Observer to be removed

```c
struct coap_observer *coap_find_observer_by_addr(struct coap_observer *observers, size_t len, const struct sockaddr *addr)
```
Returns the observer that matches address `addr`.

**Parameters**
• **observers** – Pointer to the array of observers
• **len** – Size of the array of observers
• **addr** – Address of the endpoint observing a resource

**Returns**
A pointer to a observer if a match is found, NULL otherwise.

```c
struct coap_observer *coap Observer_next_unused(struct coap Observer *observers, size_t len)
```
Returns the next available observer representation.

**Parameters**
• **observers** – Pointer to the array of observers
• **len** – Size of the array of observers

**Returns**
A pointer to a observer if there’s an available observer, NULL otherwise.
void coap_reply_init(struct coap_reply *reply, const struct coap_packet *request)
Indicates that a reply is expected for request.

Parameters
• reply – Reply structure to be initialized
• request – Request from which reply will be based

int coap_pending_init(struct coap_pending *pending, const struct coap_packet *request, 
const struct sockaddr *addr, uint8_t retries)
Initialize a pending request with a request.
The request's fields are copied into the pending struct, so request doesn't have to live for as long as the pending struct lives, but “data” that needs to live for at least that long.

Parameters
• pending – Structure representing the waiting for a confirmation message, 
  initialized with data from request
• request – Message waiting for confirmation
• addr – Address to send the retransmission
• retries – Maximum number of retransmissions of the message.

Returns
0 in case of success or negative in case of error.

struct coap_pending *coap_pending_next_unused(struct coap_pending *pendings, size_t len)
Returns the next available pending struct, that can be used to track the retransmission status of a request.

Parameters
• pendings – Pointer to the array of coap_pending structures
• len – Size of the array of coap_pending structures

Returns
pointer to a free coap_pending structure, NULL in case none could be found.

struct coap_reply *coap_reply_next_unused(struct coap_reply *replies, size_t len)
Returns the next available reply struct, so it can be used to track replies and notifications received.

Parameters
• replies – Pointer to the array of coap_reply structures
• len – Size of the array of coap_reply structures

Returns
pointer to a free coap_reply structure, NULL in case none could be found.

struct coap_pending *coap_pending_received(const struct coap_packet *response, struct 
coap_pending *pendings, size_t len)
After a response is received, returns if there is any matching pending request exits.
User has to clear all pending retransmissions related to that response by calling coap_pending_clear().

Parameters
• response – The received response
• pendings – Pointer to the array of coap_reply structures
• **len** – Size of the array of `coap_reply` structures

**Returns**
pointer to the associated `coap_pending` structure, NULL in case none could be found.

```
struct coap_reply *coap_response_received(const struct coap_packet *response, const struct sockaddr *from, struct coap_reply *replies, size_t len)
```

After a response is received, call `coap_reply_t` handler registered in `coap_reply` structure.

**Parameters**
• **response** – A response received
• **from** – Address from which the response was received
• **replies** – Pointer to the array of `coap_reply` structures
• **len** – Size of the array of `coap_reply` structures

**Returns**
Pointer to the reply matching the packet received, NULL if none could be found.

```
struct coap_pending *coap_pending_next_to_expire(struct coap_pending *pendings, size_t len)
```

Returns the next pending about to expire, `pending->timeout` informs how many ms to next expiration.

**Parameters**
• **pendings** – Pointer to the array of `coap_pending` structures
• **len** – Size of the array of `coap_pending` structures

**Returns**
The next `coap_pending` to expire, NULL if none is about to expire.

```
bool coap_pending_cycle(struct coap_pending *pending)
```

After a request is sent, user may want to cycle the pending retransmission so the timeout is updated.

**Parameters**
• **pending** – Pending representation to have its timeout updated

**Returns**
false if this is the last retransmission.

```
void coap_pending_clear(struct coap_pending *pending)
```

Cancels the pending retransmission, so it again becomes available.

**Parameters**
• **pending** – Pending representation to be canceled

```
void coap_pendings_clear(struct coap_pending *pendings, size_t len)
```

Cancels all pending retransmissions, so they become available again.

**Parameters**
• **pendings** – Pointer to the array of `coap_pending` structures
• **len** – Size of the array of `coap_pending` structures
void coap_reply_clear(struct coap_reply *reply)
  Cancels awaiting for this reply, so it becomes available again.
  User responsibility to free the memory associated with data.

Parameters
  • reply – The reply to be canceled

void coap_replies_clear(struct coap_reply *replies, size_t len)
  Cancels all replies, so they become available again.

Parameters
  • replies – Pointer to the array of coap_reply structures
  • len – Size of the array of coap_reply structures

int coap_resource_notify(struct coap_resource *resource)
  Indicates that this resource was updated and that the notify callback should be called
  for every registered observer.

Parameters
  • resource – Resource that was updated

Returns
  0 in case of success or negative in case of error.

bool coap_request_is_observe(const struct coap_packet *request)
  Returns if this request is enabling observing a resource.

Parameters
  • request – Request to be checked

Returns
  True if the request is enabling observing a resource, False otherwise

int coap_well_known_core_get(struct coap_resource *resource, struct coap_packet *request, struct coap_packet *response, uint8_t *data, uint16_t len)

struct coap_resource
  #include <coap.h> Description of CoAP resource.
  CoAP servers often want to register resources, so that clients can act on them, by fetching
  their state or requesting updates to them.

Public Members

coap_method_t get
  Which function to be called for each CoAP method.

struct coap_observer
  #include <coap.h> Represents a remote device that is observing a local resource.

struct coap_packet
  #include <coap.h> Representation of a CoAP Packet.
Public Members

uint8_t *data
User allocated buffer.

uint16_t offset
CoAP lib maintains offset while adding data.

uint16_t max_len
Max CoAP packet data length.

uint8_t hdr_len
CoAP header length.

uint16_t opt_len
Total options length (delta + len + value)

uint16_t delta
Used for delta calculation in CoAP packet.

struct coap_option
#include <coap.h> Representation of a CoAP option.

Public Members

uint16_t delta
Option delta.

uint8_t len
Option length.

uint8_t value[12]
Option value.

struct coap_pending
#include <coap.h> Represents a request awaiting for an acknowledgment (ACK).

Public Members

struct sockaddr addr
Remote address.

int64_t t0
Time when the request was sent.

uint32_t timeout
Timeout in ms.

```c
uint16_t id
    Message id.

uint8_t *data
    User allocated buffer.

uint16_t len
    Length of the CoAP packet.

uint8_t retries
    Number of times the request has been sent.
```

```c
struct coap_reply
    #include <coap.h> Represents the handler for the reply of a request, it is also used when observing resources.

struct coap_block_context
    #include <coap.h> Represents the current state of a block-wise transaction.

struct coap_core_metadata
    #include <coap_link_format.h> In case you want to add attributes to the resources included in the ‘well-known/core’ “virtual” resource, the ‘user_data’ field should point to a valid coap_core_metadata structure.
```

### CoAP client

- **Overview**
- **Sample Usage**
- **API Reference**

**Overview** The CoAP client library allows application to send CoAP requests and parse CoAP responses. The application is notified about the response via a callback that is provided to the API in the request. The CoAP client handles the communication over sockets. As the CoAP client doesn’t create socket it is using, the application is responsible for creating the socket. Plain UDP or DTLS sockets are supported.

**Sample Usage** The following is an example of a CoAP client initialization and request sending:

```c
static struct coap_client;
struct coap_client_request req = { 0 };
coap_client_init(&client, NULL);
req.method = COAP_METHOD_GET;
req.confirmable = true;
req.path = "test";
req.fmt = COAP_CONTENT_FORMAT_TEXT_PLAIN;
req.cb = response_cb;
req.payload = NULL;
```

(continues on next page)
Before any requests can be sent, the CoAP client needs to be initialized. After initialization, the application can send a CoAP request and wait for the response. Currently only one request can be sent for a single CoAP client at a time. There can be multiple CoAP clients.

The callback provided in the callback will be called in following cases:

- There is a response for the request
- The request failed for some reason

The callback contains a flag `last_block`, which indicates if there is more data to come in the response and means that the current response is part of a blockwise transfer. When the `last_block` is set to true, the response is finished and the client is ready for the next request after returning from the callback.

If the server responds to the request, the library provides the response to the application through the response callback registered in the request structure. As the response can be a blockwise transfer and the client calls the callback once per each block, the application should be to process all of the blocks to be able to process the response.

The following is an example of a very simple response handling function:

```
void response_cb(int16_t code, size_t offset, const uint8_t *payload, size_t len, bool last_block, void *user_data)
{
    if (code >= 0) {
        LOG_INF("CoAP response from server %d", code);
        if (last_block) {
            LOG_INF("Last packet received");
        }
    } else {
        LOG_ERR("Error in sending request %d", code);
    }
}
```

**API Reference**

**group coap_client**

CoAP client API.

**Defines**

```
#define MAX_COAP_MSG_LEN
```

**Typedefs**

```
typedef void (*coap_client_response_cb_t)(int16_t result_code, size_t offset, const uint8_t *payload, size_t len, bool last_block, void *user_data)
```
Callback for CoAP request.

This callback is called for responses to CoAP client requests. It is used to indicate errors, response codes from server or to deliver payload. Blockwise transfers cause this callback to be called sequentially with increasing payload offset and only partial content in buffer pointed by payload parameter.

**Param result_code**
Result code of the response. Negative if there was a failure in send. `coap_response_code` for positive.

**Param offset**
Payload offset from the beginning of a blockwise transfer.

**Param payload**
Buffer containing the payload from the response. NULL for empty payload.

**Param len**
Size of the payload.

**Param last_block**
Indicates the last block of the response.

**Param user_data**
User provided context.

**Functions**

```c
int coap_client_init(struct coap_client *client, const char *info)
```

Initialize the CoAP client.

**Parameters**

- `info` – [in] Name for the receiving thread of the client. Setting this NULL will result as default name of “coap_client”.

**Returns**

int Zero on success, otherwise a negative error code.

```c
int coap_client_req(struct coap_client *client, int sock, const struct sockaddr *addr, struct coap_client_request *req, int retries)
```

Send CoAP request.

Operation is handled asynchronously using a background thread. If the socket isn’t connected to a destination address, user must provide a destination address, otherwise the address should be set as NULL. Once the callback is called with last block set as true, socket can be closed or used for another query.

**Parameters**

- `client` – Client instance.
- `sock` – Open socket file descriptor.
- `addr` – the destination address of the request, NULL if socket is already connected.
- `req` – CoAP request structure
- `retries` – How many times to retry or -1 to use default.

**Returns**

zero when operation started successfully or negative error code otherwise.
struct coap_client_request
    #include <coap_client.h> Representation of a CoAP client request.

Public Members

enum coap_method method
    Method of the request.

bool confirmable
    CoAP Confirmable/Non-confirmable message.

const char *path
    Path of the requested resource.

enum coap_content_format fmt
    Content format to be used.

uint8_t *payload
    User allocated buffer for send request.

size_t len
    Length of the payload.

coap_client_response_cb_t cb
    Callback when response received.

struct coap_client_option *options
    Extra options to be added to request.

uint8_t num_options
    Number of extra options.

void *user_data
    User provided context.

struct coap_client_option
    #include <coap_client.h> Representation of extra options for the CoAP client request.

HTTP client

• Overview
• Sample Usage
• API Reference
Overview

The HTTP client library allows you to send HTTP requests and parse HTTP responses. The library communicates over the sockets API but it does not create sockets on its own.

The application must be responsible for creating a socket and passing it to the library. Therefore, depending on the application’s needs, the library can communicate over either a plain TCP socket (HTTP) or a TLS socket (HTTPS).

Sample Usage

The API of the HTTP client library has a single function.

The following is an example of a request structure created correctly:

```c
struct http_request req = { 0 };
static uint8_t recv_buf[512];

req.method = HTTP_GET;
req.url = "/
req.host = "localhost";
req.protocol = "HTTP/1.1";
req.response = response_cb;
req.recv_buf = recv_buf;
req.recv_buf_len = sizeof(recv_buf);

/* sock is a file descriptor referencing a socket that has been connected
* to the HTTP server.
*/
ret = http_client_req(sock, &req, 5000, NULL);
```

If the server responds to the request, the library provides the response to the application through the response callback registered in the request structure. As the library can provide the response in chunks, the application must be able to process these.

Together with the structure containing the response data, the callback function also provides information about whether the library expects to receive more data.

The following is an example of a very simple response handling function:

```c
static void response_cb(struct http_response *rsp,
                        enum http_final_call final_data,
                        void *user_data)
{
    if (final_data == HTTP_DATA_MORE) {
        LOG_INF("Partial data received (%zd bytes)", rsp->data_len);
    } else if (final_data == HTTP_DATA_FINAL) {
        LOG_INF("All the data received (%zd bytes)", rsp->data_len);
    }

    LOG_INF("Response status %s", rsp->http_status);
}
```

See HTTP client sample application for more information about the library usage.

HTTP client API.

Defines

HTTP_CRLF
HTTP_STATUS_STR_SIZE

TypeDefs

typedef int (*http_payload_cb_t)(int sock, struct http_request *req, void *user_data)
Callback used when data needs to be sent to the server:

Param sock
Socket id of the connection

Param req
HTTP request information

Param user_data
User specified data specified in http_client_req()

Return
>=0 amount of data sent, in this case http_client_req() should continue sending data, <0 if http_client_req() should return the error code to the caller.

typedef int (*http_header_cb_t)(int sock, struct http_request *req, void *user_data)
Callback can be used if application wants to construct additional HTTP headers when the HTTP request is sent.
Usage of this is optional.

Param sock
Socket id of the connection

Param req
HTTP request information

Param user_data
User specified data specified in http_client_req()

Return
>=0 amount of data sent, in this case http_client_req() should continue sending data, <0 if http_client_req() should return the error code to the caller.

typedef void (*http_response_cb_t)(struct http_response *rsp, enum http_final_call final_data, void *user_data)
Callback used when data is received from the server.

Param rsp
HTTP response information

Param final_data
Does this data buffer contain all the data or is there still more data to come.

Param user_data
User specified data specified in http_client_req()
Enums

enum http_final_call
   Values:

   enumerator HTTP_DATA_MORE = 0
   enumerator HTTP_DATA_FINAL = 1

Functions

int http_client_req(int sock, struct http_request *req, int32_t timeout, void *user_data)
   Do a HTTP request.

   The callback is called when data is received from the HTTP server. The caller must
   have created a connection to the server before calling this function so connect() call
   must have be done successfully for the socket.

   Parameters

   • sock – Socket id of the connection.
   • req – HTTP request information
   • timeout – Max timeout to wait for the data. The timeout value cannot be
     0 as there would be no time to receive the data. The timeout value is in
     milliseconds.
   • user_data – User specified data that is passed to the callback.

   Returns

   <0 if error, >=0 amount of data sent to the server

struct http_response
   #include <client.h> HTTP response from the server.

Public Members

const struct http_parser_settings *http_cb
   HTTP parser settings for the application usage.

http_response_cb_t cb
   User provided HTTP response callback which is called when a response is received
   to a sent HTTP request.

uint8_t *body_frag_start
   Start address of the body fragment contained in the recv_buf.
size_t body_frag_len
Length of the body fragment contained in the recv_buf.

uint8_t *recv_buf
Where the response is stored, this is to be provided by the user.

size_t recv_buf_len
Response buffer maximum length.

size_t data_len
Length of the data in the result buf.
If the value is larger than recv_buf_len, then it means that the data is truncated and could not be fully copied into recv_buf. This can only happen if the user did not set the response callback. If the callback is set, then the HTTP client API will call response callback many times so that all the data is delivered to the user. Will be zero in the event of a null response.

size_t content_length
HTTP Content-Length field value.
Will be set to zero in the event of a null response.

size_t processed
Amount of data given to the response callback so far, including the current data given to the callback.
This should be equal to the content_length field once the entire body has been received. Will be zero if a null response is given.

uint16_t http_status_code
Numeric HTTP status code which corresponds to the textual description.
Set to zero if null response is given. Otherwise, will be a 3-digit integer code if valid HTTP response is given.

struct http_client_internal_data
#include <client.h> HTTP client internal data that the application should not touch.

Public Members
struct http_parser parser  
   HTTP parser context.

struct http_parser_settings parser_settings  
   HTTP parser settings.

struct http_response response  
   HTTP response specific data (filled by http_client_req() when data is received)

void *user_data  
   User data.

int sock  
   HTTP socket.

struct http_request
   #include <client.h> HTTP client request.  
   This contains all the data that is needed when doing a HTTP request.

Public Members

struct http_client_internal_data internal  
   HTTP client request internal data.

enum http_method method  
   The HTTP method: GET, HEAD, OPTIONS, POST, ...

http_response_cb_t response  
   User supplied callback function to call when response is received.

const struct http_parser_settings *http_cb  
   User supplied list of HTTP callback functions if the calling application wants to 
   know the parsing status or the HTTP fields.  
   This is optional and normally not needed.

uint8_t *recv_buf  
   User supplied buffer where received data is stored.

size_t recv_buf_len  
   Length of the user supplied receive buffer.

const char *url  
   The URL for this request, for example: /index.html.

const char *protocol  
   The HTTP protocol, for example “HTTP/1.1”.
const char **header_fields
  The HTTP header fields (application specific) The Content-Type may be specified here or in the next field.
  Depending on your application, the Content-Type may vary, however some header fields may remain constant through the application’s life cycle. This is a NULL terminated list of header fields.

const char *content_type_value
  The value of the Content-Type header field, may be NULL.

const char *host
  Hostname to be used in the request.

const char *port
  Port number to be used in the request.

http_payload_cb_t payload_cb
  User supplied callback function to call when payload needs to be sent.
  This can be NULL in which case the payload field in http_request is used. The idea of this payload callback is to allow user to send more data that is practical to store in allocated memory.

const char *payload
  Payload, may be NULL.

size_t payload_len
  Payload length is used to calculate Content-Length.
  Set to 0 for chunked transfers.

http_header_cb_t optional_headers_cb
  User supplied callback function to call when optional headers need to be sent.
  This can be NULL, in which case the optional_headers field in http_request is used. The idea of this optional_headers callback is to allow user to send more HTTP header data that is practical to store in allocated memory.

const char **optional_headers
  A NULL terminated list of any optional headers that should be added to the HTTP request.
  May be NULL. If the optional_headers_cb is specified, then this field is ignored. Note that there are two similar fields that contain headers, the header_fields above and this optional_headers. This is done like this to support Websocket use case where Websocket will use header_fields variable and any optional application specific headers will be placed into this field.

Lightweight M2M (LWM2M)

- Overview
- Example LwM2M object and resources: Device
Overview Lightweight Machine to Machine (LwM2M) is an application layer protocol designed with device management, data reporting and device actuation in mind. Based on CoAP/UDP, LwM2M is a standard defined by the Open Mobile Alliance and suitable for constrained devices by its use of CoAP packet-size optimization and a simple, stateless flow that supports a REST API.

One of the key differences between LwM2M and CoAP is that an LwM2M client initiates the connection to an LwM2M server. The server can then use the REST API to manage various interfaces with the client.

LwM2M uses a simple resource model with the core set of objects and resources defined in the specification.

Example LwM2M object and resources: Device

<table>
<thead>
<tr>
<th>Object ID</th>
<th>Name</th>
<th>Instance</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Device</td>
<td>Single</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

Resource definitions

* R=Read, W=Write, E=Execute
The server could query the Manufacturer resource for Device object instance 0 (the default and only instance) by sending a READ 3/0/0 operation to the client.

The full list of registered objects and resource IDs can be found in the LwM2M registry.

Zephyr’s LwM2M library lives in the `subsys/net/lib/lwm2m`, with a client sample in `samples/net/lwm2m_client`. For more information about the provided sample see: `lwm2m-client`. The sample can be configured to use normal unsecure network sockets or sockets secured via DTLS.

The Zephyr LwM2M library implements the following items:

- engine to process networking events and core functions
- RD client which performs BOOTSTRAP and REGISTRATION functions
- SenML CBOR, SenML JSON, CBOR, TLV, JSON, and plain text formatting functions
- LwM2M Technical Specification Enabler objects such as Security, Server, Device, Firmware Update, etc.
- Extended IPSO objects such as Light Control, Temperature Sensor, and Timer

By default, the library implements LwM2M specification 1.0.2 and can be set to LwM2M specification 1.1.1 with a Kconfig option.

For more information about LwM2M visit OMA Specworks LwM2M.

### Sample usage
To use the LwM2M library, start by creating an LwM2M client context `lwm2m_ctx` structure:

```c
/* LwM2M client context */
static struct lwm2m_ctx client;
```

Create callback functions for LwM2M resource executions:
The LwM2M RD client can send events back to the sample. To receive those events, setup a callback function:

```c
static void rd_client_event(struct lwm2m_ctx *client,
                           enum lwm2m_rd_client_event client_event)
{
    switch (client_event) {
        case LWM2M_RD_CLIENT_EVENT_NONE:
            /* do nothing */
            break;
        case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_FAILURE:
            LOG_DBG("Bootstrap registration failure!");
            break;
        case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_COMPLETE:
            LOG_DBG("Bootstrap registration complete");
            break;
        case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_TRANSFER_COMPLETE:
            LOG_DBG("Bootstrap transfer complete");
            break;
        case LWM2M_RD_CLIENT_EVENT_REGISTRATION_FAILURE:
            LOG_DBG("Registration failure!");
            break;
        case LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE:
            LOG_DBG("Registration complete");
            break;
        case LWM2M_RD_CLIENT_EVENT_REG_TIMEOUT:
            LOG_DBG("Registration timeout!");
            break;
        case LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE:
            LOG_DBG("Registration update complete");
            break;
        case LWM2M_RD_CLIENT_EVENT_DEREGISTER_FAILURE:
            LOG_DBG("Deregister failure!");
            break;
        case LWM2M_RD_CLIENT_EVENT_DEREGISTER:
    } // (continues on next page)

6.3. Networking
LOG_DBG("Deregistration client");
break;
}
}

Next we assign Security resource values to let the client know where and how to connect as well as set the Manufacturer and Reboot resources in the Device object with some data and the callback we defined above:

```c
/*
 * Server URL of default Security object = 0/0/0
 * Use leshan.eclipse.org server IP (5.39.83.206) for connection
 */
lwm2m_set_string(&LWM2M_OBJ(0, 0, 0), "coap://5.39.83.206");

/*
 * Security Mode of default Security object = 0/0/2
 * 3 = NoSec mode (no security beware!)
 */
lwm2m_set_u8(&LWM2M_OBJ(0, 0, 2), 3);

#define CLIENT_MANUFACTURER "Zephyr Manufacturer"

/*
 * Manufacturer resource of Device object = 3/0/0
 * We use lwm2m_set_res_data() function to set a pointer to the
 * CLIENT_MANUFACTURER string.
 * Note the LWM2M_RES_DATA_FLAG_RO flag which stops the engine from
 * trying to assign a new value to the buffer.
 */
lwm2m_set_res_data(&LWM2M_OBJ(3, 0, 0), CLIENT_MANUFACTURER,
                   sizeof(CLIENT_MANUFACTURER),
                   LWM2M_RES_DATA_FLAG_RO);

/* Reboot resource of Device object = 3/0/4 */
lwm2m_register_exec_callback(&LWM2M_OBJ(3, 0, 4), device_reboot_cb);
```

Lastly, we start the LwM2M RD client (which in turn starts the LwM2M engine). The second parameter of `lwm2m_rd_client_start()` is the client endpoint name. This is important as it needs to be unique per LwM2M server:

```c
(void)memset(&client, 0x0, sizeof(client));
lwm2m_rd_client_start(&client, "unique-endpoint-name", 0, rd_client_event);
```

## LwM2M security modes

The Zephyr LwM2M library can be used either without security or use DTLS to secure the communication channel. When using DTLS with the LwM2M engine, PSK (Pre-Shared Key) and X.509 certificates are the security modes that can be used to secure the communication. The engine uses LwM2M Security object (Id 0) to read the stored credentials and feed keys from the security object into the TLS credential subsystem, see [secure sockets documentation](#). Enable the `CONFIG_LWM2M_DTLS_SUPPORT` Kconfig option to use the security.

Depending on the selected mode, the security object must contain following data:

### PSK

Security Mode (Resource ID 2) set to zero (Pre-Shared Key mode). Identity (Resource ID 3) contains PSK ID in binary form. Secret key (Resource ID 5) contains the PSK key in binary form. If the key or identity is provided as a hex string, it must be converted to binary before storing into the security object.
X509
When X509 certificates are used, set Security Mode (ID 2) to 2 (Certificate mode). Identity (ID 3) is used to store the client certificate and Secret key (ID 5) must have a private key associated with the certificate. Server Public Key resource (ID 4) must contain a server certificate or CA certificate used to sign the certificate chain. If the CONFIGMBEDTLS_PEM_CERTIFICATE_FORMAT Kconfig option is enabled, certificates and private key can be entered in PEM format. Otherwise, they must be in binary DER format.

NoSec
When no security is used, set Security Mode (Resource ID 2) to 3 (NoSec).

In all modes, Server URI resource (ID 0) must contain the full URI for the target server. When DNS names are used, the DNS resolver must be enabled.

LwM2M stack provides callbacks in the lwm2m_ctx structure. They are used to feed keys from the LwM2M security object into the TLS credential subsystem. By default, these callbacks can be left as NULL pointers, in which case default callbacks are used. When an external TLS stack, or non-default socket options are required, you can overwrite the lwm2m_ctx.load_credentials() or lwm2m_ctx.set_socketoptions() callbacks.

An example of setting up the security object for PSK mode:

```c
/* "000102030405060708090a0b0c0d0e0f" */
static unsigned char client_psk[] = {
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
    0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f
};
static const char client_identity[] = "Client_identity";
lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 0), "coaps://lwm2m.example.com");
lwm2m_set_u8(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 2), LWM2M_SECURITY_PSK);
/* Set the client identity as a string, but this could be binary as well */
lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 3), client_identity);
/* Set the client pre-shared key (PSK) */
lwm2m_set_opaque(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 5), client_psk, sizeof(client_psk));
```

An example of setting up the security object for X509 certificate mode:

```c
static const char certificate[] = "-----BEGIN CERTIFICATE-----\nMIIB6jCCAY+gAw...
static const char key[] = "-----BEGIN EC PRIVATE KEY-----\nMHcCAQ...
static const char root_ca[] = "-----BEGIN CERTIFICATE-----\nMIIBaz...

lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 0), "coaps://lwm2m.example.com");
lwm2m_set_u8(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 2), LWM2M_SECURITY_CERT);
lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 3), certificate);
lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 5), key);
lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 5), root_ca);
```

Before calling lwm2m_rd_client_start() assign the tls_tag # where the LwM2M library should store the DTLS information prior to connection (normally a value of 1 is ok here).

```c
(void)memset(&client, 0x0, sizeof(client));
client.tls_tag = 1; /* <---- */
lwm2m_rd_client_start(&client, "endpoint-name", 0, rd_client_event);
```

For a more detailed LwM2M client sample see: lwm2m-client.

**Multi-thread usage** Writing a value to a resource can be done using functions like lwm2m_set_u8. When writing to multiple resources, the function lwm2m_registry_lock will ensure that the client halts until all writing operations are finished.

6.3. Networking 2477
lwm2m_registry_lock();
lwm2m_set_u32(LWM2M_OBJ(1, 0, 1), 60);
lwm2m_set_u8(LWM2M_OBJ(5, 0, 3), 0);
lwm2m_set_f64(LWM2M_OBJ(3303, 0, 5700), value);
lwm2m_registry_unlock();

This is especially useful if the server is composite-observing the resources being written to. Locking will then ensure that the client only updates and sends notifications to the server after all operations are done, resulting in fewer messages in general.

**Support for time series data**  LwM2M version 1.1 adds support for SenML CBOR and SenML JSON data formats. These data formats add support for time series data. Time series formats can be used for READ, NOTIFY and SEND operations. When data cache is enabled for a resource, each write will create a timestamped entry in a cache, and its content is then returned as a content in in READ, NOTIFY or SEND operation for a given resource.

Data cache is only supported for resources with a fixed data size.

Supported resource types:
- Signed and unsigned 8-64-bit integers
- Float
- Boolean

**Enabling and configuring**  Enable data cache by selecting CONFIG_LWM2M_RESOURCE_DATA_CACHE_SUPPORT. Application needs to allocate an array of lwm2m_time_series_elem structures and then enable the cache by calling lwm2m_engine_enable_cache() for a given resource. Each resource must be enabled separately and each resource needs their own storage.

```c
/* Allocate data cache storage */
static struct lwm2m_time_series_elem temperature_cache[10];
/* Enable data cache */
lwm2m_engine_enable_cache(LWM2M_PATH(IPSO_OBJECT_TEMP_SENSOR_ID, 0, SENSOR_VALUE_RID),
                          temperature_cache, ARRAY_SIZE(temperature_cache));
```

LwM2M engine have room for four resources that have cache enabled. Limit can be increased by changing CONFIG_LWM2M_MAX_CACHED_RESOURCES. This affects a static memory usage of engine.

Data caches depends on one of the SenML data formats CONFIG_LWM2M_RW_SENML_CBOR_SUPPORT or CONFIG_LWM2M_RW_SENML_JSON_SUPPORT and needs CONFIG_POSIX_CLOCK so it can request a timestamp from the system and CONFIG_RING_BUFFER for ring buffer.

**Read and Write operations**  Full content of data cache is written into a payload when any READ, SEND or NOTIFY operation internally reads the content of a given resource. This has a side effect that any read callbacks registered for a that resource are ignored when cache is enabled. Data is written into a cache when any of the lwm2m_set_* functions are called. To filter the data entering the cache, application may register a validation callback using lwm2m_register_validate_callback().

**Limitations**  Cache size should be manually set so small that the content can fit normal packets sizes. When cache is full, new values are dropped.
LwM2M engine and application events  The Zephyr LwM2M engine defines events that can be sent back to the application through callback functions. The engine state machine shows when the events are spawned. Events depicted in the diagram are listed in the table. The events are prefixed with \texttt{LWM2M\_RD\_CLIENT\_EVENT\_}\_.

![LwM2M engine state machine](image)

Fig. 15: State machine for the LwM2M engine
Table 20: LwM2M RD Client events

<table>
<thead>
<tr>
<th>Event ID</th>
<th>Event Name</th>
<th>Description</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>NONE</td>
<td>No event</td>
<td>Do nothing</td>
</tr>
<tr>
<td>1</td>
<td>BOOT-STRAP_REG_FAILURE</td>
<td>Bootstrap registration failed. Occurs if there is a timeout or failure in bootstrap registration.</td>
<td>Retry bootstrap</td>
</tr>
<tr>
<td>2</td>
<td>BOOT-STRAP_REG_COMPLETE</td>
<td>Bootstrap registration complete. Occurs after successful bootstrap registration.</td>
<td>No actions needed</td>
</tr>
<tr>
<td>3</td>
<td>BOOT-STRAP_TR</td>
<td>Bootstrap finish command received from the server.</td>
<td>No actions needed, client proceeds to registration.</td>
</tr>
<tr>
<td>4</td>
<td>REGISTRATION_FAILURE</td>
<td>Registration to LwM2M server failed. Occurs if there is a failure in the registration.</td>
<td>Retry registration</td>
</tr>
<tr>
<td>5</td>
<td>REGISTRATION_COMPLETE</td>
<td>Registration to LwM2M server successful. Occurs after a successful registration reply from the LwM2M server or when session resumption is used.</td>
<td>No actions needed</td>
</tr>
<tr>
<td>6</td>
<td>REG_TIMEOUT</td>
<td>Registration or registration update timeout. Occurs if there is a timeout during registration. NOTE: If registration fails without a timeout, a full registration is triggered automatically and no registration update failure event is generated.</td>
<td>No actions needed, client proceeds to re-registration automatically.</td>
</tr>
<tr>
<td>7</td>
<td>REG_UPDATE_COMPLETE</td>
<td>Registration update completed. Occurs after successful registration update reply from the LwM2M server.</td>
<td>No actions needed</td>
</tr>
<tr>

<td>DEREGERISTER_FAILURE</td>
<td>Deregistration to LwM2M server failed. Occurs if there is a timeout or failure in the deregistration.</td>
<td>No actions needed, client proceeds to idle state automatically.</td>
</tr>
<tr>
<td>9</td>
<td>DISCONNECT</td>
<td>Disconnected from LwM2M server. Occurs if there is a timeout during communication with server. Also triggered after deregistration has been done.</td>
<td>If connection is required, the application should restart the client.</td>
</tr>
<tr>
<td>10</td>
<td>QUEUE_MODE_RX_OFF</td>
<td>Used only in queue mode, not actively listening for incoming packets. In queue mode the client is not required to actively listen for the incoming packets after a configured time period.</td>
<td>No actions needed</td>
</tr>
<tr>
<td>11</td>
<td>ENGINE_SUSPENDED</td>
<td>Indicate that client has now paused as a result of calling lwm2m_engine_pause(). State machine is no longer running and the handler thread is suspended. All timers are stopped so notifications are not triggered.</td>
<td>Engine can be resumed by calling lwm2m_engine_resume().</td>
</tr>
<tr>
<td>12</td>
<td>NETWORK_ERROR</td>
<td>Sending messages to the network failed too many times. If sending a message fails, it will be retried. If the retry counter reaches its limits, this event will be triggered.</td>
<td>No actions needed, client will do a re-register automatically.</td>
</tr>
</tbody>
</table>

Configuring lifetime and activity period  In LwM2M engine, there are three Kconfig options and one runtime value that configures how often the client will send LwM2M Update message.
Table 21: Update period variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>LwM2M registration lifetime</td>
<td>The lifetime parameter in LwM2M specifies how long a device’s registration with an LwM2M server remains valid. Device is expected to send LwM2M Update message before the lifetime expires.</td>
</tr>
<tr>
<td>CONFIG_LWM2M_DEFAULT_LIFETIME</td>
<td>Default lifetime value, unless set by the bootstrap server. Also defines lower limit that client accepts as a lifetime.</td>
</tr>
<tr>
<td>CONFIG_LWM2M_UPDATE_PERIOD</td>
<td>How long the client can stay idle before sending a next update.</td>
</tr>
<tr>
<td>CONFIG_LWM2M_SECONDS_TO_UPDATE_EARLY</td>
<td>Minimum time margin to send the update message before the registration lifetime expires.</td>
</tr>
</tbody>
</table>

**Fig. 16:** Default way of calculating when to update registration.

By default, the client uses CONFIG_LWM2M_SECONDS_TO_UPDATE_EARLY to calculate how many seconds before the expiration of lifetime it is going to send the registration update. The problem with default mode is when the server changes the lifetime of the registration. This is then affecting the period of updates the client is doing. If this is used with the QUEUE mode, which is typical in IPv4 networks, it is also affecting the period of when the device is reachable from the server.

**Fig. 17:** Update time is controlled by UPDATE_PERIOD.

When also the CONFIG_LWM2M_UPDATE_PERIOD is set, time to send the update message is the earliest when any of these values expire. This allows setting long lifetime for the registration and configure the period accurately, even if server changes the lifetime parameter.

In runtime, the update frequency is limited to once in 15 seconds to avoid flooding.

**LwM2M shell** For testing the client it is possible to enable Zephyr’s shell and LwM2M specific commands which support changing the state of the client. Operations supported are read, write
and execute resources. Client start, stop, pause and resume are also available. The feature is enabled by selecting `CONFIG_LWM2M_SHELL`. The shell is meant for testing so production systems should not enable it.

One imaginable scenario, where to use the shell, would be executing client side actions over UART when a server side tests would require those. It is assumed that not all tests are able to trigger required actions from the server side.

```plaintext
uart:~$ lwm2m
lwm2m - LwM2M commands
Subcommands:
  send  :send PATHS
         LwM2M SEND operation
  exec  :exec PATH [PARAM]
         Execute a resource
  read  :read PATH [OPTIONS]
         Read value from LwM2M resource
         -x  Read value as hex stream (default)
         -s  Read value as string
         -b  Read value as bool (1/0)
         -u[X] Read value as uintX_t
         -i[X] Read value as intX_t
         -f  Read value as float
         -t  Read value as time_t
  write :write PATH [OPTIONS] VALUE
         Write into LwM2M resource
         -s  Write value as string (default)
         -b  Write value as bool
         -u[X] Write value as uintX_t
         -i[X] Write value as intX_t
         -f  Write value as float
         -t  Write value as time_t
  create :create PATH
         Create object or resource instance
  delete :delete PATH
         Delete object or resource instance
  cache :cache PATH NUM
         Enable data cache for resource
         PATH is LwM2M path
         NUM how many elements to cache
  start :start EP_NAME [BOOTSTRAP FLAG]
         Start the LwM2M RD (Registration / Discovery) Client
         -b  Set the bootstrap flag (default 0)
  stop  :stop [OPTIONS]
         Stop the LwM2M RD (De-register) Client
         -f  Force close the connection
  update :Trigger Registration Update of the LwM2M RD Client
  pause :LwM2M engine thread pause
  resume :LwM2M engine thread resume
  lock  :Lock the LwM2M registry
  unlock :Unlock the LwM2M registry
```
LwM2M client

Implement a LwM2M client that connects to a LwM2M server.

**group lwm2m_api**

LwM2M high-level API.

LwM2M high-level interface is defined in this header.

**Note:** The implementation assumes UDP module is enabled.

**Note:** For more information refer to Technical Specification OMA-TS-LightweightM2M_Core-V1_1_1-20190617-A

**LwM2M Objects managed by OMA for LwM2M tech specification.**

Objects in this range have IDs from 0 to 1023.

**LWM2M_OBJECT_SECURITY_ID**

Security object.

**LWM2M_OBJECT_SERVER_ID**

Server object.

**LWM2M_OBJECT_ACCESS_CONTROL_ID**

Access Control object.

**LWM2M_OBJECT_DEVICE_ID**

Device object.

**LWM2M_OBJECT_CONNECTIVITY_MONITORING_ID**

Connectivity Monitoring object.

**LWM2M_OBJECT_FIRMWARE_ID**

Firmware object.

**LWM2M_OBJECT_LOCATION_ID**

Location object.

**LWM2M_OBJECT_CONNECTIVITY_STATISTICS_ID**

Connectivity Statistics object.

**LWM2M_OBJECT_SOFTWARE_MANAGEMENT_ID**

Software Management object.
LWM2M_OBJECT_PORTFOLIO_ID
Portfolio object.

LWM2M_OBJECT_BINARYAPPDATA_CONTAINER_ID
Binary App Data Container object.

LWM2M_OBJECT_EVENT_Log_ID
Event Log object.

LWM2M_OBJECT_GATEWAY_ID
Gateway object.

LwM2M Objects produced by 3rd party Standards Development Organizations.
Refer to the OMA LightweightM2M (LwM2M) Object and Resource Registry: http://www.openmobilealliance.org/wp/OMNA/LwM2M/LwM2MRegistry.html

IPSO_OBJECT_GENERIC_SENSOR_ID
IPSO Generic Sensor object.

IPSO_OBJECT_TEMP_SENSOR_ID
IPSO Temperature Sensor object.

IPSO_OBJECT_HUMIDITY_SENSOR_ID
IPSO Humidity Sensor object.

IPSO_OBJECT_LIGHT_CONTROL_ID
IPSO Light Control object.

IPSO_OBJECT_ACCELEROMETER_ID
IPSO Accelerometer object.

IPSO_OBJECT_VOLTAGE_SENSOR_ID
IPSO Voltage Sensor object.

IPSO_OBJECT_CURRENT_SENSOR_ID
IPSO Current Sensor object.

IPSO_OBJECT_PRESSURE_ID
IPSO Pressure Sensor object.

IPSO_OBJECT_BUZZER_ID
IPSO Buzzer object.

IPSO_OBJECT_TIMER_ID
IPSO Timer object.
IPSO_OBJECT_ONOFF_SWITCH_ID
IPSO On/Off Switch object.

IPSO_OBJECT_PUSH_BUTTON_ID
IPSO Push Button object.

UCIFI_OBJECT_BATTERY_ID
ucIFI Battery object

IPSO_OBJECT_FILLING_LEVEL_SENSOR_ID
IPSO Filling Level Sensor object.

Power source types used for the “Available Power Sources” resource of the LwM2M Device object (3/0/6).

LWM2M_DEVICE_PWR_SRC_TYPE_DC_POWER
DC power.

LWM2M_DEVICE_PWR_SRC_TYPE_BAT_INT
Internal battery.

LWM2M_DEVICE_PWR_SRC_TYPE_BAT_EXT
External battery.

LWM2M_DEVICE_PWR_SRC_TYPE_FUEL_CELL
Fuel cell.

LWM2M_DEVICE_PWR_SRC_TYPE_PWR_OVER_ETH
Power over Ethernet.

LWM2M_DEVICE_PWR_SRC_TYPE_USB
USB.

LWM2M_DEVICE_PWR_SRC_TYPE_AC_POWER
AC (mains) power.

LWM2M_DEVICE_PWR_SRC_TYPE_SOLAR
Solar.

LWM2M_DEVICE_PWR_SRC_TYPE_MAX
Max value for Available Power Source type.

Error codes used for the “Error Code” resource of the LwM2M Device object.

An LwM2M client can register one of the following error codes via the lwm2m_device_add_err() function.
LWM2M_DEVICE_ERROR_NONE
No error.

LWM2M_DEVICE_ERROR_LOW_POWER
Low battery power.

LWM2M_DEVICE_ERROR_EXT_POWER_SUPPLY_OFF
External power supply off.

LWM2M_DEVICE_ERROR_GPS_FAILURE
GPS module failure.

LWM2M_DEVICE_ERROR_LOW_SIGNAL_STRENGTH
Low received signal strength.

LWM2M_DEVICE_ERROR_OUT_OF_MEMORY
Out of memory.

LWM2M_DEVICE_ERROR_SMS_FAILURE
SMS failure.

LWM2M_DEVICE_ERROR_NETWORK_FAILURE
IP Connectivity failure.

LWM2M_DEVICE_ERROR_PERIPHERAL_FAILURE
Peripheral malfunction.

**Battery status codes used for the “Battery Status” resource (3/0/20)**

of the LwM2M Device object.

As the battery status changes, an LwM2M client can set one of the following codes via:
lwm2m_engine_set_u8("3/0/20", [battery status])

- **LWM2M_DEVICE_BATTERY_STATUS_NORMAL**
  The battery is operating normally and not on power.

- **LWM2M_DEVICE_BATTERY_STATUS_CHARGING**
  The battery is currently charging.

- **LWM2M_DEVICE_BATTERY_STATUS_CHARGE_COMP**
  The battery is fully charged and the charger is still connected.

- **LWM2M_DEVICE_BATTERY_STATUS_DAMAGED**
  The battery has some problem.

- **LWM2M_DEVICE_BATTERY_STATUS_LOW**
  The battery is low on charge.
LWM2M_DEVICE_BATTERY_STATUS_NOT_INST
The battery is not installed.

LWM2M_DEVICE_BATTERY_STATUS_UNKNOWN
The battery information is not available.

**LWM2M Firmware Update object states**

An LwM2M client or the LwM2M Firmware Update object use the following codes to represent the LwM2M Firmware Update state (5/0/3).

**STATE_IDLE**
Idle.
Before downloading or after successful updating.

**STATE_DOWNLOADING**
Downloading.
The data sequence is being downloaded.

**STATE_DOWNLOADED**
Downloaded.
The whole data sequence has been downloaded.

**STATE_UPDATING**
Updating.
The device is being updated.

**LWM2M Firmware Update object result codes**

After processing a firmware update, the client sets the result via one of the following codes via lwm2m_engine_set_u8("5/0/5", [result code])

**RESULT_DEFAULT**
Initial value.

**RESULT_SUCCESS**
Firmware updated successfully.

**RESULT_NO_STORAGE**
Not enough flash memory for the new firmware package.

**RESULT_OUT_OF_MEM**
Out of RAM during downloading process.

**RESULT_CONNECTION_LOST**
Connection lost during downloading process.
RESULT_INTEGRITY_FAILED
   Integrity check failure for new downloaded package.

RESULT_UNSUP_FW
   Unsupported package type.

RESULT_INVALID_URI
   Invalid URI.

RESULT_UPDATE_FAILED
   Firmware update failed.

RESULT_UNSUP_PROTO
   Unsupported protocol.

Defines

LWM2M_OBJLNK_MAX_ID
   Maximum value for Objlnk resource fields.

LWM2M_RES_DATA_READ_ONLY
   Resource read-only value bit.

LWM2M_RES_DATA_FLAG_RO
   Resource read-only flag.

LWM2M_HAS_RES_FLAG(res, f)
   Read resource flags helper macro.

LWM2M_RD_CLIENT_EVENT_REG_UPDATE_FAILURE
   Define for old event name keeping backward compatibility.

LWM2M_RD_CLIENT_FLAG_BOOTSTRAP
   Run bootstrap procedure in current session.

LWM2M_MAX_PATH_STR_SIZE
   LwM2M path maximum length.

Typedefs

typedef void (*lwm2m_socket_fault_cb_t)(int error)
   Callback function called when a socket error is encountered.

   Param error
   Error code
typedef void (*lwm2m_observe_cb_t)(enum lwm2m_observe_event event, struct lwm2m_obj_path *path, void *user_data)

Observe callback indicating observer adds and deletes, and notification ACKs and timeouts.

**Param event**
* [in] Observer add/delete or notification ack/timeout

**Param path**
* [in] LwM2M path

**Param user_data**
* [in] Pointer to user_data buffer, as provided in send_traceable_notification(). Used to determine for which data the ACKed/timed out notification was.

typedef void (*lwm2m_ctx_event_cb_t)(struct lwm2m_ctx *ctx, enum lwm2m_rd_client_event event)

Asynchronous RD client event callback.

**Param ctx**
* [in] LwM2M context generating the event

**Param event**
* [in] LwM2M RD client event code

typedef void *(lwm2m_engine_get_data_cb_t)(uint16_t obj_inst_id, uint16_t res_id, uint16_t res_inst_id, size_t *data_len)

Asynchronous callback to get a resource buffer and length.

Prior to accessing the data buffer of a resource, the engine can use this callback to get the buffer pointer and length instead of using the resource's data buffer.

The client or LwM2M objects can register a function of this type via: lwm2m_engine_register_read_callback() lwm2m_engine_register_pre_write_callback()

**Param obj_inst_id**
* [in] Object instance ID generating the callback.

**Param res_id**
* [in] Resource ID generating the callback.

**Param res_inst_id**
* [in] Resource instance ID generating the callback (typically 0 for non-multi instance resources).

**Param data_len**
* [out] Length of the data buffer.

**Return**
Callback returns a pointer to the data buffer or NULL for failure.

typedef int (*lwm2m_engine_set_data_cb_t)(uint16_t obj_inst_id, uint16_t res_id, uint16_t res_inst_id, uint8_t *data, uint16_t data_len, bool last_block, size_t total_size)

Asynchronous callback when data has been set to a resource buffer.

After changing the data of a resource buffer, the LwM2M engine can make use of this callback to pass the data back to the client or LwM2M objects.

A function of this type can be registered via: lwm2m_engine_register_validate_callback() lwm2m_engine_register_post_write_callback()
**Param obj_inst_id**
[in] Object instance ID generating the callback.

**Param res_id**
[in] Resource ID generating the callback.

**Param res_inst_id**
[in] Resource instance ID generating the callback (typically 0 for non-multi instance resources).

**Param data**
[in] Pointer to data.

**Param data_len**
[in] Length of the data.

**Param last_block**
[in] Flag used during block transfer to indicate the last block of data. For non-block transfers this is always false.

**Param total_size**
[in] Expected total size of data for a block transfer. For non-block transfers this is 0.

**Return**
Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

typedef int (*lwm2m_engine_user_cb_t)(uint16_t obj_inst_id)

Asynchronous event notification callback.

Various object instance and resource-based events in the LwM2M engine can trigger a callback of this function type: object instance create, and object instance delete.

Register a function of this type via: `lwm2m_engine_register_create_callback()`
`lwm2m_engine_register_delete_callback()`

**Param obj_inst_id**
[in] Object instance ID generating the callback.

**Return**
Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

typedef int (*lwm2m_engine_execute_cb_t)(uint16_t obj_inst_id, uint8_t *args, uint16_t args_len)

Asynchronous execute notification callback.

Resource executes trigger a callback of this type.

Register a function of this type via: `lwm2m_engine_register_exec_callback()`

**Param obj_inst_id**
[in] Object instance ID generating the callback.

**Param args**
[in] Pointer to execute arguments payload. (This can be NULL if no arguments are provided)

**Param args_len**
[in] Length of argument payload in bytes.

**Return**
Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.
typedef void (*lwm2m_send_cb_t)(enum lwm2m_send_status status)
   Callback returning send status.

** Enums **

enum lwm2m_observe_event
   Observe callback events.
   ** Values:**

   enumerator LWM2M_OBSERVE_EVENT_OBSERVER_ADDED
      Observer added.

   enumerator LWM2M_OBSERVE_EVENT_OBSERVER_REMOVED
      Observer removed.

   enumerator LWM2M_OBSERVE_EVENT_NOTIFY_ACK
      Notification ACKed.

   enumerator LWM2M_OBSERVE_EVENT_NOTIFY_TIMEOUT
      Notification timed out.

enum lwm2m_rd_client_event
   LwM2M RD client events.
   LwM2M client events are passed back to the event_cb function in
   lwm2m_rd_client_start()
   ** Values:**

   enumerator LWM2M_RD_CLIENT_EVENT_NONE

   enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_FAILURE

   enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_COMPLETE

   enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_TRANSFER_COMPLETE

   enumerator LWM2M_RD_CLIENT_EVENT_REGISTRATION_FAILURE

   enumerator LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE

   enumerator LWM2M_RD_CLIENT_EVENT_REG_TIMEOUT

   enumerator LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE

   enumerator LWM2M_RD_CLIENT_EVENT_DEREGISTER_FAILURE
enumerator LWM2M_RD_CLIENT_EVENT_DISCONNECT
enumerator LWM2M_RD_CLIENT_EVENT_QUEUE_MODE_RX_OFF
enumerator LWM2M_RD_CLIENT_EVENT_ENGINE_SUSPENDED
enumerator LWM2M_RD_CLIENT_EVENT_NETWORK_ERROR
enumerator LWM2M_RD_CLIENT_EVENT_REG_UPDATE
enumerator LWM2M_RD_CLIENT_EVENT_DEREGISTER

denum lwm2m_send_status
  LwM2M send status.
  LwM2M send status are generated back to the lwm2m_send_cb_t function in lwm2m_send_cb()
  Values:
  enumerator LWM2M_SEND_STATUS_SUCCESS
  enumerator LWM2M_SEND_STATUS_FAILURE
  enumerator LWM2M_SEND_STATUS_TIMEOUT

denum lwm2m_security_mode_e
  Security modes as defined in LwM2M Security object.
  Values:
  enumerator LWM2M_SECURITY_PSK = 0
    Pre-Shared Key mode.
  enumerator LWM2M_SECURITY_RAW_PK = 1
    Raw Public Key mode.
  enumerator LWM2M_SECURITY_CERT = 2
    Certificate mode.
  enumerator LWM2M_SECURITY_NOSEC = 3
    NoSec mode.
  enumerator LWM2M_SECURITY_CERT_EST = 4
    Certificate mode with EST.
int lwm2m_device_add_err(uint8_t error_code)
    Register a new error code with LwM2M Device object.

    Parameters

    Returns
    0 for success or negative in case of error.

void lwm2m_firmware_set_write_cb(lwm2m_engine_set_data_cb_t cb)
    Set data callback for firmware block transfer.
    LwM2M clients use this function to register a callback for receiving the block transfer
data when performing a firmware update.

    Parameters
    • cb – [in] A callback function to receive the block transfer data

lwm2m_engine_set_data_cb_t lwm2m_firmware_get_write_cb(void)
    Get the data callback for firmware block transfer writes.

    Returns
    A registered callback function to receive the block transfer data

void lwm2m_firmware_set_write_cb_inst(uint16_t obj_inst_id, lwm2m_engine_set_data_cb_t cb)
    Set data callback for firmware block transfer.
    LwM2M clients use this function to register a callback for receiving the block transfer
data when performing a firmware update.

    Parameters
    • obj_inst_id – [in] Object instance ID
    • cb – [in] A callback function to receive the block transfer data

lwm2m_engine_set_data_cb_t lwm2m_firmware_get_write_cb_inst(uint16_t obj_inst_id)
    Get the data callback for firmware block transfer writes.

    Parameters
    • obj_inst_id – [in] Object instance ID

    Returns
    A registered callback function to receive the block transfer data

void lwm2m_firmware_set_cancel_cb(lwm2m_engine_user_cb_t cb)
    Set callback for firmware update cancel.
    LwM2M clients use this function to register a callback to perform actions on firmware
update cancel.

    Parameters

lwm2m_engine_user_cb_t lwm2m_firmware_get_cancel_cb(void)
    Get a callback for firmware update cancel.

    Returns
    A registered callback function perform actions on firmware update cancel.
void lwm2m_firmware_set_cancel_cb_inst(uint16_t obj_inst_id, lwm2m_engine_user_cb_t cb)

Set data callback for firmware update cancel.
LwM2M clients use this function to register a callback to perform actions on firmware update cancel.

Parameters
• obj_inst_id – [in] Object instance ID

lwm2m_engine_user_cb_t lwm2m_firmware_get_cancel_cb_inst(uint16_t obj_inst_id)
Get the callback for firmware update cancel.

Parameters
• obj_inst_id – [in] Object instance ID

Returns
A registered callback function perform actions on firmware update cancel.

void lwm2m_firmware_set_update_cb(lwm2m_engine_execute_cb_t cb)
Set data callback to handle firmware update execute events.
LwM2M clients use this function to register a callback for receiving the update resource “execute” operation on the LwM2M Firmware Update object.

Parameters
• cb – [in] A callback function to receive the execute event.

lwm2m_engine_execute_cb_t lwm2m_firmware_get_update_cb(void)
Get the event callback for firmware update execute events.

Returns
A registered callback function to receive the execute event.

void lwm2m_firmware_set_update_cb_inst(uint16_t obj_inst_id, lwm2m_engine_execute_cb_t cb)
Set data callback to handle firmware update execute events.
LwM2M clients use this function to register a callback for receiving the update resource “execute” operation on the LwM2M Firmware Update object.

Parameters
• obj_inst_id – [in] Object instance ID
• cb – [in] A callback function to receive the execute event.

lwm2m_engine_execute_cb_t lwm2m_firmware_get_update_cb_inst(uint16_t obj_inst_id)
Get the event callback for firmware update execute events.

Parameters
• obj_inst_id – [in] Object instance ID

Returns
A registered callback function to receive the execute event.

int lwm2m_swmgmt_set_activate_cb(uint16_t obj_inst_id, lwm2m_engine_execute_cb_t cb)
Set callback to handle software activation requests.
The callback will be executed when the LWM2M execute operation gets called on the corresponding object's Activate resource instance.

Parameters
• `obj_inst_id` – `[in]` The instance number to set the callback for.
• `cb` – `[in]` A callback function to receive the execute event.

**Returns**
0 on success, otherwise a negative integer.

```c
int lwm2m_swmgmt_set_deactivate_cb(uint16_t obj_inst_id, lwm2m_engine_execute_cb_t cb)
```

Set callback to handle software deactivation requests.
The callback will be executed when the LWM2M execute operation gets called on the corresponding object’s Deactivate resource instance.

**Parameters**
• `obj_inst_id` – `[in]` The instance number to set the callback for.
• `cb` – `[in]` A callback function to receive the execute event.

**Returns**
0 on success, otherwise a negative integer.

```c
int lwm2m_swmgmt_set_install_package_cb(uint16_t obj_inst_id, lwm2m_engine_execute_cb_t cb)
```

Set callback to handle software install requests.
The callback will be executed when the LWM2M execute operation gets called on the corresponding object’s Install resource instance.

**Parameters**
• `obj_inst_id` – `[in]` The instance number to set the callback for.
• `cb` – `[in]` A callback function to receive the execute event.

**Returns**
0 on success, otherwise a negative integer.

```c
int lwm2m_swmgmt_set_delete_package_cb(uint16_t obj_inst_id, lwm2m_engine_execute_cb_t cb)
```

Set callback to handle software uninstall requests.
The callback will be executed when the LWM2M execute operation gets called on the corresponding object’s Uninstall resource instance.

**Parameters**
• `obj_inst_id` – `[in]` The instance number to set the callback for.
• `cb` – `[in]` A callback function for handling the execute event.

**Returns**
0 on success, otherwise a negative integer.

```c
int lwm2m_swmgmt_set_read_package_version_cb(uint16_t obj_inst_id, lwm2m_engine_get_data_cb_t cb)
```

Set callback to read software package.
The callback will be executed when the LWM2M read operation gets called on the corresponding object.

**Parameters**
• `obj_inst_id` – `[in]` The instance number to set the callback for.
• `cb` – `[in]` A callback function for handling the read event.

**Returns**
0 on success, otherwise a negative integer.
int lwm2m_swmgmt_set_write_package_cb(uint16_t obj_inst_id, lwm2m_engine_set_data_cb_t cb)

Set data callback for software management block transfer.

The callback will be executed when the LWM2M block write operation gets called on the corresponding object's resource instance.

Parameters
- **obj_inst_id** – [in] The instance number to set the callback for.
- **cb** – [in] A callback function for handling the block write event.

Returns
0 on success, otherwise a negative integer.

int lwm2m_swmgmt_install_completed(uint16_t obj_inst_id, int error_code)

Function to be called when a Software Management object instance completed the Install operation.

return 0 on success, otherwise a negative integer.

Parameters
- **obj_inst_id** – [in] The Software Management object instance
- **error_code** – [in] The result code of the operation. Zero on success otherwise it should be a negative integer.

void lwm2m_event_log_set_read_log_data_cb(lwm2m_engine_get_data_cb_t cb)

Set callback to read log data.

The callback will be executed when the LWM2M read operation gets called on the corresponding object.

Parameters
- **cb** – [in] A callback function for handling the read event.

int lwm2m_engine_update_observer_min_period(struct lwm2m_ctx *client_ctx, const char *pathstr, uint32_t period_s)

Change an observer's pmin value.

Deprecated:
Use `lwm2m_update_observer_min_period()` instead.

LwM2M clients use this function to modify the pmin attribute for an observation being made. Example to update the pmin of a temperature sensor value being observed:
lwm2m_engine_update_observer_min_period("client_ctx, 3303/0/5700", 5);

Parameters
- **client_ctx** – [in] LwM2M context
- **pathstr** – [in] LwM2M path string “obj/obj-inst/res”
- **period_s** – [in] Value of pmin to be given (in seconds).

Returns
0 for success or negative in case of error.

int lwm2m_update_observer_min_period(struct lwm2m_ctx *client_ctx, const struct lwm2m_obj_path *path, uint32_t period_s)
Change an observer’s pmin value.
LwM2M clients use this function to modify the pmin attribute for an observation being made. Example to update the pmin of a temperature sensor value being observed:
lwm2m_update_observer_min_period(client_ctx, &LWM2M_OBJ(3303, 0, 5700), 5);

Parameters
• client_ctx – [in] LwM2M context
• path – [in] LwM2M path as a struct
• period_s – [in] Value of pmin to be given (in seconds).

Returns
0 for success or negative in case of error.

int lwm2m_engine_update_observer_max_period(struct lwm2m_ctx *client_ctx, const char *pathstr, uint32_t period_s)

Change an observer’s pmax value.

Deprecated:
Use lwm2m_update_observer_max_period() instead.
LwM2M clients use this function to modify the pmax attribute for an observation being made. Example to update the pmax of a temperature sensor value being observed:
lwm2m_engine_update_observer_max_period("client_ctx, 3303/0/5700", 5);

Parameters
• client_ctx – [in] LwM2M context
• pathstr – [in] LwM2M path string “obj/obj-inst/res”
• period_s – [in] Value of pmax to be given (in seconds).

Returns
0 for success or negative in case of error.

int lwm2m_update_observer_max_period(struct lwm2m_ctx *client_ctx, const struct lwm2m_obj_path *path, uint32_t period_s)

Create an LwM2M object instance.

Deprecated:
Use lwm2m_create_obj_inst() instead.
LwM2M clients use this function to create non-default LwM2M objects: Example to create first temperature sensor object: lwm2m_engine_create_obj_inst("3303/0");

Parameters
• **pathstr** – *[in]* LwM2M path string “obj/obj-inst”

Returns
0 for success or negative in case of error.

```c
int lwm2m_create_object_inst(const struct lwm2m_obj_path* path)
```

Create an LwM2M object instance.

LwM2M clients use this function to create non-default LwM2M objects: Example to create first temperature sensor object: lwm2m_create_obj_inst(&LWM2M_OBJ(3303, 0));

Parameters
• **path** – *[in]* LwM2M path as a struct

Returns
0 for success or negative in case of error.

```c
int lwm2m_engine_delete_obj_inst(const char *pathstr)
```

Delete an LwM2M object instance.

**Deprecated:**
Use lwm2m_delete_obj_inst() instead.

LwM2M clients use this function to delete LwM2M objects.

Parameters
• **pathstr** – *[in]* LwM2M path string “obj/obj-inst”

Returns
0 for success or negative in case of error.

```c
int lwm2m_delete_object_inst(const struct lwm2m_obj_path* path)
```

Delete an LwM2M object instance.

LwM2M clients use this function to delete LwM2M objects.

Parameters
• **path** – *[in]* LwM2M path as a struct

Returns
0 for success or negative in case of error.

```c
void lwm2m_registry_lock(void)
```

Locks the registry for this thread.

Use this function before writing to multiple resources. This halts the lwm2m main thread until all the write-operations are finished.

```c
void lwm2m_registry_unlock(void)
```

Unlocks the registry previously locked by lwm2m_registry_lock().

```c
int lwm2m_engine_set_opaque(const char *pathstr, const char *data_ptr, uint16_t data_len)
```

Set resource (instance) value (opaque buffer)
Deprecated:
Use `lwm2m_set_opaque()` instead.

**Parameters**
- `data_ptr` – [in] Data buffer
- `data_len` – [in] Length of buffer

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_set_opaque(const struct lwm2m_obj_path *path, const char *data_ptr, uint16_t data_len)
```

Set resource (instance) value (opaque buffer)

**Parameters**
- `path` – [in] LwM2M path as a struct
- `data_ptr` – [in] Data buffer
- `data_len` – [in] Length of buffer

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_set_string(const char *pathstr, const char *data_ptr)
```

Set resource (instance) value (string)

**Parameters**
- `data_ptr` – [in] NULL terminated char buffer

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_set_string(const struct lwm2m_obj_path *path, const char *data_ptr)
```

Set resource (instance) value (string)

**Parameters**
- `path` – [in] LwM2M path as a struct
- `data_ptr` – [in] NULL terminated char buffer

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_set_u8(const char *pathstr, uint8_t value)
```

Set resource (instance) value (u8)

**Parameters**
- `data_ptr` – [in] NULL terminated char buffer

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_set_u8(const struct lwm2m_obj_path *path, const char *data_ptr)
```

Set resource (instance) value (u8)

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• **value** – [in] u8 value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_set_u8(const struct lwm2m_obj_path *path, uint8_t value)
```
Set resource (instance) value (u8)

**Parameters**
• **path** – [in] LwM2M path as a struct
• **value** – [in] u8 value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_set_u16(const char *pathstr, uint16_t value)
```
Set resource (instance) value (u16)

**Deprecated:**
Use `lwm2m_set_u16()` instead.

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• **value** – [in] u16 value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_set_u16(const struct lwm2m_obj_path *path, uint16_t value)
```
Set resource (instance) value (u16)

**Parameters**
• **path** – [in] LwM2M path as a struct
• **value** – [in] u16 value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_set_u32(const char *pathstr, uint32_t value)
```
Set resource (instance) value (u32)

**Deprecated:**
Use `lwm2m_set_u32()` instead.

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• **value** – [in] u32 value

**Returns**
0 for success or negative in case of error.
int lwm2m_set_u32(const struct lwm2m_obj_path *path, uint32_t value)
Set resource (instance) value (u32)

Parameters
- path – [in] LwM2M path as a struct
- value – [in] u32 value

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_u64(const char *pathstr, uint64_t value)
Set resource (instance) value (u64)

Deprecated:
Use lwm2m_set_u64() instead.

Parameters
- value – [in] u64 value

Returns
0 for success or negative in case of error.

int lwm2m_set_u64(const struct lwm2m_obj_path *path, uint64_t value)
Set resource (instance) value (u64)

Parameters
- path – [in] LwM2M path as a struct
- value – [in] u64 value

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_s8(const char *pathstr, int8_t value)
Set resource (instance) value (s8)

Deprecated:
Use lwm2m_set_s8() instead.

Parameters
- value – [in] s8 value

Returns
0 for success or negative in case of error.

int lwm2m_set_s8(const struct lwm2m_obj_path *path, int8_t value)
Set resource (instance) value (s8)

Parameters
- path – [in] LwM2M path as a struct
- value – [in] s8 value

Returns
0 for success or negative in case of error.
int lwm2m_engine_set_s16(const char *pathstr, int16_t value)
Set resource (instance) value (s16)

Deprecated:
Use lwm2m_set_s16() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] s16 value

Returns
0 for success or negative in case of error.

int lwm2m_set_s16(const struct lwm2m_obj_path *path, int16_t value)
Set resource (instance) value (s16)

Parameters
• path – [in] LwM2M path as a struct
• value – [in] s16 value

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_s32(const char *pathstr, int32_t value)
Set resource (instance) value (s32)

Deprecated:
Use lwm2m_set_s32() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] s32 value

Returns
0 for success or negative in case of error.

int lwm2m_set_s32(const struct lwm2m_obj_path *path, int32_t value)
Set resource (instance) value (s32)

Parameters
• path – [in] LwM2M path as a struct
• value – [in] s32 value

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_s64(const char *pathstr, int64_t value)
Set resource (instance) value (s64)

Deprecated:
Use lwm2m_set_s64() instead.

Parameters
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)"
• **value** – [in] s64 value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_set_s64(const struct lwm2m_obj_path *path, int64_t value)
```
Set resource (instance) value (s64)

**Parameters**
• **path** – [in] LwM2M path as a struct
• **value** – [in] s64 value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_set_bool(const char *pathstr, bool value)
```
Set resource (instance) value (bool)

**Deprecated:**
Use `lwm2m_set_bool()` instead.

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)"
• **value** – [in] bool value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_set_bool(const struct lwm2m_obj_path *path, bool value)
```
Set resource (instance) value (bool)

**Parameters**
• **path** – [in] LwM2M path as a struct
• **value** – [in] bool value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_set_float(const char *pathstr, const double *value)
```
Set resource (instance) value (double)

**Deprecated:**
Use `lwm2m_set_f64()` instead.

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)"
• **value** – [in] double value

**Returns**
0 for success or negative in case of error.
int lwm2m_set_f64(const struct lwm2m_obj_path *path, const double value)
Set resource (instance) value (double)

Parameters
• path – [in] LwM2M path as a struct
• value – [in] double value

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_objlnk(const char *pathstr, const struct lwm2m_objlnk *value)
Set resource (instance) value (Objlnk)

Deprecated:
Use lwm2m_set_objlnk() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] pointer to the lwm2m_objlnk structure

Returns
0 for success or negative in case of error.

int lwm2m_set_objlnk(const struct lwm2m_obj_path *path, const struct lwm2m_objlnk *value)
Set resource (instance) value (Objlnk)

Parameters
• path – [in] LwM2M path as a struct
• value – [in] pointer to the lwm2m_objlnk structure

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_time(const char *pathstr, time_t value)
Set resource (instance) value (Time)

Deprecated:
Use lwm2m_set_time() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] Epoch timestamp

Returns
0 for success or negative in case of error.

int lwm2m_set_time(const struct lwm2m_obj_path *path, time_t value)
Set resource (instance) value (Time)

Parameters
• path – [in] LwM2M path as a struct
• value – [in] Epoch timestamp
Returns
0 for success or negative in case of error.

int lwm2m_engine_get_opaque(const char *pathstr, void *buf, uint16_t buflen)
Get resource (instance) value (opaque buffer)

Deprecated:
Use lwm2m_get_opaque() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• buf – [out] Data buffer to copy data into
• buflen – [in] Length of buffer

Returns
0 for success or negative in case of error.

int lwm2m_get_opaque(const struct lwm2m_obj_path *path, void *buf, uint16_t buflen)
Get resource (instance) value (opaque buffer)

Parameters
• path – [in] LwM2M path as a struct
• buf – [out] Data buffer to copy data into
• buflen – [in] Length of buffer

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_string(const char *pathstr, void *str, uint16_t buflen)
Get resource (instance) value (string)

Deprecated:
Use lwm2m_get_string() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• str – [out] String buffer to copy data into
• buflen – [in] Length of buffer

Returns
0 for success or negative in case of error.

int lwm2m_get_string(const struct lwm2m_obj_path *path, void *str, uint16_t buflen)
Get resource (instance) value (string)

Parameters
• path – [in] LwM2M path as a struct
• str – [out] String buffer to copy data into
• buflen – [in] Length of buffer

Returns
0 for success or negative in case of error.
int lwm2m_engine_get_u8(const char *pathstr, uint8_t *value)
Get resource (instance) value (u8)

Deprecated:
Use lwm2m_get_u8() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res/(res-inst)”
• value – [out] u8 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_u8(const struct lwm2m_obj_path *path, uint8_t *value)
Get resource (instance) value (u8)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] u8 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_u16(const char *pathstr, uint16_t *value)
Get resource (instance) value (u16)

Deprecated:
Use lwm2m_get_u16() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res/(res-inst)”
• value – [out] u16 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_u16(const struct lwm2m_obj_path *path, uint16_t *value)
Get resource (instance) value (u16)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] u16 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_u32(const char *pathstr, uint32_t *value)
Get resource (instance) value (u32)

Deprecated:
Use lwm2m_get_u32() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] u32 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_u32(const struct lwm2m_obj_path *path, uint32_t *value)
Get resource (instance) value (u32)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] u32 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_u64(const char *pathstr, uint64_t *value)
Get resource (instance) value (u64)

Deprecated:
Use lwm2m_get_u64() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] u64 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_u64(const struct lwm2m_obj_path *path, uint64_t *value)
Get resource (instance) value (u64)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] u64 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_s8(const char *pathstr, int8_t *value)
Get resource (instance) value (s8)

Deprecated:
Use lwm2m_get_s8() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] s8 buffer to copy data into

Returns
0 for success or negative in case of error.
int lwm2m_get_s8(const struct lwm2m_obj_path *path, int8_t *value)
Get resource (instance) value (s8)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] s8 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_s16(const char *pathstr, int16_t *value)
Get resource (instance) value (s16)

Deprecated:
Use lwm2m_get_s16() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(res-inst)”
• value – [out] s16 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_s16(const struct lwm2m_obj_path *path, int16_t *value)
Get resource (instance) value (s16)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] s16 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_s32(const char *pathstr, int32_t *value)
Get resource (instance) value (s32)

Deprecated:
Use lwm2m_get_s32() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(res-inst)”
• value – [out] s32 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_s32(const struct lwm2m_obj_path *path, int32_t *value)
Get resource (instance) value (s32)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] s32 buffer to copy data into

Returns
0 for success or negative in case of error.
int lwm2m_engine_get_s64(const char *pathstr, int64_t *value)
Get resource (instance) value (s64)

Deprecated:
Use lwm2m_get_s64() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(res-inst)”
• value – [out] s64 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_s64(const struct lwm2m_obj_path *path, int64_t *value)
Get resource (instance) value (s64)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] s64 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_bool(const char *pathstr, bool *value)
Get resource (instance) value (bool)

Deprecated:
Use lwm2m_get_bool() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(res-inst)”
• value – [out] bool buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_bool(const struct lwm2m_obj_path *path, bool *value)
Get resource (instance) value (bool)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] bool buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_float(const char *pathstr, double *buf)
Get resource (instance) value (double)

Deprecated:
Use lwm2m_get_f64() instead.

Parameters
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• **buf** – [out] double buffer to copy data into

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_get_f64(const struct lwm2m_obj_path *path, double *value)
```
Get resource (instance) value (double)

**Parameters**
• **path** – [in] LwM2M path as a struct
• **value** – [out] double buffer to copy data into

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_get_objlnk(const char *pathstr, struct lwm2m_objlnk *buf)
```
Get resource (instance) value (Objlnk)

*Deprecated:* Use `lwm2m_get_objlnk()` instead.

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• **buf** – [out] `lwm2m_objlnk` buffer to copy data into

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_get_objlnk(const struct lwm2m_obj_path *path, struct lwm2m_objlnk *buf)
```
Get resource (instance) value (Objlnk)

**Parameters**
• **path** – [in] LwM2M path as a struct
• **buf** – [out] `lwm2m_objlnk` buffer to copy data into

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_get_time(const char *pathstr, time_t *buf)
```
Get resource (instance) value (Time)

*Deprecated:* Use `lwm2m_get_time()` instead.

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• **buf** – [out] time_t pointer to copy data

**Returns**
0 for success or negative in case of error.
int lwm2m_get_time(const struct lwm2m_obj_path *path, time_t *buf)
Get resource (instance) value (Time)

Parameters
• path – [in] LwM2M path as a struct
• buf – [out] time_t pointer to copy data

Returns
0 for success or negative in case of error.

int lwm2m_engine_register_read_callback(const char *pathstr,
                    lwm2m_engine_get_data_cb_t cb)
Set resource (instance) read callback.

Deprecated:
Use lwm2m_register_read_callback() instead.

LwM2M clients can use this to set the callback function for resource reads when data handling in the LwM2M engine needs to be bypassed. For example reading back opaque binary data from external storage.

This callback should not generally be used for any data that might be observed as engine does not have any knowledge of data changes.

When separate buffer for data should be used, use lwm2m_engine_set_res_buf() instead to set the storage.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• cb – [in] Read resource callback

Returns
0 for success or negative in case of error.

int lwm2m_engine_register_read_callback(const struct lwm2m_obj_path *path,
                    lwm2m_engine_get_data_cb_t cb)
Set resource (instance) read callback.

LwM2M clients can use this to set the callback function for resource reads when data handling in the LwM2M engine needs to be bypassed. For example reading back opaque binary data from external storage.

This callback should not generally be used for any data that might be observed as engine does not have any knowledge of data changes.

When separate buffer for data should be used, use lwm2m_engine_set_res_buf() instead to set the storage.

Parameters
• path – [in] LwM2M path as a struct
• cb – [in] Read resource callback

Returns
0 for success or negative in case of error.

int lwm2m_engine_register_pre_write_callback(const char *pathstr,
                    lwm2m_engine_get_data_cb_t cb)
Set resource (instance) pre-write callback.
Deprecated:
Use `lwm2m_register_pre_write_callback()` instead.

This callback is triggered before setting the value of a resource. It can pass a special data buffer to the engine so that the actual resource value can be calculated later, etc.

**Parameters**

- `cb` – [in] Pre-write resource callback

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_register_pre_write_callback(const struct lwm2m_obj_path *path, lwm2m_engine_get_data_cb_t cb)
```

Set resource (instance) pre-write callback.

This callback is triggered before setting the value of a resource. It can pass a special data buffer to the engine so that the actual resource value can be calculated later, etc.

**Parameters**

- `path` – [in] LwM2M path as a struct
- `cb` – [in] Pre-write resource callback

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_register_validate_callback(const char *pathstr, lwm2m_engine_set_data_cb_t cb)
```

Set resource (instance) validation callback.

Deprecated:
Use `lwm2m_register_validate_callback()` instead.

This callback is triggered before setting the value of a resource to the resource data buffer.

The callback allows an LwM2M client or object to validate the data before writing and notify an error if the data should be discarded for any reason (by returning a negative error code).

**Note:** All resources that have a validation callback registered are initially decoded into a temporary validation buffer. Make sure that `CONFIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE` is large enough to store each of the validated resources (individually).

**Parameters**

- `cb` – [in] Validate resource data callback

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_register_validate_callback(const struct lwm2m_obj_path *path, lwm2m_engine_set_data_cb_t cb)
```
Set resource (instance) validation callback.
This callback is triggered before setting the value of a resource to the resource data buffer.
The callback allows an LwM2M client or object to validate the data before writing and notify an error if the data should be discarded for any reason (by returning a negative error code).

**Note:** All resources that have a validation callback registered are initially decoded into a temporary validation buffer. Make sure that CONFIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE is large enough to store each of the validated resources (individually).

**Parameters**
- **path** – [in] LwM2M path as a struct
- **cb** – [in] Validate resource data callback

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_register_post_write_callback(const char *pathstr, lwm2m_engine_set_data_cb_t cb)
```

Set resource (instance) post-write callback.

**Deprecated:**
Use `lwm2m_register_post_write_callback()` instead.

This callback is triggered after setting the value of a resource to the resource data buffer.

It allows an LwM2M client or object to post-process the value of a resource or trigger other related resource calculations.

**Parameters**
- **pathstr** – [in] LwM2M path string “obj/obj-inst/res(res-inst)”
- **cb** – [in] Post-write resource callback

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_register_post_write_callback(const struct lwm2m_obj_path *path, lwm2m_engine_set_data_cb_t cb)
```

Set resource (instance) post-write callback.

This callback is triggered after setting the value of a resource to the resource data buffer.

It allows an LwM2M client or object to post-process the value of a resource or trigger other related resource calculations.

**Parameters**
- **path** – [in] LwM2M path as a struct
- **cb** – [in] Post-write resource callback

**Returns**
0 for success or negative in case of error.
int lwm2m_engine_register_exec_callback(const char *pathstr, lwm2m_engine_execute_cb_t cb)

Set resource execute event callback.

*Deprecated:* Use *lwm2m_register_exec_callback()* instead.

This event is triggered when the execute method of a resource is enabled.

**Parameters**
- **pathstr** – [in] LwM2M path string “obj/obj-inst/res”
- **cb** – [in] Execute resource callback

**Returns**
0 for success or negative in case of error.

int lwm2m_register_exec_callback(const struct lwm2m_obj_path *path, lwm2m_engine_execute_cb_t cb)

Set resource execute event callback.

This event is triggered when the execute method of a resource is enabled.

**Parameters**
- **path** – [in] LwM2M path as a struct
- **cb** – [in] Execute resource callback

**Returns**
0 for success or negative in case of error.

int lwm2m_engine_register_create_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)

Set object instance create event callback.

*Deprecated:* Use *lwm2m_register_create_callback()* instead.

This event is triggered when an object instance is created.

**Parameters**
- **obj_id** – [in] LwM2M object id
- **cb** – [in] Create object instance callback

**Returns**
0 for success or negative in case of error.

int lwm2m_register_create_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)

Set object instance create event callback.

This event is triggered when an object instance is created.

**Parameters**
- **obj_id** – [in] LwM2M object id
- **cb** – [in] Create object instance callback

**Returns**
0 for success or negative in case of error.
int lwm2m_engine_register_delete_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)
Set object instance delete event callback.

Deprecated:
Use lwm2m_register_delete_callback instead
This event is triggered when an object instance is deleted.

Parameters
• obj_id – [in] LwM2M object id
• cb – [in] Delete object instance callback

Returns
0 for success or negative in case of error.

int lwm2m_register_delete_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)
Set object instance delete event callback.
This event is triggered when an object instance is deleted.

Parameters
• obj_id – [in] LwM2M object id
• cb – [in] Delete object instance callback

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_res_buf(const char *pathstr, void *buffer_ptr, uint16_t buffer_len,
uint16_t data_len, uint8_t data_flags)
Set data buffer for a resource.

Deprecated:
Use lwm2m_set_res_buf() instead.
Use this function to set the data buffer and flags for the specified LwM2M resource.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• buffer_ptr – [in] Data buffer pointer
• buffer_len – [in] Length of buffer
• data_len – [in] Length of existing data in the buffer
• data_flags – [in] Data buffer flags (such as read-only, etc)

Returns
0 for success or negative in case of error.

int lwm2m_set_res_buf(const struct lwm2m_obj_path *path, void *buffer_ptr, uint16_t
buffer_len, uint16_t data_len, uint8_t data_flags)
Set data buffer for a resource.
Use this function to set the data buffer and flags for the specified LwM2M resource.

Parameters
• path – [in] LwM2M path as a struct
• buffer_ptr – [in] Data buffer pointer
• buffer_len – [in] Length of buffer
data_len – [in] Length of existing data in the buffer
data_flags – [in] Data buffer flags (such as read-only, etc)

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_res_data(const char *pathstr, void *data_ptr, uint16_t data_len, uint8_t data_flags)

Set data buffer for a resource.

Use this function to set the data buffer and flags for the specified LwM2M resource.

Deprecated:
Use lwm2m_set_res_buf() instead, so you can define buffer size and data size separately.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• data_ptr – [in] Data buffer pointer
• data_len – [in] Length of buffer
• data_flags – [in] Data buffer flags (such as read-only, etc)

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_res_data_len(const char *pathstr, uint16_t data_len)

Update data size for a resource.

Deprecated:
Use lwm2m_set_res_data_len() instead.

Use this function to set the new size of data in the buffer if you write to a buffer received by lwm2m_engine_get_res_buf().

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• data_len – [in] Length of data

Returns
0 for success or negative in case of error.

int lwm2m_set_res_data_len(const struct lwm2m_obj_path *path, uint16_t data_len)

Update data size for a resource.

Use this function to set the new size of data in the buffer if you write to a buffer received by lwm2m_engine_get_res_buf().

Parameters
• path – [in] LwM2M path as a struct
• data_len – [in] Length of data

Returns
0 for success or negative in case of error.
int lwm2m_engine_get_res_buf(const char *pathstr, void **buffer_ptr, uint16_t *buffer_len, uint16_t *data_len, uint8_t *data_flags)

Get data buffer for a resource.

Deprecated:
Use lwm2m_get_res_buf() instead.

Use this function to get the data buffer information for the specified LwM2M resource.
If you directly write into the buffer, you must use lwm2m_engine_set_res_data_len() function to update the new size of the written data.

All parameters except pathstr can NULL if you don’t want to read those values.

Parameters

- buffer_ptr – [out] Data buffer pointer
- buffer_len – [out] Length of buffer
- data_len – [out] Length of existing data in the buffer
- data_flags – [out] Data buffer flags (such as read-only, etc)

Returns

0 for success or negative in case of error.

int lwm2m_get_res_buf(const struct lwm2m_obj_path *path, void **buffer_ptr, uint16_t *buffer_len, uint16_t *data_len, uint8_t *data_flags)

Get data buffer for a resource.

Use this function to get the data buffer information for the specified LwM2M resource.
If you directly write into the buffer, you must use lwm2m_set_res_data_len() function to update the new size of the written data.

All parameters, except for the pathstr, can be NULL if you don’t want to read those values.

Parameters

- path – [in] LwM2M path as a struct
- buffer_ptr – [out] Data buffer pointer
- buffer_len – [out] Length of buffer
- data_len – [out] Length of existing data in the buffer
- data_flags – [out] Data buffer flags (such as read-only, etc)

Returns

0 for success or negative in case of error.

int lwm2m_engine_get_res_data(const char *pathstr, void **data_ptr, uint16_t *data_len, uint8_t *data_flags)

Get data buffer for a resource.

Use this function to get the data buffer information for the specified LwM2M resource.

Deprecated:
Use lwm2m_get_res_buf() as it can tell you the size of the buffer as well.

Parameters
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(res-inst)”
• **data_ptr** – [out] Data buffer pointer
• **data_len** – [out] Length of existing data in the buffer
• **data_flags** – [out] Data buffer flags (such as read-only, etc)

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_create_res_inst(const char *pathstr)
```
Create a resource instance.

*Deprecated:*
Use `lwm2m_create_res_inst()` instead.

LwM2M clients use this function to create multi-resource instances:
Example to create 0 instance of device available power sources:
lwm2m_engine_create_res_inst("3/0/6/0");

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res/res-inst”

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_create_res_inst(const struct lwm2m_obj_path *path)
```
Create a resource instance.

LwM2M clients use this function to create multi-resource instances:
Example to create 0 instance of device available power sources:
lwm2m_create_res_inst(&LWM2M_OBJ(3, 0, 6, 0));

**Parameters**
• **path** – [in] LwM2M path as a struct

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_delete_res_inst(const char *pathstr)
```
Delete a resource instance.

*Deprecated:*
Use `lwm2m_delete_res_inst()` instead.

Use this function to remove an existing resource instance

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res/res-inst”

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_delete_res_inst(const struct lwm2m_obj_path *path)
```
Delete a resource instance.

Use this function to remove an existing resource instance

**Parameters**
• **path** – [in] LwM2M path as a struct
Returns
0 for success or negative in case of error.

int lwm2m_update_device_service_period(uint32_t period_ms)
Update the period of the device service.
Change the duration of the periodic device service that notifies the current time.

Parameters
• period_ms – [in] New period for the device service (in milliseconds)

Returns
0 for success or negative in case of error.

bool lwm2m_engine_path_is_observed(const char *pathstr)
Check whether a path is observed.

Deprecated:
Use lwm2m_path_is_observed() instead.

Parameters
• pathstr – [in] LwM2M path string to check, e.g. “3/0/1”

Returns
true when there exists an observation of the same level or lower as the
given path, false if it doesn’t or path is not a valid LwM2M-path. E.g. true
if path refers to a resource and the parent object has an observation, false
for the inverse.

bool lwm2m_path_is_observed(const struct lwm2m_obj_path *path)
Check whether a path is observed.

Parameters
• path – [in] LwM2M path as a struct to check

Returns
true when there exists an observation of the same level or lower as the
given path, false if it doesn’t or path is not a valid LwM2M-path. E.g. true
if path refers to a resource and the parent object has an observation, false
for the inverse.

int lwm2m_engine_stop(struct lwm2m_ctx *client_ctx)
Stop the LwM2M engine.
LwM2M clients normally do not need to call this function as it is called within
lwm2m_rd_client. However, if the client does not use the RD client implementation, it
will need to be called manually.

Parameters
• client_ctx – [in] LwM2M context

Returns
0 for success or negative in case of error.

int lwm2m_engine_start(struct lwm2m_ctx *client_ctx)
Start the LwM2M engine.
LwM2M clients normally do not need to call this function as it is called by
lwm2m_rd_client_start(). However, if the client does not use the RD client implement-
tation, it will need to be called manually.
Parameters
- **client_ctx** – [in] LwM2M context

Returns
0 for success or negative in case of error.

```c
void lwm2m_acknowledge(struct lwm2m_ctx *client_ctx)
```

Acknowledge the currently processed request with an empty ACK.

LwM2M engine by default sends piggybacked responses for requests. This function allows to send an empty ACK for a request earlier (from the application callback). The LwM2M engine will then send the actual response as a separate CON message after all callbacks are executed.

Parameters
- **client_ctx** – [in] LwM2M context

```c
int lwm2m_rd_client_start(struct lwm2m_ctx *client_ctx, const char *ep_name, uint32_t flags, lwm2m_ctxt_event_cb_t event_cb, lwm2m_observe_cb_t observe_cb)
```

Start the LwM2M RD (Registration / Discovery) Client.

The RD client sits just above the LwM2M engine and performs the necessary actions to implement the “Registration interface”. For more information see Section “Client Registration Interface” of the LwM2M Technical Specification.

**NOTE:** `lwm2m_engine_start()` is called automatically by this function.

Parameters
- **client_ctx** – [in] LwM2M context
- **ep_name** – [in] Registered endpoint name
- **flags** – [in] Flags used to configure current LwM2M session.
- **event_cb** – [in] Client event callback function
- **observe_cb** – [in] Observe callback function called when an observer was added or deleted, and when a notification was acked or has timed out

Returns
0 for success, -EINPROGRESS when client is already running or negative error codes in case of failure.

```c
int lwm2m_rd_client_stop(struct lwm2m_ctx *client_ctx, lwm2m_ctxt_event_cb_t event_cb, bool deregister)
```

Stop the LwM2M RD (De-register) Client.

The RD client sits just above the LwM2M engine and performs the necessary actions to implement the “Registration interface”. For more information see Section “Client Registration Interface” of the LwM2M Technical Specification.

Parameters
- **client_ctx** – [in] LwM2M context
- **event_cb** – [in] Client event callback function
- **deregister** – [in] True to deregister the client if registered. False to force close the connection.

Returns
0 for success or negative in case of error.
int lwm2m_engine_pause(void)
Suspend the LwM2M engine Thread.
Suspend LwM2M engine. Use case could be when network connection is down. LwM2M Engine indicate before it suspend by LWM2M_RD_CLIENT_EVENT_ENGINE_SUSPENDED event.

Returns
0 for success or negative in case of error.

int lwm2m_engine_resume(void)
Resume the LwM2M engine thread.
Resume suspended LwM2M engine. After successful resume call engine will do full registration or registration update based on suspended time. Event’s LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE or LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE indicate that client is connected to server.

Returns
0 for success or negative in case of error.

void lwm2m_rd_client_update(void)
Trigger a Registration Update of the LwM2M RD Client.

char *lwm2m_path_log_buf(char *buf, struct lwm2m_obj_path *path)
Helper function to print path objects’ contents to log.

Parameters
• buf – [in] The buffer to use for formatting the string
• path – [in] The path to stringify

Returns
Resulting formatted path string

int lwm2m_engine_send(struct lwm2m_ctx *ctx, char const *path_list[], uint8_t path_list_size, bool confirmation_request)
LwM2M SEND operation to given path list

Deprecated:
Use lwm2m_send_cb() instead.

Parameters
• ctx – LwM2M context
• path_list – LwM2M Path string list
• path_list_size – Length of path list. Max size is CONFIG_LWM2M_COMPOSITE_PATH_LIST_SIZE
• confirmation_request – True request confirmation for operation.

Returns
0 for success or negative in case of error.

int lwm2m_send(struct lwm2m_ctx *ctx, const struct lwm2m_obj_path path_list[], uint8_t path_list_size, bool confirmation_request)
LwM2M SEND operation to given path list
Deprecated:
Use `lwm2m_send_cb()` instead.

Parameters
- `ctx` – LwM2M context
- `path_list` – LwM2M path struct list
- `path_list_size` – Length of path list. Max size is `CONFIG_LWM2M_COMPOSITE_PATH_LIST_SIZE`
- `confirmation_request` – True request confirmation for operation.

Returns
0 for success or negative in case of error.

```c
int lwm2m_send_cb(struct lwm2m_ctx *ctx, const struct lwm2m_obj_path path_list[], uint8_t path_list_size, lwm2m_send_cb_t reply_cb)
```

LwM2M SEND operation to given path list asynchronously with confirmation callback

Parameters
- `ctx` – LwM2M context
- `path_list` – LwM2M path struct list
- `path_list_size` – Length of path list. Max size is `CONFIG_LWM2M_COMPOSITE_PATH_LIST_SIZE`
- `reply_cb` – Callback triggered with confirmation state or NULL if not used

Returns
0 for success or negative in case of error.

```c
struct lwm2m_ctx *lwm2m_rd_client_ctx(void)
```

Returns LwM2M client context

Returns
ctx LwM2M context

```c
int lwm2m_engine_enable_cache(char const *resource_path, struct lwm2m_time_series_elem *data_cache, size_t cache_len)
```

Enable data cache for a resource.

Deprecated:
Use `lwm2m_enable_cache` instead

Application may enable caching of resource data by allocating buffer for LwM2M engine to use. Buffer must be size of struct `lwm2m_time_series_elem` times `cache_len`

Parameters
- `resource_path` – LwM2M resource path string “obj/obj-inst/res(/res-inst)”
- `data_cache` – Pointer to Data cache array
- `cache_len` – number of cached entries

Returns
0 for success or negative in case of error.
int lwm2m_enable_cache(const struct lwm2m_obj_path *path, struct lwm2m_time_series_elem *data_cache, size_t cache_len)

Enable data cache for a resource.

Application may enable caching of resource data by allocating buffer for LwM2M engine to use. Buffer must be size of struct lwm2m_time_series_elem times cache_len

Parameters
- path – LwM2M path to resource as a struct
- data_cache – Pointer to Data cache array
- cache_len – number of cached entries

Returns
0 for success or negative in case of error.

int lwm2m_security_mode(struct lwm2m_ctx *ctx)

Read security mode from selected security object instance. This data is valid only if RD client is running.

Parameters
- ctx – Pointer to client context.

Returns
int Positive values are lwm2m_security_mode_e, negative error codes otherwise.

int lwm2m_set_default_sockopt(struct lwm2m_ctx *ctx)

Set default socket options for DTLS connections. The engine calls this when lwm2m_ctx::set_socketoptions is not overwritten. You can call this from the overwritten callback to set extra options after or before defaults.

Parameters
- ctx – Client context

Returns
0 for success or negative in case of error.

struct lwm2m_obj_path
#include <lwm2m.h> LwM2M object path structure.

Public Members

uint16_t obj_id
Object ID.

uint16_t obj_inst_id
Object instance ID.

uint16_t res_id
Resource ID.

uint16_t res_inst_id
Resource instance ID.

6.3. Networking
uint8_t level

Path level (0-4).

Ex. 4 = resource instance.

struct lwm2m_ctx

#include <lwm2m.h> LwM2M context structure to maintain information for a single LwM2M connection.

**DTLS related information**

Available only when CONFIG_LWM2M_DTLS_SUPPORT is enabled and lwm2m_ctx::use_dtls is set to true.

int tls_tag

TLS tag is set by client as a reference used when the LwM2M engine calls tls_credential_(add|delete)

char *desthostname

Destination hostname.

WhenMBEDTLS SNI is enabled socket must be set with destination server hostname.

uint16_t desthostname_len

Destination hostname length.

bool hostname_verify

Flag to indicate if hostname verification is enabled.

int (*load_credentials)(struct lwm2m_ctx *client_ctx)

Custom load_credentials function.

Client can set load_credentials function as a way of overriding the default behavior of load_tls_credential() in lwm2m_engine.c

**Public Members**

struct sockaddr remote_addr

Destination address storage.

void *processed_req

A pointer to currently processed request, for internal LwM2M engine use.

The underlying type is struct lwm2m_message, but since it's declared in a private header and not exposed to the application, it's stored as a void pointer.

int (*set_socketoptions)(struct lwm2m_ctx *client_ctx)

Custom socket options.

Client can override default socket options by providing a callback that is called after a socket is created and before connect.
bool `use_dtls`
Flag to indicate if context should use DTLS.
Enabled via the use of coaps:// protocol prefix in connection information. NOTE: requires `CONFIG_LWM2M_DTLS_SUPPORT`

bool `connection_suspended`
Flag to indicate that the socket connection is suspended.
With queue mode, this will tell if there is a need to reconnect.

bool `buffer_client_messages`
Flag to indicate that the client is buffering Notifications and Send messages.
True value buffer Notifications and Send messages.

int `sec_obj_inst`
Current index of Security Object used for server credentials.

int `srv_obj_inst`
Current index of Server Object used in this context.

bool `bootstrap_mode`
Flag to enable BOOTSTRAP interface.
See Section “Bootstrap Interface” of LwM2M Technical Specification for more information.

int `sock_fd`
Socket File Descriptor.

`lwm2m_socket_fault_cb_t` `fault_cb`
Socket fault callback.
LwM2M processing thread will call this callback in case of socket errors on receive.

`lwm2m_observe_cb_t` `observe_cb`
Callback for new or cancelled observations, and acknowledged or timed out notifications.

`lwm2m_ctx_event_cb_t` `event_cb`
Callback for client events.

`uint8_t` `validate_buf[CONFIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE]`
Validation buffer.
Used as a temporary buffer to decode the resource value before validation. On successful validation, its content is copied into the actual resource buffer.

`struct lwm2m_time_series_elem`
#include `<lwm2m.h>` LwM2M Time series data structure.
Public Members

time_t t
   Cached data Unix timestamp.

struct lwm2m_objlnk
   #include <lwm2m.h> LWM2M Objlnk resource type structure.

Public Members

uint16_t obj_id
   Object ID.

uint16_t obj_inst
   Object instance ID.

MQTT

- Overview
- Sample usage
- Using MQTT with TLS
- API Reference

Overview  MQTT (Message Queuing Telemetry Transport) is an application layer protocol which works on top of the TCP/IP stack. It is a lightweight publish/subscribe messaging transport for machine-to-machine communication. For more information about the protocol itself, see [http://mqtt.org/](http://mqtt.org/).

Zephyr provides an MQTT client library built on top of BSD sockets API. The library is configurable at a per-client basis, with support for MQTT versions 3.1.0 and 3.1.1. The Zephyr MQTT implementation can be used with either plain sockets communicating over TCP, or with secure sockets communicating over TLS. See [BSD Sockets](BSD Sockets) for more information about Zephyr sockets.

MQTT clients require an MQTT server to connect to. Such a server, called an MQTT Broker, is responsible for managing client subscriptions and distributing messages published by clients. There are many implementations of MQTT brokers, one of them being Eclipse Mosquitto. See [https://mosquitto.org/](https://mosquitto.org/) for more information about the Eclipse Mosquitto project.

Sample usage  To create an MQTT client, a client context structure and buffers need to be defined:

```c
/* Buffers for MQTT client. */
static uint8_t rx_buffer[256];
static uint8_t tx_buffer[256];

/* MQTT client context */
static struct mqtt_client client_ctx;
```
Multiple MQTT client instances can be created in the application and managed independently. Additionally, a structure for MQTT Broker address information is needed. This structure must be accessible throughout the lifespan of the MQTT client and can be shared among MQTT clients:

```c
/* MQTT Broker address information. */
static struct sockaddr_storage broker;
```

An MQTT client library will notify MQTT events to the application through a callback function created to handle respective events:

```c
void mqtt_evt_handler(struct mqtt_client *client,
                      const struct mqtt_evt *evt)
{
    switch (evt->type)
    {
        /* Handle events here. */
    }
}
```

For a list of possible events, see API Reference.

The client context structure needs to be initialized and set up before it can be used. An example configuration for TCP transport is shown below:

```c
mqtt_client_init(&client_ctx);

/* MQTT client configuration */
client_ctx.broker = &broker;
client_ctx.evt_cb = mqtt_evt_handler;
memset(client_ctx.client_id.utf8, "zephyr_mqtt_client", sizeof("zephyr_mqtt_client") - 1);
client_ctx.client_id.size = sizeof("zephyr_mqtt_client") - 1;
client_ctx.client_id.utf8 = (uint8_t *)"zephyr_mqtt_client";
client_ctx.password = NULL;
client_ctx.user_name = NULL;
client_ctx.protocol_version = MQTT_VERSION_3_1_1;
client_ctx.transport.type = MQTT_TRANSPORT_NON_SECURE;

/* MQTT buffers configuration */
client_ctx.rx_buf = rx_buffer;
client_ctx.tx_buff_size = sizeof(rx_buffer);
client_ctx.tx_buf = tx_buffer;
client_ctx.tx_buff_size = sizeof(tx_buffer);
```

After the configuration is set up, the MQTT client can connect to the MQTT broker. Call the `mqtt_connect` function, which will create the appropriate socket, establish a TCP/TLS connection, and send an `MQTT CONNECT` message. When notified, the application should call the `mqtt_input` function to process the response received. Note, that `mqtt_input` is a non-blocking function, therefore the application should use socket poll to wait for the response. If the connection was successful, `MQTT_EVT_CONNACK` will be notified to the application through the callback function.

```c
rc = mqtt_connect(&client_ctx);
if (rc != 0) {
    return rc;
}

fds[0].fd = client_ctx.transport.tcp.sock;
fds[0].events = ZSOCK_POLLIN;
poll(fds, 1, K_MSEC(5000));

mqtt_input(&client_ctx);
if (!connected) {
    mqtt_abort(&client_ctx);
}
```
In the above code snippet, the MQTT callback function should set the `connected` flag upon a successful connection. If the connection fails at the MQTT level or a timeout occurs, the connection will be aborted, and the underlying socket closed.

After the connection is established, an application needs to call `mqtt_input` and `mqtt_live` functions periodically to process incoming data and upkeep the connection. If an MQTT message is received, an MQTT callback function will be called and an appropriate event notified.

The connection can be closed by calling the `mqtt_disconnect` function.

Zephyr provides sample code utilizing the MQTT client API. See `mqtt-publisher` for more information.

**Using MQTT with TLS** The Zephyr MQTT library can be used with TLS transport for secure communication by selecting a secure transport type (`MQTT_TRANSPORT_SECURE`) and some additional configuration information:

```c
client_ctx.transport.type = MQTT_TRANSPORT_SECURE;

struct mqtt_sec_config *tls_config = &client_ctx.transport.tls.config;

tls_config->peer_verify = TLS_PEER_VERIFY_REQUIRED;
tls_config->cipher_list = NULL;
tls_config->sec_tag_list = m_sec_tags;
tls_config->sec_tag_count = ARRAY_SIZE(m_sec_tags);
tls_config->hostname = MQTT_BROKER_HOSTNAME;
```

In this sample code, the `m_sec_tags` array holds a list of tags, referencing TLS credentials that the MQTT library should use for authentication. We do not specify `cipher_list`, to allow the use of all cipher suites available in the system. We set `hostname` field to broker hostname, which is required for server authentication. Finally, we enforce peer certificate verification by setting the `peer_verify` field.

Note, that TLS credentials referenced by the `m_sec_tags` array must be registered in the system first. For more information on how to do that, refer to `secure sockets documentation`.

An example of how to use TLS with MQTT is also present in `mqtt-publisher` sample application.

### API Reference

**Related code samples**

- **AWS IoT Core MQTT**  
  Connect to AWS IoT Core and publish messages using MQTT.

- **MQTT publisher**  
  Send MQTT PUBLISH messages to an MQTT server.

- **Microsoft Azure IoT Hub MQTT**  
  Connect to Azure IoT Hub and publish messages using MQTT.

**group mqtt_socket**

MQTT Client Implementation.

**Note:** The implementation assumes TCP module is enabled.

**Note:** By default the implementation uses MQTT version 3.1.1.
Defines

**MQTT_UTF8_LITERAL**(literal)
Initialize UTF-8 encoded string from C literal string.
Use it as follows:
```
struct mqtt_utf8 password = MQTT_UTF8_LITERAL("my_pass");
```

**Parameters**
- *literal*  - [in] Literal string from which to generate `mqtt_utf8` object.

Typedefs

typedef void (*`mqtt_evt_cb_t`)(struct `mqtt_client` *client, const struct `mqtt_evt` *evt)
Asynchronous event notification callback registered by the application.
- **Param client**
  - [in] Identifies the client for which the event is notified.
- **Param evt**
  - [in] Event description along with result and associated parameters (if any).

Enums

enum `mqtt_evt_type`
MQTT Asynchronous Events notified to the application from the module through the callback registered by the application.
**Values:**

- **enumerator MQTT_EVT_CONNACK**
  Acknowledgment of connection request.
  Event result accompanying the event indicates whether the connection failed or succeeded.

- **enumerator MQTT_EVT_DISCONNECT**
  Disconnection Event.
  MQTT Client Reference is no longer valid once this event is received for the client.

- **enumerator MQTT_EVT_PUBLISH**
  Publish event received when message is published on a topic client is subscribed to.
  **Note:** PUBLISH event structure only contains payload size, the payload data parameter should be ignored. Payload content has to be read manually with `mqtt_read_publish_payload` function.

- **enumerator MQTT_EVT_PUBACK**
  Acknowledgment for published message with QoS 1.
enumerator MQTT_EVT_PUBREC
   Reception confirmation for published message with QoS 2.

enumerator MQTT_EVT_PUBLER
   Release of published message with QoS 2.

enumerator MQTT_EVT_PUBCOMP
   Confirmation to a publish release message with QoS 2.

enumerator MQTT_EVT_SUBACK
   Acknowledgment to a subscribe request.

enumerator MQTT_EVT_UNSUBACK
   Acknowledgment to a unsubscribe request.

enumerator MQTT_EVT_PINGRESP
   Ping Response from server.

enum mqtt_version
   MQTT version protocol level.
   Values:

   enumerator MQTT_VERSION_3_1_0 = 3
      Protocol level for 3.1.0.

   enumerator MQTT_VERSION_3_1_1 = 4
      Protocol level for 3.1.1.

enum mqtt_qos
   MQTT Quality of Service types.
   Values:

   enumerator MQTT_QOS_0_AT_MOST_ONCE = 0x00
      Lowest Quality of Service, no acknowledgment needed for published message.

   enumerator MQTT_QOS_1_AT_LEAST_ONCE = 0x01
      Medium Quality of Service, if acknowledgment expected for published message, duplicate messages permitted.

   enumerator MQTT_QOS_2_EXACTLY_ONCE = 0x02
      Highest Quality of Service, acknowledgment expected and message shall be published only once.
      Message not published to interested parties unless client issues a PUBREL.

enum mqtt_conn_return_code
   MQTT CONNACK return codes.
   Values:
enumerator `MQTT_CONNECTION_ACCEPTED` = 0x00
   Connection accepted.

enumerator `MQTT_UNACCEPTABLE_PROTOCOL_VERSION` = 0x01
   The Server does not support the level of the MQTT protocol requested by the Client.

enumerator `MQTT_IDENTIFIER_REJECTED` = 0x02
   The Client identifier is correct UTF-8 but not allowed by the Server.

enumerator `MQTT_SERVER_UNAVAILABLE` = 0x03
   The Network Connection has been made but the MQTT service is unavailable.

enumerator `MQTT_BAD_USER_NAME_OR_PASSWORD` = 0x04
   The data in the user name or password is malformed.

enumerator `MQTT_NOT_AUTHORIZED` = 0x05
   The Client is not authorized to connect.

enum `mqtt_suback_return_code`
   MQTT SUBACK return codes.
   Values:

   enumerator `MQTT_SUBACK_SUCCESS_QoS_0` = 0x00
      Subscription with QoS 0 succeeded.

   enumerator `MQTT_SUBACK_SUCCESS_QoS_1` = 0x01
      Subscription with QoS 1 succeeded.

   enumerator `MQTT_SUBACK_SUCCESS_QoS_2` = 0x02
      Subscription with QoS 2 succeeded.

   enumerator `MQTT_SUBACK_FAILURE` = 0x80
      Subscription for a topic failed.

enum `mqtt_transport_type`
   MQTT transport type.
   Values:

   enumerator `MQTT_TRANSPORT_NON_SECURE`
      Use non secure TCP transport for MQTT connection.

   enumerator `MQTT_TRANSPORT_NUM`
      Shall not be used as a transport type.
      Indicator of maximum transport types possible.

Functions
void mqtt_client_init(struct mqtt_client *client)

Initializes the client instance.

**Note:** Shall be called to initialize client structure, before setting any client parameters and before connecting to broker.

### Parameters
- **client** – [in] Client instance for which the procedure is requested. Shall not be NULL.

**int mqtt_connect(struct mqtt_client *client)**

API to request new MQTT client connection.

**Note:** This memory is assumed to be resident until mqtt_disconnect is called.

**Note:** Any subsequent changes to parameters like broker address, user name, device id, etc. have no effect once MQTT connection is established.

**Note:** Default protocol revision used for connection request is 3.1.1. Please set client.protocol_version = MQTT_VERSION_3_1_0 to use protocol 3.1.0.

**Note:** Please modify CONFIG_MQTT_KEEPALIVE time to override default of 1 minute.

### Parameters
- **client** – [in] Client instance for which the procedure is requested. Shall not be NULL.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

**int mqtt_publish(struct mqtt_client *client, const struct mqtt_publish_param *param)**

API to publish messages on topics.

### Parameters
- **client** – [in] Client instance for which the procedure is requested. Shall not be NULL.
- **param** – [in] Parameters to be used for the publish message. Shall not be NULL.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

**int mqtt_publish_qos1_ack(struct mqtt_client *client, const struct mqtt_puback_param *param)**

API used by client to send acknowledgment on receiving QoS1 publish message.

Should be called on reception of MQTT_EVT_PUBLISH with QoS level MQTT_QOS_1_AT_LEAST_ONCE.

### Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.

• param – [in] Identifies message being acknowledged.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_publish_qos2 receive(struct mqtt_client *client, const struct mqtt_pubrec_param *param)

API used by client to send acknowledgment on receiving QoS2 publish message.
Should be called on reception of MQTT_EVT_PUBLISH with QoS level MQTT_QOS_2_EXACTLY_ONCE.

Parameters
• client – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.

• param – [in] Identifies message being acknowledged.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_publish_qos2 release(struct mqtt_client *client, const struct mqtt_pubrel_param *param)

API used by client to request release of QoS2 publish message.
Should be called on reception of MQTT_EVT_PUBREC.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.

• param – [in] Identifies message being released.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_publish_qos2 complete(struct mqtt_client *client, const struct mqtt_pubcomp_param *param)

API used by client to send acknowledgment on receiving QoS2 publish release message.
Should be called on reception of MQTT_EVT_PUBREL.

Parameters
• client – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.

• param – [in] Identifies message being completed.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_subscribe(struct mqtt_client *client, const struct mqtt_subscription_list *param)

API to request subscription of one or more topics on the connection.

Parameters
• client – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.

• param – [in] Subscription parameters. Shall not be NULL.

Returns
0 or a negative error code (errno.h) indicating reason of failure.
int `mqtt_unsubscribe` (struct `mqtt_client` *client, const struct `mqtt_subscription_list` *param)

API to request unsubscription of one or more topics on the connection.

**Note:** QoS included in topic description is unused in this API.

**Parameters**
- `client` – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.
- `param` – [in] Parameters describing topics being unsubscribed from. Shall not be NULL.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

int `mqtt_ping` (struct `mqtt_client` *client)

API to send MQTT ping.

The use of this API is optional, as the library handles the connection keep-alive on its own, see `mqtt_live`.

**Parameters**
- `client` – [in] Identifies client instance for which procedure is requested.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

int `mqtt_disconnect` (struct `mqtt_client` *client)

API to disconnect MQTT connection.

**Parameters**
- `client` – [in] Identifies client instance for which procedure is requested.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

int `mqtt_abort` (struct `mqtt_client` *client)

API to abort MQTT connection.

This will close the corresponding transport without closing the connection gracefully at the MQTT level (with disconnect message).

**Parameters**
- `client` – [in] Identifies client instance for which procedure is requested.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

int `mqtt_live` (struct `mqtt_client` *client)

This API should be called periodically for the client to be able to keep the connection alive by sending Ping Requests if need be.

**Note:** Application shall ensure that the periodicity of calling this function makes it possible to respect the Keep Alive time agreed with the broker on connection. `mqtt_connect` for details on Keep Alive time.

**Parameters**
- **client** — [in] Client instance for which the procedure is requested. Shall not be NULL.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_keepalive_time_left(const struct mqtt_client *client)
```
Helper function to determine when next keep alive message should be sent. Can be used for instance as a source for `poll` timeout.

**Parameters**
- **client** — [in] Client instance for which the procedure is requested.

**Returns**
Time in milliseconds until next keep alive message is expected to be sent. Function will return -1 if keep alive messages are not enabled.

```c
int mqtt_input(struct mqtt_client *client)
```
Receive an incoming MQTT packet. The registered callback will be called with the packet content.

**Note:** In case of PUBLISH message, the payload has to be read separately with `mqtt_read_publish_payload` function. The size of the payload to read is provided in the publish event structure.

**Note:** This is a non-blocking call.

**Parameters**
- **client** — [in] Client instance for which the procedure is requested. Shall not be NULL.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_read_publish_payload(struct mqtt_client *client, void *buffer, size_t length)
```
Read the payload of the received PUBLISH message. This function should be called within the MQTT event handler, when MQTT PUBLISH message is notified.

**Note:** This is a non-blocking call.

**Parameters**
- **client** — [in] Client instance for which the procedure is requested. Shall not be NULL.
- **buffer** — [out] Buffer where payload should be stored.
- **length** — [in] Length of the buffer, in bytes.

**Returns**
Number of bytes read or a negative error code (errno.h) indicating reason of failure.
int mqtt_read_publish_payload_blocking(struct mqtt_client *client, void *buffer, size_t length)

Blocking version of `mqtt_read_publish_payload` function.

**Parameters**

- **client** – [in] Client instance for which the procedure is requested. Shall not be NULL.
- **buffer** – [out] Buffer where payload should be stored.
- **length** – [in] Length of the buffer, in bytes.

**Returns**

Number of bytes read or a negative error code (errno.h) indicating reason of failure.

int mqtt_readall_publish_payload(struct mqtt_client *client, uint8_t *buffer, size_t length)

Blocking version of `mqtt_read_publish_payload` function which runs until the required number of bytes are read.

**Parameters**

- **client** – [in] Client instance for which the procedure is requested. Shall not be NULL.
- **buffer** – [out] Buffer where payload should be stored.
- **length** – [in] Number of bytes to read.

**Returns**

0 if success, otherwise a negative error code (errno.h) indicating reason of failure.

struct mqtt_utf8

```c
#include <mqtt.h> Abstracts UTF-8 encoded strings.
```

**Public Members**

- `const uint8_t *utf8`
  Pointer to UTF-8 string.

- `uint32_t size`
  Size of UTF string, in bytes.

struct mqtt_binstr

```c
#include <mqtt.h> Abstracts binary strings.
```

**Public Members**

- `uint8_t *data`
  Pointer to binary stream.

- `uint32_t len`
  Length of binary stream.
struct mqtt_topic
    #include <mqtt.h> Abstracts MQTT UTF-8 encoded topic that can be subscribed to or published.

Public Members

struct mqtt_utf8 topic
    Topic on to be published or subscribed to.

uint8_t qos
    Quality of service requested for the subscription.
    mqtt_qos for details.

struct mqtt_publish_message
    #include <mqtt.h> Parameters for a publish message.

Public Members

struct mqtt_topic topic
    Topic on which data was published.

struct mqtt_binstr payload
    Payload on the topic published.

struct mqtt_connack_param
    #include <mqtt.h> Parameters for a connection acknowledgment (CONNACK).

Public Members

uint8_t session_present_flag
    The Session Present flag enables a Client to establish whether the Client and Server have a consistent view about whether there is already stored Session state.

enum mqtt_conn_return_code return_code
    The appropriate non-zero Connect return code indicates if the Server is unable to process a connection request for some reason.

struct mqtt_puback_param
    #include <mqtt.h> Parameters for MQTT publish acknowledgment (PUBACK).

Public Members

uint16_t message_id
    Message id of the PUBLISH message being acknowledged.
struct mqtt_pubrec_param
#include <mqtt.h> Parameters for MQTT publish receive (PUBREC).

Public Members

uint16_t message_id
Message id of the PUBLISH message being acknowledged.

struct mqtt_pubrel_param
#include <mqtt.h> Parameters for MQTT publish release (PUBREL).

Public Members

uint16_t message_id
Message id of the PUBREC message being acknowledged.

struct mqtt_pubcomp_param
#include <mqtt.h> Parameters for MQTT publish complete (PUBCOMP).

Public Members

uint16_t message_id
Message id of the PUBREL message being acknowledged.

struct mqtt_suback_param
#include <mqtt.h> Parameters for MQTT subscription acknowledgment (SUBACK).

Public Members

uint16_t message_id
Message id of the SUBSCRIBE message being acknowledged.

struct mqtt_binstr return_codes
Return codes indicating maximum QoS level granted for each topic in the subscription list.

struct mqtt_unsuback_param
#include <mqtt.h> Parameters for MQTT unsubscribe acknowledgment (UNSUBACK).

Public Members

uint16_t message_id
Message id of the UNSUBSCRIBE message being acknowledged.
struct mqtt_publish_param
#include <mqtt.h> Parameters for a publish message (PUBLISH).

Public Members

struct mqtt_publish_message message
Messages including topic, QoS and its payload (if any) to be published.

uint16_t message_id
Message id used for the publish message.
Redundant for QoS 0.

uint8_t dup_flag
Duplicate flag.
If 1, it indicates the message is being retransmitted. Has no meaning with QoS 0.

uint8_t retain_flag
Retain flag.
If 1, the message shall be stored persistently by the broker.

struct mqtt_subscription_list
#include <mqtt.h> List of topics in a subscription request.

Public Members

struct mqtt_topic *list
Array containing topics along with QoS for each.

uint16_t list_count
Number of topics in the subscription list.

uint16_t message_id
Message id used to identify subscription request.

union mqtt_evt_param
#include <mqtt.h> Defines event parameters notified along with asynchronous events to the application.

Public Members

struct mqtt_connack_param connack
Parameters accompanying MQTT_EVT_CONNACK event.
struct mqtt_publish_param publish
    Parameters accompanying MQTT_EVT_PUBLISH event.

Note: PUBLISH event structure only contains payload size, the payload data parameter should be ignored. Payload content has to be read manually with mqtt_read_publish_payload function.

struct mqtt_puback_param puback
    Parameters accompanying MQTT_EVT_PUBACK event.

struct mqtt_pubrec_param pubrec
    Parameters accompanying MQTT_EVT_PUBREC event.

struct mqtt_pubrel_param pubrel
    Parameters accompanying MQTT_EVT_PUBREL event.

struct mqtt_pubcomp_param pubcomp
    Parameters accompanying MQTT_EVT_PUBCOMP event.

struct mqtt_suback_param suback
    Parameters accompanying MQTT_EVT_SUBACK event.

struct mqtt_unsuback_param unsuback
    Parameters accompanying MQTT_EVT UNSUBACK event.

struct mqtt_evt
    #include <mqtt.h> Defines MQTT asynchronous event notified to the application.

Public Members

denum mqtt_evt_type type
    Identifies the event.

union mqtt_evt_param param
    Contains parameters (if any) accompanying the event.

int result
    Event result.
    0 or a negative error code (errno.h) indicating reason of failure.

struct mqtt_sec_config
    #include <mqtt.h> TLS configuration for secure MQTT transports.

Public Members
int peer_verify
   Indicates the preference for peer verification.

uint32_t cipher_count
   Indicates the number of entries in the cipher list.

const int *cipher_list
   Indicates the list of ciphers to be used for the session.
   May be NULL to use the default ciphers.

uint32_t sec_tag_count
   Indicates the number of entries in the sec tag list.

const sec_tag_t *sec_tag_list
   Indicates the list of security tags to be used for the session.

const char *hostname
   Peer hostname for ceritificate verification.
   May be NULL to skip hostname verification.

int cert_nocopy
   Indicates the preference for copying certificates to the heap.

struct mqtt_transport
   #include <mqtt.h> MQTT transport specific data.

Public Members

enum mqtt_transport_type type
   Transport type selection for client instance.
   mqtt_transport_type for possible values. MQTT_TRANSPORT_MAX is not a valid type.

int sock
   Socket descriptor.

struct mqtt_internal
   #include <mqtt.h> MQTT internal state.

Public Members

struct sys_mutex mutex
   Internal.
   Mutex to protect access to the client instance.
uint32_t last_activity
   Internal.
   Wall clock value (in milliseconds) of the last activity that occurred. Needed for periodic PING.

uint32_t state
   Internal.
   Client's state in the connection.

uint32_t rx_buf_datalen
   Internal.
   Packet length read so far.

uint32_t remaining_payload
   Internal.
   Remaining payload length to read.

struct mqtt_client
   #include <mqtt.h> MQTT Client definition to maintain information relevant to the client.

Public Members

struct mqtt_internal internal
   MQTT client internal state.

struct mqtt_transport transport
   MQTT transport configuration and data.

struct mqtt_utf8 client_id
   Unique client identification to be used for the connection.

const void *broker
   Broker details, for example, address, port.
   Address type should be compatible with transport used.

struct mqtt_utf8 *user_name
   User name (if any) to be used for the connection.
   NULL indicates no user name.

struct mqtt_utf8 *password
   Password (if any) to be used for the connection.
   Note that if password is provided, user name shall also be provided. NULL indicates no password.
struct mqtt_topic *will_topic
   Will topic and QoS.
   Can be NULL.

struct mqtt_utf8 *will_message
   Will message.
   Can be NULL. Non NULL value valid only if will topic is not NULL.

mqtt_evt_cb_t evt_cb
   Application callback registered with the module to get MQTT events.

uint8_t *rx_buf
   Receive buffer used for MQTT packet reception in RX path.

uint32_t rx_buf_size
   Size of receive buffer.

uint8_t *tx_buf
   Transmit buffer used for creating MQTT packet in TX path.

uint32_t tx_buf_size
   Size of transmit buffer.

uint16_t keepalive
   Keepalive interval for this client in seconds.
   Default is CONFIG_MQTT_KEEPALIVE.

uint8_t protocol_version
   MQTT protocol version.

int8_t unacked_ping
   Unanswered PINGREQ count on this connection.

uint8_t will_retain
   Will retain flag, 1 if will message shall be retained persistently.

uint8_t clean_session
   Clean session flag indicating a fresh (1) or a retained session (0).
   Default is CONFIG_MQTT_CLEAN_SESSION.

**MQTT-SN**

- Overview
- Sample usage
- Deviations from the standard
- API Reference
Overview  MQTT-SN is a variant of the well-known MQTT protocol - see MQTT. In contrast to MQTT, MQTT-SN does not require a TCP transport, but is designed to be used over any message-based transport. Originally, it was mainly created with ZigBee in mind, but others like Bluetooth, UDP or even a UART can be used just as well.

Zephyr provides an MQTT-SN client library built on top of BSD sockets API. The library is configurable at a per-client basis, with support for MQTT-SN version 1.2. The Zephyr MQTT-SN implementation can be used with any message-based transport, but support for UDP is already built-in.

MQTT-SN clients require an MQTT-SN gateway to connect to. These gateways translate between MQTT-SN and MQTT. The Eclipse Paho project offers an implementation of a MQTT-SN gateway, but others are available too. https://www.eclipse.org/paho/index.php?page=components/mqtt-sn-transparent-gateway/index.php

The MQTT-SN spec v1.2 can be found here: https://www.oasis-open.org/committees/download.php/66091/MQTT-SN_spec_v1.2.pdf

Sample usage  To create an MQTT-SN client, a client context structure and buffers need to be defined:

```c
/* Buffers for MQTT client. */
static uint8_t rx_buffer[256];
static uint8_t tx_buffer[256];
/* MQTT-SN client context */
static struct mqtt_sn_client client;
```

Multiple MQTT-SN client instances can be created in the application and managed independently. Additionally, a structure for the transport is needed as well. The library already comes with an example implementation for UDP.

```c
/* MQTT Broker address information. */
static struct mqtt_sn_transport tp;
```

The MQTT-SN library will inform clients about certain events using a callback.

```c
static void evt_cb(struct mqtt_sn_client *client,
                   const struct mqtt_sn_evt *evt)
{
    switch(evt->type) {
    ...
    }
}
```

For a list of possible events, see API Reference.

The client context structure needs to be initialized and set up before it can be used. An example configuration for UDP transport is shown below:

```c
struct mqtt_sn_data client_id = MQTT_SN_DATA_STRING_LITERAL("ZEPHYR");
struct sockaddr_in gateway = {0};
uint8_t tx_buf[256];
uint8_t rx_buf[256];
mqtt_sn_transport_udp_init(&tp, (struct sockaddr*)&gateway, sizeof((gateway)));
mqtt_sn_client_init(&client, &client_id, &tp.tp, evt_cb, tx_buf, sizeof(tx_buf), rx_buf,... sizeof(rx_buf));
```
After the configuration is set up, the MQTT-SN client can connect to the gateway. While the MQTT-SN protocol offers functionality to discover gateways through an advertisement mechanism, this is not implemented yet in the library.

Call the `mqtt_sn_connect` function, which will send a CONNECT message. The application should periodically call the `mqtt_sn_input` function to process the response received. The application does not have to call `mqtt_sn_input` if it knows that no data has been received (e.g. when using Bluetooth). Note that `mqtt_sn_input` is a non-blocking function, if the transport struct contains a poll compatible function pointer. If the connection was successful, `MQTT_SN_EVT_CONNECTED` will be notified to the application through the callback function.

```c
err = mqtt_sn_connect(&client, false, true);
__ASSERT(err == 0, "mqtt_sn_connect() failed %d", err);
while (1) {
    mqtt_sn_input(&client);
    if (connected) {
        mqtt_sn_publish(&client, MQTT_SN_QOS_0, &topic_p, false, &pubdata);
    }
    k_sleep(K_MSEC(500));
}
```

In the above code snippet, the event handler function should set the connected flag upon a successful connection. If the connection fails at the MQTT level or a timeout occurs, the connection will be aborted.

After the connection is established, an application needs to call `mqtt_input` function periodically to process incoming data. Connection upkeep, on the other hand, is done automatically using a `k_work` item. If a MQTT message is received, an MQTT callback function will be called and an appropriate event notified.

The connection can be closed by calling the `mqtt_sn_disconnect` function. This has no effect on the transport, however. If you want to close the transport (e.g. the socket), call `mqtt_sn_client_deinit`, which will deinit the transport as well.

Zephyr provides sample code utilizing the MQTT-SN client API. See `mqtt-sn-publisher` for more information.

**Deviations from the standard** Certain parts of the protocol are not yet supported in the library.* Pre-defined topic IDs * QoS -1 - it's most useful with predefined topics * Gateway discovery using ADVERTISE, SEARCHGW and GWINFO messages. * Setting the will topic and message after the initial connect * Forwarder Encapsulation

**API Reference**

**Related code samples**

**MQTT-SN publisher**

Send MQTT-SN PUBLISH messages to an MQTT-SN gateway.

**group mqtt_sn_socket**

MQTT-SN Client Implementation.

MQTT-SN Client's Application interface is defined in this header. Targets protocol version 1.2.

**Defines**
MQTT_SN_DATA_STRING_LITERAL(literal)
  Initialize memory buffer from C literal string.
  Use it as follows:
  ```c
  struct mqtt_sn_data topic = MQTT_SN_DATA_STRING_LITERAL("/zephyr");
  ```

  **Parameters**
  - literal – [in] Literal string from which to generate `mqtt_sn_data` object.

MQTT_SN_DATA_BYTES(...)
  Initialize memory buffer from single bytes.
  Use it as follows:
  ```c
  struct mqtt_sn_data data = MQTT_SN_DATA_BYTES(0x13, 0x37);
  ```

**TypeDefs**

typedef void (*mqtt_sn_evt_cb_t)(struct mqtt_sn_client *client, const struct mqtt_sn_evt *evt)
  Asynchronous event notification callback registered by the application.

  **Param client**
  - [in] Identifies the client for which the event is notified.

  **Param evt**
  - [in] Event description along with result and associated parameters (if any).

**Enums**

enum mqtt_sn_qos
  Quality of Service.
  QoS 0-2 work the same as basic MQTT, QoS -1 is an MQTT-SN addition. QOS -1 is not supported yet.

  **Values:**

  - enumerator MQTT_SN_QOS_0
    QOS 0.
  - enumerator MQTT_SN_QOS_1
    QOS 1.
  - enumerator MQTT_SN_QOS_2
    QOS 2.
  - enumerator MQTT_SN_QOS_M1
    QOS -1.

enum mqtt_sn_topic_type
  MQTT-SN topic types.

  **Values:**
enumerator MQTT_SN_TOPIC_TYPE_NORMAL
Normal topic.
It allows usage of any valid UTF-8 string as a topic name.

enumerator MQTT_SN_TOPIC_TYPE_PREDEF
Pre-defined topic.
It allows usage of a two-byte identifier representing a topic name for which the corresponding topic name is known in advance by both the client and the gateway/server.

enumerator MQTT_SN_TOPIC_TYPE_SHORT
Short topic.
It allows usage of a two-byte string as a topic name.

enum mqtt_sn_return_code
MQTT-SN return codes.

Values:

enumerator MQTT_SN_CODE_ACCEPTED = 0x00
Accepted.

enumerator MQTT_SN_CODE_REJECTED_CONGESTION = 0x01
Rejected: congestion.

enumerator MQTT_SN_CODE_REJECTED_TOPIC_ID = 0x02
Rejected: Invalid Topic ID.

enumerator MQTT_SN_CODE_REJECTED_NOTSUP = 0x03
Rejected: Not Supported.

enum mqtt_sn_evt_type
Event types that can be emitted by the library.

Values:

enumerator MQTT_SN_EVT_CONNECTED
Connected to a gateway.

enumerator MQTT_SN_EVT_DISCONNECTED
Disconnected.

enumerator MQTT_SN_EVT_ASLEEP
Entered ASLEEP state.

enumerator MQTT_SN_EVT_AWAKE
Entered AWAKE state.

enumerator MQTT_SN_EVT_PUBLISH
Received a PUBLISH message.
enumerator MQTT_SN_EVT_PINGRESP
Received a PINGRESP.

Functions

int mqtt_sn_client_init(struct mqtt_sn_client *client, const struct mqtt_sn_data *client_id,
struct mqtt_sn_transport *transport, mqtt_sn_evt_cb_t evt_cb,
void *tx, size_t txsz, void *rx, size_t rxsz)
Initialize a client.

Parameters
• client – The MQTT-SN client to initialize.
• client_id – The ID to be used by the client.
• transport – The transport to be used by the client.
• evt_cb – The event callback function for the client.
• tx – Pointer to the transmit buffer.
• txsz – Size of the transmit buffer.
• rx – Pointer to the receive buffer.
• rxsz – Size of the receive buffer.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

void mqtt_sn_client_deinit(struct mqtt_sn_client *client)
Deinitialize the client.
This removes all topics and publishes, and also de-inits the transport.

Parameters
• client – The MQTT-SN client to deinitialize.

int mqtt_sn_connect(struct mqtt_sn_client *client, bool will, bool clean_session)
Connect the client.

Parameters
• client – The MQTT-SN client to connect.
• will – Flag indicating if a Will message should be sent.
• clean_session – Flag indicating if a clean session should be started.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_sn_disconnect(struct mqtt_sn_client *client)
Disconnect the client.

Parameters
• client – The MQTT-SN client to disconnect.

Returns
0 or a negative error code (errno.h) indicating reason of failure.
int mqtt_sn_sleep(struct mqtt_sn_client *client, uint16_t duration)
    Set the client into sleep state.

    Parameters
    • client – The MQTT-SN client to be put to sleep.
    • duration – Sleep duration (in seconds).

    Returns
    0 on success, negative errno code on failure.

int mqtt_sn_subscribe(struct mqtt_sn_client *client, enum mqtt_sn_qos qos, struct mqtt_sn_data *topic_name)
    Subscribe to a given topic.

    Parameters
    • client – The MQTT-SN client that should subscribe.
    • qos – The desired quality of service for the subscription.
    • topic_name – The name of the topic to subscribe to.

    Returns
    0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_sn_unsubscribe(struct mqtt_sn_client *client, enum mqtt_sn_qos qos, struct mqtt_sn_data *topic_name)
    Unsubscribe from a topic.

    Parameters
    • client – The MQTT-SN client that should unsubscribe.
    • qos – The quality of service used when subscribing.
    • topic_name – The name of the topic to unsubscribe from.

    Returns
    0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_sn_publish(struct mqtt_sn_client *client, enum mqtt_sn_qos qos, struct mqtt_sn_data *topic_name, bool retain, struct mqtt_sn_data *data)
    Publish a value.
    If the topic is not yet registered with the gateway, the library takes care of it.

    Parameters
    • client – The MQTT-SN client that should publish.
    • qos – The desired quality of service for the publish.
    • topic_name – The name of the topic to publish to.
    • retain – Flag indicating if the message should be retained by the broker.
    • data – The data to be published.

    Returns
    0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_sn_input(struct mqtt_sn_client *client)
    Check the transport for new incoming data.
    Call this function periodically, or if you have good reason to believe there is any data.
    If the client’s transport struct contains a poll-function, this function is non-blocking.

    Parameters
• **client** – The MQTT-SN client to check for incoming data.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

```c
struct mqtt_sn_data
#include <mqtt_sn.h> Abstracts memory buffers.

**Public Members**

const uint8_t *data
   Pointer to data.

uint16_t size
   Size of data, in bytes.

union mqtt_sn_evt_param
#include <mqtt_sn.h> Event metadata.

**Public Members**

struct mqtt_sn_data data
   The payload data associated with the event.

enum mqtt_sn_topic_type topic_type
   The type of topic for the event.

uint16_t topic_id
   The identifier for the topic of the event.

struct mqtt_sn_evt_param.[anonymous] publish
   Structure holding publish event details.

struct mqtt_sn_evt
#include <mqtt_sn.h> MQTT-SN event structure to be handled by the event callback.

**Public Members**

enum mqtt_sn_evt_type type
   Event type.

union mqtt_sn_evt_param param
   Event parameters.
struct mqtt_sn_transport

#include <mqtt_sn.h> Structure to describe an MQTT-SN transport.

MQTT-SN does not require transports to be reliable or to hold a connection. Transports just need to be frame-based, so you can use UDP, ZigBee, or even a simple UART, given some kind of framing protocol is used.

Public Members

int (*init)(struct mqtt_sn_transport *transport)
Will be called once on client init to initialize the transport.
Use this to open sockets or similar. May be NULL.

void (*deinit)(struct mqtt_sn_transport *transport)
Will be called on client deinit.
Use this to close sockets or similar. May be NULL.

int (*msg_send)(struct mqtt_sn_client *client, void *buf, size_t sz)
Will be called by the library when it wants to send a message.

ssize_t (*recv)(struct mqtt_sn_client *client, void *buffer, size_t length)
Will be called by the library when it wants to receive a message.
Implementations should follow recv conventions.

int (*poll)(struct mqtt_sn_client *client)
Check if incoming data is available.
If poll() returns a positive number, recv must not block.
May be NULL, but recv should not block then either.
Return
Positive number if data is available, or zero if there is none. Negative values signal errors.

struct mqtt_sn_client

#include <mqtt_sn.h> Structure describing an MQTT-SN client.

Public Members

struct mqtt_sn_data client_id
1-23 character unique client ID

struct mqtt_sn_data will_topic
Topic for Will message.
Must be initialized before connecting with will=true
struct mqtt_sn_data will_msg
  Will message.
  Must be initialized before connecting with will=true

enum mqtt_sn_qos will_qos
  Quality of Service for the Will message.

bool will_retain
  Flag indicating if the will message should be retained by the broker.

struct mqtt_sn_transport *transport
  Underlying transport to be used by the client.

struct net_buf_simple tx
  Buffer for outgoing data.

struct net_buf_simple rx
  Buffer for incoming data.

mqtt_sn_evt_cb_t evt_cb
  Event callback.

uint16_t next_msg_id
  Message ID for the next message to be sent.

sys_slist_t publish
  List of pending publish messages.

sys_slist_t topic
  List of registered topics.

int state
  Current state of the MQTT-SN client.

int64_t last_ping
  Timestamp of the last ping request.

uint8_t ping_retries
  Number of retries for failed ping attempts.

struct k_work_delayable process_work
  Delayable work structure for processing MQTT-SN events.

TFTP
TFTP client

Use the TFTP client library to get/put files from/to a TFTP server.

\textit{group tftp\_client}

\textbf{TFTP Client Implementation.}

\textbf{TFTP client error codes.}

\textbf{TFTPC\_SUCCESS}

Success.

\textbf{TFTPC\_DUPLICATE\_DATA}

Duplicate data received.

\textbf{TFTPC\_BUFFER\_OVERFLOW}

User buffer is too small.

\textbf{TFTPC\_UNKNOWN\_FAILURE}

Unknown failure.

\textbf{TFTPC\_REMOTE\_ERROR}

Remote server error.

\textbf{TFTPC\_RETRIES\_EXHAUSTED}

Retries exhausted.

\textbf{Defines}

\textbf{TFTP\_BLOCK\_SIZE}

RFC1350: the file is sent in fixed length blocks of 512 bytes. Each data packet contains one block of data, and must be acknowledged by an acknowledgment packet before the next packet can be sent. A data packet of less than 512 bytes signals termination of a transfer.

\textbf{TFTP\_HEADER\_SIZE}

RFC1350: For non-request TFTP message, the header contains 2-byte operation code plus 2-byte block number or error code.

\textbf{TFTPC\_MAX\_BUF\_SIZE}

Maximum amount of data that can be sent or received.

\textbf{Typedefs}
typedef void (*tftp_callback_t)(const struct tftp_evt *evt)
TFTP event notification callback registered by the application.

**Param**

*evt* [in] Event description along with result and associated parameters (if any).

**Enums**

enum tftp_evt_type
TFTP Asynchronous Events notified to the application from the module through the
callback registered by the application.

*Values:*

enumerator TFTP_EVT_DATA
DATA event when data is received from remote server.

**Note:** DATA event structure contains payload data and size.

enumerator TFTP_EVT_ERROR
ERROR event when error is received from remote server.

**Note:** ERROR event structure contains error code and message.

**Functions**

int tftp_get(struct tftpc *client, const char *remote_file, const char *mode)
This function gets data from a “file” on the remote server.

**Note:** This function blocks until the transfer is completed or network error happens.
The integrity of the client structure must be ensured until the function returns.

**Parameters**

- *client* – Client information of type *tftpc*.
- *remote_file* – Name of the remote file to get.
- *mode* – TFTP Client “mode” setting.

**Return values**

- The – size of data being received if the operation completed successfully.
- TFTPC_BUFFER_OVERFLOW – if the file is larger than the user buffer.
- TFTPC_REMOTE_ERROR – if the server failed to process our request.
- TFTPC_RETRIES_EXHAUSTED – if the client timed out waiting for server.
- -EINVAL – if *client* is NULL.
int tftp_put(struct tftpc *client, const char *remote_file, const char *mode, const uint8_t *user_buf, uint32_t user_buf_size)
This function puts data to a “file” on the remote server.

**Note:** This function blocks until the transfer is completed or network error happens. The integrity of the client structure must be ensured until the function returns.

**Parameters**
- **client** – Client information of type tftpc.
- **remote_file** – Name of the remote file to put.
- **mode** – TFTP Client “mode” setting.
- **user_buf** – Data buffer containing the data to put.
- **user_buf_size** – Length of the data to put.

**Return values**
- **The** – size of data being sent if the operation completed successfully.
- **TFTPC_REMOTE_ERROR** – if the server failed to process our request.
- **TFTPC_RETRIES_EXHAUSTED** – if the client timed out waiting for server.
- **EINVAL** – if client or user_buf is NULL or if user_buf_size is zero.

```c
struct tftp_data_param
#include <tftp.h> Parameters for data event.

Public Members

uint8_t *data_ptr
   Pointer to binary data.

uint32_t len
   Length of binary data.

struct tftp_error_param
#include <tftp.h> Parameters for error event.

Public Members

char *msg
   Error message.

int code
   Error code.

union tftp_evt_param
#include <tftp.h> Defines event parameters notified along with asynchronous events to the application.
```

6.3. Networking
Public Members

```c
struct tftp_data_param data
    Parameters accompanying TFTP_EVT_DATA event.
```

```c
struct tftp_error_param error
    Parameters accompanying TFTP_EVT_ERROR event.
```

```c
struct tftp_evt
    #include <tftp.h> Defines TFTP asynchronous event notified to the application.
```

Public Members

```c
enum tftp_evt_type type
    Identifies the event.
```

```c
union tftp_evt_param param
    Contains parameters (if any) accompanying the event.
```

```c
struct tftpc
    #include <tftp.h> TFTP client definition to maintain information relevant to the client.
```

**Note:** Application must initialize server and callback before calling GET or PUT API with the tftpc structure.

Public Members

```c
struct sockaddr server
    Socket address pointing to the remote TFTP server.
```

```c
tftp_callback_t callback
    Event notification callback.
    No notification if NULL
```

```c
uint8_t tftp_buf[(512 + 4)]
    Buffer for internal usage.
```

Network System Management

Network Configuration Library

- Overview
- Sample usage
- API Reference
Overview

The network configuration library sets up networking devices in a semi-automatic way during the system boot, based on user-supplied Kconfig options.

The following Kconfig options affect how configuration library will setup the system:

<table>
<thead>
<tr>
<th>Option name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIG_NET_CONFIG_SETTINGS</td>
<td>This option controls whether the network system is configured or initialized at all. If not set, then the config library is not used for initialization and the application needs to do all the network related configuration itself. If this option is set, then the user can optionally configure static IP addresses to be set to the first network interface in the system. Typically setting static IP addresses is only usable in testing and should not be used in production code. See the config library Kconfig file <code>subsys/net/lib/config/Kconfig</code> for specific options to set the static IP addresses.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_AUTO_INIT</td>
<td>The networking system is automatically configured when the device is started.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_INIT_TIMEOUT</td>
<td>This tells how long to wait for the networking to be ready and available. If for example IPv4 address from DHCPv4 is not received within this limit, then a call to <code>net_config_init()</code> will return error during the device startup.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_NEED_IPV4</td>
<td>The network application needs IPv4 support to function properly. This option makes sure the network application is initialized properly in order to use IPv4. If <code>CONFIG_NET_IPV4</code> is not enabled, then setting this option will automatically enable IPv4.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_NEED_IPV6</td>
<td>The network application needs IPv6 support to function properly. This option makes sure the network application is initialized properly in order to use IPv6. If <code>CONFIG_NET_IPV6</code> is not enabled, then setting this option will automatically enable IPv6.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_NEED_IPV6_ROUTER</td>
<td>If IPv6 is enabled, then this option tells that the network application needs IPv6 router to exists before continuing. This means in practice that the application wants to wait until it receives IPv6 router advertisement message before continuing.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_BT_NODE</td>
<td>Enables application to operate in Bluetooth node mode which requires GATT service to be registered and start advertising as peripheral.</td>
</tr>
</tbody>
</table>

Sample usage

If `CONFIG_NET_CONFIG_AUTO_INIT` is set, then the configuration library is automatically enabled and run during the device boot. In this case, the library will call `net_config_init()` automatically and the application does not need to do any network configuration.

If you want to use the network configuration library but without automatic initialization, you can call `net_config_init()` manually. The flags parameter can be used to give hints to the library about what kind of functionality the application wishes to have before the actual application starts.
group net_config

Network configuration library.

Defines

NET_CONFIG_NEED_ROUTER
Application needs routers to be set so that connectivity to remote network is possible.
For IPv6 networks, this means that the device should receive IPv6 router advertisement message before continuing.

NET_CONFIG_NEED_IPV6
Application needs IPv6 subsystem configured and initialized.
Typically this means that the device has IPv6 address set.

NET_CONFIG_NEED_IPV4
Application needs IPv4 subsystem configured and initialized.
Typically this means that the device has IPv4 address set.

Functions

int net_config_init(const char *app_info, uint32_t flags, int32_t timeout)
Initialize this network application.
This will call net_config_init_by_iface() with NULL network interface.

Parameters

• app_info – String describing this application.
• flags – Flags related to services needed by the client.
• timeout – How long to wait the network setup before continuing the startup.

Returns

0 if ok, <0 if error.

int net_config_init_by_iface(struct net_if *iface, const char *app_info, uint32_t flags,
int32_t timeout)
Initialize this network application using a specific network interface.
If network interface is set to NULL, then the default one is used in the configuration.

Parameters

• iface – Initialize networking using this network interface.
• app_info – String describing this application.
• flags – Flags related to services needed by the client.
• **timeout** – How long to wait the network setup before continuing the startup.

**Returns**

0 if ok, <0 if error.

```
int net_config_init_app(const struct device *dev, const char *app_info)
```

Initialize this network application.

If CONFIG_NET_CONFIG_AUTO_INIT is set, then this function is called automatically when the device boots. If that is not desired, unset the config option and call the function manually when the application starts.

**Parameters**

• **dev** – Network device to use. The function will figure out what network interface to use based on the device. If the device is NULL, then default network interface is used by the function.

• **app_info** – String describing this application.

**Returns**

0 if ok, <0 if error.

---

**DHCPv4**

- **Overview**
- **Sample usage**
- **API Reference**

**Overview** The Dynamic Host Configuration Protocol (DHCP) is a network management protocol used on IPv4 networks. A DHCPv4 server dynamically assigns an IPv4 address and other network configuration parameters to each device on a network so they can communicate with other IP networks. See this [DHCP Wikipedia article](https://en.wikipedia.org/wiki/Dynamic_Host_Configuration_Protocol) for a detailed overview of how DHCP works. Note that Zephyr only supports DHCP client functionality.

**Sample usage** See dhcpv4-client sample application for details.

**API Reference**

**Related code samples**

**DHCPv4 client**

Start a DHCPv4 client to obtain an IPv4 address from a DHCPv4 server.

```
group dhcpv4

    DHCPv4.
```

**Enums**
enum net_dhcpv4_msg_type
    DHCPv4 message types.
    These enumerations represent RFC2131 defined msg type codes, hence they should not
    be renumbered.
    Additions, removals and reorders in this definition must be reflected within correspond-
    ing changes to net_dhcpv4_msg_type_name.
    Values:

enumerator NET_DHCPV4_MSG_TYPE_DISCOVER = 1
enumerator NET_DHCPV4_MSG_TYPE_OFFER = 2
enumerator NET_DHCPV4_MSG_TYPE_REQUEST = 3
enumerator NET_DHCPV4_MSG_TYPE_DECLINE = 4
enumerator NET_DHCPV4_MSG_TYPE_ACK = 5
enumerator NET_DHCPV4_MSG_TYPE_NAK = 6
enumerator NET_DHCPV4_MSG_TYPE_RELEASE = 7
enumerator NET_DHCPV4_MSG_TYPE_INFORM = 8

Functions

void net_dhcpv4_start(struct net_if *iface)
    Start DHCPv4 client on an iface.
    Start DHCPv4 client on a given interface. DHCPv4 client will start negotiation for IPv4
    address. Once the negotiation is success IPv4 address details will be added to interface.
    Parameters
        • iface – A valid pointer on an interface

void net_dhcpv4_stop(struct net_if *iface)
    Stop DHCPv4 client on an iface.
    Stop DHCPv4 client on a given interface. DHCPv4 client will remove all configuration
    obtained from a DHCP server from the interface and stop any further negotiation with
    the server.
    Parameters
        • iface – A valid pointer on an interface

void net_dhcpv4_restart(struct net_if *iface)
    Restart DHCPv4 client on an iface.
    Restart DHCPv4 client on a given interface. DHCPv4 client will restart the state ma-
    chine without any of the initial delays used in start.
    Parameters
• iface – A valid pointer on an interface

const char *net_dhcpv4_msg_type_name(enum net_dhcpv4_msg_type msg_type)

Return a text representation of the msg_type.

Parameters

• msg_type – The msg_type to be converted to text

Returns
A text representation of msg_type

Hostname Configuration

Overview  A networked device might need a hostname, for example, if the device is configured to be a mDNS responder (see DNS Resolve for details) and needs to respond to <hostname>.local DNS queries.

The CONFIG_NET_HOSTNAME_ENABLE must be set in order to store the hostname and enable the relevant APIs. If the option is enabled, then the default hostname is set to be zephyr by CONFIG_NET_HOSTNAME option.

If the same firmware image is used to flash multiple boards, then it is not practical to use the same hostname in all of the boards. In that case, one can enable CONFIG_NET_HOSTNAME_UNIQUE which will add a unique postfix to the hostname. By default the link local address of the first network interface is used as a postfix. In Ethernet networks, the link local address refers to MAC address. For example, if the link local address is 01:02:03:04:05:06, then the unique hostname could be zephyr010203040506. If you want to set the prefix yourself, then call net_hostname_set_postfix() before the network interfaces are created. For example for the Ethernet networks, the initialization priority is set by CONFIG_ETH_INIT_PRIORITY so you would need to set the postfix before that. The postfix can be set only once.

API Reference

group net_hostname

Network hostname configuration library.

Defines

NET_HOSTNAME_MAX_LEN

Functions

static inline const char *net_hostname_get(void)

Get the device hostname.

Return_pointer to device hostname.

Returns
Pointer to hostname or NULL if not set.

6.3. Networking
static inline void net_hostname_init(void)
    Initialize and set the device hostname.
static inline int net_hostname_set_postfix(const uint8_t *hostname_postfix, int
    postfix_len)
    Set the device hostname postfix.
    Set the device hostname to some value. This is only used if CONFIG_NET_HOSTNAME_UNIQUE is set.

Parameters
  • hostname_postfix – Usually link address. The function will convert this to a string.
  • postfix_len – Length of the hostname_postfix array.

Returns
  0 if ok, <0 if error

Network Core Helpers

Overview
  The network subsystem contains two functions for sending and receiving data from the network. The net_recv_data() is typically used by network device driver when the received network data needs to be pushed up in the network stack for further processing. All the data is received via a network interface which is typically created by the device driver.

For sending, the net_send_data() can be used. Typically applications do not call this function directly as there is the BSD Sockets API for sending and receiving network data.

API Reference

Related code samples

Telnet console
  Access Zephyr shell over telnet.

mDNS responder
  Listen and respond to mDNS queries.

group net_core
  Network core library.

Enums

define net_verdict
  Net Verdict.

Values:
enumerator **NET_OK**
   
   Packet has been taken care of.

enumerator **NET_CONTINUE**
   
   Packet has not been touched, other part should decide about its fate.

enumerator **NET_DROP**
   
   Packet must be dropped.

**Functions**

```c
int net_recv_data(struct net_if *iface, struct net_pkt *pkt)
```

Called by lower network stack or network device driver when a network packet has been received.

The function will push the packet up in the network stack for further processing.

**Parameters**

- `iface` – Network interface where the packet was received.
- `pkt` – Network packet data.

**Returns**

0 if ok, <0 if error.

```c
int net_send_data(struct net_pkt *pkt)
```

Send data to network.

Send data to network. This should not be used normally by applications as it requires that the network packet is properly constructed.

**Parameters**

- `pkt` – Network packet.

**Returns**

0 if ok, <0 if error. If <0 is returned, then the caller needs to unref the pkt in order to avoid memory leak.

**Network Interface**

- **Overview**
- **Network interface state management**
- **API Reference**

**Overview**  The network interface is a nexus that ties the network device drivers and the upper part of the network stack together. All the sent and received data is transferred via a network interface. The network interfaces cannot be created at runtime. A special linker section will contain information about them and that section is populated at linking time.

Network interfaces are created by **NET_DEVICE_INIT()** macro. For Ethernet network, a macro called **ETH_NET_DEVICE_INIT()** should be used instead as it will create VLAN interfaces automatically if **CONFIG_NET_VLAN** is enabled. These macros are typically used in network device driver source code.
The network interface can be turned ON by calling `net_if_up()` and OFF by calling `net_if_down()`. When the device is powered ON, the network interface is also turned ON by default.

The network interfaces can be referenced either by a struct `net_if` * pointer or by a network interface index. The network interface can be resolved from its index by calling `net_if_get_by_index()` and from interface pointer by calling `net_if_get_by_iface()`.

The IP address for network devices must be set for them to be connectable. In a typical dynamic network environment, IP addresses are set automatically by DHCPv4, for example. If needed though, the application can set a device's IP address manually. See the API documentation below for functions such as `net_if_ipv4_addr_add()` that do that.

The `net_if_get_default()` returns a *default* network interface. What this default interface means can be configured via options like `CONFIG_NET_DEFAULT_IF_FIRST` and `CONFIG_NET_DEFAULT_IF_ETHERNET`. See Kconfig file `subsys/net/ip/Kconfig` what options are available for selecting the default network interface.

The transmitted and received network packets can be classified via a network packet priority. This is typically done in Ethernet networks when virtual LANs (VLANs) are used. Higher priority packets can be sent or received earlier than lower priority packets. The traffic class setup can be configured by `CONFIG_NET_TC_TX_COUNT` and `CONFIG_NET_TC_RX_COUNT` options.

If the `CONFIG_NET_PROMISCUOUS_MODE` is enabled and if the underlying network technology supports promiscuous mode, then it is possible to receive all the network packets that the network device driver is able to receive. See *Promiscuous Mode* API for more details.

**Network interface state management** Zephyr distinguishes between two interface states: administrative state and operational state, as described in RFC 2863. The administrative state indicate whether an interface is turned ON or OFF. This state is represented by `NET_IF_UP` flag and is controlled by the application. It can be changed by calling `net_if_up()` or `net_if_down()` functions. Network drivers or L2 implementations should not change administrative state on their own.

Bringing an interface up however not always means that the interface is ready to transmit packets. Because of that, operational state, which represents the internal interface status, was implemented. The operational state is updated whenever one of the following conditions take place:

- The interface is brought up/down by the application (administrative state changes).
- The interface is notified by the driver/L2 that PHY status has changed.
- The interface is notified by the driver/L2 that it joined/left a network.

The PHY status is represented with `NET_IF_LOWER_UP` flag and can be changed with `net_if_carrier_on()` and `net_if_carrier_off()`. By default, the flag is set on a newly initialized interface. An example of an event that changes the carrier state is Ethernet cable being plugged in or out.

The network association status is represented with `NET_IF_DORMANT` flag and can be changed with `net_if_dormant_on()` and `net_if_dormant_off()`. By default, the flag is cleared on a newly initialized interface. An example of an event that changes the dormant state is a Wi-Fi driver successfully connecting to an access point. In this scenario, driver should set the dormant state to ON during initialization, and once it detects that it connected to a Wi-Fi network, the dormant state should be set to OFF.

The operational state of an interface is updated as follows:

- `!net_if_is_admin_up()`  
  Interface is in `NET_IF_OPER_DOWN`.
- `net_if_is_admin_up() && !net_if_is_carrier_ok()`
Interface is in `NET_IF_OPER_DOWN` or `NET_IF_OPER_LOWERLAYERDOWN` if the interface is stacked (virtual).

- `net_if_is_admin_up() && net_if_is_carrier_ok() && net_if_is_dormant()` 
  Interface is in `NET_IF_OPER_DORMANT`.
- `net_if_is_admin_up() && net_if_is_carrier_ok() && !net_if_is_dormant()` 
  Interface is in `NET_IF_OPER_UP`.

Only after an interface enters `NET_IF_OPER_UP` state the `NET_IF_RUNNING` flag is set on the interface indicating that the interface is ready to be used by the application.

---

**group net_if**
Network Interface abstraction layer.

**Defines**

`NET_DEVICE_INIT(dev_id, name, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)`
Create a network interface and bind it to network device.

**Parameters**

- `dev_id` – Network device id.
- `name` – The name this instance of the driver exposes to the system.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct `pm_device` associated with the device. (optional).
- `data` – Pointer to the device's private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `l2` – Network L2 layer for this network interface.
- `l2_ctx_type` – Type of L2 context data.
- `mtu` – Maximum transfer unit in bytes for this network interface.
NET_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)
Like NET_DEVICE_INIT but taking metadata from a devicetree node.
Create a network interface and bind it to network device.

Parameters

- **node_id** – The devicetree node identifier.
- **init_fn** – Address to the init function of the driver.
- **pm** – Reference to struct `pm_device` associated with the device. (optional).
- **data** – Pointer to the device's private data.
- **config** – The address to the structure containing the configuration information for this instance of the driver.
- **prio** – The initialization level at which configuration occurs.
- **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- **l2** – Network L2 layer for this network interface.
- **l2_ctx_type** – Type of L2 context data.
- **mtu** – Maximum transfer unit in bytes for this network interface.

NET_DEVICE_DT_INST_DEFINE(inst, ...)
Like NET_DEVICE_DT_DEFINE for an instance of a DT_DRV_COMPAT compatible.

Parameters

- **inst** – instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to NET_DEVICE_DT_DEFINE.
- **...** – other parameters as expected by NETDEVICE_DT_DEFINE.

NET_DEVICE_INIT_INSTANCE(dev_id, name, instance, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)
Create multiple network interfaces and bind them to network device.
If your network device needs more than one instance of a network interface, use this macro below and provide a different instance suffix each time (0, 1, 2, ... or a, b, c ... whatever works for you)

Parameters

- **dev_id** – Network device id.
- **name** – The name this instance of the driver exposes to the system.
- **instance** – Instance identifier.
- **init_fn** – Address to the init function of the driver.
- **pm** – Reference to struct `pm_device` associated with the device. (optional).
- **data** – Pointer to the device's private data.
- **config** – The address to the structure containing the configuration information for this instance of the driver.
- **prio** – The initialization level at which configuration occurs.
- **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- **l2** – Network L2 layer for this network interface.
- **l2_ctx_type** – Type of L2 context data.
• **mtu** – Maximum transfer unit in bytes for this network interface.

**NET_DEVICE_DT_DEFINE_INSTANCE**(node_id, instance, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)

Like **NET_DEVICE_OFFLOAD_INIT** but taking metadata from a devicetree.

Create multiple network interfaces and bind them to network device. If your network device needs more than one instance of a network interface, use this macro below and provide a different instance suffix each time (0, 1, 2, ... or a, b, c ... whatever works for you)

**Parameters**
- **node_id** – The devicetree node identifier.
- **instance** – Instance identifier.
- **init_fn** – Address to the init function of the driver.
- **pm** – Reference to struct `pm_device` associated with the device. (optional).
- **data** – Pointer to the device's private data.
- **config** – The address to the structure containing the configuration information for this instance of the driver.
- **prio** – The initialization level at which configuration occurs.
- **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- **l2** – Network L2 layer for this network interface.
- **l2_ctx_type** – Type of L2 context data.
- **mtu** – Maximum transfer unit in bytes for this network interface.

**NET_DEVICE_DT_INST_DEFINE_INSTANCE**(inst, ...)

Like **NET_DEVICE_DT_DEFINE_INSTANCE** for an instance of a DT_DRV_COMPAT compatible.

**Parameters**
- **inst** – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to **NET_DEVICE_DT_DEFINE_INSTANCE**.
- **...** – other parameters as expected by **NET_DEVICE_DT_DEFINE_INSTANCE**.

**NET_DEVICE_OFFLOAD_INIT**(dev_id, name, init_fn, pm, data, config, prio, api, mtu)

Create an offloaded network interface and bind it to network device.

The offloaded network interface is implemented by a device vendor HAL or similar.

**Parameters**
- **dev_id** – Network device id.
- **name** – The name this instance of the driver exposes to the system.
- **init_fn** – Address to the init function of the driver.
- **pm** – Reference to struct `pm_device` associated with the device. (optional).
- **data** – Pointer to the device's private data.
- **config** – The address to the structure containing the configuration information for this instance of the driver.
- **prio** – The initialization level at which configuration occurs.
• **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

• **mtu** – Maximum transfer unit in bytes for this network interface.

**NET_DEVICE_DT_OFFLOAD_DEFINE**(node_id, init_fn, pm, data, config, prio, api, mtu)

Like **NET_DEVICE_OFFLOAD_INIT** but taking metadata from a devicetree node.

Create a offloaded network interface and bind it to network device. The offloaded network interface is implemented by a device vendor HAL or similar.

**Parameters**

• **node_id** – The devicetree node identifier.

• **init_fn** – Address to the init function of the driver.

• **pm** – Reference to struct *pm_device* associated with the device. (optional).

• **data** – Pointer to the device's private data.

• **config** – The address to the structure containing the configuration information for this instance of the driver.

• **prio** – The initialization level at which configuration occurs.

• **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

• **mtu** – Maximum transfer unit in bytes for this network interface.

**NET_DEVICE_DT_INST_OFFLOAD_DEFINE**(inst, ...)

Like **NET_DEVICE_DT_OFFLOAD_DEFINE** for an instance of a DT_DRV_COMPAT compatible.

**Parameters**

• **inst** – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to **NET_DEVICE_DT_OFFLOAD_DEFINE**.

• **...** – other parameters as expected by **NET_DEVICE_DT_OFFLOAD_DEFINE**.

**Typedefs**

```c
typedef int (*net_socket_create_t)(int, int, int)

A function prototype to create an offloaded socket.

The prototype is compatible with socket() function.
```

```c
typedef void (*net_if_ip_addr_cb_t)(struct net_if *, struct net_if_addr *, void *
user_data)

Callback used while iterating over network interface IP addresses.

**Param iface**

Pointer to the network interface the address belongs to

**Param addr**

Pointer to current IP address

**Param user_data**

A valid pointer to user data or NULL
```
typedef void (*net_if_mcast_callback_t)(struct net_if *iface, const struct net_addr *addr, bool is_joined)

Define callback that is called whenever IPv6 multicast address group is joined or left.

**Param iface**
A pointer to a struct `net_if` to which the multicast address is attached.

**Param addr**
IP multicast address.

**Param is_joined**
True if the address is joined, false if left.

typedef void (*net_if_link_callback_t)(struct net_if *iface, struct net_linkaddr *dst, int status)

Define callback that is called after a network packet has been sent.

**Param iface**
A pointer to a struct `net_if` to which the the `net_pkt` was sent to.

**Param dst**
Link layer address of the destination where the network packet was sent.

**Param status**
Send status, 0 is ok, < 0 error.

typedef void (*net_if_cb_t)(struct net_if *iface, void *user_data)

Callback used while iterating over network interfaces.

**Param iface**
Pointer to current network interface

**Param user_data**
A valid pointer to user data or NULL

**Enums**

enum net_if_flag
Network interface flags.

*Values:*

enumerator NET_IF_UP
Interface is admin up.

enumerator NET_IF_POINTOPOINT
Interface is pointopoint.

enumerator NET_IF_PROMISC
Interface is in promiscuous mode.

enumerator NET_IF_NO_AUTO_START
Do not start the interface immediately after initialization.

This requires that either the device driver or some other entity will need to manually take the interface up when needed. For example for Ethernet this will happen when the driver calls the `net_eth_carrier_on()` function.
enumerator **NET_IF_SUSPENDED**
   Power management specific: interface is being suspended.

enumerator **NET_IF_FORWARD_MULTICASTS**
   Flag defines if received multicasts of other interface are forwarded on this interface.
   This activates multicast routing / forwarding for this interface.

enumerator **NET_IF_IPV4**
   Interface supports IPv4.

enumerator **NET_IF_IPV6**
   Interface supports IPv6.

enumerator **NET_IF_RUNNING**
   Interface up and running (ready to receive and transmit).

enumerator **NET_IF_LOWER_UP**
   Driver signals L1 is up.

enumerator **NET_IF_DORMANT**
   Driver signals dormant.

enumerator **NET_IF_IPV6_NO_ND**
   IPv6 Neighbor Discovery disabled.

enumerator **NET_IF_IPV6_NO_MLD**
   IPv6 Multicast Listener Discovery disabled.

enum **net_if_oper_state**
   Network interface operational status (RFC 2863).

   *Values:*

enumerator **NET_IF_OPER_UNKNOWN**

enumerator **NET_IF_OPER_NOTPRESENT**

enumerator **NET_IF_OPER_DOWN**

enumerator **NET_IF_OPERLOWER_LAYERDOWN**

enumerator **NET_IF_OPER_TESTING**

enumerator **NET_IF_OPER_DORMANT**

enumerator **NET_IF_OPER_UP**
Functions

static inline void net_if_lock(struct net_if *iface)
static inline void net_if_unlock(struct net_if *iface)
static inline void net_if_flag_set(struct net_if *iface, enum net_if_flag value)
    Set a value in network interface flags.
    Parameters
    • iface – Pointer to network interface
    • value – Flag value

static inline bool net_if_flag_test_and_set(struct net_if *iface, enum net_if_flag value)
    Test and set a value in network interface flags.
    Parameters
    • iface – Pointer to network interface
    • value – Flag value
    Returns
    true if the bit was set, false if it wasn’t.

static inline void net_if_flag_clear(struct net_if *iface, enum net_if_flag value)
    Clear a value in network interface flags.
    Parameters
    • iface – Pointer to network interface
    • value – Flag value

static inline bool net_if_flag_test_and_clear(struct net_if *iface, enum net_if_flag value)
    Test and clear a value in network interface flags.
    Parameters
    • iface – Pointer to network interface
    • value – Flag value
    Returns
    true if the bit was set, false if it wasn’t.

static inline bool net_if_flag_is_set(struct net_if *iface, enum net_if_flag value)
    Check if a value in network interface flags is set.
    Parameters
    • iface – Pointer to network interface
    • value – Flag value
    Returns
    True if the value is set, false otherwise

static inline enum net_if_oper_state net_if_oper_state_set(struct net_if *iface, enum net_if_oper_state_set net_if_oper_state oper_state)
    Set an operational state on an interface.
    Parameters
    • iface – Pointer to network interface
    • oper_state – Operational state to set
Returns
The new operational state of an interface

static inline enum net_if_oper_state net_if_oper_state(struct net_if *iface)
Get an operational state of an interface.

Parameters
• iface – Pointer to network interface

Returns
Operational state of an interface

enum net_verdict net_if_send_data(struct net_if *iface, struct net_pkt *pkt)
Send a packet through a net iface.

return verdict about the packet

Parameters
• iface – Pointer to a network interface structure
• pkt – Pointer to a net packet to send

static inline const struct net_l2 *net_if_l2(struct net_if *iface)
Get a pointer to the interface L2.

Parameters
• iface – a valid pointer to a network interface structure

Returns
a pointer to the iface L2

enum net_verdict net_if_recv_data(struct net_if *iface, struct net_pkt *pkt)
Input a packet through a net iface.

Parameters
• iface – Pointer to a network interface structure
• pkt – Pointer to a net packet to input

Returns
verdict about the packet

static inline void *net_if_l2_data(struct net_if *iface)
Get a pointer to the interface L2 private data.

Parameters
• iface – a valid pointer to a network interface structure

Returns
a pointer to the iface L2 data

static inline const struct device *net_if_get_device(struct net_if *iface)
Get an network interface's device.

Parameters
• iface – Pointer to a network interface structure

Returns
a pointer to the device driver instance
void net_if_queue_tx(struct net_if *iface, struct net_pkt *pkt)
   Queue a packet to the net interface TX queue.

Parameters
   • iface – Pointer to a network interface structure
   • pkt – Pointer to a net packet to queue

static inline bool net_if_is_ip_offloaded(struct net_if *iface)
   Return the IP offload status.

Parameters
   • iface – Network interface

Returns
   True if IP offloading is active, false otherwise.

bool net_if_is_offloaded(struct net_if *iface)
   Return offload status of a given network interface.

Parameters
   • iface – Network interface

Returns
   True if IP or socket offloading is active, false otherwise.

static inline struct net_offload *net_if_offload(struct net_if *iface)
   Return the IP offload plugin.

Parameters
   • iface – Network interface

Returns
   NULL if there is no offload plugin defined, valid pointer otherwise.

static inline bool net_if_is_socket_offloaded(struct net_if *iface)
   Return the socket offload status.

Parameters
   • iface – Network interface

Returns
   True if socket offloading is active, false otherwise.

static inline void net_if_socket_offload_set(struct net_if *iface, net_socket_create_t socket_offload)
   Set the function to create an offloaded socket.

Parameters
   • iface – Network interface
   • socket_offload – A function to create an offloaded socket

static inline net_socket_create_t net_if_socket_offload(struct net_if *iface)
   Return the function to create an offloaded socket.

Parameters
   • iface – Network interface

Returns
   NULL if the interface is not socket offloaded, valid pointer otherwise
static inline struct net_linkaddr *net_if_get_link_addr(struct net_if *iface)
Get an network interface's link address.

**Parameters**
- **iface** – Pointer to a network interface structure

**Returns**
a pointer to the network link address

static inline struct net_if_config *net_if_get_config(struct net_if *iface)
Return network configuration for this network interface.

**Parameters**
- **iface** – Pointer to a network interface structure

**Returns**
Pointer to configuration

static inline void net_if_start_dad(struct net_if *iface)
Start duplicate address detection procedure.

**Parameters**
- **iface** – Pointer to a network interface structure

void net_if_start_rs(struct net_if *iface)
Start neighbor discovery and send router solicitation message.

**Parameters**
- **iface** – Pointer to a network interface structure

static inline void net_if_stop_rs(struct net_if *iface)
Stop neighbor discovery.

**Parameters**
- **iface** – Pointer to a network interface structure

static inline int net_if_set_link_addr(struct net_if *iface, uint8_t *addr , uint8_t len, enum net_link_type type)
Set a network interface's link address.

**Parameters**
- **iface** – Pointer to a network interface structure
- **addr** – A pointer to a uint8_t buffer representing the address. The buffer must remain valid throughout interface lifetime.
- **len** – length of the address buffer
- **type** – network bearer type of this link address

**Returns**
0 on success

static inline uint16_t net_if_get_mtu(struct net_if *iface)
Get an network interface's MTU.

**Parameters**
- **iface** – Pointer to a network interface structure

**Returns**
the MTU
static inline void net_if_set_mtu(struct net_if *iface, uint16_t mtu)

Set an network interface's MTU.

Parameters
- **iface** – Pointer to a network interface structure
- **mtu** – New MTU, note that we store only 16 bit mtu value.

static inline void net_if_addr_set_lf(struct net_if_addr *ifaddr, bool is_infinite)

Set the infinite status of the network interface address.

Parameters
- **ifaddr** – IP address for network interface
- **is_infinite** – Infinite status

struct net_if *net_if_get_by_link_addr(struct net_linkaddr *ll_addr)

Get an interface according to link layer address.

Parameters
- **ll_addr** – Link layer address.

Returns
Network interface or NULL if not found.

struct net_if *net_if_lookup_by_dev(const struct device *dev)

Find an interface from it's related device.

Parameters
- **dev** – A valid struct device pointer to relate with an interface

Returns
a valid struct net_if pointer on success, NULL otherwise

static inline struct net_if_config *net_if_config_get(struct net_if *iface)

Get network interface IP config.

Parameters
- **iface** – Interface to use.

Returns
NULL if not found or pointer to correct config settings.

void net_if_router_rm(struct net_if_router *router)

Remove a router from the system.

Parameters
- **router** – Pointer to existing router

void net_if_set_default(struct net_if *iface)

Set the default network interface.

Parameters
- **iface** – New default interface, or NULL to revert to the one set by Kconfig.

struct net_if *net_if_get_default(void)

Get the default network interface.

Returns
Default interface or NULL if no interfaces are configured.
struct *net_if_get_first_by_type(const struct net_l2 *l2)
Get the first network interface according to its type.

Parameters
• l2 – Layer 2 type of the network interface.

Returns
First network interface of a given type or NULL if no such interfaces was found.

struct *net_if_get_first_up(void)
Get the first network interface which is up.

Returns
First network interface which is up or NULL if all interfaces are down.

int net_if_config_ipv6_get(struct net_if *iface, struct net_if_ipv6 **ipv6)
Allocate network interface IPv6 config.
This function will allocate new IPv6 config.

Parameters
• iface – Interface to use.
• ipv6 – Pointer to allocated IPv6 struct is returned to caller.

Returns
0 if ok, <0 if error

int net_if_config_ipv6_put(struct net_if *iface)
Release network interface IPv6 config.

Parameters
• iface – Interface to use.

Returns
0 if ok, <0 if error

struct net_addr *net_if_ipv6_addr_lookup(const struct in6_addr *addr, struct net_if **iface)
Check if this IPv6 address belongs to one of the interfaces.

Parameters
• addr – IPv6 address
• iface – Pointer to interface is returned

Returns
Pointer to interface address, NULL if not found.

struct net_addr *net_if_ipv6_addr_lookup_by_iface(struct net_if *iface, struct in6_addr *addr)
Check if this IPv6 address belongs to this specific interfaces.

Parameters
• iface – Network interface
• addr – IPv6 address

Returns
Pointer to interface address, NULL if not found.
int net_if_ipv6_addr_lookup_by_index(const struct in6_addr *addr)
Check if this IPv6 address belongs to one of the interface indices.

Parameters
• addr – IPv6 address

Returns
>0 if address was found in given network interface index, all other values
mean address was not found

struct net_if_addr *net_if_ipv6_addr_add(struct net_if *iface, struct in6_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)
Add a IPv6 address to an interface.

Parameters
• iface – Network interface
• addr – IPv6 address
• addr_type – IPv6 address type
• vlifetime – Validity time for this address

Returns
Pointer to interface address, NULL if cannot be added

bool net_if_ipv6_addr_add_by_index(int index, struct in6_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)
Add a IPv6 address to an interface by index.

Parameters
• index – Network interface index
• addr – IPv6 address
• addr_type – IPv6 address type
• vlifetime – Validity time for this address

Returns
True if ok, false if address could not be added

void net_if_ipv6_addr_update_lifetime(struct net_if_addr *ifaddr, uint32_t vlifetime)
Update validity lifetime time of an IPv6 address.

Parameters
• ifaddr – Network IPv6 address
• vlifetime – Validity time for this address

bool net_if_ipv6_addr_rm(struct net_if *iface, const struct in6_addr *addr)
Remove an IPv6 address from an interface.

Parameters
• iface – Network interface
• addr – IPv6 address

Returns
True if successfully removed, false otherwise

bool net_if_ipv6_addr_rm_by_index(int index, const struct in6_addr *addr)
Remove an IPv6 address from an interface by index.

Parameters
- **index** – Network interface index
- **addr** – IPv6 address

**Returns**
True if successfully removed, false otherwise

```c
void net_if_ipv6_addr_foreach(struct net_if *iface, net_if_ip_addr_cb_t cb, void *user_data)
```

Go through all IPv6 addresses on a network interface and call callback for each used address.

**Parameters**
- **iface** – Pointer to the network interface
- **cb** – User-supplied callback function to call
- **user_data** – User specified data

```c
struct net_if_mcast_addr *net_if_ipv6_maddr_add(struct net_if *iface, const struct in6_addr *addr)
```

Add a IPv6 multicast address to an interface.

**Parameters**
- **iface** – Network interface
- **addr** – IPv6 multicast address

**Returns**
Pointer to interface multicast address, NULL if cannot be added

```c
bool net_if_ipv6_maddr_rm(struct net_if *iface, const struct in6_addr *addr)
```

Remove an IPv6 multicast address from an interface.

**Parameters**
- **iface** – Network interface
- **addr** – IPv6 multicast address

**Returns**
True if successfully removed, false otherwise

```c
struct net_if_mcast_addr *net_if_ipv6_maddr_lookup(const struct in6_addr *addr, struct net_if **iface)
```

Check if this IPv6 multicast address belongs to a specific interface or one of the interfaces.

**Parameters**
- **addr** – IPv6 address
- **iface** – If *iface is null, then pointer to interface is returned, otherwise the *iface value needs to be matched.

**Returns**
Pointer to interface multicast address, NULL if not found.

```c
void net_if_mcast_mon_register(struct net_if_mcast_monitor *mon, struct net_if *iface, net_if_mcast_callback_t cb)
```

Register a multicast monitor.

**Parameters**
- **mon** – Monitor handle. This is a pointer to a monitor storage structure which should be allocated by caller, but does not need to be initialized.
- **iface** – Network interface
• cb – Monitor callback

```c
void net_if_mcast_mon_unregister(struct net_if_mcast_monitor *mon)
```

Unregister a multicast monitor.

**Parameters**

• mon – Monitor handle

```c
void net_if_mcast_monitor(struct net_if *iface, const struct net_addr *addr, bool is_joined)
```

Call registered multicast monitors.

**Parameters**

• iface – Network interface
• addr – Multicast address
• is_joined – Is this multicast address joined (true) or not (false)

```c
void net_if_ipv6_maddr_join(struct net_if *iface, struct net_if_mcast_addr *addr)
```

Mark a given multicast address to be joined.

**Parameters**

• iface – Network interface the address belongs to
• addr – IPv6 multicast address

```c
static inline bool net_if_ipv6_maddr_is_joined(struct net_if_mcast_addr *addr)
```

Check if given multicast address is joined or not.

**Parameters**

• addr – IPv6 multicast address

**Returns**

True if address is joined, False otherwise.

```c
void net_if_ipv6_maddr_leave(struct net_if *iface, struct net_if_mcast_addr *addr)
```

Mark a given multicast address to be left.

**Parameters**

• iface – Network interface the address belongs to
• addr – IPv6 multicast address

```c
struct net_if_ipv6_prefix *net_if_ipv6_prefix_get(struct net_if *iface, struct in6_addr *addr)
```

Return prefix that corresponds to this IPv6 address.

**Parameters**

• iface – Network interface
• addr – IPv6 address

**Returns**

Pointer to prefix, NULL if not found.

```c
struct net_if_ipv6_prefix *net_if_ipv6_prefix_lookup(struct net_if *iface, struct in6_addr *addr, uint8_t len)
```

Check if this IPv6 prefix belongs to this interface.

**Parameters**

• iface – Network interface
• addr – IPv6 address
• **len** – Prefix length

**Returns**
Pointer to prefix, NULL if not found.

```c
struct net_if_ipv6_prefix *net_if_ipv6_prefix_add(struct net_if *iface, struct in6_addr *prefix, uint8_t len, uint32_t lifetime)
```

Add a IPv6 prefix to an network interface.

**Parameters**
- **iface** – Network interface
- **prefix** – IPv6 address
- **len** – Prefix length
- **lifetime** – Prefix lifetime in seconds

**Returns**
Pointer to prefix, NULL if the prefix was not added.

```c
bool net_if_ipv6_prefix_rm(struct net_if *iface, struct in6_addr *addr, uint8_t len)
```

Remove an IPv6 prefix from an interface.

**Parameters**
- **iface** – Network interface
- **addr** – IPv6 prefix address
- **len** – Prefix length

**Returns**
True if successfully removed, false otherwise

```c
static inline void net_if_ipv6_prefix_set_lf(struct net_if_ipv6_prefix *prefix, bool is_infinite)
```

Set the infinite status of the prefix.

**Parameters**
- **prefix** – IPv6 address
- **is_infinite** – Infinite status

```c
void net_if_ipv6_prefix_set_timer(struct net_if_ipv6_prefix *prefix, uint32_t lifetime)
```

Set the prefix lifetime timer.

**Parameters**
- **prefix** – IPv6 address
- **lifetime** – Prefix lifetime in seconds

```c
void net_if_ipv6_prefix_unset_timer(struct net_if_ipv6_prefix *prefix)
```

Unset the prefix lifetime timer.

**Parameters**
- **prefix** – IPv6 address

```c
bool net_if_ipv6_addr_onlink(struct net_if **iface, struct in6_addr *addr)
```

Check if this IPv6 address is part of the subnet of our network interface.

**Parameters**
- **iface** – Network interface. This is returned to the caller. The iface can be NULL in which case we check all the interfaces.
- **addr** – IPv6 address
static inline struct in6_addr *net_if_router_ipv6(struct net_if_router *router)
Get the IPv6 address of the given router.

Parameters
- router – a network router

Returns
pointer to the IPv6 address, or NULL if none

struct net_if_router *net_if_ipv6_router_lookup(struct net_if *iface, struct in6_addr *addr)
Check if IPv6 address is one of the routers configured in the system.

Parameters
- iface – Network interface
- addr – IPv6 address

Returns
Pointer to router information, NULL if cannot be found

struct net_if_router *net_if_ipv6_router_find_default(struct net_if *iface, struct in6_addr *addr)
Find default router for this IPv6 address.

Parameters
- iface – Network interface. This can be NULL in which case we go through all the network interfaces to find a suitable router.
- addr – IPv6 address

Returns
Pointer to router information, NULL if cannot be found

void net_if_ipv6_router_update_lifetime(struct net_if_router *router, uint16_t lifetime)
Update validity lifetime time of a router.

Parameters
- router – Network IPv6 address
- lifetime – Lifetime of this router.

struct net_if_router *net_if_ipv6_router_add(struct net_if *iface, struct in6_addr *addr, uint16_t router_lifetime)
Add IPv6 router to the system.

Parameters
- iface – Network interface
- addr – IPv6 address
- router_lifetime – Lifetime of the router

Returns
Pointer to router information, NULL if could not be added

bool net_if_ipv6_router_rm(struct net_if_router *router)
Remove IPv6 router from the system.

Parameters
- router – Router information.
Returns
True if successfully removed, false otherwise

uint8_t net_if_ipv6_get_hop_limit(struct net_if *iface)
Get IPv6 hop limit specified for a given interface.
This is the default value but can be overridden by the user.

Parameters
• iface – Network interface

Returns
Hop limit

void net_ipv6_set_hop_limit(struct net_if *iface, uint8_t hop_limit)
Set the default IPv6 hop limit of a given interface.

Parameters
• iface – Network interface
• hop_limit – New hop limit

static inline void net_if_ipv6_set_base_reachable_time(struct net_if *iface, uint32_t reachable_time)
Set IPv6 reachable time for a given interface.

Parameters
• iface – Network interface
• reachable_time – New reachable time

static inline uint32_t net_if_ipv6_get_reachable_time(struct net_if *iface)
Get IPv6 reachable timeout specified for a given interface.

Parameters
• iface – Network interface

Returns
Reachable timeout

uint32_t net_if_ipv6_calc_reachable_time(struct net_if_ipv6 *ipv6)
Calculate next reachable time value for IPv6 reachable time.

Parameters
• ipv6 – IPv6 address configuration

Returns
Reachable time

static inline void net_if_ipv6_set_reachable_time(struct net_if_ipv6 *ipv6)
Set IPv6 reachable time for a given interface.
This requires that base reachable time is set for the interface.

Parameters
• ipv6 – IPv6 address configuration

static inline void net_if_ipv6_set_retrans_timer(struct net_if *iface, uint32_t retrans_timer)
Set IPv6 retransmit timer for a given interface.

Parameters
• iface – Network interface
• retrans_timer – New retransmit timer

static inline uint32_t net_if_ipv6_get_retrans_timer(struct net_if *iface)
Get IPv6 retransmit timer specified for a given interface.

Parameters
• iface – Network interface

Returns
Retransmit timer

static inline const struct in6_addr *net_if_ipv6_select_src_addr(struct net_if *iface, const struct in6_addr *dst)
Get a IPv6 source address that should be used when sending network data to destination.

Parameters
• iface – Interface that was used when packet was received. If the interface is not known, then NULL can be given.
• dst – IPv6 destination address

Returns
Pointer to IPv6 address to use, NULL if no IPv6 address could be found.

static inline struct net_if *net_if_ipv6_select_src_iface(const struct in6_addr *dst)
Get a network interface that should be used when sending IPv6 network data to destination.

Parameters
• dst – IPv6 destination address

Returns
Pointer to network interface to use, NULL if no suitable interface could be found.

struct in6_addr *net_if_ipv6_get_ll(struct net_if *iface, enum net_addr_state addr_state)
Get a IPv6 link local address in a given state.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr_state – IPv6 address state (preferred, tentative, deprecated)

Returns
Pointer to link local IPv6 address, NULL if no proper IPv6 address could be found.

struct in6_addr *net_if_ipv6_get_ll_addr(enum net_addr_state state, struct net_if **iface)
Return link local IPv6 address from the first interface that has a link local address matching give state.

Parameters
• state – IPv6 address state (ANY, TENTATIVE, PREFERRED, DEPRECATED)
• iface – Pointer to interface is returned

Returns
Pointer to IPv6 address, NULL if not found.
void net_if_ipv6_dad_failed(struct net_if *iface, const struct in6_addr *addr)

Stop IPv6 Duplicate Address Detection (DAD) procedure if we find out that our IPv6 address is already in use.

Parameters

• iface – Interface where the DAD was running.
• addr – IPv6 address that failed DAD

struct in6_addr *net_if_ipv6_get_global_addr(enum net_addr_state state, struct net_if **iface)

Return global IPv6 address from the first interface that has a global IPv6 address matching the given state.

Parameters

• state – IPv6 address state (ANY, TENTATIVE, PREFERRED, DEPRECATED)
• iface – Caller can give an interface to check. If iface is set to NULL, then all the interfaces are checked. Pointer to interface where the IPv6 address is defined is returned to the caller.

Returns

Pointer to IPv6 address, NULL if not found.

int net_if_config_ipv4_get(struct net_if *iface, struct net_if_ipv4 **ipv4)

Allocate network interface IPv4 config.

This function will allocate new IPv4 config.

Parameters

• iface – Interface to use.
• ipv4 – Pointer to allocated IPv4 struct is returned to caller.

Returns

0 if ok, <0 if error

int net_if_config_ipv4_put(struct net_if *iface)

Release network interface IPv4 config.

Parameters

• iface – Interface to use.

Returns

0 if ok, <0 if error

uint8_t net_if_ipv4_get_ttl(struct net_if *iface)

Get IPv4 time-to-live value specified for a given interface.

Parameters

• iface – Network interface

Returns

Time-to-live

void net_if_ipv4_set_ttl(struct net_if *iface, uint8_t ttl)

Set IPv4 time-to-live value specified to a given interface.

Parameters

• iface – Network interface
• ttl – Time-to-live value
struct net_if_addr *net_if_ipv4_addr_lookup(const struct in_addr *addr, struct net_if **iface)

Check if this IPv4 address belongs to one of the interfaces.

Parameters
• addr – IPv4 address
• iface – Interface is returned

Returns
Pointer to interface address, NULL if not found.

struct net_if_addr *net_if_ipv4_addr_add(struct net_if *iface, struct in_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)

Add a IPv4 address to an interface.

Parameters
• iface – Network interface
• addr – IPv4 address
• addr_type – IPv4 address type
• vlifetime – Validity time for this address

Returns
Pointer to interface address, NULL if cannot be added

bool net_if_ipv4_addr_rm(struct net_if *iface, const struct in_addr *addr)

Remove a IPv4 address from an interface.

Parameters
• iface – Network interface
• addr – IPv4 address

Returns
True if successfully removed, false otherwise

int net_if_ipv4_addr_lookup_by_index(const struct in_addr *addr)

Check if this IPv4 address belongs to one of the interface indices.

Parameters
• addr – IPv4 address

Returns
>0 if address was found in given network interface index, all other values mean address was not found

bool net_if_ipv4_addr_add_by_index(int index, struct in_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)

Add a IPv4 address to an interface by network interface index.

Parameters
• index – Network interface index
• addr – IPv4 address
• addr_type – IPv4 address type
• vlifetime – Validity time for this address

Returns
True if ok, false if the address could not be added
bool net_if_ipv4_addr_rm_by_index(int index, const struct in_addr *addr)
    Remove a IPv4 address from an interface by interface index.

  Parameters
  • index – Network interface index
  • addr – IPv4 address

  Returns
  True if successfully removed, false otherwise

void net_if_ipv4_addr_foreach(struct net_if *iface, net_if_ip_addr_cb_t cb, void *user_data)
    Go through all IPv4 addresses on a network interface and call callback for each used address.

