DIS Characteristic Model Number String UUID value.

BT_UUID_DIS_MODEL_NUMBER
DIS Characteristic Model Number String.

BT_UUID_DIS_SERIAL_NUMBER
DIS Characteristic Serial Number String UUID value.

BT_UUID_DIS_SERIAL_NUMBER
DIS Characteristic Serial Number String.

BT_UUID_DIS_FIRMWARE_REVISION
DIS Characteristic Firmware Revision String UUID value.

BT_UUID_DIS_FIRMWARE_REVISION
DIS Characteristic Firmware Revision String.

BT_UUID_DIS_HARDWARE_REVISION
DIS Characteristic Hardware Revision String UUID value.

BT_UUID_DIS_HARDWARE_REVISION
DIS Characteristic Hardware Revision String.

BT_UUID_DIS_SOFTWARE_REVISION
DIS Characteristic Software Revision String UUID value.

BT_UUID_DIS_SOFTWARE_REVISION
DIS Characteristic Software Revision String.

BT_UUID_DIS_MANUFACTURER_NAME
DIS Characteristic Manufacturer Name String UUID Value.

BT_UUID_DIS_MANUFACTURER_NAME
DIS Characteristic Manufacturer Name String.

BT_UUID_GATT_IEEE_RCDL
GATT Characteristic IEEE Regulatory Certification Data List UUID Value.

BT_UUID_GATT_IEEE_RCDL
GATT Characteristic IEEE Regulatory Certification Data List.

BT_UUID_HIDS_BOOT_MOUSE_IN_REPORT_VAL
HID Boot Mouse Input Report Characteristic UUID value.

BT_UUID_HIDS_BOOT_MOUSE_IN_REPORT
HID Boot Mouse Input Report Characteristic.

BT_UUID_GATT_GMC_VAL
GATT Characteristic Glucose Measurement Context UUID Value.

BT_UUID_GATT_GMC
GATT Characteristic Glucose Measurement Context.

BT_UUID_GATT_BPM_VAL
GATT Characteristic Blood Pressure Measurement UUID Value.

BT_UUID_GATT_BPM
GATT Characteristic Blood Pressure Measurement.

BT_UUID_GATT_ICP_VAL
GATT Characteristic Intermediate Cuff Pressure UUID Value.

BT_UUID_GATT_ICP
GATT Characteristic Intermediate Cuff Pressure.

BT_UUID_HRS_MEASUREMENT_VAL
HRS Characteristic Measurement Interval UUID value.

BT_UUID_HRS_MEASUREMENT
HRS Characteristic Measurement Interval.

BT_UUID_HRS_BODYSENSOR_VAL
HRS Characteristic Body Sensor Location.

BT_UUID_HRS_BODYSENSOR
HRS Characteristic Control Point.

BT_UUID_HRS_CONTROL_POINT_VAL
HRS Characteristic Control Point UUID value.

BT_UUID_HRS_CONTROL_POINT
HRS Characteristic Control Point.

BT_UUID_GATT_REM_VAL
GATT Characteristic Removable UUID Value.

BT_UUID_GATT_REM
GATT Characteristic Removable.
BT_UUID_GATT_SRVREQ_VAL
GATT Characteristic Service Required UUID Value.

BT_UUID_GATT_SRVREQ
GATT Characteristic Service Required.

BT_UUID_GATT_SC_TEMP_C_VAL
GATT Characteristic Scientific Temperature in Celsius UUID Value.

BT_UUID_GATT_SC_TEMP_C
GATT Characteristic Scientific Temperature in Celsius.

BT_UUID_GATT_STRING_VAL
GATT Characteristic String UUID Value.

BT_UUID_GATT_STRING
GATT Characteristic String.

BT_UUID_GATT_NETA_VAL
GATT Characteristic Network Availability UUID Value.

BT_UUID_GATT_NETA
GATT Characteristic Network Availability.

BT_UUID_GATT_ALRTS_VAL
GATT Characteristic Alert Status UUID Value.

BT_UUID_GATT_ALRTS
GATT Characteristic Alert Status.

BT_UUID_GATT_RCP_VAL
GATT Characteristic Ringer Control Point UUID Value.

BT_UUID_GATT_RCP
GATT Characteristic Ringer Control Point.

BT_UUID_GATT_RS_VAL
GATT Characteristic Ringer Setting UUID Value.

BT_UUID_GATT_RS
GATT Characteristic Ringer Setting.

BT_UUID_GATT_ALRTCID_MASK_VAL
GATT Characteristic Alert Category ID Bit Mask UUID Value.

BT_UUID_GATT_ALRTCID_MASK
GATT Characteristic Alert Category ID Bit Mask.
BT_UUID_GATT_ALRTCID_VAL
   GATT Characteristic Alert Category ID UUID Value.

BT_UUID_GATT_ALRTCID
   GATT Characteristic Alert Category ID.