  Parameters
  • iface – Pointer to the network interface
  • cb – User-supplied callback function to call
  • user_data – User specified data

struct net_if_mcast_addr *net_if_ipv4_maddr_add(struct net_if *iface, const struct in_addr *addr)
    Add a IPv4 multicast address to an interface.

  Parameters
  • iface – Network interface
  • addr – IPv4 multicast address

  Returns
  Pointer to interface multicast address, NULL if cannot be added

bool net_if_ipv4_maddr_rm(struct net_if *iface, const struct in_addr *addr)
    Remove an IPv4 multicast address from an interface.

  Parameters
  • iface – Network interface
  • addr – IPv4 multicast address

  Returns
  True if successfully removed, false otherwise

struct net_if_mcast_addr *net_if_ipv4_maddr_lookup(const struct in_addr *addr, struct net_if **iface)
    Check if this IPv4 multicast address belongs to a specific interface or one of the interfaces.

  Parameters
  • addr – IPv4 address
  • iface – If *iface is null, then pointer to interface is returned, otherwise the *iface value needs to be matched.

  Returns
  Pointer to interface multicast address, NULL if not found.

void net_if_ipv4_maddr_join(struct net_if *iface, struct net_if_mcast_addr *addr)
    Mark a given multicast address to be joined.

  Parameters
• **iface** – Network interface the address belongs to
• **addr** – IPv4 multicast address

static inline bool net_if_ipv4_maddr_is_joined(struct net_if_mcast_addr *addr)
Check if given multicast address is joined or not.

**Parameters**
• **addr** – IPv4 multicast address

**Returns**
True if address is joined, False otherwise.

void net_if_ipv4_maddr_leave(struct net_if *iface, struct net_if_mcast_addr *addr)
Mark a given multicast address to be left.

**Parameters**
• **iface** – Network interface the address belongs to
• **addr** – IPv4 multicast address

static inline struct in_addr *net_if_router_ipv4(struct net_if_router *router)
Get the IPv4 address of the given router.

**Parameters**
• **router** – a network router

**Returns**
pointer to the IPv4 address, or NULL if none

struct net_if_router *net_if_ipv4_router_lookup(struct net_if *iface, struct in_addr *addr)
Check if IPv4 address is one of the routers configured in the system.

**Parameters**
• **iface** – Network interface
• **addr** – IPv4 address

**Returns**
Pointer to router information, NULL if cannot be found

struct net_if_router *net_if_ipv4_router_find_default(struct net_if *iface, struct in_addr *addr)
Find default router for this IPv4 address.

**Parameters**
• **iface** – Network interface. This can be NULL in which case we go through all the network interfaces to find a suitable router.
• **addr** – IPv4 address

**Returns**
Pointer to router information, NULL if cannot be found

struct net_if_router *net_if_ipv4_router_add(struct net_if *iface, struct in_addr *addr, bool is_default, uint16_t router_lifetime)
Add IPv4 router to the system.

**Parameters**
• **iface** – Network interface
• **addr** – IPv4 address
• **is_default** – Is this router the default one
• **router_lifetime** – Lifetime of the router

**Returns**
Pointer to router information, NULL if could not be added

```c
bool net_if_ipv4_router_rm(struct net_if_router *router)
```

Remove IPv4 router from the system.

**Parameters**
• **router** – Router information.

**Returns**
True if successfully removed, false otherwise

```c
bool net_if_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
```

Check if the given IPv4 address belongs to local subnet.

**Parameters**
• **iface** – Interface to use. Must be a valid pointer to an interface.
• **addr** – IPv4 address

**Returns**
True if address is part of local subnet, false otherwise.

```c
bool net_if_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
```

Check if the given IPv4 address is a broadcast address.

**Parameters**
• **iface** – Interface to use. Must be a valid pointer to an interface.
• **addr** – IPv4 address, this should be in network byte order

**Returns**
True if address is a broadcast address, false otherwise.

```c
static inline struct net_if *
net_if_ipv4_select_src_iface(const struct in_addr *dst)
```

Get a network interface that should be used when sending IPv4 network data to destination.

**Parameters**
• **dst** – IPv4 destination address

**Returns**
Pointer to network interface to use, NULL if no suitable interface could be found.

```c
static inline const struct in_addr *
net_if_ipv4_select_src_addr(struct net_if *iface, const struct in_addr *dst)
```

Get a IPv4 source address that should be used when sending network data to destination.

**Parameters**
• **iface** – Interface to use when sending the packet. If the interface is not known, then NULL can be given.
• **dst** – IPv4 destination address

**Returns**
Pointer to IPv4 address to use, NULL if no IPv4 address could be found.
struct *net_if_ipv4_get_ll(struct *iface, enum net_addr_state addr_state)
Get a IPv4 link local address in a given state.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr_state – IPv4 address state (preferred, tentative, deprecated)

Returns
Pointer to link local IPv4 address, NULL if no proper IPv4 address could be found.

struct *net_if_ipv4_get_global_addr(struct *iface, enum net_addr_state addr_state)
Get a IPv4 global address in a given state.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr_state – IPv4 address state (preferred, tentative, deprecated)

Returns
Pointer to link local IPv4 address, NULL if no proper IPv4 address could be found.

void net_if_ipv4_set_netmask(struct *iface, const struct in_addr *netmask)
Set IPv4 netmask for an interface.

Parameters
• iface – Interface to use.
• netmask – IPv4 netmask

bool net_if_ipv4_set_netmask_by_index(int index, const struct in_addr *netmask)
Set IPv4 netmask for an interface index.

Parameters
• index – Network interface index
• netmask – IPv4 netmask

Returns
True if netmask was added, false otherwise.

void net_if_ipv4_set_gw(struct *iface, const struct in_addr *gw)
Set IPv4 gateway for an interface.

Parameters
• iface – Interface to use.
• gw – IPv4 address of an gateway

bool net_if_ipv4_set_gw_by_index(int index, const struct in_addr *gw)
Set IPv4 gateway for an interface index.

Parameters
• index – Network interface index
• gw – IPv4 address of an gateway

Returns
True if gateway was added, false otherwise.
struct net_if *net_if_select_src_iface(const struct sockaddr *dst)
Get a network interface that should be used when sending IPv6 or IPv4 network data to destination.

Parameters
• dst – IPv6 or IPv4 destination address

Returns
Pointer to network interface to use. Note that the function will return the default network interface if the best network interface is not found.

void net_if_register_link_cb(struct net_if_link_cb *link, net_if_link_callback_t cb)
Register a link callback.

Parameters
• link – Caller specified handler for the callback.
• cb – Callback to register.

void net_if_unregister_link_cb(struct net_if_link_cb *link)
Unregister a link callback.

Parameters
• link – Caller specified handler for the callback.

void net_if_call_link_cb(struct net_if *iface, struct net_linkaddr *lladdr, int status)
Call a link callback function.

Parameters
• iface – Network interface.
• lladdr – Destination link layer address
• status – 0 is ok, < 0 error

bool net_if_need_calc_rx_checksum(struct net_if *iface)
Check if received network packet checksum calculation can be avoided or not.

For example many ethernet devices support network packet offloading in which case the IP stack does not need to calculate the checksum.

Parameters
• iface – Network interface

Returns
True if checksum needs to be calculated, false otherwise.

bool net_if_need_calc_tx_checksum(struct net_if *iface)
Check if network packet checksum calculation can be avoided or not when sending the packet.

For example many ethernet devices support network packet offloading in which case the IP stack does not need to calculate the checksum.

Parameters
• iface – Network interface

Returns
True if checksum needs to be calculated, false otherwise.
struct net_if *net_if_get_by_index(int index)
    Get interface according to index.
    This is a syscall only to provide access to the object for purposes of assigning permissions.

    Parameters
    • index – Interface index

    Returns
    Pointer to interface or NULL if not found.

int net_if_get_by_iface(struct net_if *iface)
    Get interface index according to pointer.

    Parameters
    • iface – Pointer to network interface

    Returns
    Interface index

void net_if_foreach(net_if_cb_t cb, void *user_data)
    Go through all the network interfaces and call callback for each interface.

    Parameters
    • cb – User-supplied callback function to call
    • user_data – User specified data

int net_if_up(struct net_if *iface)
    Bring interface up.

    Parameters
    • iface – Pointer to network interface

    Returns
    0 on success

static inline bool net_if_is_up(struct net_if *iface)
    Check if interface is is up and running.

    Parameters
    • iface – Pointer to network interface

    Returns
    True if interface is up, False if it is down.

int net_if_down(struct net_if *iface)
    Bring interface down.

    Parameters
    • iface – Pointer to network interface

    Returns
    0 on success

static inline bool net_if_is_admin_up(struct net_if *iface)
    Check if interface was brought up by the administrator.

    Parameters
    • iface – Pointer to network interface

    Returns
    True if interface is admin up, false otherwise.
void net_if_carrier_on(struct net_if *iface)
Underlying network device has detected the carrier (cable connected).
The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

Parameters
• iface – Pointer to network interface

void net_if_carrier_off(struct net_if *iface)
Underlying network device has lost the carrier (cable disconnected).
The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

Parameters
• iface – Pointer to network interface

static inline bool net_if_is_carrier_ok(struct net_if *iface)
Check if carrier is present on network device.

Parameters
• iface – Pointer to network interface

Returns
True if carrier is present, false otherwise.

void net_if_dormant_on(struct net_if *iface)
Mark interface as dormant.
Dormant state indicates that the interface is not ready to pass packets yet, but is waiting for some event (for example Wi-Fi network association).
The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

Parameters
• iface – Pointer to network interface

void net_if_dormant_off(struct net_if *iface)
Mark interface as not dormant.
The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

Parameters
• iface – Pointer to network interface

static inline bool net_if_is_dormant(struct net_if *iface)
Check if the interface is dormant.

Parameters
• iface – Pointer to network interface

Returns
True if interface is dormant, false otherwise.

static inline int net_if_set_promisc(struct net_if *iface)
Set network interface into promiscuous mode.
Note that not all network technologies will support this.

Parameters
• `iface` – Pointer to network interface

**Returns**
0 on success, <0 if error

static inline void net_if_unset_promisc(struct net_if *iface)
Set network interface into normal mode.

**Parameters**
• `iface` – Pointer to network interface

static inline bool net_if_is_promisc(struct net_if *iface)
Check if promiscuous mode is set or not.

**Parameters**
• `iface` – Pointer to network interface

**Returns**
True if interface is in promisc mode, False if interface is not in promiscuous mode.

static inline bool net_if_are_pending_tx_packets(struct net_if *iface)
Check if there are any pending TX network data for a given network interface.

**Parameters**
• `iface` – Pointer to network interface

**Returns**
True if there are pending TX network packets for this network interface, False otherwise.

bool net_if_is_wifi(struct net_if *iface)
Check if the network interface supports Wi-Fi.

**Parameters**
• `iface` – Pointer to network interface

**Returns**
True if interface supports Wi-Fi, False otherwise.

struct net_if *net_if_get_first_wifi(void)
Get first Wi-Fi network interface.

**Returns**
Pointer to network interface, NULL if not found.

int net_if_get_name(struct net_if *iface, char *buf, int len)
Get network interface name.
If interface name support is not enabled, empty string is returned.

**Parameters**
• `iface` – Pointer to network interface
• `buf` – User supplied buffer
• `len` – Length of the user supplied buffer

**Returns**
Length of the interface name copied to buf, -EINVAL if invalid parameters,
-ERANGE if name cannot be copied to the user supplied buffer, -ENOTSUP
if interface name support is disabled,
int net_if_set_name(struct net_if *iface, const char *buf)
    Set network interface name.

    Normally this function is not needed to call as the system will automatically assign a name to the network interface.

    Parameters
    • iface – Pointer to network interface
    • buf – User supplied name

    Returns
    0 name is set correctly -ENOTSUP interface name support is disabled -EINVAL if invalid parameters are given, -ENAMETOOLONG if name is too long

int net_if_get_by_name(const char *name)
    Get interface index according to its name.

    Parameters
    • name – Name of the network interface

    Returns
    Interface index

struct net_if_addr
    #include <net_if.h> Network Interface unicast IP addresses.
    Stores the unicast IP addresses assigned to this network interface.

Public Members

struct net_addr address
    IP address.

enum net_addr_type addr_type
    How the IP address was set.

enum net_addr_state addr_state
    What is the current state of the address.

uint8_t is_infinite
    Is the IP address valid forever.

uint8_t is_used
    Is this IP address used or not.

uint8_t is_mesh_local
    Is this IP address usage limited to the subnet (mesh) or not.

struct net_if_mcast_addr
    #include <net_if.h> Network Interface multicast IP addresses.
    Stores the multicast IP addresses assigned to this network interface.
Public Members

struct net_addr address
   IP address.

uint8_t is_used
   Is this multicast IP address used or not.

uint8_t isJoined
   Did we join to this group.

struct net_if_ipv6_prefix
   #include <net_if.h> Network Interface IPv6 prefixes.
   Stores the multicast IP addresses assigned to this network interface.

Public Members

struct net_timeout lifetime
   Prefix lifetime.

struct in6_addr prefix
   IPv6 prefix.

struct net_if *iface
   Backpointer to network interface where this prefix is used.

uint8_t len
   Prefix length.

uint8_t is_infinite
   Is the IP prefix valid forever.

uint8_t is_used
   Is this prefix used or not.

struct net_if_router
   #include <net_if.h> Information about routers in the system.
   Stores the router information.

Public Members

sys_snode_t node
   Slist lifetime timer node.

struct net_addr address
   IP address.
struct *iface
    Network interface the router is connected to.

uint32_t lif_start
    Router life timer start.

uint16_t lifetime
    Router lifetime.

uint8_t is_used
    Is this router used or not.

uint8_t is_default
    Is default router.

uint8_t is_infinite
    Is the router valid forever.

struct net_if_ipv6
    #include <net_if.h>

Public Members

struct net_if_addr unicast[NET_IF_MAX_IPV6_ADDR]
    Unicast IP addresses.

struct net_if_mcast_addr mcast[NET_IF_MAX_IPV6_MADDR]
    Multicast IP addresses.

struct net_if_ipv6_prefix prefix[NET_IF_MAX_IPV6_PREFIX]
    Prefixes.

uint32_t base_reachable_time
    Default reachable time (RFC 4861, page 52)

uint32_t reachable_time
    Reachable time (RFC 4861, page 20)

uint32_t retrans_timer
    Retransmit timer (RFC 4861, page 52)

uint8_t hop_limit
    IPv6 hop limit.

struct net_if_ipv4
    #include <net_if.h>
Public Members

struct net_if_addr unicast[NET_IF_MAX_IPV4_ADDR]
    Unicast IP addresses.

struct net_if_mcast_addr mcast[NET_IF_MAX_IPV4_MADDR]
    Multicast IP addresses.

struct in_addr gw
    Gateway.

struct in_addr netmask
    Netmask.

uint8_t ttl
    IPv4 time-to-live.

struct net_if_ip
    #include <net_if.h> Network interface IP address configuration.

struct net_if_config
    #include <net_if.h> IP and other configuration related data for network interface.

struct net_traffic_class
    #include <net_if.h> Network traffic class.
    Traffic classes are used when sending or receiving data that is classified with different priorities. So some traffic can be marked as high priority and it will be sent or received first. Each network packet that is transmitted or received goes through a fifo to a thread that will transmit it.

Public Members

struct k_fifo fifo
    Fifo for handling this Tx or Rx packet.

struct k_thread handler
    Traffic class handler thread.

k_thread_stack_t *stack
    Stack for this handler.

struct net_if_dev
    #include <net_if.h> Network Interface Device structure.
    Used to handle a network interface on top of a device driver instance. There can be many net_if_dev instance against the same device.
    Such interface is mainly to be used by the link layer, but is also tight to a network context: It then makes the relation with a network context and the network device.
Because of the strong relationship between a device driver and such network interface, each `net_if_dev` should be instantiated by one of the network device init macros found in `net_if.h`.

**Public Members**

```c
const struct device *dev
```

The actually device driver instance the `net_if` is related to.

```c
const struct net_l2 *const l2
```

Interface's L2 layer.

```c
void *l2_data
```

Interface's private L2 data pointer.

```c
struct net_linkaddr link_addr
```

The hardware link address.

```c
uint16_t mtu
```

The hardware MTU.

```c
enum net_if_oper_state oper_state
```

RFC 2863 operational status.

```c
struct net_if
#include <net_if.h> Network Interface structure.
```

Used to handle a network interface on top of a `net_if_dev` instance. There can be many `net_if` instance against the same `net_if_dev` instance.

**Public Members**

```c
struct net_if_dev *if_dev
```

The `net_if_dev` instance the `net_if` is related to.

```c
struct net_if_config config
```

Network interface instance configuration.

```c
struct net_if_mcast_monitor
#include <net_if.h> Multicast monitor handler struct.
```

Stores the multicast callback information. Caller must make sure that the variable pointed by this is valid during the lifetime of registration. Typically this means that the variable cannot be allocated from stack.

**Public Members**
sys_snodo_t node
    Node information for the slist.

struct net_if *iface
    Network interface.

net_if_mcast_callback_t cb
    Multicast callback.

struct net_if_link_cb
    #include <net_if.h> Link callback handler struct.
    Stores the link callback information. Caller must make sure that the variable pointed
    by this is valid during the lifetime of registration. Typically this means that the variable
    cannot be allocated from stack.

Public Members

sys_snodo_t node
    Node information for the slist.

net_if_link_callback_t cb
    Link callback.

L2 Layer Management

- Overview
- L2 layer API
- Network Device drivers
  - Ethernet device driver
  - IEEE 802.15.4 device driver
- API Reference

Overview  The L2 stack is designed to hide the whole networking link-layer part and the rel-}
ated device drivers from the upper network stack. This is made through a net_if declared in
include/zephyr/net/net_if.h.

The upper layers are unaware of implementation details beyond the net_if object and the generic
API provided by the L2 layer in include/zephyr/net/net_l2.h as net_12.

Only the L2 layer can talk to the device driver, linked to the net_if object. The L2 layer dictates the
API provided by the device driver, specific for that device, and optimized for working together.

Currently, there are L2 layers for Ethernet, IEEE 802.15.4 Soft-MAC, Bluetooth IPSP, CANBUS,
OpenThread, Wi-Fi, and a dummy layer example that can be used as a template for writing a
new one.
L2 layer API In order to create an L2 layer, or a driver for a specific L2 layer, one needs to understand how the L3 layer interacts with it and how the L2 layer is supposed to behave. See also network stack architecture for more details. The generic L2 API has these functions:

- **recv()**: All device drivers, once they receive a packet which they put into a net_pkt, will push this buffer to the network stack via net_recv_data(). At this point, the network stack does not know what to do with it. Instead, it passes the buffer along to the L2 stack's recv() function for handling. The L2 stack does what it needs to do with the packet, for example, parsing the link layer header, or handling link-layer only packets. The recv() function will return NET_DROP in case of an erroneous packet, NET_OK if the packet was fully consumed by the L2, or NET_CONTINUE if the network stack should then handle it.

- **send()**: Similar to receive function, the network stack will call this function to actually send a network packet. All relevant link-layer content will be generated and added by this function. The send() function returns the number of bytes sent, or a negative error code if there was a failure sending the network packet.

- **enable()**: This function is used to enable/disable traffic over a network interface. The function returns <0 if error and >=0 if no error.

- **get_flags()**: This function will return the capabilities of an L2 driver, for example whether the L2 supports multicast or promiscuous mode.

**Network Device drivers** Network device drivers fully follows Zephyr device driver model as a basis. Please refer to Device Driver Model.

There are, however, two differences:

- The driver_api pointer must point to a valid net_if_api pointer.

- The network device driver must use NETDEVICE_INIT_INSTANCE() or ETH_NETDEVICE_INIT() for Ethernet devices. These macros will call the DEVICE_DEFINE() macro, and also instantiate a unique net_if related to the created device driver instance.

Implementing a network device driver depends on the L2 stack it belongs to: Ethernet, IEEE 802.15.4, etc. In the next section, we will describe how a device driver should behave when receiving or sending a network packet. The rest is hardware dependent and is not detailed here.

**Ethernet device driver** On reception, it is up to the device driver to fill-in the network packet with as many data buffers as required. The network packet itself is a net_pkt and should be allocated through net_pkt_rx_alloc_with_buffer(). Then all data buffers will be automatically allocated and filled by net_pkt_write().

After all the network data has been received, the device driver needs to call net_recv_data(). If that call fails, it will be up to the device driver to unreference the buffer via net_pkt_unref().

On sending, the device driver send function will be called, and it is up to the device driver to send the network packet all at once, with all the buffers.

Each Ethernet device driver will need, in the end, to call ETH_NETDEVICE_INIT() like this:

```c
ETH_NETDEVICE_INIT(..., CONFIG_ETH_INIT_PRIORITY,
                   &the_valid_net_if_api_instance, 1500);
```

**IEEE 802.15.4 device driver** Device drivers for IEEE 802.15.4 L2 work basically the same as for Ethernet. What has been described above, especially for recv(), applies here as well. There are two specific differences however:

- It requires a dedicated device driver API: ieee802154_radio_api, which overloads net_if_api. This is because 802.15.4 L2 needs more from the device driver
than just `send()` and `recv()` functions. This dedicated API is declared in `include/zephyr/net/ieee802154_radio.h`. Each and every IEEE 802.15.4 device driver must provide a valid pointer on such relevantly filled-in API structure.

- Sending a packet is slightly different than in Ethernet. Most IEEE 802.15.4 PHYs support relatively small frames only, 127 bytes all inclusive: frame header, payload and frame checksum. Buffers to be sent over the radio will often not fit this frame size limitation, e.g. a buffer containing an IPv6 packet will often have to be split into several fragments and IP6 packet headers and fragments need to be compressed using a protocol like LoWPAN before being passed on to the radio driver. Additionally the IEEE 802.15.4 standard defines medium access (e.g. CSMA/CA), frame retransmission, encryption and other pre-processing procedures (e.g. addition of information elements) that individual radio drivers should not have to care about. This is why the `ieee802154_radio_api` requires a tx function pointer which differs from the `net_if_api` send function pointer. Zephyr's native IEEE 802.15.4 L2 implementation provides a generic `ieee802154_send()` instead, meant to be given as `net_if` send function. The implementation of `ieee802154_send()` takes care of IEEE 802.15.4 standard packet preparation procedures, splitting the packet into possibly compressed, encrypted and otherwise pre-processed fragment buffers, sending one buffer at a time through `ieee802154_radio_api` tx function and unreferencing the network packet only when the transmission as a whole was either successful or failed.

Interaction between IEEE 802.15.4 radio device drivers and L2 is bidirectional:

- L2 -> L1: Methods as `ieee802154_send()` and several IEEE 802.15.4 net management calls will call into the driver, e.g. to send a packet over the radio link or re-configure the driver at runtime. These incoming calls will all be handled by the methods in the `ieee802154_radio_api`.

- L1 -> L2: There are several situations in which the driver needs to initiate calls into the L2/MAC layer. Zephyr's IEEE 802.15.4 L1 -> L2 adaptation API employs an “inversion-of-control” pattern in such cases avoids duplication of complex logic across independent driver implementations and ensures implementation agnostic loose coupling and clean separation of concerns between MAC (L2) and PHY (L1) whenever reverse information transfer or close co-operation between hardware and L2 is required. During driver initialization, for example, the driver calls `ieee802154_init()` to pass the interface's MAC address as well as other hardware-related configuration to L2. Similarly, drivers may indicate performance or timing critical radio events to L2 that require close integration with the hardware (e.g. `ieee802154_handle_ack()`). Calls from L1 into L2 are not implemented as methods in `ieee802154_radio_api` but are standalone functions declared and documented as such in `include/zephyr/net/ieee802154_radio.h`. The API documentation will clearly state which functions must be implemented by all L2 stacks as part of the L1 -> L2 “inversion-of-control” adaptation API.

Note: Standalone functions in `include/zephyr/net/ieee802154_radio.h` that are not explicitly documented as callbacks are considered to be helper functions within the PHY (L1) layer implemented independently of any specific L2 stack, see for example `ieee802154_is_ar_flag_set()`.

As all net interfaces, IEEE 802.15.4 device driver implementations will have to call `NET_DEVICE_INIT_INSTANCE()` in the end:

```
NET_DEVICE_INIT_INSTANCE(...,
    the_device_init_prio,
    &the_valid_ieee802154_radio_api_instance,
    IEEE802154_L2,
    NET_L2_GET_CTX_TYPE(IEEE802154_L2), 125);
```

**Link Layer Discovery Protocol (LLDP)**
Enable LLDP support and setup VLANs.

6.3. Networking 2601
Virtual LAN

Setup two virtual LAN networks and use net-shell to view the networks' settings.

**group net_12**

Network Layer 2 abstraction layer.

** Enums **

** enum net_12_flags**

L2 flags.

*Values:*

**enumerator** `NET_L2_MULTICAST = BIT(0)`  
IP multicast supported.

**enumerator** `NET_L2_MULTICAST_SKIP_JOIN_SOLICIT_NODE = BIT(1)`  
Do not join solicited node multicast group.

**enumerator** `NET_L2_PROMISC_MODE = BIT(2)`  
Is promiscuous mode supported.

**enumerator** `NET_L2_POINT_TO_POINT = BIT(3)`  
Is this L2 point-to-point with tunneling so no need to have IP address etc to network interface.

** struct net_12 **

`#include <net_l2.h>` Network L2 structure.

Used to provide an interface to lower network stack.

** Public Members **

** enum net_verdict (**recv**)(struct net_if *iface, struct net_pkt *pkt)**

This function is used by net core to get iface's L2 layer parsing what's relevant to itself.

** int (**send**)(struct net_if *iface, struct net_pkt *pkt)**

This function is used by net core to push a packet to lower layer (interface’s L2), which in turn might work on the packet relevantly.

(adding proper header etc...) Returns a negative error code, or the number of bytes sent otherwise.

** int (**enable**)(struct net_if *iface, bool state)**

This function is used to enable/disable traffic over a network interface.

The function returns <0 if error and >=0 if no error.

** enum net_l2_flags (**get_flags**)(struct net_if *iface)**

Return L2 flags for the network interface.
Network Traffic Offloading

- **Network Offloading**
  - Overview
  - API Reference
- **Socket Offloading**
  - Overview

Network Offloading

**Overview**  The network offloading API provides hooks that a device vendor can use to provide an alternate implementation for an IP stack. This means that the actual network connection creation, data transfer, etc., is done in the vendor HAL instead of the Zephyr network stack.

**API Reference**

*group* net_offload

Network offloading interface.

Socket Offloading

**Overview**  In addition to the network offloading API, Zephyr allows offloading of networking functionality at the socket API level. With this approach, vendors who provide an alternate implementation of the networking stack, exposing socket API for their networking devices, can easily integrate it with Zephyr.

See [drivers/wifi/simplelink/simplelink_sockets.c](#) for a sample implementation on how to integrate network offloading at socket level.

Link Layer Address Handling

- **Overview**
- **API Reference**

**Overview**  The link layer addresses are set for network interfaces so that L2 connectivity works correctly in the network stack. Typically the link layer addresses are 6 bytes long like in Ethernet but for IEEE 802.15.4 the link layer address length is 8 bytes.

**API Reference**

*group* net_linkaddr

Network link address library.
Defines

`NET_LINK_ADDR_MAX_LENGTH`
Maximum length of the link address.

Enums

e num `net_link_type`
Type of the link address.
This indicates the network technology that this address is used in. Note that in order to save space we store the value into a uint8_t variable, so please do not introduce any values > 255 in this enum.

Values:

enumerator `NET_LINK_UNKNOWN` = 0
Unknown link address type.

enumerator `NET_LINK_IEEE802154`
IEEE 802.15.4 link address.

enumerator `NET_LINK_BLUETOOTH`
Bluetooth IPSP link address.

enumerator `NET_LINK_Ethernet`
Ethernet link address.

enumerator `NET_LINK_DUMMY`
Dummy link address.
Used in testing apps and loopback support.

enumerator `NET_LINK_CANBUS_RAW`
CANBUS link address.

Functions

static inline bool `net_linkaddr_cmp`
(`struct net_linkaddr` *lladdr1, `struct net_linkaddr` *lladdr2)
Compare two link layer addresses.

Parameters

• `lladdr1` – Pointer to a link layer address
• `lladdr2` – Pointer to a link layer address

Returns
True if the addresses are the same, false otherwise.
static inline int net_linkaddr_set(struct net_linkaddr_storage *lladdr_store, uint8_t *new_addr, uint8_t new_len)

Set the member data of a link layer address storage structure.

Parameters

- **lladdr_store** – The link address storage structure to change.
- **new_addr** – Array of bytes containing the link address.
- **new_len** – Length of the link address array. This value should always be <= NET_LINK_ADDR_MAX_LENGTH.

struct net_linkaddr

#include <net_linkaddr.h> Hardware link address structure.

Used to hold the link address information

**Public Members**

- `uint8_t *addr`
  The array of byte representing the address.

- `uint8_t len`
  Length of that address array.

- `uint8_t type`
  What kind of address is this for.

struct net_linkaddr_storage

#include <net_linkaddr.h> Hardware link address structure.

Used to hold the link address information. This variant is needed when we have to store the link layer address.

Note that you cannot cast this to `net_linkaddr` as `uint8_t *` is handled differently than `uint8_t addr[]` and the fields are purposely in different order:

**Public Members**

- `uint8_t type`
  What kind of address is this for.

- `uint8_t len`
  The real length of the ll address.

- `uint8_t addr[6]`
  The array of bytes representing the address.
Overview  Ethernet management API provides functions to manage the Ethernet network interface low level status. The caller of these functions can:

- raise carrier ON or carrier OFF management events
- raise VLAN enabled or VLAN disabled management events

Typically the carrier OFF event would be generated by the Ethernet device driver when it notices that the Ethernet cable is disconnected. The carrier ON event would be generated if the Ethernet device driver notices that the Ethernet cable is re-connected.

Currently the VLAN events are generated by the Ethernet L2 layer when a specific VLAN tag is either enabled or disabled.

The user application can monitor these events if it needs to act when the corresponding status changes.

API Reference

_group ethernet_mgmt

  Ethernet library.

Functions

void ethernet_mgmt_raise_carrier_on_event(struct net_if *iface)
  Raise CARRIER_ON event when Ethernet is connected.

  Parameters
  • iface – Ethernet network interface.

void ethernet_mgmt_raise_carrier_off_event(struct net_if *iface)
  Raise CARRIER_OFF event when Ethernet is disconnected.

  Parameters
  • iface – Ethernet network interface.

void ethernet_mgmt_raise_vlan_enabled_event(struct net_if *iface, uint16_t tag)
  Raise VLAN_ENABLED event when VLAN is enabled.

  Parameters
  • iface – Ethernet network interface.
  • tag – VLAN tag which is enabled.

void ethernet_mgmt_raise_vlan_disabled_event(struct net_if *iface, uint16_t tag)
  Raise VLAN_DISABLED event when VLAN is disabled.

  Parameters
  • iface – Ethernet network interface.
  • tag – VLAN tag which is disabled.
Traffic Classification

Overview  Traffic classification is an automated process that categorizes computer network traffic according to various parameters. For Zephyr, the VLAN priority code point (PCP) is used to classify both received and sent network packets. See more information about VLAN priority at IEEE 802.1Q.

By default, all network traffic is treated equal in Zephyr. If desired, the option CONFIG_NET_TC_TX_COUNT can be used to set the number of transmit queues. The option CONFIG_NET_TC_RX_COUNT can be used to set the number of receive queues. Each traffic class queue corresponds to a specific kernel work queue. Each kernel work queue has a priority. The VLAN priority is mapped to a certain traffic class according to rules specified in IEEE 802.1Q chapter I.3, chapter 8.6.6 table 8-4, and chapter 34.5 table 34-1. Each traffic class is in turn mapped to a certain kernel work queue. The maximum number of traffic classes for both Rx and Tx is 8.

See subsys/net/ip/net_tc.c for details of how various mappings are done.

Network Packet Filtering

Overview  The Network Packet Filtering facility provides the infrastructure to construct custom rules for accepting and/or denying packet transmission and reception. This can be used to create a basic firewall, control network traffic, etc.

The CONFIG_NET_PKT_FILTER must be set in order to enable the relevant APIs.

Both the transmission and reception paths may have a list of filter rules. Each rule is made of a set of conditions and a packet outcome. Every packet is subjected to the conditions attached to a rule. When all the conditions for a given rule are true then the packet outcome is immediately determined as specified by the current rule and no more rules are considered. If one condition is false then the next rule in the list is considered.

Packet outcome is either NET_OK to accept the packet or NET_DROP to drop it.

A rule is represented by a npf_rule object. It can be inserted to, appended to or removed from a rule list contained in a npf_rule_list object using npf_insert_rule(), npf_append_rule(), and npf_remove_rule(). Currently, two such rule lists exist: npf_send_rules for outgoing packets, and npf_recv_rules for incoming packets.

If a filter rule list is empty then NET_OK is assumed. If a non-empty rule list runs to the end then NET_DROP is assumed. However it is recommended to always terminate a non-empty rule list with an explicit default termination rule, either npf_default_ok or npf_default_drop.

Rule conditions are represented by a npf_test. This structure can be embedded into a larger structure when a specific condition requires extra test data. It is up to the test function for such conditions to retrieve the outer structure from the provided npf_test structure pointer.

Convenience macros are provided in include/zephyr/net/net_pkt_filter.h to statically define condition instances for various conditions, and NPF_RULE() to create a rule instance to tie them.

Examples  Here's an example usage:
The above would accept IP packets that are 200 bytes or smaller, and drop all other packets.

Another (less efficient) way to achieve the same result could be:

```c
void install_my_filter(void)
{
    npf_insert_recv_rule(&npf_default_drop);
    npf_insert_recv_rule(&small_ip_pkt);
}
```

```c
void install_my_filter(void) {
    npf_insert_recv_rule(&reject_big_pkts);
    npf_insert_recv_rule(&reject_non_ip);
    npf_insert_recv_rule(&npf_default_ok);
}
```

API Reference

*group net_pkt_filter*

Network Packet Filter API.

**Defines**

- `npf_insert_send_rule(rule)`
- `npf_insert_recv_rule(rule)`
- `npf_append_send_rule(rule)`
- `npf_append_recv_rule(rule)`
- `npf_remove_send_rule(rule)`
- `npf_remove_recv_rule(rule)`
- `npf_remove_all_send_rules()`
- `npf_remove_all_recv_rules()`
- `NPF_RULE(_name, _result, ...)`

Statically define one packet filter rule.

This creates a rule from a variable amount of filter conditions. This rule can then be inserted or appended to the rule list for a given network packet path.

Example:
static NPF_SIZE_MAX(maxsize_200, 200);
static NPF_ETH_TYPE_MATCH(ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(small_ip_pkt, NET_OK, ip_packet, maxsize_200);

void install_my_filter(void)
{
    npf_insert_recv_rule(&npf_default_drop);
    npf_insert_recv_rule(&small_ip_pkt);
}

The above would accept IP packets that are 200 bytes or smaller, and drop all other packets.

Another (less efficient) way to create the same result could be:

static NPF_SIZE_MIN(minsize_201, 201);
static NPF_ETH_TYPE_UNMATCH(not_ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(reject_big_pkts, NET_DROP, minsize_201);
static NPF_RULE(reject_non_ip, NET_DROP, not_ip_packet);

void install_my_filter(void) {
    npf_append_recv_rule(&reject_big_pkts);
    npf_append_recv_rule(&reject_non_ip);
    npf_append_recv_rule(&npf_default_ok);
}

The first rule in the list for which all conditions are true determines the fate of the packet. If one condition is false then the next rule in the list is evaluated.

Parameters

- _name – Name for this rule.
- _result – Fate of the packet if all conditions are true, either NET_OK or NET_DROP.
- ... – List of conditions for this rule.

Functions

void npf_insert_rule(struct npf_rule_list *rules, struct npf_rule *rule)
Insert a rule at the front of given rule list.

Parameters

- rules – the affected rule list
- rule – the rule to be inserted

void npf_append_rule(struct npf_rule_list *rules, struct npf_rule *rule)
Append a rule at the end of given rule list.

Parameters

- rules – the affected rule list
- rule – the rule to be appended

bool npf_remove_rule(struct npf_rule_list *rules, struct npf_rule *rule)
Remove a rule from the given rule list.

Parameters
• rules – the affected rule list
• rule – the rule to be removed

Return values
true – if given rule was found in the rule list and removed

bool npf_remove_all_rules(struct npf_rule_list *rules)
Remove all rules from the given rule list.

Parameters
• rules – the affected rule list

Return values
true – if at least one rule was removed from the rule list

Variables

struct npf_rule npf_default_ok
Default rule list termination for accepting a packet.

struct npf_rule npf_default_drop
Default rule list termination for rejecting a packet.

struct npf_rule_list npf_send_rules
rule list applied to outgoing packets

struct npf_rule_list npf_recv_rules
rule list applied to incoming packets

struct npf_rule_list npf_local_in_recv_rules
rule list applied for local incoming packets

struct npf_rule_list npf_ipv4_recv_rules
rule list applied for IPv4 incoming packets

struct npf_rule_list npf_ipv6_recv_rules
rule list applied for IPv6 incoming packets

struct npf_test
#include <net_pkt_filter.h> common filter test structure to be embedded into larger structures

Public Members

npf_test_fn_t *fn
packet condition test function

struct npf_rule
#include <net_pkt_filter.h> filter rule structure
Public Members

enum net_verdict result
    result if all tests pass

uint32_t nb_tests
    number of tests for this rule

struct npf_test *tests[]
    pointers to npf_test instances

struct npf_rule_list
#include <net_pkt_filter.h> rule set for a given test location

group npf_basic_cond

Defines

NPF_IFACE_MATCH(_name, _iface)
    Statically define an “interface match” packet filter condition.
    Parameters
    • _name – Name of the condition
    • _iface – Interface to match

NPF_IFACE_UNMATCH(_name, _iface)
    Statically define an “interface unmatch” packet filter condition.
    Parameters
    • _name – Name of the condition
    • _iface – Interface to exclude

NPF_ORIG_IFACE_MATCH(_name, _iface)
    Statically define an “orig interface match” packet filter condition.
    Parameters
    • _name – Name of the condition
    • _iface – Interface to match

NPF_ORIG_IFACE_UNMATCH(_name, _iface)
    Statically define an “orig interface unmatch” packet filter condition.
    Parameters
    • _name – Name of the condition
    • _iface – Interface to exclude

NPF_SIZE_MIN(_name, _size)
    Statically define a “data minimum size” packet filter condition.
    Parameters
    • _name – Name of the condition
    • _size – Lower bound of the packet’s data size
**NPF_SIZE_MAX**(_name, _size)  
Statically define a “data maximum size” packet filter condition.

**Parameters**
- _name – Name of the condition
- _size – Higher bound of the packet's data size

**NPF_SIZE_BOUNDS**(_name, _min_size, _max_size)  
Statically define a “data bounded size” packet filter condition.

**Parameters**
- _name – Name of the condition
- _min_size – Lower bound of the packet's data size
- _max_size – Higher bound of the packet's data size

**NPF_IP_SRC_ADDR.Allowlist**(_name, _ip_addr_array, _ip_addr_num, _af)  
Statically define a “ip address allowlist” packet filter condition.

This tests if the packet source ip address matches any of the ip addresses contained in the provided set.

**Parameters**
- _name – Name of the condition
- _ip_addr_array – Array of struct in_addr or struct in6_addr items to test against
- _ip_addr_num – number of IP addresses in the array
- _af – Addresses family type (AF_INET / AF_INET6) in the array

**NPF_IP_SRC_ADDR.Blocklist**(_name, _ip_addr_array, _ip_addr_num, _af)  
Statically define a “ip address blocklist” packet filter condition.

This tests if the packet source ip address matches any of the ip addresses contained in the provided set.

**Parameters**
- _name – Name of the condition
- _ip_addr_array – Array of struct in_addr or struct in6_addr items to test against
- _ip_addr_num – number of IP addresses in the array
- _af – Addresses family type (AF_INET / AF_INET6) in the array

*group npf_eth_cond*

**Defines**

**NPF_ETH_SRC_ADDR_MATCH**(_name, _addr_array)  
Statically define a “source address match” packet filter condition.

This tests if the packet source address matches any of the Ethernet addresses contained in the provided set.

**Parameters**
- _name – Name of the condition
• _addr_array – Array of struct net_eth_addr items to test against

NPF_ETH_SRC_ADDR_UNMATCH(_name, _addr_array)
Statically define a “source address unmatch” packet filter condition.
This tests if the packet source address matches none of the Ethernet addresses contained in the provided set.

Parameters
• _name – Name of the condition
• _addr_array – Array of struct net_eth_addr items to test against

NPF_ETH_DST_ADDR_MATCH(_name, _addr_array)
Statically define a “destination address match” packet filter condition.
This tests if the packet destination address matches any of the Ethernet addresses contained in the provided set.

Parameters
• _name – Name of the condition
• _addr_array – Array of struct net_eth_addr items to test against

NPF_ETH_DST_ADDR_UNMATCH(_name, _addr_array)
Statically define a “destination address unmatch” packet filter condition.
This tests if the packet destination address matches none of the Ethernet addresses contained in the provided set.

Parameters
• _name – Name of the condition
• _addr_array – Array of struct net_eth_addr items to test against
• ... – up to 6 mask bytes

NPF_ETH_DST_ADDR_MASK_MATCH(_name, _addr_array, ...)
Statically define a “destination address match with mask” packet filter condition.
This tests if the packet destination address matches any of the Ethernet addresses contained in the provided set after applying specified mask.

Parameters
• _name – Name of the condition
• _addr_array – Array of struct net_eth_addr items to test against
• ... – up to 6 mask bytes

NPF_ETH_TYPE_MATCH(_name, _type)
Statically define an “Ethernet type match” packet filter condition.

Parameters
• _name – Name of the condition
• _type – Ethernet type to match

\texttt{NPF\_ETH\_TYPE\_UNMATCH(\_name, _type)}

Statically define an “Ethernet type unmatch” packet filter condition.

**Parameters**

• _name – Name of the condition
• _type – Ethernet type to exclude

**Network Shell** Network shell provides helpers for figuring out network status, enabling/disabling features, and issuing commands like ping or DNS resolving. Note that net-shell should probably not be used in production code as it will require extra memory. See also **generic shell** for detailed shell information.

The following net-shell commands are implemented:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>net allocs</td>
<td>Print network memory allocations. Only available if CONFIG_NET_DEBUG_NET_PKT_ALLOC is set.</td>
</tr>
<tr>
<td>net arp</td>
<td>Print information about IPv4 ARP cache. Only available if CONFIG_NET_ARP is set in IPv4 enabled networks.</td>
</tr>
<tr>
<td>net capture</td>
<td>Monitor network traffic See Monitor Network Traffic for details.</td>
</tr>
<tr>
<td>net conn</td>
<td>Print information about network connections.</td>
</tr>
<tr>
<td>net dns</td>
<td>Show how DNS is configured. The command can also be used to resolve a DNS name. Only available if CONFIG_DNS_RESOLVER is set.</td>
</tr>
<tr>
<td>net events</td>
<td>Enable network event monitoring. Only available if CONFIG_NET_MGMT_EVENT_MONITOR is set.</td>
</tr>
<tr>
<td>net gptp</td>
<td>Print information about gPTP support. Only available if CONFIG_NET_GPTP is set.</td>
</tr>
<tr>
<td>net iface</td>
<td>Print information about network interfaces.</td>
</tr>
<tr>
<td>net ipv6</td>
<td>Print IPv6 specific information and configuration. Only available if CONFIG_NET_IPV6 is set.</td>
</tr>
<tr>
<td>net mem</td>
<td>Print information about network memory usage. The command will print more information if CONFIG_NET_BUF_POOL_USAGE is set.</td>
</tr>
<tr>
<td>net nbr</td>
<td>Print neighbor information. Only available if CONFIG_NET_IPV6 is set.</td>
</tr>
<tr>
<td>net ping</td>
<td>Ping a network host.</td>
</tr>
<tr>
<td>net route</td>
<td>Show IPv6 network routes. Only available if CONFIG_NET_ROUTE is set.</td>
</tr>
<tr>
<td>net sockets</td>
<td>Show network socket information and statistics. Only available if CONFIG_NET_SOCKETS_OBJ_CORE and CONFIG_OBJ_CORE are set.</td>
</tr>
<tr>
<td>net stats</td>
<td>Show network statistics.</td>
</tr>
<tr>
<td>net tcp</td>
<td>Connect/send data/close TCP connection. Only available if CONFIG_NET_TCP is set.</td>
</tr>
<tr>
<td>net vlan</td>
<td>Show Ethernet virtual LAN information. Only available if CONFIG_NET_VLAN is set.</td>
</tr>
</tbody>
</table>

**Time Sensitive Networking**

**generic Precision Time Protocol (gPTP)**

• **Overview**
• **Supported features**
• **Supported hardware**
Overview  This gPTP stack supports the protocol and procedures as defined in the **IEEE 802.1AS-2011 standard** (Timing and Synchronization for Time-Sensitive Applications in Bridged Local Area Networks).

Supported features  The stack handles communications and state machines defined in the **IEEE 802.1AS-2011 standard**. Mandatory requirements for a full-duplex point-to-point link endpoint, as defined in Annex A of the standard, are supported.

The stack is in principle capable of handling communications on multiple network interfaces (also defined as “ports” in the standard) and thus act as a 802.1AS bridge. However, this mode of operation has not been validated on the Zephyr OS.

Supported hardware  Although the stack itself is hardware independent, Ethernet frame timestamping support must be enabled in ethernet drivers.

Boards supported:

- frdm_k64f
- nucleo_h743zi_board
- nucleo_h745zi_q_board
- nucleo_f767zi_board
- sam_e70_xplained
- native_posix (only usable for simple testing, limited capabilities due to lack of hardware clock)
- qemu_x86 (emulated, limited capabilities due to lack of hardware clock)

Enabling the stack  The following configuration option must me enabled in prj.conf file.

- CONFIG_NET_GPTP

Application interfaces  Only two Application Interfaces as defined in section 9 of the standard are available:

- ClockTargetPhaseDiscontinuity interface (gptp_register_phase_dis_cb())
- ClockTargetEventCapture interface (gptp_event_capture())

Testing  The stack has been informally tested using the OpenAVnu gPTP and Linux ptp4l daemons. The gPTP sample application from the Zephyr source distribution can be used for testing.
Enable gPTP support and monitor functionality using net-shell.

**group gptp**

generic Precision Time Protocol (gPTP) support

**Typedefs**

typedef void (*gptp_phase_dis_callback_t)(uint8_t *gm_identity, uint16_t *time_base,
struct gptp_scaled_ns *last_gm_ph_change, double *last_gm_freq_change)

Define callback that is called after a phase discontinuity has been sent by the grand-master.

**Param gm_identity**
A pointer to first element of a ClockIdentity array. The size of the array is GPTP_CLOCK_ID_LEN.

**Param time_base**
A pointer to the value of timeBaseIndicator of the current grandmaster.

**Param last_gm_ph_change**
A pointer to the value of lastGmPhaseChange received from grandmaster.

**Param last_gm_freq_change**
A pointer to the value of lastGmFreqChange received from the grandmaster.

typedef void (*gptp_port_cb_t)(int port, struct net_if *iface, void *user_data)

Callback used while iterating over gPTP ports.

**Param port**
Port number

**Param iface**
Pointer to network interface

**Param user_data**
A valid pointer to user data or NULL

**Functions**

void gptp_register_phase_dis_cb(struct gptp_phase_dis_cb *phase_dis,
gptp_phase_dis_callback_t cb)

Register a phase discontinuity callback.

**Parameters**

- phase_dis – Caller specified handler for the callback.
- cb – Callback to register.

void gptp_unregister_phase_dis_cb(struct gptp_phase_dis_cb *phase_dis)

Unregister a phase discontinuity callback.

**Parameters**
- **phase_dis** – Caller specified handler for the callback.

```c
void gptp_call_phase_dis_cb(void)
```

Call a phase discontinuity callback function.

```c
int gptp_event_capture(struct net_ptp_time *slave_time, bool *gm_present)
```

Get gPTP time.

**Parameters**

- **slave_time** – A pointer to structure where timestamp will be saved.
- **gm_present** – A pointer to a boolean where status of the presence of a grand master will be saved.

**Returns**

Error code. 0 if no error.

```c
char *gptp_sprint_clock_id(const uint8_t *clk_id, char *output, size_t output_len)
```

Utility function to print clock id to a user supplied buffer.

**Parameters**

- **clk_id** – Clock id
- **output** – Output buffer
- **output_len** – Output buffer len

**Returns**

Pointer to output buffer

```c
void gptp_foreach_port(gptp_port_cb_t cb, void *user_data)
```

Go through all the gPTP ports and call callback for each of them.

**Parameters**

- **cb** – User-supplied callback function to call
- **user_data** – User specified data

```c
struct gptp_domain *gptp_get_domain(void)
```

Get gPTP domain.

This contains all the configuration / status of the gPTP domain.

**Returns**

Pointer to domain or NULL if not found.

```c
void gptp_clk_src_time_invoke(struct gptp_clk_src_time_invoke_params *arg)
```

This interface is used by the ClockSource entity to provide time to the ClockMaster entity of a time-aware system.

**Parameters**

- **arg** – Current state and parameters of the ClockSource entity.

```c
struct gptp_hdr *gptp_get_hdr(struct net_pkt *pkt)
```

Return pointer to gPTP packet header in network packet.

**Parameters**

- **pkt** – Network packet (received or sent)

**Returns**

Pointer to gPTP header.

```c
struct gptp_scaled_ns
```

`#include <gptp.h>` Scaled Nanoseconds.

---

6.3. Networking
Public Members

int32_t high
High half.

int64_t low
Low half.

struct gptp_uscaled_ns
#include <gptp.h> UScaled Nanoseconds.

Public Members

uint32_t high
High half.

uint64_t low
Low half.

struct gptp_port_identity
#include <gptp.h> Port Identity.

Public Members

uint8_t clk_id[GPTP_CLOCK_ID_LEN]
Clock identity of the port.

uint16_t port_number
Number of the port.

struct gptp_flags
#include <gptp.h>

Public Members

uint8_t octets[2]
Byte access.

uint16_t all
Whole field access.

struct gptp_hdr
#include <gptp.h>
Public Members

**uint8_t **message_type
Type of the message.

**uint8_t **transport_specific
Transport specific, always 1.

**uint8_t **ptp_version
Version of the PTP, always 2.

**uint8_t **reserved0
Reserved field.

**uint16_t **message_length
Total length of the message from the header to the last TLV.

**uint8_t **domain_number
Domain number, always 0.

**uint8_t **reserved1
Reserved field.

**struct **gptp_flags flags
Message flags.

**int64_t **correction_field
Correction Field.
The content depends of the message type.

**uint32_t **reserved2
Reserved field.

**struct **gptp_port_identity port_id
Port Identity of the sender.

**uint16_t **sequence_id
Sequence Id.

**uint8_t **control
Control value.
Sync: 0, Follow-up: 2, Others: 5.

**int8_t **log_msg_interval
Message Interval in Log2 for Sync and Announce messages.
struct gptp_phase_dis_cb

#include <gptp.h> Phase discontinuity callback structure.
Stores the phase discontinuity callback information. Caller must make sure that the
variable pointed by this is valid during the lifetime of registration. Typically this means
that the variable cannot be allocated from stack.

Public Members

sys_snodo_t node
Node information for the slist.

gptp_phase_dis_callback_t cb
Phase discontinuity callback.

struct gptp_clk_src_time_invoke_params
#include <gptp.h> ClockSourceTime.invoke function parameters.
Parameters passed by ClockSourceTime.invoke function.

Public Members

double last_gm_freq_change
Frequency change on the last Time Base Indicator Change.

struct net_ptp_extended_time src_time
The time this function is invoked.

struct gptp_scaled_ns last_gm_phase_change
Phase change on the last Time Base Indicator Change.

uint16_t time_base_indicator
Time Base - changed only if Phase or Frequency changes.

Network time representation in the network stack

API Reference

group net_time

Defines

NET_TIME_MAX
The largest positive time value that can be represented by net_time_t.
The smallest negative time value that can be represented by net_time_t.

The largest positive number of seconds that can be safely represented by net_time_t.

The smallest negative number of seconds that can be safely represented by net_time_t.

**Typedefs**

typedef int64_t net_time_t

Any occurrence of net_time_t specifies a concept of nanosecond resolution scalar time span, future (positive) or past (negative) relative time or absolute timestamp referred to some local network uptime reference clock that does not wrap during uptime and is - in a certain, well-defined sense - common to all local network interfaces, sometimes even to remote interfaces on the same network.

This type is EXPERIMENTAL. Usage is currently restricted to representation of time within the network subsystem.

Timed network protocols (PTP, TDMA, ...) usually require several local or remote interfaces to share a common notion of elapsed time within well-defined tolerances. Network uptime therefore differs from time represented by a single hardware counter peripheral in that it will need to be represented in several distinct hardware peripherals with different frequencies, accuracy and precision. To co-operate, these hardware counters will have to be “syntonized” or “disciplined” (i.e. frequency and phase locked) with respect to a common local or remote network reference time signal. Be aware that while syntonized clocks share the same frequency and phase, they do not usually share the same epoch (zero-point).

This also explains why network time, if represented as a cycle value of some specific hardware counter, will never be “precise” but only can be “good enough” with respect to the tolerances (resolution, drift, jitter) required by a given network protocol. All counter peripherals involved in a timed network protocol must comply with these tolerances.

Please use specific cycle/tick counter values rather than net_time_t whenever possible especially when referring to the kernel system clock or values of any single counter peripheral.

net_time_t cannot represent general clocks referred to an arbitrary epoch as it only covers roughly +/- ~290 years. It also cannot be used to represent time according to a more complex timescale (e.g. including leap seconds, time adjustments, complex calendars or time zones). In these cases you may use timespec (C11, POSIX.1-2001), timeval (POSIX.1-2001) or broken down time as in tm (C90). The advantage of net_time_t over these structured time representations is lower memory footprint, faster and simpler scalar arithmetics and easier conversion from/to low-level hardware counter values. Also net_time_t can be used in the network stack as well as in applications while POSIX concepts cannot. Converting net_time_t from/to structured time representations is possible in a limited way but - except for timespec - requires concepts that must be implemented by higher-level APIs. Utility functions converting from/to timespec will be provided as part of the net_time_t API as and when needed.
If you want to represent more coarse grained scalar time in network applications, use \texttt{time\_t} (C99, POSIX.1-2001) which is specified to represent seconds or \texttt{suseconds\_t} (POSIX.1-2001) for microsecond resolution. Kernel \texttt{k\_ticks\_t} and \texttt{cycles} (both specific to Zephyr) have an unspecified resolution but are useful to represent kernel timer values and implement high resolution spinning.

If you need even finer grained time resolution, you may want to look at (g)PTP concepts, see net\_ptp\_extended\_time.

The reason why we don’t use \texttt{int64\_t} directly to represent scalar nanosecond resolution times in the network stack is that it has been shown in the past that fields using generic type will often not be used correctly (e.g. with the wrong resolution or to represent underspecified concepts of time with unclear syntonization semantics).

Any API that exposes or consumes net\_time\_t values SHALL ensure that it maintains the specified contract including all protocol specific tolerances and therefore clients can rely on common semantics of this type. This makes times coming from different hardware peripherals and even from different network nodes comparable within well-defined limits and therefore net\_time\_t is the ideal intermediate building block for timed network protocols.

**Precision Time Protocol (PTP) time format**

- **Overview**
- **API Reference**

**Overview** The PTP time struct can store time information in high precision format (nanoseconds). The extended timestamp format can store the time in fractional nanoseconds accuracy. The PTP time format is used in \textit{generic Precision Time Protocol (gPTP)} implementation.

**API Reference** Related code samples

\texttt{gPTP}  
Enable gPTP support and monitor functionality using net-shell.

\texttt{group ptp\_time}  
Precision Time Protocol time specification.

**Functions**

\texttt{static inline net\_time\_t net\_ptp\_time\_to\_ns(struct net\_ptp\_time *ts)}  
Convert a PTP timestamp to a nanosecond precision timestamp, both related to the local network reference clock.

\textbf{Note:} Only timestamps representing up to \textasciitilde290 years can be converted to nanosecond timestamps. Larger timestamps will return the maximum representable nanosecond precision timestamp.

**Parameters**
• ts – the PTP timestamp

**Returns**
the corresponding nanosecond precision timestamp

```c
static inline struct net_ptp_time ns_to_net_ptp_time(net_time_t nsec)
```

Convert a nanosecond precision timestamp to a PTP timestamp, both related to the local network reference clock.

**Parameters**

• nsec – a nanosecond precision timestamp

**Returns**
the corresponding PTP timestamp

```c
struct net_ptp_time
```

 INCLUDE PTPTHM.H (Generalized) Precision Time Protocol Timestamp format.

This structure represents a timestamp according to the Precision Time Protocol standard ("PTP", IEEE 1588, section 5.3.3), the Generalized Precision Time Protocol standard ("gPTP", IEEE 802.1AS, section 6.4.3.4), or any other well-defined context in which precision structured timestamps are required on network messages in Zephyr.

Seconds are encoded as a 48 bits unsigned integer. Nanoseconds are encoded as a 32 bits unsigned integer.

In the context of (g)PTP, timestamps designate the time, relative to a local clock ("LocalClock") at which the message timestamp point passes a reference plane marking the boundary between the PTP Instance and the network medium (IEEE 1855, section 7.3.4.2; IEEE 802.1AS, section 8.4.3).

The exact definitions of the message timestamp point and reference plane depends on the network medium and use case.

For (g)PTP the media-specific message timestamp points and reference planes are defined in the standard. In non-PTP contexts specific to Zephyr, timestamps are measured relative to the same local clock but with a context-specific message timestamp point and reference plane, defined below per use case.

A "LocalClock" is a freerunning clock, embedded into a well-defined entity (e.g. a PTP Instance) and provides a common time to that entity relative to an arbitrary epoch (IEEE 1855, section 3.1.26, IEEE 802.1AS, section 3.16).

In Zephyr, the local clock is usually any instance of a kernel system clock driver, counter driver, RTC API driver or low-level counter/timer peripheral (e.g. an ethernet peripheral with hardware timestamp support or a radio timer) with sufficient precision for the context in which it is used.

See IEEE 802.1AS, Annex B for specific performance requirements regarding conformance of local clocks in the gPTP context. See IEEE 1588, Annex A, section A5.4 for general performance requirements regarding PTP local clocks. See IEEE 802.15.4-2020, section 15.7 for requirements in the context of ranging applications and ibid., section 6.7.6 for the relation between guard times and clock accuracy which again influence the precision required for subprotocols like CSL, TSCH, RIT, etc.

Applications that use timestamps across different subsystems or media must ensure that they understand the definition of the respective reference planes and interpret timestamps accordingly. Applications must further ensure that timestamps are either all referenced to the same local clock or convert between clocks based on sufficiently precise conversion algorithms.

Timestamps may be measured on ingress (RX timestamps) or egress (TX timestamps) of network messages. Timestamps can also be used to schedule a network message...
to a well-defined point in time in the future at which it is to be sent over the medium (timed TX). A future timestamp and a duration, both referenced to the local clock, may be given to specify a time window at which a network device should expect incoming messages (RX window).

In Zephyr this timestamp structure is currently used in the following contexts:

- **gPTP for Full Duplex Point-to-Point IEEE 802.3 links (IEEE 802.1AS, section 11):** the reference plane and message timestamp points are as defined in the standard.

- **IEEE 802.15.4 timed TX and RX:** Timestamps designate the point in time at which the end of the last symbol of the start-of-frame delimiter (SFD) (or equivalently, the start of the first symbol of the PHY header) is at the local antenna. The standard also refers to this as the “RMARKER” (IEEE 802.15.4-2020, section 6.9.1) or “symbol boundary” (ibid., section 6.5.2), depending on the context. In the context of beacon timestamps, the difference between the timestamp measurement plane and the reference plane is defined by the MAC PIB attribute “macSyncSymbolOffset”, ibid., section 8.4.3.1, table 8-94.

If further use cases are added to Zephyr using this timestamp structure, their clock performance requirements, message timestamp points and reference plane definition SHALL be added to the above list.

**Public Members**

```c
union net_ptp_time [anonymous]
    Seconds encoded on 48 bits.

uint32_t nanosecond
    Nanoseconds.
```

```c
struct net_ptp_extended_time
    #include <ptp_time.h> Generalized Precision Time Protocol Extended Timestamp format.
```

This structure represents an extended timestamp according to the Generalized Precision Time Protocol standard (IEEE 802.1AS), see section 6.4.3.5.

Seconds are encoded as 48 bits unsigned integer. Fractional nanoseconds are encoded as 48 bits, their unit is \(2^{-16}\) ns.

A precise definition of PTP timestamps and their uses in Zephyr is given in the description of `net_ptp_time`.

**Public Members**

```c
union net_ptp_extended_time [anonymous]
    Seconds encoded on 48 bits.

union net_ptp_extended_time [anonymous]
    Fractional nanoseconds on 48 bits.
```
Generic GSM Modem

**Overview**  The generic GSM modem driver allows the user to connect Zephyr to a GSM modem which provides a data connection to cellular operator's network. The Zephyr uses **PPP (Point-to-Point Protocol)** to connect to the GSM modem using UART. Note that some cellular modems have proprietary offloading support using AT commands, but usually those modems also support 3GPP standards and provide PPP connection to them. See GSM modem sample application how to setup Zephyr to use the GSM modem.

The GSM muxing, that is defined in **GSM 07.10**, and which allows mixing of AT commands and PPP traffic, is also supported in this version of Zephyr. One needs to enable **CONFIG_GSM_MUX** and **CONFIG_UART_MUX** configuration options to enable muxing.

zperf: Network Traffic Generator

**Overview**  zperf is a shell utility which allows to generate network traffic in Zephyr. The tool may be used to evaluate network bandwidth.

zperf is compatible with iPerf_2.0.5. Note that in newer iPerf versions, an error message like this is printed and the server reported statistics are missing.

```
LAST PACKET NOT RECEIVED!!!
```

zperf can be enabled in any application, a dedicated sample is also present in Zephyr. See zperf sample application for details.

**Sample Usage**  If Zephyr acts as a client, iPerf must be executed in server mode. For example, the following command line must be used for UDP testing:

```
$ iperf -s -l 1K -u -V -B 2001:db8::2
```

For TCP testing, the command line would look like this:

```
$ iperf -s -l 1K -V -B 2001:db8::2
```

In the Zephyr console, zperf can be executed as follows:

```
zperf udp upload 2001:db8::2 5001 10 1K 1M
```

For TCP the zperf command would look like this:

```
zperf tcp upload 2001:db8::2 5001 10 1K 1M
```

If the IP addresses of Zephyr and the host machine are specified in the config file, zperf can be started as follows:

```
zperf udp upload2 v6 10 1K 1M
```

or like this if you want to test TCP:

```
zperf tcp upload2 v6 10 1K 1M
```

If Zephyr is acting as a server, set the download mode as follows for UDP:

```
zperf udp upload2 v6 10 1K 1M
```

6.3. Networking
iPerf output can be limited by using the -b option if Zephyr is not able to receive all the packets in orderly manner.

### 6.3.7 Connection Manager

**Overview**

Connection Manager is a collection of optional Zephyr features that aim to allow applications to monitor and control connectivity (access to IP-capable networks) with minimal concern for the specifics of underlying network technologies.

Using Connection Manager, applications can use a single abstract API to control network association and monitor Internet access, and avoid excessive use of technology-specific boilerplate.

This allows an application to potentially support several very different connectivity technologies (for example, Wi-Fi and LTE) with a single codebase.

Applications can also use Connection Manager to generically manage and use multiple connectivity technologies simultaneously.

**Structure**  
Connection Manager is split into the following two subsystems:

- **Connectivity monitoring** (header file include/zephyr/net/conn mgr_monitoring.h) monitors all available Zephyr network interfaces (ifaces) and triggers network management events indicating when IP connectivity is gained or lost.

- **Connectivity control** (header file include/zephyr/net/conn mgr_connectivity.h) provides an abstract API for controlling iface network association.

**Connectivity monitoring**

Connectivity monitoring tracks all available ifaces (whether or not they support Connectivity control) as they transition through various operational states and acquire or lose assigned IP addresses.

Each available iface is considered ready if it meets the following criteria:

- The iface is admin-up
  - This means the iface has been instructed to become operational-up (ready for use). This is done by a call to net_if_up().
- The iface is oper-up
Fig. 18: A simplified view of how Connection Manager integrates with Zephyr and the application.

See here for a more detailed version.
This means the interface is completely ready for use; it is online, and if applicable, has associated with a network.

See `Network interface state management` for details.

- The iface has at least one assigned IP address
  - Both IPv4 and IPv6 addresses are acceptable. This condition is met as soon as one or both of these is assigned.
  - See `Network Interface` for details on iface IP assignment.

- The iface has not been ignored
  - Ignored ifaces are always treated as unready.
  - See `Ignoring ifaces` for more details.

**Note:** Typically, iface state and IP assignment are updated either by the iface's L2 implementation or bound connectivity implementation.

See `Implement iface state reporting` for details.

A ready iface ceases to be ready the moment any of the above conditions is lost.

When at least one iface is ready, the `NET_EVENT_L4_CONNECTED` network management event is triggered, and IP connectivity is said to be ready.

Afterwards, ifaces can become ready or unready without firing additional events, so long as there always remains at least one ready iface.

When there are no longer any ready ifaces left, the `NET_EVENT_L4_DISCONNECTED` network management event is triggered, and IP connectivity is said to be unready.

**Usage** Connectivity monitoring is enabled if the `CONFIG_NET_CONNECTION_MANAGER` Kconfig option is enabled.

To receive connectivity updates, create and register a listener for the `NET_EVENT_L4_CONNECTED` and `NET_EVENT_L4_DISCONNECTED` network management events:

```c
/* Callback struct where the callback will be stored */
struct net_mgmt_event_callback l4_callback;

/* Callback handler */
static void l4_event_handler(struct net_mgmt_event_callback *cb,
                             uint32_t event, struct net_if *iface)
{
    if (event == NET_EVENT_L4_CONNECTED) {
        LOG_INF("Network connectivity gained!");
    } else if (event == NET_EVENT_L4_DISCONNECTED) {
        LOG_INF("Network connectivity lost!");
    }

    /* Otherwise, it's some other event type we didn't register for. */
}

/* Call this before Connection Manager monitoring initializes */
static void my_application_setup(void)
{
    /* Configure the callback struct to respond to (at least) the L4_CONNECTED 
     * and L4_DISCONNECTED events.
     * ...
     */
}
```

(continues on next page)
* Note that the callback may also be triggered for events other than those specified here!
  *(See the net_mgmt documentation)*

    net_mgmt_init_event_callback(
        &l4_callback,
        l4_event_handler,
        NET_EVENT_L4_CONNECTED | NET_EVENT_L4_DISCONNECTED
    );

    /* Register the callback */
    net_mgmt_add_event_callback(&l4_callback);

See [Listening to network events](#) for more details on listening for net_mgmt events.

**Note:** To avoid missing initial connectivity events, you should register your listener(s) before Connection Manager monitoring initializes. See [Avoiding missed notifications](#) for strategies to ensure this.

**Avoiding missed notifications** Connectivity monitoring may trigger events immediately upon initialization.

If your application registers its event listeners after connectivity monitoring initializes, it is possible to miss this first wave of events, and not be informed the first time network connectivity is gained.

If this is a concern, your application should *register its event listeners* before connectivity monitoring initializes.

Connectivity monitoring initializes using the SYS_INIT APPLICATION initialization priority specified by the CONFIG_NET_CONNECTION_MANAGER_MONITOR_PRIORITY Kconfig option.

You can register your callbacks before this initialization by using SYS_INIT with an earlier initialization priority than this value, for instance priority 0:

    static int my_application_setup(void)
    {
        /* Register callbacks here */
        return 0;
    }

    SYS_INIT(my_application_setup, APPLICATION, 0);

If this is not feasible, you can instead request that connectivity monitoring resend the latest connectivity events at any time by calling `conn_mgr_mon_resend_status()`:

    static void my_late_application_setup(void)
    {
        /* Register callbacks here */

        /* Once done, request that events be re-triggered */
        conn_mgr_mon_resend_status();
    }

**Ignoring ifaces** Applications can request that ifaces be ignored by Connection Manager by calling `conn_mgr_ignore_iface()` with the iface to be ignored.

Alternatively, an entire *L2 implementation* can be ignored by calling `conn_mgr_ignore_l2()`.

---

6.3. Networking 2629
This has the effect of individually ignoring all the ifaces using that L2 implementation. While ignored, the iface is treated by Connection Manager as though it were unready for network traffic, no matter its actual state. This may be useful, for instance, if your application has configured one or more ifaces that cannot (or for whatever reason should not) be used to contact the wider Internet.

Bulk convenience functions optionally skip ignored ifaces.

See `conn_mgr_ignore_iface()` and `conn_mgr_watch_iface()` for more details.

Connectivity monitoring API Include header file include/zephyr/net/conn_mgr_monitoring.h to access these.

group conn_mgr
Connection Manager API.

Functions

void `conn_mgr_mon_resend_status`(void)
Resend either NET_L4_CONNECTED or NET_L4_DISCONNECTED depending on whether connectivity is currently available.

void `conn_mgr_ignore_iface`(struct `net_if` *iface)
Mark an iface to be ignored by conn_mgr.

Parameters

• iface – iface to be ignored.

void `conn_mgr_watch_iface`(struct `net_if` *iface)
Watch (stop ignoring) an iface.

Parameters

• iface – iface to no longer ignore.

bool `conn_mgr_is_iface_ignored`(struct `net_if` *iface)
Check whether the provided iface is currently ignored.

Parameters

• iface – The iface to check.

Return values

• true – if the iface is being ignored by conn_mgr.
• false – if the iface is being watched by conn_mgr.
void conn_mgr_ignore_l2(const struct net_l2 *l2)
Mark an L2 to be ignored by conn_mgr.
This is a wrapper for conn_mgr_ignore_iface that ignores all ifaces that use the L2.

Parameters
- l2 – L2 to be ignored.

void conn_mgr_watch_l2(const struct net_l2 *l2)
Watch (stop ignoring) an L2.
This is a wrapper for conn_mgr_watch_iface that watches all ifaces that use the L2.

Parameters
- l2 – L2 to watch.

Connectivity control

Many network interfaces require a network association procedure to be completed before being usable.
For such ifaces, connectivity control can provide a generic API to request network association (conn_mgr_if_connect()) and disassociation (conn_mgr_if_disconnect()). Network interfaces implement support for this API by binding themselves to a connectivity implementation.
Using this API, applications can associate with networks with minimal technology-specific boilerplate.

Connectivity control also provides the following additional features:
- Standardized persistence and timeout behaviors during association.
- Bulk functions for controlling the admin state and network association of all available ifaces simultaneously.
- Optional convenience automations for common connectivity actions.

Basic operation The following sections outline the basic operation of Connection Manager’s connectivity control.

Binding Before an iface can be commanded to associate or disassociate using Connection Manager, it must first be bound to a connectivity implementation. Binding is performed by the provider of the iface, not by the application (see Binding an iface to an implementation), and can be thought of as an extension of the iface declaration.

Once an iface is bound, all connectivity commands passed to it (such as conn_mgr_if_connect() or conn_mgr_if_disconnect()) will be routed to the corresponding implementation function in the connectivity implementation.

Note: To avoid inconsistent behavior, all connectivity implementations must adhere to the implementation guidelines.

Connecting Once a bound iface is admin-up (see Network interface state management), conn_mgr_if_connect() can be called to cause it to associate with a network.

If association succeeds, the connectivity implementation will mark the iface as operational-up (see Network interface state management).
If association fails unrecoverably, the *fatal error event* will be triggered.

You can configure an optional *timeout* for this process.

**Note:** The `conn_mgr_if_connect()` function is intentionally minimalistic, and does not take any kind of configuration. Each connectivity implementation should provide a way to pre-configure or automatically configure any required association settings or credentials. See *Allow connectivity pre-configuration* for details.

---

**Connection loss**  If connectivity is lost due to external factors, the connectivity implementation will mark the iface as operational-down.

Depending on whether *persistence* is set, the iface may then attempt to reconnect.

**Manual disconnection**  The application can also request that connectivity be intentionally abandoned by calling `conn_mgr_if_disconnect()`.

In this case, the connectivity implementation will disassociate the iface from its network and mark the iface as operational-down (see *Network interface state management*). A new connection attempt will not be initiated, regardless of whether persistence is enabled.

**Timeouts and Persistence**  Connection Manager requires that all connectivity implementations support the following standard key features:

- *Connection timeouts*
- *Connection persistence*

These features describe how ifaces should behave during connect and disconnect events. You can individually set them for each iface.

**Note:** It is left to connectivity implementations to successfully and accurately implement these two features as described below. See *Implementing timeouts and persistence* for more details from the connectivity implementation perspective.

---

**Connection Timeouts**  When `conn_mgr_if_connect()` is called on an iface, a connection attempt begins.

The connection attempt continues indefinitely until it succeeds, unless a timeout has been specified for the iface (using `conn_mgr_if_set_timeout()`).

In that case, the connection attempt will be abandoned if the timeout elapses before it succeeds. If this happens, the *timeout event* is raised.

**Connection Persistence**  Each iface also has a connection persistence setting that you can enable or disable by setting the `CONN_MGR_IF_PERSISTENT` flag with `conn_mgr_binding_set_flag()`.

This setting specifies how the iface should handle unintentional connection loss.

If persistence is enabled, any unintentional connection loss will initiate a new connection attempt, with a new timeout if applicable.

Otherwise, the iface will not attempt to reconnect.

**Note:** Persistence not does affect connection attempt behavior. Only the timeout setting affects this.
For instance, if a connection attempt on an iface times out, the iface will not attempt to reconnect, even if it is persistent.

Conversely, if there is not a specified timeout, the iface will try to connect forever until it succeeds, even if it is not persistent.

See *Persistence during connection attempts* for the equivalent implementation guideline.

**Control events** Connectivity control triggers *network management* events to inform the application of important state changes.

See Trigger connectivity control events for the corresponding connectivity implementation guideline.

**Fatal Error** The `NET_EVENT_CONN_IF_FATAL_ERROR` event is raised when an iface encounters an error from which it cannot recover (meaning any subsequent attempts to associate are guaranteed to fail, and all such attempts should be abandoned).

Handlers of this event will be passed a pointer to the iface for which the fatal error occurred. Individual connectivity implementations may also pass an application-specific data pointer.

**Timeout** The `NET_EVENT_CONN_IF_TIMEOUT` event is raised when an *iface association* attempt times out.

Handlers of this event will be passed a pointer to the iface that timed out attempting to associate.

**Listening for control events** You can listen for control events as follows:

```c
/* Declare a net_mgmt callback struct to store the callback */
struct net_mgmt_event_callback my_conn_evt_callback;

/* Declare a handler to receive control events */
static void my_conn_evt_handler(struct net_mgmt_event_callback *cb,
                                 uint32_t event, struct net_if *iface)
{
    if (event == NET_EVENT_CONN_IF_TIMEOUT)
    { /* Timeout occurred, handle it */
    } else if (event == NET_EVENT_CONN_IF_FATAL_ERROR)
    { /* Fatal error occurred, handle it */
    }

    /* Otherwise, it's some other event type we didn't register for. */
}

int main()
{
    /* Configure the callback struct to respond to (at least) the CONN_IF_TIMEOUT
     * and CONN_IF_FATAL_ERROR events. *
     * Note that the callback may also be triggered for events other than those specified here! *
     * (See the net_mgmt documentation) */
    net_mgmt_init_event_callback(
        &conn_mgr_conn_callback, conn_mgr_conn_handler,
        NET_EVENT_CONN_IF_TIMEOUT | NET_EVENT_CONN_IF_FATAL_ERROR
    );
}
```

(continues on next page)
See *Listening to network events* for more details on listening for net_mgmt events.

**Automated behaviors** There are a few actions related to connectivity that are (by default at least) performed automatically for the user:

**Automatic admin-up**

In Zephyr, ifaces are automatically taken admin-up (see *Network interface state management* for details on iface states) during initialization.

Applications can disable this behavior by setting the `NET_IF_NO_AUTO_START` interface flag with `net_if_flag_set()`.

**Automatic connect**

By default, Connection Manager will automatically connect any *bound* iface that becomes admin-up.

Applications can disable this by setting the `CONN_MGR_IF_NO_AUTO_CONNECT` connectivity flag with `conn_mgr_if_set_flag()`.

**Automatic admin-down**

By default, Connection Manager will automatically take any bound iface admin-down if it has given up on associating.

Applications can disable this for all ifaces by disabling the `CONFIG_NET_CONNECTION_MANAGER_AUTO_IF_DOWN` Kconfig option, or for individual ifaces by setting the `CONN_MGR_IF_NO_AUTO_DOWN` connectivity flag with `conn_mgr_if_set_flag()`.

**Connectivity control API** Include header file `include/zephyr/net/conn_mgr_connectivity.h` to access these.

*group* `conn_mgr_connectivity`

Connection Manager Connectivity API.

**Defines**

- `NET_EVENT_CONN_IF_TIMEOUT` net_mgmt event raised when a connection attempt times out

- `NET_EVENT_CONN_IF_FATAL_ERROR` net_mgmt event raised when a non-recoverable connectivity error occurs on an iface
**CONN_MGR_IF_NO_TIMEOUT**

Value to use with `conn_mgr_if_set_timeout` and `conn_mgr_conn_binding::timeout` to indicate no timeout.

**Enums**

**enum net_event_conn_cmd**

Values:

- enumerator `NET_EVENT_CONN_CMD_IF_TIMEOUT` = 1
- enumerator `NET_EVENT_CONN_CMD_IF_FATAL_ERROR`

**enum conn_mgr_if_flag**

Per-interface connectivity flags.

Values:

- enumerator `CONN_MGR_IF_PERSISTENT`  
  Persistent.  
  When set, indicates that the connectivity implementation bound to this iface should attempt to persist connectivity by automatically reconnecting after connection loss.

- enumerator `CONN_MGR_IF_NO_AUTO_CONNECT`  
  No auto-connect.  
  When set, `conn_mgr` will not automatically attempt to connect this iface when it reaches admin-up.

- enumerator `CONN_MGR_IF_NO_AUTO_DOWN`  
  No auto-down.  
  When set, `conn_mgr` will not automatically take the iface admin-down when it stops trying to connect, even if `CONFIG_NET_CONNECTION_MANAGER_AUTO_IF_DOWN` is enabled.

**Functions**

```c
int conn_mgr_if_connect(struct net_if *iface)
```

Connect interface.

If the provided `iface` has been bound to a connectivity implementation, initiate network connect/association.

Automatically takes the `iface` admin-up (by calling `net_if_up`) if it isn't already.

Non-Blocking.

**Parameters**

- `iface` – Pointer to network interface

**Return values**
• 0 – on success.
• -ESHUTDOWN – if the iface is not admin-up.
• -ENOTSUP – if the iface does not have a connectivity implementation.
• implementation-specific – status code otherwise.

```c
int conn_mgr_if_disconnect(struct net_if *iface)
```
Disconnect interface.

If the provided iface has been bound to a connectivity implementation, discon-
nect/dissociate it from the network, and cancel any pending attempts to con-
nect/associate.

Does nothing if the iface is currently admin-down.

**Parameters**
- iface – Pointer to network interface

**Return values**
- 0 – on success.
- -ENOTSUP – if the iface does not have a connectivity implementation.
- implementation-specific – status code otherwise.

```c
bool conn_mgr_if_is_bound(struct net_if *iface)
```
Check whether the provided network interface supports connectivity / has been bound
to a connectivity implementation.

**Parameters**
- iface – Pointer to the iface to check.

**Return values**
- true – if connectivity is supported (a connectivity implementation has
  been bound).
- false – otherwise.

```c
int conn_mgr_if_set_opt(struct net_if *iface, int optname, const void *optval, size_t optlen)
```
Set implementation-specific connectivity options.

If the provided iface has been bound to a connectivity implementation that supports
it, implementation-specific connectivity options related to the iface.

**Parameters**
- iface – Pointer to the network interface.
- optname – Integer value representing the option to set. The meaning of
  values is up to the `conn_mgr_conn_api` implementation. Some settings
  may affect multiple ifaces.
- optval – Pointer to the value to be assigned to the option.
- optlen – Length (in bytes) of the value to be assigned to the option.

**Return values**
- 0 – if successful.
- -ENOTSUP – if `conn_mgr_if_set_opt` not implemented by the iface.
- -ENOTBUFS – if optlen is too long.
- -EINVAL – if NULL optval pointer provided.
-ENOPROTOOPT – if the optname is not recognized.

implementation-specific – error code otherwise.

int conn_mgr_if_get_opt(struct net_if *iface, int optname, void *optval, size_t *optlen)

Get implementation-specific connectivity options.

If the provided iface has been bound to a connectivity implementation that supports
it, retrieves implementation-specific connectivity options related to the iface.

optlen will always be set to the total number of bytes written, regardless of whether
an error is returned, even if zero bytes were written.

Parameters

• iface – Pointer to the network interface.

• optname – Integer value representing the option to set. The meaning of
values is up to the conn_mgr_conn_api implementation. Some settings
may be shared by multiple ifaces.

• optval – Pointer to where the retrieved value should be stored.

• optlen – Pointer to length (in bytes) of the destination buffer available
for storing the retrieved value. If the available space is less than what is
needed, -ENOBUFS is returned. If the available space is invalid, -EINVAL
is returned.

Return values

• 0 – if successful.

• -ENOTSUP – if conn_mgr_if_get_opt is not implemented by the iface.

• -ENOBUFS – if retrieval buffer is too small.

• -EINVAL – if invalid retrieval buffer length is provided, or if NULL optval
or optlen pointer provided.

• -ENOPROTOOPT – if the optname is not recognized.

• implementation-specific – error code otherwise.

bool conn_mgr_if_get_flag(struct net_if *iface, enum conn_mgr_if_flag flag)

Check the value of connectivity flags.

If the provided iface is bound to a connectivity implementation, retrieves the value of
the specified connectivity flag associated with that iface.

Parameters

• iface – Pointer to the network interface to check.

• flag – The flag to check.

Returns

True if the flag is set, otherwise False. Also returns False if the provided
iface is not bound to a connectivity implementation, or the requested flag
doesn’t exist.

int conn_mgr_if_set_flag(struct net_if *iface, enum conn_mgr_if_flag flag, bool value)

Set the value of a connectivity flags.

If the provided iface is bound to a connectivity implementation, sets the value of the
specified connectivity flag associated with that iface.

Parameters

• iface – Pointer to the network interface to modify.
Return values

- **flag** – The flag to set.
- **value** – Whether the flag should be enabled or disabled.

### int conn_mgr_if_get_timeout(struct net_if *iface)

Get the connectivity timeout for an iface.

If the provided iface is bound to a connectivity implementation, retrieves the timeout setting in seconds for it.

**Parameters**

- **iface** – Pointer to the iface to check.

**Returns**

- **int** – The connectivity timeout value (in seconds) if it could be retrieved, otherwise **CONN_MGR_IF_NO_TIMEOUT**.

### int conn_mgr_if_set_timeout(struct net_if *iface, int timeout)

Set the connectivity timeout for an iface.

If the provided iface is bound to a connectivity implementation, sets the timeout setting in seconds for it.

**Parameters**

- **iface** – Pointer to the network interface to modify.
- **timeout** – The timeout value to set (in seconds). Pass **CONN_MGR_IF_NO_TIMEOUT** to disable the timeout.

**Return values**

- **0** – on success.
- **-ENOTSUP** – if the provided iface is not bound to a connectivity implementation.

**Bulk API** Connectivity control provides several bulk functions allowing all ifaces to be controlled at once.

You can restrict these functions to operate only on non-**ignored** ifaces if desired.

Include header file include/zephyr/net/conn_mgr_connectivity.h to access these.

**group conn_mgr_connectivity_bulk**

Connection Manager Bulk API.

**Functions**

**int conn_mgr_all_if_up(bool skip_ignored)**

Convenience function that takes all available ifaces into the admin-up state.

Essentially a wrapper for **net_if_up**.

**Parameters**
• skip_ignored -- If true, only affect ifaces that aren’t ignored by conn_mgr. Otherwise, affect all ifaces.

**Returns**

0 if all net_if_up calls returned 0, otherwise the first nonzero value returned by a net_if_up call.

```c
int conn_mgr_all_if_down(bool skip_ignored)
```

Convenience function that takes all available ifaces into the admin-down state.

Essentially a wrapper for `net_if_down`.

**Parameters**

• skip_ignored -- If true, only affect ifaces that aren’t ignored by conn_mgr. Otherwise, affect all ifaces.

**Returns**

0 if all net_if_down calls returned 0, otherwise the first nonzero value returned by a net_if_down call.

```c
int conn_mgr_all_if_connect(bool skip_ignored)
```

Convenience function that takes all available ifaces into the admin-up state, and connects those that support connectivity.

Essentially a wrapper for `net_if_up` and `conn_mgr_if_connect`.

**Parameters**

• skip_ignored -- If true, only affect ifaces that aren’t ignored by conn_mgr. Otherwise, affect all ifaces.

**Returns**

0 if all net_if_up and conn_mgr_if_connect calls returned 0, otherwise the first nonzero value returned by either net_if_up or conn_mgr_if_connect.

```c
int conn_mgr_all_if_disconnect(bool skip_ignored)
```

Convenience function that disconnects all available ifaces that support connectivity without putting them into admin-down state (unless auto-down is enabled for the iface).

Essentially a wrapper for `net_if_down`.

**Parameters**

• skip_ignored -- If true, only affect ifaces that aren’t ignored by conn_mgr. Otherwise, affect all ifaces.

**Returns**

0 if all net_if_up and conn_mgr_if_connect calls returned 0, otherwise the first nonzero value returned by either net_if_up or conn_mgr_if_connect.

### Connectivity Implementations

**Overview**

Connectivity implementations are technology-specific modules that allow specific Zephyr ifaces to support Connectivity Control. They are responsible for translating generic connectivity control API calls into hardware-specific operations. They are also responsible for implementing standardized persistence and timeout behaviors.

See the implementation guidelines for details on writing conformant connectivity implementations.
Architecture  The implementation API allows connectivity implementations to be defined at build time using CONNECT_MGR_CONN_DEFINE.

This creates a static instance of the conn_mgr_conn_impl struct, which then stores a reference to the passed in conn_mgr_conn_api struct (which should be populated with implementation callbacks).

Once defined, you can reference implementations by name and bind them to any unbound iface using CONNECT_MGR_BIND_CONN. Make sure not to accidentally bind two connectivity implementations to a single iface.

Once the iface is bound, connectivity control API functions can be called on the iface, and they will be translated to the corresponding implementation functions in conn_mgr_conn_api.

Binding an iface does not directly modify its iface struct.

Instead, an instance of conn_mgr_conn_binding is created and appended an internal iterable section.

This binding structure will contain a reference to the bound iface, the connectivity implementation it is bound to, as well as a pointer to a per-iface context pointer.

This iterable section can then be iterated over to find out what (if any) connectivity implementation has been bound to a given iface. This search process is used by most of the functions in the connectivity control API. As such, these functions should be called sparingly, due to their relatively high search cost.

A single connectivity implementation may be bound to multiple ifaces. See Do not instance implementations for more details.

Context Pointer  Since a single connectivity implementation may be shared by several Zephyr ifaces, each binding instantiates a context container (of configurable type) unique to that binding. Each binding is then instantiated with a reference to that container, which implementations can then use to access per-iface state information.

See also Do not access bindings without locking them and Do not instance implementations.

Defining an implementation  A connectivity implementation may be defined as follows:

```c
/* Create the API implementation functions */
int my_connect_impl(struct conn_mgr_conn_binding *const binding) {
    /* Cause your underlying technology to associate */
}
int my_disconnect_impl(struct conn_mgr_conn_binding *const binding) {
    /* Cause your underlying technology to disassociate */
}
void my_init_impl(struct conn_mgr_conn_binding *const binding) {
    /* Perform any required initialization for your underlying technology */
}

/* Declare the API struct */
static struct conn_mgr_conn_api my_impl_api = {
    .connect = my_connect_impl,
    .disconnect = my_disconnect_impl,
    .init = my_init_impl,
    /* ... so on */
};

/* Define the implementation (named MY_CONNECTIVITY_IMPL) */
CONNECT_MGR_CONN_DEFINE(MY_CONNECTIVITY_IMPL, &my_impl_api);
```
Fig. 19: A detailed view of how Connection Manager integrates with Zephyr and the application. See here for a simplified version.
Declaring an implementation publicly  Once defined, you can make a connectivity implementation available to other compilation units by declaring it (in a header file) as follows:

Listing 1: my_connectivity_header.h

```c
CONN_MGR_CONN_DECLARE_PUBLIC(MY_CONNECTIVITY_IMPL);
```

The header file that contains this declaration must be included in any compilation units that need to reference the implementation.

Declaring a context type  For `CONN_MGR_CONN_DEFINE` to work, you must declare a corresponding context pointer type. This is because all connectivity bindings contain a Context Pointer of their associated context pointer type.

If you are using `CONN_MGR_CONN_DECLARE_PUBLIC`, declare this type alongside the declaration:

Listing 2: my_connectivity_impl.h

```c
#define MY_CONNECTIVITY_IMPL_CTX_TYPE struct my_context_type *
CONN_MGR_CONN_DECLARE_PUBLIC(MY_CONNECTIVITY_IMPL);
```

Then, make sure to include the header file before calling `CONN_MGR_CONN_DEFINE`:

Listing 3: my_connectivity_impl.c

```c
#include "my_connectivity_impl.h"
CONN_MGR_CONN_DEFINE(MY_CONNECTIVITY_IMPL, &my_impl_api);
```

Otherwise, it is sufficient to simply declare the context pointer type immediately before the call to `CONN_MGR_CONN_DEFINE`:

```c
#define MYCONNECTIVITY_IMPL_CTX_TYPE struct my_context_type *
CONN_MGR_CONN_DEFINE(MY_CONNECTIVITY_IMPL, &my_impl_api);
```

Note:  Naming is important. Your context pointer type declaration must use the same name as your implementation declaration, but with _CTX_TYPE appended.

In the previous example, the context type is named `MY_CONNECTIVITY_IMPL_CTX_TYPE`, because `MY_CONNECTIVITY_IMPL` was used as the connectivity implementation name.

If your connectivity implementation does not need a context pointer, simply declare the type as void:

```c
#define MYCONNECTIVITY_IMPL_CTX_TYPE void *
```

Binding an iface to an implementation  A defined connectivity implementation may be bound to an iface by calling `CONN_MGR_BIND_CONN` anywhere after the iface's device definition:

```c
/* Define an iface */
NET_DEVICE_INIT(my_iface,
    /* ... the specifics here don't matter ... */
);  
```

(continues on next page)
/* Now bind MY_CONNECTIVITY_IMPL to that iface --
* the name used should match with the above
*/
CONN_MGR_BIND_CONN(my_iface, MY_CONNECTIVITY_IMPL);

**Connectivity implementation guidelines** Rather than implement all features centrally, Connection Manager relies on each connectivity implementation to implement many behaviors and features individually.

This approach allows Connection Manager to remain lean, and allows each connectivity implementation to choose the most appropriate approach to these behaviors for itself. However, it relies on trust that all connectivity implementations will faithfully implement the features that have been delegated to them.

To maintain consistency between all connectivity implementations, observe the following guidelines when writing your own implementation:

**Completely implement timeout and persistence** All connectivity implementations must offer complete support for **timeout and persistence**, such that a user can disable or enable these features, regardless of the inherent behavior of the underlying technology. In other words, no matter how the underlying technology behaves, your implementation must make it appear to the end user to behave exactly as specified in the *Timeouts and Persistence* section.

See *Implementing timeouts and persistence* for a detailed technical discussion on implementing timeouts and persistence.

**Conform to API specifications** Each implementation API function you implement should behave as-described in the corresponding connectivity control API function.

For example, your implementation of `conn_mgr_conn_api.connect` should conform to the behavior described for `conn_mgr_if_connect()`.

**Allow connectivity pre-configuration** Connectivity implementations should provide means for applications to pre-configure all necessary connection parameters (for example, network SSID, or PSK, if applicable), before the call to `conn_mgr_if_connect()`. It should not be necessary to provide this information as part of, or following the `conn_mgr_if_connect()` call, although implementations should await this information if it is not provided.

**Await valid connectivity configuration** If network association fails because the application pre-configured invalid connection parameters, or did not configure connection parameters at all, this should be treated as a network failure.

In other words, the connectivity implementation should not give up on the connection attempt, even if valid connection parameters have not been configured.

Instead, the connectivity implementation should asynchronously wait for valid connection parameters to be configured, either indefinitely, or until the configured **connectivity timeout** elapses.

**Implement iface state reporting** All connectivity implementations must keep bound iface state up to date.

To be specific:
• Set the iface to dormant, carrier-down, or both during binding init.
  – See Network interface state management for details regarding iface carrier and dormant states.

• Update dormancy and carrier state so that the iface is non-dormant and carrier-up whenever (and only when) association is complete and connectivity is ready.

• Set the iface either to dormant or to carrier-down as soon as interruption of service is detected.
  – It is acceptable to gate this behind a small timeout (separate from the connection timeout) for network technologies where service is commonly intermittent.

• If the technology also handles IP assignment, ensure those IP addresses are assigned to the iface.

Note: iface state updates do not necessarily need to be performed directly by connectivity implementations.
For instance:
• IP assignment is not necessary if DHCP is used for the iface.
• The connectivity implementation does not need to update iface dormancy if the underlying L2 implementation already does so.

Do not use iface state as implementation state  Zephyr ifaces may be accessed from other threads without respecting the binding mutex. As such, Zephyr iface state may change unpredictably during connectivity implementation callbacks. Therefore, do not base implementation behaviors on iface state. Keep iface state updated to reflect network availability, but do not read iface state for any purpose. If you need to keep track of dormancy or IP assignment, use a separate state variable stored in the context pointer.

Remain non-interferent  Connectivity implementations should not prevent applications from interacting directly with associated technology-specific APIs. In other words, it should be possible for an application to directly use your underlying technology without breaking your connectivity implementation. If exceptions to this are absolutely necessary, they should be constrained to specific API calls and should be documented.

Note: While connectivity implementations must not break, it is acceptable for implementations to have potentially unexpected behavior if applications attempt to directly control the association state. For instance, if an application directly instructs an underlying technology to disassociate, it would be acceptable for the connectivity implementation to interpret this as an unexpected connection loss and immediately attempt to re-associate.

Remain non-blocking  All connectivity implementation callbacks should be non-blocking. For instance, calls to conn_mgr_conn_api.connect should initiate a connection process and return immediately.
One exception is `conn_mgr_conn_api.init`, whose implementations are permitted to block. However, bear in mind that blocking during this callback will delay system init, so still consider offloading time-consuming tasks to a background thread.

**Make API immediately ready** Connectivity implementations must be ready to receive API calls immediately after `conn_mgr_conn_api.init`.

For instance, a call to `conn_mgr_conn_api.connect` must eventually lead to an association attempt, even if called immediately after `conn_mgr_conn_api.init`.

If the underlying technology cannot be made ready for connect commands immediately when `conn_mgr_conn_api.init` is called, calls to `conn_mgr_conn_api.connect` must be queued in a non-blocking fashion, and then executed later when ready.

**Do not store state information outside the context pointer** Connection Manager provides a context pointer to each binding.

Connectivity implementations should store all state information in this context pointer. The only exception is connectivity implementations that are meant to be bound to only a single iface. Such implementations may use statically declared state instead.

See also *Do not instance implementations*.

**Access ifaces only through binding structs** Do not use statically declared ifaces or externally acquire references to ifaces.

For example, do not use `net_if_get_default()` under the assumption that the bound iface will be the default iface.

Instead, always use the iface pointer provided by the relevant binding struct. See also *Do not access bindings without locking them*.

**Make implementations optional at compile-time** Connectivity implementations should provide a Kconfig option to enable or disable the implementation without affecting bound iface availability.

In other words, it should be possible to configure builds that include Connectivity Manager, as well as the iface that would have been bound to the implementation, but not the implementation itself, nor its binding.

**Do not instance implementations** Do not declare a separate connectivity implementation for every iface you are going to bind to.

Instead, bind one global connectivity implementation to all of your ifaces, and use the context pointer to store state relevant to individual ifaces.

See also *Do not access bindings without locking them* and *Access ifaces only through binding structs*.

**Do not access bindings without locking them** Bindings may be accessed and modified at random by multiple threads, so modifying or reading from a binding without first locking it may lead to unpredictable behavior.

This applies to all descendents of the binding, including anything in the context container.

Make sure to unlock the binding when you are done accessing it.
**Note:** A possible exception to this rule is if the resource in question is inherently thread-safe. However, be careful taking advantage of this exception. It may still be possible to create a race condition, for instance when accessing multiple thread-safe resources simultaneously. Therefore, it is recommended to simply always lock the binding, whether or not the resource being accessed is inherently thread-safe.

**Do not disable built-in features**  Do not attempt to prevent the use of built-in features (such as Timeouts and Persistence or Automated behaviors).

All connectivity implementations must fully support these features. Implementations must not attempt to force certain features to be always enabled or always disabled.

**Trigger connectivity control events**  Connectivity control network management events are not triggered automatically by Connection Manager.

Connectivity implementations must trigger these events themselves.

Trigger **NET_EVENT_CONN_CMD_IF_TIMEOUT** when a connection timeout occurs. See Timeout for details.

Trigger **NET_EVENT_CONN_IF_FATAL_ERROR** when a fatal (non-recoverable) connection error occurs. See Fatal Error for details.

See Network Management for details on firing network management events.

**Implementing timeouts and persistence**  First, see Timeouts and Persistence for a high-level description of the expected behavior of timeouts and persistence.

Connectivity implementations must fully conform to that description, regardless of the behavior of the underlying connectivity technology.

Sometimes this means writing extra logic in the connectivity implementation to fake certain behaviors. The following sections discuss various common edge-cases and nuances and how to handle them.

**Inherently persistent technologies**  If the underlying technology automatically attempts to reconnect or retry connection after connection loss or failure, the connectivity implementation must manually cancel such attempts when they are in conflict with timeout or persistence settings.

For example:

- If the underlying technology automatically attempts to reconnect after losing connection, and persistence is disabled for the iface, the connectivity implementation should immediately cancel this reconnection attempt.
- If a connection attempt times out on an iface whose underlying technology does not have a built-in timeout, the connectivity implementation must simulate a timeout by cancelling the connection attempt manually.

**Technology less that give up on connection attempts**  If the underlying technology has no mechanism to retry connection attempts, or would give up on them before the user-configured timeout, or would not reconnect after connection loss, the connectivity implementation must manually re-request connection to counteract these deviances.
• If your underlying technology is not persistent, you must manually trigger reconnect attempts when persistence is enabled.
• If your underlying technology does not support a timeout, you must manually cancel connection attempts if the timeout is enabled.
• If your underlying technology forces a timeout, you must manually trigger a new connection attempts if that timeout is shorter than the Connection Manager timeout.

**Technologies with association retry**  Many underlying technologies do not usually associate in a single attempt.

Instead, these underlying technologies may need to make multiple back-to-back association attempts in a row, usually with a small delay.

In these situations, the connectivity implementation should treat this series of back-to-back association sub-Attempts as a single unified connection attempt.

For instance, after a sub-attempt failure, persistence being disabled should not prevent further sub-attempts, since they all count as one single overall connection attempt. See also *Persistence during connection attempts*.

At which point a series of failed sub-attempts should be considered a failure of the connection attempt as a whole is up to each implementation to decide.

If the connection attempt crosses this threshold, but the configured timeout has not yet elapsed, or there is no timeout, sub-attempts should continue.

**Persistence during connection attempts**  Persistence should not affect any aspect of implementation behavior during a connection attempt. Persistence should only affect whether or not connection attempts are automatically triggered after a connection loss.

The configured timeout should fully determine whether connection retry should be performed.

**Implementation API**  Include header file include/zephyr/net/conn_mgr_connectivity_impl.h to access these.

Only for use by connectivity implementations.

*group conn_mgr_connectivity_impl*

Connection Manager Connectivity Implementation API.

**Defines**

**CONN_MGR_CONN_DEFINE**(conn_id, conn_api)

Define a conn_mgr connectivity implementation that can be bound to network devices.

**Parameters**

- conn_id – The name of the new connectivity implementation
- conn_api – A pointer to a conn_mgr_conn_api struct

**CONN_MGR_CONN_DECLARE_PUBLIC**(conn_id)

Helper macro to make a conn_mgr connectivity implementation publicly available.

**CONN_MGR_BIND_CONN_INST**(dev_id, inst, conn_id)

Associate a connectivity implementation with an existing network device instance.

**Parameters**
- **dev_id** – Network device id.
- **inst** – Network device instance.
- **conn_id** – Name of the connectivity implementation to associate.

`CONN_MGR_BIND_CONN(dev_id, conn_id)`  
Associate a connectivity implementation with an existing network device.

**Parameters**  
- **dev_id** – Network device id.
- **conn_id** – Name of the connectivity implementation to associate.

**Functions**

static inline struct *conn_mgr_conn_binding* `conn_mgr_if_get_binding`(<struct *net_if*> *iface*)  
Retrieves the conn_mgr binding struct for a provided iface if it exists.

Bindings for connectivity implementations with missing API structs are ignored.

For use only by connectivity implementations.

**Parameters**  
- **iface** -- bound network interface to obtain the binding struct for.

**Returns**  
struct conn_mgr_conn_binding* Pointer to the retrieved binding struct if it exists, NULL otherwise.

static inline void `conn_mgr_binding_lock`(<struct *conn_mgr_conn_binding*> *binding*)  
Lock the passed-in binding, making it safe to access.

Call this whenever accessing binding data, unless inside a `conn_mgr_conn_api` callback, where it is called automatically by conn_mgr.

Reentrant.

For use only by connectivity implementations.

**Parameters**  
- **binding** -- Binding to lock

static inline void `conn_mgr_binding_unlock`(<struct *conn_mgr_conn_binding*> *binding*)  
Unlocks the passed-in binding.

Call this after any call to `conn_mgr_binding_lock` once done accessing binding data.

Reentrant.

For use only by connectivity implementations.

**Parameters**  
- **binding** -- Binding to unlock

static inline void `conn_mgr_binding_set_flag`(<struct *conn_mgr_conn_binding*> *binding,  
enum conn_mgr_if_flag flag, bool value)  
Set the value of the specified connectivity flag for the provided binding.

Can be used from any thread or callback without calling `conn_mgr_binding_lock`.

For use only by connectivity implementations.

**Parameters**  
- **binding** -- The binding to check
• flag – The flag to check
• value – New value for the specified flag

static inline bool conn_mgr_binding_get_flag(struct conn_mgr_conn_binding *binding, enum conn_mgr_if_flag flag)

Check the value of the specified connectivity flag for the provided binding.
Can be used from any thread or callback without calling conn_mgr_binding_lock.
For use only by connectivity implementations

Parameters
• binding – The binding to check
• flag – The flag to check

Returns
bool The value of the specified flag

struct conn_mgr_conn_api
#include <conn_mgr_connectivity_impl.h> Connectivity Manager Connectivity API structure.
Used to provide generic access to network association parameters and procedures

Public Members

int (*connect)(struct conn_mgr_conn_binding *const binding)
When called, the connectivity implementation should start attempting to establish connectivity (association with a network) for the bound iface pointed to by if_conn->iface.
Must be non-blocking.
Called by conn_mgr_if_connect.

int (*disconnect)(struct conn_mgr_conn_binding *const binding)
When called, the connectivity implementation should disconnect (dissassociate), or stop any in-progress attempts to associate to a network, the bound iface pointed to by if_conn->iface.
Must be non-blocking.
Called by conn_mgr_if_disconnect.

void (*init)(struct conn_mgr_conn_binding *const binding)
Called once for each iface that has been bound to a connectivity implementation using this API.
Connectivity implementations should use this callback to perform any required per-bound-iface initialization.
Implementations may choose to gracefully handle invalid buffer lengths with partial writes, rather than raise errors, if deemed appropriate.

int (*set_opt)(struct conn_mgr_conn_binding *const binding, int optname, const void *optval, size_t optlen)
Implementation callback for conn mgr if set opt.
Used to set implementation-specific connectivity settings.
Calls to conn mgr if set opt on an iface will result in calls to this callback with the conn mgr conn binding struct bound to that iface.
It is up to the connectivity implementation to interpret optname. Options can be specific to the bound iface (pointed to by if_conn->iface), or can apply to the whole connectivity implementation.
See the description of conn mgr if set opt for more details. set opt implementations should conform to that description.
Implementations may choose to gracefully handle invalid buffer lengths with partial reads, rather than raise errors, if deemed appropriate.

```
int (*get_opt)(struct conn mgr conn binding *const binding, int optname, void *optval, size_t *optlen)
Implementation callback for conn mgr if get opt.
Used to retrieve implementation-specific connectivity settings.
Calls to conn mgr if get opt on an iface will result in calls to this callback with the conn mgr conn binding struct bound to that iface.
It is up to the connectivity implementation to interpret optname. Options can be specific to the bound iface (pointed to by if_conn->iface), or can apply to the whole connectivity implementation.
See the description of conn mgr if get opt for more details. get opt implementations should conform to that description.
```

```
struct conn mgr conn_impl
#include <conn mgr connectivity_impl.h> Connectivity Implementation struct.
Declares a conn mgr connectivity layer implementation with the provided API

Public Members

struct conn mgr conn api *api
The connectivity API used by the implementation.

struct conn mgr conn binding
#include <conn mgr connectivity_impl.h> Connectivity Manager network interface binding structure.
Binds a conn mgr connectivity implementation to an iface / network device. Stores per iface state for the connectivity implementation.

Generic connectivity state

uint32_t flags
Connectivity flags.
Public boolean state and configuration values supported by all bindings. See conn mgr if flag for options.
```
int timeout
Timeout (seconds)
Indicates to the connectivity implementation how long it should attempt to establish connectivity for during a connection attempt before giving up.
The connectivity implementation should give up on establishing connectivity after this timeout, even if persistence is enabled.
Set to `CONN_MGR_IF_NO_TIMEOUT` to indicate that no timeout should be used.

Public Members

struct net_if *iface
The network interface the connectivity implementation is bound to.

const struct conn_mgr_conn_impl *impl
The connectivity implementation the network device is bound to.

void *ctx
Pointer to private, per-iface connectivity context.

6.4 LoRa and LoRaWAN

6.4.1 Overview
LoRa (abbrev. for Long Range) is a proprietary low-power wireless communication protocol developed by the Semtech Corporation.
LoRa acts as the physical layer (PHY) based on the chirp spread spectrum (CSS) modulation technique.
LoRaWAN (for Long Range Wide Area Network) defines a networking layer on top of the LoRa PHY.
Zephyr provides APIs for LoRa to send raw data packets directly over the wireless interface as well as APIs for LoRaWAN to connect the end device to the internet through a gateway.
The Zephyr implementation is based on Semtech's LoRaMac-node library, which is included as a Zephyr module.
The LoRaWAN specification is published by the LoRa Alliance.

6.4.2 Configuration Options
LoRa PHY
Related configuration options can be found under `drivers/lora/Kconfig`.
- CONFIG_LORA
- CONFIG_LORA_SHELL
- CONFIG_LORA_INIT_PRIORITY
LoRaWAN

Related configuration options can be found under `subsys/lorawan/Kconfig`.

- `CONFIG_LORAWAN`
- `CONFIG_LORAWAN_SYSTEM_MAX_RX_ERROR`
- `CONFIG_LORAMAC_REGION_AS923`
- `CONFIG_LORAMAC_REGION_AU915`
- `CONFIG_LORAMAC_REGION_CN470`
- `CONFIG_LORAMAC_REGION_CN779`
- `CONFIG_LORAMAC_REGION_EU433`
- `CONFIG_LORAMAC_REGION_EU868`
- `CONFIG_LORAMAC_REGION_KR920`
- `CONFIG_LORAMAC_REGION_IN865`
- `CONFIG_LORAMAC_REGION_US915`
- `CONFIG_LORAMAC_REGION_RU864`

### 6.4.3 API Reference

**LoRa PHY**

**Related code samples**

**LoRa receive**

Receive packets in both synchronous and asynchronous mode using the LoRa radio.

**LoRa send**

Transmit a preconfigured payload every second using the LoRa radio.

**group lora_api**

**Enums**

```c
enum lora_signal_bandwidth
    LoRa signal bandwidth.
    Values:
    enumerator BW_125_KHZ = 0
    enumerator BW_250_KHZ
    enumerator BW_500_KHZ
```
enum lora_datarate
LoRa data-rate.

Values:

enumerator SF_6 = 6
enumerator SF_7
enumerator SF_8
enumerator SF_9
enumerator SF_10
enumerator SF_11
enumerator SF_12

enum lora_coding_rate
LoRa coding rate.

Values:

enumerator CR_4_5 = 1
enumerator CR_4_6 = 2
enumerator CR_4_7 = 3
enumerator CR_4_8 = 4

Functions

static inline int lora_config(const struct device *dev, struct lora_modem_config *config)
Configure the LoRa modem.

Parameters

• dev – LoRa device
• config – Data structure containing the intended configuration for the modem

Returns

0 on success, negative on error

static inline int lora_send(const struct device *dev, uint8_t *data, uint32_t data_len)
Send data over LoRa.

Note: This blocks until transmission is complete.
Parameters
- \texttt{dev} – LoRa device
- \texttt{data} – Data to be sent
- \texttt{data\_len} – Length of the data to be sent

Returns
0 on success, negative on error

\begin{verbatim}
static inline int lora_send_async(const struct device *dev, uint8_t *data, uint32_t data_len, struct k_poll_signal *async)
\end{verbatim}

Asynchronously send data over LoRa.

\textbf{Note:} This returns immediately after starting transmission, and locks the LoRa modem until the transmission completes.

Parameters
- \texttt{dev} – LoRa device
- \texttt{data} – Data to be sent
- \texttt{data\_len} – Length of the data to be sent
- \texttt{async} – A pointer to a valid and ready to be signaled struct \texttt{k\_poll\_signal}.
  (Note: if NULL this function will not notify the end of the transmission).

Returns
0 on success, negative on error

\begin{verbatim}
static inline int lora_recv(const struct device *dev, uint8_t *data, uint8_t size, k_timeout_t timeout, int16_t *rssi, int8_t *snr)
\end{verbatim}

Receive data over LoRa.

\textbf{Note:} This is a blocking call.

Parameters
- \texttt{dev} – LoRa device
- \texttt{data} – Buffer to hold received data
- \texttt{size} – Size of the buffer to hold the received data. Max size allowed is 255.
- \texttt{timeout} – Duration to wait for a packet.
- \texttt{rssi} – RSSI of received data
- \texttt{snr} – SNR of received data

Returns
Length of the data received on success, negative on error

\begin{verbatim}
static inline int lora_recv_async(const struct device *dev, lora_recv_cb cb)
\end{verbatim}

Receive data asynchronously over LoRa.

Receive packets continuously under the configuration previously setup by \texttt{lora\_config}.

Reception is cancelled by calling this function again with \texttt{cb} = NULL. This can be done within the callback handler.
Parameters

- **dev** – Modem to receive data on.
- **cb** – Callback to run on receiving data. If NULL, any pending asynchronous receptions will be cancelled.

Returns

0 when reception successfully setup, negative on error

```c
static inline int lora_test_cw(const struct device *dev, uint32_t frequency, int8_t tx_power, uint16_t duration)
```

Transmit an unmodulated continuous wave at a given frequency.

**Note:** Only use this functionality in a test setup where the transmission does not interfere with other devices.

Parameters

- **dev** – LoRa device
- **frequency** – Output frequency (Hertz)
- **tx_power** – TX power (dBm)
- **duration** – Transmission duration in seconds.

Returns

0 on success, negative on error

```c
struct lora_modem_config
```

#include <lora.h> Structure containing the configuration of a LoRa modem.

Public Members

```c
uint32_t frequency
```

Frequency in Hz to use for transceiving.

```c
enum lora_signal_bandwidth bandwidth
```

The bandwidth to use for transceiving.

```c
enum lora_datarate datarate
```

The data-rate to use for transceiving.

```c
enum lora_coding_rate coding_rate
```

The coding rate to use for transceiving.

```c
uint16_t preamble_len
```

Length of the preamble.

```c
int8_t tx_power
```

TX-power in dBm to use for transmission.
bool \texttt{tx}
   Set to true for transmission, false for receiving.

bool \texttt{iq\_inverted}
   Invert the In-Phase and Quadrature (IQ) signals.
   Normally this should be set to false. In advanced use-cases where a differentiation
   is needed between “uplink” and “downlink” traffic, the IQ can be inverted to create
   two different channels on the same frequency

bool \texttt{public\_network}
   Sets the sync-byte to use:

   \begin{itemize}
      \item false: for using the private network sync-byte
      \item true: for using the public network sync-byte
   \end{itemize}
   The public network sync-byte is only intended for advanced usage. Normally the private network sync-byte
   should be used for peer to peer communications and the LoRaWAN APIs should be used for interacting with a public network.

\textbf{LoRaWAN}

\underline{Related code samples}

\textbf{LoRaWAN class A device}
   Join a LoRaWAN network and send a message periodically.

\begin{verbatim}
group \textit{lorawan\_api}

   Defines

   LW\_RECV\_PORT\_ANY

   Enums

   enum \textit{lorawan\_class}
      LoRaWAN class types.
      \textbf{Values}:

      \begin{itemize}
         \item \texttt{LORAWAN\_CLASS\_A} = 0x00
         \item \texttt{LORAWAN\_CLASS\_B} = 0x01
         \item \texttt{LORAWAN\_CLASS\_C} = 0x02
      \end{itemize}
\end{verbatim}
enum lorawan_act_type
    LoRaWAN activation types.
    Values:
        enumerator LORAWAN_ACT_OTAA = 0
        enumerator LORAWAN_ACT_ABP

enum lorawan_datarate
    LoRaWAN datarate types.
    Values:
        enumerator LORAWAN_DR_0 = 0
        enumerator LORAWAN_DR_1
        enumerator LORAWAN_DR_2
        enumerator LORAWAN_DR_3
        enumerator LORAWAN_DR_4
        enumerator LORAWAN_DR_5
        enumerator LORAWAN_DR_6
        enumerator LORAWAN_DR_7
        enumerator LORAWAN_DR_8
        enumerator LORAWAN_DR_9
        enumerator LORAWAN_DR_10
        enumerator LORAWAN_DR_11
        enumerator LORAWAN_DR_12
        enumerator LORAWAN_DR_13
        enumerator LORAWAN_DR_14
        enumerator LORAWAN_DR_15
enum lorawan_region
LoRaWAN region types.

Values:

eumerator LORAWAN_REGION_AS923

eumerator LORAWAN_REGION_AU915

eumerator LORAWAN_REGION_CN470

eumerator LORAWAN_REGION_CN779

eumerator LORAWAN_REGION_EU433

eumerator LORAWAN_REGION_EU868

eumerator LORAWAN_REGION_KR920

eumerator LORAWAN_REGION_IN865

eumerator LORAWAN_REGION_US915

eumerator LORAWAN_REGION_RU864

enum lorawan_message_type
LoRaWAN message types.

Values:

eumerator LORAWAN_MSG_UNCONFIRMED = 0

eumerator LORAWAN_MSG_CONFIRMED

Functions

int lorawan_set_battery_level_callback(uint8_t (*battery_lvl_cb)(void))
Add battery level callback function.

Provide the LoRaWAN stack with a function to be called whenever a battery level needs to be read. As per LoRaWAN specification the callback needs to return “0: node is connected to an external power source,
1..254: battery level, where 1 is the minimum and 254 is the maximum value,
255: the node was not able to measure the battery level”

Should no callback be provided the lorawan backend will report 255.

Parameters
- **battery_lvl_cb** – Pointer to the battery level function

**Returns**
0 if successful, negative errno code if failure

```c
void lorawan_register_downlink_callback(struct lorawan_downlink_cb *cb)
```

Register a callback to be run on downlink packets.

**Parameters**
- **cb** – Pointer to structure containing callback parameters

```c
void lorawan_register_dr_changed_callback(void (*dr_cb)(enum lorawan_datarate))
```

Register a callback to be called when the datarate changes.

The callback is called once upon successfully joining a network and again each time the datarate changes due to ADR.

The callback function takes one parameter:
- **dr** - updated datarate

**Parameters**
- **dr_cb** – Pointer to datarate update callback

```c
int lorawan_join(const struct lorawan_join_config *config)
```

Join the LoRaWAN network.

Join the LoRaWAN network using OTAA or AWB.

**Parameters**
- **config** – Configuration to be used

**Returns**
0 if successful, negative errno code if failure

```c
int lorawan_start(void)
```

Start the LoRaWAN stack.

This function need to be called before joining the network.

**Returns**
0 if successful, negative errno code if failure

```c
int lorawan_send(uint8_t port, uint8_t *data, uint8_t len, enum lorawan_message_type type)
```

Send data to the LoRaWAN network.

Send data to the connected LoRaWAN network.

**Parameters**
- **port** – Port to be used for sending data. Must be set if the payload is not empty.
- **data** – Data buffer to be sent
- **len** – Length of the buffer to be sent. Maximum length of this buffer is 255 bytes but the actual payload size varies with region and datarate.
- **type** – Specifies if the message shall be confirmed or unconfirmed. Must be one of lorawan_message_type.

**Returns**
0 if successful, negative errno code if failure
The Zephyr Project Documentation, Release 3.5.99

int lorawan_set_class(enum lorawan_class dev_class)

Set the current device class.

Parameters
- dev_class – New device class

Returns
0 if successful, negative errno code if failure

int lorawan_set_conf_msg_tries(uint8_t tries)

Set the number of tries used for transmissions.

Parameters
- tries – Number of tries to be used

Returns
0 if successful, negative errno code if failure

void lorawan_enable_adr(bool enable)

Enable Adaptive Data Rate (ADR)

Parameters
- enable – Enable or Disable adaptive data rate.

int lorawan_set_datarate(enum lorawan_datarate dr)

Set the default data rate.

Parameters
- dr – Data rate used for transmissions

Returns
0 if successful, negative errno code if failure

enum lorawan_datarate lorawan_get_min_datarate(void)

Get the minimum possible datarate.

The minimum possible datarate may change in response to a TxParamSetupReq command from the network server.

Returns
Minimum possible data rate

void lorawan_get_payload_sizes(uint8_t *max_next_payload_size, uint8_t *max_payload_size)

Get the current payload sizes.

Query the current payload sizes. The maximum payload size varies with datarate, while the current payload size can be less due to MAC layer commands which are inserted into uplink packets.

Parameters
- max_next_payload_size – Maximum payload size for the next transmission
- max_payload_size – Current payload size
• `max_payload_size` – Maximum payload size for this datarate

```c
int lorawan_set_region(enum lorawan_region region)
```

Set the region and frequency to be used.

Control the LoRa region and frequency settings. This should be called before `lorawan_start()`. If you only have support for a single region selected via Kconfig, this function does not need to be called at all.

**Parameters**

• `region` – The region to be selected

**Returns**

0 if successful, negative errno otherwise

```c
struct lorawan_join_otaa
```

#include `<lorawan.h>` LoRaWAN join parameters for over-the-Air activation (OTAA)

Note that all of the fields use LoRaWAN 1.1 terminology.

All parameters are optional if a secure element is present in which case the values stored in the secure element will be used instead.

**Public Members**

- `join_eui` – Join EUI.
- `nwk_key` – Network Key.
- `app_key` – Application Key.
- `dev_nonce` – Device Nonce.

Starting with LoRaWAN 1.0.4 the DevNonce must be monotonically increasing for each OTAA join with the same EUI. The DevNonce should be stored in non-volatile memory by the application.

```c
struct lorawan_join_abp
```

#include `<lorawan.h>` LoRaWAN join parameters for activation by personalization (ABP)

**Public Members**

- `dev_addr` – Device address on the network.
- `app_skey` – Application session key.
uint8_t *nwk_skey
    Network session key.

uint8_t *app_eui
    Application EUI.

struct lorawan_join_config
    #include <lorawan.h> LoRaWAN join parameters.

Public Members

uint8_t *dev_eui
    Device EUI.
    Optional if a secure element is present.

enum lorawan_act_type mode
    Activation mode.

struct lorawan_downlink_cb
    #include <lorawan.h> LoRaWAN downlink callback parameters.

Public Members

uint16_t port
    Port to handle messages for.
    • Port 0: TX packet acknowledgements
    • Ports 1-255: Standard downlink port
    • LW_RECV_PORT_ANY: All downlinks

void (*cb)(uint8_t port, bool data_pending, int16_t rssi, int8_t snr, uint8_t len, const uint8_t *data)
    Callback function to run on downlink data.

Note: Callbacks are run on the system workqueue, and should therefore be as short as possible.

Param port
    Port message was sent on

Param data_pending
    Network server has more downlink packets pending

Param rssi
    Received signal strength in dBm

Param snr
    Signal to Noise ratio in dBm

Param len
    Length of data received, will be 0 for ACKs
Param data
Data received, will be NULL for ACKs

sys_snodo_t node
Node for callback list.

6.5 USB

USB device support

6.5.1 USB device support

- Overview
- Supported USB classes
  - Audio
  - Bluetooth HCI USB transport layer
  - CDC ACM
    - Console over CDC ACM UART
    - CDC ACM UART as backend
  - DFU
  - USB Human Interface Devices (HID) support
  - Mass Storage Class
  - Networking
- Binary Device Object Store (BOS) support
- Implementing a non-standard USB class
- Testing over USPIP in native_posix
- USB Vendor and Product identifiers

Overview

The USB device stack is a hardware independent interface between USB device controller driver and USB device class drivers or customer applications. It is a port of the LPCUSB device stack and has been modified and expanded over time. It provides the following functionalities:

- Uses the USB device controller driver API provided by the device controller drivers to inter-
  act with the USB device controller.

- Responds to standard device requests and returns standard descriptors, essentially han-
  dling 'Chapter 9' processing, specifically the standard device requests in table 9-3 from the
  universal serial bus specification revision 2.0.

- Provides a programming interface to be used by USB device classes or customer applica-
  tions. The APIs is described in include/zephyr/usb/usb_device.h

The device stack and USB device controller driver API have some limitations, such as not being able to support more than one controller instance at runtime and only supporting one USB device
configuration. We are actively working on new USB support, which means we will continue to maintain the device stack described here until all supported USB classes are ported, but do not expect any new features or enhancements.

**Supported USB classes**

**Audio**  There is an experimental implementation of the Audio class. It follows specification version 1.00 (bcdcADC: 0x0100) and supports synchronous synchronisation type only. See usb-audio-headphones-microphone and usb-audio-headset samples for reference.

**Bluetooth HCI USB transport layer**  Bluetooth HCI USB transport layer implementation uses HCI RAW channel to expose HCI interface to the host. It is not fully in line with the description in the Bluetooth specification and consists only of an interface with the endpoint configuration:

- HCI commands through control endpoint (host-to-device only)
- HCI events through interrupt IN endpoint
- ACL data through one bulk IN and one bulk OUT endpoints

A second interface for the voice channels has not been implemented as there is no support for this type in Bluetooth. It is not a big problem under Linux if HCI USB transport layer is the only interface that appears in the configuration, the btusb driver would not try to claim a second (isochronous) interface. The consequence is that if HCI USB is used in a composite configuration and is the first interface, then the Linux btusb driver will claim both the first and the next interface, preventing other composite functions from working. Because of this problem, HCI USB should not be used in a composite configuration. This problem is fixed in the implementation for new USB support.

**CDC ACM**  The CDC ACM class is used as backend for different subsystems in Zephyr. However, its configuration may not be easy for the inexperienced user. Below is a description of the different use cases and some pitfalls.

The interface for CDC ACM user is Universal Asynchronous Receiver-Transmitter (UART) driver API. But there are two important differences in behavior to a real UART controller:

- Data transfer is only possible after the USB device stack has been initialized and started, until then any data is discarded
- If device is connected to the host, it still needs an application on the host side which requests the data
- The CDC ACM poll out implementation follows the API and blocks when the TX ring buffer is full only if the hw-flow-control property is enabled and called from a non-ISR context.

The devicetree compatible property for CDC ACM UART is zephyr,cdc-acm-uart. CDC ACM support is automatically selected when USB device support is enabled and a compatible node in the devicetree sources is present. If necessary, CDC ACM support can be explicitly disabled by CONFIG_USB_CDC_ACM. About four CDC ACM UART instances can be defined and used, limited by the maximum number of supported endpoints on the controller.

CDC ACM UART node is supposed to be child of a USB device controller node. Since the designation of the controller nodes varies from vendor to vendor, and our samples and application should be as generic as possible, the default USB device controller is usually assigned an zephyr_udc0 node label. Often, CDC ACM UART is described in a devicetree overlay file and looks like this:
Samples usb-cdc-acm and usb-hid-cdc have similar overlay files. And since no special properties are present, it may seem overkill to use devicetree to describe CDC ACM UART. The motivation behind using devicetree is the easy interchangeability of a real UART controller and CDC ACM UART in applications.

**Console over CDC ACM UART** With the CDC ACM UART node from above and zephyr,console property of the chosen node, we can describe that CDC ACM UART is to be used with the console. A similar overlay file is used by the usb-cdc-acm-console sample.

```c
/ {
    chosen {
        zephyr,console = &cdc_acm_uart0;
    };
}
&zephyr_udc0 {
    cdc_acm_uart0: cdc_acm_uart0 {
        compatible = "zephyr,cdc-acm-uart";
        label = "CDC_ACM_0";
    };
};

Before the application uses the console, it is recommended to wait for the DTR signal:

```c
const struct device *const dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_console));
uint32_t dtr = 0;
if (usb_enable(NULL)) {
    return;
}
while (!dtr) {
    uart_line_ctrl_get(dev, UART_LINE_CTRL_DTR, &dtr);
    k_sleep(K_MSEC(100));
}
printk("nuqne\n");
```

**CDC ACM UART as backend** As for the console sample, it is possible to configure CDC ACM UART as backend for other subsystems by setting *Chosen nodes* properties.

List of few Zephyr specific chosen properties which can be used to select CDC ACM UART as backend for a subsystem or application:

- zephyr,bt-c2h-uart used in Bluetooth, for example see bluetooth-hci-uart-sample
- zephyr,ot-uart used in OpenThread, for example see coprocessor
- zephyr,shell-uart used by shell for serial backend, for example see samples/subsys/shell/shell_module
- zephyr,uart-mcumgr used by smp-svr sample

6.5. USB
DFU  USB DFU class implementation is tightly coupled to Device Firmware Upgrade and MCU-Boot API. This means that the target platform must support the Flash Image API.

See usb-dfu sample for reference.

**USB Human Interface Devices (HID) support**  HID support abuses Device Driver Model simply to allow applications to use the device_get_binding(). Note that there is no HID device API as such, instead the interface is provided by hid_ops. The default instance name is HID_n, where n can be {0, 1, 2, ...} depending on the CONFIG_USB_HID_DEVICE_COUNT.

Each HID instance requires a HID report descriptor. The interface to the core and the report descriptor must be registered using usb_hid_register_device().

As the USB HID specification is not only used by the USB subsystem, the USB HID API reference is split into two parts, Human Interface Devices (HID) and USB HID Class API. HID helper macros from Human Interface Devices (HID) should be used to compose a HID report descriptor. Macro names correspond to those used in the USB HID specification.

For the HID class interface, an IN interrupt endpoint is required for each instance, an OUT interrupt endpoint is optional. Thus, the minimum implementation requirement for hid_ops is to provide int_in_ready callback.

```c
#define REPORT_ID 1
static bool configured;
static const struct device *hdev;

static void int_in_ready_cb(const struct device *dev)
{
    static uint8_t report[2] = {REPORT_ID, 0};
    if (hid_int_ep_write(hdev, report, sizeof(report), NULL)) {
        LOG_ERR("Failed to submit report");
    } else {
        report[1]++;
    }
}

static void status_cb(enum usb_dc_status_code status, const uint8_t *param)
{
    if (status == USB_DC_RESET) {
        configured = false;
    }
    if (status == USB_DC_CONFIGURED && !configured) {
        int_in_ready_cb(hdev);
        configured = true;
    }
}

static const uint8_t hid_report_desc[] = {
    HID_USAGE_PAGE(HID_USAGE_GEN_DESKTOP),
    HID_USAGE(HID_USAGE_GEN_DESKTOP_UNDEFINED),
    HID_COLLECTION(HID_COLLECTION_APPLICATION),
    HID_LOGICAL_MIN8(0x00),
    HID_LOGICAL_MAX16(0xFF, 0x00),
    HID_REPORT_ID(REPORT_ID),
    HID_REPORT_SIZE(8),
    HID_REPORT_COUNT(1),
    HID_USAGES(HID_USAGE_GEN_DESKTOP_UNDEFINED),
    HID_INPUT(0x02),
    HID_END_COLLECTION,
};
```

(continues on next page)
static const struct hid_ops my_ops = {
    .int_in_ready = int_in_ready_cb,
};

int main(void)
{
    int ret;

    hdev = device_get_binding("HID_0");
    if (hdev == NULL) {
        return -ENODEV;
    }

    usb_hid_register_device(hdev, hid_report_desc, sizeof(hid_report_desc), &my_ops);

    ret = usb_hid_init(hdev);
    if (ret) {
        return ret;
    }

    return usb_enable(status_cb);
}

If the application wishes to receive output reports via the OUT interrupt endpoint, it must enable CONFIG_ENABLE_HID_INT_OUT_EP and provide int_out_ready callback. The disadvantage of this is that Kconfig options such as CONFIG_ENABLE_HID_INT_OUT_EP or CONFIG_HID_INTERRUPT_EP_MPS apply to all instances. This design issue will be fixed in the HID class implementation for the new USB support.

See usb-hid or usb-hid-mouse sample for reference.

**Mass Storage Class**  
MSC follows Bulk-Only Transport specification and uses Disk Access to access and expose a RAM disk, emulated block device on a flash partition, or SD Card to the host. Only one disk instance can be exported at a time.

The disc to be used by the implementation is set by the CONFIG_MASS_STORAGE_DISK_NAME and should be the same as the name used by the disc access driver that the application wants to expose to the host. SD card disk drivers use options CONFIG_MMC_VOLUME_NAME or CONFIG_SDMMC_VOLUME_NAME, and flash and RAM disk drivers use node property disk-name to set the disk name.

For the emulated block device on a flash partition, the flash partition and flash disk to be used must be described in the devicetree. If a storage partition is already described at the board level, application devicetree overlay must also delete storage_partition node first. CONFIG_MASS_STORAGE_DISK_NAME should be the same as disk-name property.

```c
#delete-node/ &storage_partition;

&mx25r64 {
    partitions {
        compatible = "fixed-partitions";
        #address-cells = <1>;
        #size-cells = <1>;

        storage_partition: partition00 {
            label = "storage";
            reg = <0x00000000 0x00200000>;
        };
    }
```
The disk-property “NAND” may be confusing, but it is simply how some file systems identifies the disc. Therefore, if the application also accesses the file system on the exposed disc, default names should be used, see usb-mass sample for reference.

Networking There are three implementations that work in a similar way, providing a virtual Ethernet connection between the remote (USB host) and Zephyr network support.

- CDC ECM class, enabled with CONFIG_USB_DEVICE_NETWORK_ECM
- CDC EEM class, enabled with CONFIG_USB_DEVICE_NETWORK_EEM
- RNDIS support, enabled with CONFIG_USB_DEVICE_NETWORK_RNDIS

See zperf or socket-dumb-http-server for reference. Typically, users will need to add a configuration file overlay to the build, such as samples/net/zperf/overlay-netusb.conf.

Applications using RNDIS support should enable CONFIG_USB_DEVICE_OS_DESC for a better user experience on a host running Microsoft Windows OS.

Binary Device Object Store (BOS) support

BOS handling can be enabled with Kconfig option CONFIG_USB_DEVICE_BOS. This option also has the effect of changing device descriptor bcdUSB to 0210. The application should register descriptors such as Capability Descriptor using usb_bos_register_cap(). Registered descriptors are added to the root BOS descriptor and handled by the stack.

See webusb sample for reference.

Implementing a non-standard USB class

The configuration of USB device is done in the stack layer.

The following structures and callbacks need to be defined:

- Part of USB Descriptor table
- USB Endpoint configuration table
- USB Device configuration structure
- Endpoint callbacks
- Optionally class, vendor and custom handlers

For example, for the USB loopback application:
```
struct usb_loopback_config {
    struct usb_if_descriptor if0;
    struct usb_ep_descriptor if0_out_ep;
    struct usb_ep_descriptor if0_in_ep;
} __packed;

USBD_CLASS_DESCR_DEFINE(primary, 0) struct usb_loopback_config loopback_cfg = {
    /* Interface descriptor 0 */
    .if0 = {
        .bLength = sizeof(struct usb_if_descriptor),
        .bDescriptorType = USB_DESC_INTERFACE,
        .bInterfaceNumber = 0,
        .bAlternateSetting = 0,
        .bNumEndpoints = 2,
        .bInterfaceClass = USB_BCC_VENDOR,
        .bInterfaceSubClass = 0,
        .bInterfaceProtocol = 0,
        .iInterface = 0,
    },

    /* Data Endpoint OUT */
    .if0_out_ep = {
        .bLength = sizeof(struct usb_ep_descriptor),
        .bDescriptorType = USB_DESC_ENDPOINT,
        .bEndpointAddress = LOOPBACK_OUT_EP_ADDR,
        .bmAttributes = USB_DC_EP_BULK,
        .wMaxPacketSize = sys_cpu_to_le16(CONFIG_LOOPBACK_BULK_EP_MPS),
        .bInterval = 0x00,
    },

    /* Data Endpoint IN */
    .if0_in_ep = {
        .bLength = sizeof(struct usb_ep_descriptor),
        .bDescriptorType = USB_DESC_ENDPOINT,
        .bEndpointAddress = LOOPBACK_IN_EP_ADDR,
        .bmAttributes = USB_DC_EP_BULK,
        .wMaxPacketSize = sys_cpu_to_le16(CONFIG_LOOPBACK_BULK_EP_MPS),
        .bInterval = 0x00,
    },
};

Endpoint configuration:
```
```
static struct usb_ep_cfg_data ep_cfg[] = {
    { .ep_cb = loopback_out_cb, .ep_addr = LOOPBACK_OUT_EP_ADDR, },
    { .ep_cb = loopback_in_cb, .ep_addr = LOOPBACK_IN_EP_ADDR, },
};

USB Device configuration structure:
```
```
USBD_DEFINE_CFG_DATA(loopback_config) = {
    .usb_device_description = NULL,
    .interface_config = loopback_interface_config,  
    .interface_descriptor = &loopback_cfg.if0,     
    .cb_usb_status = loopback_status_cb,          
    .interface = {
(continues on next page)```
.class_handler = NULL,
.custom_handler = NULL,
.vendor_handler = loopback_vendor_handler,
},
.num_endpoints = ARRAY_SIZE(ep_cfg),
.endpoint = ep_cfg,
};

The vendor device requests are forwarded by the USB stack core driver to the class driver through the registered vendor handler.

For the loopback class driver, loopback_vendor_handler() processes the vendor requests:

```c
static int loopback_vendor_handler(struct usb_setup_packet *setup,
    int32_t *len, uint8_t **data)
{
    LOG_DBG("Class request: bRequest 0x%x bmRequestType 0x%x len %d",
        setup->bRequest, setup->bmRequestType, *len);
    if (setup->RequestType.recipient != USB_REQTYPE_RECIPIENT_DEVICE) {
        return -ENOTSUP;
    }

    if (usb_reqtype_is_to_device(setup) &&
        setup->bRequest == 0x5b) {
        LOG_DBG("Host-to-Device, data %p", *data);
        /*
         * Copy request data in loopback_buf buffer and reuse
         * it later in control device-to-host transfer.
         */
        memcpy(loopback_buf, *data,
            MIN(sizeof(loopback_buf), setup->wLength));
        return 0;
    }

    if ((usb_reqtype_is_to_host(setup)) &&
        (setup->bRequest == 0x5c)) {
        LOG_DBG("Device-to-Host, wLength %d, data %p", 
            setup->wLength, *data);
        *data = loopback_buf;
        *len = MIN(sizeof(loopback_buf), setup->wLength);
        return 0;
    }

    return -ENOTSUP;
}
```

The class driver waits for the USB_DC_CONFIGURED device status code before transmitting any data.

**Testing over USPIP in native_posix**

A virtual USB controller implemented through USBIP might be used to test the USB device stack. Follow the general build procedure to build the USB sample for the native_posix configuration. Run built sample with:

```
wst build -t run
```

In a terminal window, run the following command to list USB devices:
In a terminal window, run the following command to attach the USB device:

```bash
$ sudo usbip attach -r localhost -b 1-1
```

The USB device should be connected to your Linux host, and verified with the following commands:

```bash
$ sudo usbip port
```

### USB Vendor and Product identifiers

The USB Vendor ID for the Zephyr project is 0x2FE3. This USB Vendor ID must not be used when a vendor integrates Zephyr USB device support into its own product.

Each USB sample has its own unique Product ID. The USB maintainer, if one is assigned, or otherwise the Zephyr Technical Steering Committee, may allocate other USB Product IDs based on well-motivated and documented requests.

The following Product IDs are currently used:

<table>
<thead>
<tr>
<th>Sample</th>
<th>PID</th>
</tr>
</thead>
<tbody>
<tr>
<td>usb-cdc-acm</td>
<td>0x0001</td>
</tr>
<tr>
<td>usb-cdc-acm-composite</td>
<td>0x0002</td>
</tr>
<tr>
<td>usb-hid-cdc</td>
<td>0x0003</td>
</tr>
<tr>
<td>usb-cdc-acm-console</td>
<td>0x0004</td>
</tr>
<tr>
<td>usb-dfu</td>
<td>0x0005</td>
</tr>
<tr>
<td>usb-hid</td>
<td>0x0006</td>
</tr>
<tr>
<td>usb-hid-mouse</td>
<td>0x0007</td>
</tr>
<tr>
<td>usb-mass</td>

<td>0x000D</td>
</tr>
</tbody>
</table>

The USB device descriptor field `bcdDevice` (Device Release Number) represents the Zephyr kernel major and minor versions as a binary coded decimal value.

### 6.5.2 USB device support APIs
USB device controller driver API

The USB device controller driver API is described in include/zephyr/drivers/usb/usb_dc.h and sometimes referred to as the usb_dc API.

This API has some limitations by design, it does not follow Device Driver Model and is being replaced by a new UDC driver API.

API reference

group _usb_device_controller_api

USB Device Controller API.

Typedefs

typedef void (*usb_dc_ep_callback)(uint8_t ep, enum usb_dc_ep_cb_status_code cb_status)

Callback function signature for the USB Endpoint status.

typedef void (*usb_dc_status_callback)(enum usb_dc_status_code cb_status, const uint8_t *param)

Callback function signature for the device.

 Enums

enum usb_dc_status_code

USB Driver Status Codes.

Status codes reported by the registered device status callback.

Values:

enumerator USB_DC_ERROR

USB error reported by the controller.

enumerator USB_DC_RESET

USB reset.

enumerator USB_DC_CONNECTED

USB connection established, hardware enumeration is completed.

enumerator USB_DC_CONFIGURED

USB configuration done.

enumerator USB_DC_DISCONNECTED

USB connection lost.

enumerator USB_DC_SUSPEND

USB connection suspended by the HOST.
enumerator **USB_DC_RESUME**
   USB connection resumed by the HOST.

enumerator **USB_DC_INTERFACE**
   USB interface selected.

enumerator **USB_DC_SET_HALT**
   Set Feature ENDPOINT_HALT received.

enumerator **USB_DC_CLEAR_HALT**
   Clear Feature ENDPOINT_HALT received.

enumerator **USB_DC_SOF**
   Start of Frame received.

enumerator **USB_DC_UNKNOWN**
   Initial USB connection status.

enum **usb_dc_ep_cb_status_code**
   USB Endpoint Callback Status Codes.
   Status Codes reported by the registered endpoint callback.
   
   **Values:**

   enumerator **USB_DC_EP_SETUP**
      SETUP received.

   enumerator **USB_DC_EP_DATA_OUT**
      Out transaction on this EP, data is available for read.

   enumerator **USB_DC_EP_DATA_IN**
      In transaction done on this EP.

enum **usb_dc_ep_transfer_type**
   USB Endpoint Transfer Type.
   
   **Values:**

   enumerator **USB_DC_EP_CONTROL** = 0
      Control type endpoint.

   enumerator **USB_DC_EP_ISOCHRONOUS**
      Isochronous type endpoint.

   enumerator **USB_DC_EP_BULK**
      Bulk type endpoint.

   enumerator **USB_DC_EP_INTERRUPT**
      Interrupt type endpoint
enum usb_dc_ep_synchronization_type
    USB Endpoint Synchronization Type.

Note: Valid only for Isochronous Endpoints

Values:

enumerator USB_DC_EP_NO_SYNCHRONIZATION = (0U « 2U)
    No Synchronization.
enumerator USB_DC_EPASYNCHRONOUS = (1U « 2U)
    Asynchronous.
enumerator USB_DC_EP_ADAPTIVE = (2U « 2U)
    Adaptive.
enumerator USB_DC_EP_SYNCHRONOUS = (3U « 2U)
    Synchronous.

Functions

int usb_dc_attach(void)
    Attach USB for device connection.
    Function to attach USB for device connection. Upon success, the USB PLL is enabled, and the USB device is now capable of transmitting and receiving on the USB bus and of generating interrupts.
    Returns
        0 on success, negative errno code on fail.

int usb_dc_detach(void)
    Detach the USB device.
    Function to detach the USB device. Upon success, the USB hardware PLL is powered down and USB communication is disabled.
    Returns
        0 on success, negative errno code on fail.

int usb_dc_reset(void)
    Reset the USB device.
    This function returns the USB device and firmware back to it's initial state. N.B. the USB PLL is handled by the usb_detach function
    Returns
        0 on success, negative errno code on fail.

int usb_dc_set_address(const uint8_t addr)
    Set USB device address.
    Parameters
        • addr – [in] Device address
    Returns
        0 on success, negative errno code on fail.
void **usb_dc_set_status_callback**(const **usb_dc_status_callback** cb)
Function to set USB device controller status callback. The registered callback is used to report changes in the status of the device controller. The status code are described by the **usb_dc_status_code** enumeration.

**Parameters**

- **cb** – [in] Callback function

int **usb_dc_ep_check_cap** (const struct **usb_dc_ep_cfg_data** *const cfg)
Function to check capabilities of an endpoint. **usb_dc_ep_cfg_data** structure provides the endpoint configuration parameters: endpoint address, endpoint maximum packet size and endpoint type. The driver should check endpoint capabilities and return 0 if the endpoint configuration is possible.

**Parameters**

- **cfg** – [in] Endpoint config

**Returns**

0 on success, negative errno code on fail.

int **usb_dc_ep_configure** (const struct **usb_dc_ep_cfg_data** *const cfg)
Function to configure an endpoint. **usb_dc_ep_cfg_data** structure provides the endpoint configuration parameters: endpoint address, endpoint maximum packet size and endpoint type.

**Parameters**

- **cfg** – [in] Endpoint config

**Returns**

0 on success, negative errno code on fail.

int **usb_dc_ep_set_stall** (const uint8_t ep)
Set stall condition for the selected endpoint.

**Parameters**

- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table

**Returns**

0 on success, negative errno code on fail.

int **usb_dc_ep_clear_stall** (const uint8_t ep)
Clear stall condition for the selected endpoint.

**Parameters**

- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table

**Returns**

0 on success, negative errno code on fail.

int **usb_dc_ep_is_stalled** (const uint8_t ep, uint8_t *const stalled)
Check if the selected endpoint is stalled.

**Parameters**

- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
• stalled – [out] Endpoint stall status

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_halt(const uint8_t ep)
Halt the selected endpoint.

Parameters
• ep – [in] Endpoint address corresponding to the one listed in the device
  configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_enable(const uint8_t ep)
Enable the selected endpoint.

Function to enable the selected endpoint. Upon success interrupts are enabled for the
  corresponding endpoint and the endpoint is ready for transmitting/receiving data.

Parameters
• ep – [in] Endpoint address corresponding to the one listed in the device
  configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_disable(const uint8_t ep)
Disable the selected endpoint.

Function to disable the selected endpoint. Upon success interrupts are disabled for the
  corresponding endpoint and the endpoint is no longer able for transmitting/receiving data.

Parameters
• ep – [in] Endpoint address corresponding to the one listed in the device
  configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_flush(const uint8_t ep)
Flush the selected endpoint.

This function flushes the FIFOs for the selected endpoint.

Parameters
• ep – [in] Endpoint address corresponding to the one listed in the device
  configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_write(const uint8_t ep, const uint8_t *const data, const uint32_t data_len,
  uint32_t *const ret_bytes)
Write data to the specified endpoint.

This function is called to write data to the specified endpoint. The supplied
  usb_ep_callback function will be called when data is transmitted out.

Parameters
• ep – [in] Endpoint address corresponding to the one listed in the device
  configuration table
• **data** – [in] Pointer to data to write
• **data_len** – [in] Length of the data requested to write. This may be zero for a zero length status packet.
• **ret_bytes** – [out] Bytes scheduled for transmission. This value may be NULL if the application expects all bytes to be written

**Returns**
0 on success, negative errno code on fail.

```c
int usb_dc_ep_read(const uint8_t ep, uint8_t *const data, const uint32_t max_data_len, uint32_t *const read_bytes)
```

Read data from the specified endpoint.

This function is called by the endpoint handler function, after an OUT interrupt has been received for that EP. The application must only call this function through the supplied `usb_ep_callback` function. This function clears the ENDPOINT NAK, if all data in the endpoint FIFO has been read, so as to accept more data from host.

**Parameters**
• **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
• **data** – [in] Pointer to data buffer to write to
• **max_data_len** – [in] Max length of data to read
• **read_bytes** – [out] Number of bytes read. If data is NULL and max_data_len is 0 the number of bytes available for read should be returned.

**Returns**
0 on success, negative errno code on fail.

```c
int usb_dc_ep_set_callback(const uint8_t ep, const usb_dc_ep_callback cb)
```

Set callback function for the specified endpoint.

Function to set callback function for notification of data received and available to application or transmit done on the selected endpoint, NULL if callback not required by application code. The callback status code is described by `usb_dc_ep_cb_status_code`.

**Parameters**
• **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
• **cb** – [in] Callback function

**Returns**
0 on success, negative errno code on fail.

```c
int usb_dc_ep_read_wait(uint8_t ep, uint8_t *data, uint32_t max_data_len, uint32_t *read_bytes)
```

Read data from the specified endpoint.

This is similar to `usb_dc_ep_read`, the difference being that, it doesn’t clear the endpoint NAKs so that the consumer is not bogged down by further upcalls till he is done with the processing of the data. The caller should reactivate ep by invoking `usb_dc_ep_read_continue()` do so.

**Parameters**
• **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
• **data** – [in] Pointer to data buffer to write to
• **max_data_len** – [in] Max length of data to read

• **read_bytes** – [out] Number of bytes read. If data is NULL and max_data_len is 0 the number of bytes available for read should be returned.

**Returns**
0 on success, negative errno code on fail.

```c
int usb_dc_ep_read_continue(uint8_t ep)
```
Continue reading data from the endpoint.

Clear the endpoint NAK and enable the endpoint to accept more data from the host. Usually called after `usb_dc_ep_read_wait()` when the consumer is fine to accept more data. Thus these calls together act as a flow control mechanism.

**Parameters**

• **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table

**Returns**
0 on success, negative errno code on fail.

```c
int usb_dc_ep_mps(uint8_t ep)
```
Get endpoint max packet size.

**Parameters**

• **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table

**Returns**
Endpoint max packet size (mps)

```c
int usb_dc_wakeup_request(void)
```
Start the host wake up procedure.

Function to wake up the host if it's currently in sleep mode.

**Returns**
0 on success, negative errno code on fail.

```c
struct usb_dc_ep_cfg_data
#include <usb_dc.h> USB Endpoint Configuration.
Structure containing the USB endpoint configuration.
```

**Public Members**

```c
uint8_t ep_addr
```
The number associated with the EP in the device configuration structure IN EP = 0x80 | <endpoint number> OUT EP = 0x00 | <endpoint number>

```c
uint16_t ep_mps
```
Endpoint max packet size.

```c
enum usb_dc_ep_transfer_type ep_type
```
Endpoint Transfer Type.

May be Bulk, Interrupt, Control or Isochronous
USB device stack API

API reference There are two ways to transmit data, using the 'low' level read/write API or the 'high' level transfer API.

Low level API
To transmit data to the host, the class driver should call usb_write(). Upon completion the registered endpoint callback will be called. Before sending another packet the class driver should wait for the completion of the previous write. When data is received, the registered endpoint callback is called. usb_read() should be used for retrieving the received data. For CDC ACM sample driver this happens via the OUT bulk endpoint handler (cdc_acm_bulk_out) mentioned in the endpoint array (cdc_acm_ep_data).

High level API
The usb_transfer method can be used to transfer data to/from the host. The transfer API will automatically split the data transmission into one or more USB transaction(s), depending endpoint max packet size. The class driver does not have to implement endpoint callback and should set this callback to the generic usb_transfer_ep_callback.

### Typedefs

typedef void (*usb_ep_callback)(uint8_t ep, enum usb_dc_ep_cb_status_code cb_status)

Callback function signature for the USB Endpoint status.

```c
typedef int (*usb_request_handler)(struct usb_setup_packet *setup, int32_t *transfer_len, uint8_t **payload_data)
```

Callback function signature for class specific requests.

Function which handles Class specific requests corresponding to an interface number specified in the device descriptor table. For host to device direction the ‘len’ and ‘payload_data’ contain the length of the received data and the pointer to the received data respectively. For device to host class requests, ‘len’ and ‘payload_data’ should be set by the callback function with the length and the address of the data to be transmitted buffer respectively.

```c
typedef void (*usb_interface_config)(struct usb_desc_header *head, uint8_t bInterfaceNumber)
```

Function for interface runtime configuration.

```c
typedef void (*usb_transfer_callback)(uint8_t ep, int tsize, void *priv)
```

Callback function signature for transfer completion.

### Functions

```c
int usb_set_config(const uint8_t *usb_descriptor)
```

Configure USB controller.

Function to configure USB controller. Configuration parameters must be valid or an error is returned

**Parameters**

- usb_descriptor – [in] USB descriptor table

**Returns**

0 on success, negative errno code on fail

```c
int usb_deconfig(void)
```

Deconfigure USB controller.

This function returns the USB device to it’s initial state

**Returns**

0 on success, negative errno code on fail

```c
int usb_enable(usb_dc_status_callback status_cb)
```

Enable the USB subsystem and associated hardware.

This function initializes the USB core subsystem and enables the corresponding hardware so that it can begin transmitting and receiving on the USB bus, as well as generating interrupts.

Class-specific initialization and registration must be performed by the user before invoking this, so that any data or events on the bus are processed correctly by the associated class handling code.
Parameters

- **status_cb** – [in] Callback registered by user to notify about USB device controller state.

Returns

0 on success, negative errno code on fail.

```c
int usb_disable(void)
```

Disable the USB device.

Function to disable the USB device. Upon success, the specified USB interface is clock gated in hardware, it is no longer capable of generating interrupts.

Returns

0 on success, negative errno code on fail

```c
int usb_write(uint8_t ep, const uint8_t *data, uint32_t data_len, uint32_t *bytes_ret)
```

Write data to the specified endpoint.

Function to write data to the specified endpoint. The supplied usb_ep_callback will be called when transmission is done.

Parameters

- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
- **data** – [in] Pointer to data to write
- **data_len** – [in] Length of data requested to write. This may be zero for a zero length status packet.
- **bytes_ret** – [out] Bytes written to the EP FIFO. This value may be NULL if the application expects all bytes to be written

Returns

0 on success, negative errno code on fail

```c
int usb_read(uint8_t ep, uint8_t *data, uint32_t max_data_len, uint32_t *ret_bytes)
```

Read data from the specified endpoint.

This function is called by the Endpoint handler function, after an OUT interrupt has been received for that EP. The application must only call this function through the supplied usb_ep_callback function.

Parameters

- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
- **data** – [in] Pointer to data buffer to write to
- **max_data_len** – [in] Max length of data to read
- **ret_bytes** – [out] Number of bytes read. If data is NULL and max_data_len is 0 the number of bytes available for read is returned.

Returns

0 on success, negative errno code on fail

```c
int usb_ep_set_stall(uint8_t ep)
```

Set STALL condition on the specified endpoint.

This function is called by USB device class handler code to set stall condition on endpoint.

Parameters
• ep – [in] Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail

int usb_ep_clear_stall(uint8_t ep)
Clears STALL condition on the specified endpoint.
This function is called by USB device class handler code to clear stall condition on endpoint.

Parameters
• ep – [in] Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail

int usb_ep_read_wait(uint8_t ep, uint8_t *data, uint32_t max_data_len, uint32_t *read_bytes)
Read data from the specified endpoint.
This is similar to usb_ep_read, the difference being that, it doesn't clear the endpoint NAKs so that the consumer is not bogged down by further upcalls till he is done with the processing of the data. The caller should reactivate ep by invoking usb_ep_read_continue() do so.

Parameters
• ep – [in] Endpoint address corresponding to the one listed in the device configuration table
• data – [in] pointer to data buffer to write to
• max_data_len – [in] max length of data to read
• read_bytes – [out] Number of bytes read. If data is NULL and max_data_len is 0 the number of bytes available for read should be returned.

Returns
0 on success, negative errno code on fail.

int usb_ep_read_continue(uint8_t ep)
Continue reading data from the endpoint.
Clear the endpoint NAK and enable the endpoint to accept more data from the host. Usually called after usb_ep_read_wait() when the consumer is fine to accept more data. Thus these calls together acts as flow control mechanism.

Parameters
• ep – [in] Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

void usb_transfer_ep_callback(uint8_t ep, enum usb_dc_ep_cb_status_code)
Transfer management endpoint callback.
If a USB class driver wants to use high-level transfer functions, driver needs to register this callback as usb endpoint callback.
int **usb_transfer**
(int ep, int *data, size_t dlen, unsigned int flags,
 *usb_transfer_callback* cb, void *priv)

Start a transfer.

Start a USB transfer to/from the data buffer. This function is asynchronous and can be executed in IRQ context. The provided callback will be called on transfer completion (or error) in thread context.

**Parameters**

- `ep` – [in] Endpoint address corresponding to the one listed in the device configuration table
- `data` – [in] Pointer to data buffer to write-to/read-from
- `dlen` – [in] Size of data buffer
- `flags` – [in] Transfer flags (USB_TRANS_READ, USB_TRANS_WRITE...)  
- `cb` – [in] Function called on transfer completion/failure
- `priv` – [in] Data passed back to the transfer completion callback

**Returns**

0 on success, negative errno code on fail.

int **usb_transfer_sync**
(int ep, int *data, size_t dlen, unsigned int flags)

Start a transfer and block-wait for completion.

Synchronous version of usb_transfer, wait for transfer completion before returning. A return value of zero can also mean that transfer was cancelled or that the endpoint is not ready. This is due to the design of transfers and usb_dc API.

**Parameters**

- `ep` – [in] Endpoint address corresponding to the one listed in the device configuration table
- `data` – [in] Pointer to data buffer to write-to/read-from
- `dlen` – [in] Size of data buffer
- `flags` – [in] Transfer flags

**Returns**

Number of bytes transferred on success, negative errno code on fail.

void **usb_cancel_transfer**
(int ep)

Cancel any ongoing transfer on the specified endpoint.

**Parameters**

- `ep` – [in] Endpoint address corresponding to the one listed in the device configuration table

void **usb_cancel_transfers**
(void)

Cancel all ongoing transfers.

bool **usb_transfer_is_busy**
(int ep)

Check that transfer is ongoing for the endpoint.

**Parameters**

- `ep` – [in] Endpoint address corresponding to the one listed in the device configuration table

**Returns**

true if transfer is ongoing, false otherwise.
int usb_wakeup_request(void)
   Start the USB remote wakeup procedure.
   Function to request a remote wakeup. This feature must be enabled in configuration,
   otherwise it will always return -ENOTSUP error.

   Returns
   0 on success, negative errno code on fail, i.e. when the bus is already active.

bool usb_get_remote_wakeup_status(void)
   Get status of the USB remote wakeup feature.

   Returns
   true if remote wakeup has been enabled by the host, false otherwise.

struct usb_ep_cfg_data
   #include <usb_device.h> USB Endpoint Configuration.
   This structure contains configuration for the endpoint.

   Public Members

   usb_ep_callback ep_cb
   Callback function for notification of data received and available to application or
   transmit done, NULL if callback not required by application code.

   uint8_t ep_addr
   The number associated with the EP in the device configuration structure IN EP =
   0x80 | <endpoint number> OUT EP = 0x00 | <endpoint number>

struct usb_interface_cfg_data
   #include <usb_device.h> USB Interface Configuration.
   This structure contains USB interface configuration.

   Public Members

   usb_request_handler class_handler
   Handler for USB Class specific Control (EP 0) communications.

   usb_request_handler vendor_handler
   Handler for USB Vendor specific commands.

   usb_request_handler custom_handler
   The custom request handler gets a first chance at handling the request before it is
   handed over to the ‘chapter 9’ request handler:
   return 0 on success, -EINVAL if the request has not been handled by the custom
   handler and instead needs to be handled by the core USB stack. Any other error
   code to denote failure within the custom handler.
struct usb_cfg_data

#include <usb_device.h> USB device configuration.

The Application instantiates this with given parameters added using the “usb_set_config” function. Once this function is called changes to this structure will result in undefined behavior. This structure may only be updated after calls to usb_deconfig

Public Members

cnst uint8_t *usb_device_description
    USB device description, see http://www.beyondlogic.org/usbnutshell/usb5.shtml#DeviceDescriptors.

void *interface_descriptor
    Pointer to interface descriptor.

usb_interface_config interface_config
    Function for interface runtime configuration.

void (*cb_usb_status)(structusb_cfg_data *cfg, enumusb_dc_status_code cb_status, const uint8_t *param)
    Callback to be notified on USB connection status change.

structusb_interface_cfg_data interface
    USB interface (Class) handler and storage space.

uint8_t num_endpoints
    Number of individual endpoints in the device configuration.

structusb_ep_cfg_data *endpoint
    Pointer to an array of endpoint structs of length equal to the number of EP associated with the device description, not including control endpoints.

USB HID Class API

USB device specific part for HID support defined in include/zephyr/usb/class/usb_hid.h.

API Reference

**Functions**

void usb_hid_register_device(const struct device *dev, const uint8_t *desc, size_t size, const struct hid_ops *op)

Register HID device.

**Parameters**

- `dev` – [in] Pointer to USB HID device
- `desc` – [in] Pointer to HID report descriptor
- `size` – [in] Size of HID report descriptor
- `op` – [in] Pointer to USB HID device interrupt struct

int hid_int_ep_write(const struct device *dev, const uint8_t *data, uint32_t data_len, uint32_t *bytes_ret)

Write to USB HID interrupt endpoint buffer.

**Parameters**

- `dev` – [in] Pointer to USB HID device
- `data` – [in] Pointer to data buffer
- `data_len` – [in] Length of data to copy

**Returns**

0 on success, negative errno code on fail.

int hid_int_ep_read(const struct device *dev, uint8_t *data, uint32_t max_data_len, uint32_t *ret_bytes)

Read from USB HID interrupt endpoint buffer.

**Parameters**

- `dev` – [in] Pointer to USB HID device
- `data` – [in] Pointer to data buffer
- `max_data_len` – [in] Max length of data to copy
- `ret_bytes` – [out] Number of bytes to copy. If data is NULL and `max_data_len` is 0 the number of bytes available in the buffer will be returned.

**Returns**

0 on success, negative errno code on fail.
int usb_hid_set_proto_code(const struct device *dev, uint8_t proto_code)
Set USB HID class Protocol Code.
Should be called before usb_hid_init().

Parameters
• dev – [in] Pointer to USB HID device
• proto_code – [in] Protocol Code to be used for bInterfaceProtocol

Returns
0 on success, negative errno code on fail.

int usb_hid_init(const struct device *dev)
Initialize USB HID class support.

Parameters
• dev – [in] Pointer to USB HID device

Returns
0 on success, negative errno code on fail.

struct hid_ops
#include <usb_hid.h> USB HID device interface.

Binary Device Object Store (BOS) support API

API reference

group usb_bos
USB Binary Device Object Store support.

Defines

USB_DEVICE_BOS_DESC_DEFINE_CAP
Helper macro to place the BOS compatibility descriptor in the right memory section.

Enums

enum usb_bos_capability_types
Device capability type codes.

Values:

enumerator USB_BOS_CAPABILITY_EXTENSION = 0x02

enumerator USB_BOS_CAPABILITY_PLATFORM = 0x05
Functions

void usb_bos_register_cap(struct usb_bos_platform_descriptor *hdr)
    Register BOS capability descriptor.
    This function should be used by the application to register BOS capability descriptors
    before the USB device stack is enabled.

Parameters
    • hdr – [in] Pointer to BOS capability descriptor

struct usb_bos_capability_lpm
    #include <bos.h> BOS USB 2.0 extension capability descriptor.

struct usb_bos_platform_descriptor
    #include <bos.h> BOS platform capability descriptor.

struct usb_bos_capability_webusb
    #include <bos.h> WebUSB specific part of platform capability descriptor.

struct usb_bos_capability_msos
    #include <bos.h> Microsoft OS 2.0 descriptor specific part of platform capability de-
    scriptor.

New experimental USB support

6.5.3 New experimental USB device support

Overview

The new USB device support is experimental. It consists of USB device controller (UDC) driver
API and USB device stack (next) API. The new device stack brings support for multiple device
controllers, support for multiple configurations, and dynamic registration of class instances to
a configuration at runtime. The stack also provides a specific class API that should be used to
implement the functions (classes). It will replace USB device support.

If you would like to play around with the new device support, or the new USB support in general,
please try usb-shell sample. The sample is mainly to help test the capabilities of the stack and
correct implementation of the USB controller drivers.

Supported USB classes

Bluetooth HCI USB transport layer  See bluetooth-hci-usb-sample sample for reference. To
build the sample for the new device support, set the configuration -DCONF_FILE=usbd_next_prj.
conf either directly or via west.

CDC ACM  CDC ACM implementation has support for multiple instances. Description from CDC
ACM also applies to the new implementation. See usb-cdc-acm sample for reference. To build
the sample for the new device support, set the configuration -DCONF_FILE=usbd_next_prj.conf either directly or via west.

Mass Storage Class  See usb-mass sample for reference. To build the sample for the new device
support, set the configuration -DCONF_FILE=usbd_next_prj.conf either directly or via west.
Networking  At the moment only CDC ECM class is implemented and has support for multiple instances. It provides a virtual Ethernet connection between the remote (USB host) and Zephyr network support.

See zperf for reference. To build the sample for the new device support, set the configuration overlay file -DDEXTRA_CONF_FILE=overlay-usbd_next_ecm.conf and devicetree overlay file -DDTC_OVERLAY_FILE="usbd_next_ecm.overlay either directly or via west.

6.5.4  New USB device support APIs

USB device controller (UDC) driver API

The USB device controller driver API is described in include/zephyr/drivers/usb/udc.h and referred to as the UDC driver API.

UDC driver API is experimental and is subject to change without notice. It is a replacement for USB device controller driver API. If you wish to port an existing driver to UDC driver API, or add a new driver, please use drivers/usb/udc/udc_skeleton.c as a starting point.

API reference

**group udc_api**

New USB device controller (UDC) driver API.

**Functions**

static inline bool udc_is_initialized(const struct device *dev)
Checks whether the controller is initialized.

**Parameters**

- dev – [in] Pointer to device struct of the driver instance

**Returns**

true if controller is initialized, false otherwise

static inline bool udc_is_enabled(const struct device *dev)
Checks whether the controller is enabled.

**Parameters**

- dev – [in] Pointer to device struct of the driver instance

**Returns**

true if controller is enabled, false otherwise

static inline bool udc_is_suspended(const struct device *dev)
Checks whether the controller is suspended.

**Parameters**

- dev – [in] Pointer to device struct of the driver instance

**Returns**

true if controller is suspended, false otherwise
int udc_init(const struct device *dev, udc_event_cb_t event_cb)

Initialize USB device controller.

Initialize USB device controller and control IN/OUT endpoint. After initialization controller driver should be able to detect power state of the bus and signal power state changes.

Parameters

- **dev** – [in] Pointer to device struct of the driver instance
- **event_cb** – [in] Event callback from the higher layer (USB device stack)

Return values

- **EINVAL** – on parameter error (no callback is passed)
- **EALREADY** – already initialized

Returns

0 on success, all other values should be treated as error.

int udc_enable(const struct device *dev)

Enable USB device controller.

Enable powered USB device controller and allow host to recognize and enumerate the device.

Parameters

- **dev** – [in] Pointer to device struct of the driver instance

Return values

- **EPERM** – controller is not initialized
- **EALREADY** – already enabled

Returns

0 on success, all other values should be treated as error.

int udc_disable(const struct device *dev)

Disable USB device controller.

Disable enabled USB device controller. The driver should continue to detect power state changes.

Parameters

- **dev** – [in] Pointer to device struct of the driver instance

Return values

- **EALREADY** – already disabled

Returns

0 on success, all other values should be treated as error.

int udc_shutdown(const struct device *dev)

Power off USB device controller.

Shut down the controller completely to reduce energy consumption or to change the role of the controller.

Parameters

- **dev** – [in] Pointer to device struct of the driver instance

Return values

- **EALREADY** – controller is not initialized

Returns

0 on success, all other values should be treated as error.
static inline struct udc_device_caps udc_caps(const struct device *dev)
Get USB device controller capabilities.
Obtain the capabilities of the controller such as full speed (FS), high speed (HS), and more.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Returns
USB device controller capabilities.

enum udc_bus_speed udc_device_speed(const struct device *dev)
Get actual USB device speed.
The function should be called after the reset event to determine the actual bus speed.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Returns
USB device controller capabilities.

static inline int udc_set_address(const struct device *dev, const uint8_t addr)
Set USB device address.
Set address of enabled USB device.

Parameters
• dev – [in] Pointer to device struct of the driver instance
• addr – [in] USB device address

Return values
-EPERM – controller is not enabled (or not initialized)

Returns
0 on success, all other values should be treated as error.

static inline int udc_host_wakeup(const struct device *dev)
Initiate host wakeup procedure.
Initiate host wakeup. Only possible when the bus is suspended.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
-EPERM – controller is not enabled (or not initialized)

Returns
0 on success, all other values should be treated as error.

int udc_ep_try_config(const struct device *dev, const uint8_t ep, const uint8_t attributes,
uint16_t *const mps, const uint8_t interval)
Try an endpoint configuration.
Try an endpoint configuration based on endpoint descriptor. This function may modify
wMaxPacketSize descriptor fields of the endpoint. All properties of the descriptor, such
as direction, and transfer type, should be set correctly. If wMaxPacketSize value is zero,
it will be updated to maximum buffer size of the endpoint.

Parameters
• **dev** – [in] Pointer to device struct of the driver instance
• **ep** – [in] Endpoint address (same as bEndpointAddress)
• **attributes** – [in] Endpoint attributes (same as bmAttributes)
• **mps** – [in] Maximum packet size (same as wMaxPacketSize)
• **interval** – [in] Polling interval (same as bInterval)

**Return values**
• **-EINVAL** – on wrong parameter
• **-ENOTSUP** – endpoint configuration not supported
• **-ENODEV** – no endpoints available

**Returns**
0 on success, all other values should be treated as error.

```c
int udc_ep_enable(const struct device *dev, const uint8_t ep, const uint8_t attributes, const uint16_t mps, const uint8_t interval)
```

Configure and enable endpoint.

Configure and make an endpoint ready for use. Valid for all endpoints except control IN/OUT.

**Parameters**
• **dev** – [in] Pointer to device struct of the driver instance
• **ep** – [in] Endpoint address (same as bEndpointAddress)
• **attributes** – [in] Endpoint attributes (same as bmAttributes)
• **mps** – [in] Maximum packet size (same as wMaxPacketSize)
• **interval** – [in] Polling interval (same as bInterval)

**Return values**
• **-EINVAL** – on wrong parameter (control IN/OUT endpoint)
• **-EPERM** – controller is not initialized
• **-ENODEV** – endpoint configuration not found
• **-EALREADY** – endpoint is already enabled

**Returns**
0 on success, all other values should be treated as error.

```c
int udc_ep_disable(const struct device *dev, const uint8_t ep)
```

Disable endpoint.

Valid for all endpoints except control IN/OUT.

**Parameters**
• **dev** – [in] Pointer to device struct of the driver instance
• **ep** – [in] Endpoint address

**Return values**
• **-EINVAL** – on wrong parameter (control IN/OUT endpoint)
• **-ENODEV** – endpoint configuration not found
• **-EALREADY** – endpoint is already disabled
• **-EPERM** – controller is not initialized
Returns
0 on success, all other values should be treated as error.

```c
int udc_ep_set_halt(const struct device *dev, const uint8_t ep)
```

Halt endpoint.
Valid for all endpoints.

**Parameters**

- **dev** – [in] Pointer to device struct of the driver instance
- **ep** – [in] Endpoint address

**Return values**

- `EINVAL` – endpoint configuration not found
- `ENOTSUP` – not supported (e.g. isochronous endpoint)
- `EPERM` – controller is not enabled

**Returns**
0 on success, all other values should be treated as error.

```c
int udc_ep_clear_halt(const struct device *dev, const uint8_t ep)
```

Clear endpoint halt.
Valid for all endpoints.

**Parameters**

- **dev** – [in] Pointer to device struct of the driver instance
- **ep** – [in] Endpoint address

**Return values**

- `EINVAL` – endpoint configuration not found
- `ENOTSUP` – not supported (e.g. isochronous endpoint)
- `EPERM` – controller is not enabled

**Returns**
0 on success, all other values should be treated as error.

```c
int udc_ep_enqueue(const struct device *dev, struct net_buf *const buf)
```

Queue USB device controller request.
Add request to the queue. If the queue is empty, the request buffer can be claimed by the controller immediately.

**Parameters**

- **dev** – [in] Pointer to device struct of the driver instance
- **buf** – [in] Pointer to UDC request buffer

**Return values**

- `EINVAL` – endpoint configuration not found
- `EACCES` – endpoint is not enabled (TBD)
- `EBUSY` – request can not be queued
- `EPERM` – controller is not initialized

**Returns**
0 on success, all other values should be treated as error.
int udc_ep_dequeue(const struct device *dev, const uint8_t ep)
    Remove all USB device controller requests from endpoint queue.
    UDC_EVT_EP_REQUEST event will be generated when the driver releases claimed buffer, no new requests will be claimed, all requests in the queue will passed as chained list of the event variable buf. The endpoint queue is empty after that.

    Parameters
    • dev – [in] Pointer to device struct of the driver instance
    • ep – [in] Endpoint address

    Return values
    • -ENOMEM – endpoint configuration not found
    • -EACCES – endpoint is not disabled
    • -EPERM – controller is not initialized

    Returns
    0 on success, all other values should be treated as error.

struct net_buf *udc_ep_buf_alloc(const struct device *dev, const uint8_t ep, const size_t size)
    Allocate UDC request buffer.
    Allocate a new buffer from common request buffer pool.

    Parameters
    • dev – [in] Pointer to device struct of the driver instance
    • ep – [in] Endpoint address
    • size – [in] Size of the request buffer

    Returns
    pointer to allocated request or NULL on error.

int udc_ep_buf_free(const struct device *dev, struct net_buf *const buf)
    Free UDC request buffer.
    Put the buffer back into the request buffer pool.

    Parameters
    • dev – [in] Pointer to device struct of the driver instance
    • buf – [in] Pointer to UDC request buffer

    Returns
    0 on success, all other values should be treated as error.

static inline void udc_ep_buf_set_zlp(struct net_buf *const buf)
    Set ZLP flag in requests metadata.
    The controller should send a ZLP at the end of the transfer.

    Parameters
    • buf – [in] Pointer to UDC request buffer

static inline struct udc_buf_info *udc_get_buf_info(const struct net_buf *const buf)
    Get requests metadata.

    Parameters
    • buf – [in] Pointer to UDC request buffer
Returns
pointer to metadata structure.

USB device stack (next) API

New USB device stack API is experimental and is subject to change without notice.

**Defines**

`USB_BSTRING_LENGTH(s)`
`USB_STRING_DESCRIPTOR_LENGTH(s)`

`USBD_NUMOF_INTERFACES_MAX`

`USBD_CTX_REGISTERED`
USB Class instance registered flag.

`USBD_DEVICE_DEFINE(device_name, uhc_dev, vid, pid)`

`USBD_CONFIGURATION_DEFINE(name, attrib, power)`
**USBD_DESC_LANG_DEFINE** (name)
Create a string descriptor node and language string descriptor.

This macro defines a descriptor node and a string descriptor that, when added to the device context, is automatically used as the language string descriptor zero. Both descriptor node and descriptor are defined with static-storage-class specifier. Default and currently only supported language ID is 0x0409 English (United States). If string descriptors are used, it is necessary to add this descriptor as the first one to the USB device context.

**Parameters**
- name – Language string descriptor node identifier.

**USBD_DESC_STRING_DEFINE** (d_name, d_string, d_utype)

**USBD_DESC_MANUFACTURER_DEFINE** (d_name, d_string)
Create a string descriptor node and manufacturer string descriptor.

This macro defines a descriptor node and a string descriptor that, when added to the device context, is automatically used as the manufacturer string descriptor. Both descriptor node and descriptor are defined with static-storage-class specifier.

**Parameters**
- d_name – String descriptor node identifier.
- d_string – ASCII7 encoded manufacturer string literal

**USBD_DESC_PRODUCT_DEFINE** (d_name, d_string)
Create a string descriptor node and product string descriptor.

This macro defines a descriptor node and a string descriptor that, when added to the device context, is automatically used as the product string descriptor. Both descriptor node and descriptor are defined with static-storage-class specifier.

**Parameters**
- d_name – String descriptor node identifier.
- d_string – ASCII7 encoded product string literal

**USBD_DESC_SERIAL_NUMBER_DEFINE** (d_name, d_string)
Create a string descriptor node and serial number string descriptor.

This macro defines a descriptor node and a string descriptor that, when added to the device context, is automatically used as the serial number string descriptor. The string literal parameter is used as a placeholder, the unique number is obtained from hwinfo. Both descriptor node and descriptor are defined with static-storage-class specifier.

**Parameters**
- d_name – String descriptor node identifier.
- d_string – ASCII7 encoded serial number string literal placeholder

**USBD_DEFINE_CLASS** (class_name, class_api, class_data)

**VENDOR_REQ_DEFINE** (_reqs, _len)
Helper to declare request table of *usbd_cctx_vendor_req*.

**Parameters**
- _reqs – Pointer to the vendor request field
- _len – Number of supported vendor requests
USBD_VENDOR_REQ(_reqs...)
Helper to declare supported vendor requests.

Parameters
• _reqs – Variable number of vendor requests

Enums

eenum usbd_desc_usage_type
  Values:
  enumerator USBD_DUT_STRING_LANG
  enumerator USBD_DUT_STRING_MANUFACTURER
  enumerator USBD_DUT_STRING_PRODUCT
  enumerator USBD_DUT_STRING_SERIAL_NUMBER
  enumerator USBD_DUT_STRING_INTERFACE

enum usbd_ch9_state
  USB device support middle layer runtime state.
  Part of USB device states without suspended and powered states, as it is better to track them separately.
  Values:
  enumerator USBD_STATE_DEFAULT = 0
  enumerator USBD_STATE_ADDRESS
  enumerator USBD_STATE_CONFIGURED

Functions

int usbd_add_descriptor(struct usbd_contex *uds_ctx, struct usbd_desc_node *dn)
Add common USB descriptor.
Add common descriptor like string or bos.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• dn – [in] Pointer to USB descriptor node

Returns
0 on success, other values on fail.
int usbd_add_configuration(struct usbd_contex *uds_ctx, struct usbd_config_node *cd)
Add a USB device configuration.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• cd – [in] Pointer to USB configuration node

Returns
0 on success, other values on fail.

int usbd_register_class(struct usbd_contex *uds_ctx, const char *name, uint8_t cfg)
Register an USB class instance.

An USB class implementation can have one or more instances. To identify the instances we use device drivers API. Device names have a prefix derived from the name of the class, for example CDC_ACM for CDC ACM class instance, and can also be easily identified in the shell. Class instance can only be registered when the USB device stack is disabled. Registered instances are initialized at initialization of the USB device stack, and the interface descriptors of each instance are adapted to the whole context.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• name – [in] Class instance name
• cfg – [in] Configuration value (similar to bConfigurationValue)

Returns
0 on success, other values on fail.

int usbd_unregister_class(struct usbd_contex *uds_ctx, const char *name, uint8_t cfg)
Unregister an USB class instance.

USB class instance will be removed and will not appear on the next start of the stack. Instance can only be unregistered when the USB device stack is disabled.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• name – [in] Class instance name
• cfg – [in] Configuration value (similar to bConfigurationValue)

Returns
0 on success, other values on fail.

int usbd_init(struct usbd_contex *uds_ctx)
Initialize USB device.

Initialize USB device descriptors and configuration, initialize USB device controller. Class instances should be registered before they are involved. However, the stack should also initialize without registered instances, even if the host would complain about missing interfaces.

Parameters
• uds_ctx – [in] Pointer to USB device support context

Returns
0 on success, other values on fail.

int usbd_enable(struct usbd_contex *uds_ctx)
Enable the USB device support and registered class instances.

This function enables the USB device support.
Parameters
• uds_ctx – [in] Pointer to USB device support context

Returns
0 on success, other values on fail.

int usbd_disable(struct usbd_contex *uds_ctx)
Disable the USB device support.
This function disables the USB device support.

Parameters
• uds_ctx – [in] Pointer to USB device support context

Returns
0 on success, other values on fail.

int usbd_shutdown(struct usbd_contex *const uds_ctx)
Shutdown the USB device support.
This function completely disables the USB device support.

Parameters
• uds_ctx – [in] Pointer to USB device support context

Returns
0 on success, other values on fail.

int usbd_ep_set_halt(struct usbd_contex *uds_ctx, uint8_t ep)
Halt endpoint.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• ep – [in] Endpoint address

Returns
0 on success, or error from udc_ep_set_halt()

int usbd_ep_clear_halt(struct usbd_contex *uds_ctx, uint8_t ep)
Clear endpoint halt.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• ep – [in] Endpoint address

Returns
0 on success, or error from udc_ep_clear_halt()

bool usbd_ep_is_halted(struct usbd_contex *uds_ctx, uint8_t ep)
Checks whether the endpoint is halted.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• ep – [in] Endpoint address

Returns
ture if endpoint is halted, false otherwise
Allocate buffer for USB device control request.
Allocate a new buffer from controller's driver buffer pool.

Parameters
- `uds_ctx` – [in] Pointer to USB device support context
- `ep` – [in] Endpoint address
- `size` – [in] Size of the request buffer

Returns
pointer to allocated request or NULL on error.

Allocate buffer for USB device request.
Allocate a new buffer from controller's driver buffer pool.

Parameters
- `c_nd` – [in] Pointer to USB device class node
- `ep` – [in] Endpoint address
- `size` – [in] Size of the request buffer

Returns
pointer to allocated request or NULL on error.

Queue USB device control request.
Add control request to the queue.

Parameters
- `uds_ctx` – [in] Pointer to USB device support context
- `buf` – [in] Pointer to UDC request buffer

Returns
0 on success, all other values should be treated as error.

Queue USB device request.
Add request to the queue.

Parameters
- `c_nd` – [in] Pointer to USB device class node
- `buf` – [in] Pointer to UDC request buffer

Returns
0 on success, or error from `udc_ep_enqueue()`

Remove all USB device controller requests from endpoint queue.

Parameters
- `uds_ctx` – [in] Pointer to USB device support context
- `ep` – [in] Endpoint address
Returns
0 on success, or error from udc_ep_dequeue()

int usbd_ep_buf_free(struct usbd_contex *uds_ctx, struct net_buf *buf)
Free USB device request buffer.
Put the buffer back into the request buffer pool.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• buf – [in] Pointer to UDC request buffer

Returns
0 on success, all other values should be treated as error.

bool usbd_is_suspended(struct usbd_contex *uds_ctx)
Checks whether the USB device controller is suspended.

Parameters
• uds_ctx – [in] Pointer to USB device support context

Returns
true if endpoint is halted, false otherwise

int usbd_wakeup_request(struct usbd_contex *uds_ctx)
Initiate the USB remote wakeup (TBD)

Returns
0 on success, other values on fail.

int usbd_device_set_bcd(struct usbd_contex *const uds_ctx, const uint16_t bcd)
Set USB device descriptor value bcdUSB.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• bcd – [in] bcdUSB value

Returns
0 on success, other values on fail.

int usbd_device_set_vid(struct usbd_contex *const uds_ctx, const uint16_t vid)
Set USB device descriptor value idVendor.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• vid – [in] idVendor value

Returns
0 on success, other values on fail.

int usbd_device_set_pid(struct usbd_contex *const uds_ctx, const uint16_t pid)
Set USB device descriptor value idProduct.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• pid – [in] idProduct value

Returns
0 on success, other values on fail.
### int usbd_device_set_class

Set USB device descriptor value bDeviceClass.

**Parameters**
- **uds_ctx** – [in] Pointer to USB device support context
- **value** – [in] bDeviceClass value

**Returns**
0 on success, other values on fail.

### int usbd_device_set_subclass

Set USB device descriptor value bDeviceSubClass.

**Parameters**
- **uds_ctx** – [in] Pointer to USB device support context
- **value** – [in] bDeviceSubClass value

**Returns**
0 on success, other values on fail.

### int usbd_device_set_proto

Set USB device descriptor value bDeviceProtocol.

**Parameters**
- **uds_ctx** – [in] Pointer to USB device support context
- **value** – [in] bDeviceProtocol value

**Returns**
0 on success, other values on fail.

### int usbd_config_attrib_rwup

Setup USB device configuration attribute Remote Wakeup.

**Parameters**
- **uds_ctx** – [in] Pointer to USB device support context
- **cfg** – [in] Configuration number
- **enable** – [in] Sets attribute if true, clears it otherwise

**Returns**
0 on success, other values on fail.

### int usbd_config_attrib_self

Setup USB device configuration attribute Self-powered.

**Parameters**
- **uds_ctx** – [in] Pointer to USB device support context
- **cfg** – [in] Configuration number
- **enable** – [in] Sets attribute if true, clears it otherwise

**Returns**
0 on success, other values on fail.

### int usbd_config_maxpower

Setup USB device configuration power consumption.
Parameters

- **uds_ctx** – [in] Pointer to USB device support context
- **cfg** – [in] Configuration number
- **power** – [in] Maximum power consumption value (bMaxPower)

Returns

0 on success, other values on fail.

```c
struct usbd_desc_node
#include <usbd.h>
Descriptor node.
Descriptor node is used to manage descriptors that are not directly part of a structure,
such as string or bos descriptors.

Public Members

sys_dnode_t node
slist node struct

unsigned int idx
Descriptor index, required for string descriptors.

unsigned int utype
Descriptor usage type (not bDescriptorType)

unsigned int utf16le
If not set, string descriptor must be converted to UTF16LE.

unsigned int custom_sn
If not set, device stack obtains SN using the hwinfo API.

void *desc
Pointer to a descriptor.

struct usbd_config_node
#include <usbd.h> Device configuration node.
Configuration node is used to manage device configurations, at least one configuration
is required. It does not have an index, instead bConfigurationValue of the descriptor
is used for identification.

Public Members

sys_snode_t node
slist node struct

void *desc
Pointer to configuration descriptor.
```
```c
sys_slist_t class_list
   List of registered classes (functions)

struct usbd_ch9_data
#include <usbd.h> USB device support middle layer runtime data.

Public Members

struct usb_setup_packet setup
   Setup packet, up-to-date for the respective control request.

int ctrl_type
   Control type, internally used for stage verification.

enum usbd_ch9_state state
   Protocol state of the USB device stack.

uint32_t ep_halt
   Halted endpoints bitmap.

uint8_t configuration
   USB device stack selected configuration.

bool new_address
   Indicate new device address.

uint8_t alternate[16U]
   Array to track interfaces alternate settings.

struct usbd_status
#include <usbd.h> USB device support status.

Public Members

unsigned int initialized
   USB device support is initialized.

unsigned int enabled
   USB device support is enabled.

unsigned int suspended
   USB device is suspended.

unsigned int rwup
   USB remote wake-up feature is enabled.
```
struct `usbd_contex`

#include <usbd.h> USB device support runtime context. 
Main structure that organizes all descriptors, configuration, and interfaces. An UDC device must be assigned to this structure.

**Public Members**

const char *`name`
Name of the USB device.

struct `k_mutex` `mutex`
Access mutex.

const struct `device` *`dev`
Pointer to UDC device.

struct `usbd_ch9_data` `ch9_data`
Middle layer runtime data.

sys_dlist_t `descriptors`
slist to manage descriptors like string, bos

sys_slist_t `configs`
slist to manage device configurations

struct `usbd_status` `status`
Status of the USB device support.

void *`desc`
Pointer to device descriptor.

struct `usbd_cctx_vendor_req`

#include <usbd.h> Vendor Requests Table.

**Public Members**

const uint8_t *`reqs`
Array of vendor requests supported by the class.

uint8_t `len`
Length of the array.

struct `usbd_class_api`

#include <usbd.h> USB device support class instance API.
Public Members

void (*feature_halt)(struct usbd_class_node *const node, uint8_t ep, bool halted)
    Feature halt state update handler.

void (*update)(struct usbd_class_node *const node, uint8_t iface, uint8_t alternate)
    Configuration update handler.

int (*control_to_dev)(struct usbd_class_node *const node, const struct usb_setup_packet *const setup, const struct net_buf *const buf)
    USB control request handler to device.

int (*control_to_host)(struct usbd_class_node *const node, const struct usb_setup_packet *const setup, struct net_buf *const buf)
    USB control request handler to host.

int (*request)(struct usbd_class_node *const node, struct net_buf *buf, int err)
    Endpoint request completion event handler.

void (*suspended)(struct usbd_class_node *const node)
    USB power management handler suspended.

void (*resumed)(struct usbd_class_node *const node)
    USB power management handler resumed.

void (*enable)(struct usbd_class_node *const node)
    Class associated configuration is selected.

void (*disable)(struct usbd_class_node *const node)
    Class associated configuration is disabled.

int (*init)(struct usbd_class_node *const node)
    Initialization of the class implementation.

void (*shutdown)(struct usbd_class_node *const node)
    Shutdown of the class implementation.

struct usbd_class_data
    #include <usbd.h> USB device support class data.

Public Members

struct usbd_context *uds_ctx
    Pointer to USB device stack context structure.

void *desc
    Pointer to a class implementation descriptor that should end with a nil descriptor
     (bLength = 0 and bDescriptorType = 0).
const struct usbd_cctx_vendor_req *v_reqs
    Supported vendor request table, can be NULL.

uint32_t ep_assigned
    Bitmap of all endpoints assigned to the instance.
    The IN endpoints are mapped in the upper halfword.

uint32_t ep_active
    Bitmap of the enabled endpoints of the instance.
    The IN endpoints are mapped in the upper halfword.

uint32_t iface_bm
    Bitmap of the bInterfaceNumbers of the class instance.

atomic_t state
    Variable to store the state of the class instance.

void *priv
    Pointer to private data.

struct usbd_class_node
    #include <usbd.h>

Public Members

sys_snode_t node
    Node information for the slist.

const char *name
    Name of the USB device class instance.

const struct usbd_class_api *api
    Pointer to device support class API.

struct usbd_class_data *data
    Pointer to USB device support class data.

6.5.5 USB host support APIs

USB host controller (UHC) driver API

The USB host controller driver API is described in include/zephyr/drivers/usb/uhc.h and referred
to as the UHC driver API.
UHC driver API is experimental and is subject to change without notice.
Driver API reference

group uhc_api

USB host controller (UHC) driver API.

Defines

UHC_STATUS_INITIALIZED
Controller is initialized by uhc_init()

UHC_STATUS_ENABLED
Controller is enabled and all API functions are available.

typedefs

typedef int (*uhc_event_cb_t)(const struct device *dev, const struct uhc_event *const event)
Callback to submit UHC event to higher layer.
At the higher level, the event is to be inserted into a message queue.

Param dev
[in] Pointer to device struct of the driver instance

Param event
[in] Point to event structure

Return
0 on success, all other values should be treated as error.

Enums

enum uhc_control_stage
USB control transfer stage.
Values:

enumerator UHC_CONTROL_STAGE_SETUP = 0

enumerator UHC_CONTROL_STAGE_DATA

enumerator UHC_CONTROL_STAGE_STATUS

enum uhc_event_type
USB host controller event types.
Values:

enumerator UHC_EVT_DEV_CONNECTED_LS
Low speed device connected.
enumerator UHC_EVT_DEV_CONNECTED_FS
    Full speed device connected.

enumerator UHC_EVT_DEV_CONNECTED_HS
    High speed device connected.

enumerator UHC_EVT_DEV_REMOVED
    Device (peripheral) removed.

enumerator UHC_EVT_RESETED
    Bus reset operation finished.

enumerator UHC_EVT_SUSPENDED
    Bus suspend operation finished.

enumerator UHC_EVT_RESUMED
    Bus resume operation finished.

enumerator UHC_EVT_RWUP
    Remote wakeup signal.

enumerator UHC_EVT_EP_REQUEST
    Endpoint request result event.

enumerator UHC_EVT_ERROR
    Non-correctable error event, requires attention from higher levels or application.

Functions

static inline bool uhc_is_initialized(const struct device *dev)
    Checks whether the controller is initialized.

    Parameters
    • dev – [in] Pointer to device struct of the driver instance

    Returns
    true if controller is initialized, false otherwise

static inline bool uhc_is_enabled(const struct device *dev)
    Checks whether the controller is enabled.

    Parameters
    • dev – [in] Pointer to device struct of the driver instance

    Returns
    true if controller is enabled, false otherwise

static inline int uhc_bus_reset(const struct device *dev)
    Reset USB bus.

    Perform USB bus reset, controller may emit UHC_EVT_RESETED at the end of reset signaling.

    Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
-EBUSY – if the controller is already performing a bus operation

Returns
0 on success, all other values should be treated as error.

static inline int uhc_sof_enable(const struct device *dev)
Enable Start of Frame generator.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
-EALREADY – if already enabled

Returns
0 on success, all other values should be treated as error.

static inline int uhc_bus_suspend(const struct device *dev)
Suspend USB bus.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
-EALREADY – if already suspended

Returns
0 on success, all other values should be treated as error.

static inline int uhc_bus_resume(const struct device *dev)
Resume USB bus.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
-EBUSY – if the controller is already performing a bus operation

Returns
0 on success, all other values should be treated as error.

struct uhc_transfer *uhc_xfer_alloc(const struct device *dev, const uint8_t addr, const uint8_t ep, const uint8_t attrib, const uint16_t mps, const uint16_t timeout, void *const udev, void *const cb)

Allocate UHC transfer.

Allocate a new transfer from common transfer pool. Transfer has no buffer after allocation, but can be allocated and added from different pools.

Parameters
• dev – [in] Pointer to device struct of the driver instance

• addr – [in] Device (peripheral) address
Allocate UHC transfer with buffer.
Allocate a new transfer from common transfer pool with buffer.

Parameters
- dev – [in] Pointer to device struct of the driver instance
- addr – [in] Device (peripheral) address
- ep – [in] Endpoint address
- attrib – [in] Endpoint attributes
- mps – [in] Maximum packet size of the endpoint
- timeout – [in] Timeout in number of frames
- udev – [in] Opaque pointer to USB device
- cb – [in] Transfer completion callback
- size – [in] Size of the buffer

Returns
pointer to allocated transfer or NULL on error.

int uhc_xfer_free(const struct device *dev, struct uhc_transfer *const xfer)
Free UHC transfer and any buffers.
Free any buffers and put the transfer back into the transfer pool.

Parameters
- dev – [in] Pointer to device struct of the driver instance
- xfer – [in] Pointer to UHC transfer

Returns
0 on success, all other values should be treated as error.

int uhc_xfer_buf_add(const struct device *dev, struct uhc_transfer *const xfer, struct net_buf *buf)
Add UHC transfer buffer.
Add a previously allocated buffer to the transfer.

Parameters
- dev – [in] Pointer to device struct of the driver instance
- xfer – [in] Pointer to UHC transfer
- buf – [in] Pointer to UHC request buffer
Returns
pointer to allocated request or NULL on error.

struct net_buf *uhc_xfer_buf_alloc(const struct device *dev, const size_t size)
Allocate UHC transfer buffer.
Allocate a new buffer from common request buffer pool and assign it to the transfer if the xfer parameter is not NULL.

Parameters
• dev – [in] Pointer to device struct of the driver instance
• size – [in] Size of the request buffer

Returns
pointer to allocated request or NULL on error.

void uhc_xfer_buf_free(const struct device *dev, struct net_buf *const buf)
Free UHC request buffer.
Put the buffer back into the request buffer pool.

Parameters
• dev – [in] Pointer to device struct of the driver instance
• buf – [in] Pointer to UHC request buffer

int uhc_ep_enqueue(const struct device *dev, struct uhc_transfer *const xfer)
Queue USB host controller transfer.
Add transfer to the queue. If the queue is empty, the transfer can be claimed by the controller immediately.

Parameters
• dev – [in] Pointer to device struct of the driver instance
• xfer – [in] Pointer to UHC transfer

Return values
-EPERM – controller is not initialized

Returns
0 on success, all other values should be treated as error.

int uhc_ep_dequeue(const struct device *dev, struct uhc_transfer *const xfer)
Remove a USB host controller transfers from queue.
Not implemented yet.

Parameters
• dev – [in] Pointer to device struct of the driver instance
• xfer – [in] Pointer to UHC transfer

Return values
-EPERM – controller is not initialized

Returns
0 on success, all other values should be treated as error.

int uhc_init(const struct device *dev, uhc_event_cb_t event_cb)
Initialize USB host controller.
Initialize USB host controller.

Parameters
• dev – [in] Pointer to device struct of the driver instance
• event_cb – [in] Event callback from the higher layer (USB host stack)

Return values
• -EINVAL – on parameter error (no callback is passed)
• -EALREADY – already initialized

Returns
0 on success, all other values should be treated as error.

int uhc_enable(const struct device *dev)
Enable USB host controller.
Enable powered USB host controller and allow host stack to recognize and enumerate devices.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
• -EPERM – controller is not initialized
• -EALREADY – already enabled

Returns
0 on success, all other values should be treated as error.

int uhc_disable(const struct device *dev)
Disable USB host controller.
Disable enabled USB host controller.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
• -EALREADY – already disabled

Returns
0 on success, all other values should be treated as error.

int uhc_shutdown(const struct device *dev)
Poweroff USB host controller.
Shut down the controller completely to reduce energy consumption or to change the role of the controller.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
• -EALREADY – controller is already uninitialized

Returns
0 on success, all other values should be treated as error.

static inline struct uhc_device_caps uhc_caps(const struct device *dev)
Get USB host controller capabilities.
Obtain the capabilities of the controller such as high speed (HS), and more.

Parameters
• dev – [in] Pointer to device struct of the driver instance
**Returns**
USB host controller capabilities.

```c
struct uhc_transfer

#include <uhc.h>  // UHC endpoint buffer info.

This structure is mandatory for all UHC request. It contains the meta data about the
request and FIFOs to store `net_buf` structures for each request.

The members of this structure should not be used directly by a higher layer (host stack).
```

**Public Members**

```c
sys_dnode_t node
dlist node

uint8_t setup_pkt[8]
Control transfer setup packet.

struct net_buf *buf
Transfer data buffer.

uint8_t addr
Device (peripheral) address.

uint8_t ep
Endpoint to which request is associated.

uint8_t attrib
Endpoint attributes (TBD)

uint16_t mps
Maximum packet size.

uint16_t timeout
Timeout in number of frames.

unsigned int queued
Flag marks request buffer is queued.

unsigned int stage
Control stage status, up to the driver to use it or not.

void *udev
Pointer to USB device (opaque for the UHC)

void *cb
Pointer to transfer completion callback (opaque for the UHC)
int err
    Transfer result, 0 on success, other values on error.

struct uhc_event
    #include <uhc.h> USB host controller event.
    Common structure for all events that originate from the UHC driver and are passed to
    higher layer using message queue and a callback (uhc_event_cb_t) provided by higher
    layer during controller initialization (uhc_init).

    **Public Members**

    **sys_snodet** node
        slist node for the message queue

    enum uhc_event_type type
        Event type.

    int status
        Event status value, if any.

    struct uhc_transfer *xfer
        Pointer to request used only for UHC_EVT_EP_REQUEST.

    const struct device *dev
        Pointer to controller's device struct.

struct uhc_device_caps
    #include <uhc.h> USB host controller capabilities.
    This structure is mainly intended for the USB host stack.

    **Public Members**

    uint32_t hs
        USB high speed capable controller.

struct uhc_data
    #include <uhc.h> Common UHC driver data structure.
    Mandatory structure for each UHC controller driver. To be implemented as device's
    private data (device->data).

    **Public Members**

    struct uhc_device_caps caps
        Controller capabilities.
struct k_mutex mutex
    Driver access mutex.

sys_dlist_t ctrl_xfers
    dlist for control transfers

sys_dlist_t bulk_xfers
    dlist for bulk transfers

uhc_event_cb_t event_cb
    Callback to submit an UHC event to upper layer.

atomic_t status
    USB host controller status.

void *priv
    Driver private data.

USB Power Delivery support

6.5.6 USB-C device stack

The USB-C device stack is a hardware independent interface between a Type-C Port Controller (TCPC) and customer applications. It is a port of the Google ChromeOS Type-C Port Manager (TCPM) stack. It provides the following functionalities:

- Uses the APIs provided by the Type-C Port Controller drivers to interact with the Type-C Port Controller.
- Provides a programming interface that's used by a customer applications. The APIs is described in include/zephyr/usb_c/usbc.h

Currently the device stack supports implementation of Sink only and Source only devices. Dual Role Power (DRP) devices are not yet supported.

List of samples for different purposes.

Implementing a Sink Type-C and Power Delivery USB-C device

The configuration of a USB-C Device is done in the stack layer and devicetree. The following devicetree, structures and callbacks need to be defined:

- Devicetree usb-c-connector node referencing a TCPC
- Devicetree vbus node referencing a VBUS measurement device
- User defined structure that encapsulates application specific data
- Policy callbacks

For example, for the Sample USB-C Sink application:

Each Physical Type-C port is represented in the devicetree by a usb-c-connector compatible node:
port1: usbc-port01 {
    compatible = "usb-c-connector";
    reg = <1>;
    tcpc = <&ucpd1>;
    vbus = <&vbus1>;
    power-role = "sink";
    sink-pdos = <PDO_FIXED(5000, 100, 0)>;
}

VBUS is measured by a device that's referenced in the devicetree by a usb-c-vbus-adc compatible node:

vbus1: vbus {
    compatible = "zephyr,usb-c-vbus-adc";
    io-channels = <&adc2 8>;
    output-ohms = <49900>;
    full-ohms = ((330000 + 49900));
}

A user defined structure is defined and later registered with the subsystem and can be accessed from callback through an API:

```c
/** *
 * @brief A structure that encapsulates Port data.
 */
static struct port0_data_t {
    /** Sink Capabilities */
    uint32_t snk_caps[DT_PROP_LEN(USBC_PORT0_NODE, sink_pdos)];
    /** Number of Sink Capabilities */
    int snk_cap_cnt;
    /** Source Capabilities */
    uint32_t src_caps[PDO_MAX_DATA_OBJECTS];
    /** Number of Source Capabilities */
    int src_cap_cnt;
    /** Power Supply Ready flag */
    atomic_t ps_ready;
} port0_data = {
    .snk_caps = (DT_FOREACH_PROP_ELEM(USBC_PORT0_NODE, sink_pdos, SINK_PDO)),
    .snk_cap_cnt = DT_PROP_LEN(USBC_PORT0_NODE, sink_pdos),
    .src_caps = {0},
    .src_cap_cnt = 0,
    .ps_ready = 0
};
```

These callbacks are used by the subsystem to set or get application specific data:

```c
static int port0_policy_cb_get_snk_cap(const struct device *dev,
                                       uint32_t **pdos,
                                       int *num_pdos)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    *pdos = dpm_data->snk_caps;
    *num_pdos = dpm_data->snk_cap_cnt;
    return 0;
}

static void port0_policy_cb_set_src_cap(const struct device *dev,
                                         const uint32_t *pdos,
                                         const int num_pdos)
```
{  
  struct port0_data_t *dpm_data;
  int num;
  int i;

  dpm_data = usbc_get_dpm_data(dev);
  num = num_pdos;
  if (num > PDO_MAX_DATA_OBJECTS) {
    num = PDO_MAX_DATA_MAXOBJECTS;
  }

  for (i = 0; i < num; i++) {
    dpm_data->src_caps[i] = *(pdos + i);
  }

dpm_data->src_cap_cnt = num;
}

static uint32_t port0_policy_cb_get_rdo(const struct device *dev) {
  struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
  return build_rdo(dpm_data);
}

This callback is used by the subsystem to query if a certain action can be taken:

bool port0_policy_check(const struct device *dev,
                        const enum usbc_policy_check_t policy_check) {
  switch (policy_check) {
    case CHECK_POWER_ROLE_SWAP:    /* Reject power role swaps */
      return false;
    case CHECK_DATA_ROLE_SWAP_TO_DFP: /* Reject data role swap to DFP */
      return false;
    case CHECK_DATA_ROLE_SWAP_TO_UFP: /* Accept data role swap to UFP */
      return true;
    case CHECK_SNK_AT_DEFAULT_LEVEL: /* This device is always at the default power level */
      return true;
    default:                       /* Reject all other policy checks */
      return false;
  }
}

This callback is used by the subsystem to notify the application of an event:

static void port0_notify(const struct device *dev,
                        const enum usbc_policy_notify_t policy_notify) {
  struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
  switch (policy_notify) {
    case PROTOCOL_ERROR:        break;
  }
}
case MSG_DISCARDED:
    break;

case MSG_ACCEPT_RECEIVED:
    break;

case MSG_REJECTED_RECEIVED:
    break;

case MSG_NOT_SUPPORTED_RECEIVED:
    break;

case TRANSITION_PS:
    atomic_set_bit(&dpm_data->ps_ready, 0);
    break;

case PD_CONNECTED:
    break;

case NOT_PD_CONNECTED:
    break;

case POWER_CHANGE_0A0:
    LOG_INF("PWR 0A");
    break;

case POWER_CHANGE_DEF:
    LOG_INF("PWR DEF");
    break;

case POWER_CHANGE_1A5:
    LOG_INF("PWR 1A5");
    break;

case POWER_CHANGE_3A0:
    LOG_INF("PWR 3A0");
    break;

case DATA_ROLE_IS_UFP:
    break;

case DATA_ROLE_IS_DFP:
    break;

case PORT_PARTNER_NOT_RESPONSIVE:
    LOG_INF("Port Partner not PD Capable");
    break;

case SNK_TRANSITION_TO_DEFAULT:
    break;

case HARD_RESET_RECEIVED:
    break;

case SENDER_RESPONSE_TIMEOUT:
    break;

case SOURCE_CAPABILITIES_RECEIVED:
    break;
}

Registering the callbacks:

/* Register USB-C Callbacks */

/* Register Policy Check callback */
usbc_set_policy_cb_check(usbc_port0, port0_policy_check);

/* Register Policy Notify callback */
usbc_set_policy_cb_notify(usbc_port0, port0_notify);

/* Register Policy Get Sink Capabilities callback */
usbc_set_policy_cb_get_snk_cap(usbc_port0, port0_policy_cb_get_snk_cap);

/* Register Policy Set Source Capabilities callback */
usbc_set_policy_cb_set_src_cap(usbc_port0, port0_policy_cb_set_src_cap);

/* Register Policy Get Request Data Object callback */
usbc_set_policy_cb_get_rdo(usbc_port0, port0_policy_cb_get_rdo);

Register the user defined structure:

6.5. USB
Start the USB-C subsystem:

```c
/* Start the USB-C Subsystem */
usbc_start(usbc_port0);
```

Implementing a Source Type-C and Power Delivery USB-C device

The configuration of a USB-C Device is done in the stack layer and devicetree.
Define the following devicetree, structures and callbacks:

- Devicetree `usb-c-connector` node referencing a TCPC
- Devicetree `vbus` node referencing a VBUS measurement device
- User defined structure that encapsulates application specific data
- Policy callbacks

For example, for the Sample USB-C Source application:

Each Physical Type-C port is represented in the devicetree by a `usb-c-connector compatible` node:

```c
port1: usbc-port0 { 
    compatible = "usb-c-connector";
    reg = <1>;
    tcpc = <&ucpd1>;
    vbus = <&vbus1>;
    power-role = "source";
    typec-power-opmode = "3.0A";
    source-pdos = <PDO_FIXED(5000, 100, 0) PDO_FIXED(9000, 100, 0) PDO_
        FIXED(15000, 100, 0)>;
}
```

VBUS is measured by a device that's referenced in the devicetree by a `usb-c-vbus-adc compatible` node:

```c
vbus1: vbus {
    compatible = "zephyr,usb-c-vbus-adc";
    io-channels = <&adc1 9>;
    output-ohms = <49000>;
    full-ohms = <(330000 + 49000)>

    /* Pin B13 is used to control VBUS Discharge for Port1 */
    discharge-gpios = <&gpiob 13 GPIO_ACTIVE_HIGH>;
}
```

A user defined structure is defined and later registered with the subsystem and can be accessed from callback through an API:

```c
/**
 * @brief A structure that encapsulates Port data.
 */
static struct port0_data_t {
    /** Source Capabilities */
    uint32_t src_caps[DT_PROP_LEN(USBC_PORT0_NODE, source_pdos)];
    /** Number of Source Capabilities */
    ... (continues on next page)
```
These callbacks are used by the subsystem to set or get application specific data:

```c
/**
 * @brief PE calls this function when it needs to set the Rp on CC
 */
int port0_policy_cb_get_src_rp(const struct device *dev,
                               enum tc_rp_value *rp)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    *rp = dpm_data->rp;
    return 0;
}

/**
 * @brief PE calls this function to Enable (5V) or Disable (0V) the Power Supply
 */
int port0_policy_cb_src_en(const struct device *dev, bool en)
{
    source_ctrl_set(en ? SOURCE_5V : SOURCE_0V);
    return 0;
}

/**
 * @brief PE calls this function to Enable or Disable VCONN
 */
int port0_policy_cb_vconn_en(const struct device *dev, enum tc_cc_polarity pol, bool en)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    dpm_data->vconn_pol = pol;
    if (en == false) {
        /* Disable VCONN on CC1 and CC2 */
        vconn_ctrl_set(VCONN_OFF);
    } else if (pol == TC_POLARITY_CC1) {
(continues on next page)
/* set VCONN on CC1 */
vconn_ctrl_set(VCONN1_ON);
}
else {
/* set VCONN on CC2 */
vconn_ctrl_set(VCONN2_ON);
}
return 0;
/**
 * @brief PE calls this function to get the Source Caps that will be sent
 * to the Sink
 */
int port0_policy_cb_get_src_caps(const struct device *dev,
    const uint32_t **pdos, uint32_t *num_pdos)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    *pdos = dpm_data->src_caps;
    *num_pdos = dpm_data->src_cap_cnt;
    return 0;
}
/**
 * @brief PE calls this function to verify that a Sink's request if valid
 */
static enum usbc_snk_req_reply_t port0_policy_cb_check_sink_request(const struct device *dev,
    const uint32_t request_msg)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    union pd_fixed_supply_pdo_source pdo;
    uint32_t obj_pos;
    uint32_t op_current;
    dpm_data->sink_request.raw_value = request_msg;
    obj_pos = dpm_data->sink_request.fixed.object_pos;
    op_current = PD_CONVERT_FIXED_PDO_CURRENT_TO_MA(dpm_data->sink_request.fixed.operating_-
        current);
    if (obj_pos == 0 || obj_pos > dpm_data->src_cap_cnt) {
        return SNK_REQUEST_REJECT;
    }
    pdo.raw_value = dpm_data->src_caps[obj_pos - 1];
    if (dpm_data->sink_request.fixed.operating_current > pdo.max_current) {
        return SNK_REQUEST_REJECT;
    }
    dpm_data->obj_pos = obj_pos;
    atomic_set_bit(&port0_data.show_sink_request, 0);
    /* Clear PS ready. This will be set to true after PS is ready after
    * it transitions to the new level.
    */
    port0_data.ps_ready = false;
}
return SNK_REQUEST_VALID;
}

/**
 * @brief PE calls this function to check if the Power Supply is at the requested level
 */
static bool port0_policy_cb_is_ps_ready(const struct device *dev) {
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    /* Return true to inform that the Power Supply is ready */
    return dpm_data->ps_ready;
}

/**
 * @brief PE calls this function to check if the Present Contract is still valid
 */
static bool port0_policy_cb_present_contract_is_valid(const struct device *dev,
                                                       const uint32_t present_contract) {
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    union pd_fixed_supply_pdo_source pdo;
    union pd_rdo request;
    uint32_t obj_pos;
    uint32_t op_current;

    request.raw_value = present_contract;
    obj_pos = request.fixed.object_pos;
    op_current = PD_CONVERT_FIXED_PDO_CURRENT_TO_MA(request.fixed.operating_current);

    if (obj_pos == 0 || obj_pos > dpm_data->src_cap_cnt) {
        return false;
    }

    pdo.raw_value = dpm_data->src_caps[obj_pos - 1];

    if (request.fixed.operating_current > pdo.max_current) {
        return false;
    }

    return true;
}

This callback is used by the subsystem to query if a certain action can be taken:

bool port0_policy_check(const struct device *dev,
                        const enum usbc_policy_check_t policy_check) {
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);

    switch (policy_check) {
    case CHECK_POWER_ROLE_SWAP:
        /* Reject power role swaps */
        return false;
    case CHECK_DATA_ROLE_SWAP_TO_DFP:
        /* Accept data role swap to DFP */

This callback is used by the subsystem to notify the application of an event:

```c
static void port0_notify(const struct device *dev,
                         const enum usbc_policy_notify_t policy_notify)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    switch (policy_notify) {
    case PROTOCOL_ERROR:
        break;
    case MSG_DISCARDED:
        break;
    case MSG_ACCEPT_RECEIVED:
        break;
    case MSG_REJECTED_RECEIVED:
        break;
    case MSG_NOT_SUPPORTED_RECEIVED:
        break;
    case TRANSITION_PS:
        dpm_data->ps_tran_start = true;
        break;
    case PD_CONNECTED:
        break;
    case NOT_PD_CONNECTED:
        break;
    case DATA_ROLE_IS_UFP:
        break;
    case DATA_ROLE_IS_DFP:
        break;
    case PORT_PARTNER_NOT_RESPONSIVE:
        LOG_INF("Port Partner not PD Capable");
        break;
    case HARD_RESET_RECEIVED:
        /*
         * This notification is sent from the PE_SRC_Transition_to_default
         * state and requires the following:
         * 1: Vconn should be turned OFF
         */
    }
    return true;
    case CHECK_DATA_ROLE_SWAP_TO_UFP:
        /* Reject data role swap to UFP */
        return false;
    case CHECK_SRC_PS_AT_DEFAULT_LEVEL:
        /* This check is sent from the PE_SRC_Transition_to_default
         * state and requires the following:
         * 1: Vconn should be turned ON
         * 2: Return TRUE when Power Supply is at default level
         */
        /* Power on VCONN */
        vconn_ctrl_set(dpm_data->vconn_pol);
        /* PS should be at default level after receiving a Hard Reset */
        return true;
    default:
        /* Reject all other policy checks */
        return false;
    }
```
* 2: Reset of the local hardware
*/

/* Power off VCONN */
vconn_ctrl_set(VCONN_OFF);
/* Transition PS to Default level */
source_ctrl_set(SOURCE_5V);
buzz

default:
} }

Registering the callbacks:

/* Register USBC Callbacks */

/* Register Policy Check callback */
usbc_set_policy_cb_check(usbc_port0, port0_policy_check);
/* Register Policy Notify callback */
usbc_set_policy_cb_notify(usbc_port0, port0_notify);
/* Register Policy callback to set the Rp on CC lines */
usbc_set_policy_cb_get_src_rp(usbc_port0, port0_policy_cb_get_src_rp);
/* Register Policy callback to enable or disable power supply */
usbc_set_policy_cb_src_en(usbc_port0, port0_policy_cb_src_en);
/* Register Policy callback to enable or disable vconn */
usbc_set_vconn_control_cb(usbc_port0, port0_policy_cb_vconn_en);
/* Register Policy callback to send the source caps to the sink */
usbc_set_policy_cb_get_src_caps(usbc_port0, port0_policy_cb_get_src_caps);
/* Register Policy callback to check if the sink request is valid */
usbc_set_policy_cb_check_sink_request(usbc_port0, port0_policy_cb_check_sink_request);
/* Register Policy callback to check if the power supply is ready */
usbc_set_policy_cb_is_ps_ready(usbc_port0, port0_policy_cb_is_ps_ready);
/* Register Policy callback to check if Present Contract is still valid */
usbc_set_policy_cb_present_contract_is_valid(usbc_port0,
  port0_policy_cb_present_contract_is_valid);

Register the user defined structure:

/* Set Application port data object. This object is passed to the policy callbacks */
usbc_set_dpm_data(usbc_port0, &port0_data);

Start the USB-C subsystem:

/* Start the USB-C Subsystem */
usbc_start(usbc_port0);

API reference

Related code samples

Basic USB-C Sink
Implement a USB-C Power Delivery application in the form of a USB-C Sink.

Basic USB-C Source
Implement a USB-C Power Delivery application in the form of a USB-C Source.

group _usbc_device_api
USB-C Device APIs.

**Defines**

**FIXED\_5V\_100MA\_RDO**

This Request Data Object (RDO) value can be returned from the `policy_cb_get_rdo` if 5V@100mA with the following options are sufficient for the Sink to operate.

The RDO is configured as follows: Maximum operating current 100mA Operating current 100mA Unchunked Extended Messages Not Supported No USB Suspend Not USB Communications Capable No capability mismatch Don’t giveback Object position 1 (5V PDO)

** Enums**

```c
enum usbc_policy_request_t

Device Policy Manager requests.

Values:

enumerator REQUEST\_NOP

No request.

enumerator REQUEST\_TC\_DISABLED

Request Type-C layer to transition to Disabled State.

enumerator REQUEST\_TC\_ERROR\_RECOVERY

Request Type-C layer to transition to Error Recovery State.

enumerator REQUEST\_TC\_END

End of Type-C requests.

enumerator REQUEST\_PE\_DR\_SWAP

Request Policy Engine layer to perform a Data Role Swap.

enumerator REQUEST\_PE\_HARD\_RESET\_SEND

Request Policy Engine layer to send a hard reset.

enumerator REQUEST\_PE\_SOFT\_RESET\_SEND

Request Policy Engine layer to send a soft reset.

enumerator REQUEST\_PE\_GET\_SRC\_CAPS

Request Policy Engine layer to get Source Capabilities from port partner.

enumerator REQUEST\_GET\_SNK\_CAPS

Request Policy Engine to get Sink Capabilities from port partner.
```
enumerator REQUEST_PE_GOTO_MIN
   Request Policy Engine to request the port partner to source minimum power.

enum usbc_policy_notify_t
   Device Policy Manager notifications.
   Values:

   enumerator MSG_ACCEPT_RECEIVED
      Power Delivery Accept message was received.

   enumerator MSG_REJECTED_RECEIVED
      Power Delivery Reject message was received.

   enumerator MSG_DISCARDED
      Power Delivery discarded the message being transmitted.

   enumerator MSG_NOT_SUPPORTED_RECEIVED
      Power Delivery Not Supported message was received.

   enumerator DATA_ROLE_IS_UFP
      Data Role has been set to Upstream Facing Port (UFP)

   enumerator DATA_ROLE_IS_DFP
      Data Role has been set to Downstream Facing Port (DFP)

   enumerator PD_CONNECTED
      A PD Explicit Contract is in place.

   enumerator NOT_PD_CONNECTED
      No PD Explicit Contract is in place.

   enumerator TRANSITION_PS
      Transition the Power Supply.

   enumerator PORT_PARTNER_NOT_RESPONSIVE
      Port partner is not responsive.

   enumerator PROTOCOL_ERROR
      Protocol Error occurred.

   enumerator SNK_TRANSITION_TO_DEFAULT
      Transition the Sink to default.

   enumerator HARD_RESET_RECEIVED
      Hard Reset Received.

   enumerator POWER_CHANGE_0A0
      Sink SubPower state at 0V.

6.5. USB
enumerator **POWER_CHANGE_DEF**
    Sink SubPower state a 5V / 500mA.

enumerator **POWER_CHANGE_1A5**
    Sink SubPower state a 5V / 1.5A.

enumerator **POWER_CHANGE_3A0**
    Sink SubPower state a 5V / 3A.

enumerator **SENDER_RESPONSE_TIMEOUT**
    Sender Response Timeout.

enumerator **SOURCE_CAPABILITIES_RECEIVED**
    Source Capabilities Received.

**enum usbc_policy_check_t**

    Device Policy Manager checks.

    **Values:**

    enumerator **CHECK_POWER_ROLE_SWAP**
        Check if Power Role Swap is allowed.

    enumerator **CHECK_DATA_ROLE_SWAP_TO_DFP**
        Check if Data Role Swap to DFP is allowed.

    enumerator **CHECK_DATA_ROLE_SWAP_TO_UFP**
        Check if Data Role Swap to UFP is allowed.

    enumerator **CHECK_SNK_AT_DEFAULT_LEVEL**
        Check if Sink is at default level.

    enumerator **CHECK_VCONN_CONTROL**
        Check if should control VCONN.

    enumerator **CHECK_SRC_PS_AT_DEFAULT_LEVEL**
        Check if Source Power Supply is at default level.

**enum usbc_policy_wait_t**

    Device Policy Manager Wait message notifications.

    **Values:**

    enumerator **WAIT_SINK_REQUEST**
        The port partner is unable to meet the sink request at this time.

    enumerator **WAIT_POWER_ROLE_SWAP**
        The port partner is unable to do a Power Role Swap at this time.
enumerator WAIT_DATA_ROLE_SWAP
The port partner is unable to do a Data Role Swap at this time.

enumerator WAIT_VCONN_SWAP
The port partner is unable to do a VCONN Swap at this time.

enum usbc_snk_req_reply_t
Device Policy Manager's response to a Sink Request.
Values:

enumerator SNK_REQUEST_VALID
The sink port partner’s request can be met.

counterpart
enumerator SNK_REQUEST_REJECT
The sink port partner’s request can not be met.

counterpart
enumerator SNK_REQUEST_WAIT
The sink port partner’s request can be met at a later time.

**Functions**

```c
int usbc_start(const struct device *dev)
Start the USB-C Subsystem.

**Parameters**

- dev – Runtime device structure

**Return values**

0 – on success
```

```c
int usbc_suspend(const struct device *dev)
Suspend the USB-C Subsystem.

**Parameters**

- dev – Runtime device structure

**Return values**

0 – on success
```

```c
int usbc_request(const struct device *dev, const enum usbc_policy_request_t req)
Make a request of the USB-C Subsystem.

**Parameters**

- dev – Runtime device structure
- req – request

**Return values**

0 – on success
```

```c
void usbc_bypass_next_sleep(const struct device *dev)
```
void usbc_set_dpm_data(const struct device *dev, void *dpm_data)
Set pointer to Device Policy Manager (DPM) data.

Parameters
• dev – Runtime device structure
• dpm_data – pointer to dpm data

void *usbc_get_dpm_data(const struct device *dev)
Get pointer to Device Policy Manager (DPM) data.

Parameters
• dev – Runtime device structure

Return values
• pointer – to dpm data that was set with usbc_set_dpm_data
• NULL – if dpm data was not set

void usbc_set_vconn_control_cb(const struct device *dev, const tcpc_vconn_control_cb_t cb)
Set the callback used to set VCONN control.

Parameters
• dev – Runtime device structure
• cb – VCONN control callback

void usbc_set_vconn_discharge_cb(const struct device *dev, const tcpc_vconn_discharge_cb_t cb)
Set the callback used to discharge VCONN.

Parameters
• dev – Runtime device structure
• cb – VCONN discharge callback

void usbc_set_policy_cb_check(const struct device *dev, const policy_cb_check_t cb)
Set the callback used to check a policy.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_notify(const struct device *dev, const policy_cb_notify_t cb)
Set the callback used to notify Device Policy Manager of a policy change.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_wait_notify(const struct device *dev, const policy_cb_wait_notify_t cb)
Set the callback used to notify Device Policy Manager of WAIT message reception.

Parameters
• dev – Runtime device structure
• cb – callback
void usbc_set_policy_cb_get_snk_cap(const struct device *dev, const policy_cb_get_snk_cap_t cb)

Set the callback used to get the Sink Capabilities.

**Parameters**
- dev – Runtime device structure
- cb – callback

void usbc_set_policy_cb_set_src_cap(const struct device *dev, const policy_cb_set_src_cap_t cb)

Set the callback used to store the received Port Partner’s Source Capabilities.

**Parameters**
- dev – Runtime device structure
- cb – callback

void usbc_set_policy_cb_get_rdo(const struct device *dev, const policy_cb_get_rdo_t cb)

Set the callback used to get the Request Data Object (RDO)

**Parameters**
- dev – Runtime device structure
- cb – callback

void usbc_set_policy_cb_is_snk_at_default(const struct device *dev, const policy_cb_is_snk_at_default_t cb)

Set the callback used to check if the sink power supply is at the default level.

**Parameters**
- dev – Runtime device structure
- cb – callback

void usbc_set_policy_cb_get_src_rp(const struct device *dev, const policy_cb_get_src_rp_t cb)

Set the callback used to get the Rp value that should be placed on the CC lines.

**Parameters**
- dev – USB-C Connector Instance
- cb – callback

void usbc_set_policy_cb_src_en(const struct device *dev, const policy_cb_src_en_t cb)

Set the callback used to enable VBUS.

**Parameters**
- dev – USB-C Connector Instance
- cb – callback

void usbc_set_policy_cb_get_src_caps(const struct device *dev, const policy_cb_get_src_caps_t cb)

Set the callback used to get the Source Capabilities from the Device Policy Manager.

**Parameters**
- dev – USB-C Connector Instance
- cb – callback
void usbc_set_policy_cb_check_sink_request(const struct device *dev, const policy_cb_check_sink_request_t cb)

Set the callback used to check if Sink request is valid.

Parameters
• dev – USB-C Connector Instance
• cb – callback

void usbc_set_policy_cb_is_ps_ready(const struct device *dev, const policy_cb_is_ps_ready_t cb)

Set the callback used to check if Source Power Supply is ready.

Parameters
• dev – USB-C Connector Instance
• cb – callback

void usbc_set_policy_cb_present_contract_is_valid(const struct device *dev, const policy_cb_present_contract_is_valid_t cb)

Set the callback to check if present Contract is still valid.

Parameters
• dev – USB-C Connector Instance
• cb – callback

void usbc_set_policy_cb_change_src_caps(const struct device *dev, const policy_cb_change_src_caps_t cb)

Set the callback used to request that a different set of Source Caps be sent to the Sink.

Parameters
• dev – USB-C Connector Instance
• cb – callback

void usbc_set_policy_cb_set_port_partner_snk_cap(const struct device *dev, const policy_cb_set_port_partner_snk_cap_t cb)

Set the callback used to store the Capabilities received from a Sink Port Partner.

Parameters
• dev – USB-C Connector Instance
• cb – callback

SINK callback reference

group sink_callbacks

Typedefs

typedef int (*policy_cb_get_snk_cap_t)(const struct device *dev, uint32_t **pdos, int *num_pdos)

Callback type used to get the Sink Capabilities.
Param dev
USB-C Connector Instance

Param pdos
pointer where pdos are stored

Param num_pdos
pointer where number of pdos is stored

Return
0 on success

typedef void (*policy_cb_set_src_cap_t)(const struct device *dev, const uint32_t *pdos, const int num_pdos)
Callback type used to report the received Port Partner's Source Capabilities.

Param dev
USB-C Connector Instance

Param pdos
pointer to the partner's source pdos

Param num_pdos
number of source pdos

typedef bool (*policy_cb_check_t)(const struct device *dev, const enum usbc_policy_check_t policy_check)
Callback type used to check a policy.

Param dev
USB-C Connector Instance

Param policy_check
policy to check

Return
true if policy is currently allowed by the device policy manager

typedef bool (*policy_cb_wait_notify_t)(const struct device *dev, const enum usbc_policy_wait_t wait_notify)
Callback type used to notify Device Policy Manager of WAIT message reception.

Param dev
USB-C Connector Instance

Param wait_notify
wait notification

Return
return true if the PE should wait and resend the message

typedef void (*policy_cb_notify_t)(const struct device *dev, const enum usbc_policy_notify_t policy_notify)
Callback type used to notify Device Policy Manager of a policy change.

Param dev
USB-C Connector Instance

Param policy_notify
policy notification

typedef uint32_t (*policy_cb_get_rdo_t)(const struct device *dev)
Callback type used to get the Request Data Object (RDO)
typedef bool (*policy_cb_is_snk_at_default_t)(const struct device *dev)
Callback type used to check if the sink power supply is at the default level.

Param dev
USB-C Connector Instance

Return
RDO

true if power supply is at default level

SOURCE callback reference

group source_callbacks

Typedefs

typedef int (*policy_cb_get_src_caps_t)(const struct device *dev, const uint32_t **pdos, uint32_t *num_pdos)
Callback type used to get the Source Capabilities from the Device Policy Manager.

Param dev
USB-C Connector Instance

Param pdos
pointer to source capability pdos

Param num_pdos
pointer to number of source capability pdos

Return
0 on success

typedef enum usbc_snk_req_reply_t (*policy_cb_check_sink_request_t)(const struct device *dev, const uint32_t request_msg)
Callback type used to check if Sink request is valid.

Param dev
USB-C Connector Instance

Param request_msg
request message to check

Return
sink request reply

true if power supply is ready, else false
typedef bool (*policy_cb_present_contract_is_valid_t)(const struct device *dev, const uint32_t present_contract)

Callback type used to check if present Contract is still valid.

**Param dev**
USB-C Connector Instance

**Param present_contract**
present contract

**Return**
true if present contract is still valid

typedef bool (*policy_cb_change_src_caps_t)(const struct device *dev)

Callback type used to request that a different set of Source Caps be sent to the Sink.

**Param dev**
USB-C Connector Instance

**Return**
true if a different set of Cource Caps is available

typedef void (*policy_cb_set_port_partner_snk_cap_t)(const struct device *dev, const uint32_t *pdos, const int num_pdos)

Callback type used to report the Capabilities received from a Sink Port Partner.

**Param dev**
USB-C Connector Instance

**Param pdos**
pointer to sink cap pdos

**Param num_pdos**
number of sink cap pdos

typedef int (*policy_cb_get_src_rp_t)(const struct device *dev, enum tc_rp_value *rp)

Callback type used to get the Rp value that should be placed on the CC lines.

**Param dev**
USB-C Connector Instance

**Param rp**
rp value

**Return**
0 on success

typedef int (*policy_cb_src_en_t)(const struct device *dev, bool en)

Callback type used to enable VBUS.

**Param dev**
USB-C Connector Instance

**Param en**
true if VBUS should be enabled, else false to disable it

**Return**
0 on success

**Common sections related to USB support**

6.5. USB
6.5.7 Human Interface Devices (HID)

Common USB HID part that can be used outside of USB support, defined in header file include/zephyr/usb/class/hid.h.

HID items reference

group usb_hid_items

Defines
**HID_ITEM**\((bTag, bType, bSize)\)
Define HID short item.

**Parameters**
- \(bTag\) – Item tag
- \(bType\) – Item type
- \(bSize\) – Item data size

**Returns**
HID Input item

**HID_INPUT**\((a)\)
Define HID Input item with the data length of one byte.

For usage examples, see \(HID_MOUSE_REPORT_DESC(),\)
\(HID_KEYBOARD_REPORT_DESC()\)

**Parameters**
- \(a\) – Input item data

**Returns**
HID Input item

**HID_OUTPUT**\((a)\)
Define HID Output item with the data length of one byte.

For usage examples, see \(HID_KEYBOARD_REPORT_DESC()\)

**Parameters**
- \(a\) – Output item data

**Returns**
HID Output item

**HID_FEATURE**\((a)\)
Define HID Feature item with the data length of one byte.

**Parameters**
- \(a\) – Feature item data

**Returns**
HID Feature item

**HID_COLLECTION**\((a)\)
Define HID Collection item with the data length of one byte.

For usage examples, see \(HID_MOUSE_REPORT_DESC(),\)
\(HID_KEYBOARD_REPORT_DESC()\)

**Parameters**
- \(a\) – Collection item data

**Returns**
HID Collection item

**HID_END_COLLECTION**
Define HID End Collection (non-data) item.

For usage examples, see \(HID_MOUSE_REPORT_DESC(),\)
\(HID_KEYBOARD_REPORT_DESC()\)
Returns
HID End Collection item

HID_USAGE_PAGE(page)
Define HID Usage Page item.
For usage examples, see $HID_MOUSE_REPORT_DESC()$, $HID_KEYBOARD_REPORT_DESC()$

Parameters
• page – Usage Page

Returns
HID Usage Page item

HID_LOGICAL_MIN8(a)
Define HID Logical Minimum item with the data length of one byte.
For usage examples, see $HID_MOUSE_REPORT_DESC()$, $HID_KEYBOARD_REPORT_DESC()$

Parameters
• a – Minimum value in logical units

Returns
HID Logical Minimum item

HID_LOGICAL_MAX8(a)
Define HID Logical Maximum item with the data length of one byte.
For usage examples, see $HID_MOUSE_REPORT_DESC()$, $HID_KEYBOARD_REPORT_DESC()$

Parameters
• a – Maximum value in logical units

Returns
HID Logical Maximum item

HID_LOGICAL_MIN16(a, b)
Define HID Logical Minimum item with the data length of two bytes.

Parameters
• a – Minimum value lower byte
• b – Minimum value higher byte

Returns
HID Logical Minimum item

HID_LOGICAL_MAX16(a, b)
Define HID Logical Maximum item with the data length of two bytes.

Parameters
• a – Minimum value lower byte
• b – Minimum value higher byte

Returns
HID Logical Maximum item

HID_LOGICAL_MIN32(a, b, c, d)
Define HID Logical Minimum item with the data length of four bytes.

Parameters
• \(a\) – Minimum value lower byte
• \(b\) – Minimum value low middle byte
• \(c\) – Minimum value high middle byte
• \(d\) – Minimum value higher byte

**Returns**
HID Logical Minimum item

HID_LOGICAL_MAX32\(\(a, b, c, d\)\)
Define HID Logical Maximum item with the data length of four bytes.

**Parameters**
• \(a\) – Minimum value lower byte
• \(b\) – Minimum value low middle byte
• \(c\) – Minimum value high middle byte
• \(d\) – Minimum value higher byte

**Returns**
HID Logical Maximum item

HID_REPORT_SIZE\(\text{size}\)\)
Define HID Report Size item with the data length of one byte.

For usage examples, see `HID_MOUSE_REPORT_DESC()`, `HID_KEYBOARD_REPORT_DESC()`

**Parameters**
• \(\text{size}\) – Report field size in bits

**Returns**
HID Report Size item

HID_REPORT_ID\(\text{id}\)
Define HID Report ID item with the data length of one byte.

**Parameters**
• \(\text{id}\) – Report ID

**Returns**
HID Report ID item

HID_REPORT_COUNT\(\text{count}\)
Define HID Report Count item with the data length of one byte.

For usage examples, see `HID_MOUSE_REPORT_DESC()`, `HID_KEYBOARD_REPORT_DESC()`

**Parameters**
• \(\text{count}\) – Number of data fields included in the report

**Returns**
HID Report Count item

HID_USAGE\(\text{idx}\)
Define HID Usage Index item with the data length of one byte.

For usage examples, see `HID_MOUSE_REPORT_DESC()`, `HID_KEYBOARD_REPORT_DESC()`

**Parameters**
• $$\text{idx}$$ – Number of data fields included in the report

**Returns**
HID Usage Index item

**HID_USAGE_MIN8(a)**
Define HID Usage Minimum item with the data length of one byte.
For usage examples, see `HID_MOUSE_REPORT_DESC()`, `HID_KEYBOARD_REPORT_DESC()`

**Parameters**
• $$a$$ – Starting Usage

**Returns**
HID Usage Minimum item

**HID_USAGE_MAX8(a)**
Define HID Usage Maximum item with the data length of one byte.
For usage examples, see `HID_MOUSE_REPORT_DESC()`, `HID_KEYBOARD_REPORT_DESC()`

**Parameters**
• $$a$$ – Ending Usage

**Returns**
HID Usage Minimum item

**HID_USAGE_MIN16(a, b)**
Define HID Usage Minimum item with the data length of two bytes.
For usage examples, see `HID_MOUSE_REPORT_DESC()`, `HID_KEYBOARD_REPORT_DESC()`

**Parameters**
• $$a$$ – Starting Usage lower byte
• $$b$$ – Starting Usage higher byte

**Returns**
HID Usage Minimum item

**HID_USAGE_MAX16(a, b)**
Define HID Usage Maximum item with the data length of two bytes.
For usage examples, see `HID_MOUSE_REPORT_DESC()`, `HID_KEYBOARD_REPORT_DESC()`

**Parameters**
• $$a$$ – Ending Usage lower byte
• $$b$$ – Ending Usage higher byte

**Returns**
HID Usage Maximum item

**HID Mouse and Keyboard report descriptors**

The pre-defined Mouse and Keyboard report descriptors can be used by a HID device implementation or simply as examples.

`group usb_hid_mk_report_desc`
Defines

HID_MOUSE_REPORT_DESC(bcnt)

Simple HID mouse report descriptor for n button mouse.

Parameters

• bcnt – Button count. Allowed values from 1 to 8.

HID_KEYBOARD_REPORT_DESC()

Simple HID keyboard report descriptor.

 Enums

define hid_kbd_code

HID keyboard button codes.

Values:

enumerator HID_KEY_A = 4
enumerator HID_KEY_B = 5
enumerator HID_KEY_C = 6
enumerator HID_KEY_D = 7
enumerator HID_KEY_E = 8
enumerator HID_KEY_F = 9

Hardware Support

7.1 Architecture-related Guides

7.1.1 Zephyr support status on ARC processors

Overview

This page describes current state of Zephyr for ARC processors and some future plans. Please note that

- plans are given without exact deadlines
- software features require corresponding hardware to be present and configured the proper way
- not all the features can be enabled at the same time

Support status

Legend: Y - yes, supported; N - no, not supported; WIP - Work In Progress; TBD - to be decided
### Processor families

### Notes

#### 7.1.2 Arm Cortex-M Developer Guide

**Overview**

This page contains detailed information about the status of the Arm Cortex-M architecture porting in the Zephyr RTOS and describes key aspects when developing Zephyr applications for Arm Cortex-M-based platforms.

---

¹ usage of CCMs is limited on SMP systems
² except the systems with secure features (SecureShield) due to HW limitation
³ We only support save/restore ACCL/ACCH registers in task's context. Rest of DSP/AGU registers save/restore isn't implemented but kernel itself does not use these registers. This allows single task per core to use DSP/AGU safely.
⁴ QEMU doesn’t support all the ARC processor’s HW features. For the detailed info please check the ARC QEMU documentation
⁵ Single-thread kernel is support only for single core targets
Key supported features

The table below summarizes the status of key OS features in the different Arm Cortex-M implementation variants.

Notes

OS features

Threads

Thread stack alignment Each Zephyr thread is defined with its own stack memory. By default, Cortex-M enforces a double word thread stack alignment, see CONFIG_STACK_ALIGN_DOUBLE_WORD. If MPU-based HW-assisted stack overflow detection (CONFIG_MPU_STACK_GUARD) is enabled, thread stacks need to be aligned with a larger value, reflected by CONFIG_ARM_MPU_REGION_MIN_ALIGN_AND_SIZE. In Arm v6-M and Arm v7-M architecture variants, thread stacks are additionally required to be align with a value equal to their size, in applications that need to support user mode (CONFIG_USERSPACE). The thread stack sizes in that case need to be a power of two. This is all reflected by CONFIG_MPU_REQUIRES_POWER_OF_TWO_ALIGNMENT, that is enforced in Arm v6-M and Arm v7-M builds with user mode support.

Stack pointers While executing in thread mode the processor is using the Process Stack Pointer (PSP). The processor uses the Main Stack Pointer (MSP) while executing in handler mode, that is, while servicing exceptions and HW interrupts. Using PSP in thread mode facilitates thread stack pointer manipulation during thread context switching, without affecting the current execution context flow in handler mode.

In Arm Cortex-M builds a single interrupt stack memory is shared among exceptions and interrupts. The size of the interrupt stack needs to be selected taking into consideration nested interrupts, each pushing an additional stack frame. Developers can modify the interrupt stack size using CONFIG_ISR_STACK_SIZE.

The interrupt stack is also used during early boot so the kernel can initialize the main thread's stack before switching to the main thread.

Thread context switching In Arm Cortex-M builds, the PendSV exception is used in order to trigger a context switch to a different thread. PendSV exception is always present in Cortex-M implementations. PendSV is configured with the lowest possible interrupt priority level, in all Cortex-M variants. The main reasons for that design are

- to utilize the tail chaining feature of Cortex-M processors, and thus limit the number of context switch operations that occur.
- to not impact the interrupt latency observed by HW interrupts.

As a result, context switch in Cortex-M is non-atomic, i.e. it may be preempted by HW interrupts, however, a context-switch operation must be completed before a new thread context-switch may start.

Typically a thread context-switch will perform the following operations

- When switching-out the current thread, the processor stores
  - the callee-saved registers (R4 - R11) in the thread's container for callee-saved registers, which is located in kernel memory
  - the thread's current operation mode
    * user or privileged execution mode
    * presence of an active floating point context
    * the EXC_RETURN value of the current handler context (PendSV)

---

1 SysTick is optional in Cortex-M1
2 Stack limit checking only in Secure builds in Cortex-M23
the floating point callee-saved registers (S16 - S31) in the thread's container for FP callee-saved registers, if the current thread has an active FP context

- the PSP of the current thread which points to the beginning of the current thread's exception stack frame. The latter contains the caller-saved context and the return address of the switched-out thread.

- When switching-in a new thread the processor

  - restores the new thread's callee-saved registers from the thread's container for callee-saved registers
  - restores the new thread's operation mode
  - restores the FP callee-saved registers if the switched-in thread had an active FP context before being switched-out
  - re-programs the dynamic MPU regions to allow a user thread access its stack and application memories, and/or programs a stack-overflow MPU guard at the bottom of the thread's privileged stack
  - restores the PSP for the incoming thread and re-programs the stack pointer limit register (if applicable, see CONFIG_BUILTIN_STACK_GUARD)
  - optionally does a stack limit checking for the switched-in thread, if sentinel-based stack limit checking is enabled (see CONFIG_STACK_SENTINEL).

PendSV exception return sequence restores the new thread's caller-saved registers and the return address, as part of unstacking the exception stack frame.

The implementation of the context-switch mechanism is present in arch/arm/core/swap_helper.s.

Stack limit checking (Arm v8-M) Armv8-M and Armv8.1-M variants support stack limit checking using the MSPLIM and PSPLIM core registers. The feature is enabled when CONFIG_BUILTIN_STACK_GUARD is set. When stack limit checking is enabled, both the thread's privileged or user stack, as well as the interrupt stack are guarded by PSPLIM and MSPLIM registers, respectively. MSPLIM is configured once during kernel boot, while PSLIM is re-programmed during every thread context-switch or during system calls, when the thread switches from using its default stack to using its privileged stack, and vice versa. PSPLIM re-programming

  - has a relatively low runtime overhead (programming is done with MSR instructions)
  - does not impact interrupt latency
  - does not require any memory areas to be reserved for stack guards
  - does not make use of MPU regions

It is, therefore, considered as a lightweight but very efficient stack overflow detection mechanism in Cortex-M applications.

Stack overflows trigger the dedicated UsageFault exception provided by Arm v8-M.

Interrupt handling features This section describes certain aspects around exception and interrupt handling in Arm Cortex-M.

Interrupt priority levels The number of available (configurable) interrupt priority levels is determined by the number of implemented interrupt priority bits in NVIC; this needs to be described for each Cortex-M platform using DeviceTree.
Reserved priority levels  A number of interrupt priority levels are reserved for the OS.

By design, system fault exceptions have the highest priority level. In Baseline Cortex-M, this is actually enforced by hardware, as HardFault is the only available processor fault exception, and its priority is higher than any configurable exception priority.

In Mainline Cortex-M, the available fault exceptions (e.g. MemManageFault, UsageFault, etc.) are assigned the highest configurable priority level. (CONFIG_CPU_CORTEX_M_HAS_PROGRAMMABLEFAULT_PRIOS signifies explicitly that the Cortex-M implementation supports configurable fault priorities.)

This priority level is never shared with HW interrupts (an exception to this rule is described below). As a result, processor faults occurring in regular ISRs will be handled by the corresponding fault handler and will not escalate to a HardFault, similar to processor faults occurring in thread mode.

SVC exception is normally configured with the highest configurable priority level (an exception to this rule will be described below). SVCs are used by the Zephyr kernel to dispatch system calls, trigger runtime system errors (e.g. Kernel oops or panic), or implement IRQ offloading.

In Baseline Cortex-M the priority level of SVC may be shared with other exceptions or HW interrupts that are also given the highest configurable priority level (As a result of this, kernel runtime errors during interrupt handling will escalate to HardFault. Additional logic in the fault handling routines ensures that such runtime errors are detected successfully).

In Mainline Cortex-M, however, the SVC priority level is reserved, thus normally it is only shared with the fault exceptions of configurable priority. This simplifies the fault handling routines in Mainline Cortex-M architecture, since runtime kernel errors are serviced by the SVC handler (i.e no HardFault escalation, even if the kernel errors occur in ISR context).

HW interrupts in Mainline Cortex-M builds are allocated a priority level lower than the SVC.

One exception to the above rules is when Zephyr applications support Zero Latency Interrupts (ZLIs). Such interrupts are designed to have a priority level higher than any HW or system interrupt. If the ZLI feature is enabled in Mainline Cortex-M builds (see CONFIG_ZERO_LATENCY_IRQS), then

- ZLIs are assigned the highest configurable priority level
- SVCs are assigned the second highest configurable priority level
- Regular HW interrupts are assigned priority levels lower than SVC.

The priority level configuration in Cortex-M is implemented in include/arch/arm/exc.h.

Locking and unlocking IRQs  In Baseline Cortex-M locking interrupts is implemented using the PRIMASK register.

arch_irq_lock()

will set the PRIMASK register to 1, eventually, masking all IRQs with configurable priority. While this fulfils the OS requirement of locking interrupts, the consequence is that kernel runtime errors (triggering SVCs) will escalate to HardFault.

In Mainline Cortex-M locking interrupts is implemented using the BASEPRI register (Mainline Cortex-M builds select CONFIG_CPU_CORTEX_M_HAS_BASEPRI to signify that BASEPRI register is implemented.). By modifying BASEPRI (or BASEPRI_MAX) arch_irq_lock() masks all system and HW interrupts with the exception of
• SVCs
• processor faults
• ZLIs

This allows zero latency interrupts to be triggered inside OS critical sections. Additionally, this allows system (processor and kernel) faults to be handled by Zephyr in exactly the same way, regardless of whether IRQs have been locked or not when the error occurs. It also allows for system calls to be dispatched while IRQs are locked.

**Note:** Mainline Cortex-M fault handling is designed and configured in a way that all processor and kernel faults are handled by the corresponding exception handlers and never result in HardFault escalation. In other words, a HardFault may only occur in Zephyr applications that have modified the default fault handling configurations. The main reason for this design was to reserve the HardFault exception for handling exceptional error conditions in safety critical applications.

**Dynamic direct interrupts** Cortex-M builds support the installation of direct interrupt service routines during runtime. Direct interrupts are designed for performance-critical interrupt handling and do not go through all of the common Zephyr interrupt handling code.

Direct dynamic interrupts are enabled via switching on `CONFIG_DYNAMIC_DIRECT_INTERRUPTS`.

Note that enabling direct dynamic interrupts requires enabling support for dynamic interrupts in the kernel, as well (see `CONFIG_DYNAMIC_INTERRUPTS`).

**Zero Latency interrupts** As described above, in Mainline Cortex-M applications, the Zephyr kernel reserves the highest configurable interrupt priority level for its own use (SVC). SVCs will not be masked by interrupt locking. Zero-latency interrupt can be used to set up an interrupt at the highest interrupt priority which will not be blocked by interrupt locking. To use the ZLI feature `CONFIG_ZERO_LATENCY_IRQS` needs to be enabled.

Zero latency IRQs have minimal interrupt latency, as they will always preempt regular HW or system interrupts.

Note, however, that since ZLI ISRs will run at a priority level higher than the kernel exceptions they cannot use any kernel functionality. Additionally, since the ZLI interrupt priority level is equal to processor fault priority level, faults occurring in ZLI ISRs will escalate to HardFault and will not be handled in the same way as regular processor faults. Developers need to be aware of this limitation.

**CPU Idling** The Cortex-M architecture port implements both `k_cpu_idle()` and `k_cpu_atomic_idle()`. The implementation is present in `arch/arm/core/cpu_idle.S`.

In both implementations, the processor will attempt to put the core to low power mode. In `k_cpu_idle()` the processor ends up executing WFI (Wait For Interrupt) instruction, while in `k_cpu_atomic_idle()` the processor will execute a WFE (Wait For Event) instruction.

When using the CPU idling API in Cortex-M it is important to note the following:

• Both `k_cpu_idle()` and `k_cpu_atomic_idle()` are assumed to be invoked with interrupts locked. This is taken care of by the kernel if the APIs are called by the idle thread.

• After waking up from low power mode, both functions will restore interrupts unconditionally, that is, regardless of the interrupt lock status before the CPU idle API was called.

The Zephyr CPU Idling mechanism is detailed in [CPU Idling](#).
Memory protection features  This section describes certain aspects around memory protection features in Arm Cortex-M applications.

User mode system calls  User mode is supported in Cortex-M platforms that implement the standard (Arm) MPU or a similar core peripheral logic for memory access policy configuration and control, such as the NXP MPU for Kinetis platforms. (Currently, CONFIG_ARCH_HAS_USERSPACE is selected if CONFIG_ARM_MPU is enabled by the user in the board default Kconfig settings).

A thread performs a system call by triggering a (synchronous) SVC exception, where

- up to 5 arguments are placed on registers R1 - R5
- system call ID is placed on register R6.

The SVC Handler will branch to the system call preparation logic, which will perform the following operations

- switch the thread’s PSP to point to the beginning of the thread’s privileged stack area, optionally reprogramming the PSPLIM if stack limit checking is enabled
- modify CONTROL register to switch to privileged mode
- modify the return address in the SVC exception stack frame, so that after exception return the system call dispatcher is executed (in thread privileged mode)

Once the system call execution is completed the system call dispatcher will restore the user’s original PSP and PSPLIM and switch the CONTROL register back to unprivileged mode before returning back to the caller of the system call.

System calls execute in thread mode and can be preempted by interrupts at any time. A thread may also be context-switched-out while doing a system call; the system call will resume as soon as the thread is switched-in again.

The system call dispatcher executes at SVC priority, therefore it cannot be preempted by HW interrupts (with the exception of ZLIs), which may observe some additional interrupt latency if they occur during a system call preparation.

MPU-assisted stack overflow detection  Cortex-M platforms with MPU may enable CONFIG_MPU_STACK_GUARD to enable the MPU-based stack overflow detection mechanism. The following points need to be considered when enabling the MPU stack guards

- stack overflows are triggering processor faults as soon as they occur
- the mechanism is essential for detecting stack overflows in supervisor threads, or user threads in privileged mode; stack overflows in threads in user mode will always be detected regardless of CONFIG_MPU_STACK_GUARD being set.
- stack overflows are always detected, however, the mechanism does not guarantee that no memory corruption occurs when supervisor threads overflow their stack memory
- CONFIG_MPU_STACK_GUARD will normally reserve one MPU region for programming the stack guard (in certain Arm v8-M configurations with CONFIG_MPU_GAP_FILLING enabled 2 MPU regions are required to implement the guard feature)
- MPU guards are re-programmed at every context-switch, adding a small overhead to the thread swap routine. Compared, however, to the CONFIG_BUILTIN_STACK_GUARD feature, no re-programming occurs during system calls.
- When CONFIG_HW_STACK_PROTECTION is enabled on Arm v8-M platforms the native stack limit checking mechanism is used by default instead of the MPU-based stack overflow detection mechanism; users may override this setting by manually enabling CONFIG_MPU_STACK_GUARD in these scenarios.
Memory map and MPU considerations

**Fixed MPU regions**  By default, when `CONFIG_ARM_MPU` is enabled a set of fixed MPU regions are programmed during system boot.

- One MPU region programs the entire flash area as read-execute. User can override this setting by enabling `CONFIG_MPU_ALLOW_FLASH_WRITE`, which programs the flash with RWX permissions. If `CONFIG_USERSPACE` is enabled unprivileged access on the entire flash area is allowed.

- One MPU region programs the entire SRAM area with privileged-only RW permissions. That is, an MPU region is utilized to disallow execute permissions on SRAM. (An exception to this setting is when `CONFIG_MPU_GAP_FILLING` is disabled (Arm v8-M only); in that case no SRAM MPU programming is done so the access is determined by the default Arm memory map policies, allowing for privileged-only RWX permissions on SRAM).

- All the memory regions defined in the devicetree with the property `zephyr,memory-attr` defining the MPU permissions for the memory region. See the next section for more details.

The above MPU regions are defined in `soc/arm/common/cortex_m/arm_mpu_regions.c`. Alternative MPU configurations are allowed by enabling `CONFIG_CPU_HAS_CUSTOM_FIXED_SOC_MPU_REGIONS`. When enabled, this option signifies that the Cortex-M SoC will define and configure its own fixed MPU regions in the SoC definition.

**Fixed MPU regions defined in devicetree**  When the property `zephyr,memory-attr` is present in a memory node, a new MPU region will be allocated and programmed during system boot. When used with the `zephyr,memory-region` devicetree compatible, it will result in a linker section being generated associated to that MPU region.

For example, to define a new non-cacheable memory region in devicetree:

```c
sram_no_cache: memory@20300000 {
    compatible = "zephyr,memory-region", "mmio-sram";
    reg = <0x20300000 0x100000>;
    zephyr,memory-region = "SRAM_NO_CACHE";
    zephyr,memory-attr = <( DT_MEM_ARM(ATTR_MPU_RAM_NOCACHE) )>;
};
```

This will automatically create a new MPU entry in with the correct name, base, size and attributes gathered directly from the devicetree.

**Static MPU regions**  Additional static MPU regions may be programmed once during system boot. These regions are required to enable certain features:

- a RX region to allow execution from SRAM, when `CONFIG_ARCH_HAS_RAMFUNC_SUPPORT` is enabled and users have defined functions to execute from SRAM.

- a RX region for relocating text sections to SRAM, when `CONFIG_CODE_DATA_RELOCATION_SRAM` is enabled

- a no-cache region to allow for a none-cacheable SRAM area, when `CONFIG_NOCACHE_MEMORY` is enabled

- a possibly unprivileged RW region for GCOV code coverage accounting area, when `CONFIG_COVERAGE_GCOV` is enabled

- a no-access region to implement null pointer dereference detection, when `CONFIG_NULL_POINTER_EXCEPTION_DETECTION_MPU` is enabled

The boundaries of these static MPU regions are derived from symbols exposed by the linker, in `include/linker/linker-defs.h`. 

7.1. Architecture-related Guides 2759
Dynamic MPU regions Certain thread-specific MPU regions may be re-programmed dynamically, at each thread context switch:

- an unprivileged RW region for the current thread's stack area (for user threads)
- a read-only region for the MPU stack guard
- unprivileged RW regions for the partitions of the current thread's application memory domain.

Considerations The number of available MPU regions for a Cortex-M platform is a limited resource. Most platforms have 8 MPU regions, while some Cortex-M33 or Cortex-M7 platforms may have up to 16 MPU regions. Therefore there is a relatively strict limitation on how many fixed, static and dynamic MPU regions may be programmed simultaneously. For platforms with 8 available MPU regions it might not be possible to enable all the aforementioned features that require MPU region programming. In most practical applications, however, only a certain set of features is required and 8 MPU regions are, in many cases, sufficient.

In Arm v8-M processors the MPU architecture does not allow programmed MPU regions to overlap. CONFIG_MPU_GAP_FILLING controls whether the fixed MPU region covering the entire SRAM is programmed. When it does, a full SRAM area partitioning is required, in order to program the static and the dynamic MPU regions. This increases the total number of required MPU regions. When CONFIG_MPU_GAP_FILLING is not enabled the fixed MPU region covering the entire SRAM is not programmed, thus, the static and dynamic regions are simply programmed on top of the always-existing background region (full-SRAM partitioning is not required). Note, however, that the background SRAM region allows execution from SRAM, so when CONFIG_MPU_GAP_FILLING is not set Zephyr is not protected against attacks that attempt to execute malicious code from SRAM.

Floating point Services Both unshared and shared FP registers mode are supported in Cortex-M (see Floating Point Services for more details).

When FPU support is enabled in the build (CONFIG_FPU is enabled), the sharing FP registers mode (CONFIG_FPU_SHARING) is enabled by default. This is done as some compiler configurations may activate a floating point context by generating FP instructions for any thread, regardless of whether floating point calculations are performed, and that context must be preserved when switching such threads in and out.

The developers can still disable the FP sharing mode in their application projects, and switch to Unshared FP registers mode, if it is guaranteed that the image code does not generate FP instructions outside the single thread context that is allowed (and supposed) to do so.

Under FPU sharing mode, the callee-saved FPU registers are saved and restored in context-switch, if the corresponding threads have an active FP context. This adds some runtime overhead on the swap routine. In addition to the runtime overhead, the sharing FPU mode

- requires additional memory for each thread to save the callee-saved FP registers
- requires additional stack memory for each thread, to stack the caller-saved FP registers, upon exception entry, if an FP context is active. Note, however, that since lazy stacking is enabled, there is no runtime overhead of FP context stacking in regular interrupts (FP state preservation is only activated in the swap routine in PendSV interrupt).

Misc

Chain-loadable images Cortex-M applications may either be standalone images or chain-loadable, for instance, by a bootloader. Application images chain-loadable by bootloaders (or other applications) normally occupy a specific area in the flash denoted as their code partition. CONFIG_USE_DT_CODE_PARTITION will ensure that a Zephyr chain-loadable image will be linked into its code partition, specified in DeviceTree.
**HW initialization at boot** In order to boot properly, chain-loaded applications may require that the core Arm hardware registers and peripherals are initialized in their reset values. Enabling `CONFIG_INIT_ARCH_HW_AT_BOOT` Zephyr to force the initialization of the internal Cortex-M architectural state during boot to the reset values as specified by the corresponding Arm architecture manual.

**Software vector relaying** In Cortex-M platforms that implement the VTOR register (see `CONFIG_CPU_CORTEX_M_HAS_VTOR`), chain-loadable images relocate the Cortex-M vector table by updating the VTOR register with the offset of the image vector table. Baseline Cortex-M platforms without VTOR register might not be able to relocate their vector table which remains at a fixed location. Therefore, a chain-loadable image will require an alternative way to route HW interrupts and system exceptions to its own vector table; this is achieved with software vector relaying.

When a bootloader image enables `CONFIG_SW_VECTOR_RELAY` it is able to relay exceptions and interrupts based on a vector table pointer that is set by the chain-loadable application. The latter sets the `CONFIG_SW_VECTOR_RELAY_CLIENT` option to instruct the boot sequence to set the vector table pointer in SRAM so that the bootloader can forward the exceptions and interrupts to the chain-loadable image's software vector table.

While this feature is intended for processors without VTOR register, it may also be used in Mainline Cortex-M platforms.

**Code relocation** Cortex-M support the code relocation feature. When `CONFIG_CODE_DATA_RELOCATION_SRAM` is selected, Zephyr will relocate .text, data and .bss sections from the specified files and place it in SRAM. It is possible to relocate only parts of the code sections into SRAM, without relocating the whole image text and data sections. More details on the code relocation feature can be found in *Code And Data Relocation*.

**Linking Cortex-M applications**

Most Cortex-M platforms make use of the default Cortex-M GCC linker script in `include/arch/arm/cortex-m/scripts/linked.ld`, although it is possible for platforms to use a custom linker script as well.

**CMSIS**

Cortex-M CMSIS headers are hosted in a standalone module repository: [zephyrproject-rtos/cmsis].

`CONFIG_CPU_CORTEX_M` selects `CONFIG_HAS_CMSIS_CORE` to signify that CMSIS headers are available for all supported Cortex-M variants.

**Testing**

A list of unit tests for the Cortex-M porting and miscellaneous features is present in `tests/arch/arm/`. The tests suites are continuously extended and new test suites are added, in an effort to increase the coverage of the Cortex-M architecture support in Zephyr.
QEMU

We use QEMU to verify the implemented features of the Cortex-M architecture port in Zephyr. Adequate coverage is achieved by defining and utilizing a list of QEMU targets, each with a specific architecture variant and Arm peripheral support list.

The table below lists the QEMU platform targets defined in Zephyr along with the corresponding Cortex-M implementation variant and the peripherals these targets emulate.

Maintainers & Collaborators

The status of the Arm Cortex-M architecture port in Zephyr is: maintained. The updated list of maintainers and collaborators for Cortex-M can be found in MAINTAINERS.yml.

7.1.3 Zephyr support status on RISC-V processors

Overview

This page describes current state of Zephyr for RISC-V processors. Currently, there's support for some boards, as well as Qemu support and support for some FPGA implementations such as neorv32 and litex_vexriscv.

Zephyr support includes PMP, user mode, several ISA extensions as well as semihosting.

User mode and PMP support

When the platform has Physical Memory Protection (PMP) support, enabling it on Zephyr allows user space support and stack protection to be selected.

ISA extensions

It's possible to set in Zephyr which ISA extensions (RV32/64I(E)MAFD(G)QC) are available on a given platform, by setting the appropriate RISCV_INTERFACES kconfig. Look at arch/riscv/Kconfig.isa for more information.

Note that Zephyr SDK toolchain support may not be defined for all combinations.
SMP support

SMP is supported on RISC-V, but currently only on Qemu platforms. In order to test the SMP support, one can use `qemu_riscv32_smp` or `qemu_riscv64_smp` boards.

7.1.4 Semihosting Guide

Overview

Semihosting is a mechanism that enables code running on ARM and RISC-V targets to communicate and use the Input/Output facilities on a host computer that is running a debugger or emulator.

More complete documentation on the available functionality is available at the ARM Github documentation.

The RISC-V functionality borrows from the ARM definitions, as described at the RISC-V Github documentation.

File Operations

Semihosting enables files on the host computer to be opened, read, and modified by an application. This can be useful when attempting to validate the behaviour of code across datasets that are larger than what can fit into ROM of an emulated platform. File paths can be either absolute, or relative to the directory of the running process.

```c
const char *path = "./data.bin";
long file_len, bytes_read, fd;
uint8_t buffer[16];

/* Open the data file for reading */
fd = semihost_open(path, SEMIHOST_OPEN_RB);
if (fd < 0) {
    return -ENOENT;
}
/* Read all data from the file */
file_len = semihost_flen(fd);
while(file_len > 0) {
    bytes_read = semihost_read(fd, buffer, MIN(file_len, sizeof(buffer)));
    if (bytes_read < 0) {
        break;
    }
    /* Process read data */
    do_data_processing(buffer, bytes_read);
    /* Update remaining length */
    file_len -= bytes_read;
}
/* Close the file */
semihost_close(fd);
```

7.1.5 Additional Functionality

Additional functionality is available by running semihosting instructions directly with `semihost_exec()` with one of the instructions defined in `semihost_instr`. For complete documentation on the required arguments and return codes, see the ARM Github documentation.
API Reference

*group* **semihost**

**Enums**

enum **semihost_instr**

Semihosting instructions.

*Values:*

enumerator **SEMIHOST_OPEN** = 0x01

Open a file or stream on the host system.

enumerator **SEMIHOST_ISTTY** = 0x09

Check whether a file is associated with a stream/terminal.

enumerator **SEMIHOST_WRITE** = 0x05

Write to a file or stream.

enumerator **SEMIHOST_READ** = 0x06

Read from a file at the current cursor position.

enumerator **SEMIHOST_CLOSE** = 0x02

Closes a file on the host which has been opened by SEMIHOST_OPEN.

enumerator **SEMIHOST_FLEN** = 0x0C

Get the length of a file.

enumerator **SEMIHOST_SEEK** = 0x0A

Set the file cursor to a given position in a file.

enumerator **SEMIHOST_TMPNAM** = 0x0D

Get a temporary absolute file path to create a temporary file.

enumerator **SEMIHOST_REMOVE** = 0x0E

Remove a file on the host system.

Possibly insecure!

enumerator **SEMIHOST_RENAME** = 0xF

Rename a file on the host system.

Possibly insecure!

enumerator **SEMIHOST_WRITEC** = 0x03

Write one character to the debug terminal.

enumerator **SEMIHOST_WRITE0** = 0x04

Write a NULL terminated string to the debug terminal.
enumerator SEMIHOST_READC = 0x07
    Read one character from the debug terminal.
enumerator SEMIHOST_CLOCK = 0x10
enumerator SEMIHOST_ELAPSED = 0x30
enumerator SEMIHOST_TICKFREQ = 0x31
enumerator SEMIHOST_TIME = 0x11
enumerator SEMIHOST_ERRNO = 0x13
    Retrieve the errno variable from semihosting operations.
enumerator SEMIHOST_GET_CMDLINE = 0x15
    Get commandline parameters for the application to run with.
enumerator SEMIHOST_HEAPINFO = 0x16
enumerator SEMIHOST_ISERROR = 0x08
enumerator SEMIHOST_SYSTEM = 0x12

enum semihost_open_mode
    Modes to open a file with.
    Behaviour corresponds to equivalent fopen strings. i.e. SEMIHOST_OPEN_RB_PLUS == “rb+”
    Values:
    enumerator SEMIHOST_OPEN_R = 0
    enumerator SEMIHOST_OPEN_RB = 1
    enumerator SEMIHOST_OPEN_R_PLUS = 2
    enumerator SEMIHOST_OPEN_RB_PLUS = 3
    enumerator SEMIHOST_OPEN_W = 4
    enumerator SEMIHOST_OPEN_WB = 5
    enumerator SEMIHOST_OPEN_W_PLUS = 6
    enumerator SEMIHOST_OPEN_WB_PLUS = 7
    enumerator SEMIHOST_OPEN_A = 8
Functions

long \texttt{semihost\_exec}(enum \texttt{semihost\_instr} \texttt{instr}, void *\texttt{args})
Manually execute a semihosting instruction.

Parameters
• \texttt{instr} – instruction code to run
• \texttt{args} – instruction specific arguments

Returns
integer return code of instruction

char \texttt{semihost\_poll\_in}(void)
Read a byte from the console.

Returns
char byte read from the console.

void \texttt{semihost\_poll\_out}(char \texttt{c})
Write a byte to the console.

Parameters
• \texttt{c} – byte to write to console

long \texttt{semihost\_open}(const char *\texttt{path}, long \texttt{mode})
Open a file on the host system.

Parameters
• \texttt{path} – file path to open. Can be absolute or relative to current directory of the running process.
• \texttt{mode} – value from \texttt{semihost\_open\_mode}.

Return values
• \texttt{handle} – positive handle on success.
• \texttt{-1} – on failure.

long \texttt{semihost\_close}(long \texttt{fd})
Close a file.

Parameters
• \texttt{fd} – handle returned by \texttt{semihost\_open}.

Return values
• \texttt{0} – on success.
• \texttt{-1} – on failure.
long semihost_flen(long fd)
Query the size of a file.

Parameters
- fd – handle returned by *semihost_open*.

Return values
- positive – file size on success.
- -1 – on failure.

long semihost_seek(long fd, long offset)
Seeks to an absolute position in a file.

Parameters
- fd – handle returned by *semihost_open*.
- offset – offset from the start of the file in bytes.

Return values
- 0 – on success.
- -errno – negative error code on failure.

long semihost_read(long fd, void *buf, long len)
Read the contents of a file into a buffer.

Parameters
- fd – handle returned by *semihost_open*.
- buf – buffer to read data into.
- len – number of bytes to read.

Return values
- read – number of bytes read on success.
- -errno – negative error code on failure.

long semihost_write(long fd, const void *buf, long len)
Write the contents of a buffer into a file.

Parameters
- fd – handle returned by *semihost_open*.
- buf – buffer to write data from.
- len – number of bytes to write.

Return values
- 0 – on success.
- -errno – negative error code on failure.

### 7.1.6 x86 Developer Guide

**Overview**

This page contains information on certain aspects when developing for x86-based platforms.
Virtual Memory

During very early boot, page tables are loaded so technically the kernel is executing in virtual address space. By default, physical and virtual memory are identity mapped and thus giving the appearance of execution taking place in physical address space. The physical address space is marked by kconfig `CONFIG_SRAM_BASE_ADDRESS` and `CONFIG_SRAM_SIZE` while the virtual address space is marked by `CONFIG_KERNEL_VM_BASE` and `CONFIG_KERNEL_VM_SIZE`. Note that `CONFIG_SRAM_OFFSET` controls where the Zephyr kernel is being placed in the memory, and its counterpart `CONFIG_KERNEL_VM_OFFSET`.

Separate Virtual Address Space from Physical Address Space  On 32-bit x86, it is possible to have separate physical and virtual address space. Code and data are linked in virtual address space, but are still loaded in physical memory. However, during boot, code and data must be available and also addressable in physical address space before `vm_enter` inside `arch/x86/core/ia32/crt0.S`. After `vm_enter`, code execution is done via virtual addresses and data can be referred via their virtual addresses. This is possible as the page table generation script (`arch/x86/gen_mmu.py`) identity maps the physical addresses at the page directory level, in addition to mapping virtual addresses to the physical memory. Later in the boot process, the entries for identity mapping at the page directory level are cleared in `z_x86_mmu_init()`, effectively removing the identity mapping of physical memory. This unmapping must be done for userspace isolation or else they would be able to access restricted memory via physical addresses. Since the identity mapping is done at the page directory level, there is no need to allocate additional space for the page table. However, additional space may still be required for additional page directory table.

There are restrictions on where virtual address space can be:

- Physical and virtual address spaces must be disjoint. This is required as the entries in page directory table will be cleared. If they are not disjoint, it would clear the entries needed for virtual addresses.
  - If `CONFIG_X86_PA` is enabled (=y), each address space must reside in their own 1GB region, due to each entry of PDP (Page Directory Pointer) covers 1GB of memory. For example:
    * Assuming `CONFIG_SRAM_OFFSET` and `CONFIG_KERNEL_VM_OFFSET` are both 0x0.
    * `CONFIG_SRAM_BASE_ADDRESS`: 0x00000000 and `CONFIG_KERNEL_VM_BASE`: 0x40000000 is valid, while `CONFIG_SRAM_BASE_ADDRESS`: 0x00000000 and `CONFIG_KERNEL_VM_BASE`: 0x20000000 is not.
  - If `CONFIG_X86_PA` is disabled (=n), each address space must reside in their own 4MB region, due to each entry of PD (Page Directory) covers 4MB of memory.
  - Both `CONFIG_SRAM_BASE_ADDRESS` and `CONFIG_KERNEL_VM_BASE` must also align with the starting addresses of targeted regions.

Specifying Additional Memory Mappings at Build Time

The page table generation script (`arch/x86/gen_mmu.py`) generates the necessary multi-level page tables for code execution and data access using the kernel image produced by the first linker pass. Additional command line arguments can be passed to the script to generate additional memory mappings. This is useful for static mappings and/or device MMIO access during very early boot. To pass extra command line arguments to the script, populate a CMake list named `X86_EXTRA_GEN_MMU_ARGUMENTS` in the board configuration file. Here is an example:

```bash
set(X86_EXTRA_GEN_MMU_ARGUMENTS
  -m 0xA0000000,0x2000
  -m 0x80000000,0x400000,LWUX,0xB0000000)
```
The argument `--map` takes the following value: `<physical address>,<size>[,<flags:LUWX>[,<virtual address>]]`, where:

- `<physical address>` is the physical address of the mapping. (Required)
- `<size>` is the size of the region to be mapped. (Required)
- `<flags>` is the flag associated with the mapping: (Optional)
  - `L`: Large page at the page directory level.
  - `U`: Allow userspace access.
  - `W`: Read/write.
  - `X`: Allow execution.
  - `D`: Cache disabled.
- `<virtual address>` is the virtual address of the mapping. (Optional)

Note that specifying additional memory mappings requires larger storage space for the pre-allocated page tables (both kernel and per-domain tables). `CONFIG_X86_EXTRA_PAGE_TABLE_PAGES` is needed to specify how many more memory pages to be reserved for the page tables. If the needed space is not exactly the same as required space, the `gen_mmu.py` script will print out a message indicating what needs to be the value for the kconfig.

### 7.2 Barriers API

`group barrier_apis`

**Functions**

ALWAYS_INLINE static void `barrier_dmem_fence_full`(void)

Full/sequentially-consistent data memory barrier.

This routine acts as a synchronization fence between threads and prevents re-ordering of data accesses instructions across the barrier instruction.

ALWAYS_INLINE static void `barrier_dsync_fence_full`(void)

Full/sequentially-consistent data synchronization barrier.

This routine acts as a synchronization fence between threads and prevents re-ordering of data accesses instructions across the barrier instruction like `barrier_dmem_fence_full()`, but has the additional effect of blocking execution of any further instructions, not just loads or stores, or both, until synchronization is complete.

**Note:** When not supported by hardware or architecture, this instruction falls back to a full/sequentially-consistent data memory barrier.

ALWAYS_INLINE static void `barrier_isync_fence_full`(void)

Full/sequentially-consistent instruction synchronization barrier.

This routine is used to guarantee that any subsequent instructions are fetched and to ensure any previously executed context-changing operations, such as writes to system control registers, have completed by the time the routine completes. In hardware terms, this might mean that the instruction pipeline is flushed, for example.
Note: When not supported by hardware or architecture, this instruction falls back to a compiler barrier.

7.3 Cache Interface

This is a high-level guide to cache interface and Kconfig options related to cache controllers. See Cache API for API reference material.

Zephyr has different Kconfig options to control how the cache controller is implemented and controlled.

- **CONFIG_CPU_HAS_DCACHE / CONFIG_CPU_HAS_ICACHE**: these hidden options should be selected at SoC / platform level when the CPU actually supports a data or instruction cache. The cache controller can be in the core or can be an external cache controller for which a driver is provided.

  These options have the goal to document an available feature and should be set whether we plan to support and use the caches in Zephyr or not.

- **CONFIG_DCACHE / CONFIG_ICACHE**: these options must be selected when support for data or instruction cache is present and working in zephyr.

  All the code paths related to cache control must be conditionally enabled depending on these symbols. When the symbol is set the cache is considered enabled and used.

  These symbols say nothing about the actual API interface exposed to the user. For example a platform using the data cache can enable the CONFIG_DCACHE symbol and use some HAL exported function in some platform-specific code to enable and manage the d-cache.

- **CONFIG_CACHE_MANAGEMENT**: this option must be selected when the cache operations are exposed to the user through a standard API (see Cache API).

  When this option is enabled we assume that all the cache functions are implemented in the architectural code or in an external cache controller driver.

- **CONFIG_ARCH_CACHE / CONFIG_EXTERNAL_CACHE**: mutually exclusive options for CACHE_TYPE used to define whether the cache operations are implemented at arch level or using an external cache controller with a provided driver.

  - **CONFIG_ARCH_CACHE**: the cache API is implemented by the arch code
  
  - **CONFIG_EXTERNAL_CACHE**: the cache API is implemented by a driver that supports the external cache controller. In this case the driver must be located as usual in the drivers/cache directory

7.3.1 Cache API

`group cache_interface`

**Functions**

`ALWAYS_INLINE static void sys_cache_data_enable(void)`

Enable the d-cache.

Enable the data cache
ALWAYS_INLINE static void sys_cache_data_disable(void)
  Disable the d-cache.
  Disable the data cache

ALWAYS_INLINE static void sys_cache_instr_enable(void)
  Enable the i-cache.
  Enable the instruction cache

ALWAYS_INLINE static void sys_cache_instr_disable(void)
  Disable the i-cache.
  Disable the instruction cache

ALWAYS_INLINE static int sys_cache_data_flush_all(void)
  Flush the d-cache.
  Flush the whole data cache.

  **Return values**
  * 0 – If succeeded.
  * -ENOTSUP – If not supported.
  * -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_instr_flush_all(void)
  Flush the i-cache.
  Flush the whole instruction cache.

  **Return values**
  * 0 – If succeeded.
  * -ENOTSUP – If not supported.
  * -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_data_invd_all(void)
  Invalidate the d-cache.
  Invalidate the whole data cache.

  **Return values**
  * 0 – If succeeded.
  * -ENOTSUP – If not supported.
  * -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_instr_invd_all(void)
  Invalidate the i-cache.
  Invalidate the whole instruction cache.

  **Return values**
  * 0 – If succeeded.
  * -ENOTSUP – If not supported.
  * -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_data_flush_and_invd_all(void)
  Flush and Invalidate the d-cache.
  Flush and Invalidate the whole data cache.
Return values

- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_instr_flush_and_invd_all(void)
Flush and Invalidate the i-cache.

Return values

- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

int sys_cache_data_flush_range(void *addr, size_t size)
Flush an address range in the d-cache.

Parameters

- addr – Starting address to flush.
- size – Range size.

Return values

- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_instr_flush_range(void *addr, size_t size)
Flush an address range in the i-cache.

Parameters

- addr – Starting address to flush.
- size – Range size.

Return values

- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

Note: the cache operations act on cache line. When multiple data structures share
the same cache line being flushed, all the portions of the data structures sharing the
same line will be flushed. This is usually not a problem because writing back is a
non-destructive process that could be triggered by hardware at any time, so having an
aligned addr or a padded size is not strictly necessary.
• 0 – If succeeded.
• -ENOTSUP – If not supported.
• -errno – Negative errno for other failures.

```c
int sys_cache_data_invd_range(void *addr, size_t size)
```

Invalidates an address range in the d-cache.

Invalidates the specified address range of the data cache.

**Note:** the cache operations act on cache line. When multiple data structures share the same cache line being invalidated, all the portions of the non-read-only data structures sharing the same line will be invalidated as well. This is a destructive process that could lead to data loss and/or corruption. When `addr` is not aligned to the cache line and/or `size` is not a multiple of the cache line size the behaviour is undefined.

**Parameters**

- `addr` – Starting address to invalidate.
- `size` – Range size.

**Return values**

- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

```c
ALWAYS_INLINE static int sys_cache_instr_invd_range(void *addr, size_t size)
```

Invalidates an address range in the i-cache.

Invalidates the specified address range of the instruction cache.

**Note:** the cache operations act on cache line. When multiple data structures share the same cache line being invalidated, all the portions of the non-read-only data structures sharing the same line will be invalidated as well. This is a destructive process that could lead to data loss and/or corruption. When `addr` is not aligned to the cache line and/or `size` is not a multiple of the cache line size the behaviour is undefined.

**Parameters**

- `addr` – Starting address to invalidate.
- `size` – Range size.

**Return values**

- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

```c
int sys_cache_data_flush_and_invd_range(void *addr, size_t size)
```

Flushes and invalidates an address range in the d-cache.

Flush and invalidate the specified address range of the data cache.

**Parameters**

- `addr` – Starting address to invalidate.
- `size` – Range size.

**Return values**

- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.
The cache operations act on cache line. When multiple data structures share the same cache line being flushed, all the portions of the data structures sharing the same line will be flushed before being invalidated. This is usually not a problem because writing back is a non-destructive process that could be triggered by hardware at any time, so having an aligned `addr` or a padded size is not strictly necessary.

**Parameters**
- `addr` – Starting address to flush and invalidate.
- `size` – Range size.

**Return values**
- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

```c
ALWAYS_INLINE static int sys_cache_instr_flush_and_invd_range(void *addr, size_t size)
```
Flush and Invalidate an address range in the i-cache.
Flush and Invalidate the specified address range of the instruction cache.

The cache operations act on cache line. When multiple data structures share the same cache line being flushed, all the portions of the data structures sharing the same line will be flushed before being invalidated. This is usually not a problem because writing back is a non-destructive process that could be triggered by hardware at any time, so having an aligned `addr` or a padded size is not strictly necessary.

**Parameters**
- `addr` – Starting address to flush and invalidate.
- `size` – Range size.

**Return values**
- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

```c
ALWAYS_INLINE static size_t sys_cache_data_line_size_get(void)
```
Get the d-cache line size.
The API is provided to get the data cache line.
The cache line size is calculated (in order of priority):

- At run-time when `CONFIG_DCACHE_LINE_SIZE_DETECT` is set.
- At compile time using the value set in `CONFIG_DCACHE_LINE_SIZE`.
- At compile time using the d-cache-line-size CPU0 property of the DT.
- 0 otherwise

**Return values**
- `size` – Size of the d-cache line.
ALWAYS_INLINE static size_t sys_cache_instr_line_size_get(void)

Get the instruction cache line size.

The API is provided to get the instruction cache line.

The cache line size is calculated (in order of priority):

- At run-time when CONFIG_ICACHE_LINE_SIZE_DETECT is set.
- At compile time using the value set in CONFIG_ICACHE_LINE_SIZE.
- At compile time using the i-cache-line-size CPU0 property of the DT.
- 0 otherwise

Return values

- size – Size of the d-cache line.
- 0 – If the d-cache is not enabled.

7.4 Peripheral and Hardware Emulators

7.4.1 Overview

Zephyr supports a simple emulator framework to support testing of drivers without requiring real hardware.

Emulators are used to emulate hardware devices, to support testing of various subsystems. For example, it is possible to write an emulator for an I2C compass such that it appears on the I2C bus and can be used just like a real hardware device.

Emulators often implement special features for testing. For example a compass may support returning bogus data if the I2C bus speed is too high, or may return invalid measurements if calibration has not yet been completed. This allows for testing that high-level code can handle these situations correctly. Test coverage can therefore approach 100% if all failure conditions are emulated.

7.4.2 Concept

The diagram below shows application code / high-level tests at the top. This is the ultimate application we want to run.

Below that are peripheral drivers, such as the AT24 EEPROM driver. We can test peripheral drivers using an emulation driver connected via a native_posix I2C controller/emulator which passes I2C traffic from the AT24 driver to the AT24 simulator.

Separately we can test the STM32 and NXP I2C drivers on real hardware using API tests. These require some sort of device attached to the bus, but with this, we can validate much of the driver functionality.

Putting the two together, we can test the application and peripheral code entirely on native_posix. Since we know that the I2C driver on the real hardware works, we should expect the application and peripheral drivers to work on the real hardware also.

Using the above framework we can test an entire application (e.g. Embedded Controller) on native_posix using emulators for all non-chip drivers:
Chapter 7. Hardware Support
The ‘real’ code is shown in green. The Zephyr emulation-framework code is shown in yellow. The blue boxes are the extra code we have to write to emulate the peripherals.

With this approach we can:

- Write individual tests for each driver (green), covering all failure modes, error conditions, etc.
- Ensure 100% test coverage for drivers (green)
- Write tests for combinations of drivers, such as GPIOs provided by an I2C GPIO expander driver talking over an I2C bus, with the GPIOs controlling a charger. All of this can work in the emulated environment or on real hardware.
- Write a complex application that ties together all of these pieces and runs on native_posix. We can develop on a host, use source-level debugging, etc.
- Transfer the application to any board which provides the required features (e.g. I2C, enough GPIOs), by adding Kconfig and devicetree fragments.

### 7.4.3 Creating a Device Driver Emulator

The emulator subsystem is modeled on the Device Driver Model. You create an emulator instance using one of the `EMUL_DT_DEFINE()` or `EMUL_DT_INST_DEFINE()` APIs.

Emulators for peripheral devices reuse the same devicetree node as the real device driver. This means that your emulator defines `DT_DRV_COMPAT` using the same `compat` value from the real driver.

```c
/* From drivers/sensor/bm160/bm160.c */
#define DT_DRV_COMPAT bosch_bmi160
/* From subsys/emul/emul_bmi160.c */
#define DT_DRV_COMPAT bosch_bmi160
```

The `EMUL_DT_DEFINE()` function accepts two API types:

1. `bus_api` - This points to the API for the upstream bus that the emulator connects to. The `bus_api` parameter is required. The supported emulated bus types include I2C, SPI, and eSPI.

2. `_backend_api` - This points to the device-class specific backend API for the emulator. The `_backend_api` parameter is optional.

The diagram below demonstrates the logical organization of the `bus_api` and `_backend_api` using the BC1.2 charging detector driver as the model device-class.

The real code is shown in green, while the emulator code is shown in yellow.

The `bus_api` connects the BC1.2 emulators to the `native_posix` I2C controller. The real BC1.2 drivers are unchanged and operate exactly as if there was a physical I2C controller present in the system. The `native_posix` I2C controller uses the `bus_api` to initiate register reads and writes to the emulator.

The `_backend_api` provides a mechanism for tests to manipulate the emulator out of band. Each device class defines its own API functions. The backend API functions focus on high-level behavior and do not provide hooks for specific emulators.

In the case of the BC1.2 charging detector the backend API provides functions to simulate connecting and disconnecting a charger to the emulated BC1.2 device. Each emulator is responsible for updating the correct vendor specific registers and potentially signalling an interrupt.

Example test flow:

1. Test registers BC1.2 detection callback using the Zephyr BC1.2 driver API.
2. Test connects a charger using the BC1.2 emulator backend.
3. Test verifies B1.2 detection callback invoked with correct charger type.
4. Test disconnects a charger using the BC1.2 emulator backend.

With this architecture, the same test can be used will all supported drivers in the same driver class.

### 7.4.4 Available Emulators

Zephyr includes the following emulators:

- EEPROM, which uses a file as the EEPROM contents
- I2C emulator driver, allowing drivers to be connected to an emulator so that tests can be performed without access to the real hardware
- SPI emulator driver, which does the same for SPI
- eSPI emulator driver, which does the same for eSPI. The emulator is being developed to support more functionalities.
- CAN loopback driver

A GPIO emulator is planned but is not yet complete.

### 7.4.5 Samples

Here are some examples present in Zephyr:

1. Bosch BMI160 sensor driver connected via both I2C and SPI to an emulator:
   
   ```shell
   west build -b native_posix tests/drivers/sensor/accel/
   ```

2. Simple test of the EEPROM emulator:
   
   ```shell
   west build -b native_posix tests/drivers/eeprom
   ```

3. The same test has a second EEPROM which is an Atmel AT24 EEPROM driver connected via I2C an emulator:
   
   ```shell
   west build -b native_posix tests/drivers/eeprom
   ```

### API Reference

**group io_emulators**

Emulators used to test drivers and higher-level code that uses them.

**Defines**

**EMUL_DT_NAME_GET(node_id)**

Use the devicetree node identifier as a unique name.

**Parameters**

- **node_id** – A devicetree node identifier
**EMUL_DT_DEFINE** (node_id, init_fn, data_ptr, cfg_ptr, bus_api, _backend_api)

Define a new emulator.

This adds a new struct emul to the linker list of emulations. This is typically used in your emulator's `DT_INST_FOREACH_STATUS_OKAY()` clause.

**Parameters**

- **node_id** – Node ID of the driver to emulate (e.g. `DT_DRV_INST(n)`); the node_id MUST have a corresponding `DEVICE_DT_DEFINE()`.
- **init_fn** – function to call to initialise the emulator (see emul_init typedef)
- **data_ptr** – emulator-specific data
- **cfg_ptr** – emulator-specific configuration data
- **bus_api** – emulator-specific bus api
- **_backend_api** – emulator-specific backend api

**EMUL_DT_INST_DEFINE** (inst, ...)

Like `EMUL_DT_DEFINE()`, but uses an instance of a DT_DRV_COMPAT compatible instead of a node identifier.

**Parameters**

- **inst** – instance number. The node_id argument to EMUL_DT_DEFINE is set to `DT_DRV_INST(inst)`.
- **...** – other parameters as expected by EMUL_DT_DEFINE.

**EMUL_DT_GET** (node_id)

Get a `const struct emul*` from a devicetree node identifier.

Returns a pointer to an emulator object created from a devicetree node, if any device was allocated by an emulator implementation.

If no such device was allocated, this will fail at linker time. If you get an error that looks like undefined reference to `_device_dts_ord<N>`, that is what happened. Check to make sure your emulator implementation is being compiled, usually by enabling the Kconfig options it requires.

**Parameters**

- **node_id** – A devicetree node identifier

**Returns**

A pointer to the emul object created for that node

**Typedefs**

typedef int (*emul_init_t)(const struct emul *emul, const struct device *parent)

Standard callback for emulator initialisation providing the initialiser record and the device that calls the emulator functions.

**Param emul**

Emulator to init

**Param parent**

Parent device that is using the emulator
Enums

enum emul_bus_type
The types of supported buses.

Values:

enumerator EMUL_BUS_TYPE_I2C
enumerator EMUL_BUS_TYPE_ESPI
enumerator EMUL_BUS_TYPE_SPI

Functions

int emul_init_for_bus(const struct device *dev)
Set up a list of emulators.

Parameters

• dev – Device the emulators are attached to (e.g. an I2C controller)

Returns

0 if OK
negative value on error

const struct emul *emul_get_binding(const char *name)
Retrieve the emul structure for an emulator by name.

Emulator objects are created via the EMUL_DT_DEFINE() macro and placed in memory by the linker. If the emulator structure is needed for custom API calls, it can be retrieved by the name that the emulator exposes to the system (this is the devicetree node's label by default).

Parameters

• name – Emulator name to search for. A null pointer, or a pointer to an empty string, will cause NULL to be returned.

Returns

pointer to emulator structure; NULL if not found or cannot be used.

struct emul_link_for_bus
#include <emul.h> Structure uniquely identifying a device to be emulated.

struct emul_list_for_bus
#include <emul.h> List of emulators attached to a bus.

Public Members

const struct emul_link_for_bus *children
Identifiers for children of the node.
unsigned int num_children
 Number of children of the node.

struct emul
#include <emul.h> An emulator instance - represents the target emulated device/peripheral that is interacted with through an emulated bus.
Instances of emulated bus nodes (e.g. i2c_emul) and emulators (i.e. struct emul) are exactly 1..1

Public Members

emul_init_t init
 function used to initialise the emulator state

const struct device *dev
 handle to the device for which this provides low-level emulation

const void *cfg
 Emulator-specific configuration data.

void *data
 Emulator-specific data.

type emul_bus_type bus_type
 The bus type that the emulator is attached to.

const void *backend_api
 Address of the API structure exposed by the emulator instance.

union bus
#include <emul.h> Pointer to the emulated bus node.

Public Members

struct i2c_emul *i2c

struct espi_emul *espi

struct spi_emul *spi

7.5 Peripherals

7.5.1 1-Wire Bus
Overview

1-Wire is a low speed half-duplex serial bus using only a single wire plus ground for both data transmission and device power supply. Similarly to I2C, 1-Wire uses a bidirectional open-collector data line, and is a single master multidrop bus. This means one master initiates all data exchanges with the slave devices. The 1-Wire bus supports longer bus lines than I2C, while it reaches speeds of up to 15.4 kbps in standard mode and up to 125 kbps in overdrive mode. Reliable communication in standard speed configuration is possible with 10 nodes over a bus length of 100 meters. Using overdrive speed, 3 nodes on a bus of 10 meters length are expected to work solid. Optimized timing parameters and fewer nodes on the bus may allow to reach larger bus extents.

The implementation details are specified in the [BOOK OF IBUTTON STANDARDS](#).

![Fig. 1: A typical 1-Wire bus topology](#)

**W1 Master API** Zephyr's 1-Wire Master API is used to interact with 1-Wire slave devices like temperature sensors and serial memories.

In Zephyr this API is split into the following layers.

- The link layer handles basic communication functions such as bus reset, presence detect and bit transfer operations. It is the only hardware-dependent layer in Zephyr. This layer is supported by a driver using the Zephyr [Universal Asynchronous Receiver-Transmitter (UART)](#) interface, which should work on most Zephyr platforms. In the future, a GPIO/Timer based driver and hardware specific drivers might be added.
- The 1-Wire network layer handles all means for slave identification and bus arbitration. This includes ROM commands like Match ROM, or Search ROM.
  - All slave devices have a unique 64-bit identification number, which includes a 8-bit 1-Wire Family Code and a 8-bit CRC.
  - In order to find slaves on the bus, the standard specifies an search algorithm which successively detects all slaves on the bus. This algorithm is described in detail by Maxim’s [Applicationnote 187](#).
- Transport layer and Presentation layer functions are not implemented in the generic 1-Wire driver and therefore must be handled in individual slave drivers.

The 1-Wire API is considered experimental.

**Configuration Options**

Related configuration options:

- `CONFIG_W1`
- `CONFIG_W1_NET`
API Reference

1-Wire data link layer

group w1_data_link

1-Wire data link layer

Functions

int w1_reset_bus(const struct device *dev)
Reset the 1-Wire bus to prepare slaves for communication.
This routine resets all 1-Wire bus slaves such that they are ready to receive a command. Connected slaves answer with a presence pulse once they are ready to receive data.
In case the driver supports both standard speed and overdrive speed, the reset routine takes care of sending either a short or a long reset pulse depending on the current state. The speed can be changed using w1_configure().

Parameters

• dev – [in] Pointer to the device structure for the driver instance.

Return values

• 0 – If no slaves answer with a present pulse.
• 1 – If at least one slave answers with a present pulse.
• -errno – Negative error code on error.

int w1_read_bit(const struct device *dev)
Read a single bit from the 1-Wire bus.

Parameters

• dev – [in] Pointer to the device structure for the driver instance.

Return values

• rx_bit – The read bit value on success.
• -errno – Negative error code on error.

int w1_write_bit(const struct device *dev, const bool bit)
Write a single bit to the 1-Wire bus.

Parameters

• dev – [in] Pointer to the device structure for the driver instance.
• bit – Transmitting bit value 1 or 0.

Return values

• 0 – If successful.
• -errno – Negative error code on error.

int w1_read_byte(const struct device *dev)
Read a single byte from the 1-Wire bus.

Parameters

• dev – [in] Pointer to the device structure for the driver instance.

Return values

• rx_byte – The read byte value on success.
int w1_write_byte(const struct device *dev, uint8_t byte)
Write a single byte to the 1-Wire bus.

Parameters
- dev – [in] Pointer to the device structure for the driver instance.
- byte – Transmitting byte.

Return values
- 0 – If successful.
- -errno – Negative error code on error.

int w1_read_block(const struct device *dev, uint8_t *buffer, size_t len)
Read a block of data from the 1-Wire bus.

Parameters
- dev – [in] Pointer to the device structure for the driver instance.
- buffer – [out] Pointer to receive buffer.
- len – Length of receiving buffer (in bytes).

Return values
- 0 – If successful.
- -errno – Negative error code on error.

int w1_write_block(const struct device *dev, const uint8_t *buffer, size_t len)
Write a block of data from the 1-Wire bus.

Parameters
- dev – [in] Pointer to the device structure for the driver instance.
- len – Length of transmitting buffer (in bytes).

Return values
- 0 – If successful.
- -errno – Negative error code on error.

size_t w1_get_slave_count(const struct device *dev)
Get the number of slaves on the bus.

Parameters
- dev – [in] Pointer to the device structure for the driver instance.

Return values
- slave_count – Positive Number of connected 1-Wire slaves on success.
- -errno – Negative error code on error.

int w1_configure(const struct device *dev, enum w1_settings_type type, uint32_t value)
Configure parameters of the 1-Wire master.

Allowed configuration parameters are defined in enum w1_settings_type, but master
devices may not support all types.

Parameters
- dev – [in] Pointer to the device structure for the driver instance.
• **type** – Enum specifying the setting type.
• **value** – The new value for the passed settings type.

**Return values**
• 0 – If successful.
• -ENOTSUP – The master doesn’t support the configuration of the supplied type.
• -EIO – General input / output error, failed to configure master devices.

### 1-Wire network layer

**group w1_network**

1-Wire network layer

### 1-Wire ROM Commands

**W1_CMD_SKIP_ROM**

This command allows the bus master to read the slave devices without providing their ROM code.

**W1_CMD_MATCH_ROM**

This command allows the bus master to address a specific slave device by providing its ROM code.

**W1_CMD_RESUME**

This command allows the bus master to resume a previous read out from where it left off.

**W1_CMD_READ_ROM**

This command allows the bus master to read the ROM code from a single slave device. This command should be used when there is only a single slave device on the bus.

**W1_CMD_SEARCH_ROM**

This command allows the bus master to discover the addresses (i.e., ROM codes) of all slave devices on the bus.

**W1_CMD_SEARCH_ALARM**

This command allows the bus master to identify which devices have experienced an alarm condition.

**W1_CMD_OVERDRIVE_SKIP_ROM**

This command allows the bus master to address all devices on the bus and then switch them to overdrive speed.

**W1_CMD_OVERDRIVE_MATCH_ROM**

This command allows the bus master to address a specific device and switch it to overdrive speed.
CRC Defines

W1_CRC8_SEED
Seed value used to calculate the 1-Wire 8-bit crc.

W1_CRC8_POLYNOMIAL
Polynomial used to calculate the 1-Wire 8-bit crc.

W1_CRC16_SEED
Seed value used to calculate the 1-Wire 16-bit crc.

W1_CRC16_POLYNOMIAL
Polynomial used to calculate the 1-Wire 16-bit crc.

Defines

W1_SEARCH_ALL_FAMILIES
This flag can be passed to searches in order to not filter on family ID.

W1_ROM_INIT_ZERO
Intialize all w1_rom struct members to zero.

Typedefs

typedef void (*w1_search_callback_t)(struct w1_rom rom, void *user_data)
Define the application callback handler function signature for searches.

Param rom
found The ROM of the found slave.

Param user_data
User data provided to the w1_search_bus() call.

Functions

int w1_read_rom(const struct device *dev, struct w1_rom *rom)
Read Peripheral 64-bit ROM.

This procedure allows the 1-Wire bus master to read the peripherals’ 64-bit ROM without using the Search ROM procedure. This command can be used as long as not more than a sigle peripheral is connected to the bus. Otherwise data collisions occur and a faulty ROM is read.

Parameters

• dev – [in] Pointer to the device structure for the driver instance.
• rom – [out] Pointer to the ROM structure.

Return values

• 0 – If successful.
• -ENODEV – In case no slave responds to reset.
int w1_match_rom(const struct device *dev, const struct w1_slave_config *config)

Select a specific slave by broadcasting a selected ROM.

This routine allows the 1-Wire bus master to select a slave identified by its unique ROM, such that the next command will target only this single selected slave.

This command is only necessary in multidrop environments, otherwise the Skip ROM command can be issued. Once a slave has been selected, to reduce the communication overhead, the resume command can be used instead of this command to communicate with the selected slave.

Parameters

- dev – [in] Pointer to the device structure for the driver instance.
- config – [in] Pointer to the slave specific 1-Wire config.

Return values

- 0 – If successful.
- -ENODEV – In case no slave responds to reset.
- -errno – Other negative error code on error.

int w1_resume_command(const struct device *dev)

Select the slave last addressed with a Match ROM or Search ROM command.

This routine allows the 1-Wire bus master to re-select a slave device that was already addressed using a Match ROM or Search ROM command.

Parameters

- dev – Pointer to the device structure for the driver instance.

Return values

- 0 – If successful.
- -ENODEV – In case no slave responds to reset.
- -errno – Other negative error code on error.

int w1_skip_rom(const struct device *dev, const struct w1_slave_config *config)

Select all slaves regardless of ROM.

This routine sets up the bus slaves to receive a command. It is usually used when there is only one peripheral on the bus to avoid the overhead of the Match ROM command. But it can also be used to concurrently write to all slave devices.

Parameters

- dev – [in] Pointer to the device structure for the driver instance.
- config – [in] Pointer to the slave specific 1-Wire config.

Return values

- 0 – If successful.
- -ENODEV – In case no slave responds to reset.
- -errno – Other negative error code on error.

int w1_reset_select(const struct device *dev, const struct w1_slave_config *config)

In single drop configurations use Skip Select command, otherwise use Match ROM command.

Parameters
• **dev** – [in] Pointer to the device structure for the driver instance.
• **config** – [in] Pointer to the slave specific 1-Wire config.

**Return values**
• 0 – If successful.
• -ENODEV – In case no slave responds to reset.
• -errno – Other negative error code on error.

```c
int w1_write_read(const struct device *dev, const struct w1_slave_config *config, const uint8_t *write_buf, size_t write_len, uint8_t *read_buf, size_t read_len)
```

Write then read data from the 1-Wire slave with matching ROM.

This routine uses `w1_reset_select` to select the given ROM. Then writes given data and reads the response back from the slave.

**Parameters**
• **dev** – [in] Pointer to the device structure for the driver instance.
• **config** – [in] Pointer to the slave specific 1-Wire config.
• **write_buf** – [in] Pointer to the data to be written.
• **write_len** – Number of bytes to write.
• **read_buf** – [out] Pointer to storage for read data.
• **read_len** – Number of bytes to read.

**Return values**
• 0 – If successful.
• -ENODEV – In case no slave responds to reset.
• -errno – Other negative error code on error.

```c
int w1_search_bus(const struct device *dev, uint8_t command, uint8_t family, w1_search_callback_t callback, void *user_data)
```

Search 1-wire slaves on the bus.

This function searches slaves on the 1-wire bus, with the possibility to search either all slaves or only slaves that have an active alarm state. If a callback is passed, the callback is called for each found slave.

Note: Filtering on families is not supported.

**Parameters**
• **dev** – [in] Pointer to the device structure for the driver instance.
• **command** – Can either be W1_SEARCH_ALARM or W1_SEARCH_ROM.
• **family** – W1_SEARCH_ALL_FAMILIES searches all families, filtering on a specific family is not yet supported.
• **callback** – Application callback handler function to be called for each found slave.
• **user_data** – [in] User data to pass to the application callback handler function.

**Return values**
• **slave_count** – Number of slaves found.
• -errno – Negative error code on error.

static inline int w1_search_rom(const struct device *dev, w1_search_callback_t callback, 
    void *user_data)

Search for 1-Wire slave on bus.
This routine can discover unknown slaves on the bus by scanning for the unique 64-bit
registration number.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• callback – Application callback handler function to be called for each
  found slave.
• user_data – [in] User data to pass to the application callback handler
  function.

Return values
• slave_count – Number of slaves found.
• -errno – Negative error code on error.

static inline int w1_search_alarm(const struct device *dev, w1_search_callback_t callback, 
    void *user_data)

Search for 1-Wire slaves with an active alarm.
This routine searches 1-Wire slaves on the bus, which currently have an active alarm.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• callback – Application callback handler function to be called for each
  found slave.
• user_data – [in] User data to pass to the application callback handler
  function.

Return values
• slave_count – Number of slaves found.
• -errno – Negative error code on error.

static inline uint64_t w1_rom_to_uint64(const struct w1_rom *rom)

Function to convert a w1_rom struct to an uint64_t.

Parameters
• rom – [in] Pointer to the ROM struct.

Return values
rom64 – The ROM converted to an unsigned integer in endianness.

static inline void w1_uint64_to_rom(const uint64_t rom64, struct w1_rom *rom)

Function to write an uint64_t to struct w1_rom pointer.

Parameters
• rom64 – Unsigned 64 bit integer representing the ROM in host endianness.
• rom – [out] The ROM struct pointer.

static inline uint8_t w1_crc8(const uint8_t *src, size_t len)

Compute CRC-8 checksum as defined in the 1-Wire specification.

The 1-Wire of CRC 8 variant is using 0x31 as its polynomial with the initial value set to
0x00. This CRC is used to check the correctness of the unique 56-bit ROM.
Parameters

- **src** – [in] Input bytes for the computation.
- **len** – Length of the input in bytes.

Return values

crc – The computed CRC8 value.

```c
static inline uint16_t w1_crc16(const uint16_t seed, const uint8_t *src, const size_t len)
```

Compute 1-Wire variant of CRC 16.

The 16-bit 1-Wire crc variant is using the reflected polynomial function X^16 + X^15 * + X^2 + 1 with the initial value set to 0x0000. See also APPLICATION NOTE 27: "UNDERSTANDING AND USING CYCLIC REDUNDANCY CHECKS WITH MAXIM 1-WIRE AND IBUTTON PRODUCTS" https://www.maximintegrated.com/en/design/technical-documents/app-notes/2/27.html

Parameters

- **seed** – Init value for the CRC, it is usually set to 0x0000.
- **src** – [in] Input bytes for the computation.
- **len** – Length of the input in bytes.

Return values

crc – The computed CRC16 value.

```c
struct w1_rom
```

# include <w1.h> w1_rom struct.

Public Members

**uint8_t family**

The 1-Wire family code identifying the slave device type.

An incomplete list of family codes is available at: https://www.maximintegrated.com/en/app-notes/index.mvp/id/155 others are documented in the respective device data sheet.

**uint8_t serial[6]**

The serial together with the family code composes the unique 56-bit id.

**uint8_t crc**

8-bit checksum of the 56-bit unique id.

```c
struct w1_slave_config
```

# include <w1.h> Node specific 1-wire configuration struct.

This struct is passed to network functions, such that they can configure the bus to address the specific slave using the selected speed.

Public Members

```c
struct w1_rom rom
```

Unique 1-Wire ROM.

7.5. Peripherals 2791
uint32_t overdrive
    overdrive speed is used if set to 1.

1-Wire generic functions and helpers  Functions that are not directly related to any of the networking layers.

**group w1_interface**
    1-Wire Interface

** Enums**

enum w1_settings_type
    Defines the 1-Wire master settings types, which are runtime configurable.
    
    **Values:**

    enumerator W1_SETTING_SPEED
        Overdrive speed is enabled in case a value of 1 is passed and disabled passing 0.

    enumerator W1_SETTING_STRONG_PULLUP
        The strong pullup resistor is activated immediately after the next written data block by passing a value of 1, and deactivated passing 0.

    enumerator W1_SETTINGS_TYPE_COUNT
        Number of different settings types.

** Functions**

static inline int w1_lock_bus(const struct device *dev)
    Lock the 1-wire bus to prevent simultaneous access.

    This routine locks the bus to prevent simultaneous access from different threads. The calling thread waits until the bus becomes available. A thread is permitted to lock a mutex it has already locked.

    **Parameters**

    • dev – [in] Pointer to the device structure for the driver instance.

    **Return values**

    • 0 – If successful.
    • -errno – Negative error code on error.
static inline int w1_unlock_bus(const struct device *dev)
Unlock the 1-wire bus.

This routine unlocks the bus to permit access to bus line.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• -errno – Negative error code on error.

7.5.2 Analog-to-Digital Converter (ADC)

Overview

API Reference

Related code samples

Analog-to-Digital Converter (ADC)
Read analog inputs from ADC channels.

group adc_interface
ADC driver APIs.

Defines

ADC_CHANNEL_CFG_DT(node_id)
Get ADC channel configuration from a given devicetree node.

This returns a static initializer for a struct adc_channel_cfg filled with data from a given devicetree node.

Example devicetree fragment:

```c
&adc {
  #address-cells = <1>;
  #size-cells = <0>;

  channel@0 {
    reg = <0>;
    zephyr,gain = "ADC_GAIN_1_6";
    zephyr,reference = "ADC_REF_INTERNAL";
    zephyr,acquisition-time = <ADC_ACQ_TIME(ADC_ACQ_TIME_MICROSECONDS, 20)>;
    zephyr,input-positive = <NRF_SAADC_AIN6>;
    zephyr,input-negative = <NRF_SAADC_AIN7>;
  }

  channel@1 {
    reg = <1>;
    zephyr,gain = "ADC_GAIN_1_6";
    zephyr,reference = "ADC_REF_INTERNAL";
    zephyr,acquisition-time = <ADC_ACQ_TIME_DEFAULT>;
    zephyr,input-positive = <NRF_SAADC_AIN0>;
  }
}
```

(continues on next page)
Example usage:

```c
static const struct adc_channel_cfg ch0_cfg_dt =
  ADC_CHANNEL_CFG_DT(DT_CHILD(DT_NODELABEL(adc), channel_0));
static const struct adc_channel_cfg ch1_cfg_dt =
  ADC_CHANNEL_CFG_DT(DT_CHILD(DT_NODELABEL(adc), channel_1));

// Initializes 'ch0_cfg_dt' to:
// {
//   .channel_id = 0,
//   .gain = ADC_GAIN_1_6,
//   .reference = ADC_REF_INTERNAL,
//   .acquisition_time = ADC_ACQ_TIME(ADC_ACQ_TIME_MICROSECONDS, 20),
//   .differential = true,
//   .input_positive = NRF_SAADC_AIN6,
//   .input_negative = NRF_SAADC_AIN7,
// }
// and 'ch1_cfg_dt' to:
// {
//   .channel_id = 1,
//   .gain = ADC_GAIN_1_6,
//   .reference = ADC_REF_INTERNAL,
//   .acquisition_time = ADC_ACQ_TIME_DEFAULT,
//   .input_positive = NRF_SAADC_AIN0,
// }
```

Parameters

- `node_id` – Devicetree node identifier.

Returns

Static initializer for an `adc_channel_cfg` structure.

`ADC_DT_SPEC_GET_BY_IDX(node_id, idx)`

Get ADC io-channel information from devicetree.

This returns a static initializer for an `adc_dt_spec` structure given a devicetree node and a channel index. The node must have the “io-channels” property defined.

Example devicetree fragment:

```c
/ {
  zephyr, user {
    io-channels = <&adc0 1>, <&adc0 3>;
  };
};

&adc0 {
  #address-cells = <1>;
  #size-cells = <0>;
  channel@3 {
    reg = <3>;
    zephyr, gain = "ADC_GAIN_1_5";
    zephyr, reference = "ADC_REF_VDD_1_4";
    zephyr, vref-mv = <750>;
    zephyr, acquisition-time = <ADC_ACQ_TIME_DEFAULT>;
    zephyr, resolution = <12>;
}
```
Example usage:

```c
static const struct adc_dt_spec adc-chan0 = 
  ADC_DT_SPEC_GET_BY_IDX(DT_PATH(zephyr_user), 0);
static const struct adc_dt_spec adc-chan1 = 
  ADC_DT_SPEC_GET_BY_IDX(DT_PATH(zephyr_user), 1);

// Initializes 'adc-chan0' to:
// { 
//   .dev = DEVICE_DT_GET(DT_NODELABEL(adc0)),
//   .channel_id = 1,
// }
// and 'adc-chan1' to:
// { 
//   .dev = DEVICE_DT_GET(DT_NODELABEL(adc0)),
//   .channel_id = 3,
//   .channel_cfg_dt_node_exists = true,
//   .channel_cfg = {
//     .channel_id = 3,
//     .gain = ADC_GAIN_1_5,
//     .reference = ADC_REF_VDD_1_4,
//     .acquisition_time = ADC_ACQ_TIME_DEFAULT,
//   },
//   .vref_mv = 750,
//   .resolution = 12,
//   .oversampling = 4,
// }
```

See also:

`ADC_DT_SPEC_GET()`

**Parameters**

- `node_id` – Devicetree node identifier.
- `idx` – Channel index.

**Returns**

Static initializer for an `adc_dt_spec` structure.

`ADC_DT_SPEC_INST_GET_BY_IDX(inst, idx)`

Get ADC io-channel information from a DT_DRV_COMPAT devicetree instance.

See also:

`ADC_DT_SPEC_GET_BY_IDX()`

**Parameters**

- `inst` – DT_DRV_COMPAT instance number
- `idx` – Channel index.

**Returns**

Static initializer for an `adc_dt_spec` structure.
ADC_DT_SPEC_GET(node_id)
Equivalent to ADC_DT_SPEC_GET_BY_IDX(node_id, 0).

See also:
ADC_DT_SPEC_GET_BY_IDX()

Parameters
• node_id – Devicetree node identifier.

Returns
Static initializer for an adc_dt_spec structure.

ADC_DT_SPEC_INST_GET(inst)
Equivalent to ADC_DT_SPEC_INST_GET_BY_IDX(inst, 0).

See also:
ADC_DT_SPEC_GET()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
Static initializer for an adc_dt_spec structure.

Typedefs

typedef enum adc_action (*adc_sequence_callback)(const struct device *dev, const struct adc_sequence *sequence, uint16_t sampling_index)
Type definition of the optional callback function to be called after a requested sampling is done.

Param dev
Pointer to the device structure for the driver instance.

Param sequence
Pointer to the sequence structure that triggered the sampling. This parameter points to a copy of the structure that was supplied to the call that started the sampling sequence, thus it cannot be used with the CONTAINER_OF() macro to retrieve some other data associated with the sequence. Instead, the adc_sequence_options::user_data field should be used for such purpose.

Param sampling_index
Index (0-65535) of the sampling done.

Return
Action to be performed by the driver. See adc_action.

typedef int (*adc_api_channel_setup)(const struct device *dev, const struct adc_channel_cfg *channel_cfg)
Type definition of ADC API function for configuring a channel.

See adc_channel_setup() for argument descriptions.
typedef int (*adc_api_read)(const struct device *dev, const struct adc_sequence *sequence)
Type definition of ADC API function for setting a read request.
See adc_read() for argument descriptions.

typedef int (*adc_api_read_async)(const struct device *dev, const struct adc_sequence *sequence, struct k_poll_signal *async)
Type definition of ADC API function for setting an asynchronous read request.
See adc_read_async() for argument descriptions.

Enums

eenum adc_gain
ADC channel gain factors.
Values:

enumerator ADC_GAIN_1_6
x 1/6.

denominator
enumerator ADC_GAIN_1_5
x 1/5.

denominator
enumerator ADC_GAIN_1_4
x 1/4.

denominator
enumerator ADC_GAIN_1_3
x 1/3.

denominator
enumerator ADC_GAIN_2_5
x 2/5.

denominator
enumerator ADC_GAIN_1_2
x 1/2.

denominator
enumerator ADC_GAIN_2_3
x 2/3.

denominator
enumerator ADC_GAIN_4_5
x 4/5.

denominator
enumerator ADC_GAIN_1
x 1.

denominator
enumerator ADC_GAIN_2
x 2.

denominator
enumerator ADC_GAIN_3
x 3.
enumerator ADC_GAIN_4
    x 4.

enumerator ADC_GAIN_6
    x 6.

enumerator ADC_GAIN_8
    x 8.

enumerator ADC_GAIN_12
    x 12.

enumerator ADC_GAIN_16
    x 16.

enumerator ADC_GAIN_24
    x 24.

enumerator ADC_GAIN_32
    x 32.

enumerator ADC_GAIN_64
    x 64.

enumerator ADC_GAIN_128
    x 128.

enum adc_reference
ADC references.
Values:

enumerator ADC_REF_VDD_1
    VDD.

enumerator ADC_REF_VDD_1_2
    VDD/2.

enumerator ADC_REF_VDD_1_3
    VDD/3.

enumerator ADC_REF_VDD_1_4
    VDD/4.

enumerator ADC_REF_INTERNAL
    Internal.

enumerator ADC_REF_EXTERNAL0
    External, input 0.
enumerator ADC_REF_EXTERNAL1

External, input 1.

enum adc_action

Action to be performed after a sampling is done.

Values:

enumerator ADC_ACTION_CONTINUE = 0

The sequence should be continued normally.

enumerator ADC_ACTION_REPEAT

The sampling should be repeated.

New samples or sample should be read from the ADC and written in the same place as the recent ones.

enumerator ADC_ACTION_FINISH

The sequence should be finished immediately.

Functions

int adc_gain_invert(enum adc_gain gain, int32_t *value)

Invert the application of gain to a measurement value.

For example, if the gain passed in is ADC_GAIN_1_6 and the referenced value is 10, the value after the function returns is 60.

Parameters

• gain – the gain used to amplify the input signal.
• value – a pointer to a value that initially has the effect of the applied gain but has that effect removed when this function successfully returns. If the gain cannot be reversed the value remains unchanged.

Return values

• 0 – if the gain was successfully reversed
• -EINVAL – if the gain could not be interpreted

int adc_channel_setup(const struct device *dev, const struct adc_channel_cfg *channel_cfg)

Configure an ADC channel.

It is required to call this function and configure each channel before it is selected for a read request.

Parameters

• dev – Pointer to the device structure for the driver instance.
• channel_cfg – Channel configuration.

Return values

• 0 – On success.
• -EINVAL – If a parameter with an invalid value has been provided.
static inline int adc_channel_setup_dt(const struct adc_dt_spec *spec)
Configure an ADC channel from a struct adc_dt_spec.

See also:
adc_channel_setup()

Parameters
• spec – ADC specification from Devicetree.

Returns
A value from adc_channel_setup() or -ENOTSUP if information from Device- 
tree is not valid.

int adc_read(const struct device *dev, const struct adc_sequence *sequence)
Set a read request.

If invoked from user mode, any sequence struct options for callback must be NULL.

Parameters
• dev – Pointer to the device structure for the driver instance.
• sequence – Structure specifying requested sequence of samplings.

Return values
• 0 – On success.
• -EINVAL – If a parameter with an invalid value has been provided.
• -ENOMEM – If the provided buffer is to small to hold the results of all re- 
    quested samplings.
• -ENOTSUP – If the requested mode of operation is not supported.
• -EBUSY – If another sampling was triggered while the previous one was 
    still in progress. This may occur only when samplings are done with 
    intervals, and it indicates that the selected interval was too small. All 
    requested samples are written in the buffer, but at least some of them 
    were taken with an extra delay compared to what was scheduled.

static inline int adc_read_dt(const struct adc_dt_spec *spec, const struct adc_sequence *sequence)
Set a read request from a struct adc_dt_spec.

See also:
adc_read()

Parameters
• spec – ADC specification from Devicetree.
• sequence – Structure specifying requested sequence of samplings.

Returns
A value from adc_read().
int adc_read_async(const struct device *dev, const struct adc_sequence *sequence, struct k_poll_signal *async)

Set an asynchronous read request.

If invoked from user mode, any sequence struct options for callback must be NULL.

**Note:** This function is available only if `CONFIG_ADC_ASYNC` is selected.

### Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **sequence** – Structure specifying requested sequence of samplings.
- **async** – Pointer to a valid and ready to be signaled struct `k_poll_signal`. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

### Returns

0 on success, negative error code otherwise. See `adc_read()` for a list of possible error codes.

static inline uint16_t adc_ref_internal(const struct device *dev)

Get the internal reference voltage.

Returns the voltage corresponding to `ADC_REF_INTERNAL`, measured in millivolts.

### Returns

A positive value is the reference voltage value. Returns zero if reference voltage information is not available.

static inline int adc_raw_to_millivolts(int32_t ref_mv, enum adc_gain gain, uint8_t resolution, int32_t *valp)

Convert a raw ADC value to millivolts.

This function performs the necessary conversion to transform a raw ADC measurement to a voltage in millivolts.

### Parameters

- **ref_mv** – the reference voltage used for the measurement, in millivolts. This may be from `adc_ref_internal()` or a known external reference.
- **gain** – the ADC gain configuration used to sample the input
- **resolution** – the number of bits in the absolute value of the sample. For differential sampling this needs to be one less than the resolution in struct `adc_sequence`.
- **valp** – pointer to the raw measurement value on input, and the corresponding millivolt value on successful conversion. If conversion fails the stored value is left unchanged.

### Return values

- **0** – on successful conversion
- **-EINVAL** – if the gain is not reversible

static inline int adc_raw_to_millivolts_dt(const struct adc_dt_spec *spec, int32_t *valp)

Convert a raw ADC value to millivolts using information stored in a struct `adc_dt_spec`.

---

7.5. Peripherals 2801
See also:

`adc_raw_to_millivolts()`

**Parameters**

- **spec** – [in] ADC specification from Devicetree.
- **valp** – [inout] Pointer to the raw measurement value on input, and the corresponding millivolt value on successful conversion. If conversion fails the stored value is left unchanged.

**Returns**

A value from `adc_raw_to_millivolts()` or -ENOTSUP if information from Devicetree is not valid.

```c
static inline int adc_sequence_init_dt(const struct adc_dt_spec *spec, struct adc_sequence *seq)
```

Initialize a struct `adc_sequence` from information stored in struct `adc_dt_spec`.

Note that this function only initializes the following fields:

- `adc_sequence::channels`
- `adc_sequence::resolution`
- `adc_sequence::oversampling`

Other fields should be initialized by the caller.

**Parameters**

- **spec** – [in] ADC specification from Devicetree.
- **seq** – [out] Sequence to initialize.

**Return values**

- **0** – On success
- **-ENOTSUP** – If `spec` does not have valid channel configuration

```c
static inline bool adc_is_ready_dt(const struct adc_dt_spec *spec)
```

Validate that the ADC device is ready.

**Parameters**

- **spec** – ADC specification from devicetree

**Return values**

- **true** – if the ADC device is ready for use and false otherwise.

```c
struct adc_channel_cfg
```

`#include <adc.h>` Structure for specifying the configuration of an ADC channel.

**Public Members**

```c
enum adc_gain gain
```

Gain selection.

```c
enum adc_reference reference
```

Reference selection.
uint16_t acquisition_time

Acquisition time.

Use the ADC_ACQ_TIME macro to compose the value for this field or pass ADC_ACQ_TIME_DEFAULT to use the default setting for a given hardware (e.g. when the hardware does not allow to configure the acquisition time). Particular drivers do not necessarily support all the possible units. Value range is 0-16383 for a given unit.

uint8_t channel_id

Channel identifier.

This value primarily identifies the channel within the ADC API - when a read request is done, the corresponding bit in the “channels” field of the “adc_sequence” structure must be set to include this channel in the sampling. For hardware that does not allow selection of analog inputs for given channels, but rather have dedicated ones, this value also selects the physical ADC input to be used in the sampling. Otherwise, when it is needed to explicitly select an analog input for the channel, or two inputs when the channel is a differential one, the selection is done in “input_positive” and “input_negative” fields. Particular drivers indicate which one of the above two cases they support by selecting or not a special hidden Kconfig option named ADC_CONFIGURABLE_INPUTS. If this option is not selected, the macro CONFIG_ADC_CONFIGURABLE_INPUTS is not defined and consequently the mentioned two fields are not present in this structure. While this API allows identifiers from range 0-31, particular drivers may support only a limited number of channel identifiers (dependent on the underlying hardware capabilities or configured via a dedicated Kconfig option).

uint8_t differential

Channel type: single-ended or differential.

struct adc_dt_spec

#include <adc.h> Container for ADC channel information specified in devicetree.

See also:
ADC_DT_SPEC_GET_BY_IDX

See also:
ADC_DT_SPEC_GET

Public Members

const struct device *dev

Pointer to the device structure for the ADC driver instance used by this io-channel.

uint8_t channel_id

ADC channel identifier used by this io-channel.

bool channel_cfg_dt_node_exists

Flag indicating whether configuration of the associated ADC channel is provided as a child node of the corresponding ADC controller in devicetree.
struct `adc_channel_cfg` channel_cfg

Configuration of the associated ADC channel specified in devicetree.

This field is valid only when `channel_cfg_dt_node_exists` is set to `true`.

uint16_t `vref_mv`

Voltage of the reference selected for the channel or 0 if this value is not provided in devicetree.

This field is valid only when `channel_cfg_dt_node_exists` is set to `true`.

uint8_t `resolution`

ADC resolution to be used for that channel.

This field is valid only when `channel_cfg_dt_node_exists` is set to `true`.

uint8_t `oversampling`

Oversampling setting to be used for that channel.

This field is valid only when `channel_cfg_dt_node_exists` is set to `true`.

struct `adc_sequence_options`

`#include <adc.h>` Structure defining additional options for an ADC sampling sequence.

**Public Members**

uint32_t `interval_us`

Interval between consecutive samplings (in microseconds), 0 means sample as fast as possible, without involving any timer.

The accuracy of this interval is dependent on the implementation of a given driver. The default routine that handles the intervals uses a kernel timer for this purpose, thus, it has the accuracy of the kernel's system clock. Particular drivers may use some dedicated hardware timers and achieve a better precision.

`adc_sequence_callback` `callback`

Callback function to be called after each sampling is done.

Optional - set to NULL if it is not needed.

void *`user_data`

Pointer to user data.

It can be used to associate the sequence with any other data that is needed in the callback function.

uint16_t `extra_samplings`

Number of extra samplings to perform (the total number of samplings is 1 + extra_samplings).

struct `adc_sequence`

`#include <adc.h>` Structure defining an ADC sampling sequence.
Public Members

const struct adc_sequence_options *options
   Pointer to a structure defining additional options for the sequence.
   If NULL, the sequence consists of a single sampling.

uint32_t channels
   Bit-mask indicating the channels to be included in each sampling of this sequence.
   All selected channels must be configured with adc_channel_setup() before they are
   used in a sequence. The least significant bit corresponds to channel 0.

void *buffer
   Pointer to a buffer where the samples are to be written.
   Samples from subsequent samplings are written sequentially in the buffer. The
   number of samples written for each sampling is determined by the number of
   channels selected in the “channels” field. The values written to the buffer rep-
   resent a sample from each selected channel starting from the one with the lowest
   ID. The buffer must be of an appropriate size, taking into account the number of
   selected channels and the ADC resolution used, as well as the number of samplings
   contained in the sequence.

size_t buffer_size
   Specifies the actual size of the buffer pointed by the “buffer” field (in bytes).
   The driver must ensure that samples are not written beyond the limit and it must
   return an error if the buffer turns out to be not large enough to hold all the re-
   quested samples.

uint8_t resolution
   ADC resolution.
   For single-ended channels the sample values are from range: 0 .. 2^resolution - 1,
   for differential ones:
   - 2^(resolution-1) .. 2^(resolution-1) - 1.

uint8_t oversampling
   Oversampling setting.
   Each sample is averaged from 2^oversampling conversion results. This feature
   may be unsupported by a given ADC hardware, or in a specific mode (e.g. when
   sampling multiple channels).

bool calibrate
   Perform calibration before the reading is taken if requested.
   The impact of channel configuration on the calibration process is specific to the un-
   derlying hardware. ADC implementations that do not support calibration should
   ignore this flag.

struct adc_driver_api
   #include <adc.h> ADC driver API.
   This is the mandatory API any ADC driver needs to expose.
7.5.3 Auxiliary Display (auxdisplay)

Overview

Auxiliary Displays are text-based displays that have simple interfaces for displaying textual, numeric or alphanumeric data, as opposed to the Display Interface, auxiliary displays do not support custom graphical output to displays (and and most often monochrome), the most advanced custom feature supported is generation of custom characters. These inexpensive displays are commonly found with various configurations and sizes, a common display size is 16 characters by 2 lines.

This API is unstable and subject to change.

Configuration Options

Related configuration options:
- CONFIG_AUXDISPLAY
- CONFIG_AUXDISPLAY_INIT_PRIORITY

API Reference

Related code samples

Auxiliary display
Output "Hello World" to an auxiliary display.

```group auxdisplay_interface``
Auxiliary (Text) Display Interface.
```

Defines

```
AUXDISPLAY_LIGHT_NOT_SUPPORTED
Used for minimum and maximum brightness/backlight values if not supported.
```

Typedefs

```typedef uint32_t auxdisplay_mode_t``
Used to describe the mode of an auxiliary (text) display.

 Enums

```enum auxdisplay_position``
Used for moving the cursor or display position.
```

  Values:
enumerator AUXDISPLAY_POSITION_ABSOLUTE = 0
Moves to specified X,Y position.

enumerator AUXDISPLAY_POSITION_RELATIVE
Shifts current position by +/- X,Y position, does not take display direction into consideration.

enumerator AUXDISPLAY_POSITION_RELATIVE_DIRECTION
Shifts current position by +/- X,Y position, takes display direction into consideration.

enumerator AUXDISPLAY_POSITION_COUNT

enum auxdisplay_direction
Used for setting character append position.

Values:

enumerator AUXDISPLAY_DIRECTION_RIGHT = 0
Each character will be placed to the right of existing characters.

enumerator AUXDISPLAY_DIRECTION_LEFT
Each character will be placed to the left of existing characters.

enumerator AUXDISPLAY_DIRECTION_COUNT

Functions

int auxdisplay_display_on(const struct device *dev)
Turn display on.

Parameters
• dev – Auxiliary display device instance

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -errno – Negative errno code on other failure.

int auxdisplay_display_off(const struct device *dev)
Turn display off.

Parameters
• dev – Auxiliary display device instance

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -errno – Negative errno code on other failure.
int auxdisplay_cursor_set_enabled(const struct device *dev, bool enabled)
Set cursor enabled status on an auxiliary display.

Parameters
• dev – Auxiliary display device instance
• enabled – True to enable cursor, false to disable

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -errno – Negative errno code on other failure.

int auxdisplay_position_blinking_set_enabled(const struct device *dev, bool enabled)
Set cursor blinking status on an auxiliary display.

Parameters
• dev – Auxiliary display device instance
• enabled – Set to true to enable blinking position, false to disable

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -errno – Negative errno code on other failure.

int auxdisplay_cursor_shift_set(const struct device *dev, uint8_t direction, bool display_shift)
Set cursor shift after character write and display shift.

Parameters
• dev – Auxiliary display device instance
• direction – Sets the direction of the display when characters are written
• display_shift – If true, will shift the display when characters are written (which makes it look like the display is moving, not the cursor)

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -EINVAL – if provided argument is invalid.
• -errno – Negative errno code on other failure.

int auxdisplay_cursor_position_set(const struct device *dev, enum auxdisplay_position type, int16_t x, int16_t y)
Set cursor (and write position) on an auxiliary display.

Parameters
• dev – Auxiliary display device instance
• type – Type of move, absolute or offset
• x – Exact or offset X position
• y – Exact or offset Y position

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -EINVAL – if provided argument is invalid.
• -errno – Negative errno code on other failure.

int auxdisplay_cursor_position_get(const struct device *dev, int16_t *x, int16_t *y)
Get current cursor on an auxiliary display.

Parameters
• dev – Auxiliary display device instance
• x – Will be updated with the exact X position
• y – Will be updated with the exact Y position

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -EINVAL – if provided argument is invalid.
• -errno – Negative errno code on other failure.

int auxdisplay_display_position_set(const struct device *dev, enum auxdisplay_position type, int16_t x, int16_t y)
Set display position on an auxiliary display.

Parameters
• dev – Auxiliary display device instance
• type – Type of move, absolute or offset
• x – Exact or offset X position
• y – Exact or offset Y position

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -EINVAL – if provided argument is invalid.
• -errno – Negative errno code on other failure.

int auxdisplay_display_position_get(const struct device *dev, int16_t *x, int16_t *y)
Get current display position on an auxiliary display.

Parameters
• dev – Auxiliary display device instance
• x – Will be updated with the exact X position
• y – Will be updated with the exact Y position

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -EINVAL – if provided argument is invalid.
• -errno – Negative errno code on other failure.
int auxdisplay_capabilities_get(const struct device *dev, struct auxdisplay_capabilities *capabilities)

Fetch capabilities (and details) of auxiliary display.

Parameters
• dev – Auxiliary display device instance
• capabilities – Will be updated with the details of the auxiliary display

Return values
• 0 – on success.
• -errno – Negative errno code on other failure.

int auxdisplay_clear(const struct device *dev)

Clear display of auxiliary display and return to home position (note that this does not reset the display configuration, e.g. custom characters and display mode will persist).

Parameters
• dev – Auxiliary display device instance

Return values
• 0 – on success.
• -errno – Negative errno code on other failure.

int auxdisplay_brightness_get(const struct device *dev, uint8_t *brightness)

Get the current brightness level of an auxiliary display.

Parameters
• dev – Auxiliary display device instance
• brightness – Will be updated with the current brightness

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -EINVAL – if provided argument is invalid.
• -errno – Negative errno code on other failure.

int auxdisplay_brightness_set(const struct device *dev, uint8_t brightness)

Update the brightness level of an auxiliary display.

Parameters
• dev – Auxiliary display device instance
• brightness – The brightness level to set

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -EINVAL – if provided argument is invalid.
• -errno – Negative errno code on other failure.

int auxdisplay_backlight_get(const struct device *dev, uint8_t *backlight)

Get the backlight level details of an auxiliary display.

Parameters
• dev – Auxiliary display device instance
• backlight – Will be updated with the current backlight level

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -errno – Negative errno code on other failure.

int auxdisplay_backlight_set(const struct device *dev, uint8_t backlight)
Update the backlight level of an auxiliary display.

Parameters
• dev – Auxiliary display device instance
• backlight – The backlight level to set

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -EINVAL – if provided argument is invalid.
• -errno – Negative errno code on other failure.

int auxdisplay_is_busy(const struct device *dev)
Check if an auxiliary display driver is busy.

Parameters
• dev – Auxiliary display device instance

Return values
• 1 – on success and display busy.
• 0 – on success and display not busy.
• -ENOSYS – if not supported/implemented.
• -errno – Negative errno code on other failure.

int auxdisplay_custom_character_set(const struct device *dev, struct auxdisplay_character *character)
Sets a custom character in the display, the custom character struct must contain the pixel data for the custom character to add and valid custom character index, if successful then the character_code variable in the struct will be set to the character code that can be used with the auxdisplay_write() function to show it.

A character must be valid for a display consisting of a uint8 array of size character width by character height, values should be 0x00 for pixel off or 0xff for pixel on, if a display supports shades then values between 0x00 and 0xff may be used (display driver dependent).

Parameters
• dev – Auxiliary display device instance
• character – Pointer to custom character structure

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -EINVAL – if provided argument is invalid.
int auxdisplay_write(const struct device *dev, const uint8_t *data, uint16_t len)

Write data to auxiliary display screen at current position.

Parameters
• dev – Auxiliary display device instance
• data – Text data to write
• len – Length of text data to write

Return values
• 0 – on success.
• -EINVAL – if provided argument is invalid.
• -errno – Negative errno code on other failure.

int auxdisplay_custom_command(const struct device *dev, struct auxdisplay_custom_data *data)

Send a custom command to the display (if supported by driver)

Parameters
• dev – Auxiliary display device instance
• data – Custom command structure (this may be extended by specific drivers)

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -EINVAL – if provided argument is invalid.
• -errno – Negative errno code on other failure.

struct auxdisplay_light

#include <auxdisplay.h> Light levels for brightness and/or backlight.

If not supported by a display/driver, both minimum and maximum will be AUXDISPLAY_LIGHT_NOT_SUPPORTED.

Public Members

uint8_t minimum
Minimum light level supported.

uint8_t maximum
Maximum light level supported.

struct auxdisplay_capabilities

#include <auxdisplay.h> Structure holding display capabilities.
Public Members

uint16_t columns
    Number of character columns.

uint16_t rows
    Number of character rows.

auxdisplay_mode_t mode
    Display-specific data (e.g.
    4-bit or 8-bit mode for HD44780-based displays)

struct auxdisplay_light brightness
    Brightness details for display (if supported)

struct auxdisplay_light backlight
    Backlight details for display (if supported)

uint8_t custom_characters
    Number of custom characters supported by display (0 if unsupported)

uint8_t custom_character_width
    Width (in pixels) of a custom character; supplied custom characters should match.

uint8_t custom_character_height
    Height (in pixels) of a custom character; supplied custom characters should match.

struct auxdisplay_custom_data
    #include <auxdisplay.h> Structure for a custom command.
    This may be extended by specific drivers.

Public Members

uint8_t *data
    Raw command data to be sent.

uint16_t len
    Length of supplied data.

uint32_t options
    Display-driver specific options for command.

struct auxdisplay_character
    #include <auxdisplay.h> Structure for a custom character.
Public Members

uint8_t \texttt{index}

Custom character index on the display.

uint8_t *\texttt{data}

Custom character pixel data, a character must be valid for a display consisting of a uint8 array of size character width by character height, values should be 0x00 for pixel off or 0xff for pixel on, if a display supports shades then values between 0x00 and 0xff may be used (display driver dependent).

uint8_t \texttt{character\_code}

Will be updated with custom character index to use in the display write function to display this custom character.

7.5.4 Audio

Audio Codec

Overview

The Audio Codec API provides access to digital audio codecs.

Configuration Options

Related configuration options:

\begin{itemize}
\item CONFIG_AUDIO_CODEC
\end{itemize}

API Reference

\texttt{group audio\_codec\_interface}

Abstraction for audio codecs.

Typedefs

typedef void (\texttt{audio\_codec\_error\_callback\_t})(\texttt{const\ struct\ device*}\ dev, \texttt{uint32\_t}\ errors)

Callback for error interrupt.

\textbf{Param dev}

Pointer to the codec device

\textbf{Param errors}

Device errors (bitmask of \texttt{audio\_codec\_error\_type} values)

Enums

\texttt{enum audio\_pcm\_rate\_t}

PCM audio sample rates.

\texttt{Values:}
enumerator AUDIO_PCM_RATE_8K = 8000
  8 kHz sample rate
enumerator AUDIO_PCM_RATE_16K = 16000
  16 kHz sample rate
enumerator AUDIO_PCM_RATE_24K = 24000
  24 kHz sample rate
enumerator AUDIO_PCM_RATE_32K = 32000
  32 kHz sample rate
enumerator AUDIO_PCM_RATE_44P1K = 44100
  44.1 kHz sample rate
enumerator AUDIO_PCM_RATE_48K = 48000
  48 kHz sample rate
enumerator AUDIO_PCM_RATE_96K = 96000
  96 kHz sample rate
enumerator AUDIO_PCM_RATE_192K = 192000
  192 kHz sample rate

enum audio_pcm_width_t
  PCM audio sample bit widths.
  Values:
  enumerator AUDIO_PCM_WIDTH_16_BITS = 16
    16-bit sample width
  enumerator AUDIO_PCM_WIDTH_20_BITS = 20
    20-bit sample width
  enumerator AUDIO_PCM_WIDTH_24_BITS = 24
    24-bit sample width
  enumerator AUDIO_PCM_WIDTH_32_BITS = 32
    32-bit sample width

enum audio_dai_type_t
  Digital Audio Interface (DAI) type.
  Values:
  enumerator AUDIO_DAI_TYPE_I2S
    I2S Interface.
enumerator AUDIO_DAI_TYPE_INVALID
Other interfaces can be added here.

enum audio_property_t
Codec properties that can be set by audio_codec_set_property().

Values:

enumerator AUDIO_PROPERTY_OUTPUT_VOLUME
Output volume.

enumerator AUDIO_PROPERTY_OUTPUT_MUTE
Output mute/unmute.

enum audio_channel_t
Audio channel identifiers to use in audio_codec_set_property().

Values:

enumerator AUDIO_CHANNEL_FRONT_LEFT
Front left channel.

enumerator AUDIO_CHANNEL_FRONT_RIGHT
Front right channel.

enumerator AUDIO_CHANNEL_LFE
Low frequency effect channel.

enumerator AUDIO_CHANNEL_FRONT_CENTER
Front center channel.

enumerator AUDIO_CHANNEL_REAR_LEFT
Rear left channel.

enumerator AUDIO_CHANNEL_REAR_RIGHT
Rear right channel.

enumerator AUDIO_CHANNEL_REAR_CENTER
Rear center channel.

enumerator AUDIO_CHANNEL_SIDE_LEFT
Side left channel.

enumerator AUDIO_CHANNEL_SIDE_RIGHT
Side right channel.

enumerator AUDIO_CHANNEL_ALL
All channels.
enum audio_codec_error_type
    Codec error type.
    
    Values:
    
    enumerator AUDIO_CODEC_ERROR_OVERCURRENT = BIT(0)
        Output over-current.
    
    enumerator AUDIO_CODEC_ERROR_OVERTEMPERATURE = BIT(1)
        Codec over-temperature.
    
    enumerator AUDIO_CODEC_ERROR_UNDERVOLTAGE = BIT(2)
        Power low voltage.
    
    enumerator AUDIO_CODEC_ERROR_OVERVOLTAGE = BIT(3)
        Power high voltage.
    
    enumerator AUDIO_CODEC_ERROR_DC = BIT(4)
        Output direct-current.

Functions

static inline int audio_codec_configure(const struct device *dev, struct audio_codec_cfg *cfg)
    Configure the audio codec.
    Configure the audio codec device according to the configuration parameters provided as input
    
    Parameters
    • dev – Pointer to the device structure for codec driver instance.
    • cfg – Pointer to the structure containing the codec configuration.
    
    Returns
    0 on success, negative error code on failure

static inline void audio_codec_start_output(const struct device *dev)
    Set codec to start output audio playback.
    
    Parameters
    • dev – Pointer to the device structure for codec driver instance.

static inline void audio_codec_stop_output(const struct device *dev)
    Set codec to stop output audio playback.
    
    Parameters
    • dev – Pointer to the device structure for codec driver instance.

static inline int audio_codec_set_property(const struct device *dev, audio_property_t property, audio_channel_t channel, audio_property_value_t val)
Set a codec property defined by `audio_property_t`.
Set a property such as volume level, clock configuration etc.

**Parameters**
- `dev` – Pointer to the device structure for codec driver instance.
- `property` – The codec property to set
- `channel` – The audio channel for which the property has to be set
- `val` – Pointer to a property value of type `audio_codec_property_value_t`

**Returns**
0 on success, negative error code on failure

```c
static inline int audio_codec_apply_properties(const struct device *dev)
```

Atomically apply any cached properties.
Following one or more invocations of `audio_codec_set_property`, that may have been
cached by the driver, `audio_codec_apply_properties` can be invoked to apply all the
properties as atomic as possible

**Parameters**
- `dev` – Pointer to the device structure for codec driver instance.

**Returns**
0 on success, negative error code on failure

```c
static inline int audio_codec_clear_errors(const struct device *dev)
```

Clear any codec errors.
Clear all codec errors. If an error interrupt exists, it will be de-asserted.

**Parameters**
- `dev` – Pointer to the device structure for codec driver instance.

**Returns**
0 on success, negative error code on failure

```c
static inline int audio_codec_register_error_callback(const struct device *dev,
                                                    audio_codec_error_callback_t cb)
```

Register a callback function for codec error.
The callback will be called from a thread, so I2C or SPI operations are safe. However,
the thread's stack is limited and defined by the driver. It is currently up to the caller to
ensure that the callback does not overflow the stack.

**Parameters**
- `dev` – Pointer to the audio codec device
- `cb` – The function that should be called when an error is detected fires

**Returns**
0 if successful, negative errno code if failure.

```c
union audio_dai_cfg_t
#include <codec.h> Digital Audio Interface Configuration.
```

Configuration is dependent on DAI type
Public Members

```c
struct i2s_config i2s
I2S configuration.
```

```c
struct audio_codec_cfg
#include <codec.h> Codec configuration parameters.
```

Public Members

```c
uint32_t mclk_freq
MCLK input frequency in Hz.
```

```c
audio_dai_type_t dai_type
Digital interface type.
```

```c
audio_dai_cfg_t dai_cfg
DAI configuration info.
```

```c
union audio_property_value_t
#include <codec.h> Codec property values.
```

Public Members

```c
int vol
Volume level in 0.5dB resolution.
```

```c
bool mute
Mute if true, unmute if false.
```

Digital Microphone (DMIC)

**Overview**  The audio DMIC interface provides access to digital microphones.

**Configuration Options**  Related configuration options:
- CONFIG_AUDIO_DMIC

**API Reference**

**Related code samples**

**Digital Microphone (DMIC)**
- Perform PDM transfers using different configurations.

**X-NUCLEO-IKS02A1 shield - MEMS microphone**
- Acquire audio using the digital MEMS microphone on X-NUCLEO-IKS02A1 shield.
group audio_dmic_interface
Abstraction for digital microphones.

 Enums

enum dmic_state
    DMIC driver states.
    Values:
    enumerator DMIC_STATE_UNINIT
        Uninitialized.
    enumerator DMIC_STATE_INITIALIZED
        Initialized.
    enumerator DMIC_STATE_CONFIGURED
        Configured.
    enumerator DMIC_STATE_ACTIVE
        Active.
    enumerator DMIC_STATE_PAUSED
        Paused.

enum dmic_trigger
    DMIC driver trigger commands.
    Values:
    enumerator DMIC_TRIGGER_STOP
        Stop stream.
    enumerator DMIC_TRIGGER_START
        Start stream.
    enumerator DMIC_TRIGGER_PAUSE
        Pause stream.
    enumerator DMIC_TRIGGER_RELEASE
        Release paused stream.
    enumerator DMIC_TRIGGER_RESET
        Reset stream.

enum pdm_lr
    PDM Channels LEFT / RIGHT.
    Values:
enumerator PDM_CHAN_LEFT
  Left channel.

enumerator PDM_CHAN_RIGHT
  Right channel.

## Functions

static inline uint32_t dmic_build_channel_map(uint8_t channel, uint8_t pdm, enum pdm_lr lr)

Build the channel map to populate struct `pdm_chan_cfg`.

Returns the map of PDM controller and LEFT/RIGHT channel shifted to the bit position corresponding to the input logical channel value

**Parameters**

- channel – The logical channel number
- pdm – The PDM hardware controller number
- lr – LEFT/RIGHT channel within the chosen PDM hardware controller

**Returns**

Bit-map containing the PDM and L/R channel information

static inline void dmic_parse_channel_map(uint32_t channel_map_lo, uint32_t channel_map_hi, uint8_t channel, uint8_t pdm, enum pdm_lr *lr)

Helper function to parse the channel map in `pdm_chan_cfg`.

Returns the PDM controller and LEFT/RIGHT channel corresponding to the channel map and the logical channel provided as input

**Parameters**

- channel_map_lo – Lower order/significant bits of the channel map
- channel_map_hi – Higher order/significant bits of the channel map
- channel – The logical channel number
- pdm – Pointer to the PDM hardware controller number
- lr – Pointer to the LEFT/RIGHT channel within the PDM controller

static inline uint32_t dmic_build_clk_skew_map(uint8_t pdm, uint8_t skew)

Build a bit map of clock skew values for each PDM channel.

Returns the bit-map of clock skew value shifted to the bit position corresponding to the input PDM controller value

**Parameters**

- pdm – The PDM hardware controller number
- skew – The skew to apply for the clock output from the PDM controller

**Returns**

Bit-map containing the clock skew information

7.5. Peripherals 2821
static inline int dmic_configure(const struct device *dev, struct dmic_cfg *cfg)
Configure the DMIC driver and controller(s)
Configures the DMIC driver device according to the number of channels, channel mapping, PDM I/O configuration, PCM stream configuration, etc.

Parameters
• dev – Pointer to the device structure for DMIC driver instance
• cfg – Pointer to the structure containing the DMIC configuration

Returns
0 on success, a negative error code on failure

static inline int dmic_trigger(const struct device *dev, enum dmic_trigger cmd)
Send a command to the DMIC driver.
Sends a command to the driver to perform a specific action

Parameters
• dev – Pointer to the device structure for DMIC driver instance
• cmd – The command to be sent to the driver instance

Returns
0 on success, a negative error code on failure

static inline int dmic_read(const struct device *dev, uint8_t stream, void **buffer, size_t *size, int32_t timeout)
Read received decimated PCM data stream.
Optionally waits for audio to be received and provides the received audio buffer from the requested stream

Parameters
• dev – Pointer to the device structure for DMIC driver instance
• stream – Stream identifier
• buffer – Pointer to the received buffer address
• size – Pointer to the received buffer size
• timeout – Timeout in milliseconds to wait in case audio is not yet received, or SYS_FOREVER_MS

Returns
0 on success, a negative error code on failure

struct pdm_io_cfg
#include <dmic.h> PDM Input/Output signal configuration.

Parameters common to all PDM controllers

uint32_t min_pdm_clk_freq
Minimum clock frequency supported by the mic.

uint32_t max_pdm_clk_freq
Maximum clock frequency supported by the mic.
**Parameters unique to each PDM controller**

uint8_t *min_pdm_clk_dc
   Minimum duty cycle in % supported by the mic.

uint8_t *max_pdm_clk_dc
   Maximum duty cycle in % supported by the mic.

**Public Members**

uint32_t *pcm_rate
   PCM sample rate of stream.

uint8_t *pcm_width
   PCM sample width of stream.

uint16_t *block_size
   PCM sample block size per transfer.

struct k_mem_slab *mem_slab
   SLAB for DMIC driver to allocate buffers for stream.

struct pdm_chan_cfg
   #include <dmic.h> Mapping/ordering of the PDM channels to logical PCM output channel.

Since each controller can have 2 audio channels (stereo), there can be a total of 8x2=16 channels. The actual number of channels shall be described in act_num_chan.

If 2 streams are enabled, the channel order will be the same for both streams.

Each channel is described as a 4-bit number, the least significant bit indicates LEFT/RIGHT selection of the PDM controller.

The most significant 3 bits indicate the PDM controller number:

---

7.5. **Peripherals**
• bits 0-3 are for channel 0, bit 0 indicates LEFT or RIGHT
• bits 4-7 are for channel 1, bit 4 indicates LEFT or RIGHT and so on.

CONSTRAINT: The LEFT and RIGHT channels of EACH PDM controller needs to be adjacent to each other.

**Requested channel map**

```c
uint32_t req_chan_map_lo
Channels 0 to 7.
```

```c
uint32_t req_chan_map_hi
Channels 8 to 15.
```

**Actual channel map that the driver could configure**

```c
uint32_t act_chan_map_lo
Channels 0 to 7.
```

```c
uint32_t act_chan_map_hi
Channels 8 to 15.
```

**Public Members**

```c
uint8_t req_num_chan
Requested number of channels.
```

```c
uint8_t act_num_chan
Actual number of channels that the driver could configure.
```

```c
uint8_t req_num_streams
Requested number of streams for each channel.
```

```c
uint8_t act_num_streams
Actual number of streams that the driver could configure.
```

```c
struct dmic_cfg
#include <dmic.h> Input configuration structure for the DMIC configuration API.
```

**Public Members**

```c
struct pcm_stream_cfg *streams
Array of pcm_stream_cfg for application to provide configuration for each stream.
```
Inter-IC Sound (I2S) Bus

Overview  The I2S (Inter-IC Sound) API provides support for the standard I2S interface as well as common non-standard extensions such as PCM Short/Long Frame Sync and Left/Right Justified Data Formats.

Configuration Options   Related configuration options:

- CONFIG_I2S

API Reference  Related code samples

I2S echo  Process an audio stream to add an echo effect.

---

group i2s_interface

I2S (Inter-IC Sound) Interface.

The I2S API provides support for the standard I2S interface standard as well as common non-standard extensions such as PCM Short/Long Frame Sync, Left/Right Justified Data Format.

Defines

I2S_FMT_DATA_FORMAT_SHIFT

Data Format bit field position.

I2S_FMT_DATA_FORMAT_MASK

Data Format bit field mask.

I2S_FMT_DATA_FORMAT_I2S

Standard I2S Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The MSB is always sent one clock period after the WS changes. Left channel data are sent first indicated by WS = 0, followed by right channel data indicated by WS = 1.

---

I2S_FMT_DATA_FORMAT_PCM_SHORT

PCM Short Frame Sync Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the falling edge of the clock signal.
(SCK). The falling edge of the frame sync signal (WS) indicates the start of the PCM word. The frame sync is one clock cycle long. An arbitrary number of data words can be sent in one frame.

| SCK | WS | SD | | Word 1 | Word 2 | | Word 3 | Word n |
|-----|----|----|------------|--------------|--------------|------------|--------------|

**I2S_FMT_DATA_FORMAT_PCM_LONG**

PCM Long Frame Sync Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the falling edge of the clock signal (SCK). The rising edge of the frame sync signal (WS) indicates the start of the PCM word. The frame sync has an arbitrary length, however it has to fall before the start of the next frame. An arbitrary number of data words can be sent in one frame.

| SCK | WS | SD | | Word 1 | Word 2 | | Word 3 | Word n |
|-----|----|----|------------|--------------|--------------|------------|--------------|

**I2S_FMT_DATA_FORMAT_LEFT Justiça**

Left Justified Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The bits within the data word are left justified such that the MSB is always sent in the clock period following the WS transition. Left channel data are sent first indicated by WS = 1, followed by right channel data indicated by WS = 0.

| SCK | WS | SD | | Left channel | Right channel |
|-----|----|----|----------------|----------------|

**I2S_FMT_DATA_FORMAT_RIGHT JUSTIFIED**

Right Justified Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The bits within the data word are right justified such that the LSB is always sent in the clock period preceding the WS transition. Left channel data are sent first indicated by WS = 1, followed by right channel data indicated by WS = 0.
I2S_FMT_DATA_ORDER_MSB
Send MSB first.

I2S_FMT_DATA_ORDER_LSB
Send LSB first.

I2S_FMT_DATA_ORDER_INV
Invert bit ordering, send LSB first.

I2S_FMT_CLK_FORMAT_SHIFT
Data Format bit field position.

I2S_FMT_CLK_FORMAT_MASK
Data Format bit field mask.

I2S_FMT_BIT_CLK_INV
Invert bit clock.

I2S_FMT_FRAME_CLK_INV
Invert frame clock.

I2S_FMT_CLK_NF_NB
Normal Frame, Normal Bit Clk.

I2S_FMT_CLK_NF_IB
Normal Frame, Inverted Bit Clk.

I2S_FMT_CLK_IF_NB
Inverted Frame, Normal Bit Clk.

I2S_FMT_CLK_IF_IB
Inverted Frame, Inverted Bit Clk.

I2S_OPT_BIT_CLK_CONT
Run bit clock continuously.

I2S_OPT_BIT_CLK_GATED
Run bit clock when sending data only.

I2S_OPT_BIT_CLK_MASTER
I2S driver is bit clock master.
I2S_OPT_BIT_CLK_SLAVE
I2S driver is bit clock slave.

I2S_OPT_FRAME_CLK_MASTER
I2S driver is frame clock master.

I2S_OPT_FRAME_CLK_SLAVE
I2S driver is frame clock slave.

I2S_OPT_LOOPBACK
Loop back mode.
In loop back mode RX input will be connected internally to TX output. This is used primarily for testing.

I2S_OPT_PINGPONG
Ping pong mode.
In ping pong mode TX output will keep alternating between a ping buffer and a pong buffer. This is normally used in audio streams when one buffer is being populated while the other is being played (DMAed) and vice versa. So, in this mode, 2 sets of buffers fixed in size are used. Static Arrays are used to achieve this and hence they are never freed.

typedef uint8_t i2s_fmt_t
I2S data stream format options.

typedef uint8_t i2s_opt_t
I2S configuration options.

Enum

e num i2s_dir
I2C Direction.

Values:

enumerator I2S_DIR_RX
Receive data.

enumerator I2S_DIR_TX
Transmit data.

enumerator I2S_DIR_BOTH
Both receive and transmit data.
enum i2s_state

Interface state.

Values:

enumerator I2S_STATE_NOT_READY

The interface is not ready.

The interface was initialized but is not yet ready to receive / transmit data. Call i2s_configure() to configure interface and change its state to READY.

enumerator I2S_STATE_READY

The interface is ready to receive / transmit data.

enumerator I2S_STATE_RUNNING

The interface is receiving / transmitting data.

enumerator I2S_STATE_STOPPING

The interface is draining its transmit queue.

enumerator I2S_STATE_ERROR

TX buffer underrun or RX buffer overrun has occurred.

enum i2s_trigger_cmd

Trigger command.

Values:

enumerator I2S_TRIGGER_START

Start the transmission / reception of data.

If I2S_DIR_TX is set some data has to be queued for transmission by the i2s_write() function. This trigger can be used in READY state only and changes the interface state to RUNNING.

enumerator I2S_TRIGGER_STOP

Stop the transmission / reception of data.

Stop the transmission / reception of data at the end of the current memory block. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When the current TX / RX block is transmitted / received the state is changed to READY. Subsequent START trigger will resume transmission / reception where it stopped.

enumerator I2S_TRIGGER_DRAIN

Empty the transmit queue.

Send all data in the transmit queue and stop the transmission. If the trigger is applied to the RX queue it has the same effect as I2S_TRIGGER_STOP. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When all TX blocks are transmitted the state is changed to READY.
enumerator I2S_TRIGGER_DROP
Discard the transmit / receive queue.
Stop the transmission / reception immediately and discard the contents of the respective queue. This trigger can be used in any state other than NOT_READY and changes the interface state to READY.

enumerator I2S_TRIGGER_PREPARE
Prepare the queues after underrun/overrun error has occurred.
This trigger can be used in ERROR state only and changes the interface state to READY.

Functions

```c
int i2s_configure(const struct device *dev, enum i2s_dir dir, const struct i2s_config *cfg)
```
Configure operation of a host I2S controller.

- The dir parameter specifies if Transmit (TX) or Receive (RX) direction will be configured by data provided via cfg parameter.
- The function can be called in NOT_READY or READY state only. If executed successfully the function will change the interface state to READY.
- If the function is called with the parameter cfg->frame_clk_freq set to 0 the interface state will be changed to NOT_READY.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX, TX, or both, as defined by I2S_DIR_*.
  The I2S_DIR_BOTH value may not be supported by some drivers. For those, the RX and TX streams need to be configured separately.
- `cfg` – Pointer to the structure containing configuration parameters.

**Return values**

- `0` – If successful.
- `-EINVAL` – Invalid argument.
- `-ENOSYS` – I2S_DIR_BOTH value is not supported.

```c
static inline const struct i2s_config *i2s_config_get(const struct device *dev, enum i2s_dir dir)
```
Fetch configuration information of a host I2S controller.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX or TX as defined by I2S_DIR_*

**Return values**

- Pointer – to the structure containing configuration parameters, or NULL if un-configured.

```c
static inline int i2s_read(const struct device *dev, void **mem_block, size_t *size)
```
Read data from the RX queue.

Data received by the I2S interface is stored in the RX queue consisting of memory blocks preallocated by this function from rx_mem_slab (as defined by i2s_configure).
Ownership of the RX memory block is passed on to the user application which has to release it.

The data is read in chunks equal to the size of the memory block. If the interface is in READY state the number of bytes read can be smaller.

If there is no data in the RX queue the function will block waiting for the next RX memory block to fill in. This operation can timeout as defined by i2s_configure. If the timeout value is set to K_NO_WAIT the function is non-blocking.

Reading from the RX queue is possible in any state other than NOT_READY. If the interface is in the ERROR state it is still possible to read all the valid data stored in RX queue. Afterwards the function will return -EIO error.

Parameters
- dev – Pointer to the device structure for the driver instance.
- mem_block – Pointer to the RX memory block containing received data.
- size – Pointer to the variable storing the number of bytes read.

Return values
- 0 – If successful.
- -EIO – The interface is in NOT_READY or ERROR state and there are no more data blocks in the RX queue.
- -EBUSY – Returned without waiting.
- -EAGAIN – Waiting period timed out.

int i2s_buf_read(const struct device *dev, void *buf, size_t *size)
Read data from the RX queue into a provided buffer.

Data received by the I2S interface is stored in the RX queue consisting of memory blocks preallocated by this function from rx_mem_slab (as defined by i2s_configure). Calling this function removes one block from the queue which is copied into the provided buffer and then freed.

The provided buffer must be large enough to contain a full memory block of data, which is parameterized for the channel via i2s_configure().

This function is otherwise equivalent to i2s_read().

Parameters
- dev – Pointer to the device structure for the driver instance.
- buf – Destination buffer for read data, which must be at least the as large as the configured memory block size for the RX channel.
- size – Pointer to the variable storing the number of bytes read.

Return values
- 0 – If successful.
- -EIO – The interface is in NOT_READY or ERROR state and there are no more data blocks in the RX queue.
- -EBUSY – Returned without waiting.
- -EAGAIN – Waiting period timed out.

static inline int i2s_write(const struct device *dev, void *mem_block, size_t size)
Write data to the TX queue.

Data to be sent by the I2S interface is stored first in the TX queue. TX queue consists of memory blocks preallocated by the user from tx_mem_slab (as defined by
i2s_configure). This function takes ownership of the memory block and will release it when all data are transmitted.

If there are no free slots in the TX queue the function will block waiting for the next TX memory block to be send and removed from the queue. This operation can timeout as defined by i2s_configure. If the timeout value is set to K_NO_WAIT the function is non-blocking.

Writing to the TX queue is only possible if the interface is in READY or RUNNING state.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `mem_block` – Pointer to the TX memory block containing data to be sent.
- `size` – Number of bytes to write. This value has to be equal or smaller than the size of the memory block.

**Return values**

- `0` – If successful.
- `-EIO` – The interface is not in READY or RUNNING state.
- `-EBUSY` – Returned without waiting.
- `-EAGAIN` – Waiting period timed out.

```c
int i2s_buf_write(const struct device *dev, void *buf, size_t size)
```

Write data to the TX queue from a provided buffer.

This function acquires a memory block from the I2S channel TX queue and copies the provided data buffer into it. It is otherwise equivalent to `i2s_write()`.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `buf` – Pointer to a buffer containing the data to transmit.
- `size` – Number of bytes to write. This value has to be equal or smaller than the size of the channel's TX memory block configuration.

**Return values**

- `0` – If successful.
- `-EIO` – The interface is not in READY or RUNNING state.
- `-EBUSY` – Returned without waiting.
- `-EAGAIN` – Waiting period timed out.
- `-ENOMEM` – No memory in TX slab queue.
- `-EINVAL` – Size parameter larger than TX queue memory block.

```c
int i2s_trigger(const struct device *dev, enum i2s_dir dir, enum i2s_trigger_cmd cmd)
```

Send a trigger command.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX, TX, or both, as defined by I2S_DIR_*. The I2S_DIR_BOTH value may not be supported by some drivers. For those, triggering need to be done separately for the RX and TX streams.
- `cmd` – Trigger command.

**Return values**
• 0 – If successful.
• -EINVAL – Invalid argument.
• -EIO – The trigger cannot be executed in the current state or a DMA channel cannot be allocated.
• -ENOMEM – RX/TX memory block not available.
• -ENOSYS – I2S_DIR_BOTH value is not supported.

```c
struct i2s_config
#include <i2s.h> Interface configuration options.
```

Memory slab pointed to by the mem_slab field has to be defined and initialized by the user. For I2S driver to function correctly number of memory blocks in a slab has to be at least 2 per queue. Size of the memory block should be multiple of frame_size where frame_size = (channels * word_size_bytes). As an example 16 bit word will occupy 2 bytes, 24 or 32 bit word will occupy 4 bytes.

Please check Zephyr Kernel Primer for more information on memory slabs.

---

**Remark**

When I2S data format is selected parameter channels is ignored, number of words in a frame is always 2.

---

**Public Members**

```c
uint8_t word_size
    Number of bits representing one data word.

uint8_t channels
    Number of words per frame.

i2s_fmt_t format
    Data stream format as defined by I2S_FMT_* constants.

i2s_opt_t options
    Configuration options as defined by I2S_OPT_* constants.

uint32_t frame_clk_freq
    Frame clock (WS) frequency, this is sampling rate.

struct k_mem_slab *mem_slab
    Memory slab to store RX/TX data.

size_t block_size
    Size of one RX/TX memory block (buffer) in bytes.
```
**int32_t timeout**

Read/Write timeout.

Number of milliseconds to wait in case TX queue is full or RX queue is empty, or 0, or SYS_FOREVER_MS.

---

**Digital Audio Interface (DAI)**

**Overview**  The DAI (Digital Audio Interface) is a generic high level API for audio drivers. It can be configured with bespoke data for vendor specific configuration.

**Configuration Options**  Related configuration options:

- CONFIG_DAI

**API Reference**

*group dai_interface*

DAI Interface.

The DAI API provides support for the standard I2S (SSP) and its common variants. It supports also DMIC, HDA and SDW backends. The API has a config function with bespoke data argument for device/vendor specific config. There are also optional timestamping functions to get device specific audio clock time.

**Enums**

**enum dai_type**

Types of DAI.

The type of the DAI. This ID type is used to configure bespoke DAI HW settings.

DAIs have a lot of physical link feature variability and therefore need different configuration data to cater for different use cases. We usually need to pass extra bespoke configuration prior to DAI start.

**Values:**

- enumerator **DAI_LEGACY_I2S** = 0  
  Legacy I2S compatible with i2s.h.

- enumerator **DAI_INTEL_SSP**  
  Intel SSP.

- enumerator **DAI_INTEL_DMIC**  
  Intel DMIC.

- enumerator **DAI_INTEL_HDA**  
  Intel HD/A.

- enumerator **DAI_INTEL_ALH**  
  Intel ALH.
enumerator DAI_IMX_SAI
    i.MX SAI

enumerator DAI_IMX_ESAI
    i.MX ESAI

enumerator DAI_AMD_BT
    Amd BT.

enumerator DAI_AMD_SP
    Amd SP.

enumerator DAI_AMD_DMIC
    Amd DMIC.

enumerator DAI_MEDIATEK_AFE
    Mtk AFE.

enumerator DAI_INTEL_SSP_NHLT
    nhlt ssp

enumerator DAI_INTEL_DMIC_NHLT
    nhlt ssp

enumerator DAI_INTEL_HDA_NHLT
    nhlt Intel HD/A

enumerator DAI_INTEL_ALH_NHLT
    nhlt Intel ALH

enum dai_dir
    DAI Direction.
    
    Values:
    
    enumerator DAI_DIR_RX = 1
        Receive data.

    enumerator DAI_DIR_TX
        Transmit data.

    enumerator DAI_DIR_BOTH
        Both receive and transmit data.

enum dai_state
    Interface state.
    
    Values:
enumerator DAIVSTATE_NOT_READY = 0
The interface is not ready.
The interface was initialized but is not yet ready to receive / transmit data. Call dai_config_set() to configure interface and change its state to READY.

enumerator DAIVSTATE_READY
The interface is ready to receive / transmit data.

enumerator DAIVSTATE_RUNNING
The interface is receiving / transmitting data.

enumerator DAIVSTATE_PRE_RUNNING
The interface is clocking but not receiving / transmitting data.

enumerator DAIVSTATE_PAUSED
The interface paused.

enumerator DAIVSTATE_STOPPING
The interface is draining its transmit queue.

enumerator DAIVSTATE_ERROR
TX buffer underrun or RX buffer overrun has occurred.

enum dai_trigger_cmd
Trigger command.
Values:

enumerator DAIVTRIGGER_START = 0
Start the transmission / reception of data.
If DAIVDIR_TX is set some data has to be queued for transmission by the dai_write() function. This trigger can be used in READY state only and changes the interface state to RUNNING.

enumerator DAIVTRIGGER_PRE_START
Optional - Pre Start the transmission / reception of data.
Allows the DAI and downstream codecs to prepare for audio Tx/Rx by starting any required clocks for downstream PLL/FLL locking.

enumerator DAIVTRIGGER_STOP
Stop the transmission / reception of data.
Stop the transmission / reception of data at the end of the current memory block. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When the current TX / RX block is transmitted / received the state is changed to READY. Subsequent START trigger will resume transmission / reception where it stopped.
enumerator **DAI_TRIGGER_PAUSE**
Pause the transmission / reception of data.

Pause the transmission / reception of data at the end of the current memory block. Behavior is implementation specific but usually this state doesn't completely stop the clocks or transmission. The DAI could be transmitting 0's (silence), but it is not consuming data from outside.

enumerator **DAI_TRIGGER_POST_STOP**
Optional - Post Stop the transmission / reception of data.

Allows the DAI and downstream codecs to shutdown cleanly after audio Tx/Rx by stopping any required clocks for downstream audio completion.

enumerator **DAI_TRIGGER_DRAIN**
Empty the transmit queue.

Send all data in the transmit queue and stop the transmission. If the trigger is applied to the RX queue it has the same effect as DAI_TRIGGER_STOP. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When all TX blocks are transmitted the state is changed to READY.

enumerator **DAI_TRIGGER_DROP**
Discard the transmit / receive queue.

Stop the transmission / reception immediately and discard the contents of the respective queue. This trigger can be used in any state other than NOT_READY and changes the interface state to READY.

enumerator **DAI_TRIGGER_PREPARE**
Prepare the queues after underrun/overrun error has occurred.

This trigger can be used in ERROR state only and changes the interface state to READY.

enumerator **DAI_TRIGGER_RESET**
Reset.

This trigger frees resources and moves the driver back to initial state.

enumerator **DAI_TRIGGER_COPY**
Copy.

This trigger prepares for data copying.

**Functions**

```c
static inline int dai_probe(const struct device *dev)
    Probe operation of DAI driver.
```
The function will be called to power up the device and update for example possible reference count of the users. It can be used also to initialize internal variables and memory allocation.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.

**Return values**

- 0 – If successful.

static inline int *dai_remove*(const struct device *dev)

Remove operation of DAI driver.

The function will be called to unregister/unbind the device, for example to power down the device or decrease the usage reference count.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.

**Return values**

- 0 – If successful.

static inline int *dai_config_set*(const struct device *dev, const struct dai_config *cfg, const void *bespoke_cfg)

Configure operation of a DAI driver.

The dir parameter specifies if Transmit (TX) or Receive (RX) direction will be configured by data provided via cfg parameter.

The function can be called in NOT_READY or READY state only. If executed successfully the function will change the interface state to READY.

If the function is called with the parameter cfg->frame_clk_freq set to 0 the interface state will be changed to NOT_READY.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **cfg** – Pointer to the structure containing configuration parameters.
- **bespoke_cfg** – Pointer to the structure containing bespoke config.

**Return values**

- 0 – If successful.
- EINVAL – Invalid argument.
- ENOSYS – DAI_DIR_BOTH value is not supported.

static inline int *dai_config_get*(const struct device *dev, struct dai_config *cfg, enum dai_dir dir)

Fetch configuration information of a DAI driver.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance
- **cfg** – Pointer to the config structure to be filled by the instance
- **dir** – Stream direction: RX or TX as defined by DAI_DIR_*

**Return values**

- 0 – if success, negative if invalid parameters or DAI un-configured
static inline const struct dai_properties *dai_get_properties(const struct device *dev, enum dai_dir dir, int stream_id)

Fetch properties of a DAI driver.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance
- `dir` – Stream direction: RX or TX as defined by DAI_DIR_*
- `stream_id` – Stream id: some drivers may have stream specific properties, this id specifies the stream.

**Return values**
- Pointer to the structure containing properties, or NULL if error or no properties

static inline int dai_trigger(const struct device *dev, enum dai_dir dir, enum dai_trigger_cmd cmd)

Send a trigger command.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX, TX, or both, as defined by DAI_DIR_*. The DAI_DIR_BOTH value may not be supported by some drivers. For those, triggering need to be done separately for the RX and TX streams.
- `cmd` – Trigger command.

**Return values**
- 0 – If successful.
- EINVAL – Invalid argument.
- EIO – The trigger cannot be executed in the current state or a DMA channel cannot be allocated.
- ENOMEM – RX/TX memory block not available.
- ENOSYS – DAI_DIR_BOTH value is not supported.

static inline int dai_ts_config(const struct device *dev, struct dai_ts_cfg *cfg)

Configures timestamping in attached DAI.

Optional method.

**Parameters**
- `dev` – Component device.
- `cfg` – Timestamp config.

**Return values**
- 0 – If successful.

static inline int dai_ts_start(const struct device *dev, struct dai_ts_cfg *cfg)

Starts timestamping.

Optional method.

**Parameters**
- `dev` – Component device.
• cfg – Timestamp config.

**Return values**
0 – If successful.

```c
static inline int dai_ts_stop(const struct device *dev, struct dai_ts_cfg *cfg)
```

Stops timestamping.

Optional method.

**Parameters**
• dev – Component device.
• cfg – Timestamp config.

**Return values**
0 – If successful.

```c
static inline int dai_ts_get(const struct device *dev, struct dai_ts_cfg *cfg, struct dai_ts_data *tsd)
```

Gets timestamp.

Optional method.

**Parameters**
• dev – Component device.
• cfg – Timestamp config.
• tsd – Receives timestamp data.

**Return values**
0 – If successful.