BT_UUID_GATT_ALRTNCP_VAL
   GATT Characteristic Alert Notification Control Point Value.

BT_UUID_GATT_ALRTNCP
   GATT Characteristic Alert Notification Control Point.

BT_UUID_GATT_UALRTS_VAL
   GATT Characteristic Unread Alert Status UUID Value.

BT_UUID_GATT_UALRTS
   GATT Characteristic Unread Alert Status.

BT_UUID_GATT_NALRT_VAL
   GATT Characteristic New Alert UUID Value.

BT_UUID_GATT_NALRT
   GATT Characteristic New Alert.

BT_UUID_GATT_SNALRTC_VAL
   GATT Characteristic Supported New Alert Category UUID Value.

BT_UUID_GATT_SNALRTC
   GATT Characteristic Supported New Alert Category.

BT_UUID_GATT_SUALRTC_VAL
   GATT Characteristic Supported Unread Alert Category UUID Value.

BT_UUID_GATT_SUALRTC
   GATT Characteristic Supported Unread Alert Category.

BT_UUID_GATT_BPF_VAL
   GATT Characteristic Blood Pressure Feature UUID Value.

BT_UUID_GATT_BPF
   GATT Characteristic Blood Pressure Feature.

BT_UUID_HIDS_INFO_VAL
   HID Information Characteristic UUID value.

BT_UUID_HIDS_INFO
   HID Information Characteristic.
6.1. Bluetooth

**BT_UUID_HIDS_REPORT_MAP_VAL**
HID Report Map Characteristic UUID value.

**BT_UUID_HIDS_REPORT_MAP**
HID Report Map Characteristic.

**BT_UUID_HIDS_CTRL_POINT_VAL**
HID Control Point Characteristic UUID value.

**BT_UUID_HIDS_CTRL_POINT**
HID Control Point Characteristic.

**BT_UUID_HIDS_REPORT_VAL**
HID Report Characteristic UUID value.

**BT_UUID_HIDS_REPORT**
HID Report Characteristic.

**BT_UUID_HIDS_PROTOCOL_MODE_VAL**
HID Protocol Mode Characteristic UUID value.

**BT_UUID_HIDS_PROTOCOL_MODE**
HID Protocol Mode Characteristic.

**BT_UUID_GATT_SIW_VAL**
GATT Characteristic Scan Interval Windows UUID Value.

**BT_UUID_GATT_SIW**
GATT Characteristic Scan Interval Windows.

**BT_UUID_DIS_PNP_ID_VAL**
DIS Characteristic PnP ID UUID value.

**BT_UUID_DIS_PNP_ID**
DIS Characteristic PnP ID.

**BT_UUID_GATT_GF_VAL**
GATT Characteristic Glucose Feature UUID Value.

**BT_UUID_GATT_GF**
GATT Characteristic Glucose Feature.

**BT_UUID_RECORD_ACCESS_CONTROL_POINT_VAL**
Record Access Control Point Characteristic value.

**BT_UUID_RECORD_ACCESS_CONTROL_POINT**
Record Access Control Point.
BT_UUID_RSC_MEASUREMENT_VAL
    RSC Measurement Characteristic UUID value.

BT_UUID_RSC_MEASUREMENT
    RSC Measurement Characteristic.

BT_UUID_RSC_FEATURE_VAL
    RSC Feature Characteristic UUID value.

BT_UUID_RSC_FEATURE
    RSC Feature Characteristic.

BT_UUID_SC_CONTROL_POINT_VAL
    SC Control Point Characteristic UUID value.

BT_UUID_SC_CONTROL_POINT
    SC Control Point Characteristic.

BT_UUID_GATT_DI_VAL
    GATT Characteristic Digital Input UUID Value.

BT_UUID_GATT_DI
    GATT Characteristic Digital Input.

BT_UUID_GATT_DO_VAL
    GATT Characteristic Digital Output UUID Value.

BT_UUID_GATT_DO
    GATT Characteristic Digital Output.

BT_UUID_GATT_AI_VAL
    GATT Characteristic Analog Input UUID Value.

BT_UUID_GATT_AI
    GATT Characteristic Analog Input.

BT_UUID_GATT_AO_VAL
    GATT Characteristic Analog Output UUID Value.

BT_UUID_GATT_AO
    GATT Characteristic Analog Output.

BT_UUID_GATT_AGGR_VAL
    GATT Characteristic Aggregate UUID Value.

BT_UUID_GATT_AGGR
    GATT Characteristic Aggregate.
6.1. Bluetooth

- **BT_UUID_CSC_MEASUREMENT_VAL**
  CSC Measurement Characteristic UUID value.

- **BT_UUID_CSC_MEASUREMENT**
  CSC Measurement Characteristic.

- **BT_UUID_CSC_FEATURE_VAL**
  CSC Feature Characteristic UUID value.