```c
struct dai_properties
#include <dai.h> DAI properties.
```

This struct is used with APIs get_properties function to query DAI properties like fifo address and dma handshake. These are needed for example to setup dma outside the driver code.

**Public Members**

```c
uint32_t fifo_address
    Fifo hw address for e.g.
    when connecting to dma.
```

```c
uint32_t fifo_depth
    Fifo depth.
```

```c
uint32_t dma_hs_id
    DMA handshake id.
```

```c
uint32_t reg_init_delay
    Delay for initializing registers.
```
int stream_id
Stream ID.

struct dai_config
#include <dai.h> Main DAI config structure.
Generic DAI interface configuration options.

Public Members

dai_type type
Type of the DAI.

uint32_t dai_index
Index of the DAI.

uint32_t channels
Number of audio channels, words in frame.

uint32_t rate
Frame clock (WS) frequency, sampling rate.

uint16_t format
DAI specific data stream format.

uint8_t options
DAI specific configuration options.

uint8_t word_size
Number of bits representing one data word.

size_t block_size
Size of one RX/TX memory block (buffer) in bytes.

uint16_t link_config
DAI specific link configuration.

struct dai_ts_cfg
#include <dai.h> DAI timestamp configuration.

Public Members

uint32_t walclk_rate
Rate in Hz, e.g.
19200000
int type
  Type of the DAI (SSP, DMIC, HDA, etc.).

int direction
  Direction (playback/capture)

int index
  Index for SSPx to select correct timestamp register.

int dma_id
  DMA instance id.

int dma_chan_index
  Used DMA channel index.

int dma_chan_count
  Number of channels in single DMA.

struct dai_ts_data
  #include <dai.h> DAI timestamp data.

Public Members

uint64_t walclk
  Wall clock.

uint64_t sample
  Sample count.

uint32_t walclk_rate
  Rate in Hz, e.g.
  19200000

7.5.5 Battery Backed RAM (BBRAM)

The BBRAM APIs allow interfacing with the unique properties of this memory region. The following common types of BBRAM properties are easily accessed via this API:

  • IBBR (invalid) state - check that the BBRAM is not corrupt.
  • VSBY (voltage standby) state - check if the BBRAM is using standby voltage.
  • VCC (active power) state - check if the BBRAM is on normal power.
  • Size - get the size (in bytes) of the BBRAM region.

Along with these, the API provides a means for reading and writing to the memory region via bbram_read() and bbram_write() respectively. Both functions are expected to only succeed if the BBRAM is in a valid state and the operation is bounded to the memory region.
API Reference

**group bbram_interface**

BBRAM Interface.

**Typedefs**

```c
typedef int (*bbram_api_check_invalid_t)(const struct device *dev)
    API template to check if the BBRAM is invalid.
```

**See also:**

`bbram_check_invalid`

```c
typedef int (*bbram_api_check_standby_power_t)(const struct device *dev)
    API template to check for standby power failure.
```

**See also:**

`bbram_check_standby_power`

```c
typedef int (*bbram_api_check_power_t)(const struct device *dev)
    API template to check for V CC1 power failure.
```

**See also:**

`bbram_check_power`

```c
typedef int (*bbram_api_get_size_t)(const struct device *dev, size_t *size)
    API template to check the size of the BBRAM.
```

**See also:**

`bbram_get_size`

```c
typedef int (*bbram_api_read_t)(const struct device *dev, size_t offset, size_t size, uint8_t *data)
    API template to read from BBRAM.
```

**See also:**

`bbram_read`

```c
typedef int (*bbram_api_write_t)(const struct device *dev, size_t offset, size_t size, const uint8_t *data)
    API template to write to BBRAM.
```

**See also:**

`bbram_write`
Functions

int bbram_check_invalid(const struct device *dev)
Check if BBRAM is invalid.
Check if “Invalid Battery-Backed RAM” status is set then reset the status bit. This may
occur as a result to low voltage at the VBAT pin.

Parameters
• dev – [in] BBRAM device pointer.

Returns
0 if the Battery-Backed RAM data is valid, -EFAULT otherwise.

int bbram_check_standby_power(const struct device *dev)
Check for standby (Volt SBY) power failure.
Check if the V standby power domain is turned on after it was off then reset the status
bit.

Parameters
• dev – [in] BBRAM device pointer.

Returns
0 if V SBY power domain is in normal operation.

int bbram_check_power(const struct device *dev)
Check for V CC1 power failure.
This will return an error if the V CC1 power domain is turned on after it was off and
reset the status bit.

Parameters
• dev – [in] BBRAM device pointer.

Returns
0 if the V CC1 power domain is in normal operation, -EFAULT otherwise.

int bbram_get_size(const struct device *dev, size_t *size)
Get the size of the BBRAM (in bytes).

Parameters
• dev – [in] BBRAM device pointer.
• size – [out] Pointer to write the size to.

Returns
0 for success, -EFAULT otherwise.

int bbram_read(const struct device *dev, size_t offset, size_t size, uint8_t *data)
Read bytes from BBRAM.

Parameters
• dev – [in] The BBRAM device pointer to read from.
• offset – [in] The offset into the RAM address to start reading from.
• size – [in] The number of bytes to read.
• data – [out] The buffer to load the data into.

Returns
0 on success, -EFAULT if the address range is out of bounds.
int `bbram_write`(`const struct device *dev, size_t offset, size_t size, const uint8_t *data`)
Write bytes to BBRAM.

**Parameters**
- `dev` – [in] The BBRAM device pointer to write to.
- `offset` – [in] The offset into the RAM address to start writing to.
- `size` – [in] The number of bytes to write.
- `data` – [out] Pointer to the start of data to write.

**Returns**
- 0 on success, -EFAULT if the address range is out of bounds.

int `bbram_emul_set_invalid`(`const struct device *dev, bool is_invalid`)
Set the emulated BBRAM driver’s invalid state.

Calling this will affect the emulated behavior of `bbram_check_invalid()`.

**Parameters**
- `dev` – [in] The emulated device to modify
- `is_invalid` – [in] The new invalid state

**Returns**
- 0 on success, negative values on error.

int `bbram_emul_set_standby_power_state`(`const struct device *dev, bool failure`)
Set the emulated BBRAM driver’s standby power state.

Calling this will affect the emulated behavior of `bbram_check_standby_power()`.

**Parameters**
- `dev` – [in] The emulated device to modify
- `failure` – [in] Whether or not standby power failure should be emulated

**Returns**
- 0 on success, negative values on error.

int `bbram_emul_set_power_state`(`const struct device *dev, bool failure`)
Set the emulated BBRAM driver's power state.

Calling this will affect the emulated behavior of `bbram_check_power()`.

**Parameters**
- `dev` – [in] The emulated device to modify
- `failure` – [in] Whether or not a power failure should be emulated

**Returns**
- 0 on success, negative values on error.

```
struct bbram_driver_api
#include <bbram.h>
```

### 7.5.6 BC1.2 Devices (Experimental)

The Battery Charging specification, currently at revision 1.2, is commonly referred to as just BC1.2. BC1.2 defines limits and detection mechanisms for USB devices to draw current exceeding the USB 2.0 specification limit of 0.5A, 2.5W.
The BC1.2 specification uses the term Charging Port for the device that supplies VBUS on the
USB connection and the term Portable Device for the device that sinks current from the USB
connection.

Note that the BC1.2 Specification uses the acronym PD for Portable Device. This should not be
confused with the USB-C Power Delivery, which also uses the acronym PD.

On many devices, BC1.2 is the fallback mechanism to determine the connected charger capability
on USB type C ports when the attached type-C partner does not support Power Delivery.

Key parameters from the BC1.2 Specification include:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Symbol</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed PD (portable device) Current Draw from Charging Port</td>
<td>IDEV_CHG</td>
<td>1.5 A</td>
</tr>
<tr>
<td>Charging Downstream Port Rated Current</td>
<td>ICDP</td>
<td>1.5 - 5.0 A</td>
</tr>
<tr>
<td>Maximum Configured Current when connected to a SDP</td>
<td>ICFG_MAX</td>
<td>500 mA</td>
</tr>
<tr>
<td>Dedicated Charging Port Rated Current</td>
<td>IDCP</td>
<td>1.5 - 5.0 A</td>
</tr>
<tr>
<td>Suspend current</td>
<td>ISUSP</td>
<td>2.5 mA</td>
</tr>
<tr>
<td>Unit load current</td>
<td>IUNIT</td>
<td>100 mA</td>
</tr>
</tbody>
</table>

While the ICDP and IDCP rated currents go up to 5.0 A, the BC1.2 current is limited by the
IDEV_CHG parameter. So the BC1.2 support is capped at 1.5 A in the Zephyr implementation
when using portable-device mode.

Basic Operation

The BC1.2 device driver provides only two APIs, bc12_set_role() and bc12_set_result_cb().

The application calls bc12_set_role() to transition the BC1.2 device to either a disconnected,
portable-device, or charging port mode.

For the disconnected state, the BC1.2 driver powers down the detection chip. The power down
operation is vendor specific.

The application calls bc12_set_role() with the type set to BC12_PORTABLE_DEVICE when both
the following conditions are true:

- The application configured the port as an upstream facing port, i.e. a USB device port.
- The application detects VBUS on the USB connection.

For portable-device mode, the BC1.2 driver powers up the detection chip and starts charger
detection. At completion of the charger detection, the BC1.2 driver notifies the callback registered
with bc12_set_result_cb(). By default, the BC1.2 driver clamps the current to 1.5A to comply
with the BC1.2 specification.

To comply with the USB 2.0 specification, when the driver detects a SDP (Standard Downstream
Port) charging partner or if BC1.2 detection fails, the driver reports the available current as ISUSP
(2.5 mA). The application may increase the current draw to IUNIT (100 mA) when the connected
USB host resumes the USB bus and may increase the current draw to ICFG_MAX (500 mA) when
the USB host configures the USB device.

Charging port mode is used by the application when the USB port is configured as a downstream
facing port, i.e. a USB host port. For charging port mode, the BC1.2 driver powers up the detection
chip and configures the charger type specified by a devicetree property. If the driver supports
detection of plug and unplug events, the BC1.2 driver notifies the callback registered with
bc12_set_result_cb() to indicate the current connection state of the portable device partner.
Configuration Options

Related configuration options:

- CONFIG_USB_BC12

API Reference

group b12_interface

BC1.2 driver APIs.

BC1.2 constants

BC12_CHARGER_VOLTAGE_UV

BC1.2 USB charger voltage.

BC12_CHARGER_MIN_CURR_UA

BC1.2 USB charger minimum current.

Set to match the Isusp of 2.5 mA parameter. This is returned by the driver when either BC1.2 detection fails, or the attached partner is a SDP (standard downstream port).

The application may increase the current draw after determining the USB device state of suspended/unconfigured/configured. Suspended: 2.5 mA Unconfigured: 100 mA Configured: 500 mA (USB 2.0)

BC12_CHARGER_MAX_CURR_UA

BC1.2 USB charger maximum current.

Typedefs

typedef void (*bc12_callback_t)(const struct device *dev, struct bc12_partner_state *state, void *user_data)

BC1.2 callback for charger configuration.

Param dev

BC1.2 device which is notifying of the new charger state.

Param state

Current state of the BC1.2 client, including BC1.2 type detected, voltage, and current limits. If NULL, then the partner charger is disconnected or the BC1.2 device is operating in host mode.

Param user_data

Requester supplied data which is passed along to the callback.

Enums

enum bc12_role

BC1.2 device role.

Values:
enumerator BC12_DISCONNECTED
enumerator BC12_PORTABLE_DEVICE
enumerator BC12_CHARGING_PORT

enum bc12_type
    BC1.2 charging partner type.
    Values:
        enumerator BC12_TYPE_NONE
            No partner connected.
        enumerator BC12_TYPE_SDP
            Standard Downstream Port.
        enumerator BC12_TYPE_DCP
            Dedicated Charging Port.
        enumerator BC12_TYPE_CDP
            Charging Downstream Port.
        enumerator BC12_TYPE_PROPRIETARY
            Proprietary charging port.
        enumerator BC12_TYPE_UNKNOWN
            Unknown charging port, BC1.2 detection failed.
        enumerator BC12_TYPE_COUNT
            Count of valid BC12 types.

Functions

int bc12_set_role(const struct device *dev, enum bc12_role role)
    Set the BC1.2 role.
    Parameters
        • dev – Pointer to the device structure for the BC1.2 driver instance.
        • role – New role for the BC1.2 device.
    Return values
        • 0 – If successful.
        • -EIO – general input/output error.

int bc12_set_result_cb(const struct device *dev, bc12_callback_t cb, void *user_data)
    Register a callback for BC1.2 results.
    Parameters
        • dev – Pointer to the device structure for the BC1.2 driver instance.
• \texttt{cb} – Function pointer for the result callback.
• \texttt{user\_data} – Requester supplied data which is passed along to the callback.

Return values
• \texttt{0} – If successful.
• \texttt{-EIO} – general input/output error.

\textbf{struct bc12\_partner\_state}

\textit{#include <usb\_bc12.h>} BC1.2 detected partner state.

\textbf{Param bc12\_role}
Current role of the BC1.2 device.

\textbf{Param type}
Charging partner type. Valid when \texttt{bc12\_role} is \texttt{BC12\_PORTABLE\_DEVICE}.

\textbf{Param current\_ma}
Current, in \texttt{uA}, that the charging partner provides. Valid when \texttt{bc12\_role} is \texttt{BC12\_PORTABLE\_DEVICE}.

\textbf{Param voltage\_mv}
Voltage, in \texttt{uV}, that the charging partner provides. Valid when \texttt{bc12\_role} is \texttt{BC12\_PORTABLE\_DEVICE}.

\textbf{Param pd\_partner\_connected}
True if a PD partner is currently connected. Valid when \texttt{bc12\_role} is \texttt{BC12\_CHARGING\_PORT}.

\textit{group b12\_emulator\_backend}
BC1.2 backend emulator APIs.

\textbf{Functions}

\textbf{static inline int bc12\_emul\_set\_charging\_partner (const struct emul \*target, enum \texttt{bc12\_type} partner\_type)}
Set the charging partner type connected to the BC1.2 device.

The corresponding BC1.2 emulator updates the vendor specific registers to simulate connection of the specified charging partner type. The emulator also generates an interrupt for processing by the real driver, if supported.

\textbf{Parameters}
• \texttt{target} – Pointer to the emulator structure for the BC1.2 emulator instance.
• \texttt{partner\_type} – The simulated partner type. Set to \texttt{BC12\_TYPE\_NONE} to disconnect the charging partner.

\textbf{Return values}
• \texttt{0} – If successful.
• \texttt{-EINVAL} – if the partner type is not supported.

\textbf{static inline int bc12\_emul\_set\_pd\_partner (const struct emul \*target, bool connected)}
Set the portable device partner state.

The corresponding BC1.2 emulator updates the vendor specific registers to simulate connection or disconnection of a portable device partner. The emulator also generates an interrupt for processing by the real driver, if supported.
Parameters

- **target** – Pointer to the emulator structure for the BC1.2 emulator instance.
- **connected** – If true, emulate a connection of a portable device partner. If false, emulate a disconnect event.

Return values

- 0 – If successful.
- -EINVAL – If the connection/disconnection of PD partner is not supported.

### 7.5.7 Clock Control

**Overview**

The clock control API provides access to clocks in the system, including the ability to turn them on and off.

**Configuration Options**

Related configuration options:

- CONFIG_CLOCK_CONTROL

**API Reference**

**Related code samples**

**LiteX clock control driver**

Use LiteX clock control driver to generate multiple clock signals.

```c
#define CLOCK_CONTROL_SUBSYS_ALL
```

**Typedefs**

```c
typedef void *clock_control_subsys_t
```

clock_control_subsys_t is a type to identify a clock controller sub-system.

Such data pointed is opaque and relevant only to the clock controller driver instance being used.
typedef void *clock_control_subsys_rate_t

clock_control_subsys_rate_t is a type to identify a clock controller sub-system rate.

Such data pointed is opaque and relevant only to set the clock controller rate of the
driver instance being used.

typedef void (*clock_control_cb_t)(const struct device *dev, clock_control_subsys_t
subsys, void *user_data)

Callback called on clock started.

Param dev
Device structure whose driver controls the clock.

Param subsys
Opaque data representing the clock.

Param user_data
User data.

typedef int (*clock_control)(const struct device *dev, clock_control_subsys_t sys)

typedef int (*clock_control_get)(const struct device *dev, clock_control_subsys_t sys,
uint32_t *rate)

typedef int (*clock_control_async_on_fn)(const struct device *dev, clock_control_subsys_t
sys, clock_control_cb_t cb, void *user_data)

typedef enum clock_control_status (*clock_control_get_status_fn)(const struct device
*dev, clock_control_subsys_t sys)

typedef int (*clock_control_set)(const struct device *dev, clock_control_subsys_t sys,
clock_control_subsys_rate_t rate)

typedef int (*clock_control_configure_fn)(const struct device *dev, clock_control_subsys_t
sys, void *data)

Enums

enum clock_control_status
 Current clock status.

Values:

enumerator CLOCK_CONTROL_STATUS_STARTING

enumerator CLOCK_CONTROL_STATUS_OFF

enumerator CLOCK_CONTROL_STATUS_ON

enumerator CLOCK_CONTROL_STATUS_UNKNOWN

7.5. Peripherals
Functions

static inline int clock_control_on(const struct device *dev, clock_control_subsys_t sys)

Enable a clock controlled by the device.

On success, the clock is enabled and ready when this function returns. This function may sleep, and thus can only be called from thread context.

Use clock_control_async_on() for non-blocking operation.

Parameters

- dev – Device structure whose driver controls the clock.
- sys – Opaque data representing the clock.

Returns

0 on success, negative errno on failure.

static inline int clock_control_off(const struct device *dev, clock_control_subsys_t sys)

Disable a clock controlled by the device.

This function is non-blocking and can be called from any context. On success, the clock is disabled when this function returns.

Parameters

- dev – Device structure whose driver controls the clock.
- sys – Opaque data representing the clock.

Returns

0 on success, negative errno on failure.

static inline int clock_control_async_on(const struct device *dev, clock_control_subsys_t sys, clock_control_cb_t cb, void *user_data)

Request clock to start with notification when clock has been started.

Function is non-blocking and can be called from any context. User callback is called when clock is started.

Parameters

- dev – Device.
- sys – A pointer to an opaque data representing the sub-system.
- cb – Callback.
- user_data – User context passed to the callback.

Return values

- 0 – if start is successfully initiated.
- EALREADY – if clock was already started and is starting or running.
- ENOTSUP – If the requested mode of operation is not supported.
- ENOSYS – if the interface is not implemented.
- other – negative errno on vendor specific error.

static inline enum clock_control_status clock_control_get_status(const struct device *dev, clock_control_subsys_t sys)

Get clock status.

Parameters
static inline int clock_control_get_rate(const struct device *dev, clock_control_subsys_t sys, uint32_t *rate)

Obtain the clock rate of given sub-system.

Parameters

• dev – Pointer to the device structure for the clock controller driver instance
• sys – A pointer to an opaque data representing the sub-system
• rate – [out] Subsystem clock rate

Return values

• 0 – on successful rate reading.
• -EAGAIN – if rate cannot be read. Some drivers do not support returning the rate when the clock is off.
• -ENOTSUP – if reading the clock rate is not supported for the given sub-system.
• -ENOSYS – if the interface is not implemented.

static inline int clock_control_set_rate(const struct device *dev, clock_control_subsys_t sys, clock_control_subsys_rate_t rate)

Set the rate of the clock controlled by the device.

On success, the new clock rate is set and ready when this function returns. This function may sleep, and thus can only be called from thread context.

Parameters

• dev – Device structure whose driver controls the clock.
• sys – Opaque data representing the clock.
• rate – Opaque data representing the clock rate to be used.

Return values

• -EALREADY – if clock was already in the given rate.
• -ENOTSUP – If the requested mode of operation is not supported.
• -ENOSYS – if the interface is not implemented.
• other – negative errno on vendor specific error.

static inline int clock_control_configure(const struct device *dev, clock_control_subsys_t sys, void *data)

Configure a source clock.

This function is non-blocking and can be called from any context. On success, the selected clock is configured as per caller’s request.

It is caller’s responsibility to ensure that subsequent calls to the API provide the right information to allows clock_control driver to perform the right action (such as using the right clock source on clock_control_get_rate call).

data is implementation specific and could be used to convey supplementary information required for expected clock configuration.
Parameters
- **dev** – Device structure whose driver controls the clock
- **sys** – Opaque data representing the clock
- **data** – Opaque data providing additional input for clock configuration

Return values
- **0** – On success
- **ENOSYS** – If the device driver does not implement this call
- **-errno** – Other negative errno on failure.

```c
struct clock_control_driver_api
#include <clock_control.h>
```

7.5.8 Controller Area Network (CAN)

CAN Controller

- **Overview**
- **Sending**
- **Receiving**
- **Setting the bitrate**
- **SocketCAN**
- **Samples**
- **CAN Controller API Reference**

**Overview**  Controller Area Network is a two-wire serial bus specified by the Bosch CAN Specification, Bosch CAN with Flexible Data-Rate specification and the ISO 11898-1:2003 standard. CAN is mostly known for its application in the automotive domain. However, it is also used in home and industrial automation and other products.

**Warning:** CAN controllers can only initialize when the bus is in the idle (recessive) state for at least 11 recessive bits. Therefore you have to make sure that CAN RX is high, at least for a short time. This is also necessary for loopback mode.

The bit-timing as defined in ISO 11898-1:2003 looks as following:

```
Sync_Seg  Prop_Seg  Prop_Seg  Prop_Seg
```

![Figure 2: CAN Timing. ©Alexander Wachtler](chart.png)

A single bit is split into four segments.
- **Sync_Seg**: The nodes synchronize at the edge of the Sync_Seg. It is always one time quantum in length.
- **Prop_Seg**: The signal propagation delay of the bus and other delays of the transceiver and node.
• Phase_Seg1 and Phase_Seg2: Define the sampling point. The bit is sampled at the end of Phase_Seg1.

The bit-rate is calculated from the time of a time quantum and the values defined above. A bit has the length of Sync_Seg plus Prop_Seg plus Phase_Seg1 plus Phase_Seg2 multiplied by the time of single time quantum. The bit-rate is the inverse of the length of a single bit.

A bit is sampled at the sampling point. The sample point is between Phase_Seg1 and Phase_Seg2 and therefore is a parameter that the user needs to choose. The CiA recommends setting the sample point to 87.5% of the bit.

The resynchronization jump width (SJW) defines the amount of time quantum the sample point can be moved. The sample point is moved when resynchronization is needed.

The timing parameters (SJW, bitrate and sampling point, or bitrate, Prop_Seg, Phase_Seg1 and Phase_Seg2) are initially set from the device-tree and can be changed at run-time from the timing-API.

CAN uses so-called identifiers to identify the frame instead of addresses to identify a node. This identifier can either have 11-bit width (Standard or Basic Frame) or 29-bit in case of an Extended Frame. The Zephyr CAN API supports both Standard and Extended identifiers concurrently. A CAN frame starts with a dominant Start Of Frame bit. After that, the identifiers follow. This phase is called the arbitration phase. During the arbitration phase, write collisions are allowed. They resolve by the fact that dominant bits override recessive bits. Nodes monitor the bus and notice when their transmission is being overridden and in case, abort their transmission. This effectively gives lower number identifiers priority over higher number identifiers.

Filters are used to whitelist identifiers that are of interest for the specific node. An identifier that doesn't match any filter is ignored. Filters can either match exactly or a specified part of the identifier. This method is called masking. As an example, a mask with 11 bits set for standard or 29 bits set for extended identifiers must match perfectly. Bits that are set to zero in the mask are ignored when matching an identifier. Most CAN controllers implement a limited number of filters in hardware. The number of filters is also limited in Kconfig to save memory.

Errors may occur during transmission. In case a node detects an erroneous frame, it partially overrides the current frame with an error-frame. Error-frames can either be error passive or error active, depending on the state of the controller. In case the controller is in error active state, it sends six consecutive dominant bits, which is a violation of the stuffing rule that all nodes can detect. The sender may resend the frame right after.

An initialized node can be in one of the following states:

• Error-active
• Error-passive
• Bus-off

After initialization, the node is in the error-active state. In this state, the node is allowed to send active error frames, ACK, and overload frames. Every node has a receive- and transmit-error counter. If either the receive- or the transmit-error counter exceeds 127, the node changes to error-passive state. In this state, the node is not allowed to send error-active frames anymore. If the transmit-error counter increases further to 255, the node changes to the bus-off state. In this state, the node is not allowed to send any dominant bits to the bus. Nodes in the bus-off state may recover after receiving 128 occurrences of 11 concurrent recessive bits.

You can read more about CAN bus in this CAN Wikipedia article.

Zephyr supports following CAN features:

• Standard and Extended Identifiers
• Filters with Masking
• Loopback and Silent mode
• Remote Request
Sending  The following code snippets show how to send data.

This basic sample sends a CAN frame with standard identifier 0x123 and eight bytes of data. When passing NULL as the callback, as shown in this example, the send function blocks until the frame is sent and acknowledged by at least one other node or an error occurred. The timeout only takes effect on acquiring a mailbox. When a transmitting mailbox is assigned, sending cannot be canceled.

```c
struct can_frame frame = {
    .flags = 0,
    .id = 0x123,
    .dlc = 8,
    .data = {1,2,3,4,5,6,7,8}
};
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
int ret;
ret = can_send(can_dev, &frame, K_MSEC(100), NULL, NULL);
if (ret != 0) {
    LOG_ERR("Sending failed [%d]", ret);
}
```

This example shows how to send a frame with extended identifier 0x1234567 and two bytes of data. The provided callback is called when the message is sent or an error occurred. Passing `K_FOREVER` to the timeout causes the function to block until a transfer mailbox is assigned to the frame or an error occurred. It does not block until the message is sent like the example above.

```c
void tx_callback(const struct device *dev, int error, void *user_data)
{
    char *sender = (char *)user_data;
    if (error != 0) {
        LOG_ERR("Sending failed [%d]\nSender: %s\n", error, sender);
    }
}

int send_function(const struct device *can_dev)
{
    struct can_frame frame = {
        .flags = CAN_FRAME_IDE,
        .id = 0x1234567,
        .dlc = 2
    };
    frame.data[0] = 1;
    frame.data[1] = 2;
    return can_send(can_dev, &frame, K_FOREVER, tx_callback, "Sender 1");
}
```

Receiving  Frames are only received when they match a filter. The following code snippets show how to receive frames by adding filters.

Here we have an example for a receiving callback as used for `can_add_rx_filter()`. The user data argument is passed when the filter is added.

```c
void rx_callback_function(const struct device *dev, struct can_frame *frame, void *user_data)
{
    ... do something with the frame ... 
}
```
The following snippet shows how to add a filter with a callback function. It is the most efficient but also the most critical way to receive messages. The callback function is called from an interrupt context, which means that the callback function should be as short as possible and must not block. Adding callback functions is not allowed from userspace context.

The filter for this example is configured to match the identifier 0x123 exactly.

```c
const struct can_filter my_filter = {
    .flags = CAN_FILTER_DATA,
    .id = 0x123,
    .mask = CAN_STD_ID_MASK
};
int filter_id;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
filter_id = can_add_rx_filter(can_dev, rx_callback_function, callback_arg, &my_filter);
if (filter_id < 0) {
    LOG_ERR("Unable to add rx filter [%d]", filter_id);
}
```

Here an example for `can_add_rx_filter_msgq()` is shown. With this function, it is possible to receive frames synchronously. This function can be called from userspace context. The size of the message queue should be as big as the expected backlog.

The filter for this example is configured to match the extended identifier 0x1234567 exactly.

```c
const struct can_filter my_filter = {
    .flags = CAN_FILTER_DATA | CAN_FILTER_IDE,
    .id = 0x1234567,
    .mask = CAN_EXT_ID_MASK
};
CAN_MSGQ_DEFINE(my_can_msgq, 2);
struct can_frame rx_frame;
int filter_id;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
filter_id = can_add_rx_filter_msgq(can_dev, &my_can_msgq, &my_filter);
if (filter_id < 0) {
    LOG_ERR("Unable to add rx msgq [%d]", filter_id);
    return;
}
while (true) {
    k_msgq_get(&my_can_msgq, &rx_frame, K_FOREVER);
    ... do something with the frame ...
}
```

`can_remove_rx_filter()` removes the given filter.

```c
can_remove_rx_filter(can_dev, filter_id);
```

**Setting the bitrate** The bitrate and sampling point is initially set at runtime. To change it from the application, one can use the `can_set_timing()` API. The `can_calc_timing()` function can calculate timing from a bitrate and sampling point in permille. The following example sets the bitrate to 250k baud with the sampling point at 87.5%.

```c
struct can_timing timing;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
int ret;
ret = can_calc_timing(can_dev, &timing, 250000, 875);
```
if (ret > 0) {
  LOG_INF("Sample-Point error: %d", ret);
}

if (ret < 0) {
  LOG_ERR("Failed to calc a valid timing");
  return;
}

ret = can_stop(can_dev);
if (ret != 0) {
  LOG_ERR("Failed to stop CAN controller");
}

ret = can_set_timing(can_dev, &timing);
if (ret != 0) {
  LOG_ERR("Failed to set timing");
}

ret = can_start(can_dev);
if (ret != 0) {
  LOG_ERR("Failed to start CAN controller");
}

A similar API exists for calculating and setting the timing for the data phase for CAN FD capable controllers. See `can_set_timing_data()` and `can_calc_timing_data()`.

**SocketCAN**  Zephyr additionally supports SocketCAN, a BSD socket implementation of the Zephyr CAN API. SocketCAN brings the convenience of the well-known BSD Socket API to Controller Area Networks. It is compatible with the Linux SocketCAN implementation, where many other high-level CAN projects build on top. Note that frames are routed to the network stack instead of passed directly, which adds some computation and memory overhead.

**Samples** We have two ready-to-build samples demonstrating use of the Zephyr CAN API: Zephyr CAN counter sample and SocketCAN sample.

**CAN Controller API Reference**

**Related code samples**

**group can_interface**
CAN Interface.

**CAN controller configuration**

int can_get_core_clock(const struct device *dev, uint32_t *rate)  
Get the CAN core clock rate.  
Returns the CAN core clock rate. One time quantum is 1/(core clock rate).
Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `rate` – [out] CAN core clock rate in Hz.

Returns
0 on success, or a negative error code on error

```c
int can_get_max_bitrate(const struct device *dev, uint32_t *max_bitrate)
```

Get maximum supported bitrate.

Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `max_bitrate` – [out] Maximum supported bitrate in bits/s

Return values
- 0 – If successful.
- ENOSYS – If this function is not implemented by the driver.

```c
const struct can_timing *can_get_timing_min(const struct device *dev)
```

Get the minimum supported timing parameter values.

Parameters
- `dev` – Pointer to the device structure for the driver instance.

Returns
Pointer to the minimum supported timing parameter values.

```c
const struct can_timing *can_get_timing_max(const struct device *dev)
```

Get the maximum supported timing parameter values.

Parameters
- `dev` – Pointer to the device structure for the driver instance.

Returns
Pointer to the maximum supported timing parameter values.

```c
int can_calc_timing(const struct device *dev, struct can_timing *res, uint32_t bitrate,
                    uint16_t sample_pnt)
```

Calculate timing parameters from bitrate and sample point.

Calculate the timing parameters from a given bitrate in bits/s and the sampling point in permill (1/1000) of the entire bit time. The bitrate must always match perfectly. If no result can be reached for the given parameters, EINVAL is returned.

Note: The requested `sample_pnt` will not always be matched perfectly. The algorithm calculates the best possible match.

Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `res` – [out] Result is written into the `can_timing` struct provided.
- `bitrate` – Target bitrate in bits/s.
- `sample_pnt` – Sampling point in permill of the entire bit time.
Return values

- 0 – or positive sample point error on success.
- -EINVAL – if the requested bitrate or sample point is out of range.
- -ENOTSUP – if the requested bitrate is not supported.
- -EIO – if \texttt{can\_get\_core\_clock()} is not available.

\begin{verbatim}
const struct can_timing *can_get_timing_data_min(const struct device *dev)
\end{verbatim}

Get the minimum supported timing parameter values for the data phase.

Same as \texttt{can\_get\_timing\_min()} but for the minimum values for the data phase.

\textbf{Note:} \texttt{CONFIG\_CAN\_FD\_MODE} must be selected for this function to be available.

Parameters

- \texttt{dev} – Pointer to the device structure for the driver instance.

Returns

Pointer to the minimum supported timing parameter values, or NULL if CAN FD support is not implemented by the driver.

\begin{verbatim}
const struct can_timing *can_get_timing_data_max(const struct device *dev)
\end{verbatim}

Get the maximum supported timing parameter values for the data phase.

Same as \texttt{can\_get\_timing\_max()} but for the maximum values for the data phase.

\textbf{Note:} \texttt{CONFIG\_CAN\_FD\_MODE} must be selected for this function to be available.

Parameters

- \texttt{dev} – Pointer to the device structure for the driver instance.

Returns

Pointer to the maximum supported timing parameter values, or NULL if CAN FD support is not implemented by the driver.

\begin{verbatim}
int can_calc_timing_data(const struct device *dev, struct can_timing *res, uint32_t bitrate, uint16_t sample_pnt)
\end{verbatim}

Calculate timing parameters for the data phase.

Same as \texttt{can\_calc\_timing()} but with the maximum and minimum values from the data phase.

\textbf{Note:} \texttt{CONFIG\_CAN\_FD\_MODE} must be selected for this function to be available.

Parameters

- \texttt{dev} – Pointer to the device structure for the driver instance.
- \texttt{res} – [\textbf{out}] Result is written into the \texttt{can\_timing} struct provided.
- \texttt{bitrate} – Target bitrate for the data phase in bits/s
- \texttt{sample\_pnt} – Sampling point for the data phase in permille of the entire bit time.

Return values
Zephyr Project Documentation, Release 3.5.99

- or positive sample point error on success.
- EINVAL – if the requested bitrate or sample point is out of range.
- ENOTSUP – if the requested bitrate is not supported.
- EIO – if can_get_core_clock() is not available.

int can_set_timing_data(const struct device *dev, const struct can_timing *timing_data)
Configure the bus timing for the data phase of a CAN FD controller.

See also:
    can_set_timing()

Note:  CONFIG_CAN_FD_MODE must be selected for this function to be available.

Parameters
- dev – Pointer to the device structure for the driver instance.
- timing_data – Bus timings for data phase

Return values
- 0 – If successful.
- EBUSY – if the CAN controller is not in stopped state.
- EIO – General input/output error, failed to configure device.
- ENOTSUP – if the timing parameters are not supported by the driver.
- ENOSYS – if CAN FD support is not implemented by the driver.

int can_set_bitrate_data(const struct device *dev, uint32_t bitrate_data)
Set the bitrate for the data phase of the CAN FD controller.

CAN in Automation (CiA) 301 v4.2.0 recommends a sample point location of 87.5% percent for all bitrates. However, some CAN controllers have difficulties meeting this for higher bitrates.

This function defaults to using a sample point of 75.0% for bitrates over 800 kbit/s, 80.0% for bitrates over 500 kbit/s, and 87.5% for all other bitrates. This is in line with the sample point locations used by the Linux kernel.

See also:
    can_set_bitrate()

Note:  CONFIG_CAN_FD_MODE must be selected for this function to be available.

Parameters
- dev – Pointer to the device structure for the driver instance.
- bitrate_data – Desired data phase bitrate.

Return values
- 0 – If successful.
- EBUSY – if the CAN controller is not in stopped state.
-EINVAL – if the requested bitrate is out of range.
-ENOTSUP – if the requested bitrate not supported by the CAN controller/transceiver combination.
-ERANGE – if the resulting sample point is off by more than +/- 5%.
-EIO – General input/output error, failed to set bitrate.

```
int can_calc_prescaler(const struct device *dev, struct can_timing *timing, uint32_t bitrate)
```

Fill in the prescaler value for a given bitrate and timing.

Fill the prescaler value in the timing struct. The sjw, prop_seg, phase_seg1 and phase_seg2 must be given.

The returned bitrate error is remainder of the division of the clock rate by the bitrate times the timing segments.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `timing` – Result is written into the `can_timing` struct provided.
- `bitrate` – Target bitrate.

**Return values**

- 0 – or positive bitrate error.
- Negative – error code on error.

```
int can_set_timing(const struct device *dev, const struct can_timing *timing)
```

Configure the bus timing of a CAN controller.

**See also:**

`can_set_timing_data()`

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `timing` – Bus timings.

**Return values**

- 0 – If successful.
- -EBUSY – if the CAN controller is not in stopped state.
- -ENOTSUP – if the timing parameters are not supported by the driver.
- -EIO – General input/output error, failed to configure device.

```
int can_get_capabilities(const struct device *dev, can_mode_t *cap)
```

Get the supported modes of the CAN controller.

The returned capabilities may not necessarily be supported at the same time (e.g. some CAN controllers support both CAN_MODE_LOOPBACK and CAN_MODE_LISTENONLY, but not at the same time).

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `cap` – [out] Supported capabilities.
Return values

• 0 – If successful.
• -EIO – General input/output error, failed to get capabilities.

int can_start(const struct device *dev)
Start the CAN controller.
Bring the CAN controller out of CAN_STATE_STOPPED. This will reset the RX/TX error
counters, enable the CAN controller to participate in CAN communication, and enable
the CAN tranceiver, if supported.
Starting the CAN controller resets all the CAN controller statistics.

See also:
can_stop()
See also:
can_transceiver_enable()

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values

• 0 – if successful.
• -EALREADY – if the device is already started.
• -EIO – General input/output error, failed to start device.

int can_stop(const struct device *dev)
Stop the CAN controller.
Bring the CAN controller into CAN_STATE_STOPPED. This will disallow the CAN controller
from participating in CAN communication, abort any pending CAN frame transmis-
sions, and disable the CAN transceiver, if supported.

See also:
can_start()
See also:
can_transceiver_disable()

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values

• 0 – if successful.
• -EALREADY – if the device is already stopped.
• -EIO – General input/output error, failed to stop device.

int can_set_mode(const struct device *dev, can_mode_t mode)
Set the CAN controller to the given operation mode.

Parameters
• **dev** – Pointer to the device structure for the driver instance.
• **mode** – Operation mode.

**Return values**

• **0** – If successful.
• **-EBUSY** – if the CAN controller is not in stopped state.
• **-EIO** – General input/output error, failed to configure device.

```c
int can_set_bitrate(const struct device *dev, uint32_t bitrate)
```

Set the bitrate of the CAN controller.

CAN in Automation (CiA) 301 v4.2.0 recommends a sample point location of 87.5% percent for all bitrates. However, some CAN controllers have difficulties meeting this for higher bitrates.

This function defaults to using a sample point of 75.0% for bitrates over 800 kbit/s, 80.0% for bitrates over 500 kbit/s, and 87.5% for all other bitrates. This is in line with the sample point locations used by the Linux kernel.

**See also:**
`can_set_bitrate_data()`

**Parameters**

• **dev** – Pointer to the device structure for the driver instance.
• **bitrate** – Desired arbitration phase bitrate.

**Return values**

• **0** – If successful.
• **-EBUSY** – if the CAN controller is not in stopped state.
• **-EINVAL** – if the requested bitrate is out of range.
• **-ENOTSUP** – if the requested bitrate not supported by the CAN controller/transceiver combination.
• **-ERANGE** – if the resulting sample point is off by more than +/- 5%.
• **-EIO** – General input/output error, failed to set bitrate.

**Transmitting CAN frames**

```c
int can_send(const struct device *dev, const struct can_frame *frame,
             k_timeout_t timeout, can_tx_callback_t callback, void *user_data)
```

Queue a CAN frame for transmission on the CAN bus.

Queue a CAN frame for transmission on the CAN bus with optional timeout and completion callback function.

Queued CAN frames are transmitted in order according to the their priority:

• The lower the CAN-ID, the higher the priority.

• Data frames have higher priority than Remote Transmission Request (RTR) frames with identical CAN-IDs.

• Frames with standard (11-bit) identifiers have higher priority than frames with extended (29-bit) identifiers with identical base IDs (the higher 11 bits of the extended identifier).
• Transmission order for queued frames with the same priority is hardware dependent.

By default, the CAN controller will automatically retry transmission in case of lost bus arbitration or missing acknowledge. Some CAN controllers support disabling automatic retransmissions via `CAN_MODE_ONE_SHOT`.

**Note:** If transmitting segmented messages spanning multiple CAN frames with identical CAN-IDs, the sender must ensure to only queue one frame at a time if FIFO order is required.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **frame** – CAN frame to transmit.
- **timeout** – Timeout waiting for a empty TX mailbox or `K_FOREVER`.
- **callback** – Optional callback for when the frame was sent or a transmission error occurred. If `NULL`, this function is blocking until frame is sent. The callback must be `NULL` if called from user mode.
- **user_data** – User data to pass to callback function.

**Return values**

- `0` – if successful.
- `-EINVAL` – if an invalid parameter was passed to the function.
- `-ENOTSUP` – if an unsupported parameter was passed to the function.
- `-ENETDOWN` – if the CAN controller is in stopped state.
- `-ENETUNREACH` – if the CAN controller is in bus-off state.
- `-EBUSY` – if CAN bus arbitration was lost (only applicable if automatic retransmissions are disabled).
- `-EIO` – if a general transmit error occurred (e.g. missing ACK if automatic retransmissions are disabled).
- `-EAGAIN` – on timeout.

**Receiving CAN frames**

```c
static inline int can_add_rx_filter(const struct device *dev, can_rx_callback_t callback, void *user_data, const struct can_filter *filter)
```

Add a callback function for a given CAN filter.

Add a callback to CAN identifiers specified by a filter. When a received CAN frame matching the filter is received by the CAN controller, the callback function is called in interrupt context.

If a received frame matches more than one filter (i.e., the filter IDs/masks or flags overlap), the priority of the match is hardware dependent.

The same callback function can be used for multiple filters.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
• **callback** – This function is called by the CAN controller driver whenever a frame matching the filter is received.
• **user_data** – User data to pass to callback function.
• **filter** – Pointer to a `can_filter` structure defining the filter.

**Return values**

• **filter_id** – on success.
• `-ENOSPC` – if there are no free filters.
• `-EINVAL` – if the requested filter type is invalid.
• `-ENOTSUP` – if the requested filter type is not supported.

```c
int can_add_rx_filter_msgq(const struct device *dev, struct k_msgq *msgq, const struct can_filter *filter)
```

Simple wrapper function for adding a message queue for a given filter.

Wrapper function for `can_add_rx_filter()` which puts received CAN frames matching the filter in a message queue instead of calling a callback.

If a received frame matches more than one filter (i.e., the filter IDs/masks or flags overlap), the priority of the match is hardware dependent.

The same message queue can be used for multiple filters.

---

**Note:** The message queue must be initialized before calling this function and the caller must have appropriate permissions on it.

---

**Warning:** Message queue overruns are silently ignored and overrun frames discarded. Custom error handling can be implemented by using `can_add_rx_filter()` and `k_msgq_put()` directly.

**Parameters**

• **dev** – Pointer to the device structure for the driver instance.
• **msgq** – Pointer to the already initialized `k_msgq` struct.
• **filter** – Pointer to a `can_filter` structure defining the filter.

**Return values**

• **filter_id** – on success.
• `-ENOSPC` – if there are no free filters.
• `-ENOTSUP` – if the requested filter type is not supported.

```c
void can_remove_rx_filter(const struct device *dev, int filter_id)
```

Remove a CAN RX filter.

This routine removes a CAN RX filter based on the filter ID returned by `can_add_rx_filter()` or `can_add_rx_filter_msgq()`.

**Parameters**

• **dev** – Pointer to the device structure for the driver instance.
• **filter_id** – Filter ID
int can_get_max_filters(const struct device *dev, bool ide)
Get maximum number of RX filters.

Get the maximum number of concurrent RX filters for the CAN controller.

Parameters

• dev – Pointer to the device structure for the driver instance.
• ide – Get the maximum standard (11-bit) CAN ID filters if false, or extended (29-bit) CAN ID filters if true.

Return values

• Positive – number of maximum concurrent filters.
• -EIO – General input/output error.
• -ENOSYS – If this function is not implemented by the driver.

CAN_MSGQ_DEFINE(name, max_frames)
Statically define and initialize a CAN RX message queue.
The message queue's ring buffer contains space for max_frames CAN frames.

See also:

can_add_rx_filter_msgq()

Parameters

• name – Name of the message queue.
• max_frames – Maximum number of CAN frames that can be queued.

CAN bus error reporting and handling

int can_get_state(const struct device *dev, enum can_state *state, struct can_bus_err_cnt *err_cnt)
Get current CAN controller state.
Returns the current state and optionally the error counter values of the CAN controller.

Parameters

• dev – Pointer to the device structure for the driver instance.
• state – [out] Pointer to the state destination enum or NULL.
• err_cnt – [out] Pointer to the err_cnt destination structure or NULL.

Return values

• 0 – If successful.
• -EIO – General input/output error, failed to get state.

int can_recover(const struct device *dev, k_timeout_t timeout)
Recover from bus-off state.
Recover the CAN controller from bus-off state to error-active state.

Note: CONFIG_CAN_AUTO_BUS_OFF_RECOVERY must be deselected for this function to be available.
Parameters
- **dev** – Pointer to the device structure for the driver instance.
- **timeout** – Timeout for waiting for the recovery or K_FOREVER.

Return values
- **0** – on success.
- **-ENETDOWN** – if the CAN controller is in stopped state.
- **-EAGAIN** – on timeout.

static inline void can_set_state_change_callback(const struct device *dev, can_state_change_callback_t callback, void *user_data)

Set a callback for CAN controller state change events.
Set the callback for CAN controller state change events. The callback function will be called in interrupt context.

Only one callback can be registered per controller. Calling this function again overrides any previously registered callback.

Parameters
- **dev** – Pointer to the device structure for the driver instance.
- **callback** – Callback function.
- **user_data** – User data to pass to callback function.

CAN statistics

uint32_t can_stats_get_bit_errors(const struct device *dev)

Get the bit error counter for a CAN device.
The bit error counter is incremented when the CAN controller is unable to transmit either a dominant or a recessive bit.

Note: CONFIG_CAN_STATS must be selected for this function to be available.

Parameters
- **dev** – Pointer to the device structure for the driver instance.

Returns
bit error counter

uint32_t can_stats_get_bit0_errors(const struct device *dev)

Get the bit0 error counter for a CAN device.
The bit0 error counter is incremented when the CAN controller is unable to transmit a dominant bit.

See also:

*can_stats_get_bit_errors()*

Note: CONFIG_CAN_STATS must be selected for this function to be available.
Parameters
- dev – Pointer to the device structure for the driver instance.

Returns
bit0 error counter

```c
uint32_t can_stats_get_bit1_errors(const struct device *dev)
```

Get the bit1 error counter for a CAN device.
The bit1 error counter is incremented when the CAN controller is unable to transmit a recessive bit.

See also:
`can_stats_get_bit_errors()`

Note: CONFIG_CAN_STATS must be selected for this function to be available.

Parameters
- dev – Pointer to the device structure for the driver instance.

Returns
bit1 error counter

```c
uint32_t can_stats_get_stuff_errors(const struct device *dev)
```

Get the stuffing error counter for a CAN device.
The stuffing error counter is incremented when the CAN controller detects a bit stuffing error.

Note: CONFIG_CAN_STATS must be selected for this function to be available.

Parameters
- dev – Pointer to the device structure for the driver instance.

Returns
stuffing error counter

```c
uint32_t can_stats_get_crc_errors(const struct device *dev)
```

Get the CRC error counter for a CAN device.
The CRC error counter is incremented when the CAN controller detects a frame with an invalid CRC.

Note: CONFIG_CAN_STATS must be selected for this function to be available.
uint32_t can_stats_get_form_errors(const struct device *dev)
Get the form error counter for a CAN device.
The form error counter is incremented when the CAN controller detects a fixed-form bit field containing illegal bits.

**Note:** CONFIG_CAN_STATS must be selected for this function to be available.

**Parameters**
- **dev** – Pointer to the device structure for the driver instance.

**Returns**
- form error counter

uint32_t can_stats_get_ack_errors(const struct device *dev)
Get the acknowledge error counter for a CAN device.
The acknowledge error counter is incremented when the CAN controller does not monitor a dominant bit in the ACK slot.

**Note:** CONFIG_CAN_STATS must be selected for this function to be available.

**Parameters**
- **dev** – Pointer to the device structure for the driver instance.

**Returns**
- acknowledge error counter

uint32_t can_stats_get_rx_overruns(const struct device *dev)
Get the RX overrun counter for a CAN device.
The RX overrun counter is incremented when the CAN controller receives a CAN frame matching an installed filter but lacks the capacity to store it (either due to an already full RX mailbox or a full RX FIFO).

**Note:** CONFIG_CAN_STATS must be selected for this function to be available.

**Parameters**
- **dev** – Pointer to the device structure for the driver instance.

**Returns**
- RX overrun counter

**CAN utility functions**

static inline uint8_t can_dlc_to_bytes(uint8_t dlc)
Convert from Data Length Code (DLC) to the number of data bytes.

**Parameters**
- **dlc** – Data Length Code (DLC).

**Return values**
- **Number** – of bytes.
static inline uint8_t can_bytes_to_dlc(uint8_t num_bytes)
    Convert from number of bytes to Data Length Code (DLC)

    Parameters
    • num_bytes – Number of bytes.

    Return values
    Data – Length Code (DLC).

static inline bool can_frame_matches_filter(const struct can_frame *frame, const struct can_filter *filter)
    Check if a CAN frame matches a CAN filter.

    Parameters
    • frame – CAN frame.
    • filter – CAN filter.

    Returns
    true if the CAN frame matches the CAN filter, false otherwise

**CAN frame definitions**

**CAN_STD_ID_MASK**
    Bit mask for a standard (11-bit) CAN identifier.

**CAN_MAX_STD_ID**
    Maximum value for a standard (11-bit) CAN identifier.

**CAN_EXT_ID_MASK**
    Bit mask for an extended (29-bit) CAN identifier.

**CAN_MAX_EXT_ID**
    Maximum value for an extended (29-bit) CAN identifier.

**CAN_MAX_DLC**
    Maximum data length code for CAN 2.0A/2.0B.

**CANFD_MAX_DLC**
    Maximum data length code for CAN FD.

**CAN controller mode flags**

**CAN_MODE_NORMAL**
    Normal mode.

**CAN_MODE_LOOPBACK**
    Controller is in loopback mode (receives own frames).
CAN_MODE_LISTENONLY
Controller is not allowed to send dominant bits.

CAN_MODE_FD
Controller allows transmitting/receiving CAN FD frames.

CAN_MODE_ONE_SHOT
Controller does not retransmit in case of lost arbitration or missing ACK.

CAN_MODE_3_SAMPLES
Controller uses triple sampling mode.

CAN frame flags

CAN_FRAME_IDE
Frame uses extended (29-bit) CAN ID.

CAN_FRAME_RTR
Frame is a Remote Transmission Request (RTR)

CAN_FRAME_FDF
Frame uses CAN FD format (FD)

CAN_FRAME_BRS
Frame uses CAN FD Baud Rate Switch (BRS).
Only valid in combination with CAN_FRAME_FDF.

CAN_FRAME_ESI
CAN FD Error State Indicator (ESI).
Indicates that the transmitting node is in error-passive state. Only valid in combination with CAN_FRAME_FDF.

CAN filter flags

CAN_FILTER_IDE
Filter matches frames with extended (29-bit) CAN IDs.

CAN_FILTER_RTR
Filter matches Remote Transmission Request (RTR) frames.

CAN_FILTER_DATA
Filter matches data frames.

CAN_FILTER_FDF
Filter matches CAN FD frames (FD)
Defines

\textbf{CAN\_STATS\_BIT\_ERROR\_INC}(\texttt{dev}_.)

Increment the bit error counter for a CAN device.

The bit error counter is incremented when the CAN controller is unable to transmit either a dominant or a recessive bit.

\textbf{See also:}

\textit{CAN\_STATS\_BIT0\_ERROR\_INC()}

\textbf{See also:}

\textit{CAN\_STATS\_BIT1\_ERROR\_INC()}

\textbf{Note:} This error counter should only be incremented if the CAN controller is unable to distinguish between failure to transmit a dominant versus failure to transmit a recessive bit. If the CAN controller supports distinguishing between the two, the bit0 or bit1 error counter shall be incremented instead.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{dev}_. – Pointer to the device structure for the driver instance.
\end{itemize}

\textbf{CAN\_STATS\_BIT0\_ERROR\_INC}(\texttt{dev}_.)

Increment the bit0 error counter for a CAN device.

The bit0 error counter is incremented when the CAN controller is unable to transmit a dominant bit.

Incrementing this counter will automatically increment the bit error counter.

\textbf{See also:}

\textit{CAN\_STATS\_BITERROR\_INC()}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{dev}_. – Pointer to the device structure for the driver instance.
\end{itemize}

\textbf{CAN\_STATS\_BIT1\_ERROR\_INC}(\texttt{dev}_.)

Increment the bit1 (recessive) error counter for a CAN device.

The bit1 error counter is incremented when the CAN controller is unable to transmit a recessive bit.

Incrementing this counter will automatically increment the bit error counter.

\textbf{See also:}

\textit{CAN\_STATS\_BITERROR\_INC()}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{dev}_. – Pointer to the device structure for the driver instance.
\end{itemize}

\textbf{CAN\_STATS\_STUFF\_ERROR\_INC}(\texttt{dev}_.)

Increment the stuffing error counter for a CAN device.

The stuffing error counter is incremented when the CAN controller detects a bit stuffing error.
Parameters

- dev – Pointer to the device structure for the driver instance.

**CAN_STATS_CRC_ERROR_INC(dev)**

Increment the CRC error counter for a CAN device.

The CRC error counter is incremented when the CAN controller detects a frame with an invalid CRC.

**Parameters**

- dev – Pointer to the device structure for the driver instance.

**CAN_STATS_FORM_ERROR_INC(dev)**

Increment the form error counter for a CAN device.

The form error counter is incremented when the CAN controller detects a fixed-form bit field containing illegal bits.

**Parameters**

- dev – Pointer to the device structure for the driver instance.

**CAN_STATS_ACK_ERROR_INC(dev)**

Increment the acknowledge error counter for a CAN device.

The acknowledge error counter is incremented when the CAN controller does not monitor a dominant bit in the ACK slot.

**Parameters**

- dev – Pointer to the device structure for the driver instance.

**CAN_STATS_RX_OVERRUN_INC(dev)**

Increment the RX overrun counter for a CAN device.

The RX overrun counter is incremented when the CAN controller receives a CAN frame matching an installed filter but lacks the capacity to store it (either due to an already full RX mailbox or a full RX FIFO).

**Parameters**

- dev – Pointer to the device structure for the driver instance.

**CAN_STATS_RESET(dev)**

Zero all statistics for a CAN device.

The driver is responsible for resetting the statistics before starting the CAN controller.

**Parameters**

- dev – Pointer to the device structure for the driver instance.

**CAN_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, level, prio, api, ...)**

Like **DEVICE_DT_DEFINE()** with CAN device specifics.

Defines a device which implements the CAN API. May generate a custom **device_state** container struct and **init_fn** wrapper when needed depending on **CONFIG_CAN_STATS**.

**Parameters**

- node_id – The devicetree node identifier.
- init_fn – Name of the init function of the driver.
- pm – PM device resources reference (NULL if device does not use PM).
- data – Pointer to the device's private data.
• **config** – The address to the structure containing the configuration information for this instance of the driver.

• **level** – The initialization level. See SYS_INIT() for details.

• **prio** – Priority within the selected initialization level. See SYS_INIT() for details.

• **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

**CANDEVICE_DT_INST_DEFINE**(inst, ...)

Like **CANDEVICE_DT_DEFINE()** for an instance of a DT_DRV_COMPAT compatible.

**Parameters**

• **inst** – Instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to **CANDEVICE_DT_DEFINE()**.

• **...** – Other parameters as expected by **CANDEVICE_DT_DEFINE()**.

**Typedefs**

typedef uint32_t **can_mode_t**

Provides a type to hold CAN controller configuration flags.

The lower 24 bits are reserved for common CAN controller mode flags. The upper 8 bits are reserved for CAN controller/driver specific flags.

**See also:**

**CAN_MODE_FLAGS**.

typedef void (*can_tx_callback_t)(const struct device *dev, int error, void *user_data)

Defines the application callback handler function signature.

**Param dev**

Pointer to the device structure for the driver instance.

**Param error**

Status of the performed send operation. See the list of return values for **can_send()** for value descriptions.

**Param user_data**

User data provided when the frame was sent.

typedef void (*can_rx_callback_t)(const struct device *dev, struct can_frame *frame, void *user_data)

Defines the application callback handler function signature for receiving.

**Param dev**

Pointer to the device structure for the driver instance.

**Param frame**

Received frame.

**Param user_data**

User data provided when the filter was added.
typedef void (*can_state_change_callback_t)(const struct device *dev, enum can_state state, struct can_bus_err_cnt err_cnt, void *user_data)

Defines the state change callback handler function signature.

**Param dev**
Pointer to the device structure for the driver instance.

**Param state**
State of the CAN controller.

**Param err_cnt**
CAN controller error counter values.

**Param user_data**
User data provided the callback was set.

**Enums**

enum can_state
Defines the state of the CAN controller.

Values:

enumerator CAN_STATE_ERROR_ACTIVE
Error-active state (RX/TX error count < 96).

enumerator CAN_STATE_ERROR_WARNING
Error-warning state (RX/TX error count < 128).

enumerator CAN_STATE_ERROR_PASSIVE
Error-passive state (RX/TX error count < 256).

enumerator CAN_STATE_BUS_OFF
Bus-off state (RX/TX error count >= 256).

enumerator CAN_STATE_STOPPED
CAN controller is stopped and does not participate in CAN communication.

struct can_frame
#include "can.h" CAN frame structure.

**Public Members**

uint32_t id
Standard (11-bit) or extended (29-bit) CAN identifier.

uint8_t dlc
Data Length Code (DLC) indicating data length in bytes.

**uint8_t flags**

Flags.

**See also:**

*CAN_FRAME_FLAGS*.

**uint16_t timestamp**

Captured value of the free-running timer in the CAN controller when this frame was received.

The timer is incremented every bit time and captured at the start of frame bit (SOF).

**Note:** *CONFIG_CAN_RX_TIMESTAMP* must be selected for this field to be available.

**uint8_t data[CAN_MAX_DLEN]**

Payload data accessed as unsigned 8 bit values.

**uint32_t data_32[DIV_ROUND_UP(CAN_MAX_DLEN, sizeof(uint32_t))]**

Payload data accessed as unsigned 32 bit values.

**union can_frame.[anonymous] [anonymous]**

The frame payload data.

**struct can_filter**

```
#include <can.h> CAN filter structure.
```

**Public Members**

**uint32_t id**

CAN identifier to match.

**uint32_t mask**

CAN identifier matching mask.

If a bit in this mask is 0, the value of the corresponding bit in the id field is ignored by the filter.

**uint8_t flags**

Flags.

**See also:**

*CAN_FILTER_FLAGS*.

**struct can_bus_err_cnt**

```
#include <can.h> CAN controller error counters.
```
Public Members

```c
uint8_t tx_err_cnt
   Value of the CAN controller transmit error counter.

uint8_t rx_err_cnt
   Value of the CAN controller receive error counter.
```

```c
struct can_timing
   #include <can.h> CAN bus timing structure.

This struct is used to pass bus timing values to the configuration and bitrate calculation functions.

The propagation segment represents the time of the signal propagation. Phase segment 1 and phase segment 2 define the sampling point. The prop_seg and phase_seg1 values affect the sampling point in the same way and some controllers only have a register for the sum of those two. The sync segment always has a length of 1 time quantum (see below).

```
+---------+----------+------------+------------+
| sync_seg | prop_seg | phase_seg1 | phase_seg2 |
+---------+----------+------------+------------+
```

1 time quantum (tq) has the length of 1/(core_clock / prescaler). The bitrate is defined by the core clock divided by the prescaler and the sum of the segments:

\[
\text{br} = \frac{\text{core_clock}}{\text{prescaler}} / \left(1 + \text{prop_seg} + \text{phase_seg1} + \text{phase_seg2}\right)
\]

The Synchronization Jump Width (SJW) defines the amount of time quanta the sample point can be moved. The sample point is moved when resynchronization is needed.

Public Members

```c
uint16_t sjw
   Synchronisation jump width.

uint16_t prop_seg
   Propagation segment.

uint16_t phase_seg1
   Phase segment 1.

uint16_t phase_seg2
   Phase segment 2.

uint16_t prescaler
   Prescaler value.
```

```c
struct can_device_state
   #include <can.h> CAN specific device state which allows for CAN device class specific additions.
```
Public Members

struct device_state devstate
    Common device state.

struct stats_can stats
    CAN device statistics.

CAN Transceiver

• Overview
• CAN Transceiver API Reference

Overview  A CAN transceiver is an external device that converts the logic level signals from the CAN controller to the bus-levels. The bus lines are called CAN High (CAN H) and CAN Low (CAN L). The transmit wire from the controller to the transceiver is called CAN TX, and the receive wire is called CAN RX. These wires use the logic levels whereas the bus-level is interpreted differentially between CAN H and CAN L. The bus can be either in the recessive (logical one) or dominant (logical zero) state. The recessive state is when both lines, CAN H and CAN L, are roughly at the same voltage level. This state is also the idle state. To write a dominant bit to the bus, open-drain transistors tie CAN H to Vdd and CAN L to ground. The first and last node use a 120-ohm resistor between CAN H and CAN L to terminate the bus. The dominant state always overrides the recessive state. This structure is called a wired-AND.

CAN Transceiver API Reference

group can_transceiver
    CAN Transceiver Driver APIs.

Functions
static inline int can_transceiver_enable(const struct device *dev)
    Enable CAN transceiver.
    Enable the CAN transceiver.

See also:
    can_start()

Note: The CAN transceiver is controlled by the CAN controller driver and should not
    normally be controlled by the application.

Parameters
    • dev – Pointer to the device structure for the driver instance.

Return values
    • 0 – If successful.
    • -EIO – General input/output error, failed to enable device.

static inline int can_transceiver_disable(const struct device *dev)
    Disable CAN transceiver.
    Disable the CAN transceiver.

See also:
    can_stop()

Note: The CAN transceiver is controlled by the CAN controller driver and should not
    normally be controlled by the application.

Parameters
    • dev – Pointer to the device structure for the driver instance.

Return values
    • 0 – If successful.
    • -EIO – General input/output error, failed to disable device.

7.5.9 Chargers

The charger subsystem exposes an API to uniformly access battery charger devices. Currently,
    only reading data is supported.

Basic Operation

Properties  Fundamentally, a property is a configurable setting, state, or quantity that a charger
device can measure.

Chargers typically support multiple properties, such as temperature readings of the battery-pack
    or present-time current/voltage.
Properties are fetched using a client allocated array of `charger_get_property`. This array is then populated by values as according to its `property_type` field.

**API Reference**

*group charger_interface*

Charger Interface.

**Typedefs**

typedef uint16_t charger_prop_t

A charger property's identifier.

See `charger_property` for a list of identifiers

typedef int (*charger_get_property_t)(const struct device *dev, const charger_prop_t prop,
union charger_propval *val)

Callback API for getting a charger property.
See `charger_get_property()` for argument description

typedef int (*charger_set_property_t)(const struct device *dev, const charger_prop_t prop,
const union charger_propval *val)

Callback API for setting a charger property.
See `charger_set_property()` for argument description

** Enums **

enum charger_property

Runtime Dynamic Battery Parameters.

*Values:*

enumerator CHARGER_PROP_ONLINE = 0

Indicates if external supply is present for the charger.
Value should be of type enum charger_online

enumerator CHARGER_PROP_PRESENT

Reports whether or not a battery is present.
Value should be of type bool

enumerator CHARGER_PROP_STATUS

Represents the charging status of the charger.
Value should be of type enum charger_status

enumerator CHARGER_PROP_CHARGE_TYPE

Represents the charging algo type of the charger.
Value should be of type enum charger_charge_type
enumerator CHARGER_PROP_HEALTH
    Represents the health of the charger.
    Value should be of type enum charger_health

enumerator CHARGER_PROP_CONSTANT_CHARGE_CURRENT_UA
    Configuration of current sink used for charging in µA.

enumerator CHARGER_PROP_PRECHARGE_CURRENT_UA
    Configuration of current sink used for conditioning in µA.

enumerator CHARGER_PROP_CHARGE_TERM_CURRENT_UA
    Configuration of charge termination target in µA.

enumerator CHARGER_PROP_CONSTANT_CHARGE_VOLTAGE_UV
    Configuration of charge voltage regulation target in µV.

enumerator CHARGER_PROP_COMMON_COUNT
    Reserved to demark end of common charger properties.

enumerator CHARGER_PROP_CUSTOM_BEGIN = CHARGER_PROP_COMMON_COUNT + 1
    Reserved to demark downstream custom properties - use this value as the actual
    value may change over future versions of this API.

enumerator CHARGER_PROP_MAX = UINT16_MAX
    Reserved to demark end of valid enum properties.

definition enum charger_online
    External supply states.
    Values:

    enumerator CHARGER_ONLINE_OFFLINE = 0
        External supply not present.

    enumerator CHARGER_ONLINE_FIXED
        External supply is present and of fixed output.

    enumerator CHARGER_ONLINE_PROGRAMMABLE
        External supply is present and of programmable output.

definition enum charger_status
    Charging states.
    Values:

    enumerator CHARGER_STATUS_UNKNOWN = 0
        Charging device state is unknown.

    enumerator CHARGER_STATUS_CHARGING
        Charging device is charging a battery.
enumerator CHARGER_STATUS_DISCHARGING
    Charging device is not able to charge a battery.

eenumerator CHARGER_STATUS_NOT_CHARGING
    Charging device is not charging a battery.

eenumerator CHARGER_STATUS_FULL
    The battery is full and the charging device will not attempt charging.

enum charger_charge_type
    Charge algorithm types.
    Values:

    enumerator CHARGER_CHARGE_TYPE_UNKNOWN = 0
        Charge type is unknown.

    enumerator CHARGER_CHARGE_TYPE_NONE
        Charging is not occurring.

    enumerator CHARGER_CHARGE_TYPE_TRICKLE

    enumerator CHARGER_CHARGE_TYPE_FAST
        Charging is occurring at the fastest desired charge rate.

    enumerator CHARGER_CHARGE_TYPE_STANDARD
        Charging is occurring at a moderate charge rate.

    enumerator CHARGER_CHARGE_TYPE_ADAPTIVE

    enumerator CHARGER_CHARGE_TYPE_LONGLIFE

    enumerator CHARGER_CHARGE_TYPE_BYPASS

enum charger_health
    Charger health conditions.
    These conditions determine the ability to, or the rate of, charge
    Values:

    enumerator CHARGER_HEALTH_UNKNOWN = 0
        Charger health condition is unknown.

    enumerator CHARGER_HEALTH_GOOD
        Charger health condition is good.

    enumerator CHARGER_HEALTH_OVERHEAT
        The charger device is overheated.
enumerator CHARGER_HEALTH_OVERVOLTAGE
   The battery voltage has exceeded its overvoltage threshold.

enumerator CHARGER_HEALTH_UNSPEC_FAILURE

enumerator CHARGER_HEALTH_COLD
   The battery temperature is below the “cold” threshold.

enumerator CHARGER_HEALTH_WATCHDOG_TIMER_EXPIRE
   The charger device's watchdog timer has expired.

enumerator CHARGER_HEALTH_SAFETY_TIMER_EXPIRE
   The charger device's safety timer has expired.

enumerator CHARGER_HEALTH_CALIBRATION_REQUIRED
   The charger device requires calibration.

enumerator CHARGER_HEALTH_WARM
   The battery temperature is in the “warm” range.

enumerator CHARGER_HEALTH_COOL
   The battery temperature is in the “cool” range.

enumerator CHARGER_HEALTH_HOT
   The battery temperature is below the “hot” threshold.

enumerator CHARGER_HEALTH_NO_BATTERY
   The charger device does not detect a battery.

Functions

int charger_get_prop(const struct device *dev, const charger_prop_t prop, union charger_propval *val)

Fetch a battery charger property.

Parameters
    • dev – Pointer to the battery charger device
    • prop – Charger property to get
    • val – Pointer to charger_propval union

Return values
    • 0 – if successful
    • < 0 if getting property failed

int charger_set_prop(const struct device *dev, const charger_prop_t prop, const union charger_propval *val)

Set a battery charger property.

Parameters
    • dev – Pointer to the battery charger device
• **prop** – Charger property to set
• **val** – Pointer to `charger_propval` union

**Return values**
• 0 – if successful
• < 0 if setting property failed

union `charger_propval`

#include <charger.h> container for a charger_property value

**Public Members**

enum `charger_online` **online**

CHARGER_PROP_ONLINE.

bool **present**

CHARGER_PROP_PRESENT.

enum `charger_status` **status**

CHARGER_PROP_STATUS.

enum `charger_charge_type` **charge_type**

CHARGER_PROP_CHARGE_TYPE.

enum `charger_health` **health**

CHARGER_PROP_HEALTH.

`uint32_t const_charge_current_ua`

CHARGER_PROP_CONSTANT_CHARGE_CURRENT_UA.

`uint32_t precharge_current_ua`

CHARGER_PROP_PRECHARGE_CURRENT_UA.

`uint32_t charge_term_current_ua`

CHARGER_PROP_CHARGE_TERM_CURRENT_UA.

`uint32_t const_charge_voltage_uv`

CHARGER_PROP_CONSTANT_CHARGE_VOLTAGE_UV.

`struct charger_driver_api`

#include <charger.h> Charging device API.

Caching is entirely on the onus of the client

7.5.10 **Coredump Device**
Overview

The coredump device is a pseudo-device driver with two types. A COREDUMP_TYPE_MEMCPY type exposes device tree bindings for memory address/size values to be included in any dump. And the driver exposes an API to add/remove dump memory regions at runtime. A COREDUMP_TYPE_CALLBACK device requires exactly one entry in the memory-regions array with a size of 0 and a desired size. The driver will statically allocate memory of the desired size and provide an API to register a callback function to fill that memory when a dump occurs.

Configuration Options

Related configuration options:

• CONFIG_COREDUMP_DEVICE

API Reference

group coredump_device_interface

Coredump pseudo-device driver APIs.

Typedefs

typedef void (*coredump_dump_callback_t)(uintptr_t dump_area, size_t dump_area_size)

Callback that occurs at dump time, data copied into dump_area will be included in the dump that is generated.

Param dump_area
Pointer to area to copy data into for inclusion in dump

Param dump_area_size
Size of available memory at dump_area

Functions

static inline bool coredump_device_register_memory(const struct device *dev, struct coredump_mem_region_node *region)

Register a region of memory to be stored in core dump at the time it is generated.

Parameters

• dev – Pointer to the device structure for the driver instance.
• region – Struct describing memory to be collected

Returns

true if registration succeeded

false if registration failed

static inline bool coredump_device_unregister_memory(const struct device *dev, struct coredump_mem_region_node *region)

Unregister a region of memory to be stored in core dump at the time it is generated.

Parameters
• dev – Pointer to the device structure for the driver instance.
• region – Struct describing memory to be collected

**Returns**
true if unregistration succeeded

**Returns**
false if unregistration failed

```c
static inline bool coredump_device_register_callback(const struct device *dev,
coredump_dump_callback_t callback)
```

Register a callback to be invoked at dump time.

**Parameters**
• dev – Pointer to the device structure for the driver instance.
• callback – Callback to be invoked at dump time

**Returns**
true if registration succeeded

**Returns**
false if registration failed

```c
struct coredump_mem_region_node
#include <coredump.h> Structure describing a region in memory that may be stored in
core dump at the time it is generated.
```

Instances of this are passed to the `coredump_device_register_memory()` and `coredump_device_unregister_memory()` functions to indicate addition and removal of memory regions to be captured

**Public Members**

```c
sys_snodo_t node
    Node of single-linked list, do not modify.

uintptr_t start
    Address of start of memory region.

size_t size
    Size of memory region.
```

### 7.5.11 Counter

**Overview**

**API Reference**

**Related code samples**

**Counter Alarm**

Implement an alarm application using the counter API.
DS3231 TCXO RTC
Interact with a DS3231 real-time clock using the counter API and dedicated driver API.

**group counter_interface**
Counter Interface.

**Counter device capabilities**

**COUNTER_CONFIG_INFO_COUNT_UP**
Counter count up flag.

**Flags used by counter_top_cfg.**

**COUNTER_TOP_CFG_DONT_RESET**
Flag preventing counter reset when top value is changed.
If flags is set then counter is free running while top value is updated, otherwise counter is reset (see `counter_set_top_value()`).

**COUNTER_TOP_CFG_RESET_WHEN_LATE**
Flag instructing counter to reset itself if changing top value results in counter going out of new top value bound.
See `COUNTER_TOP_CFG_DONT_RESET`.

**Alarm configuration flags**

Used in alarm configuration structure (`counter_alarm_cfg`).

**COUNTER_ALARM_CFG_ABSOLUTE**
Counter alarm absolute value flag.
Ticks relation to counter value. If set ticks are treated as absolute value, else it is relative to the counter reading performed during the call.

**COUNTER_ALARM_CFG_EXPIRE_WHEN_LATE**
Alarm flag enabling immediate expiration when driver detects that absolute alarm was set too late.
Alarm callback must be called from the same context as if it was set on time.

**Counter guard period flags**

Used by `counter_set_guard_period` and `counter_get_guard_period`.

**COUNTER_GUARD_PERIOD_LATE_TO_SET**
Identifies guard period needed for detection of late setting of absolute alarm (see `counter_set_channel_alarm`).
### Typedefs

typedef void (*counter_alarm_callback_t)(const struct device *dev, uint8_t chan_id, uint32_t ticks, void *user_data)

Alarm callback.

- **Param dev**
  Pointer to the device structure for the driver instance.

- **Param chan_id**
  Channel ID.

- **Param ticks**
  Counter value that triggered the alarm.

- **Param user_data**
  User data.

typedef void (*counter_top_callback_t)(const struct device *dev, void *user_data)

Callback called when counter turns around.

- **Param dev**
  Pointer to the device structure for the driver instance.

- **Param user_data**
  User data provided in `counter_set_top_value`.

typedef int (*counter_api_start)(const struct device *dev)

typedef int (*counter_api_stop)(const struct device *dev)

typedef int (*counter_api_get_value)(const struct device *dev, uint32_t *ticks)

typedef int (*counter_api_get_value_64)(const struct device *dev, uint64_t *ticks)

typedef int (*counter_api_set_alarm)(const struct device *dev, uint8_t chan_id, const struct counter_alarm_cfg *alarm_cfg)

typedef int (*counter_api_cancel_alarm)(const struct device *dev, uint8_t chan_id)

typedef int (*counter_api_set_top_value)(const struct device *dev, const struct counter_top_cfg *cfg)

typedef uint32_t (*counter_api_get_pending_int)(const struct device *dev)

typedef uint32_t (*counter_api_get_top_value)(const struct device *dev)

typedef uint32_t (*counter_api_get_guard_period)(const struct device *dev, uint32_t flags)

typedef uint32_t (*counter_api_get_freq)(const struct device *dev)
Functions

bool counter_is_counting_up(const struct device *dev)
Function to check if counter is counting up.

Parameters
  • dev – [in] Pointer to the device structure for the driver instance.

Return values
  • true – if counter is counting up.
  • false – if counter is counting down.

uint8_t counter_get_num_of_channels(const struct device *dev)
Function to get number of alarm channels.

Parameters
  • dev – [in] Pointer to the device structure for the driver instance.

Returns
  Number of alarm channels.

uint32_t counter_get_frequency(const struct device *dev)
Function to get counter frequency.

Parameters
  • dev – [in] Pointer to the device structure for the driver instance.

Returns
  Frequency of the counter in Hz, or zero if the counter does not have a fixed frequency.

uint32_t counter_us_to_ticks(const struct device *dev, uint64_t us)
Function to convert microseconds to ticks.

Parameters
  • dev – [in] Pointer to the device structure for the driver instance.

Returns
  Converted ticks. Ticks will be saturated if exceed 32 bits.

uint64_t counter_ticks_to_us(const struct device *dev, uint32_t ticks)
Function to convert ticks to microseconds.

Parameters
  • dev – [in] Pointer to the device structure for the driver instance.
  • ticks – [in] Ticks.

Returns
  Converted microseconds.

uint32_t counter_get_max_top_value(const struct device *dev)
Function to retrieve maximum top value that can be set.

Parameters
  • dev – [in] Pointer to the device structure for the driver instance.

Returns
  Max top value.
int counter_start(const struct device *dev)
Start counter device in free running mode.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• Negative – errno code if failure.

int counter_stop(const struct device *dev)
Stop counter device.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• -ENOTSUP – if the device doesn’t support stopping the counter.

int counter_get_value(const struct device *dev, uint32_t *ticks)
Get current counter value.

Parameters
• dev – Pointer to the device structure for the driver instance.
• ticks – Pointer to where to store the current counter value

Return values
• 0 – If successful.
• Negative – error code on failure getting the counter value

int counter_get_value_64(const struct device *dev, uint64_t *ticks)
Get current counter 64-bit value.

Parameters
• dev – Pointer to the device structure for the driver instance.
• ticks – Pointer to where to store the current counter value

Return values
• 0 – If successful.
• Negative – error code on failure getting the counter value

int counter_set_channel_alarm(const struct device *dev, uint8_t chan_id, const struct counter_alarm_cfg *alarm_cfg)
Set a single shot alarm on a channel.
After expiration alarm can be set again, disabling is not needed. When alarm expiration handler is called, channel is considered available and can be set again in that context.

Note: API is not thread safe.
• chan_id – Channel ID.
• alarm_cfg – Alarm configuration.

Return values
• 0 – If successful.
• -ENOTSUP – if request is not supported (device does not support interrupts or requested channel).
• -EINVAL – if alarm settings are invalid.
• -ETIME – if absolute alarm was set too late.
• -EBUSY – if alarm is already active.

int counter_cancel_channel_alarm(const struct device *dev, uint8_t chan_id)
Cancel an alarm on a channel.

Note: API is not thread safe.

Parameters
• dev – Pointer to the device structure for the driver instance.
• chan_id – Channel ID.

Return values
• 0 – If successful.
• -ENOTSUP – if request is not supported or the counter was not started yet.

int counter_set_top_value(const struct device *dev, const struct counter_top_cfg *cfg)
Set counter top value.

Function sets top value and optionally resets the counter to 0 or top value depending on counter direction. On turnaround, counter can be reset and optional callback is periodically called. Top value can only be changed when there is no active channel alarm.

COUNTER_TOP_CFG_DONT_RESET prevents counter reset. When counter is running while top value is updated, it is possible that counter progresses outside the new top value. In that case, error is returned and optionally driver can reset the counter (see COUNTER_TOP_CFG_RESET_WHEN_LATE).

Parameters
• dev – Pointer to the device structure for the driver instance.
• cfg – Configuration. Cannot be NULL.

Return values
• 0 – If successful.
• -ENOTSUP – if request is not supported (e.g. top value cannot be changed or counter cannot/must be reset during top value update).
• -EBUSY – if any alarm is active.
• -ETIME – if COUNTER_TOP_CFG_DONT_RESET was set and new top value is smaller than current counter value (counter counting up).
int counter_get_pending_int(const struct device *dev)
  Function to get pending interrupts.
  
  The purpose of this function is to return the interrupt status register for the device. This is especially useful when waking up from low power states to check the wake up source.

Parameters
  • dev – Pointer to the device structure for the driver instance.

Return values
  • 1 – if any counter interrupt is pending.
  • 0 – if no counter interrupt is pending.

uint32_t counter_get_top_value(const struct device *dev)
  Function to retrieve current top value.

Parameters
  • dev – [in] Pointer to the device structure for the driver instance.

Returns
  Top value.

int counter_set_guard_period(const struct device *dev, uint32_t ticks, uint32_t flags)
  Set guard period in counter ticks.

When setting an absolute alarm value close to the current counter value there is a risk that the counter will have counted past the given absolute value before the driver manages to activate the alarm. If this would go unnoticed then the alarm would only expire after the timer has wrapped and reached the given absolute value again after a full timer period. This could take a long time in case of a 32 bit timer. Setting a sufficiently large guard period will help the driver detect unambiguously whether it is late or not.

The guard period should be as many counter ticks as the driver will need at most to actually activate the alarm after the driver API has been called. If the driver finds that the counter has just passed beyond the given absolute tick value but is still close enough to fall within the guard period, it will assume that it is “late”, i.e. that the intended expiry time has already passed. Depending on the COUNTER_ALARM_CFG_EXPIRE_WHEN_LATE flag the driver will either ignore the alarm or expire it immediately in such a case.

If, however, the counter is past the given absolute tick value but outside the guard period, then the driver will assume that this is intentional and let the counter wrap around to/from zero before it expires.

More precisely:

• When counting upwards (see COUNTER_CONFIG_INFO_COUNT_UP) the given absolute tick value must be above (now + guard_period) % top_value to be accepted by the driver.

• When counting downwards, the given absolute tick value must be less than (now + top_value - guard_period) % top_value to be accepted.

Examples:

• counting upwards, now = 4950, top value = 5000, guard period = 100: absolute tick value >= (4950 + 100) % 5000 = 50
• counting downwards, now = 50, top value = 5000, guard period = 100: absolute tick value <= (50 + 5000 - * 100) % 5000 = 4950

If you need only short alarm periods, you can set the guard period very high (e.g. half of the counter top value) which will make it highly unlikely that the counter will ever unintentionally wrap.

The guard period is set to 0 on initialization (no protection).

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `ticks` – Guard period in counter ticks.
- `flags` – See `COUNTER_GUARD_PERIOD_FLAGS`.

**Return values**

- 0 – if successful.
- -ENOTSUP – if function or flags are not supported.
- -EINVAL – if ticks value is invalid.

```c
uint32_t counter_get_guard_period(const struct device *dev, uint32_t flags)
```

Return guard period.

See also:

`counter_set_guard_period`.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `flags` – See `COUNTER_GUARD_PERIOD_FLAGS`.

**Returns**

Guard period given in counter ticks or 0 if function or flags are not supported.

```c
struct counter_alarm_cfg
#include <counter.h> Alarm callback structure.
```

**Public Members**

`counter_alarm_callback_t callback`

Callback called on alarm (cannot be NULL).

```c
uint32_t ticks
```

Number of ticks that triggers the alarm.

It can be relative (to now) or an absolute value (see `COUNTER_ALARM_CFG_ABSOLUTE`). Both, relative and absolute, alarm values can be any value between zero and the current top value (see `counter_get_top_value`). When setting an absolute alarm value close to the current counter value there is a risk that the counter will have counted past the given absolute value before the driver manages to activate the alarm. Therefore a guard period can be defined that lets the driver decide unambiguously whether it is late or not (see `counter_set_guard_period`). If the counter is clock driven then ticks can be
converted to microseconds (see \texttt{counter\_ticks\_to\_us}). Alternatively, the counter implementation may count asynchronous events.

\begin{verbatim}
void *user_data
    User data returned in callback.

uint32_t flags
    Alarm flags (see \texttt{COUNTER\_ALARM\_FLAGS}).
\end{verbatim}

\begin{verbatim}
struct counter_top_cfg
    \#include <counter.h> Top value configuration structure.
\end{verbatim}

\textbf{Public Members}

\begin{verbatim}
uint32_t ticks
    Top value.

counter_top_callback_t callback
    Callback function (can be NULL).
\end{verbatim}

\begin{verbatim}
void *user_data
    User data passed to callback function (not valid if callback is NULL).

uint32_t flags
    Flags (see \texttt{COUNTER\_TOP\_FLAGS}).
\end{verbatim}

\begin{verbatim}
struct counter_config_info
    \#include <counter.h> Structure with generic counter features.
\end{verbatim}

\textbf{Public Members}

\begin{verbatim}
uint32_t max_top_value
    Maximal (default) top value on which counter is reset (cleared or reloaded).

uint32_t freq
    Frequency of the source clock if synchronous events are counted.

uint8_t flags
    Flags (see \texttt{COUNTER\_FLAGS}).

uint8_t channels
    Number of channels that can be used for setting alarm.
\end{verbatim}

struct counter_driver_api
    \#include <counter.h>
\end{verbatim}
7.5.12 Digital-to-Analog Converter (DAC)

Overview

The DAC API provides access to Digital-to-Analog Converter (DAC) devices.

Configuration Options

Related configuration options:

- CONFIG_DAC

API Reference

Related code samples

**Digital-to-Analog Converter (DAC)**

Generate an analog sawtooth signal using the DAC driver API.

```c
#include <device.h>
#include <dac.h>

int dac_channel_setup(const struct device *dev, const struct dac_channel_cfg *channel_cfg)

Configure a DAC channel.

It is required to call this function and configure each channel before it is selected for
a write request.

**Parameters**

- dev – Pointer to the device structure for the driver instance.
- channel_cfg – Channel configuration.

**Return values**

- 0 – On success.
- -EINVAL – If a parameter with an invalid value has been provided.
- -ENOTSUP – If the requested resolution is not supported.

```c
int dac_write_value(const struct device *dev, uint8_t channel, uint32_t value)

Write a single value to a DAC channel.

**Parameters**

- dev – Pointer to the device structure for the driver instance.
- channel – Number of the channel to be used.
- value – Data to be written to DAC output registers.

**Return values**

- 0 – On success.
- -EINVAL – If a parameter with an invalid value has been provided.
struct dac_channel_cfg
#include <dac.h> Structure for specifying the configuration of a DAC channel.

Public Members

uint8_t channel_id
    Channel identifier of the DAC that should be configured.

uint8_t resolution
    Desired resolution of the DAC (depends on device capabilities).

bool buffered
    Enable output buffer for this channel.
    This is relevant for instance if the output is directly connected to the load, without
    an amplifier in between. The actual details on this are hardware dependent.

7.5.13 Direct Memory Access (DMA)

Overview

API Reference

group dma_interface
    DMA Interface.

Defines

DMA_STATUS_COMPLETE

DMA_STATUS_BLOCK

DMA_MAGIC

DMA_BUF_ADDR_ALIGNMENT(node)
    Get the device tree property describing the buffer address alignment.
    Useful when statically defining or allocating buffers for DMA usage where memory
    alignment often matters.

Parameters

• node – Node identifier, e.g. DT_NODELABEL(dma_0)

Returns
    alignment Memory byte alignment required for DMA buffers
DMA_BUF_SIZE_ALIGNMENT(node)
Get the device tree property describing the buffer size alignment.
Useful when statically defining or allocating buffers for DMA usage where memory alignment often matters.

Parameters
• node – Node identifier, e.g. DT_NODELABEL(dma_0)

Returns
alignment Memory byte alignment required for DMA buffers

DMA_COPY_ALIGNMENT(node)
Get the device tree property describing the minimal chunk of data possible to be copied.

Parameters
• node – Node identifier, e.g. DT_NODELABEL(dma_0)

Returns
minimal Minimal chunk of data possible to be copied

Typedefs

typedef void (*dma_callback_t)(const struct device *dev, void *user_data, uint32_t channel, int status)
    Callback function for DMA transfer completion.
    If enabled, callback function will be invoked at transfer or block completion, or when an error happens. In circular mode, status indicates that the DMA device has reached either the end of the buffer (DMA_STATUS_COMPLETE) or a water mark (DMA_STATUS_BLOCK).

Param dev
    Pointer to the DMA device calling the callback.

Param user_data
    A pointer to some user data or NULL

Param channel
    The channel number

Param status
    • 0-DMA_STATUS_COMPLETE buffer fully consumed
    • 1-DMA_STATUS_BLOCK buffer consumption reached a configured block or water mark
    • a negative errno otherwise

Enums

enum dma_channel_direction
    Values:

    enumerator MEMORY_TO_MEMORY = 0x0
enumerator MEMORY_TO_PERIPHERAL

enumerator PERIPHERAL_TO_MEMORY

enumerator PERIPHERAL_TO_PERIPHERAL

enumerator HOST_TO_MEMORY

enumerator MEMORY_TO_HOST

enumerator DMA_CHANNEL_DIRECTION_COMMON_COUNT
   Number of all common channel directions.

enumerator DMA_CHANNEL_DIRECTION_PRIV_START = DMA_CHANNEL_DIRECTION_COMMON_COUNT
   This and higher values are dma controller or soc specific.
   Refer to the specified dma driver header file.

enumerator DMA_CHANNEL_DIRECTION_MAX = 0x7
   Maximum allowed value (3 bit field!)

enum dma_addr_adj
   Valid values for source_addr_adj and dest_addr_adj.
   Values:

enumerator DMA_ADDR_ADJ_INCREMENT

enumerator DMA_ADDR_ADJ_DECREMENT

enumerator DMA_ADDR_ADJ_NO_CHANGE

enum dma_channel_filter
   Values:

enumerator DMA_CHANNEL_NORMAL

enumerator DMA_CHANNEL_PERIODIC

enum dma_attribute_type
   Values:

enumerator DMA_ATTR_BUFFER_ADDRESS_ALIGNMENT

enumerator DMA_ATTR_BUFFER_SIZE_ALIGNMENT

enumerator DMA_ATTR_COPY_ALIGNMENT

7.5. Peripherals
enumerator DMA_ATTR_MAX_BLOCK_COUNT

Functions

static inline int dma_config(const struct device *dev, uint32_t channel, struct dma_config *config)

Configure individual channel for DMA transfer.

Parameters

- dev – Pointer to the device structure for the driver instance.
- channel – Numeric identification of the channel to configure
- config – Data structure containing the intended configuration for the selected channel

Return values

- 0 – if successful.
- Negative – errno code if failure.

static inline int dma_reload(const struct device *dev, uint32_t channel, uint32_t src, uint32_t dst, size_t size)

Reload buffer(s) for a DMA channel.

Parameters

- dev – Pointer to the device structure for the driver instance.
- channel – Numeric identification of the channel to configure selected channel
- src – source address for the DMA transfer
- dst – destination address for the DMA transfer
- size – size of DMA transfer

Return values

- 0 – if successful.
- Negative – errno code if failure.

int dma_start(const struct device *dev, uint32_t channel)

Enables DMA channel and starts the transfer, the channel must be configured beforehand.

Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid.

Start is allowed on channels that have already been started and must report success.

Parameters

- dev – Pointer to the device structure for the driver instance.
- channel – Numeric identification of the channel where the transfer will be processed

Return values

- 0 – if successful.
- Negative – errno code if failure.
int `dma_stop(const struct device *dev, uint32_t channel)`

Stops the DMA transfer and disables the channel.

Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid.

Stop is allowed on channels that have already been stopped and must report success.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **channel** – Numeric identification of the channel where the transfer was being processed.

**Return values**

- 0 – if successful.
- Negative – errno code if failure.

int `dma_suspend(const struct device *dev, uint32_t channel)`

Suspend a DMA channel transfer.

Implementations must check the validity of the channel state and ID passed in and return -EINVAL if either are invalid.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **channel** – Numeric identification of the channel to suspend.

**Return values**

- 0 – If successful.
- -ENOSYS – If not implemented.
- -EINVAL – If invalid channel id or state.
- -errno – Other negative errno code failure.

int `dma_resume(const struct device *dev, uint32_t channel)`

Resume a DMA channel transfer.

Implementations must check the validity of the channel state and ID passed in and return -EINVAL if either are invalid.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **channel** – Numeric identification of the channel to resume.

**Return values**

- 0 – If successful.
- -ENOSYS – If not implemented
- -EINVAL – If invalid channel id or state.
- -errno – Other negative errno code failure.

int `dma_request_channel(const struct device *dev, void *filter_param)`

request DMA channel.

request DMA channel resources return -EINVAL if there is no valid channel available.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
• filter_param – filter function parameter

**Return values**
• dma – channel if successful.
• Negative – errno code if failure.

```c
void dma_release_channel(const struct device *dev, uint32_t channel)
```
release DMA channel.
release DMA channel resources

**Parameters**
• dev – Pointer to the device structure for the driver instance.
• channel – channel number

```c
int dma_chan_filter(const struct device *dev, int channel, void *filter_param)
```
DMA channel filter.
filter channel by attribute

**Parameters**
• dev – Pointer to the device structure for the driver instance.
• channel – channel number
• filter_param – filter attribute

**Return values**
Negative – errno code if not support

```c
static inline int dma_get_status(const struct device *dev, uint32_t channel, struct dma_status *stat)
```
get current runtime status of DMA transfer
Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid or -ENOSYS if not supported.

**Parameters**
• dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel where the transfer was being processed
• stat – a non-NULL `dma_status` object for storing DMA status

**Return values**
• non-negative – if successful.
• Negative – errno code if failure.

```c
static inline int dma_get_attribute(const struct device *dev, uint32_t type, uint32_t *value)
```
get attribute of a dma controller
This function allows to get a device specific static or runtime attribute like required address and size alignment of a buffer. Implementations must check the validity of the type passed in and return -EINVAL if it is invalid or -ENOSYS if not supported.

**Parameters**
• dev – Pointer to the device structure for the driver instance.
• type – Numeric identification of the attribute
• value – A non-NULL pointer to the variable where the read value is to be placed
Return values

• non-negative – if successful.
• Negative – errno code if failure.

static inline uint32_t dma_width_index(uint32_t size)

Look-up generic width index to be used in registers.

WARNING: This look-up works for most controllers, but may not work for yours. Ensure your controller expects the most common register bit values before using this convenience function. If your controller does not support these values, you will have to write your own look-up inside the controller driver.

Parameters

• size – width of bus (in bytes)

Return values

common – DMA index to be placed into registers.

static inline uint32_t dma_burst_index(uint32_t burst)

Look-up generic burst index to be used in registers.

WARNING: This look-up works for most controllers, but may not work for yours. Ensure your controller expects the most common register bit values before using this convenience function. If your controller does not support these values, you will have to write your own look-up inside the controller driver.

Parameters

• burst – number of bytes to be sent in a single burst

Return values

common – DMA index to be placed into registers.

struct dma_block_config

#include <dma.h> DMA block configuration structure.

Param source_address

is block starting address at source

Param source_gather_interval

is the address adjustment at gather boundary

Param dest_address

is block starting address at destination

Param dest_scatter_interval

is the address adjustment at scatter boundary

Param dest_scatter_count

is the continuous transfer count between scatter boundaries

Param source_gather_count

is the continuous transfer count between gather boundaries

Param block_size

is the number of bytes to be transferred for this block.

Param config

is a bit field with the following parts:

<table>
<thead>
<tr>
<th>bit</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>disable</td>
</tr>
<tr>
<td>1</td>
<td>enable</td>
</tr>
<tr>
<td>2</td>
<td>increment</td>
</tr>
<tr>
<td>3</td>
<td>decrement</td>
</tr>
<tr>
<td>4</td>
<td>no change</td>
</tr>
</tbody>
</table>

(continues on next page)
### DMA Configuration Structure

**struct dma_config**

```c
#include <dma.h>  // DMA configuration structure.
```

**Param dma_slot**

- **[0 : 7]** - which peripheral and direction (HW specific)

**Param channel_direction**

- **[8 : 10]** - 000-memory to memory, 001-memory to peripheral, 010-peripheral to memory, 011-peripheral to peripheral, 100-host to memory, 101-memory to host ...

**Param complete_callback_en**

- **[11]** - 0-callback invoked at completion only, 1-callback invoked at completion of each block

**Param error_callback_en**

- **[12]** - 0-error callback enabled, 1-error callback disabled

**Param source_handshake**

- **[13]** - 0-HW, 1-SW

**Param dest_handshake**

- **[14]** - 0-HW, 1-SW

**Param channel_priority**

- **[15 : 18]** - DMA channel priority

**Param source_chaining_en**

- **[19]** - enable/disable source block chaining, 0-disable, 1-enable

**Param dest_chaining_en**

- **[20]** - enable/disable destination block chaining, 0-disable, 1-enable

**Param linked_channel**

- **[21 : 27]** - after channel count exhaust will initiate a channel service request at this channel

**Param cyclic**

- **[28]** - enable/disable cyclic buffer, 0-disable, 1-enable

**Param reserved**

- **[29 : 31]**

**Param source_data_size**

- **[0 : 15]** - width of source data (in bytes)

**Param dest_data_size**

- **[16 : 31]** - width of dest data (in bytes)
**Param source_burst_length**

[0 : 15] - number of source data units

**Param dest_burst_length**

[16 : 31] - number of destination data units

**Param block_count**

is the number of blocks used for block chaining, this depends on availability of the DMA controller.

**Param user_data**

private data from DMA client.

**Param dma_callback**

see dma_callback_t for details

```c
struct dma_status
{
    #include <dma.h> DMA runtime status structure.

    busy - is current DMA transfer busy or idle dir - DMA transfer direction pending_length - data length pending to be transferred in bytes or platform dependent. free - free buffer space write_position - write position in a circular dma buffer read_position - read position in a circular dma buffer
}
```

```c
struct dma_context
{
    #include <dma.h> DMA context structure Note: the dma_context shall be the first member of DMA client driver Data, got by dev->data.

    magic - magic code to identify the context dma_channels - dma channels atomic - driver atomic_t pointer
}
```

### 7.5.14 Display Interface

**API Reference**

**Generic Display Interface**

**Related code samples**

**Display**

Draw basic rectangles on a display device.

**LVGL basic sample**

Display “Hello World” and a dynamic counter using LVGL.

**LVGL demos**

Run LVGL built-in demos.

**LVGL line chart with accelerometer data**

Display acceleration data on a real-time chart using LVGL.

**group display_interface**

Display Interface.

**Defines**
DISPLAY_BITS_PER_PIXEL(fmt)

Bits required per pixel for display format.

This macro expands to the number of bits required for a given display format. It can be used to allocate a framebuffer based on a given display format type.

**Typedefs**

typedef int (*display_blanking_on_api)(const struct device *dev)

Callback API to turn on display blanking See display_blanking_on() for argument description.

typedef int (*display_blanking_off_api)(const struct device *dev)

Callback API to turn off display blanking See display_blanking_off() for argument description.

typedef int (*display_write_api)(const struct device *dev, const uint16_t x, const uint16_t y, const struct display_buffer_descriptor *desc, const void *buf)

Callback API for writing data to the display See display_write() for argument description.

typedef int (*display_read_api)(const struct device *dev, const uint16_t x, const uint16_t y, const struct display_buffer_descriptor *desc, void *buf)

Callback API for reading data from the display See display_read() for argument description.

typedef void *(*display_get_framebuffer_api)(const struct device *dev)

Callback API to get framebuffer pointer See display_get_framebuffer() for argument description.

typedef int (*display_set_brightness_api)(const struct device *dev, const uint8_t brightness)

Callback API to set display brightness See display_set_brightness() for argument description.

typedef int (*display_set_contrast_api)(const struct device *dev, const uint8_t contrast)

Callback API to set display contrast See display_set_contrast() for argument description.

typedef void (*display_get_capabilities_api)(const struct device *dev, struct display_capabilities *capabilities)

Callback API to get display capabilities See display_get_capabilities() for argument description.

typedef int (*display_set_pixel_format_api)(const struct device *dev, const enum display_pixel_format pixel_format)

Callback API to set pixel format used by the display See display_set_pixel_format() for argument description.

typedef int (*display_set_orientation_api)(const struct device *dev, const enum display_orientation orientation)

Callback API to set orientation used by the display See display_set_orientation() for argument description.
Enums

enum display_pixel_format
Display pixel formats.
Display pixel format enumeration.
In case a pixel format consists out of multiple bytes the byte order is big endian.
Values:

enumerator PIXEL_FORMAT_RGB_888 = BIT(0)
enumerator PIXEL_FORMAT_MONO01 = BIT(1)
enumerator PIXEL_FORMAT_MONO10 = BIT(2)
enumerator PIXEL_FORMAT_ARGB_8888 = BIT(3)
enumerator PIXEL_FORMAT_RGB_565 = BIT(4)
enumerator PIXEL_FORMAT_BGR_565 = BIT(5)

enum display_screen_info
Values:

enumerator SCREEN_INFO_MONO_VTILED = BIT(0)
If selected, one octet represents 8 pixels ordered vertically, otherwise ordered horizontally.
enumerator SCREEN_INFO_MONO_MSB_FIRST = BIT(1)
If selected, the MSB represents the first pixel, otherwise MSB represents the last pixel.
enumerator SCREEN_INFO_EPD = BIT(2)
Electrophoretic Display.
enumerator SCREEN_INFO_DOUBLE_BUFFER = BIT(3)
Screen has two alternating ram buffers.
enumerator SCREEN_INFO_X_ALIGNMENT_WIDTH = BIT(4)
Screen has x alignment constrained to width.

enum display_orientation
Enumeration with possible display orientation.
Values:

enumerator DISPLAY_ORIENTATION_NORMAL
enumerator DISPLAY_ORIENTATION_ROTATED_90
enumerator **DISPLAY_ORIENTATION_ROTATED_180**

enumerator **DISPLAY_ORIENTATION_ROTATED_270**

**Functions**

static inline int **display_write**(const struct device *dev, const uint16_t x, const uint16_t y, const struct display_buffer_descriptor *desc, const void *buf)

Write data to display.

**Parameters**

- **dev** – Pointer to device structure
- **x** – x Coordinate of the upper left corner where to write the buffer
- **y** – y Coordinate of the upper left corner where to write the buffer
- **desc** – Pointer to a structure describing the buffer layout
- **buf** – Pointer to buffer array

**Return values**

0 – on success else negative errno code.

static inline int **display_read**(const struct device *dev, const uint16_t x, const uint16_t y, const struct display_buffer_descriptor *desc, void *buf)

Read data from display.

**Parameters**

- **dev** – Pointer to device structure
- **x** – x Coordinate of the upper left corner where to read from
- **y** – y Coordinate of the upper left corner where to read from
- **desc** – Pointer to a structure describing the buffer layout
- **buf** – Pointer to buffer array

**Return values**

0 – on success else negative errno code.

static inline void **display_get_framebuffer**(const struct device *dev)

Get pointer to framebuffer for direct access.

**Parameters**

- **dev** – Pointer to device structure

**Return values**

Pointer – to frame buffer or NULL if direct framebuffer access is not supported

static inline int **display_blanking_on**(const struct device *dev)

Turn display blanking on.

This function blanks the complete display. The content of the frame buffer will be retained while blanking is enabled and the frame buffer will be accessible for read and write operations.

In case backlight control is supported by the driver the backlight is turned off. The backlight configuration is retained and accessible for configuration.
In case the driver supports display blanking the initial state of the driver would be the same as if this function was called.

**Parameters**
- dev – Pointer to device structure

**Return values**
- 0 – on success else negative errno code.

```c
static inline int display_blanking_off(const struct device *dev)
```

Turn display blanking off.

Restore the frame buffer content to the display. In case backlight control is supported by the driver the backlight configuration is restored.

**Parameters**
- dev – Pointer to device structure

**Return values**
- 0 – on success else negative errno code.

```c
static inline int display_set_brightness(const struct device *dev, uint8_t brightness)
```

Set the brightness of the display.

Set the brightness of the display in steps of 1/256, where 255 is full brightness and 0 is minimal.

**Parameters**
- dev – Pointer to device structure
- brightness – Brightness in steps of 1/256

**Return values**
- 0 – on success else negative errno code.

```c
static inline int display_set_contrast(const struct device *dev, uint8_t contrast)
```

Set the contrast of the display.

Set the contrast of the display in steps of 1/256, where 255 is maximum difference and 0 is minimal.

**Parameters**
- dev – Pointer to device structure
- contrast – Contrast in steps of 1/256

**Return values**
- 0 – on success else negative errno code.

```c
static inline void display_get_capabilities(const struct device *dev, struct display_capabilities *capabilities)
```

Get display capabilities.

**Parameters**
- dev – Pointer to device structure
- capabilities – Pointer to capabilities structure to populate

```c
static inline int display_set_pixel_format(const struct device *dev, const enum display_pixel_format pixel_format)
```

Set pixel format used by the display.

**Parameters**
- dev – Pointer to device structure
• **pixel_format** – Pixel format to be used by display

**Return values**

0 – on success else negative errno code.

```c
static inline int display_set_orientation(const struct device *dev, const enum display_orientation orientation)
```

Set display orientation.

**Parameters**

• `dev` – Pointer to device structure

• `orientation` – Orientation to be used by display

**Return values**

0 – on success else negative errno code.

```c
struct display_capabilities
#include <display.h> Structure holding display capabilities.
```

**Public Members**

```c
uint16_t x_resolution
Display resolution in the X direction.
```

```c
uint16_t y_resolution
Display resolution in the Y direction.
```

```c
uint32_t supported_pixel_formats
Bitwise or of pixel formats supported by the display.
```

```c
uint32_t screen_info
Information about display panel.
```

```c
enum display_pixel_format current_pixel_format
Currently active pixel format for the display.
```

```c
enum display_orientation current_orientation
Current display orientation.
```

```c
struct display_buffer_descriptor
#include <display.h> Structure to describe display data buffer layout.
```

**Public Members**

```c
uint32_t buf_size
Data buffer size in bytes.
```

```c
uint16_t width
Data buffer row width in pixels.
```
uint16_t height
    Data buffer column height in pixels.

uint16_t pitch
    Number of pixels between consecutive rows in the data buffer.

struct display_driver_api
    
    #include <display.h> Display driver API API which a display driver should expose.

Functions

void glcd_print(const struct device *dev, char *data, uint32_t size)
Send text to the screen.

Parameters

• dev – Pointer to device structure for driver instance.
• data – the ASCII text to display
• size – the length of the text in bytes

void glcd_cursor_pos_set(const struct device *dev, uint8_t col, uint8_t row)
Set text cursor position for next additions.

Parameters

• dev – Pointer to device structure for driver instance.
• col – the column for the cursor to be moved to (0-15)
• row – the row it should be moved to (0 or 1)

void glcd_clear(const struct device *dev)
Clear the current display.

Parameters

• dev – Pointer to device structure for driver instance.

void glcd_display_state_set(const struct device *dev, uint8_t opt)
Function to change the display state.
This function provides the user the ability to change the state of the display as per
needed. Controlling things like powering on or off the screen, the option to display the
cursor or not, and the ability to blink the cursor.

Parameters

• dev – Pointer to device structure for driver instance.
• opt – An 8bit bitmask of GLCD_DS_ * options.

uint8_t glcd_display_state_get(const struct device *dev)
return the display feature set associated with the device

Parameters

• dev – the Grove LCD to get the display features set
Returns
the display feature set associated with the device.

void glcd_input_state_set(const struct device *dev, uint8_t opt)
Function to change the input state.
This function provides the user the ability to change the state of the text input. Controlling things like text entry from the left or right side, and how far to increment on new text.

Parameters
• dev – Pointer to device structure for driver instance.
• opt – A bitmask of GLCD_IS_* options

uint8_t glcd_input_state_get(const struct device *dev)
return the input set associated with the device

Parameters
• dev – the Grove LCD to get the input features set

Returns
the input set associated with the device.

void glcd_function_set(const struct device *dev, uint8_t opt)
Function to set the functional state of the display.
This function provides the user the ability to change the state of the display as per needed. Controlling things like the number of rows, dot size, and text display quality.

Parameters
• dev – Pointer to device structure for driver instance.
• opt – A bitmask of GLCD_FS_* options

uint8_t glcd_function_get(const struct device *dev)
return the function set associated with the device

Parameters
• dev – the Grove LCD to get the functions set

Returns
the function features set associated with the device.

void glcd_color_select(const struct device *dev, uint8_t color)
Set LCD background to a predefined color.

Parameters
• dev – Pointer to device structure for driver instance.
• color – One of the predefined color options

void glcd_color_set(const struct device *dev, uint8_t r, uint8_t g, uint8_t b)
Set LCD background to custom RGB color value.

Parameters
• dev – Pointer to device structure for driver instance.
• r – A numeric value for the red color (max is 255)
• g – A numeric value for the green color (max is 255)
• b – A numeric value for the blue color (max is 255)
BBC micro:bit Display

**group** mb_display

BBC micro:bit display APIs.

**Defines**

**MB_IMAGE(_rows...)**

Generate an image object from a given array rows/columns.

This helper takes an array of 5 rows, each consisting of 5 0/1 values which correspond to the columns of that row. The value 0 means the pixel is disabled whereas a 1 means the pixel is enabled.

The pixels go from left to right and top to bottom, i.e. top-left corner is the first row's first value, top-right is the first rows last value, and bottom-right corner is the last value of the last (5th) row. As an example, the following would create a smiley face image:

**Parameters**

- _rows – Each of the 5 rows represented as a 5-value column array.

**Returns**

Image bitmap that can be passed e.g. to `mb_display_image()`.

** Enums**

**enum** mb_display_mode

Display mode.

First 16 bits are reserved for modes, last 16 for flags.

**Values:**

- enumerator MB_DISPLAY_MODE_DEFAULT
  
  Default mode (“single” for images, “scroll” for text).

- enumerator MB_DISPLAY_MODE_SINGLE
  
  Display images sequentially, one at a time.

- enumerator MB_DISPLAY_MODE_SCROLL
  
  Display images by scrolling.

- enumerator MB_DISPLAY_FLAG_LOOP = BIT(16)
  
  Loop back to the beginning when reaching the last image.

**Functions**

```c
struct mb_display *mb_display_get(void)
```

Get a pointer to the BBC micro:bit display object.

**Returns**

Pointer to display object.
void mb_display_image(struct mb_display *disp, uint32_t mode, int32_t duration, const struct mb_image *img, uint8_t img_count)
Display one or more images on the BBC micro:bit LED display.
This function takes an array of one or more images and renders them sequentially on the micro:bit display. The call is asynchronous, i.e. the processing of the display happens in the background. If there is another image being displayed it will be canceled and the new one takes over.

Parameters
• disp – Display object.
• mode – One of the MB_DISPLAY_MODE_* options.
• duration – Duration how long to show each image (in milliseconds), or SYS_FOREVER_MS.
• img – Array of image bitmaps (struct mb_image objects).
• img_count – Number of images in ‘img’ array.

void mb_display_print(struct mb_display *disp, uint32_t mode, int32_t duration, const char *fmt, ...)
Print a string of characters on the BBC micro:bit LED display.
This function takes a printf-style format string and outputs it in a scrolling fashion to the display.
The call is asynchronous, i.e. the processing of the display happens in the background. If there is another image or string being displayed it will be canceled and the new one takes over.

Parameters
• disp – Display object.
• mode – One of the MB_DISPLAY_MODE_* options.
• duration – Duration how long to show each character (in milliseconds), or SYS_FOREVER_MS.
• fmt – printf-style format string
• ... – Optional list of format arguments.

void mb_display_stop(struct mb_display *disp)
Stop the ongoing display of an image.

Parameters
• disp – Display object.

struct mb_image
#include <mb_display.h> Representation of a BBC micro:bit display image.
This struct should normally not be used directly, rather created using the MB_IMAGE() macro.

Monochrome Character Framebuffer

group monochrome_character_framebuffer
Public Monochrome Character Framebuffer API.

Defines

FON T_ENTRYDEFINE(_name, _width, _height, _caps, _data, _fc, _lc)
Macro for creating a font entry.

Parameters

• _name – Name of the font entry.
• _width – Width of the font in pixels
• _height – Height of the font in pixels.
• _caps – Font capabilities.
• _data – Raw data of the font.
• _fc – Character mapped to first font element.
• _lc – Character mapped to last font element.

Enums

enum cfb_display_param
Values:

enumerator CFB_DISPLAY_HEIGHT = 0
enumerator CFB_DISPLAY_WIDTH
enumerator CFB_DISPLAY_PPT
enumerator CFB_DISPLAY_ROWS
enumerator CFB_DISPLAY_COLS

enum cfb_font_caps
Values:

enumerator CFB_FONT_MONO_VPACKED = BIT(0)
enumerator CFB_FONT_MONO_HPACKED = BIT(1)
enumerator CFB_FONT_MSB_FIRST = BIT(2)
Functions

int cfb_print(const struct device *dev, const char *const str, uint16_t x, uint16_t y)
Print a string into the framebuffer.

Parameters
  • dev – Pointer to device structure for driver instance
  • str – String to print
  • x – Position in X direction of the beginning of the string
  • y – Position in Y direction of the beginning of the string

Returns
  0 on success, negative value otherwise

int cfb_draw_text(const struct device *dev, const char *const str, int16_t x, int16_t y)
Print a string into the framebuffer.
For compare to cfb_print, cfb_draw_text accept non tile-aligned coords and not line wrapping.

Parameters
  • dev – Pointer to device structure for driver instance
  • str – String to print
  • x – Position in X direction of the beginning of the string
  • y – Position in Y direction of the beginning of the string

Returns
  0 on success, negative value otherwise

int cfb_draw_point(const struct device *dev, const struct cfb_position *pos)
Draw a point.

Parameters
  • dev – Pointer to device structure for driver instance
  • pos – position of the point

Returns
  0 on success, negative value otherwise

int cfb_draw_line(const struct device *dev, const struct cfb_position *start, const struct cfb_position *end)
Draw a line.

Parameters
  • dev – Pointer to device structure for driver instance
  • start – start position of the line
  • end – end position of the line

Returns
  0 on success, negative value otherwise

int cfb_draw_rect(const struct device *dev, const struct cfb_position *start, const struct cfb_position *end)
Draw a rectangle.

Parameters
  • dev – Pointer to device structure for driver instance
• start – Top-Left position of the rectangle
• end – Bottom-Right position of the rectangle

Returns
0 on success, negative value otherwise

int cfb_framebuffer_clear(const struct device *dev, bool clear_display)
Clear framebuffer.

Parameters
• dev – Pointer to device structure for driver instance
• clear_display – Clear the display as well

Returns
0 on success, negative value otherwise

int cfb_framebuffer_invert(const struct device *dev)
Invert Pixels.

Parameters
• dev – Pointer to device structure for driver instance

Returns
0 on success, negative value otherwise

int cfb_invert_area(const struct device *dev, uint16_t x, uint16_t y, uint16_t width, uint16_t height)
Invert Pixels in selected area.

Parameters
• dev – Pointer to device structure for driver instance
• x – Position in X direction of the beginning of area
• y – Position in Y direction of the beginning of area
• width – Width of area in pixels
• height – Height of area in pixels

Returns
0 on success, negative value otherwise

int cfb_framebuffer_finalize(const struct device *dev)
Finalize framebuffer and write it to display RAM, invert or reorder pixels if necessary.

Parameters
• dev – Pointer to device structure for driver instance

Returns
0 on success, negative value otherwise

int cfb_get_display_parameter(const struct device *dev, enum cfb_display_param)
Get display parameter.

Parameters
• dev – Pointer to device structure for driver instance
• cfb_display_param – One of the display parameters

Returns
Display parameter value
int cfb_framebuffer_set_font(const struct device *dev, uint8_t idx)
Set font.

Parameters
• dev – Pointer to device structure for driver instance
• idx – Font index

Returns
0 on success, negative value otherwise

int cfb_set_kerning(const struct device *dev, int8_t kerning)
Set font kerning (spacing between individual letters).

Parameters
• dev – Pointer to device structure for driver instance
• kerning – Font kerning

Returns
0 on success, negative value otherwise

int cfb_get_font_size(const struct device *dev, uint8_t idx, uint8_t *width, uint8_t *height)
Get font size.

Parameters
• dev – Pointer to device structure for driver instance
• idx – Font index
• width – Pointers to the variable where the font width will be stored.
• height – Pointers to the variable where the font height will be stored.

Returns
0 on success, negative value otherwise

int cfb_get_numof_fonts(const struct device *dev)
Get number of fonts.

Parameters
• dev – Pointer to device structure for driver instance

Returns
number of fonts

int cfb_framebuffer_init(const struct device *dev)
Initialize Character Framebuffer.

Parameters
• dev – Pointer to device structure for driver instance

Returns
0 on success, negative value otherwise

struct cfb_font
#include <cfb.h>

struct cfb_position
#include <cfb.h>
7.5.15 Electrically Erasable Programmable Read-Only Memory (EEPROM)

Overview

The EEPROM API provides read and write access to Electrically Erasable Programmable Read-Only Memory (EEPROM) devices.

EEPROMs have an erase block size of 1 byte, a long lifetime, and allow overwriting data on byte-by-byte access.

Configuration Options

Related configuration options:

- CONFIG_EEPROM

API Reference

Related code samples

EEPROM
Store a boot count value in EEPROM.

group eeprom_interface

EEPROM Interface.

Functions

int eeprom_read(const struct device *dev, off_t offset, void *data, size_t len)
Read data from EEPROM.

Parameters

- dev – EEPROM device
- offset – Address offset to read from.
- data – Buffer to store read data.
- len – Number of bytes to read.

Returns

0 on success, negative errno code on failure.

int eeprom_write(const struct device *dev, off_t offset, const void *data, size_t len)
Write data to EEPROM.

Parameters

- dev – EEPROM device
- offset – Address offset to write data to.
- data – Buffer with data to write.
- len – Number of bytes to write.

Returns

0 on success, negative errno code on failure.
size_t eeprom_get_size(const struct device *dev)
Get the size of the EEPROM in bytes.

Parameters
• dev – EEPROM device.

Returns
EEPROM size in bytes.

7.5.16 Enhanced Serial Peripheral Interface (eSPI) Bus

Overview

The eSPI (enhanced serial peripheral interface) is a serial bus that is based on SPI. It also features a four-wire interface (receive, transmit, clock and slave select) and three configurations: single IO, dual IO and quad IO.

The technical advancements include lower voltage signal levels (1.8V vs. 3.3V), lower pin count, and the frequency is twice as fast (66MHz vs. 33MHz) Because of its enhancements, the eSPI is used to replace the LPC (lower pin count) interface, SPI, SMBus and sideband signals.

See eSPI interface specification for additional details.

API Reference

HOST_KBC_EVT_OBE
**Typedefs**

typedef void (*espi_callback_handler_t)(const struct device *dev, struct espi_callback *cb, struct espi_event espi_evt)

Define the application callback handler function signature.

**Param dev**
Device struct for the eSPI device.

**Param cb**
Original struct espi_callback owning this handler.

**Param espi_evt**
event details that trigger the callback handler.

** Enums **

enum espi_io_mode
  eSPI I/O mode capabilities

  * Values: *

  * enumerator ESPI_IO_MODE_SINGLE_LINE = BIT(0) *

  * enumerator ESPI_IO_MODE_DUAL_LINES = BIT(1) *

  * enumerator ESPI_IO_MODE_QUAD_LINES = BIT(2) *

enum espi_channel
  eSPI channel.

(continues on next page)
Identifies each eSPI logical channel supported by eSPI controller. Each channel allows independent traffic, but the assignment of channel type to channel number is fixed.

Note that generic commands are not associated with any channel, so traffic over eSPI can occur if all channels are disabled or not ready.

**Values:**

- **enumerator** `ESPI_CHANNEL_PERIPHERAL = BIT(0)`
- **enumerator** `ESPI_CHANNEL_VWIRE = BIT(1)`
- **enumerator** `ESPI_CHANNEL_OOB = BIT(2)`
- **enumerator** `ESPI_CHANNEL_FLASH = BIT(3)`

**enum espi_bus_event**

- eSPI bus event.
- eSPI bus event to indicate events for which user can register callbacks.

**Values:**

- **enumerator** `ESPI_BUS_RESET = BIT(0)`
- **enumerator** `ESPI_BUS_EVENT_CHANNEL_READY = BIT(1)`
- **enumerator** `ESPI_BUS_EVENT_VWIRE_RECEIVED = BIT(2)`
- **enumerator** `ESPI_BUS_EVENT_OOB_RECEIVED = BIT(3)`
- **enumerator** `ESPI_BUS_PERIPHERAL_NOTIFICATION = BIT(4)`
enumerator ESPI_BUS_SAF_NOTIFICATION = BIT(5)

enum espi_pc_event
eSPI peripheral channel events.
eSPI peripheral channel event types to indicate users.
Values:

enumerator ESPI_PC_EVT_BUS_CHANNEL_READY = BIT(0)

denumerator ESPI_PC_EVT_BUS_MASTER_ENABLE = BIT(1)

enum espi_virtual_peripheral
eSPI peripheral notification type.
eSPI peripheral notification event details to indicate which peripheral trigger the eSPI callback
Values:

enumerator ESPI_PERIPHERAL_UART

denumerator ESPI_PERIPHERAL_8042_KBC

enumerator ESPI_PERIPHERAL_HOST_IO

enumerator ESPI_PERIPHERAL_DEBUG_PORT80

enumerator ESPI_PERIPHERAL_HOST_IO_PVT

enum espi_cycle_type
eSPI cycle types supported over eSPI peripheral channel
Values:

Functions

int espi_config(const struct device *dev, struct espi_cfg *cfg)
Configure operation of a eSPI controller.

This routine provides a generic interface to override eSPI controller capabilities.

If this eSPI controller is acting as slave, the values set here will be discovered as part through the GET_CONFIGURATION command issued by the eSPI master during initialization.

If this eSPI controller is acting as master, the values set here will be used by eSPI master to determine minimum common capabilities with eSPI slave then send via SET_CONFIGURATION command.
Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `cfg` – the device runtime configuration for the eSPI controller.

Return values

- `0` – If successful.
- `-EIO` – General input / output error, failed to configure device.
- `-EINVAL` – invalid capabilities, failed to configure device.
- `-ENOTSUP` – capability not supported by eSPI slave.

`bool espi_get_channel_status(const struct device *dev, enum espi_channel ch)`

Query to see if a channel is ready.

This routine allows to check if logical channel is ready before use. Note that queries for channels not supported will always return false.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `ch` – the eSPI channel for which status is to be retrieved.

Return values

- `true` – If eSPI channel is ready.
- `false` – otherwise.

`int espi_read_request(const struct device *dev, struct espi_request_packet *req)`

Sends memory, I/O or message read request over eSPI.

This routines provides a generic interface to send a read request packet.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
• req – Address of structure representing a memory, I/O or message read request.

Return values
• 0 – If successful.
• -ENOTSUP – if eSPI controller doesn’t support raw packets and instead low memory transactions are handled by controller hardware directly.
• -EIO – General input / output error, failed to send over the bus.

int espi_write_request(const struct device *dev, struct espi_request_packet *req)
Sends memory, I/O or message write request over eSPI.

This routines provides a generic interface to send a write request packet.

Parameters
• dev – Pointer to the device structure for the driver instance.
• req – Address of structure representing a memory, I/O or message write request.

Return values
• 0 – If successful.
• -ENOTSUP – if eSPI controller doesn’t support raw packets and instead low memory transactions are handled by controller hardware directly.
• -EINVAL – General input / output error, failed to send over the bus.

int espi_read_lpc_request(const struct device *dev, enum lpc_peripheral_opcode op, uint32_t *data)
Reads SOC data from a LPC peripheral with information updated over eSPI.

This routine provides a generic interface to read a block whose information was updated by an eSPI transaction. Reading may trigger a transaction. The eSPI packet is assembled by the HW block.

Parameters
• dev – Pointer to the device structure for the driver instance.
• op – Enum representing opcode for peripheral type and read request.
• data – Parameter to be read from to the LPC peripheral.

Return values
• 0 – If successful.
• -ENOTSUP – if eSPI peripheral is off or not supported.
• -EINVAL – for unimplemented lpc opcode, but in range.

int espi_write_lpc_request(const struct device *dev, enum lpc_peripheral_opcode op, uint32_t *data)
Writes data to a LPC peripheral which generates an eSPI transaction.

This routine provides a generic interface to write data to a block which triggers an eSPI transaction. The eSPI packet is assembled by the HW block.

Parameters
• dev – Pointer to the device structure for the driver instance.
• op – Enum representing an opcode for peripheral type and write request.
• data – Represents the parameter passed to the LPC peripheral.
Return values
- 0 – If successful.
- -ENOTSUP – if eSPI peripheral is off or not supported.
- -EINVAL – for unimplemented lpc opcode, but in range.

```c
int espi_send_vwire(const struct device *dev, enum espi_vwire_signal signal, uint8_t level)
```

Sends system/platform signal as a virtual wire packet.

This routines provides a generic interface to send a virtual wire packet from slave to master.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `signal` – The signal to be send to eSPI master.
- `level` – The level of signal requested LOW or HIGH.

**Return values**
- 0 – If successful.
- -EIO – General input / output error, failed to send over the bus.

```c
int espi_receive_vwire(const struct device *dev, enum espi_vwire_signal signal, uint8_t *level)
```

Retrieves level status for a signal encapsulated in a virtual wire.

This routines provides a generic interface to request a virtual wire packet from eSPI master and retrieve the signal level.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `signal` – the signal to be requested from eSPI master.
- `level` – the level of signal requested 0b LOW, 1b HIGH.

**Return values**
- -EIO – General input / output error, failed request to master.

```c
int espi_send_oob(const struct device *dev, struct espi_oob_packet *pckt)
```

Sends SMBus transaction (out-of-band) packet over eSPI bus.

This routines provides an interface to encapsulate a SMBus transaction and send into packet over eSPI bus.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `pckt` – Address of the packet representation of SMBus transaction.

**Return values**
- -EIO – General input / output error, failed request to master.

```c
int espi_receive_oob(const struct device *dev, struct espi_oob_packet *pckt)
```

Receives SMBus transaction (out-of-band) packet from eSPI bus.

This routines provides an interface to receive and decoded a SMBus transaction from eSPI bus.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `pckt` – Address of the packet representation of SMBus transaction.
Return values
- **EIO** – General input / output error, failed request to master.

```c
int espi_read_flash(const struct device *dev, struct espi_flash_packet *pckt)
```
Sends a read request packet for shared flash.

This routines provides an interface to send a request to read the flash component
shared between the eSPI master and eSPI slaves.

**Parameters**
- **dev** – Pointer to the device structure for the driver instance.
- **pckt** – Address of the representation of read flash transaction.

**Return values**
- **ENOTSUP** – eSPI flash logical channel transactions not supported.
- **EBUSY** – eSPI flash channel is not ready or disabled by master.
- **EIO** – General input / output error, failed request to master.

```c
int espi_write_flash(const struct device *dev, struct espi_flash_packet *pckt)
```
Sends a write request packet for shared flash.

This routines provides an interface to send a request to write to the flash components
shared between the eSPI master and eSPI slaves.

**Parameters**
- **dev** – Pointer to the device structure for the driver instance.
- **pckt** – Address of the representation of write flash transaction.

**Return values**
- **ENOTSUP** – eSPI flash logical channel transactions not supported.
- **EBUSY** – eSPI flash channel is not ready or disabled by master.
- **EIO** – General input / output error, failed request to master.

```c
int espi_flash_erase(const struct device *dev, struct espi_flash_packet *pckt)
```
Sends a write request packet for shared flash.

This routines provides an interface to send a request to write to the flash components
shared between the eSPI master and eSPI slaves.

**Parameters**
- **dev** – Pointer to the device structure for the driver instance.
- **pckt** – Address of the representation of write flash transaction.

**Return values**
- **ENOTSUP** – eSPI flash logical channel transactions not supported.
- **EBUSY** – eSPI flash channel is not ready or disabled by master.
- **EIO** – General input / output error, failed request to master.

```c
static inline void espi_init_callback(struct espi_callback *callback,
                                        espi_callback_handler_t handler, enum espi_bus_event evt_type)
```
Callback model.
Helper to initialize a struct `espi_callback` properly.

**Parameters**
- `callback` – A valid Application's callback structure pointer.
- `handler` – A valid handler function pointer.
• **evt_type** – indicates the eSPI event relevant for the handler. For VWIRE_RECEIVED event the data will indicate the new level asserted

```
static inline int espi_add_callback(const struct device *dev, struct espi_callback *callback)
```

Add an application callback.

Note: enables to add as many callbacks as needed on the same device.

**Note:** Callbacks may be added to the device from within a callback handler invocation, but whether they are invoked for the current eSPI event is not specified.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **callback** – A valid Application's callback structure pointer.

**Returns**

0 if successful, negative errno code on failure.

```
static inline int espi_remove_callback(const struct device *dev, struct espi_callback *callback)
```

Remove an application callback.

Note: enables to remove as many callbacks as added through `espi_add_callback()`.

**Warning:** It is explicitly permitted, within a callback handler, to remove the registration for the callback that is running, i.e. `callback`. Attempts to remove other registrations on the same device may result in undefined behavior, including failure to invoke callbacks that remain registered and unintended invocation of removed callbacks.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **callback** – A valid application's callback structure pointer.

**Returns**

0 if successful, negative errno code on failure.

```
int espi_saf_config(const struct device *dev, const struct espi_saf_cfg *cfg)
```

Configure operation of a eSPI controller.

This routine provides a generic interface to override eSPI controller capabilities. If this eSPI controller is acting as slave, the values set here will be discovered as part through the GET_CONFIGURATION command issued by the eSPI master during initialization.

If this eSPI controller is acting as master, the values set here will be used by eSPI master to determine minimum common capabilities with eSPI slave then send via SET_CONFIGURATION command.

```
| eSPI | eSPI | eSPI | eSPI | eSPI | eSPI |
| slave | driver | bus | driver | host |
```

(continues on next page)
Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `cfg` – the device runtime configuration for the eSPI controller.

Return values

- 0 – If successful.
- -EIO – General input / output error, failed to configure device.
- -EINVAL – invalid capabilities, failed to configure device.
- -ENOTSUP – capability not supported by eSPI slave.

```c
int espi_saf_set_protection_regions(const struct device *dev, const struct espi_saf_protection *pr)
```

Set one or more SAF protection regions.
This routine provides an interface to override the default flash protection regions of the SAF controller.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `pr` – Pointer to the SAF protection region structure.

Return values

- 0 – If successful.
- -EIO – General input / output error, failed to configure device.
- -EINVAL – invalid capabilities, failed to configure device.
- -ENOTSUP – capability not supported by eSPI slave.

```c
int espi_saf_activate(const struct device *dev)
```

Activate SAF block.
This routine activates the SAF block and should only be called after SAF has been configured and the eSPI Master has enabled the Flash Channel.

Parameters
dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful
• -EINVAL – if failed to activate SAF.

bool espi_saf_get_channel_status(const struct device *dev)
Query to see if SAF is ready.
This routine allows to check if SAF is ready before use.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• true – If eSPI SAF is ready.
• false – otherwise.

int espi_saf_flash_read(const struct device *dev, struct espi_saf_packet *pckt)
Sends a read request packet for slave attached flash.
This routines provides an interface to send a request to read the flash component shared between the eSPI master and eSPI slaves.

Parameters
• dev – Pointer to the device structure for the driver instance.
• pckt – Address of the representation of read flash transaction.

Return values
• -ENOTSUP – eSPI flash logical channel transactions not supported.
• -EBUSY – eSPI flash channel is not ready or disabled by master.
• -EIO – General input / output error, failed request to master.

int espi_saf_flash_write(const struct device *dev, struct espi_saf_packet *pckt)
Sends a write request packet for slave attached flash.
This routines provides an interface to send a request to write to the flash components shared between the eSPI master and eSPI slaves.

Parameters
• dev – Pointer to the device structure for the driver instance.
• pckt – Address of the representation of write flash transaction.

Return values
• -ENOTSUP – eSPI flash logical channel transactions not supported.
• -EBUSY – eSPI flash channel is not ready or disabled by master.
• -EIO – General input / output error, failed request to master.

int espi_saf_flash_erase(const struct device *dev, struct espi_saf_packet *pckt)
Sends a write request packet for slave attached flash.
This routines provides an interface to send a request to write to the flash components shared between the eSPI master and eSPI slaves.

Parameters
• dev – Pointer to the device structure for the driver instance.
• pckt – Address of the representation of erase flash transaction.
Return values

- **-ENOTSUP** – eSPI flash logical channel transactions not supported.
- **-EBUSY** – eSPI flash channel is not ready or disabled by master.
- **-EIO** – General input / output error, failed request to master.

static inline void `espi_saf_init_callback` (struct espi_callback *callback, 
espi_callback_handler_t handler, enum espi_bus_event evt_type)

Callback model.
Helper to initialize a struct espi_callback properly.

**Parameters**

- **callback** – A valid Application's callback structure pointer.
- **handler** – A valid handler function pointer.
- **evt_type** – indicates the eSPI event relevant for the handler. For V WIRE_RECEIVED event the data will indicate the new level asserted

```c
static inline int espi_saf_add_callback(const struct device *dev, struct espi_callback *callback)
```

Add an application callback.

**Note:** enables to add as many callbacks as needed on the same device.

**Note:** Callbacks may be added to the device from within a callback handler invocation, but whether they are invoked for the current eSPI event is not specified.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **callback** – A valid Application's callback structure pointer.

**Returns**

0 if successful, negative errno code on failure.

```c
static inline int espi_saf_remove_callback(const struct device *dev, struct espi_callback *callback)
```

Remove an application callback.

**Note:** enables to remove as many callbacks as added through `espi_add_callback()`.

**Warning:** It is explicitly permitted, within a callback handler, to remove the registration for the callback that is running, i.e. callback. Attempts to remove other registrations on the same device may result in undefined behavior, including failure to invoke callbacks that remain registered and unintended invocation of removed callbacks.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **callback** – A valid application's callback structure pointer.

**Returns**

0 if successful, negative errno code on failure.
struct espi_evt_data_kbc
   #include <espi.h> Bit field definition of evt_data in struct \textit{espi\_event} for KBC.

struct espi_evt_data_acpi
   #include <espi.h> Bit field definition of evt_data in struct \textit{espi\_event} for ACPI.

struct espi_event
   #include <espi.h> eSPI event

\textbf{Public Members}

enum \textit{espi\_bus\_event} \textit{evt\_type}
   Event type.

uint32_t \textit{evt\_details}
   Additional details for bus event type.

uint32_t \textit{evt\_data}
   Data associated to the event.

struct espi\_cfg
   #include <espi.h> eSPI bus configuration parameters

\textbf{Public Members}

7.5.17  Entropy

Overview

The entropy API provides functions to retrieve entropy values from entropy hardware present on the platform. The entropy APIs are provided for use by the random subsystem and cryptographic services. They are not suitable to be used as random number generation functions.

API Reference

group entropy_interface
    Entropy Interface.

Defines

ENTROPY_BUSYWAIT
    Driver is allowed to busy-wait for random data to be ready.

Typedefs

typedef int (*entropy_get_entropy_t)(const struct device *dev, uint8_t *buffer, uint16_t length)
    Callback API to get entropy.

See entropy_get_entropy() for argument description

Note:  This call has to be thread safe to satisfy requirements of the random subsystem.

typedef int (*entropy_get_entropy_isr_t)(const struct device *dev, uint8_t *buffer, uint16_t length, uint32_t flags)
    Callback API to get entropy from an ISR.

See entropy_get_entropy_isr() for argument description

Functions

int entropy_get_entropy(const struct device *dev, uint8_t *buffer, uint16_t length)
    Fills a buffer with entropy.
    Blocks if required in order to generate the necessary random data.

Parameters

•  dev – Pointer to the entropy device.
•  buffer – Buffer to fill with entropy.
•  length – Buffer length.

Return values
• 0 – on success.
• -ERRNO – errno code on error.

static inline int entropy_get_entropy_isr(const struct device *dev, uint8_t *buffer, uint16_t length, uint32_t flags)

Fills a buffer with entropy in a non-blocking or busy-wait manner.
Callable from ISRs.

Parameters
• dev – Pointer to the device structure.
• buffer – Buffer to fill with entropy.
• length – Buffer length.
• flags – Flags to modify the behavior of the call.

Return values
number – of bytes filled with entropy or -error.

struct entropy_driver_api
#include <entropy.h> Entropy driver API structure.
This is the mandatory API any Entropy driver needs to expose.

7.5.18 Error Detection And Correction (EDAC)

Error Detection And Correction is a mechanism used to detect and correct errors while storing or reading data.

In Band Error Correction Code (IBECC)

Overview  The mechanism initially found in Intel Elkhart Lake SOCs and later boards is an integrated memory controller with IBECC.
The In-Band Error Correction Code (IBECC) improves reliability by providing error detection and correction. IBECC can work for all or for specific regions of physical memory space. The IBECC is useful for memory technologies that do not support the out-of-band ECC.
IBECC adds memory overhead of 1/32 of the memory. This memory is not accessible and used to store ECC syndrome data. IBECC converts read / write transactions to two separate transactions: one for actual data and another for cache line containing ECC value.
There is a debug feature IBECC Error Injection which helps to debug and verify IBECC functionality. ECC errors are injected on the write path and cause ECC errors on the read path.

IBECC Configuration  There are three IBECC operation modes which can be selected by Bootloader. They are listed below:
• OPERATION_MODE = 0x0 sets functional mode to protect requests based on address range
• OPERATION_MODE = 0x1 sets functional mode to all requests not be protected and to ignore range checks
• OPERATION_MODE = 0x2 sets functional mode to protect all requests and ignore range checks
IBECC operational mode is configured through BIOS or Bootloader. For operation mode 0 there are more BIOS configuration options such as memory regions.

Due to high security risk Error Injection capability should not be enabled for production. Error Injection is only enabled for tests.

**IBECC Logging**  IBECC logs the following fields:

- Error Address
- Error Syndrome
- Error Type
  - Correctable Error (CE) - error is detected and corrected by IBECC module.
  - Uncorrectable Error (UE) - error is detected by IBECC module and not automatically corrected.

The IBECC driver provides error type for the higher-level application to implement desired policy with respect for handling those memory errors. Error syndrome is not used in the IBECC driver but provided to higher-level application.

**Usage notes** Exceptional care needs to be taken with Non Maskable Interrupt (NMI). NMI will arrive at any time, even if the local CPU has disabled interrupts. That means that no locking mechanism can protect code against an NMI happening. Zephyr’s IPC mechanisms universally use local IRQ locking as the base layer for all higher-level synchronization primitives. So, you cannot share anything that is “protected” by a lock with an NMI, because the protection does not work. The only tool you have available for synchronization in the Zephyr API that works against an NMI is the atomic layer. This also applies to callback function which is called by NMI handler.

**Configuration option** Related configuration option:

- CONFIG_EDAC_IBECC

**Configuration option**

Related configuration option:

- CONFIG_EDAC

**API Reference**

**Related code samples**

**EDAC shell**

Test error detection and correction (EDAC) using shell commands.

```bash
group edac
```
Enums

enum edac_error_type
    EDAC error type.
    Values:

    enumerator EDAC_ERROR_TYPE_DRAM_COR = BIT(0)
        Correctable error type.

    enumerator EDAC_ERROR_TYPE_DRAM_UC = BIT(1)
        Uncorrectable error type.

Functions

static inline int edac_inject_set_param1(const struct device *dev, uint64_t value)
    Set injection parameter param1.
    Set first error injection parameter value.
    Parameters
        • dev – Pointer to the device structure
        • value – First injection parameter
    Return values
        • -ENOSYS – if the optional interface is not implemented
        • 0 – on success, other error code otherwise

static inline int edac_inject_get_param1(const struct device *dev, uint64_t *value)
    Get injection parameter param1.
    Get first error injection parameter value.
    Parameters
        • dev – Pointer to the device structure
        • value – Pointer to the first injection parameter
    Return values
        • -ENOSYS – if the optional interface is not implemented
        • 0 – on success, error code otherwise

static inline int edac_inject_set_param2(const struct device *dev, uint64_t value)
    Set injection parameter param2.
    Set second error injection parameter value.
    Parameters
        • dev – Pointer to the device structure
        • value – Second injection parameter
    Return values
        • -ENOSYS – if the optional interface is not implemented
        • 0 – on success, error code otherwise
static inline int edac_inject_get_param2(const struct device *dev, uint64_t *value)
Get injection parameter param2.

Parameters
• dev – Pointer to the device structure
• value – Pointer to the second injection parameter

Return values
• -ENOSYS – if the optional interface is not implemented
• 0 – on success, error code otherwise

static inline int edac_inject_set_error_type(const struct device *dev, uint32_t error_type)
Set error type value.

Set the value of error type to be injected

Parameters
• dev – Pointer to the device structure
• error_type – Error type value

Return values
• -ENOSYS – if the optional interface is not implemented
• 0 – on success, error code otherwise

static inline int edac_inject_get_error_type(const struct device *dev, uint32_t *error_type)
Get error type value.

Get the value of error type to be injected

Parameters
• dev – Pointer to the device structure
• error_type – Pointer to error type value

Return values
• -ENOSYS – if the optional interface is not implemented
• 0 – on success, error code otherwise

static inline int edac_inject_error_trigger(const struct device *dev)
Set injection control.

Trigger error injection.

Parameters
• dev – Pointer to the device structure

Return values
• -ENOSYS – if the optional interface is not implemented
• 0 – on success, error code otherwise

static inline int edac_ecc_error_log_get(const struct device *dev, uint64_t *value)
Get ECC Error Log.

Read value of ECC Error Log.

Parameters
• dev – Pointer to the device structure
• **value** – Pointer to the ECC Error Log value

### Return values

• **0** – on success, error code otherwise
• **-ENOSYS** – if the mandatory interface is not implemented

```c
static inline int edac_ecc_error_log_clear(const struct device *dev)
Clear ECC Error Log.
```

### Parameters

• **dev** – Pointer to the device structure

### Return values

• **0** – on success, error code otherwise
• **-ENOSYS** – if the mandatory interface is not implemented

```c
static inline int edac_parity_error_log_get(const struct device *dev, uint64_t *value)
Get Parity Error Log.
```

### Parameters

• **dev** – Pointer to the device structure
• **value** – Pointer to the parity Error Log value

### Return values

• **0** – on success, error code otherwise
• **-ENOSYS** – if the mandatory interface is not implemented

```c
static inline int edac_parity_error_log_clear(const struct device *dev)
Clear Parity Error Log.
```

### Parameters

• **dev** – Pointer to the device structure

### Return values

• **0** – on success, error code otherwise
• **-ENOSYS** – if the mandatory interface is not implemented

```c
static inline int edac_errors_cor_get(const struct device *dev)
Get number of correctable errors.
```

### Parameters

• **dev** – Pointer to the device structure

### Return values

• **num** – Number of correctable errors
• **-ENOSYS** – if the mandatory interface is not implemented

```c
static inline int edac_errors_uc_get(const struct device *dev)
Get number of uncorrectable errors.
```

### Parameters

• **dev** – Pointer to the device structure
Return values
• num – Number of uncorrectable errors
• -ENOSYS – if the mandatory interface is not implemented

static inline int edac_notify_callback_set(const struct device *dev, edac_notify_callback_f cb)

Register callback function for memory error exception.
This callback runs in interrupt context

Parameters
• dev – EDAC driver device to install callback
• cb – Callback function pointer

Return values
• 0 – on success, error code otherwise
• -ENOSYS – if the mandatory interface is not implemented

struct edac_driver_api
   #include <edac.h> EDAC driver API.
   This is the mandatory API any EDAC driver needs to expose.

7.5.19 Flash

Overview

Flash offset concept
Offsets used by the user API are expressed in relation to the flash memory beginning address. This rule shall be applied to all flash controller regular memory that layout is accessible via API for retrieving the layout of pages (see CONFIG_FLASH_PAGE_LAYOUT).
An exception from the rule may be applied to a vendor-specific flash dedicated-purpose region (such a region obviously can’t be covered under API for retrieving the layout of pages).

User API Reference

Related code samples

Flash shell
Explore a flash device using shell commands.

JEDEC SPI-NOR flash
Use the flash API to interact with an SPI NOR serial flash memory device.

JESD216 flash
Use the JESD216 flash API to extract information from a compatible serial memory device.

nRF SoC flash
Use the flash API to interact with the SoC flash.
group flash_interface

FLASH Interface.

Defines

FLASH_EX_OP_VENDOR_BASE
FLASH_EX_OP_IS_VENDOR(c)

Typedefs

typedef bool (*flash_page_cb)(const struct flash_pages_info *info, void *data)
Callback type for iterating over flash pages present on a device.
The callback should return true to continue iterating, and false to halt.

See also:
flash_page_foreach()

Param info
Information for current page

Param data
Private data for callback

Return
True to continue iteration, false to halt iteration.

 Enums

defined enum flash_ex_op_types
Enumeration for extra flash operations.

Values:

enumerator FLASH_EX_OP_RESET = 0

Functions

int flash_read(const struct device *dev, off_t offset, void *data, size_t len)
Read data from flash.

All flash drivers support reads without alignment restrictions on the read offset, the read size, or the destination address.

Parameters

• dev – : flash dev
• offset – : Offset (byte aligned) to read
• data – : Buffer to store read data
• `len` –: Number of bytes to read.

**Returns**
0 on success, negative errno code on fail.

```c
int flash_write(const struct device *dev, off_t offset, const void *data, size_t len)
```

Write buffer into flash memory.

All flash drivers support a source buffer located either in RAM or SoC flash, without alignment restrictions on the source address. Write size and offset must be multiples of the minimum write block size supported by the driver.

Any necessary write protection management is performed by the driver write implementation itself.

**Parameters**

- `dev` –: flash device
- `offset` –: starting offset for the write
- `data` –: data to write
- `len` –: Number of bytes to write

**Returns**
0 on success, negative errno code on fail.

```c
int flash_erase(const struct device *dev, off_t offset, size_t size)
```

Erase part or all of a flash memory.

Acceptable values of erase size and offset are subject to hardware-specific multiples of page size and offset. Please check the API implemented by the underlying sub driver, for example by using `flash_get_page_info_by_offs()` if that is supported by your flash driver.

Any necessary erase protection management is performed by the driver erase implementation itself.

See also:
`flash_get_page_info_by_offs()`

See also:
`flash_get_page_info_by_idx()`

**Parameters**

- `dev` –: flash device
- `offset` –: erase area starting offset
- `size` –: size of area to be erased

**Returns**
0 on success, negative errno code on fail.

```c
int flash_get_page_info_by_offs(const struct device *dev, off_t offset, struct flash_pages_info *info)
```

Get the size and start offset of flash page at certain flash offset.

**Parameters**

- `dev` –: flash device
- `offset` – Offset within the page
Get the size and start offset of flash page of certain index.

Parameters

- dev – flash device
- page_index – Index of the page. Index are counted from 0.
- info – Page Info structure to be filled

Returns

0 on success, -EINVAL if page of the index doesn’t exist.

Get the total number of flash pages.

Parameters

- dev – flash device

Returns

Number of flash pages.

Iterate over all flash pages on a device.

This routine iterates over all flash pages on the given device, ordered by increasing start offset. For each page, it invokes the given callback, passing it the page’s information and a private data object.

Parameters

- dev – Device whose pages to iterate over
- cb – Callback to invoke for each flash page
- data – Private data for callback function

Read data from Serial Flash Discoverable Parameters.

This routine reads data from a serial flash device compatible with the JEDEC JESD216 standard for encoding flash memory characteristics.

Availability of this API is conditional on selecting CONFIG_FLASH_JESD216_API and support of that functionality in the driver underlying dev.

Parameters

- dev – device from which parameters will be read
- offset – address within the SDFP region containing data of interest
- data – where the data to be read will be placed
- len – the number of bytes of data to be read

Return values

- 0 – on success
- -ENOTSUP – if the flash driver does not support SDFP access
- negative – values for other errors.
int flash_read_jedec_id(const struct device *dev, uint8_t *id)

Read the JEDEC ID from a compatible flash device.

Parameters
- `dev` – device from which id will be read
- `id` – pointer to a buffer of at least 3 bytes into which id will be stored

Return values
- 0 – on successful store of 3-byte JEDEC id
- -ENOTSUP – if flash driver doesn’t support this function
- negative – values for other errors

size_t flash_get_write_block_size(const struct device *dev)

Get the minimum write block size supported by the driver.

The write block size supported by the driver might differ from the write block size of memory used because the driver might implements write-modify algorithm.

Parameters
- `dev` – flash device

Returns
write block size in bytes.

const struct flash_parameters *flash_get_parameters(const struct device *dev)

Get pointer to flash_parameters structure.

Returned pointer points to a structure that should be considered constant through a runtime, regardless if it is defined in RAM or Flash. Developer is free to cache the structure pointer or copy its contents.

Returns
pointer to flash_parameters structure characteristic for the device.

int flash_ex_op(const struct device *dev, uint16_t code, const uintptr_t in, void *out)

Execute flash extended operation on given device.

Besides of standard flash operations like write or erase, flash controllers also support additional features like write protection or readout protection. These features are not available in every flash controller, what’s more controllers can implement it in a different way.

It doesn’t make sense to add a separate flash API function for every flash controller feature, because it could be unique (supported on small number of flash controllers) or the API won’t be able to represent the same feature on every flash controller.

Parameters
- `dev` – Flash device
- `code` – Operation which will be executed on the device.
- `in` – Pointer to input data used by operation. If operation doesn’t need any input data it could be NULL.
- `out` – Pointer to operation output data. If operation doesn’t produce any output it could be NULL.

Return values
- 0 – on success.
- -ENOTSUP – if given device doesn’t support extended operation.
- -ENOSYS – if support for extended operations is not enabled in Kconfig
• negative – value on extended operation errors.

struct flash_parameters
#include <flash.h> Flash memory parameters.
Contents of this structure suppose to be filled in during flash device initialization and stay constant through a runtime.

struct flash_pages_info
#include <flash.h>

Implementation interface API Reference

group flash_internal_interface
FLASH internal Interface.

Typedefs

typedef int (*flash_api_read)(const struct device *dev, off_t offset, void *data, size_t len)

typedef int (*flash_api_write)(const struct device *dev, off_t offset, const void *data, size_t len)

Flash write implementation handler type.

Note: Any necessary write protection management must be performed by the driver, with the driver responsible for ensuring the “write-protect” after the operation completes (successfully or not) matches the write-protect state when the operation was started.

typedef int (*flash_api_erase)(const struct device *dev, off_t offset, size_t size)

Flash erase implementation handler type.

Note: Any necessary erase protection management must be performed by the driver, with the driver responsible for ensuring the “erase-protect” after the operation completes (successfully or not) matches the erase-protect state when the operation was started.

typedef const struct flash_parameters *(*flash_api_get_parameters)(const struct device *dev)

typedef void (*flash_api_pages_layout)(const struct device *dev, const struct flash_pages_layout **layout, size_t *layout_size)

Retrieve a flash device's layout.
A flash device layout is a run-length encoded description of the pages on the device. (Here, “page” means the smallest erasable area on the flash device.)
For flash memories which have uniform page sizes, this routine returns an array of length 1, which specifies the page size and number of pages in the memory.
Layouts for flash memories with nonuniform page sizes will be returned as an array with multiple elements, each of which describes a group of pages that all have the same size. In this case, the sequence of array elements specifies the order in which these groups occur on the device.

**Param dev**
Flash device whose layout to retrieve.

**Param layout**
The flash layout will be returned in this argument.

**Param layout_size**
The number of elements in the returned layout.

typedef int (*flash_api_sfdp_read)(const struct device *dev, off_t offset, void *data, size_t len)

typedef int (*flash_api_read_jedec_id)(const struct device *dev, uint8_t *id)

typedef int (*flash_api_ex_op)(const struct device *dev, uint16_t code, const uintptr_t in, void *out)

struct flash_pages_layout
#include <flash.h>

struct flash_driver_api
#include <flash.h>

7.5.20 Fuel Gauge

The fuel gauge subsystem exposes an API to uniformly access battery fuel gauge devices. Currently, only reading data is supported.

Note: This API is currently experimental and this doc will be significantly changed as new features are added to the API.

**Basic Operation**

**Properties** Fundamentally, a property is a quantity that a fuel gauge device can measure.

Fuel gauges typically support multiple properties, such as temperature readings of the battery-pack or present-time current/voltage.

Properties are fetched by the client one at a time using fuel_gauge_get_prop(), or fetched in a batch using fuel_gauge_get_props().

Properties are set by the client one at a time using fuel_gauge_set_prop(), or set in a batch using fuel_gauge_set_props().

**Battery Cutoff** Many fuel gauges embedded within battery packs expose a register address that when written to with a specific payload will do a battery cutoff. This battery cutoff is often referred to as ship, shelf, or sleep mode due to its utility in reducing battery drain while devices are stored or shipped.

The fuel gauge API exposes battery cutoff with the fuel_gauge_battery_cutoff() function.
Caching  The Fuel Gauge API explicitly provides no caching for its clients.

API Reference

\textit{group} fuel\_gauge\_interface

Fuel Gauge Interface.

\textbf{Defines}

\texttt{SBS\_GAUGE\_MANUFACTURER\_NAME\_MAX\_SIZE}

Data structures for reading SBS buffer properties.

\texttt{SBS\_GAUGE\_DEVICE\_NAME\_MAX\_SIZE}

\texttt{SBS\_GAUGE\_DEVICE\_CHEMISTRY\_MAX\_SIZE}

\textbf{Typedefs}

typedef uint16_t fuel\_gauge\_prop\_t

typedef int (*fuel\_gauge\_get\_property\_t)(const struct device *dev, fuel\_gauge\_prop\_t prop, union fuel\_gauge\_prop\_val *val)

Callback API for getting a fuel gauge property.

See fuel\_gauge\_get\_property() for argument description

typedef int (*fuel\_gauge\_set\_property\_t)(const struct device *dev, fuel\_gauge\_prop\_t prop, union fuel\_gauge\_prop\_val val)

Callback API for setting a fuel gauge property.

See fuel\_gauge\_set\_property() for argument description

typedef int (*fuel\_gauge\_get\_buffer\_property\_t)(const struct device *dev, fuel\_gauge\_prop\_t prop\_type, void *dst, size_t dst\_len)

Callback API for getting a fuel gauge buffer property.

See fuel\_gauge\_get\_buffer\_property() for argument description

typedef int (*fuel\_gauge\_battery\_cutoff\_t)(const struct device *dev)

Callback API for doing a battery cutoff.

See fuel\_gauge\_battery\_cutoff() for argument description

\textbf{Enums}

enum fuel\_gauge\_prop\_type

Values:
enumerator FUEL_GAUGE_AVG_CURRENT = 0
  Runtime Dynamic Battery Parameters.
  Provide a 1 minute average of the current on the battery. Does not check for
  flags or whether those values are bad readings. See driver instance header for
details on implementation and how the average is calculated. Units in uA nega-
tive=discharging

enumerator FUEL_GAUGE_BATTERY_CUTOFF
  Used to cutoff the battery from the system - useful for storage/shipping of devices.

enumerator FUEL_GAUGE_CURRENT
  Battery current (uA); negative=discharging.

enumerator FUEL_GAUGE_CHARGE_CUTOFF
  Whether the battery underlying the fuel-gauge is cut off from charge.

enumerator FUEL_GAUGE_CYCLE_COUNT
  Cycle count in 1/100ths (number of charge/discharge cycles)

enumerator FUEL_GAUGE_CONNECT_STATE
  Connect state of battery.

enumerator FUEL_GAUGE_FLAGS
  General Error/Runtime Flags.

enumerator FUEL_GAUGE_FULL_CHARGE_CAPACITY
  Full Charge Capacity in uAh (might change in some implementations to determine
  wear)

enumerator FUEL_GAUGE_PRESENT_STATE
  Is the battery physically present.

enumerator FUEL_GAUGE_REMAINING_CAPACITY
  Remaining capacity in uAh.

enumerator FUEL_GAUGE_RUNTIME_TO_EMPTY
  Remaining battery life time in minutes.

enumerator FUEL_GAUGE_RUNTIME_TO_FULL
  Remaining time in minutes until battery reaches full charge.

enumerator FUEL_GAUGE_SBS_MFR_ACCESS
  Retrieve word from SBS1.1 ManufacturerAccess.

enumerator FUEL_GAUGE_ABSOLUTE_STATE_OF_CHARGE
  Absolute state of charge (percent, 0-100) - expressed as % of design capacity.

enumerator FUEL_GAUGE_RELATIVE_STATE_OF_CHARGE
  Relative state of charge (percent, 0-100) - expressed as % of full charge capacity.
enumerator FUEL_GAUGE_TEMPERATURE
   Temperature in 0.1 K.

enumerator FUEL_GAUGE_VOLTAGE
   Battery voltage (uV)

enumerator FUEL_GAUGE_SBS_MODE
   Battery Mode (flags)

enumerator FUEL_GAUGE_CHARGE_CURRENT
   Battery desired Max Charging Current (uA)

enumerator FUEL_GAUGE_CHARGE_VOLTAGE
   Battery desired Max Charging Voltage (uV)

enumerator FUEL_GAUGE_STATUS
   Alarm, Status and Error codes (flags)

enumerator FUEL_GAUGE_DESIGN_CAPACITY
   Design Capacity (mAh or 10mWh)

enumerator FUEL_GAUGE_DESIGN_VOLTAGE
   Design Voltage (mV)

enumerator FUEL_GAUGE_SBS_ATRATE
   AtRate (mA or 10 mW)

enumerator FUEL_GAUGE_SBS_ATRATE_TIME_TO_FULL
   AtRateTimeToFull (minutes)

enumerator FUEL_GAUGE_SBS_ATRATE_TIME_TOEMPTY
   AtRateTimeToEmpty (minutes)

enumerator FUEL_GAUGE_SBS_ATRATE_OK
   AtRateOK (boolean)

enumerator FUEL_GAUGE_SBS_REMAINING_CAPACITY_ALARM
   Remaining Capacity Alarm (mAh or 10mWh)

enumerator FUEL_GAUGE_SBS_REMAINING_TIME_ALARM
   Remaining Time Alarm (minutes)

enumerator FUEL_GAUGE_MANUFACTURER_NAME
   Manufacturer of pack (1 byte length + 20 bytes data)

enumerator FUEL_GAUGE_DEVICE_NAME
   Name of pack (1 byte length + 20 bytes data)
enumerator FUEL_GAUGE_DEVICE_CHEMISTRY
Chemistry (1 byte length + 4 bytes data)

enumerator FUEL_GAUGE_COMMON_COUNT
Reserved to demark end of common fuel gauge properties.

enumerator FUEL_GAUGE_CUSTOM_BEGIN
Reserved to demark downstream custom properties - use this value as the actual value may change over future versions of this API.

enumerator FUEL_GAUGE_PROP_MAX = UINT16_MAX
Reserved to demark end of valid enum properties.

Functions

int fuel_gauge_get_prop(const struct device *dev, fuel_gauge_prop_t prop, union fuel_gauge_prop_val *val)
Fetch a battery fuel-gauge property.

Parameters
- dev – Pointer to the battery fuel-gauge device
- prop – Type of property to be fetched from device
- val – pointer to a union fuel_gauge_prop_val where the property is read into from the fuel gauge device.

Returns
0 if successful, negative errno code if failure.

int fuel_gauge_get_props(const struct device *dev, fuel_gauge_prop_t *props, union fuel_gauge_prop_val *vals, size_t len)
Fetch multiple battery fuel-gauge properties.
The default implementation is the same as calling fuel_gauge_get_prop() multiple times. A driver may implement the get_properties field of the fuel gauge driver APIs struct to override this implementation.

Parameters
- dev – Pointer to the battery fuel-gauge device
- props – Array of the type of property to be fetched from device, each index corresponds to the same index of the vals input array.
- vals – Pointer to array of union fuel_gauge_prop_val where the property is read into from the fuel gauge device. The vals array is not permuted.
- len – number of properties in props & vals array

Returns
0 if successful, negative errno code of first failing property

int fuel_gauge_set_prop(const struct device *dev, fuel_gauge_prop_t prop, union fuel_gauge_prop_val val)
Set a battery fuel-gauge property.

Parameters
- dev – Pointer to the battery fuel-gauge device
• prop – Type of property that's being set
  • val – Value to set associated prop property.

Returns
0 if successful, negative errno code of first failing property

int fuel_gauge_set_props(const struct device *dev, fuel_gauge_prop_t *props, union fuel_gauge_prop_val *vals, size_t len)

Set a battery fuel-gauge property.

Parameters
  • dev – Pointer to the battery fuel-gauge device
  • props – Array of the type of property to be set, each index corresponds to the same index of the vals input array.
  • vals – Pointer to array of union fuel_gauge_prop_val where the property is written the fuel gauge device. The vals array is not permuted.
  • len – number of properties in props array

Returns
return=0 if successful. Otherwise, return array index of failing property.

int fuel_gauge_get_buffer_prop(const struct device *dev, fuel_gauge_prop_t prop_type, void *dst, size_t dst_len)

Fetch a battery fuel-gauge buffer property.

Parameters
  • dev – Pointer to the battery fuel-gauge device
  • prop_type – Type of property to be fetched from device
  • dst – byte array or struct that will hold the buffer data that is read from the fuel gauge
  • dst_len – the length of the destination array in bytes

Returns
return=0 if successful, return < 0 if getting property failed, return 0 on success

int fuel_gauge_battery_cutoff(const struct device *dev)

Have fuel gauge cutoff its associated battery.

Parameters
  • dev – Pointer to the battery fuel-gauge device

Returns
return=0 if successful and battery cutoff is now in process, return < 0 if failed to do battery cutoff.

union fuel_gauge_prop_val

#include <fuel_gauge.h> Property field to value/type union.

Public Members

Note: Historically this API allowed drivers to implement a custom multi-get/set property function, this was added so drivers could potentially optimize batch read with their specific chip.

However, it was removed because of no existing concrete case upstream. If this need is demonstrated, we can add this back in as an API field.
group fuel_gauge_emulator_backend
Fuel gauge backend emulator APIs.

Functions

int emul_fuel_gauge_set_battery_charging(const struct emul *target, uint32_t uV, int uA)
Set charging for fuel gauge associated battery. Set how much the battery associated with a fuel gauge IC is charging or discharging. Where voltage is always positive and a positive or negative current denotes charging or discharging, respectively.

Parameters
• target – Pointer to the emulator structure for the fuel gauge emulator instance.
• uV – Microvolts describing the battery voltage.
• uA – Microamps describing the battery current where negative is discharging.

Return values
• 0 – If successful.
• -EINVAL – if mV or mA are 0.

int emul_fuel_gauge_is_battery_cutoff(const struct emul *target, bool *cutoff)
Check if the battery has been cut off.

Parameters
• target – Pointer to the emulator structure for the fuel gauge emulator instance.
• cutoff – Pointer to bool storing variable.

Return values
• 0 – If successful.
• -ENOTSUP – if not supported by emulator.

7.5.21 GNSS (Global Navigation Satellite System)

Overview

GNSS is a general term which covers satellite systems used for navigation, like GPS (Global Positioning System). GNSS services are usually accessed through GNSS modems which receive and process GNSS signals to determine their position, or more specifically, their antennas position. They usually additionally provide a precise time synchronization mechanism, commonly named PPS (Pulse-Per-Second).

Subsystem support

The GNSS subsystem is based on the Modem modules. The GNSS subsystem covers everything from sending and receiving commands to and from the modem, to parsing, creating and processing NMEA0183 messages.
Adding support for additional NMEA0183 based GNSS modems requires little more than implementing power management and configuration for the specific GNSS modem.

Adding support for GNSS modems which use other protocols and/or busses than the usual NMEA0183 over UART is possible, but will require a bit more work from the driver developer.

Configuration Options

Related configuration options:

- CONFIG_GNSS
- CONFIG_GNSS_SATELLITES
- CONFIG_GNSS_DUMP_TO_LOG

Navigation Reference

Related code samples

GNSS
Connect to a GNSS device to obtain time, navigation data, and satellite information.

\[ \text{navigation_distance}(\text{distance}, \text{p1}, \text{p2}) \]

Calculate the distance between two navigation points along the surface of the sphere they are relative to.

**Parameters**

- **distance** – Destination for calculated distance in millimeters
- **p1** – First navigation point
- **p2** – Second navigation point

**Returns**

0 if successful

-EINVAL if either navigation point is invalid

\[ \text{navigation_bearing}(\text{bearing}, \text{from}, \text{to}) \]

Calculate the bearing from one navigation point to another.

**Parameters**

- **bearing** – Destination for calculated bearing angle in millidegrees
- **from** – First navigation point
- **to** – Second navigation point
Returns
0 if successful

Returns
-EINVAL if either navigation point is invalid

struct navigation_data
#include <navigation.h> Navigation data structure.
The structure describes the momentary navigation details of a point relative to a
sphere (commonly Earth)

Public Members

int64_t latitude
Latitudal position in nanodegrees (0 to +-180E9)

int64_t longitude
Longitudal position in nanodegrees (0 to +-180E9)

uint32_t bearing
Bearing angle in millidegrees (0 to 360E3)

uint32_t speed
Speed in millimeters per second.

int32_t altitude
Altitude in millimeters.

group gnss_interface
GNSS Interface.

Defines

GNSS_DATA_CALLBACK_DEFINE(_dev,_callback)
Register a callback structure for GNSS data published.

Parameters
• _dev – Device pointer
• _callback – The callback function
Register a callback structure for GNSS satellites published.

**Parameters**
- `_dev` – Device pointer
- `_callback` – The callback function

**Typedefs**

typedef int (*`gnss_set_fix_rate_t`)(const struct `device` *dev, uint32_t `fix_interval_ms`)
API for setting fix rate.

typedef int (*`gnss_get_fix_rate_t`)(const struct `device` *dev, uint32_t *`fix_interval_ms`)
API for getting fix rate.

typedef int (*`gnss_set_periodic_config_t`)(const struct `device` *dev, const struct `gnss_periodic_config` *`periodic_config`)
API for setting periodic tracking configuration.

typedef int (*`gnss_get_periodic_config_t`)(const struct `device` *dev, struct `gnss_periodic_config` *`periodic_config`)
API for setting periodic tracking configuration.

typedef int (*`gnss_set_navigation_mode_t`)(const struct `device` *dev, enum `gnss_navigation_mode` `mode`)
API for setting navigation mode.

typedef int (*`gnss_get_navigation_mode_t`)(const struct `device` *dev, enum `gnss_navigation_mode` *`mode`)
API for getting navigation mode.

typedef uint32_t `gnss_systems_t`
Type storing bitmask of GNSS systems.

typedef int (*`gnss_set_enabled_systems_t`)(const struct `device` *dev, `gnss_systems_t` `systems`)
API for enabling systems.

typedef int (*`gnss_get_enabled_systems_t`)(const struct `device` *dev, `gnss_systems_t` *`systems`)
API for getting enabled systems.

typedef int (*`gnss_get_supported_systems_t`)(const struct `device` *dev, `gnss_systems_t` *`systems`)
API for getting enabled systems.

typedef void (*`gnss_data_callback_t`)(const struct `device` *dev, const struct `gnss_data` *`data`)
Template for GNSS data callback.
typedef void (*

```
gnss_satellites_callback_t
```
)(const struct

```
device *
```
devid, const struct

```
gnss_satellite *
```
satellites, uint16_t size)

Template for GNSS satellites callback.

## Enums

### enum gnss_pps_mode

GNSS PPS modes.

**Values:**

- **enumerator GNSS_PPS_MODE_DISABLED = 0**  
  PPS output disabled.

- **enumerator GNSS_PPS_MODE_ENABLED = 1**  
  PPS output always enabled.

- **enumerator GNSS_PPS_MODE_ENABLED_AFTER_LOCK = 2**  
  PPS output enabled from first lock.

- **enumerator GNSS_PPS_MODE_ENABLED WHILE LOCKED = 3**  
  PPS output enabled while locked.

### enum gnss_navigation_mode

GNSS navigation modes.

**Values:**

- **enumerator GNSS_NAVIGATION_MODE ZERO DYNAMICS = 0**  
  Dynamics have no impact on tracking.

- **enumerator GNSS_NAVIGATION_MODE LOW DYNAMICS = 1**  
  Low dynamics have higher impact on tracking.

- **enumerator GNSS_NAVIGATION_MODE BALANCED DYNAMICS = 2**  
  Low and high dynamics have equal impact on tracking.

- **enumerator GNSS_NAVIGATION_MODE HIGH DYNAMICS = 3**  
  High dynamics have higher impact on tracking.

### enum gnss_system

Systems contained in gnss_systems_t.

**Values:**

- **enumerator GNSS_SYSTEM_GPS = BIT(0)**  
  Global Positioning System (GPS)

- **enumerator GNSS_SYSTEM GLONASS = BIT(1)**  
  GLObal NAvigation Satellite System (GLONASS)
enumerator GNSS_SYSTEM_GALILEO = BIT(2)
Galileo.

enumerator GNSS_SYSTEM_BEIDOU = BIT(3)
BeiDou Navigation Satellite System.

enumerator GNSS_SYSTEM_QZSS = BIT(4)
Quasi-Zenith Satellite System (QZSS)

enumerator GNSS_SYSTEM_IRNSS = BIT(5)
Indian Regional Navigation Satellite System (IRNSS)

enumerator GNSS_SYSTEM_SBAS = BIT(6)
Satellite-Based Augmentation System (SBAS)

enumerator GNSS_SYSTEM_IMES = BIT(7)
Indoor Messaging System (IMES)

enum gnss_fix_status
GNSS fix status.
Values:

enumerator GNSS_FIX_STATUS_NO_FIX = 0
No GNSS fix acquired.

enumerator GNSS_FIX_STATUS_GNSS_FIX = 1
GNSS fix acquired.

enumerator GNSS_FIX_STATUS_DGNSS_FIX = 2
Differential GNSS fix acquired.

enumerator GNSS_FIX_STATUS_ESTIMATED_FIX = 3
Estimated fix acquired.

enum gnss_fix_quality
GNSS fix quality.
Values:

enumerator GNSS_FIX_QUALITY_INVALID = 0
Invalid fix.

enumerator GNSS_FIX_QUALITY_GNSS_SPS = 1
Standard positioning service.

enumerator GNSS_FIX_QUALITY_DGNSS = 2
Differential GNSS.
enumerator GNSS_FIX_QUALITY_GNSS_PPS = 3
   Precise positioning service.
enumerator GNSS_FIX_QUALITY_RTK = 4
   Real-time kinematic.
enumerator GNSS_FIX_QUALITY_FLOAT_RTK = 5
   Floating real-time kinematic.
enumerator GNSS_FIX_QUALITY_ESTIMATED = 6
   Estimated fix.

Functions

int gnss_set_fix_rate(const struct device *dev, uint32_t fix_interval_ms)
   Set the GNSS fix rate.
   Parameters
   • dev – Device instance
   • fix_interval_ms – Fix interval to set in milliseconds
   Returns
   0 if successful
   -errno negative errno code on failure
int gnss_get_fix_rate(const struct device *dev, uint32_t *fix_interval_ms)
   Get the GNSS fix rate.
   Parameters
   • dev – Device instance
   • fix_interval_ms – Destination for fix interval in milliseconds
   Returns
   0 if successful
   -errno negative errno code on failure
int gnss_set_periodic_config(const struct device *dev, const struct gnss_periodic_config *config)
   Set the GNSS periodic tracking configuration.
   Parameters
   • dev – Device instance
   • config – Periodic tracking configuration to set
   Returns
   0 if successful
   -errno negative errno code on failure
int gnss_get_periodic_config(const struct device *dev, struct gnss_periodic_config *config)

Get the GNSS periodic tracking configuration.

Parameters
• dev – Device instance
• config – Destination for periodic tracking configuration

Returns
0 if successful

Returns
-errno negative errno code on failure

int gnss_set_navigation_mode(const struct device *dev, enum gnss_navigation_mode mode)

Set the GNSS navigation mode.

Parameters
• dev – Device instance
• mode – Navigation mode to set

Returns
0 if successful

Returns
-errno negative errno code on failure

int gnss_get_navigation_mode(const struct device *dev, enum gnss_navigation_mode *mode)

Get the GNSS navigation mode.

Parameters
• dev – Device instance
• mode – Destination for navigation mode

Returns
0 if successful

Returns
-errno negative errno code on failure

int gnss_set_enabled_systems(const struct device *dev, gnss_systems_t systems)

Set enabled GNSS systems.

Parameters
• dev – Device instance
• systems – Systems to enable

Returns
0 if successful

Returns
-errno negative errno code on failure

int gnss_get_enabled_systems(const struct device *dev, gnss_systems_t *systems)

Get enabled GNSS systems.

Parameters
• dev – Device instance
- **systems** – Destination for enabled systems

**Returns**
- 0 if successful

**Returns**
- \(-\text{errno} \) negative \(\text{errno} \) code on failure

```c
int gnss_get_supported_systems (const struct device *dev, gnss_systems_t *systems)
```

Get supported GNSS systems.

**Parameters**
- `dev` – Device instance
- `systems` – Destination for supported systems

**Returns**
- 0 if successful

**Returns**
- \(-\text{errno} \) negative \(\text{errno} \) code on failure

```c
struct gnss_periodic_config
#include <gnss.h> GNSS periodic tracking configuration.
```

**Note:** Setting either `active_time` or `inactive_time` to 0 will disable periodic function.

**Public Members**

```c
uint32_t active_time_ms
```

The time the GNSS will spend in the active state in ms.

```c
uint32_t inactive_time_ms
```

The time the GNSS will spend in the inactive state in ms.

```c
struct gnss_info
#include <gnss.h> GNSS info data structure.
```

**Public Members**

```c
uint16_t satellites_cnt
```

Number of satellites being tracked.

```c
uint16_t hdop
```

Horizontal dilution of precision in 1/1000.

```c
enum gnss_fix_status fix_status
```

The fix status.

```c
enum gnss_fix_quality fix_quality
```

The fix quality.
struct gnss_time
#include <gnss.h> GNSS time data structure.

Public Members

uint8_t hour
Hour [0, 23].

uint8_t minute
Minute [0, 59].

uint16_t millisecond
Millisecond [0, 59999].

uint8_t month_day
Day of month [1, 31].

uint8_t month
Month [1, 12].

uint8_t century_year
Year [0, 99].

struct gnss_driver_api
#include <gnss.h> GNSS API structure.

struct gnss_data
#include <gnss.h> GNSS data structure.

Public Members

struct navigation_data nav_data
Navigation data acquired.

struct gnss_info info
GNSS info when navigation data was acquired.

struct gnss_time utc
UTC time when data was acquired.

struct gnss_data_callback
#include <gnss.h> GNSS callback structure.

Public Members
const struct device *dev
   Filter callback to GNSS data from this device if not NULL.

   gnss_data_callback_t callback
   Callback called when GNSS data is published.

struct gnss_satellite
   #include <gnss.h> GNSS satellite structure.

   Public Members

   uint8_t prn
      Pseudo-random noise sequence.

   uint8_t snr
      Signal-to-noise ratio in dB.

   uint8_t elevation
      Elevation in degrees [0, 90].

   uint16_t azimuth
      Azimuth relative to True North in degrees [0, 359].

   enum gnss_system system
      System of satellite.

   uint8_t is_tracked
      True if satellite is being tracked.

struct gnss_satellites_callback
   #include <gnss.h> GNSS callback structure.

   Public Members

   const struct device *dev
      Filter callback to GNSS data from this device if not NULL.

   gnss_satellites_callback_t callback
      Callback called when GNSS satellites is published.

7.5.22 General-Purpose Input/Output (GPIO)

Overview

Configuration Options

Related configuration options:
- CONFIG_GPIO

**API Reference**

**Related code samples**

**Basic thread manipulation**
- Spawn multiple threads that blink LEDs and print information to the console.

**Blinky**
- Blink an LED forever using the GPIO API.

**Button**
- Handle GPIO inputs with interrupts.

**GPIO with custom Devicetree binding**
- Use custom Devicetree binding to control a GPIO.

**HD44780 LCD controller**
- Control an HD44780-based LCD display using GPIO pins.

**X-NUCLEO-53L0A1 shield**
- Interact with the 7-segment display and VL53L0X ranging sensor of an X-NUCLEO-53L0A1 shield.

```c
#include <gpio.h>

/* GPIO input/output configuration flags */

#define GPIO_INPUT   /* Enables pin as input. */
#define GPIO_OUTPUT  /* Enables pin as output, no change to the output state. */
#define GPIO_DISCONNECTED /* Disables pin for both input and output. */
#define GPIO_OUTPUT_LOW /* Configures GPIO pin as output and initializes it to a low state. */
#define GPIO_OUTPUT_HIGH /* Configures GPIO pin as output and initializes it to a high state. */
#define GPIO_OUTPUT_INACTIVE /* Configures GPIO pin as output and initializes it to a logic 0. */
#define GPIO_OUTPUT_ACTIVE  /* Configures GPIO pin as output and initializes it to a logic 1. */
```

2970 Chapter 7. Hardware Support
GPIO interrupt configuration flags

The GPIO_INT_* flags are used to specify how input GPIO pins will trigger interrupts. The interrupts can be sensitive to pin physical or logical level. Interrupts sensitive to pin logical level take into account GPIO_ACTIVE_LOW flag. If a pin was configured as Active Low, physical level low will be considered as logical level 1 (an active state), physical level high will be considered as logical level 0 (an inactive state). The GPIO controller should reset the interrupt status, such as clearing the pending bit, etc., when configuring the interrupt triggering properties. Applications should use the GPIO_INT_MODE_ENABLE_ONLY and GPIO_INT_MODE_DISABLE_ONLY flags to enable and disable interrupts on the pin without changing any GPIO settings.

**GPIO_INT_DISABLE**
Disables GPIO pin interrupt.

**GPIO_INT_EDGE_RISING**
Configures GPIO interrupt to be triggered on pin rising edge and enables it.

**GPIO_INT_EDGE_FALLING**
Configures GPIO interrupt to be triggered on pin falling edge and enables it.

**GPIO_INT_EDGE_BOTH**
Configures GPIO interrupt to be triggered on pin rising or falling edge and enables it.

**GPIO_INT_EDGE_TO_INACTIVE**
Configures GPIO interrupt to be triggered on pin state change to logical level 0 and enables it.

**GPIO_INT_EDGE_TO_ACTIVE**
Configures GPIO interrupt to be triggered on pin state change to logical level 1 and enables it.

**GPIO_INT_LEVEL_INACTIVE**
Configures GPIO interrupt to be triggered on pin logical level 0 and enables it.

**GPIO_INT_LEVEL_ACTIVE**
Configures GPIO interrupt to be triggered on pin logical level 1 and enables it.

**GPIO pin active level flags**

**GPIO_ACTIVE_LOW**
GPIO pin is active (has logical value ‘1’) in low state.
**GPIO_ACTIVE_HIGH**

GPIO pin is active (has logical value ‘1’) in high state.

**GPIO pin drive flags**

**GPIO_OPEN_DRAIN**

Configures GPIO output in open drain mode (wired AND).

**Note:** ‘Open Drain’ mode also known as ‘Open Collector’ is an output configuration which behaves like a switch that is either connected to ground or disconnected.

**GPIO_OPEN_SOURCE**

Configures GPIO output in open source mode (wired OR).

**Note:** ‘Open Source’ is a term used by software engineers to describe output mode opposite to ‘Open Drain’. It behaves like a switch that is either connected to power supply or disconnected. There exist no corresponding hardware schematic and the term is generally unknown to hardware engineers.

**GPIO pin bias flags**

**GPIO_PULL_UP**

Enables GPIO pin pull-up.

**GPIO_PULL_DOWN**

Enable GPIO pin pull-down.

**Defines**

**GPIO_DT_SPEC_GET_BY_IDX**(node_id, prop, idx)

Static initializer for a gpio_dt_spec.

This returns a static initializer for a gpio_dt_spec structure given a devicetree node identifier, a property specifying a GPIO and an index.

Example devicetree fragment:

```plaintext
n: node {
    foo-gpios = <&gpio0 1 GPIO_ACTIVE_LOW>,
                <&gpio1 2 GPIO_ACTIVE_LOW>;
}
```

Example usage:

```c
const struct gpio_dt_spec spec = GPIO_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n),
    foo_gpios, 1);
// Initializes 'spec' to:
// {
//     .port = DEVICE_DT_GET(DT_NODELABEL(gpio1)),
// (continues on next page)
```

2972 Chapter 7. Hardware Support
The ‘gpio’ field must still be checked for readiness, e.g. using `device_is_ready()`. It is an error to use this macro unless the node exists, has the given property, and that property specifies a GPIO controller, pin number, and flags as shown above.

**Parameters**
- `node_id` – devicetree node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – logical index into “prop”

**Returns**
static initializer for a struct `gpio_dt_spec` for the property

`GPIO_DT_SPEC_GET_BY_IDX_OR(node_id, prop, idx, default_value)`

Like `GPIO_DT_SPEC_GET_BY_IDX()`, with a fallback to a default value.

If the devicetree node identifier `node_id` refers to a node with a property ‘prop’, this expands to `GPIO_DT_SPEC_GET_BY_IDX(node_id, prop, idx)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

**Parameters**
- `node_id` – devicetree node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – logical index into “prop”
- `default_value` – fallback value to expand to

**Returns**
static initializer for a struct `gpio_dt_spec` for the property, or `default_value` if the node or property do not exist

`GPIO_DT_SPEC_GET(node_id, prop)`
Equivalent to `GPIO_DT_SPEC_GET_BY_IDX(node_id, prop, 0)`.

**See also:**

`GPIO_DT_SPEC_GET_BY_IDX()`

**Parameters**
- `node_id` – devicetree node identifier
- `prop` – lowercase-and-underscores property name

**Returns**
static initializer for a struct `gpio_dt_spec` for the property

`GPIO_DT_SPEC_GET_OR(node_id, prop, default_value)`
Equivalent to `GPIO_DT_SPEC_GET_BY_IDX_OR(node_id, prop, 0, default_value)`.

**See also:**

`GPIO_DT_SPEC_GET_BY_IDX_OR()`
Parameters

- **node_id** – devicetree node identifier
- **prop** – lowercase-and-underscores property name
- **default_value** – fallback value to expand to

Returns

static initializer for a struct `gpio_dt_spec` for the property

`GPIO_DT_SPEC_INST_GET_BY_IDX(inst, prop, idx)`

Static initializer for a `gpio_dt_spec` from a DT_DRV_COMPAT instance's GPIO property at an index.

See also:

`GPIO_DT_SPEC_GET_BY_IDX()`

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **prop** – lowercase-and-underscores property name
- **idx** – logical index into “prop”

Returns

static initializer for a struct `gpio_dt_spec` for the property

`GPIO_DT_SPEC_INST_GET_BY_IDX_OR(inst, prop, idx, default_value)`

Static initializer for a `gpio_dt_spec` from a DT_DRV_COMPAT instance's GPIO property at an index, with fallback.

See also:

`GPIO_DT_SPEC_GET_BY_IDX()`

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **prop** – lowercase-and-underscores property name
- **idx** – logical index into “prop”
- **default_value** – fallback value to expand to

Returns

static initializer for a struct `gpio_dt_spec` for the property

`GPIO_DT_SPEC_INST_GET(inst, prop)`

Equivalent to `GPIO_DT_SPEC_INST_GET_BY_IDX(inst, prop, 0)`.

See also:

`GPIO_DT_SPEC_INST_GET_BY_IDX()`

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **prop** – lowercase-and-underscores property name
Returns
static initializer for a struct gpio_dt_spec for the property

`GPIO_DT_SPEC_INST_GET_OR`(inst, prop, default_value)
Equivalent to `GPIO_DT_SPEC_INST_GET_BY_IDX_OR`(inst, prop, 0, default_value).

See also:
`GPIO_DT_SPEC_INST_GET_BY_IDX()`

Parameters
- inst – DT_DRV_COMPAT instance number
- prop – lowercase-and-underscores property name
- default_value – fallback value to expand to

Returns
static initializer for a struct gpio_dt_spec for the property

`GPIO_DT_RESERVED_RANGES_NGPIOS`(node_id, ngpios)
Makes a bitmask of reserved GPIOs from DT "gpio-reserved-ranges" property and "ngpios" argument.
This macro returns the value as a bitmask of the "gpio-reserved-ranges" property. This property defines the disabled (or 'reserved') GPIOs in the range 0…ngpios-1 and is specified as an array of value's pairs that define the start offset and size of the reserved ranges.
For example, setting “gpio-reserved-ranges = <3 2>, <10 1>;” means that GPIO offsets 3, 4 and 10 cannot be used even if ngpios = <18>.
The implementation constraint is inherited from common DT limitations: a maximum of 64 pairs can be used (with result limited to bitsize of gpio_port_pins_t type).
NB: Due to the nature of C macros, some incorrect tuple definitions (for example, overlapping or out of range) will produce undefined results.
Also be aware that if ngpios is less than 32 (bit size of DT int type), then all unused MSBs outside the range defined by ngpios will be marked as reserved too.

Example devicetree fragment:

```c
a {
    compatible = "some,gpio-controller";
    ngpios = <32>;
    gpio-reserved-ranges = <0 4>, <5 3>, <9 5>, <11 2>, <15 2>,
                           <18 2>, <21 1>, <23 1>, <25 4>, <30 2>;
};

b {
    compatible = "some,gpio-controller";
    ngpios = <18>;
    gpio-reserved-ranges = <3 2>, <10 1>;
};
```

Example usage:

```c
struct some_config {
    uint32_t ngpios;
    uint32_t gpios_reserved;
};
```
(continues on next page)
This expands to:

```c
struct some_config {
    uint32_t ngpios;
    uint32_t gpios_reserved;
};
```

```c
static const struct some_config dev_cfg_a = {
    .ngpios = DT_PROP_OR(DT_LABEL(a), ngpios, 0),
    .gpios_reserved = GPIO_DT_RESERVED_RANGES_NGPIOS(DT_LABEL(a),
        DT_PROP(DT_LABEL(a), ngpios)),
};
```

```c
static const struct some_config dev_cfg_b = {
    .ngpios = DT_PROP_OR(DT_LABEL(b), ngpios, 0),
    .gpios_reserved = GPIO_DT_RESERVED_RANGES_NGPIOS(DT_LABEL(b),
        DT_PROP(DT_LABEL(b), ngpios)),
};
```

Parameters

- `node_id` – GPIO controller node identifier.
- `ngpios` – number of GPIOs.

Returns

the bitmask of reserved gpios

`GPIO_DT_RESERVED_RANGES(node_id)`

Makes a bitmask of reserved GPIOs from the "gpio-reserved-ranges" and "ngpios" DT properties values.

Parameters

- `node_id` – GPIO controller node identifier.

Returns

the bitmask of reserved gpios

`GPIO_DT_INST_RESERVED_RANGES_NGPIOS(inst, ngpios)`

Makes a bitmask of reserved GPIOs from a DT_DRV_COMPAT instance's "gpio-reserved-ranges" property and "ngpios" argument.

See also:

`GPIO_DT_RESERVED_RANGES()`

Parameters
• **inst** – DT_DRV_COMPAT instance number
• **ngpios** – number of GPIOs

**Returns**
the bitmask of reserved gpios

`GPIO_DT_INST_RESERVED_RANGES(inst)`

Make a bitmask of reserved GPIOs from a DT_DRV_COMPAT instance's GPIO "gpio-reserved-ranges" and "ngpios" properties.

See also:
`GPIO_DT_RESERVED_RANGES()`

**Parameters**
• **inst** – DT_DRV_COMPAT instance number

**Returns**
the bitmask of reserved gpios

`GPIO_DT_PORT_PIN_MASK_NGPIOS_EXC(node_id, ngpios)`

Makes a bitmask of allowed GPIOs from DT "gpio-reserved-ranges" property and "ngpios" argument.

This macro is paired with `GPIO_DT_RESERVED_RANGES_NGPIOS()`, however unlike the latter, it returns a bitmask of ALLOWED gpios.

Example devicetree fragment:
```plaintext
a {
    compatible = "some,gpio-controller";
    ngpios = <32>;
    gpio-reserved-ranges = <0 8>, <9 5>, <15 16>;
}
```

Example usage:
```c
struct some_config {
    uint32_t port_pin_mask;
};

static const struct some_config dev_cfg = {
    .port_pin_mask = GPIO_DT_PORT_PIN_MASK_NGPIOS_EXC(DT_LABEL(a), 32),
};
```

This expands to:
```c
struct some_config {
    uint32_t port_pin_mask;
};

static const struct some_config dev_cfg = {
    .port_pin_mask = 0x80004100,
        // 0b1000 0000 0000 0000 0100 0001 0000 000
};
```

**Parameters**
• **node_id** – GPIO controller node identifier.
- **ngpios** – number of GPIOs

**Returns**
the bitmask of allowed gpios

\[ \text{GPIO\_DT\_INST\_PORT\_PIN\_MASK\_NGPIOS\_EXC}(\text{inst, ngpios}) \]

Makes a bitmask of allowed GPIOs from a DT_DRV_COMPAT instance’s "gpio-reserved-ranges" property and "ngpios" argument.

**See also:**
GPIO\_DT\_NGPIOS\_PORT\_PIN\_MASK\_EXC()

**Parameters**
- **inst** – DT_DRV_COMPAT instance number
- **ngpios** – number of GPIOs

**Returns**
the bitmask of allowed gpios

\[ \text{GPIO\_MAX\_PINS\_PER\_PORT} \]

Maximum number of pins that are supported by gpio\_port\_pins\_t.

\[ \text{GPIO\_DT\_FLAGS\_MASK} \]

Mask for DT GPIO flags.

**Typedefs**

typedef uint32_t gpio\_port\_pins\_t

Identifies a set of pins associated with a port.

The pin with index n is present in the set if and only if the bit identified by (1U « n) is set.

typedef uint32_t gpio\_port\_value\_t

Provides values for a set of pins associated with a port.

The value for a pin with index n is high (physical mode) or active (logical mode) if and only if the bit identified by (1U « n) is set. Otherwise the value for the pin is low (physical mode) or inactive (logical mode).

Values of this type are often paired with a gpio\_port\_pins\_t value that specifies which encoded pin values are valid for the operation.

typedef uint8_t gpio\_pin\_t

Provides a type to hold a GPIO pin index.

This reduced-size type is sufficient to record a pin number, e.g. from a devicetree GPIOs property.

typedef uint16_t gpio\_dt\_flags\_t

Provides a type to hold GPIO devicetree flags.

All GPIO flags that can be expressed in devicetree fit in the low 16 bits of the full flags field, so use a reduced-size type to record that part of a GPIOs property.
The lower 8 bits are used for standard flags. The upper 8 bits are reserved for SoC specific flags.

typedef uint32_t gpio_flags_t
Provides a type to hold GPIO configuration flags.
This type is sufficient to hold all flags used to control GPIO configuration, whether pin or interrupt.

typedef void (*gpio_callback_handler_t)(const struct device *port, struct gpio_callback *cb, gpio_port_pins_t pins)
Define the application callback handler function signature.

Note: cb pointer can be used to retrieve private data through CONTAINER_OF() if original struct gpio_callback is stored in another private structure.

Param port
Device struct for the GPIO device.

Param cb
Original struct gpio_callback owning this handler

Param pins
Mask of pins that triggers the callback handler

Functions

static inline bool gpio_is_ready_dt(const struct gpio_dt_spec *spec)
Validate that GPIO port is ready.

Parameters
• spec – GPIO specification from devicetree

Return values
• true – if the GPIO spec is ready for use.
• false – if the GPIO spec is not ready for use.

int gpio_pin_interrupt_configure(const struct device *port, gpio_pin_t pin, gpio_flags_t flags)
Configure pin interrupt.

Note: This function can also be used to configure interrupts on pins not controlled directly by the GPIO module. That is, pins which are routed to other modules such as I2C, SPI, UART.

Parameters
• port – Pointer to device structure for the driver instance.
• pin – Pin number.
• flags – Interrupt configuration flags as defined by GPIO_INT_.*.

Return values
• 0 – If successful.
• -ENOSYS – If the operation is not implemented by the driver.
• -ENOTSUP – If any of the configuration options is not supported (unless otherwise directed by flag documentation).
• -EINVAL – Invalid argument.
• -EBUSY – Interrupt line required to configure pin interrupt is already in use.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_interrupt_configure_dt(const struct gpio_dt_spec *spec, gpio_flags_t flags)

Configure pin interrupts from a gpio_dt_spec.
This is equivalent to:

```
gpio_pin_interrupt_configure(spec->port, spec->pin, flags);
```

The spec->dt_flags value is not used.

Parameters
• spec – GPIO specification from devicetree
• flags – interrupt configuration flags

Returns
a value from gpio_pin_interrupt_configure()

int gpio_pin_configures(const struct device *port, gpio_pin_t pin, gpio_flags_t flags)

Configure a single pin.

Parameters
• port – Pointer to device structure for the driver instance.
• pin – Pin number to configure.
• flags – Flags for pin configuration: ‘GPIO input/output configuration flags’, ‘GPIO pin drive flags’, ‘GPIO pin bias flags’.

Return values
• 0 – If successful.
• -ENOTSUP – if any of the configuration options is not supported (unless otherwise directed by flag documentation).
• -EINVAL – Invalid argument.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_configure_dt(const struct gpio_dt_spec *spec, gpio_flags_t extra_flags)

Configure a single pin from a gpio_dt_spec and some extra flags.
This is equivalent to:

```
gpio_pin_configure(spec->port, spec->pin, spec->dt_flags | extra_flags);
```

Parameters
• spec – GPIO specification from devicetree
• extra_flags – additional flags
Zephyr Project Documentation, Release 3.5.99

Returns
a value from \textit{gpio\_pin\_configure()}

\begin{verbatim}
int gpio_port_get_direction(const struct device *port, gpio_port_pins_t map,
                           gpio_port_pins_t *inputs, gpio_port_pins_t *outputs)
\end{verbatim}

Get direction of select pins in a port.
Retrieve direction of each pin specified in \texttt{map}.
If \texttt{inputs} or \texttt{outputs} is NULL, then this function does not get the respective input or output direction information.

Parameters
\begin{itemize}
  \item \texttt{port} – Pointer to the device structure for the driver instance.
  \item \texttt{map} – Bitmap of pin directions to query.
  \item \texttt{inputs} – Pointer to a variable where input directions will be stored.
  \item \texttt{outputs} – Pointer to a variable where output directions will be stored.
\end{itemize}

Return values
\begin{itemize}
  \item 0 – If successful.
  \item -ENOSYS – if the underlying driver does not support this call.
  \item -EIO – I/O error when accessing an external GPIO chip.
  \item -EWOULDBLOCK – if operation would block.
\end{itemize}

\begin{verbatim}
static inline int gpio_pin_is_input(const struct device *port, gpio_pin_t pin)
\end{verbatim}

Check if \texttt{pin} is configured for input.

Parameters
\begin{itemize}
  \item \texttt{port} – Pointer to device structure for the driver instance.
  \item \texttt{pin} – Pin number to query the direction of
\end{itemize}

Return values
\begin{itemize}
  \item 1 – if \texttt{pin} is configured as \texttt{GPIO\_INPUT}.
  \item 0 – if \texttt{pin} is not configured as \texttt{GPIO\_INPUT}.
  \item -ENOSYS – if the underlying driver does not support this call.
  \item -EIO – I/O error when accessing an external GPIO chip.
  \item -EWOULDBLOCK – if operation would block.
\end{itemize}

\begin{verbatim}
static inline int gpio_pin_is_input_dt(const struct gpio_dt_spec *spec)
\end{verbatim}

Check if a single pin from \texttt{gpio\_dt\_spec} is configured for input.
This is equivalent to:

\begin{verbatim}
gpio_pin_is_input(spec->port, spec->pin);
\end{verbatim}

Parameters
\begin{itemize}
  \item \texttt{spec} – GPIO specification from devicetree.
\end{itemize}

Returns
A value from \textit{gpio\_pin\_is\_input()}. 7.5. Peripherals 2981
static inline int gpio_pin_is_output(const struct device *port, gpio_pin_t pin)
    Check if pin is configured for output.

    Parameters
    • port – Pointer to device structure for the driver instance.
    • pin – Pin number to query the direction of

    Return values
    • 1 – if pin is configured as GPIO_OUTPUT.
    • 0 – if pin is not configured as GPIO_OUTPUT.
    • -ENOSYS – if the underlying driver does not support this call.
    • -EIO – I/O error when accessing an external GPIO chip.
    • -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_is_output_dt(const struct gpio_dt_spec *spec)
    Check if a single pin from gpio_dt_spec is configured for output.

    Parameters
    • spec – GPIO specification from devicetree.

    Returns
    A value from gpio_pin_is_output().

int gpio_pin_get_config(const struct device *port, gpio_pin_t pin, gpio_flags_t *flags)
    Get a configuration of a single pin.

    Parameters
    • port – Pointer to device structure for the driver instance.
    • pin – Pin number which configuration is get.
    • flags – Pointer to variable in which the current configuration will be
              stored if function is successful.

    Return values
    • 0 – If successful.
    • -ENOSYS – if getting current pin configuration is not implemented by the
                 driver.
    • -EINVAL – Invalid argument.
    • -EIO – I/O error when accessing an external GPIO chip.
    • -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_get_config_dt(const struct gpio_dt_spec *spec, gpio_flags_t *flags)
    Get a configuration of a single pin from a gpio_dt_spec.

    Parameters
    • spec – GPIO specification from devicetree.
• **spec** – GPIO specification from devicetree
• **flags** – Pointer to variable in which the current configuration will be stored if function is successful.

**Returns**
a value from *gpio_pin_configure()*

```c
int gpio_port_get_raw(const struct device *port, gpio_port_value_t *value)
```

Get physical level of all input pins in a port.

A low physical level on the pin will be interpreted as value 0. A high physical level will be interpreted as value 1. This function ignores GPIO_ACTIVE_LOW flag.

Value of a pin with index \( n \) will be represented by bit \( n \) in the returned port value.

**Parameters**
• \( \text{port} \) – Pointer to the device structure for the driver instance.
• \( \text{value} \) – Pointer to a variable where pin values will be stored.

**Return values**
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

```c
static inline int gpio_port_get(const struct device *port, gpio_port_value_t *value)
```

Get logical level of all input pins in a port.

Get logical level of an input pin taking into account GPIO_ACTIVE_LOW flag. If pin is configured as Active High, a low physical level will be interpreted as logical value 0. If pin is configured as Active Low, a low physical level will be interpreted as logical value 1.

Value of a pin with index \( n \) will be represented by bit \( n \) in the returned port value.

**Parameters**
• \( \text{port} \) – Pointer to the device structure for the driver instance.
• \( \text{value} \) – Pointer to a variable where pin values will be stored.

**Return values**
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

```c
int gpio_port_set_masked_raw(const struct device *port, gpio_port_pins_t mask, gpio_port_value_t value)
```

Set physical level of output pins in a port.

Writing value 0 to the pin will set it to a low physical level. Writing value 1 will set it to a high physical level. This function ignores GPIO_ACTIVE_LOW flag.

Pin with index \( n \) is represented by bit \( n \) in mask and value parameter.

**Parameters**
• \( \text{port} \) – Pointer to the device structure for the driver instance.
• \( \text{mask} \) – Mask indicating which pins will be modified.
• \( \text{value} \) – Value assigned to the output pins.

**Return values**

- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

static inline int gpio_port_set_masked(const struct device *port, gpio_port_pins_t mask, gpio_port_value_t value)

Set logical level of output pins in a port.
Set logical level of an output pin taking into account GPIO_ACTIVE_LOW flag. Value 0 sets the pin in logical 0 / inactive state. Value 1 sets the pin in logical 1 / active state. If pin is configured as Active High, the default, setting it in inactive state will force the pin to a low physical level. If pin is configured as Active Low, setting it in inactive state will force the pin to a high physical level.

Pin with index n is represented by bit n in mask and value parameter.

Parameters
- port – Pointer to the device structure for the driver instance.
- mask – Mask indicating which pins will be modified.
- value – Value assigned to the output pins.

Return values
- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

int gpio_port_set_bits_raw(const struct device *port, gpio_port_pins_t pins)

Set physical level of selected output pins to high.

Parameters
- port – Pointer to the device structure for the driver instance.
- pins – Value indicating which pins will be modified.

Return values
- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

static inline int gpio_port_set_bits(const struct device *port, gpio_port_pins_t pins)

Set logical level of selected output pins to active.

Parameters
- port – Pointer to the device structure for the driver instance.
- pins – Value indicating which pins will be modified.

Return values
- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

int gpio_port_clear_bits_raw(const struct device *port, gpio_port_pins_t pins)

Set physical level of selected output pins to low.

Parameters
• **port** – Pointer to the device structure for the driver instance.
• **pins** – Value indicating which pins will be modified.

**Return values**

• **0** – If successful.
• **-EIO** – I/O error when accessing an external GPIO chip.
• **-EWOULDBLOCK** – if operation would block.

static inline int gpio_port_clear_bits(const struct device *port, gpio_port_pins_t pins)
Set logical level of selected output pins to inactive.

**Parameters**

• **port** – Pointer to the device structure for the driver instance.
• **pins** – Value indicating which pins will be modified.

**Return values**

• **0** – If successful.
• **-EIO** – I/O error when accessing an external GPIO chip.
• **-EWOULDBLOCK** – if operation would block.

int gpio_port_toggle_bits(const struct device *port, gpio_port_pins_t pins)
Toggle level of selected output pins.

**Parameters**

• **port** – Pointer to the device structure for the driver instance.
• **pins** – Value indicating which pins will be modified.

**Return values**

• **0** – If successful.
• **-EIO** – I/O error when accessing an external GPIO chip.
• **-EWOULDBLOCK** – if operation would block.

static inline int gpio_port_set_clr_bits_raw(const struct device *port, gpio_port_pins_t set_pins, gpio_port_pins_t clear_pins)
Set physical level of selected output pins.

**Parameters**

• **port** – Pointer to the device structure for the driver instance.
• **set_pins** – Value indicating which pins will be set to high.
• **clear_pins** – Value indicating which pins will be set to low.

**Return values**

• **0** – If successful.
• **-EIO** – I/O error when accessing an external GPIO chip.
• **-EWOULDBLOCK** – if operation would block.

static inline int gpio_port_set_clr_bits(const struct device *port, gpio_port_pins_t set_pins, gpio_port_pins_t clear_pins)
Set logical level of selected output pins.

**Parameters**

• **port** – Pointer to the device structure for the driver instance.
**set_pins** – Value indicating which pins will be set to active.

**clear_pins** – Value indicating which pins will be set to inactive.

**Return values**

- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

```c
static inline int gpio_pin_get_raw(const struct device *port, gpio_pin_t pin)
```

Get physical level of an input pin.

A low physical level on the pin will be interpreted as value 0. A high physical level will be interpreted as value 1. This function ignores GPIO_ACTIVE_LOW flag.

**Parameters**

- **port** – Pointer to the device structure for the driver instance.
- **pin** – Pin number.

**Return values**

- 1 – If pin physical level is high.
- 0 – If pin physical level is low.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

```c
static inline int gpio_pin_get(const struct device *port, gpio_pin_t pin)
```

Get logical level of an input pin.

Get logical level of an input pin taking into account GPIO_ACTIVE_LOW flag. If pin is configured as Active High, a low physical level will be interpreted as logical value 0. If pin is configured as Active Low, a low physical level will be interpreted as logical value 1.

Note: If pin is configured as Active High, the default, `gpio_pin_get()` function is equivalent to `gpio_pin_get_raw()`.

**Parameters**

- **port** – Pointer to the device structure for the driver instance.
- **pin** – Pin number.

**Return values**

- 1 – If pin logical value is 1 / active.
- 0 – If pin logical value is 0 / inactive.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

```c
static inline int gpio_pin_get_dt(const struct gpio_dt_spec *spec)
```

Get logical level of an input pin from a `gpio_dt_spec`.

This is equivalent to:

```c
gpio_pin_get(spec->port, spec->pin);
```

**Parameters**

- **spec** – GPIO specification from devicetree
Returns
a value from `gpio_pin_get()`

static inline int gpio_pin_set_raw(const struct device *port, gpio_pin_t pin, int value)
Set physical level of an output pin.
Writing value 0 to the pin will set it to a low physical level. Writing any value other than 0 will set it to a high physical level. This function ignores GPIO_ACTIVE_LOW flag.

Parameters
- `port` – Pointer to the device structure for the driver instance.
- `pin` – Pin number.
- `value` – Value assigned to the pin.

Return values
- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_set(const struct device *port, gpio_pin_t pin, int value)
Set logical level of an output pin.
Set logical level of an output pin taking into account GPIO_ACTIVE_LOW flag. Value 0 sets the pin in logical 0 / inactive state. Any value other than 0 sets the pin in logical 1 / active state. If pin is configured as Active High, the default, setting it in inactive state will force the pin to a low physical level. If pin is configured as Active Low, setting it in inactive state will force the pin to a high physical level.

Note: If pin is configured as Active High, `gpio_pin_set()` function is equivalent to `gpio_pin_set_raw()`.

Parameters
- `port` – Pointer to the device structure for the driver instance.
- `pin` – Pin number.
- `value` – Value assigned to the pin.

Return values
- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_set_dt(const struct gpio_dt_spec *spec, int value)
Set logical level of a output pin from a gpio_dt_spec.
This is equivalent to:
`gpio_pin_set(spec->port, spec->pin, value);`

Parameters
- `spec` – GPIO specification from devicetree
- `value` – Value assigned to the pin.

Returns
a value from `gpio_pin_set()`
static inline int gpio_pin_toggle(const struct device *port, gpio_pin_t pin)
  Toggle pin level.

  **Parameters**
  - **port** – Pointer to the device structure for the driver instance.
  - **pin** – Pin number.

  **Return values**
  - **0** – If successful.
  - **-EIO** – I/O error when accessing an external GPIO chip.
  - **-EWOULDBLOCK** – if operation would block.

static inline int gpio_pin_toggle_dt(const struct gpio_dt_spec *spec)
  Toggle pin level from a gpio_dt_spec.
  This is equivalent to:
  ```
  gpio_pin_toggle(spec->port, spec->pin);
  ```

  **Parameters**
  - **spec** – GPIO specification from devicetree

  **Returns**
  a value from `gpio_pin_toggle()`

static inline void gpio_init_callback(struct gpio_callback *callback,
                                       gpio_callback_handler_t handler,
                                       gpio_port_pins_t pin_mask)
  Helper to initialize a struct gpio_callback properly.

  **Parameters**
  - **callback** – A valid Application's callback structure pointer.
  - **handler** – A valid handler function pointer.
  - **pin_mask** – A bit mask of relevant pins for the handler

static inline int gpio_add_callback(const struct device *port, struct gpio_callback *callback)
  Add an application callback.

  Note: enables to add as many callback as needed on the same port.

**Note:** Callbacks may be added to the device from within a callback handler invocation, but whether they are invoked for the current GPIO event is not specified.

  **Parameters**
  - **port** – Pointer to the device structure for the driver instance.
  - **callback** – A valid Application's callback structure pointer.

  **Return values**
  - **0** – If successful
  - **-ENOSYS** – If driver does not implement the operation
• -errno – Other negative errno code on failure.

static inline int gpio_add_callback_dt(const struct gpio_dt_spec *spec, struct gpio_callback *callback)

Add an application callback.
This is equivalent to:

gpio_add_callback(spec->port, callback);

Parameters
• spec – GPIO specification from devicetree.
• callback – A valid application's callback structure pointer.

Returns
a value from gpio_add_callback().

static inline int gpio_remove_callback_dt(const struct gpio_dt_spec *spec, struct gpio_callback *callback)

Remove an application callback.

Note: enables to remove as many callbacks as added through gpio_add_callback().

Warning: It is explicitly permitted, within a callback handler, to remove the registration for the callback that is running, i.e. callback. Attempts to remove other registrations on the same device may result in undefined behavior, including failure to invoke callbacks that remain registered and unintended invocation of removed callbacks.

Parameters
• port – Pointer to the device structure for the driver instance.
• callback – A valid application's callback structure pointer.

Return values
• 0 – If successful
• -ENOSYS – If driver does not implement the operation
• -errno – Other negative errno code on failure.

static inline int gpio_remove_callback_dt(const struct gpio_dt_spec *spec, struct gpio_callback *callback)

Remove an application callback.
This is equivalent to:

gpio_remove_callback(spec->port, callback);

Parameters
• spec – GPIO specification from devicetree.
• callback – A valid application's callback structure pointer.

Returns
a value from gpio_remove_callback().
int gpio_get_pending_int(const struct device *dev)
    Function to get pending interrupts.
    The purpose of this function is to return the interrupt status register for the device. This is especially useful when waking up from low power states to check the wake up source.

    Parameters
    • dev – Pointer to the device structure for the driver instance.

    Return values
    • status – ! 0 if at least one gpio interrupt is pending.
    • 0 – if no gpio interrupt is pending.
    • -ENOSYS – If driver does not implement the operation

struct gpio_dt_spec

#include <gpio.h> Container for GPIO pin information specified in devicetree.
    This type contains a pointer to a GPIO device, pin number for a pin controlled by that device, and the subset of pin configuration flags which may be given in devicetree.

Public Members

const struct device *port
    GPIO device controlling the pin.

gpio_pin_t pin
    The pin's number on the device.

gpio_dt_flags_t dt_flags
    The pin's configuration flags as specified in devicetree.

struct gpio_driver_config

#include <gpio.h> This structure is common to all GPIO drivers and is expected to be the first element in the object pointed to by the config field in the device structure.
**Public Members**

`gpio_port_pins_t port_pin_mask`

Mask identifying pins supported by the controller.

Initialization of this mask is the responsibility of device instance generation in the driver.

**struct gpio_driver_data**

```
#include <gpio.h>
```

This structure is common to all GPIO drivers and is expected to be the first element in the driver’s `struct driver_data` declaration.

**Public Members**

`gpio_port_pins_t invert`

Mask identifying pins that are configured as active low.

Management of this mask is the responsibility of the wrapper functions in this header.

**struct gpio_callback**

```
#include <gpio.h>
```

GPIO callback structure.

Used to register a callback in the driver instance callback list. As many callbacks as needed can be added as long as each of them are unique pointers of `struct gpio_callback`. Beware such structure should not be allocated on stack.

Note: To help setting it, see `gpio_init_callback()` below

**Public Members**

`sys_sn ode_t node`

This is meant to be used in the driver and the user should not mess with it (see drivers/gpio/gpio_utils.h)

`gpio_callback_handler_t handler`

Actual callback function being called when relevant.

`gpio_port_pins_t pin_mask`

A mask of pins the callback is interested in, if 0 the callback will never be called.

Such pin_mask can be modified whenever necessary by the owner, and thus will affect the handler being called or not. The selected pins must be configured to trigger an interrupt.

7.5.23 Hardware Information

**Overview**

The HW Info API provides access to hardware information such as device identifiers and reset cause flags.
Reset cause flags can be used to determine why the device was reset; for example due to a watchdog timeout or due to power cycling. Different devices support different subset of flags. Use `hwinfo_get_supported_reset_cause()` to retrieve the flags that are supported by that device.

**Configuration Options**

Related configuration options:

- `CONFIG_HWINFO`

**API Reference**

*group hwinfo_interface*

Hardware Information Interface.

**Reset cause flags**

- `RESET_PIN`
  
  External pin.

- `RESETSOFTWARE`
  
  Software reset.

- `RESET_BROWNOUT`
  
  Brownout (drop in voltage)

- `RESET_POR`
  
  Power-on reset (POR)

- `RESET_WATCHDOG`
  
  Watchdog timer expiration.

- `RESET_DEBUG`
  
  Debug event.

- `RESET_SECURITY`
  
  Security violation.

- `RESET_LOW_POWER_WAKE`
  
  Waking up from low power mode.

- `RESET_CPU_LOCKUP`
  
  CPU lock-up detected.

- `RESET_PARITY`
  
  Parity error.
RESET_PLL
PLL error.

RESET_CLOCK
Clock error.

RESET_HARDWARE
Hardware reset.

RESET_USER
User reset.

RESET_TEMPERATURE
Temperature reset.

Functions

ssize_t hwinfo_get_device_id(uint8_t *buffer, size_t length)
Copy the device id to a buffer.
This routine copies “length” number of bytes of the device ID to the buffer. If the device
ID is smaller then length, the rest of the buffer is left unchanged. The ID depends on
the hardware and is not guaranteed unique.
Drivers are responsible for ensuring that the ID data structure is a sequence of bytes.
The returned ID value is not supposed to be interpreted based on vendor-specific as-
sumptions of byte order. It should express the identifier as a raw byte sequence, doing
any endian conversion necessary so that a hex representation of the bytes produces
the intended serial number.

Parameters
• buffer – Buffer to write the ID to.
• length – Max length of the buffer.

Return values
• size – of the device ID copied.
• -ENOSYS – if there is no implementation for the particular device.
• any – negative value on driver specific errors.

int hwinfo_get_reset_cause(uint32_t *cause)
Retrieve cause of device reset.

This routine retrieves the flags that indicate why the device was reset.
On some platforms the reset cause flags accumulate between successive resets and
this routine may return multiple flags indicating all reset causes since the device was
powered on. If you need to retrieve the cause only for the most recent reset call
hwinfo_clear_reset_cause after calling this routine to clear the hardware flags before
the next reset event.
Successive calls to this routine will return the same value, unless
hwinfo_clear_reset_cause has been called.

Parameters
• cause – OR'd reset cause flags

Return values

• zero – if successful.
• -ENOSYS – if there is no implementation for the particular device.
• any – negative value on driver specific errors.

int hwinfo_clear_reset_cause(void)
Clear cause of device reset.
Clears reset cause flags.

Return values

• zero – if successful.
• -ENOSYS – if there is no implementation for the particular device.
• any – negative value on driver specific errors.

int hwinfo_get_supported_reset_cause(uint32_t *supported)
Get supported reset cause flags.

Retrieves all reset_cause flags that are supported by this device.

Parameters

• supported – OR'd reset cause flags that are supported

Return values

• zero – if successful.
• -ENOSYS – if there is no implementation for the particular device.
• any – negative value on driver specific errors.

7.5.24 I2C EEPROM Target

Overview

API Reference

group i2c_eeprom_target_api
I2C EEPROM Target Driver API.

Functions

int eeprom_target_program(const struct device *dev, const uint8_t *eeprom_data, unsigned int length)
Program memory of the virtual EEPROM.

Parameters

• dev – Pointer to the device structure for the driver instance.
• eeprom_data – Pointer of data to program into the virtual eeprom memory
• length – Length of data to program into the virtual eeprom memory

Return values
• 0 – If successful.
• -EINVAL – Invalid data size

int eeprom_target_read(const struct device *dev, uint8_t *eeprom_data, unsigned int offset)

Read single byte of virtual EEPROM memory.

Parameters
• dev – Pointer to the device structure for the driver instance.
• eeprom_data – Pointer of byte where to store the virtual eeprom memory
• offset – Offset into EEPROM memory where to read the byte

Return values
• 0 – If successful.
• -EINVAL – Invalid data pointer or offset

int eeprom_target_set_addr(const struct device *dev, uint8_t addr)

Change the address of eeprom taget at runtime.

Parameters
• dev – Pointer to the device structure for the driver instance.
• addr – New address to assign to the eeprom target devide

Return values
• 0 – Is successful
• -EINVAL – If parameters are invalid
• -EIO – General input / output error during i2c_taget_register
• -ENOSYS – If target mode is not implemented

7.5.25 Improved Inter-Integrated Circuit (I3C) Bus

I3C (Improved Inter-Integrated Circuit) is a two-signal shared peripheral interface bus. Devices on the bus can operate in two roles: as a “controller” that initiates transactions and controls the clock, or as a “target” that responds to transaction commands.

Currently, the API is based on I3C Specification version 1.1.1.

- I3C Controller API
  - In-Band Interrupt (IBI)
  - Device Tree
  - Device Drivers for I3C Devices
- I2C Devices under I3C Bus
- Configuration Options
- API Reference
**I3C Controller API**

Zephyr’s I3C controller API is used when an I3C controller controls the bus, in particularly the start and stop conditions and the clock. This is the most common mode, used to interact with I3C target devices such as sensors.

Due to the nature of the I3C, there are devices on the bus where they may not have addresses when powered on. Therefore, an additional dynamic address assignment needs to be carried out by the I3C controller. Because of this, the controller needs to maintain separate structures to keep track of device status. This can be done at build time, for example, by creating arrays of device descriptors for both I3C and I²C devices:

```c
static struct i3c_device_desc i3c_device_array[] = I3C_DEVICE_ARRAY_DT_INST(inst);
static struct i3c_i2c_device_desc i2c_device_array[] = I3C_I2C_DEVICE_ARRAY_DT_INST(inst);
```

The macros `I3C_DEVICE_ARRAY_DT_INST` and `I3C_I2C_DEVICE_ARRAY_DT_INST` are helper macros to aid in creating arrays of device descriptors corresponding to the devicetree nodes under the I3C controller.

Here is a list of generic steps for initializing the I3C controller and the I3C bus inside the device driver initialization function:

1. Initialize the data structure of the I3C controller device driver instance. The usual device defining macros such as `DEVICE_DT_INST_DEFINE` can be used, and the initialization function provided as a parameter to the macro.
   - The `i3c_addr_slots` and `i3c_dev_list` are structures to aid in address assignments and device list management. If this is being used, this struct needs to be initialized by calling `i3c_addr_slots_init()`. These two structures can also be used with various helper functions.
   - Initialize the device descriptors if needed by the controller driver.

2. Initialize the hardware, including but not limited to:
   - Setup pin mux and directions.
   - Setup the clock for the controller.
   - Power on the hardware.
   - Configure the hardware (e.g. SCL clock frequency).

3. Perform bus initialization. There is a generic helper function, `i3c_bus_init()`, which performs the following steps. This function can be used if the controller does not require any special handling during bus initialization.
   1. Do RSTDAA to reset dynamic addresses of connected devices. If any connected devices have already been assigned an address, the bookkeeping data structures do not have records of these, for example, at power-on. So it is a good idea to reset and assign them new addresses.
   2. Do DISEC to disable any events from devices.
   3. Do SETDASA to use static addresses as dynamic address if so desired.
      - SETAASA may not be supported for all connected devices to assign static addresses as dynamic addresses.
      - BCR and DCR need to be obtained separately to populate the relevant fields in the I3C target device descriptor struct.
   4. Do ENTDAA to start dynamic address assignment, if there are still devices without addresses.
      - If there is a device waiting for address, it will send its Provisioned ID, BCR, and DCR back. Match the received Provisioned ID to the list of registered I3C devices.
– If there is a match, assign an address (either from the stated static address if SETDASA has not been done, or use a free address).

* Also, set the BCR and DCR fields in the device descriptor struct.

– If there is no match, depending on policy, it can be assigned a free address, or the device driver can stop the assignment process and errors out.

* Note that the I3C API requires device descriptor to function. A device without a device descriptor cannot be accessed through the API.

• This step can be skipped if there is no connected devices requiring DAA.

5. These are optional but highly recommended:

• Do GETMRL and GETMWL to get maximum read/write length.

• Do GETMXDS to get maximum read/write speed and maximum read turnaround time.

• The helper function, i3c_bus_init(), would retrieve basic device information such as BCR, DCR, MRL and MWL.

6. Do ENEC to re-enable events from devices.

• The helper function, i3c_bus_init(), only re-enables hot-join events. IBI event should only be enabled when enabling IBI of a device.

**In-Band Interrupt (IBI)** If a target device can generate In-Band Interrupt (IBI), the controller needs to be made aware of it.

• i3c.ibi_enable() to enable IBI of a target device.

  – Some controller hardware have IBI slots which need to be programmed so that the controller can recognize incoming IBIs from a particular target device.

  * If the hardware has IBI slots, i3c.ibi_enable() needs to program those IBI slots.

  * Note that there are usually limited IBI slots on the controller so this operation may fail.

  – The implementation in driver should also send the ENEC command to enable interrupt of this target device.

• i3c.ibi_disable() to disable IBI of a target device.

  – If controller hardware makes use of IBI slots, this will remove description of the target device from the slots.

  – The implementation in driver should also send the DISSEC command to disable interrupt of this target device.

**Device Tree** Here is an example for defining a I3C controller in device tree:

```plaintext
i3c0: i3c@10000 {
    compatible = "vendor,i3c";
    #address-cells = <0x3>;
    #size-cells = <0x0>;
    reg = <0x10000 0x1000>;
    interrupts = <0x1F 0x0>;
    pinctrl-0 = <&pinmux-i3c>;
    pinctrl-names = "default";
}
```

(continues on next page)
i2c-scl-hz = <400000 >;
i3c-scl-hz = <1200000 >;

status = "okay";
i3c-dev0: i3c-dev0@4200000ABCD12345678 {
  compatible = "vendor,i3c-dev";
  reg = <0x42 0xABCD 0x12345678 >;
  status = "okay";
};
i2c-dev0: i2c-dev0@380000000000000050 {
  compatible = "vendor-i2c-dev";
  reg = <0x38 0x0 0x50 >;
  status = "okay";
};

I3C Devices  For I3C devices, the reg property has 3 elements:

- The first one is the static address of the device.
  - Can be zero if static address is not used. Address will be assigned during DAA (Dynamic Address Assignment).
  - If non-zero and property assigned-address is not set, this will be the address of the device after SETDASA (Set Dynamic Address from Static Address) is issued.
- Second element is the upper 16-bit of the Provisioned ID (PID) which contains the manufacturer ID left-shifted by 1. This is the bits 33-47 (zero-based) of the 48-bit Provisioned ID.
- Third element contains the lower 32-bit of the Provisioned ID which is a combination of the part ID (left-shifted by 16, bits 16-31 of the PID) and the instance ID (left-shifted by 12, bits 12-15 of the PID).

Note that the unit-address (the part after @) must match the reg property fully where each element is treated as 32-bit integer, combining to form a 96-bit integer. This is required for properly generating device tree macros.

I2C Devices  For I2C devices where the device driver has support for working under I3C bus, the device node can be described as a child of the I3C controller. If the device driver is written to only work with I2C controllers, define the node under the I2C virtual controller as described below. Otherwise, the reg property, similar to I3C devices, has 3 elements:

- The first one is the static address of the device. This must be a valid address as I2C devices do not support dynamic address assignment.
- Second element is always zero.
  - This is used by various helper macros to determine whether the device tree entry corresponds to an I2C device.
- Third element is the LVR (Legacy Virtual Register):
  - bit[31:8] are unused.
- bit[7:5] are the I^2C device index:
  * Index 0
    - I^2C device has a 50 ns spike filter where it is not affected by high frequency on SCL.
  * Index 1
    - I^2C device does not have a 50 ns spike filter but can work with high frequency on SCL.
  * Index 2
    - I^2C device does not have a 50 ns spike filter and cannot work with high frequency on SCL.

- bit[4] is the I^2C mode indicator:
  * 0 is FM+ mode.
  * 1 is FM mode.

Similar to I3C devices, the unit-address must match the reg property fully where each element is treated as 32-bit integer, combining to form a 96-bit integer.

Device Drivers for I3C Devices  All of the transfer functions of I3C controller API require the use of device descriptors, i3c_device_desc. This struct contains runtime information about a I3C device, such as, its dynamic address, BCR, DCR, MRL and MWL. Therefore, the device driver of a I3C device should grab a pointer to this device descriptor from the controller using i3c_device_find(). This function takes an ID parameter of type i3c_device_id for matching. The returned pointer can then be used in subsequent API calls to the controller.

I^2C Devices under I3C Bus  Since I3C is backward compatible with I^2C, the I3C controller API can accommodate I2C API calls without modifications if the controller device driver implements the I2C API. This has the advantage of using existing I2C devices without any modifications to their device drivers. However, since the I3C controller API works on device descriptors, any calls to I2C API will need to look up the corresponding device descriptor from the I2C device address. This adds a bit of processing cost to any I2C API calls.

On the other hand, a device driver can be extended to utilize native I2C device support via the I3C controller API. During device initialization, i3c_i2c_device_find() needs to be called to retrieve the pointer to the device descriptor. This pointer can be used in subsequent API calls.

Note that, with either methods mentioned above, the devicetree node of the I2C device must be declared according to I3C standard:

The I^2C virtual controller device driver provides a way to interface I^2C devices on the I3C bus where the associated device drivers can be used as-is without modifications. This requires adding an intermediate node in the device tree:

```
 i3c0: i3c@10000 { 
  <... I3C controller related properties ...>
  <... Nodes of I3C devices, if any ...>
    i2c-dev0: i2c-dev0@420000000000000050 { 
      compatible = "vendor-i2c-dev";
      reg = < 0x42 0x0 0x50 >;
      status = "okay";
    };
}
```

I3C_BCR_MAX_DATA_SPEED_LIMIT
Max Data Speed Limitation bit.
0 - No Limitation. 1 - Limitation obtained via GETMXDS CCC.

I3C_BCR_IBI_REQUEST_CAPABLE
IBI Request Capable bit.

I3C_BCR_IBI_PAYLOAD_HAS_DATA_BYTE
IBI Payload bit.
0 - No data bytes following the accepted IBI. 1 - One data byte (MDB, Mandatory Data Byte) follows the accepted IBI. Additional data bytes may also follows.

I3C_BCR_OFFLINE_CAPABLE
Offline Capable bit.
0 - Will always respond to I3C commands. 1 - Will not always respond to I3C commands.

I3C_BCR_VIRTUAL_TARGET
Virtual Target Support bit.
0 - Is not a virtual target. 1 - Is a virtual target.

I3C_BCR_ADV_CAPABILITIES
Advanced Capabilities bit.
0 - Does not support optional advanced capabilities. 1 - Supports optional advanced capabilities which can be viewed via GETCAPS CCC.

I3C_BCR_DEVICE_ROLE_I3C_TARGET
Device Role - I3C Target.

I3C_BCR_DEVICE_ROLE_I3C_CONTROLLER_CAPABLE
Device Role - I3C Controller Capable.

I3C_BCR_DEVICE_ROLE_SHIFT
Device Role bit shift value.

I3C_BCR_DEVICE_ROLE_MASK
Device Role bit shift mask.

I3C_BCR_DEVICE_ROLE (bcr)
Device Role.
Obtain Device Role value from the BCR value obtained via GETBCR.

Parameters
- bcr – BCR value

Device Characteristic Register (DCR)
Legacy Virtual Register (LVR)

7.5. Peripherals
• LVR[7:5]: I2C device index:
  – 0: I2C device has a 50 ns spike filter where it is not affected by high frequency on SCL.
  – 1: I2C device does not have a 50 ns spike filter but can work with high frequency on SCL.
  – 2: I2C device does not have a 50 ns spike filter and cannot work with high frequency on SCL.
• LVR[4]: I2C mode indicator:
  – 0: FM+ mode
  – 1: FM mode
• LVR[3:0]: Reserved.

\( I3C_{DCR \_I2C\_FM\_PLUS\_MODE} \)
I2C FM+ Mode.

\( I3C_{DCR \_I2C\_FM\_MODE} \)
I2C FM Mode.

\( I3C_{DCR \_I2C\_MODE\_SHIFT} \)
I2C Mode Indicator bit shift value.

\( I3C_{DCR \_I2C\_MODE\_MASK} \)
I2C Mode Indicator bitmask.

\( I3C_{DCR \_I2C\_MODE(dcr)} \)
I2C Mode.

Obtain I2C Mode value from the DCR value obtained via GETDCR.

**Parameters**

• dcr – DCR value

\( I3C_{DCR \_I2C\_DEV\_IDX\_0} \)
I2C Device Index 0.
I2C device has a 50 ns spike filter where it is not affected by high frequency on SCL.

\( I3C_{DCR \_I2C\_DEV\_IDX\_1} \)
I2C Device Index 1.
I2C device does not have a 50 ns spike filter but can work with high frequency on SCL.

\( I3C_{DCR \_I2C\_DEV\_IDX\_2} \)
I2C Device Index 2.
I2C device does not have a 50 ns spike filter and cannot work with high frequency on SCL.

\( I3C_{DCR \_I2C\_DEV\_IDX\_SHIFT} \)
I2C Device Index bit shift value.
I3C_DCR_I2C_DEV_IDX_MASK
I2C Device Index bitmask.

I3C_DCR_I2C_DEV_IDX(dcr)
I2C Device Index.
Obtain I2C Device Index value from the DCR value obtained via GETDCR.

Parameters
- dcr – DCR value

Defines

I3C_DEVICE_ID(pid)
Structure initializer for i3c_device_id from PID.
This helper macro expands to a static initializer for a struct i3c_device_id by populating the PID (Provisioned ID) field.

Parameters
- pid – Provisioned ID.

Enums

eenum i3c_bus_mode
I3C bus mode.

Values:

enumerator I3C_BUS_MODE_PURE
Only I3C devices are on the bus.

enumerator I3C_BUS_MODE_MIXED_FAST
Both I3C and legacy I2C devices are on the bus.
The I2C devices have 50ns spike filter on SCL.

enumerator I3C_BUS_MODE_MIXED_LIMITED
Both I3C and legacy I2C devices are on the bus.
The I2C devices do not have 50ns spike filter on SCL and can tolerate maximum SDR SCL clock frequency.

enumerator I3C_BUS_MODE_MIXED_SLOW
Both I3C and legacy I2C devices are on the bus.
The I2C devices do not have 50ns spike filter on SCL but cannot tolerate maximum SDR SCL clock frequency.

enumerator I3C_BUS_MODE_MAX = I3C_BUS_MODE_MIXED_SLOW

eenumerator I3C_BUS_MODE_INVALID
enum i3c_i2c_speed_type
I2C bus speed under I3C bus.
Only FM and FM+ modes are supported for I2C devices under I3C bus.
Values:

enumerator I3C_I2C_SPEED_FM
I2C FM mode.

enumerator I3C_I2C_SPEED_FMPLUS
I2C FM+ mode.

enumerator I3C_I2C_SPEED_MAX = I3C_I2C_SPEED_FMPLUS

enumerator I3C_I2C_SPEED_INVALID

enum i3c_data_rate
I3C data rate.
I3C data transfer rate defined by the I3C specification.
Values:

enumerator I3C_DATA_RATE_SDR
Single Data Rate messaging.

enumerator I3C_DATA_RATE_HDR_DDR
High Data Rate - Double Data Rate messaging.

enumerator I3C_DATA_RATE_HDR_TSL
High Data Rate - Ternary Symbol Legacy-inclusive-Bus.

enumerator I3C_DATA_RATE_HDR_TSP
High Data Rate - Ternary Symbol for Pure Bus.

enumerator I3C_DATA_RATE_HDR_BT
High Data Rate - Bulk Transport.

enumerator I3C_DATA_RATE_MAX = I3C_DATA_RATE_HDR_BT

enumerator I3C_DATA_RATE_INVALID

enum i3c_sdr_controller_error_codes
I3C SDR Controller Error Codes.
These are error codes defined by the I3C specification.
I3C_ERROR_CE_UNKNOWN and I3C_ERROR_CE_NONE are not official error codes according to the specification. These are there simply to aid in error handling during interactions with the I3C drivers and subsystem.
Values:
enumerator I3C_ERROR_CE0
Transaction after sending CCC.

denumerator I3C_ERROR_CE1
Monitoring Error.

denumerator I3C_ERROR_CE2
No response to broadcast address (0x7E)

denumerator I3C_ERROR_CE3
Failed Controller Handoff.

denumerator I3C_ERROR_CE_UNKNOWN
Unknown error (not official error code)

denumerator I3C_ERROR_CE_NONE
No error (not official error code)

denumerator I3C_ERROR_CE_MAX = I3C_ERROR_CE_UNKNOWN

denumerator I3C_ERROR_CE_INVALID

denum i3c_sdr_target_error_codes
I3C SDR Target Error Codes.
These are error codes defined by the I3C specification.
I3C_ERROR_TE_UNKNOWN and I3C_ERROR_TE_NONE are not official error codes according to the specification. These are there simply to aid in error handling during interactions with the I3C drivers and subsystem.
Values:

denumerator I3C_ERROR_TE0
Invalid Broadcast Address or Dynamic Address after DA assignment.

denumerator I3C_ERROR_TE1
CCC Code.

denumerator I3C_ERROR_TE2
Write Data.

denumerator I3C_ERROR_TE3
Assigned Address during Dynamic Address Arbitration.

denumerator I3C_ERROR_TE4
0x7E/R missing after RESTART during Dynamic Address Arbitration.

denumerator I3C_ERROR_TE5
Transaction after detecting CCC.
enumerator I3C_ERROR_TE6
  Monitoring Error.

enumerator I3C_ERROR_DBR
  Dead Bus Recovery.

enumerator I3C_ERROR_TE_UNKNOWN
  Unknown error (not official error code)

enumerator I3C_ERROR_TE_NONE
  No error (not official error code)

enumerator I3C_ERROR_TE_MAX = I3C_ERROR_TE_UNKNOWN

enumerator I3C_ERROR_TE_INVALID

enum i3c_config_type
  Type of configuration being passed to configure function.
  Values:

  enumerator I3C_CONFIG_CONTROLLER

  enumerator I3C_CONFIG_TARGET

  enumerator I3C_CONFIG_CUSTOM

Functions

struct i3c_device_desc *i3c_dev_list_find(const struct i3c_dev_list *dev_list, const struct i3c_device_id *id)

Find a I3C target device descriptor by ID.
This finds the I3C target device descriptor in the device list matching the provided ID struct (id).

  Parameters
  • dev_list – Pointer to the device list struct.
  • id – Pointer to I3C device ID struct.

  Returns
  Pointer the the I3C target device descriptor, or NULL if none is found.

struct i3c_device_desc *i3c_dev_list_i3c_addr_find(struct i3c_dev_attached_list *dev_list, uint8_t addr)

Find a I3C target device descriptor by dynamic address.
This finds the I3C target device descriptor in the attached device list matching the dynamic address (addr)

  Parameters
  • dev_list – Pointer to the device list struct.
addr – Dynamic address to be matched.

Returns

Pointer the the I3C target device descriptor, or NULL if none is found.

struct *i3c_dev_list_i2c_addr_find(struct *dev_list, uint16_t addr)

Find a I2C target device descriptor by address.

Parameters

• dev_list – Pointer to the device list struct.
• addr – Address to be matched.

Returns

Pointer the the I2C target device descriptor, or NULL if none is found.

int i3c_determine_default_addr(struct *target, uint8_t *addr)

Helper function to find the default address an i3c device is attached with.

Parameters

• target – [in] The pointer of the device descriptor
• addr – [out] Address to be assigned to target device.

Return values

• 0 – if successful.
• -EINVAL – if the expected default address is already in use

int i3c_dev_list_daa_addr_helper(struct *addr_slots, const struct *dev_list, uint64_t pid, bool must_match, bool assigned_okay, struct **target, uint8_t *addr)

Helper function to find a usable address during ENTDAA.

Parameters

i3c_dev_list_daa_addr_helper, this preferred address will be returned if this address is still available. If it is not available, another free address will be returned.

If must_match is true, this will return an arbitrary address. This is useful when not all devices are described in device tree. Or else, the DAA process cannot proceed since there is no address to be assigned.

If assigned_okay is true, it will return the same address already assigned to the device.

If assigned_okay is false, the device cannot have an address assigned already (that
See also: \texttt{i3c\_device\_desc::dynamic\_addr}. If no address has been assigned, it behaves as if \texttt{assigned\_okay} is false. This is useful for assigning the same address to the same device (for example, hot-join after device coming back from suspend).

See also: \texttt{i3c\_device\_desc::dynamic\_addr} is not zero). This is mainly used during the initial DAA.

\textbf{Parameters}

- \texttt{addr\_slots} – [in] Pointer to address slots struct.
- \texttt{dev\_list} – [in] Pointer to the device list struct.
- \texttt{pid} – [in] Provisioned ID of device to be assigned address.
- \texttt{must\_match} – [in] True if PID must match devices in the device list. False otherwise.
- \texttt{assigned\_okay} – [in] True if it is okay to return the address already assigned to the target matching the PID \texttt{(pid)}.
- \texttt{target} – [out] Store the pointer of the device descriptor if it matches the incoming PID \texttt{(pid)}.
- \texttt{addr} – [out] Address to be assigned to target device.

\textbf{Return values}

- 0 – if successful.
- -ENODEV – if no device matches the PID \texttt{(pid)} in the device list and \texttt{must\_match} is true.
- -EINVAL – if the device matching PID \texttt{(pid)} already has an address assigned or invalid function arguments.

\begin{verbatim}
static inline int i3c\_configure(const struct device *dev, enum i3c\_config\_type type, void *config)
\end{verbatim}

Configure the I3C hardware.

\textbf{Parameters}

- \texttt{dev} – Pointer to controller device driver instance.
- \texttt{type} – Type of configuration parameters being passed in \texttt{config}.
- \texttt{config} – Pointer to the configuration parameters.

\textbf{Return values}

- 0 – If successful.
- -EINVAL – If invalid configure parameters.
- -EIO – General Input/Output errors.
- -ENOSYS – If not implemented.

\begin{verbatim}
static inline int i3c\_config\_get(const struct device *dev, enum i3c\_config\_type type, void *config)
\end{verbatim}

Get configuration of the I3C hardware.

This provides a way to get the current configuration of the I3C hardware.

This can return cached config or probed hardware parameters, but it has to be up to date with current configuration.
Note that if type is I3C_CONFIG_CUSTOM, config must contain the ID of the parameter to be retrieved.

**Parameters**

- **dev** – [in] Pointer to controller device driver instance.
- **type** – [in] Type of configuration parameters being passed in config.
- **config** – [inout] Pointer to the configuration parameters.

**Return values**

- **0** – If successful.
- **-EIO** – General Input/Output errors.
- **-ENOSYS** – If not implemented.

```c
static inline int i3c_recover_bus(const struct device *dev)
```

Attempt bus recovery on the I3C bus.

This routine asks the controller to attempt bus recovery.

**Return values**

- **0** – If successful.
- **-EBUSY** – If bus recovery fails.
- **-EIO** – General input/output error.
- **-ENOSYS** – Bus recovery is not supported by the controller driver.

```c
int i3c_attach_i3c_device(struct i3c_device_desc *target)
```

Attach an I3C device.

Called to attach an I3C device to the addresses. This is typically called before a SETDASA or ENTDAA to reserve the addresses. This will also call the optional api to update any registers within the driver if implemented.

**Warning:** Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the i3c/i2c devices.

**Parameters**

- **target** – Pointer to the target device descriptor

**Return values**

- **0** – If successful.
- **-EINVAL** – If address is not available or if the device has already been attached before

```c
int i3c_reattach_i3c_device(struct i3c_device_desc *target, uint8_t old_dyn_addr)
```

Reattach I3C device.

called after every time an I3C device has its address changed. It can be because the device has been powered down and has lost its address, or it can happen when a device had a static address and has been assigned a dynamic address with SETDASA or a dynamic address has been updated with SETNEWDA. This will also call the optional api to update any registers within the driver if implemented.
Warning: Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preemted or by using a mutex to govern writes to the i3c/i2c devices.

Parameters
- \texttt{target} – Pointer to the target device descriptor
- \texttt{old_dyn_addr} – The old dynamic address of target device, 0 if there was no old dynamic address

Return values
- 0 – If successful.
- \texttt{-EINVAL} – If address is not available

\begin{verbatim}
int i3c_detach_i3c_device(struct i3c_device_desc *target)
\end{verbatim}

Detach I3C Device.
called to remove an I3C device and to free up the address that it used. If it's dynamic address was not set, then it assumed that SETDASA failed and will free it's static addr. This will also call the optional api to update any registers within the driver if implemented.

Warning: Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preemted or by using a mutex to govern writes to the i3c/i2c devices.

Parameters
- \texttt{target} – Pointer to the target device descriptor

Return values
- 0 – If successful.
- \texttt{-EINVAL} – If device is already detached

\begin{verbatim}
int i3c_attach_i2c_device(struct i3c_i2c_device_desc *target)
\end{verbatim}

Attach an I2C device.
Called to attach a I2C device to the addresses. This will also call the optional api to update any registers within the driver if implemented.

Warning: Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preemted or by using a mutex to govern writes to the i3c/i2c devices.

Parameters
- \texttt{target} – Pointer to the target device descriptor

Return values
- 0 – If successful.
- \texttt{-EINVAL} – If address is not available or if the device has already been attached before
int i3c_detach_i2c_device(struct i3c_i2c_device_desc *target)

Detach I2C Device.

called to remove an I2C device and to free up the address that it used. This will also call the optional api to update any registers within the driver if implemented.

**Warning:** Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the i3c/i2c devices.

**Parameters**
- **target** – Pointer to the target device descriptor

**Return values**
- 0 – If successful.
- -EINVAL – If device is already detached

static inline int i3c_do_daa(const struct device *dev)

Perform Dynamic Address Assignment on the I3C bus.

This routine asks the controller to perform dynamic address assignment where the controller belongs. Only the active controller of the bus should do this.

**Note:** For controller driver implementation, the controller should perform SETDASA to allow static addresses to be the dynamic addresses before actually doing ENTDAA.

**Parameters**
- **dev** – Pointer to the device structure for the controller driver instance.

**Return values**
- 0 – If successful.
- -EBUSY – Bus is busy.
- -EIO – General input / output error.
- -ENODEV – If a provisioned ID does not match to any target devices in the registered device list.
- -ENOSPC – No more free addresses can be assigned to target.
- -ENOSYS – Dynamic address assignment is not supported by the controller driver.

int i3c_do CCC(const struct device *dev, struct i3c_ccc_payload *payload)

Send CCC to the bus.

**Parameters**
- **dev** – Pointer to the device structure for the controller driver instance.
- **payload** – Pointer to the structure describing the CCC payload.

**Return values**
- 0 – If successful.
- -EBUSY – Bus is busy.
- -EIO – General Input / output error.
• -EINVAL – Invalid valid set in the payload structure.
• -ENOSYS – Not implemented.

static inline struct i3c_device_desc *i3c_device_find(const struct device *dev, const struct i3c_device_id *id)

Find a registered I3C target device.
Controller only API.
This returns the I3C device descriptor of the I3C device matching the incoming id.

Parameters
• dev – Pointer to controller device driver instance.
• id – Pointer to I3C device ID.

Returns
Pointer to I3C device descriptor, or NULL if no I3C device found matching incoming id.

int i3c_bus_init(const struct device *dev, const struct i3c_dev_list *i3c_dev_list)
Generic helper function to perform bus initialization.

Parameters
• dev – Pointer to controller device driver instance.
• i3c_dev_list – Pointer to I3C device list.

Return values
• 0 – If successful.
• -EBUSY – Bus is busy.
• -EIO – General input / output error.
• -ENODEV – If a provisioned ID does not match to any target devices in the registered device list.
• -ENOSPC – No more free addresses can be assigned to target.
• -ENOSYS – Dynamic address assignment is not supported by the controller driver.

int i3c_device_basic_info_get(struct i3c_device_desc *target)
Get basic information from device and update device descriptor.

This retrieves some basic information:
• Bus Characteristics Register (GETBCR)
• Device Characteristics Register (GETDCR)
• Max Read Length (GETMRL)
• Max Write Length (GETMWL) from the device and update the corresponding fields of the device descriptor.

This only updates the field(s) in device descriptor only if CCC operations succeed.

Parameters
• target – [inout] I3C target device descriptor.

Return values
• 0 – if successful.
• -EIO – General Input/Output error.
struct `i3c_config_controller`

`#include <i3c.h>` Configuration parameters for I3C hardware to act as controller.

**Public Members**

`bool is_secondary`
True if the controller is to be the secondary controller of the bus.
False to be the primary controller.

`uint32_t i3c`
SCL frequency (in Hz) for I3C transfers.

`uint32_t i2c`
SCL frequency (in Hz) for I2C transfers.

`uint8_t supported_hdr`
Bit mask of supported HDR modes (0 - 7).
This can be used to enable or disable HDR mode supported by the hardware at runtime.

struct `i3c_config_custom`

`#include <i3c.h>` Custom I3C configuration parameters.
This can be used to configure the I3C hardware on parameters not covered by

**See also:**

`i3c_config_controller` or

**See also:**

`i3c_config_target`. Mostly used to configure vendor specific parameters of the I3C hardware.

**Public Members**

`uint32_t id`
ID of the configuration parameter.

`uintptr_t val`
Value of configuration parameter.

`void *ptr`
Pointer to configuration parameter.
Mainly used to pointer to a struct that the device driver understands.

struct `i3c_device_id`

`#include <i3c.h>` Structure used for matching I3C devices.
Public Members

const uint64_t pid
    Device Provisioned ID.

struct i3c_device_desc
    #include <i3c.h> Structure describing a I3C target device.
Instances of this are passed to the I3C controller device APIs, for example:
    • i3c_device_register() to tell the controller of a target device.
    • i3c_transfers() to initiate data transfers between controller and target device.
Fields bus, pid and static_addr must be initialized by the module that implements the
target device behavior prior to passing the object reference to I3C controller device
APIs. static_addr can be zero if target device does not have static address.
Field node should not be initialized or modified manually.

Public Members

const struct device *const bus
    Used to attach this node onto a linked list.
    I3C bus to which this target device is attached

const struct device *const dev
    Device driver instance of the I3C device.

const uint64_t pid
    Device Provisioned ID.

const uint8_t static_addr
    Static address for this target device.
    0 if static address is not being used, and only dynamic address is used. This means
that the target device must go through ENTDAA (Dynamic Address Assignment) to
get a dynamic address before it can communicate with the controller. This means
SETAASA and SETDASA CCC cannot be used to set dynamic address on the target
device (as both are to tell target device to use static address as dynamic address).

const uint8_t init_dynamic_addr
    Initial dynamic address.
    This is specified in the device tree property “assigned-address” to indicate the de-
sired dynamic address during address assignment (SETDASA and ENTDAA).
    0 if there is no preference.

uint8_t dynamic_addr
    Dynamic Address for this target device used for communication.
    This is to be set by the controller driver in one of the following situations:
    • During Dynamic Address Assignment (during ENTDAA)
    • Reset Dynamic Address Assignment (RSTDAA)
    • Set All Addresses to Static Addresses (SETAASA)
• Set New Dynamic Address (SETNEWDA)
• Set Dynamic Address from Static Address (SETDASA)
0 if address has not been assigned.

`uint8_t group_addr`
Group address for this target device.
Set during:
• Reset Group Address(es) (RSTGRPA)
• Set Group Address (SETGRPA)
0 if group address has not been assigned.

`uint8_t bcr`
Bus Characteristic Register (BCR)

• BCR[7:6]: Device Role
  – 0: I3C Target
  – 1: I3C Controller capable
  – 2: Reserved
  – 3: Reserved
• BCR[5]: Advanced Capabilities
  – 0: Does not support optional advanced capabilities.
  – 1: Supports optional advanced capabilities which can be viewed via GET-CAPS CCC.
• BCR[4]: Virtual Target Support
  – 0: Is not a virtual target.
  – 1: Is a virtual target.
• BCR[3]: Offline Capable
  – 0: Will always respond to I3C commands.
  – 1: Will not always response to I3C commands.
• BCR[2]: IBI Payload
  – 0: No data bytes following the accepted IBI.
  – 1: One data byte (MDB, Mandatory Data Byte) follows the accepted IBI. Additional data bytes may also follows.
• BCR[1]: IBI Request Capable
  – 0: Not capable
  – 1: Capable
• BCR[0]: Max Data Speed Limitation
  – 0: No Limitation
  – 1: Limitation obtained via GETMXDS CCC.

`uint8_t dcr`
Device Characteristic Register (DCR)
Describes the type of device. Refer to official documentation on what this number means.

`uint8_t maxrd`
Maximum Read Speed.

`uint8_t maxwr`
Maximum Write Speed.

`uint32_t max_read_turnaround`
Maximum Read turnaround time in microseconds.
uint16_t mrl
Maximum Read Length.

uint16_t mwl
Maximum Write Length.

uint8_t max_ibi
Maximum IBI Payload Size.
Valid only if BCR[2] is 1.

i3c_target.ibi_cb_t ibi_cb
Private data by the controller to aid in transactions.
Do not modify. In-Band Interrupt (IBI) callback.

struct i3c_i2c_device_desc
#include <i3c.h> Structure describing a I2C device on I3C bus.
Instances of this are passed to the I3C controller device APIs, for example: ()
i3c_i2c_device_register() to tell the controller of an I2C device. () i3c_i2c_transfers()
to initiate data transfers between controller and I2C device.
Fields other than node must be initialized by the module that implements the device
behavior prior to passing the object reference to I3C controller device APIs.

Public Members

const struct device *bus
Used to attach this node onto a linked list.
I3C bus to which this I2C device is attached

const uint16_t addr
Static address for this I2C device.

const uint8_t lvr
Legacy Virtual Register (LVR)

- LVR[7:5]: I2C device index:
  - 0: I2C device has a 50 ns spike filter where it is not affected by high frequency
    on SCL.
  - 1: I2C device does not have a 50 ns spike filter but can work with high fre-
    quency on SCL.
  - 2: I2C device does not have a 50 ns spike filter and cannot work with high
    frequency on SCL.
- LVR[4]: I2C mode indicator:
  - 0: FM+ mode
  - 1: FM mode
- LVR[3:0]: Reserved.

struct i3c_dev_attached_list
#include <i3c.h> Structure for describing attached devices for a controller.
This contains slists of attached I3C and I2C devices.
This is a helper struct that can be used by controller device driver to aid in device management.

Public Members

struct i3c_addr_slots addr_slots
Address slots:

• Aid in dynamic address assignment.
• Quick way to find out if a target address is a I3C or I2C device.

sys_slist_t i3c
Linked list of attached I3C devices.

sys_slist_t i2c
Linked list of attached I2C devices.

struct i3c_dev_list
#include <i3c.h> Structure for describing known devices for a controller.
This contains arrays of known I3C and I2C devices.
This is a helper struct that can be used by controller device driver to aid in device management.

Public Members

struct i3c_device_desc *const i3c
Pointer to array of known I3C devices.

struct i3c_i2c_device_desc *const i2c
Pointer to array of known I2C devices.

const uint8_t num_i3c
Number of I3C devices in array.

const uint8_t num_i2c
Number of I2C devices in array.

struct i3c_driver_config
#include <i3c.h> This structure is common to all I3C drivers and is expected to be the first element in the object pointed to by the config field in the device structure.
Public Members

struct i3c_dev_list dev_list
   I3C/I2C device list struct.

struct i3c_driver_data
   #include <i3c.h> This structure is common to all I3C drivers and is expected to be the first element in the driver's struct driver_data declaration.

Public Members

struct i3c_config_controller ctrl_config
   Controller Configuration.

struct i3c_dev_attached_list attached_dev
   Attached I3C/I2C devices and addresses.

group i3c_ccc
   I3C Common Command Codes.

Defines

I3C_CCC_BROADCAST_MAX_ID
   Maximum CCC ID for broadcast.

I3C_CCC_ENEC(broadcast)
   Enable Events Command.
   Parameters
   • broadcast – True if broadcast, false if direct.

I3C_CCC_DISEC(broadcast)
   Disable Events Command.
   Parameters
   • broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS(as, broadcast)
   Enter Activity State.
   Parameters
   • as – Desired activity state
   • broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS0(broadcast)
   Enter Activity State 0.
   Parameters
   • broadcast – True if broadcast, false if direct.
I3C_CCC_ENTAS1(broadcast)
Enter Activity State 1.

**Parameters**
- **broadcast** – True if broadcast, false if direct.

I3C_CCC_ENTAS2(broadcast)
Enter Activity State 2.

**Parameters**
- **broadcast** – True if broadcast, false if direct.

I3C_CCC_ENTAS3(broadcast)
Enter Activity State 3.

**Parameters**
- **broadcast** – True if broadcast, false if direct.

I3C_CCC_RSTDAAReset Dynamic Address Assignment (Broadcast)

I3C_CCC_ENTDAAREnter Dynamic Address Assignment (Broadcast)

I3C_CCC_DEFTGTSDefine List of Targets (Broadcast)

I3C_CCC_SETMWL(broadcast)Set Max Write Length (Broadcast or Direct)

**Parameters**
- **broadcast** – True if broadcast, false if direct.

I3C_CCC_SETMRL(broadcast)Set Max Read Length (Broadcast or Direct)

**Parameters**
- **broadcast** – True if broadcast, false if direct.

I3C_CCC_ENTMEnter Test Mode (Broadcast)

I3C_CCC_SETBUSCONSet Bus Context (Broadcast)

I3C_CCC_ENDXFER(broadcast)Data Transfer Ending Procedure Control.

**Parameters**
- **broadcast** – True if broadcast, false if direct.

I3C_CCC_ENTHDR(x)Enter HDR Mode (HDR-DDR) (Broadcast)

I3C_CCC_ENTHDR0Enter HDR Mode 0 (HDR-DDR) (Broadcast)
I3C_CCC_ENTHDR1
   Enter HDR Mode 1 (HDR-TSP) (Broadcast)

I3C_CCC_ENTHDR2
   Enter HDR Mode 2 (HDR-TSL) (Broadcast)

I3C_CCC_ENTHDR3
   Enter HDR Mode 3 (HDR-BT) (Broadcast)

I3C_CCC_ENTHDR4
   Enter HDR Mode 4 (Broadcast)

I3C_CCC_ENTHDR5
   Enter HDR Mode 5 (Broadcast)

I3C_CCC_ENTHDR6
   Enter HDR Mode 6 (Broadcast)

I3C_CCC_ENTHDR7
   Enter HDR Mode 7 (Broadcast)

I3C_CCC_SETXTIME(broadcast)
   Exchange Timing Information (Broadcast or Direct)
   Parameters
      • broadcast – True if broadcast, false if direct.

I3C_CCC_SETAASA
   Set All Addresses to Static Addresses (Broadcast)

I3C_CCC_RSTACT(broadcast)
   Target Reset Action.
   Parameters
      • broadcast – True if broadcast, false if direct.

I3C_CCC_DEFGRPA
   Define List of Group Address (Broadcast)

I3C_CCC_RSTGRPA(broadcast)
   Reset Group Address.
   Parameters
      • broadcast – True if broadcast, false if direct.

I3C_CCC_MLANE(broadcast)
   Multi-Lane Data Transfer Control (Broadcast)

I3C_CCC_VENDOR(broadcast, id)
   Vendor/Standard Extension.
   Parameters
      • broadcast – True if broadcast, false if direct.
      • id – Extension ID.
I3C_CCC_SETDASA
  Set Dynamic Address from Static Address (Direct)

I3C_CCC_SETNEWDA
  Set New Dynamic Address (Direct)

I3C_CCC_GETMNL
  Get Max Write Length (Direct)

I3C_CCC_GETMRL
  Get Max Read Length (Direct)

I3C_CCC_GETPID
  Get Provisioned ID (Direct)

I3C_CCC_GETBCR
  Get Bus Characteristics Register (Direct)

I3C_CCC_GETDCR
  Get Device Characteristics Register (Direct)

I3C_CCC_GETSTATUS
  Get Device Status (Direct)

I3C_CCC_GETACCCR
  Get Accept Controller Role (Direct)

I3C_CCC_SETBRGTGT
  Set Bridge Targets (Direct)

I3C_CCC_GETMXDS
  Get Max Data Speed (Direct)

I3C_CCC_GETCAPS
  Get Optional Feature Capabilities (Direct)

I3C_CCC_SETROUTE
  Set Route (Direct)

I3C_CCC_D2DXFER
  Device to Device(s) Tunneling Control (Direct)

I3C_CCC_GETXTIME
  Get Exchange Timing Information (Direct)

I3C_CCC_SETGRPA
  Set Group Address (Direct)
I3C_CCC_ENEC_EVT_ENINTR
Enable Events (ENEC) - Target Interrupt Requests.

I3C_CCC_ENEC_EVT_ENCR
Enable Events (ENEC) - Controller Role Requests.

I3C_CCC_ENEC_EVT_ENHJ
Enable Events (ENEC) - Hot-Join Event.

I3C_CCC_ENEC_EVT_ALL

I3C_CCC_DISEC_EVT_DISINTR
Disable Events (DISEC) - Target Interrupt Requests.

I3C_CCC_DISEC_EVT_DISCR
Disable Events (DISEC) - Controller Role Requests.

I3C_CCC_DISEC_EVT_DISHJ
Disable Events (DISEC) - Hot-Join Event.

I3C_CCC_DISEC_EVT_ALL

I3C_CCC_EVT_INTR
Events - Target Interrupt Requests.

I3C_CCC_EVT_CR
Events - Controller Role Requests.

I3C_CCC_EVT_HJ
Events - Hot-Join Event.

I3C_CCC_EVT_ALL
Bitmask for all events.

I3C_CCC_GETSTATUS_PROTOCOL_ERR
GETSTATUS Format 1 - Protocol Error bit.

I3C_CCC_GETSTATUS_ACTIVITY_MODE_SHIFT
GETSTATUS Format 1 - Activity Mode bit shift value.

I3C_CCC_GETSTATUS_ACTIVITY_MODE_MASK
GETSTATUS Format 1 - Activity Mode bitmask.

I3C_CCC_GETSTATUS_ACTIVITY_MODE(status)
GETSTATUS Format 1 - Activity Mode.

Obtain Activity Mode from GETSTATUS Format 1 value obtained via GETSTATUS.

Parameters
- status – GETSTATUS Format 1 value
I3C_CCC_GETSTATUS_NUM_INT_SHIFT
GETSTATUS Format 1 - Number of Pending Interrupts bit shift value.

I3C_CCC_GETSTATUS_NUM_INT_MASK
GETSTATUS Format 1 - Number of Pending Interrupts bitmask.

I3C_CCC_GETSTATUS_NUM_INT(status)
GETSTATUS Format 1 - Number of Pending Interrupts.
Obtain Number of Pending Interrupts from GETSTATUS Format 1 value obtained via GETSTATUS.

Parameters
• status – GETSTATUS Format 1 value

I3C_CCC_GETSTATUS_PRECR_DEEP_SLEEP_DETECTED
GETSTATUS Format 2 - PERCR - Deep Sleep Detected bit.

I3C_CCC_GETSTATUS_PRECR_HANDOFF_DELAY_NACK
GETSTATUS Format 2 - PERCR - Handoff Delay NACK.

I3C_CCC_GETMXDS_MAX_SDR_FSCl_MAX
Get Max Data Speed (GETMXDS) - Default Max Sustained Data Rate.

I3C_CCC_GETMXDS_MAX_SDR_FSCl_8MHZ
Get Max Data Speed (GETMXDS) - 8MHz Max Sustained Data Rate.

I3C_CCC_GETMXDS_MAX_SDR_FSCl_6MHZ
Get Max Data Speed (GETMXDS) - 6MHz Max Sustained Data Rate.

I3C_CCC_GETMXDS_MAX_SDR_FSCl_4MHZ
Get Max Data Speed (GETMXDS) - 4MHz Max Sustained Data Rate.

I3C_CCC_GETMXDS_MAX_SDR_FSCl_2MHZ
Get Max Data Speed (GETMXDS) - 2MHz Max Sustained Data Rate.

I3C_CCC_GETMXDS_TSCO_8NS
Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 8ns.

I3C_CCC_GETMXDS_TSCO_9NS
Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 9ns.

I3C_CCC_GETMXDS_TSCO_10NS
Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 10ns.

I3C_CCC_GETMXDS_TSCO_11NS
Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 11ns.

I3C_CCC_GETMXDS_TSCO_12NS
Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 12ns.
I3C_CCC_GETMXDS_TSCO_GT_12NS
Get Max Data Speed (GETMXDS) - Clock to Data Turnaround > 12ns.

I3C_CCC_GETMXDS_MAXWR_DEFINING_BYTE_SUPPORT
Get Max Data Speed (GETMXDS) - maxWr - Optional Defining Byte Support.

I3C_CCC_GETMXDS_MAXWR_MAX_SDR_FSCL_SHIFT
Get Max Data Speed (GETMXDS) - Max Sustained Data Rate bit shift value.

I3C_CCC_GETMXDS_MAXWR_MAX_SDR_FSCL_MASK
Get Max Data Speed (GETMXDS) - Max Sustained Data Rate bitmask.

I3C_CCC_GETMXDS_MAXWR_MAX_SDR_FSCL(maxwr)
Get Max Data Speed (GETMXDS) - maxWr - Max Sustained Data Rate.
Obtain Max Sustained Data Rate value from GETMXDS maxWr value obtained via GETMXDS.

Parameters
- • maxwr – GETMXDS maxWr value.

I3C_CCC_GETMXDS_MAXRD_W2R_PERMITS_STOP_BETWEEN
Get Max Data Speed (GETMXDS) - maxRd - Write-to-Read Permits Stop Between.

I3C_CCC_GETMXDS_MAXRD_TSCO_SHIFT
Get Max Data Speed (GETMXDS) - maxRd - Clock to Data Turnaround bit shift value.

I3C_CCC_GETMXDS_MAXRD_TSCO_MASK
Get Max Data Speed (GETMXDS) - maxRd - Clock to Data Turnaround bitmask.

I3C_CCC_GETMXDS_MAXRD_MAX_SDR_FSCL(maxrd)
Get Max Data Speed (GETMXDS) - maxRd - Clock to Data Turnaround.
Obtain Clock to Data Turnaround value from GETMXDS maxRd value obtained via GETMXDS.

Parameters
- • maxrd – GETMXDS maxRd value.

I3C_CCC_GETMXDS_MAXRD_MAX_SDR_FSCL_SHIFT
Get Max Data Speed (GETMXDS) - maxRd - Max Sustained Data Rate bit shift value.

I3C_CCC_GETMXDS_MAXRD_MAX_SDR_FSCL_MASK
Get Max Data Speed (GETMXDS) - maxRd - Max Sustained Data Rate bitmask.

I3C_CCC_GETMXDS_MAXRD_MAX_SDR_FSCL(maxrd)
Get Max Data Speed (GETMXDS) - maxRd - Max Sustained Data Rate.
Obtain Max Sustained Data Rate value from GETMXDS maxRd value obtained via GETMXDS.

Parameters
- • maxrd – GETMXDS maxRd value.
I3C_CCC_GETMXDS_CRDHLY1_SET_BUS_ACT_STATE
Get Max Data Speed (GETMXDS) - CRDHLY1 - Set Bus Activity State bit shift value.

I3C_CCC_GETMXDS_CRDHLY1_CTRL_HANDOFF_ACT_STATE_SHIFT
Get Max Data Speed (GETMXDS) - CRDHLY1 - Controller Handoff Activity State bit shift value.

I3C_CCC_GETMXDS_CRDHLY1_CTRL_HANDOFF_ACT_STATE_MASK
Get Max Data Speed (GETMXDS) - CRDHLY1 - Controller Handoff Activity State bitmask.

I3C_CCC_GETMXDS_CRDHLY1_CTRL_HANDOFF_ACT_STATE(crhdly1)
Get Max Data Speed (GETMXDS) - CRDHLY1 - Controller Handoff Activity State.
Obtain Controller Handoff Activity State value from GETMXDS value obtained via GET-MXDS.

Parameters
- crhdly1 – GETMXDS value.

I3C_CCC_GETCAPS1_HDR_DDR
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR-DDR mode bit.

I3C_CCC_GETCAPS1_HDR_BT
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR-BT mode bit.

I3C_CCC_GETCAPS1_HDR_MODE(x)
Get Optional Feature Capabilities (GETCAPS) - HDR Mode.
Get the bit corresponding to HDR mode.

Parameters
- x – HDR mode

I3C_CCC_GETCAPS1_HDR_MODE0
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 0.

I3C_CCC_GETCAPS1_HDR_MODE1
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 1.

I3C_CCC_GETCAPS1_HDR_MODE2
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 2.

I3C_CCC_GETCAPS1_HDR_MODE3
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 3.

I3C_CCC_GETCAPS1_HDR_MODE4
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 4.

I3C_CCC_GETCAPS1_HDR_MODE5
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 5.

I3C_CCC_GETCAPS1_HDR_MODE6
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 6.
I3C_CCC_GETCAPS1_HDR_MODE7
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 7.

I3C_CCC_GETCAPS2_HDRDDR_WRITE_ABORT
Get Optional Feature Capabilities (GETCAPS) Format 2 - HDR-DDR Write Abort bit.

I3C_CCC_GETCAPS2_HDRDDR_ABORT_CRC
Get Optional Feature Capabilities (GETCAPS) Format 2 - HDR-DDR Abort CRC bit.

I3C_CCC_GETCAPS2_GRPADDR_CAP_SHIFT
Get Optional Feature Capabilities (GETCAPS) Format 2 - Group Address Capabilities bit shift value.

I3C_CCC_GETCAPS2_GRPADDR_CAP_MASK
Get Optional Feature Capabilities (GETCAPS) Format 2 - Group Address Capabilities bitmask.

I3C_CCC_GETCAPS2_GRPADDR_CAP(getcaps2)
Get Optional Feature Capabilities (GETCAPS) Format 2 - Group Address Capabilities.
Obtain Group Address Capabilities value from GETCAPS Format 2 value obtained via GETCAPS.

Parameters
• getcaps2 – GETCAPS2 value.

I3C_CCC_GETCAPS2_SPEC_VER_SHIFT
Get Optional Feature Capabilities (GETCAPS) Format 2 - I3C 1.x Specification Version bit shift value.

I3C_CCC_GETCAPS2_SPEC_VER_MASK
Get Optional Feature Capabilities (GETCAPS) Format 2 - I3C 1.x Specification Version bitmask.

I3C_CCC_GETCAPS2_SPEC_VER(getcaps2)
Get Optional Feature Capabilities (GETCAPS) Format 2 - I3C 1.x Specification Version.
Obtain I3C 1.x Specification Version value from GETCAPS Format 2 value obtained via GETCAPS.

Parameters
• getcaps2 – GETCAPS2 value.

I3C_CCC_GETCAPS3_MLANE_SUPPORT
Get Optional Feature Capabilities (GETCAPS) Format 3 - Multi-Lane Data Transfer Support bit.

I3C_CCC_GETCAPS3_D2DXFER_SUPPORT
Get Optional Feature Capabilities (GETCAPS) Format 3 - Device to Device Transfer (D2DXFER) Support bit.

I3C_CCC_GETCAPS3_D2DXFER_IBI_CAPABLE
Get Optional Feature Capabilities (GETCAPS) Format 3 - Device to Device Transfer (D2DXFER) IBI Capable bit.
I3C_CCC_GETCAPS3_GETCAPS_DEFINING_BYTE_SUPPORT
Get Optional Feature Capabilities (GETCAPS) Format 3 - Defining Byte Support in GETCAPS bit.

I3C_CCC_GETCAPS3_GETSTATUS_DEFINING_BYTE_SUPPORT
Get Optional Feature Capabilities (GETCAPS) Format 3 - Defining Byte Support in GETSTATUS bit.

I3C_CCC_GETCAPS3_HDRBT_CRC32_SUPPORT

I3C_CCC_GETCAPS3_IBI_MDR_PENDING_READ_NOTIFICATION
Get Optional Feature Capabilities (GETCAPS) Format 3 - IBI MDB Support for Pending Read Notification bit.

 Enums

enum i3c_ccc_getstatus_fmt
  Indicate which format of GETSTATUS to use.
  Values:
    enumerator GETSTATUS_FORMAT_1
      GETSTATUS Format 1.
    enumerator GETSTATUS_FORMAT_2
      GETSTATUS Format 2.

enum i3c_ccc_getstatus_defbyte
  Defining byte values for GETSTATUS Format 2.
  Values:
    enumerator GETSTATUS_FORMAT_2_TGTSTAT = 0x00U
      Target status.
    enumerator GETSTATUS_FORMAT_2_PRECR = 0x91U
      PRECR - Alternate status format describing Controller-capable device.
    enumerator GETSTATUS_FORMAT_2_INVALID = 0x100U
      Invalid defining byte.

enum i3c_ccc_rstact_defining_byte
  Enum for I3C Reset Action (RSTACT) Defining Byte Values.
  Values:
    enumerator I3C_CCC_RSTACT_NO_RESET = 0x00U
      No Reset on Target Reset Pattern.

7.5. Peripherals
enumerator \texttt{I3C\_CCC\_RSTACT\_PERIPHERAL\_ONLY} = 0x01U
Reset the I3C Peripheral Only.

enumerator \texttt{I3C\_CCC\_RSTACT\_RESET\_WHOLE\_TARGET} = 0x02U
Reset the Whole Target.

enumerator \texttt{I3C\_CCC\_RSTACT\_DEBUG\_NETWORK\_ADAPTER} = 0x03U
Debug Network Adapter Reset.

enumerator \texttt{I3C\_CCC\_RSTACT\_VIRTUAL\_TARGET\_DETECT} = 0x04U
Virtual Target Detect.

\textbf{Functions}

\texttt{\textit{static inline bool i3c\_ccc\_is\_payload\_broadcast\( (\text{const struct } i3c\_ccc\_payload* \text{payload}) \)\text{}}}
Test if I3C CCC payload is for broadcast.
This tests if the CCC payload is for broadcast.

\textbf{Parameters}
\begin{itemize}
\item \texttt{payload} – [in] Pointer to the CCC payload.
\end{itemize}

\textbf{Return values}
\begin{itemize}
\item \texttt{true} – if payload target is broadcast
\item \texttt{false} – if payload target is direct
\end{itemize}

\texttt{\textit{int i3c\_ccc\_do\_getbcr\( (\text{struct } i3c\_device\_desc* \text{target}, \text{struct } i3c\_ccc\_getbcr* \text{bcr}) \)\text{}}}
Get BCR from a target.
Helper function to get BCR (Bus Characteristic Register) from target device.

\textbf{See also:}
\texttt{i3c\_do\_ccc}

\texttt{\textit{\begin{verbatim}
\begin{verbatim}
\end{verbatim}
\end{verbatim}}}

\textbf{Parameters}
\begin{itemize}
\item \texttt{target} – [in] Pointer to the target device descriptor.
\item \texttt{bcr} – [out] Pointer to the BCR payload structure.
\end{itemize}

\textbf{Returns}

\texttt{\textit{int i3c\_ccc\_do\_getdcr\( (\text{struct } i3c\_device\_desc* \text{target}, \text{struct } i3c\_ccc\_getdcr* \text{dcr}) \)\text{}}}
Get DCR from a target.
Helper function to get DCR (Device Characteristic Register) from target device.

\textbf{See also:}
\texttt{i3c\_do\_ccc}

\texttt{\textit{\begin{verbatim}
\begin{verbatim}
\end{verbatim}
\end{verbatim}}}

\textbf{Parameters}
\begin{itemize}
\item \texttt{target} – [in] Pointer to the target device descriptor.
\item \texttt{dcr} – [out] Pointer to the DCR payload structure.
Returns

int i3c_ccc_do_getpid(struct i3c_device_desc *target, struct i3c_ccc_getpid *pid)
Get PID from a target.
Helper function to get PID (Provisioned ID) from target device.

See also:
i3c_do_ccc

Parameters
• target – [in] Pointer to the target device descriptor.
• pid – [out] Pointer to the PID payload structure.

Returns

int i3c_ccc_do_rstact_all(const struct device *controller, enum i3c_ccc_rstact_defining_byte action)
Broadcast RSTACT to reset I3C Peripheral.
Helper function to broadcast Target Reset Action (RSTACT) to all connected targets to
Reset the I3C Peripheral Only (0x01).

See also:
i3c_do_ccc

Parameters
• controller – [in] Pointer to the controller device driver instance.

Returns

int i3c_ccc_do_rstdaa_all(const struct device *controller)
Broadcast RSTDAA to reset dynamic addresses for all targets.
Helper function to reset dynamic addresses of all connected targets.

See also:
i3c_do_ccc

Parameters
• controller – [in] Pointer to the controller device driver instance.

Returns

int i3c_ccc_do_setdasa(const struct i3c_device_desc *target)
Set Dynamic Address from Static Address for a target.
Helper function to do SETDASA (Set Dynamic Address from Static Address) for a par-
ticular target.
Note this does not update target with the new dynamic address.
See also:

\texttt{i3c\_do\_ccc}

**Parameters**

- \texttt{target} – \texttt{[in]} Pointer to the target device descriptor where the device is configured with a static address.

**Returns**

```c
int i3c\_ccc\_do\_setnewda(const struct \texttt{i3c\_device\_desc} *target, struct \texttt{i3c\_ccc\_address} new\_da)
```

Set New Dynamic Address for a target.
Helper function to do SETNEWDA(Set New Dynamic Address) for a particular target.
Note this does not update target with the new dynamic address.

See also:

\texttt{i3c\_do\_ccc}

**Parameters**

- \texttt{target} – \texttt{[in]} Pointer to the target device descriptor where the device is configured with a static address.
- \texttt{new\_da} – \texttt{[in]} Pointer to the new\_da struct.

**Returns**

```c
int i3c\_ccc\_do\_events\_all\_set(const struct device *controller, bool enable, struct \texttt{i3c\_ccc\_events} *events)
```

Broadcast ENEC/DISEC to enable/disable target events.
Helper function to broadcast Target Events Command to enable or disable target events (ENEC/DISEC).

See also:

\texttt{i3c\_do\_ccc}

**Parameters**

- \texttt{controller} – \texttt{[in]} Pointer to the controller device driver instance.
- \texttt{enable} – \texttt{[in]} ENEC if true, DISEC if false.
- \texttt{events} – \texttt{[in]} Pointer to the event struct.

**Returns**

```c
int i3c\_ccc\_do\_events\_set(struct \texttt{i3c\_device\_desc} *target, bool enable, struct \texttt{i3c\_ccc\_events} *events)
```

Direct CCC ENEC/DISEC to enable/disable target events.
Helper function to send Target Events Command to enable or disable target events (ENEC/DISEC) on a single target.
See also:

\texttt{i3c\_do\_ccc}

Parameters

- \texttt{target} – [in] Pointer to the target device descriptor.
- \texttt{enable} – [in] ENEC if true, DISEC if false.
- \texttt{events} – [in] Pointer to the event struct.

Returns

\texttt{int i3c\_ccc\_do\_setmwl\_all(const struct device *controller, const struct i3c\_ccc\_mwl *mwl)}

Broadcast SETMWL to Set Maximum Write Length.
Helper function to do SETMWL (Set Maximum Write Length) to all connected targets.

See also:

\texttt{i3c\_do\_ccc}

Parameters

- \texttt{controller} – [in] Pointer to the controller device driver instance.
- \texttt{mwl} – [in] Pointer to SETMWL payload.

Returns

\texttt{int i3c\_ccc\_do\_setmwl(const struct i3c\_device\_desc *target, const struct i3c\_ccc\_mwl *mwl)}

Single target SETMWL to Set Maximum Write Length.
Helper function to do SETMWL (Set Maximum Write Length) to one target.

See also:

\texttt{i3c\_do\_ccc}

Parameters

- \texttt{target} – [in] Pointer to the target device descriptor.
- \texttt{mwl} – [in] Pointer to SETMWL payload.

Returns

\texttt{int i3c\_ccc\_do\_getmwl(const struct i3c\_device\_desc *target, struct i3c\_ccc\_mwl *mwl)}

Single target GETMWL to Get Maximum Write Length.
Helper function to do GETMWL (Get Maximum Write Length) of one target.

See also:

\texttt{i3c\_do\_ccc}

Parameters

- \texttt{target} – [in] Pointer to the target device descriptor.
- \texttt{mwl} – [out] Pointer to GETMWL payload.

Returns
int i3c_ccc_do_setmrl_all(const struct device *controller, const struct i3c_ccc_mrl *mrl, bool has_ibi_size)
Broadcast SETMRL to Set Maximum Read Length.
Helper function to do SETMRL (Set Maximum Read Length) to all connected targets.

See also:
i3c_do_ccc

Parameters
• controller – [in] Pointer to the controller device driver instance.
• mrl – [in] Pointer to SETMRL payload.
• has_ibi_size – [in] True if also sending the optional IBI payload size. False if not sending.

Returns

int i3c_ccc_do_setmrl1(const struct i3c_device_desc *target, const struct i3c_ccc_mrl *mrl)
Single target SETMRL to Set Maximum Read Length.
Helper function to do SETMRL (Set Maximum Read Length) to one target.
Note this uses the BCR of the target to determine whether to send the optional IBI payload size.

See also:
i3c_do_ccc

Parameters
• target – [in] Pointer to the target device descriptor.
• mrl – [in] Pointer to SETMRL payload.

Returns

int i3c_ccc_do_getmrl1(const struct i3c_device_desc *target, struct i3c_ccc_mrl *mrl)
Single target GETMRL to Get Maximum Read Length.
Helper function to do GETMRL (Get Maximum Read Length) of one target.
Note this uses the BCR of the target to determine whether to send the optional IBI payload size.

See also:
i3c_do_ccc

Parameters
• target – [in] Pointer to the target device descriptor.
• mrl – [out] Pointer to GETMRL payload.

Returns
int i3c_ccc_do_getstatus(const struct i3c_device_desc *target, union i3c_ccc_getstatus *status, enum i3c_ccc_getstatus_fmt fmt, enum i3c_ccc_getstatus_defbyte defbyte)

Single target GETSTATUS to Get Target Status.
Helper function to do GETSTATUS (Get Target Status) of one target.
Note this uses the BCR of the target to determine whether to send the optional IBI payload size.

See also:
  i3c_do_ccc

Parameters
  • target – [in] Pointer to the target device descriptor.
  • status – [out] Pointer to GETSTATUS payload.

Returns
static inline int i3c_ccc_do_getstatus_fmt1(const struct i3c_device_desc *target, union i3c_ccc_getstatus *status)

Single target GETSTATUS to Get Target Status (Format 1).
Helper function to do GETSTATUS (Get Target Status, format 1) of one target.

See also:
  i3c_do_ccc

Parameters
  • target – [in] Pointer to the target device descriptor.
  • status – [out] Pointer to GETSTATUS payload.

Returns
static inline int i3c_ccc_do_getstatus_fmt2(const struct i3c_device_desc *target, union i3c_ccc_getstatus *status, enum i3c_ccc_getstatus_defbyte defbyte)

Single target GETSTATUS to Get Target Status (Format 2).
Helper function to do GETSTATUS (Get Target Status, format 2) of one target.

See also:
  i3c_do_ccc

Parameters
  • target – [in] Pointer to the target device descriptor.
  • status – [out] Pointer to GETSTATUS payload.
Returns

struct i3c_ccc_target_payload
#include <ccc.h> Payload structure for Direct CCC to one target.

Public Members

uint8_t addr
   Target address.

uint8_t rnw
   0 for Write, 1 for Read

uint8_t *data
   • For Write CCC, pointer to the byte array of data to be sent, which may contain
     the Sub-Command Byte and additional data.
   • For Read CCC, pointer to the byte buffer for data to be read into.

size_t data_len
   Length in bytes for data.

struct i3c_ccc_payload
#include <ccc.h> Payload structure for one CCC transaction.

Public Members

uint8_t id
   The CCC ID (I3C_CCC_*).

uint8_t *data
   Pointer to byte array of data for this CCC.
   This is the bytes following the CCC command in CCC frame. Set to NULL if no asso-
   ciated data.

size_t data_len
   Length in bytes for optional data array.

struct i3c_ccc_target_payload *payloads
   Array of struct i3c_ccc_target_payload.
   Each element describes the target and associated payloads for this CCC.
   Use with Direct CCC.

size_t num_targets
   Number of targets.

struct i3c_ccc_events
#include <ccc.h> Payload for ENEC/DISEC CCC (Target Events Command).
Public Members

uint8_t events
   Event byte:

   • Bit[0]: ENINT/DISINT:
     – Target Interrupt Requests
   • Bit[1]: ENCR/DISCR:
     – Controller Role Requests
   • Bit[3]: ENHJ/DISHJ:
     – Hot-Join Event

struct i3c_ccc_mwl
#include <ccc.h> Payload for SETMWL/GETMWL CCC (Set/Get Maximum Write Length).

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

Public Members

uint16_t len
   Maximum Write Length.

struct i3c_ccc_mrl
#include <ccc.h> Payload for SETMRL/GETMRL CCC (Set/Get Maximum Read Length).

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

Public Members

uint16_t len
   Maximum Read Length.

uint8_t ibi_len
   Optional IBI Payload Size.

struct i3c_ccc_deftgts_active_controller
#include <ccc.h> The active controller part of payload for DEFTGTS CCC.

This is used by DEFTGTS (Define List of Targets) CCC to describe the active controller on the I3C bus.

7.5. Peripherals
**Public Members**

`uint8_t addr`
Dynamic Address of Active Controller.

`uint8_t dcr`
Device Characteristic Register of Active Controller.

`uint8_t bcr`
Bus Characteristic Register of Active Controller.

`uint8_t static_addr`
Static Address of Active Controller.

**struct i3c_ccc_deftgts_target**

`#include <ccc.h>` The target device part of payload for DEFTGTS CCC.

This is used by DEFTGTS (Define List of Targets) CCC to describe the existing target devices on the I3C bus.

**Public Members**

`uint8_t addr`
Dynamic Address of a target device, or a group address.

`uint8_t dcr`
Device Characteristic Register of a I3C target device or a group.

`uint8_t lvr`
Legacy Virtual Register for legacy I2C device.

`uint8_t bcr`
Bus Characteristic Register of a target device or a group.

`uint8_t static_addr`
Static Address of a target device or a group.

**struct i3c_ccc_deftgts**

`#include <ccc.h>` Payload for DEFTGTS CCC (Define List of Targets).

**Note:** `i3c_ccc_deftgts_target` is an array of targets, where the number of elements is dependent on the number of I3C targets on the bus. Please have enough space for both read and write of this CCC.

**Public Members**
struct `i3c_ccc_deftgts_active_controller` `active_controller`

Data describing the active controller.

struct `i3c_ccc_deftgts_target` `targets[]`

Data describing the target(s) on the bus.

struct `i3c_ccc_address`

`#include <ccc.h>` Payload for a single device address.

This is used for:

- SETDASA (Set Dynamic Address from Static Address)
- SETNEWDA (Set New Dynamic Address)
- SETGRPA (Set Group Address)
- GETACCCR (Get Accept Controller Role)

Note that the target address is encoded within struct `i3c_ccc_target_payload` instead of being encoded in this payload.

Public Members

uint8_t `addr`

- For SETDASA, Static Address to be assigned as Dynamic Address.
- For SETNEWDA, new Dynamic Address to be assigned.
- For SETGRPA, new Group Address to be set.
- For GETACCCR, the correct address of Secondary Controller.

Note: For SETDATA, SETNEWDA and SETGRAP, the address is left-shift by 1, and bit[0] is always 0.

Note: For SET GETACCCR, the address is left-shift by 1, and bit[0] is the calculated odd parity bit.

struct `i3c_ccc getpid`

`#include <ccc.h>` Payload for GETPID CCC (Get Provisioned ID).

Public Members

uint8_t `pid[6]`

48-bit Provisioned ID.

Note: Data is big-endian where first byte is MSB.

struct `i3c_ccc getbcr`

`#include <ccc.h>` Payload for GETBCR CCC (Get Bus Characteristics Register).
Public Members

`uint8_t bcr`

Bus Characteristics Register.

```c
#include <ccc.h>
```

Payload for GETDCR CCC (Get Device Characteristics Register).

Public Members

`uint8_t dcr`

Device Characteristics Register.

```c
union i3c_ccc_getstatus
#include <ccc.h>
```

Payload for GETSTATUS CCC (Get Device Status).

Public Members

`uint16_t status`

Device Status.

- Bit[15:8]: Reserved.
- Bit[7:6]: Activity Mode.
- Bit[5]: Protocol Error.
- Bit[4]: Reserved.
- Bit[3:0]: Number of Pending Interrupts.

**Note:** For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

```c
struct i3c_ccc_getstatus.
```

Defining Byte 0x00: TGTSTAT.

**See also:**

i3c_ccc_getstatus::fmt1::status

`uint16_t precr`

Defining Byte 0x91: PRECR.

- Bit[15:8]: Vendor Reserved
- Bit[7:2]: Reserved
- Bit[1]: Handoff Delay NACK
- Bit[0]: Deep Sleep Detected
Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

```c
uint16_t raw_u16

union i3c_ccc_getstatus.[anonymous] fmt2
```

```c
uint16_t id
```

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

```c
struct i3c_ccc_getstatus
```

```c
union i3c_ccc_getstatus.[anonymous] fmt2
```

```c
include <ccc.h> One Bridged Target for SETBRGTGT payload.
```

**Public Members**

```c
uint8_t addr
```

Dynamic address of the bridged target.

Note: The address is left-shift by 1, and bit[0] is always 0.

```c
uint16_t id
```

16-bit ID for the bridged target.

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

```c
struct i3c_ccc_setbrgtgt_tgt
```

```c
#include <ccc.h> One Bridged Target for SETBRGTGT payload.
```

**Public Members**

```c
uint8_t count
```

Number of bridged targets.

```c
struct i3c_ccc_setbrgtgt_tgt targets[]
```

Array of bridged targets.

```c
union i3c_ccc_getmxds
```

```c
#include <ccc.h> Payload for GETMXDS CCC (Get Max Data Speed).
```

Note: This is only for GETMXDS Format 1 and Format 2.
Public Members

uint8_t maxwr
    maxWr

uint8_t maxrd
    maxRd

struct i3c_ccc_getmxds.[anonymous] fmt1

uint8_t maxrdturn[3]
    Maximum Read Turnaround Time in microsecond.
    This is in little-endian where first byte is LSB.

struct i3c_ccc_getmxds.[anonymous] fmt2

uint8_t wrrdtturn
    Defining Byte 0x00: WRRDTURN.

See also:
    i3c_ccc_getmxds::fmt2

uint8_t crhdly1
    Defining Byte 0x91: CRHDLY.
    • Bit[2]: Set Bus Activity State
    • Bit[1:0]: Controller Handoff Activity State

struct i3c_ccc_getmxds.[anonymous] fmt3

struct i3c_ccc_getcaps
    #include <ccc.h> Payload for GETCAPS CCC (Get Optional Feature Capabilities).

Note: Only support GETCAPS Format 1.

Public Members

uint8_t getcaps[4]

group i3c_addresses
    I3C Address-related Helper Code.
Defines

I3C_BROADCAST_ADDR
Broadcast Address on I3C bus.

I3C_MAX_ADDR
Maximum value of device addresses.

Enums

enum i3c_addr_slot_status
Enum to indicate whether an address is reserved, has I2C/I3C device attached, or no device attached.

Values:

enumerator I3C_ADDR_SLOT_STATUS_FREE = 0U
Address has not device attached.

enumerator I3C_ADDR_SLOT_STATUS_RSVD
Address is reserved.

enumerator I3C_ADDR_SLOT_STATUS_I3C_DEV
Address is associated with an I3C device.

enumerator I3C_ADDR_SLOT_STATUS_I2C_DEV
Address is associated with an I2C device.

enumerator I3C_ADDR_SLOT_STATUS_MASK = 0x03U
Bit masks used to filter status bits.

Functions

int i3c_addr_slots_init(const struct device *dev)
Initialize the I3C address slots struct.
This clears out the assigned address bits, and set the reserved address bits according to the I3C specification.

Parameters

• dev – Pointer to controller device driver instance.

Return values

• 0 – if successful.
• -EINVAL – if duplicate addresses.

void i3c_addr_slots_set(struct i3c_addr_slots *slots, uint8_t dev_addr, enum i3c_addr_slot_status status)
Set the address status of a device.

Parameters
enum i3c_addr_slot_status i3c_addr_slots_status(struct i3c_addr_slots *slots, uint8_t dev_addr)

Get the address status of a device.

Parameters
- slots – Pointer to the address slots structure.
- dev_addr – Device address.

Returns
Address status for the address dev_addr.

bool i3c_addr_slots_is_free(struct i3c_addr_slots *slots, uint8_t dev_addr)

Check if the address is free.

Parameters
- slots – Pointer to the address slots structure.
- dev_addr – Device address.

Return values
- true – if address is free.
- false – if address is not free.

uint8_t i3c_addr_slots_next_free_find(struct i3c_addr_slots *slots)

Find the next free address.
This can be used to find the next free address that can be assigned to a new device.

Parameters
- slots – Pointer to the address slots structure.

Returns
The next free address, or 0 if none found.

static inline void i3c_addr_slots_mark_free(struct i3c_addr_slots *addr_slots, uint8_t addr)

Mark the address as free (not used) in device list.

Parameters
- addr_slots – Pointer to the address slots struct.
- addr – Device address.

static inline void i3c_addr_slots_mark_rsvd(struct i3c_addr_slots *addr_slots, uint8_t addr)

Mark the address as reserved in device list.

Parameters
- addr_slots – Pointer to the address slots struct.
- addr – Device address.

static inline void i3c_addr_slots_mark_i3c(struct i3c_addr_slots *addr_slots, uint8_t addr)

Mark the address as I3C device in device list.

Parameters
- addr_slots – Pointer to the address slots struct.
- addr – Device address.
• **addr_slots** – Pointer to the address slots struct.
• **addr** – Device address.

static inline void i3c_addr_slots_mark_i2c(struct i3c_addr_slots *addr_slots, uint8_t addr)
Mark the address as I2C device in device list.

**Parameters**
• **addr_slots** – Pointer to the address slots struct.
• **addr** – Device address.

```c
#include <addresses.h>
```
Structure to keep track of addresses on I3C bus.

**group i3c_target_device**
I3C Target Device API.

**Functions**

static inline int i3c_target_tx_write(const struct device *dev, uint8_t *buf, uint16_t len)
Write to the target's TX FIFO.

Write to the TX FIFO dev I3C bus driver using the provided buffer and length. Some I3C targets will NACK read requests until data is written to the TX FIFO. This function will write as much as it can to the FIFO return the total number of bytes written. It is then up to the application to utilize the target callbacks to write the remaining data. Negative returns indicate error.

Most of the existing hardware allows simultaneous support for master and target mode. This is however not guaranteed.

**Parameters**
• **dev** – Pointer to the device structure for an I3C controller driver configured in target mode.
• **buf** – Pointer to the buffer
• **len** – Length of the buffer

**Return values**
• **Total** – number of bytes written
• **-ENOTSUP** – Not in Target Mode
• **-ENOSPC** – No space in Tx FIFO
• **-ENOSYS** – If target mode is not implemented

static inline int i3c_target_register(const struct device *dev, struct i3c_target_config *cfg)
Registers the provided config as target device of a controller.

Enable I3C target mode for the dev I3C bus driver using the provided config struct (cfg) containing the functions and parameters to send bus events. The I3C target will be registered at the address provided as i3c_target_config::address struct member. Any I3C bus events related to the target mode will be passed onto I3C target device driver via a set of callback functions provided in the ‘callbacks’ struct member.

Most of the existing hardware allows simultaneous support for master and target mode. This is however not guaranteed.
Parameters

- **dev** – Pointer to the device structure for an I3C controller driver configured in target mode.
- **cfg** – Config struct with functions and parameters used by the I3C target driver to send bus events

Return values

- 0 – Is successful
- -EINVAL – If parameters are invalid
- -EIO – General input / output error.
- -ENOSYS – If target mode is not implemented

static inline int i3c_target_unregister(const struct device *dev, struct i3c_target_config *cfg)

Unregisters the provided config as target device.

This routine disables I3C target mode for the `dev` I3C bus driver using the provided config struct (cfg) containing the functions and parameters to send bus events.

Parameters

- **dev** – Pointer to the device structure for an I3C controller driver configured in target mode.
- **cfg** – Config struct with functions and parameters used by the I3C target driver to send bus events

Return values

- 0 – Is successful
- -EINVAL – If parameters are invalid
- -ENOSYS – If target mode is not implemented

struct i3c_config_target

#include <target_device.h> Configuration parameters for I3C hardware to act as target device.

This can also be used to configure the controller if it is to act as a secondary controller on the bus.

Public Members

bool enable

If the hardware is to act as a target device on the bus.

uint8_t static_addr

I3C target address.

Used used when operates as secondary controller or as a target device.

uint64_t pid

Provisioned ID.
bool pid_random
    True if lower 32-bit of Provisioned ID is random.
    This sets the bit 32 of Provisioned ID which means the lower 32-bit is random value.

uint8_t bcr
    Bus Characteristics Register (BCR).

uint8_t dcr
    Device Characteristics Register (DCR).

uint16_t max_read_len
    Maximum Read Length (MRL).

uint16_t max_write_len
    Maximum Write Length (MWL).

uint8_t supported_hdr
    Bit mask of supported HDR modes (0 - 7).
    This can be used to enable or disable HDR mode supported by the hardware at runtime.

struct i3c_target_config
    #include <target_device.h> Structure describing a device that supports the I3C target API.
    Instances of this are passed to the i3c_target_register() and i3c_target_unregister() functions to indicate addition and removal of a target device, respective.
    Fields other than node must be initialized by the module that implements the device behavior prior to passing the object reference to i3c_target_register().

Public Members

    sys_snode_t node
        Private, do not modify.

    uint8_t flags
        Flags for the target device defined by I3C_TARGET_FLAGS_* constants.

    uint8_t address
        Address for this target device.

    const struct i3c_target_callbacks *callbacks
        Callback functions.

struct i3c_target_callbacks
    #include <target_device.h>
Public Members

int (*write_requested_cb)(struct i3c_target_config *config)
Function called when a write to the device is initiated.
This function is invoked by the controller when the bus completes a start condition
for a write operation to the address associated with a particular device.
A success return shall cause the controller to ACK the next byte received. An error
return shall cause the controller to NACK the next byte received.

  Param config
  Configuration structure associated with the device to which the operation
  is addressed.

  Return
  0 if the write is accepted, or a negative error code.

int (*write_received_cb)(struct i3c_target_config *config, uint8_t val)
Function called when a write to the device is continued.
This function is invoked by the controller when it completes reception of a byte of
data in an ongoing write operation to the device.
A success return shall cause the controller to ACK the next byte received. An error
return shall cause the controller to NACK the next byte received.

  Param config
  Configuration structure associated with the device to which the operation
  is addressed.

  Param val
  the byte received by the controller.

  Return
  0 if more data can be accepted, or a negative error code.

int (*read_requested_cb)(struct i3c_target_config *config, uint8_t *val)
Function called when a read from the device is initiated.
This function is invoked by the controller when the bus completes a start condition
for a read operation from the address associated with a particular device.
The value returned in val will be transmitted. A success return shall cause the
controller to react to additional read operations. An error return shall cause the
controller to ignore bus operations until a new start condition is received.

  Param config
  Configuration structure associated with the device to which the operation
  is addressed.

  Param val
  Pointer to storage for the first byte of data to return for the read request.

  Return
  0 if more data can be requested, or a negative error code.

int (*read_processed_cb)(struct i3c_target_config *config, uint8_t *val)
Function called when a read from the device is continued.
This function is invoked by the controller when the bus is ready to provide addi-
tional data for a read operation from the address associated with the device device.
The value returned in val will be transmitted. A success return shall cause the
controller to react to additional read operations. An error return shall cause the
controller to ignore bus operations until a new start condition is received.
**Param config**
Configuration structure associated with the device to which the operation is addressed.

**Param val**
Pointer to storage for the next byte of data to return for the read request.

**Return**
0 if data has been provided, or a negative error code.

```c
int (*stop_cb)(struct i3c_target_config *config)
```

Function called when a stop condition is observed after a start condition addressed to a particular device.

This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device. After the function returns the controller shall enter a state where it is ready to react to new start conditions.

**Param config**
Configuration structure associated with the device to which the operation is addressed.

**Return**
Ignored.

```c
struct i3c_target_driver_api
#include <target_device.h>
```

### 7.5.26 Inter-Integrated Circuit (I2C) Bus

**Overview**

**Note:** The terminology used in Zephyr I2C APIs follows that of the NXP I2C Bus Specification Rev 7.0. These changed from previous revisions as of its release October 1, 2021.

**I2C** (Inter-Integrated Circuit, pronounced “eye squared see”) is a commonly-used two-signal shared peripheral interface bus. Many system-on-chip solutions provide controllers that communicate on an I2C bus. Devices on the bus can operate in two roles: as a “controller” that initiates transactions and controls the clock, or as a “target” that responds to transaction commands. A I2C controller on a given SoC will generally support the controller role, and some will also support the target mode. Zephyr has API for both roles.

**I2C Controller API**  Zephyr's I2C controller API is used when an I2C peripheral controls the bus, in particular the start and stop conditions and the clock. This is the most common mode, used to interact with I2C devices like sensors and serial memory.

This API is supported in all in-tree I2C peripheral drivers and is considered stable.

**I2C Target API**  Zephyr's I2C target API is used when an I2C peripheral responds to transactions initiated by a different controller on the bus. It might be used for a Zephyr application with transducer roles that are controlled by another device such as a host processor.

This API is supported in very few in-tree I2C peripheral drivers. The API is considered experimental, as it is not compatible with the capabilities of all I2C peripherals supported in controller mode.
Configuration Options

Related configuration options:

- CONFIG_I2C

API Reference

*group i2c_interface*

I2C Interface.

**Defines**

**I2C_SPEED_STANDARD**

I2C Standard Speed: 100 kHz.

**I2C_SPEED_FAST**

I2C Fast Speed: 400 kHz.

**I2C_SPEED_FAST_PLUS**

I2C Fast Plus Speed: 1 MHz.

**I2C_SPEED_HIGH**

I2C High Speed: 3.4 MHz.

**I2C_SPEED_ULTRA**

I2C Ultra Fast Speed: 5 MHz.

**I2C_SPEED_DT**

Device Tree specified speed.

**I2C_SPEED_SHIFT**

**I2C_SPEED_SET(speed)**

**I2C_SPEED_MASK**

**I2C_SPEED_GET(cfg)**

**I2C_ADDR_10_BITS**

Use 10-bit addressing.

DEPRECATED - Use I2C_MSG_ADDR_10_BITS instead.

**I2C_MODE_CONTROLLER**

Peripheral to act as Controller.
I2C_DT_SPEC_GET_ON_I3C(node_id)
Structure initializer for i2c_dt_spec from devicetree (on I3C bus)
This helper macro expands to a static initializer for a struct i2c_dt_spec by reading the relevant bus and address data from the devicetree.

Parameters
• node_id – Devicetree node identifier for the I2C device whose struct i2c_dt_spec to create an initializer for

I2C_DT_SPEC_GET_ON_I2C(node_id)
Structure initializer for i2c_dt_spec from devicetree (on I2C bus)
This helper macro expands to a static initializer for a struct i2c_dt_spec by reading the relevant bus and address data from the devicetree.

Parameters
• node_id – Devicetree node identifier for the I2C device whose struct i2c_dt_spec to create an initializer for

I2C_DT_SPEC_GET(node_id)
Structure initializer for i2c_dt_spec from devicetree.
This helper macro expands to a static initializer for a struct i2c_dt_spec by reading the relevant bus and address data from the devicetree.

Parameters
• node_id – Devicetree node identifier for the I2C device whose struct i2c_dt_spec to create an initializer for

I2C_DT_SPEC_INST_GET(inst)
Structure initializer for i2c_dt_spec from devicetree instance.
This is equivalent to I2C_DT_SPEC_GET(DT_DRV_INST(inst)).

Parameters
• inst – Devicetree instance number

I2C_MSG_WRITE
Write message to I2C bus.

I2C_MSG_READ
Read message from I2C bus.

I2C_MSG_STOP
Send STOP after this message.

I2C_MSG_RESTART
RESTART I2C transaction for this message.

Note: Not all I2C drivers have or require explicit support for this feature. Some drivers require this be present on a read message that follows a write, or vice-versa. Some drivers will merge adjacent fragments into a single transaction using this flag; some will not.
I2C_MSG_ADDR_10_BITS
Use 10-bit addressing for this message.

Note: Not all SoC I2C implementations support this feature.

I2C_TARGET_FLAGS_ADDR_10_BITS
Target device responds to 10-bit addressing.

I2C_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, level, prio, api, ...)
Like DEVICE_DT_DEFINE() with I2C specifics.
Defines a device which implements the I2C API. May generate a custom device_state container struct and init_fn wrapper when needed depending on I2C CONFIG_I2C_STATS.

Parameters
• node_id – The devicetree node identifier.
• init_fn – Name of the init function of the driver. Can be NULL.
• pm – PM device resources reference (NULL if device does not use PM).
• data – Pointer to the device's private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• level – The initialization level. See SYS_INIT() for details.
• prio – Priority within the selected initialization level. See SYS_INIT() for details.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

I2C_DEVICE_DT_INST_DEFINE(inst, ...)
Like I2C_DEVICE_DT_DEFINE() for an instance of a DT_DRV_COMPAT compatible.

Parameters
• inst – instance number. This is replaced by DT_DRV_COMPAT(inst ) in the call to I2C_DEVICE_DT_DEFINE().
• ... – other parameters as expected by I2C_DEVICE_DT_DEFINE().

I2C_DT_IODEV_DEFINE(name, node_id)
Define an iodev for a given dt node on the bus.
These do not need to be shared globally but doing so will save a small amount of memory.

Parameters
• name – Symbolic name of the iodev to define
• node_id – Devicetree node identifier

Typedefs
typedef void (*i2c_callback_t)(const struct device *dev, int result, void *data)
I2C callback for asynchronous transfer requests.

**Param dev**
I2C device which is notifying of transfer completion or error

**Param result**
Result code of the transfer request. 0 is success, -errno for failure.

**Param data**
Transfer requester supplied data which is passed along to the callback.

typedef int (*i2c_target_writeRequested_cb_t)(struct i2c_target_config *config)
Function called when a write to the device is initiated.
This function is invoked by the controller when the bus completes a start condition for a write operation to the address associated with a particular device.
A success return shall cause the controller to ACK the next byte received. An error return shall cause the controller to NACK the next byte received.

**Param config**
The configuration structure associated with the device to which the operation is addressed.

**Return**
0 if the write is accepted, or a negative error code.

typedef int (*i2c_target_writeReceived_cb_t)(struct i2c_target_config *config, uint8_t val)
Function called when a write to the device is continued.
This function is invoked by the controller when it completes reception of a byte of data in an ongoing write operation to the device.
A success return shall cause the controller to ACK the next byte received. An error return shall cause the controller to NACK the next byte received.

**Param config**
The configuration structure associated with the device to which the operation is addressed.

**Param val**
The byte received by the controller.

**Return**
0 if more data can be accepted, or a negative error code.

typedef int (*i2c_target_readRequested_cb_t)(struct i2c_target_config *config, uint8_t *val)
Function called when a read from the device is initiated.
This function is invoked by the controller when the bus completes a start condition for a read operation from the address associated with a particular device.
The value returned in `val` will be transmitted. A success return shall cause the controller to react to additional read operations. An error return shall cause the controller to ignore bus operations until a new start condition is received.

**Param config**
The configuration structure associated with the device to which the operation is addressed.
**Param val**

pointer to storage for the first byte of data to return for the read request.

**Return**

0 if more data can be requested, or a negative error code.

```c
typedef int (*i2c_target_read_processed_cb_t)(struct i2c_target_config *config, uint8_t *val)
```

Function called when a read from the device is continued.
This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device.
The value returned in *val will be transmitted. A success return shall cause the controller to react to additional read operations. An error return shall cause the controller to ignore bus operations until a new start condition is received.

**Param config**

the configuration structure associated with the device to which the operation is addressed.

**Param val**

pointer to storage for the next byte of data to return for the read request.

**Return**

0 if data has been provided, or a negative error code.

```c
typedef int (*i2c_target_stop_cb_t)(struct i2c_target_config *config)
```

Function called when a stop condition is observed after a start condition addressed to a particular device.
This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device. After the function returns the controller shall enter a state where it is ready to react to new start conditions.

**Param config**

the configuration structure associated with the device to which the operation is addressed.

**Return**

Ignored.

**Functions**

```c
static inline bool i2c_is_ready_dt(const struct i2c_dt_spec *spec)
```

Validate that I2C bus is ready.

**Parameters**

- `spec` – I2C specification from devicetree

**Return values**

- `true` – if the I2C bus is ready for use.
- `false` – if the I2C bus is not ready for use.

```c
void i2c_dump_msgs_rw(const struct device *dev, const struct i2c_msg *msgs, uint8_t num_msgs, uint16_t addr, bool dump_read)
```

Dump out an I2C message.
Dumps out a list of I2C messages. For any that are writes (W), the data is displayed in hex. Setting dump_read will dump the data for read messages too, which only makes sense when called after the messages have been processed.

It looks something like this (with name “testing”):

```
D: I2C msg: testing, addr=56
D:  W len=01: 06
D:  W len=0e:
D: contents:
D: 00 01 02 03 04 05 06 07 |........
D: 08 09 0a 0b 0c 0d |......
D:  W len=01: 0f
D:  R len=01: 6c
```

**Parameters**

- **dev** – Target for the messages being sent. Its name will be printed in the log.
- **msgs** – Array of messages to dump.
- **num_msgs** – Number of messages to dump.
- **addr** – Address of the I2C target device.
- **dump_read** – Dump data from I2C reads, otherwise only writes have data dumped.

```c
static inline void i2c_dump_msgs(const struct device* dev, const struct i2c_msg* msgs,
                                 uint8_t num_msgs, uint16_t addr)
```

Dump out an I2C message, before it is executed.

This is equivalent to:

```c
i2c_dump_msgs_rw(dev, msgs, num_msgs, addr, false);
```

The read messages’ data isn’t dumped.

**Parameters**

- **dev** – Target for the messages being sent. Its name will be printed in the log.
- **msgs** – Array of messages to dump.
- **num_msgs** – Number of messages to dump.
- **addr** – Address of the I2C target device.

```c
static inline void i2c_xfer_stats(const struct device* dev, struct i2c_msg* msgs,
                                   uint8_t num_msgs)
```

Updates the i2c stats for i2c transfers.

**Parameters**

- **dev** – I2C device to update stats for
- **msgs** – Array of struct `i2c_msg`
- **num_msgs** – Number of i2c_msgs

```c
int i2c_configure(const struct device* dev, uint32_t dev_config)
```

Configure operation of a host controller.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
• dev_config – Bit-packed 32-bit value to the device runtime configuration for the I2C controller.

Return values
• 0 – If successful.
• -EIO – General input / output error, failed to configure device.

int i2c_get_config(const struct device *dev, uint32_t *dev_config)
Get configuration of a host controller.

This routine provides a way to get current configuration. It is allowed to call the function before i2c_configure, because some I2C ports can be configured during init process. However, if the I2C port is not configured, i2c_get_config returns an error.

i2c_get_config can return cached config or probe hardware, but it has to be up to date with current configuration.

Parameters
• dev – Pointer to the device structure for the driver instance.
• dev_config – Pointer to return bit-packed 32-bit value of the I2C controller configuration.

Return values
• 0 – If successful.
• -EIO – General input / output error.
• -ERANGE – Configured I2C frequency is invalid.
• -ENOSYS – If get config is not implemented

int i2c_transfer(const struct device *dev, struct i2c_msg *msgs, uint8_t num_msgs, uint16_t addr)
Perform data transfer to another I2C device in controller mode.

This routine provides a generic interface to perform data transfer to another I2C device synchronously. Use i2c_read()/i2c_write() for simple read or write.

The array of message msgs must not be NULL. The number of message num_msgs may be zero, in which case no transfer occurs.

Note: Not all scatter/gather transactions can be supported by all drivers. As an example, a gather write (multiple consecutive i2c_msg buffers all configured for I2C_MSG_WRITE) may be packed into a single transaction by some drivers, but others may emit each fragment as a distinct write transaction, which will not produce the same behavior. See the documentation of struct i2c_msg for limitations on support for multi-message bus transactions.

Parameters
• dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
• msgs – Array of messages to transfer.
• num_msgs – Number of messages to transfer.
• addr – Address of the I2C target device.

Return values
• 0 – If successful.
• -EIO – General input / output error.

static inline int i2c_transfer_cb(const struct device *dev, struct i2c_msg *msgs, uint8_t num_msgs, uint16_t addr, i2c_callback_t cb, void *userdata)

Perform data transfer to another I2C device in controller mode.
This routine provides a generic interface to perform data transfer to another I2C device asynchronously with a callback completion.

See also:
i2c_transfer()

Function properties (list may not be complete)
isr-ok

Parameters
• dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
• msgs – Array of messages to transfer; must live until callback completes.
• num_msgs – Number of messages to transfer.
• addr – Address of the I2C target device.
• cb – Function pointer for completion callback.
• userdata – Userdata passed to callback.

Return values
• 0 – If successful.
• -EIO – General input / output error.
• -ENOSYS – If transfer async is not implemented
• -EWOULDBLOCK – If the device is temporarily busy doing another transfer

static inline int i2c_transfer_cb_dt(const struct i2c_dt_spec *spec, struct i2c_msg *msgs, uint8_t num_msgs, i2c_callback_t cb, void *userdata)

Perform data transfer to another I2C device in master mode asynchronously.
This is equivalent to:

i2c_transfer_cb(spec->bus, msgs, num_msgs, spec->addr, cb, userdata);

Parameters
• spec – I2C specification from devicetree.
• msgs – Array of messages to transfer.
• num_msgs – Number of messages to transfer.
• cb – Function pointer for completion callback.
• userdata – Userdata passed to callback.

Returns
a value from i2c_transfer_cb()
static inline int i2c_write_read_cb(const struct device *dev, struct i2c_msg *msgs, uint8_t num_msgs, uint16_t addr, const void *write_buf, size_t num_write, void *read_buf, size_t num_read, i2c_callback_t cb, void *userdata)

Write then read data from an I2C device asynchronously.

This supports the common operation “this is what I want”, “now give it to me” transaction pair through a combined write-then-read bus transaction but using i2c_transfer_cb. This helper function expects caller to pass a message pointer with 2 and only 2 size.

Parameters

• dev – Pointer to the device structure for an I2C controller driver configured in master mode.
• msgs – Array of messages to transfer.
• num_msgs – Number of messages to transfer.
• addr – Address of the I2C device
• write_buf – Pointer to the data to be written
• num_write – Number of bytes to write
• read_buf – Pointer to storage for read data
• num_read – Number of bytes to read
• cb – Function pointer for completion callback.
• userdata – Userdata passed to callback.

Return values

• 0 – if successful
• negative – on error.

static inline int i2c_write_read_cb_dt(const struct i2c_dt_spec *spec, struct i2c_msg *msgs, uint8_t num_msgs, const void *write_buf, size_t num_write, void *read_buf, size_t num_read, i2c_callback_t cb, void *userdata)

Write then read data from an I2C device asynchronously.

This is equivalent to:

```
i2c_write_read_cb(spec->bus, msgs, num_msgs,
   spec->addr, write_buf, num_write, read_buf, num_read);
```

Parameters

• spec – I2C specification from devicetree.
• msgs – Array of messages to transfer.
• num_msgs – Number of messages to transfer.
• write_buf – Pointer to the data to be written
• num_write – Number of bytes to write
• read_buf – Pointer to storage for read data
• num_read – Number of bytes to read
• cb – Function pointer for completion callback.
• userdata – Userdata passed to callback.

Returns
a value from i2c_write_read_cb()

static inline int i2c_transfer_signal(const struct device *dev, struct i2c_msg *msgs,
uint8_t num_msgs, uint16_t addr, struct k_poll_signal *sig)

Perform data transfer to another I2C device in controller mode.
This routine provides a generic interface to perform data transfer to another I2C device
asynchronously with a k_poll_signal completion.

See also:
i2c_transfer_cb()

Function properties (list may not be complete)
isr-ok

Parameters
• dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
• msgs – Array of messages to transfer, must live until callback completes.
• num_msgs – Number of messages to transfer.
• addr – Address of the I2C target device.
• sig – Signal to notify of transfer completion.

Return values
• 0 – If successful.
• -EIO – General input / output error.
• -ENOSYS – If transfer async is not implemented
• -EWOULDBLOCK – If the device is temporarily busy doing another transfer

static inline void i2c_iodev_submit(struct rtio_iodev_sqe *iodev_sqe)
Submit request(s) to an I2C device with RTIO.

Parameters
• iodev_sqe – Prepared submissions queue entry connected to an iodev defined by I2C_DT_IODEV_DEFINE.

struct rtio_sqe *i2c_rtio_copy(struct rtio *r, struct rtio_iodev *iodev, const struct i2c_msg *msgs, uint8_t num_msgs)

Copy the i2c_msgs into a set of RTIO requests.

Parameters
• r – RTIO context
• iodev – RTIO IODEv to target for the submissions
• msgs – Array of messages
• num_msgs – Number of i2c msgs in array
Return values

- sqe – Last submission in the queue added
- NULL – Not enough memory in the context to copy the requests

static inline int i2c_transfer_dt(const struct i2c_dt_spec *spec, struct i2c_msg *msgs, uint8_t num_msgs)

Perform data transfer to another I2C device in controller mode.

This is equivalent to:

```c
i2c_transfer(spec->bus, msgs, num_msgs, spec->addr);
```

Parameters

- spec – I2C specification from devicetree.
- msgs – Array of messages to transfer.
- num_msgs – Number of messages to transfer.

Returns

a value from `i2c_transfer()`

int i2c_recover_bus(const struct device *dev)

Recover the I2C bus.

Attempt to recover the I2C bus.

Parameters

- dev – Pointer to the device structure for an I2C controller driver configured in controller mode.

Return values

- 0 – If successful
- -EBUSY – If bus is not clear after recovery attempt.
- -EIO – General input / output error.
- -ENOSYS – If bus recovery is not implemented

static inline int i2c_target_register(const struct device *dev, struct i2c_target_config *cfg)

Registers the provided config as Target device of a controller.

Enable I2C target mode for the ‘dev’ I2C bus driver using the provided ‘config’ struct containing the functions and parameters to send bus events. The I2C target will be registered at the address provided as ‘address’ struct member. Addressing mode - 7 or 10 bit - depends on the ‘flags‘ struct member. Any I2C bus events related to the target mode will be passed onto I2C target device driver via a set of callback functions provided in the ‘callbacks‘ struct member.

Most of the existing hardware allows simultaneous support for controller and target mode. This is however not guaranteed.

Parameters

- dev – Pointer to the device structure for an I2C controller driver configured in target mode.
- cfg – Config struct with functions and parameters used by the I2C driver to send bus events

Return values
• 0 – Is successful
• -EINVAL – If parameters are invalid
• -EIO – General input / output error.
• -ENOSYS – If target mode is not implemented

static inline int i2c_target_unregister(const struct device *dev, struct i2c_target_config *cfg)

Unregisters the provided config as Target device.
This routine disables I2C target mode for the ‘dev’ I2C bus driver using the provided ‘config’ struct containing the functions and parameters to send bus events.

Parameters
• dev – Pointer to the device structure for an I2C controller driver configured in target mode.
• cfg – Config struct with functions and parameters used by the I2C driver to send bus events

Return values
• 0 – Is successful
• -EINVAL – If parameters are invalid
• -ENOSYS – If target mode is not implemented

int i2c_target_driver_register(const struct device *dev)

Instructs the I2C Target device to register itself to the I2C Controller.
This routine instructs the I2C Target device to register itself to the I2C Controller via its parent controller’s i2c_target_register() API.

Parameters
• dev – Pointer to the device structure for the I2C target device (not itself an I2C controller).

Return values
• 0 – Is successful
• -EINVAL – If parameters are invalid
• -EIO – General input / output error.

int i2c_target_driver_unregister(const struct device *dev)

Instructs the I2C Target device to unregister itself from the I2C Controller.
This routine instructs the I2C Target device to unregister itself from the I2C Controller via its parent controller’s i2c_target_unregister() API.

Parameters
• dev – Pointer to the device structure for the I2C target device (not itself an I2C controller).

Return values
• 0 – Is successful
• -EINVAL – If parameters are invalid

static inline int i2c_write(const struct device *dev, const uint8_t *buf, uint32_t num_bytes, uint16_t addr)

Write a set amount of data to an I2C device.
This routine writes a set amount of data synchronously.
Parameters

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `buf` – Memory pool from which the data is transferred.
- `num_bytes` – Number of bytes to write.
- `addr` – Address to the target I2C device for writing.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.

static inline int i2c_write_dt(const struct i2c_dt_spec *spec, const uint8_t *buf, uint32_t num_bytes)

Write a set amount of data to an I2C device.

This is equivalent to:

```c
i2c_write(spec->bus, buf, num_bytes, spec->addr);
```

Parameters

- `spec` – I2C specification from devicetree.
- `buf` – Memory pool from which the data is transferred.
- `num_bytes` – Number of bytes to write.

Returns a value from `i2c_write()`

static inline int i2c_read(const struct device *dev, uint8_t *buf, uint32_t num_bytes, uint16_t addr)

Read a set amount of data from an I2C device.

This routine reads a set amount of data synchronously.

Parameters

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `buf` – Memory pool that stores the retrieved data.
- `num_bytes` – Number of bytes to read.
- `addr` – Address of the I2C device being read.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.

static inline int i2c_read_dt(const struct i2c_dt_spec *spec, uint8_t *buf, uint32_t num_bytes)

Read a set amount of data from an I2C device.

This is equivalent to:

```c
i2c_read(spec->bus, buf, num_bytes, spec->addr);
```
static inline int i2c_write_read(const struct device *dev, uint16_t addr, const void *write_buf, size_t num_write, void *read_buf, size_t num_read)

Write then read data from an I2C device.

This supports the common operation “this is what I want”, “now give it to me” transaction pair through a combined write-then-read bus transaction.

Parameters

• dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
• addr – Address of the I2C device
• write_buf – Pointer to the data to be written
• num_write – Number of bytes to write
• read_buf – Pointer to storage for read data
• num_read – Number of bytes to read

Return values

• 0 – if successful
• negative – on error.

static inline int i2c_write_read_dt(const struct i2c_dt_spec *spec, const void *write_buf, size_t num_write, void *read_buf, size_t num_read)

Write then read data from an I2C device.

This is equivalent to:

```c
i2c_write_read(spec->bus, spec->addr, write_buf, num_write, read_buf, num_read);
```

Parameters

• spec – I2C specification from devicetree.
• write_buf – Pointer to the data to be written
• num_write – Number of bytes to write
• read_buf – Pointer to storage for read data
• num_read – Number of bytes to read

Returns

a value from i2c_write_read()
static inline int i2c_burst_read(const struct device *dev, uint16_t dev_addr, uint8_t start_addr, uint8_t *buf, uint32_t num_bytes)

Read multiple bytes from an internal address of an I2C device.

This routine reads multiple bytes from an internal address of an I2C device synchronously.

Instances of this may be replaced by i2c_write_read().

Parameters
- dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
- dev_addr – Address of the I2C device for reading.
- start_addr – Internal address from which the data is being read.
- buf – Memory pool that stores the retrieved data.
- num_bytes – Number of bytes being read.

Return values
- 0 – If successful.
- -EIO – General input/output error.

static inline int i2c_burst_read_dt(const struct i2c_dt_spec *spec, uint8_t start_addr, uint8_t *buf, uint32_t num_bytes)

Read multiple bytes from an internal address of an I2C device.

This is equivalent to:

```c
i2c_burst_read(spec->bus, spec->addr, start_addr, buf, num_bytes);
```

Parameters
- spec – I2C specification from devicetree.
- start_addr – Internal address from which the data is being read.
- buf – Memory pool that stores the retrieved data.
- num_bytes – Number of bytes to read.

Returns
a value from i2c_burst_read()

static inline int i2c_burst_write(const struct device *dev, uint16_t dev_addr, uint8_t start_addr, const uint8_t *buf, uint32_t num_bytes)

Write multiple bytes to an internal address of an I2C device.

This routine writes multiple bytes to an internal address of an I2C device synchronously.

Warning: The combined write synthesized by this API may not be supported on all I2C devices. Uses of this API may be made more portable by replacing them with calls to i2c_write() passing a buffer containing the combined address and data.

Parameters
- dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
- dev_addr – Address of the I2C device for writing.
• **start_addr** – Internal address to which the data is being written.
• **buf** – Memory pool from which the data is transferred.
• **num_bytes** – Number of bytes being written.

**Return values**
• **0** – If successful.
• **-EIO** – General input / output error.

```c
static inline int i2c_burst_write_dt(const struct i2c_dt_spec *spec, uint8_t start_addr,
                                      const uint8_t *buf, uint32_t num_bytes)
```

Write multiple bytes to an internal address of an I2C device.

This is equivalent to:

```c
i2c_burst_write(spec->bus, spec->addr, start_addr, buf, num_bytes);
```

**Parameters**
• **spec** – I2C specification from devicetree.
• **start_addr** – Internal address to which the data is being written.
• **buf** – Memory pool from which the data is transferred.
• **num_bytes** – Number of bytes being written.

**Returns**
a value from `i2c_burst_write()`

```c
static inline int i2c_reg_read_byte_dt(const struct i2c_dt_spec *spec, uint8_t reg_addr,
                                       uint8_t *value)
```

Read internal register of an I2C device.

This routine reads the value of an 8-bit internal register of an I2C device synchronously.

**Parameters**
• **reg_addr** – Address of the internal register being read.

**Return values**
• **0** – If successful.
• **-EIO** – General input / output error.

```c
static inline int i2c_reg_read_byte_dt(const struct i2c_dt_spec *spec, uint8_t reg_addr,
                                       uint8_t *value)
```

Read internal register of an I2C device.

This is equivalent to:

```c
i2c_reg_read_byte(spec->bus, spec->addr, reg_addr, value);
```

**Parameters**
• **spec** – I2C specification from devicetree.
• **reg_addr** – Address of the internal register being read.
• **value** – Memory pool that stores the retrieved register value.

**Returns**

a value from `i2c_reg_read_byte()

static inline int `i2c_reg_write_byte` (const struct `device` *dev, uint16_t dev_addr, uint8_t reg_addr, uint8_t value)

Write internal register of an I2C device.

This routine writes a value to an 8-bit internal register of an I2C device synchronously.

**Note:** This function internally combines the register and value into a single bus transaction.

**Parameters**

• **dev** – Pointer to the device structure for an I2C controller driver configured in controller mode.

• **dev_addr** – Address of the I2C device for writing.

• **reg_addr** – Address of the internal register being written.

• **value** – Value to be written to internal register.

**Return values**

• **0** – If successful.

• **-EIO** – General input / output error.

static inline int `i2c_reg_write_byte_dt` (const struct `i2c_dt_spec` *spec, uint8_t reg_addr, uint8_t value)

Write internal register of an I2C device.

This is equivalent to:

```c
i2c_reg_write_byte(spec->bus, spec->addr, reg_addr, value);
```

**Parameters**

• **spec** – I2C specification from devicetree.

• **reg_addr** – Address of the internal register being written.

• **value** – Value to be written to internal register.

**Returns**

a value from `i2c_reg_write_byte()

static inline int `i2c_reg_update_byte` (const struct `device` *dev, uint8_t dev_addr, uint8_t reg_addr, uint8_t mask, uint8_t value)

Update internal register of an I2C device.

This routine updates the value of a set of bits from an 8-bit internal register of an I2C device synchronously.

**Note:** If the calculated new register value matches the value that was read this function will not generate a write operation.

**Parameters**
• dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
• dev_addr – Address of the I2C device for updating.
• reg_addr – Address of the internal register being updated.
• mask – Bitmask for updating internal register.
• value – Value for updating internal register.

Return values
• 0 – If successful.
• -EIO – General input / output error.

static inline int i2c_reg_update_byte_dt(const struct i2c_dt_spec *spec, uint8_t reg_addr, uint8_t mask, uint8_t value)

Update internal register of an I2C device.
This is equivalent to:

i2c_reg_update_byte(spec->bus, spec->addr, reg_addr, mask, value);

Parameters
• spec – I2C specification from devicetree.
• reg_addr – Address of the internal register being updated.
• mask – Bitmask for updating internal register.
• value – Value for updating internal register.

Returns
  a value from i2c_reg_update_byte()

Variables

const struct rtio_iodev_api i2c_iodev_api

struct i2c_dt_spec
  #include <i2c.h> Complete I2C DT information.

  Param bus
  is the I2C bus

  Param addr
  is the target address

struct i2c_msg
  #include <i2c.h> One I2C Message.

This defines one I2C message to transact on the I2C bus.

Note: Some of the configurations supported by this API may not be supported by specific SoC I2C hardware implementations, in particular features related to bus transactions intended to read or write data from different buffers within a single transaction.
Invocations of \texttt{i2c_transfer()} may not indicate an error when an unsupported configuration is encountered. In some cases drivers will generate separate transactions for each message fragment, with or without presence of \texttt{I2C\_MSG\_RESTART} in \texttt{flags}.

**Public Members**

```
uint8_t *buf
   Data buffer in bytes.
```

```
uint32_t len
   Length of buffer in bytes.
```

```
uint8_t flags
   Flags for this message.
```

```
struct \texttt{i2c\_target\_callbacks}
   #include \texttt{<i2c\_h>}
   Structure providing callbacks to be implemented for devices that supports the I2C target API.
   This structure may be shared by multiple devices that implement the same API at different addresses on the bus.
```

```
struct \texttt{i2c\_target\_config}
   #include \texttt{<i2c\_h>}
   Structure describing a device that supports the I2C target API.
   Instances of this are passed to the \texttt{i2c\_target\_register()} and \texttt{i2c\_target\_unregister()} functions to indicate addition and removal of a target device, respective.
   Fields other than \texttt{node} must be initialized by the module that implements the device behavior prior to passing the object reference to \texttt{i2c\_target\_register()}. 
```

**Public Members**

```
sys\_snode\_t node
   Private, do not modify.
```

```
uint8_t flags
   Flags for the target device defined by I2C\_TARGET\_FLAGS\_* constants.
```

```
uint16_t address
   Address for this target device.
```

```
const struct \texttt{i2c\_target\_callbacks} *callbacks
   Callback functions.
```

```
struct \texttt{i2c\_device\_state}
   #include \texttt{<i2c\_h>}
   I2C specific device state which allows for i2c device class specific additions.
```

---

### group ipm_interface

IPM Interface.

#### Typedefs

typedef void (*ipm_callback_t)(const struct device *ipmdev, void *user_data, uint32_t id, volatile void *data)

Callback API for incoming IPM messages.

These callbacks execute in interrupt context. Therefore, use only interrupt-safe APIs. Registration of callbacks is done via `ipm_register_callback`

**Param ipmdev**
Driver instance

**Param user_data**
Pointer to some private data provided at registration time.

**Param id**
Message type identifier.

**Param data**
Message data pointer. The correct amount of data to read out must be inferred using the message id/upper level protocol.

typedef int (*ipm_send_t)(const struct device *ipmdev, int wait, uint32_t id, const void *data, int size)
Callback API to send IPM messages.
See ipm_send() for argument definitions.

typedef int (*ipm_max_data_size_get_t)(const struct device *ipmdev)
Callback API to get maximum data size.
See ipm_max_data_size_get() for argument definitions.

typedef uint32_t (*ipm_max_id_val_get_t)(const struct device *ipmdev)
Callback API to get the ID’s maximum value.
See ipm_max_id_val_get() for argument definitions.

typedef void (*ipm_register_callback_t)(const struct device *port, ipm_callback_t cb, void *user_data)
Callback API upon registration.
See ipm_register_callback() for argument definitions.

typedef int (*ipm_set_enabled_t)(const struct device *ipmdev, int enable)
Callback API upon enablement of interrupts.
See ipm_set_enabled() for argument definitions.

typedef void (*ipm_complete_t)(const struct device *ipmdev)
Callback API upon command completion.
See ipm_complete() for argument definitions.

Functions

int ipm_send(const struct device *ipmdev, int wait, uint32_t id, const void *data, int size )
Try to send a message over the IPM device.
A message is considered consumed once the remote interrupt handler finishes. If there is deferred processing on the remote side, or if outgoing messages must be queued and wait on an event/semaphore, a high-level driver can implement that.
There are constraints on how much data can be sent or the maximum value of id. Use the ipm_max_data_size_get and ipm_max_id_val_get routines to determine them.
The size parameter is used only on the sending side to determine the amount of data to put in the message registers. It is not passed along to the receiving side. The upper-level protocol dictates the amount of data read back.

Parameters

• ipmdev – Driver instance
• wait – If nonzero, busy-wait for remote to consume the message. The message is considered consumed once the remote interrupt handler finishes. If there is deferred processing on the remote side, or you would like to queue outgoing messages and wait on an event/semaphore, you can implement that in a high-level driver
• id – Message identifier. Values are constrained by ipm_max_data_size_get since many boards only allow for a subset of bits in a 32-bit register to store the ID.
• **data** – Pointer to the data sent in the message.
• **size** – Size of the data.

**Return values**
• **-EBUSY** – If the remote hasn’t yet read the last data sent.
• **-EMSGSIZE** – If the supplied data size is unsupported by the driver.
• **-EINVAL** – If there was a bad parameter, such as: too-large id value. or the device isn’t an outbound IPM channel.
• **0** – On success.

```c
static inline void ipm_register_callback(const struct device *ipmdev, ipm_callback_t cb, void *user_data)
```

Register a callback function for incoming messages.

**Parameters**
• **ipmdev** – Driver instance pointer.
• **cb** – Callback function to execute on incoming message interrupts.
• **user_data** – Application-specific data pointer which will be passed to the callback function when executed.

```c
int ipm_max_data_size_get(const struct device *ipmdev)
```

Return the maximum number of bytes possible in an outbound message.

IPM implementations vary on the amount of data that can be sent in a single message since the data payload is typically stored in registers.

**Parameters**
• **ipmdev** – Driver instance pointer.

**Returns**
Maximum possible size of a message in bytes.

```c
uint32_t ipm_max_id_val_get(const struct device *ipmdev)
```

Return the maximum id value possible in an outbound message.

Many IPM implementations store the message’s ID in a register with some bits reserved for other uses.

**Parameters**
• **ipmdev** – Driver instance pointer.

**Returns**
Maximum possible value of a message ID.

```c
int ipm_set_enabled(const struct device *ipmdev, int enable)
```

Enable interrupts and callbacks for inbound channels.

**Parameters**
• **ipmdev** – Driver instance pointer.
• **enable** – Set to 0 to disable and to nonzero to enable.

**Return values**
• **0** – On success.
• **-EINVAL** – If it isn’t an inbound channel.
void ipm_complete(const struct device *ipmdev)
    Signal asynchronous command completion.

    Some IPM backends have an ability to deliver a command asynchronously. The call-
    back will be invoked in interrupt context, but the message (including the provided data
    pointer) will stay “active” and unacknowledged until later code (presumably in thread
    mode) calls ipm_complete().

    This function is, obviously, a noop on drivers without async support.

    Parameters
    • ipmdev – Driver instance pointer.

    struct ipm_driver_api
    #include <ipm.h>

7.5.28 Keyboard Scan

Overview

The kscan driver (keyboard scan matrix) is used for detecting a key press in a connected matrix
keyboard or any device with buttons such as joysticks. Typically, matrix keyboards are imple-
mented using a two-dimensional configuration in order to sense several keys. This allows inter-
facing to many keys through fewer physical pins. Keyboard matrix drivers read the rows while
applying power through the columns one at a time with the purpose of detecting key events.
There is no correlation between the physical and electrical layout of keys. For example, the
physical layout may be one array of 16 or fewer keys, which may be electrically connected to a 4
x 4 array. In addition, key values are defined by a keymap provided by the keyboard manufac-
turer.

    KSCAN APIs.
## Typedefs

typedef void (*kscan_callback_t)(const struct device *dev, uint32_t row, uint32_t column, bool pressed)

  Keyboard scan callback called when user press/release a key on a matrix keyboard.

  **Param dev**
  Pointer to the device structure for the driver instance.

  **Param row**
  Describes row change.

  **Param column**
  Describes column change.

  **Param pressed**
  Describes the kind of key event.

## Functions

### int kscan_config(const struct device *dev, kscan_callback_t callback)

  Configure a Keyboard scan instance.

  **Parameters**
  - *dev* – Pointer to the device structure for the driver instance.
  - *callback* – called when keyboard devices reply to a keyboard event such as key pressed/released.

  **Return values**
  - 0 – If successful.
  - Negative – errno code if failure.

### int kscan_enable_callback(const struct device *dev)

  Enables callback.

  **Parameters**
  - *dev* – Pointer to the device structure for the driver instance.

  **Return values**
  - 0 – If successful.
  - Negative – errno code if failure.

### int kscan_disable_callback(const struct device *dev)

  Disables callback.

  **Parameters**
  - *dev* – Pointer to the device structure for the driver instance.

  **Return values**
  - 0 – If successful.
  - Negative – errno code if failure.
7.5.29  Light-Emitting Diode (LED)

Overview

The LED API provides access to Light Emitting Diodes, both in individual and strip form.

Control 9 LEDs connected to an LP5569 driver chip.

**PCA9633 LED**
Control 4 LEDs connected to a PCA9633 driver chip.

**SX1509B RGB LED**
Control an RGB LED connected to an SX1509B driver chip.

```
group led_interface
  LED Interface.
```

Typedefs
typedef int (*led_api_blink)(const struct device *dev, uint32_t led, uint32_t delay_on, uint32_t delay_off)

Callback API for blinking an LED.

See also:
led_blink() for argument descriptions.

typedef int (*led_api_get_info)(const struct device *dev, uint32_t led, const struct led_info **info)

Optional API callback to get LED information.

See also:
led_get_info() for argument descriptions.

typedef int (*led_api_set_brightness)(const struct device *dev, uint32_t led, uint8_t value)

Callback API for setting brightness of an LED.

See also:
led_set_brightness() for argument descriptions.

typedef int (*led_api_set_color)(const struct device *dev, uint32_t led, uint8_t num_colors, const uint8_t *color)

Optional API callback to set the colors of a LED.

See also:
led_set_color() for argument descriptions.

typedef int (*led_api_on)(const struct device *dev, uint32_t led)

Callback API for turning on an LED.

See also:
led_on() for argument descriptions.

typedef int (*led_api_off)(const struct device *dev, uint32_t led)

Callback API for turning off an LED.

See also:
led_off() for argument descriptions.

typedef int (*led_api_write_channels)(const struct device *dev, uint32_t start_channel, uint32_t num_channels, const uint8_t *buf)

Callback API for writing a strip of LED channels.
See also:
*led_api_write_channels()* for arguments descriptions.

## Functions

**int led_blink(const struct device *dev, uint32_t led, uint32_t delay_on, uint32_t delay_off)**

Blink an LED.

This optional routine starts blinking a LED forever with the given time period.

**Parameters**
- **dev** – LED device
- **led** – LED number
- **delay_on** – Time period (in milliseconds) an LED should be ON
- **delay_off** – Time period (in milliseconds) an LED should be OFF

**Returns**
0 on success, negative on error

**int led_get_info(const struct device *dev, uint32_t led, const struct led_info **info)**

Get LED information.

This optional routine provides information about a LED.

**Parameters**
- **dev** – LED device
- **led** – LED number
- **info** – Pointer to a pointer filled with LED information

**Returns**
0 on success, negative on error

**int led_set_brightness(const struct device *dev, uint32_t led, uint8_t value)**

Set LED brightness.

This optional routine sets the brightness of a LED to the given value. Calling this function after *led_blink()* won't affect blinking.

LEDs which can only be turned on or off may provide this function. These should simply turn the LED on if value is nonzero, and off if value is zero.

**Parameters**
- **dev** – LED device
- **led** – LED number
- **value** – Brightness value to set in percent

**Returns**
0 on success, negative on error

**int led_write_channels(const struct device *dev, uint32_t start_channel, uint32_t num_channels, const uint8_t *buf)**

Write/update a strip of LED channels.

This optional routine writes a strip of LED channels to the given array of levels. Therefore it can be used to configure several LEDs at the same time.

Calling this function after *led_blink()* won't affect blinking.
Parameters

• dev – LED device
• start_channel – Absolute number (i.e. not relative to a LED) of the first channel to update.
• num_channels – The number of channels to write/update.
• buf – array of values to configure the channels with. num_channels entries must be provided.

Returns

0 on success, negative on error

int led_set_channel(const struct device *dev, uint32_t channel, uint8_t value)

Set a single LED channel.

This optional routine sets a single LED channel to the given value.

Calling this function after led_blink() won’t affect blinking.

Parameters

• dev – LED device
• channel – Absolute channel number (i.e. not relative to a LED)
• value – Value to configure the channel with

Returns

0 on success, negative on error

int led_set_color(const struct device *dev, uint32_t led, uint8_t num_colors, const uint8_t *color)

Set LED color.

This routine configures all the color channels of a LED with the given color array.

Calling this function after led_blink() won’t affect blinking.

Parameters

• dev – LED device
• led – LED number
• num_colors – Number of colors in the array.
• color – Array of colors. It must be ordered following the color mapping of the LED controller. See the the color_mapping member in struct led_info.

Returns

0 on success, negative on error

int led_on(const struct device *dev, uint32_t led)

Turn on an LED.

This routine turns on an LED

Parameters

• dev – LED device
• led – LED number

Returns

0 on success, negative on error
int led_off(const struct device *dev, uint32_t led)
    Turn off an LED.

This routine turns off an LED

Parameters
   • dev – LED device
   • led – LED number

Returns
    0 on success, negative on error

struct led_info
    #include <led.h> LED information structure.

This structure gathers useful information about LED controller.

    Param label
        LED label.

    Param num_colors
        Number of colors per LED.

    Param index
        Index of the LED on the controller.

    Param color_mapping
        Mapping of the LED colors.

struct led_driver_api
    #include <led.h> LED driver API.

LED Strip
Related code samples

APA102 LED strip
    Control an LED strip using an APA102, Adafruit DotStar, or compatible driver chip.

LPD880x LED strip
    Control an LED strip using an LPD880x-compatible driver chip.

WS2812 LED strip
    Control an LED strip using a WS2812 (or compatible) driver chip.

group led_strip_interface
    LED Strip Interface.

Typedefs

typedef int (*led_api_update_rgb)(const struct device *dev, struct led_rgb *pixels, size_t num_pixels)
    Callback API for updating an RGB LED strip.

See also:
    led_strip_update_rgb() for argument descriptions.
typedef int (*led_api_update_channels)(const struct device *dev, uint8_t *channels, size_t num_channels)

Callback API for updating channels without an RGB interpretation.

See also:
led_strip_update_channels() for argument descriptions.

Functions

static inline int led_strip_update_rgb(const struct device *dev, struct led_rgb *pixels, size_t num_pixels)
Update an LED strip made of RGB pixels.
Important: This routine may overwrite pixels.
This routine immediately updates the strip display according to the given pixels array.

Warning: May overwrite pixels

Parameters
• dev – LED strip device
• pixels – Array of pixel data
• num_pixels – Length of pixels array

Returns
0 on success, negative on error

static inline int led_strip_update_channels(const struct device *dev, uint8_t *channels, size_t num_channels)
Update an LED strip on a per-channel basis.
Important: This routine may overwrite channels.
This routine immediately updates the strip display according to the given channels array. Each channel byte corresponds to an individually addressable color channel or LED. Channels are updated linearly in strip order.

Warning: May overwrite channels

Parameters
• dev – LED strip device
• channels – Array of per-channel data
• num_channels – Length of channels array

Returns
0 on success, negative on error
struct led_rgb
#include <led_strip.h> Color value for a single RGB LED.

Individual strip drivers may ignore lower-order bits if their resolution in any channel is less than a full byte.

Public Members

uint8_t r
Red channel.

uint8_t g
Green channel.

uint8_t b
Blue channel.

struct led_strip_driver_api
#include <led_strip.h> LED strip driver API.

This is the mandatory API any LED strip driver needs to expose.

7.5.30 Management Data Input/Output (MDIO)

Overview

MDIO is a bus that is commonly used to communicate with ethernet PHY devices. Many ethernet MAC controllers also provide hardware to communicate over MDIO bus with a peripheral device. This API is intended to be used primarily by PHY drivers but can also be used by user firmware.

API Reference

group mdio_interface
MDIO Interface.

Functions

void mdio_bus_enable(const struct device *dev)
Enable MDIO bus.

Parameters

• dev – [in] Pointer to the device structure for the controller

void mdio_bus_disable(const struct device *dev)
Disable MDIO bus and tri-state drivers.

Parameters

• dev – [in] Pointer to the device structure for the controller
int mdio_read(const struct device *dev, uint8_t prtad, uint8_t regad, uint16_t *data)
Read from MDIO Bus.

This routine provides a generic interface to perform a read on the MDIO bus.

Parameters
- dev – [in] Pointer to the device structure for the controller
- prtad – [in] Port address
- regad – [in] Register address
- data – Pointer to receive read data

Return values
- 0 – If successful.
- -EIO – General input / output error.
- -ETIMEDOUT – If transaction timed out on the bus
- -ENOSYS – If read is not supported

int mdio_write(const struct device *dev, uint8_t prtad, uint8_t regad, uint16_t data)
Write to MDIO bus.

This routine provides a generic interface to perform a write on the MDIO bus.

Parameters
- dev – [in] Pointer to the device structure for the controller
- prtad – [in] Port address
- regad – [in] Register address
- data – [in] Data to write

Return values
- 0 – If successful.
- -EIO – General input / output error.
- -ETIMEDOUT – If transaction timed out on the bus
- -ENOSYS – If write is not supported

int mdio_read_c45(const struct device *dev, uint8_t prtad, uint8_t devad, uint16_t regad, uint16_t *data)
Read from MDIO Bus using Clause 45 access.

This routine provides an interface to perform a read on the MDIO bus using IEEE 802.3 Clause 45 access.

Parameters
- dev – [in] Pointer to the device structure for the controller
- prtad – [in] Port address
- devad – [in] Device address
- regad – [in] Register address
- data – Pointer to receive read data

Return values
- 0 – If successful.
- -EIO – General input / output error.
-ETIMEDOUT – If transaction timedout on the bus
-ENOSYS – if write using Clause 45 access is not supported

```c
int mdio_write_c45(const struct device *dev, uint8_t prtad, uint8_t devad, uint16_t regad, uint16_t data)
```

Write to MDIO bus using Clause 45 access.

This routine provides an interface to perform a write on the MDIO bus using IEEE 802.3 Clause 45 access.

**Parameters**
- `dev` – [in] Pointer to the device structure for the controller
- `prtad` – [in] Port address
- `devad` – [in] Device address
- `regad` – [in] Register address
- `data` – [in] Data to write

**Return values**
- 0 – If successful.
- -EIO – General input / output error.
- -ETIMEDOUT – If transaction timedout on the bus
- -ENOSYS – if write using Clause 45 access is not supported

  Disable hback-porch area.

MIPI_DSI_MODE_VIDEO_HSA
  Disable hsync-active area.

MIPI_DSI_MODE_VSYNC_FLUSH
  Flush display FIFO on vsync pulse.

MIPI_DSI_MODE_EOT_PACKET
  Disable EoT packets in HS mode.

MIPI_DSI_CLOCK_NON_CONTINUOUS
  Device supports non-continuous clock behavior (DSI spec 5.6.1)
MIPI_DSI_MODE_LPM

Transmit data in low power.

MIPI-DSI Pixel formats.

MIPI_DSI_PIXFMT_RGB888

RGB888 (24bpp).

MIPI_DSI_PIXFMT_RGB666

RGB666 (24bpp).

MIPI_DSI_PIXFMT_RGB666_PACKED

Packed RGB666 (18bpp).

MIPI_DSI_PIXFMT_RGB565

RGB565 (16bpp).

Defines

MIPI_DSI_MSG_USE_LPM

Functions

static inline int mipi_dsi_attach(const struct device *dev, uint8_t channel, const struct mipi_dsi_device *mdev)

Attach a new device to the MIPI-DSI bus.

Parameters

• dev – MIPI-DSI host device.
• channel – Device channel (VID).
• mdev – MIPI-DSI device description.

Returns

0 on success, negative on error

static inline ssize_t mipi_dsi_transfer(const struct device *dev, uint8_t channel, struct mipi_dsi_msg *msg)

Transfer data to/from a device attached to the MIPI-DSI bus.

Parameters

• dev – MIPI-DSI device.
• channel – Device channel (VID).
• msg – Message.

Returns

Size of the transferred data on success, negative on error.
ssize_t mipi_dsi_generic_read(const struct device *dev, uint8_t channel, const void *params, size_t nparams, void *buf, size_t len)

MIPI-DSI generic read.

**Parameters**
- dev – MIPI-DSI host device.
- channel – Device channel (VID).
- params – Buffer containing request parameters.
- nparams – Number of parameters.
- buf – Buffer where read data will be stored.
- len – Length of the reception buffer.

**Returns**
Size of the read data on success, negative on error.

ssize_t mipi_dsi_generic_write(const struct device *dev, uint8_t channel, const void *buf, size_t len)

MIPI-DSI generic write.

**Parameters**
- dev – MIPI-DSI host device.
- channel – Device channel (VID).
- buf – Transmission buffer.
- len – Length of the transmission buffer

**Returns**
Size of the written data on success, negative on error.

ssize_t mipi_dsi_dcs_read(const struct device *dev, uint8_t channel, uint8_t cmd, void *buf, size_t len)

MIPI-DSI DCS read.

**Parameters**
- dev – MIPI-DSI host device.
- channel – Device channel (VID).
- cmd – DCS command.
- buf – Buffer where read data will be stored.
- len – Length of the reception buffer.

**Returns**
Size of the read data on success, negative on error.

ssize_t mipi_dsi_dcs_write(const struct device *dev, uint8_t channel, uint8_t cmd, const void *buf, size_t len)

MIPI-DSI DCS write.

**Parameters**
- dev – MIPI-DSI host device.
- channel – Device channel (VID).
- cmd – DCS command.
- buf – Transmission buffer.
- len – Length of the transmission buffer
**Returns**
Size of the written data on success, negative on error.

7.5.32 Multi-Channel Inter-Processor Mailbox (MBOX)

Overview

An MBOX device is a peripheral capable of passing signals (and data depending on the peripheral) between CPUs and clusters in the system. Each MBOX instance is providing one or more channels, each one targeting one other CPU cluster (multiple channels can target the same cluster).

API Reference

Related code samples

MBOX
    Perform inter-processor mailbox communication using the MBOX API.
An MBOX device is a peripheral capable of passing signals (and data depending on the peripheral) between CPUs and clusters in the system. Each MBOX instance is providing one or more channels, each one targeting one other CPU cluster (multiple channels can target the same cluster).

For example in the plot the device ‘dev A’ is using the TX channel 9 to signal (or send data to) the CPU #2 and it’s expecting data or signals on the RX channel 8. Thus it can send the message through the channel 9, and it can register a callback on the channel 8 of the MBOX device.

This API supports two modes: signalling mode and data transfer mode.

In signalling mode:
- `mbox_mtu_get()` must return 0
- `mbox_send()` must have (msg == NULL)
- the callback must be called with (data == NULL)

In data transfer mode:
- `mbox_mtu_get()` must return a (value != 0)
- `mbox_send()` must have (msg != NULL)
- the callback must be called with (data != NULL)
- The msg content must be the same between sender and receiver

Defines

**MBOX_DT_CHANNEL_GET**(node_id, name)
Structure initializer for `mbox_channel` from devicetree.

This helper macro expands to a static initializer for a `mbox_channel` by reading the relevant device controller and channel number from the devicetree.

Example devicetree fragment:

```
mbox1: mbox-controller@... { ... };
```
Example usage:

```c
const struct mbox_channel channel = MBOX_DT_CHANNEL_GET(DT_NODELABEL(n), tx);
```

### Parameters

- **node_id** – Devicetree node identifier for the MBOX device
- **name** – lowercase-and-underscores name of the `mboxes` element

### Typedefs

#### `mbox_callback_t`

```c
typedef void (*mbox_callback_t)(const struct device *dev, uint32_t channel, void *user_data, struct mbox_msg *data)
```

Callback API for incoming MBOX messages. These callbacks execute in interrupt context. Therefore, use only interrupt-safe APIs. Registration of callbacks is done via `mbox_register_callback()`. The data parameter must be NULL in signalling mode.

- **Param dev** Driver instance
- **Param channel** Channel ID
- **Param user_data** Pointer to some private data provided at registration time
- **Param data** Message struct

#### `mbox_send_t`

```c
typedef int (*mbox_send_t)(const struct device *dev, uint32_t channel, const struct mbox_msg *msg)
```

Callback API to send MBOX messages. See `mbox_send()` for function description.

- **Param dev** Driver instance
- **Param channel** Channel ID
- **Param msg** Message struct

#### `mbox_mtu_get_t`

```c
typedef int (*mbox_mtu_get_t)(const struct device *dev)
```

Callback API to get maximum data size. See `mbox_mtu_get()` for argument definitions.
typedef int (*mbox_register_callback_t)(const struct device *dev, uint32_t channel, mbox_callback_t cb, void *user_data)

Callback API upon registration.

See `mbox_register_callback()` for function description

**Param dev**
Driver instance

**Param channel**
Channel ID

**Param cb**
Callback function to execute on incoming message interrupts.

**Param user_data**
Application-specific data pointer which will be passed to the callback function when executed.

**Return**
See return values for `mbox_register_callback()`

typedef int (*mbox_set_enabled_t)(const struct device *dev, uint32_t channel, bool enable)

Callback API upon enablement of interrupts.

See `mbox_set_enabled()` for function description

**Param dev**
Driver instance

**Param channel**
Channel ID

**Param enable**
Set to 0 to disable and to nonzero to enable.

**Return**
See return values for `mbox_set_enabled()`

typedef uint32_t (*mbox_max_channels_get_t)(const struct device *dev)

Callback API to get maximum number of channels.

See `mbox_max_channels_get()` for argument definitions.

**Functions**

static inline void mbox_init_channel(struct mbox_channel *channel, const struct device *dev, uint32_t ch_id)

Initialize a channel struct.

Initialize an `mbox_channel` passed by the user with a provided MBOX device and channel ID. This function is needed when the information about the device and the channel ID is not in the DT. In the DT case `MBOX_DT_CHANNEL_GET()` must be used instead.

**Parameters**

- `channel` – Pointer to the channel struct
- `dev` – Driver instance
- `ch_id` – Channel ID
int mbox_send(const struct mbox_channel *channel, const struct mbox_msg *msg)
Try to send a message over the MBOX device.
Send a message over an mbox_channel. The msg parameter must be NULL when the
driver is used for signalling.
If the msg parameter is not NULL, this data is expected to be delivered on the receiving
side using the data parameter of the receiving callback.

Parameters
- channel – Channel instance pointer
- msg – Pointer to the message struct

Return values
- -EBUSY – If the remote hasn’t yet read the last data sent.
- -EMSGSIZE – If the supplied data size is unsupported by the driver.
- -EINVAL – If there was a bad parameter, such as: too-large channel de-
scriptor or the device isn’t an outbound MBOX channel.
- 0 – On success, negative value on error.

static inline int mbox_register_callback(const struct mbox_channel *channel,
mbox_callback_t cb, void *user_data)
Register a callback function on a channel for incoming messages.
This function doesn’t assume anything concerning the status of the interrupts. Use
mbox_set_enabled() to enable or to disable the interrupts if needed.

Parameters
- channel – Channel instance pointer.
- cb – Callback function to execute on incoming message interrupts.
- user_data – Application-specific data pointer which will be passed to the
callback function when executed.

Return values
- 0 – On success, negative value on error.

int mbox_mtu_get(const struct device *dev)
Return the maximum number of bytes possible in an outbound message.
Returns the actual number of bytes that it is possible to send through an outgoing chan-
nel.
This number can be 0 when the driver only supports signalling or when on the receiv-
ing side the content and size of the message must be retrieved in an indirect way (i.e.
probing some other peripheral, reading memory regions, etc...).
If this function returns 0, the msg parameter in mbox_send() is expected to be NULL.

Parameters
- dev – Driver instance pointer.

Returns
Maximum possible size of a message in bytes, 0 for signalling, negative
value on error.

int mbox_set_enabled(const struct mbox_channel *channel, bool enable)
Enable (disable) interrupts and callbacks for inbound channels.
Enable interrupt for the channel when the parameter ‘enable’ is set to true. Disable it
otherwise.
Immediately after calling this function with ‘enable’ set to true, the channel is considered enabled and ready to receive signal and messages (even already pending), so the user must take care of installing a proper callback (if needed) using \texttt{mbox_register_callback()} on the channel before enabling it. For this reason it is recommended that all the channels are disabled at probe time.

Enabling a channel for which there is no installed callback is considered undefined behavior (in general the driver must take care of gracefully handling spurious interrupts with no installed callback).

**Parameters**
- \texttt{channel} – Channel instance pointer.
- \texttt{enable} – Set to 0 to disable and to nonzero to enable.

**Return values**
- \texttt{0} – On success.
- \texttt{-EINVAL} – If it isn’t an inbound channel.

\texttt{uint32_t \_mbox\_max\_channels\_get(const struct device *dev)}

Return the maximum number of channels.

**Parameters**
- \texttt{dev} – Driver instance pointer.

**Returns**
Maximum possible number of supported channels on success, negative value on error.

\texttt{struct mbox\_msg}

\texttt{#include <mbox.h>} Message struct (to hold data and its size).

**Public Members**
- \texttt{const void *data}
  
  Pointer to the data sent in the message.

- \texttt{size_t size}
  
  Size of the data.

\texttt{struct mbox\_channel}

\texttt{#include <mbox.h>} Provides a type to hold an MBOX channel.

Struct type to hold an MBOX device pointer and the channel ID.

**Public Members**
- \texttt{const struct device \_dev}
  
  MBOX device pointer.

- \texttt{uint32_t \_id}
  
  Channel ID.
struct mbox_driver_api
#include <mbox.h>

7.5.33 Peripheral Component Interconnect express Bus (PCIe)

Overview

API Reference

*group pcie_host_interface
PCIE_ID_IS_VALID(id)

**get the PCIe Vendor and Device ID for a node.**

**Parameters**

- `node_id` – DTS node identifier

**Returns**

The VID/DID combination as pcie_id_t

**PCIE_DT_ID(node_id)**

Get the PCIe Vendor and Device ID for a node.

**Parameters**

- `node_id` – DTS node identifier

**Returns**

The VID/DID combination as pcie_id_t

**PCIE_DT_INST_ID(inst)**

Get the PCIe Vendor and Device ID for a node.

This is equivalent to `PCIE_DT_ID(DT_DRV_INST(inst))`

**Parameters**

- `inst` – Devicetree instance number

**Returns**

The VID/DID combination as pcie_id_t

**DEVICE_PCIE_DECLARE(node_id)**

Declare a PCIe context variable for a DTS node.

Declares a PCIe context for a DTS node. This must be done before using the `DEVICE_PCIE_INIT()` macro for the same node.

**Parameters**

- `node_id` – DTS node identifier

**DEVICE_PCIE_INST_DECLARE(inst)**

Declare a PCIe context variable for a DTS node.

This is equivalent to `DEVICE_PCIE_DECLARE(DT_DRV_INST(inst))`

**Parameters**

- `inst` – Devicetree instance number
DEVICE_PCIE_INIT(node_id, name)
  Initialize a named struct member to point at a PCIe context.

  Initialize PCIe-related information within a specific instance of a device config struct, using information from DTS. Using the macro requires having first created PCIe context struct using the DEVICE_PCIE_DECLARE() macro.

  Example for an instance of a driver belonging to the “foo” subsystem

  struct foo_config { struct pcie_dev *pcie; …};
  DEVICE_PCIE_ID_DECLARE(DT_DRV_INST(…));
  struct foo_config my_config = {
    DEVICE_PCIE_INIT(pcie, DT_DRV_INST(…)), …};

  Parameters
  • node_id – DTS node identifier
  • name – Member name within config for the MMIO region

DEVICE_PCIE_INST_INIT(inst, name)
  Initialize a named struct member to point at a PCIe context.

  This is equivalent to DEVICE_PCIE_INIT(DT_DRV_INST(inst), name)

  Parameters
  • inst – DeviceTree instance number
  • name – Name of the struct member (of type struct pcie_dev *)

PCIE_HOST_CONTROLLER(n)
  Get the BDF for a given PCI host controller.

  This macro is useful when the PCI host controller behind PCIE_BDF(0, 0, 0) indicates a multifunction device. In such a case each function of this endpoint is a potential host controller itself.

  Parameters
  • n – Bus number

  Returns
  BDF value of the given host controller

PCIE_CONF_CAPPTR
PCIE_CONF_CAPPTR_FIRST(w)
PCIE_CONF_CAP_ID(w)
PCIE_CONF_CAP_NEXT(w)

PCIE_CONF_EXT_CAPPTR

PCIE_MAX_BUS
PCIE_MAX_DEV
PCIE_MAX_FUNC

PCIE_IRQ_CONNECT(bdf_p, irq_p, priority_p, isr_p, isr_param_p, flags_p)
Initialize an interrupt handler for a PCIe endpoint IRQ.
This routine is only meant to be used by drivers using PCIe bus and having fixed or
MSI based IRQ (so no runtime detection of the IRQ). In case of runtime detection see
pcie_connect_dynamic_irq()

Parameters
- bdf_p – PCIe endpoint BDF
- irq_p – IRQ line number.
- priority_p – Interrupt priority.
- isr_p – Address of interrupt service routine.
- isr_param_p – Parameter passed to interrupt service routine.
- flags_p – Architecture-specific IRQ configuration flags..

Typedefs

typedef uint32_t pcie_bdf_t
A unique PCI(e) endpoint (bus, device, function).
A PCI(e) endpoint is uniquely identified topologically using a (bus, device, function)
tuple. The internal structure is documented in include/dt-bindings/pcie/pcie.h: see
PCIE_BDF() and friends, since these tuples are referenced from devicetree.

typedef uint32_t pcie_id_t
A unique PCI(e) identifier (vendor ID, device ID).
The PCIE_CONF_ID register for each endpoint is a (vendor ID, device ID) pair, which is
meant to tell the system what the PCI(e) endpoint is. Again, look to PCIE_ID_* macros
in include/dt-bindings/pcie/pcie.h for more.

7.5. Peripherals
typedef bool (*pcie_scan_cb_t)(pcie_bdf_t bdf, pcie_id_t id, void *cb_data)

Callback type used for scanning for PCI endpoints.

**Param bdf**
BDF value for a found endpoint.

**Param id**
Vendor & Device ID for the found endpoint.

**Param cb_data**
Custom, use case specific data.

**Return**
true to continue scanning, false to stop scanning.

**Enums**

enum [anonymous]

Values:

enumerator **PCIE_SCAN_RECURSIVE** = **BIT**(0)
Scan all available PCI host controllers and sub-busses.

enumerator **PCIE_SCAN_CB_ALL** = **BIT**(1)
Do the callback for all endpoint types, including bridges.

**Functions**

**pcie_bdf_t pcie_bdf_lookup(pcie_id_t id)**
Look up the BDF based on PCI(e) vendor & device ID.
This function is used to look up the BDF for a device given its vendor and device ID.

*Deprecated:*

*See also:*

*DEVICE_PCIE_DECLARE*

**Parameters**

- **id** – PCI(e) vendor & device ID encoded using PCIE_ID()

**Returns**

The BDF for the device, or PCIE_BDF_NONE if it was not found

**uint32_t pcie_conf_read(pcie_bdf_t bdf, unsigned int reg)**
Read a 32-bit word from an endpoint's configuration space.
This function is exported by the arch/SoC/board code.

**Parameters**

- **bdf** – PCI(e) endpoint
- **reg** – the configuration word index (not address)
Returns  
the word read (0xFFFFFFFFU if nonexistent endpoint or word)

void pcie_conf_write(pcie_bdf_t bdf, unsigned int reg, uint32_t data)
Write a 32-bit word to an endpoint's configuration space.
This function is exported by the arch/SoC/board code.

Parameters
- bdf – PCI(e) endpoint
- reg – the configuration word index (not address)
- data – the value to write

int pcie_scan(const struct pcie_scan_opt *opt)
Scan for PCIe devices.
Scan the PCI bus (or busses) for available endpoints.

Parameters
- opt – Options determining how to perform the scan.

Returns
0 on success, negative POSIX error number on failure.

bool pcie_probe(pcie_bdf_t bdf, pcie_id_t id)
Probe for the presence of a PCI(e) endpoint.

Deprecated:

See also:
DEVICE_PCIE_DECLARE

Parameters
- bdf – the endpoint to probe
- id – the endpoint ID to expect, or PCIE_ID_NONE for “any device”

Returns
true if the device is present, false otherwise

bool pcie_get_mbar(pcie_bdf_t bdf, unsigned int bar_index, struct pcie_bar *mbar)
Get the MBAR at a specific BAR index.

Parameters
- bdf – the PCI(e) endpoint
- bar_index – 0-based BAR index
- mbar – Pointer to struct pcie_bar

Returns
true if the mbar was found and is valid, false otherwise

bool pcie_probe_mbar(pcie_bdf_t bdf, unsigned int index, struct pcie_bar *mbar)
Probe the nth MMIO address assigned to an endpoint.

A PCI(e) endpoint has 0 or more memory-mapped regions. This function allows the caller to enumerate them by calling with index=0..n. Value of n has to be below 6, as there is a maximum of 6 BARs. The indices are order-preserving with respect to

7.5. Peripherals
the endpoint BARs: e.g., index 0 will return the lowest-numbered memory BAR on the endpoint.

**Parameters**
- `bdf` – the PCI(e) endpoint
- `index` – (0-based) index
- `mbar` – Pointer to struct `pcie_bar`

**Returns**
true if the mbar was found and is valid, false otherwise

```c
bool pcie_get_iobar(pcie_bdf_t bdf, unsigned int bar_index, struct pcie_bar *iobar)
```
Get the I/O BAR at a specific BAR index.

**Parameters**
- `bdf` – the PCI(e) endpoint
- `bar_index` – 0-based BAR index
- `iobar` – Pointer to struct `pcie_bar`

**Returns**
true if the I/O BAR was found and is valid, false otherwise

```c
bool pcie_probe_iobar(pcie_bdf_t bdf, unsigned int index, struct pcie_bar *iobar)
```
Probe the nth I/O BAR address assigned to an endpoint.

A PCI(e) endpoint has 0 or more I/O regions. This function allows the caller to enumerate them by calling with index=0..n. Value of n has to be below 6, as there is a maximum of 6 BARs. The indices are order-preserving with respect to the endpoint BARs: e.g., index 0 will return the lowest-numbered I/O BAR on the endpoint.

**Parameters**
- `bdf` – the PCI(e) endpoint
- `index` – (0-based) index
- `iobar` – Pointer to struct `pcie_bar`

**Returns**
true if the I/O BAR was found and is valid, false otherwise

```c
void pcie_set_cmd(pcie_bdf_t bdf, uint32_t bits, bool on)
```
Set or reset bits in the endpoint command/status register.

**Parameters**
- `bdf` – the PCI(e) endpoint
- `bits` – the powerset of bits of interest
- `on` – use true to set bits, false to reset them

```c
unsigned int pcie_alloc_irq(pcie_bdf_t bdf)
```
Allocate an IRQ for an endpoint.

This function first checks the IRQ register and if it contains a valid value this is returned. If the register does not contain a valid value allocation of a new one is attempted. Such function is only exposed if CONFIG_PCIE_CONTROLLER is unset. It is thus available where architecture tied dynamic IRQ allocation for PCIe device makes sense.

**Parameters**
• bdf – the PCI(e) endpoint

**Returns**
the IRQ number, or PCIE_CONF_INTR_IRQ_NONE if allocation failed.

```c
unsigned int pcie_get_irq(pcie_bdf_t bdf)
```

Return the IRQ assigned by the firmware/board to an endpoint.

**Parameters**

• bdf – the PCI(e) endpoint

**Returns**
the IRQ number, or PCIE_CONF_INTR_IRQ_NONE if unknown.

```c
void pcie_irq_enable(pcie_bdf_t bdf, unsigned int irq)
```

Enable the PCI(e) endpoint to generate the specified IRQ.

If MSI is enabled and the endpoint supports it, the endpoint will be configured to generate the specified IRQ via MSI. Otherwise, it is assumed that the IRQ has been routed by the boot firmware to the specified IRQ, and the IRQ is enabled (at the I/O APIC, or wherever appropriate).

**Parameters**

• bdf – the PCI(e) endpoint
• irq – the IRQ to generate

```c
uint32_t pcie_get_cap(pcie_bdf_t bdf, uint32_t cap_id)
```

Find a PCI(e) capability in an endpoint's configuration space.

**Parameters**

• bdf – the PCI endpoint to examine
• cap_id – the capability ID of interest

**Returns**
the index of the configuration word, or 0 if no capability.

```c
uint32_t pcie_get_ext_cap(pcie_bdf_t bdf, uint32_t cap_id)
```

Find an Extended PCI(e) capability in an endpoint's configuration space.

**Parameters**

• bdf – the PCI endpoint to examine
• cap_id – the capability ID of interest

**Returns**
the index of the configuration word, or 0 if no capability.

```c
bool pcie_connect_dynamic_irq(pcie_bdf_t bdf, unsigned int irq, unsigned int priority, void (*routine)(const void *parameter), const void *parameter, uint32_t flags)
```

Dynamically connect a PCIe endpoint IRQ to an ISR handler.

**Parameters**

• bdf – the PCI endpoint to examine
• irq – the IRQ to connect (see pcie_alloc_irq())
• priority – priority of the IRQ
• routine – the ISR handler to connect to the IRQ
• parameter – the parameter to provide to the handler
• flags – IRQ connection flags

**Returns**
true if connected, false otherwise

```c
struct pcie_dev
  #include <pcie.h>

struct pcie_bar
  #include <pcie.h>

struct pcie_scan_opt
  #include <pcie.h> Options for performing a scan for PCI devices.
```

**Public Members**

```c
uint8_t bus
  Initial bus number to scan.

cbie_scan_cb_t cb
  Function to call for each found endpoint.

void *cb_data
  Custom data to pass to the scan callback.

uint32_t flags
  Scan flags.
```

### 7.5.34 Platform Environment Control Interface (PECI)

**Overview**

The Platform Environment Control Interface, abbreviated as PECI, is a thermal management standard introduced in 2006 with the Intel Core 2 Duo Microprocessors. The PECI interface allows external devices to read processor temperature, perform processor manageability functions, and manage processor interface tuning and diagnostics. The PECI bus driver APIs enable the interaction between Embedded Microcontrollers and CPUs.

**Configuration Options**

Related configuration options:

enumerator PECI_CMD_GET_DIB = 0xF7

Functions

int peci_config(const struct device *dev, uint32_t bitrate)
 Configures the PECI interface.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `bitrate` – the selected bitrate expressed in Kbps.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int peci_enable(const struct device *dev)
 Enable PECI interface.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int peci_disable(const struct device *dev)
 Disable PECI interface.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int peci_transfer(const struct device *dev, struct peci_msg *msg)
 Performs a PECI transaction.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `msg` – Structure representing a PECI transaction.

Return values

- 0 – If successful.
- Negative – errno code if failure.

struct peci_buf

#include <peci.h> PECI buffer structure.
Public Members

uint8_t *buf
    Valid pointer on a data buffer, or NULL otherwise.

size_t len
    Length of the data buffer expected to be received without considering the frame check sequence byte.

Note: Frame check sequence byte is added into rx buffer: need to allocate an additional byte for this in rx buffer.

struct peci_msg
    #include <peci.h> PECI transaction packet format.

Public Members

uint8_t addr
    Client address.

enum peci_command_code cmd_code
    Command code.

struct peci_buf tx_buffer
    Pointer to buffer of write data.

struct peci_buf rx_buffer
    Pointer to buffer of read data.

uint8_t flags
    PECI msg flags.

7.5.35 PS/2

Overview

The PS/2 connector first hit the market in 1987 on IBM's desktop PC line of the same name before becoming an industry-wide standard for mouse and keyboard connections. Starting around 2007, USB superseded PS/2 and is the modern peripheral device connection standard. For legacy support on boards with a PS/2 connector, Zephyr provides these PS/2 driver APIs.

Configuration Options

Related configuration options:

- CONFIG_PS2
**group ps2_interface**  
PS/2 Driver APIs.

### Typedefs

```
typedef void (*ps2_callback_t)(const struct device *dev, uint8_t data)  
```

PS/2 callback called when user types or click a mouse.

- **Param dev**
  - Pointer to the device structure for the driver instance.

- **Param data**
  - Data byte passed pack to the user.

### Functions

**int ps2_config(const struct device *dev, ps2_callback_t callback_isr)**  
Configure a ps2 instance.

- **Parameters**
  - **dev** – Pointer to the device structure for the driver instance.
  - **callback_isr** – called when PS/2 devices reply to a configuration command or when a mouse/keyboard send data to the client application.

- **Return values**
  - 0 – If successful.
  - Negative – errno code if failure.

**int ps2_write(const struct device *dev, uint8_t value)**  
Write to PS/2 device.

- **Parameters**
  - **dev** – Pointer to the device structure for the driver instance.
  - **value** – Data for the PS2 device.

- **Return values**
  - 0 – If successful.
  - Negative – errno code if failure.

**int ps2_read(const struct device *dev, uint8_t *value)**  
Read slave-to-host values from PS/2 device.

- **Parameters**
  - **dev** – Pointer to the device structure for the driver instance.
• **value** – Pointer used for reading the PS/2 device.

**Return values**

• **0** – If successful.

• **Negative** – errno code if failure.

```c
int ps2_enable_callback(const struct device *dev)
```

Enables callback.

**Parameters**

• **dev** – Pointer to the device structure for the driver instance.

**Return values**

• **0** – If successful.

• **Negative** – errno code if failure.

```c
int ps2_disable_callback(const struct device *dev)
```

Disables callback.

**Parameters**

• **dev** – Pointer to the device structure for the driver instance.

**Return values**

• **0** – If successful.

• **Negative** – errno code if failure.

## 7.5.36 Pulse Width Modulation (PWM)

**Overview**

**API Reference**

**Related code samples**

**Fade LED**
Fade an LED using the PWM API.

**PWM Blinky**
Blink an LED using the PWM API.

**PWM RGB LED**
Drive an RGB LED using the PWM API.

**Servomotor**
Drive a servomotor using the PWM API.

**group pwm_interface**

PWM Interface.

**PWM capture configuration flags**
PWM Capture Type

- **PWM_CAPTURE_TYPE_PERIOD**: PWM pin capture captures period.
- **PWM_CAPTURE_TYPE_PULSE**: PWM pin capture captures pulse width.
- **PWM_CAPTURE_TYPE_BOTH**: PWM pin capture captures both period and pulse width.

PWM Capture Mode

- **PWM_CAPTURE_MODE_SINGLE**: PWM pin capture captures a single period/pulse width.
- **PWM_CAPTURE_MODE_CONTINUOUS**: PWM pin capture captures period/pulse width continuously.

PWM Period Set Helpers

The period cell in the PWM specifier needs to be provided in nanoseconds. However, in some applications it is more convenient to use another scale.

- **PWM_NSEC(x)**: Specify PWM period in nanoseconds.
- **PWM_USEC(x)**: Specify PWM period in microseconds.
- **PWM_MSEC(x)**: Specify PWM period in milliseconds.
- **PWM_SEC(x)**: Specify PWM period in seconds.
- **PWM_HZ(x)**: Specify PWM frequency in hertz.
- **PWM_KHZ(x)**: Specify PWM frequency in kilohertz.

PWM Polarity Flags

The **PWM_POLARITY_*** flags are used with `pwm_set_cycles()`, `pwm_set()` or `pwm_configure_capture()` to specify the polarity of a PWM channel. The flags are on the lower 8 bits of the `pwm_flags_t`.

- **PWM_POLARITY_NORMAL**: PWM pin normal polarity (active-high pulse).
- **PWM_POLARITY_INVERTED**: PWM pin inverted polarity (active-low pulse).
Defines

`PWM_DT_SPEC_GET_BY_NAME(node_id, name)`

Static initializer for a struct `pwm_dt_spec`.

This returns a static initializer for a struct `pwm_dt_spec` given a devicetree node identifier and an index.

Example devicetree fragment:

```
node {
    pwms = <&pwm1 1 1000 PWM_POLARITY_NORMAL>,
    <&pwm2 3 2000 PWM_POLARITY_INVERTED>;
    pwm-names = "alpha", "beta";
};
```

Example usage:

```
const struct pwm_dt_spec spec = PWM_DT_SPEC_GET_BY_NAME(DT_NODELABEL(n), alpha);
```

The device (dev) must still be checked for readiness, e.g. using `device_is_ready()`. It is an error to use this macro unless the node exists, has the 'pwms' property, and that 'pwms' property specifies a PWM controller, a channel, a period in nanoseconds and optionally flags.

See also:

`PWM_DT_SPEC_INST_GET_BY_NAME`

Parameters

- `node_id` – Devicetree node identifier.
- `name` – Lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property.

Returns

Static initializer for a struct `pwm_dt_spec` for the property.

`PWM_DT_SPEC_INST_GET_BY_NAME(inst, name)`

Static initializer for a struct `pwm_dt_spec` from a DT_DRV_COMPAT instance.

See also:

`PWM_DT_SPEC_GET_BY_NAME`

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `name` – Lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property.
**Returns**

Static initializer for a struct `pwm_dt_spec` for the property.

`PWM_DT_SPEC_GET_BY_NAME_OR(node_id, name, default_value)`

Like `PWM_DT_SPEC_GET_BY_NAME()`, with a fallback to a default value.

If the devicetree node identifier `node_id` refers to a node with a property `pwms`, this expands to `PWM_DT_SPEC_GET_BY_NAME(node_id, name)`. The `default_value` parameter is not expanded in this case. Otherwise, this expands to `default_value`.

See also:

`PWM_DT_SPEC_INST_GET_BY_NAME_OR`

**Parameters**

- `node_id` – Devicetree node identifier.
- `name` – Lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property
- `default_value` – Fallback value to expand to.

**Returns**

Static initializer for a struct `pwm_dt_spec` for the property, or `default_value` if the node or property do not exist.

`PWM_DT_SPEC_INST_GET_BY_NAME_OR(inst, name, default_value)`

Like `PWM_DT_SPEC_INST_GET_BY_NAME()`, with a fallback to a default value.

See also:

`PWM_DT_SPEC_GET_BY_NAME_OR`

**Parameters**

- `inst` – DT_DRV_COMPAT instance number
- `name` – Lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property.
- `default_value` – Fallback value to expand to.

**Returns**

Static initializer for a struct `pwm_dt_spec` for the property, or `default_value` if the node or property do not exist.

`PWM_DT_SPEC_GET_BY_IDX(node_id, idx)`

Static initializer for a struct `pwm_dt_spec`.

This returns a static initializer for a struct `pwm_dt_spec` given a devicetree node identifier and an index.

Example devicetree fragment:

```
node {
  pwms = <&pwm1 1 1000 PWM_POLARITY_NORMAL>,
        <&pwm2 3 2000 PWM_POLARITY_INVERTED>;
};
```

Example usage:
const struct pwm_dt_spec spec = PWM_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), 1);

// Initializes 'spec' to:
// {
//   .dev = DEVICE_DT_GET(DT_NODELABEL(pwm2)),
//   .channel = 3,
//   .period = 2000,
//   .flags = PWM_POLARITY_INVERTED,
// }

The device (dev) must still be checked for readiness, e.g. using `device_is_ready()`. It is an error to use this macro unless the node exists, has the 'pwms' property, and that 'pwms' property specifies a PWM controller, a channel, a period in nanoseconds and optionally flags.

See also:

PWM_DT_SPEC_INST_GET_BY_IDX

Parameters

• `node_id` – Devicetree node identifier.
• `idx` – Logical index into ‘pwms’ property.

Returns

Static initializer for a struct `pwm_dt_spec` for the property.

PWM_DT_SPEC_INST_GET_BY_IDX(inst, idx)

Static initializer for a struct `pwm_dt_spec` from a DT_DRV_COMPAT instance.

See also:

PWM_DT_SPEC_GET_BY_IDX

Parameters

• `inst` – DT_DRV_COMPAT instance number
• `idx` – Logical index into ‘pwms’ property.

Returns

Static initializer for a struct `pwm_dt_spec` for the property.

PWM_DT_SPEC_GET_BY_IDX_OR(node_id, idx, default_value)

Like `PWM_DT_SPEC_GET_BY_IDX()`, with a fallback to a default value.

If the devicetree node identifier 'node_id' refers to a node with a property 'pwms', this expands to `PWM_DT_SPEC_GET_BY_IDX(node_id, idx)`. The default_value parameter is not expanded in this case. Otherwise, this expands to `default_value`.

See also:

PWM_DT_SPEC_INST_GET_BY_IDX_OR

Parameters

• `node_id` – Devicetree node identifier.
• `idx` – Logical index into ‘pwms’ property.
• default_value – Fallback value to expand to.

Returns
Static initializer for a struct pwm_dt_spec for the property, or default_value if the node or property do not exist.

PWM_DT_SPEC_INST_GET_BY_IDX_OR(inst, idx, default_value)
Like PWM_DT_SPEC_INST_GET_BY_IDX(), with a fallback to a default value.

See also:
PWM_DT_SPEC_GET_BY_IDX_OR

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – Logical index into ‘pwms’ property.
• default_value – Fallback value to expand to.

Returns
Static initializer for a struct pwm_dt_spec for the property, or default_value if the node or property do not exist.

PWM_DT_SPEC_GET(node_id)
Equivalent to PWM_DT_SPEC_GET_BY_IDX(node_id, 0).

See also:
PWM_DT_SPEC_GET_BY_IDX
See also:
PWM_DT_SPEC_INST_GET

Parameters
• node_id – Devicetree node identifier.

Returns
Static initializer for a struct pwm_dt_spec for the property.

PWM_DT_SPEC_INST_GET(inst)
Equivalent to PWM_DT_SPEC_INST_GET_BY_IDX(inst, 0).

See also:
PWM_DT_SPEC_INST_GET_BY_IDX
See also:
PWM_DT_SPEC_GET

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
Static initializer for a struct pwm_dt_spec for the property.
PWM_DT_SPEC_GET_OR(node_id, default_value)
   Equivalent to PWM_DT_SPEC_GET_BY_IDX_OR(node_id, 0, default_value).

See also:
PWM_DT_SPEC_GET_BY_IDX_OR
See also:
PWM_DT_SPEC_INST_GET_OR

Parameters
• node_id – Devicetree node identifier.
• default_value – Fallback value to expand to.

Returns
Static initializer for a struct pwm_dt_spec for the property.

PWM_DT_SPEC_INST_GET_OR(inst, default_value)
   Equivalent to PWM_DT_SPEC_INST_GET_BY_IDX_OR(inst, 0, default_value).

See also:
PWM_DT_SPEC_INST_GET_BY_IDX_OR
See also:
PWM_DT_SPEC_GET_OR

Parameters
• inst – DT_DRV_COMPAT instance number
• default_value – Fallback value to expand to.

Returns
Static initializer for a struct pwm_dt_spec for the property.

Typedefs

typedef uint16_t pwm_flags_t
   Provides a type to hold PWM configuration flags.
   The lower 8 bits are used for standard flags. The upper 8 bits are reserved for SoC specific flags.

See also:
PWM_CAPTURE_FLAGS.

typedef void (*pwm_capture_callback_handler_t)(const struct device *dev, uint32_t channel, uint32_t period_cycles, uint32_t pulse_cycles, int status, void *user_data)
   PWM capture callback handler function signature.

Note: The callback handler will be called in interrupt context.
Note: CONFIG_PWM_CAPTURE must be selected to enable PWM capture support.

Param dev
[in] PWM device instance.

Param channel
PWM channel.

Param period_cycles
Captured PWM period width (in clock cycles). HW specific.

Param pulse_cycles
Captured PWM pulse width (in clock cycles). HW specific.

Param status
Status for the PWM capture (0 if no error, negative errno otherwise. See pwm_capture_cycles() return value descriptions for details).

Param user_data
User data passed to pwm_configure_capture()

Functions

int pwm_set_cycles(const struct device *dev, uint32_t channel, uint32_t period, uint32_t pulse, pwm_flags_t flags)

Set the period and pulse width for a single PWM output.

The PWM period and pulse width will synchronously be set to the new values without glitches in the PWM signal, but the call will not block for the change to take effect.

Passing 0 as pulse will cause the pin to be driven to a constant inactive level. Passing a non-zero pulse equal to period will cause the pin to be driven to a constant active level.

Note: Not all PWM controllers support synchronous, glitch-free updates of the PWM period and pulse width. Depending on the hardware, changing the PWM period and/or pulse width may cause a glitch in the generated PWM signal.

Note: Some multi-channel PWM controllers share the PWM period across all channels. Depending on the hardware, changing the PWM period for one channel may affect the PWM period for the other channels of the same PWM controller.

Parameters

- channel – PWM channel.
- period – Period (in clock cycles) set to the PWM. HW specific.
- pulse – Pulse width (in clock cycles) set to the PWM. HW specific.
- flags – Flags for pin configuration.

Return values

- 0 – If successful.
-EINVAL – If pulse > period.
-errno – Negative errno code on failure.

```c
int pwm_get_cycles_per_sec(const struct device *dev, uint32_t channel, uint64_t *cycles)
```
Get the clock rate (cycles per second) for a single PWM output.

**Parameters**
- `channel` – PWM channel.
- `cycles` – [out] Pointer to the memory to store clock rate (cycles per sec).

**HW specific.**

**Return values**
- 0 – If successful.
- -errno – Negative errno code on failure.

```c
static inline int pwm_set(const struct device *dev, uint32_t channel, uint32_t period, uint32_t pulse, pwm_flags_t flags)
```
Set the period and pulse width in nanoseconds for a single PWM output.

**Note:** Utility macros such as `PWM_MSEC()` can be used to convert from other scales or units to nanoseconds, the units used by this function.

**Parameters**
- `channel` – PWM channel.
- `period` – Period (in nanoseconds) set to the PWM.
- `pulse` – Pulse width (in nanoseconds) set to the PWM.
- `flags` – Flags for pin configuration (polarity).

**Return values**
- 0 – If successful.
- -ENOTSUP – If requested period or pulse cycles are not supported.
- -errno – Other negative errno code on failure.

```c
static inline int pwm_set_dt(const struct pwm_dt_spec *spec, uint32_t period, uint32_t pulse)
```
Set the period and pulse width in nanoseconds from a struct `pwm_dt_spec` (with custom period).

This is equivalent to:

```c
pwm_set(spec->dev, spec->channel, period, pulse, spec->flags)
```

The period specified in `spec` is ignored. This API call can be used when the period specified in Devicetree needs to be changed at runtime.

**See also:**
- `pwm_set_pulse_dt()`
Parameters

- \texttt{spec} – [in] PWM specification from devicetree.
- \texttt{period} – Period (in nanoseconds) set to the PWM.
- \texttt{pulse} – Pulse width (in nanoseconds) set to the PWM.

Returns

A value from \texttt{pwm_set()}.  

static inline int \texttt{pwm_set_pulse_dt} \(\texttt{\(\texttt{(const struct pwm_dt_spec *spec, uint32_t pulse)}}\) \texttt{\)\} \)

Set the period and pulse width in nanoseconds from a struct \texttt{pwm_dt_spec}.

This is equivalent to:

\begin{verbatim}
pwm_set(spec->dev, spec->channel, spec->period, pulse, spec->flags)
\end{verbatim}

See also:

\texttt{pwm_set_pulse_dt()}

Parameters

- \texttt{spec} – [in] PWM specification from devicetree.
- \texttt{pulse} – Pulse width (in nanoseconds) set to the PWM.

Returns

A value from \texttt{pwm_set()}.  

static inline int \texttt{pwm_cycles_to_usec} \(\texttt{\(\texttt{(const struct device *dev, uint32_t channel, uint32_t cycles, uint64_t *usec)}}\) \texttt{\)\} \)

Convert from PWM cycles to microseconds.

Parameters

- \texttt{dev} – [in] PWM device instance.
- \texttt{channel} – PWM channel.
- \texttt{cycles} – Cycles to be converted.
- \texttt{usec} – [out] Pointer to the memory to store calculated usec.

Return values

- \texttt{0} – If successful.
- \texttt{-ERANGE} – If result is too large.
- \texttt{-errno} – Other negative errno code on failure.

static inline int \texttt{pwm_cycles_to_nsec} \(\texttt{\(\texttt{(const struct device *dev, uint32_t channel, uint32_t cycles, uint64_t *nsec)}}\) \texttt{\)\} \)

Convert from PWM cycles to nanoseconds.

Parameters

- \texttt{dev} – [in] PWM device instance.
- \texttt{channel} – PWM channel.
- \texttt{cycles} – Cycles to be converted.
- \texttt{nsec} – [out] Pointer to the memory to store the calculated nsec.

Return values

- \texttt{0} – If successful.
• \texttt{-ERANGE} – If result is too large.
• \texttt{-errno} – Other negative errno code on failure.

static inline int \texttt{pwm\_configure\_capture(const struct device *dev, uint32\_t channel,}
\texttt{pwm\_flags\_t flags,}
\texttt{pwm\_capture\_callback\_handler\_t cb, void}
\texttt{*user\_data)}

Configure PWM period/pulse width capture for a single PWM input.
After configuring PWM capture using this function, the capture can be enabled/disabled using \texttt{pwm\_enable\_capture()} and \texttt{pwm\_disable\_capture()}.

\textbf{Note}: This API function cannot be invoked from user space due to the use of a function callback. In user space, one of the simpler API functions (\texttt{pwm\_capture\_cycles()}, \texttt{pwm\_capture\_usec()}, or \texttt{pwm\_capture\_nsec()}) can be used instead.

\textbf{Note}: \texttt{CONFIG\_PWM\_CAPTURE} must be selected for this function to be available.

\begin{verbatim}
Parameters
• dev – [in] PWM device instance.
• channel – PWM channel.
• flags – PWM capture flags
• cb – [in] Application callback handler function to be called upon capture
• user\_data – [in] User data to pass to the application callback handler function

Return values
• \texttt{-EINVAL} – if invalid function parameters were given
• \texttt{-ENOSYS} – if PWM capture is not supported or the given flags are not supported
• \texttt{-EIO} – if IO error occurred while configuring
• \texttt{-EBUSY} – if PWM capture is already in progress
\end{verbatim}

\textbf{int \texttt{pwm\_enable\_capture(const struct device *dev, uint32\_t channel)}}

Enable PWM period/pulse width capture for a single PWM input.
The PWM pin must be configured using \texttt{pwm\_configure\_capture()} prior to calling this function.

\textbf{Note}: \texttt{CONFIG\_PWM\_CAPTURE} must be selected for this function to be available.

\begin{verbatim}
Parameters
• dev – [in] PWM device instance.
• channel – PWM channel.

Return values
• 0 – If successful.
• \texttt{-EINVAL} – if invalid function parameters were given
\end{verbatim}
int pwm_disable_capture(const struct device *dev, uint32_t channel)

Disable PWM period/pulse width capture for a single PWM input.

Note: CONFIG_PWM_CAPTURE must be selected for this function to be available.

Parameters

- **dev** – [in] PWM device instance.
- **channel** – PWM channel.

Return values

- 0 – If successful.
- -EINVAL – if invalid function parameters were given
- -ENOSYS – if PWM capture is not supported
- -EIO – if IO error occurred while disabling PWM capture

int pwm_capture_cycles(const struct device *dev, uint32_t channel, pwm_flags_t flags, uint32_t *period, uint32_t *pulse, k_timeout_t timeout)

Capture a single PWM period/pulse width in clock cycles for a single PWM input.

This API function wraps calls to *pwm_configure_capture()* , *pwm_enable_capture()* , and *pwm_disable_capture()* and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.

Note: CONFIG_PWM_CAPTURE must be selected for this function to be available.

Parameters

- **dev** – [in] PWM device instance.
- **channel** – PWM channel.
- **flags** – PWM capture flags.
- **period** – [out] Pointer to the memory to store the captured PWM period width (in clock cycles). HW specific.
- **pulse** – [out] Pointer to the memory to store the captured PWM pulse width (in clock cycles). HW specific.
- **timeout** – Waiting period for the capture to complete.

Return values

- 0 – If successful.
- -EBUSY – PWM capture already in progress.
- -EAGAIN – Waiting period timed out.
- -EIO – IO error while capturing.
- -ERANGE – If result is too large.
static inline int pwm_capture_usec(const struct device *dev, uint32_t channel, pwm_flags_t flags, uint64_t *period, uint64_t *pulse, k_timeout_t timeout)

Capture a single PWM period/pulse width in microseconds for a single PWM input. This API function wraps calls to pwm_capture_cycles() and pwm_cycles_to_usec() and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.

**Note:** CONFIG_PWM_CAPTURE must be selected for this function to be available.

**Parameters**

- **dev** – [in] PWM device instance.
- **channel** – PWM channel.
- **flags** – PWM capture flags.
- **period** – [out] Pointer to the memory to store the captured PWM period width (in usec).
- **pulse** – [out] Pointer to the memory to store the captured PWM pulse width (in usec).
- **timeout** – Waiting period for the capture to complete.

**Return values**

- **0** – If successful.
- **-EBUSY** – PWM capture already in progress.
- **-EAGAIN** – Waiting period timed out.
- **-EIO** – IO error while capturing.
- **-ERANGE** – If result is too large.
- **-errno** – Other negative errno code on failure.

static inline int pwm_capture_nsec(const struct device *dev, uint32_t channel, pwm_flags_t flags, uint64_t *period, uint64_t *pulse, k_timeout_t timeout)

Capture a single PWM period/pulse width in nanoseconds for a single PWM input. This API function wraps calls to pwm_capture_cycles() and pwm_cycles_to_nsec() and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.

**Note:** CONFIG_PWM_CAPTURE must be selected for this function to be available.

**Parameters**

- **dev** – [in] PWM device instance.
- **channel** – PWM channel.
- **flags** – PWM capture flags.
- **period** – [out] Pointer to the memory to store the captured PWM period width (in nsec).
• **pulse** – [out] Pointer to the memory to store the captured PWM pulse width (in nsec).
• **timeout** – Waiting period for the capture to complete.

**Return values**
• 0 – If successful.
• -EBUSY – PWM capture already in progress.
• -EAGAIN – Waiting period timed out.
• -EIO – IO error while capturing.
• -ERANGE – If result is too large.
• -errno – Other negative errno code on failure.

```c
static inline bool pwm_is_ready_dt(const struct pwm_dt_spec *spec) {
    Validate that the PWM device is ready.
    Parameters
    • spec – PWM specification from devicetree
    Return values
    • true – If the PWM device is ready for use
    • false – If the PWM device is not ready for use
```

**struct pwm_dt_spec**

```c
#include <pwm.h> Container for PWM information specified in devicetree. This type contains a pointer to a PWM device, channel number (controlled by the PWM device), the PWM signal period in nanoseconds and the flags applicable to the channel. Note that not all PWM drivers support flags. In such case, flags will be set to 0.
```

- `PWM_DT_SPEC_GET_BY_NAME_OR`
- `PWM_DT_SPEC_GET_BY_IDX`
- `PWM_DT_SPEC_GET_BY_IDX_OR`
- `PWM_DT_SPEC_GET`
- `PWM_DT_SPEC_GET_OR`

**Public Members**
const struct device *dev
    PWM device instance.

uint32_t channel
    Channel number.

uint32_t period
    Period in nanoseconds.

pwm_flags_t flags
    Flags.

7.5.37 Real-Time Clock (RTC)

Overview

<table>
<thead>
<tr>
<th>Word</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Real-time clock</td>
<td>Low power device tracking time using broken-down time</td>
</tr>
<tr>
<td>Real-time counter</td>
<td>Low power counter which can be used to track time</td>
</tr>
<tr>
<td>RTC</td>
<td>Acronym for real-time clock</td>
</tr>
</tbody>
</table>

An RTC is a low power device which tracks time using broken-down time. It should not be confused with low-power counters which sometimes share the same name, acronym, or both.

RTCs are usually optimized for low energy consumption and are usually kept running even when the system is in a low power state.

RTCs usually contain one or more alarms which can be configured to trigger at a given time. These alarms are commonly used to wake up the system from a low power state.

History of RTCs in Zephyr

RTCs have been supported before this API was created, using the Counter API. The unix timestamp was used to convert between broken-down time and the unix timestamp within the RTC drivers, which internally used the broken-down time representation.

The disadvantages of this approach were that hardware counters could not be set to a specific count, requiring all RTCs to use device specific APIs to set the time, converting from unix time to broken-down time, unnecessarily in some cases, and some common features missing, like input clock calibration and the update callback.

Configuration Options

Related configuration options:

- CONFIG_RTC
- CONFIG_RTC_ALARM
- CONFIG_RTC_UPDATE
- CONFIG_RTC_CALIBRATION
**RTC Interface Alarm**

```c
int rtc_alarm_get_supported_fields(const struct device *dev, uint16_t id, uint16_t *mask)
```

API for getting the supported fields of the RTC alarm time.

**Note:** Bits in the mask param are defined here `RTC_ALARM_TIME_MASK`.

**Parameters**

- `dev` – Device instance
- `id` – Id of the alarm
- `mask` – Mask of fields in the alarm time which are supported

**Returns**

- 0 if successful
- -EINVAL if id is out of range or time is invalid
- -ENOTSUP if API is not supported by hardware
- -errno code if failure

```c
int rtc_alarm_set_time(const struct device *dev, uint16_t id, uint16_t mask, const struct rtc_time *timeptr)
```

API for setting RTC alarm time.

To enable an RTC alarm, one or more fields of the RTC alarm time must be enabled. The mask designates which fields of the RTC alarm time to enable. If the mask parameter is 0, the alarm will be disabled. The RTC alarm will trigger when all enabled fields of the alarm time match the RTC time.

**Note:** The timeptr param may be NULL if the mask param is 0

**Note:** Only the enabled fields in the timeptr param need to be configured

**Note:** Bits in the mask param are defined here `RTC_ALARM_TIME_MASK`
• `timeptr` – The alarm time to set

**Returns**
0 if successful

**Returns**
-EINVAL if id is out of range or time is invalid

**Returns**
-ENOTSUP if API is not supported by hardware

**Returns**
-errno code if failure

```c
int rtc_alarm_get_time(const struct device *dev, uint16_t id, uint16_t *mask, struct rtc_time *timeptr)
```

API for getting RTC alarm time.

**Note:** Bits in the mask param are defined here `RTC_ALARM_TIME_MASK`

---

**Parameters**
- `dev` – Device instance
- `id` – Id of the alarm
- `mask` – Destination for mask of fields which are enabled in the alarm time
- `timeptr` – Destination for the alarm time

**Returns**
0 if successful

**Returns**
-EINVAL if id is out of range

**Returns**
-ENOTSUP if API is not supported by hardware

**Returns**
-errno code if failure

```c
int rtc_alarm_is_pending(const struct device *dev, uint16_t id)
```

API for testing if RTC alarm is pending.

Test whether or not the alarm with id is pending. If the alarm is pending, the pending status is cleared.

**Parameters**
- `dev` – Device instance
- `id` – Id of the alarm to test

**Returns**
1 if alarm was pending

**Returns**
0 if alarm was not pending

**Returns**
-EINVAL if id is out of range

**Returns**
-ENOTSUP if API is not supported by hardware
Returns
-errno code if failure

int rtc_alarm_set_callback(const struct device *dev, uint16_t id, rtc_alarm_callback callback, void *user_data)

API for setting alarm callback.

Setting the alarm callback for an alarm will enable the alarm callback. When the callback for an alarm is enabled, the alarm triggered event will invoke the callback, after which the alarm pending status will be cleared automatically. The alarm will remain enabled until manually disabled using rtc_alarm_set_time().

To disable the alarm callback for an alarm, the callback and user_data parameters must be set to NULL. When the alarm callback for an alarm is disabled, the alarm triggered event will set the alarm status to “pending”. To check if the alarm status is “pending“, use rtc_alarm_is_pending().

Parameters
- dev – Device instance
- id – Id of the alarm for which the callback shall be set
- callback – Callback called when alarm occurs
- user_data – Optional user data passed to callback

Returns
0 if successful

Returns
-EINVAL if id is out of range

Returns
-ENOTSUP if API is not supported by hardware

Returns
-errno code if failure

RTC Interface Update

int rtc_update_set_callback(const struct device *dev, rtc_update_callback callback, void *user_data)

API for setting update callback.

Setting the update callback will enable the update callback. The update callback will be invoked every time the RTC clock is updated by 1 second. It can be used to synchronize the RTC clock with other clock sources.

To disable the update callback for the RTC clock, the callback and user_data parameters must be set to NULL.

Parameters
- dev – Device instance
- callback – Callback called when update occurs
- user_data – Optional user data passed to callback

Returns
0 if successful

Returns
-ENOTSUP if API is not supported by hardware
Returns
-errno code if failure

RTC Interface Calibration

int rtc_set_calibration(const struct device *dev, int32_t calibration)
API for setting RTC calibration.
Calibration is applied to the RTC clock input. A positive calibration value will increase
the frequency of the RTC clock, a negative value will decrease the frequency of the RTC
clock.

Parameters
• dev – Device instance
• calibration – Calibration to set in parts per billion

Returns
0 if successful
Returns
-EINVAL if calibration is out of range
Returns
-ENOTSUP if API is not supported by hardware
Returns
-errno code if failure

int rtc_get_calibration(const struct device *dev, int32_t *calibration)
API for getting RTC calibration.

Parameters
• dev – Device instance
• calibration – Destination for calibration in parts per billion

Returns
0 if successful
Returns
-ENOTSUP if API is not supported by hardware
Returns
-errno code if failure

RTC Interface Helpers

static inline struct tm *rtc_time_to_tm(struct rtc_time *timeptr)
Convenience function for safely casting a rtc_time pointer to a tm pointer.

RTC Alarm Time Mask

Mask for alarm time fields to enable when setting alarm time
RTC_ALARM_TIME_MASK_MINUTE
RTC_ALARM_TIME_MASK_HOUR
RTC_ALARM_TIME_MASK_MONTHDAY
RTC_ALARM_TIME_MASK_MONTH
RTC_ALARM_TIME_MASK_YEAR
RTC_ALARM_TIME_MASK_WEEKDAY
RTC_ALARM_TIME_MASK_YEARDAY
RTC_ALARM_TIME_MASK_NSEC

Typedefs

typedef void (*rtc_update_callback)(const struct device *dev, void *user_data)
RTC update event callback.

  **Param dev**
  Device instance invoking the handler

  **Param user_data**
  Optional user data provided when update irq callback is set

typedef void (*rtc_alarm_callback)(const struct device *dev, uint16_t id, void *user_data)
RTC alarm triggered callback.

  **Param dev**
  Device instance invoking the handler

  **Param id**
  Alarm id

  **Param user_data**
  Optional user data passed with the alarm configuration

Functions

int rtc_set_time(const struct device *dev, const struct rtc_time *timeptr)
API for setting RTC time.

  **Parameters**
  • *dev* – Device instance
  • *timeptr* – The time to set

  **Returns**
  0 if successful

  **Returns**
  -EINVAL if RTC time is invalid or exceeds hardware capabilities
int rtc_get_time(const struct device *dev, struct rtc_time *timeptr)

API for getting RTC time.

Parameters

- dev – Device instance
- timeptr – Destination for the time

Returns

- 0 if successful
- -ENODATA if RTC time has not been set
- errno code if failure

struct rtc_time

#include <rtc.h> Structure for storing date and time values with sub-second precision.
The structure is 1-1 mapped to the struct tm for the members tm_sec to tm_isdst making it compatible with the standard time library.

Note: Use rtc_time_to_tm() to safely cast from a rtc_time pointer to a tm pointer.

Public Members

int tm_sec

Seconds [0, 59].

int tm_min

Minutes [0, 59].

int tm_hour

Hours [0, 23].

int tm_mday

Day of the month [1, 31].

int tm_mon

Month [0, 11].

int tm_year

Year - 1900.

int tm_wday

Day of the week [0, 6] (Sunday = 0) (Unknown = -1)

int tm_yday

Day of the year [0, 365] (Unknown = -1)
RTC device driver test suite

The test suite validates the behavior of the RTC device driver. It is designed to be portable between boards. It uses the device tree alias rtc to designate the RTC device to test.

This test suite tests the following:

- Setting and getting the time.
- RTC Time incrementing correctly.
- Alarms if supported by hardware, with and without callback enabled
- Calibration if supported by hardware.

The calibration test tests a range of values which are printed to the console to be manually compared. The user must review the set and gotten values to ensure they are valid.

By default, only the mandatory setting and getting of time is enabled for testing. To test the optional alarms, update event callback and clock calibration, these must be enabled by selecting CONFIG_RTC_ALARM, CONFIG_RTC_UPDATE and CONFIG_RTC_CALIBRATION.

The following examples build the test suite for the native_posix board. To build the test suite for a different board, replace the native_posix board with your board.

To build the test application with the default configuration, testing only the mandatory features, the following command can be used for reference:

```
# From the root of the zephyr repository
west build -b native_posix tests/drivers/rtc/rtc_api
```

To build the test with additional RTC features enabled, use menuconfig to enable the additional features by updating the configuration. The following command can be used for reference:

```
# From the root of the zephyr repository
west build -b native_posix tests/drivers/rtc/rtc_api
west build -t menuconfig
```

Then build the test application using the following command:

```
# From the root of the zephyr repository
west build -b native_posix tests/drivers/rtc/rtc_api
```

To run the test suite, flash and run the application on your board, the output will be printed to the console.

**Note:** The tests take up to 30 seconds each if they are testing real hardware.

### 7.5.38 Regulators

This subsystem provides control of voltage and current regulators. A common example is a GPIO that controls a transistor that supplies current to a device that is not always needed. Another example is a PMIC, typically a much more complex device.
The *-supply devicetree properties are used to identify the regulator(s) that a devicetree node directly depends on. Within the driver for the node the regulator API is used to issue requests for power when the device is to be active, and release the power request when the device shuts down.

The simplest case where a regulator is needed is one where there is only one client. For those situations the cost of using the regulator device infrastructure is not justified, and *-gpios devicetree properties should be used. There is no device interface to these regulators as they are entirely controlled within the driver for the corresponding node, e.g. a sensor.

**API Reference**

```c
struct regulator_device
```

Regulator Interface.

**Regulator error flags.**

- **REGULATOR_ERROR_OVER_VOLTAGE**
  Voltage is too high.

- **REGULATOR_ERROR_OVER_CURRENT**
  Current is too high.

- **REGULATOR_ERROR_OVER_TEMP**
  Temperature is too high.

**Typedefs**

typedef uint8_t `regulator_dvs_state_t`
Opaque type to store regulator DVS states.

typedef uint8_t `regulator_mode_t`
Opaque type to store regulator modes.

typedef uint8_t `regulator_error_flags_t`
Opaque bit map for regulator error flags (see `REGULATOR_ERRORS`)

**Functions**

```c
int regulator_enable(const struct device *dev)
```
Enable a regulator.

Reference-counted request that a regulator be turned on. A regulator is considered “on” when it has reached a stable/usable state. Regulators that are always on, or configured in devicetree with `regulator-always-on` will always stay enabled, and so this function will always succeed.

**Parameters**
• dev – Regulator device instance

Return values
• 0 – If regulator has been successfully enabled.
• -errno – Negative errno in case of failure.
• -ENOTSUP – If regulator enablement can not be controlled.

bool regulator_is_enabled(const struct device *dev)
Check if a regulator is enabled.

Parameters
• dev – Regulator device instance.

Return values
• true – If regulator is enabled.
• false – If regulator is disabled.

int regulator_disable(const struct device *dev)
Disable a regulator.

Release a regulator after a previous regulator_enable() completed successfully. Regulators that are always on, or configured in devicetree with regulator-always-on will always stay enabled, and so this function will always succeed.

This must be invoked at most once for each successful regulator_enable().

Parameters
• dev – Regulator device instance.

Return values
• 0 – If regulator has been successfully disabled.
• -errno – Negative errno in case of failure.
• -ENOTSUP – If regulator disablement can not be controlled.

static inline unsigned int regulator_count_voltages(const struct device *dev)
Obtain the number of supported voltage levels.

Each voltage level supported by a regulator gets an index, starting from zero. The total number of supported voltage levels can be used together with regulator_list_voltage() to list all supported voltage levels.

Parameters
• dev – Regulator device instance.

Returns
Number of supported voltages.

static inline int regulator_list_voltage(const struct device *dev, unsigned int idx, int32_t *volt_uv)
Obtain the value of a voltage given an index.

Each voltage level supported by a regulator gets an index, starting from zero. Together with regulator_count_voltages(), this function can be used to iterate over all supported voltages.

Parameters
• dev – Regulator device instance.
• idx – Voltage index.
• volt_uv – [out] Where voltage for the given index will be stored, in microvolts.

Return values
• 0 – If index corresponds to a supported voltage.
• -EINVAL – If index does not correspond to a supported voltage.

bool regulator_is_supported_voltage(const struct device *dev, int32_t min_uv, int32_t max_uv)

Check if a voltage within a window is supported.

Parameters
• dev – Regulator device instance.
• min_uv – Minimum voltage in microvolts.
• max_uv – Maximum voltage in microvolts.

Return values
• true – If voltage is supported.
• false – If voltage is not supported.

int regulator_set_voltage(const struct device *dev, int32_t min_uv, int32_t max_uv)

Set the output voltage.

The output voltage will be configured to the closest supported output voltage. regulator_get_voltage() can be used to obtain the actual configured voltage. The voltage will be applied to the active or selected mode. Output voltage may be limited using regulator-min-microvolt and/or regulator-max-microvolt in devicetree.

Parameters
• dev – Regulator device instance.
• min_uv – Minimum acceptable voltage in microvolts.
• max_uv – Maximum acceptable voltage in microvolts.

Return values
• 0 – If successful.
• -EINVAL – If the given voltage window is not valid.
• -ENOSYS – If function is not implemented.
• -errno – In case of any other error.

static inline int regulator_get_voltage(const struct device *dev, int32_t *volt_uv)

Obtain output voltage.

Parameters
• dev – Regulator device instance.
• volt_uv – [out] Where configured output voltage will be stored.

Return values
• 0 – If successful
• -ENOSYS – If function is not implemented.
• -errno – In case of any other error.
static inline unsigned int regulator_count_current_limits(const struct device *dev)

Obtain the number of supported current limit levels.

Each current limit level supported by a regulator gets an index, starting from zero. The total number of supported current limit levels can be used together with regulator_list_current_limit() to list all supported current limit levels.

**Parameters**

- **dev** – Regulator device instance.

**Returns**

Number of supported current limits.

static inline int regulator_list_current_limit(const struct device *dev, unsigned int idx, int32_t *current_ua)

Obtain the value of a current limit given an index.

Each current limit level supported by a regulator gets an index, starting from zero. Together with regulator_count_current_limits(), this function can be used to iterate over all supported current limits.

**Parameters**

- **dev** – Regulator device instance.
- **idx** – Current index.
- **current_ua** – [out] Where current for the given index will be stored, in microamps.

**Return values**

- **0** – If index corresponds to a supported current limit.
- **EINVAL** – If index does not correspond to a supported current limit.

int regulator_set_current_limit(const struct device *dev, int32_t min_ua, int32_t max_ua)

Set output current limit.

The output current limit will be configured to the closest supported output current limit. regulator_get_current_limit() can be used to obtain the actual configured current limit. Current may be limited using current-min-microamp and/or current-max-microamp in Devicetree.

**Parameters**

- **dev** – Regulator device instance.
- **min_ua** – Minimum acceptable current limit in microamps.
- **max_ua** – Maximum acceptable current limit in microamps.

**Return values**

- **0** – If successful.
- **EINVAL** – If the given current limit window is not valid.
- **ENOSYS** – If function is not implemented.
- **errno** – In case of any other error.

static inline int regulator_get_current_limit(const struct device *dev, int32_t *curr_ua)

Get output current limit.

**Parameters**

- **dev** – Regulator device instance.
• **curr ua** – [out] Where output current limit will be stored.

**Return values**

- **0** – If successful.
- **-ENOSYS** – If function is not implemented.
- **-errno** – In case of any other error.

```c
int regulator_set_mode(const struct device *dev, regulator_mode_t mode)
```

Set mode.

Regulators can support multiple modes in order to permit different voltage configuration or better power savings. This API will apply a mode for the regulator. Allowed modes may be limited using `regulator-allowed-modes` devicetree property.

**Parameters**

- **dev** – Regulator device instance.
- **mode** – Mode to select for this regulator.

**Return values**

- **0** – If successful.
- **-ENOTSUP** – If mode is not supported.
- **-ENOSYS** – If function is not implemented.
- **-errno** – In case of any other error.

```c
static inline int regulator_get_mode(const struct device *dev, regulator_mode_t *mode)
```

Get mode.

**Parameters**

- **dev** – Regulator device instance.
- **mode** – [out] Where mode will be stored.

**Return values**

- **0** – If successful.
- **-ENOSYS** – If function is not implemented.
- **-errno** – In case of any other error.

```c
static inline int regulator_get_error_flags(const struct device *dev, regulator_error_flags_t *flags)
```

Get active error flags.

**Parameters**

- **dev** – Regulator device instance.
- **flags** – [out] Where error flags will be stored.

**Return values**

- **0** – If successful.
- **-ENOSYS** – If function is not implemented.
- **-errno** – In case of any other error.
7.5.39 Reset Controller

Overview

Reset controllers are units that control the reset signals to multiple peripherals. The reset controller API allows peripheral drivers to request control over their reset input signals, including the ability to assert, deassert and toggle those signals. Also, the reset status of the reset input signal can be checked.

Mainly, the line_assert and line_deassert API functions are optional because in most cases we want to toggle the reset signals.

Configuration Options

Related configuration options:

- CONFIG_RESET

API Reference

group reset_controller_interface

Reset Controller Interface.

Defines

RESET_DT_SPEC_GET_BY_IDX(node_id, idx)

Static initializer for a reset_dt_spec.

This returns a static initializer for a reset_dt_spec structure given a devicetree node identifier, a property specifying a Reset Controller and an index.

Example devicetree fragment:

```
node {
  resets = <&reset 10>;
}
```

Example usage:

```
const struct reset_dt_spec spec = RESET_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), 0);
// Initializes 'spec' to:
// { .dev = DEVICE_DT_GET(DT_NODELABEL(reset)), .id = 10 }
```

The ‘reset’ field must still be checked for readiness, e.g., using device_is_ready(). It is an error to use this macro unless the node exists, has the given property, and that property specifies a reset controller reset line id as shown above.

Parameters

- node_id – devicetree node identifier
- idx – logical index into “resets”

Returns

static initializer for a struct reset_dt_spec for the property
RESET_DT_SPEC_GET(node_id)
Equivalent to \texttt{RESET_DT_SPEC_GET\_BY\_IDX(node\_id, 0)}.

See also:
\texttt{RESET\_DT\_SPEC\_GET\_BY\_IDX()}

Parameters
\begin{itemize}
\item \texttt{node\_id} – devicetree node identifier
\end{itemize}

Returns
static initializer for a struct \texttt{reset\_dt\_spec} for the property

RESET_DT_SPEC_INST_GET\_BY\_IDX(inst, idx)
Static initializer for a \texttt{reset\_dt\_spec} from a DT_DRV\_COMPAT instance’s Reset Controller property at an index.

See also:
\texttt{RESET\_DT\_SPEC\_GET\_BY\_IDX()}

Parameters
\begin{itemize}
\item \texttt{inst} – DT_DRV\_COMPAT instance number
\item \texttt{idx} – logical index into “resets”
\end{itemize}

Returns
static initializer for a struct \texttt{reset\_dt\_spec} for the property

RESET_DT_SPEC_INST_GET(inst)
Equivalent to \texttt{RESET\_DT\_SPEC\_INST\_GET\_BY\_IDX(inst, 0)}.

See also:
\texttt{RESET\_DT\_SPEC\_INST\_GET\_BY\_IDX()}

Parameters
\begin{itemize}
\item \texttt{inst} – DT_DRV\_COMPAT instance number
\end{itemize}

Returns
static initializer for a struct \texttt{reset\_dt\_spec} for the property

Functions

\texttt{int \texttt{reset\_status}(const struct device *dev, uint32\_t id, uint8\_t *status)}
Get the reset status.

This function returns the reset status of the device.

Parameters
\begin{itemize}
\item \texttt{dev} – Reset controller device.
\item \texttt{id} – Reset line.
\item \texttt{status} – Where to write the reset status.
\end{itemize}

Return values
• 0 – On success.
• -ENOSYS – If the functionality is not implemented by the driver.
• -errno – Other negative errno in case of failure.

static inline int reset_status_dt(const struct reset_dt_spec *spec, uint8_t *status)
Get the reset status from a reset_dt_spec.
This is equivalent to:
reset_status(spec->dev, spec->id, status);

Parameters
• spec – Reset controller specification from devicetree
• status – Where to write the reset status.

Returns
a value from reset_status()

int reset_line_assert(const struct device *dev, uint32_t id)
Put the device in reset state.
This function sets/clears the reset bits of the device, depending on the logic level
(active-high/active-low).

Parameters
• dev – Reset controller device.
• id – Reset line.

Return values
• 0 – On success.
• -ENOSYS – If the functionality is not implemented by the driver.
• -errno – Other negative errno in case of failure.

static inline int reset_line_assert_dt(const struct reset_dt_spec *spec)
Assert the reset state from a reset_dt_spec.
This is equivalent to:
reset_line_assert(spec->dev, spec->id);

Parameters
• spec – Reset controller specification from devicetree

Returns
a value from reset_line_assert()

int reset_line_deassert(const struct device *dev, uint32_t id)
Take out the device from reset state.
This function sets/clears the reset bits of the device, depending on the logic level
(active-low/active-high).

Parameters
• dev – Reset controller device.
• id – Reset line.

Return values
• 0 – On success.
- **-ENOSYS** – If the functionality is not implemented by the driver.
- **-errno** – Other negative errno in case of failure.

```c
static inline int reset_line_deassert_dt(const struct reset_dt_spec *spec)
    Deassert the reset state from a reset_dt_spec.
This is equivalent to:
reset_line_deassert(spec->dev, spec->id)
```

**Parameters**
- `spec` – Reset controller specification from devicetree

**Returns**
a value from `reset_line_deassert()`

```c
int reset_line_toggle(const struct device *dev, uint32_t id)
    Reset the device.
This function performs reset for a device (assert + deassert).
```

**Parameters**
- `dev` – Reset controller device.
- `id` – Reset line.

**Return values**
- 0 – On success.
- **-ENOSYS** – If the functionality is not implemented by the driver.
- **-errno** – Other negative errno in case of failure.

```c
static inline int reset_line_toggle_dt(const struct reset_dt_spec *spec)
    Reset the device from a reset_dt_spec.
This is equivalent to:
reset_line_toggle(spec->dev, spec->id)
```

**Parameters**
- `spec` – Reset controller specification from devicetree

**Returns**
a value from `reset_line_toggle()`

```c
struct reset_dt_spec
    #include <reset.h> Reset controller device configuration.
```

**Public Members**

```c
const struct device *dev
    Reset controller device.
```

```c
uint32_t id
    Reset line.
```
7.5.40 Retained Memory

Overview

The retained memory driver API provides a way of reading from/writing to memory areas whereby the contents of the memory is retained whilst the device is powered (data may be lost in low power modes).

Configuration Options

Related configuration options:

- CONFIG_RETAINED_MEM
- CONFIG_RETAINED_MEM_INIT_PRIORITY
- CONFIG_RETAINED_MEM_MUTEX_FORCE_DISABLE

Mutex protection

Mutex protection of retained memory drivers is enabled by default when applications are compiled with multithreading support. This means that different threads can safely call the retained memory functions without clashing with other concurrent thread function usage, but means that retained memory functions cannot be used from ISRs. It is possible to disable mutex protection globally on all retained memory drivers by enabling CONFIG_RETAINED_MEM_MUTEX_FORCE_DISABLE - users are then responsible for ensuring that the function calls do not conflict with each other.

API Reference

group retained_mem_interface

Retained memory driver interface.

Typedefs

typedef ssize_t (*retained_mem_size_api)(const struct device *dev)

Callback API to get size of retained memory area.

See retained_mem_size() for argument description.

typedef int (*retained_mem_read_api)(const struct device *dev, off_t offset, uint8_t *buffer, size_t size)

Callback API to read from retained memory area.

See retained_mem_read() for argument description.

.typedef int (*retained_mem_write_api)(const struct device *dev, off_t offset, const uint8_t *buffer, size_t size)

Callback API to write to retained memory area.

See retained_mem_write() for argument description.
typedef int (*retained_mem_clear_api)(const struct device *dev)
Callback API to clear retained memory area (reset all data to 0x00).
See retained_mem_clear() for argument description.

Functions

ssize_t retained_mem_size(const struct device *dev)
Returns the size of the retained memory area.

Parameters
• dev – Retained memory device to use.

Return values
Positive – value indicating size in bytes on success, else negative errno code.

int retained_mem_read(const struct device *dev, off_t offset, uint8_t *buffer, size_t size)
Reads data from the Retained memory area.

Parameters
• dev – Retained memory device to use.
• offset – Offset to read data from.
• buffer – Buffer to store read data in.
• size – Size of data to read.

Return values
0 – on success else negative errno code.

int retained_mem_write(const struct device *dev, off_t offset, const uint8_t *buffer, size_t size)
Writes data to the Retained memory area - underlying data does not need to be cleared prior to writing.

Parameters
• dev – Retained memory device to use.
• offset – Offset to write data to.
• buffer – Data to write.
• size – Size of data to be written.

Return values
0 – on success else negative errno code.

int retained_mem_clear(const struct device *dev)
Clears data in the retained memory area by setting it to 0x00.

Parameters
• dev – Retained memory device to use.

Return values
0 – on success else negative errno code.
struct retained_mem_driver_api

#include <retained_mem.h> Retained memory driver API API which can be used by a
device to store data in a retained memory area.

Retained memory is memory that is retained while the device is powered but is lost
when power to the device is lost (note that low power modes in some devices may clear
the data also). This may be in a non-initialised RAM region, or in specific registers, but
is not reset when a different application begins execution or the device is rebooted
(without power loss). It must support byte-level reading and writing without a need to
erase data before writing.

Note that drivers must implement all functions, none of the functions are optional.

7.5.41 Secure Digital High Capacity (SDHC)

The SDHC api offers a generic interface for interacting with an SD host controller device. It is
used by the SD subsystem, and is not intended to be directly used by the application

Basic Operation

SD Host Controller  An SD host controller is a device capable of sending SD commands to an
attached SD card. These commands can be sent using the native SD protocol, or over SPI. Some SD
host controllers are also capable of communicating with MMC devices. The SDHC api is designed
to provide a generic way to send commands to and interact with attached SD devices.

Requests  The core of the SDHC api is the sdhc_request() api. Requests contain a sdhc_command
command structure, and an optional sdhc_data data structure. The caller may check the return
code, or the response field of the SD command structure to determine if the SDHC request suc-
cceeded. The data structure allows the caller to specify a number of blocks to transfer, and a
buffer location to read or write them from. Whether the provided buffer is used for sending or
reading data depends on the command opcode provided.

Host Controller I/O  The sdhc_set_io() api allows the user to change I/O settings of the SD host
controller, such as clock frequency, I/O voltage, and card power. Not all controllers will support
applying all I/O settings. For example, SPI mode controllers typically cannot toggle power to the
SD card.

Related configuration options:

• CONFIG_SDHC

API Reference

group sdhc_interface

SDHC interface.

SD command timeouts

SDHC_TIMEOUT_FOREVER
Defines

SDHC_NATIVE_RESPONSE_MASK

SDHC_SPI_RESPONSE_TYPE_MASK

Typedefs

typedef void (*sdhc_interrupt_cb_t)(const struct device *dev, int reason, const void *user_data)

SDHC card interrupt callback prototype.

Function prototype for SDHC card interrupt callback.

Param dev

SDHC device that produced interrupt

Param reason

one of sdhc_interrupt_source values.

Param user_data

User data, set via sdhc_enable_interrupt

Enums

enum sdhc_bus_mode

SD bus mode.

Most controllers will use push/pull, including spi, but SDHC controllers that implement SD host specification can support open drain mode

Values:

enumerator SDHC_BUSMODE_OPENDRAIN = 1

enumerator SDHC_BUSMODE_PUSHPULL = 2

enum sdhc_power

SD host controller power.

Many host controllers can control power to attached SD cards. This enum allows applications to request the host controller power off the SD card.

Values:

enumerator SDHC_POWER_OFF = 1

enumerator SDHC_POWER_ON = 2
enum sdhc_bus_width
SD host controller bus width.
Only relevant in SD mode, SPI does not support bus width. UHS cards will use 4 bit data bus, all cards start in 1 bit mode

Values:

enumerator SDHC_BUS_WIDTH1BIT = 1U
enumerator SDHC_BUS_WIDTH4BIT = 4U
enumerator SDHC_BUS_WIDTH8BIT = 8U

denum sdhc_timing_mode
SD host controller timing mode.
Used by SD host controller to determine the timing of the cards attached to the bus. Cards start with legacy timing, but UHS-II cards can go up to SDR104.

Values:

enumerator SDHC_TIMING_LEGACY = 1U
   Legacy 3.3V Mode.
enumerator SDHC_TIMING_HS = 2U
   Legacy High speed mode (3.3V)
enumerator SDHC_TIMING_SDR12 = 3U
   Identification mode & SDR12.
enumerator SDHC_TIMING_SDR25 = 4U
   High speed mode & SDR25.
enumerator SDHC_TIMING_SDR50 = 5U
   SDR49 mode.
enumerator SDHC_TIMING_SDR104 = 6U
   SDR104 mode.
enumerator SDHC_TIMING_DDR50 = 7U
   DDR50 mode.
enumerator SDHC_TIMING_DDR52 = 8U
   DDR52 mode.
enumerator SDHC_TIMING_HS200 = 9U
   HS200 mode.
enumerator SDHC_TIMING_HS400 = 10U
   HS400 mode.
enum sd_voltage
SD voltage.
UHS cards can run with 1.8V signalling for improved power consumption. Legacy
cards may support 3.0V signalling, and all cards start at 3.3V. Only relevant for SD
controllers, not SPI ones.
Values:

enumerator SD_VOL_3_3_V = 1U
card operation voltage around 3.3v

enumerator SD_VOL_3_0_V = 2U
card operation voltage around 3.0v

enumerator SD_VOL_1_8_V = 3U
card operation voltage around 1.8v

enumerator SD_VOL_1_2_V = 4U
card operation voltage around 1.2v

enum sdhc_interrupt_source
SD host controller interrupt sources.
Interrupt sources for SD host controller.
Values:

enumerator SDHC_INT_SDIO = BIT(0)
Card interrupt, used by SDIO cards.

enumerator SDHC_INT_INSERTED = BIT(1)
Card was inserted into slot.

enumerator SDHC_INT_REMOVED = BIT(2)
Card was removed from slot.

Functions

int sdhc_hw_reset(const struct device *dev)
reset SDHC controller state
Used when the SDHC has encountered an error. Resetting the SDHC controller should
clear all errors on the SDHC, but does not necessarily reset I/O settings to boot (this can
be done with sdhc_set_io)

Parameters
  • dev – SD host controller device

Return values
  • 0 – reset succeeded
  • -ETIMEDOUT – controller reset timed out
  • -EIO – reset failed
int sdhc_request(const struct device *dev, struct sdhc_command *cmd, struct sdhc_data *data)
Send command to SDHC.
Sends a command to the SD host controller, which will send this command to attached SD cards.

Parameters
• dev – SDHC device
• cmd – SDHC command
• data – SDHC data. Leave NULL to send SD command without data.

Return values
• 0 – command was sent successfully
• -ETIMEDOUT – command timed out while sending
• -ENOTSUP – host controller does not support command
• -EIO – I/O error

int sdhc_set_io(const struct device *dev, struct sdhc_io *io)
set I/O properties of SDHC
I/O properties should be reconfigured when the card has been sent a command to change its own SD settings. This function can also be used to toggle power to the SD card.

Parameters
• dev – SDHC device
• io – I/O properties

Returns
0 I/O was configured correctly

Returns
-ENOTSUP controller does not support these I/O settings

Returns
-EIO controller could not configure I/O settings

int sdhc_card_present(const struct device *dev)
check for SDHC card presence
Checks if card is present on the SD bus. Note that if a controller requires cards be powered up to detect presence, it should do so in this function.

Parameters
• dev – SDHC device

Return values
• 1 – card is present
• 0 – card is not present
• -EIO – I/O error

int sdhc_execute_tuning(const struct device *dev)
run SDHC tuning
SD cards require signal tuning for UHS modes SDR104 and SDR50. This function allows an application to request the SD host controller to tune the card.

Parameters
- **dev** – SDHC device

**Return values**
- 0 – tuning succeeded, card is ready for commands
- -ETIMEDOUT – tuning failed after timeout
- -ENOTSUP – controller does not support tuning
- -EIO – I/O error while tuning

```c
int sdhc_card_busy(const struct device *dev)
```
check if SD card is busy

This check should generally be implemented as checking the line level of the DAT[0:3] lines of the SD bus. No SD commands need to be sent, the controller simply needs to report the status of the SD bus.

**Parameters**
- **dev** – SDHC device

**Return values**
- 0 – card is not busy
- 1 – card is busy
- -EIO – I/O error

```c
int sdhc_get_host_props(const struct device *dev, struct sdhc_host_props *props)
```
Get SD host controller properties.

Gets host properties from the host controller. Host controller should initialize all values in the `sdhc_host_props` structure provided.

**Parameters**
- **dev** – SDHC device
- **props** – property structure to be filled by sdhc driver

**Return values**
- 0 – function succeeded.
- -ENOTSUP – host controller does not support this call

```c
int sdhc_enable_interrupt(const struct device *dev, sdhc_interrupt_cb_t callback, int sources, void *user_data)
```
Enable SDHC interrupt sources.

Enables SDHC interrupt sources. Each subsequent call of this function should replace the previous callback set, and leave only the interrupts specified in the “sources” argument enabled.

**Parameters**
- **dev** – SDHC device
- **callback** – Callback called when interrupt occurs
- **sources** – bitmask of `sdhc_interrupt_source` values indicating which interrupts should produce a callback
- **user_data** – parameter that will be passed to callback function

**Return values**
- 0 – interrupts were enabled, and callback was installed
- -ENOTSUP – controller does not support this function
int sdhc_disable_interrupt(const struct device *dev, int sources)
Disable SDHC interrupt sources.
Disables SDHC interrupt sources. If multiple sources are enabled, only the ones specified in “sources” will be masked.

Parameters
- dev – SDHC device
- sources – bitmask of sdhc_interrupt_source values indicating which interrupts should be disabled.

Return values
- 0 – interrupts were disabled
- -ENOTSUP – controller does not support this function
- -EIO – I/O error

struct sdhc_command
#include <sdhc.h> SD host controller command structure.
This command structure is used to send command requests to an SD host controller, which will be sent to SD devices.

Public Members

uint32_t opcode
SD Host specification CMD index.

uint32_t arg
SD host specification argument.

uint32_t response[4]
SD card response field.

uint32_t response_type
Expected SD response type.

unsigned int retries
Max number of retries.

int timeout_ms
Command timeout in milliseconds.

struct sdhc_data
#include <sdhc.h> SD host controller data structure.
This command structure is used to send data transfer requests to an SD host controller, which will be sent to SD devices.
Public Members

unsigned int block_addr
   Block to start read from.

unsigned int block_size
   Block size.

unsigned int blocks
   Number of blocks.

unsigned int bytes_xferred
   populated with number of bytes sent by SDHC

void *data
   Data to transfer or receive.

int timeout_ms
   data timeout in milliseconds

struct sdhc_host_caps
   #include <sdhc.h> SD host controller capabilities.
   SD host controller capability flags. These flags should be set by the SDHC driver, using
   the sdhc_get_host_props api.

Public Members

unsigned int timeout_clk_freq
   Timeout clock frequency.

unsigned int timeout_clk_unit
   Timeout clock unit.

unsigned int sd_base_clk
   SD base clock frequency.

unsigned int max_blk_len
   Max block length.

unsigned int bus_8_bit_support
   8-bit Support for embedded device

unsigned int bus_4_bit_support
   4 bit bus support

unsigned int adma_2_support
   ADMA2 support.
unsigned int high_spd_support
    High speed support.

unsigned int sdma_support
    SDMA support.

unsigned int suspend_res_support
    Suspend/Resume support.

unsigned int vol_330_support
    Voltage support 3.3V.

unsigned int vol_300_support
    Voltage support 3.0V.

unsigned int vol_180_support
    Voltage support 1.8V.

unsigned int address_64_bit_support_v4
    64-bit system address support for V4

unsigned int address_64_bit_support_v3
    64-bit system address support for V3

unsigned int sdio_async_interrupt_support
    Asynchronous interrupt support.

unsigned int slot_type
    Slot type.

unsigned int sdr50_support
    SDR50 support.

unsigned int sdr104_support
    SDR104 support.

unsigned int ddr50_support
    DDR50 support.

unsigned int uhs_2_support
    UHS-II support.

unsigned int drv_type_a_support
    Driver type A support.

unsigned int drv_type_c_support
    Driver type C support.
unsigned int `drv_type_d_support`
   Driver type D support.

unsigned int `retune_timer_count`
   Timer count for re-tuning.

unsigned int `sdr50_needs_tuning`
   Use tuning for SDR50.

unsigned int `retuning_mode`
   Re-tuning mode.

unsigned int `clk_multiplier`
   Clock multiplier.

unsigned int `adma3_support`
   ADMA3 support.

unsigned int `vdd2_180_support`
   1.8V VDD2 support

unsigned int `hs200_support`
   HS200 support.

unsigned int `hs400_support`
   HS400 support.

struct `sdhc_io`
   
   `#include <sdhc.h>` SD host controller I/O control structure.
   Controls I/O settings for the SDHC. Note that only a subset of these settings apply to host controllers in SPI mode. Populate this struct, then call `sdhc_set_io` to apply I/O settings

**Public Members**

enum `sdhc_clock_speed` `clock`
   Clock rate.

enum `sdhc_bus_mode` `bus_mode`
   command output mode

enum `sdhc_power` `power_mode`
   SD power supply mode.

enum `sdhc_bus_width` `bus_width`
   SD bus width.

enum `sdhc_timing_mode` `timing`
   SD bus timing.
enum sd_driver_type driver_type
    SD driver type.

denum sd_voltage signal_voltage
    IO signalling voltage (usually 1.8 or 3.3V)

struct sdhc_host_props
    #include <sdhc.h> SD host controller properties.
    Populated by the host controller using sdhc_get_host_props api.

Public Members

unsigned int f_max
    Max bus frequency.

unsigned int f_min
    Min bus frequency.

unsigned int power_delay
    Delay to allow SD to power up or down (in ms)

struct sdhc_host_caps host_caps
    Host capability bitfield.

uint32_t max_current_330
    Max current (in mA) at 3.3V.

uint32_t max_current_300
    Max current (in mA) at 3.0V.

uint32_t max_current_180
    Max current (in mA) at 1.8V.

bool is_spi
    Is the host using SPI mode.

struct sdhc_driver_api
    #include <sdhc.h>

7.5.42 Sensors

The sensor subsystem exposes an API to uniformly access sensor devices. Common operations are: reading data and executing code when specific conditions are met.
Basic Operation

Channels  Fundamentally, a channel is a quantity that a sensor device can measure.

Sensors can have multiple channels, either to represent different axes of the same physical property (e.g. acceleration); or because they can measure different properties altogether (ambient temperature, pressure and humidity). Complex sensors cover both cases, so a single device can expose three acceleration channels and a temperature one.

It is imperative that all sensors that support a given channel express results in the same unit of measurement. Consult the API Reference for all supported channels, along with their description and units of measurement:

Values  Sensor stable APIs return results as sensor_value. This representation avoids use of floating point values as they may not be supported on certain setups.

A newer experimental (may change) API that can interpret raw sensor data is available in parallel. This new API exposes raw encoded sensor data to the application and provides a separate decoder to convert the data to a Q31 format which is compatible with the Zephyr Digital Signal Processing (DSP). The values represented are in the range of (-1.0, 1.0) and require a shift operation in order to scale them to their SI unit values. See Async Read for more information.

Fetching Values  Getting a reading from a sensor requires two operations. First, an application instructs the driver to fetch a sample of all its channels. Then, individual channels may be read. In the case of channels with multiple axes, they can be read in a single operation by supplying the corresponding _XYZ channel type and a buffer of 3 sensor_value objects. This approach ensures consistency of channels between reads and efficiency of communication by issuing a single transaction on the underlying bus.

Below is an example illustrating the usage of the BME280 sensor, which measures ambient temperature and atmospheric pressure. Note that sensor_sample_fetch() is only called once, as it reads and compensates data for both channels.

```c
/*
 * Get a device structure from a devicetree node with compatible
 * "bosch,bme280". (If there are multiple, just pick one.) */
static const struct device *get_bme280_device(void)
{
    const struct device *dev = DEVICE_DT_GET_ANY(bosch_bme280);

    if (dev == NULL) {
        /* No such node, or the node does not have status "okay". */
        printk("\nError: no device found.\n");
        return NULL;
    }

    if (!device_is_ready(dev)) {
        printk("\nError: Device \"%s\" is not ready; 
        "check the driver initialization logs for errors.\n",
                dev->name);
        return NULL;
    }

    printk("Found device \"%s\", getting sensor data\n", dev->name);
    return dev;
}

int main(void)
```

(continues on next page)
{  
    const struct device *dev = get_bme280_device();
    if (dev == NULL) {
        return 0;
    }

    while (1) {
        struct sensor_value temp, press, humidity;
        sensor_sample_fetch(dev);
        sensor_channel_get(dev, SENSOR_CHAN_AMBIENT_TEMP, &temp);
        sensor_channel_get(dev, SENSOR_CHAN_PRESS, &press);
        sensor_channel_get(dev, SENSOR_CHAN_HUMIDITY, &humidity);
        printk("temp: %d.%06d; press: %d.%06d; humidity: %d.%06d
", temp.val1, temp.val2, press.val1, press.val2,
            humidity.val1, humidity.val2);
        k_sleep(K_MSEC(1000));
    }
    return 0;
}

Async Read  

To enable the async APIs, use CONFIG_SENSOR_ASYNC_API.

Reading the sensors leverages the Real Time I/O (RTIO) subsystem. Applications gain control of the data processing thread and even memory management. In order to get started with reading the sensors, an IODev must be created via the SENSOR_DT_READ_IODEV. Next, an RTIO context must be created. It is strongly suggested that this context is created with a memory pool via RTIO_DEFINE_WITH_MEMPOOL.

```c
#include <zephyr/device.h>
#include <zephyr/drivers/sensor.h>
#include <zephyr/rtio/rtio.h>

static const struct device *lid_accel = DEVICE_DT_GET(DT_ALIAS(lid_accel));
SENSOR_DT_READ_IODEV(lid accel iodev, DT_ALIAS(lid_accel), SENSOR_CHAN_ACCEL_XYZ);

RTIO_DEFINE_WITH_MEMPOOL(sensors rtio,
    4, /* submission queue size */
    4, /* completion queue size */
    16, /* number of memory blocks */
    32, /* size of each memory block */
    4, /* memory alignment */
);
```

To trigger a read, the application simply needs to call sensor_read() and pass the relevant IODev and RTIO context. Getting the result is done like any other RTIO operation, by waiting on a completion queue event (CQE). In order to help reduce some boilerplate code, the helper function sensor_processing_with_callback() is provided. When called, the function will block until a CQE becomes available from the provided RTIO context. The appropriate buffers are extracted and the callback is called. Once the callback is done, the memory is reclaimed by the memory-pool. This looks like:

```c
static void sensor_processing_callback(int result, uint8_t *buf,
                                          uint32_t buf_len, void *userdata) {
    // Process the data...
}
```
static void sensor_processing_thread(void *, void *, void *) {
    while (true) {
        sensor_processing_with_callback(&sensors_rtio, sensor_processing_callback);
    }
}

K_THREAD_DEFINE(sensor_processing_tid, 1024, sensor_processing_thread, NULL, NULL, NULL, 0, 0, 0);

Note: Helper functions to create custom length IODev nodes and ones that don’t have static bindings will be added soon.

Processing the Data  Once data collection completes and the processing callback was called, processing the data is done via the sensor_decoder_api. The API provides a means for applications to control when to process the data and how many resources to dedicate to the processing. The API is entirely self contained and requires no system calls (even when CONFIG_USERSPACE is enabled).

static struct sensor_decoder_api *lid_accel_decoder = SENSOR_DECODER_DT_GET(DT_ALIAS(lid_accel));

static void sensor_processing_callback(int result, uint8_t *buf, uint32_t buf_len, void *userdata) {
    uint64_t timestamp;
    sensor_frame_iterator_t fit = {0};
    sensor_channel_iterator_t cit = {0};
    enum sensor_channel channels[3];
    q31_t values[3];
    int8_t shift[3];

    lid_accel_decoder->get_timestamp(buf, &timestamp);
    lid_accel_decoder->decode(buf, &fit, &cit, channels, values, 3);

    /* Values are now in q31_t format, we're going to convert them to micro-units */
    /* First, we need to know by how much to shift the values */
    lid_accel_decoder->get_shift(buf, channels[0], &shift[0]);
    lid_accel_decoder->get_shift(buf, channels[1], &shift[1]);
    lid_accel_decoder->get_shift(buf, channels[2], &shift[2]);

    /* Shift the values to get the SI units */
    int64_t scaled_values[] = {
        (int64_t)values[0] << shift[0],
        (int64_t)values[1] << shift[1],
        (int64_t)values[2] << shift[2],
    };

    /* FIELD_GET(GENMASK64(63, 31), scaled_values[]) - will give the integer value
     * FIELD_GET(GENMASK64(30, 0), scaled_values[]) / INT32_MAX - is the decimal value
     */
}
Configuration and Attributes

Setting the communication bus and address is considered the most basic configuration for sensor devices. This setting is done at compile time, via the configuration menu. If the sensor supports interrupts, the interrupt lines and triggering parameters described below are also configured at compile time.

Alongside these communication parameters, sensor chips typically expose multiple parameters that control the accuracy and frequency of measurement. In compliance with Zephyr’s design goals, most of these values are statically configured at compile time.

However, certain parameters could require runtime configuration, for example, threshold values for interrupts. These values are configured via attributes. The example in the following section showcases a sensor with an interrupt line that is triggered when the temperature crosses a threshold. The threshold is configured at runtime using an attribute.

Triggers

*Triggers* in Zephyr refer to the interrupt lines of the sensor chips. Many sensor chips support one or more triggers. Some examples of triggers include: new data is ready for reading, a channel value has crossed a threshold, or the device has sensed motion.

To configure a trigger, an application needs to supply a `sensor_trigger` and a handler function. The structure contains the trigger type and the channel on which the trigger must be configured.

Because most sensors are connected via SPI or I2C buses, it is not possible to communicate with them from the interrupt execution context. The execution of the trigger handler is deferred to a thread, so that data fetching operations are possible. A driver can spawn its own thread to fetch data, thus ensuring minimum latency. Alternatively, multiple sensor drivers can share a system-wide thread. The shared thread approach increases the latency of handling interrupts but uses less memory. You can configure which approach to follow for each driver. Most drivers can entirely disable triggers resulting in a smaller footprint.

The following example contains a trigger fired whenever temperature crosses the 26 degree Celsius threshold. It also samples the temperature every second. A real application would ideally disable periodic sampling in the interest of saving power. Since the application has direct access to the kernel config symbols, no trigger is registered when triggering was disabled by the driver’s configuration.

```
#define UCEL_PER_CEL 1000000
#define UCEL_PER_MCEL 1000
#define TEMP_INITIAL_CEL 25
#define TEMP_WINDOW_HALF_UCEL 500000

**group sensor_interface**
Sensor Interface.

**Defines**

`SENSOR_DECODE_CONTEXT_INIT(decoder_, buffer_, channel_, channel_index_)`
Initialize a `sensor_decode_context`.

`SENSOR_DT_READ_IODEV(name, dt_node, ...)`
Define a reading instance of a sensor.

Use this macro to generate a `rtio_iodev` for reading specific channels. Example:

```c
SENSOR_DT_READ_IODEV(icm42688_accelgyro, DT_NODELABEL(icm42688),
    SENSOR_CHAN_ACCEL_XYZ, SENSOR_CHAN_GYRO_XYZ);
```

```c
int main(void) {
    sensor_read(&icm42688_accelgyro, &rtio);
}
```
**SENSOR_CHANNEL_3_AXIS(chan)**

Checks if a given channel is a 3-axis channel

**Parameters**

- **chan** – [in] The channel to check

**Return values**

- **true** – if `chan` is any of `SENSOR_CHAN_ACCEL_XYZ`, `SENSOR_CHAN_GYRO_XYZ`, or `SENSOR_CHAN_MAGN_XYZ`
- **false** – otherwise

**SENSOR_G**

The value of gravitational constant in micro m/s^2.

**SENSOR_PI**

The value of constant PI in micros.

**SENSOR_INFO_DEFINE(name, ...)**

**SENSOR_INFO_DT_DEFINE(node_id)**

**SENSOR_DEVICE_DT_DEFINE(node_id, init_fn, pm_device, data_ptr, cfg_ptr, level, prio, api_ptr, ...)**

Like `DEVICE_DT_DEFINE()` with sensor specifics.

Defines a device which implements the sensor API. May define an element in the sensor info iterable section used to enumerate all sensor devices.

**Parameters**

- **node_id** – The devicetree node identifier.
- **init_fn** – Name of the init function of the driver.
- **pm_device** – PM device resources reference (NULL if device does not use PM).
- **data_ptr** – Pointer to the device’s private data.
- **cfg_ptr** – The address to the structure containing the configuration information for this instance of the driver.
- **level** – The initialization level. See SYS_INIT() for details.
- **prio** – Priority within the selected initialization level. See SYS_INIT() for details.
- **api_ptr** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

**SENSOR_DEVICE_DT_INST_DEFINE(inst, ...)**

Like `SENSOR_DEVICE_DT_DEFINE()` for an instance of a DT_DRV_COMPAT compatible.

**Parameters**

- **inst** – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to `SENSOR_DEVICE_DT_DEFINE()`.
- **...** – other parameters as expected by `SENSOR_DEVICE_DT_DEFINE()`.
**Typedefs**

typedef void (*sensor_trigger_handler_t)(const struct device *dev, const struct sensor_trigger *trigger)

Callback API upon firing of a trigger.

**Param dev**
Pointer to the sensor device

**Param trigger**
The trigger

typedef int (*sensor_attr_set_t)(const struct device *dev, enum sensor_channel chan, enum sensor_attribute attr, const struct sensor_value *val)

Callback API upon setting a sensor’s attributes.

See `sensor_attr_set()` for argument description

typedef int (*sensor_attr_get_t)(const struct device *dev, enum sensor_channel chan, enum sensor_attribute attr, struct sensor_value *val)

Callback API upon getting a sensor’s attributes.

See `sensor_attr_get()` for argument description

typedef int (*sensor_trigger_set_t)(const struct device *dev, const struct sensor_trigger *trig, sensor_trigger_handler_t handler)

Callback API for setting a sensor’s trigger and handler.

See `sensor_trigger_set()` for argument description

typedef int (*sensor_sample_fetch_t)(const struct device *dev, enum sensor_channel chan)

Callback API for fetching data from a sensor.

See `sensor_sample_fetch()` for argument description

typedef int (*sensor_channel_get_t)(const struct device *dev, enum sensor_channel chan, struct sensor_value *val)

Callback API for getting a reading from a sensor.

See `sensor_channel_get()` for argument description

typedef int (*sensor_get_decoder_t)(const struct device *dev, const struct sensor_decoder_api **api)

Get the decoder associate with the given device.

See also:

`sensor_get_decoder` for more details

typedef int (*sensor_submit_t)(const struct device *sensor, struct rtio_iodev_sqe *sqe)

typedef void (*sensor_processing_callback_t)(int result, uint8_t *buf, uint32_t buf_len, void *userdata)

Callback function used with the helper processing function.
See also:

`sensor_processing_with_callback`

**Param result**

[in] The result code of the read (0 being success)

**Param buf**

[in] The data buffer holding the sensor data

**Param buf_len**

[in] The length (in bytes) of the `buf`

**Param userdata**

[in] The optional userdata passed to `sensor_read()`

### Enums

e num `sensor_channel`

Sensor channels.

**Values:**

- enumerator `SENSOR_CHAN_ACCEL_X`
  
  Acceleration on the X axis, in m/s^2.

- enumerator `SENSOR_CHAN_ACCEL_Y`
  
  Acceleration on the Y axis, in m/s^2.

- enumerator `SENSOR_CHAN_ACCEL_Z`
  
  Acceleration on the Z axis, in m/s^2.

- enumerator `SENSOR_CHAN_ACCEL_XYZ`
  
  Acceleration on the X, Y and Z axes.

- enumerator `SENSOR_CHAN_GYRO_X`
  
  Angular velocity around the X axis, in radians/s.

- enumerator `SENSOR_CHAN_GYRO_Y`
  
  Angular velocity around the Y axis, in radians/s.

- enumerator `SENSOR_CHAN_GYRO_Z`
  
  Angular velocity around the Z axis, in radians/s.

- enumerator `SENSOR_CHAN_GYRO_XYZ`
  
  Angular velocity around the X, Y and Z axes.

- enumerator `SENSOR_CHAN_MAGN_X`
  
  Magnetic field on the X axis, in Gauss.

- enumerator `SENSOR_CHAN_MAGN_Y`
  
  Magnetic field on the Y axis, in Gauss.
enumerator SENSOR_CHAN_MAGN_Z
    Magnetic field on the Z axis, in Gauss.

enumerator SENSOR_CHAN_MAGN_XYZ
    Magnetic field on the X, Y and Z axes.

enumerator SENSOR_CHAN_DIE_TEMP
    Device die temperature in degrees Celsius.

enumerator SENSOR_CHAN_AMBIENT_TEMP
    Ambient temperature in degrees Celsius.

enumerator SENSOR_CHAN_PRESS
    Pressure in kilopascal.

enumerator SENSOR_CHAN_PROX
    Proximity.
    Adimensional. A value of 1 indicates that an object is close.

enumerator SENSOR_CHAN_HUMIDITY
    Humidity, in percent.

enumerator SENSOR_CHAN_LIGHT
    Illuminance in visible spectrum, in lux.

enumerator SENSOR_CHAN_IR
    Illuminance in infra-red spectrum, in lux.

enumerator SENSOR_CHAN_RED
    Illuminance in red spectrum, in lux.

enumerator SENSOR_CHAN_GREEN
    Illuminance in green spectrum, in lux.

enumerator SENSOR_CHAN_BLUE
    Illuminance in blue spectrum, in lux.

enumerator SENSOR_CHAN_ALTITUDE
    Altitude, in meters.

enumerator SENSOR_CHAN_PM_1_0
    1.0 micro-meters Particulate Matter, in ug/m^3

enumerator SENSOR_CHAN_PM_2_5
    2.5 micro-meters Particulate Matter, in ug/m^3

enumerator SENSOR_CHAN_PM_10
    10 micro-meters Particulate Matter, in ug/m^3
enumerator **SENSOR_CHAN_DISTANCE**
Distance.
From sensor to target, in meters

enumerator **SENSOR_CHAN_CO2**
CO2 level, in parts per million (ppm)

enumerator **SENSOR_CHAN_VOC**
VOC level, in parts per billion (ppb)

enumerator **SENSOR_CHAN_GAS_RES**
Gas sensor resistance in ohms.

enumerator **SENSOR_CHAN_VOLTAGE**
Voltage, in volts.

enumerator **SENSOR_CHAN_VSHUNT**
Current Shunt Voltage in milli-volts.

enumerator **SENSOR_CHAN_CURRENT**
Current, in amps.

enumerator **SENSOR_CHAN_POWER**
Power in watts.

enumerator **SENSOR_CHAN_RESISTANCE**
Resistance, in Ohm.

enumerator **SENSOR_CHAN_ROTATION**
Angular rotation, in degrees.

enumerator **SENSOR_CHAN_POS_DX**
Position change on the X axis, in points.

enumerator **SENSOR_CHAN_POS_DY**
Position change on the Y axis, in points.

enumerator **SENSOR_CHAN_POS_DZ**
Position change on the Z axis, in points.

enumerator **SENSOR_CHAN_RPM**
Revolution per minute, in RPM.

enumerator **SENSOR_CHAN_GAUGE_VOLTAGE**
Voltage, in volts.

enumerator **SENSOR_CHAN_GAUGE_AVG_CURRENT**
Average current, in amps.
enumerator SENSOR_CHAN_GAUGE_STDDBY_CURRENT
  Standby current, in amps.

enumerator SENSOR_CHAN_GAUGE_MAX_LOAD_CURRENT
  Max load current, in amps.

enumerator SENSOR_CHAN_GAUGE_TEMP
  Gauge temperature

enumerator SENSOR_CHAN_GAUGE_STATE_OF_CHARGE
  State of charge measurement in %.

enumerator SENSOR_CHAN_GAUGE_FULL_CHARGE_CAPACITY
  Full Charge Capacity in mAh.

enumerator SENSOR_CHAN_GAUGE_REMAINING_CHARGE_CAPACITY
  Remaining Charge Capacity in mAh.

enumerator SENSOR_CHAN_GAUGE_NOM_AVAIL_CAPACITY
  Nominal Available Capacity in mAh.

enumerator SENSOR_CHAN_GAUGE_FULL_AVAIL_CAPACITY
  Full Available Capacity in mAh.

enumerator SENSOR_CHAN_GAUGE_AVG_POWER
  Average power in mW.

enumerator SENSOR_CHAN_GAUGE_STATE_OF_HEALTH
  State of health measurement in %.

enumerator SENSOR_CHAN_GAUGE_TIME_TO_EMPTY
  Time to empty in minutes.

enumerator SENSOR_CHAN_GAUGE_TIME_TO_FULL
  Time to full in minutes.

enumerator SENSOR_CHAN_GAUGE_CYCLE_COUNT
  Cycle count (total number of charge/discharge cycles)

enumerator SENSOR_CHAN_GAUGE_DESIGN_VOLTAGE
  Design voltage of cell in V (max voltage)

enumerator SENSOR_CHAN_GAUGE_DESIRED_VOLTAGE
  Desired voltage of cell in V (nominal voltage)

enumerator SENSOR_CHAN_GAUGE_DESIRED_CHARGING_CURRENT
  Desired charging current in mA.
enumerator SENSOR_CHAN_ALL
   All channels.

enumerator SENSOR_CHAN_COMMON_COUNT
   Number of all common sensor channels.

enumerator SENSOR_CHAN_PRIV_START = SENSOR_CHAN_COMMON_COUNT
   This and higher values are sensor specific.
   Refer to the sensor header file.

enumerator SENSOR_CHAN_MAX = INT16_MAX
   Maximum value describing a sensor channel type.

enum sensor_trigger_type
   Sensor trigger types.
   Values:

enumerator SENSOR_TRIG_TIMER
   Timer-based trigger, useful when the sensor does not have an interrupt line.

enumerator SENSOR_TRIG_DATA_READY
   Trigger fires whenever new data is ready.

enumerator SENSOR_TRIG_DELTA
   Trigger fires when the selected channel varies significantly.
   This includes any-motion detection when the channel is acceleration or gyro. If de-
   tection is based on slope between successive channel readings, the slope threshold
   is configured via the SENSOR_ATTR_SLOPE_TH and SENSOR_ATTR_SLOPE_DUR at-
   tributes.

enumerator SENSOR_TRIG_NEAR_FAR
   Trigger fires when a near/far event is detected.

enumerator SENSOR_TRIG_THRESHOLD
   Trigger fires when channel reading transitions configured thresholds.
   The thresholds are configured via the SENSOR_ATTR_LOWER_THRESH, SEN-
   SOR_ATTR_UPPER_THRESH, and SENSOR_ATTR_Hysteresis attributes.

enumerator SENSOR_TRIG_TAP
   Trigger fires when a single tap is detected.

enumerator SENSOR_TRIG_DOUBLE_TAP
   Trigger fires when a double tap is detected.

enumerator SENSOR_TRIG_FREEFALL
   Trigger fires when a free fall is detected.
enumerator SENSOR_TRIG_MOTION
    Trigger fires when motion is detected.

enumerator SENSOR_TRIG_STATIONARY
    Trigger fires when no motion has been detected for a while.

enumerator SENSOR_TRIG_COMMON_COUNT
    Number of all common sensor triggers.

gerenumerator SENSOR_TRIG_PRIV_START = SENSOR_TRIG_COMMON_COUNT
    This and higher values are sensor specific.
    Refer to the sensor header file.

gerenumerator SENSOR_TRIG_MAX = INT16_MAX
    Maximum value describing a sensor trigger type.

define enum sensor_attribute
    Sensor attribute types.
    Values:

gerenumerator SENSOR_ATTR_SAMPLING_FREQUENCY
    Sensor sampling frequency, i.e.
    how many times a second the sensor takes a measurement.

gerenumerator SENSOR_ATTR_LOWER_THRESH
    Lower threshold for trigger.

ğerenumerator SENSOR_ATTR_UPPER_THRESH
    Upper threshold for trigger.

gerenumerator SENSOR_ATTR_SLOPE_TH
    Threshold for any-motion (slope) trigger.

gerenumerator SENSOR_ATTR_SLOPE_DUR
    Duration for which the slope values needs to be outside the threshold for the trigger to fire.

ğerenumerator SENSOR_ATTR_HYSTERESIS

ğerenumerator SENSOR_ATTR_OVERSAMPLING
    Oversampling factor.

ğerenumerator SENSOR_ATTR_FULL_SCALE
    Sensor range, in SI units.

ğerenumerator SENSOR_ATTR_OFFSET
    The sensor value returned will be altered by the amount indicated by offset: final_value = sensor_value + offset.
enumerator SENSOR_ATTR_CALIB_TARGET
    Calibration target.
    This will be used by the internal chip's algorithms to calibrate itself on a certain
    axis, or all of them.

enumerator SENSOR_ATTR_CONFIGURATION
    Configure the operating modes of a sensor.

enumerator SENSOR_ATTR_CALIBRATION
    Set a calibration value needed by a sensor.

enumerator SENSOR_ATTR_FEATURE_MASK
    Enable/disable sensor features.

enumerator SENSOR_ATTR_ALERT
    Alert threshold or alert enable/disable.

enumerator SENSOR_ATTR_FF_DUR
    Free-fall duration represented in milliseconds.
    If the sampling frequency is changed during runtime, this attribute should be set
    to adjust freefall duration to the new sampling frequency.

enumerator SENSOR_ATTR_COMMON_COUNT
    Number of all common sensor attributes.

enumerator SENSOR_ATTR_PRIV_START = SENSOR_ATTR_COMMON_COUNT
    This and higher values are sensor specific.
    Refer to the sensor header file.

enumerator SENSOR_ATTR_MAX = INT16_MAX
    Maximum value describing a sensor attribute type.

Functions

static inline int sensor_decode(struct sensor_decode_context *ctx, void *out, uint16_t
    max_count)

Decode N frames using a sensor_decode_context.

Parameters

• ctx – [inout] The context to use for decoding
• out – [out] The output buffer
• max_count – [in] Maximum number of frames to decode

Returns

The decode result from sensor_decoder_api's decode function

int sensor_natively_supported_channel_size_info(enum sensor_channel channel, size_t
    *base_size, size_t *frame_size)
int sensor_attr_set(const struct device *dev, enum sensor_channel chan, enum sensor_attribute attr, const struct sensor_value *val)

Set an attribute for a sensor.

Parameters

- dev – Pointer to the sensor device
- chan – The channel the attribute belongs to, if any. Some attributes may only be set for all channels of a device, depending on device capabilities.
- attr – The attribute to set
- val – The value to set the attribute to

Returns

0 if successful, negative errno code if failure.

int sensor_attr_get(const struct device *dev, enum sensor_channel chan, enum sensor_attribute attr, struct sensor_value *val)

Get an attribute for a sensor.

Parameters

- dev – Pointer to the sensor device
- chan – The channel the attribute belongs to, if any. Some attributes may only be set for all channels of a device, depending on device capabilities.
- attr – The attribute to get
- val – Pointer to where to store the attribute

Returns

0 if successful, negative errno code if failure.

static inline int sensor_trigger_set(const struct device *dev, const struct sensor_trigger *trig, sensor_trigger_handler_t handler)

Activate a sensor's trigger and set the trigger handler.

The handler will be called from a thread, so I2C or SPI operations are safe. However, the thread's stack is limited and defined by the driver. It is currently up to the caller to ensure that the handler does not overflow the stack.

The user-allocated trigger will be stored by the driver as a pointer, rather than a copy, and passed back to the handler. This enables the handler to use CONTAINER_OF to retrieve a context pointer when the trigger is embedded in a larger struct and requires that the trigger is not allocated on the stack.

Function properties (list may not be complete)

supervisor

Parameters

- dev – Pointer to the sensor device
- trig – The trigger to activate
- handler – The function that should be called when the trigger fires

Returns

0 if successful, negative errno code if failure.
int sensor_sample_fetch(const struct device *dev)

Fetch a sample from the sensor and store it in an internal driver buffer.

Read all of a sensor's active channels and, if necessary, perform any additional operations necessary to make the values useful. The user may then get individual channel values by calling sensor_channel_get.

The function blocks until the fetch operation is complete.

Since the function communicates with the sensor device, it is unsafe to call it in an ISR if the device is connected via I2C or SPI.

Parameters
- dev – Pointer to the sensor device

Returns
- 0 if successful, negative errno code if failure.

int sensor_sample_fetch_chan(const struct device *dev, enum sensor_channel type)

Fetch a sample from the sensor and store it in an internal driver buffer.

Read and compute compensation for one type of sensor data (magnetometer, accelerometer, etc). The user may then get individual channel values by calling sensor_channel_get.

This is mostly implemented by multi function devices enabling reading at different sampling rates.

The function blocks until the fetch operation is complete.

Since the function communicates with the sensor device, it is unsafe to call it in an ISR if the device is connected via I2C or SPI.

Parameters
- dev – Pointer to the sensor device
- type – The channel that needs updated

Returns
- 0 if successful, negative errno code if failure.

int sensor_channel_get(const struct device *dev, enum sensor_channel chan, struct sensor_value *val)

Get a reading from a sensor device.

Return a useful value for a particular channel, from the driver's internal data. Before calling this function, a sample must be obtained by calling sensor_sample_fetch or sensor_sample_fetch_chan. It is guaranteed that two subsequent calls of this function for the same channels will yield the same value, if sensor_sample_fetch or sensor_sample_fetch_chan has not been called in the meantime.

For vectorial data samples you can request all axes in just one call by passing the specific channel with _XYZ suffix. The sample will be returned at val[0], val[1] and val[2] (X, Y and Z in that order).

Parameters
- dev – Pointer to the sensor device
- chan – The channel to read
- val – Where to store the value

Returns
- 0 if successful, negative errno code if failure.
int sensor_get_decoder(const struct device *dev, const struct sensor_decoder_api **decoder)

Get the sensor’s decoder API.

Parameters
• dev – [in] The sensor device
• decoder – [in] Pointer to the decoder which will be set upon success

Returns
0 on success
< 0 on error

int sensor_reconfigure_read_iodev(struct rtio_iodev *iodev, const struct device *sensor, const enum sensor_channel *channels, size_t num_channels)

Reconfigure a reading iodev.

Allows a reconfiguration of the iodev associated with reading a sample from a sensor.

Important: If the iodev is currently servicing a read operation, the data will likely be invalid. Please be sure the flush or wait for all pending operations to complete before using the data after a configuration change.

It is also important that the data field of the iodev is a sensor_read_config.

Parameters
• iodev – [in] The iodev to reconfigure
• sensor – [in] The sensor to read from
• channels – [in] One or more channels to read
• num_channels – [in] The number of channels in channels

Returns
0 on success
< 0 on error

static inline int sensor_read(struct rtio_iodev *iodev, struct rtio *ctx, void *userdata)

Read data from a sensor.

Using cfg, read one snapshot of data from the device by using the provided RTIO context ctx. This call will generate a rtio_sqe that will leverage the RTIO’s internal mempool when the time comes to service the read.

Parameters
• iodev – [in] The iodev created by SENSOR_DT_READ_IODEV
• ctx – [in] The RTIO context to service the read
• userdata – [in] Optional userdata that will be available when the read is complete

Returns
0 on success
< 0 on error
void sensor_processing_with_callback(struct rtio *ctx, sensor_processing_callback_t cb)
    Helper function for common processing of sensor data.

This function can be called in a blocking manner after sensor_read() or in a standalone
thread dedicated to processing. It will wait for a cqe from the RTIO context, once re-
ceived, it will decode the userdata and call the cb. Once the cb returns, the buffer will
be released back into ctx’s mempool if available.

Parameters
• ctx – [in] The RTIO context to wait on
• cb – [in] Callback to call when data is ready for processing

static inline int32_t sensor_ms2_to_g(const struct sensor_value *ms2)
    Helper function to convert acceleration from m/s^2 to Gs.

Parameters
• ms2 – A pointer to a sensor_value struct holding the acceleration, in m/s^2.

Returns
    The converted value, in Gs.

static inline void sensor_g_to_ms2(int32_t g, struct sensor_value *ms2)
    Helper function to convert acceleration from Gs to m/s^2.

Parameters
• g – The G value to be converted.
• ms2 – A pointer to a sensor_value struct, where the result is stored.

static inline int32_t sensor_ms2_to_ug(const struct sensor_value *ms2)
    Helper function to convert acceleration from m/s^2 to micro Gs.

Parameters
• ms2 – A pointer to a sensor_value struct holding the acceleration, in m/s^2.

Returns
    The converted value, in micro Gs.

static inline void sensor_ug_to_ms2(int32_t ug, struct sensor_value *ms2)
    Helper function to convert acceleration from micro Gs to m/s^2.

Parameters
• ug – The micro G value to be converted.
• ms2 – A pointer to a sensor_value struct, where the result is stored.

static inline int32_t sensor_rad_to_degrees(const struct sensor_value *rad)
    Helper function for converting radians to degrees.

Parameters
• rad – A pointer to a sensor_value struct, holding the value in radians.

Returns
    The converted value, in degrees.

static inline void sensor_degrees_to_rad(int32_t d, struct sensor_value *rad)
    Helper function for converting degrees to radians.

Parameters
• d – The value (in degrees) to be converted.
• rad – A pointer to a sensor_value struct, where the result is stored.
static inline int32_t sensor_rad_to_10udegrees(const struct sensor_value *rad)
    Helper function for converting radians to 10 micro degrees.

    When the unit is 1 micro degree, the range that the int32_t can represent is +/-2147.483
degrees. In order to increase this range, here we use 10 micro degrees as the unit.

    Parameters
    • rad – A pointer to a sensor_value struct, holding the value in radians.

    Returns
    The converted value, in 10 micro degrees.

static inline void sensor_10udegrees_to_rad(int32_t d, struct sensor_value *rad)
    Helper function for converting 10 micro degrees to radians.

    Parameters
    • d – The value (in 10 micro degrees) to be converted.
    • rad – A pointer to a sensor_value struct, where the result is stored.

static inline double sensor_value_to_double(const struct sensor_value *val)
    Helper function for converting struct sensor_value to double.

    Parameters
    • val – A pointer to a sensor_value struct.

    Returns
    The converted value.

static inline float sensor_value_to_float(const struct sensor_value *val)
    Helper function for converting struct sensor_value to float.

    Parameters
    • val – A pointer to a sensor_value struct.

    Returns
    The converted value.

static inline int sensor_value_from_double(struct sensor_value *val, double inp)
    Helper function for converting double to struct sensor_value.

    Parameters
    • val – A pointer to a sensor_value struct.
    • inp – The converted value.

    Returns
    0 if successful, negative errno code if failure.

static inline int sensor_value_from_float(struct sensor_value *val, float inp)
    Helper function for converting float to struct sensor_value.

    Parameters
    • val – A pointer to a sensor_value struct.
    • inp – The converted value.

    Returns
    0 if successful, negative errno code if failure.

static inline int64_t sensor_value_to_milli(const struct sensor_value *val)
    Helper function for converting struct sensor_value to integer milli units.

    Parameters
• val – A pointer to a `sensor_value` struct.

Returns
The converted value.

```c
static inline int64_t sensor_value_to_micro(const struct sensor_value *val)
```
Helper function for converting struct `sensor_value` to integer micro units.

Parameters
• val – A pointer to a `sensor_value` struct.

Returns
The converted value.

```c
struct sensor_value
#define <sensor.h> Representation of a sensor readout value.

The value is represented as having an integer and a fractional part, and can be obtained using the formula \( val1 + val2 \times 10^{-6} \). Negative values also adhere to the above formula, but may need special attention. Here are some examples of the value representation:

<table>
<thead>
<tr>
<th>Value</th>
<th>val1</th>
<th>val2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.5</td>
<td>0</td>
<td>50000</td>
</tr>
<tr>
<td>-0.5</td>
<td>0</td>
<td>-50000</td>
</tr>
<tr>
<td>-1.0</td>
<td>-1</td>
<td>0</td>
</tr>
<tr>
<td>-1.5</td>
<td>-1</td>
<td>-50000</td>
</tr>
</tbody>
</table>

Public Members

```c
int32_t val1
Integer part of the value.
```

```c
int32_t val2
Fractional part of the value (in one-millionth parts).
```

```c
struct sensor_trigger
#define <sensor.h> Sensor trigger spec.

Public Members

```c
enum sensor_trigger_type type
Trigger type.
```

```c
enum sensor_channel chan
Channel the trigger is set on.
```

```c
struct sensor_decoder_api
#define <sensor.h> Decodes a single raw data buffer.

Data buffers are provided on the `RTIO` context that's supplied to c:func:sensor_read.
Public Members

```c
int (*get_frame_count)(const uint8_t *buffer, enum sensor_channel channel, size_t channel_idx, uint16_t *frame_count)
```
Get the number of frames in the current buffer.

- **Param buffer**
  - [in] The buffer provided on the RTIO context.
- **Param channel**
  - [in] The channel to get the count for
- **Param channel_idx**
  - [in] The index of the channel
- **Param frame_count**
  - [out] The number of frames on the buffer (at least 1)
- **Return**
  - 0 on success
  - -ENOTSUP if the channel/channel_idx aren’t found

```c
int (*get_size_info)(enum sensor_channel channel, size_t *base_size, size_t *frame_size)
```
Get the size required to decode a given channel.

When decoding a single frame, use `base_size`. For every additional frame, add another `frame_size`. As an example, to decode 3 frames use: ‘`base_size + 2 * frame_size`’.

- **Param channel**
  - [in] The channel to query
- **Param base_size**
  - [out] The size of decoding the first frame
- **Param frame_size**
  - [out] The additional size of every additional frame
- **Return**
  - 0 on success
  - -ENOTSUP if the channel is not supported

```c
int (*decode)(const uint8_t *buffer, enum sensor_channel channel, size_t channel_idx, uint32_t *fit, uint16_t max_count, void *data_out)
```
Decode up to `max_count` samples from the buffer.

Decode samples of channel `sensor_channel` across multiple frames. If there exist multiple instances of the same channel, `channel_index` is used to differentiate them. As an example, assume a sensor provides 2 distance measurements:

```c
// Decode the first channel instance of 'distance'
decoder->decode(buffer, SENSOR_CHAN_DISTANCE, 0, &fit, 5, out);
...

// Decode the second channel instance of 'distance'
decoder->decode(buffer, SENSOR_CHAN_DISTANCE, 1, &fit, 5, out);
```

- **Param buffer**
  - [in] The buffer provided on the RTIO context
- **Param channel**
  - [in] The channel to decode
- **Param channel_idx**
  - [in] The index of the channel
Param fit
[inout] The current frame iterator

Param max_count
[in] The maximum number of channels to decode.

Param data_out
[out] The decoded data

Return
0 no more samples to decode

Return
>0 the number of decoded frames

Return
<0 on error

struct sensor_decode_context
#include <sensor.h> Used for iterating over the data frames via the sensor_decoder_api.

Example usage:

```c
struct sensor_decode_context ctx = SENSOR_DECODE_CONTEXT_INIT(
    decoder, buffer, SENSOR_CHAN_ACCEL_XYZ, 0);

while (true) {
    struct sensor_three_axis_data accel_out_data;
    num_decoded_channels = sensor_decode(ctx, &accel_out_data, 1);
    if (num_decoded_channels <= 0) {
        printk("Done decoding buffer\n");
        break;
    }

    printk("Decoded (%" PRId32", %" PRId32", %" PRId32")\n", accel_out_data.
        readings[0].x, accel_out_data.readings[0].y, accel_out_data.readings[0].z);
}
```

struct sensor_read_config
#include <sensor.h>

struct sensor_driver_api
#include <sensor.h>

struct sensor_data_generic_header
#include <sensor.h>

group sensor_emulator_backend
Sensor emulator backend API.

Functions

static inline bool emul_sensor_backend_is_supported(const struct emul *target)
Check if a given sensor emulator supports the backend API.

Parameters

- target – Pointer to emulator instance to query
Returns
True if supported, false if unsupported or if target is NULL.

static inline int emul_sensor_backend_set_channel(const struct emul *target, enum sensor_channel ch, q31_t value, int8_t shift)

Set an expected value for a given channel on a given sensor emulator.

Parameters
• target – Pointer to emulator instance to operate on
• ch – Sensor channel to set expected value for
• value – Expected value in fixed-point format using standard SI unit for sensor type
• shift – Shift value (scaling factor) applied to value

Returns
0 if successful

Returns
-ENOTSUP if no backend API or if channel not supported by emul

Returns
-ERANGE if provided value is not in the sensor's supported range

static inline int emul_sensor_backend_get_sample_range(const struct emul *target, enum sensor_channel ch, q31_t *lower, q31_t *upper, q31_t *epsilon, int8_t *shift)

Query an emulator for a channel's supported sample value range and tolerance.

Parameters
• target – Pointer to emulator instance to operate on
• ch – The channel to request info for. If ch is unsupported, return -ENOTSUP
• lower – [out] Minimum supported sample value in SI units, fixed-point format
• upper – [out] Maximum supported sample value in SI units, fixed-point format
• epsilon – [out] Tolerance to use comparing expected and actual values to account for rounding and sensor precision issues. This can usually be set to the minimum sample value step size. Uses SI units and fixed-point format.
• shift – [out] The shift value (scaling factor) associated with lower, upper, and epsilon.

Returns
0 if successful

Returns
-ENOTSUP if no backend API or if channel not supported by emul

7.5.43 Serial Peripheral Interface (SPI) Bus

Overview
Related code samples

**Enhanced Serial Peripheral Interface (eSPI)**
Use eSPI to connect to a slave device and exchange virtual wire packets.

**SPI bitbang**
Use the bitbang SPI driver for communicating with a slave.

```c
#include <zephyr.h>
#include <drivers/gpio.h>
#include <drivers/spi.h>

struct spi_device_config spi_config = {
  .spi_config = {
    .spi_resources = { .spi_dev = spi_dev },
    .reg_base = spi_reg_base,
    .irq = spi_irq,
    .irq_type = kIRQ_EDGE_NEGATIVE,
    .raw_bits = 8,
    .bits_per_word = 8,
    .delay = 0,
    .max_speed_hz = 100000000,
    .max_transfer_size = 10000,
    .mode = SPI_OP_MODE_MASTER,
    .cpol = SPI_MODE_CPOL,
    .cpha = SPI_MODE_CPHA,
    .loop = 0,
    .mask = 0x0,
  },
};

// Connect to slave device
kretent enter_spi_dev = k_module_enter_api(spi_config);

// Transfer data
while (k_ret_status) {
  // Transfer data to slave
  // Handle interrupts
}
```

### SPI operational mode

- **SPI_OP_MODE_MASTER**
- **SPI_OP_MODE_SLAVE**
- **SPI_OP_MODE_MASK**
- **SPI_OP_MODE_GET(_operation_)**

### SPI Polarity & Phase Modes

- **SPI_MODE_CPOL**
  Clock Polarity: if set, clock idle state will be 1 and active state will be 0.
  If untouched, the inverse will be true which is the default.

- **SPI_MODE_CPHA**
  Clock Phase: this dictates when is the data captured, and depends on clock's polarity.
  When SPI_MODE_CPOL is set and this bit as well, capture will occur on low to high transition and high to low if this bit is not set (default). This is fully reversed if CPOL is not set.

- **SPI_MODE_LOOP**
  Whatever data is transmitted is looped-back to the receiving buffer of the controller.
  This is fully controller dependent as some may not support this, and can be used for testing purposes only.

- **SPI_MODE_MASK**

- **SPI_MODE_GET(_mode_)**
SPI Transfer modes (host controller dependent)

SPI_TRANSFER_MSB

SPI_TRANSFER_LSB

SPI word size

SPI_WORD_SIZE_SHIFT

SPI_WORD_SIZE_MASK

SPI_WORD_SIZE_GET(_operation_)

SPI_WORD_SET(_word_size_)

Specific SPI devices control bits

SPI_HOLD_ON_CS

SPI_LOCK_ON

SPI_CS_ACTIVE_HIGH

SPI MISO lines

Some controllers support dual, quad or octal MISO lines connected to slaves. Default is single, which is the case most of the time. Without CONFIG_SPI_EXTENDED_MODES being enabled, single is the only supported one.

SPI_LINES_SINGLE

SPI_LINES_DUAL

SPI_LINES_QUAD

SPI_LINES_OCTAL

SPI_LINES_MASK

SPI duplex mode

Some controllers support half duplex transfer, which results in 3-wire usage. By default, full duplex will prevail.
SPI Frame Format

2 frame formats are exposed: Motorola and TI.

The main difference is the behavior of the CS line. In Motorola it stays active the whole transfer. In TI, it's active only one serial clock period prior to actually make the transfer, it is thus inactive during the transfer, which ends when the clocks ends as well. By default, as it is the most commonly used, the Motorola frame format will prevail.

Defines

`SPI_CS_GPIOS_DT_SPEC_GET(spi_dev)`

Get a struct `gpio_dt_spec` for a SPI device's chip select pin.

Example devicetree fragment:

```plaintext
gpio1: gpio@abcd0001 { ... };

gpio2: gpio@abcd0002 { ... };

spi@abcd0003 {
   compatible = "vnd.spi";
   cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
              <&gpio2 20 GPIO_ACTIVE_LOW>;

   a: spi-dev-a@0 {
      reg = <0>;
   };

   b: spi-dev-b@1 {
      reg = <1>;
   };
};
```

Example usage:

```plaintext
SPI_CS_GPIOS_DT_SPEC_GET(DT_NODELABEL(a))
   // { DEVICE_DT_GET(DT_NODELABEL(gpio1)), 10, GPIO_ACTIVE_LOW }
SPI_CS_GPIOS_DT_SPEC_GET(DT_NODELABEL(b))
   // { DEVICE_DT_GET(DT_NODELABEL(gpio2)), 20, GPIO_ACTIVE_LOW }
```

Parameters

- `spi_dev` – a SPI device node identifier

Returns

`gpio_dt_spec` struct corresponding with `spi_dev`'s chip select
SPI_CS_GPIOS_DT_SPEC_INST_GET (inst)
Get a struct gpio_dt_spec for a SPI device's chip select pin.
This is equivalent to SPI_CS_GPIOS_DT_SPEC_GET (DT_DRV_INST (inst)).

Parameters
- inst – Devicetree instance number

Returns
gpio_dt_spec struct corresponding with spi_dev's chip select

SPI_CS_CONTROL_INIT (node_id, delay_)
Initialize and get a pointer to a spi_cs_control from a devicetree node identifier.
This helper is useful for initializing a device on a SPI bus. It initializes a struct spi_cs_control and returns a pointer to it. Here, node_id is a node identifier for a SPI device, not a SPI controller.

Example devicetree fragment:
```
spi@... {
    cs-gpios = <&gpio0 1 GPIO_ACTIVE_LOW>;
    spidev: spi-device@0 { ... };
};
```

Example usage:
```
struct spi_cs_control ctrl = 
    SPI_CS_CONTROL_INIT (DT_NODELABEL (spidev), 2);
```

This example is equivalent to:
```
struct spi_cs_control ctrl = {
    .gpio = SPI_CS_GPIOS_DT_SPEC_GET (DT_NODELABEL (spidev)),
    .delay = 2,
};
```

Parameters
- node_id – Devicetree node identifier for a device on a SPI bus
- delay_ – The delay field to set in the spi_cs_control

Returns
a pointer to the spi_cs_control structure

SPI_CS_CONTROL_INIT_INST (inst, delay_)
Get a pointer to a spi_cs_control from a devicetree node.
This is equivalent to SPI_CS_CONTROL_INIT (DT_DRV_INST (inst), delay).
Therefore, DT_DRV_COMPAT must already be defined before using this macro.

Parameters
- inst – Devicetree node instance number
- delay_ – The delay field to set in the spi_cs_control

Returns
a pointer to the spi_cs_control structure

SPI_CONFIG_DT (node_id, operation_, delay_)
Structure initializer for spi_config from devicetree.
This helper macro expands to a static initializer for a struct spi_config by reading the relevant frequency, slave, and cs data from the devicetree.
Parameters

- **node_id** – Devicetree node identifier for the SPI device whose struct `spi_config` to create an initializer for
- **operation_** – the desired operation field in the struct `spi_config`
- **delay_** – the desired delay field in the struct `spi_config`'s `spi_cs_control`, if there is one

**SPI_CONFIG_DT_INST**(inst, operation_, delay_)

Structure initializer for `spi_config` from devicetree instance.

This is equivalent to `SPI_CONFIG_DT(DT_DRV_INST(inst), operation_, delay_)`.

Parameters

- **inst** – Devicetree instance number
- **operation_** – the desired operation field in the struct `spi_config`
- **delay_** – the desired delay field in the struct `spi_config`'s `spi_cs_control`, if there is one

**SPI_DT_SPEC_GET**(node_id, operation_, delay_)

Structure initializer for `spi_dt_spec` from devicetree.

This helper macro expands to a static initializer for a struct `spi_dt_spec` by reading the relevant bus, frequency, slave, and cs data from the devicetree.

Important: multiple fields are automatically constructed by this macro which must be checked before use. `spi_is_ready` performs the required `device_is_ready` checks.

*Deprecated:*

Use `spi_is_ready_dt` instead.

Parameters

- **node_id** – Devicetree node identifier for the SPI device whose struct `spi_dt_spec` to create an initializer for
- **operation_** – the desired operation field in the struct `spi_config`
- **delay_** – the desired delay field in the struct `spi_config`'s `spi_cs_control`, if there is one

**SPI_DT_SPEC_INST_GET**(inst, operation_, delay_)

Structure initializer for `spi_dt_spec` from devicetree instance.

This is equivalent to `SPI_DT_SPEC_GET(DT_DRV_INST(inst), operation_, delay_)`.

Parameters

- **inst** – Devicetree instance number
- **operation_** – the desired operation field in the struct `spi_config`
- **delay_** – the desired delay field in the struct `spi_config`'s `spi_cs_control`, if there is one

**SPI_DEVICE_DT_DEFINE**(node_id, init_fn, pm, data, config, level, prio, api, ...)

**SPI_STATS_RX_BYTES_INC**(dev_)

**SPI_STATS_TX_BYTES_INC**(dev_)

**SPI_STATS_TRANSFER_ERROR_INC**(dev_)
spi_transceive_stats(dev, error, tx_bufs, rx_bufs)

SPI_DT_IODEV_DEFINE(name, node_id, operation_, delay_)
Define an iodev for a given dt node on the bus.
These do not need to be shared globally but doing so will save a small amount of memory.

Parameters
- name – Symbolic name to use for defining the iodev
- node_id – Devicetree node identifier
- operation_ – SPI operational mode
- delay_ – Chip select delay in microseconds

Typedefs

typedef uint16_t spi_operation_t
Opaque type to hold the SPI operation flags.

typedef int (*spi_api_io)(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs)
Callback API for I/O See spi_transceive() for argument descriptions.
Callback API for asynchronous I/O See spi_transceive_async() for argument descriptions.

typedef void (*spi_callback_t)(const struct device *dev, int result, void *data)
SPI callback for asynchronous transfer requests.

Param dev
SPI device which is notifying of transfer completion or error

Param result
Result code of the transfer request. 0 is success, -errno for failure.

Param data
Transfer requester supplied data which is passed along to the callback.

typedef int (*spi_api_io_async)(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs, spi_callback_t cb, void *userdata)

typedef int (*spi_api_release)(const struct device *dev, const struct spi_config *config)
Callback API for unlocking SPI device.
See spi_release() for argument descriptions

Functions

static inline bool spi_cs_is_gpio(const struct spi_config *config)
Check if SPI CS is controlled using a GPIO.

Parameters
- config – SPI configuration.
Returns
true If CS is controlled using a GPIO.

Returns
false If CS is controlled by hardware or any other means.

static inline bool spi_cs_is_gpio_dt(const struct spi_dt_spec *spec)
Check if SPI CS in spi_dt_spec is controlled using a GPIO.

Parameters
• spec – SPI specification from devicetree.

Returns
true If CS is controlled using a GPIO.

Returns
false If CS is controlled by hardware or any other means.

static inline bool spi_is_ready(const struct spi_dt_spec *spec)
Validate that SPI bus is ready.

Parameters
• spec – SPI specification from devicetree

Return values
• true – if the SPI bus is ready for use.
• false – if the SPI bus is not ready for use.

static inline bool spi_is_ready_dt(const struct spi_dt_spec *spec)
Validate that SPI bus (and CS gpio if defined) is ready.

Parameters
• spec – SPI specification from devicetree

Return values
• true – if the SPI bus is ready for use.
• false – if the SPI bus (or the CS gpio defined) is not ready for use.

int spi_transceive(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs)
Read/write the specified amount of data from the SPI driver.

Note: This function is synchronous.

Parameters
• dev – Pointer to the device structure for the driver instance
• config – Pointer to a valid spi_config structure instance. Pointer-comparison may be used to detect changes from previous operations.
• tx_bufs – Buffer array where data to be sent originates from, or NULL if none.
• rx_bufs – Buffer array where data to be read will be written to, or NULL if none.

Return values
• frames – Positive number of frames received in slave mode.
• 0 – If successful in master mode.
• -errno – Negative errno code on failure.

static inline int spi_transceive_dt(const struct spi_dt_spec *spec, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs)

Read/write data from an SPI bus specified in spi_dt_spec.
This is equivalent to:

```c
spi_transceive(spec->bus, &spec->config, tx_bufs, rx_bufs);
```

**Parameters**

• **spec** – SPI specification from devicetree

• **tx_bufs** – Buffer array where data to be sent originates from, or NULL if none.

• **rx_bufs** – Buffer array where data to be read will be written to, or NULL if none.

**Returns**

a value from `spi_transceive()`.

static inline int spi_read(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *rx_bufs)

Read the specified amount of data from the SPI driver.

**Note:** This function is synchronous.

**Note:** This function is a helper function calling `spi_transceive`.

**Parameters**

• **dev** – Pointer to the device structure for the driver instance

• **config** – Pointer to a valid `spi_config` structure instance. Pointer-comparison may be used to detect changes from previous operations.

• **rx_bufs** – Buffer array where data to be read will be written to.

**Return values**

• 0 – If successful.

• -errno – Negative errno code on failure.

static inline int spi_read_dt(const struct spi_dt_spec *spec, const struct spi_buf_set *rx_bufs)

Read data from a SPI bus specified in spi_dt_spec.
This is equivalent to:

```c
spi_read(spec->bus, &spec->config, rx_bufs);
```

**Parameters**

• **spec** – SPI specification from devicetree

• **rx_bufs** – Buffer array where data to be read will be written to.
Returns
a value from \textit{spi\_read()}. 

\texttt{static inline int spi\_write}(\texttt{const struct device *dev, const struct spi\_config *config, const struct spi\_buf\_set *tx\_bufs}) 

Write the specified amount of data from the SPI driver. 

\textbf{Note:} This function is synchronous. 

\textbf{Note:} This function is a helper function calling spi\_transceive. 

\textbf{Parameters} 

\begin{itemize}
  \item \texttt{dev} – Pointer to the device structure for the driver instance 
  \item \texttt{config} – Pointer to a valid \texttt{spi\_config} structure instance. Pointer-comparison may be used to detect changes from previous operations. 
  \item \texttt{tx\_bufs} – Buffer array where data to be sent originates from. 
\end{itemize} 

\textbf{Return values} 

\begin{itemize}
  \item 0 – If successful. 
  \item -\texttt{errno} – Negative \texttt{errno} code on failure. 
\end{itemize} 

\texttt{static inline int spi\_write\_dt}(\texttt{const struct spi\_dt\_spec *spec, const struct spi\_buf\_set *tx\_bufs}) 

Write data to a SPI bus specified in \texttt{spi\_dt\_spec}. 

This is equivalent to:

\begin{verbatim}
spi\_write(spec->bus, &spec->config, tx\_bufs);
\end{verbatim} 

\textbf{Parameters} 

\begin{itemize}
  \item \texttt{spec} – SPI specification from devicetree 
  \item \texttt{tx\_bufs} – Buffer array where data to be sent originates from. 
\end{itemize} 

\textbf{Returns} 

a value from \texttt{spi\_write()}. 

\texttt{static inline int spi\_transceive\_cb}(\texttt{const struct device *dev, const struct spi\_config *config, const struct spi\_buf\_set *tx\_bufs, const struct spi\_buf\_set *rx\_bufs, \texttt{spi\_callback\_t} callback, void *userdata}) 

Read/write the specified amount of data from the SPI driver. 

\textbf{Note:} This function is asynchronous. 

\textbf{Note:} This function is available only if CONFIG\_SPI\_ASYNC is selected. 

\textbf{Parameters} 

\begin{itemize}
  \item \texttt{dev} – Pointer to the device structure for the driver instance 
\end{itemize}
• **config** – Pointer to a valid `spi_config` structure instance. Pointer-comparison may be used to detect changes from previous operations.

• **tx_bufs** – Buffer array where data to be sent originates from, or NULL if none.

• **rx_bufs** – Buffer array where data to be read will be written to, or NULL if none.

• **callback** – Function pointer to completion callback. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

• **userdata** – Userdata passed to callback

**Return values**

• **frames** – Positive number of frames received in slave mode.

• **0** – If successful in master mode.

• **-errno** – Negative errno code on failure

```c
static inline int spi_transceive_signal(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs, struct k_poll_signal *sig)
```

Read/write the specified amount of data from the SPI driver.

**Note:** This function is asynchronous.

**Note:** This function is available only if `CONFIG_SPI_ASYNC` and `CONFIG_POLL` are selected.

**Parameters**

• **dev** – Pointer to the device structure for the driver instance

• **config** – Pointer to a valid `spi_config` structure instance. Pointer-comparison may be used to detect changes from previous operations.

• **tx_bufs** – Buffer array where data to be sent originates from, or NULL if none.

• **rx_bufs** – Buffer array where data to be read will be written to, or NULL if none.

• **sig** – A pointer to a valid and ready to be signaled struct `k_poll_signal`. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

**Return values**

• **frames** – Positive number of frames received in slave mode.

• **0** – If successful in master mode.

• **-errno** – Negative errno code on failure

```c
static inline int spi_transceive_async(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs, struct k_poll_signal *sig)
```
Alias for `spi_transceive_signal` for backwards compatibility.

**Deprecated:**

Use `spi_transceive_signal` instead.

```c
static inline int spi_read_signal(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *rx_bufs, struct k_poll_signal *sig)
```

Read the specified amount of data from the SPI driver.

**Note:** This function is asynchronous.

**Note:** This function is a helper function calling `spi_transceive_signal`.

**Note:** This function is available only if `CONFIG_SPI_ASYNC` and `CONFIG_POLL` are selected.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance
- `config` – Pointer to a valid `spi_config` structure instance. Pointer-comparison may be used to detect changes from previous operations.
- `rx_bufs` – Buffer array where data to be read will be written to.
- `sig` – A pointer to a valid and ready to be signaled struct `k_poll_signal`. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

**Return values**

- `0` – If successful
- `-errno` – Negative errno code on failure.

```c
static inline int spi_read_async(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *rx_bufs, struct k_poll_signal *sig)
```

Alias for `spi_read_signal` for backwards compatibility.

**Deprecated:**

Use `spi_read_signal` instead.

```c
static inline int spi_write_signal(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, struct k_poll_signal *sig)
```

Write the specified amount of data from the SPI driver.

**Note:** This function is asynchronous.

**Note:** This function is a helper function calling `spi_transceive_async`. 

---

3192 Chapter 7. Hardware Support
Note: This function is available only if CONFIG_SPI_ASYNC and CONFIG_POLL are selected.

Parameters
- **dev** – Pointer to the device structure for the driver instance
- **config** – Pointer to a valid spi_config structure instance. Pointer-comparison may be used to detect changes from previous operations.
- **tx_bufs** – Buffer array where data to be sent originates from.
- **sig** – A pointer to a valid and ready to be signaled struct k_poll_signal. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

Return values
- **0** – If successful.
- **-errno** – Negative errno code on failure.

static inline int spi_write_async(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, struct k_poll_signal *sig)

Alias for spi_write_signal for backwards compatibility.

Deprecated:
Use spi_write_signal instead.

static inline void spi_iodev_submit(struct rtio_iodev_sqe *iodev_sqe)
Submit a SPI device with a request.

Parameters
- **iodev_sqe** – Prepared submissions queue entry connected to an iodev defined by SPI_IODEV_DEFINE. Must live as long as the request is in flight.

static inline bool spi_is_ready_iodev(const struct rtio_iodev *spi_iodev)
Validate that SPI bus (and CS gpio if defined) is ready.

Parameters
- **spi_iodev** – SPI iodev defined with SPI_DT_IODEV_DEFINE

Return values
- **true** – if the SPI bus is ready for use.
- **false** – if the SPI bus (or the CS gpio defined) is not ready for use.

static inline int spi_rtio_copy(struct rtio *r, struct rtio_iodev *iodev, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs, struct rtio_sqe **last_sqe)
Copy the tx_bufs and rx_bufs into a set of RTIO requests.

Parameters
- **r** – [in] rtio context
- **iodev** – [in] iodev to transceive with
- **tx_bufs** – [in] transmit buffer set
- **rx_bufs** – [in] receive buffer set
• last_sqe – [out] last sqe submitted, NULL if not enough memory

Return values
• Number – of submission queue entries
• -ENOMEM – out of memory

int spi_release(const struct device *dev, const struct spi_config *config)
Release the SPI device locked on and/or the CS by the current config.

Note: This synchronous function is used to release either the lock on the SPI device and/or the CS line that was kept if, and if only, given config parameter was the last one to be used (in any of the above functions) and if it has the SPI_LOCK_ON bit set and/or the SPI_HOLD_ON_CS bit set into its operation bits field. This can be used if the caller needs to keep its hand on the SPI device for consecutive transactions and/or if it needs the device to stay selected. Usually both bits will be used along each other, so the device is locked and stays on until another operation is necessary or until it gets released with the present function.

Parameters
• dev – Pointer to the device structure for the driver instance
• config – Pointer to a valid spi_config structure instance.

Return values
• 0 – If successful.
• -errno – Negative errno code on failure.

static inline int spi_release_dt(const struct spi_dt_spec *spec)
Release the SPI device specified in spi_dt_spec.
This is equivalent to:

spi_release(spec->bus, &spec->config);

Parameters
• spec – SPI specification from devicetree

Returns
a value from spi_release().

Variables

cnst struct rtio_iodev_api spi_iodev_api

struct spi_cs_control

#include <spi.h> SPI Chip Select control structure.
This can be used to control a CS line via a GPIO line, instead of using the controller inner CS logic.
struct gpio_dt_spec gpio
  GPIO devicetree specification of CS GPIO.

  The device pointer can be set to NULL to fully inhibit CS control if necessary.
  The GPIO flags GPIO_ACTIVE_LOW/GPIO_ACTIVE_HIGH should be equivalent to
  SPI_CS_ACTIVE_HIGH/SPI_CS_ACTIVE_LOW options in struct spi_config.

uint32_t delay
  Delay in microseconds to wait before starting the transmission and before releas-
  ing the CS line.

struct spi_config
  #include <spi.h> SPI controller configuration structure.

Public Members

uint32_t frequency
  Bus frequency in Hertz.

spi_operation_t operation
  Operation flags.
  It is a bit field with the following parts:

  • 0: Master or slave.
  • 1..3: Polarity, phase and loop mode.
  • 4: LSB or MSB first.
  • 5..10: Size of a data frame in bits.
  • 11: Full/half duplex.
  • 12: Hold on the CS line if possible.
  • 13: Keep resource locked for the caller.
  • 14: Active high CS logic.
  • 15: Motorola or TI frame format (optional).
  If CONFIG_SPI_EXTENDED_MODES is enabled:

  • 16..17: MISO lines (Single/Dual/Quad/Octal).
  • 18..31: Reserved for future use.

uint16_t slave
  Slave number from 0 to host controller slave limit.

struct spi_cs_control cs
  GPIO chip-select line (optional, must be initialized to zero if not used).

struct spi_dt_spec
  #include <spi.h> Complete SPI DT information.

  Param bus
    is the SPI bus

  Param config
    is the slave specific configuration
struct spi_buf
#include <spi.h> SPI buffer structure.

Param buf
is a valid pointer on a data buffer, or NULL otherwise.

Param len
is the length of the buffer or, if buf is NULL, will be the length which as to be sent as dummy bytes (as TX buffer) or the length of bytes that should be skipped (as RX buffer).

struct spi_buf_set
#include <spi.h> SPI buffer array structure.

Param buffers
is a valid pointer on an array of spi_buf, or NULL.

Param count
is the length of the array pointed by buffers.

struct spi_driver_api
#include <spi.h> SPI driver API This is the mandatory API any SPI driver needs to expose.

7.5.44 System Management Bus (SMBus)

Overview

System Management Bus (SMBus) is derived from I2C for communication with devices on the motherboard. A system may use SMBus to communicate with the peripherals on the motherboard without using dedicated control lines. SMBus peripherals can provide various manufacturer information, report errors, accept control parameters, etc.

Devices on the bus can operate in three roles: as a Controller that initiates transactions and controls the clock, a Peripheral that responds to transaction commands, or a Host, which is a specialized Controller, that provides the main interface to the system's CPU. Zephyr has API for the Controller role.

SMBus peripheral devices can initiate communication with Controller with two methods:

- **Host Notify protocol**: Peripheral device that supports the Host Notify protocol behaves as a Controller to perform the notification. It writes a three-bytes message to a special address “SMBus Host (0x08)” with own address and two bytes of relevant data.

- **SMBALERT# signal**: Peripheral device uses special signal SMBALERT# to request attention from the Controller. The Controller needs to read one byte from the special “SMBus Alert Response Address (ARA) (0x0c)”. The peripheral device responds with a data byte containing its own address.
Currently, the API is based on SMBus Specification version 2.0

Note: See Rule A.2: Inclusive Language for information about the terminology used in this API.

SMBus Controller API

Zephyr's SMBus controller API is used when an SMBus device controls the bus, particularly the start and stop conditions and the clock. This is the most common mode used to interact with SMBus peripherals.

Configuration Options

Related configuration options:

- CONFIG_SMBUS

API Reference

Related code samples

SMBus shell
Interact with SMBus peripherals using shell commands.

group smbus_interface
SMBus Interface.

SMBus read / write direction

enum smbus_direction
SMBus read / write direction.

Values:

enumerator SMBUS_MSG_WRITE = 0
Write a message to SMBus peripheral.

enumerator SMBUS_MSG_READ = 1
Read a message from SMBus peripheral.

SMBus Protocol commands

SMBus Specification defines the following SMBus protocols operations
SMBUS_CMD_QUICK

SMBus Quick protocol is a very simple command with no data sent or received.
Peripheral may denote only R/W bit, which can still be used for the peripheral management, for example to switch peripheral On/Off. Quick protocol can also be used for peripheral devices scanning.

```
0 1
0 1 2 3 4 5 6 7 8 9 0
|S| Periph Addr |D|A|P|
```

SMBUS_CMD_BYTE

SMBus Byte protocol can send or receive one byte of data.

**Byte Write**

```
0 1 2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0
|S| Periph Addr |W|A| Command code |A|P|
```

**Byte Read**

```
0 1 2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0
|S| Periph Addr |R|A| Byte received |N|P|
```

SMBUS_CMD_BYTE_DATA

SMBus Byte Data protocol sends the first byte (command) followed by read or write one byte.

**Byte Data Write**

```
0 1 2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0
|S| Periph Addr |W|A| Command code |A| Data Write |A|P|
```

**Byte Data Read**

```
0 1 2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0
|S| Periph Addr |W|A| Command code |A|S| Periph Addr |R|A|
| Data Read |N|P|
```

SMBUS_CMD_WORD_DATA

SMBus Word Data protocol sends the first byte (command) followed by read or write two bytes.

```
0 1 2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0
|S| Periph Addr |W|A| Command code |A|S| Periph Addr |R|A|
| Data Read |N|P|
```
SMBUS_CMD_PROC_CALL

SMBus Process Call protocol is Write Word followed by Read Word.

It is named so because the command sends data and waits for the peripheral to return a reply.

SMBUS_CMD_BLOCK

SMBus Block protocol reads or writes a block of data up to 32 bytes.

The Count byte specifies the amount of data.
SMBUS_CMD_BLOCK_PROC

SMBus Block Write - Block Read Process Call protocol is Block Write followed by Block Read.

```
| S | Periph Addr | W | Command code | A | Count = N | A |
|-----------------------------------------------|
| Data Write 1 | A | ... | A | Data Write N | A | S |
| Periph Addr | R | A | Recv Count=N | A | Data Read 1 | A | |
| ... | A | Data Read N | N | P |
```

**SMBus device functionality**

The following parameters describe the functionality of the SMBus device:

- **SMBUS_MODE_CONTROLLER**
  Peripheral to act as Controller.

- **SMBUS_MODE_PEC**

- **SMBUS_MODE_HOST_NOTIFY**
  Support Host Notify functionality.

- **SMBUS_MODE_SMBALERT**
  Support SMBALERT signal functionality.

**SMBus special reserved addresses**

The following addresses are reserved by SMBus specification:

- **SMBUS_ADDRESS_ARA**
  Alert Response Address (ARA)
  A broadcast address used by the system host as part of the Alert Response Protocol.

**Defines**

- **SMBUS_BLOCK_BYTES_MAX**
  Maximum number of bytes in SMBus Block protocol.
SMBUS_DT_SPEC_GET(node_id)
Structure initializer for `smbus_dt_spec` from devicetree.

This helper macro expands to a static initializer for a struct `smbus_dt_spec` by reading the relevant bus and address data from the devicetree.

**Parameters**
- `node_id` – Devicetree node identifier for the SMBus device whose struct `smbus_dt_spec` to create an initializer for

SMBUS_DT_SPEC_INST_GET(inst)
Structure initializer for `smbus_dt_spec` from devicetree instance.

This is equivalent to `SMBUS_DT_SPEC_GET(DT_DRV_INST(inst))`.

**Parameters**
- `inst` – Devicetree instance number

SMBUS_DEVICE_DT_DEFINE(node_id, init_fn, pm_device, data_ptr, cfg_ptr, level, prio, api_ptr, ...)
Like `DEVICE_DT_DEFINE()` with SMBus specifics.

Defines a device which implements the SMBus API. May generate a custom `device_state` container struct and `init_fn` wrapper when needed depending on SMBus CONFIG_SMBUS_STATS.

**Parameters**
- `node_id` – The devicetree node identifier.
- `init_fn` – Name of the init function of the driver.
- `pm_device` – PM device resources reference (NULL if device does not use PM).
- `data_ptr` – Pointer to the device's private data.
- `cfg_ptr` – The address to the structure containing the configuration information for this instance of the driver.
- `level` – The initialization level. See SYS_INIT() for details.
- `prio` – Priority within the selected initialization level. See SYS_INIT() for details.
- `api_ptr` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

SMBUS_DEVICE_DT_INST_DEFINE(inst, ...)
Like `SMBUS_DEVICE_DT_DEFINE()` for an instance of a DT_DRV_COMPAT compatible.

**Parameters**
- `inst` – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to `SMBUS_DEVICE_DT_DEFINE()`.
- `...` – other parameters as expected by `SMBUS_DEVICE_DT_DEFINE()`.

Typedefs

typedef void (*smbus_callback_handler_t)(const struct device *dev, struct smbus_callback *cb, uint8_t addr)

Define SMBus callback handler function signature.

7.5. Peripherals
Param dev
Pointer to the device structure for the SMBus driver instance.

Param cb
Structure `smbus_callback` owning this handler.

Param addr
Address of the SMBus peripheral device.

Functions

static inline void `smbus_xfer_stats`(const struct device *dev, uint8_t sent, uint8_t recv)
Updates the SMBus stats.

Parameters
- `dev` – Pointer to the device structure for the SMBus driver instance to update stats for.
- `sent` – Number of bytes sent
- `recv` – Number of bytes received

int `smbus_configure`(const struct device *dev, uint32_t dev_config)
Configure operation of a SMBus host controller.

Parameters
- `dev` – Pointer to the device structure for the SMBus driver instance.
- `dev_config` – Bit-packed 32-bit value to the device runtime configuration for the SMBus controller.

Return values
- 0 – If successful.
- -EIO – General input / output error.

int `smbus_get_config`(const struct device *dev, uint32_t *dev_config)
Get configuration of a SMBus host controller.

This routine provides a way to get current configuration. It is allowed to call the function before `smbus_configure`, because some SMBus ports can be configured during init process. However, if the SMBus port is not configured, `smbus_get_config` returns an error.

`smbus_get_config` can return cached config or probe hardware, but it has to be up to date with current configuration.

Parameters
- `dev` – Pointer to the device structure for the SMBus driver instance.
- `dev_config` – Pointer to return bit-packed 32-bit value of the SMBus controller configuration.

Return values
- 0 – If successful.
- -EIO – General input / output error.
- -ENOSYS – If function `smbus_get_config()` is not implemented by the driver.
int smbus_smbalert_set_cb(const struct device *dev, struct smbus_callback *cb)

Add SMBUSALERT callback for a SMBus host controller.

Parameters
- dev – Pointer to the device structure for the SMBus driver instance.
- cb – Pointer to a callback structure.

Return values
- 0 – If successful.
- -EIO – General input / output error.
- -ENOSYS – If function smbus_smbalert_set_cb() is not implemented by the driver.

int smbus_smbalert_remove_cb(const struct device *dev, struct smbus_callback *cb)

Remove SMBUSALERT callback from a SMBus host controller.

Parameters
- dev – Pointer to the device structure for the SMBus driver instance.
- cb – Pointer to a callback structure.

Return values
- 0 – If successful.
- -EIO – General input / output error.
- -ENOSYS – If function smbus_smbalert_remove_cb() is not implemented by the driver.

int smbus_host_notify_set_cb(const struct device *dev, struct smbus_callback *cb)

Add Host Notify callback for a SMBus host controller.

Parameters
- dev – Pointer to the device structure for the SMBus driver instance.
- cb – Pointer to a callback structure.

Return values
- 0 – If successful.
- -EIO – General input / output error.
- -ENOSYS – If function smbus_host_notify_set_cb() is not implemented by the driver.

int smbus_host_notify_remove_cb(const struct device *dev, struct smbus_callback *cb)

Remove Host Notify callback from a SMBus host controller.

Parameters
- dev – Pointer to the device structure for the SMBus driver instance.
- cb – Pointer to a callback structure.

Return values
- 0 – If successful.
- -EIO – General input / output error.
- -ENOSYS – If function smbus_host_notify_remove_cb() is not implemented by the driver.
int smbus_quick(const struct device *dev, uint16_t addr, enum smbus_direction direction)
Perform SMBus Quick operation.

This routine provides a generic interface to perform SMBus Quick operation.

**Parameters**
- `dev` – Pointer to the device structure for the SMBus driver instance. driver configured in controller mode.
- `addr` – Address of the SMBus peripheral device.
- `direction` – Direction Read or Write.

**Return values**
- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function `smbus_quick()` is not implemented by the driver.

int smbus_byte_write(const struct device *dev, uint16_t addr, uint8_t byte)
Perform SMBus Byte Write operation.

This routine provides a generic interface to perform SMBus Byte Write operation.

**Parameters**
- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `byte` – Byte to be sent to the peripheral device.

**Return values**
- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function `smbus_byte_write()` is not implemented by the driver.

int smbus_byte_read(const struct device *dev, uint16_t addr, uint8_t *byte)
Perform SMBus Byte Read operation.

This routine provides a generic interface to perform SMBus Byte Read operation.

**Parameters**
- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `byte` – Byte received from the peripheral device.

**Return values**
- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function `smbus_byte_read()` is not implemented by the driver.

int smbus_byte_data_write(const struct device *dev, uint16_t addr, uint8_t cmd, uint8_t *byte)
Perform SMBus Byte Data Write operation.

This routine provides a generic interface to perform SMBus Byte Data Write operation.

**Parameters**
- `dev` – Pointer to the device structure for the SMBus driver instance.
• **addr** – Address of the SMBus peripheral device.
• **cmd** – Command byte which is sent to peripheral device first.
• **byte** – Byte to be sent to the peripheral device.

**Return values**
• 0 – If successful.
• -EIO – General input / output error.
• -ENOSYS – If function `smbus_byte_data_write()` is not implemented by the driver.

```c
int smbus_byte_data_read(const struct device *dev, uint16_t addr, uint8_t cmd, uint8_t *byte)
```

Perform SMBus Byte Data Read operation.

This routine provides a generic interface to perform SMBus Byte Data Read operation.

**Parameters**
• **dev** – Pointer to the device structure for the SMBus driver instance.
• **addr** – Address of the SMBus peripheral device.
• **cmd** – Command byte which is sent to peripheral device first.
• **byte** – Byte received from the peripheral device.

**Return values**
• 0 – If successful.
• -EIO – General input / output error.
• -ENOSYS – If function `smbus_byte_data_read()` is not implemented by the driver.

```c
int smbus_word_data_write(const struct device *dev, uint16_t addr, uint8_t cmd, uint16_t word)
```

Perform SMBus Word Data Write operation.

This routine provides a generic interface to perform SMBus Word Data Write operation.

**Parameters**
• **dev** – Pointer to the device structure for the SMBus driver instance.
• **addr** – Address of the SMBus peripheral device.
• **cmd** – Command byte which is sent to peripheral device first.
• **word** – Word (16-bit) to be sent to the peripheral device.

**Return values**
• 0 – If successful.
• -EIO – General input / output error.
• -ENOSYS – If function `smbus_word_data_write()` is not implemented by the driver.

```c
int smbus_word_data_read(const struct device *dev, uint16_t addr, uint8_t cmd, uint16_t *word)
```

Perform SMBus Word Data Read operation.

This routine provides a generic interface to perform SMBus Word Data Read operation.

**Parameters**
• **dev** – Pointer to the device structure for the SMBus driver instance.
• **addr** – Address of the SMBus peripheral device.
• **cmd** – Command byte which is sent to peripheral device first.
• **word** – Word (16-bit) received from the peripheral device.

**Return values**

- **0** – If successful.
- **-EIO** – General input / output error.
- **-ENOSYS** – If function `smbus_word_data_read()` is not implemented by the driver.

```c
int smbus_pcall(const struct device *dev, uint16_t addr, uint8_t cmd, uint16_t send_word,
                 uint16_t *recv_word)
```

Perform SMBus Process Call operation.

This routine provides a generic interface to perform SMBus Process Call operation, which means Write 2 bytes following by Read 2 bytes.

**Parameters**

- **dev** – Pointer to the device structure for the SMBus driver instance.
- **addr** – Address of the SMBus peripheral device.
- **cmd** – Command byte which is sent to peripheral device first.
- **send_word** – Word (16-bit) to be sent to the peripheral device.
- **recv_word** – Word (16-bit) received from the peripheral device.

**Return values**

- **0** – If successful.
- **-EIO** – General input / output error.
- **-ENOSYS** – If function `smbus_pcall()` is not implemented by the driver.

```c
int smbus_block_write(const struct device *dev, uint16_t addr, uint8_t cmd, uint8_t count,
                       uint8_t *buf)
```

Perform SMBus Block Write operation.

This routine provides a generic interface to perform SMBus Block Write operation.

**Parameters**

- **dev** – Pointer to the device structure for the SMBus driver instance.
- **addr** – Address of the SMBus peripheral device.
- **cmd** – Command byte which is sent to peripheral device first.
- **count** – Size of the data block buffer. Maximum 32 bytes.
- **buf** – Data block buffer to be sent to the peripheral device.

**Return values**

- **0** – If successful.
- **-EIO** – General input / output error.
- **-ENOSYS** – If function `smbus_block_write()` is not implemented by the driver.
int smbus_block_read(const struct device *dev, uint16_t addr, uint8_t cmd, uint8_t *count, uint8_t *buf)

Perform SMBus Block Read operation.

This routine provides a generic interface to perform SMBus Block Read operation.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `cmd` – Command byte which is sent to peripheral device first.
- `count` – Size of the data peripheral sent. Maximum 32 bytes.
- `buf` – Data block buffer received from the peripheral device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function `smbus_block_read()` is not implemented by the driver.

int smbus_block_pcall(const struct device *dev, uint16_t addr, uint8_t cmd, uint8_t snd_count, uint8_t *snd_buf, uint8_t *rcv_count, uint8_t *rcv_buf)

Perform SMBus Block Process Call operation.

This routine provides a generic interface to perform SMBus Block Process Call operation. This operation is basically Block Write followed by Block Read.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `cmd` – Command byte which is sent to peripheral device first.
- `snd_count` – Size of the data block buffer to send.
- `snd_buf` – Data block buffer send to the peripheral device.
- `rcv_count` – Size of the data peripheral sent.
- `rcv_buf` – Data block buffer received from the peripheral device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function `smbus_block_pcall()` is not implemented by the driver.

struct smbus_callback

#include <smbus.h> SMBus callback structure.

Used to register a callback in the driver instance callback list. As many callbacks as needed can be added as long as each of them is a unique pointer of struct `smbus_callback`.

Note: Such struct should not be allocated on stack.
Public Members

`sys_snodo_t node`
This should be used in driver for a callback list management.

`smbus_callback_handler_t handler`
Actual callback function being called when relevant.

`uint8_t addr`
Peripheral device address.

```
#include <smbus.h>
```
Complete SMBus DT information.

Public Members

`const struct device *bus`
SMBus bus.

`uint16_t addr`
Address of the SMBus peripheral device.

### 7.5.45 Universal Asynchronous Receiver-Transmitter (UART)

#### Overview

Zephyr provides three different ways to access the UART peripheral. Depending on the method, different API functions are used according to below sections:

1. **Polling API**
2. **Interrupt-driven API**
3. **Asynchronous API using Direct Memory Access (DMA)**

Polling is the most basic method to access the UART peripheral. The reading function, `uart_poll_in`, is a non-blocking function and returns a character or -1 when no valid data is available. The writing function, `uart_poll_out`, is a blocking function and the thread waits until the given character is sent.

With the Interrupt-driven API, possibly slow communication can happen in the background while the thread continues with other tasks. The Kernel's Data Passing features can be used to communicate between the thread and the UART driver.

The Asynchronous API allows to read and write data in the background using DMA without interrupting the MCU at all. However, the setup is more complex than the other methods.

**Warning:** Interrupt-driven API and the Asynchronous API should NOT be used at the same time, since both APIs require hardware interrupts to function properly, using the callbacks for both APIs would result in interference between each other. `CONFIG_UART_EXCLUSIVE_API_CALLBACKS` is enabled by default so that only the callbacks associated with one API is active at a time.
## Configuration Options

Most importantly, the Kconfig options define whether the polling API (default), the interrupt-driven API or the asynchronous API can be used. Only enable the features you need in order to minimize memory footprint.

Related configuration options:

- `CONFIG_SERIAL`
- `CONFIG_UART_INTERRUPT_DRIVEN`
- `CONFIG_UART_ASYNC_API`
- `CONFIG_UART_WIDE_DATA`
- `CONFIG_UART_USE_RUNTIME_CONFIGURE`
- `CONFIG_UART_LINE_CTRL`
- `CONFIG_UART_DRV_CMD`

## API Reference

### Related code samples

**802.15.4 "serial-radio"**
Implement a slip-radio device for Contiki-based border routers.

**Console over USB CDC ACM**
Output "Hello World!" to the console over USB CDC ACM.

**Native TTY UART**
Use native TTY driver to send and receive data between two UART-to-USB bridge dongles.

**STM32 single-wire UART**
Use single-wire/half-duplex UART functionality of STM32 devices.

**UART echo**
Read data from the console and echo it back.

---

**group uart_interface**
UART Interface.

### Enums

**enum uart_line_ctrl**
Line control signals.

*Values:*

- enumerator `UART_LINE_CTRL_BAUD_RATE = BIT(0)`
  Baud rate.

- enumerator `UART_LINE_CTRL_RTS = BIT(1)`
  Request To Send (RTS)
enumerator UART_LINE_CTRL_DTR = \textit{BIT}(2)
Data Terminal Ready (DTR)

enumerator UART_LINE_CTRL_DCD = \textit{BIT}(3)
Data Carrier Detect (DCD)

enumerator UART_LINE_CTRL_DSR = \textit{BIT}(4)
Data Set Ready (DSR)

enum uart_rx_stop_reason
Reception stop reasons.
Values that correspond to events or errors responsible for stopping receiving.
Values:

enumerator UART_ERROR_OVERRUN = (1 ∗ 0)
Overrun error.

enumerator UART_ERROR_PARITY = (1 ∗ 1)
Parity error.

enumerator UART_ERROR_FRAMING = (1 ∗ 2)
Framing error.

enumerator UART_BREAK = (1 ∗ 3)
Break interrupt.
A break interrupt was received. This happens when the serial input is held at a logic '0' state for longer than the sum of start time + data bits + parity + stop bits.

enumerator UART_ERROR_COLLISION = (1 ∗ 4)
Collision error.
This error is raised when transmitted data does not match received data. Typically this is useful in scenarios where the TX and RX lines maybe connected together such as RS-485 half-duplex. This error is only valid on UARTs that support collision checking.

enumerator UART_ERROR_NOISE = (1 ∗ 5)
Noise error.

enum uart_config_parity
Parity modes.
Values:

type UART_CFG_PARITY

enumerator UART_CFG_PARITY_NONE
No parity.

enumerator UART_CFG_PARITY_ODD
Odd parity.
enumerator UART_CFG_PARITY_EVEN
   Even parity.

enumerator UART_CFG_PARITY_MARK
   Mark parity.

enumerator UART_CFG_PARITY_SPACE
   Space parity.

enum uart_config_stop_bits
   Number of stop bits.
   Values:

   enumerator UART_CFG_STOP_BITS_0_5
      0.5 stop bit

   enumerator UART_CFG_STOP_BITS_1
      1 stop bit

   enumerator UART_CFG_STOP_BITS_1_5
      1.5 stop bits

   enumerator UART_CFG_STOP_BITS_2
      2 stop bits

enum uart_config_data_bits
   Number of data bits.
   Values:

   enumerator UART_CFG_DATA_BITS_5
      5 data bits

   enumerator UART_CFG_DATA_BITS_6
      6 data bits

   enumerator UART_CFG_DATA_BITS_7
      7 data bits

   enumerator UART_CFG_DATA_BITS_8
      8 data bits

   enumerator UART_CFG_DATA_BITS_9
      9 data bits

enum uart_config_flow_control
   Hardware flow control options.

   With flow control set to none, any operations related to flow control signals can be managed by user with uart_line_ctrl functions. In other cases, flow control is managed by hardware/driver.

7.5. Peripherals
Values:

enumerator UART_CFG_FLOWCTRL_NONE
   No flow control.

enumerator UART_CFG_FLOWCTRL_RTS_CTS
   RTS/CTS flow control.

enumerator UART_CFG_FLOWCTRL_DTR_DSR
   DTR/DSR flow control.

enumerator UART_CFG_FLOWCTRL_RS485
   RS485 flow control.

Functions

int uart_err_check(const struct device *dev)
Check whether an error was detected.

Parameters

   • dev – UART device instance.

Return values

   • 0 – If no error was detected.
   • err – Error flags as defined in uart_rx_stop_reason
   • -ENOSYS – If not implemented.

int uart_configure(const struct device *dev, const struct uart_config *cfg)
Set UART configuration.

Sets UART configuration using data from *cfg.

Parameters

   • dev – UART device instance.
   • cfg – UART configuration structure.

Return values

   • 0 – If successful.
   • -errno – Negative errno code in case of failure.
   • -ENOSYS – If configuration is not supported by device or driver does not support setting configuration in runtime.
   • -ENOTSUP – If API is not enabled.

int uart_config_get(const struct device *dev, struct uart_config *cfg)
Get UART configuration.

Stores current UART configuration to *cfg, can be used to retrieve initial configuration after device was initialized using data from DTS.

Parameters

   • dev – UART device instance.
   • cfg – UART configuration structure.
Return values

- 0 – If successful.
- -errno – Negative errno code in case of failure.
- -ENOSYS – If driver does not support getting current configuration.
- -ENOTSUP – If API is not enabled.

int uart_line_ctrl_set(const struct device *dev, uint32_t ctrl, uint32_t val)

Manipulate line control for UART.

Parameters

- dev – UART device instance.
- ctrl – The line control to manipulate (see enum uart_line_ctrl).
- val – Value to set to the line control.

Return values

- 0 – If successful.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.
- -errno – Other negative errno value in case of failure.

int uart_line_ctrl_get(const struct device *dev, uint32_t ctrl, uint32_t *val)

Retrieve line control for UART.

Parameters

- dev – UART device instance.
- ctrl – The line control to retrieve (see enum uart_line_ctrl).
- val – Pointer to variable where to store the line control value.

Return values

- 0 – If successful.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.
- -errno – Other negative errno value in case of failure.

int uart_drv_cmd(const struct device *dev, uint32_t cmd, uint32_t p)

Send extra command to driver.

Implementation and accepted commands are driver specific. Refer to the drivers for more information.

Parameters

- dev – UART device instance.
- cmd – Command to driver.
- p – Parameter to the command.

Return values

- 0 – If successful.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.
- -errno – Other negative errno value in case of failure.
struct uart_config
    #include <uart.h> UART controller configuration structure.

Public Members

uint32_t baudrate
    Baudrate setting in bps.

uint8_t parity
    Parity bit, use uart_config parity.

uint8_t stop_bits
    Stop bits, use uart_config_stop_bits.

uint8_t data_bits
    Data bits, use uart_config_data_bits.

uint8_t flow_ctrl
    Flow control setting, use uart_config_flow_control.

Polling API

group uart_polling

Functions

int uart_poll_in(const struct device *dev, unsigned char *p_char)
    Read a character from the device for input.

    This routine checks if the receiver has valid data. When the receiver has valid data, it reads a character from the device, stores to the location pointed to by p_char, and returns 0 to the calling thread. It returns -1, otherwise. This function is a non-blocking call.

    Parameters
        • dev – UART device instance.
        • p_char – Pointer to character.

    Return values
        • 0 – If a character arrived.
        • -1 – If no character was available to read (i.e. the UART input buffer was empty).
        • -ENOSYS – If the operation is not implemented.
        • -EBUSY – If async reception was enabled using uart_rx_enable
int uart_poll_in_u16(const struct device *dev, uint16_t *p_u16)
    Read a 16-bit datum from the device for input.

This routine checks if the receiver has valid data. When the receiver has valid data, it
reads a 16-bit datum from the device, stores to the location pointed to by p_u16, and
returns 0 to the calling thread. It returns -1, otherwise. This function is a non-blocking
call.

Parameters
- dev – UART device instance.
- p_u16 – Pointer to 16-bit data.

Return values
- 0 – If data arrived.
- -1 – If no data was available to read (i.e., the UART input buffer was empty).
- -ENOTSUP – If API is not enabled.
- -ENOSYS – If the function is not implemented.
- -EBUSY – If async reception was enabled using uart_rx_enable

void uart_poll_out(const struct device *dev, unsigned char out_char)
    Write a character to the device for output.

This routine checks if the transmitter is full. When the transmitter is not full, it writes
a character to the data register. It waits and blocks the calling thread, otherwise. This
function is a blocking call.

To send a character when hardware flow control is enabled, the handshake signal CTS
must be asserted.

Parameters
- dev – UART device instance.
- out_char – Character to send.

void uart_poll_out_u16(const struct device *dev, uint16_t out_u16)
    Write a 16-bit datum to the device for output.

This routine checks if the transmitter is full. When the transmitter is not full, it writes
a 16-bit datum to the data register. It waits and blocks the calling thread, otherwise.
This function is a blocking call.

To send a datum when hardware flow control is enabled, the handshake signal CTS
must be asserted.

Parameters
- dev – UART device instance.
- out_u16 – Wide data to send.

Interrupt-driven API

group uart_interrupt

7.5. Peripherals
### Typedefs

typedef void (*uart_irq_callback_user_data_t)(const struct device *dev, void *user_data)

Define the application callback function signature for `uart_irq_callback_user_data_set()` function.

- **Param dev**
  UART device instance.

- **Param user_data**
  Arbitrary user data.

typedef void (*uart_irq_config_func_t)(const struct device *dev)

For configuring IRQ on each individual UART device.

- **Param dev**
  UART device instance.

### Functions

static inline int uart_fifo_fill(const struct device *dev, const uint8_t *tx_data, int size)

Fill FIFO with data.

This function is expected to be called from UART interrupt handler (ISR), if `uart_irq_tx_ready()` returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). Likewise, *not* calling this function from an ISR if `uart_irq_tx_ready()` returns true may lead to undefined behavior, e.g. infinite interrupt loops. It's mandatory to test return value of this function, as different hardware has different FIFO depth (oftentimes just 1).

- **Parameters**
  - **dev** – UART device instance.
  - **tx_data** – Data to transmit.
  - **size** – Number of bytes to send.

- **Return values**
  - -ENOSYS – if this function is not supported
  - -ENOTSUP – If API is not enabled.

- **Returns**
  Number of bytes sent.

static inline int uart_fifo_fill_u16(const struct device *dev, const uint16_t *tx_data, int size)

Fill FIFO with wide data.

This function is expected to be called from UART interrupt handler (ISR), if `uart_irq_tx_ready()` returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). Likewise, *not* calling this function from an ISR if `uart_irq_tx_ready()` returns true may lead to undefined behavior, e.g. infinite interrupt loops. It's mandatory to test return value of this function, as different hardware has different FIFO depth (oftentimes just 1).

- **Parameters**
  - **dev** – UART device instance.
  - **tx_data** – Wide data to transmit.
• size – Number of datum to send.

Return values
• -ENOSYS – If this function is not implemented
• -ENOTSUP – If API is not enabled.

Returns
Number of datum sent.

static inline int uart_fifo_read(const struct device *dev, uint8_t *rx_data, const int size)
Read data from FIFO.

This function is expected to be called from UART interrupt handler (ISR), if uart_irq_rx_ready() returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). It’s unspecified whether “RX ready” condition as returned by uart_irq_rx_ready() is level- or edge- triggered. That means that once uart_irq_rx_ready() is detected, uart_fifo_read() must be called until it reads all available data in the FIFO (i.e. until it returns less data than was requested).

Parameters
• dev – UART device instance.
• rx_data – Data container.
• size – Container size.

Return values
• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.

Returns
Number of bytes read.

static inline int uart_fifo_read_u16(const struct device *dev, uint16_t *rx_data, const int size)
Read wide data from FIFO.

This function is expected to be called from UART interrupt handler (ISR), if uart_irq_rx_ready() returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). It’s unspecified whether “RX ready” condition as returned by uart_irq_rx_ready() is level- or edge- triggered. That means that once uart_irq_rx_ready() is detected, uart_fifo_read() must be called until it reads all available data in the FIFO (i.e. until it returns less data than was requested).

Parameters
• dev – UART device instance.
• rx_data – Wide data container.
• size – Container size.

Return values
• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.

Returns
Number of datum read.

void uart_irq_tx_enable(const struct device *dev)
Enable TX interrupt in IER.

Parameters
- dev – UART device instance.

```c
void uart_irq_tx_disable(const struct device *dev)
```

Disable TX interrupt in IER.

**Parameters**

- dev – UART device instance.

```c
static inline int uart_irq_tx_ready(const struct device *dev)
```

Check if UART TX buffer can accept a new char.

Check if UART TX buffer can accept at least one character for transmission (i.e. `uart_fifo_fill()` will succeed and return non-zero). This function must be called in a UART interrupt handler, or its result is undefined. Before calling this function in the interrupt handler, `uart_irq_update()` must be called once per the handler invocation.

**Parameters**

- dev – UART device instance.

**Return values**

- 1 – If TX interrupt is enabled and at least one char can be written to UART.
- 0 – If device is not ready to write a new byte.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.

```c
void uart_irq_rx_enable(const struct device *dev)
```

Enable RX interrupt.

**Parameters**

- dev – UART device instance.

```c
void uart_irq_rx_disable(const struct device *dev)
```

Disable RX interrupt.

**Parameters**

- dev – UART device instance.

```c
static inline int uart_irq_tx_complete(const struct device *dev)
```

Check if UART TX block finished transmission.

Check if any outgoing data buffered in UART TX block was fully transmitted and TX block is idle. When this condition is true, UART device (or whole system) can be power off. Note that this function is not useful to check if UART TX can accept more data, use `uart_irq_tx_ready()` for that. This function must be called in a UART interrupt handler, or its result is undefined. Before calling this function in the interrupt handler, `uart_irq_update()` must be called once per the handler invocation.

**Parameters**

- dev – UART device instance.

**Return values**

- 1 – If nothing remains to be transmitted.
- 0 – If transmission is not completed.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.
static inline int uart_irq_rx_ready(const struct device *dev)
    Check if UART RX buffer has a received char.
    Check if UART RX buffer has at least one pending character (i.e. \texttt{uart_fifo_read()} will
    succeed and return non-zero). This function must be called in a UART interrupt han-
    dler, or its result is undefined. Before calling this function in the interrupt handler,
    \texttt{uart_irq_update()} must be called once per the handler invocation. It’s unspecified
    whether condition as returned by this function is level- or edge- triggered (i.e. if this
    function returns true when RX FIFO is non-empty, or when a new char was received
    since last call to it). See description of \texttt{uart_fifo_read()} for implication of this.

    \textbf{Parameters}
    \begin{itemize}
    \item \texttt{dev} – UART device instance.
    \end{itemize}

    \textbf{Return values}
    \begin{itemize}
    \item 1 – If a received char is ready.
    \item 0 – If a received char is not ready.
    \item -ENOSYS – If this function is not implemented.
    \item -ENOTSUP – If API is not enabled.
    \end{itemize}

void uart_irq_err_enable(const struct device *dev)
    Enable error interrupt.

    \textbf{Parameters}
    \begin{itemize}
    \item \texttt{dev} – UART device instance.
    \end{itemize}

void uart_irq_err_disable(const struct device *dev)
    Disable error interrupt.

    \textbf{Parameters}
    \begin{itemize}
    \item \texttt{dev} – UART device instance.
    \end{itemize}

int uart_irq_is_pending(const struct device *dev)
    Check if any IRQs is pending.

    \textbf{Parameters}
    \begin{itemize}
    \item \texttt{dev} – UART device instance.
    \end{itemize}

    \textbf{Return values}
    \begin{itemize}
    \item 1 – If an IRQ is pending.
    \item 0 – If an IRQ is not pending.
    \item -ENOSYS – If this function is not implemented.
    \item -ENOTSUP – If API is not enabled.
    \end{itemize}

int uart_irq_update(const struct device *dev)
    Start processing interrupts in ISR.
    This function should be called the first thing in the ISR. Calling \texttt{uart_irq_rx_ready()},
    \texttt{uart_irq_tx_ready()}, \texttt{uart_irq_tx_complete()} allowed only after this.
    The purpose of this function is:

    \begin{itemize}
    \item For devices with auto-acknowledge of interrupt status on register read to cache
        the value of this register (rx_ready, etc. then use this case).
    \item For devices with explicit acknowledgment of interrupts, to ack any pending inter-
        rupts and likewise to cache the original value.
    \end{itemize}
For devices with implicit acknowledgment, this function will be empty. But the ISR must perform the actions needed to ack the interrupts (usually, call `uart_fifo_read()` on rx_ready, and `uart_fifo_fill()` on tx_ready).

**Parameters**
- `dev` – UART device instance.

**Return values**
- 1 – On success.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.

```c
static inline int uart_irq_callback_user_data_set
    (const struct device *dev,
     uart_irq_callback_user_data_t cb, void *user_data)
```

Set the IRQ callback function pointer.

This sets up the callback for IRQ. When an IRQ is triggered, the specified function will be called with specified user data. See description of `uart_irq_update()` for the requirements on ISR.

**Parameters**
- `dev` – UART device instance.
- `cb` – Pointer to the callback function.
- `user_data` – Data to pass to callback function.

**Return values**
- 0 – On success.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.

```c
static inline int uart_irq_callback_set
    (const struct device *dev,
     uart_irq_callback_user_data_t cb)
```

Set the IRQ callback function pointer (legacy).

This sets up the callback for IRQ. When an IRQ is triggered, the specified function will be called with the device pointer.

**Parameters**
- `dev` – UART device instance.
- `cb` – Pointer to the callback function.

**Return values**
- 0 – On success.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.

Asynchronous API

```
group uart_async
```
**Typedefs**

```c
typedef void (*uart_callback_t)(const struct device *dev, struct uart_event *evt, void *user_data)
```

Define the application callback function signature for `uart_callback_set()` function.

- **Param dev**
  UART device instance.

- **Param evt**
  Pointer to `uart_event` instance.

- **Param user_data**
  Pointer to data specified by user.

** Enums**

```c
enum uart_event_type
```

Types of events passed to callback in UART_ASYNC_API.

**Receiving:**

a. To start receiving, `uart_rx_enable` has to be called with first buffer

b. When receiving starts to current buffer, `UART_RX_BUF_REQUEST` will be generated, in response to that user can either:
   - Provide second buffer using `uart_rx_buf_rsp`, when first buffer is filled, receiving will automatically start to second buffer.
   - Ignore the event, this way when current buffer is filled `UART_RX_RDY` event will be generated and receiving will be stopped.

c. If some data was received and timeout occurred `UART_RX_RDY` event will be generated. It can happen multiples times for the same buffer. RX timeout is counted from last byte received i.e. if no data was received, there won’t be any timeout event.

d. `UART_RX_BUFReleased` event will be generated when the current buffer is no longer used by the driver. It will immediately follow `UART_RX_RDY` event. Depending on the implementation buffer may be released when it is completely or partially filled.

e. If there was second buffer provided, it will become current buffer and we start again at point 2. If no second buffer was specified receiving is stopped and `UART_RX_DISABLED` event is generated. After that whole process can be repeated.

Any time during reception `UART_RX_STOPPED` event can occur. If there is any data received, `UART_RX_RDY` event will be generated. It will be followed by `UART_RX_BUFReleased` event for every buffer currently passed to driver and finally by `UART_RX_DISABLED` event.

Receiving can be disabled using `uart_rx_disable`, after calling that function, if there is any data received, `UART_RX_RDY` event will be generated. `UART_RX_BUFReleased` event will be generated for every buffer currently passed to driver and finally `UART_RX_DISABLED` event will occur.

**Transmitting:**

a. Transmitting starts by `uart_tx` function.

b. If whole buffer was transmitted `UART_TX_DONE` is generated. If timeout occurred `UART_TX_ABORTED` will be generated.
Transmitting can be aborted using `uart_tx_abort`, after calling that function `UART_TX_ABORTED` event will be generated.

**Values:**

enumerator UART_TX_DONE

Whole TX buffer was transmitted.

enumerator UART_TX_ABORTED

Transmitting aborted due to timeout or `uart_tx_abort` call.

When flow control is enabled, there is a possibility that TX transfer won't finish in the allotted time. Some data may have been transferred, information about it can be found in event data.

enumerator UART_RX_RDY

Received data is ready for processing.

This event is generated in the following cases:

- When RX timeout occurred, and data was stored in provided buffer. This can happen multiple times in the same buffer.
- When provided buffer is full.
- After `uart_rx_disable()`.
- After stopping due to external event (`UART_RX_STOPPED`).

enumerator UART_RX_BUF_REQUEST

Driver requests next buffer for continuous reception.

This event is triggered when receiving has started for a new buffer, i.e. it's time to provide a next buffer for a seamless switchover to it. For continuous reliable receiving, user should provide another RX buffer in response to this event, using `uart_rx_buf_rsp` function

If `uart_rx_buf_rsp` is not called before current buffer is filled up, receiving will stop.

enumerator UART_RX_BUF_RELEASED

Buffer is no longer used by UART driver.

enumerator UART_RX_DISABLED

RX has been disabled and can be reenabled.

This event is generated whenever receiver has been stopped, disabled or finished its operation and can be enabled again using `uart_rx_enable`

enumerator UART_RX_STOPPED

RX has stopped due to external event.

Reason is one of `uart_rx_stop_reason`.

**Functions**

```c
static inline int uart_callback_set(const struct device *dev, uart_callback_t callback, void *user_data)
```

Set event handler function.

Since it is mandatory to set callback to use other asynchronous functions, it can be used to detect if the device supports asynchronous API. Remaining API does not have that detection.
Parameters
- **dev** – UART device instance.
- **callback** – Event handler.
- **user_data** – Data to pass to event handler function.

Return values
- **0** – If successful.
- **-ENOSYS** – If not supported by the device.
- **-ENOTSUP** – If API not enabled.

```c
int uart_tx(const struct device *dev, const uint8_t *buf, size_t len, int32_t timeout)
```
Send given number of bytes from buffer through UART.
Function returns immediately and event handler, set using `uart_callback_set`, is called after transfer is finished.

Parameters
- **dev** – UART device instance.
- **buf** – Pointer to transmit buffer.
- **len** – Length of transmit buffer.
- **timeout** – Timeout in microseconds. Valid only if flow control is enabled.
  SYS_FOREVER_US disables timeout.

Return values
- **0** – If successful.
- **-ENOTSUP** – If API is not enabled.
- **-EBUSY** – If there is already an ongoing transfer.
- **-errno** – Other negative errno value in case of failure.

```c
int uart_tx_u16(const struct device *dev, const uint16_t *buf, size_t len, int32_t timeout)
```
Send given number of datum from buffer through UART.
Function returns immediately and event handler, set using `uart_callback_set`, is called after transfer is finished.

Parameters
- **dev** – UART device instance.
- **buf** – Pointer to wide data transmit buffer.
- **len** – Length of wide data transmit buffer.
- **timeout** – Timeout in milliseconds. Valid only if flow control is enabled.
  SYS_FOREVER_MS disables timeout.

Return values
- **0** – If successful.
- **-ENOTSUP** – If API is not enabled.
- **-EBUSY** – If there is already an ongoing transfer.
- **-errno** – Other negative errno value in case of failure.
int uart_tx_abort(const struct device *dev)
Abort current TX transmission.

UART_TX_DONE event will be generated with amount of data sent.

Parameters

• dev – UART device instance.

Return values

• 0 – If successful.
• -ENOTSUP – If API is not enabled.
• -EFAULT – There is no active transmission.
• -errno – Other negative errno value in case of failure.

int uart_rx_enable(const struct device *dev, uint8_t *buf, size_t len, int32_t timeout)
Start receiving data through UART.

Function sets given buffer as first buffer for receiving and returns immediately. After that event handler, set using uart_callback_set, is called with UART_RX_RDY or UART_RX_BUF_REQUEST events.

Parameters

• dev – UART device instance.
• buf – Pointer to receive buffer.
• len – Buffer length.
• timeout – Inactivity period after receiving at least a byte which triggers UART_RX_RDY event. Given in microseconds. SYS_FOREVER_US disables timeout. See uart_event_type for details.

Return values

• 0 – If successful.
• -ENOTSUP – If API is not enabled.
• -EBUSY – RX already in progress.
• -errno – Other negative errno value in case of failure.

int uart_rx_enable_u16(const struct device *dev, uint16_t *buf, size_t len, int32_t timeout)
Start receiving wide data through UART.

Function sets given buffer as first buffer for receiving and returns immediately. After that event handler, set using uart_callback_set, is called with UART_RX_RDY or UART_RX_BUF_REQUEST events.

Parameters

• dev – UART device instance.
• buf – Pointer to wide data receive buffer.
• len – Buffer length.
• timeout – Inactivity period after receiving at least a byte which triggers UART_RX_RDY event. Given in milliseconds. SYS_FOREVER_MS disables timeout. See uart_event_type for details.

Return values

• 0 – If successful.
• -ENOTSUP – If API is not enabled.
• -EBUSY – RX already in progress.
• -errno – Other negative errno value in case of failure.

static inline int uart_rx_buf_rsp(const struct device *dev, uint8_t *buf, size_t len)
Provide receive buffer in response to UART_RX_BUF_REQUEST event.
Provide pointer to RX buffer, which will be used when current buffer is filled.

Note: Providing buffer that is already in usage by driver leads to undefined behavior.
Buffer can be reused when it has been released by driver.

Parameters
• dev – UART device instance.
• buf – Pointer to receive buffer.
• len – Buffer length.

Return values
• 0 – If successful.
• -ENOTSUP – If API is not enabled.
• -EBUSY – Next buffer already set.
• -EACCES – Receiver is already disabled (function called too late?).
• -errno – Other negative errno value in case of failure.

static inline int uart_rx_buf_rsp_u16(const struct device *dev, uint16_t *buf, size_t len)
Provide wide data receive buffer in response to UART_RX_BUF_REQUEST event.
Provide pointer to RX buffer, which will be used when current buffer is filled.

Note: Providing buffer that is already in usage by driver leads to undefined behavior.
Buffer can be reused when it has been released by driver.

Parameters
• dev – UART device instance.
• buf – Pointer to wide data receive buffer.
• len – Buffer length.

Return values
• 0 – If successful.
• -ENOTSUP – If API is not enabled
• -EBUSY – Next buffer already set.
• -EACCES – Receiver is already disabled (function called too late?).
• -errno – Other negative errno value in case of failure.
int uart_rx_disable(const struct device *dev)
    Disable RX.

    UART_RX_BUF_RELEASED event will be generated for every buffer scheduled, after that UART_RX_DISABLED event will be generated. Additionally, if there is any pending received data, the UART_RX_RDY event for that data will be generated before the UART_RX_BUF_RELEASED events.

    Parameters
    • dev – UART device instance.

    Return values
    • 0 – If successful.
    • -ENOTSUP – If API is not enabled.
    • -EFAULT – There is no active reception.
    • -errno – Other negative errno value in case of failure.

struct uart_event_tx
    #include <uart.h> UART TX event data.

    Public Members

    const uint8_t *buf
        Pointer to current buffer.

    size_t len
        Number of bytes sent.

struct uart_event_rx
    #include <uart.h> UART RX event data.

    The data represented by the event is stored in rx.buf[rx.offset] to rx.buf[rx.offset+rx.len]. That is, the length is relative to the offset.

    Public Members

    uint8_t *buf
        Pointer to current buffer.

    size_t offset
        Currently received data offset in bytes.

    size_t len
        Number of new bytes received.

struct uart_event_rx_buf
    #include <uart.h> UART RX buffer released event data.
Public Members

uint8_t *buf
    Pointer to buffer that is no longer in use.

struct uart_event_rx_stop
    #include <uart.h> UART RX stopped data.

Public Members

eenum uart_rx_stop_reason reason
    Reason why receiving stopped.

struct uart_event_rx data
    Last received data.

struct uart_event
    #include <uart.h> Structure containing information about current event.

Public Members

eenum uart_event_type type
    Type of event.

union uart_event_data
    #include <uart.h> Event data.

Public Members

struct uart_event_tx tx
    UART_TX_DONE and UART_TX_ABORTED events data.

struct uart_event_rx rx
    UART_RX_RDY event data.

struct uart_event_rx_buf rx_buf
    UART_RX_BUF_RELEASED event data.

struct uart_event_rx_stop rx_stop
    UART_RX_STOPPED event data.
7.5.46 USB-C VBUS

Overview

USB-C VBUS is the line in a USB Type-C connection that delivers power from a Source to a Sink device.

USB-C VBUS API   The USB-C VBUS device driver presents an API that's used to control and measure VBUS.

Configuration Options

Related configuration options:

- CONFIG_USBC_VBUS_DRIVER

API Reference

group usbc_vbus_api

USB-C VBUS API.

Functions

static inline bool usbc_vbus_check_level(const struct device *dev, enum tc_vbus_level level)
Checks if VBUS is at a particular level.

Parameters

- dev – Runtime device structure
- level – The level voltage to check against

Return values

- true – if VBUS is at the level voltage
- false – if VBUS is not at that level voltage

static inline int usbc_vbus_measure(const struct device *dev, int *meas)
Reads and returns VBUS measured in mV.

Parameters

- dev – Runtime device structure
- meas – pointer where the measured VBUS voltage is stored

Return values

- 0 – on success
- -EIO – on failure

static inline int usbc_vbus_discharge(const struct device *dev, bool enable)
Controls a pin that discharges VBUS.

Parameters

- dev – Runtime device structure
• **enable** – Discharge VBUS when true

**Return values**

• **0** – on success
• **-EIO** – on failure
• **-ENOENT** – if discharge pin isn’t defined

static inline int **usbc_vbus_enable** (const struct **device** *dev, bool enable)

Controls a pin that enables VBUS measurements.

**Parameters**

• **dev** – Runtime device structure
• **enable** – enable VBUS measurements when true

**Return values**

• **0** – on success
• **-EIO** – on failure
• **-ENOENT** – if enable pin isn’t defined

```c
struct usbc_vbus_driver_api
#include <usbc_vbus.h>
```

### 7.5.47 USB Type-C Port Controller (TCPC)

**Overview**

**TCPC (USB Type-C Port Controller)** The TCPC is a device used to simplify the implementation of a USB-C system by providing the following three functions:

- VBUS and VCONN control **USB Type-C**: The TCPC may provide a Source device, the mechanism to control VBUS sourcing, and a Sink device, the mechanism to control VBUS sinking. A similar mechanism is provided for the control of VCONN.
- **CC control and sensing**: The TCPC implements logic for controlling the CC pin pull-up and pull-down resistors. It also provides a way to sense and report what resistors are present on the CC pin.
- **Power Delivery message reception and transmission** **USB Power Delivery**: The TCPC sends and receives messages constructed in the TCPM and places them on the CC lines.

**TCPC API** The TCPC device driver functions as the liaison between the TCPC device and the application software; this is accomplished by the Zephyr's API provided by the device driver that's used to communicate with and control the TCPC device.

**Configuration Options**

Related configuration options:

- **CONFIG_USBC_TCPC_DRIVER**
API Reference

group usb_type_c
    USB Type-C.

Defines

TC_V_SINK_DISCONNECT_MIN_MV
    VBUS minimum for a sink disconnect detection.
    See Table 4-3 VBUS Sink Characteristics

TC_V_SINK_DISCONNECT_MAX_MV
    VBUS maximum for a sink disconnect detection.
    See Table 4-3 VBUS Sink Characteristics

TC_T_VBUS_ON_MAX_MS
    From entry to Attached.SRC until VBUS reaches the minimum vSafe5V threshold as measured at the source’s receptacle See Table 4-29 VBUS and VCONN Timing Parameters.

TC_T_VBUS_OFF_MAX_MS
    From the time the Sink is detached until the Source removes VBUS and reaches vSafe0V (See USB PD).
    See Table 4-29 VBUS and VCONN Timing Parameters

TC_T_VCONN_ON_MAX_MS
    From the time the Source supplied VBUS in the Attached.SRC state.
    See Table 4-29 VBUS and VCONN Timing Parameters

TC_T_VCONN_ON_PA_MAX_MS
    From the time a Sink with accessory support enters the PoweredAccessory state until the Sink sources minimum VCONN voltage (see Table 4-5) See Table 4-29 VBUS and VCONN Timing Parameters.

TC_T_VCONN_OFF_MAX_MS
    From the time that a Sink is detached or as directed until the VCONN supply is disconnected.
    See Table 4-29 VBUS and VCONN Timing Parameters

TC_T_SINK_ADJ_MAX_MS
    Response time for a Sink to adjust its current consumption to be in the specified range due to a change in USB Type-C Current advertisement See Table 4-29 VBUS and VCONN Timing Parameters.

TC_T_DRP_MIN_MS
    The minimum period a DRP shall complete a Source to Sink and back advertisement See Table 4-30 DRP Timing Parameters.
TC_T_DRP_MAX_MS
The maximum period a DRP shall complete a Source to Sink and back advertisement. See Table 4-30 DRP Timing Parameters.

TC_T_DRP_TRANSITION_MIN_MS
The minimum time a DRP shall complete transitions between Source and Sink roles during role resolution. See Table 4-30 DRP Timing Parameters.

TC_T_DRP_TRANSITION_MAX_MS
The maximum time a DRP shall complete transitions between Source and Sink roles during role resolution. See Table 4-30 DRP Timing Parameters.

TC_T_DRP_TRY_MIN_MS
Minimum wait time associated with the Try.SRC state. See Table 4-30 DRP Timing Parameters

TC_T_DRP_TRY_MAX_MS
Maximum wait time associated with the Try.SRC state. See Table 4-30 DRP Timing Parameters

TC_T_DRP_TRY_WAIT_MIN_MS
Minimum wait time associated with the Try.SNK state. See Table 4-30 DRP Timing Parameters

TC_T_DRP_TRY_WAIT_MAX_MS
Maximum wait time associated with the Try.SNK state. See Table 4-30 DRP Timing Parameters

TC_T_TRY_TIMEOUT_MIN_MS
Minimum timeout for transition from Try.SRC to TryWait.SNK. See Table 4-30 DRP Timing Parameters

TC_T_TRY_TIMEOUT_MAX_MS
Maximum timeout for transition from Try.SRC to TryWait.SNK. See Table 4-30 DRP Timing Parameters

TC_T_VPD_DETACH_MIN_MS
Minimum Time for a DRP to detect that the connected Charge-Through VCONNPowered USB Device has been detached, after VBUS has been removed. See Table 4-30 DRP Timing Parameters

TC_T_VPD_DETACH_MAX_MS
Maximum Time for a DRP to detect that the connected Charge-Through VCONNPowered USB Device has been detached, after VBUS has been removed. See Table 4-30 DRP Timing Parameters
TC_T_CC_DEBOUNCE_MIN_MS
Minimum time a port shall wait before it can determine it is attached. See Table 4-31 CC Timing.

TC_T_CC_DEBOUNCE_MAX_MS
Maximum time a port shall wait before it can determine it is attached. See Table 4-31 CC Timing.

TC_T_PD_DEBOUNCE_MIN_MS
Minimum time a Sink port shall wait before it can determine it is detached due to the potential for USB PD signaling on CC as described in the state definitions. See Table 4-31 CC Timing

TC_T_PD_DEBOUNCE_MAX_MS
Maximum time a Sink port shall wait before it can determine it is detached due to the potential for USB PD signaling on CC as described in the state definitions. See Table 4-31 CC Timing

TC_T_TRY_CC_DEBOUNCE_MIN_MS
Minimum Time a port shall wait before it can determine it is re-attached during the try-wait process. See Table 4-31 CC Timing

TC_T_TRY_CC_DEBOUNCE_MAX_MS
Maximum Time a port shall wait before it can determine it is re-attached during the try-wait process. See Table 4-31 CC Timing

TC_T_ERROR_RECOVERY_SELF_POWERED_MIN_MS
Minimum time a self-powered port shall remain in the ErrorRecovery state. See Table 4-31 CC Timing

TC_T_ERROR_RECOVERY_SOURCE_MIN_MS
Minimum time a source shall remain in the ErrorRecovery state if it was sourcing VCONN in the previous state. See Table 4-31 CC Timing

TC_T_RP_VALUE_CHANGE_MIN_MS
Minimum time a Sink port shall wait before it can determine there has been a change in Rp where CC is not BMC Idle or the port is unable to detect BMC Idle. See Table 4-31 CC Timing

TC_T_RP_VALUE_CHANGE_MAX_MS
Maximum time a Sink port shall wait before it can determine there has been a change in Rp where CC is not BMC Idle or the port is unable to detect BMC Idle. See Table 4-31 CC Timing
TC_T_SRC_DISCONNECT_MIN_MS
Minimum time a Source shall detect the SRC.Open state.
The Source should detect the SRC.Open state as quickly as practical. See Table 4-31 CC Timing

TC_T_SRC_DISCONNECT_MAX_MS
Maximum time a Source shall detect the SRC.Open state.
The Source should detect the SRC.Open state as quickly as practical. See Table 4-31 CC Timing

TC_T_NO_TOGGLE_CONNECT_MIN_MS
Minimum time to detect connection when neither Port Partner is toggling.
See Table 4-31 CC Timing

TC_T_NO_TOGGLE_CONNECT_MAX_MS
Maximum time to detect connection when neither Port Partner is toggling.
See Table 4-31 CC Timing

TC_T_ONE_PORT_TOGGLE_CONNECT_MIN_MS
Minimum time to detect connection when one Port Partner is toggling (0ms ... dc-SRC.DRP max * tDRP max + 2 * tNoToggleConnect).
See Table 4-31 CC Timing

TC_T_ONE_PORT_TOGGLE_CONNECT_MAX_MS
Maximum time to detect connection when one Port Partner is toggling (0ms ... dc-SRC.DRP max * tDRP max + 2 * tNoToggleConnect).
See Table 4-31 CC Timing

TC_T_TWO_PORT_TOGGLE_CONNECT_MIN_MS
Minimum time to detect connection when both Port Partners are toggling (0ms ... 5 * tDRP max + 2 * tNoToggleConnect).
See Table 4-31 CC Timing

TC_T_TWO_PORT_TOGGLE_CONNECT_MAX_MS
Maximum time to detect connection when both Port Partners are toggling (0ms ... 5 * tDRP max + 2 * tNoToggleConnect).
See Table 4-31 CC Timing

TC_T_VPDCTDD_MIN_US
Minimum time for a Charge-Through VCONN-Powered USB Device to detect that the Charge-Through source has disconnected from CC after VBUS has been removed, transition to CTUnattached.VPD, and re-apply its Rp termination advertising 3.0 A on the host port CC.
See Table 4-31 CC Timing

TC_T_VPDCTDD_MAX_MS
Maximum time for a Charge-Through VCONN-Powered USB Device to detect that the
Charge-Through source has disconnected from CC after VBUS has been removed, transition to CTUnattached.VPD, and re-apply its Rp termination advertising 3.0 A on the host port CC.

See Table 4-31 CC Timing

**TC_T_VPDDISABLE_MIN_MS**

Minimum time for a Charge-Through VCONN-Powered USB Device shall remain in CT-Disabled.VPD state.

See Table 4-31 CC Timing

**Enums**

eNum **tc_cc_voltage_state**

CC Voltage status.

**Values:**

- **enumerator TC_CC_VOLT_OPEN** = 0
  - No port partner connection.

- **enumerator TC_CC_VOLT_RA** = 1
  - Port partner is applying Ra.

- **enumerator TC_CC_VOLT_RD** = 2
  - Port partner is applying Rd.

- **enumerator TC_CC_VOLT_RP_DEF** = 5
  - Port partner is applying Rp (0.5A)

- **enumerator TC_CC_VOLT_RP_1A5** = 6

- **enumerator TC_CC_VOLT_RP_3A0** = 7
  - Port partner is applying Rp (3.0A)

eNum **tc_vbus_level**

VBUS level voltages.

**Values:**

- **enumerator TC_VBUS_SAFE0V** = 0
  - VBUS is less than vSafe0V max.

- **enumerator TC_VBUS_PRESENT** = 1
  - VBUS is at least vSafe5V min.

- **enumerator TC_VBUS_REMOVED** = 2
  - VBUS is less than vSinkDisconnect max.
enum \texttt{tc\_rp\_value}

Pull-Up resistor values.

\textit{Values:}

enumerator \texttt{TC\_RP\_USB} = 0

Pull-Up resistor for a current of 900mA.

enumerator \texttt{TC\_RP\_1A5} = 1

Pull-Up resistor for a current of 1.5A.

enumerator \texttt{TC\_RP\_3A0} = 2

Pull-Up resistor for a current of 3.0A.

enumerator \texttt{TC\_RP\_RESERVED} = 3

No Pull-Up resistor is applied.

enum \texttt{tc\_cc\_pull}

CC pull resistors.

\textit{Values:}

enumerator \texttt{TC\_CC\_RA} = 0

Ra Pull-Down resistor.

enumerator \texttt{TC\_CC\_RP} = 1

Rp Pull-Up resistor.

enumerator \texttt{TC\_CC\_RD} = 2

Rd Pull-Down resistor.

enumerator \texttt{TC\_CC\_OPEN} = 3

No CC resistor.

enumerator \texttt{TC\_RA\_RD} = 4

Ra and Rd Pull-Down resistor.

enum \texttt{tc\_cable\_plug}

Cable plug.

See 6.2.1.1.7 Cable Plug. Only applies to SOP’ and SOP”. Replaced by \texttt{pd\_power\_role} for SOP packets.

\textit{Values:}

enumerator \texttt{PD\_PLUG\_FROM\_DFP\_UFP} = 0

enumerator \texttt{PD\_PLUG\_FROM\_CABLE\_VPD} = 1

enum \texttt{tc\_power\_role}

Power Delivery Power Role.

\textit{Values:}
enumerator TC_ROLE_SINK = 0
   Power role is a sink.

enumerator TC_ROLE_SOURCE = 1
   Power role is a source.

enum tc_data_role
   Power Delivery Data Role.
   Values:

   enumerator TC_ROLE_UFP = 0
      Data role is an Upstream Facing Port.

   enumerator TC_ROLE_DFP = 1
      Data role is a Downstream Facing Port.

   enumerator TC_ROLE_DISCONNECTED = 2
      Port is disconnected.

enum tc_cc_polarity
   Polarity of the CC lines.
   Values:

   enumerator TC_POLARITY_CC1 = 0
      Use CC1 IO for Power Delivery communication.

   enumerator TC_POLARITY_CC2 = 1
      Use CC2 IO for Power Delivery communication.

enum tc_cc_states
   Possible port partner connections based on CC line states.
   Values:

   enumerator TC_CC_NONE = 0
      No port partner attached.

   enumerator TC_CC_UFP_NONE = 1
      From DFP perspective.
      No UFP accessory connected

   enumerator TC_CC_UFP_AUDIO_ACC = 2
      UFP Audio accessory connected.

   enumerator TC_CC_UFP_DEBUG_ACC = 3
      UFP Debug accessory connected.

   enumerator TC_CC_UFP_ATTACHED = 4
      Plain UFP attached.
enumerator TC_CC_DFP_ATTACHED = 5
    From UFP perspective.
    Plain DFP attached

enumerator TC_CC_DFP_DEBUG_ACC = 6
    DFP debug accessory connected.

group usb_type_c_port_controller_api
    USB Type-C Port Controller API.

    **Typedefs**

typedef int (*tcpc_vconn_control_cb_t)(const struct device *dev, enum tc_cc_polarity pol, bool enable)

typedef int (*tcpc_vconn_discharge_cb_t)(const struct device *dev, enum tc_cc_polarity pol, bool enable)

typedef void (*tcpc_alert_handler_cb_t)(const struct device *dev, void *data, enum tcpc_alert alert)

    **Enums**

enum tcpc_alert
    TCPC Alert bits.
    Values:

    enumerator TCPC_ALERT_CC_STATUS
        CC status changed.

    enumerator TCPC_ALERT_POWER_STATUS
        Power status changed.

    enumerator TCPC_ALERT_MSG_STATUS
        Receive Buffer register changed.

    enumerator TCPC_ALERT_HARD_RESET_RECEIVED
        Received Hard Reset message.

    enumerator TCPC_ALERT_TRANSMIT_MSG_FAILED
        SOP* message transmission not successful.

    enumerator TCPC_ALERT_TRANSMIT_MSG_DISCARDED
        Reset or SOP* message transmission not sent due to an incoming receive message.

7.5. Peripherals
enumerator TCPC_ALERT_TRANSMIT_MSG_SUCCESS
    Reset or SOP* message transmission successful.

evaluator TCPC_ALERT_VBUS_ALARM_HI
    A high-voltage alarm has occurred.

evaluator TCPC_ALERT_VBUS_ALARM_LO
    A low-voltage alarm has occurred.

evaluator TCPC_ALERT_FAULT_STATUS
    A fault has occurred.
    Read the FAULT_STATUS register

evaluator TCPC_ALERT_RX_BUFFER_OVERFLOW
    TCPC RX buffer has overflowed.

evaluator TCPC_ALERT_VBUS_SNK_DISCONNECT
    The TCPC in Attached.SNK state has detected a sink disconnect.

evaluator TCPC_ALERT_BEGINNING_MSG_STATUS
    Receive buffer register changed.

evaluator TCPC_ALERT_EXTENDED_STATUS
    Extended status changed.

evaluator TCPC_ALERT_EXTENDED
    An extended interrupt event has occurred.
    Read the alert_extended register

evaluator TCPC_ALERT_VENDOR_DEFINED
    A vendor defined alert has been detected.

enum tcpc_status_reg
    TCPC Status register.
    Values:

    evaluator TCPC_CC_STATUS
        The CC Status register.

    evaluator TCPC_POWER_STATUS
        The Power Status register.

    evaluator TCPC_FAULT_STATUS
        The Fault Status register.

    evaluator TCPC_EXTENDED_STATUS
        The Extended Status register.
enumerator TCPC_EXTENDED_ALERT_STATUS
   The Extended Alert Status register.

enumerator TCPC_VENDOR_DEFINED_STATUS
   The Vendor Defined Status register.

Functions

static inline int tcpc_is_cc_rp(enum tc_cc_voltage_state cc)
   Returns whether the sink has detected a Rp resistor on the other side.

static inline int tcpc_is_cc_open(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
   Returns true if both CC lines are completely open.

static inline int tcpc_is_cc_snk_dbg_acc(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
   Returns true if we detect the port partner is a snk debug accessory.

static inline int tcpc_is_cc_src_dbg_acc(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
   Returns true if we detect the port partner is a src debug accessory.

static inline int tcpc_is_cc_audio_acc(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
   Returns true if the port partner is an audio accessory.

static inline int tcpc_is_cc_at_least_one_rd(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
   Returns true if the port partner is presenting at least one Rd.

static inline int tcpc_is_cc_only_one_rd(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
   Returns true if the port partner is presenting Rd on only one CC line.

static inline int tcpc_init(const struct device *dev)
   Initializes the TCPC.

Parameters
   • dev – Runtime device structure

Return values
   • 0 – on success
   • -EIO – on failure
   • -EAGAIN – if initialization should be postponed

static inline int tcpc_get_cc(const struct device *dev, enum tc_cc_voltage_state *cc1, enum tc_cc_voltage_state *cc2)
   Reads the status of the CC lines.

Parameters
   • dev – Runtime device structure
   • cc1 – A pointer where the CC1 status is written
   • cc2 – A pointer where the CC2 status is written
Return values

• \(0\) – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_select_rp_value(const struct device *dev, enum tc_rp_value rp)

Sets the value of CC pull up resistor used when operating as a Source.

Parameters

• dev – Runtime device structure
• rp – Value of the Pull-Up Resistor.

Return values

• \(0\) – on success
• -ENOSYS –
• -EIO – on failure

static inline int tcpc_get_rp_value(const struct device *dev, enum tc_rp_value *rp)

Gets the value of the CC pull up resistor used when operating as a Source.

Parameters

• dev – Runtime device structure
• rp – pointer where the value of the Pull-Up Resistor is stored

Return values

• \(0\) – on success
• -ENOSYS –
• -EIO – on failure

static inline int tcpc_set_cc(const struct device *dev, enum tc_cc_pull pull)

Sets the CC pull resistor and sets the role as either Source or Sink.

Parameters

• dev – Runtime device structure
• pull – The pull resistor to set

Return values

• \(0\) – on success
• -EIO – on failure

static inline void tcpc_set_vconn_cb(const struct device *dev, tcpc_vconn_control_cb_t vconn_cb)

Sets a callback that can enable or disable VCONN if the TCPC is unable to or the system is configured in a way that does not use the VCONN control capabilities of the TCPC. The callback is called in the tcpc_set_vconn function if vconn_cb isn't NULL

Parameters

• dev – Runtime device structure
• vconn_cb – pointer to the callback function that controls vconn
static inline void \texttt{tcpc\_set\_vconn\_discharge\_cb}(const \texttt{struct device *dev,}
\texttt{tcpc\_vconn\_discharge\_cb\_t cb})

Sets a callback that can enable or discharge VCONN if the TCPC is unable to or the
system is configured in a way that does not use the VCONN control capabilities of the
TCPC.

The callback is called in the \texttt{tcpc\_vconn\_discharge} function if \texttt{cb} isn't NULL

**Parameters**
- \texttt{dev} – Runtime device structure
- \texttt{cb} – pointer to the callback function that discharges vconn

static inline int \texttt{tcpc\_vconn\_discharge}(const \texttt{struct device *dev, bool enable})

Discharges VCONN.

This function uses the TCPC to discharge VCONN if possible or calls the callback func-
tion set by \texttt{tcpc\_set\_vconn\_cb}

**Parameters**
- \texttt{dev} – Runtime device structure
- \texttt{enable} – VCONN discharge is enabled when true, it's disabled

**Return values**
- 0 – on success
- -EIO – on failure
- -ENOSYS – if not implemented

static inline int \texttt{tcpc\_set\_vconn}(const \texttt{struct device *dev, bool enable})

Enables or disables VCONN.

This function uses the TCPC to measure VCONN if possible or calls the callback function
set by \texttt{tcpc\_set\_vconn\_cb}

**Parameters**
- \texttt{dev} – Runtime device structure
- \texttt{enable} – VCONN is enabled when true, it's disabled

**Return values**
- 0 – on success
- -EIO – on failure
- -ENOSYS – if not implemented

static inline int \texttt{tcpc\_set\_roles}(const \texttt{struct device *dev, enum tc\_power\_role power\_role,}
\texttt{enum tc\_data\_role data\_role})

Sets the Power and Data Role of the PD message header.

This function only needs to be called once per data / power role change

**Parameters**
- \texttt{dev} – Runtime device structure
- \texttt{power\_role} – current power role
- \texttt{data\_role} – current data role

**Return values**
- 0 – on success
static inline int tcpc_get_rx_pending_msg(const struct device *dev, struct pd_msg *buf)
Retrieves the Power Delivery message from the TCPC.
If buf is NULL, then only the status is returned, where 0 means there is a message pending and -ENODATA means there is no pending message.

Parameters
• dev – Runtime device structure
• buf – pointer where the pd_buf pointer is written, NULL if only checking the status

Return values
• Greater or equal to 0 is the number of bytes received if buf parameter is provided
• 0 – if there is a message pending and buf parameter is NULL
• -EIO – on failure
• -ENODATA – if no message is pending

static inline int tcpc_set_rx_enable(const struct device *dev, bool enable)
Enables the reception of SOP* message types.

Parameters
• dev – Runtime device structure
• enable – Enable Power Delivery when true, else it's disabled

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_set_cc_polarity(const struct device *dev, enum tc_cc_polarity polarity)
Sets the polarity of the CC lines.

Parameters
• dev – Runtime device structure
• polarity – Polarity of the cc line

Return values
• 0 – on success
• -EIO – on failure

static inline int tcpc_transmit_data(const struct device *dev, struct pd_msg *msg)
Transmits a Power Delivery message.

Parameters
• dev – Runtime device structure
• msg – Power Delivery message to transmit

Return values
• 0 – on success
static inline int tcpc_dump_std_reg(const struct device *dev)

Dump a set of TCPC registers.

Parameters
• dev – Runtime device structure

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_set_alert_handler_cb(const struct device *dev, tcpc_alert_handler_cb_t handler, void *data)

Sets the alert function that’s called when an interrupt is triggered due to an alert bit. Calling this function enables the particular alert bit.

Parameters
• dev – Runtime device structure
• handler – The callback function called when the bit is set
• data – user data passed to the callback

Return values
• 0 – on success
• -EINVAL – on failure

static inline int tcpc_get_status_register(const struct device *dev, enum tcpc_status_reg reg, int32_t *status)

Gets a status register.

Parameters
• dev – Runtime device structure
• reg – The status register to read
• status – Pointer where the status is stored

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_clear_status_register(const struct device *dev, enum tcpc_status_reg reg, uint32_t mask)

Clears a TCPC status register.

Parameters
• dev – Runtime device structure
• reg – The status register to read
• mask – A bit mask of the status register to clear. A status bit is cleared when it’s set to 1.

Return values
static inline int tcpc_mask_status_register(const struct device *dev, enum tcpc_status_reg reg, uint32_t mask)

Sets the mask of a TCPC status register.

**Parameters**
- `dev` – Runtime device structure
- `reg` – The status register to read
- `mask` – A bit mask of the status register to mask. The status bit is masked if it's 0, else it's unmasked.

**Return values**
- 0 – on success
- -EIO – on failure
- -ENOSYS – if not implemented

static inline int tcpc_set_debug_accessory(const struct device *dev, bool enable)

Manual control of TCPC DebugAccessory control.

**Parameters**
- `dev` – Runtime device structure
- `enable` – Enable Debug Accessory when true, else it's disabled

**Return values**
- 0 – on success
- -EIO – on failure
- -ENOSYS – if not implemented

static inline int tcpc_set_debug_detach(const struct device *dev)

Detach from a debug connection.

**Parameters**
- `dev` – Runtime device structure

**Return values**
- 0 – on success
- -EIO – on failure
- -ENOSYS – if not implemented

static inline int tcpc_set_drp_toggle(const struct device *dev, bool enable)

Enable TCPC auto dual role toggle.

**Parameters**
- `dev` – Runtime device structure
- `enable` – Auto dual role toggle is active when true, else it's disabled

**Return values**
- 0 – on success
- -EIO – on failure
static inline int tcpc_get_snk_ctrl(const struct device *dev)
Queries the current sinking state of the TCPC.

Parameters
- dev – Runtime device structure

Return values
- true – if sinking power
- false – if not sinking power
- -ENOSYS – if not implemented

static inline int tcpc_get_src_ctrl(const struct device *dev)
Queries the current sourcing state of the TCPC.

Parameters
- dev – Runtime device structure

Return values
- true – if sourcing power
- false – if not sourcing power
- -ENOSYS – if not implemented

static inline int tcpc_set_bist_test_mode(const struct device *dev, bool enable)
Controls the BIST Mode of the TCPC.
It disables RX alerts while the mode is active.

Parameters
- dev – Runtime device structure
- enable – The TCPC enters BIST TEST Mode when true

Return values
- 0 – on success
- -EIO – on failure
- -ENOSYS – if not implemented

static inline int tcpc_get_chip_info(const struct device *dev, struct tcpc_chip_info *chip_info)
Gets the TCPC firmware version.

Parameters
- dev – Runtime device structure
- chip_info – Pointer to TCPC chip info where the version is stored

Return values
- 0 – on success
- -EIO – on failure
- -ENOSYS – if not implemented
static inline int `tcpc_set_low_power_mode` (const struct `device` *dev, bool enable)
Instructs the TCPC to enter or exit low power mode.

**Parameters**
- `dev` – Runtime device structure
- `enable` – The TCPC enters low power mode when true, else it exits it

**Return values**
- 0 – on success
- -EIO – on failure
- -ENOSYS – if not implemented

static inline int `tcpc_sop_prime_enable` (const struct `device` *dev, bool enable)
Enables the reception of SOP Prime messages.

**Parameters**
- `dev` – Runtime device structure
- `enable` – Can receive SOP Prime messages when true, else it can not

**Return values**
- 0 – on success
- -EIO – on failure
- -ENOSYS – if not implemented

```c
struct tcpc_chip_info
#include <usbc_tcpc.h> TCPC Chip Information.
```

**Public Members**

```c
uint16_t vendor_id
Vendor Id.

uint16_t product_id
Product Id.

uint16_t device_id
Device Id.

uint64_t fw_version_number
Firmware version number.

uint8_t min_req_fw_version_string[8]
Minimum Required firmware version string.

uint64_t min_req_fw_version_number
Minimum Required firmware version number.
```

```c

**USB PD 3.1 Rev 1.6, Table 6-70 Counter Parameters**

**PD_N_CAPS_COUNT**

The CapsCounter is used to count the number of Source Capabilities Messages which have been sent by a Source at power up or after a Hard Reset.

Parameter Name: nCapsCounter

**PD_N_HARD_RESET_COUNT**

The HardResetCounter is used to retry the Hard Reset whenever there is no response from the remote device (see Section 6.6.6) Parameter Name: nHardResetCounter.

**USB PD 3.1 Rev 1.6, Table 6-68 Time Values**

**PD_T_NO_RESPONSE_MIN_MS**

The NoResponseTimer is used by the Policy Engine in a Source to determine that its Port Partner is not responding after a Hard Reset.

Parameter Name: tNoResponseTimer

**PD_T_NO_RESPONSE_MAX_MS**

The NoResponseTimer is used by the Policy Engine in a Source to determine that its Port Partner is not responding after a Hard Reset.

Parameter Name: tNoResponseTimer

**PD_T_PS_HARD_RESET_MIN_MS**

Min time the Source waits to ensure that the Sink has had sufficient time to process Hard Reset Signaling before turning off its power supply to VBUS Parameter Name: tPSHardReset.

**PD_T_PS_HARD_RESET_MAX_MS**

Max time the Source waits to ensure that the Sink has had sufficient time to process Hard Reset Signaling before turning off its power supply to VBUS Parameter Name: tPSHardReset.

**PD_T_SINK_TX_MIN_MS**

Minimum time a Source waits after changing Rp from SinkTxOk to SinkTxNG before initiating an AMS by sending a Message.

Parameter Name: tSinkTx

**PD_T_SINK_TX_MAX_MS**

Maximum time a Source waits after changing Rp from SinkTxOk to SinkTxNG before initiating an AMS by sending a Message.

Parameter Name: tSinkTx

7.5. Peripherals
**PD_T_TYPEC_SEND_SOURCE_CAP_MIN_MS**

Minimum time a source shall wait before sending a Source_Capabilities message while the following is true: 1) The Port is Attached.

2) The Source is not in an active connection with a PD Sink Port. Parameter Name: tTypeCSendSourceCap

**PD_T_TYPEC_SEND_SOURCE_CAP_MAX_MS**

Maximum time a source shall wait before sending a Source_Capabilities message while the following is true: 1) The Port is Attached.

2) The Source is not in an active connection with a PD Sink Port. Parameter Name: tTypeCSendSourceCap

**Defines**

**PD_MAX_EXTENDED_MSG_LEGACY_LEN**

Maximum length of a non-Extended Message in bytes.

See Table 6-75 Value Parameters Parameter Name: MaxExtendedMsgLegacyLen

**PD_MAX_EXTENDED_MSG_LEN**

Maximum length of an Extended Message in bytes.

See Table 6-75 Value Parameters Parameter Name: MaxExtendedMsgLen

**PD_MAX_EXTENDED_MSG_CHUNK_LEN**

Maximum length of a Chunked Message in bytes.

When one of both Port Partners do not support Extended Messages of Data Size greater than PD_MAX_EXTENDED_MSG_LEGACY_LEN then the Protocol Layer supports a Chunking mechanism to break larger Messages into smaller Chunks of size PD_MAX_EXTENDED_MSG_CHUNK_LEN. See Table 6-75 Value Parameters Parameter Name: MaxExtendedMsgChunkLen

**PD_T_TYPEC_SINK_WAIT_CAP_MIN_MS**

Minimum time a sink shall wait for a Source_Capabilities message before sending a Hard Reset See Table 6-61 Time Values Parameter Name: tTypeCSinkWaitCap.

**PD_T_TYPEC_SINK_WAIT_CAP_MAX_MS**

Minimum time a sink shall wait for a Source_Capabilities message before sending a Hard Reset See Table 6-61 Time Values Parameter Name: tTypeCSinkWaitCap.

**PD_V_SAFE_0V_MAX_MV**

VBUS maximum safe operating voltage at “zero volts”.

See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: vSafe0V

**PD_V_SAFE_5V_MIN_MV**

VBUS minimum safe operating voltage at 5V.

See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: vSafe5V
**PD_T_SAFE_0V_MAX_MS**
Time to reach PD_V_SAFE_0V_MV max in milliseconds.
See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: tSafe0V

**PD_T_SAFE_5V_MAX_MS**
Time to reach PD_V_SAFE_5V_MV max in milliseconds.
See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: tSafe5V

**PD_T_TX_TIMEOUT_MS**
Time to wait for TCPC to complete transmit.

**PD_T_HARD_RESET_COMPLETE_MIN_MS**
Minimum time a Hard Reset must complete.
See Table 6-68 Time Values

**PD_T_HARD_RESET_COMPLETE_MAX_MS**
Maximum time a Hard Reset must complete.
See Table 6-68 Time Values

**PD_T_SENDER_RESPONSE_MIN_MS**
Minimum time a response must be sent from a Port Partner See Table 6-68 Time Values.

**PD_T_SENDER_RESPONSE_NOM_MS**
Nominal time a response must be sent from a Port Partner See Table 6-68 Time Values.

**PD_T_SENDER_RESPONSE_MAX_MS**
Maximum time a response must be sent from a Port Partner See Table 6-68 Time Values.

**PD_T_SPR_PS_TRANSITION_MIN_MS**
Minimum SPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

**PD_T_SPR_PS_TRANSITION_NOM_MS**
Nominal SPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

**PD_T_SPR_PS_TRANSITION_MAX_MS**
Maximum SPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

**PD_T_EPR_PS_TRANSITION_MIN_MS**
Minimum EPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

**PD_T_EPR_PS_TRANSITION_NOM_MS**
Nominal EPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.
**PD_T_EPR_PS_TRANSITION_MAX_MS**

Maximum EPR Mode time for a power supply to transition to a new level. See Table 6-68 Time Values.

**PD_T_SINK_REQUEST_MIN_MS**

Minimum time to wait before sending another request after receiving a Wait message. See Table 6-68 Time Values.

**PD_T_CHUNKING_NOT_SUPPORTED_MIN_MS**

Minimum time to wait before sending a Not_Supported message after receiving a Chunked message. See Table 6-68 Time Values.

**PD_T_CHUNKING_NOT_SUPPORTED_NOM_MS**

Nominal time to wait before sending a Not_Supported message after receiving a Chunked message. See Table 6-68 Time Values.

**PD_T_CHUNKING_NOT_SUPPORTED_MAX_MS**

Maximum time to wait before sending a Not_Supported message after receiving a Chunked message. See Table 6-68 Time Values.

**PD_CONVERT_BYTES_TO_PD_HEADER_COUNT**

Convert bytes to PD Header data object count, where a data object is 4-bytes.

**Parameters**

- \(c\) – number of bytes to convert

**PD_CONVERT_PD_HEADER_COUNT_TO_BYTES**

Convert PD Header data object count to bytes.

**Parameters**

- \(c\) – number of PD Header data objects

**SINK_TX_OK**

Collision avoidance Rp values in REV 3.0 Sink Transmit “OK”.

**SINK_TX_NG**

Collision avoidance Rp values in REV 3.0 Sink Transmit “NO GO”.

**PD_GET_EXT_HEADER**

Used to get extended header from the first 32-bit word of the message.

**Parameters**

- \(c\) – first 32-bit word of the message

**PDO_MAX_DATA_OBJECTS**

PDO - Power Data Object, RDO - Request Data Object.

Maximum number of 32-bit data objects sent in a single request.

**PD_CONVERT_MA_TO_FIXED_PDO_CURRENT**

Convert milliamps to Fixed PDO Current in 10mA units.

**Parameters**

- \(c\) – Current in milliamps
**PD_CONVERT_MV_TO_FIXED_PDO_VOLTAGE(v)**

Convert millivolts to Fixed PDO Voltage in 50mV units.

**Parameters**

- **v** – Voltage in millivolts

**PD_CONVERT_FIXED_PDO_CURRENT_TO_MA(c)**

Convert a Fixed PDO Current from 10mA units to milliamps.

**Parameters**

- **c** – Fixed PDO current in 10mA units.

**PD_CONVERT_FIXED_PDO_VOLTAGE_TO_MV(v)**

Convert a Fixed PDO Voltage from 50mV units to millivolts.

Used for converting `pd_fixed_supply_pdo_source.voltage` and `pd_fixed_supply_pdo_sink.voltage`

**Parameters**

- **v** – Fixed PDO voltage in 50mV units.

**PD_CONVERT_MA_TO_VARIABLE_PDO_CURRENT(c)**

Convert milliamps to Variable PDO Current in 10ma units.

**Parameters**

- **c** – Current in milliamps

**PD_CONVERT_MV_TO_VARIABLE_PDO_VOLTAGE(v)**

Convert millivolts to Variable PDO Voltage in 50mV units.

**Parameters**

- **v** – Voltage in millivolts

**PD_CONVERT_VARIABLE_PDO_CURRENT_TO_MA(c)**

Convert a Variable PDO Current from 10mA units to milliamps.

**Parameters**

- **c** – Variable PDO current in 10mA units.

**PD_CONVERT_VARIABLE_PDO_VOLTAGE_TO_MV(v)**

Convert a Variable PDO Voltage from 50mV units to millivolts.

**Parameters**

- **v** – Variable PDO voltage in 50mV units.

**PD_CONVERT_MW_TO_BATTERY_PDO_POWER(c)**

Convert milliwatts to Battery PDO Power in 250mW units.

**Parameters**

- **c** – Power in milliwatts

**PD_CONVERT_MV_TO_BATTERY_PDO_VOLTAGE(v)**

Convert milliwatts to Battery PDO Voltage in 50mV units.

**Parameters**

- **v** – Voltage in millivolts
PD_CONVERT_BATTERY_PDO_POWER_TO_MW(c)
Convert a Battery PDO Power from 250mW units to milliwatts.

Parameters
- c – Power in 250mW units.

PD_CONVERT_BATTERY_PDO_VOLTAGE_TO_MV(v)
Convert a Battery PDO Voltage from 50mV units to millivolts.

Parameters
- v – Voltage in 50mV units.

PD_CONVERT_MA_TO_AUGMENTED_PDO_CURRENT(c)
Convert milliamps to Augmented PDO Current in 50mA units.

Parameters
- c – Current in milliamps

PD_CONVERT_MV_TO_AUGMENTED_PDO_VOLTAGE(v)
Convert millivolts to Augmented PDO Voltage in 100mV units.

Parameters
- v – Voltage in millivolts

PD_CONVERT_AUGMENTED_PDO_CURRENT_TO_MA(c)
Convert an Augmented PDO Current from 50mA units to milliamps.

Parameters
- c – Augmented PDO current in 50mA units.

PD_CONVERT_AUGMENTED_PDO_VOLTAGE_TO_MV(v)
Convert an Augmented PDO Voltage from 100mV units to millivolts.

Parameters
- v – Augmented PDO voltage in 100mV units.

NUM_SOP_STAR_TYPES
Number of valid Transmit Types.

 Enums

enum pdo_type
Power Data Object Type Table 6-7 Power Data Object.

Values:

enumerator PDO_FIXED = 0
Fixed supply (Vmin = Vmax)

denumerator PDO_BATTERY = 1
Battery.

denumerator PDO_VARIABLE = 2
Variable Supply (non-Battery)
enumerator PDO_AUGMENTED = 3
    Augmented Power Data Object (APDO)

enum pd_frs_type
    Fast Role Swap Required for USB Type-C current.
    Values:
    enumerator FRS_NOT_SUPPORTED
        Fast Swap not supported.
    enumerator FRS_DEFAULT_USB_POWER
        Default USB Power.
    enumerator FRS_1P5A_5V
        1.5A @ 5V
    enumerator FRS_3P0A_5V
        3.0A @ 5V

enum pd_rev_type
    Protocol revision.
    Values:
    enumerator PD_REV10 = 0
        PD revision 1.0.
    enumerator PD_REV20 = 1
        PD revision 2.0.
    enumerator PD_REV30 = 2
        PD revision 3.0.

enum pd_packet_type
    Power Delivery packet type See USB Type-C Port Controller Interface Specification, Revision 2.0, Version 1.2, Table 4-38 TRANSMIT Register Definition.
    Values:
    enumerator PD_PACKET_SOP = 0
        Port Partner message.
    enumerator PD_PACKET_SOP_PRIME = 1
        Cable Plug message.
    enumerator PD_PACKET_PRIME_PRIME = 2
        Cable Plug message far end.
    enumerator PD_PACKET_DEBUG_PRIME = 3
        Currently undefined in the PD specification.
enumerator PD_PACKET_DEBUG_PRIME_PRIME = 4
   Currently undefined in the PD specification.

enumerator PD_PACKET_TX_HARD_RESET = 5
   Hard Reset message to the Port Partner.

enumerator PD_PACKET_CABLE_RESET = 6
   Cable Reset message to the Cable.

enumerator PD_PACKET_TX_BIST_MODE_2 = 7
   BIST_MODE_2 message to the Port Partner.

enumerator PD_PACKET_MSG_INVALID = 0xf
   USED ONLY FOR RECEPTION OF UNKNOWN MSG TYPES.

enum pd_ctrl_msg_type
   Control Message type See Table 6-5 Control Message Types.
   Values:

   enumerator PD_CTRL_GOOD_CRC = 1
      0 Reserved
      GoodCRC Message

   enumerator PD_CTRL_GOTO_MIN = 2
      GotoMin Message.

   enumerator PD_CTRL_ACCEPT = 3
      Accept Message.

   enumerator PD_CTRL_REJECT = 4
      Reject Message.

   enumerator PD_CTRL_PING = 5
      Ping Message.

   enumerator PD_CTRL_PS_RDY = 6
      PS_RDY Message.

   enumerator PD_CTRL_GET_SOURCE_CAP = 7
      Get_Source_Cap Message.

   enumerator PD_CTRL_GET_SINK_CAP = 8
      Get_Sink_Cap Message.

   enumerator PD_CTRL_DR_SWAP = 9
      DR_Swap Message.
enum PD_CTRL_PR_SWAP = 10
    PR_Swap Message.

enumerator PD_CTRL_VCONN_SWAP = 11
    VCONN_Swap Message.

enumerator PD_CTRL_WAIT = 12
    Wait Message.

enumerator PD_CTRL_SOFT_RESET = 13
    Soft Reset Message.

enumerator PD_CTRL_DATA_RESET = 14
    Used for REV 3.0.
    Data_Reset Message

enumerator PD_CTRL_DATA_RESET_COMPLETE = 15
    Data_Reset_Complete Message.

enumerator PD_CTRL_NOT_SUPPORTED = 16
    Not_Supported Message.

enumerator PDCTRL_GET_SOURCE_CAP_EXT = 17
    Get_Source_Cap_Extended Message.

enumerator PD_CTRL_GET_STATUS = 18
    Get_Status Message.

enumerator PD_CTRL_FR_SWAP = 19
    FR_Swap Message.

enumerator PD_CTRL_GET_PPS_STATUS = 20
    Get_PPS_Status Message.

enumerator PD_CTRL_GET_COUNTRY_CODES = 21
    Get_Country_Codes Message.

enumerator PD_CTRL_GET_SINK_CAP_EXT = 22
    Get_Sink_Cap_Extended Message.

enum pd_data_msg_type
    Data message type See Table 6-6 Data Message Types.

    Values:

    enumerator PD_DATA_SOURCE_CAP = 1
        0 Reserved
        Source_Capabilities Message

7.5. Peripherals
enumerator PD_DATA_REQUEST = 2
  Request Message.

enumerator PD_DATA_BIST = 3
  BIST Message.

enumerator PD_DATA_SINK_CAP = 4
  Sink Capabilities Message.

enumerator PD_DATA_BATTERY_STATUS = 5
  5-14 Reserved for REV 2.0

enumerator PD_DATA_ALERT = 6
  Alert Message.

enumerator PD_DATA_GET_COUNTRY_INFO = 7
  Get Country Info Message.

enumerator PD_DATA_ENTER_USB = 8
  8-14 Reserved for REV 3.0
  Enter USB message

enumerator PD_DATA_VENDOR_DEF = 15
  Vendor Defined Message.

enum pd_ext_msg_type
  Extended message type for REV 3.0 See Table 6-48 Extended Message Types.
  
  Values:

enumerator PD_EXT_SOURCE_CAP = 1
  0 Reserved
  Source_Capabilities_Extended Message

enumerator PD_EXT_STATUS = 2
  Status Message.

enumerator PD_EXT_GET_BATTERY_CAP = 3
  Get_Battery_Cap Message.

enumerator PD_EXT_GET_BATTERY_STATUS = 4
  Get_Battery_Status Message.

enumerator PD_EXT_BATTERY_CAP = 5
  Battery_Capabilities Message.

enumerator PD_EXT_GET_MANUFACTURER_INFO = 6
  Get_Manufacturer_Info Message.
enumerator PD_EXT_MANUFACTURER_INFO = 7
    Manufacturer_Info Message.

denumerator PD_EXT_SECURITY_REQUEST = 8
    Security_Request Message.

denumerator PD_EXT_SECURITY_RESPONSE = 9
    Security_Response Message.

denumerator PD_EXT_FIRMWARE_UPDATE_REQUEST = 10
    Firmware_Update_Request Message.

denumerator PD_EXT_FIRMWARE_UPDATE_RESPONSE = 11
    Firmware_Update_Response Message.

denumerator PD_EXT_PPS_STATUS = 12
    PPS_Status Message.

denumerator PD_EXT_COUNTRY_INFO = 13
    Country_Codes Message.

denumerator PD_EXT_COUNTRY_CODES = 14
    Country_Info Message.

enum usbpd_cc_pin
    Active PD CC pin.
    Values:

    enumerator USBPD_CC_PIN_1 = 0
        PD is active on CC1.

    enumerator USBPD_CC_PIN_2 = 1
        PD is active on CC2.

union pd_header
    #include <usbc_pd.h> Build a PD message header See Table 6-1 Message Header.

    Public Members

    uint16_t message_type
        Type of message.

    uint16_t port_data_role
        Port Data role.

    uint16_t specification_revision
        Specification Revision.
uint16_t port_power_role
    Port Power Role.

uint16_t message_id
    Message ID.

uint16_t number_of_data_objects
    Number of Data Objects.

uint16_t extended
    Extended Message.

struct pd_header.[anonymous] [anonymous]

uint16_t raw_value

union pd_ext_header
    #include <usbc_pd.h> Build an extended message header See Table 6-3 Extended Message Header.

Public Members

uint16_t data_size
    Number of total bytes in data block.

uint16_t reserved0
    Reserved.

uint16_t request_chunk
    1 for a chunked message, else 0

uint16_t chunk_number
    Chunk number when chkd = 1, else 0.

uint16_t chunked
    1 for chunked messages

struct pd_ext_header.[anonymous] [anonymous]

uint16_t raw_value
    Raw PD Ext Header value.

union pd_fixed_supply_pdo_source
    #include <usbc_pd.h> Create a Fixed Supply PDO Source value See Table 6-9 Fixed Supply PDO - Source.
Public Members

uint32_t max_current
Maximum Current in 10mA units.

uint32_t voltage
Voltage in 50mV units.

uint32_t peak_current
Peak Current.

uint32_t reserved0
Reserved – Shall be set to zero.

uint32_t unchunked_ext_msg_supported
Unchunked Extended Messages Supported.

uint32_t dual_role_data
Dual-Role Data.

uint32_t usb_comms_capable
USB Communications Capable.

uint32_t unconstrained_power
Unconstrained Power.

uint32_t usb_suspend_supported
USB Suspend Supported.

uint32_t dual_role_power
Dual-Role Power.

enum pdo_type type
Fixed supply.
SET TO PDO_FIXED

struct pd_fixed_supply_pdo_source

uint32_t raw_value
Raw PDO value.

union pd_fixed_supply_pdo_sink
#include <usbc_pd.h> Create a Fixed Supply PDO Sink value See Table 6-14 Fixed Supply PDO - Sink.

Public Members

7.5. Peripherals
uint32_t operational_current
   Operational Current in 10mA units.

uint32_t voltage
   Voltage in 50mV units.

uint32_t reserved0
   Reserved – Shall be set to zero.

enum pd_frs_type frs_required
   Fast Role Swap required USB Type-C Current.

uint32_t dual_role_data
   Dual-Role Data.

uint32_t usb_comms_capable
   USB Communications Capable.

uint32_t unconstrained_power
   Unconstrained Power.

uint32_t higher_capability
   Higher Capability.

uint32_t dual_role_power
   Dual-Role Power.

enum pdo_type type
   Fixed supply.
   SET TO PDO_FIXED

struct pd_fixed_supply_pdo_sink.

uint32_t raw_value
   Raw PDO value.

union pd_variable_supply_pdo_source
   #include <usbc_pd.h> Create a Variable Supply PDO Source value See Table 6-11 Variable Supply (non-Battery) PDO - Source.

**Public Members**

uint32_t max_current
   Maximum Current in 10mA units.

uint32_t min_voltage
   Minimum Voltage in 50mV units.
uint32_t max_voltage
   Maximum Voltage in 50mV units.

denum pdo_type type
   Variable supply.
   SET TO PDO_VARIABLE

struct pd_variable_supplypdo_source [anonymous] [anonymous]

uint32_t raw_value
   Raw PDO value.

union pd_variable_supplypdo_sink
   #include <usbc_pd.h> Create a Variable Supply PDO Sink value See Table 6-15 Variable
   Supply (non-Battery) PDO - Sink.

**Public Members**

uint32_t operational_current
   operational Current in 10mA units

uint32_t min_voltage
   Minimum Voltage in 50mV units.

uint32_t max_voltage
   Maximum Voltage in 50mV units.

denum pdo_type type
   Variable supply.
   SET TO PDO_VARIABLE

struct pd_variable_supplypdo_sink [anonymous] [anonymous]

uint32_t raw_value
   Raw PDO value.

union pd_battery_supplypdo_source
   #include <usbc_pd.h> Create a Battery Supply PDO Source value See Table 6-12 Battery
   Supply PDO - Source.

**Public Members**

uint32_t max_power
   Maximum Allowable Power in 250mW units.

7.5. Peripherals

3261
\textbf{uint32_t} \texttt{min\_voltage}  
Minimum Voltage in 50mV units.

\textbf{uint32_t} \texttt{max\_voltage}  
Maximum Voltage in 50mV units.

\textbf{enum pdo_type} \texttt{type}  
Battery supply.

\texttt{SET\ TO\ PDO\_BATTERY}

\textbf{struct pd\_battery\_supply\_pdo\_source} \texttt{[anonymous]} \texttt{[anonymous]}

\textbf{uint32_t} \texttt{raw\_value}  
Raw PDO value.

\textbf{union pd\_battery\_supply\_pdo\_sink}  
\texttt{#include <usbc\_pd.h>} Create a Battery Supply PDO Sink value See Table 6-16 Battery Supply PDO - Sink.

\textbf{Public Members}

\textbf{uint32_t} \texttt{operational\_power}  
Operational Power in 250mW units.

\textbf{uint32_t} \texttt{min\_voltage}  
Minimum Voltage in 50mV units.

\textbf{uint32_t} \texttt{max\_voltage}  
Maximum Voltage in 50mV units.

\textbf{enum pdo_type} \texttt{type}  
Battery supply.

\texttt{SET\ TO\ PDO\_BATTERY}

\textbf{struct pd\_battery\_supply\_pdo\_sink} \texttt{[anonymous]} \texttt{[anonymous]}

\textbf{uint32_t} \texttt{raw\_value}  
Raw PDO value.

   Reserved – Shall be set to zero.

uint32_t reserved3
   00b – Programmable Power Supply 01b…11b - Reserved, Shall Not be used Setting as reserved because it defaults to 0 when not set.

enum pdo_type type
   Augmented Power Data Object (APDO).
   SET TO PDO_AUGMENTED

struct pd_augmented_supplypdo_sink.[anonymous].[anonymous]

uint32_t raw_value
   Raw PDO value.

union pd_rdo
   #include <usbc_pd.h> The Request Data Object (RDO) Shall be returned by the Sink making a request for power.
   See Section 6.4.2 Request Message

Public Members

uint32_t min_or_max_operating_current
   Operating Current 10mA units NOTE: If Give Back Flag is zero, this field is the Maximum Operating Current.
   If Give Back Flag is one, this field is the Minimum Operating Current.

uint32_t operating_current
   Operating current in 10mA units.
   Operating Current 50mA units.

uint32_t reserved0
   Reserved - Shall be set to zero.

uint32_t unchunked_ext_msg_supported
   Unchunked Extended Messages Supported.

uint32_t no_usb_suspend
   No USB Suspend.
uint32_t **usb_comm_capable**
   USB Communications Capable.

uint32_t **cap_mismatch**
   Capability Mismatch.

uint32_t **giveback**
   Give Back Flag.

uint32_t **object_pos**
   Object Position (000b is Reserved and Shall Not be used)

uint32_t **reserved1**
   Reserved - Shall be set to zero.

struct **pd_rdo**.[anonymous] **fixed**
   Create a Fixed RDO value See Table 6-19 Fixed and Variable Request Data Object.

struct **pd_rdo**.[anonymous] **variable**
   Create a Variable RDO value See Table 6-19 Fixed and Variable Request Data Object.

uint32_t **min_operating_power**
   Minimum Operating Power in 250mW units.

uint32_t **operating_power**
   Operating power in 250mW units.

struct **pd_rdo**.[anonymous] **battery**
   Create a Battery RDO value See Table 6-20 Battery Request Data Object.

uint32_t **output_voltage**
   Output Voltage in 20mV units.

uint32_t **reserved2**
   Reserved - Shall be set to zero.

uint32_t **reserved3**
   Reserved - Shall be set to zero.

struct **pd_rdo**.[anonymous] **augmented**
   Create an Augmented RDO value See Table 6-22 Programmable Request Data Object.

uint32_t **raw_value**
   Raw RDO value.

struct **pd_msg**
   
   #include <usbc_pd.h> Power Delivery message.

**7.5. Peripherals**
Public Members

enum pd_packet_type type
Type of this packet.

union pd_header header
Header of this message.

uint32_t len
Length of bytes in data.

uint8_t data[260]
Message data.

7.5.48 Time-aware General-Purpose Input/Output (TGPIO)

Overview

Configuration Options

Related configuration options:

• CONFIG_TIMEAWARE_GPIO

API Reference

Related code samples
Time-aware GPIO
   Synchronize clocks.

group tgpio_interface
   Time-aware GPIO Interface.

Enums

enum tgpio_pin_polarity
   Event polarity.
   Values:

enumerator TGPIO_RISING_EDGE = 0
enumerator TGPIO_FALLING_EDGE
enumerator TGPIO_TOGGLE_EDGE
Functions

int tgpio_port_get_time(const struct device *dev, uint64_t *current_time)
Get time from ART timer.

Parameters
• dev – TGPIO device
• current_time – Pointer to store timer value in cycles

Returns
0 if successful
negative errno code on failure.

int tgpio_port_get_cycles_per_second(const struct device *dev, uint32_t *cycles)
Get current running rate.

Parameters
• dev – TGPIO device
• cycles – pointer to store current running requency

Returns
0 if successful, negative errno code on failure.

int tgpio_pin_disable(const struct device *dev, uint32_t pin)
Disable operation on pin.

Parameters
• dev – TGPIO device
• pin – TGPIO pin

Returns
0 if successful, negative errno code on failure.

int tgpio_pin_config_ext_timestamp(const struct device *dev, uint32_t pin, uint32_t event_polarity)
Enable/Continue operation on pin.

Parameters
• dev – TGPIO device
• pin – TGPIO pin
• event_polarity – TGPIO pin event polarity

Returns
0 if successful, negative errno code on failure.

int tgpio_pin_periodic_output(const struct device *dev, uint32_t pin, uint64_t start_time,
uint64_t repeat_interval, bool periodic_enable)
Enable periodic pulse generation on a pin.

Parameters
• dev – TGPIO device
• pin – TGPIO pin
• start_time – start_time of first pulse in hw cycles
• repeat_interval – repeat interval between two pulses in hw cycles
• periodic_enable – enables periodic mode if ‘true’ is passed.
int tgpio_pin_read_ts_ec(const struct device *dev, uint32_t pin, uint64_t *timestamp, uint64_t *event_count)

Read timestamp and event counter from TGPIO.

Parameters

• dev – TGPIO device
• pin – TGPIO pin
• timestamp – timestamp of the last pulse received
• event_count – number of pulses received since the pin is enabled

Returns

0 if successful, negative errno code on failure.

7.5.49  Video

The video driver API offers a generic interface to video devices.

Basic Operation

Video Device  A video device is the abstraction of a hardware or software video function, which can produce, process, consume or transform video data. The video API is designed to offer flexible way to create, handle and combine various video devices.

Endpoint  Each video device can have one or more endpoints. Output endpoints configure video output function and generate data. Input endpoints configure video input function and consume data.

Video Buffer  A video buffer provides the transport mechanism for the data. There is no particular requirement on the content. The requirement for the content is defined by the endpoint format. A video buffer can be queued to a device endpoint for filling (input ep) or consuming (output ep) operation, once the operation is achieved, buffer can be dequeued for post-processing, release or reuse.

Controls  A video control is accessed and identified by a CID (control identifier). It represents a video control property. Different devices will have different controls available which can be generic, related to a device class or vendor specific. The set/get control functions provide a generic scalable interface to handle and create controls.

Configuration Options

Related configuration options:

• CONFIG_VIDEO
API Reference

Related code samples

Video TCP server sink
Capture video frames and send them over the network to a TCP client.

Video capture
Use the video API to retrieve video frames from a capture device.

Video Interface.

Defines

video_fourcc(a, b, c, d)

Typedefs

typedef int (*video_api_set_format_t)(const struct device *dev, enum video_endpoint_id ep, struct video_format *fmt)
    Set video format.
    See video_set_format() for argument descriptions.

typedef int (*video_api_get_format_t)(const struct device *dev, enum video_endpoint_id ep, struct video_format *fmt)
    Get current video format.
    See video_get_format() for argument descriptions.

typedef int (*video_api_enqueue_t)(const struct device *dev, enum video_endpoint_id ep, struct video_buffer *buf)
    Enqueue a buffer in the driver's incoming queue.
    See video_enqueue() for argument descriptions.

typedef int (*video_api_dequeue_t)(const struct device *dev, enum video_endpoint_id ep, struct video_buffer **buf, k_timeout_t timeout)
    Dequeue a buffer from the driver's outgoing queue.
    See video_dequeue() for argument descriptions.

typedef int (*video_api_flush_t)(const struct device *dev, enum video_endpoint_id ep, bool cancel)
    Flush endpoint buffers, buffer are moved from incoming queue to outgoing queue.
    See video_flush() for argument descriptions.

typedef int (*video_api_stream_start_t)(const struct device *dev)
    Start the capture or output process.
    See video_stream_start() for argument descriptions.
typedef int (*video_api_stream_stop_t)(const struct device *dev)  
Stop the capture or output process.  
See video_stream_stop() for argument descriptions.

typedef int (*video_api_set_ctrl_t)(const struct device *dev, unsigned int cid, void *value)  
Set a video control value.  
See video_set_ctrl() for argument descriptions.

typedef int (*video_api_get_ctrl_t)(const struct device *dev, unsigned int cid, void *value)  
Get a video control value.  
See video_get_ctrl() for argument descriptions.

typedef int (*video_api_get_caps_t)(const struct device *dev, enum video_endpoint_id ep, struct video_caps *caps)  
Get capabilities of a video endpoint.  
See video_get_caps() for argument descriptions.

typedef int (*video_api_set_signal_t)(const struct device *dev, enum video_endpoint_id ep, struct k_poll_signal *signal)  
Register/Unregister poll signal for buffer events.  
See video_set_signal() for argument descriptions.

Enums

enum video_endpoint_id  
video_endpoint_id enum  
Identify the video device endpoint.  
Values:

enumerator VIDEO_EP_NONE
enumerator VIDEO_EP_ANY
enumerator VIDEO_EP_IN
enumerator VIDEO_EP_OUT

enum video_signal_result  
video_event enum  
Identify video event.  
Values:

enumerator VIDEO_BUF_DONE
Functions

static inline int video_set_format(const struct device *dev, enum video_endpoint_id ep, struct video_format *fmt)

Set video format.
Configure video device with a specific format.

Parameters

• dev – Pointer to the device structure for the driver instance.
• ep – Endpoint ID.
• fmt – Pointer to a video format struct.

Return values

• 0 – Is successful.
• -EINVAL – If parameters are invalid.
• -ENOTSUP – If format is not supported.
• -EIO – General input / output error.

static inline int video_get_format(const struct device *dev, enum video_endpoint_id ep, struct video_format *fmt)

Get video format.
Get video device current video format.

Parameters

• dev – Pointer to the device structure for the driver instance.
• ep – Endpoint ID.
• fmt – Pointer to video format struct.

Return values

• pointer – to video format

static inline int video_enqueue(const struct device *dev, enum video_endpoint_id ep, struct video_buffer *buf)

Enqueue a video buffer.
Enqueue an empty (capturing) or filled (output) video buffer in the driver’s endpoint incoming queue.

Parameters

• dev – Pointer to the device structure for the driver instance.
• ep – Endpoint ID.
• buf – Pointer to the video buffer.

Return values

• 0 – Is successful.
• -EINVAL – If parameters are invalid.
Dequeue a video buffer.
Dequeue a filled (capturing) or displayed (output) buffer from the driver’s endpoint outgoing queue.

Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `ep` – Endpoint ID.
- `buf` – Pointer a video buffer pointer.
- `timeout` – Timeout

Return values
- 0 – Is successful.
- EINVAL – If parameters are invalid.
- EIO – General input / output error.

Flush endpoint buffers.
A call to flush finishes when all endpoint buffers have been moved from incoming queue to outgoing queue. Either because canceled or fully processed through the video function.

Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `ep` – Endpoint ID.
- `cancel` – If true, cancel buffer processing instead of waiting for completion.

Return values
- 0 – Is successful, -ERRNO code otherwise.

Start the video device function.
video_stream_start is called to enter ‘streaming’ state (capture, output...). The driver may receive buffers with video_enqueue() before video_stream_start is called. If driver/device needs a minimum number of buffers before being able to start streaming, then driver set the min_vbuf_count to the related endpoint capabilities.

Return values
- 0 – Is successful.
- EIO – General input / output error.

Stop the video device function.
On video_stream_stop, driver must stop any transactions or wait until they finish.

Return values
- 0 – Is successful.
- EIO – General input / output error.
static inline int video_get_caps(const struct device *dev, enum video_endpoint_id ep, struct video_caps *caps)

Get the capabilities of a video endpoint.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **ep** – Endpoint ID.
- **caps** – Pointer to the `video_caps` struct to fill.

**Return values**

- 0 – Is successful, -ERRNO code otherwise.

static inline int video_set_ctrl(const struct device *dev, unsigned int cid, void *value)

Set the value of a control.

This set the value of a video control, value type depends on control ID, and must be interpreted accordingly.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **cid** – Control ID.
- **value** – Pointer to the control value.

**Return values**

- 0 – Is successful.
- -EINVAL – If parameters are invalid.
- -ENOTSUP – If format is not supported.
- -EIO – General input / output error.

static inline int video_get_ctrl(const struct device *dev, unsigned int cid, void *value)

Get the current value of a control.

This retrieve the value of a video control, value type depends on control ID, and must be interpreted accordingly.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **cid** – Control ID.
- **value** – Pointer to the control value.

**Return values**

- 0 – Is successful.
- -EINVAL – If parameters are invalid.
- -ENOTSUP – If format is not supported.
- -EIO – General input / output error.

static inline int video_set_signal(const struct device *dev, enum video_endpoint_id ep, struct k_poll_signal *signal)

Register/Unregister k_poll signal for a video endpoint.

Register a poll signal to the endpoint, which will be signaled on frame completion (done, aborted, error). Registering a NULL poll signal unregisters any previously registered signal.

**Parameters**
• dev – Pointer to the device structure for the driver instance.
• ep – Endpoint ID.
• signal – Pointer to k_poll_signal

Return values
0 – Is successful, -ERRNO code otherwise.

struct video_buffer *video_buffer_alloc(size_t size)
Allocate video buffer.

Parameters
• size – Size of the video buffer.

Return values
pointer – to allocated video buffer

void video_buffer_release(struct video_buffer *buf)
Release a video buffer.

Parameters
• buf – Pointer to the video buffer to release.

struct video_format
#include <video.h> Video format structure.
Used to configure frame format.

Public Members

uint32_t pixelformat
FourCC pixel format value (Video pixel formats)

uint32_t width
frame width in pixels.

uint32_t height
frame height in pixels.

uint32_t pitch
line stride.
This is the number of bytes that needs to be added to the address in the first pixel of a row in order to go to the address of the first pixel of the next row (>=width).

struct video_format_cap
#include <video.h> Video format capability.
Used to describe a video endpoint format capability.

Public Members

uint32_t pixelformat
FourCC pixel format value (Video pixel formats).
uint32_t width_min
    minimum supported frame width in pixels.

uint32_t width_max
    maximum supported frame width in pixels.

uint32_t height_min
    minimum supported frame height in pixels.

uint32_t height_max
    maximum supported frame height in pixels.

uint16_t width_step
    width step size in pixels.

uint16_t height_step
    height step size in pixels.

struct video_caps
#include <video.h> Video format capabilities.
Used to describe video endpoint capabilities.

    Public Members

    const struct video_format_cap *format_caps
        list of video format capabilities (zero terminated).

    uint8_t min_vbuf_count
        minimal count of video buffers to enqueue before being able to start the stream.

struct video_buffer
#include <video.h> Video buffer structure.
Represent a video frame.

    Public Members

    void *driver_data
        pointer to driver specific data.

    uint8_t *buffer
        pointer to the start of the buffer.

    uint32_t size
        size of the buffer in bytes.
uint32_t bytesused
number of bytes occupied by the valid data in the buffer.

uint32_t timestamp
time reference in milliseconds at which the last data byte was actually received for
input endpoints or to be consumed for output endpoints.

struct video_driver_api
#include <video.h>

group video_controls
Video controls.

Control classes

VIDEO_CTRL_CLASS_GENERIC
Generic class controls.

VIDEO_CTRL_CLASS_CAMERA
Camera class controls.

VIDEO_CTRL_CLASS_MPEG
MPEG-compression controls.

VIDEO_CTRL_CLASS_JPEG
JPEG-compression controls.

VIDEO_CTRL_CLASS_VENDOR
Vendor-specific class controls.

Generic class control IDs

VIDEO_CID_HFLIP
Mirror the picture horizontally.

VIDEO_CID_VFLIP
Mirror the picture vertically.

Camera class control IDs

VIDEO_CID_CAMERA_EXPOSURE

VIDEO_CID_CAMERA_GAIN

VIDEO_CID_CAMERA_ZOOM
**Watchdog**

Use the watchdog driver API to reset the board when it gets stuck in an infinite loop.

**Watchdog options**

- **WDT_OPT_PAUSE_IN_SLEEP**
  Pause watchdog timer when CPU is in sleep state.

- **WDT_OPT_PAUSE_HALTED_BY_DBG**
  Pause watchdog timer when CPU is halted by the debugger.

**Watchdog behavior flags**

- **WDT_FLAG_RESET_NONE**
  Reset: none.

- **WDT_FLAG_RESET_CPU_CORE**
  Reset: CPU core.
WDT_FLAG_RESET_SOC
   Reset: SoC.

**Typedefs**

typedef void (*wdt_callback_t)(const struct device *dev, int channel_id)
   Watchdog callback.

**Param dev**
   Watchdog device instance.

**Param channel_id**
   Channel identifier.

**Functions**

int wdt_setup(const struct device *dev, uint8_t options)
   Set up watchdog instance.

   This function is used for configuring global watchdog settings that affect all timeouts. It should be called after installing timeouts. After successful return, all installed timeouts are valid and must be serviced periodically by calling `wdt_feed()`.

   **Parameters**
   - `dev` – Watchdog device instance.
   - `options` – Configuration options (see `WDT_OPT`).

   **Return values**
   - `0` – If successful.
   - `-ENOTSUP` – If any of the set options is not supported.
   - `-EBUSY` – If watchdog instance has been already setup.
   - `-errno` – In case of any other failure.

int wdt_disable(const struct device *dev)
   Disable watchdog instance.

   This function disables the watchdog instance and automatically uninstalls all timeouts. To set up a new watchdog, install timeouts and call `wdt_setup()` again. Not all watchdogs can be restarted after they are disabled.

   **Parameters**
   - `dev` – Watchdog device instance.

   **Return values**
   - `0` – If successful.
   - `-EFAULT` – If watchdog instance is not enabled.
   - `-EPERM` – If watchdog can not be disabled directly by application code.
   - `-errno` – In case of any other failure.
static inline int wdt_install_timeout(const struct device *dev, const struct wdt_timeout_cfg *cfg)

Install a new timeout.

**Note:** This function must be used before *wdt_setup()*. Changes applied here have no effects until *wdt_setup()* is called.

### Parameters

- **dev** – Watchdog device instance.
- **cfg** – [in] Timeout configuration.

### Return values

- **channel_id** – If successful, a non-negative value indicating the index of the channel to which the timeout was assigned. This value is supposed to be used as the parameter in calls to *wdt_feed()*.
- **-EBUSY** – If timeout can not be installed while watchdog has already been setup.
- **-ENOMEM** – If no more timeouts can be installed.
- **-ENOTSUP** – If any of the set flags is not supported.
- **-EINVAL** – If any of the window timeout value is out of possible range. This value is also returned if watchdog supports only one timeout value for all timeouts and the supplied timeout window differs from windows for alarms installed so far.
- **-errno** – In case of any other failure.

```c
int wdt_feed(const struct device *dev, int channel_id)
```

Feed specified watchdog timeout.

### Parameters

- **dev** – Watchdog device instance.
- **channel_id** – Channel index.

### Return values

- **0** – If successful.
- **-EAGAIN** – If completing the feed operation would stall the caller, for example due to an in-progress watchdog operation such as a previous *wdt_feed()* call.
- **-EINVAL** – If there is no installed timeout for supplied channel.
- **-errno** – In case of any other failure.

```c
struct wdt_window
```

#include <watchdog.h> Watchdog timeout window.

Each installed timeout needs feeding within the specified time window, otherwise the watchdog will trigger. If the watchdog instance does not support window timeouts then min value must be equal to 0.

**Note:** If specified values can not be precisely set they are always rounded up.
Public Members

`uint32_t min`
Lower limit of watchdog feed timeout in milliseconds.

`uint32_t max`
Upper limit of watchdog feed timeout in milliseconds.

```c
#include <watchdog.h>
```
Watchdog timeout configuration.

Public Members

```c
struct wdt_timeout_cfg
```

`callback`
Timeout callback (can be `NULL`).

`next`
Pointer to the next timeout configuration.

This field is only available if `CONFIG_WDT_MULTISTAGE` is enabled (watchdogs with staged timeouts functionality). Value must be `NULL` for single stage timeout.

`flags`
Flags (see `WDT_FLAGS`).

7.6 Pin Control

This is a high-level guide to pin control. See Pin Control API for API reference material.

7.6.1 Introduction

The hardware blocks that control pin multiplexing and pin configuration parameters such as pin direction, pull-up/down resistors, etc. are named **pin controllers**. The pin controller's main users are SoC hardware peripherals, since the controller enables exposing peripheral signals, like for example, map I2C0 SDA signal to pin PX0. Not only that, but it usually allows configuring certain pin settings that are necessary for the correct functioning of a peripheral, for example, the slew-rate depending on the operating frequency. The available configuration options are vendor/SoC dependent and can range from simple pull-up/down options to more advanced settings such as debouncing, low-power modes, etc.

The way pin control is implemented in hardware is vendor/SoC specific. It is common to find a **centralized** approach, that is, all pin configuration parameters are controlled by a single hardware block (typically named pinmux), including signal mapping. The figure below illustrates this approach. PX0 can be mapped to UART0_TX, I2C0_SCK or SPI0_MOSI depending on the AF control bits. Other configuration parameters such as pull-up/down are controlled in the same block via `CONFIG` bits. This model is used by several SoC families, such as many from NXP and STM32.
Other vendors/SoCs use a distributed approach. In such case, the pin mapping and configuration are controlled by multiple hardware blocks. The figure below illustrates a distributed approach where pin mapping is controlled by peripherals, such as in Nordic nRF SoCs.

From a user perspective, there is no difference in pin controller usage regardless of the hardware implementation: a user will always apply a state. The only difference lies in the driver implementation. In general, implementing a pin controller driver for a hardware that uses a distributed approach requires more effort, since the driver needs to gather knowledge of peripheral dependent registers.

**Pin control vs. GPIO**

Some functionality covered by a pin controller driver overlaps with GPIO drivers. For example, pull-up/down resistors can usually be enabled by both the pin control driver and the GPIO driver.
In Zephyr context, the pin control driver purpose is to perform peripheral signal multiplexing and configuration of other pin parameters required for the correct operation of that peripheral. Therefore, the main users of the pin control driver are SoC peripherals. In contrast, GPIO drivers are for general purpose control of a pin, that is, when its logic level is read or controlled manually.

### 7.6.2 State model

For a device driver to operate correctly, a certain pin configuration needs to be applied. Some device drivers require a static configuration, usually set up at initialization time. Others need to change the configuration at runtime depending on the operating conditions, for example, to enable a low-power mode when suspending the device. Such requirements are modeled using states, a concept that has been adapted from the one in the Linux kernel. Each device driver owns a set of states. Each state has a unique name and contains a full pin configuration set (see the figure below). This effectively means that states are independent of each other, so they do not need to be applied in any specific order. Another advantage of the state model is that it isolates device drivers from pin configuration.

<table>
<thead>
<tr>
<th>UART0 peripheral</th>
<th></th>
<th>sleep state</th>
</tr>
</thead>
<tbody>
<tr>
<td>default state</td>
<td>TX</td>
<td>TX</td>
</tr>
<tr>
<td>TX</td>
<td>• Pin: PA0</td>
<td>• Pin: PA0</td>
</tr>
<tr>
<td></td>
<td>• Pull: NONE</td>
<td>• Pull: NONE</td>
</tr>
<tr>
<td></td>
<td>• Low Power: NO</td>
<td>• Low Power: YES</td>
</tr>
<tr>
<td>RX</td>
<td>RX</td>
<td>RX</td>
</tr>
<tr>
<td>RX</td>
<td>• Pin: PA1</td>
<td>• Pin: PA1</td>
</tr>
<tr>
<td></td>
<td>• Pull: UP</td>
<td>• Pull: NONE</td>
</tr>
<tr>
<td></td>
<td>• Low Power: NO</td>
<td>• Low Power: YES</td>
</tr>
</tbody>
</table>

#### Standard states

The name assigned to pin control states or the number of them is up to the device driver requirements. In many cases a single state applied at initialization time will be sufficient, but in some other cases more will be required. In order to make things consistent, a naming convention has been established for the most common use cases. The figure below details the standardized states and its purpose.

<table>
<thead>
<tr>
<th>State</th>
<th>Identifier</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>PINCTRL_STATE_DEFAULT</td>
<td>State of the pins when the device is in operational state</td>
</tr>
<tr>
<td>sleep</td>
<td>PINCTRL_STATE_SLEEP</td>
<td>State of the pins when the device is in low power or sleep modes</td>
</tr>
</tbody>
</table>

Note that other standard states could be introduced in the future.
Custom states

Some device drivers may require using custom states beyond the standard ones. To achieve that, the device driver needs to have in its scope definitions for the custom state identifiers named as PINCTRL_STATE_{STATE_NAME}, where {STATE_NAME} is the capitalized state name. For example, if mystate has to be supported, a definition named PINCTRL_STATE_MYSTATE needs to be in the driver's scope.

**Note:** It is important that custom state identifiers start from PINCTRL_STATE_PRIV_START

If custom states need to be accessed from outside the driver, for example to perform dynamic pin control, custom identifiers should be placed in a header that is publicly accessible.

Skipping states

In most situations, the states defined in Devicetree will be the ones used in the compiled firmware. However, there are some cases where certain states will be conditionally used depending on a compilation flag. A typical case is the sleep state. This state is only used in practice if CONFIG_PMDEVICE is enabled. If a firmware variant without device power management is needed, one should in theory remove the sleep state from Devicetree to not waste ROM space storing such unused state.

States can be skipped by the pinctrl Devicetree macros if a definition named PINCTRL_SKIP_{STATE_NAME} expanding to 1 is present when pin control configuration is defined. In case of the sleep state, the pinctrl API already provides such definition conditional to the availability of device power management:

```c
#ifndef CONFIG_PMDEVICE
/** If device power management is not enabled, "sleep" state will be ignored. */
#define PINCTRL_SKIP_SLEEP 1
#endif
```

### 7.6.3 Dynamic pin control

Dynamic pin control refers to the capability of changing pin configuration at runtime. This feature can be useful in situations where the same firmware needs to run onto slightly different boards, each having a peripheral routed at a different set of pins. This feature can be enabled by setting CONFIG_PINCTRL_DYNAMIC.

**Note:** Dynamic pin control should only be used on devices that have not been initialized. Changing pin configurations while a device is operating may lead to unexpected behavior. Since Zephyr does not support device de-initialization yet, this functionality should only be used during early boot stages.

One of the effects of enabling dynamic pin control is that pinctrl_dev_config will be stored in RAM instead of ROM (not states or pin configurations, though). The user can then use pinctrl_update_states() to update the states stored in pinctrl_dev_config with a new set. This effectively means that the device driver will apply the pin configurations stored in the updated states when it applies a state.
7.6.4 Devicetree representation

Because Devicetree is meant to describe hardware, it is the natural choice when it comes to storing pin control configuration. In the following sections you will find an overview on how states and pin configurations are represented in Devicetree.

States

Given a device, each of its pin control state is represented in Devicetree by `pinctrl-N` properties, being N the state index starting from zero. The `pinctrl-names` property is then used to assign a unique identifier for each state property by index, for example, `pinctrl-names` list entry 0 is the name for `pinctrl-0`.

```
periph0: periph0 {
    ... /* state 0 ("default") */
    pinctrl-0 = <...>;
    ... /* state N ("mystate") */
    pinctrl-N = <...>;
    /* names for state 0 up to state N */
    pinctrl-names = "default", ..., "mystate";
    ... }
```

Pin configuration

There are multiple ways to represent the pin configurations in Devicetree. However, all end up encoding the same information: the pin multiplexing and the pin configuration parameters. For example, UART_RX is mapped to PX0 and pull-up is enabled. The representation choice largely depends on each vendor/SoC, so the Devicetree binding files for the pin control drivers are the best place to look for details.

A popular and versatile option is shown in the example below. One of the advantages of this choice is the grouping capability based on shared pin configuration. This allows to reduce the verbosity of the pin control definitions. Another advantage is that the pin configuration parameters for a particular state are enclosed in a single Devicetree node.

```
/* board.dts */
#include "board-pinctrl.dtsi"

&periph0 {
    pinctrl-0 = &periph0_default;
    pinctrl-names = "default";
};
```

```
/* vnd-soc-pkgxx.h
 * File with valid mappings for a specific package (may be autogenerated).
 * This file is optional, but recommended.
 */
/*
#define PERIPH0_SIGA_PX0 VNDSOC_PIN(X, 0, MUX0)
#define PERIPH0_SIGB_PY7 VNDSOC_PIN(Y, 7, MUX4)
#define PERIPH0_SIGC_PZ1 VNDSOC_PIN(Z, 1, MUX2)
... */
```
Another popular model is based on having a node for each pin configuration and state. While this model may lead to shorter board pin control files, it also requires to have one node for each pin mapping and state, since in general, nodes can not be re-used for multiple states. This method is discouraged if autogeneration is not an option.

**Note:** Because all Devicetree information is parsed into a C header, it is important to make sure its size is kept to a minimum. For this reason it is important to prefix pre-generated nodes with `/omit-if-no-ref/`. This prefix makes sure that the node is discarded when not used.
/* board-pinctrl.dts */
#include <vnd-soc-pkgxx.dtsi>

/* Enable pull-up for PX0 (default state) */
&periph0_siga_px0_default {
  bias-pull-up;
};

/* Enable pull-up for PZ1 (default state) */
&periph0_sigm_pz1_default {
  bias-pull-up;
};

Note: It is discouraged to add pin configuration defaults in pre-defined nodes. In general, pin configurations depend on the board design or on the peripheral working conditions, so the decision should be made by the board. For example, enabling a pull-up by default may not always be desired because the board already has one or because its value depends on the operating bus speed. Another downside of defaults is that user may not be aware of them, for example:

/* not evident that "periph0_siga_px0_default" also implies "bias-pull-up" */
/omit-if-no-ref/ periph0_siga_px0_default: periph0_siga_px0_default {
  pinmux = <VNDSOC_PIN(X, 0, MUX0)>;
  bias-pull-up;
};

7.6.5 Implementation guidelines

Pin control drivers

Pin control drivers need to implement a single function: `pinctrl_configure_pins()`. This function receives an array of pin configurations that need to be applied. Furthermore, if CONFIG_PINCTRL_STORE_REG is set, it also receives the associated device register address for the given pins. This information may be required by some drivers to perform device specific actions.

The pin configuration is stored in an opaque type that is vendor/SoC dependent: `pinctrl_soc_pin_t`. This type needs to be defined in a header named `pinctrl_soc.h` file that is in the Zephyr's include path. It can range from a simple integer value to a struct with multiple fields. `pinctrl_soc.h` also needs to define a macro named `Z_PINCTRL_STATE_PINS_INIT` that accepts two arguments: a node identifier and a property name (`pinctrl-N`). With this information the macro needs to define an initializer for all pin configurations contained within the `pinctrl-N` property of the given node.

Regarding Devicetree pin configuration representation, vendors can decide which option is better for their devices. However, the following guidelines should be followed:

- Use `pinctrl-N (N=0, 1, ...)` and `pinctrl-names` properties to define pin control states. These properties are defined in `dts/bindings/pinctrl/pinctrl-device.yaml`.
- Use standard pin configuration properties as defined in `dts/bindings/pinctrl/pincfg-node.yaml`.

Representations not following these guidelines may be accepted if they are already used by the same vendor in other operating systems, e.g. Linux.
Device drivers

In this section you will find some tips on how a device driver should use the pinctrl API to successfully configure the pins it needs.

The device compatible needs to be modified in the corresponding binding so that the pinctrl-device.yaml is included. For example:

```yaml
include: [base.yaml, pinctrl-device.yaml]
```

This file is needed to add pinctrl-N and pinctrl-names properties to the device.

From a device driver perspective there are two steps that need to be performed to be able to use the pinctrl API. First, the pin control configuration needs to be defined. This includes all states and pins. PINCTRL_DT_DEFINE or PINCTRL_DT_INST_DEFINE macros should be used for this purpose. Second, a reference to the device instance pinctrl_dev_config needs to be stored, since it is required to later use the API. This can be achieved using the PINCTRL_DT_DEV_CONFIG_GET and PINCTRL_DT_INST_DEV_CONFIG_GET macros.

It is worth to note that the only relationship between a device and its associated pin control configuration is based on variable naming conventions. The way an instance of pinctrl_dev_config is named for a corresponding device instance allows to later obtain a reference to it given the device's Devicetree node identifier. This allows to minimize ROM usage, since only devices requiring pin control will own a reference to a pin control configuration.

Once the driver has defined the pin control configuration and kept a reference to it, it is ready to use the API. The most common way to apply a state is by using pinctrl_apply_state(). It is also possible to use the lower level function pinctrl_apply_state_direct() to skip state lookup if it is cached in advance (e.g. at init time). Since state lookup time is expected to be fast, it is recommended to use pinctrl_apply_state().

The example below contains a complete example of a device driver that uses the pinctrl API.

```c
/* A driver for the "mydev" compatible device */
#define DT_DRV_COMPAT mydev
...
#define MYDEV_DEFINE(i) \
  (continues on next page)
```
7.6.6 Pin Control API

**group pinctrl_interface**

Pin Controller Interface.

Pin control states

**PINCTRL_STATE_DEFAULT**

Default state (state used when the device is in operational state).

**PINCTRL_STATE_SLEEP**

Sleep state (state used when the device is in low power mode).

**PINCTRL_STATE_PRIV_START**

This and higher values refer to custom private states.

Defines

**PINCTRL_REG_NONE**

Utility macro to indicate no register is used.

**PINCTRL_DT_DEV_CONFIG_DECLARE(node_id)**

Declare pin control configuration for a given node identifier.

This macro should be used by tests or applications using runtime pin control to declare the pin control configuration for a device. **PINCTRL_DT_DEV_CONFIG_GET** can later be used to obtain a reference to such configuration.

Only available if CONFIG_PINCTRL_NON_STATIC is selected.

**Parameters**

- **node_id** – Node identifier.
PINCTRL_DT_DEFINE(node_id)
Define all pin control information for the given node identifier.

This helper macro should be called together with device definition. It defines and initializes the pin control configuration for the device represented by node_id. Each pin control state (pinctrl-0, ..., pinctrl-N) is also defined and initialized. Note that states marked to be skipped will not be defined (refer to Z_PINCTRL_SKIP_STATE for more details).

Parameters
- node_id – Node identifier.

PINCTRL_DT_INST_DEFINE(inst)
Define all pin control information for the given compatible index.

See also:
PINCTRL_DT_DEFINE

Parameters
- inst – Instance number.

PINCTRL_DT_DEV_CONFIG_GET(node_id)
Obtain a reference to the pin control configuration given a node identifier.

Parameters
- node_id – Node identifier.

PINCTRL_DT_INST_DEV_CONFIG_GET(inst)
Obtain a reference to the pin control configuration given current compatible instance number.

See also:
PINCTRL_DT_DEV_CONFIG_GET

Parameters
- inst – Instance number.

Functions

int pinctrl_lookup_state(const struct pinctrl_dev_config *config, uint8_t id, const struct pinctrl_state **state)
Find the state configuration for the given state id.

Parameters
- config – Pin controller configuration.
- id – Pin controller state id (see PINCTRL_STATES).
- state – Found state.

Return values
- 0 – If state has been found.
- -ENOENT – If the state has not been found.
int pinctrl_configure_pins(const pinctrl_soc_pin_t *pins, uint8_t pin_cnt, uintptr_t reg)
Configure a set of pins.
This function will configure the necessary hardware blocks to make the configuration immediately effective.

Warning: This function must never be used to configure pins used by an instantiated device driver.

Parameters

- **pins** – List of pins to be configured.
- **pin_cnt** – Number of pins.
- **reg** – Device register (optional, use PINCTRL_REG_NONE if not used).

Return values

- **0** – If succeeded
- **-errno** – Negative errno for other failures.

static inline int pinctrl_apply_state_direct(const struct pinctrl_dev_config *config, const struct pinctrl_state *state)
Apply a state directly from the provided state configuration.

Parameters

- **config** – Pin control configuration.
- **state** – State.

Return values

- **0** – If succeeded
- **-errno** – Negative errno for other failures.

static inline int pinctrl_apply_state(const struct pinctrl_dev_config *config, uint8_t id)
Apply a state from the given device configuration.

Parameters

- **config** – Pin control configuration.
- **id** – Id of the state to be applied (see PINCTRL_STATES).

Return values

- **0** – If succeeded.
- **-ENOENT** – If given state id does not exist.
- **-errno** – Negative errno for other failures.

struct pinctrl_state
#include <pinctrl.h> Pin control state configuration.

Public Members

const pinctrl_soc_pin_t *pins
Pin configurations.
struct pinctrl_dev_config
   
   #include <pinctrl.h> Pin controller configuration for a given device.

**Public Members**

uintptr_t reg
   
   Device address (only available if CONFIG_PINCTRL_STORE_REG is enabled).

const struct pinctrl_state *states
   
   List of state configurations.

uint8_t state_cnt
   
   Number of state configurations.

---

**Dynamic pin control**

*group* pinctrl_interface_dynamic

**Defines**

PINCTRL_DT_STATE_PINS_DEFINE(node_id, prop)
   
   Helper macro to define the pins of a pin control state from Devicetree.
   
   The name of the defined state pins variable is the same used by prop. This macro is expected to be used in conjunction with PINCTRL_DT_STATE_INIT.

   **See also:**

   PINCTRL_DT_STATE_INIT

   **Parameters**

   • node_id – Node identifier containing prop.
   • prop – Property within node_id containing state configuration.

PINCTRL_DT_STATE_INIT(prop, state)
   
   Utility macro to initialize a pin control state.
   
   This macro should be used in conjunction with PINCTRL_DT_STATE_PINS_DEFINE when using dynamic pin control to define an alternative state configuration stored in Devicetree.

   **Example:**
// board.dts
/
{
    zephyr,user {
        // uart0_alt_default node contains alternative pin config
        uart0_alt_default = <&uart0_alt_default>;
    }
};

// application
PINCTRL_DT_STATE_PINS_DEFINE(DT_PATH(zephyr_user), uart0_alt_default);

static const struct pinctrl_state uart0_alt[] = {
    PINCTRL_DT_STATE_INIT(uart0_alt_default, PINCTRL_STATE_DEFAULT)
};

See also:
PINCTRL_DT_STATE_PINS_DEFINE

Parameters
• prop – Property name in Devicetree containing state configuration.
• state – State represented by prop (see PINCTRL_STATES).

Functions

int pinctrl_update_states(struct pinctrl_dev_config *config, const struct pinctrl_state *
                          states, uint8_t state_cnt)

Update states with a new set.

Note: In order to guarantee device drivers correct operation the same states have to
be provided. For example, if default and sleep are in the current list of states, it is
expected that the new array of states also contains both.

Parameters
• config – Pin control configuration.
• states – New states to be set.
• state_cnt – Number of new states to be set.

Return values
• -EINVAL – If the new configuration does not contain the same states as the
current active configuration.
• -ENOSYS – If the functionality is not available.
• 0 – On success.

7.7  Porting

These pages document how to port Zephyr to new hardware.

7.7.1  Architecture Porting Guide

An architecture port is needed to enable Zephyr to run on an ISA (instruction set architecture) or an ABI (Application Binary Interface) that is not currently supported.

The following are examples of ISAs and ABIs that Zephyr supports:

- x86_32 ISA with System V ABI
- ARMv7-M ISA with Thumb2 instruction set and ARM Embedded ABI (aeabi)
- ARCv2 ISA

For information on Kconfig configuration, see Setting Kconfig configuration values. Architectures use a Kconfig configuration scheme similar to boards.

An architecture port can be divided in several parts; most are required and some are optional:

- **The early boot sequence**: each architecture has different steps it must take when the CPU comes out of reset (required).
- **Interrupt and exception handling**: each architecture handles asynchronous and unrequested events in a specific manner (required).
- **Thread context switching**: the Zephyr context switch is dependent on the ABI and each ISA has a different set of registers to save (required).
- **Thread creation and termination**: A thread's initial stack frame is ABI and architecture-dependent, and thread abortion possibly as well (required).
- **Device drivers**: most often, the system clock timer and the interrupt controller are tied to the architecture (some required, some optional).
- **Utility libraries**: some common kernel APIs rely on a architecture-specific implementation for performance reasons (required).
- **CPU idling/power management**: most architectures implement instructions for putting the CPU to sleep (partly optional, most likely very desired).
- **Fault management**: for implementing architecture-specific debug help and handling of fatal error in threads (partly optional).
- **Linker scripts and toolchains**: architecture-specific details will most likely be needed in the build system and when linking the image (required).

**Early Boot Sequence**

The goal of the early boot sequence is to take the system from the state it is after reset to a state where is can run C code and thus the common kernel initialization sequence. Most of the time, very few steps are needed, while some architectures require a bit more work to be performed.

Common steps for all architectures:

- Setup an initial stack.
- If running an XIP (eXecute-In-Place) kernel, copy initialized data from ROM to RAM.
- If not using an ELF loader; zero the BSS section.
- Jump to _Cstart(), the early kernel initialization
_Cstart() is responsible for context switching out of the fake context running at startup into the main thread.

Some examples of architecture-specific steps that have to be taken:

- If given control in real mode on x86_32, switch to 32-bit protected mode.
- Setup the segment registers on x86_32 to handle boot loaders that leave them in an unknown or broken state.
- Initialize a board-specific watchdog on Cortex-M3/4.
- Switch stacks from MSP to PSP on Cortex-M.
- Use a different approach than calling into _Swap() on Cortex-M to prevent race conditions.
- Setup FIRQ and regular IRQ handling on ARCv2.

### Interrupt and Exception Handling

Each architecture defines interrupt and exception handling differently.

When a device wants to signal the processor that there is some work to be done on its behalf, it raises an interrupt. When a thread does an operation that is not handled by the serial flow of the software itself, it raises an exception. Both, interrupts and exceptions, pass control to a handler. The handler is known as an ISR (Interrupt Service Routine) in the case of interrupts. The handler performs the work required by the exception or the interrupt. For interrupts, that work is device-specific. For exceptions, it depends on the exception, but most often the core kernel itself is responsible for providing the handler.

The kernel has to perform some work in addition to the work the handler itself performs. For example:

- Prior to handing control to the handler:
  - Save the currently executing context.
  - Possibly getting out of power saving mode, which includes waking up devices.
  - Updating the kernel uptime if getting out of tickless idle mode.
- After getting control back from the handler:
  - Decide whether to perform a context switch.
  - When performing a context switch, restore the context being context switched in.

This work is conceptually the same across architectures, but the details are completely different:

- The registers to save and restore.
- The processor instructions to perform the work.
- The numbering of the exceptions.
- etc.

It thus needs an architecture-specific implementation, called the interrupt/exception stub.

Another issue is that the kernel defines the signature of ISRs as:

```c
void (*isr)(void *parameter)
```

Architectures do not have a consistent or native way of handling parameters to an ISR. As such there are two commonly used methods for handling the parameter:

- Using some architecture defined mechanism, the parameter value is forced in the stub. This is commonly found in X86-based architectures.
The parameters to the ISR are inserted and tracked via a separate table requiring the architecture to discover at runtime which interrupt is executing. A common interrupt handler demuxer is installed for all entries of the real interrupt vector table, which then fetches the device's ISR and parameter from the separate table. This approach is commonly used in the ARC and ARM architectures via the CONFIG_GEN_ISR_TABLES implementation. You can find examples of the stubs by looking at _interrupt_enter() in x86, _Interrupt() in ARM, _isr_wrapper() in ARM, or the full implementation description for ARC in arch/arc/core/isr_wrapper.S.

Each architecture also has to implement primitives for interrupt control:

- locking interrupts: irq_lock(), irq_unlock().
- registering interrupts: IRQ_CONNECT().
- programming the priority if possible irq_priority_set().
- enabling/disabling interrupts: irq_enable(), irq_disable().

Note: IRQ_CONNECT is a macro that uses assembler and/or linker script tricks to connect interrupts at build time, saving boot time and text size.

The vector table should contain a handler for each interrupt and exception that can possibly occur. The handler can be as simple as a spinning loop. However, we strongly suggest that handlers at least print some debug information. The information helps figuring out what went wrong when hitting an exception that is a fault, like divide-by-zero or invalid memory access, or an interrupt that is not expected (spurious interrupt). See the ARM implementation in arch/arm/core/cortex_m/fault.c for an example.

Thread Context Switching

Multi-threading is the basic purpose to have a kernel at all. Zephyr supports two types of threads: preemptible and cooperative.

Two crucial concepts when writing an architecture port are the following:

- Cooperative threads run at a higher priority than preemptible ones, and always preempt them.
- After handling an interrupt, if a cooperative thread was interrupted, the kernel always goes back to running that thread, since it is not preemptible.

A context switch can happen in several circumstances:

- When a thread executes a blocking operation, such as taking a semaphore that is currently unavailable.
- When a preemptible thread unblocks a thread of higher priority by releasing the object on which it was blocked.
- When an interrupt unblocks a thread of higher priority than the one currently executing, if the currently executing thread is preemptible.
- When a thread runs to completion.
- When a thread causes a fatal exception and is removed from the running threads. For example, referencing invalid memory.

Therefore, the context switching must thus be able to handle all these cases.

The kernel keeps the next thread to run in a “cache”, and thus the context switching code only has to fetch from that cache to select which thread to run.

There are two types of context switches: cooperative and preemptive.
• A **cooperative** context switch happens when a thread willfully gives the control to another thread. There are two cases where this happens
  – When a thread explicitly yields.
  – When a thread tries to take an object that is currently unavailable and is willing to wait until the object becomes available.
• A **preemptive** context switch happens either because an ISR or a thread causes an operation that schedules a thread of higher priority than the one currently running, if the currently running thread is preemptible. An example of such an operation is releasing an object on which the thread of higher priority was waiting.

**Note:** Control is never taken from cooperative thread when one of them is the running thread.

A cooperative context switch is always done by having a thread call the `_Swap()` kernel internal symbol. When `_Swap` is called, the kernel logic knows that a context switch has to happen: `_Swap` does not check to see if a context switch must happen. Rather, `_Swap` decides what thread to context switch in. `_Swap` is called by the kernel logic when an object being operated on is unavailable, and some thread yielding/sleeping primitives.

**Note:** On x86 and Nios2, `_Swap` is generic enough and the architecture flexible enough that `_Swap` can be called when exiting an interrupt to provoke the context switch. This should not be taken as a rule, since neither the ARM Cortex-M or ARCv2 port do this.

Since `_Swap` is cooperative, the caller-saved registers from the ABI are already on the stack. There is no need to save them in the `k_thread` structure.

A context switch can also be performed preemptively. This happens upon exiting an ISR, in the kernel interrupt exit stub:

- `_interrupt_enter` on x86 after the handler is called.
- `_IntExit` on ARM.
- `_firq_exit` and `_rirq_exit` on ARCv2.

In this case, the context switch must only be invoked when the interrupted thread was preemptible, not when it was a cooperative one, and only when the current interrupt is not nested. The kernel also has the concept of “locking the scheduler”. This is a concept similar to locking the interrupts, but lighter-weight since interrupts can still occur. If a thread has locked the scheduler, it is temporarily non-preemptible.

So, the decision logic to invoke the context switch when exiting an interrupt is simple:

- If the interrupted thread is not preemptible, do not invoke it.
- Else, fetch the cached thread from the ready queue, and:
  – If the cached thread is not the current thread, invoke the context switch.
  – Else, do not invoke it.

This is simple, but crucial: if this is not implemented correctly, the kernel will not function as intended and will experience bizarre crashes, mostly due to stack corruption.

**Note:** If running a coop-only system, i.e. if `CONFIG_NUM_PREEMPT_PRIORITIES` is 0, no preemptive context switch ever happens. The interrupt code can be optimized to not take any scheduling decision when this is the case.
Thread Creation and Termination

To start a new thread, a stack frame must be constructed so that the context switch can pop it the same way it would pop one from a thread that had been context switched out. This is to be implemented in an architecture-specific _new_thread internal routine.

The thread entry point is also not to be called directly, i.e. it should not be set as the PC (program counter) for the new thread. Rather it must be wrapped in _thread_entry. This means that the PC in the stack frame shall be set to _thread_entry, and the thread entry point shall be passed as the first parameter to _thread_entry. The specifics of this depend on the ABI.

The need for an architecture-specific thread termination implementation depends on the architecture. There is a generic implementation, but it might not work for a given architecture.

One reason that has been encountered for having an architecture-specific implementation of thread termination is that aborting a thread might be different if aborting because of a graceful exit or because of an exception. This is the case for ARM Cortex-M, where the CPU has to be taken out of handler mode if the thread triggered a fatal exception, but not if the thread gracefully exits its entry point function.

This means implementing an architecture-specific version of k_thread_abort(), and setting the Kconfig option CONFIG_ARCH_HAS_THREAD_ABORT as needed for the architecture (e.g. see arch/arm/core/cortex_m/Kconfig).

Thread Local Storage

To enable thread local storage on a new architecture:

1. Implement arch_tls_stack_setup() to setup the TLS storage area in stack. Refer to the toolchain documentation on how the storage area needs to be structured. Some helper functions can be used:
   - Function z_tls_data_size() returns the size needed for thread local variables (excluding any extra data required by toolchain and architecture).
   - Function z_tls_copy() prepares the TLS storage area for thread local variables. This only copies the variable themselves and does not do architecture and/or toolchain specific data.

2. In the context switching, grab the tls field inside the new thread's struct k_thread and put it into an appropriate register (or some other variable) for access to the TLS storage area. Refer to toolchain and architecture documentation on which registers to use.

3. In kconfig, add select CONFIG_ARCH_HAS_THREAD_LOCAL_STORAGE to kconfig related to the new architecture.

4. Run the tests/kernel/threads/tls to make sure the new code works.

Device Drivers

The kernel requires very few hardware devices to function. In theory, the only required device is the interrupt controller, since the kernel can run without a system clock. In practice, to get access to most, if not all, of the sanity check test suite, a system clock is needed as well. Since these two are usually tied to the architecture, they are part of the architecture port.

Interrupt Controllers

There can be significant differences between the interrupt controllers and the interrupt concepts across architectures.

For example, x86 has the concept of an IDT and different interrupt controllers. The position of an interrupt in the IDT determines its priority.
On the other hand, the ARM Cortex-M has the NVIC (Nested Vectored Interrupt Controller) as part of the architecture definition. There is no need for an IDT-like table that is separate from the NVIC vector table. The position in the table has nothing to do with priority of an IRQ: priorities are programmable per-entry.

The ARCv2 has its interrupt unit as part of the architecture definition, which is somewhat similar to the NVIC. However, where ARC defines interrupts as having a one-to-one mapping between exception and interrupt numbers (i.e. exception 1 is IRQ1, and device IRQs start at 16), ARM has IRQ0 being equivalent to exception 16 (and weirdly enough, exception 1 can be seen as IRQ-15).

All these differences mean that very little, if anything, can be shared between architectures with regards to interrupt controllers.

**System Clock**  
X86 has APIC timers and the HPET as part of its architecture definition. ARM Cortex-M has the SYSTICK exception. Finally, ARCv2 has the timer0/1 device.

Kernel timeouts are handled in the context of the system clock timer driver's interrupt handler.

**Console Over Serial Line**  
There is one other device that is almost a requirement for an architecture port, since it is so useful for debugging. It is a simple polling, output-only, serial port driver on which to send the console (`printk`, `printf`) output.

It is not required, and a RAM console (`CONFIG_RAM_CONSOLE`) can be used to send all output to a circular buffer that can be read by a debugger instead.

**Utility Libraries**

The kernel depends on a few functions that can be implemented with very few instructions or in a lock-less manner in modern processors. Those are thus expected to be implemented as part of an architecture port.

- Atomic operators.
  - If instructions do exist for a given architecture, the implementation is configured using the `CONFIG_ATOMIC_OPERATIONS_ARCH` Kconfig option.
  - If instructions do not exist for a given architecture, a generic version that wraps `irq_lock()` or `irq_unlock()` around non-atomic operations exists. It is configured using the `CONFIG_ATOMIC_OPERATIONS_C` Kconfig option.

- Find-least-significant-bit-set and find-most-significant-bit-set.
  - If instructions do not exist for a given architecture, it is always possible to implement these functions as generic C functions.

It is possible to use compiler built-ins to implement these, but be careful they use the required compiler barriers.

**CPU Idling/Power Management**

The kernel provides support for CPU power management with two functions: `arch_cpu_idle()` and `arch_cpu_atomic_idle()`.

`arch_cpu_idle()` can be as simple as calling the power saving instruction for the architecture with interrupts unlocked, for example `hlt` on x86, `wfi` or `wfe` on ARM, `sleep` on ARC. This function can be called in a loop within a context that does not care if it gets interrupted or not by an interrupt before going to sleep. There are basically two scenarios when it is correct to use this function:
• In a single-threaded system, in the only thread when the thread is not used for doing real work after initialization, i.e. it is sitting in a loop doing nothing for the duration of the application.

• In the idle thread.

`arch_cpu_atomic_idle()`, on the other hand, must be able to atomically re-enable interrupts and invoke the power saving instruction. It can thus be used in real application code, again in single-threaded systems.

Normally, idling the CPU should be left to the idle thread, but in some very special scenarios, these APIs can be used by applications.

Both functions must exist for a given architecture. However, the implementation can be simply the following steps, if desired:

1. unlock interrupts
2. NOP

However, a real implementation is strongly recommended.

**Fault Management**

In the event of an unhandled CPU exception, the architecture code must call into `z_fatal_error()`. This function dumps out architecture-agnostic information and makes a policy decision on what to do next by invoking `k_sys_fatal_error()`. This function can be overridden to implement application-specific policies that could include locking interrupts and spinning forever (the default implementation) or even powering off the system (if supported).

**Toolchain and Linking**

Toolchain support has to be added to the build system.

Some architecture-specific definitions are needed in `include/zephyr/toolchain/gcc.h`. See what exists in that file for currently supported architectures.

Each architecture also needs its own linker script, even if most sections can be derived from the linker scripts of other architectures. Some sections might be specific to the new architecture, for example the SCB section on ARM and the IDT section on x86.

**Memory Management**

If the target platform enables paging and requires drivers to memory-map their I/O regions, `CONFIG_MMU` needs to be enabled and the following API implemented:

- `arch_mem_map()`
- `arch_mem_unmap()`
- `arch_page_phys_get()`

**Stack Objects**

The presence of memory protection hardware affects how stack objects are created. All architecture ports must specify the required alignment of the stack pointer, which is some combination of CPU and ABI requirements. This is defined in architecture headers with `ARCH_STACK_PTR_ALIGN` and is typically something small like 4, 8, or 16 bytes.

Two types of thread stacks exist:
“kernel” stacks defined with \texttt{K\_KERNEL\_STACK\_DEFINE()} and related APIs, which can host kernel threads running in supervisor mode or used as the stack for interrupt/exception handling. These have significantly relaxed alignment requirements and use less reserved data. No memory is reserved for privilege elevation stacks.

“thread” stacks which typically use more memory, but are capable of hosting thread running in user mode, as well as any use-cases for kernel stacks.

If \texttt{CONFIG\_USERSPACE} is not enabled, “thread” and “kernel” stacks are equivalent.

Additional macros may be defined in the architecture layer to specify the alignment of the base of stack objects, any reserved data inside the stack object not used for the thread’s stack buffer, and how to round up stack sizes to support user mode threads. In the absence of definitions some defaults are assumed:

- \texttt{ARCH\_KERNEL\_STACK\_RESERVED}: default no reserved space
- \texttt{ARCH\_THREAD\_STACK\_RESERVED}: default no reserved space
- \texttt{ARCH\_KERNEL\_STACK\_OBJ\_ALIGN}: default align to \texttt{ARCH\_STACK\_PTR\_ALIGN}
- \texttt{ARCH\_THREAD\_STACK\_OBJ\_ALIGN}: default align to \texttt{ARCH\_STACK\_PTR\_ALIGN}
- \texttt{ARCH\_THREAD\_STACK\_SIZE\_ALIGN}: default round up to \texttt{ARCH\_STACK\_PTR\_ALIGN}

All stack creation macros are defined in terms of these.

Stack objects all have the following layout, with some regions potentially zero-sized depending on configuration. There are always two main parts: reserved memory at the beginning, and then the stack buffer itself. The bounds of some areas can only be determined at runtime in the context of its associated thread object. Other areas are entirely computable at build time.

Some architectures may need to carve-out reserved memory at runtime from the stack buffer, instead of unconditionally reserving it at build time, or to supplement an existing reserved area (as is the case with the ARM FPU). Such carve-outs will always be tracked in \texttt{thread\_stack\_info\_start}. The region specified by \texttt{thread\_stack\_info\_start} and \texttt{thread\_stack\_info\_size} is always fully accessible by a user mode thread. \texttt{thread\_stack\_info\_delta} denotes an offset which can be used to compute the initial stack pointer from the very end of the stack object, taking into account storage for TLS and ASLR random offsets.

At present, Zephyr does not support stacks that grow upward.

\textbf{No Memory Protection} \hspace{1em} If no memory protection is in use, then the defaults are sufficient.

\textbf{HW-based stack overflow detection} \hspace{1em} This option uses hardware features to generate a fatal error if a thread in supervisor mode overflows its stack. This is useful for debugging, although
for a couple reasons, you can’t reliably make any assertions about the state of the system after this happens:

- The kernel could have been inside a critical section when the overflow occurs, leaving important global data structures in a corrupted state.
- For systems that implement stack protection using a guard memory region, it’s possible to overshoot the guard and corrupt adjacent data structures before the hardware detects this situation.

To enable the CONFIG_HW_STACK_PROTECTION feature, the system must provide some kind of hardware-based stack overflow protection, and enable the CONFIG_ARCH_HAS_STACK_PROTECTION option.

Two forms of HW-based stack overflow detection are supported: dedicated CPU features for this purpose, or special read-only guard regions immediately preceding stack buffers.

CONFIG_HW_STACK_PROTECTION only catches stack overflows for supervisor threads. This is not required to catch stack overflow from user threads; CONFIG_USERSPACE is orthogonal.

This feature only detects supervisor mode stack overflows, including stack overflows when handling system calls. It doesn’t guarantee that the kernel has not been corrupted. Any stack overflow in supervisor mode should be treated as a fatal error, with no assertions about the integrity of the overall system possible.

Stack overflows in user mode are recoverable (from the kernel’s perspective) and require no special configuration; CONFIG_HW_STACK_PROTECTION only applies to catching overflows when the CPU is in supervisor mode.

CPU-based stack overflow detection If we are detecting stack overflows in supervisor mode via special CPU registers (like ARM’s SPLIM), then the defaults are sufficient.

Guard-based stack overflow detection We are detecting supervisor mode stack overflows via special memory protection region located immediately before the stack buffer that generates an exception on write. Reserved memory will be used for the guard region.

ARCH_KERNEL_STACK_RESERVED should be defined to the minimum size of a memory protection region. On most ARM CPUs this is 32 bytes. ARCH_KERNEL_STACK_OBJ_ALIGN should also be set to the required alignment for this region.

MMU-based systems should not reserve RAM for the guard region and instead simply leave an non-present virtual page below every stack when it is mapped into the address space. The stack object will still need to be properly aligned and sized to page granularity.

Guard carve-outs for kernel stacks are uncommon and should be avoided if possible. They tend to be needed for two situations:

- The same stack may be re-purposed to host a user thread, in which case the guard is unnecessary and shouldn’t be unconditionally reserved. This is the case when privilege elevation stacks are not inside the stack object.
- The required guard size is variable and depends on context. For example, some ARM CPUs have lazy floating point stacking during exceptions and may decrement the stack pointer by a large value without writing anything, completely overshooting a minimally-sized guard
and corrupting adjacent memory. Rather than unconditionally reserving a larger guard, the extra memory is carved out if the thread uses floating point.

**User mode enabled** Enabling user mode activates two new requirements:

- A separate fixed-sized privilege mode stack, specified by `CONFIG_PRIVILEGED_STACK_SIZE`, must be allocated that the user thread cannot access. It is used as the stack by the kernel when handling system calls. If stack guards are implemented, a stack guard region must be able to be placed before it, with support for carve-outs if necessary.

- The memory protection hardware must be able to program a region that exactly covers the thread's stack buffer, tracked in `thread.stack_info`. This implies that `ARCH_THREAD_STACK_SIZE_ADJUST()` will need to round up the requested stack size so that a region may cover it, and that `ARCH_THREAD_STACK_OBJ_ALIGN()` is also specified per the granularity of the memory protection hardware.

This becomes more complicated if the memory protection hardware requires that all memory regions be sized to a power of two, and aligned to their own size. This is common on older MPUs and is known with `CONFIG_MPU_REQUIRES_POWER_OF_TWO_ALIGNMENT`.

`thread.stack_info` always tracks the user-accessible part of the stack object, it must always be correct to program a memory protection region with user access using the range stored within.

**Non power-of-two memory region requirements** On systems without power-of-two region requirements, the reserved memory area for threads stacks defined by `K_THREAD_STACK_RESERVED` may be used to contain the privilege mode stack. The layout could be something like:

```
+------------------------------+ <- thread.stack_obj
| Other platform data |
+------------------------------|
| Guard region (if enabled) |
+------------------------------|
| Guard carve-out (if needed) |
|..............................|
| Privilege elevation stack |
+------------------------------< thread.stack_obj +
| Stack buffer | K_THREAD_STACK_RESERVED =
|. . thread.stack_info.start
```

The guard region, and any carve-out (if needed) would be configured as a read-only region when the thread is created.

- If the thread is a supervisor thread, the privilege elevation region is just extra stack memory. An overflow will eventually crash into the guard region.

- If the thread is running in user mode, a memory protection region will be configured to allow user threads access to the stack buffer, but nothing before or after it. An overflow in user mode will crash into the privilege elevation stack, which the user thread has no access to. An overflow when handling a system call will crash into the guard region.

On an MMU system there should be no physical guards; the privilege mode stack will be mapped into kernel memory, and the stack buffer in the user part of memory, each with non-present virtual guard pages below them to catch runtime stack overflows.

Other platform data may be stored before the guard region, but this is highly discouraged if such data could be stored in `thread.arch` somewhere.

`ARCH_THREAD_STACK_RESERVED` will need to be defined to capture the size of the reserved region containing platform data, privilege elevation stacks, and guards. It must be appropriately sized such that an MPU region to grant user mode access to the stack buffer can be placed immediately after it.
Power-of-two memory region requirements  Thread stack objects must be sized and aligned to the same power of two, without any reserved memory to allow efficient packing in memory. Thus, any guards in the thread stack must be completely carved out, and the privilege elevation stack must be allocated elsewhere.

ARCH_THREAD_STACK_SIZE_ADJUST() and ARCH_THREAD_STACK_OBJ_ALIGN() should both be defined to Z_POW2_CEIL(). K_THREAD_STACK_RESERVED must be 0.

For the privilege stacks, the CONFIG_GEN_PRIV_STACKS must be enabled. For every thread stack found in the system, a corresponding fixed-size kernel stack used for handling system calls is generated. The address of the privilege stacks can be looked up quickly at runtime based on the thread stack address using z_priv_stack_find(). These stacks are laid out the same way as other kernel-only stacks.

```
+-----------------------------+ <- z_priv_stack_find(thread.stack_obj)
| Reserved memory | } K_KERNEL_STACK_RESERVED
+-----------------------------+
| Guard carve-out (if needed) |
|.............................|
| Privilege elevation stack |
+-----------------------------+ <- z_priv_stack_find(thread.stack_obj) +
K_KERNEL_STACK_RESERVED +
CONFIG_PRIVILEGED_STACK_SIZE
+-----------------------------+- <- thread.stack_obj
| MPU guard carve-out         |
| (supervisor mode only)     |
|.............................| <- thread.stack_info.start
| Stack buffer               |
```

The guard carve-out in the thread stack object is only used if the thread is running in supervisor mode. If the thread drops to user mode, there is no guard and the entire object is used as the stack buffer, with full access to the associated user mode thread and thread.stack_info updated appropriately.

User Mode Threads

To support user mode threads, several kernel-to-arch APIs need to be implemented, and the system must enable the CONFIG_ARCH_HAS_USERSPACE option. Please see the documentation for each of these functions for more details:

- arch_buffer_validate() to test whether the current thread has access permissions to a particular memory region
- arch_user_mode_enter() which will irreversibly drop a supervisor thread to user mode privileges. The stack must be wiped.
- arch_syscall_oops() which generates a kernel oops when system call parameters can’t be validated, in such a way that the oops appears to be generated from where the system call was invoked in the user thread
- arch_syscall_invoke0() through arch_syscall_invoke6() invoke a system call with the appropriate number of arguments which must all be passed in during the privilege elevation via registers.
- arch_is_user_context() return nonzero if the CPU is currently running in user mode
- arch_mem_domain_max_partitions_get() which indicates the max number of regions for a memory domain. MMU systems have an unlimited amount, MPU systems have constraints on this.
Some architectures may need to update software memory management structures or modify hardware registers on another CPU when memory domain APIs are invoked. If so, \texttt{CONFIG_ARCH_MEM_DOMAIN_SYNCHRONOUS_API} must be selected by the architecture and some additional APIs must be implemented. This is common on MMU systems and uncommon on MPU systems:

- \texttt{arch_mem_domain_thread_add()}
- \texttt{arch_mem_domain_thread_remove()}
- \texttt{arch_mem_domain_partition_add()}
- \texttt{arch_mem_domain_partition_remove()}

Please see the doxygen documentation of these APIs for details.

In addition to implementing these APIs, there are some other tasks as well:

- \texttt{new_thread()} needs to spawn threads with \texttt{K_USER} in user mode
- On context switch, the outgoing thread's stack memory should be marked inaccessible to user mode by making the appropriate configuration changes in the memory management hardware. The incoming thread's stack memory should likewise be marked as accessible. This ensures that threads can't mess with other thread stacks.
- On context switch, the system needs to switch between memory domains for the incoming and outgoing threads.
- Thread stack areas must include a kernel stack region. This should be inaccessible to user threads at all times. This stack will be used when system calls are made. This should be fixed size for all threads, and must be large enough to handle any system call.
- A software interrupt or some kind of privilege elevation mechanism needs to be established. This is closely tied to how the \texttt{arch_syscall_invoke} macros are implemented. On system call, the appropriate handler function needs to be looked up in \texttt{_k_syscall_table}. Bad system call IDs should jump to the \texttt{K_SYSCALL_BAD} handler. Upon completion of the system call, care must be taken not to leak any register state back to user mode.

### GDB Stub

To enable GDB stub for remote debugging on a new architecture:

1. Create a new \texttt{gdbstub.h} header file under appropriate architecture include directory (\texttt{include/arch/\langle arch \rangle/gdbstub.h}).

   - Create a new struct \texttt{struct gdb_ctx} as the GDB context.
     - Must define a member named \texttt{exception} of type \texttt{unsigned int} to store the GDB exception reason. This value needs to be set before entering \texttt{z_gdb_main_loop()}.  
     - Architecture can define as many members as needed for GDB stub to function.
     - Pointer to this struct needs to be passed to \texttt{z_gdb_main_loop()}, where this pointer will be passed to other GDB stub functions.

2. Functions for entering and exiting GDB stub main loop.

   - If the architecture relies on interrupts to service breakpoints, interrupt service routines (ISR) need to be implemented, which will serve as the entry point to GDB stub main loop.
   - These functions need to save and restore context so code execution can continue as if no breakpoints have been encountered.
   - These functions need to call \texttt{z_gdb_main_loop()} after saving execution context to go into the GDB stub main loop to receive commands from GDB.
Before calling `z_gdb_main_loop()`, `gdb_ctx.exception` must be set to specify the exception reason.

3. Implement necessary functions to support GDB stub functionality:
   - `arch_gdb_init()`
     - This needs to initialize necessary bits to support GDB stub functionality, for example, setting up the GDB context and connecting debug interrupts.
     - This must stop code execution via architecture specific method (e.g. raising debug interrupts). This allows GDB to connect during boot.
   - `arch_gdb_contiue()`
     - This function is called when GDB sends a `c` or `continue` command to continue code execution.
   - `arch_gdb_step()`
     - This function is called when GDB sends a `si` or `stepi` command to execute one machine instruction, before returning to GDB prompt.
   - **Hardware register read/write functions:**
     - Since the GDB stub is running on the target, manipulation of hardware registers need to cached to avoid affecting the execution of GDB stub. Think of it as context switching, where the execution context is changed to the GDB stub. So that the register values of the running thread before context switch need to be stored. Manipulation of register values must only be done to this cached copy. The updated values will then be written to hardware registers before switching back to the previous running thread.
     - `arch_gdb_reg_readall()`
       - This collects all hardware register values that would appear in a `g/G` packets which will be sent back to GDB. The format of the G-packet is architecture specific. Consult GDB on what is expected.
       - Note that, for most architectures, a valid G-packet must be returned and sent to GDB. If a packet without incorrect length is sent to GDB, GDB will abort the debugging session.
     - `arch_gdb_reg_writeall()`
       - This takes a G-packet sent by GDB and populates the hardware registers with values from the G-packet.
     - `arch_gdb_reg_readone()`
       - This reads the value of one hardware register and sends the result to GDB.
     - `arch_gdb_reg_writeone()`
       - This writes the value of one hardware register received from GDB.
   - **Breakpoints:**
     - `arch_gdb_add_breakpoint()` and `arch_gdb_remove_breakpoint()`
     - GDB may decide to use software breakpoints which modifies the memory at the breakpoint locations to replace the instruction with software breakpoint or trap instructions. GDB will then restore the memory content once execution reaches the breakpoints. GDB supports this by default and there is usually no need to handle software breakpoints in the architecture code (where breakpoint type is 0).
     - Hardware breakpoints (type 1) are required if the code is in ROM or flash that cannot be modified at runtime. Consult the architecture datasheet on how to enable hardware breakpoints.
– If hardware breakpoints are not supported by the architecture, there is no need to implement these in architecture code. GDB will then rely on software breakpoints.

4. For architecture where certain memory regions are not accessible, an array named `gdb_mem_region_array` of type `gdb_mem_region` needs to be defined to specify regions that are accessible. For each array item:
   - `gdb_mem_region.start` specifies the start of a memory region.
   - `gdb_mem_region.end` specifies the end of a memory region.
   - `gdb_mem_region.attributes` specifies the permission of a memory region.
     - `GDB_MEM_REGION_RO`: region is read-only.
     - `GDB_MEM_REGION_RW`: region is read-write.
   - `gdb_mem_region.alignment` specifies read/write alignment of a memory region. Use 0 if there is no alignment requirement and read/write can be done byte-by-byte.

### API Reference

#### Timing

**group arch-timing**

**Unnamed Group**

```c
void arch_timing_init(void)
```

Initialize the timing subsystem.

Perform the necessary steps to initialize the timing subsystem.

**See also:**

timing_init()

```c
void arch_timing_start(void)
```

Signal the start of the timing information gathering.

Signal to the timing subsystem that timing information will be gathered from this point forward.

**See also:**

timing_start()

**Note:** Any call to `arch_timing_counter_get()` must be done between calls to `arch_timing_start()` and `arch_timing_stop()`, and on the same CPU core.

```c
void arch_timing_stop(void)
```

Signal the end of the timing information gathering.

Signal to the timing subsystem that timing information is no longer being gathered from this point forward.
See also:

```c
void timing_stop()
```

**Note:** Any call to `arch_timing_counter_get()` must be done between calls to `arch_timing_start()` and `arch_timing_stop()`, and on the same CPU core.

```c
 timing_t arch_timing_counter_get(void)
 Return timing counter.
```

See also:

```c
void timing_counter_get()
```

**Note:** Any call to `arch_timing_counter_get()` must be done between calls to `arch_timing_start()` and `arch_timing_stop()`, and on the same CPU core.

**Note:** Not all platforms have a timing counter with 64 bit precision. It is possible to see this value “go backwards” due to internal rollover. Timing code must be prepared to address the rollover (with platform-dependent code, e.g. by casting to a uint32_t before subtraction) or by using `arch_timing_cycles_get()` which is required to understand the distinction.

```c
Returns
Timing counter.
```

```c
uint64_t arch_timing_cycles_get(volatile timing_t *const start, volatile timing_t *const end)
Get number of cycles between start and end.
For some architectures or SoCs, the raw numbers from counter need to be scaled to obtain actual number of cycles, or may roll over internally. This function computes a positive-definite interval between two returned cycle values.

See also:

```c
void timing_cycles_get()
```

**Parameters**

- **start** – Pointer to counter at start of a measured execution.
- **end** – Pointer to counter at stop of a measured execution.

**Returns**
Number of cycles between start and end.

```c
uint64_t arch_timing_freq_get(void)
Get frequency of counter used (in Hz).
```

See also:

```c
void timing_freq_get()
```
Returns
Frequency of counter used for timing in Hz.

uint64_t arch_timing_cycles_to_ns(uint64_t cycles)
Convert number of cycles into nanoseconds.

See also:
 timing_cycles_to_ns()

Parameters
• cycles – Number of cycles

Returns
Converted time value

uint64_t arch_timing_cycles_to_ns_avg(uint64_t cycles, uint32_t count)
Convert number of cycles into nanoseconds with averaging.

See also:
 timing_cycles_to_ns_avg()

Parameters
• cycles – Number of cycles
  • count – Times of accumulated cycles to average over

Returns
Converted time value

uint32_t arch_timing_freq_get_mhz(void)
Get frequency of counter used (in MHz).

See also:
 timing_freq_get_mhz()

Returns
Frequency of counter used for timing in MHz.

Functions

void arch_busy_wait(uint32_t usec_to_wait)
Architecture-specific implementation of busy-waiting.

Parameters
• usec_to_wait – Wait period, in microseconds

static inline uint32_t arch_k_cycle_get_32(void)
Obtain the current cycle count, in units specified by CONFIG_SYS_CLOCK_HW_CYCLES_PER_SEC.

While this is historically specified as part of the architecture API, in practice virtually all platforms forward it to the sys_clock_cycle_get_32() API provided by the timer driver.
See also:

`k_cycle_get_32()`

**Returns**
The current cycle time. This should count up monotonically through the full 32 bit space, wrapping at 0xffffffff. Hardware with fewer bits of precision in the timer is expected to synthesize a 32 bit count.

```c
static inline uint64_t arch_k_cycle_get_64(void)
```

As for `arch_k_cycle_get_32()`, but with a 64 bit return value.

Not all timer hardware has a 64 bit timer, this needs to be implemented only if CONFIG_TIMER_HAS_64BIT_CYCLE_COUNTER is set.

See also:

`arch_k_cycle_get_32()`

**Returns**
The current cycle time. This should count up monotonically through the full 64 bit space, wrapping at $2^{64}$-1. Hardware with fewer bits of precision in the timer is generally not expected to implement this API.

**Threads**

`group arch-threads`

**Functions**

```c
void arch_new_thread(struct k_thread *thread, k_thread_stack_t *stack, char *stack_ptr,
                    k_thread_entry_t entry, void *p1, void *p2, void *p3)
```

Handle arch-specific logic for setting up new threads.

The stack and arch-specific thread state variables must be set up such that a later attempt to switch to this thread will succeed and we will enter `z_thread_entry` with the requested thread and arguments as its parameters.

At some point in this function's implementation, `z_setup_new_thread()` must be called with the true bounds of the available stack buffer within the thread's stack object.

The provided stack pointer is guaranteed to be properly aligned with respect to the CPU and ABI requirements. There may be space reserved between the stack pointer and the bounds of the stack buffer for initial stack pointer randomization and thread-local storage.

Fields in thread->base will be initialized when this is called.

**Parameters**

- **thread** – Pointer to uninitialized struct `k_thread`
- **stack** – Pointer to the stack object
- **stack_ptr** – Aligned initial stack pointer
- **entry** – Thread entry function
- **p1** – 1st entry point parameter
• p2 – 2nd entry point parameter
• p3 – 3rd entry point parameter

static inline void arch_switch(void *switch_to, void **switched_from)

Cooperative context switch primitive.

The action of arch_switch() should be to switch to a new context passed in the first argument, and save a pointer to the current context into the address passed in the second argument.

The actual type and interpretation of the switch handle is specified by the architecture. It is the same data structure stored in the “switch_handle” field of a newly-created thread in arch_new_thread(), and passed to the kernel as the “interrupted” argument to z_get_next_switch_handle().

Note that on SMP systems, the kernel uses the store through the second pointer as a synchronization point to detect when a thread context is completely saved (so another CPU can know when it is safe to switch). This store must be done AFTER all relevant state is saved, and must include whatever memory barriers or cache management code is required to be sure another CPU will see the result correctly.

The simplest implementation of arch_switch() is generally to push state onto the thread stack and use the resulting stack pointer as the switch handle. Some architectures may instead decide to use a pointer into the thread struct as the “switch handle” type. These can legally assume that the second argument to arch_switch() is the address of the switch_handle field of struct thread_base and can use an offset on this value to find other parts of the thread struct. For example a (C pseudocode) implementation of arch_switch() might look like:

```c
void arch_switch(void *switch_to, void **switched_from) { struct k_thread *new = switch_to; struct k_thread *old = CONTAINER_OF(switched_from, struct k_thread, switch_handle);

// save old context... *switched_from = old; // restore new context... }
```

Note that the kernel manages the switch_handle field for synchronization as described above. So it is not legal for architecture code to assume that it has any particular value at any other time. In particular it is not legal to read the field from the address passed in the second argument.

**Parameters**

• switch_to – Incoming thread’s switch handle
• switched_from – Pointer to outgoing thread's switch handle storage location, which must be updated.

void arch_switch_to_main_thread(struct k_thread *main_thread, char *stack_ptr, k_thread_entry_t _main)

Custom logic for entering main thread context at early boot.

Used by architectures where the typical trick of setting up a dummy thread in early boot context to “switch out” of isn’t workable.

**Parameters**

• main_thread – main thread object
• stack_ptr – Initial stack pointer
• _main – Entry point for application main function.

int arch_float_disable(struct k_thread *thread)

DISABLE floating point context preservation.
The function is used to disable the preservation of floating point context information for a particular thread.

**Note:** For ARM architecture, disabling floating point preservation may only be requested for the current thread and cannot be requested in ISRs.

**Return values**
- 0 – On success.
- -EINVAL – If the floating point disabling could not be performed.
- -ENOTSUP – If the operation is not supported

```c
int arch_float_enable(struct k_thread *thread, unsigned int options)
```

Enable floating point context preservation.

The function is used to enable the preservation of floating point context information for a particular thread. This API depends on each architecture implementation. If the architecture does not support enabling, this API will always be failed.

The `options` parameter indicates which floating point register sets will be used by the specified thread. Currently it is used by x86 only.

**Parameters**
- `thread` – ID of thread.
- `options` – architecture dependent options

**Return values**
- 0 – On success.
- -EINVAL – If the floating point enabling could not be performed.
- -ENOTSUP – If the operation is not supported

---

**Functions**

```c
size_t arch_tls_stack_setup(struct k_thread *new_thread, char *stack_ptr)
```

Setup Architecture-specific TLS area in stack.

This sets up the stack area for thread local storage. The structure inside TLS area is architecture specific.

**Parameters**
- `new_thread` – New thread object
- `stack_ptr` – Stack pointer

**Returns**
Number of bytes taken by the TLS area

---

**Power Management**

---

7.7. Porting
Functions

FUNC_NORETURN void arch_system_halt(unsigned int reason)
    Halt the system, optionally propagating a reason code.

void arch_cpu_idle(void)
    Power save idle routine.
    This function will be called by the kernel idle loop or possibly within an implementa-
    tion of z_pm_save_idle in the kernel when the '_pm_save_flag' variable is non-zero.
    Architectures that do not implement power management instructions may immedi-
    ately return, otherwise a power-saving instruction should be issued to wait for an in-
    terrupt.

    See also:
    k_cpu_idle()

    Note: The function is expected to return after the interrupt that has caused the CPU
to exit power-saving mode has been serviced, although this is not a firm requirement.

void arch_cpu_atomic_idle(unsigned int key)
    Atomically re-enable interrupts and enter low power mode.
    The requirements for arch_cpu_atomic_idle() are as follows:

    a. Enabling interrupts and entering a low-power mode needs to be atomic, i.e. there
       should be no period of time where interrupts are enabled before the processor
       enters a low-power mode. See the comments in k_lifo_get(), for example, of the
       race condition that occurs if this requirement is not met.

    b. After waking up from the low-power mode, the interrupt lockout state must be
       restored as indicated in the 'key' input parameter.

    See also:
    k_cpu_atomic_idle()

    Parameters
    • key – Lockout key returned by previous invocation of arch_irq_lock()

Symmetric Multi-Processing

    group arch-smp

    Typedefs

typedef FUNC_NORETURN void (*arch_cpustart_t)(void *data)
    Per-cpu entry function.

    Param data
    context parameter, implementation specific
Functions

void arch_start_cpu(int cpu_num, k_thread_stack_t *stack, int sz, arch_cpustart_t fn, void *arg)

  Start a numbered CPU on a MP-capable system.
  This starts and initializes a specific CPU. The main thread on startup is running on
  CPU zero, other processors are numbered sequentially. On return from this function,
  the CPU is known to have begun operating and will enter the provided function. Its
  interrupts will be initialized but disabled such that irq_unlock() with the provided key
  will work to enable them.
  Normally, in SMP mode this function will be called by the kernel initialization and
  should not be used as a user API. But it is defined here for special-purpose apps which
  want Zephyr running on one core and to use others for design-specific processing.

Parameters
  • cpu_num – Integer number of the CPU
  • stack – Stack memory for the CPU
  • sz – Stack buffer size, in bytes
  • fn – Function to begin running on the CPU.
  • arg – Untyped argument to be passed to “fn”

bool arch_cpu_active(int cpu_num)
  Return CPU power status.

Parameters
  • cpu_num – Integer number of the CPU

static inline struct _cpu *arch_curr_cpu(void)
  Return the CPU struct for the currently executing CPU.

static inline uint32_t arch_proc_id(void)
  Processor hardware ID.
  Most multiprocessor architectures have a low-level unique ID value associated with
  the current CPU that can be retrieved rapidly and efficiently in kernel context. Note
  that while the numbering of the CPUs is guaranteed to be unique, the values are
  platform-defined. In particular, they are not guaranteed to match Zephyr’s own se-
  quential CPU IDs (even though on some platforms they do).

Note: There is an inherent race with this API: the system may preempt the current
thread and migrate it to another CPU before the value is used. Safe usage requires
knowing the migration is impossible (e.g. because the code is in interrupt context,
holds a spinlock, or cannot migrate due to k_cpu_mask state).

Returns
  Unique ID for currently-executing CPU

void arch_sched_ipi(void)
  Broadcast an interrupt to all CPUs.
  This will invoke z_sched_ipi() on other CPUs in the system.
static inline unsigned int arch_num_cpus(void)
    Returns the number of CPUs.
    For most systems this will be the same as CONFIG_MP_MAX_NUM_CPUS, however some systems may determine this at runtime instead.
    Returns
    the number of CPUs

Interrupts

Functions

static inline bool arch_is_in_isr(void)
    Test if the current context is in interrupt context.
    XXX: This is inconsistently handled among arches wrt exception context See: #17656
    Returns
    true if we are in interrupt context

static inline unsigned int arch_irq_lock(void)
    Lock interrupts on the current CPU.

    See also:
    irq_lock()

static inline void arch_irq_unlock(unsigned int key)
    Unlock interrupts on the current CPU.

    See also:
    irq_unlock()

static inline bool arch_irq_unlocked(unsigned int key)
    Test if calling arch_irq_unlock() with this key would unlock irqs.
    Parameters
        • key – value returned by arch_irq_lock()
    Returns
    true if interrupts were unlocked prior to the arch_irq_lock() call that produced the key argument.

void arch_irq_disable(unsigned int irq)
    Disable the specified interrupt line.

    See also:
    irq_disable()

Note: The behavior of interrupts that arrive after this call returns and before the corresponding call to arch_irq_enable() is undefined. The hardware is not required to latch
and deliver such an interrupt, though on some architectures that may work. Other architectures will simply lose such an interrupt and never deliver it. Many drivers and subsystems are not tolerant of such dropped interrupts and it is the job of the application layer to ensure that behavior remains correct.

```c
void arch_irq_enable(unsigned int irq)
    Enable the specified interrupt line.

See also:
    irq_enable()
```

```c
int arch_irq_is_enabled(unsigned int irq)
    Test if an interrupt line is enabled.

See also:
    irq_is_enabled()
```

```c
int arch_irq_connect_dynamic(unsigned int irq, unsigned int priority, void (*routine)(const void *parameter), const void *parameter, uint32_t flags)
    Arch-specific hook to install a dynamic interrupt.
Parameters
    • irq – IRQ line number
    • priority – Interrupt priority
    • routine – Interrupt service routine
    • parameter – ISR parameter
    • flags – Arch-specific IRQ configuration flag
Returns
    The vector assigned to this interrupt
```

```c
int arch_irq_disconnect_dynamic(unsigned int irq, unsigned int priority, void (*routine)(const void *parameter), const void *parameter, uint32_t flags)
    Arch-specific hook to dynamically uninstall a shared interrupt.
If the interrupt is not being shared, then the associated _sw_isr_table entry will be replaced by (NULL, z_irq_spurious) (default entry).
Parameters
    • irq – IRQ line number
    • priority – Interrupt priority
    • routine – Interrupt service routine
    • parameter – ISR parameter
    • flags – Arch-specific IRQ configuration flag
Returns
    0 in case of success, negative value otherwise
```
unsigned int arch_irq_allocate(void)
Arch-specific hook for allocating IRQs.

Note: disable/enable IRQ relevantly inside the implementation of such function to avoid concurrency issues. Also, an allocated IRQ is assumed to be used thus a following

See also:
arch_irq_is_used() should return true.

Returns
The newly allocated IRQ or UINT_MAX on error.

void arch_irq_set_used(unsigned int irq)
Arch-specific hook for declaring an IRQ being used.

Note: disable/enable IRQ relevantly inside the implementation of such function to avoid concurrency issues.

Parameters
• irq – the IRQ to declare being used

bool arch_irq_is_used(unsigned int irq)
Arch-specific hook for checking if an IRQ is being used already.

Parameters
• irq – the IRQ to check

Returns
true if being, false otherwise

Userspace

group arch-userspace

Functions

static inline uintptr_t arch_syscall_invoke0(uintptr_t call_id)
Invoke a system call with 0 arguments.

No general-purpose register state other than return value may be preserved when transitioning from supervisor mode back down to user mode for security reasons.

It is required that all arguments be stored in registers when elevating privileges from user to supervisor mode.

Processing of the syscall takes place on a separate kernel stack. Interrupts should be enabled when invoking the system call marshaller from the dispatch table. Thread preemption may occur when handling system calls.

Call IDs are untrusted and must be bounds-checked, as the value is used to index the system call dispatch table, containing function pointers to the specific system call code.

Parameters
• call_id – System call ID

Returns
Return value of the system call. Void system calls return 0 here.
static inline uintptr_t arch_syscall_invoke1(uintptr_t arg1, uintptr_t call_id)
    Invoke a system call with 1 argument.

See also:
arch_syscall_invoke0()

Parameters
• arg1 – First argument to the system call.
• call_id – System call ID, will be bounds-checked and used to reference
  kernel-side dispatch table

Returns
    Return value of the system call. Void system calls return 0 here.

static inline uintptr_t arch_syscall_invoke2(uintptr_t arg1, uintptr_t arg2, uintptr_t call_id)
    Invoke a system call with 2 arguments.

See also:
arch_syscall_invoke0()

Parameters
• arg1 – First argument to the system call.
• arg2 – Second argument to the system call.
• call_id – System call ID, will be bounds-checked and used to reference
  kernel-side dispatch table

Returns
    Return value of the system call. Void system calls return 0 here.

static inline uintptr_t arch_syscall_invoke3(uintptr_t arg1, uintptr_t arg2, uintptr_t arg3, uintptr_t call_id)
    Invoke a system call with 3 arguments.

See also:
arch_syscall_invoke0()

Parameters
• arg1 – First argument to the system call.
• arg2 – Second argument to the system call.
• arg3 – Third argument to the system call.
• call_id – System call ID, will be bounds-checked and used to reference
  kernel-side dispatch table

Returns
    Return value of the system call. Void system calls return 0 here.
static inline uintptr_t arch_syscall_invoke4(uintptr_t arg1, uintptr_t arg2, uintptr_t arg3, uintptr_t arg4, uintptr_t call_id)

Invoke a system call with 4 arguments.

See also:
arch_syscall_invoke0()

Parameters
• arg1 – First argument to the system call.
• arg2 – Second argument to the system call.
• arg3 – Third argument to the system call.
• arg4 – Fourth argument to the system call.
• call_id – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

Returns
Return value of the system call. Void system calls return 0 here.

static inline uintptr_t arch_syscall_invoke5(uintptr_t arg1, uintptr_t arg2, uintptr_t arg3, uintptr_t arg4, uintptr_t arg5, uintptr_t call_id)

Invoke a system call with 5 arguments.

See also:
arch_syscall_invoke0()

Parameters
• arg1 – First argument to the system call.
• arg2 – Second argument to the system call.
• arg3 – Third argument to the system call.
• arg4 – Fourth argument to the system call.
• arg5 – Fifth argument to the system call.
• call_id – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

Returns
Return value of the system call. Void system calls return 0 here.

static inline uintptr_t arch_syscall_invoke6(uintptr_t arg1, uintptr_t arg2, uintptr_t arg3, uintptr_t arg4, uintptr_t arg5, uintptr_t arg6, uintptr_t call_id)

Invoke a system call with 6 arguments.

See also:
arch_syscall_invoke0()

Parameters
• arg1 – First argument to the system call.
• **arg2** – Second argument to the system call.
• **arg3** – Third argument to the system call.
• **arg4** – Fourth argument to the system call.
• **arg5** – Fifth argument to the system call.
• **arg6** – Sixth argument to the system call.
• **call_id** – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

**Returns**
Return value of the system call. Void system calls return 0 here.

static inline bool arch_is_user_context(void)
Indicate whether we are currently running in user mode.

**Returns**
True if the CPU is currently running with user permissions

int arch_mem_domain_max_partitions_get(void)
Get the maximum number of partitions for a memory domain.

**Returns**
Max number of partitions, or -1 if there is no limit

int arch_buffer_validate(void *addr, size_t size, int write)
Check memory region permissions.

Given a memory region, return whether the current memory management hardware configuration would allow a user thread to read/write that region. Used by system calls to validate buffers coming in from userspace.

Notes: The function is guaranteed to never return validation success, if the entire buffer area is not user accessible.

The function is guaranteed to correctly validate the permissions of the supplied buffer, if the user access permissions of the entire buffer are enforced by a single, enabled memory management region.

In some architectures the validation will always return failure if the supplied memory buffer spans multiple enabled memory management regions (even if all such regions permit user access).

**Warning:** Buffer of size zero (0) has undefined behavior.

**Parameters**
• **addr** – start address of the buffer
• **size** – the size of the buffer
• **write** – If non-zero, additionally check if the area is writable. Otherwise, just check if the memory can be read.

**Returns**
nonzero if the permissions don’t match.

size_t arch_virt_region_align(uintptr_t phys, size_t size)
Get the optimal virtual region alignment to optimize the MMU table layout.
Some MMU HW requires some region to be aligned to some of the intermediate block alignment in order to reduce table usage. This call returns the optimal virtual address alignment in order to permit such optimization in the following MMU mapping call.

**Parameters**

- **phys** – [in] Physical address of region to be mapped, aligned to `CONFIG_MMU_PAGE_SIZE`
- **size** – [in] Size of region to be mapped, aligned to `CONFIG_MMU_PAGE_SIZE`

**Returns**

Alignment to apply on the virtual address of this region

```c
FUNC_NORETURN void arch_user_mode_enter(k_thread_entry_t user_entry, void *p1, void *p2, void *p3)
```

Perform a one-way transition from supervisor to kernel mode.

Implementations of this function must do the following:

- Reset the thread's stack pointer to a suitable initial value. We do not need any prior context since this is a one-way operation.
- Set up any kernel stack region for the CPU to use during privilege elevation
- Put the CPU in whatever its equivalent of user mode is
- Transfer execution to `arch_new_thread()` passing along all the supplied arguments, in user mode.

**Parameters**

- **user_entry** – Entry point to start executing as a user thread
- **p1** – 1st parameter to user thread
- **p2** – 2nd parameter to user thread
- **p3** – 3rd parameter to user thread

```c
FUNC_NORETURN void arch_syscall_oops(void *ssf)
```

Induce a kernel oops that appears to come from a specific location.

Normally, `k_oops()` generates an exception that appears to come from the call site of the `k_oops()` itself.

However, when validating arguments to a system call, if there are problems we want the oops to appear to come from where the system call was invoked and not inside the validation function.

**Parameters**

- **ssf** – System call stack frame pointer. This gets passed as an argument to `__k_syscall_handler_t` functions and its contents are completely architecture specific.

```c
size_t arch_user_string_nlen(const char *s, size_t maxsize, int *err)
```

Safely take the length of a potentially bad string.

This must not fault, instead the `err` parameter must have `-1` written to it. This function otherwise should work exactly like `libc_strnlen()`. On success `err` should be set to 0.

**Parameters**

- **s** – String to measure
- **maxsize** – Max length of the string
• **err** – Error value to write

**Returns**

Length of the string, not counting NULL byte, up to maxsize

```c
static inline bool arch_mem_coherent(void *ptr)
```

Detect memory coherence type.

Required when ARCH_HAS_COHERENCE is true. This function returns true if the byte pointed to lies within an architecture-defined “coherence region” (typically implemented with uncached memory) and can safely be used in multiprocessor code without explicit flush or invalidate operations.

**Note:** The result is for only the single byte at the specified address, this API is not required to check region boundaries or to expect aligned pointers. The expectation is that the code above will have queried the appropriate address(es).

```c
static inline void arch_cohe_re_stacks(struct k_thread *old_thread, void *old_switch_handle, struct k_thread *new_thread)
```

Ensure cache coherence prior to context switch.

Required when ARCH_HAS_COHERENCE is true. On cache-incoherent multiprocessor architectures, thread stacks are cached by default for performance reasons. They must therefore be flushed appropriately on context switch. The rules are:

a. The region containing live data in the old stack (generally the bytes between the current stack pointer and the top of the stack memory) must be flushed to underlying storage so a new CPU that runs the same thread sees the correct data. This must happen before the assignment of the switch_handle field in the thread struct which signals the completion of context switch.

b. Any data areas to be read from the new stack (generally the same as the live region when it was saved) should be invalidated (and NOT flushed!) in the data cache. This is because another CPU may have run or re-initialized the thread since this CPU suspended it, and any data present in cache will be stale.

**Note:** The kernel will call this function during interrupt exit when a new thread has been chosen to run, and also immediately before entering `arch_switch()` to effect a code-driven context switch. In the latter case, it is very likely that more data will be written to the old_thread stack region after this function returns but before the completion of the switch. Simply flushing naively here is not sufficient on many architectures and coordination with the `arch_switch()` implementation is likely required.

**Parameters**

- **old_thread** – The old thread to be flushed before being allowed to run on other CPUs.

- **old_switch_handle** – The switch handle to be stored into old_thread (it will not be valid until the cache is flushed so is not present yet). This will be NULL if inside `z_swap()` (because the `arch_switch()` has not saved it yet).

- **new_thread** – The new thread to be invalidated before it runs locally.

---

**Memory Management**

---

7.7. Porting
**group arch-mmu**

**Defines**

**ARCH_DATA_PAGE_ACCESSSED**
Bit indicating the data page was accessed since the value was last cleared.
Used by marking eviction algorithms. Safe to set this if uncertain.
This bit is undefined if ARCH_DATA_PAGE_LOADED is not set.

**ARCH_DATA_PAGE_DIRTY**
Bit indicating the data page, if evicted, will need to be paged out.
Set if the data page was modified since it was last paged out, or if it has never been
paged out before. Safe to set this if uncertain.
This bit is undefined if ARCH_DATA_PAGE_LOADED is not set.

**ARCH_DATA_PAGE_LOADED**
Bit indicating that the data page is loaded into a physical page frame.
If un-set, the data page is paged out or not mapped.

**ARCH_DATA_PAGE_NOT_MAPPED**
If ARCH_DATA_PAGE_LOADED is un-set, this will indicate that the page is not mapped
at all.
This bit is undefined if ARCH_DATA_PAGE_LOADED is set.

** Enums**

enum **arch_page_location**
Status of a particular page location.

*Values:*

enumerator **ARCH_PAGE_LOCATION_PAGED_OUT**
The page has been evicted to the backing store.

enumerator **ARCH_PAGE_LOCATION_PAGED_IN**
The page is resident in memory.

enumerator **ARCH_PAGE_LOCATION_BAD**
The page is not mapped.

** Functions**
void arch_mem_map(void *virt, uintptr_t phys, size_t size, uint32_t flags)
Map physical memory into the virtual address space.

This is a low-level interface to mapping pages into the address space. Behavior when providing unaligned addresses/sizes is undefined, these are assumed to be aligned to CONFIG_MMU_PAGE_SIZE.

The core kernel handles all management of the virtual address space; by the time we invoke this function, we know exactly where this mapping will be established. If the page tables already had mappings installed for the virtual memory region, these will be overwritten.

If the target architecture supports multiple page sizes, currently only the smallest page size will be used.

The memory range itself is never accessed by this operation.

This API must be safe to call in ISRs or exception handlers. Calls to this API are assumed to be serialized, and indeed all usage will originate from kernel/mm.c which handles virtual memory management.

Architectures are expected to pre-allocate page tables for the entire address space, as defined by CONFIG_KERNEL_VM_BASE and CONFIG_KERNEL_VM_SIZE. This operation should never require any kind of allocation for paging structures.

Validation of arguments should be done via assertions.

This API is part of infrastructure still under development and may change.

Parameters

- **virt** – Page-aligned Destination virtual address to map
- **phys** – Page-aligned Source physical address to map
- **size** – Page-aligned size of the mapped memory region in bytes
- **flags** – Caching, access and control flags, see K_MAP_* macros

void arch_mem_unmap(void *addr, size_t size)
Remove mappings for a provided virtual address range.

This is a low-level interface for un-mapping pages from the address space. When this completes, the relevant page table entries will be updated as if no mapping was ever made for that memory range. No previous context needs to be preserved. This function must update mappings in all active page tables.

Behavior when providing unaligned addresses/sizes is undefined, these are assumed to be aligned to CONFIG_MMU_PAGE_SIZE.

Behavior when providing an address range that is not already mapped is undefined.

This function should never require memory allocations for paging structures, and it is not necessary to free any paging structures. Empty page tables due to all contained entries being un-mapped may remain in place.

Implementations must invalidate TLBs as necessary.

This API is part of infrastructure still under development and may change.

Parameters

- **addr** – Page-aligned base virtual address to un-map
- **size** – Page-aligned region size
int arch_page_phys_get(void *virt, uintptr_t *phys)

Get the mapped physical memory address from virtual address.

The function only needs to query the current set of page tables as the information it reports must be common to all of them if multiple page tables are in use. If multiple page tables are active it is unnecessary to iterate over all of them.

Unless otherwise specified, virtual pages have the same mappings across all page tables. Calling this function on data pages that are exceptions to this rule (such as the scratch page) is undefined behavior. Just check the currently installed page tables and return the information in that.

Parameters

• virt – Page-aligned virtual address
• phys – [out] Mapped physical address (can be NULL if only checking if virtual address is mapped)

Return values

• 0 – if mapping is found and valid
• -EFAULT – if virtual address is not mapped

void arch_reserved_pages_update(void)

Update page frame database with reserved pages.

Some page frames within system RAM may not be available for use. A good example of this is reserved regions in the first megabyte on PC-like systems.

Implementations of this function should mark all relevant entries in z_page_frames with K_PAGE_FRAME_RESERVED. This function is called at early system initialization with mm_lock held.

void arch_mem_page_out(void *addr, uintptr_t location)

Update all page tables for a paged-out data page.

This function:

• Sets the data page virtual address to trigger a fault if accessed that can be distinguished from access violations or un-mapped pages.
• Saves the provided location value so that it can retrieved for that data page in the page fault handler.
• The location value semantics are undefined here but the value will be always be page-aligned. It could be 0.

If multiple page tables are in use, this must update all page tables. This function is called with interrupts locked.

Calling this function on data pages which are already paged out is undefined behavior.

This API is part of infrastructure still under development and may change.

void arch_mem_page_in(void *addr, uintptr_t phys)

Update all page tables for a paged-in data page.

This function:

• Maps the specified virtual data page address to the provided physical page frame address, such that future memory accesses will function as expected. Access and caching attributes are undisturbed.
• Clears any accounting for “accessed” and “dirty” states.
If multiple page tables are in use, this must update all page tables. This function is called with interrupts locked.

Calling this function on data pages which are already paged in is undefined behavior.

This API is part of infrastructure still under development and may change.

```c
void arch_mem_scratch(uintptr_t phys)
```

Update current page tables for a temporary mapping.

Map a physical page frame address to a special virtual address Z_SCRATCH_PAGE, with read/write access to supervisor mode, such that when this function returns, the calling context can read/write the page frame's contents from the Z_SCRATCH_PAGE address.

This mapping only needs to be done on the current set of page tables, as it is only used for a short period of time exclusively by the caller. This function is called with interrupts locked.

This API is part of infrastructure still under development and may change.

```c
enum arch_page_location arch_page_location_get(void *addr, uintptr_t *location)
```

Fetch location information about a page at a particular address.

The function only needs to query the current set of page tables as the information it reports must be common to all of them if multiple page tables are in use. If multiple page tables are active it is unnecessary to iterate over all of them. This may allow certain types of optimizations (such as reverse page table mapping on x86).

This function is called with interrupts locked, so that the reported information can’t become stale while decisions are being made based on it.

Unless otherwise specified, virtual data pages have the same mappings across all page tables. Calling this function on data pages that are exceptions to this rule (such as the scratch page) is undefined behavior. Just check the currently installed page tables and return the information in that.

**Parameters**

- `addr` – Virtual data page address that took the page fault
- `location` – [out] In the case of ARCH_PAGE_FAULT_PAGED_OUT, the backing store location value used to retrieve the data page. In the case of ARCH_PAGE_FAULT_PAGED_IN, the physical address the page is mapped to.

**Return values**

- ARCH_PAGE_FAULT_PAGED_OUT – The page was evicted to the backing store.
- ARCH_PAGE_FAULT_PAGED_IN – The data page is resident in memory.
- ARCH_PAGE_FAULT_BAD – The page is un-mapped or otherwise has had invalid access

```c
uintptr_t arch_page_info_get(void *addr, uintptr_t *location, bool clear_accessed)
```

Retrieve page characteristics from the page table(s)

The architecture is responsible for maintaining “accessed” and “dirty” states of data pages to support marking eviction algorithms. This can either be directly supported by hardware or emulated by modifying protection policy to generate faults on reads or writes. In all cases the architecture must maintain this information in some way.

For the provided virtual address, report the logical OR of the accessed and dirty states for the relevant entries in all active page tables in the system if the page is mapped and not paged out.
If clear_accessed is true, the ARCH_DATA_PAGE_ACCESSED flag will be reset. This function will report its prior state. If multiple page tables are in use, this function clears accessed state in all of them.

This function is called with interrupts locked, so that the reported information can’t become stale while decisions are being made based on it.

The return value may have other bits set which the caller must ignore.

Clearing accessed state for data pages that are not ARCH_DATA_PAGE_LOADED is undefined behavior.

ARCH_DATA_PAGE_DIRTY and ARCH_DATA_PAGE_ACCESSED bits in the return value are only significant if ARCH_DATA_PAGE_LOADED is set, otherwise ignore them.

ARCH_DATA_PAGE_NOT_MAPPED bit in the return value is only significant if ARCH_DATA_PAGE_LOADED is un-set, otherwise ignore it.

Unless otherwise specified, virtual data pages have the same mappings across all page tables. Calling this function on data pages that are exceptions to this rule (such as the scratch page) is undefined behavior.

This API is part of infrastructure still under development and may change.

**Parameters**

- `addr` – Virtual address to look up in page tables
- `location` – [out] If non-NULL, updated with either physical page frame address or backing store location depending on ARCH_DATA_PAGE_LOADED state. This is not touched if ARCH_DATA_PAGE_NOT_MAPPED.
- `clear_accessed` – Whether to clear ARCH_DATA_PAGE_ACCESSED state

**Return values**

Value – with ARCH_DATA_PAGE_* bits set reflecting the data page configuration

---

**Miscellaneous Architecture APIs**

*group arch-misc*

**Functions**

```c
int arch_printk_char_out(int c)
```

Early boot console output hook.

Definition of this function is optional. If implemented, any invocation of printk() (or logging calls with CONFIG_LOG_MODE_MINIMAL which are backed by printk) will default to sending characters to this function. It is useful for early boot debugging before main serial or console drivers come up.

This can be overridden at runtime with __printk_hook_install().

The default __weak implementation of this does nothing.

**Parameters**

- `c` – Character to print

**Returns**

The character printed
static inline void arch_kernel_init(void)
    Architecture-specific kernel initialization hook.
    This function is invoked near the top of _Cstart, for additional architecture-specific setup before the rest of the kernel is brought up.

static inline void arch_nop(void)
    Do nothing and return.
    Yawn.

GDB Stub APIs

*group* arch-gdbstub

**Functions**

void arch_gdb_init(void)
    Architecture layer debug start.
    This function is called by gdb_init()

void arch_gdb_continue(void)
    Continue running program.
    Continue software execution.

void arch_gdb_step(void)
    Continue with one step.
    Continue software execution until reaches the next statement.

size_t arch_gdb_reg_readall(struct gdb_ctx *ctx, uint8_t *buf, size_t buflen)
    Read all registers, and outputs as hexadecimal string.
    This reads all CPU registers and outputs as hexadecimal string. The output string must be parsable by GDB.

    **Parameters**
    • *ctx* – GDB context
    • *buf* – Buffer to output hexadecimal string.
    • *buflen* – Length of buffer.

    **Returns**
    Length of hexadecimal string written. Return 0 if error or not supported.

size_t arch_gdb_reg_writeall(struct gdb_ctx *ctx, uint8_t *hex, size_t hexlen)
    Take a hexadecimal string and update all registers.
    This takes in a hexadecimal string as presented from GDB, and updates all CPU registers with new values.

    **Parameters**
    • *ctx* – GDB context
    • *hex* – Input hexadecimal string.
    • *hexlen* – Length of hexadecimal string.

    **Returns**
    Length of hexadecimal string parsed. Return 0 if error or not supported.
size_t arch_gdb_reg_readone(struct gdb_ctx *ctx, uint8_t *buf, size_t buflen, uint32_t regno)

Read one register, and outputs as hexadecimal string.
This reads one CPU register and outputs as hexadecimal string. The output string must be parsable by GDB.

Parameters
• ctx – GDB context
• buf – Buffer to output hexadecimal string.
• buflen – Length of buffer.
• regno – Register number

Returns
Length of hexadecimal string written. Return 0 if error or not supported.

size_t arch_gdb_reg_writeone(struct gdb_ctx *ctx, uint8_t *hex, size_t hexlen, uint32_t regno)

Take a hexadecimal string and update one register.
This takes in a hexadecimal string as presented from GDB, and updates one CPU registers with new value.

Parameters
• ctx – GDB context
• hex – Input hexadecimal string.
• hexlen – Length of hexadecimal string.
• regno – Register number

Returns
Length of hexadecimal string parsed. Return 0 if error or not supported.

int arch_gdb_add_breakpoint(struct gdb_ctx *ctx, uint8_t type, uintptr_t addr, uint32_t kind)

Add breakpoint or watchpoint.

Parameters
• ctx – GDB context
• type – Breakpoint or watchpoint type
• addr – Address of breakpoint or watchpoint
• kind – Size of breakpoint/watchpoint in bytes

Return values
• 0 – Operation successful
• -1 – Error encountered
• -2 – Not supported

int arch_gdb_remove_breakpoint(struct gdb_ctx *ctx, uint8_t type, uintptr_t addr, uint32_t kind)

Remove breakpoint or watchpoint.

Parameters
• ctx – GDB context
• type – Breakpoint or watchpoint type
• **addr** – Address of breakpoint or watchpoint
• **kind** – Size of breakpoint/watchpoint in bytes

**Return values**
• 0 – Operation successful
• -1 – Error encountered
• -2 – Not supported

### 7.7.2 Board Porting Guide

To add Zephyr support for a new board, you at least need a *board directory* with various files in it. Files in the board directory inherit support for at least one SoC and all of its features. Therefore, Zephyr must support your SoC as well.

**Boards, SoCs, etc.**

Zephyr’s hardware support hierarchy has these layers, from most to least specific:
• Board: a particular CPU instance and its peripherals in a concrete hardware specification
• SoC: the exact system on a chip the board’s CPU is part of
• SoC series: a smaller group of tightly related SoCs
• SoC family: a wider group of SoCs with similar characteristics
• CPU core: a particular CPU in an architecture
• Architecture: an instruction set architecture

You can visualize the hierarchy like this:

![Configuration Hierarchy Diagram](image-url)

**Fig. 4: Configuration Hierarchy**
Here are some examples. Notice how the SoC series and family levels are not always used.

**Make sure your SoC is supported**

Start by making sure your SoC is supported by Zephyr. If it is, it's time to Create your board directory. If you don’t know, try:

- checking boards for names that look relevant, and reading individual board documentation to find out for sure.
- asking your SoC vendor

If you need to add SoC, CPU core, or even architecture support, this is the wrong page, but here is some general advice.

**Architecture**  See [Architecture Porting Guide](#).

**CPU Core**  CPU core support files go in core subdirectories under `arch`, e.g. `arch/x86/core`.

See [Install a Toolchain](#) for information about toolchains (compiler, linker, etc.) supported by Zephyr. If you need to support a new toolchain, [Build and Configuration Systems](#) is a good place to start learning about the build system. Please reach out to the community if you are looking for advice or want to collaborate on toolchain support.

**SoC**  Zephyr SoC support files are in architecture-specific subdirectories of `soc`. They are generally grouped by SoC family.

When adding a new SoC family or series for a vendor that already has SoC support within Zephyr, please try to extract common functionality into shared files to avoid duplication. If there is no support for your vendor yet, you can add it in a new directory `zephyr/soc/<YOUR-ARCH>/ <YOUR-SOC>`; please use self-explanatory directory names.

**Create your board directory**

Once you’ve found an existing board that uses your SoC, you can usually start by copy/pasting its board directory and changing its contents for your hardware.

You need to give your board a unique name. Run `west boards` for a list of names that are already taken, and pick something new. Let’s say your board is called `plank` (please don’t actually use that name).

Start by creating the board directory `zephyr/boards/<ARCH>/plank`, where `<ARCH>` is your SoC's architecture subdirectory. (You don’t have to put your board directory in the zephyr repository, but it’s the easiest way to get started. See [Custom Board, Devicetree and SOC Definitions](#) for documentation on moving your board directory to a separate repository once it’s working.)
Note: The board directory name does not need to match the name of the board. Multiple boards can even be defined in one directory. For example, for boards with multi-core SoC, a logical board might be created for each core following the naming scheme <board>_<soc-core>, with definitions for all of these different boards defined inside the same directory. This and similar schemes are common for upstream vendor boards.

Your board directory should look like this:

```
boards/<ARCH>/plank
    ├── board.cmake
    ├── CMakeLists.txt
    │   └── plank.png
    │       └── index.rst
    ├── Kconfig.board
    ├── Kconfig.defconfig
    ├── plank_defconfig
    ├── plank.dts
    └── plank.yaml
```

Replace plank with your board’s name, of course.

The mandatory files are:

1. plank.dts: a hardware description in devicetree format. This declares your SoC, connectors, and any other hardware components such as LEDs, buttons, sensors, or communication peripherals (USB, BLE controller, etc).

2. Kconfig.board, Kconfig.defconfig, plank_defconfig: software configuration in Configuration System (Kconfig) formats. This provides default settings for software features and peripheral drivers.

The optional files are:

- board.cmake: used for Flash and debug support
- CMakeLists.txt: if you need to add additional source files to your build.
- doc/index.rst, doc/plank.png: documentation for and a picture of your board. You only need this if you’re Contributing your board to Zephyr.
- plank.yaml: a YAML file with miscellaneous metadata used by the Test Runner (Twister).

Write your devicetree

The devicetree file boards/<ARCH>/plank/plank.dts describes your board hardware in the Devicetree Source (DTS) format (as usual, change plank to your board’s name). If you’re new to devicetree, see Introduction to devicetree.

In general, plank.dts should look like this:

```
/dts-v1/;
#include <your_soc_vendor/your_soc.dtsi>
/
   { model = "A human readable name";
     compatible = "yourcompany,plank";
   }
```

(continues on next page)
chosen {
    zephyr,console = &your_uart_console;
    zephyr,sram = &your_memory_node;
    /* other chosen settings for your hardware */
}

/* Your board-specific hardware: buttons, LEDs, sensors, etc. */
leds {
    compatible = "gpio-leds";
    led0: led_0 {
        gpios = < /* GPIO your LED is hooked up to */ >;
        label = "LED 0";
    };
    /* ... other LEDs ... */
}

buttons {
    compatible = "gpio-keys";
    /* ... your button definitions ... */
}

/* These aliases are provided for compatibility with samples */
aliases {
    led0 = &led0; /* now you support the blinky sample! */
    /* other aliases go here */
}

&some_peripheral_you_want_to_enable { /* like a GPIO or SPI controller */
    status = "okay";
};

&another_peripheral_you_want {
    status = "okay";
};

If you're in a hurry, simple hardware can usually be supported by copy/paste followed by trial and error. If you want to understand details, you will need to read the rest of the devicetree documentation and the devicetree specification.

Example: FRDM-K64F and Hexiwear K64  This section contains concrete examples related to writing your board's devicetree.

The FRDM-K64F and Hexiwear K64 board devicetrees are defined in frdm_k64fs.dts and hexiwear_k64.dts respectively. Both boards have NXP SoCs from the same Kinetis SoC family, the K6X.

Common devicetree definitions for K6X are stored in nxp_k6x.dtsi, which is included by both board .dts files. nxp_k6x.dtsi in turn includes armv7-m.dtsi, which has common definitions for Arm v7-M cores.

Since nxp_k6x.dtsi is meant to be generic across K6X-based boards, it leaves many devices disabled by default using status properties. For example, there is a CAN controller defined as follows (with unimportant parts skipped):

can0: can@40024000 {
    ...
It is up to the board .dts or application overlay files to enable these devices as desired, by setting `status = "okay"`. The board .dts files are also responsible for any board-specific configuration of the device, such as adding nodes for on-board sensors, LEDs, buttons, etc.

For example, FRDM-K64 (but not Hexiwear K64) .dts enables the CAN controller and sets the bus speed:

```plaintext
&can0 {
    status = "okay";
    bus-speed = <125000>;
};
```

The &can0 { ... }; syntax adds/overrides properties on the node with label can0, i.e. the can@4002400 node defined in the .dtsi file.

Other examples of board-specific customization is pointing properties in aliases and chosen to the right nodes (see Aliases and chosen nodes), and making GPIO/pinmux assignments.

## Write Kconfig files

Zephyr uses the Kconfig language to configure software features. Your board needs to provide some Kconfig settings before you can compile a Zephyr application for it.

Setting Kconfig configuration values is documented in detail in Setting Kconfig configuration values.

There are three mandatory Kconfig files in the board directory for a board named plank:

```
boards/<ARCH>/plank
    ├── Kconfig.board
    │    └── Kconfig.defconfig
    └── plank_defconfig
```

**Kconfig.board**

Included by boards/Kconfig to include your board in the list of options.

This should at least contain a definition for a BOARD_PLANK option, which looks something like this:

```plaintext
config BOARD_PLANK
    bool "Plank board"
    depends on SOC_SERIES_YOUR_SOC_SERIES_HERE
    select SOC_PART_NUMBER_ABCDEFGH
```

**Kconfig.defconfig**

Board-specific default values for Kconfig options.

The entire file should be inside an if BOARD_PLANK / endif pair of lines, like this:

```plaintext
if BOARD_PLANK
    # Always set CONFIG_BOARD here. This isn't meant to be customized,
    # but is set as a "default" due to Kconfig language restrictions.
    config BOARD
        default "plank"
```

(continues on next page)
# Other options you want enabled by default go next. Examples:

```c
config FOO
default y
```

```c
if NETWORKING
config SOC_ETHERNET_DRIVER
default y
endif # NETWORKING
```

```c
endif # BOARD_PLANK
```

## plank_defconfig

A Kconfig fragment that is merged as-is into the final build directory .config whenever an application is compiled for your board.

You should at least select your board's SOC and do any mandatory settings for your system clock, console, etc. The results are architecture-specific, but typically look something like this:

```c
CONFIG_SOC_${VENDOR_XYZ3000}=y  # select your SoC
CONFIG_SYS_CLOCK_HW_CYCLES_PER_SEC=12000000  # set up your clock, etc
CONFIG_SERIAL=y
```

## plank_x_y_z.conf

A Kconfig fragment that is merged as-is into the final build directory .config whenever an application is compiled for your board revision x.y.z.

## Build, test, and fix

Now it's time to build and test the application(s) you want to run on your board until you're satisfied.

For example:

```
west build -b plank samples/hello_world
west flash
```

For `west flash` to work, see *Flash and debug support* below. You can also just flash `build/zephyr/zephyr.elf`, `zephyr.hex`, or `zephyr.bin` with any other tools you prefer.

## General recommendations

For consistency and to make it easier for users to build generic applications that are not board specific for your board, please follow these guidelines while porting.

- Unless explicitly recommended otherwise by this section, leave peripherals and their drivers disabled by default.
- Configure and enable a system clock, along with a tick source.
- Provide pin and driver configuration that matches the board's valuable components such as sensors, buttons or LEDs, and communication interfaces such as USB, Ethernet connector, or Bluetooth/Wi-Fi chip.
- If your board uses a well-known connector standard (like Arduino, Mikrobus, Grove, or 96Boards connectors), add connector nodes to your DTS and configure pin muxes accordingly.
• Configure components that enable the use of these pins, such as configuring an SPI instance to use the usual Arduino SPI pins.
• If available, configure and enable a serial output for the console using the zephyr,console chosen node in the devicetree.
• If your board supports networking, configure a default interface.
• Enable all GPIO ports connected to peripherals or expansion connectors.
• If available, enable pinmux and interrupt controller drivers.
• It is recommended to enable the MPU by default, if there is support for it in hardware. For boards with limited memory resources it is acceptable to disable it. When the MPU is enabled, it is recommended to also enable hardware stack protection (CONFIG_HW_STACK_PROTECTION=y) and, thus, allow the kernel to detect stack overflows when the system is running in privileged mode.

Flash and debug support

Zephyr supports Building, Flashing and Debugging via west extension commands.

To add west flash and west debug support for your board, you need to create a board.cmake file in your board directory. This file's job is to configure a “runner” for your board. (There's nothing special you need to do to get west build support for your board.)

“Runners” are Zephyr-specific Python classes that wrap flash and debug host tools and integrate with west and the zephyr build system to support west flash and related commands. Each runner supports flashing, debugging, or both. You need to configure the arguments to these Python scripts in your board.cmake to support those commands like this example board.cmake:

```python
board_runner_args(jlink "--device=nrf52" "--speed=4000")
board_runner_args(pyocd "--target=nrf52" "--frequency=4000000")
include($ZEPHYR_BASE/boards/common/nrfjprog.board.cmake)
include($ZEPHYR_BASE/boards/common/jlink.board.cmake)
include($ZEPHYR_BASE/boards/common/pyocd.board.cmake)
```

This example configures the nrfjprog, jlink, and pyocd runners.

**Warning:** Runners usually have names which match the tools they wrap, so the jlink runner wraps Segger's J-Link tools, and so on. But the runner command line options like --speed etc. are specific to the Python scripts.

**Note:** Runners and board configuration should be created without being targeted to a single operating system if the tool supports multiple operating systems, nor should it rely upon special system setup/configuration. For example: do not assume that a user will have prior knowledge/configuration or (if using Linux) special udev rules installed, do not assume one specific /dev/X device for all platforms as this will not be compatible with Windows or macOS, and allow for overriding of the selected device so that multiple boards can be connected to a single system and flashed/debugged at the choice of the user.

For more details:
• Run west flash --context to see a list of available runners which support flashing, and west flash --context -r <RUNNER> to view the specific options available for an individual runner.
• Run `west debug --context` and `west debug --context <RUNNER>` to get the same output for runners which support debugging.

• Run `west flash --help` and `west debug --help` for top-level options for flashing and debugging.

• See *Flash and debug runners* for Python APIs.

• Look for board.cmake files for other boards similar to your own for more examples.

To see what a `west flash` or `west debug` command is doing exactly, run it in verbose mode:

```
w west --verbose flash
w west --verbose debug
```

Verbose mode prints any host tool commands the runner uses.

The order of the `include()` calls in your board.cmake matters. The first `include` sets the default runner if it's not already set. For example, including `nrfjprog.board.cmake` first means that `nrfjprog` is the default flash runner for this board. Since `nrfjprog` does not support debugging, `jlink` is the default debug runner.

### Multiple board revisions

See *Building for a board revision* for basics on this feature from the user perspective.

To create a new board revision for the `plank` board, create these additional files in the board folder:

```
boards/<ARCH>/plank
├── plank_<revision>.conf  # optional
└── plank_<revision>.overlay # optional
   revision.cmake
```

When the user builds for board `plank@<revision>`:

• The optional Kconfig settings specified in the file `plank_<revision>.conf` will be merged into the board's default Kconfig configuration.

• The optional devicetree overlay `plank_<revision>.overlay` will be added to the common `plank.dts` devicetree file

• The `revision.cmake` file controls how the Zephyr build system matches the `<board>@<revision>` string specified by the user when building an application for the board.

Currently, `<revision>` can be either a numeric `MAJOR.MINOR.PATCH` style revision like `1.5.0`, an integer number like `1`, or single letter like `A`, `B`, etc. Zephyr provides a CMake board extension function, `board_check_revision()`, to make it easy to match either style from `revision.cmake`.

Valid board revisions may be specified as arguments to the `board_check_revision()` function, like:

```
board_check_revision(FORMAT MAJOR.MINOR.PATCH
                     VALID_REVISIONS 0.1.0 0.3.0 ...)
```

**Note**: `VALID_REVISIONS` can be omitted if all valid revisions have specific Kconfig fragments, such as `<board>_0_1_0.conf`, `<board>_0_3_0.conf`. This allows you to just place Kconfig revision fragments in the board folder and not have to keep the corresponding `VALID_REVISIONS` in sync.

The following sections describe how to support these styles of revision numbers.
MAJOR.MINOR.PATCH revisions  Let's say you want to add support for revisions 0.5.0, 1.0.0, and 1.5.0 of the plank board with both Kconfig fragments and devicetree overlays. Create revision.cmake with `board_check_revision(FORMAT MAJOR.MINOR.PATCH)`, and create the following additional files in the board directory:

```
boards/<ARCH>/plank
├── plank_0_5_0.conf
├── plank_0_5_0.overlay
├── plank_1_0_0.conf
├── plank_1_0_0.overlay
├── plank_1_5_0.conf
├── plank_1_5_0.overlay
└── revision.cmake
```

Notice how the board files have changed periods ("." ) in the revision number to underscores ("_").

Fuzzy revision matching  To support “fuzzy” MAJOR.MINOR.PATCH revision matching for the plank board, use the following code in revision.cmake:

```
board_check_revision(FORMAT MAJOR.MINOR.PATCH)
```

If the user selects a revision between those available, the closest revision number that is not larger than the user's choice is used. For example, if the user builds for `plank@0.7.0`, the build system will target revision `0.5.0`.

The build system will print this at CMake configuration time:

```
-- Board: plank, Revision: 0.7.0 (Active: 0.5.0)
```

This allows you to only create revision configuration files for board revision numbers that introduce incompatible changes.

Any revision less than the minimum defined will be treated as an error.

You may use `0.0.0` as a minimum revision to build for by creating the file `plank_0_0_0.conf` in the board directory. This will be used for any revision lower than `0.5.0`, for example if the user builds for `plank@0.1.0`.

Exact revision matching  Alternatively, the `EXACT` keyword can be given to `board_check_revision()` in revision.cmake to allow exact matches only, like this:

```
board_check_revision(FORMAT MAJOR.MINOR.PATCH EXACT)
```

With this revision.cmake, building for `plank@0.7.0` in the above example will result in the following error message:

```
Board revision `0.7.0` not found. Please specify a valid board revision.
```

Letter revision matching  Let's say instead that you need to support revisions A, B, and C of the plank board. Create the following additional files in the board directory:

```
boards/<ARCH>/plank
├── plank_A.conf
└── plank_A.overlay
```

(continues on next page)
And add the following to revision.cmake:

```c
board_check_revision(FORMAT LETTER)
```

**Number revision matching** Let’s say instead that you need to support revisions 1, 2, and 3 of the plank board. Create the following additional files in the board directory:

```plaintext
boards/<ARCH>/plank
├── plank_1.conf
├── plank_1.overlay
├── plank_2.conf
├── plank_2.overlay
├── plank_3.conf
├── plank_3.overlay
└── revision.cmake
```

And add the following to revision.cmake:

```c
board_check_revision(FORMAT NUMBER)
```

**board_check_revision() details**

```c
board_check_revision(FORMAT <LETTER | NUMBER | MAJOR.MINOR.PATCH>
[OPTIONAL EXACT]
[DEFAULT_REVISION <revision>]
[HIGHEST_REVISION <revision>]
[VALID_REVISIONS <revision> [<revision> ...]]
)
```

This function supports the following arguments:

- **FORMAT LETTER**: matches single letter revisions from A to Z only
- **FORMAT NUMBER**: matches integer revisions
- **FORMAT MAJOR.MINOR.PATCH**: matches exactly three digits. The command line allows for loose typing, that is -DBOARD=<board>@1 and -DBOARD=<board>@1.0 will be handled as -DBOARD=<board>@1.0.0. Kconfig fragment and devicetree overlay files must use full numbering to avoid ambiguity, so only <board>_1_0_0.conf and <board>_1_0_0.overlay are allowed.
- **OPTIONAL**: if given, a revision is not required to be specified. If the revision is not supplied, the base board is used with no overlays. Can be combined with EXACT, in which case providing the revision is optional, but if given the EXACT rules apply. Mutually exclusive with DEFAULT_REVISION.
- **EXACT**: if given, the revision is required to be an exact match. Otherwise, the closest matching revision not greater than the user's choice will be selected.
1. DEFAULT_REVISION <revision>: if given, <revision> is the default revision to use when user has not selected a revision number. If not given, the build system prints an error when the user does not specify a board revision.

2. HIGHEST_REVISION: if given, specifies the highest valid revision for a board. This can be used to ensure that a newer board cannot be used with an older Zephyr. For example, if the current board directory supports revisions 0.x.0-0.99.99 and 1.0.0-1.99.99, and it is expected that the implementation will not work with board revision 2.0.0, then giving HIGHEST_REVISION 1.99.99 causes an error if the user builds using <board>@2.0.0.

3. VALID_REVISIONS: if given, specifies a list of revisions that are valid for this board. If this argument is not given, then each Kconfig fragment of the form <board>_<revision>.conf in the board folder will be used as a valid revision for the board.

**Custom revision.cmake files**

Some boards may not use board revisions supported by board_check_revision(). To support revisions of any type, the file revision.cmake can implement custom revision matching without calling board_check_revision().

To signal to the build system that it should use a different revision than the one specified by the user, revision.cmake can set the variable ACTIVE_BOARD_REVISION to the revision to use instead. The corresponding Kconfig files and devicetree overlays must be named <board>_<ACTIVE_BOARD_REVISION>.conf and <board>_<ACTIVE_BOARD_REVISION>.overlay.

For example, if the user builds for plank@zero, revision.cmake can set ACTIVE_BOARD_REVISION to one to use the files plank_one.conf and plank_one.overlay.

**Contributing your board**

If you want to contribute your board to Zephyr, first – thanks!

There are some extra things you'll need to do:

1. Make sure you've followed all the General recommendations. They are requirements for boards included with Zephyr.

2. Add documentation for your board using the template file doc/templates/board.tmpl. See Documentation Generation for information on how to build your documentation before submitting your pull request.

3. Prepare a pull request adding your board which follows the Contribution Guidelines.

**Board extensions**

Boards already supported by Zephyr can be extended by downstream users, such as example-application or vendor SDKs. In some situations, certain hardware description or choices can not be added in the upstream Zephyr repository, but they can be in a downstream project, where custom bindings or driver classes can also be created. This feature may also be useful in development phases, when the board skeleton lives upstream, but other features are developed in a downstream module.

Board extensions are board fragments that can be present in an out-of-tree board root folder, under ${BOARD_ROOT}/boards/extensions. Here is an example structure of an extension for the plank board and its revisions:
boards/extensions/plank
├── plank.conf  # optional
├── plank_<revision>.conf  # optional
├── plank.overlay  # optional
└── plank_<revision>.overlay  # optional

A board extension directory must follow the naming structure of the original board it extends. It may contain Kconfig fragments and/or devicetree overlays. Extensions are, by default, automatically loaded and applied on top of board files, before anything else. There is no guarantee on which order extensions are applied, in case multiple exist. This feature can be disabled by passing `-DBOARD_EXTENSIONS=OFF` when building.

Note that board extensions need to follow the same guidelines as regular boards. For example, it is wrong to enable extra peripherals or subsystems in a board extension.

**Warning:** Board extensions are not allowed in any module referenced in Zephyr's `west.yml` manifest file. Any board changes are required to be submitted to the main Zephyr repository.

### 7.7.3 Shields

Shields, also known as “add-on” or “daughter boards”, attach to a board to extend its features and services for easier and modularized prototyping. In Zephyr, the shield feature provides Zephyr-formatted shield descriptions for easier compatibility with applications.

#### Shield porting and configuration

Shield configuration files are available in the board directory under `/boards/shields`:

```
boards/shields/<shield>
├── <shield>.overlay
└── Kconfig.shield
    └── Kconfig.defconfig
```

These files provide shield configuration as follows:

- **<shield>.overlay**: This file provides a shield description in devicetree format that is merged with the board's devicetree before compilation.

- **Kconfig.shield**: This file defines shield Kconfig symbols that will be used for default shield configuration. To ease use with applications, the default shield configuration here should be consistent with those in the *Write your devicetree*.

- **Kconfig.defconfig**: This file defines the default shield configuration. It is made to be consistent with the *Write your devicetree*. Hence, shield configuration should be done by keeping in mind that features activation is application responsibility.

Besides, in order to avoid name conflicts with devices that may be defined at board level, it is advised, specifically for shields devicetree descriptions, to provide a device nodelabel in the form `<device>_<shield>`, for instance:

```
sdhc_myshield: sdhc@1 {
    reg = <1>;
    ...
};
```
**Board compatibility**

Hardware shield-to-board compatibility depends on the use of well-known connectors used on popular boards (such as Arduino and 96boards). For software compatibility, boards must also provide a configuration matching their supported connectors.

This should be done at two different level:

- **Pinmux:** Connector pins should be correctly configured to match shield pins
- **Devicetree:** A board devicetree file, BOARD.dts should define an alternate nodelabel for each connector interface. For example, for Arduino I2C:

  ```
  arduino_i2c: &i2c1 {};
  ```

**Board specific shield configuration** If modifications are needed to fit a shield to a particular board or board revision, you can override a shield description for a specific board by adding board or board revision overriding files to a shield, as follows:

```
boards/shields/<shield>
  └── boards
      ├── <board>_<revision>.overlay
      │ └── <board>.overlay
      └── <board>.defconfig
          └── <board>_<revision>.conf
          └── <board>.conf
```

**Shield activation**

Activate support for one or more shields by adding the matching -DSHIELD arg to CMake command

```
# From the root of the zephyr repository
west build -b None your_app -- -DSHIELD="x_nucleo_idb05a1 x_nucleo_iks01a1"
```

Alternatively, it could be set by default in a project's CMakeLists.txt:

```
set(SHIELD x_nucleo_iks01a1)
```

**Shield variants**

Some shields may support several variants or revisions. In that case, it is possible to provide multiple version of the shields description:

```
boards/shields/<shield>
  └── <shield_v1>.overlay
      └── <shield_v1>.defconfig
      └── <shield_v2>.overlay
          └── <shield_v2>.defconfig
```

In this case, a shield-particular revision name can be used:

```
# From the root of the zephyr repository
west build -b None your_app -- -DSHIELD=shield_v2
```
You can also provide a board-specific configuration to a specific shield revision:

```markdown
boards/shields/<shield>
  ├── <shield_v1>.overlay
  │     └── <shield_v1>.defconfig
  │       └── <shield_v2>.overlay
  │          └── <shield_v2>.defconfig
  └── boards
      └── <shield_v2>
          ├── <board>.overlay
          │    └── <board>.defconfig
```

**GPIO nexus nodes**

GPIOs accessed by the shield peripherals must be identified using the shield GPIO abstraction, for example from the `arduino-header-r3` compatible. Boards that provide the header must map the header pins to SOC-specific pins. This is accomplished by including a nexus node that looks like the following into the board devicetree file:

```devicetree
arduino_header: connector {
    compatible = "arduino-header-r3";
    #gpio-cells = <2>
    gpio-map-mask = <0xffffffff 0xffffffc0>
    gpio-map-pass-thru = <0 0x3f>
    gpio-map = <0 0 &gpioa 0>, /* A0 */
             <1 0 &gpioa 1>, /* A1 */
             <2 0 &gpioa 4>, /* A2 */
             <3 0 &gpiob 0>, /* A3 */
             <4 0 &gpioc 1>, /* A4 */
             <5 0 &gpioc 0>, /* A5 */
             <6 0 &gpioa 3>, /* D0 */
             <7 0 &gpiob 2>, /* D1 */
             <8 0 &gpiob 10>, /* D2 */
             <9 0 &gpiob 3>, /* D3 */
             <10 0 &gpiob 5>, /* D4 */
             <11 0 &gpiob 4>, /* D5 */
             <12 0 &gpiob 10>, /* D6 */
             <13 0 &gpioa 8>, /* D7 */
             <14 0 &gpioa 9>, /* D8 */
             <15 0 &gpioc 7>, /* D9 */
             <16 0 &gpiob 6>, /* D10 */
             <17 0 &gpioa 7>, /* D11 */
             <18 0 &gpioa 6>, /* D12 */
             <19 0 &gpioa 5>, /* D13 */
             <20 0 &gpiob 9>, /* D14 */
             <21 0 &gpioa 8>; /* D15 */
};
```

This specifies how Arduino pin references like `<&arduino_header 11 0>` are converted to SOC gpio pin references like `<&gpiob 4 0>`.

In Zephyr GPIO specifiers generally have two parameters (indicated by `#gpio-cells = <2>`): the pin number and a set of flags. The low 6 bits of the flags correspond to features that can be configured in devicetree. In some cases it's necessary to use a non-zero flag value to tell the driver how a particular pin behaves, as with:

```plaintext
drdy-gpios = <&arduino_header 11 GPIO_ACTIVE_LOW>;
```
After preprocessing this becomes <&arduino_header 11 1>. Normally the presence of such a flag would cause the map lookup to fail, because there is no map entry with a non-zero flags value. The gpio-map-mask property specifies that, for lookup, all bits of the pin and all but the low 6 bits of the flags are used to identify the specifier. Then the gpio-map-pass-thru specifies that the low 6 bits of the flags are copied over, so the SOC GPIO reference becomes <&gpio 4 1> as intended.

See nexus node for more information about this capability.
Chapter 8

Contributing to Zephyr

Contributions from the community are the backbone of the project. Whether it is by submitting code, improving documentation, or proposing new features, your efforts are highly appreciated. This page lists useful resources and guidelines to help you in your contribution journey.

8.1 General Guidelines

8.1.1 Contribution Guidelines

As an open-source project, we welcome and encourage the community to submit patches directly to the project. In our collaborative open source environment, standards and methods for submitting changes help reduce the chaos that can result from an active development community.

This document explains how to participate in project conversations, log bugs and enhancement requests, and submit patches to the project so your patch will be accepted quickly in the codebase.

Licensing

Licensing is very important to open source projects. It helps ensure the software continues to be available under the terms that the author desired.

Zephyr uses the Apache 2.0 license (as found in the LICENSE file in the project's GitHub repo) to strike a balance between open contribution and allowing you to use the software however you would like to. The Apache 2.0 license is a permissive open source license that allows you to freely use, modify, distribute and sell your own products that include Apache 2.0 licensed software. (For more information about this, check out articles such as Why choose Apache 2.0 licensing and Top 10 Apache License Questions Answered).

A license tells you what rights you have as a developer, as provided by the copyright holder. It is important that the contributor fully understands the licensing rights and agrees to them. Sometimes the copyright holder isn't the contributor, such as when the contributor is doing work on behalf of a company.

Components using other Licenses  There are some imported or reused components of the Zephyr project that use other licensing, as described in Licensing of Zephyr Project components.

Importing code into the Zephyr OS from other projects that use a license other than the Apache 2.0 license needs to be fully understood in context and approved by the Zephyr governing board.
By carefully reviewing potential contributions and also enforcing a Developer Certification of Origin (DCO) for contributed code, we can ensure that the Zephyr community can develop products with the Zephyr Project without concerns over patent or copyright issues.

See Contributing External Components for more information about this contributing and review process for imported components.

**Licensing of Zephyr Project components**  The Zephyr kernel tree imports or reuses packages, scripts and other files that are not covered by the Apache 2.0 License. In some places there is no LICENSE file or way to put a LICENSE file there, so we describe the licensing in this document.

`scripts/{checkpatch.pl,checkstack.pl,spelling.txt}`

**Origin:** Linux Kernel

**Licensing:** GPLv2 License

**Copyrights Notices**

Please follow this Community Best Practice for Copyright Notices from the Linux Foundation.

**Developer Certification of Origin (DCO)**

To make a good faith effort to ensure licensing criteria are met, the Zephyr project requires the Developer Certificate of Origin (DCO) process to be followed.

The DCO is an attestation attached to every contribution made by every developer. In the commit message of the contribution, (described more fully later in this document), the developer simply adds a Signed-off-by statement and thereby agrees to the DCO.

When a developer submits a patch, it is a commitment that the contributor has the right to submit the patch per the license. The DCO agreement is shown below and at http://developercertificate.org/.

---

**Developer's Certificate of Origin 1.1**

By making a contribution to this project, I certify that:

(a) The contribution was created in whole or in part by me and I have the right to submit it under the open source license indicated in the file; or

(b) The contribution is based upon previous work that, to the best of my knowledge, is covered under an appropriate open source license and I have the right under that license to submit that work with modifications, whether created in whole or in part by me, under the same open source license (unless I am permitted to submit under a different license), as indicated in the file; or

(c) The contribution was provided directly to me by some other person who certified (a), (b) or (c) and I have not modified it.

(d) I understand and agree that this project and the contribution are public and that a record of the contribution (including all personal information I submit with it, including my sign-off) is maintained indefinitely and may be redistributed consistent with this project or the open source license(s) involved.

---
DCO Sign-Off  The “sign-off” in the DCO is a “Signed-off-by:” line in each commit’s log message. The Signed-off-by: line must be in the following format:

```
Signed-off-by: Your Name <your.email@example.com>
```

For your commits, replace:

- Your Name with your legal name (pseudonyms, hacker handles, and the names of groups are not allowed)
- your.email@example.com with the same email address you are using to author the commit (CI will fail if there is no match)

You can automatically add the Signed-off-by: line to your commit body using `git commit -s`. Use other commits in the zephyr git history as examples.

Additional requirements:

- If you are altering an existing commit created by someone else, you must add your Signed-off-by: line without removing the existing one.
- If you forget to add the Signed-off-by: line, you can add it to your previous commit by running `git commit --amend -s`.
- If you’ve pushed your changes to GitHub already you’ll need to force push your branch after this with `git push -f`.

Notes  Any contributions made as part of submitted pull requests are considered free for the Project to use. Developers are permitted to cherry-pick patches that are included in pull requests submitted by other contributors. It is expected that:

- the content of the patches will not be substantially modified,
- the cherry-picked commits or portions of a commit shall preserve the original sign-off messages and the author identity.

Modifying Contributions made by other developers describes additional recommended policies around working with contributions submitted by other developers.

Prerequisites

As a contributor, you’ll want to be familiar with the Zephyr project, how to configure, install, and use it as explained in the Zephyr Project website and how to set up your development environment as introduced in the Zephyr Getting Started Guide.

You should be familiar with common developer tools such as Git and CMake, and platforms such as GitHub.

If you haven’t already done so, you’ll need to create a (free) GitHub account on https://github.com and have Git tools available on your development system.

Note:  The Zephyr development workflow supports all 3 major operating systems (Linux, macOS, and Windows) but some of the tools used in the sections below are only available on Linux and macOS. On Windows, instead of running these tools yourself, you will need to rely on the Continuous Integration (CI) service using Github Actions, which runs automatically on GitHub when you submit your Pull Request (PR). You can see any failure results in the workflow details link near the end of the PR conversation list. See Continuous Integration for more information.
Source Tree Structure

To clone the main Zephyr Project repository use the instructions in *Get Zephyr and install Python dependencies*.

This section describes the main repository's source tree. In addition to the Zephyr kernel itself, you'll also find the sources for technical documentation, sample code, supported board configurations, and a collection of subsystem tests. All of these are available for developers to contribute to and enhance.

Understanding the Zephyr source tree can help locate the code associated with a particular Zephyr feature.

At the top of the tree, several files are of importance:

- **CMakeLists.txt**
  The top-level file for the CMake build system, containing a lot of the logic required to build Zephyr.

- **Kconfig**
  The top-level Kconfig file, which refers to the file `Kconfig.zephyr` also found in the top-level directory.
  
  See the [Kconfig section of the manual](https://docs.zephyrproject.org) for detailed Kconfig documentation.

- **west.yml**
  The *West (Zephyr's meta-tool)* manifest, listing the external repositories managed by the `west` command-line tool.

The Zephyr source tree also contains the following top-level directories, each of which may have one or more additional levels of subdirectories not described here.

- **arch**
  Architecture-specific kernel and system-on-chip (SoC) code. Each supported architecture (for example, x86 and ARM) has its own subdirectory, which contains additional subdirectories for the following areas:
  
  - architecture-specific kernel source files
  - architecture-specific kernel include files for private APIs

- **soc**
  SoC related code and configuration files.

- **boards**
  Board related code and configuration files.

- **doc**
  Zephyr technical documentation source files and tools used to generate the https://docs.zephyrproject.org web content.

- **drivers**
  Device driver code.

- **dts**
  *devicetree* source files used to describe non-discoverable board-specific hardware details.

- **include**
  Include files for all public APIs, except those defined under *lib*.

- **kernel**
  Architecture-independent kernel code.

- **lib**
  Library code, including the minimal standard C library.

- **misc**
  Miscellaneous code that doesn’t belong to any of the other top-level directories.
samples
Sample applications that demonstrate the use of Zephyr features.

scripts
Various programs and other files used to build and test Zephyr applications.

cmake
Additional build scripts needed to build Zephyr.

subsys
Subsystems of Zephyr, including:
- USB device stack code
- Networking code, including the Bluetooth stack and networking stacks
- File system code
- Bluetooth host and controller

tests
Test code and benchmarks for Zephyr features.

share
Additional architecture independent data. It currently contains Zephyr's CMake package.

Pull Requests and Issues

Before starting on a patch, first check in our issues Zephyr Project Issues system to see what's been reported on the issue you'd like to address. Have a conversation on the Zephyr devel mailing list (or the Zephyr Discord Server) to see what others think of your issue (and proposed solution). You may find others that have encountered the issue you're finding, or that have similar ideas for changes or additions. Send a message to the Zephyr devel mailing list to introduce and discuss your idea with the development community.

It's always a good practice to search for existing or related issues before submitting your own. When you submit an issue (bug or feature request), the triage team will review and comment on the submission, typically within a few business days.

You can find all open pull requests on GitHub and open Zephyr Project Issues in Github issues.

Tools and Git Setup

Name and email We need to know who you are, and how to contact you. To add this information to your Git installation, set the Git configuration variables user.name to your full name, and user.email to your email address.

For example, if your name is Zephyr Developer and your email address is z.developer@example.com:

```
git config --global user.name "Zephyr Developer"
git config --global user.email "z.developer@example.com"
```

gitlint When you submit a pull request to the project, a series of checks are performed to verify your commit messages meet the requirements. The same step done during the CI process can be performed locally using the gitlint command.

Run gitlint locally in your tree and branch where your patches have been committed:
gitlint

Note, gitlint only checks HEAD (the most recent commit), so you should run it after each commit, or use the `--commits` option to specify a commit range covering all the development patches to be submitted.

twister

Note: twister support on windows is limited and execution of tests is not supported, only building.

To verify that your changes did not break any tests or samples, please run the `twister` script locally before submitting your pull request to GitHub.

Twister allows limiting the scope of the tests built and run by pointing it to the tests related to the code or the platform you have modified. For example, to limit tests to a single platform and an area in the kernel:

```
source zephyr-env.sh
west twister -p qemu_x86 -T tests/kernel/sched
```

Running tests on connected devices is also supported using the `--device-testing` options. Please consult with the `Twister` documentation for more details.

To run the same tests the CI system runs, follow these steps from within your local Zephyr source working directory:

```
source zephyr-env.sh
west twister --integration
```

The above will execute the basic `twister` script, which will run various tests using the QEMU emulator and other simulators supported in Zephyr. It will also do some build tests on various samples with advanced features that can't run in a simulator or QEMU.

We highly recommend you run these tests locally to avoid any CI failures. However, note that building and executing tests using twister requires significant computing resources. When running locally and to get results in a reasonable time, limit the scope to the areas and platforms you have modified. In case of major changes to the kernel, build or configuration infrastructures of Zephyr, it is advised to use `twister` for verifying majority the changes before handing over to the dedicated CI resources provided by the Zephyr project.

clang-format

The `clang-format` tool can be helpful to quickly reformat large amounts of new source code to our Coding Style standards together with the `.clang-format` configuration file provided in the repository. `clang-format` is well integrated into most editors, but you can also run it manually like this:

```
clang-format -i my_source_file.c
```

`clang-format` is part of LLVM, which can be downloaded from the project releases page <https://github.com/llvm/llvm-project/releases>. Note that if you are a Linux user, `clang-format` will likely be available as a package in your distribution repositories.

Coding Style

Use these coding guidelines to ensure that your development complies with the project's style and naming conventions.

In general, follow the Linux kernel coding style, with the following exceptions:
• The line length is 100 columns or fewer. In the documentation, longer lines for URL references are an allowed exception.

• Add braces to every if, else, do, while, for and switch body, even for single-line code blocks. Use the --ignore BRACES flag to make checkpatch stop complaining.

• Use spaces instead of tabs to align comments after declarations, as needed.

• Use C89-style single line comments, /* */. The C99-style single line comment, //, is not allowed.

• Use /** */ for doxygen comments that need to appear in the documentation.

• Avoid using binary literals (constants starting with 0b).

When there are differences between the guidelines above and the formatting generated by code formatting tools, the guidelines above take precedence.

The Linux kernel GPL-licensed tool checkpatch is used to check coding style conformity.

**Note:** checkpatch does not currently run on Windows.

Checkpatch is available in the scripts directory. To invoke it when committing code, make the file $ZEPHYR_BASE/.git/hooks/pre-commit executable and edit it to contain:

```
#!/bin/sh
set -e exec
exec git diff --cached | $(ZEPHYR_BASE)/scripts/checkpatch.pl
```

Instead of running checkpatch at each commit, you may prefer to run it only before pushing on zephyr repo. To do this, make the file $ZEPHYR_BASE/.git/hooks/pre-push executable and edit it to contain:

```
#!/bin/sh
remote="$1"
url="$2"
z40=00000000000000000000000000000000

echo "Run push hook"

while read local_ref local_sha remote_ref remote_sha
do
    args="$remote $url $local_ref $local_sha $remote_ref $remote_sha"
    exec $(ZEPHYR_BASE)/scripts/series-push-hook.sh $args
done

exit 0
```

If you want to override checkpatch verdict and push you branch despite reported issues, you can add option –no-verify to the git push command.

A more complete alternative to this is using check_compliance.py script from ci-tools repo.

**Static Code Analysis**

Coverity Scan is a free service for static code analysis of Open Source projects. It is based on Coverity's commercial product and is able to analyze C, C++ and Java code.

Coverity's static code analysis doesn't run the code. Instead of that it uses abstract interpretation to gain information about the code's control flow and data flow. It's able to follow all possible code paths that a program may take. For example the analyzer understands that malloc() returns
a memory that must be freed with free() later. It follows all branches and function calls to see if all possible combinations free the memory. The analyzer is able to detect all sorts of issues like resource leaks (memory, file descriptors), NULL dereferencing, use after free, unchecked return values, dead code, buffer overflows, integer overflows, uninitialized variables, and many more.

The results are available on the **Coverity Scan** website. In order to access the results you have to create an account yourself. From the Zephyr project page, you may select “Add me to project” to be added to the project. New members must be approved by an admin.

Coverity scans the Zephyr codebase weekly. GitHub issues are automatically created for any problems found and assigned to the maintainers of the affected areas.

**Workflow**  If after analyzing the Coverity report it is concluded that it is a false positive please set the classification to either “False positive” or “Intentional”, the action to “Ignore”, owner to your own account and add a comment why the issue is considered false positive or intentional.

Update the related Github issue in the zephyr project with the details, and only close it after completing the steps above on scan service website. Any issues closed without a fix or without ignoring the entry in the scan service will be automatically reopened if the issue continues to be present in the code.

**Contribution Workflow**

One general practice we encourage, is to make small, controlled changes. This practice simplifies review, makes merging and rebasing easier, and keeps the change history clear and clean.

When contributing to the Zephyr Project, it is also important you provide as much information as you can about your change, update appropriate documentation, and test your changes thoroughly before submitting.

The general GitHub workflow used by Zephyr developers uses a combination of command line Git commands and browser interaction with GitHub. As it is with Git, there are multiple ways of getting a task done. We’ll describe a typical workflow here:

1. **Create a Fork of Zephyr** to your personal account on GitHub. (Click on the fork button in the top right corner of the Zephyr project repo page in GitHub.)

2. On your development computer, change into the zephyr folder that was created when you obtained the code:

   ```
   cd zephyrproject/zephyr
   ```

   Rename the default remote pointing to the **upstream repository** from origin to upstream:

   ```
   git remote rename origin upstream
   ```

   Let Git know about the fork you just created, naming it origin:

   ```
   git remote add origin https://github.com/<your github id>/zephyr
   ```

   and verify the remote repos:

   ```
   git remote -v
   ```

   The output should look similar to:

   ```
   origin https://github.com/<your github id>/zephyr (fetch)
   origin https://github.com/<your github id>/zephyr (push)
   upstream https://github.com/zephyrproject-rtos/zephyr (fetch)
   upstream https://github.com/zephyrproject-rtos/zephyr (push)
   ```
3. Create a topic branch (off of main) for your work (if you're addressing an issue, we suggest including the issue number in the branch name):

```bash
git checkout main
git checkout -b fix_comment_typo
```

Some Zephyr subsystems do development work on a separate branch from main so you may need to indicate this in your checkout:

```bash
git checkout -b fix_out_of_date_patch origin/net
```

4. Make changes, test locally, change, test, test again, ... (Check out the prior chapter on twister as well).

5. When things look good, start the pull request process by adding your changed files:

```bash
git add [file(s) that changed, add -p if you want to be more specific]
```

You can see files that are not yet staged using:

```bash
git status
```

6. Verify changes to be committed look as you expected:

```bash
git diff --cached
```

7. Commit your changes to your local repo:

```bash
git commit -s
```

The -s option automatically adds your Signed-off-by: to your commit message. Your commit will be rejected without this line that indicates your agreement with the Developer Certification of Origin (DCO). See the Commit Message Guidelines section for specific guidelines for writing your commit messages.

8. Push your topic branch with your changes to your fork in your personal GitHub account:

```bash
git push origin fix_comment_typo
```

9. In your web browser, go to your forked repo and click on the Compare & pull request button for the branch you just worked on and you want to open a pull request with.

10. Review the pull request changes, and verify that you are opening a pull request for the main branch. The title and message from your commit message should appear as well.

11. GitHub will assign one or more suggested reviewers (based on the CODEOWNERS file in the repo). If you are a project member, you can select additional reviewers now too.

12. Click on the submit button and your pull request is sent and awaits review. Email will be sent as review comments are made, or you can check on your pull request at https://github.com/zephyrproject-rtos/zephyr/pulls.

**Note:** As more commits are merged upstream, the GitHub PR page will show a This branch is out-of-date with the base branch message and a Update branch button on the PR page. That message should be ignored, as the commits will be rebased as part of merging anyway, and triggering a branch update from the GitHub UI will cause the PR approvals to be dropped.

13. While you're waiting for your pull request to be accepted and merged, you can create another branch to work on another issue. (Be sure to make your new branch off of main and not the previous branch.):
14. If reviewers do request changes to your patch, you can interactively rebase commit(s) to fix review issues. In your development repo:

```bash
git fetch --all
git rebase --ignore-whitespace upstream/main
```

The `--ignore-whitespace` option stops `git apply` (called by rebase) from changing any whitespace. Continuing:

```bash
git rebase -i <offending-commit-id>^
```

In the interactive rebase editor, replace `pick` with `edit` to select a specific commit (if there's more than one in your pull request), or remove the line to delete a commit entirely. Then edit files to fix the issues in the review.

As before, inspect and test your changes. When ready, continue the patch submission:

```bash
git add [file(s)]
git rebase --continue
```

Update commit comment if needed, and continue:

```bash
git push --force origin fix_comment_typo
```

By force pushing your update, your original pull request will be updated with your changes so you won't need to resubmit the pull request.

**Note:** While amending commits and force pushing is a common review model outside GitHub, and the one recommended by Zephyr, it’s not the main model supported by GitHub. Forced pushes can cause unexpected behavior, such as not being able to use “View Changes” buttons except for the last one - GitHub complains it can’t find older commits. You’re also not always able to compare the latest reviewed version with the latest submitted version. When rewriting history GitHub only guarantees access to the latest version.

15. If the CI run fails, you will need to make changes to your code in order to fix the issues and amend your commits by rebasing as described above. Additional information about the CI system can be found in *Continuous Integration*.

**Commit Message Guidelines**

Changes are submitted as Git commits. Each commit has a *commit message* describing the change. Acceptable commit messages look like this:

```
[area]: [summary of change]

[Commit message body (must be non-empty)]

Signed-off-by: [Your Full Name] <[your.email@address]>
```

You need to change text in square brackets ([like this]) above to fit your commit. Examples and more details follow.
Example  Here is an example of a good commit message.

drivers: sensor: abcd1234: fix bus I/O error handling

The abcd1234 sensor driver is failing to check the flags field in the response packet from the device which signals that an error occurred. This can lead to reading invalid data from the response buffer. Fix it by checking the flag and adding an error path.

Signed-off-by: Zephyr Developer <z.developer@example.com>

[area]: [summary of change]  This line is called the commit's title. Titles must be:

- one line
- less than 72 characters long
- followed by a completely blank line

[area]  The [area] prefix usually identifies the area of code being changed. It can also identify the change's wider context if multiple areas are affected.

Here are some examples:

- doc: ... for documentation changes
- drivers: foo: for foo driver changes
- Bluetooth: Shell: for changes to the Bluetooth shell
- net: ethernet: for Ethernet-related networking changes
- dts: for treewide devicetree changes
- style: for code style changes

If you're not sure what to use, try running git log FILE, where FILE is a file you are changing, and using previous commits that changed the same file as inspiration.

[summary of change]  The [summary of change] part should be a quick description of what you've done. Here are some examples:

- doc: update wiki references to new site
- drivers: sensor: sensor_shell: fix channel name collision

Warning:  An empty commit message body is not permitted. Even for trivial changes, please include a descriptive commit message body. Your pull request will fail CI checks if you do not.

Commit Message Body  This part of the commit should explain what your change does, and why it's needed. Be specific. A body that says "Fixes stuff" will be rejected. Be sure to include the following as relevant:

- what the change does,
- why you chose that approach,
- what assumptions were made, and
- how you know it works – for example, which tests you ran.
Each line in your commit message should usually be 75 characters or less. Use newlines to wrap longer lines. Exceptions include lines with long URLs, email addresses, etc.

For examples of accepted commit messages, you can refer to the Zephyr GitHub changelog.

If the change addresses a GitHub issue, include a line of the form:

Fixes #[issue number]

Where [issue number] is the relevant GitHub issue’s number. For example:

Fixes: #1234

**Signed-off-by:** ...

**Tip:** You should have set your Name and email already. Create your commit with git commit -s to add the Signed-off-by: line automatically using this information.

For open source licensing reasons, your commit must include a Signed-off-by: line that looks like this:

Signed-off-by: [Your Full Name] <[your.email@address]>

For example, if your full name is Zephyr Developer and your email address is z.developer@example.com:

Signed-off-by: Zephyr Developer <z.developer@example.com>

This means that you have personally made sure your change complies with the Developer Certification of Origin (DCO). For this reason, you must use your legal name. Pseudonyms or “hacker aliases” are not permitted.

Your name and the email address you use must match the name and email in the Git commit’s Author: field.

**Other Commit Expectations**  See the Contributor Expectations for a more complete discussion of contributor and reviewer expectations.

**Submitting Proposals**  You can request a new feature or submit a proposal by submitting an issue to our GitHub Repository. If you would like to implement a new feature, please submit an issue with a proposal (RFC) for your work first, to be sure that we can use it. Please consider what kind of change it is:

- For a Major Feature, first open an issue and outline your proposal so that it can be discussed. This will also allow us to better coordinate our efforts, prevent duplication of work, and help you to craft the change so that it is successfully accepted into the project. Providing the following information will increase the chances of your issue being dealt with quickly:
  - Overview of the Proposal
  - Motivation for or Use Case
  - Design Details
  - Alternatives
  - Test Strategy
- Small Features can be crafted and directly submitted as a Pull Request.
Identifying Contribution Origin  When adding a new file to the tree, it is important to detail the source of origin on the file, provide attributions, and detail the intended usage. In cases where the file is an original to Zephyr, the commit message should include the following (“Original” is the assumption if no Origin tag is present):

| Origin: Original |

In cases where the file is imported from an external project, the commit message shall contain details regarding the original project, the location of the project, the SHA-id of the origin commit for the file and the intended purpose.

For example, a copy of a locally maintained import:

| Origin: Contiki OS  
License: BSD 3-Clause  
URL: http://www.contiki-os.org/  
commit: 853207acfd6549b10eb3e44504b1a75ae1ad63a  
Purpose: Introduction of networking stack. |

For example, a copy of an externally maintained import in a module repository:

| Origin: Tiny Crypt  
License: BSD 3-Clause  
URL: https://github.com/01org/tinycrypt  
commit: 08ded7f21529c39e5133688ff6b93a9d0c94e5c6e  
Purpose: Introduction of TinyCrypt |

Continuous Integration (CI)

The Zephyr Project operates a Continuous Integration (CI) system that runs on every Pull Request (PR) in order to verify several aspects of the PR:

- Git commit formatting
- Coding Style
- Twister builds for multiple architectures and boards
- Documentation build to verify any doc changes

CI is run on Github Actions and it uses the same tools described in the Contribution Tools section. The CI results must be green indicating “All checks have passed” before the Pull Request can be merged. CI is run when the PR is created, and again every time the PR is modified with a commit.

The current status of the CI run can always be found at the bottom of the GitHub PR page, below the review status. Depending on the success or failure of the run you will see:

- “All checks have passed”
- “All checks have failed”

In case of failure you can click on the “Details” link presented below the failure message in order to navigate to Github Actions and inspect the results. Once you click on the link you will be taken to the Github actions summary results page where a table with all the different builds will be shown. To see what build or test failed click on the row that contains the failed (i.e. non-green) build.

Contributions to External Modules

Follow the guidelines in the Modules (External projects) section for contributing new modules and submitting changes to existing modules.
Treewide Changes

This section describes contributions that are treewide changes and some additional associated requirements that apply to them. These requirements exist to try to give such changes increased review and user visibility due to their large impact.

Definition and Decision Making  A treewide change is defined as any change to Zephyr APIs, coding practices, or other development requirements that either implies required changes throughout the zephyr source code repository or can reasonably be expected to do so for a wide class of external Zephyr-based source code.

This definition is informal by necessity. This is because the decision on whether any particular change is treewide can be subjective and may depend on additional context.

Project maintainers should use good judgement and prioritize the Zephyr developer experience when deciding when a proposed change is treewide. Protracted disagreements can be resolved by the Zephyr Project's Technical Steering Committee (TSC), but please avoid premature escalation to the TSC.

Requirements for Treewide Changes

• The zephyr repository must apply the 'treewide' GitHub label to any issues or pull requests that are treewide changes
• The person proposing a treewide change must create an RFC issue describing the change, its rationale and impact, etc. before any pull requests related to the change can be merged
• The project's Architecture Working Group (WG) must include the issue on the agenda and discuss whether the project will accept or reject the change before any pull requests related to the change can be merged (with escalation to the TSC if consensus is not reached at the WG)
• The Architecture WG must specify the procedure for merging any PRs associated with each individual treewide change, including any required approvals for pull requests affecting specific subsystems or extra review time requirements
• The person proposing a treewide change must email devel@lists.zephyrproject.org about the RFC if it is accepted by the Architecture WG before any pull requests related to the change can be merged

Examples  Some example past treewide changes are:

• the deprecation of version 1 of the Logging API in favor of version 2 (see commit 262cc55609)
• the removal of support for a legacy Devicetree bindings syntax (6bf761fc0a)

Note that adding a new version of a widely used API while maintaining support for the old one is not a treewide change. Deprecation and removal of such APIs, however, are treewide changes.

Specialized driver requirements

Drivers for standalone devices should use the Zephyr bus APIs (SPI, I2C...) whenever possible so that the device can be used with any SoC from any vendor implementing a compatible bus.

If it is not technically possible to achieve full performance using the Zephyr APIs due to specialized accelerators in a particular SoC family, one could extend the support for an external device by providing a specialized path for that SoC family. However, the driver must still provide a regular path (via Zephyr APIs) for all other SoCs. Every exception must be approved by the Architecture WG in order to be validated and potentially to be learned/improved from.
8.1.2 Coding Guidelines

The project TSC and the Safety Committee of the project agreed to implement a staged and incremental approach for complying with a set of coding rules (AKA Coding Guidelines) to improve quality and consistency of the code base. Below are the agreed upon stages and the approximate timelines:

**Stage I**
Coding guideline rules are available to be followed and referenced, but not enforced. Rules are not yet enforced in CI and pull-requests cannot be blocked by reviewers/approvers due to violations.

**Stage II**
Begin enforcement on a limited scope of the code base. Initially, this would be the safety certification scope. For rules easily applied across codebase, we should not limit compliance to initial scope. This step requires tooling, CI setup and an enforcement strategy.

**Stage III**
Revisit the coding guideline rules and based on experience from previous stages, refine/iterate on selected rules.

**Stage IV**
Expand enforcement to the wider codebase. Exceptions may be granted on some areas of the codebase with a proper justification. Exception would require TSC approval.

**Note:** Coding guideline rules may be removed/changed at any time by filing a GH issue/RFC.

---

**Main rules**

The coding guideline rules are based on MISRA-C 2012 and are a subset of MISRA-C. The subset is listed in the table below with a summary of the rules, its severity and the equivalent rules from other standards for reference.

**Note:** For existing Zephyr maintainers and collaborators, if you are unable to obtain a copy through your employer, a limited number of copies will be made available through the project. If you need a copy of MISRA-C 2012, please send email to safety@lists.zephyrproject.org and provide details on reason why you can’t obtain one through other options and expected contributions once you have one. The safety committee will review all requests.

### Additional rules

**Rule A.1: Conditional Compilation**

**Severity** Required

**Description** Do not conditionally compile function declarations in header files. Do not conditionally compile structure declarations in header files. You may conditionally exclude fields within structure definitions to avoid wasting memory when the feature they support is not enabled.

**Rationale** Excluding declarations from the header based on compile-time options may prevent their documentation from being generated. Their absence also prevents use of if (IS_ENABLED(CONFIG_FOO)) {} as an alternative to preprocessor conditionals when the code path should change based on the selected options.

**Rule A.2: Inclusive Language**

**Severity** Required
Description  Do not introduce new usage of offensive terms listed below. This rule applies but is not limited to source code, comments, documentation, and branch names. Replacement terms may vary by area or subsystem, but should aim to follow updated industry standards when possible.

Exceptions are allowed for maintaining existing implementations or adding new implementations of industry standard specifications governed externally to the Zephyr Project.

Existing usage is recommended to change as soon as updated industry standard specifications become available or new terms are publicly announced by the governing body, or immediately if no specifications apply.

<table>
<thead>
<tr>
<th>Offensive Terms</th>
<th>Recommended Replacements</th>
</tr>
</thead>
</table>
| {master,leader} / slave   | • {primary,main} / {secondary,replica}  
• {initiator,requester} / {target, responder}  
• {controller,host} / {device,worker, proxy,target}  
• director / performer  
• central / peripheral |
| blacklist / whitelist | • denylist / allowlist  
• blocklist / allowlist  
• rejectlist / acceptlist |
| grandfather policy | • legacy |
| sanity            | • coherence  
• confidence |

Rationale  Offensive terms do not create an inclusive community environment and therefore violate the Zephyr Project Code of Conduct. This coding rule was inspired by a similar rule in Linux.

Status  Related GitHub Issues and Pull Requests are tagged with the Inclusive Language Label.

**Rule A.3: Macro name collisions**

**Severity**  Required

**Description**  Macros with commonly used names such as MIN, MAX, ARRAY_SIZE, must not be modified or protected to avoid name collisions with other implementations. In particular, they must not be prefixed to place them in a Zephyr-specific namespace, re-defined using #undef, or conditionally excluded from compilation using #ifdef. Instead, if a conflict arises with an existing definition originating from a module, the module's code itself needs to be modified (ideally upstream, alternatively via a change in Zephyr's own fork). This rule applies to Zephyr as a project.
in general, regardless of the time of introduction of the macro or its current name in the tree. If a macro name is commonly used in several other well-known open source projects then the implementation in Zephyr should use that name. While there is a subjective and non-measurable component to what “commonly used” means, the ultimate goal is to offer users familiar macros. Finally, this rule applies to inter-module name collisions as well: in that case both modules, prior to their inclusion, should be modified to use module-specific versions of the macro name that collides.

**Rationale** Zephyr is an RTOS that comes with additional functionality and dependencies in the form of modules. Those modules are typically independent projects that may use macro names that can conflict with other modules or with Zephyr itself. Since, in the context of this documentation, Zephyr is considered the central or main project, it should implement the non-namespaced versions of the macros. Given that Zephyr uses a fork of the corresponding upstream for each module, it is always possible to patch the macro implementation in each module to avoid collisions.

**Rule A.4: C Standard Library Usage Restrictions in Zephyr Kernel**

**Severity** Required

**Description** The use of the C standard library functions and macros in the Zephyr kernel shall be limited to the following functions and macros from the ISO/IEC 9899:2011 standard, also known as C11, and their extensions:

<table>
<thead>
<tr>
<th>Function</th>

</tbody>
</table>

All of the functions listed above must be implemented by the *minimal libc* to ensure that the Zephyr kernel can build with the minimal libc.

In addition, any functions from the above list that are not part of the ISO/IEC 9899:2011 standard must be implemented by the *common libc* to ensure their availability across multiple C standard libraries.

Introducing new C standard library functions to the Zephyr kernel is allowed with justification given that the above requirements are satisfied.

Note that the use of the functions listed above are subject to secure and safe coding practices and it should not be assumed that their use in the Zephyr kernel is unconditionally permitted by
being listed in this rule.

The “Zephyr kernel” in this context consists of the following components:

- Kernel (kernel)
- OS Library (lib/os)
- Architecture Port (arch)
- Logging Subsystem (subsys/logging)

**Rationale**  
Zephyr kernel must be able to build with the *minimal libc*, a limited C standard library implementation that is part of the Zephyr RTOS and maintained by the Zephyr Project, to allow self-contained testing and verification of the kernel and core OS services.

In order to ensure that the Zephyr kernel can build with the minimal libc, it is necessary to restrict the use of the C standard library functions and macros in the Zephyr kernel to the functions and macros that are available as part of the minimal libc.

**Rule A.5: C Standard Library Usage Restrictions in Zephyr Codebase**

**Severity**  
Required

**Description**  
The use of the C standard library functions and macros in the Zephyr codebase shall be limited to the functions, excluding the Annex K “Bounds-checking interfaces”, from the ISO/IEC 9899:2011 standard, also known as C11, unless exempted by this rule.

The “Zephyr codebase” in this context refers to all source code files committed to the main Zephyr repository, except the Zephyr kernel as defined by the Rule A.4: C Standard Library Usage Restrictions in Zephyr Kernel.

The following non-ISO 9899:2011, hereinafter referred to as non-standard, functions and macros are exempt from this rule and allowed to be used in the Zephyr codebase:

<table>
<thead>
<tr>
<th>Function</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>strlen()</td>
<td>POSIX.1-2008</td>
</tr>
<tr>
<td>strtok_r()</td>
<td>POSIX.1-2001</td>
</tr>
</tbody>
</table>

All non-standard functions and macros listed above must be implemented by the *common libc* in order to make sure that these functions can be made available when using a C standard library that does not implement these functions.

Adding a new non-standard function from common C standard libraries to the above list is allowed with justification, given that the above requirement is satisfied. However, when there exists a standard function that is functionally equivalent, the standard function shall be used.

**Rationale**  
Some C standard libraries, such as Newlib and Picolibc, include additional functions and macros that are defined by the standards and de-facto standards that extend the ISO C standard (e.g. POSIX, Linux).

The ISO/IEC 9899:2011 standard does not require C compiler toolchains to include the support for these non-standard functions, and therefore using these functions can lead to compatibility issues with the third-party toolchains that come with their own C standard libraries.
Parasoft Codescan Tool

Parasoft Codescan is an official static code analysis tool used by the Zephyr project. It is used to automate compliance with a range of coding and security standards. The tool is currently set to the MISRA-C:2012 Coding Standard because the Zephyr Coding Guidelines are based on that standard. It is used together with the Coverity Scan tool to achieve the best code health and precision in bug findings.

Violations fixing process

Step 1
Any Zephyr Project member, company or a developer can request access to the Parasoft reporting centre if they wish to get involved in fixing violations by submitting issues.

Step 2
A developer starts to review violations.

Step 3
A developer submits a Github PR with the fix. Commit messages should follow the same guidelines as other PRs in the Zephyr project. Please add a comment that your fix was found by a static coding scanning tool. Developers should follow and refer to the Zephyr Coding Guidelines as basic rules for coding. These rules are based on the MISRA-C standard.

Below you can find an example of a recommended commit message:

```
lib: os: add braces to 'if' statements

An 'if' (expression) construct shall be followed by a compound statement.
Add braces to improve readability and maintainability.

Found as a coding guideline violation (Rule 15.6) by static
coding scanning tool.

Signed-off-by: Johnny Developer <johnny.developer@company.com>
```

Step 4
If a violation is a false positive, the developer should mark it for the Codescan tool just like they would do for the Coverity tool. The developer should also add a comment to the code explaining that the violation raised by the static code analysis tool should be considered a false positive.

Step 5
If the developer has found a real violation that the community decided to ignore, the developer must submit a PR with a suppression tag and a comment explaining why the violation has been deviated. The template structure of the comment and tag in the code should be:

```
/* Explain why that part of the code doesn't follow the standard,
 * explain why it is a deliberate deviation from the standard.
 * Don't refer to the Parasoft tool here, just mention that static code
 * analysis tool raised a violation in the line below.
 */

code_line_with_a_violation /* parasoft-suppress Rule ID */
```

Below you can find an example of a recommended commit message:

```
testsuite: suppress usage of setjmp in a testcode (rule 21.4)

According to the Rule 21.4 the standard header file <setjmp.h> shall not
be used. We will suppress this violation because it is in
test code. Tag suppresses reporting of the violation for the
line where the violation is located.
```

(continues on next page)
This is a deliberate deviation.

Found as a coding guideline violation (Rule 21.4) by static coding scanning tool.

Signed-off-by: Johnny Developer <johnny.developer@company.com>

The example below demonstrates how deviations can be suppressed in the code:

```c
/* Static code analysis tool can raise a violation that the standard
 * header <setjmp.h> shall not be used.
 * Since this violation is in test code, we will suppress it.
 * Deliberate deviation.
 */
#include <setjmp.h> /* parasoft-suppress MISRAC2012-RULE_21_4-a MISRAC2012-RULE_21_4-b */
```

This variant above suppresses item MISRAC2012-RULE_21_4-a and MISRAC2012-RULE_21_4-b on the line with “setjmp” header include. You can add as many rules to suppress you want - just make sure to keep the Parasoft tag on one line and separate rules with a space.

To read more about suppressing findings in the Parasoft tool, refer to the official Parasoft documentation.

**Step 6**

After a PR is submitted, the developer should add the Coding guidelines and MISRA-C Github labels so their PR can be easily tracked by maintainers. If you have any concerns about what your PR should look like, you can search on Github using those tags and refer to similar PRs that have already been merged.

### 8.1.3 Proposals and RFCs

Many changes, including bug fixes and documentation improvements can be implemented and reviewed via the normal GitHub pull request workflow.

Many changes however are “substantial” and need to go through a design process and produce a consensus among the project stakeholders.

The “RFC” (request for comments) process is intended to provide a consistent and controlled path for new features to enter the project.

Contributors and project stakeholders should consider using this process if they intend to make “substantial” changes to Zephyr or its documentation. Some examples that would benefit from an RFC are:

- A new feature that creates new API surface area, and would require a feature flag if introduced.
- The modification of an existing stable API.
- The removal of features that already shipped as part of Zephyr.
- The introduction of new idiomatic usage or conventions, even if they do not include code changes to Zephyr itself.

The RFC process is a great opportunity to get more eyeballs on proposals coming from contributors before it becomes a part of Zephyr. Quite often, even proposals that seem “obvious” can be significantly improved once a wider group of interested people have a chance to weigh in.

The RFC process can also be helpful to encourage discussions about a proposed feature as it is being designed, and incorporate important constraints into the design while it's easier to change, before the design has been fully implemented.

Some changes do not require an RFC:
- Rephrasing, reorganizing or refactoring
- Addition or removal of warnings
- Addition of new boards, SoCs or drivers to existing subsystems
- ...

The process in itself consists in creating a GitHub issue with the *RFC label* that documents the proposal thoroughly. There is an *RFC template* included in the main Zephyr GitHub repository that serves as a guideline to write a new RFC.

As with Pull Requests, RFCs might require discussion in the context of one of the *Zephyr meetings* in order to move it forward in cases where there is either disagreement or not enough voiced opinions in order to proceed. Make sure to either label it appropriately or include it in the corresponding GitHub project in order for it to be examined during the next meeting.

### 8.1.4 Contributor Expectations

**Overview**

The Zephyr project encourages *contributors* to submit changes as smaller pull requests. Smaller pull requests (PRs) have the following benefits:

- Reviewed more quickly and reviewed more thoroughly. It's easier for reviewers to set aside a few minutes to review smaller changes several times than it is to allocate large blocks of time to review a large PR.
- Less wasted work if reviewers or maintainers reject the direction of the change.
- Easier to rebase and merge. Smaller PRs are less likely to conflict with other changes in the tree.
- Easier to revert if the PR breaks functionality.

*Note:* This page does not apply to draft PRs which can have any size, any number of commits and any combination of smaller PRs for testing and preview purposes. Draft PRs have no review expectation and PRs created as drafts from the start do not notify anyone by default.

**Defining Smaller PRs**

- Smaller PRs should encompass one self-contained logical change.
- When adding a new large feature or API, the PR should address only one part of the feature. In this case create an *RFC proposal* to describe the additional parts of the feature for reviewers.
- PRs should include tests or samples under the following conditions:
  - Adding new features or functionality.
  - Modifying a feature, especially for API behavior contract changes.
  - Fixing a hardware agnostic bug. The test should fail without the bug fixed and pass with the fix applied.
- PRs must update any documentation affected by a functional code change.
- If introducing a new API, the PR must include an example usage of the API. This provides context to the reviewer and prevents submitting PRs with unused APIs.
Multiple Commits on a Single PR  Contributors are further encouraged to break up PRs into multiple commits. Keep in mind each commit in the PR must still build cleanly and pass all the CI tests.

For example, when introducing an extension to an API, contributors can break up the PR into multiple commits targeting these specific changes:

1. Introduce the new APIs, including shared devicetree bindings
2. Update driver implementation X, with driver specific devicetree bindings
3. Update driver implementation Y
4. Add tests for the new API
5. Add a sample using the API
6. Update the documentation

Large Changes  Large changes to the Zephyr project must submit an RFC proposal describing the full scope of change and future work. The RFC proposal provides the required context to reviewers, but allows for smaller, incremental, PRs to get reviewed and merged into the project. The RFC should also define the minimum viable implementation.

Changes which require an RFC proposal include:

- Submitting a new feature.
- Submitting a new API.
- Treewide Changes.
- Other large changes that can benefit from the RFC proposal process.

Maintainers have the discretion to request that contributors create an RFC for PRs that are too large or complicated.

PR Requirements

- Each commit in the PR must provide a commit message following the Commit Message Guidelines.
- All files in the PR must comply with Licensing Requirements.
- Follow the Zephyr Coding Style and Coding Guidelines.
- PRs must pass all CI checks. This is a requirement to merge the PR. Contributors may mark a PR as draft and explicitly request reviewers to provide early feedback, even with failing CI checks.
- When breaking a PR into multiple commits, each commit must build cleanly. The CI system does not enforce this policy, so it is the PR author's responsibility to verify.
- When major new functionality is added, tests for the new functionality shall be added to the automated test suite. All API functions should have test cases and there should be tests for the behavior contracts of the API. Maintainers and reviewers have the discretion to determine if the provided tests are sufficient. The examples below demonstrate best practices on how to test APIs effectively.
  - Kernel timer tests provide around 85% test coverage for the kernel timer, measured by lines of code.
  - Emulators for off-chip peripherals are an effective way to test driver APIs. The fuel gauge tests use the smart battery emulator, providing test coverage for the fuel gauge API and the smart battery driver.
  - Code coverage reports for the Zephyr project are available on Codecov.
• Incompatible changes to APIs must also update the release notes for the next release detailing the change. APIs marked as experimental are excluded from this requirement.
• Changes to APIs must increment the API version number according to the API version rules.
• PRs must also satisfy all Merge Criteria before a member of the release engineering team merges the PR into the zephyr tree.

Maintainers may request that contributors break up a PR into smaller PRs and may request that they create an RFC proposal.

Workflow Suggestions That Help Reviewers
• Unless they applied the reviewer’s recommendation exactly, authors must not resolve and hide comments, they must let the initial reviewer do it. The Zephyr project does not require all comments to be resolved before merge. Leaving some completed discussions open can sometimes be useful to understand the greater picture.
• Respond to comments using the “Start Review” and “Add Review” green buttons in the “Files changed” view. This allows responding to multiple comments and publishing the responses in bulk. This reduces the number of emails sent to reviewers.
• As GitHub does not implement git range-diff, try to minimize rebases in the middle of a review. If a rebase is required, push this as a separate update with no other changes since the last push of the PR. When pushing a rebase only, add a comment to the PR indicating which commit is the rebase.

PR Review Escalation  The Zephyr community is a diverse group of individuals, with different levels of commitment and priorities. As such, reviewers and maintainers may not get to a PR right away.

The Zephyr Dev Meeting performs a triage of PRs missing reviewer approval, following this process:

1. Identify and update PRs missing an Assignee.
2. Identify PRs without any comments or reviews, ping the PR Assignee to start a review or assign to a different maintainer.
3. For PRs that have otherwise stalled, the Zephyr Dev Meeting pings the Assignee and any reviewers that have left comments on the PR.

Contributors may escalate PRs outside of the Zephyr Dev Meeting triage process as follows:
• After 1 week of inactivity, ping the Assignee or reviewers on the PR by adding a comment to the PR.
• After 2 weeks of inactivity, post a message on the #pr-help channel on Discord linking to the PR.
• After 2 weeks of inactivity, add the dev-review label to the PR. This explicitly adds the PR to the agenda for the next Zephyr Dev Meeting independent of the triage process. Not all contributors have the required privileges to add labels to PRs, in this case the contributor should request help on Discord or send an email to the Zephyr devel mailing list.

Note that for new PRs, contributors should generally wait for at least one Zephyr Dev Meeting before escalating the PR themselves.

PR Technical Escalation  In cases where a contributor objects to change requests from reviewers, Zephyr defines the following escalation process for resolving technical disagreements.
Before escalation of technical disagreements, follow the steps below:
• Resolve in the PR among assignee, maintainers and reviewer.
– Assignee to act as moderator if applicable.

• Optionally resolve in the next Zephyr Dev Meeting meeting with more Maintainers and project stakeholders.
  – The involved parties and the Assignee to be present when the issue is discussed.

• If no progress is made, the assignee (maintainer) has the right to dismiss stale, unrelated or irrelevant change requests by reviewers giving the reviewers a minimum of 1 business day to respond and revisit their initial change requests or start the escalation process.

The assignee has the responsibility to document the reasoning for dismissing any reviews in the PR and should notify the reviewer about their review being dismissed.

To give the reviewers time to respond and escalate, the assignee is expected to block the PR from being merged either by not approving the PR or by setting the DNM label.

Escalation can be triggered by any party participating in the review process (assignee, reviewers or the original author of the change) following the steps below:

• Escalate to the Architecture Working Group by adding the Architecture Review label on the PR. Beside the weekly meeting where such escalations are processed, the Architecture Working Group shall facilitate an offline review of the escalation if requested, especially if any of the parties can’t attend the meeting.

• If all avenues of resolution and escalation have failed, assignees can escalate to the TSC and get a binding resolution in the TSC by adding the TSC label on the PR.

• The Assignee is expected to ensure the resolution of the escalation and the outcome is documented in the related pull request or issues on Github.

8.1.5 Reviewer Expectations

• Be respectful when commenting on PRs. Refer to the Zephyr Code of Conduct for more details.

• The Zephyr Project recognizes that reviewers and maintainers have limited bandwidth. As a reviewer, prioritize review requests in the following order:
  1. PRs related to items in the Zephyr Release Plan or those targeting the next release during the stabilization period (after RC1).
  2. PRs where the reviewer has requested blocking changes.
  3. PRs assigned to the reviewer as the area maintainer.
  4. All other PRs.

• Try to provide feedback on the entire PR in one shot. This provides the contributor an opportunity to address all comments in the next PR update.

• Partial reviews are permitted, but the reviewer must add a comment indicating what portion of the PR they reviewed. Examples of useful partial reviews include:
  – Domain specific reviews (e.g. Devicetree).
  – Code style changes that impact the readability of the PR.
  – Reviewing commits separately when the requested changes cascade into the later commits.

• Avoid increasing scope of the PR by requesting new features, especially when there is a corresponding RFC associated with the PR. Instead, reviewers should add suggestions as a comment to the RFC. This also encourages more collaboration as it is easier for multiple contributors to work on a feature once the minimum implementation has merged.
When using the “Request Changes” option, mark trivial, non-functional, requests as “Non-blocking” in the comment. Reviewers should approve PRs once only non-blocking changes remain. The PR author has discretion as to whether they address all non-blocking comments. PR authors should acknowledge every review comment in some way, even if it’s just with an emoticon.

Reviewers shall be clear and concise what changes they are requesting when the “Request Changes” option is used. Requested changes shall be in the scope of the PR in question and following the contribution and style guidelines of the project.

Contribution Guidelines
Learn about the overall process and guidelines for contributing to the Zephyr project.
This page is a mandatory read for first-time contributors as it contains important information on how to ensure your contribution can be considered for inclusion in the project and potentially merged.

Contributor Expectations
This document is another mandatory read that describes the expected behavior of all contributors to the project.

Coding Guidelines
Code contributions are expected to follow a set of coding guidelines to ensure consistency and readability across the code base.
This page describes these guidelines and introduces important considerations regarding the use of inclusive language.

Proposals and RFCs
Learn when and how to submit RFCs (Request for Comments) for new features and changes to the project.

8.2 Documentation

The Zephyr project thrives on good documentation. Whether it is as part of a code contribution or as a standalone effort, contributing documentation is particularly valuable to the project.

8.2.1 Documentation Guidelines

Note: For instructions on building the documentation, see Documentation Generation.

Zephyr Project content is written using the reStructuredText markup language (.rst file extension) with Sphinx extensions, and processed using Sphinx to create a formatted standalone website. Developers can view this content either in its raw form as .rst markup files, or (with Sphinx installed) they can build the documentation locally to generate the documentation in HTML or PDF format. The HTML content can then be viewed using a web browser. This same .rst content is served by the Zephyr documentation website.

You can read details about reStructuredText and about Sphinx extensions from their respective websites.

This document provides a quick reference for commonly used reST and Sphinx-defined directives and roles used to create the documentation you’re reading.
Headings

While reST allows use of both underline and matching overline to indicate a heading, we only use an underline indicator for headings.

- Document title (h1) use “#” for the underline character
- First section heading level (h2) use “*”
- Second section heading level (h3) use “=”
- Third section heading level (h4) use “-”

The heading underline must be at least as long as the title it’s under.

For example:

```
This is a title heading
########################

some content goes here

First section heading
*********************
```

Content Highlighting

Some common reST inline markup samples:

- one asterisk: *text* for emphasis (italics),
- two asterisks: **text** for strong emphasis (boldface), and
- two backquotes: `text` for inline code samples.

If asterisks or backquotes appear in running text and could be confused with inline markup delimiters, you can eliminate the confusion by adding a backslash (\) before it.

Lists

For bullet lists, place an asterisk (*) or hyphen (-) at the start of a paragraph and indent continuation lines with two spaces.

The first item in a list (or sublist) must have a blank line before it and should be indented at the same level as the preceding paragraph (and not indented itself).

For numbered lists start with a 1. or a. for example, and continue with autonumbering by using a # sign. Indent continuation lines with three spaces:

```
* This is a bulleted list.
* It has two items, the second
  item and has more than one line of reST text. Additional lines
  are indented to the first character of the
  text of the bullet list.

1. This is a new numbered list. If the wasn't a blank line before it,
   it would be a continuation of the previous list (or paragraph).
#. It has two items too.

a. This is a numbered list using alphabetic list headings
#. It has three items (and uses autonumbering for the rest of the list)
#. Here's the third item
```

(continues on next page)
This is an autonumbered list (default is to use numbers starting with 1).

- This is a second-level list under the first item (also autonumbered). Notice the indenting.
- And a second item in the nested list.
- And a second item back in the containing list. No blank line needed, but it wouldn't hurt for readability.

Definition lists (with a term and its definition) are a convenient way to document a word or phrase with an explanation. For example this reST content:

```plaintext
The Makefile has targets that include:

html
    Build the HTML output for the project

clean
    Remove all generated output, restoring the folders to a clean state.
```

Would be rendered as:

The Makefile has targets that include:

- **html**: Build the HTML output for the project
- **clean**: Remove all generated output, restoring the folders to a clean state.

## Multi-column lists

If you have a long bullet list of items, where each item is short, you can indicate the list items should be rendered in multiple columns with a special `.. rst-class:: rst-columns` directive. The directive will apply to the next non-comment element (e.g., paragraph), or to content indented under the directive. For example, this unordered list:

```plaintext
.. rst-class:: rst-columns

* A list of
* short items
* that should be
* displayed
* horizontally
* so it doesn't
* use up so much
* space on
* the page
```

would be rendered as:

- A list of
- short items
- that should be
- displayed
- horizontally
- so it doesn't
• use up so much
• space on
• the page

A maximum of three columns will be displayed, and change based on the available width of the display window, reducing to one column on narrow (phone) screens if necessary. We've deprecated use of the hlist directive because it misbehaves on smaller screens.

Tables

There are a few ways to create tables, each with their limitations or quirks. Grid tables offer the most capability for defining merged rows and columns, but are hard to maintain:

<table>
<thead>
<tr>
<th>Header row, column 1</th>
<th>Header 2</th>
<th>Header 3</th>
<th>Header 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>(header rows optional)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>body row 1, column 1</td>
<td>column 2</td>
<td>column 3</td>
<td>column 4</td>
</tr>
<tr>
<td>body row 2</td>
<td>...</td>
<td>...</td>
<td>you can</td>
</tr>
<tr>
<td>body row 3 with a two column span</td>
<td>...</td>
<td>span</td>
<td>rows</td>
</tr>
<tr>
<td>body row 4</td>
<td>...</td>
<td>...</td>
<td>too</td>
</tr>
</tbody>
</table>

This example would render as:

<table>
<thead>
<tr>
<th>Header row, column 1 (header rows optional)</th>
<th>Header 2</th>
<th>Header 3</th>
<th>Header 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>body row 1, column 1</td>
<td>column 2</td>
<td>column 3</td>
<td>column 4</td>
</tr>
<tr>
<td>body row 2</td>
<td>...</td>
<td>...</td>
<td>you can easily span rows</td>
</tr>
<tr>
<td>body row 3 with a two column span</td>
<td>...</td>
<td>...</td>
<td></td>
</tr>
<tr>
<td>body row 4</td>
<td>...</td>
<td>...</td>
<td></td>
</tr>
</tbody>
</table>

List tables are much easier to maintain, but don't support row or column spans:

```
.. list-table:: Table title
   :widths: 15 20 40
   :header-rows: 1

   * - Heading 1
     - Heading 2
     - Heading 3
   * - body row 1, column 1
     - body row 1, column 2
     - body row 1, column 3
   * - body row 2, column 1
     - body row 2, column 2
     - body row 2, column 3
```

This example would render as:
The :widths: parameter lets you define relative column widths. The default is equal column widths. If you have a three-column table and you want the first column to be half as wide as the other two equal-width columns, you can specify :widths: `1 2 2`. If you'd like the browser to set the column widths automatically based on the column contents, you can use :widths: `auto`.

**File names and Commands**

Sphinx extends reST by supporting additional inline markup elements (called “roles”) used to tag text with special meanings and allow style output formatting. (You can refer to the Sphinx Inline Markup documentation for the full list).

For example, there are roles for marking filenames (:file:`name`) and command names such as make (:command:`make`). You can also use the “inline code“ markup (double backticks) to indicate a filename.

For references to files that are in the Zephyr GitHub tree, a special role can be used that creates a hyperlink to that file. For example a reference to the reST file used to create this document can be generated using :zephyr_file:`doc/contribute/documentation/index.rst` that will show up as `doc/contribute/documentation/index.rst`, a link to the “blob” file in the github repo. There's also a :zephyr_raw:`doc/guides/documentation/index.rst` role that will link to the “raw” content, `doc/contribute/documentation/index.rst`. (You can click on these links to see the difference.)

**Internal Cross-Reference Linking**

Traditional ReST links are only supported within the current file using the notation:

Refer to the `internal-linking` page

which renders as,

Refer to the internal-linking page

Note the use of a trailing underscore to indicate an outbound link. In this example, the label was added immediately before a heading, so the text that's displayed is the heading text itself. You can change the text that's displayed as the link writing this as:

Refer to the `show this text instead <internal-linking>` page

which renders as,

Refer to the show this text instead page

**External Cross-Reference Linking**

With Sphinx's help, we can create link-references to any tagged text within the Zephyr Project documentation.

Target locations in a document are defined with a label directive:
Note the leading underscore indicating an inbound link. The content immediately following this label must be a heading, and is the target for a :ref:`my label name` reference from anywhere within the Zephyr documentation. The heading text is shown when referencing this label. You can also change the text that's displayed for this link, such as:

```
:ref:`some other text <my label name>`
```

To enable easy cross-page linking within the site, each file should have a reference label before its title so it can be referenced from another file. These reference labels must be unique across the whole site, so generic names such as “samples” should be avoided. For example the top of this document's .rst file is:

```
.. _doc_guidelines:

Documentation Guidelines for the Zephyr Project

Documentation Guidelines

Other .rst documents can link to this document using the :ref:`doc_guidelines` tag and it will show up as Documentation Guidelines. This type of internal cross reference works across multiple files, and the link text is obtained from the document source so if the title changes, the link text will update as well.

You can also define links to any URL and then reference it in your document. For example, with this label definition in the document:

```
.. _Zephyr Wikipedia Page:

https://en.wikipedia.org/wiki/Zephyr_(operating_system)
```

you can reference it with:

```
Read the `Zephyr Wikipedia Page`_ for more information about the project.
```

‘any’ links

Within the Zephyr project, we've defined the default role to be “any”, meaning if you just write a phrase in back-ticks, e.g., `doc_guidelines`, Sphinx will search through all domains looking for something called doc_guidelines to link to. In this case it will find the label at the top of this document, and link to doc_guidelines. This can be useful for linking to doxygen-generated links for function names and such, but will cause a warning such as:

```
WARNING: 'any' reference target not found: doc_guidelines
```

if you misspelled `doc_guidelines` as `doc_giudelines`.

Non-ASCII Characters

You can insert non-ASCII characters such as a Trademark symbol (™), by using the notation |trade|. Available replacement names are defined in an include file used during the Sphinx processing of the reST files. The names of these replacement characters are the same as used in HTML entities used to insert characters in HTML, e.g., &trade; and are defined in the file sphinx_build/substitutions.txt as listed here:

```
We’ve kept the substitutions list small but others can be added as needed by submitting a change to the substitutions.txt file.

**Code and Command Examples**

Use the reST code-block directive to create a highlighted block of fixed-width text, typically used for showing formatted code or console commands and output. Smart syntax highlighting is also supported (using the Pygments package). You can also directly specify the highlighting language. For example:

```c
struct k_object {
    char *name;
    uint8_t perms[CONFIG_MAX_THREAD_BYTES];
    uint8_t type;
    uint8_t flags;
    uint32_t data;
} __packed;
```

Note the blank line between the code-block directive and the first line of the code-block body, and the body content is indented three spaces (to the first non-white space of the directive name). This would be rendered as:

```
struct k_object {
    char *name;
    uint8_t perms[CONFIG_MAX_THREAD_BYTES];
    uint8_t type;
    uint8_t flags;
    uint32_t data;
} __packed;
```

Other languages are of course supported (see languages supported by Pygments), and in particular, you are encouraged to make use of the following when appropriate:
• c for C code
• cpp for C++ code
• python for Python code
• console for console output, i.e. interactive shell sessions where commands are prefixed by a prompt (ex. $ for Linux, or uart:-$ for Zephyr's shell), and where the output is also shown. The commands will be highlighted, and the output will not. What's more, copying code block using the “copy” button will automatically copy just the commands, excluding the prompt and the outputs of the commands.
• shell or bash for shell commands. Both languages get highlighted the same but you may use bash for conveying that the commands are bash-specific, and shell for generic shell commands.

Note: Do not use bash or shell if your code block includes a prompt, use console instead. Reciprocally, do not use console if your code block does not include a prompt and is not showcasing an interactive session with command(s) and their output.

Table 5: When to use bash/shell vs. console

<table>
<thead>
<tr>
<th>Use case</th>
<th>code-block snippet</th>
<th>Expected output</th>
</tr>
</thead>
</table>
| One or several commands, no output | .. code-block:: shell
   echo "Hello World!" | echo "Hello World!" |
| An interactive shell session with command(s) and their output | .. code-block:: console
   $ echo "Hello World!"
   Hello World! | $ echo "Hello World!"
   Hello World! |
| An interactive Zephyr shell session, with commands and their outputs | .. code-block:: console
   uart:--$ version
   Zephyr version 3.5.99
   uart:--$ kernel uptime
   Uptime: 20970 ms | uart:--$ version
   Zephyr version 3.5.99
   uart:--$ kernel uptime
   Uptime: 20970 ms |

• bat for Windows batch files
• cfg for config files with “KEY=value” entries (ex. Kconfig .conf files)
• cmake for CMake
• devicetree for Devicetree
• kconfig for Kconfig
• yaml for YAML
• rst for reStructuredText

When no language is specified, the language is set to none and the code block is not highlighted. You may also use none explicitly to achieve the same result; for example:

.. code-block:: none

(continues on next page)
Images

Images are included in documentation by using an image directive:

```
.. image:: ../../../images/doc-gen-flow.png
   :align: center
   :alt: alt text for the image
```

or if you'd like to add an image caption, use:

```
.. figure:: ../../../images/doc-gen-flow.png
   :alt: image description

Caption for the figure
```

The file name specified is relative to the document source file, and we recommend putting images into an images folder where the document source is found. The usual image formats handled by a web browser are supported: JPEG, PNG, GIF, and SVG. Keep the image size only as large as needed, generally at least 500 px wide but no more than 1000 px, and no more than 250 KB unless a particularly large image is needed for clarity.

Tabs, spaces, and indenting

Indenting is significant in reST file content, and using spaces is preferred. Extra indenting can (unintentionally) change the way content is rendered too. For lists and directives, indent the content text to the first non-white space in the preceding line. For example:

```
* List item that spans multiple lines of text
  showing where to indent the continuation line.

1. And for numbered list items, the continuation
   line should align with the text of the line above.

.. code-block::

   The text within a directive block should align with the
   first character of the directive name.
```

Refer to the Zephyr Coding Style for additional requirements.
**zephyr-app-commands Directive**

This is a Zephyr directive for generating consistent documentation of the shell commands needed to manage (build, flash, etc.) an application.

For example, to generate commands to build samples/hello_world for qemu_x86 use:

```plaintext
zephyr-app-commands::
:zephyr-app: samples/hello_world
:board: qemu_x86
:goals: build
```

Directive options:

- **:tool:** which tool to use. Valid options are currently ‘cmake’, ‘west’ and ‘all’. The default is ‘west’.

- **:app:** path to the application to build.

- **:zephyr-app:** path to the application to build, this is an app present in the upstream zephyr repository. Mutually exclusive with :app:.

- **:cd-into:** if set, build instructions are given from within the :app: folder, instead of outside of it.

- **:generator:** which build system to generate. Valid options are currently ‘ninja’ and ‘make’. The default is ‘ninja’. This option is not case sensitive.

- **:host-os:** which host OS the instructions are for. Valid options are ‘unix’, ‘win’ and ‘all’. The default is ‘all’.

- **:board:** if set, the application build will target the given board.

- **:shield:** if set, the application build will target the given shield.

- **:conf:** if set, the application build will use the given configuration file. If multiple conf files are provided, enclose the space-separated list of files with quotes, e.g., “a.conf b.conf”.

- **:gen-args:** if set, additional arguments to the CMake invocation

- **:build-args:** if set, additional arguments to the build invocation

- **:build-dir:** if set, the application build directory will APPEND this (relative, Unix-separated) path to the standard build directory. This is mostly useful for distinguishing builds for one application within a single page.

- **:goals:** a whitespace-separated list of what to do with the app (in ‘build’, ‘flash’, ‘debug’, ‘debugserver’, ‘run’). Commands to accomplish these tasks will be generated in the right order.
:maybe-skip-config:
if set, this indicates the reader may have already created a build directory and
changed there, and will tweak the text to note that doing so again is not necessary.

:compact:
if set, the generated output is a single code block with no additional comment
lines

:west-args:
if set, additional arguments to the west invocation (ignored for CMake)

:flash-args:
if set, additional arguments to the flash invocation

For example, the .. zephyr-app-commands listed above would render like this in the generated
HTML output:

```
# From the root of the zephyr repository
west build -b qemu_x86 samples/hello_world
```

**Alternative Tabbed Content**

As introduced in the *Getting Started Guide*, you can provide alternative content to the reader via
a tabbed interface. When the reader clicks on a tab, the content for that tab is displayed, for
example:

```
.. tabs::
   .. tab:: Apples
       Apples are green, or sometimes red.
   .. tab:: Pears
       Pears are green.
   .. tab:: Oranges
       Oranges are orange.
```

will display as:

Apples
Apples are green, or sometimes red.
Pears
Pears are green.
Oranges
Oranges are orange.

Tabs can also be grouped, so that changing the current tab in one area changes all tabs with the
same name throughout the page. For example:

Linux
Linux Line 1
macOS
macOS Line 1
Windows
In this latter case, we’re using .. group-tab:: instead of simply .. tab::. Under the hood, we’re using the sphinx-tabs extension that’s included in the Zephyr setup. Within a tab, you can have most any content other than a heading (code-blocks, ordered and unordered lists, pictures, paragraphs, and such). You can read more about sphinx-tabs from the link above.

8.2.2 Documentation Generation

These instructions will walk you through generating the Zephyr Project’s documentation on your local system using the same documentation sources as we use to create the online documentation found at https://docs.zephyrproject.org

Documentation overview

Zephyr Project content is written using the reStructuredText markup language (.rst file extension) with Sphinx extensions, and processed using Sphinx to create a formatted stand-alone website. Developers can view this content either in its raw form as .rst markup files, or you can generate the HTML content and view it with a web browser directly on your workstation. This same .rst content is also fed into the Zephyr Project’s public website documentation area (with a different theme applied).

You can read details about reStructuredText, and Sphinx from their respective websites.

The project’s documentation contains the following items:

- ReStructuredText source files used to generate documentation found at the https://docs.zephyrproject.org website. Most of the ReStructuredText sources are found in the /doc directory, but others are stored within the code source tree near their specific component (such as /samples and /boards)
- Doxygen-generated material used to create all API-specific documents also found at https://docs.zephyrproject.org
- Script-generated material for kernel configuration options based on Kconfig files found in the source code tree

The reStructuredText files are processed by the Sphinx documentation system, and make use of the breathe extension for including the doxygen-generated API material. Additional tools are required to generate the documentation locally, as described in the following sections.

Installing the documentation processors

Our documentation processing has been tested to run with:

- Doxygen version 1.8.13
- Graphviz 2.43
- Latexmk version 4.56
In order to install the documentation tools, first install Zephyr as described in Getting Started Guide. Then install additional tools that are only required to generate the documentation, as described below:

**Linux**

Common to all Linux installations, install the Python dependencies required to build the documentation:

```
pip install -r ~/zephyrproject/zephyr/doc/requirements.txt
```

**On Ubuntu Linux:**

```
sudo apt-get install --no-install-recommends doxygen graphviz librsvg2-bin \
texlive-latex-base texlive-latex-extra latexmk texlive-fonts-recommended
```

**On Fedora Linux:**

```
sudo dnf install doxygen graphviz texlive-latex latexmk \
texlive-collection-fontsrecommended librsvg2-tools
```

**On Clear Linux:**

```
sudo swupd bundle-add texlive graphviz
```

**On Arch Linux:**

```
sudo pacman -S graphviz doxygen librsvg texlive-core texlive-bin \
texlive-latexextra texlive-fontextr
```

**macOS**

Install the Python dependencies required to build the documentation:

```
 pip install -r ~/zephyrproject/zephyr/doc/requirements.txt
```

Use brew and tlmgr to install the tools:
brew install doxygen graphviz mactex librsvg
tlmgr install latexmk
tlmgr install collection-fontsrecommended

Windows
Install the Python dependencies required to build the documentation:
pip install -r %HOMEPATH%\zephyrproject\zephyr\doc\requirements.txt

Open a cmd.exe window as Administrator and run the following command:
choco install doxygen.install graphviz strawberryperl miktex rsvg-convert

Note: On Windows, the Sphinx executable sphinx-build.exe is placed in the Scripts folder of your Python installation path. Depending on how you have installed Python, you might need to add this folder to your PATH environment variable. Follow the instructions in Windows Python Path to add those if needed.

Documentation presentation theme
Sphinx supports easy customization of the generated documentation appearance through the use of themes. Replace the theme files and do another make html and the output layout and style is changed. The read-the-docs theme is installed as part of the Get Zephyr and install Python dependencies step you took in the getting started guide.

Running the documentation processors
The/doc directory in your cloned copy of the Zephyr project git repo has all the .rst source files, extra tools, and Makefile for generating a local copy of the Zephyr project’s technical documentation. Assuming the local Zephyr project copy is in a folder zephyr in your home folder, here are the commands to generate the html content locally:

# On Linux/macOS
cd ~/zephyr/doc
# On Windows

cd %userprofile%\zephyr\doc

# Use cmake to configure a Ninja-based build system:
cmake -GNinja -B_build

# Enter the build directory
cd _build

# To generate HTML output, run ninja on the generated build system:
ninja html
# If you modify or add .rst files, run ninja again:
ninja html

# To generate PDF output, run ninja on the generated build system:
ninja pdf

Warning: The documentation build system creates copies in the build directory of every .rst file used to generate the documentation, along with dependencies referenced by those .rst files.
This means that Sphinx warnings and errors refer to the copies, and not the version-controlled original files in Zephyr. Be careful to make sure you don’t accidentally edit the copy of the file in an error message, as these changes will not be saved.

Depending on your development system, it will take up to 15 minutes to collect and generate the HTML content. When done, you can view the HTML output with your browser started at doc/_build/html/index.html and if generated, the PDF file is available at doc/_build/latex/zephyr.pdf.

If you want to build the documentation from scratch just delete the contents of the build folder and run cmake and then ninja again.

**Note:** If you add or remove a file from the documentation, you need to re-run CMake.

On Unix platforms a convenience doc/Makefile can be used to build the documentation directly from there:

```bash
# To generate HTML output
make html
# To generate PDF output
make pdf
```

**Filtering expected warnings**

There are some known issues with Sphinx/Breathe that generate Sphinx warnings even though the input is valid C code. While these issues are being considered for fixing we have created a Sphinx extension that allows to filter them out based on a set of regular expressions. The extension is named zephyr.warnings_filter and it is located at doc/_extensions/zephyr/warnings_filter.py. The warnings to be filtered out can be added to the doc/known-warnings.txt file.

The most common warning reported by Sphinx/Breathe is related to duplicate C declarations. This warning may be caused by different Sphinx/Breathe issues:

- Multiple declarations of the same object are not supported
- Different objects (e.g. a struct and a function) can not share the same name
- Nested elements (e.g. in a struct or union) can not share the same name

**Developer-mode Document Building**

When making and testing major changes to the documentation, we provide an option to temporarily stub-out the auto-generated Devicetree bindings documentation so the doc build process runs faster.

To enable this mode, set the following option when invoking cmake:

```
-DDT_TURBO_MODE=1
```

or invoke make with the following target:
cd ~/zephyr

# To generate HTML output without detailed Kconfig
make html-fast

Viewing generated documentation locally

The generated HTML documentation can be hosted locally with python for viewing with a web browser:

```
$ python3 -m http.server -d _build/html
```

Note: WSL2 users may need to explicitly bind the address to 127.0.0.1 in order to be accessible from the host machine:

```
$ python3 -m http.server -d _build/html --bind 127.0.0.1
```

Linking external Doxygen projects against Zephyr

External projects that build upon Zephyr functionality and wish to refer to Zephyr documentation in Doxygen (through the use of @ref), can utilize the tag file exported at zephyr.tag

Once downloaded, the tag file can be used in a custom doxyfile.in as follows:

```
TAGFILES = */path/to/zephyr.tag=https://docs.zephyrproject.org/latest/doxygen/html/*
```

For additional information refer to Doxygen External Documentation.

Documentation Guidelines

This page provides some simple guidelines for writing documentation using the reStructuredText (reST) markup language and Sphinx documentation generator.

Documentation Generation

As you write documentation, it can be helpful to see how it will look when rendered.

This page describes how to build the Zephyr documentation locally.

8.3 Dealing with external components

8.3.1 Contributing External Components

In some cases it is desirable to leverage existing, external source code in order to avoid re-implementing basic functionality or features that are readily available in other open source projects.

This section describes the circumstances under which external source code can be imported into Zephyr, and the process that governs the inclusion.

There are three main factors that will be considered during the inclusion process in order to determine whether it will be accepted. These will be described in the following sections.

Note that most of this page deals with external components that end up being compiled and linked into the final image, and programmed into the target hardware. For external tooling that is only used during compilation, code analysis, testing or simulation please refer to the Contributing External Tooling section at the end of the page.
Software License

**Note:** External source code licensed under the Apache-2.0 license is not subject to this section.

Integrating code into the Zephyr Project from other projects that use a license other than the Apache 2.0 license needs to be fully understood in context and approved by the Zephyr governing board, as described in the Zephyr project charter. The board will automatically reject licenses that have not been approved by the Open Source Initiative (OSI). See the Submission and review process section for more details.

By carefully reviewing potential contributions and also enforcing a Developer Certification of Origin (DCO) for contributed code, we ensure that the Zephyr community can develop products with the Zephyr Project without concerns over patent or copyright issues.

Merit

Just like with any other regular contribution, one that contains external code needs to be evaluated for merit. However, in the particular case of code that comes from an existing project, there are additional questions that must be answered in order to accept the contribution. More specifically, the following will be considered by the Technical Steering Committee and evaluated carefully before the external source code is accepted into the project:

- Is this the most optimal way to introduce the functionality to the project? Both the cost of implementing this internally and the one incurred in maintaining an externally developed codebase need to be evaluated.
- Is the external project being actively maintained? This is particularly important for source code that deals with security or cryptography.
- Have alternatives to the particular implementation proposed been considered? Are there other open source projects that implement the same functionality?

Mode of integration

There are two ways of integrating external source code into the Zephyr Project, and careful consideration must be taken to choose the appropriate one for each particular case.

**Integration in the main tree**  The first way to integrate external source code into the project is to simply import the source code files into the main zephyr repository. This automatically implies that the imported source code becomes part of the “mainline” codebase, which in turn requires that:

- The code is formatted according to the Zephyr Coding Style
- The code adheres to the project's Coding Guidelines
- The code is subject to the same checks and verification requirements as the rest of the code in the main tree, including static analysis
- All files contain an SPDX tag if not already present
- If the source is not Apache 2.0 licensed, an entry is added to the licensing page.

This mode of integration can be applicable to both small and large external codebases, but it is typically used more commonly with the former.
Integration as a module  The second way of integrating external source code into the project is to import the whole or parts of the third-party open source project into a separate repository, and then include it under the form of a module. With this approach the code is considered as being developed externally, and thus it is not automatically subject to the requirements of the previous section.

Integration in main manifest file (west.yaml) Integrating external code into the main west.yaml manifest file is limited to code that is used by a Zephyr subsystem (libraries), by a platform, drivers (HAL) or tooling needed to test or build Zephyr components.

The integration of modules in this group is validated by the Zephyr project CI, and verified to be working with each Zephyr release.

Integrated modules will not be removed from the tree without a detailed migration plan.

Integration as optional modules Standalone or loose integration of modules/projects without any incoming dependencies shall be made optional and shall be kept standalone. Optional projects that provide value to users directly and through a Zephyr subsystem or platform shall be added to an optional manifest file that is filtered by default (submanifests/optional.yml).

Such optional projects might include samples and tests in their own repositories.

There shall not be any direct dependency added in the Zephyr code tree (Git repository) and all sample or test code shall be maintained as part of the module.

Note: This is valid for all new optional modules. Existing optional modules with samples and test code in the Zephyr Git repository will be transitioned out over time.

Integration as external modules Similar to optional modules, but added to the Zephyr project as an entry in the documentation using a pre-defined template. This type of modules exists outside the Zephyr project manifest with documentation instructing users and developers how to integrate the functionality.

Ongoing maintenance

Regardless of the mode of integration, external source code that is integrated in Zephyr requires regular ongoing maintenance. The submitter of the proposal to integrate external source code must therefore commit to maintain the integration of such code for the foreseeable future. This may require adding an entry in the MAINTAINERS.yml as part of the process.

Submission and review process

Before external source code can be included in the project, it must be reviewed and accepted by the Technical Steering Committee (TSC) and, in some cases, by the Zephyr governing board.

A request for external source code integration must be made by creating a new issue in the Zephyr project issue tracking system on GitHub with details about the source code and how it integrates into the project.

Follow the steps below to begin the submission process:

1. Make sure to read through the Contributing External Components section in detail, so that you are informed of the criteria used by the TSC and board in order to approve or reject a request
2. Use the New External Source Code Issue to open an issue
3. Fill out all required sections, making sure you provide enough detail for the TSC to assess the merit of the request. Optionally you can also create a Pull Request that demonstrates the integration of the external source code and link to it from the issue.

4. Wait for feedback from the TSC, respond to any additional questions added as GitHub issue comments.

If, after consideration by the TSC, the conclusion is that integrating external source code is the best solution, and the external source code is licensed under the Apache-2.0 license, the submission process is complete and the external source code can be integrated.

If, however, the external source code uses a license other than Apache-2.0, then these additional steps must be followed:

1. The TSC chair will forward the link to the GitHub issue created during the early submission process to the Zephyr governing board for further review.

2. The Zephyr governing board has two weeks to review and ask questions:
   - If there are no objections, the matter is closed. Approval can be accelerated by unanimous approval of the board before the two weeks are up.
   - If a governing board member raises an objection that cannot be resolved via email, the board will meet to discuss whether to override the TSC approval or identify other approaches that can resolve the objections.

3. On approval of the Zephyr TSC and governing board the submission process is complete.

The flowchart below shows an overview of the process:

![Flowchart of the submission process]

**Fig. 2: Submission process**

### 8.3.2 Contributing External Tooling

This section deals exclusively with the inclusion of external tooling in the Zephyr project, where tooling is defined as software that assists the compilation, testing or simulation processes but in no case ends up being part of the code compiled and linked into the final image. “Inclusion” in this context means becoming part of the Zephyr default distribution either in the main tree directly under the `scripts/` folder or indirectly as a west project in the main `west.yml` manifest.
Therefore, this section does not apply to 3rd-party tooling such as toolchains, simulators or others, which may still be referenced by the Zephyr build system or docs without being included in Zephyr.

Tooling components must be released under a license approved by the Open Source Initiative (OSI).

Just like with regular external components, tooling that is imported from another project can be integrated either in the main tree or as a west project. Note that in this case the corresponding west project will not be a module, because tooling does not make use of the Zephyr build system and does not need to be processed by it. Please see Modules vs west projects for additional information on the differences.

If the tool is integrated in the main tree it should be placed under the scripts/ folder. If the tool is integrated as a west project, then the project repository can be hosted outside the zephyrproject-rtos GitHub organization, provided that the project is made optional via the group-filter: field in the main west.yml manifest. More info on optional projects can be found in this section.

The TSC must approve every Pull Request that introduces a new external tooling component. This will be done on a case-by-case, individual analysis of the proposed addition by the TSC representatives.

### 8.3.3 Additional considerations about the main manifest

In general, any additions or removals whatsoever to the projects: section of the main manifest file requires TSC approval. This includes, but is not limited to:

- Adding and removing groups and group filters
- Adding and removing projects
- Adding and removing import statements

### 8.3.4 Binary Blobs

In the context of an operating system that supports multiple architectures and many different IC families, some functionality may be unavailable without the help of executable code distributed in binary form. Binary blobs (or blobs for short) are files containing proprietary machine code or data in a binary format, e.g. without corresponding source code released under an OSI approved license.

Zephyr supports downloading and using third-party binary blobs via its built-in mechanisms, with some important caveats, described in the following sections. It is important to note that all the information in this section applies only to upstream (vanilla) Zephyr.

There are no limitations whatsoever (except perhaps license compatibility) in the support for binary blobs in forks or third-party distributions of Zephyr. In fact, Zephyr's build system supports arbitrary use cases related to blobs. This includes linking against libraries, flashing images to targets, etc. Users are therefore free to create Zephyr-based downstream software which uses binary blobs if they cannot meet the requirements described in this page.

**Software license**

Most binary blobs are distributed under proprietary licenses which vary significantly in nature and conditions. It is up to the vendor to specify the license as part of the blob submission process. Blob vendors may impose a click-through or other EULA-like workflow when users fetch and install blobs.
Hosting

Blobs must be hosted on the Internet and managed by third-party infrastructure. Two potential examples are Git repositories and web servers managed by individual hardware vendors.

The Zephyr Project does not host binary blobs in its Git repositories or anywhere else.

Fetching blobs

Blobs are fetched from official third-party sources by the `west blobs command` command.

The blobs themselves must be specified in the `module.yml` files included in separate Zephyr module repositories maintained by their respective vendors. This means that in order to include a reference to a binary blob to the upstream Zephyr distribution, a module repository must exist first or be created as part of the submission process.

Each blob which may be fetched must be individually identified in the corresponding `module.yml` file. A specification for a blob must contain:

- An abstract description of the blob itself
- Version information
- A reference to vendor-provided documentation
- The blob's `type`, which must be one of the allowed types
- A checksum for the blob, which `west blobs` checks after downloading. This is required for reproducibility and to allow bisecting issues as blobs change using Git and west
- License text applicable to the blob or a reference to such text, in SPDX format

See the corresponding section for a more formal definition of the fields.

The `west blobs` command can be used to list metadata of available blobs and to fetch blobs from user-selected modules.

The `west blobs` command only fetches and stores the binary blobs themselves. Any accompanying code, including interface header files for the blobs, must be present in the corresponding module repository.

Tainting

Inclusion of binary blobs will taint the Zephyr build. The definition of tainting originates in the Linux kernel and, in the context of Zephyr, a tainted image will be one that includes binary blobs in it.

Tainting will be communicated to the user in the following manners:

- One or more Kconfig options `TAINT_BLOBS_*` will be set to `y`
- The Zephyr build system, during its configuration phase, will issue a warning. It will be possible to disable the warning using Kconfig
- The `west spdx` command will include the tainted status in its output
- The kernel's default fatal error handler will also explicitly print out the kernel's tainted status

Allowed types

The following binary blob types are acceptable in Zephyr:
• Precompiled libraries: Hardware enablement libraries, distributed in precompiled binary form, typically for SoC peripherals. An example could be an enablement library for a wireless peripheral

• Firmware images: An image containing the executable code for a secondary processor or CPU. This can be full or partial (typically delta or patch data) and is generally copied into RAM or flash memory by the main CPU. An example could be the firmware for the core running a Bluetooth LE Controller

• Miscellaneous binary data files. An example could be pre-trained neural network model data

Hardware agnostic features provided via a proprietary library are not acceptable. For example, a proprietary and hardware agnostic TCP/IP stack distributed as a static archive would be rejected.

Note that just because a blob has an acceptable type does not imply that it will be unconditionally accepted by the project; any blob may be rejected for other reasons on a case by case basis (see library-specific requirements below). In case of disagreement, the TSC is the arbiter of whether a particular blob fits in one of the above types.

Precompiled library-specific requirements

This section contains additional requirements specific to precompiled library blobs.

Any person who wishes to submit a precompiled library must represent that it meets these requirements. The project may remove a blob from the upstream distribution if it is discovered that the blob fails to meet these requirements later on.

Interface header files   The precompiled library must be accompanied by one or more header files, distributed under a non-copyleft OSI approved license, that define the interface to the library.

Allowed dependencies   This section defines requirements related to external symbols that a library blob requires the build system to provide.

- The blob must not depend on Zephyr APIs directly. In other words, it must have been possible to build the binary without any Zephyr source code present at all. This is required for loose coupling and maintainability, since Zephyr APIs may change and such blobs cannot be modified by all project maintainers

- Instead, if the code in the precompiled library requires functionality provided by Zephyr (or an RTOS in general), an implementation of an OS abstraction layer (aka porting layer) can be provided alongside the library. The implementation of this OS abstraction layer must be in source code form, released under an OSI approved license and documented using Doxygen

Toolchain requirements   Precompiled library blobs must be in a data format which is compatible with and can be linked by a toolchain supported by the Zephyr Project. This is required for maintainability and usability. Use of such libraries may require special compiler and/or linker flags, however. For example, a porting layer may require special flags, or a static archive may require use of specific linker flags.

Limited scope   Allowing arbitrary library blobs carries a risk of degrading the degree to which the upstream Zephyr software distribution is open source. As an extreme example, a target with a zephyr kernel clock driver that is just a porting layer around a library blob would not be bootable with open source software.
To mitigate this risk, the scope of upstream library blobs is limited. The project maintainers define an open source test suite that an upstream target must be able to pass using only open source software included in the mainline distribution and its modules. The open source test suite currently consists of:

- samples/philosophers
- tests/kernel

The scope of this test suite may grow over time. The goal is to specify tests for a minimal feature set which must be supported via open source software for any target with upstream Zephyr support.

At the discretion of the release team, the project may remove support for a hardware target if it cannot pass this test suite.

### Support and maintenance

The Zephyr Project is not expected to be responsible for the maintenance and support of contributed binary blobs. As a consequence, at the discretion of the Zephyr Project release team, and on a case-by-case basis:

- GitHub issues reported on the zephyr repository tracker that require use of blobs to reproduce may not be treated as bugs
- Such issues may be closed as out of scope of the Zephyr project

This does not imply that issues which require blobs to reproduce will be closed without investigation. For example, the issue may be exposing a bug in a Zephyr code path that is difficult or impossible to trigger without a blob. Project maintainers may accept and attempt to resolve such issues.

However, some flexibility is required because project maintainers may not be able to determine if a given issue is due to a bug in Zephyr or the blob itself, may be unable to reproduce the bug due to lack of hardware, etc.

Blobs must have designated maintainers that must be responsive to issue reports from users and provide updates to the blobs to address issues. At the discretion of the Zephyr Project release team, module revisions referencing blobs may be removed from zephyr/west.yml at any time due to lack of responsiveness or support from their maintainers. This is required to maintain project control over bit-rot, security issues, etc.

The submitter of the proposal to integrate a binary blob must commit to maintain the integration of such blob for the foreseeable future.

Regarding Continuous Integration, binary blobs will not be fetched in the project’s CI infrastructure that builds and optionally executes tests and samples to prevent regressions and issues from entering the codebase. This includes both CI ran when a new GitHub Pull Request is opened as well as any other regularly scheduled execution of the CI infrastructure.

### Submission and review process

For references to binary blobs to be included in the project, they must be reviewed and accepted by the Technical Steering Committee (TSC). This process is only required for new binary blobs; updates to binary blobs follow the module update procedure.

A request for integration with binary blobs must be made by creating a new issue in the Zephyr project issue tracking system on GitHub with details about the blobs and the functionality they provide to the project.

Follow the steps below to begin the submission process:
1. Make sure to read through the *Binary Blobs* section in detail, so that you are informed of the criteria used by the TSC in order to approve or reject a request

2. Use the New Binary Blobs Issue to open an issue

3. Fill out all required sections, making sure you provide enough detail for the TSC to assess the merit of the request. Additionally you must also create a Pull Request that demonstrates the integration of the binary blobs and then link to it from the issue

4. Wait for feedback from the TSC, respond to any additional questions added as GitHub issue comments

If, after consideration by the TSC, the submission of the binary blob(s) is approved, the submission process is complete and the binary blob(s) can be integrated.

**Contributing External Components**

Basic functionality or features that would make useful addition to Zephyr might be readily available in other open source projects, and it is recommended and encouraged to reuse such code. This page describes in more details when and how to import external source code into Zephyr.

**Contributing External Tooling**

Similarly, external tooling used during compilation, code analysis, testing or simulation, can be beneficial and is covered in this section.

**Binary Blobs**

As some functionality might only be made available with the help of executable code distributed in binary form, this page describes the process and guidelines for contributing binary blobs to the project.

### 8.4 Zephyr Contributor Badge

When your first contribution to the Zephyr project gets merged, you'll become eligible to claim your Zephyr Contributor Badge. This digital badge can be displayed on your website, blog, social media profile, etc. It will allow you to showcase your involvement in the Zephyr project and help raise its awareness.

You may apply for your Contributor Badge by filling out the Zephyr Contributor Badge form.

### 8.5 Need help along the way?

If you have questions related to the contribution process, the Zephyr community is here to help. You may join our Discord channel or use the Developer Mailing List.
Chapter 9

Project and Governance

9.1 TSC Project Roles

9.1.1 Main Roles

TSC projects generally will involve Maintainers, Collaborators, and Contributors:

Maintainer: lead Collaborators on an area identified by the TSC (e.g. Architecture, code subsystems, etc.). Maintainers shall also serve as the area’s representative on the TSC as needed. Maintainers may become voting members of the TSC under the guidelines stated in the project Charter.

Collaborator: A highly involved Contributor in one or more areas. May become a Maintainer with approval of existing TSC voting members.

Contributor: anyone in the community that contributes code or documentation to the project. Contributors may become Collaborators by approval of the existing Collaborators and Maintainers of the particular code base areas or subsystems.

Contributor

A Contributor is a developer who wishes to contribute to the project, at any level. Contributors are granted the following rights and responsibilities:

• Right to contribute code, documentation, translations, artwork, etc.
• Right to report defects (bugs) and suggestions for enhancement.
• Right to participate in the process of reviewing contributions by others.
• Right to initiate and participate in discussions in any communication methods.
• Right to approach any member of the community with matters they believe to be important.
• Right to participate in the feature development process.
• Responsibility to abide by decisions, once made. They are welcome to provide new, relevant information to reopen decisions.
• Responsibility for issues and bugs introduced by one's own contributions.
• Responsibility to respect the rules of the community.
• Responsibility to provide constructive advice whenever participating in discussions and in the review of contributions.
• Responsibility to follow the project's code of conduct (https://github.com/zephyrproject-rtos/zephyr/blob/main/CODE_OF_CONDUCT.md)

Contributors are initially only given Read access to the Zephyr GitHub repository. Specifically, at the Read access level, Contributors are not allowed to assign reviewers to their own pull requests. An automated process will assign reviewers. You may also share the pull request on the Zephyr devel mailing list or on the Zephyr Discord Server.

Contributors who show dedication and skill are granted the Triage permission level to the Zephyr GitHub repository.

You may nominate yourself, or another GitHub user, for promotion to the Triage permission level by creating a GitHub issue, using the nomination template.

Contributors granted the Triage permission level are permitted to add reviewers to a pull request and can be added as a reviewer by other GitHub users. Contributor change requests or approval on pull requests are not counted with respect to accepting and merging a pull request. However, Contributors comments and requested changes should still be considered by the pull request author.

**Collaborator**

A **Collaborator** is a Contributor who is also responsible for the maintenance of Zephyr source code. Their opinions weigh more when decisions are made, in a fully meritocratic fashion.

Contributors have the following rights and responsibilities, in addition to those listed for Contributors:

- Right to set goals for the short and medium terms for the project being maintained, alongside the Maintainer.
- Responsibility to participate in the feature development process.
- Responsibility to review relevant code changes within reasonable time.
- Responsibility to ensure the quality of the code to expected levels.
- Responsibility to participate in community discussions.
- Responsibility to mentor new contributors when appropriate.
- Responsibility to participate in the quality verification and release process, when those happen.

Contributors are promoted to the Collaborator role by adding the GitHub user name to one or more collaborators sections of the MAINTAINERS File in the Zephyr repository.

Collaborator change requests on pull requests should be addressed by the original submitter. In cases where the changes requested do not follow the expectations and the guidelines of the project or in cases of disagreement, it is the responsibility of the assignee to advance the review process and resolve any disagreements.

Collaborator approval of pull requests are counted toward the minimum required approvals needed to merge a PR. Other criteria for merging may apply.

**Maintainer**

A **Maintainer** is a Collaborator who is also responsible for knowing, directing and anticipating the needs of a given zephyr source code area.

Maintainers have the following rights and responsibilities, in addition to those listed for Contributors and Collaborators:

- Right to set the overall architecture of the relevant subsystems or areas of involvement.
• Right to make decisions in the relevant subsystems or areas of involvement, in conjunction with the collaborators and submitters. See PR Technical Escalation.

• Responsibility to convey the direction of the relevant subsystem or areas to the TSC

• Responsibility to ensure all contributions of the project have been reviewed within reasonable time.

• Responsibility to enforce the code of conduct.

Contributors or Collaborators are promoted to the Maintainer role by adding the GitHub user name to one or more maintainers sections of the MAINTAINERS File in the Zephyr repository.

Maintainer approval of pull requests are counted toward the minimum required approvals needed to merge a PR. Other criteria for merging may apply.

9.1.2 Role Retirement

• Individuals elected to the following Project roles, including, Maintainer, Release Engineering Team member, Release Manager, but are no longer engaged in the project as described by the rights and responsibilities of that role, may be requested by the TSC to retire from the role they are elected.

• Such a request needs to be raised as a motion in the TSC and be approved by the TSC voting members. By approval of the TSC the individual is considered to be retired from the role they have been elected.

• The above applies to elected TSC Project roles that may be defined in addition.

9.1.3 Teams and Supporting Activities

Assignee

An Assignee is one of the maintainers of a subsystem or code being changed. Assignees are set either automatically based on the code being changed or set by the other Maintainers, the Release Engineering team can set an assignee when the latter is not possible.

• Right to dismiss stale and unrelated reviews or reviews not following expectations from reviewers and seek reviews from additional maintainers, developers and contributors

• Right to block pull requests from being merged until issues or changes requested are addressed

• Responsibility to re-assign a pull request if they are the original submitter of the code

• Responsibility to drive the pull request to a mergeable state

• Solicit approvals from maintainers of the subsystems affected

• Responsibility to drive the PR Technical Escalation process

Release Engineering Team

A team of active Maintainers involved in multiple areas.

• The members of the Release Engineering team are expected to fill the Release Manager role based on a defined cadence and selection process.

• The cadence and selection process are defined by the Release Engineering team and are approved by the TSC.

• The team reports directly into the TSC.
Release Engineering team has the following rights and responsibilities:

- Right to merge code changes to the zephyr tree following the project rules.
- Right to revert any changes that have broken the code base.
- Right to close any stale changes after <N> months of no activity.
- Responsibility to take directions from the TSC and follow them.
- Responsibility to coordinate code merges with maintainers.
- Responsibility to merge all contributions regardless of their origin and area if they have been approved by the respective maintainers and follow the merge criteria of a change.
- Responsibility to keep the Zephyr code base in a working and passing state (as per CI).

Joining the Release Engineering team

- Maintainers highly involved in the project may be nominated by a TSC voting member to join the Release Engineering team. Nominees may become members of the team by approval of the existing TSC voting members.
- To ensure a functional Release Engineering team the TSC shall periodically review the team's followed processes, the appropriate size, and the membership composition (ensure, for example, that team members are geographically distributed across multiple locations and time-zones).

**Release Manager**

A Maintainer responsible for driving a specific release to completion following the milestones and the roadmap of the project for this specific release.

- TSC has to approve a release manager.

A Release Manager is a member of the Release Engineering team and has the rights and responsibilities of that team in addition to the following:

- Right to manage and coordinate all code merges after the code freeze milestone (M3, see program management overview.)
- Responsibility to drive and coordinate the triaging process for the release
- Responsibility to create the release notes of the release
- Responsibility to notify all stakeholders of the project, including the community at large about the status of the release in a timely manner.
- Responsibility to coordinate with QA and validation and verify changes either directly or through QA before major changes and major milestones.

9.1.4 MAINTAINERS File

Generic guidelines for deciding and filling in the Maintainers' list

- The MAINTAINERS.yml file shall replace the CODEOWNERS file and will be used for both setting assignees and reviewers.
- We should keep the granularity of code maintainership at a manageable level
- We should be looking for maintainers for areas of code that are orphaned (i.e. without an explicit maintainer)
  - Un-maintained areas should be indicated clearly in the MAINTAINERS file
- All submitted pull requests should have an assignee
- We introduce an area/subsystem hierarchy to address the above point
  - Parent-area maintainer should be acting as default substitute/fallback assignee for unmaintained sub-areas
  - Area maintainer gets precedence over parent-area maintainer
- Pull requests may be re-assigned if this is needed or more appropriate
  - Re-assigned by original assignee
- In general, updates to the MAINTAINERS file should be in a standalone commit alongside other changes introducing new files and directories to the tree.
- Major changes to the file, including the addition of new areas with new maintainers should come in as standalone pull requests and require TSC review.
- If additional review by the TSC is required, the maintainers of the file should send the requested changes to the TSC and give members of the TSC two (2) days to object to any of the changes to maintainership of areas or the addition of new maintainers or areas.
- Path, collaborator and name changes do not require a review by the TSC.
- Addition of new areas without a maintainer do not require review by the TSC.
- The MAINTAINERS file itself shall have a maintainer
- Architectures, core components, sub-systems, samples, tests
  - Each area shall have an explicit maintainer
- Boards (incl relevant samples, tests), SoCs (incl DTS) * May have a maintainer, shall have a higher-level platform maintainer
- Drivers
– Shall have a driver-area (and API) maintainer
– Could have individual driver implementation maintainers but preferably collabora-
tor/contributors
– In the above case, platform-specific PRs may be re-assigned to respective collabora-
tor/contributor of driver implementation

9.1.5 Release Activity

Merge Criteria

• Minimal of 2 approvals, including an approval by the designated assignee.
• Pull requests should be reviewed by at least a maintainer or collaborator of each affected
area; Unless the changes to a given area are considered trivial enough, in which case ap-
provals by other affected subsystems maintainers/collaborators would suffice.
• Four eye principle on the organisation level. We already require at least 2 approvals (basic
four eye principle), however, such reviews and approvals might be unintentionally biased
in the case where the submitter is from the same organisation as the approvers. To allow
for project wide review and approvals, the merge criteria is extended with the guidelines
below:
  – Changes or additions to common and shared code shall have approvals from different
  organisations (at least one approval from an organisation different than the submit-
ters’). Common and shared code is defined as anything that does not fall under soc,
boards and drivers/*/*.
Changes or additions to hardware support (driver, SoC, boards) shall at least have the merger be from a different organisation. This applies only to implementation of an API supporting vendor specific hardware and not the APIs.

Release engineers may make exceptions for areas with contributions primarily coming from one organisation and where reviews from other organisations are not possible, however, merges shall be completed by a person from a different organisation. In such cases, the minimum review period of at least 2 days shall be strictly followed to allow for additional reviews.

Release engineers shall not merge code changes originating and reviewed only by their own organisation. To be able to merge such changes, at least one review shall be from a different organisation.

- A minimum review period of 2 business days, 4 hours for trivial changes (see Give reviewers time to review before code merge).
- Hotfixes can be merged at any time after CI has passed and are excluded from most of the conditions listed above.
- All required checks are passing:
  - Codeowners
  - Device Tree
  - Documentation
  - Gitlint
  - Identity/Emails
  - Kconfig
  - License checks
  - Checkpatch (Coding Style)
  - Pylint
  - Integration Tests (Via twister) on emulation/simulation platforms
  - Simulated Bluetooth Tests
- Planned
  - Footprint
  - Code coverage
  - Coding Guidelines
  - Static Analysis (Coverity)
  - Documentation coverage (APIs)

## 9.2 Release Process

The Zephyr project releases on a time-based cycle, rather than a feature-driven one. Zephyr releases represent an aggregation of the work of many contributors, companies, and individuals from the community.

A time-based release process enables the Zephyr project to provide users with a balance of the latest technologies and features and excellent overall quality. A roughly 4-month release cycle allows the project to coordinate development of the features that have actually been implemented, allowing the project to maintain the quality of the overall release without delays because of one or two features that are not ready yet.
The Zephyr release model was loosely based on the Linux kernel model:

- Release tagging procedure:
  - linear mode on main branch,
  - release branches for maintenance after release tagging.
- Each release period will consist of a development phase followed by a stabilization phase. Release candidates will be tagged during the stabilization phase. During the stabilization phase, only stabilization changes such as bug fixes and documentation will be merged unless granted a special exemption by the Technical Steering Committee.
  - Development phase: all changes are considered and merged, subject to approval from the respective maintainers.
  - Stabilisation phase: the release manager creates a vN-rc1 tag and the tree enters the stabilization phase
  - CI sees the tag, builds and runs tests; Test teams analyse the report from the build and test run and give an ACK/NAK to the build
  - The release owner, with test teams and any other needed input, determines if the release candidate is a go for release
  - If it is a go for a release, the release owner lays a tag release vN at the same point

![Fig. 1: Release Cycle](image)

**Note:** The milestones for the current major version can be found on the [Official GitHub Wiki](https://github.com). Information on previous releases can be found here.

### 9.2.1 Development Phase

A relatively straightforward discipline is followed with regard to the merging of patches for each release. At the beginning of each development cycle, the main branch is said to be open for development. At that time, code which is deemed to be sufficiently stable (and which is accepted by the maintainers and the wide community) is merged into the mainline tree. The bulk of changes for a new development cycle (and all of the major changes) will be merged during this time.

The development phase lasts for approximately three months. At the end of this time, the release owner will declare that the development phase is over and releases the first of the release candidates. For the codebase release which is destined to be 3.1.0, for example, the release which happens at the end of the development phase will be called 3.1.0-rc1. The -rc1 release is the signal that the time to merge new features has passed, and that the time to stabilize the next release of the codebase has begun.
9.2.2 Stabilization Phase

Over the next weeks, only patches which fix problems should be submitted to the mainline. On occasion, a more significant change will be allowed, but such occasions are rare and require a TSC approval (Change Control Board). As a general rule, if you miss submitting your code during the development phase for a given feature, the best thing to do is to wait for the next development cycle. (An occasional exception is made for drivers for previously unsupported hardware; if they do not touch any other in-tree code, they cannot cause regressions and should be safe to add at any time).

As fixes make their way into the mainline, the patch rate will slow over time. The mainline release owner releases new -rc drops once or twice a week; a normal series will get up to somewhere between -rc4 and -rc6 before the code base is considered to be sufficiently stable and the release criteria have been achieved at which point the final 3.1.0 release is made.

At that point, the whole process starts over again.

9.2.3 Release Quality Criteria

The current backlog of prioritized bugs shall be used as a quality metric to gate the final release. The following counts shall be used:

Table 2: Bug Count Release Thresholds

<table>
<thead>
<tr>
<th>High</th>
<th>Medium</th>
<th>Low</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>&lt;20</td>
<td>&lt;50</td>
</tr>
</tbody>
</table>

Note: The “low” bug count target of <50 will be a phased approach starting with 150 for release 2.4.0, 100 for release 2.5.0, and 50 for release 2.6.0.
### 9.2.4 Release Milestones

<table>
<thead>
<tr>
<th>Time-line</th>
<th>Checkpoint</th>
<th>Description</th>
<th>Owner</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

### 9.2.5 Releases

The following syntax should be used for releases and tags in Git:

- Release [Major].[Minor].[Patch Level]
- Release Candidate [Major].[Minor].[Patch Level]-rc[RC Number]
- Tagging:
  - v[Major].[Minor].[Patch Level]-rc[RC Number]
  - v[Major].[Minor].[Patch Level]
  - v[Major].[Minor].99 - A tag applied to main branch to signify that work on v[Major].[Minor+1] has started. For example, v1.7.99 will be tagged at the start of v1.8 process. The tag corresponds to VERSION_MAJOR/VERSION_MINOR/PATCHLEVEL macros as defined for a work-in-progress main branch version. Presence of this tag allows generation of sensible output for “git describe” on main branch, as typically used for automated builds and CI tools.

**Long Term Support (LTS)**

Long-term support releases are designed to be supported and maintained for an extended period and is the recommended release for products and the auditable branch used for certification.

An LTS release is defined as:

- **Product focused**
- **Extended Stabilisation period**: Allow for more testing and bug fixing
- **Stable APIs**
- **Quality Driven Process**
**Long Term**: Maintained for an extended period of time (at least 2.5 years) overlapping previous LTS release for at least half a year.

**Product Focused** Zephyr LTS is the recommended release for product makers with an extended support and maintenance which includes general stability and bug fixes, security fixes. An LTS includes both mature and new features. API and feature maturity is documented and tracked. The footprint and scope of mature and stable APIs expands as we move from one LTS to the next giving users access to bleeding edge features and new hardware while keeping a stable foundation that evolves over time.

**Extended Stabilisation Period** Zephyr LTS development cycle differs from regular releases and has an extended stabilization period. Feature freeze of regular releases happens 3-4 weeks before the scheduled release date. The stabilization period for LTS is extended by 3 weeks with the feature freeze occurring 6-7 weeks before the anticipated release date. The time between code freeze and release date is extended in this case.

**Stable APIs** Zephyr LTS provides a stable and long-lived foundation for developing products. To guarantee stability of the APIs and the implementation of such APIs it is required that any release software that makes the core of the OS went through the Zephyr API lifecycle and stabilized over at least 2 releases. This guarantees that we release many of the highlighted and core features with mature and well-established implementations with stable APIs that are supported during the lifetime of the release LTS.

- **API Freeze (LTS - 2)**
  - All stable APIs need to be frozen 2 releases before an LTS. APIs can be extended with additional features, but the core implementation is not modified. This is valid for the following subsystems for example:
    - Device Drivers (i2c.h, spi.h)...
    - Kernel (k_*):
    - OS services (logging, debugging, ..)
    - DTS: API and bindings stability
    - Kconfig
New APIs for experimental features can be added at any time as long as they are stand-alone and documented as experimental or unstable features/APIs.

- Feature Freeze (LTS - 1) - No new features or overhaul/restructuring of code covering major LTS features.
  - Kernel + Base OS
  - Additional advertised LTS features
  - Auxiliary features on top of and/or extending the base OS and advertised LTS features can be added at any time and should be marked as experimental if applicable

**Quality Driven Process**  The Zephyr project follows industry standards and processes with the goal of providing a quality oriented releases. This is achieved by providing the following products to track progress, integrity and quality of the software components provided by the project:

- Compliance with published coding guidelines, style guides and naming conventions and documentation of deviations.
- Regular static analysis on the complete tree using available commercial and open-source tools and documentation of deviations and false positives.
- Documented components and APIs
- Requirements Catalog
- Verification Plans
- Verification Reports
- Coverage Reports
- Requirements Traceability Matrix (RTM)
- SPDX License Reports

Each release is created with the above products to document the quality and the state of the software when it was released.

**Long Term Support and Maintenance**  A Zephyr LTS release is published every 2 years and is branched and maintained independently from the main tree for at least 2.5 years after it was released. Support and maintenance for an LTS release stops at least half a year after the following LTS release is published.

Changes and fixes flow in both directions. However, changes from main branch to an LTS branch will be limited to fixes that apply to both branches and for existing features only.

All fixes for an LTS branch that apply to the mainline tree shall be submitted to mainline tree as well.
Auditable Code Base

An auditable code base is to be established from a defined subset of Zephyr OS features and will be limited in scope. The LTS, development tree, and the auditable code bases shall be kept in sync after the audit branch is created, but with a more rigorous process in place for adding new features into the audit branch used for certification.

This process will be applied before new features move into the auditable code base.

The initial and subsequent certification targets will be decided by the Zephyr project governing board.

Processes to achieve selected certification will be determined by the Security and Safety Working Groups and coordinated with the TSC.

9.2.6 Release Procedure

This section documents the Release manager responsibilities so that it serves as a knowledge repository for Release managers.

Release Checklist

Each release has a GitHub issue associated with it that contains the full checklist. After a release is complete, a checklist for the next release is created.

Tagging

The final release and each release candidate shall be tagged using the following steps:

**Note:** Tagging needs to be done via explicit git commands and not via GitHub's release interface. The GitHub release interface does not generate annotated tags (it generates 'lightweight' tags regardless of release or pre-release). You should also upload your gpg public key to your GitHub account, since the instructions below involve creating signed tags. However, if you do not have a gpg public key you can opt to remove the -s option from the commands below.

Release Candidate

**Note:** This section uses tagging 1.11.0-rc1 as an example, replace with the appropriate release candidate version.

1. Update the version variables in the VERSION file located in the root of the Git repository to match the version for this release candidate. The EXTRAVERSION variable is used to identify the rc[RC Number] value for this candidate:

```
EXTRAVERSION = rc1
```

2. Post a PR with the updated VERSION file using release: Zephyr 1.11.0-rc1 as the commit subject. Merge the PR after successful CI.

3. Tag and push the version, using an annotated tag:

```
$ git pull
$ git tag -s -m "Zephyr 1.11.0-rc1" v1.11.0-rc1
$ git push git@github.com:zephyrproject-rtos/zephyr.git v1.11.0-rc1
```
4. Send an email to the mailing lists (announce and devel) with a link to the release

Final Release

**Note:** This section uses tagging 1.11.0 as an example, replace with the appropriate final release version.

When all final release criteria has been met and the final release notes have been approved and merged into the repository, the final release version will be set and repository tagged using the following procedure:

1. Update the version variables in the `VERSION` file located in the root of the Git repository. Set `EXTRAVERSION` variable to an empty string to indicate final release:

   ```
   EXTRAVERSION = 
   ```

2. Post a PR with the updated `VERSION` file using release: Zephyr 1.11.0 as the commit subject. Merge the PR after successful CI.

3. Tag and push the version, using two annotated tags:

   ```
   $ git pull
   $ git tag -s -m "Zephyr 1.11.0" v1.11.0
   $ git push git@github.com:zephyrproject-rtos/zephyr.git v1.11.0
   ```

4. Find the new v1.11.0 tag at the top of the releases page and edit the release with the Edit tag button with the following:

   - Copy the overview of `docs/releases/release-notes-1.11.rst` into the release notes textbox and link to the full release notes file on docs.zephyrproject.org.

5. Send an email to the mailing lists (announce and devel) with a link to the release

### 9.3 Feature Tracking

For feature tracking we use Github labels to classify new features and enhancements. The following is the description of each category:

**Enhancement**
Changes to existing features that are not considered a bug and would not block a release. This is an incremental enhancement to a feature that already exists in Zephyr.

**Feature request**
A request for the implementation or inclusion of a new unit of functionality that is not part of any release plans yet, that has not been vetted, and needs further discussion and details.

**Feature**
A committed and planned unit of functionality with a detailed design and implementation proposal and an owner. Features must go through an RFC process and must be vetted and discussed in the TSC before a target milestone is set.

**Hardware Support**
A request or plan to port an existing feature or enhancement to a particular hardware platform. This ranges from porting Zephyr itself to a new architecture, SoC or board to adding an implementation of a peripheral driver API for an existing hardware platform.

**Meta**
A label to group other GitHub issues that are part of a single feature or unit of work.

The following workflow should be used to process features:
This is the formal way for asking for a new feature in Zephyr and indicating its importance to the project. Often, the requester may have a readiness and willingness to drive implementation of the feature in an upcoming release, and should assign the request to themselves. If not though, an owner will be assigned after evaluation by the TSC. A feature request can also have a companion RFC with more details on the feature and a proposed design or implementation.

- Label new features requests as `feature-request`
- The TSC discusses new `feature-request` items regularly and triages them. Items are examined for similarity with existing features, how they fit with the project goals and other timeline considerations. The priority is determined as follows:
  - High = Next milestone
  - Medium = As soon as possible
  - Low = Best effort
- After the initial discussion and triaging, the label is moved from `feature-request` to `feature` with the target milestone and an assignee.

All items marked as `feature-request` are non-binding and those without an assignee are open for grabs, meaning that they can be picked up and implemented by any project member or the community. You should contact an assigned owner if you’d like to discuss or contribute to that feature's implementation.

### 9.3.1 Roadmap and Release Plans

Project roadmaps and release plans are both important tools for the project, but they have very different purposes and should not be confused. A project roadmap communicates the high-level overview of a project's strategy, while a release plan is a tactical document designed to capture and track the features planned for upcoming releases.

- The project roadmap communicates the why; a release plan details the what
- A release plan spans only a few months; a product roadmap might cover a year or more

#### Project Roadmap

The project roadmap should serve as a high-level, visual summary of the project’s strategic objectives and expectations.

If built properly, the roadmap can be a valuable tool for several reasons. It can help the project present its plan in a compelling way to existing and new stakeholders, to help recruit new members and it can be a helpful resource the team and community can refer to throughout the project's development, to ensure they are still executing according to plan.

As such, the roadmap should contain only strategic-level details, major project themes, epics, and goals.

#### Release Plans

The release plan comes into play when the project roadmap's high-level strategy is translated into an actionable plan built on specific features, enhancements, and fixes that need to go into a specific release or milestone.

The release plan communicates those features and enhancements slated for your project's next release (or the next few releases). So it acts as more of a project plan, breaking the big ideas down into smaller projects the community and main stakeholders of the project can make progress on.
Items labeled as features are short or long term release items that shall have an assignee and a milestone set.

9.4 Code Flow and Branches

9.4.1 Introduction

The zephyr Git repository has three types of branches:

**main**

Which contains the latest state of development

**collab-**

Collaboration branches that are used for shared development of new features to be introduced into the main branch when ready. Creating a new collaboration branch requires a justification and TSC approval. Collaboration branches shall be based off the main branch and any changes developed in the collab branch shall target the main development branch. For released versions of Zephyr, the introduction of fixes and new features, if approved by the TSC, shall be done using backport pull requests.

**vx.y-branch**

Branches which track maintenance releases based on a major release

Development in collaboration branches before features go to mainline allows teams to work independently on a subsystem or a feature, improves efficiency and turnaround time, and encourages collaboration and streamlines communication between developers.

Changes submitted to a collaboration branch can evolve and improve incrementally in a branch, before they are submitted to the mainline tree for final integration.

By dedicating an isolated branch to complex features, it's possible to initiate in-depth discussions around new additions before integrating them into the official project.

Collaboration branches are ephemeral and shall be removed once the collaboration work has been completed. When a branch is requested, the proposal should include the following:

- Define exit criteria for merging the collaboration branch changes back into the main branch.
- Define a timeline for the expected life cycle of the branch. It is recommended to select a Zephyr release to set the timeline. Extensions to this timeline requires TSC approval.

9.4.2 Roles and Responsibilities

Collaboration branch owners have the following responsibilities:

- Use the infrastructure and tools provided by the project (GitHub, Git)
- All changes to collaboration branches shall come in form of github pull requests.
- Force pushing a collaboration branch is only allowed when rebasing against the main branch.
- Review changes coming from team members and request review from branch owners when submitting changes.
- Keep the branch in sync with upstream and update on a regular basis.
- Push changes frequently to upstream using the following methods:
  - GitHub pull requests: for example, when reviews have not been done in the local branch (one-man branch).
9.5 Modifying Contributions made by other developers

9.5.1 Scenarios

Zephyr contributors and collaborators are encouraged to assist as reviewers in pull requests, so that patches may be approved and merged to Zephyr's main branch as part of the original pull requests. The authors of the pull requests are responsible for amending their original commits following the review process.

There are occasions, however, when a contributor might need to modify patches included in pull requests that are submitted by other Zephyr contributors. For instance, this is the case when:

- a developer cherry-picks commits submitted by other contributors into their own pull requests in order to:
  - integrate useful content which is part of a stale pull request, or
  - get content merged to the project's main branch as part of a larger patch
- a developer pushes to a branch or pull request opened by another contributor in order to:
  - assist in updating pull requests in order to get the patches merged to the project's main branch
  - drive stale pull requests to completion so they can be merged

9.5.2 Accepted policies

A developer who intends to cherry-pick and potentially modify patches sent by another contributor shall:

- clarify in their pull request the reason for cherry-picking the patches, instead of assisting in getting the patches merged in their original pull request, and
- invite the original author of the patches to their pull request review.

A developer who intends to force-push to a branch or pull request of another Zephyr contributor shall clarify in the pull request the reason for pushing and for modifying the existing patches (e.g. stating that it is done to drive the pull request review to completion, when the pull request author is not able to do so).

**Note:** Developers should try to limit the above practice to pull requests identified as *stale*. Read about how to identify pull requests as stale in *development processes and tools*.

If the original patches are substantially modified, the developer can either:

- (preferably) reach out to the original author and request them to acknowledge that the modified patches may be merged while having the original sign-off line and author identity, or
- submit the modified patches as their own work (i.e. with their own sign-off line and author identity). In this case, the developer shall identify in the commit message(s) the original source the submitted work is based on (mentioning, for example, the original PR number).
Note: Contributors should uncheck the box “Allow Edits By Maintainers” to indicate that they do not wish their patches to be amended, inside their original branch or pull request, by other Zephyr developers.

9.6 Development Environment and Tools

9.6.1 Code Review

GitHub is intended to provide a framework for reviewing every commit before it is accepted into the code base. Changes, in the form of Pull Requests (PR) are uploaded to GitHub but don't actually become a part of the project until they've been reviewed, passed a series of checks (CI), and are approved by maintainers. GitHub is used to support the standard open source practice of submitting patches, which are then reviewed by the project members before being applied to the code base.

Pull requests should be appropriately labeled, and linked to any relevant bug or feature tracking issues.

The Zephyr project uses GitHub for code reviews and Git tree management. When submitting a change or an enhancement to any Zephyr component, a developer should use GitHub. GitHub automatically assigns a responsible reviewer on a component basis, as defined in the CODE-OWNERS file stored with the code tree in the Zephyr project repository. A limited set of release managers are allowed to merge a pull request into the main branch once reviews are complete.

Give reviewers time to review before code merge

The Zephyr project is a global project that is not tied to a certain geography or timezone. We have developers and contributors from across the globe. When changes are proposed using pull request, we need to allow for a minimal review time to give developers and contributors the opportunity to review and comment on changes. There are different categories of changes and we know that some changes do require reviews by subject matter experts and owners of the subsystem being changed. Many changes fall under the “trivial” category that can be addressed with general reviews and do not need to be queued for a maintainer or code-owner review. Additionally, some changes might require further discussions and a decision by the TSC or the Security working group. To summarize the above, the diagram below proposes minimal review times for each category:

Workflow

- An author of a change can suggest in his pull-request which category a change should belong to. A project maintainers or TSC member monitoring the inflow of changes can change the label of a pull request by adding a comment justifying why a change should belong to another category.
- The project will use the label system to categorize the pull requests.
- Changes should not be merged before the minimal time has expired.

Categories/Labels
Fig. 4: Pull request classes
Hotfix Any change that is a fix to an issue that blocks developers from doing their daily work, for example CI breakage, Test breakage, Minor documentation fixes that impact the user experience.

Such fixes can be merged at any time after they have passed CI checks. Depending on the fix, severity, and availability of someone to review them (other than the author) they can be merged with justification without review by one of the project owners.

Trivial Trivial changes are those that appear obvious enough and do not require maintainer or code-owner involvement. Such changes should not change the logic or the design of a subsystem or component. For example a trivial change can be:

- Documentation changes
- Configuration changes
- Minor Build System tweaks
- Minor optimization to code logic without changing the logic
- Test changes and fixes
- Sample modifications to support additional configuration or boards etc.

Maintainer Any changes that touch the logic or the original design of a subsystem or component will need to be reviewed by the code owner or the designated subsystem maintainer. If the code changes is initiated by a contributor or developer other than the owner the pull request needs to be assigned to the code owner who will have to drive the pull request to a mergeable state by giving feedback to the author and asking for more reviews from other developers.

Security Changes that appear to have an impact to the overall security of the system need to be reviewed by a security expert from the security working group.

TSC and Working Groups Changes that introduce new features or functionality or change the way the overall system works need to be reviewed by the TSC or the responsible Working Group. For example for stable API changes, the proposal needs to be presented in the Architecture meeting so that the relevant stakeholders are made aware of the change.

A Pull-Request should have an Assignee

- An assignee to a pull request should not be the same as the author of the pull-request
- An assignee to a pull request is responsible for driving the pull request to a mergeable state
- An assignee is responsible for dismissing stale reviews and seeking reviews from additional developers and contributors
- Pull requests should not be merged without an approval by the assignee.

Pull Request should not be merged by author without review

All pull requests need to be reviewed and should not be merged by the author without a review. The following exceptions apply:

- Hot fixes: Fixing CI issues, reverts, and system breakage
- Release related changes: Changing version file, applying tags and release related activities without any code changes.
Developers and contributors should always seek review, however there are cases when reviewers are not available and there is a need to get a code change into the tree as soon as possible.

**Reviewers shall not ‘Request Changes‘ without comments or justification**

Any change requests (-1) on a pull request have to be justified. A reviewer should avoid blocking a pull-request with no justification. If a reviewer feels that a change should not be merged without their review, then: Request change of the category: for example:

- Trivial -> Maintainer
- Assign Pull Request to yourself, this will mean that a pull request should not be merged without your approval.

**Pull Requests should have at least 2 approvals before they are merged**

A pull-request shall be merged only with two positive reviews (approval). Beside the person merging the pull-request (merging != approval), two additional approvals are required to be able to merge a pull request. The person merging the request can merge without approving or approve and merge to get to the 2 approvals required.

**Reviewers should keep track of pull requests they have provided feedback to**

If a reviewer has requested changes in a pull request, he or she should monitor the state of the pull request and/or respond to mention requests to see if his feedback has been addressed. Failing to do so, negative reviews shall be dismissed by the assignee or an owner of the repository. Reviews will be dismissed following the criteria below:

- The feedback or concerns were visibly addressed by the author
- The reviewer did not revisit the pull request after 2 week and multiple pings by the author
- The review is unrelated to the code change or asking for unjustified structural changes such as:
  - Split the PR
  - Can you fix this unrelated code that happens to appear in the diff
  - Can you fix unrelated issues
  - Etc.

**Closing Stale Issues and Pull Requests**

- The Pull requests and issues sections on Github are NOT discussion forums. They are items that we need to execute and drive to closure. Use the mailing lists for discussions.
- In case of both issues and pull-requests the original poster needs to respond to questions and provide clarifications regarding the issue or the change. After one week without a response to a request, a second attempt to elicit a response from the contributor will be made. After one more week without a response the item may be closed (draft and DNM tagged pull requests are excluded).
9.6.2 Continuous Integration

All changes submitted to GitHub are subject to tests that are run on emulated platforms and architectures to identify breakage and regressions that can be immediately identified. Testing using Twister additionally performs build tests of all boards and platforms. Documentation changes are also verified through review and build testing to verify doc generation will be successful.

Any failures found during the CI test run will result in a negative review assigned automatically by the CI system. Developers are expected to fix issues and rework their patches and submit again.

The CI infrastructure currently runs the following tests:

- Run “checkpatch” for code style issues (can vote -1 on errors; see note)
- Gitlint: Git commit style based on project requirements
- License Check: Check for conflicting licenses
- Run “twister” script
  - Run kernel tests in QEMU (can vote -1 on errors)
  - Build various samples for different boards (can vote -1 on errors)
- Verify documentation builds correctly.

**Note:** “checkpatch” is a Perl script that uses regular expressions to extract information that requires a C language parser to process accurately. As such it sometimes issues false positives. Known cases include constructs like:

```c
static uint8_t __aligned(PAGE_SIZE) page_pool[PAGE_SIZE * POOL_PAGES];
IOPCTL_Type *base = config->base;
```

Both lines produce a diagnostic regarding spaces around the * operator: the first is misidentified as a pointer type declaration that would be correct as PAGE_SIZE * POOL_PAGES while the second is misidentified as a multiplication expression that would be correct as IOPCTL_Type * base.

Maintainers can override the -1 in cases where the CI infrastructure gets the wrong answer.

9.6.3 Labeling issues and pull requests in GitHub

The project uses GitHub issues and pull requests (PRs) to track and manage daily and long-term work and contributions to the Zephyr project. We use GitHub **labels** to classify and organize these issues and PRs by area, type, priority, and more, making it easier to find and report on relevant items.

All GitHub issues or pull requests must be appropriately labeled. Issues and PRs often have multiple labels assigned, to help classify them in the different available categories. When reviewing a PR, if it has missing or incorrect labels, maintainers shall fix it.

This saves us all time when searching, reduces the chances of the PR or issue being forgotten, speeds up reviewing, avoids duplicate issue reports, etc.

These are the labels we currently have, grouped by applicability:

**Labels applicable to issues only**

- **priority**: {high | medium | low}
To classify the impact and importance of a bug or feature.
Note: Issue priorities are generally set or changed during the bug-triage or TSC meetings.

- **Regression**
Something, which was working, but does not anymore (bug subtype).

- **Enhancement**
Changes/Updates/Additions to existing features.

- **Feature request**
A request for a new feature.

- **Feature**
A planned feature with a milestone.

- **Hardware Support**
Covers porting an existing feature (including Zephyr itself) to new hardware.

- **Duplicate**
This issue is a duplicate of another issue (please specify).

- **Good first issue**
Good for a first time contributor to take.

- **Release Notes**
Issues that need to be mentioned in release notes as known issues with additional information.

Any issue must be classified and labeled as either Bug, Enhancement, RFC, Feature, Feature Request or Hardware Support. More information on how feature requests are handled and become features can be found in Feature Tracking.

**Labels applicable to pull requests only**

The issue or PR describes a change to a stable API.

- **Hotfix**
Fix for an issue blocking development.

- **Trivial**
- **Maintainer**
Maintainer review required.

- **Security Review**
To be reviewed by a security expert.

- **DNM**
This PR should not be merged (Do Not Merge). For work in progress, GitHub “draft” PRs are preferred.

- **Needs review**
The PR needs attention from the maintainers.

- **Backport**
The PR is a backport or should be backported.

- **Licensing**
The PR has licensing issues which require a licensing expert to review it.

Note: For all labels applicable to PRs: Please note that the label, together with PR complexity, affects how long a merge should be held to ensure proper review. See review process for details.

Labels applicable to both pull requests and issues

• area: *
Indicates Zephyr subsystems (e.g., area: Kernel, area: I2C, area: Memory Management), project functions (e.g., area: Debugging, area: Documentation, area: Process), or other categories (e.g., area: Coding Style, area: MISRA-C) affected by the bug or the pull request.

An area maintainer should be able to filter by an area label and find all issues and PRs which relate to that area.

• platform: *
An issue or PR which affects only a particular platform.

• dev-review
The issue is to be discussed in the following dev-review if time permits.

• TSC
TSC stands for Technical Steering Committee. The issue is to be discussed in the following TSC meeting if time permits.

• Stable API Change
The issue or PR describes a change to a stable API. See additional information in Introducing incompatible changes.

• Bug
The issue is a bug, or the PR is fixing a bug.

• Coverity
A Coverity detected issue or its fix.

• Waiting for response
The Zephyr developers are waiting for the submitter to respond to a question, or address an issue.

• Blocked
Blocked by another PR or issue.

• Stale
An issue or a PR which seems abandoned, and requires attention by the author.

• In progress
For PRs: is work in progress and should not be merged yet. For issues: is being worked on.

• RFC
The author would like input from the community. For a PR it should be considered a draft.

• LTS
Long term release branch related.

• EXT
Related to an external component.
9.7 Bug Reporting

To maintain traceability and relation between proposals, changes, features, and issues, it is recommended to cross-reference source code commits with the relevant GitHub issues and vice versa. Any changes that originate from a tracked feature or issue should contain a reference to the feature by mentioning the corresponding issue or pull-request identifiers.

At any time it should be possible to establish the origin of a change and the reason behind it by following the references in the code.

9.7.1 Reporting a regression issue

It could happen that the issue being reported is identified as a regression, as the use case is known to be working on earlier commit or release. In this case, providing directly the guilty commit when submitting the bug gains a lot of time in the eventual bug fixing.

To identify the commit causing the regression, several methods could be used, but tree bisecting method is an efficient one that doesn’t require deep code expertise and can be used by everyone.

For this, git bisect is the recommended tool.

Recommendations on the process:

- Run west update on each bisection step.
- Once the bisection is over and a culprit identified, verify manually the result.

9.8 Communication and Collaboration

The Zephyr Discord Server is the primary chat forum used by Zephyr developers, contributors, and users.

The Zephyr project mailing lists are used as an additional communication tool by project members, contributors, and the community. There are specialized mailing lists for specific interests. Several lists are public and open. Mailing lists are always available for use in situations where Discord is unavailable or an unsuitable forum.

In general, bug reports and other issues should be reported as GitHub Issues and not broadcasted to the mailing list. The same applies to code reviews.

9.9 Code Documentation

9.9.1 API Documentation

Well documented APIs enhance the experience for developers and are an essential requirement for defining an API's success. Doxygen is a general purpose documentation tool that the Zephyr project uses for documenting APIs. It generates either an on-line documentation browser (in HTML) and/or provides input for other tools that is used to generate a reference manual from documented source files. In particular, doxygen's XML output is used as an input when producing the Zephyr project's online documentation.
9.9.2 Reference to Requirements

APIs for the most part document the implementation of requirements or advertised features and can be traced back to features. We use the API documentation as the main interface to trace implementation back to documented features. This is done using custom Doxygen tags that reference requirements maintained somewhere else in a requirement catalogue.

9.9.3 Test Documentation

To help understand what each test does and which functionality it tests we also document all test code using the same tools and in the same context and generate documentation for all unit and integration tests maintained in the same environment. Tests are documented using references to the APIs or functionality they validate by creating a link back to the APIs and by adding a reference to the original requirements.

9.9.4 Documentation Guidelines

Test Code

The Zephyr project uses several test methodologies, the most common being the Ztest framework. Test documentation should only be done on the entry test functions (usually prefixed with test_ ) and those that are called directly by the Ztest framework. Those tests are going to appear in test reports and using their name and identifier is the best way to identify them and trace back to them from requirements.

Test documentation should not interfere with the actual API documentation and needs to follow a new structure to avoid confusion. Using a consistent naming scheme and following a well-defined structure we will be able to group this documentation in its own module and identify it uniquely when parsing test data for traceability reports. Here are a few guidelines to be followed:

- All test code documentation should be grouped under the all_tests doxygen group
- All test documentation should be under doxygen groups that are prefixed with tests_

The custom doxygen @verify directive signifies that a test verifies a requirement:

```c
/**
 * @brief Tests for the Semaphore kernel object
 * @defgroup kernel_semaphore_tests Semaphore
 * @ingroup all_tests
 * @
 * ...
/**
 * @brief A brief description of the tests
 * Some details about the test
 * more details
 * @verify[@req{1111}]
 */
void test_sema_thread2thread(void)
{
 ...}
...```
To get coverage of how an implementation or a piece of code satisfies a requirements, we use the `satisfy` alias in doxygen:

```c
/**
 * @brief Give a semaphore.
 *
 * This routine gives @a sem, unless the semaphore is already at its maximum permitted count.
 *
 * @note Can be called by ISRs.
 *
 * @param sem Address of the semaphore.
 *
 * @satisfy{@req{015}}
 */
__syscall void k_sem_give(struct k_sem *sem);
```

To generate the matrix, you will first need to build the documentation, specifically you will need to build the doxygen XML output:

```
$ make doxygen
```

Parse the generated XML data from doxygen to generate the traceability matrix.

The Zephyr project defines a development process workflow using GitHub Issues to track feature, enhancement, and bug reports together with GitHub Pull Requests (PRs) for submitting and reviewing changes. Zephyr community members work together to review these Issues and PRs, managing feature enhancements and quality improvements of Zephyr through its regular releases, as outlined in the program management overview.

We can only manage the volume of Issues and PRs, by requiring timely reviews, feedback, and responses from the community and contributors, both for initial submissions and for follow-up questions and clarifications. Read about the project's development processes and tools and specifics about review timelines to learn about the project's goals and guidelines for our active developer community.

*TSC Project Roles* describes in detail the Zephyr project roles and associated permissions with respect to the development process workflow.

### 9.10 Terminology

- **mainline**: The main tree where the core functionality and core features are being developed.
- **subsystem/feature branch**: is a branch within the same repository. In our case, we will use the term branch also when referencing branches not in the same repository, which are a copy of a repository sharing the same history.
- **upstream**: A parent branch the source code is based on. This is the branch you pull from and push to, basically your upstream.
- **LTS**: Long Term Support
Chapter 10

Security

These documents describe the requirements, processes, and developer guidelines for ensuring security is addressed within the Zephyr project.

10.1 Zephyr Security Overview

10.1.1 Introduction

This document outlines the steps of the Zephyr Security Subcommittee towards a defined security process that helps developers build more secure software while addressing security compliance requirements. It presents the key ideas of the security process and outlines which documents need to be created. After the process is implemented and all supporting documents are created, this document is a top-level overview and entry point.

Overview and Scope

We begin with an overview of the Zephyr development process, which mainly focuses on security functionality.

In subsequent sections, the individual parts of the process are treated in detail. As depicted in Figure 1, these main steps are:

1. **Secure Development:** Defines the system architecture and development process that ensures adherence to relevant coding principles and quality assurance procedures.

2. **Secure Design:** Defines security procedures and implement measures to enforce them. A security architecture of the system and relevant sub-modules is created, threats are identified, and countermeasures designed. Their correct implementation and the validity of the threat models are checked by code reviews. Finally, a process shall be defined for reporting, classifying, and mitigating security issues.

3. **Security Certification:** Defines the certifiable part of the Zephyr RTOS. This includes an evaluation target, its assets, and how these assets are protected. Certification claims shall be determined and backed with appropriate evidence.

Intended Audience

This document is a guideline for the development of a security process by the Zephyr Security Subcommittee and the Zephyr Technical Steering Committee. It provides an overview of the Zephyr security process for (security) engineers and architects.
Nomenclature

In this document, the keywords “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” are to be interpreted as described in [?].

These words are used to define absolute requirements (or prohibitions), highly recommended requirements, and truly optional requirements. As noted in RFC-2119, “These terms are frequently used to specify behavior with security implications. The effects on security of not implementing a MUST or SHOULD, or doing something the specification says MUST NOT or SHOULD NOT be done may be very subtle. Document authors should take the time to elaborate the security implications of not following recommendations or requirements as most implementors will not have had the benefit of the experience and discussion that produced the specification.”

Security Document Update

This document is a living document. As new requirements, features, and changes are identified, they will be added to this document through the following process:

1. Changes will be submitted from the interested party(ies) via pull requests to the Zephyr documentation repository.
2. The Zephyr Security Subcommittee will review these changes and provide feedback or acceptance of the changes.
3. Once accepted, these changes will become part of the document.

10.1.2 Current Security Definition

This section recapitulates the current status of secure development within the Zephyr RTOS. Currently, focus is put on functional security and code quality assurance, although additional security features are scoped.

The three major security measures currently implemented are:

- **Security Functionality** with a focus on cryptographic algorithms and protocols. Support for cryptographic hardware is scoped for future releases. The Zephyr runtime architecture
is a monolithic binary and removes the need for dynamic loaders, thereby reducing the exposed attack surface.

- **Quality Assurance** is driven by using a development process that requires all code to be reviewed before being committed to the common repository. Furthermore, the reuse of proven building blocks such as network stacks increases the overall quality level and guarantees stable APIs. Static code analyses provide additional quality checks.

- **Execution Protection** including thread separation, stack and memory protection is currently available in the upstream Zephyr RTOS starting with version 1.9.0 (stack protection). Memory protection and thread separation were added in version 1.10.0 for X86 and in version 1.11.0 for ARM and ARC.

These topics are discussed in more detail in the following subsections.

**Security Functionality**

The security functionality in Zephyr hinges mainly on the inclusion of cryptographic algorithms, and on its monolithic system design.

The cryptographic features are provided through a set of cryptographic libraries. Applications can choose TinyCrypt2 or Mbed TLS based on their needs. TinyCrypt2 supports key cryptographic algorithms required by the connectivity stacks. TinyCrypt2, however, only provides a limited set of algorithms. Mbed TLS supports a wider range of algorithms, but at the cost of additional requirements such as malloc support. Applications can choose the solution that matches their individual requirements. Future work may include APIs to abstract the underlying crypto library choice.

APIs for vendor specific cryptographic IPs in both hardware and software are planned, including secure key storage in the form of secure access modules (SAMs), Trusted Platform Modules (TPMs), and Trusted Execution Environments (TEEs).

The security architecture is based on a monolithic design where the Zephyr kernel and all applications are compiled into a single static binary. System calls are implemented as function calls without requiring context switches. Static linking eliminates the potential for dynamically loading malicious code.

Additional protection features are available in later releases. Stack protection mechanisms are provided to protect against stack overruns. In addition, applications can take advantage of thread separation features to split the system into privileged and unprivileged execution environments. Memory protection features provide the capability to partition system resources (memory, peripheral address space, etc.) and assign resources to individual threads or groups of threads. Stack, thread execution level, and memory protection constraints are enforced at the time of context switch.

**Quality Assurance**

The Zephyr project uses an automated quality assurance process. The goal is to have a process including mandatory code reviews, feature and issue management/tracking, and static code analyses.

Code reviews are documented and enforced using a voting system before getting checked into the repository by the responsible subsystem's maintainer. The main goals of the code review are:

- Verifying correct functionality of the implementation
- Increasing the readability and maintainability of the contributed source code
- Ensuring appropriate usage of string and memory functions
- Validation of the user input
Reviewing the security relevant code for potential issues

The current coding principles focus mostly on coding styles and conventions. Functional correctness is ensured by the build system and the experience of the reviewer. Especially for security relevant code, concrete and detailed guidelines need to be developed and aligned with the developers (see: Secure Coding).

Static code analyses are run on the Zephyr code tree on a regular basis, see Static Code Analysis. Bug and issue tracking and management is performed using Github. The term “survivability” was coined to cover pro-active security tasks such as security issue categorization and management. A problem identified as vulnerability is managed within Github security advisories. Issues determined by static analyses should have more stringent reviews before they are closed as non-issues (at least another person educated in security processes need to agree on non-issue before closing).

A security subcommittee has been formed to develop a security process in more detail; this document is part of that process.

Execution Protection

Execution protection is supported and can be categorized into the following tasks:

- **Memory separation:** Memory will be partitioned into regions and assigned attributes based on the owner of that region of memory. Threads will only have access to regions they control.
- **Stack protection:** Stack guards would provide mechanisms for detecting and trapping stack overruns. Individual threads should only have access to their own stacks.
- **Thread separation:** Individual threads should only have access to their own memory resources. As threads are scheduled, only memory resources owned by that thread will be accessible. Topics such as program flow protection and other measures for tamper resistance are currently not in scope.

System Level Security (Ecosystem, ...)

System level security encompasses a wide variety of categories. Some examples of these would be:

- Secure/trusted boot
- Over the air (OTA) updates
- External Communication
- Device authentication
- Access control of onboard resources
  - Flash updating
  - Secure storage
  - Peripherals
- Root of trust
- Reduction of attack surface

Some of these categories are interconnected and rely on multiple pieces to be in place to produce a full solution for the application.
10.1.3 Secure Development Process

The development of secure code shall adhere to certain criteria. These include coding guidelines and development processes that can be roughly separated into two categories related to software quality and related to software security. Furthermore, a system architecture document shall be created and kept up-to-date with future development.

System Architecture

A high-level schematic of the Zephyr system architecture is given in Figure 2. It separates the architecture into an OS part (kernel + OS Services) and a user-specific part (Application Services). The OS part itself contains low-level, platform specific drivers and the generic implementation of I/O APIs, file systems, kernel-specific functions, and the cryptographic library.

A document describing the system architecture and design choices shall be created and kept up to date with future development. This document shall include the base architecture of the Zephyr OS and an overview of important submodules. For each of the modules, a dedicated architecture document shall be created and evaluated against the implementation. These documents shall serve as an entry point to new developers and as a basis for the security architecture. Please refer to the Zephyr subsystem documentation for detailed information.
Secure Coding

Designing an open software system such as Zephyr to be secure requires adhering to a defined set of design standards. These standards are included in the Zephyr Project documentation, specifically in its Secure Coding section. In [?], the following, widely accepted principles for protection mechanisms are defined to prevent security violations and limit their impact:

- **Open design** as a design principle incorporates the maxim that protection mechanisms cannot be kept secret on any system in widespread use. Instead of relying on secret, custom-tailored security measures, publicly accepted cryptographic algorithms and well established cryptographic libraries shall be used.

- **Economy of mechanism** specifies that the underlying design of a system shall be kept as simple and small as possible. In the context of the Zephyr project, this can be realized, e.g., by modular code [?] and abstracted APIs.

- **Complete mediation** requires that each access to every object and process needs to be authenticated first. Mechanisms to store access conditions shall be avoided if possible.

- **Fail-safe defaults** defines that access is restricted by default and permitted only in specific conditions defined by the system protection scheme, e.g., after successful authentication. Furthermore, default settings for services shall be chosen in a way to provide maximum security. This corresponds to the “Secure by Default” paradigm [?].

- **Separation of privilege** is the principle that two conditions or more need to be satisfied before access is granted. In the context of the Zephyr project, this could encompass split keys [?].

- **Least privilege** describes an access model in which each user, program and thread shall have the smallest possible subset of permissions in the system required to perform their task. This positive security model aims to minimize the attack surface of the system.

- **Least common mechanism** specifies that mechanisms common to more than one user or process shall not be shared if not strictly required. The example given in [?] is a function that should be implemented as a shared library executed by each user and not as a supervisor procedure shared by all users.

- **Psychological acceptability** requires that security features are easy to use by the developers in order to ensure its usage and the correctness of its application.

In addition to these general principles, the following points are specific to the development of a secure RTOS:

- **Complementary Security/Defense in Depth**: do not rely on a single threat mitigation approach. In case of the complementary security approach, parts of the threat mitigation are performed by the underlying platform. In case such mechanisms are not provided by the platform, or are not trusted, a defense in depth [?] paradigm shall be used.

- **Less commonly used services off by default**: to reduce the exposure of the system to potential attacks, features or services shall not be enabled by default if they are only rarely used (a threshold of 80% is given in [?]). For the Zephyr project, this can be realized using the configuration management. Each functionality and module shall be represented as a configuration option and needs to be explicitly enabled. Then, all features, protocols, and drivers not required for a particular use case can be disabled. The user shall be notified if low-level options and APIs are enabled but not used by the application.

- **Change management**: to guarantee a traceability of changes to the system, each change shall follow a specified process including a change request, impact analysis, ratification, implementation, and validation phase. In each stage, appropriate documentation shall be provided. All commits shall be related to a bug report or change request in the issue tracker. Commits without a valid reference shall be denied.

Based on these design principles and commonly accepted best practices, a secure development guide shall be developed, published, and implemented into the Zephyr development process.
Further details on this are given in the Secure Design section.

Quality Assurance

The quality assurance part encompasses the following criteria:

- **Adherence to the Coding Conventions** with respect to coding style, naming schemes of modules, functions, variables, and so forth. This increases the readability of the Zephyr code base and eases the code review. These coding conventions are enforced by automated scripts prior to check-in.

- **Adherence to Deployment Guidelines** is required to ensure consistent releases with a well-documented feature set and a trackable list of security issues.

- **Code Reviews** ensure the functional correctness of the code base and shall be performed on each proposed code change prior to check-in. Code reviews shall be performed by at least one independent reviewer other than the author(s) of the code change. These reviews shall be performed by the subsystem maintainers and developers on a functional level and are to be distinguished from security reviews as laid out in the Secure Design section. Refer to the Project and Governance documentation for more information.

- **Static Code Analysis** tools efficiently detect common coding mistakes in large code bases. All code shall be analyzed using an appropriate tool prior to merges into the main repository. This is not per individual commit, but is to be run on some interval on specific branches. It is mandatory to remove all findings or waive potential false-positives before each release. Waivers shall be documented centrally and in the form of a comment inside the source code itself. The documentation shall include the employed tool and its version, the date of the analysis, the branch and parent revision number, the reason for the waiver, the author of the respective code, and the approver(s) of the waiver. This shall as a minimum run on the main release branch and on the security branch. It shall be ensured that each release has zero issues with regard to static code analysis (including waivers). Refer to the Project and Governance documentation for more information.

- **Complexity Analyses** shall be performed as part of the development process and metrics such as cyclomatic complexity shall be evaluated. The main goal is to keep the code as simple as possible.

- **Automation**: the review process and checks for coding rule adherence are a mandatory part of the precommit checks. To ensure consistent application, they shall be automated as part of the precommit procedure. Prior to merging large pieces of code in from subsystems, in addition to review process and coding rule adherence, all static code analysis must have been run and issues resolved.

Release and Lifecycle Management

Lifecycle management contains several aspects:

- **Device management** encompasses the possibility to update the operating system and/or security related sub-systems of Zephyr enabled devices in the field.

- **Lifecycle management**: system stages shall be defined and documented along with the transactions between the stages in a system state diagram. For security reasons, this shall include locking of the device in case an attack has been detected, and a termination if the end of life is reached.

- **Release management** describes the process of defining the release cycle, documenting releases, and maintaining a record of known vulnerabilities and mitigations. Especially for certification purposes the integrity of the release needs to be ensured in a way that later manipulation (e.g., inserting of backdoors, etc.) can be easily detected.
• Rights management and NDAs: if required by the chosen certification, the confidentiality and integrity of the system needs to be ensured by an appropriate rights management (e.g., separate source code repository) and non-disclosure agreements between the relevant parties. In case of a repository shared between several parties, measures shall be taken that no malicious code is checked in.

These points shall be evaluated with respect to their impact on the development process employed for the Zephyr project.

10.1.4 Secure Design

In order to obtain a certifiable system or product, the security process needs to be clearly defined and its application needs to be monitored and driven. This process includes the development of security related modules in all of its stages and the management of reported security issues. Furthermore, threat models need to be created for currently known and future attack vectors, and their impact on the system needs to be investigated and mitigated. Please refer to the Secure Coding outlined in the Zephyr project documentation for detailed information.

The software security process includes:

• Adherence to the Secure Development Coding is mandatory to avoid that individual components breach the system security and to minimize the vulnerability of individual modules. While this can be partially achieved by automated tests, it is inevitable to investigate the correct implementation of security features such as countermeasures manually in security-critical modules.

• Security Reviews shall be performed by a security architect in preparation of each security-targeted release and each time a security-related module of the Zephyr project is changed. This process includes the validation of the effectiveness of implemented security measures, the adherence to the global security strategy and architecture, and the preparation of audits towards a security certification if required.

• Security Issue Management encompasses the evaluation of potential system vulnerabilities and their mitigation as described in Security Issue Management.

These criteria and tasks need to be integrated into the development process for secure software and shall be automated wherever possible. On system level, and for each security related module of the secure branch of Zephyr; a directly responsible security architect shall be defined to guide the secure development process.

Security Architecture

The general guidelines above shall be accompanied by an architectural security design on system- and module-level. The high level considerations include

• The identification of security and compliance requirements
• Functional security such as the use of cryptographic functions whenever applicable
• Design of countermeasures against known attack vectors
• Recording of security relevant auditable events
• Support for Trusted Platform Modules (TPM) and Trusted Execution Environments (TEE)
• Mechanisms to allow for in-the-field updates of devices using Zephyr
• Task scheduler and separation

The security architecture development is based on assets derived from the structural overview of the overall system architecture. Based on this, the individual steps include:
1. **Identification of assets** such as user data, authentication and encryption keys, key generation data (obtained from RNG), security relevant status information.

2. **Identification of threats** against the assets such as breaches of confidentiality, manipulation of user data, etc.

3. **Definition of requirements** regarding security and protection of the assets, e.g., countermeasures or memory protection schemes.

The security architecture shall be harmonized with the existing system architecture and implementation to determine potential deviations and mitigate existing weaknesses. Newly developed sub-modules that are integrated into the secure branch of the Zephyr project shall provide individual documents describing their security architecture. Additionally, their impact on the system level security shall be considered and documented.

**Security Vulnerability Reporting**

Please see *Security Vulnerability Reporting* for information on reporting security vulnerabilities.

**Threat Modeling and Mitigation**

The modeling of security threats against the Zephyr RTOS is required for the development of an accurate security architecture and for most certification schemes. The first step of this process is the definition of assets to be protected by the system. The next step then models how these assets are protected by the system and which threats against them are present. After a threat has been identified, a corresponding threat model is created. This model contains the asset and system vulnerabilities, as well as the description of the potential exploits of these vulnerabilities. Additionally, the impact on the asset, the module it resides in, and the overall system is to be estimated. This threat model is then considered in the module and system security architecture and appropriate countermeasures are defined to mitigate the threat or limit the impact of exploits.

In short, the threat modeling process can be separated into these steps (adapted from [?]):

1. Definition of assets
2. Application decomposition and creation of appropriate data flow diagrams (DFDs)
3. Threat identification and categorization using the [?] and [?] approaches
4. Determination of countermeasures and other mitigation approaches

This procedure shall be carried out during the design phase of modules and before major changes of the module or system architecture. Additionally, new models shall be created, or existing ones shall be updated whenever new vulnerabilities or exploits are discovered. During security reviews, the threat models and the mitigation techniques shall be evaluated by the responsible security architect.

From these threat models and mitigation techniques tests shall be derived that prove the effectiveness of the countermeasures. These tests shall be integrated into the continuous integration workflow to ensure that the security is not impaired by regressions.

**Vulnerability Analyses**

In order to find weak spots in the software implementation, vulnerability analyses (VA) shall be performed. Of special interest are investigations on cryptographic algorithms, critical OS tasks, and connectivity protocols.

On a pure software level, this encompasses

- **Penetration testing** of the RTOS on a particular hardware platform, which involves testing the respective Zephyr OS configuration and hardware as one system.
• **Side channel attacks** (timing invariance, power invariance, etc.) should be considered. For instance, ensuring **timing invariance** of the cryptographic algorithms and modules is required to reduce the attack surface. This applies to both the software implementations and when using cryptographic hardware.

• **Fuzzing tests** shall be performed on both exposed APIs and protocols.

The list given above serves primarily illustration purposes. For each module and for the complete Zephyr system (in general on a particular hardware platform), a suitable VA plan shall be created and executed. The findings of these analyses shall be considered in the security issue management process, and learnings shall be formulated as guidelines and incorporated into the secure coding guide.

If possible (as in case of fuzzing analyses), these tests shall be integrated into the continuous integration process.

### 10.1.5 Security Certification

One goal of creating a secure branch of the Zephyr RTOS is to create a certifiable system or certifiable submodules thereof. The certification scope and scheme are yet to be decided. However, many certifications such as Common Criteria require evidence that the evaluation claims are indeed fulfilled, so a general certification process is outlined in the following. Based on the final choices for the certification scheme and evaluation level, this process needs to be refined.

**Generic Certification Process**

In general, the steps towards a certification or precertification (compare []) are:

1. The **definition of assets** to be protected within the Zephyr RTOS. Potential candidates are confidential information such as cryptographic keys, user data such as communication logs, and potentially IP of the vendor or manufacturer.

2. Developing a **threat model** and **security architecture** to protect the assets against exploits of vulnerabilities of the system. As a complete threat model includes the overall product including the hardware platform, this might be realized by a split model containing a precertified secure branch of Zephyr which the vendor could use to certify their Zephyr-enabled product.

3. Formulating an **evaluation target** that includes the **certification claims** on the security of the assets to be evaluated and certified, as well as assumptions on the operating conditions.

4. Providing **proof** that the claims are fulfilled. This includes consistent documentation of the security development process, etc.

These steps are partially covered in previous sections as well. In contrast to these sections, the certification process only requires to consider those components that shall be covered by the certification. The security architecture, for example, considers assets on system level and might include items not relevant for the certification.

**Certification Options**

For the security certification as such, the following options can be pursued:

1. **Abstract precertification of Zephyr as a pure software system**: this option requires assumptions on the underlying hardware platform and the final application running on top of Zephyr. If these assumptions are met by the hardware and the application, a full certification can be more easily achieved. This option is the most flexible approach but puts the largest burden on the product vendor.
2. **Certification of Zephyr on specific hardware platform without a specific application in mind:** this scenario describes the enablement of a secure platform running the Zephyr RTOS. The hardware manufacturer certifies the platform under defined assumptions on the application. If these are met, the final product can be certified with little effort.

3. **Certification of an actual product:** in this case, a full product including a specific hardware, the Zephyr RTOS, and an application is certified.

In all three cases, the certification scheme (e.g., FIPS 140-2 or Common Criteria), the scope of the certification (main-stream Zephyr, security branch, or certain modules), and the certification/assurance level need to be determined.

In case of partial certifications (options 1 and 2), assumptions on hardware and/or software are required for certifications. These can include:

- **Appropriate physical security** of the hardware platform and its environment.
- **Sufficient protection of storage and timing channels** on the hardware platform itself and all connected devices. (No mentioning of remote connections.)
- Only **trusted/assured applications** running on the device
- The device and its software stack is configured and operated by **properly trained and trusted individuals** with no malicious intent.

These assumptions shall be part of the security claim and evaluation target documents.

### 10.2 Security Vulnerability Reporting

#### 10.2.1 Introduction

Vulnerabilities to the Zephyr project may be reported via email to the vulnerabilities@zephyrproject.org mailing list. These reports will be acknowledged and analyzed by the security response team within 1 week. Each vulnerability will be entered into the Zephyr Project security advisory GitHub. The original submitter will be granted permission to view the issues that they have reported.

#### 10.2.2 Security Issue Management

Issues within this bug tracking system will transition through a number of states according to this diagram:
• New: This state represents new reports that have been entered directly by a reporter. When entered by the response team in response to an email, the issue shall be transitioned directly to Triage.

• Triage: This issue is awaiting Triage by the response team. The response team will analyze the issue, determine a responsible entity, assign it to that individual, and move the issue to the Assigned state. Part of triage will be to set the issue's priority.

• Assigned: The issue has been assigned, and is awaiting a fix by the assignee.

• Review: Once there is a Zephyr pull request for the issue, the PR link will be added to a comment in the issue, and the issue moved to the Review state.

• Accepted: Indicates that this issue has been merged into the appropriate branch within Zephyr.

• Public: The embargo period has ended. The issue will be made publicly visible, the associ-
ated CVE updated, and the vulnerabilities page in the docs updated to include the detailed information.

The security advisories created are kept private, due to the sensitive nature of security reports. The issues are only visible to certain parties:

- Members of the PSIRT mailing list
- the reporter
- others, as proposed and ratified by the Zephyr Security Subcommittee. In the general case, this will include:
  - The code owner responsible for the fix.
  - The Zephyr release owners for the relevant releases affected by this vulnerability.

The Zephyr Security Subcommittee shall review the reported vulnerabilities during any meeting with more than three people in attendance. During this review, they shall determine if new issues need to be embargoed.

The guideline for embargo will be based on: 1. Severity of the issue, and 2. Exploitability of the issue. Issues that the subcommittee decides do not need an embargo will be reproduced in the regular Zephyr project bug tracking system.

Security sensitive vulnerabilities shall be made public after an embargo period of at most 90 days. The intent is to allow 30 days within the Zephyr project to fix the issues, and 60 days for external parties building products using Zephyr to be able to apply and distribute these fixes.

Fixes to the code shall be made through pull requests PR in the Zephyr project github. Developers shall make an attempt to not reveal the sensitive nature of what is being fixed, and shall not refer to CVE numbers that have been assigned to the issue. The developer instead should merely describe what has been fixed.

The security subcommittee will maintain information mapping embargoed CVEs to these PRs (this information is within the Github security advisories), and produce regular reports of the state of security issues.

Each issue that is considered a security vulnerability shall be assigned a CVE number. As fixes are created, it may be necessary to allocate additional CVE numbers, or to retire numbers that were assigned.

### 10.2.3 Vulnerability Notification

Each Zephyr release shall contain a report of CVEs that were fixed in that release. Because of the sensitive nature of these vulnerabilities, the release shall merely include a list of CVEs that have been fixed. After the embargo period, the vulnerabilities page shall be updated to include additional details of these vulnerabilities. The vulnerability page shall give credit to the reporter(s) unless a reporter specifically requests anonymity.

The Zephyr project shall maintain a vulnerability-alerts mailing list. This list will be seeded initially with a contact from each project member. Additional parties can request to join this list by filling out the form at the Vulnerability Registry. These parties will be vetted by the project director to determine that they have a legitimate interest in knowing about security vulnerabilities during the embargo period.

Periodically, the security subcommittee will send information to this mailing list describing known embargoed issues, and their backport status within the project. This information is intended to allow them to determine if they need to backport these changes to any internal trees.

When issues have been triaged, this list will be informed of:

- The Zephyr Project security advisory link (GitHub).
- The CVE number assigned.
• The subsystem involved.
• The severity of the issue.

After acceptance of a PR fixing the issue (merged), in addition to the above, the list will be informed of:
  • The association between the CVE number and the PR fixing it.
  • Backport plans within the Zephyr project.

### 10.2.4 Backporting of Security Vulnerabilities

Each security issue fixed within zephyr shall be backported to the following releases:
  • The current Long Term Stable (LTS) release.
  • The most recent two releases.

The developer of the fix shall be responsible for any necessary backports, and apply them to any of the above listed release branches, unless the fix does not apply (the vulnerability was introduced after this release was made). All recommendations for vulnerability fixes apply for backport pull requests (and associated issues). Additionally, it is recommended that the developer privately informs the responsible release manager that the backport pull request and issue are addressing a vulnerability.

Backports will be tracked on the security advisory.

### 10.2.5 Need to Know

Due to the sensitive nature of security vulnerabilities, it is important to share details and fixes only with those parties that have a need to know. The following parties will need to know details about security vulnerabilities before the embargo period ends:
  • Maintainers will have access to all information within their domain area only.
  • The current release manager, and the release manager for historical releases affected by the vulnerability (see backporting above).
  • The Project Security Incident Response (PSIRT) team will have full access to information. The PSIRT is made up of representatives from platinum members, and volunteers who do work on triage from other members.
  • As needed, release managers and maintainers may be invited to attend additional security meetings to discuss vulnerabilities.

### 10.3 Secure Coding

Traditionally, microcontroller-based systems have not placed much emphasis on security. They have usually been thought of as isolated, disconnected from the world, and not very vulnerable, just because of the difficulty in accessing them. The Internet of Things has changed this. Now, code running on small microcontrollers often has access to the internet, or at least to other devices (that may themselves have vulnerabilities). Given the volume they are often deployed at, uncontrolled access can be devastating\(^1\).

This document describes the requirements and process for ensuring security is addressed within the Zephyr project. All code submitted should comply with these principles. Much of this document comes from [?].

---

\(^1\) An attack resulted in a significant portion of DNS infrastructure being taken down.
10.3.1 Introduction and Scope

This document covers guidelines for the Zephyr Project, from a security perspective. Many of
the ideas contained herein are captured from other open source efforts.

We begin with an overview of secure design as it relates to Zephyr. This is followed by a section
on Secure development knowledge, which gives basic requirements that a developer working on
the project will need to have. This section gives references to other security documents, and full
details of how to write secure software are beyond the scope of this document. This section also
describes vulnerability knowledge that at least one of the primary developers should have. This
knowledge will be necessary for the review process described below this.

Following this is a description of the review process used to incorporate changes into the Zephyr
codebase. This is followed by documentation about how security-sensitive issues are handled by
the project.

Finally, the document covers how changes are to be made to this document.

10.3.2 Secure Coding

Designing an open software system such as Zephyr to be secure requires adhering to a defined set
of design standards. In [?], the following, widely accepted principles for protection mechanisms
are defined to help prevent security violations and limit their impact:

- **Open design** as a design guideline incorporates the maxim that protection mechanisms
cannot be kept secret on any system in widespread use. Instead of relying on secret,
custom-tailored security measures, publicly accepted cryptographic algorithms and well
established cryptographic libraries shall be used.

- **Economy of mechanism** specifies that the underlying design of a system shall be kept as
simple and small as possible. In the context of the Zephyr project, this can be realized, e.g.,
by modular code [?] and abstracted APIs.

- **Complete mediation** requires that each access to every object and process needs to be
authenticated first. Mechanisms to store access conditions shall be avoided if possible.

- **Fail-safe defaults** defines that access is restricted by default and permitted only in specific
conditions defined by the system protection scheme, e.g., after successful authentication.
Furthermore, default settings for services shall be chosen in a way to provide maximum
security. This corresponds to the “Secure by Default” paradigm [?].

- **Separation of privilege** is the principle that two conditions or more need to be satisfied
before access is granted. In the context of the Zephyr project, this could encompass split
keys [?].

- **Least privilege** describes an access model in which each user, program, and thread, shall
have the smallest possible subset of permissions in the system required to perform their
task. This positive security model aims to minimize the attack surface of the system.

- **Least common mechanism** specifies that mechanisms common to more than one user or
process shall not be shared if not strictly required. The example given in [?] is a function
that should be implemented as a shared library executed by each user and not as a supervi-
sor procedure shared by all users.

- **Psychological acceptability** requires that security features are easy to use by the develop-
ers in order to ensure their usage and the correctness of its application.

In addition to these general principles, the following points are specific to the development of a
secure RTOS:

- **Complementary Security/Defense in Depth**: do not rely on a single threat mitigation ap-
proach. In case of the complementary security approach, parts of the threat mitigation are
performed by the underlying platform. In case such mechanisms are not provided by the platform, or are not trusted, a defense in depth paradigm shall be used.

- **Less commonly used services off by default**: to reduce the exposure of the system to potential attacks, features or services shall not be enabled by default if they are only rarely used (a threshold of 80% is given in []). For the Zephyr project, this can be realized using the configuration management. Each functionality and module shall be represented as a configuration option and needs to be explicitly enabled. Then, all features, protocols, and drivers not required for a particular use case can be disabled. The user shall be notified if low-level options and APIs are enabled but not used by the application.

- **Change management**: to guarantee a traceability of changes to the system, each change shall follow a specified process including a change request, impact analysis, ratification, implementation, and validation phase. In each stage, appropriate documentation shall be provided. All commits shall be related to a bug report or change request in the issue tracker. Commits without a valid reference shall be denied.

## 10.3.3 Secure development knowledge

### Secure designer

The Zephyr project must have at least one primary developer who knows how to design secure software.

This requires understanding the following design principles, including the 8 principles from []:

- economy of mechanism (keep the design as simple and small as practical, e.g., by adopting sweeping simplifications)
- fail-safe defaults (access decisions shall deny by default, and projects' installation shall be secure by default)
- complete mediation (every access that might be limited must be checked for authority and be non-bypassable)
- open design (security mechanisms should not depend on attacker ignorance of its design, but instead on more easily protected and changed information like keys and passwords)
- separation of privilege (ideally, access to important objects should depend on more than one condition, so that defeating one protection system won't enable complete access. For example, multi-factor authentication, such as requiring both a password and a hardware token, is stronger than single-factor authentication)
- least privilege (processes should operate with the least privilege necessary)
- least common mechanism (the design should minimize the mechanisms common to more than one user and depended on by all users, e.g., directories for temporary files)
- psychological acceptability (the human interface must be designed for ease of use - designing for “least astonishment” can help)
- limited attack surface (the set of the different points where an attacker can try to enter or extract data)
- input validation with whitelists (inputs should typically be checked to determine if they are valid before they are accepted; this validation should use whitelists (which only accept known-good values), not blacklists (which attempt to list known-bad values)).

### Vulnerability Knowledge

A “primary developer” in a project is anyone who is familiar with the project's code base, is comfortable making changes to it, and is acknowledged as such by most other participants in the
A primary developer would typically make a number of contributions over the past year (via code, documentation, or answering questions). Developers would typically be considered primary developers if they initiated the project (and have not left the project more than three years ago), have the option of receiving information on a private vulnerability reporting channel (if there is one), can accept commits on behalf of the project, or perform final releases of the project software. If there is only one developer, that individual is the primary developer.

At least one of the primary developers must know of common kinds of errors that lead to vulnerabilities in this kind of software, as well as at least one method to counter or mitigate each of them.

Examples (depending on the type of software) include SQL injection, OS injection, classic buffer overflow, cross-site scripting, missing authentication, and missing authorization. See the CWE/SANS top 25 or OWASP Top 10 for commonly used lists.

Zephyr Security Subcommittee

There shall be a “Zephyr Security Subcommittee”, responsible for enforcing this guideline, monitoring reviews, and improving these guidelines.

This team will be established according to the Zephyr Project charter.

10.3.4 Code Review

The Zephyr project shall use a code review system that all changes are required to go through. Each change shall be reviewed by at least one primary developer that is not the author of the change. This developer shall determine if this change affects the security of the system (based on their general understanding of security), and if so, shall request the developer with vulnerability knowledge, or the secure designer to also review the code. Any of these individuals shall have the ability to block the change from being merged into the mainline code until the security issues have been addressed.

10.3.5 Issues and Bug Tracking

The Zephyr project shall have an issue tracking system (such as GitHub) that can be used to record and track defects that are found in the system.

Because security issues are often sensitive, this issue tracking system shall have a field to indicate a security issue. Setting this field shall result in the issue only being visible to the Zephyr Security Subcommittee. In addition, there shall be a field to allow the Zephyr Security Subcommittee to add additional users that will have visibility to a given issue.

This embargo, or limited visibility, shall only be for a fixed duration, with a default being a project-decided value. However, because security considerations are often external to the Zephyr project itself, it may be necessary to increase this embargo time. The time necessary shall be clearly annotated in the issue itself.

The list of issues shall be reviewed at least once a month by the Zephyr Security Subcommittee. This review should focus on tracking the fixes, determining if any external parties need to be notified or involved, and determining when to lift the embargo on the issue. The embargo should not be lifted via an automated means, but the review team should avoid unnecessary delay in lifting issues that have been resolved.
10.3.6 Modifications to This Document

Changes to this document shall be reviewed by the Zephyr Security Subcommittee, and approved by consensus.

10.4 Sensor Device Threat Model

This document describes a threat model for an IoT sensor device. Spelling out a threat model helps direct development effort, and can be used to help prioritize these efforts as well.

This device contains a sensor of some type (for example temperature, or a pressure in a pipe), which sends this data to an SoC running a microcontroller. This microcontroller connects to a cloud service, and relays this sensor data to this service. The cloud service is also able to send configuration data to the device, as well as software update images. A general diagram can be seen in Figure 1:

![Diagram of Sensor Device Threat Model](image)

Fig. 3: Figure 1. Sensor General Diagram

In this sensor device, the sensor connects with the SoC via an SPI bus, and the SoC has a network interface that it uses to communicate with the cloud service. The particulars of these interfaces can impact the threat model in unexpected ways, and variants on this will need to be considered (for example, using a separate network interface SoC connected via some type of bus).

This model also focuses on communicating via the MQTT-over-TLS protocol, as this seems to be in wide use\(^1\).

10.4.1 Assets

One aspect of the threat model to consider are assets involved in the operation of the device. The following list enumerates the assets included in this model:

1. **The bootloader**. This is a small code/data image contained in on-device flash that is the first code to run. In order to establish a root of trust, this image must be immutable. This

---

\(^1\) See [https://www.slideshare.net/kartben/iot-developer-survey-2018](https://www.slideshare.net/kartben/iot-developer-survey-2018). As of this writing, the three major cloud IoT service providers, AWS IoT, Google Cloud IoT, and Microsoft Azure IoT all provide MQTT over TLS. Some feedback has suggested that some find difficulty with UDP protocols and routing issues on various networks.
model assumes that the SoC provides a mechanism to protect a region of the flash from future writes, and that this will be done after this image is programmed into the device, early in production [th-imboot].

2. **The application firmware image.** This asset consists of the remainder of the firmware run by the microcontroller. The distinction is made because this part of the image will need to be updated periodically as security vulnerabilities are discovered. Requirements for updates to this image are:
   a. The image shall only be replaced with an authorized image [th-authrepl].
   b. When an authorized replacement image is available, the update shall be done in a timely manner [th-timely-update].
   c. The image update shall be seen as atomic, meaning that when the image is run, the flash shall contain either the update image in its entirety, or the old image in its entirety [th-atomic-update].

3. **Root certificate list.** In order to authenticate the cloud service (server), the IoT device must have a list of root certificates that are allowed to sign the certificate on the server. For cloud-provider based services, this list will generally be provided by the service provider. Because the root certificates can expire, and possibly be revoked, this list will need to be periodically updated [th-root-certs], [th-root-check].

4. **Client secrets.** To authenticate the client to the service, the client must possess some kind of secret. This is generally a private key, usually either an RSA key or an EC private key. When establishing communication with the server, the device will use this secret either as part of the TLS establishment, or to sign a message used in the communication.

   This secret is generally generated by the service provider, or by software running elsewhere, and must be securely installed on the device. Policy may dictate that this secret be replaced periodically, which will require a way to update the client secret. Typically, the service will allow two or three active keys to allow this update to proceed while the old key is used.

   These secrets must be protected from read, and the smallest amount of code necessary shall have access to them. [th-secret-storage]

5. **Current date/time.** TLS certificate verification requires knowledge of the current date and time in order to determine if the current time falls within the certificate's current validity time. Also, token based client authentication will generally require the client to sign a message containing a time window that the token is valid. Certificate validation requires the device's notion of date and time to be accurate within a day or so. Token generation generally requires the time to be accurate within 5-10 minutes.

   It may be possible to approximate secure time by querying an external time server. Secure NTP is possibly beyond the capabilities of an IoT device. The main risks of having incorrect time are denial of service (the device rejects valid certificates), and the generation of tokens with invalid times. It could be possible to trick the device into generating tokens that are valid in the future, but the attacker would also have to spoof the server's certificate to be able to intercept this. [th-time]

6. **Sensor data.** The data received from the sensor itself, and delivered to the service shall be delivered without modification or tampering.

7. **Device configuration.** Various configuration data, such as the hostname of the service to connect to, the address of a time server, frequency and parameters of when sensor data is sent to the service, and other need to be kept by the device. This configuration data will need to be updated periodically as the configuration changes. Updates should be allowed only from authorized parties. [th-conf]

8. **Logs.** In order to assist with analysis of security issues, the device shall log information about security-pertinent events. IoT devices generally have limited storage, and as such, these logs need to be carefully selected. It may also be possible to send these log events
to the cloud service where they can be stored in a more resource-available environment. Types of events that should be logged include:

a. **Firmware image updates.** The system should log the download of new images, and when an image is successfully updated.

b. **Client secret changes.** Changes and new client secrets should be logged.

c. **Changes to the device configuration.**

10.4.2 Communication

In addition to assets, the threat model also considers the locations where data or assets are communicated between entities of the system.

1. **Flash contents.** The flash device contains several regions. The contents of flash can be modified programmatically by the SoC's CPU.

a. **The bootloader.** As described in the Assets section, the bootloader is a small section of the flash device containing the code initially run. This section shall be written early in the lifecycle of the device, and the flash device then configured to permanently disallow modification of this section. This configuration should also prevent modification via external interfaces, such as JTAG or SWD debuggers.

The bootloader is responsible for verifying the signature of the application image as well as updating the application image from the update image when an update is needed.

The bootloader shall verify the signature of the update image before installing it.

The bootloader shall only accept an update image with a newer version number than the current image.

b. **The application image.** The application image contains the code executed during normal operation of the device. Before running this image, the bootloader shall verify a digital signature of the image, to avoid running an image that has been tampered with. The flash/system shall be configured such that after the bootloader has completed, the CPU will be unable to write to the application image.

c. **The update image.** This is an area of flash that holds a new version of the application image. This image will be downloaded and stored by the application during normal operation. When this has completed, the application can trigger a reboot, and the bootloader can install the new image.

d. **Secret storage.** An area of the flash will be used to store client secrets. This area is written and read by a subset of the application image. The application shall be configured to protect this area from both reads and writes by code that does not need to have access to it, giving consideration to possible exploits found within a majority of the application code. Revealing the contents of the secrets would allow the attacker to spoof this device.

Initial secrets shall be placed in the device during a provisioning activity, distinct from normal operation of the device. Later updates can be made under the direction of communication received over a secured channel to the service.

e. **Configuration storage.** There shall be an area to store other configuration information. On resource-constrained devices, it is allowed for this to be stored in the same region as the secret storage, however, this adds additional code that has access to the secret storage area, and as such, more code that must be scrutinized.

f. **Log storage.** The device may have an area of flash where log events can be written.
2. **Sensor/Actuator interface.** In this design, the sensor or actuator communicates with the SoC via a bus, such as SPI. The hardware design shall be made to make intercepting this bus difficult for an attack. Required techniques depend on the sensitivity and use of the sensor data, and can range from having the sensor mounted on the same PCB as the MCU to epoxy potting the entire device.

3. **Communication with cloud service.** Communication between the device, and the cloud service will be done over the general internet. As such, it shall be assumed that an attacker can arbitrarily intercept this channel and, for example, return spoofed DNS results or attempt man-in-the-middle attacks against communication with cloud services.

The device shall use TLS for all communication with the cloud service [th-all-tls]. The TLS stack shall be configured to use only cipher suites that are generally considered secure\(^2\), including forward secrecy. The communication shall be secured by the following:

   a. **Cipher suite selection.** The device shall only allow communication with generally agreed secure cipher suites [th-tls-ciphers].

   b. **Server certificate verification.** The server presented by the server shall be verified [th-root-check].

      i. **Naming.** The certificate shall name the host and service the cloud service server is providing. RFC6125 describes best practices for this. It is permissible for the device to require the certificate to be more restrictive than as described in this RFC, provided the service can use a certificate that can comply.

      ii. **Path validation.** The device shall verify that the certificate chain has a valid signature path from a root certificate contained within the device, to the certificate presented by the service. RFC4158 describes this is general. The device is permitted to require a more restricted path, provided the server certificate used complies with this restriction.

      iii. **Validity period.** The validity period of all presented certificates shall be checked against the device's best notion of the current time.

   c. **Client authentication.** The client shall authenticate itself to the service using a secret known only to that particular device. There are several options, and the technique used is generally mandated by the particular service provider being used [th-tls-client-auth].

      i. **TLS client certificates.** The TLS protocol allows the client to present a certificate, and assert its knowledge of the secret described by that certificate. Generally, these certificates will be stored within the service provider. These certificates can be self-signed, or signed by a CA. Since the service provider maintains a list of valid certificates (mapping them to a device identity), having these certificates signed by a CA does not add any additional security, but may be useful in the management of these certificates.

      ii. **Token-based authentication.** It is also possible for the client to authenticate itself using the password field of the MQTT CONNECT packet. However, the secret itself must not be transmitted in this packet. Instead, a token-based protocol, such as RFC7519’s JSON Web Token (JWT) can be used. These tokens will generally have a small validity period (e.g. 1 hour), to prevent them from being reused if they are intercepted. The token shall not be sent until the device has verified the identity of the server.

   d. **Random/Entropy source.** Cryptographic communication requires the generation of secure pseudorandom numbers. The device shall use a modern, accepted cryptographic random-bit generator to generate these random numbers. It shall use either a Non-Deterministic Random Bit Generator (True RBG) implemented in hardware within the SoC, or a Deterministic Random Bit Generator (Pseudo RBG) seeded by

\(^2\) As new exploits are discovered, what is considered secure can change. Organizations such as https://www.ssllabs.com/ provide information on current ideas of how TLS must be configured to be secure.
4. **Communication with the time service.** Ideally, the device shall contain hardware that maintains a secure time. However, most SoCs in use do not have support for this, and it will be necessary to consult an external time service. [RFC4330](https://tools.ietf.org/html/rfc4330) and referenced RFCs describe the Simple Network Time Protocol that can be used to query the current time from a network time server.

5. **Device lifecycle.** An IoT device will have a lifecycle from production to destruction and disposal of the device. Aspects of this lifecycle that impact security include initial provisioning, normal operation, re-provisioning, and destruction.

   a. **Initial provisioning.** During the initial provisioning stage, it is necessary to program the bootloader, an initial application image, a device secret, and initial configuration data. In addition, the bootloader flash protection shall be installed. Of this information, only the device secret needs to differ per device. This secret shall be securely maintained, and destroyed in all locations outside of the device once it has been programmed.

   b. **Normal operation.** Normal operation includes the behavior described by the rest of this document.

   c. **Re-provisioning.** Sometimes it is necessary to re-provision a device, such as for a different application. One way to do this is to keep the same device secret, and replace the configuration data, as well as the cloud service data associated with the device. It is also possible to program a new device secret, but if this is done it shall be done securely, and the new secret destroyed externally once programmed into the device.

   d. **Destruction.** To prevent the device secret from being used to spoof the device, upon decommissioning, the secret for a particular device shall be rendered ineffective. Possibilities include:

      i. Hardware destruction of the device.

      ii. Securely wiping the flash area containing the secret.

      iii. Removing the device identity and certificate from the service.

### 10.4.3 Other Considerations

In addition to the above, network connected devices generally will need a way to configure them to connect to the network environment they are placed in. There are numerous ways of doing this, and it is important for these configuration methods to not circumvent the security requirements described above.

### 10.4.4 Threats

### 10.4.5 Notes

### 10.5 Hardening Tool

Before launching a product, it’s crucial to ensure that your software is as secure as possible. This process, known as “hardening”, involves strengthening the security of a system to protect it from potential threats and vulnerabilities.

---

3 Note that merely erasing this flash area is unlikely to be sufficient.
At a high-level, hardening a Zephyr application can be seen as a two-fold process:

1. Disabling features and compilation flags that might lead to security vulnerabilities (ex. making sure that no “experimental” features are being used, disabling features typically used for debugging purposes such as assertions, shell, etc.).

2. Enabling optional features that can lead to improve security (ex. stack sentinel, hardware stack protection, etc.). Some of these features might be hardware-dependent.

To simplify this process, Zephyr offers a **hardening tool** designed to analyze an application’s configuration against a set of hardening preferences defined by the **Security Working Group**. The tool looks at the KConfig options in the build target and provides tailored suggestions and recommendations to adjust security-related options.

### 10.5.1 Usage

Using west:

```bash
west build -b reel_board samples/hello_world
west build -t hardenconfig
```

Using CMake and ninja:

```bash
# Use cmake to configure a Ninja-based buildsystem:
cmake -Bbuild -GNinja -DBOARD=reel_board samples/hello_world

# Now run ninja on the generated build system:
ninja -Cbuild -t hardenconfig
```

The output should be similar to the table below. For each configuration option set to a value that could lead to a security vulnerability, the table will propose a recommended value that should be used instead.

<table>
<thead>
<tr>
<th>name</th>
<th>current</th>
<th>recommended</th>
<th>check result</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIG_BOOT_BANNER</td>
<td>y</td>
<td>n</td>
<td>FAIL</td>
</tr>
<tr>
<td>CONFIG_BUILD_OUTPUT_STRIPPED</td>

</tbody>
</table>

### 10.6 Vulnerabilities

This page collects all of the vulnerabilities that are discovered and fixed in each release. It will also often have more details than is available in the releases. Some vulnerabilities are deemed to be sensitive, and will not be publicly discussed until there is sufficient time to fix them. Because the release notes are locked to a version, the information here can be updated after the embargo is lifted.

#### 10.6.1 CVE-2017
CVE-2017-14199

Buffer overflow in `getaddrinfo()`.

- CVE-2017-14199
- Zephyr project bug tracker ZEPSEC-12
- PR6158 fix for 1.11.0

CVE-2017-14201

The shell DNS command can cause unpredictable results due to misuse of stack variables.

Use After Free vulnerability in the Zephyr shell allows a serial or telnet connected user to cause denial of service, and possibly remote code execution.

This has been fixed in release v1.14.0.

- CVE-2017-14201
- Zephyr project bug tracker ZEPSEC-17
- PR13260 fix for v1.14.0

CVE-2017-14202

The shell implementation does not protect against buffer overruns resulting in unpredictable behavior.

Improper Restriction of Operations within the Bounds of a Memory Buffer vulnerability in the shell component of Zephyr allows a serial or telnet connected user to cause a crash, possibly with arbitrary code execution.

This has been fixed in release v1.14.0.

- CVE-2017-14202
- Zephyr project bug tracker ZEPSEC-18
- PR13048 fix for v1.14.0

10.6.2 CVE-2019

CVE-2019-9506

The Bluetooth BR/EDR specification up to and including version 5.1 permits sufficiently low encryption key length and does not prevent an attacker from influencing the key length negotiation. This allows practical brute-force attacks (aka “KNOB”) that can decrypt traffic and inject arbitrary ciphertext without the victim noticing.

- CVE-2019-9506
- Zephyr project bug tracker ZEPSEC-20
- PR18702 fix for v1.14.0
- PR18659 fix for v2.0.0
10.6.3 CVE-2020

CVE-2020-10019

Buffer Overflow vulnerability in USB DFU of zephyr allows a USB connected host to cause possible remote code execution.

This has been fixed in releases v1.14.2, v2.2.0, and v2.1.1.

- CVE-2020-10019
- Zephyr project bug tracker ZEPSEC-25
- PR23460 fix for 1.14.x
- PR23457 fix for 2.1.x
- PR23190 fix in 2.2.0

CVE-2020-10021

Out-of-bounds write in USB Mass Storage with unaligned sizes

Out-of-bounds Write in the USB Mass Storage memoryWrite handler with unaligned Sizes.

See NCC-ZEP-024, NCC-ZEP-025, NCC-ZEP-026

This has been fixed in releases v1.14.2, and v2.2.0.

- CVE-2020-10021
- Zephyr project bug tracker ZEPSEC-26
- PR23455 fix for v1.14.2
- PR23456 fix for the v2.1 branch
- PR23240 fix for v2.2.0

CVE-2020-10022

UpdateHub Module Copies a Variable-Size Hash String Into a Fixed-Size Array

A malformed JSON payload that is received from an UpdateHub server may trigger memory corruption in the Zephyr OS. This could result in a denial of service in the best case, or code execution in the worst case.

See NCC-ZEP-016

This has been fixed in the below pull requests for main, branch from v2.1.0, and branch from v2.2.0.

- CVE-2020-10022
- Zephyr project bug tracker ZEPSEC-28
- PR24154 fix for main
- PR24065 fix for branch from v2.1.0
- PR24066 fix for branch from v2.2.0
CVE-2020-10023

Shell Subsystem Contains a Buffer Overflow Vulnerability In shell_spaces_trim

The shell subsystem contains a buffer overflow, whereby an adversary with physical access to the device is able to cause a memory corruption, resulting in denial of service or possibly code execution within the Zephyr kernel.

See NCC-ZEP-019

This has been fixed in releases v1.14.2, v2.2.0, and in a branch from v2.1.0,

- CVE-2020-10023
- Zephyr project bug tracker ZEPSEC-29
- PR23646 fix for v1.14.2
- PR23649 fix for branch from v2.1.0
- PR23304 fix for v2.2.0

CVE-2020-10024

ARM Platform Uses Signed Integer Comparison When Validating Syscall Numbers

The arm platform-specific code uses a signed integer comparison when validating system call numbers. An attacker who has obtained code execution within a user thread is able to elevate privileges to that of the kernel.

See NCC-ZEP-001

This has been fixed in releases v1.14.2, and v2.2.0, and in a branch from v2.1.0,

- CVE-2020-10024
- Zephyr project bug tracker ZEPSEC-30
- PR23535 fix for v1.14.2
- PR23498 fix for branch from v2.1.0
- PR23323 fix for v2.2.0

CVE-2020-10027

ARC Platform Uses Signed Integer Comparison When Validating Syscall Numbers

An attacker who has obtained code execution within a user thread is able to elevate privileges to that of the kernel.

See NCC-ZEP-001

This has been fixed in releases v1.14.2, and v2.2.0, and in a branch from v2.1.0,

- CVE-2020-10027
- Zephyr project bug tracker ZEPSEC-35
- PR23500 fix for v1.14.2
- PR23499 fix for branch from v2.1.0
- PR23328 fix for v2.2.0
CVE-2020-10028

Multiple Syscalls In GPIO Subsystem Performs No Argument Validation

Multiple syscalls with insufficient argument validation

See NCC-ZEP-006

This has been fixed in releases v1.14.2, and v2.2.0, and in a branch from v2.1.0.

- CVE-2020-10028
- Zephyr project bug tracker ZEPSEC-32
- PR23733 fix for v1.14.2
- PR23737 fix for branch from v2.1.0
- PR23308 fix for v2.2.0 (gpio patch)

CVE-2020-10058

Multiple Syscalls In kscan Subsystem Performs No Argument Validation

Multiple syscalls in the Kscan subsystem perform insufficient argument validation, allowing
code executing in userspace to potentially gain elevated privileges.

See NCC-ZEP-006

This has been fixed in a branch from v2.1.0, and release v2.2.0.

- CVE-2020-10058
- Zephyr project bug tracker ZEPSEC-34
- PR23748 fix for branch from v2.1.0
- PR23308 fix for v2.2.0 (kscan patch)

CVE-2020-10059

UpdateHub Module Explicitly Disables TLS Verification

The UpdateHub module disables DTLS peer checking, which allows for a man in the middle
attack. This is mitigated by firmware images requiring valid signatures. However, there is no
benefit to using DTLS without the peer checking.

See NCC-ZEP-018

This has been fixed in a PR against Zephyr main.

- CVE-2020-10059
- Zephyr project bug tracker ZEPSEC-36
- PR24954 fix on main (to be fixed in v2.3.0)
- PR24954 fix v2.1.0
- PR24954 fix v2.2.0
CVE-2020-10060

UpdateHub Might Dereference An Uninitialized Pointer

In updatehub_probe, right after JSON parsing is complete, objects[1] is accessed from the output structure in two different places. If the JSON contained less than two elements, this access would reference uninitialized stack memory. This could result in a crash, denial of service, or possibly an information leak.

Recommend disabling updatehub until such a time as a fix can be made available.

See NCC-ZEP-030

This has been fixed in a PR against Zephyr main.

- CVE-2020-10060
- Zephyr project bug tracker ZEPSEC-37
- PR27865 fix on main (to be fixed in v2.4.0)
- PR27865 fix for v2.3.0
- PR27865 fix for v2.2.0
- PR27865 fix for v2.1.0

CVE-2020-10061

Error handling invalid packet sequence

Improper handling of the full-buffer case in the Zephyr Bluetooth implementation can result in memory corruption.

This has been fixed in branches for v1.14.0, v2.2.0, and will be included in v2.3.0.

- CVE-2020-10061
- Zephyr project bug tracker ZEPSEC-75
- PR23516 fix for v2.3 (split driver)
- PR23517 fix for v2.3 (legacy driver)
- PR23091 fix for branch from v1.14.0
- PR23547 fix for branch from v2.2.0

CVE-2020-10062

Packet length decoding error in MQTT

CVE: An off-by-one error in the Zephyr project MQTT packet length decoder can result in memory corruption and possible remote code execution. NCC-ZEP-031

The MQTT packet header length can be 1 to 4 bytes. An off-by-one error in the code can result in this being interpreted as 5 bytes, which can cause an integer overflow, resulting in memory corruption.

This has been fixed in main for v2.3.

- CVE-2020-10062
- Zephyr project bug tracker ZEPSEC-84
- commit 11b7a37d for v2.3
- NCC-ZEP report (NCC-ZEP-031)
CVE-2020-10063
Remote Denial of Service in CoAP Option Parsing Due To Integer Overflow
A remote adversary with the ability to send arbitrary CoAP packets to be parsed by Zephyr is able to cause a denial of service.
This has been fixed in main for v2.3.
- CVE-2020-10063
- Zephyr project bug tracker ZEPSEC-55
- PR24435 fix in main for v2.3
- PR24531 fix for branch from v2.2
- PR24535 fix for branch from v2.1
- PR24530 fix for branch from v1.14
- NCC-ZEP report (NCC-ZEP-032)

CVE-2020-10064
Improper Input Frame Validation in ieee802154 Processing
- CVE-2020-10064
- Zephyr project bug tracker ZEPSEC-65
- PR24971 fix for v2.4
- PR33451 fix for v1.4

CVE-2020-10065
OOB Write after not validating user-supplied length (<= 0xffff) and copying to fixed-size buffer (default: 77 bytes) for HCI_ACL packets in bluetooth HCI over SPI driver.
- CVE-2020-10065
- Zephyr project bug tracker ZEPSEC-66
- This issue has not been fixed.

CVE-2020-10066
Incorrect Error Handling in Bluetooth HCI core
In hci_cmd_done, the buf argument being passed as null causes nullpointer dereference.
- CVE-2020-10066
- Zephyr project bug tracker ZEPSEC-67
- PR24902 fix for v2.4
- PR25089 fix for v1.4
CVE-2020-10067

Integer Overflow In is_in_region Allows User Thread To Access Kernel Memory

A malicious userspace application can cause a integer overflow and bypass security checks performed by system call handlers. The impact would depend on the underlying system call and can range from denial of service to information leak to memory corruption resulting in code execution within the kernel.

See NCC-ZEP-005

This has been fixed in releases v1.14.2, and v2.2.0.

- CVE-2020-10067
- Zephyr project bug tracker ZEPSEC-27
- PR23653 fix for v1.14.2
- PR23654 fix for the v2.1 branch
- PR23239 fix for v2.2.0

CVE-2020-10068

Zephyr Bluetooth DLE duplicate requests vulnerability

In the Zephyr project Bluetooth subsystem, certain duplicate and back-to-back packets can cause incorrect behavior, resulting in a denial of service.

This has been fixed in branches for v1.14.0, v2.2.0, and will be included in v2.3.0.

- CVE-2020-10068
- Zephyr project bug tracker ZEPSEC-78
- PR23707 fix for v2.3 (split driver)
- PR23708 fix for v2.3 (legacy driver)
- PR23091 fix for branch from v1.14.0
- PR23964 fix for v2.2.0

CVE-2020-10069

Zephyr Bluetooth unchecked packet data results in denial of service

An unchecked parameter in bluetooth data can result in an assertion failure, or division by zero, resulting in a denial of service attack.

This has been fixed in branches for v1.14.0, v2.2.0, and will be included in v2.3.0.

- CVE-2020-10069
- Zephyr project bug tracker ZEPSEC-81
- PR23705 fix for v2.3 (split driver)
- PR23706 fix for v2.3 (legacy driver)
- PR23091 fix for branch from v1.14.0
- PR23963 fix for branch from v2.2.0
CVE-2020-10070

MQTT buffer overflow on receive buffer

In the Zephyr Project MQTT code, improper bounds checking can result in memory corruption and possibly remote code execution. NCC-ZEP-031

When calculating the packet length, arithmetic overflow can result in accepting a receive buffer larger than the available buffer space, resulting in user data being written beyond this buffer.

This has been fixed in main for v2.3.

- CVE-2020-10070
- Zephyr project bug tracker ZEPSEC-85
- commit 0b39cbf3 for v2.3
- NCC-ZEP report (NCC-ZEP-031)

CVE-2020-10071

Insufficient publish message length validation in MQTT

The Zephyr MQTT parsing code performs insufficient checking of the length field on publish messages, allowing a buffer overflow and potentially remote code execution. NCC-ZEP-031

This has been fixed in main for v2.3.

- CVE-2020-10071
- Zephyr project bug tracker ZEPSEC-86
- commit 989c4713 fix for v2.3
- NCC-ZEP report (NCC-ZEP-031)

CVE-2020-10072

All threads can access all socket file descriptors

There is no management of permissions to network socket API file descriptors. Any thread running on the system may read/write a socket file descriptor knowing only the numerical value of the file descriptor.

- CVE-2020-10072
- Zephyr project bug tracker ZEPSEC-87
- PR25804 fix for v2.4
- PR27176 fix for v1.4

CVE-2020-10136

IP-in-IP protocol routes arbitrary traffic by default zephyrproject

- CVE-2020-10136
- Zephyr project bug tracker ZEPSEC-64
CVE-2020-13598

FS: Buffer Overflow when enabling Long File Names in FAT_FS and calling fs_stat
Performing fs_stat on a file with a filename longer than 12 characters long will cause a buffer overflow.

- CVE-2020-13598
- Zephyr project bug tracker ZEPSEC-88
- PR25852 fix for v2.4
- PR28782 fix for v2.3
- PR33577 fix for v1.4

CVE-2020-13599

Security problem with settings and littlefs
When settings is used in combination with littlefs all security related information can be extracted from the device using MCUmgr and this could be used e.g in bt-mesh to get the device key, network key, app keys from the device.

- CVE-2020-13599
- Zephyr project bug tracker ZEPSEC-57
- PR26083 fix for v2.4

CVE-2020-13600

Malformed SPI in response for eswifi can corrupt kernel memory

- CVE-2020-13600
- Zephyr project bug tracker ZEPSEC-91
- PR26712 fix for v2.4

CVE-2020-13601

Possible read out of bounds in dns read

- CVE-2020-13601
- Zephyr project bug tracker ZEPSEC-92
- PR27774 fix for v2.4
- PR30503 fix for v1.4

CVE-2020-13602

Remote Denial of Service in LwM2M do_write_op_tlv
In the Zephyr LwM2M implementation, malformed input can result in an infinite loop, resulting in a denial of service attack.

- CVE-2020-13602
- Zephyr project bug tracker ZEPSEC-56
• PR26571 fix for v2.4
• PR33578 fix for v1.4

**CVE-2020-13603**

Possible overflow in mempool

- Zephyr offers pre-built ‘malloc’ wrapper function instead.
- The ‘malloc’ function is wrapper for the ‘sys_mem_pool_alloc’ function
- `sys_mem_pool_alloc` allocates `size + WB_UP(sizeof(struct sys_mem_pool_block))` in an unsafe manner.
- Asking for very large size values leads to internal integer wrap-around.
- Integer wrap-around leads to successful allocation of very small memory.
- For example: calling `malloc(0xffffffff)` leads to successful allocation of 7 bytes.
- That leads to heap overflow.

**CVE-2020-13603**

- Zephyr project bug tracker ZEPSEC-111
- PR31796 fix for v2.4
- PR32808 fix for v1.4

10.6.4 **CVE-2021**

**CVE-2021-3319**

DOS: Incorrect 802154 Frame Validation for Omitted Source / Dest Addresses

Improper processing of omitted source and destination addresses in ieee802154 frame validation (`ieee802154_validate_frame`)

This has been fixed in main for v2.5.0

- **CVE-2020-3319**
- Zephyr project bug tracker GHSA-94jg-2p6q-5364
- PR31908 fix for main

**CVE-2021-3320**

Mismatch between validation and handling of 802154 ACK frames, where ACK frames are considered during validation, but not during actual processing, leading to a type confusion.

- **CVE-2020-3320**
- PR31908 fix for main

**CVE-2021-3321**

Incomplete check of minimum IEEE 802154 fragment size leading to an integer underflow.

- **CVE-2020-3321**
- Zephyr project bug tracker ZEPSEC-114
• PR33453 fix for v2.4

CVE-2021-3323

Integer Underflow in 6LoWPAN IPHC Header Uncompression
This has been fixed in main for v2.5.0
• CVE-2020-3323
• Zephyr project bug tracker GHSA-89j6-qpxf-pfpc
• PR 31971 fix for main

CVE-2021-3430

Assertion reachable with repeated LL_CONNECTION_PARAM_REQ.
This has been fixed in main for v2.6.0
• CVE-2021-3430
• Zephyr project bug tracker GHSA-46h3-hjcq-2jjr
• PR 33272 fix for main
• PR 33369 fix for 2.5
• PR 33759 fix for 1.14.2

  • PR 37816 fix for 2.6
CVE-2021-3581

HCI data not properly checked leads to memory overflow in the Bluetooth stack

In the process of setting SCAN_RSP through the HCI command, the Zephyr Bluetooth protocol stack did not effectively check the length of the incoming HCI data. Causes memory overflow, and then the data in the memory is overwritten, and may even cause arbitrary code execution.

This has been fixed in main for v2.6.0

Chapter 11

Safety

These documents describe the processes, developer guidelines and requirements for ensuring safety is addressed within the Zephyr project.

11.1 Zephyr Safety Overview

11.1.1 Introduction

This document is the safety documentation providing an overview over the safety-relevant activities and what the Zephyr Project and the Zephyr Safety Working Group / Committee try to achieve.

This overview is provided for people who are interested in the functional safety development part of the Zephyr RTOS and project members who want to contribute to the safety aspects of the project.

11.1.2 Overview

In this section we give the reader an overview of what the general goal of the safety certification is, what standard we aim to achieve and what quality standards and processes need to be implemented to reach such a safety certification.

11.1.3 Safety Document update

This document is a living document and may evolve over time as new requirements, guidelines, or processes are introduced.

1. Changes will be submitted from the interested party(ies) via pull requests to the Zephyr documentation repository.
2. The Zephyr Safety Committee will review these changes and provide feedback or acceptance of the changes.
3. Once accepted, these changes will become part of the document.
11.1.4 General safety scope

The general scope of the Safety Committee is to achieve a certification for the IEC 61508 standard and the Safety Integrity Level (SIL) 3 / Systematic Capability (SC) 3 for a limited source scope (see certification scope TBD). Since the code base is pre-existing, we use the route 3s/1s approach defined by the IEC 61508 standard.

**Route 3s**

*Assessment of non-compliant development. Which is basically the route 1s with existing sources.*

**Route 1s**

*Compliant development. Compliance with the requirements of this standard for the avoidance and control of systematic faults in software.*

**Summarization IEC 61508 standard**

The IEC 61508 standard is a widely recognized international standard for functional safety of electrical, electronic, and programmable electronic safety-related systems. Here’s an overview of some of the key safety aspects of the standard:

1. **Hazard and Risk Analysis:** The IEC 61508 standard requires a thorough analysis of potential hazards and risks associated with a system in order to determine the appropriate level of safety measures needed to reduce those risks to acceptable levels.

2. **Safety Integrity Level (SIL):** The standard introduces the concept of Safety Integrity Level (SIL) to classify the level of risk reduction required for each safety function. The higher the SIL, the greater the level of risk reduction required.

3. **System Design:** The IEC 61508 standard requires a systematic approach to system design that includes the identification of safety requirements, the development of a safety plan, and the use of appropriate safety techniques and measures to ensure that the system meets the required SIL.

4. **Verification and Validation:** The standard requires rigorous testing and evaluation of the safety-related system to ensure that it meets the specified SIL and other safety requirements. This includes verification of the system design, validation of the system’s functionality, and ongoing monitoring and maintenance of the system.

5. **Documentation and Traceability:** The IEC 61508 standard requires a comprehensive documentation process to ensure that all aspects of the safety-related system are fully documented and that there is full traceability from the safety requirements to the final system design and implementation.

Overall, the IEC 61508 standard provides a framework for the design, development, and implementation of safety-related systems that aims to reduce the risk of accidents and improve overall safety. By following the standard, organizations can ensure that their safety-related systems are designed and implemented to the highest level of safety integrity.

11.1.5 Quality

Quality is a mandatory expectation for software across the industry. The code base of the project must achieve various software quality goals in order to be considered an auditable code base from a safety perspective and to be usable for certification purposes. But software quality is not an additional requirement caused by functional safety standards. Functional safety considers quality as an existing pre-condition and therefore the “quality managed” status should be pursued for any project regardless of the functional safety goals. The following list describes the quality goals which need to be reached to achieve an auditable code base:

1. Basic software quality standards
a. Coding Guidelines (including: static code analysis, coding style, etc.)
b. Requirements and requirements tracing
c. Test coverage

2. Software architecture design principles
   a. Layered architecture model
   b. Encapsulated components
   c. Encapsulated single functionality (if not fitable and manageable in safety)

Basic software quality standards - Safety view

In this chapter the Safety Committee describes why they need the above listed quality goals as pre-condition and what needs to be done to achieve an auditable code base from the safety perspective. Generally speaking, it can be said that all of these quality measures regarding safety are used to minimize the error rate during code development.

Coding Guidelines   The coding guidelines are the basis to a common understanding and a unified ruleset and development style for industrial software products. For safety the coding guidelines are essential and have another purpose beside the fact of a unified ruleset. It is also necessary to prove that the developers follow a unified development style to prevent systematic errors in the process of developing software and thus to minimize the overall error rate of the complete software system.

Also the IEC 61508 standard sets a pre-condition and recommendation towards the use of coding standards / guidelines to reduce likelihood of errors.

Requirements and requirements tracing   Requirements and requirement management are not only important for software development, but also very important in terms of safety. On the one hand, this specifies and describes in detail and on a technical level what the software should do, and on the other hand, it is an important and necessary tool to verify whether the described functionality is implemented as expected. For this purpose, tracing the requirements down to the code level is used. With the requirements management and tracing in hand, it can now be verified whether the functionality has been tested and implemented correctly, thus minimizing the systematic error rate.

Also the IEC 61508 standard highly recommends (which is like a must-have for the certification) requirements and requirements tracing.

Test coverage   A high test coverage, in turn, is evidence of safety that the code conforms precisely to what it was developed for and does not execute any unforeseen instructions. If the entire code is tested and has a high (ideally 100%) test coverage, it has the additional advantage of quickly detecting faulty changes and further minimizing the error rate. However, it must be noted that different requirements apply to safety for test coverage, and various metrics must be considered, which are prescribed by the IEC 61508 standard for the SIL 3 / SC3 target. The following must be fulfilled, among other things:

- Structural test coverage (entry points) 100%
- Structural test coverage (statements) 100%
- Structural test coverage (branches) 100%

If the 100% cannot be reached (e.g. statement coverage of defensive code) that part needs to be described and justified in the documentation.
Software architecture design principles

To create and maintain a structured software product it is also necessary to consider individual software architecture designs and implement them in accordance with safety standards because some designs and implementations are not reasonable in safety, so that the overall software and code base can be used as auditable code. However, most of these software architecture designs have already been implemented in the Zephyr project and need to be verified by the Safety Committee / Safety Working Group and the safety architect.

Layered architecture model  The IEC 61508 standard strongly recommends a modular approach to software architecture. This approach has been pursued in the Zephyr project from the beginning with its layered architecture. The idea behind this architecture is to organize modules or components with similar functionality into layers. As a result, each layer can be assigned a specific role in the system. This model has the advantage in safety that interfaces between different components and layers can be shown at a very high level, and thus it can be determined which functionalities are safety-relevant and can be limited. Furthermore, various analyses and documentations can be built on top of this architecture, which are important for certification and the responsible certification body.

Encapsulated components  Encapsulated components are an essential part of the architecture design for safety at this point. The most important aspect is the separation of safety-relevant components from non-safety-relevant components, including their associated interfaces. This ensures that the components have no repercussions on other components.

Encapsulated single functionality (if not reasonable and manageable in safety)  Another requirement for the overall system and software environment is that individual functionalities can be disabled within components. This is because if a function is absolutely unacceptable for safety (e.g. complete dynamic memory management), then these individual functionalities should be able to be turned off. The Zephyr Project already offers such a possibility through the use of Kconfig and its flexible configurability.

11.1.6 Processes and workflow

The diagram describes the rough process defined by the Safety Committee to ensure safety in the development of the Zephyr project. To ensure understanding, a few points need to be highlighted and some details explained regarding the role of the safety architect and the role of the safety committee in the whole process. The diagram only describes the paths that are possible when a change is related to safety.

1. On the main branch, the safety scope of the project should be identified, which typically represents a small subset of the entire code base. This subset should then be made auditable during normal development on “main”, which means that special attention is paid to quality goals (Quality) and safety processes within this scope. The Safety Architect works alongside the Technical Steering Committee (TSC) in this area, monitoring the development process to ensure that the architecture meets the safety requirements.

2. At this point, the safety architect plays an increasingly important role. For PRs/issues that fall within the safety scope, the safety architect should ideally be involved in the discussions and decisions of minor changes in the safety scope to be able to react to safety-relevant changes that are not conformant. If a pull request or issue introduces a significant and influential change or improvement that requires extended discussion or decision-making, the safety architect should bring it to the attention of the Safety Committee or the Technical Steering Committee (TSC) as appropriate, so that they can make a decision on the best course of action.
11.1. Zephyr Safety Overview

Fig. 1: Safety process and workflow overview
3. This section describes the certification side. At this point, the code base has to be in an “auditable” state, and ideally no further changes should be necessary or made to the code base. There is still a path from the main branch to this area. This is needed in case a serious bug or important change is found or implemented on the main branch in the safety scope, after the LTS and the auditable branch were created. In this case, the Safety Committee, together with the safety architect, must decide whether this bug fix or change should be integrated into the LTS so that the bug fix or change could also be integrated into the auditable branch. This integration can take three forms: First either as only a code change or second as only an update to the safety documentation or third as both.

4. This describes the necessary safety process required for certification itself. Here, the final analyses, tests, and documents are created and conducted which must be created and conducted during the certification, and which are prescribed by the certifying authority and the standard being certified. If the certification body approves everything at this stage and the safety process is completed, a safety release can be created and published.

5. This transition from the auditable branch to the main branch should only occur in exceptional circumstances, specifically when something has been identified during the certification process that needs to be quickly adapted on the “auditable” branch in order to obtain certification. In order to prevent this issue from arising again during the next certification, there needs to be a path to merge these changes back into the main branch so that they are not lost, and to have them ready for the next certification if necessary.

---

**Important:** Safety should not block the project and minimize the room to grow in any way.

**Important: TODO:** Find and define ways, guidelines and processes which minimally impact the daily work of the maintainers, reviewers and contributors and also the safety architect itself. But which are also suitable for safety.

[th-imboot] Must boot with an immutable bootloader.
[th-authrepl] Application image shall only be replaced with an authorized image.
[th-timely-update] Application updates shall be done in a timely manner.
[th-atomic-update] Application updates shall be atomic.
[th-root-certs] TLS must have a list of trusted root certificates.
[th-root-check] TLS must verify root certificate from server is valid.
[th-secret-storage] There must be a mechanism to securely store client secrets. The least amount of code necessary shall have access to these secrets.
[th-time] System must have moderately accurate notion of the current date/time.
[th-conf] The system must receive, and keep configuration data.
[th-logs] The system must log security-related events, and either store them locally, or send to a service.
[th-all-tls] All communications with the cloud service shall use TLS.
[th-tls-ciphers] TLS shall be configured to allow only generally agreed cipher suites (including forward secrecy).
[th-tls-client-auth] The device shall authenticate itself with the cloud provider using one of the methods described.
[th-entropy] The TLS layer shall use a modern, accepted cryptographic random-bit generator seeded by an entropy source within the SoC.
[th-initial-provision] The device shall have a per-device secret loaded before deployment.

[th-initial-secret] The initial secret shall be securely maintained, and destroyed in any external location as soon as the device is provisioned.

[th-reprovision] Reprovisioning a device shall be done securely.

[th-destruction] Upon decommissioning, the device secret shall be rendered ineffective.