- **BT_UUID_CSC_FEATURE**
  CSC Feature Characteristic.

- **BT_UUID_SENSOR_LOCATION_VAL**
  Sensor Location Characteristic UUID value.

- **BT_UUID_SENSOR_LOCATION**
  Sensor Location Characteristic.

- **BT_UUID_GATT_PLX_SCM_VAL**
  GATT Characteristic PLX Spot-Check Measurement UUID Value.

- **BT_UUID_GATT_PLX_SCM**
  GATT Characteristic PLX Spot-Check Measurement.

- **BT_UUID_GATT_PLX_CM_VAL**
  GATT Characteristic PLX Continuous Measurement UUID Value.

- **BT_UUID_GATT_PLX_CM**
  GATT Characteristic PLX Continuous Measurement.

- **BT_UUID_GATT_PLX_F_VAL**
  GATT Characteristic PLX Features UUID Value.

- **BT_UUID_GATT_PLX_F**
  GATT Characteristic PLX Features.

- **BT_UUID_GATT_POPE_VAL**
  GATT Characteristic Pulse Oximetry Pulastile Event UUID Value.

- **BT_UUID_GATT_POPE**
  GATT Characteristic Pulse Oximetry Pulsatile Event.

- **BT_UUID_GATT_POCP_VAL**
  GATT Characteristic Pulse Oximetry Control Point UUID Value.

- **BT_UUID_GATT_POCP**
  GATT Characteristic Pulse Oximetry Control Point.
BT_UUID_GATT_CPS_CPM
  GATT Characteristic Cycling Power Measurement.

BT_UUID_GATT_CPS_CPM_VAL
  GATT Characteristic Cycling Power Measurement UUID Value.

BT_UUID_GATT_CPS_CPV
  GATT Characteristic Cycling Power Vector.

BT_UUID_GATT_CPS_CPV_VAL
  GATT Characteristic Cycling Power Vector UUID Value.

BT_UUID_GATT_CPS_CPF
  GATT Characteristic Cycling Power Feature.

BT_UUID_GATT_CPS_CPF_VAL
  GATT Characteristic Cycling Power Feature UUID Value.

BT_UUID_GATT_CPS_CPCP
  GATT Characteristic Cycling Power Control Point.

BT_UUID_GATT_CPS_CPCP_VAL
  GATT Characteristic Cycling Power Control Point UUID Value.

BT_UUID_GATT_LOC_SPD
  GATT Characteristic Location and Speed.

BT_UUID_GATT_LOC_SPD_VAL
  GATT Characteristic Location and Speed UUID Value.

BT_UUID_GATT_NAV
  GATT Characteristic Navigation.

BT_UUID_GATT_NAV_VAL
  GATT Characteristic Navigation UUID Value.

BT_UUID_GATT_PQ
  GATT Characteristic Position Quality.

BT_UUID_GATT_PQ_VAL
  GATT Characteristic Position Quality UUID Value.

BT_UUID_GATT_LNF
  GATT Characteristic LN Feature.

BT_UUID_GATT_LNF_VAL
  GATT Characteristic LN Feature UUID Value.
BT_UUID_GATT_LNCP_VAL
   GATT Characteristic LN Control Point UUID Value.

BT_UUID_GATT_LNCP
   GATT Characteristic LN Control Point.

BT_UUID_ELEVATION_VAL
   Elevation Characteristic UUID value.

BT_UUID_ELEVATION
   Elevation Characteristic.

BT_UUID_PRESSURE_VAL
   Pressure Characteristic UUID value.

BT_UUID_PRESSURE
   Pressure Characteristic.

BT_UUID_TEMPERATURE_VAL
   Temperature Characteristic UUID value.

BT_UUID_TEMPERATURE
   Temperature Characteristic.

BT_UUID_HUMIDITY_VAL
   Humidity Characteristic UUID value.

BT_UUID_HUMIDITY
   Humidity Characteristic.

BT_UUID_TRUE_WIND_SPEED_VAL
   True Wind Speed Characteristic UUID value.

BT_UUID_TRUE_WIND_SPEED
   True Wind Speed Characteristic.

BT_UUID_TRUE_WIND_DIR_VAL
   True Wind Direction Characteristic UUID value.

BT_UUID_TRUE_WIND_DIR
   True Wind Direction Characteristic.

BT_UUID_APPARENT_WIND_SPEED_VAL
   Apparent Wind Speed Characteristic UUID value.

BT_UUID_APPARENT_WIND_SPEED
   Apparent Wind Speed Characteristic.
BT_UUID_APPARENT_WIND_DIR_VAL
Apparent Wind Direction Characteristic UUID value.

BT_UUID_APPARENT_WIND_DIR
Apparent Wind Direction Characteristic.

BT_UUID_GUST_FACTOR_VAL
Gust Factor Characteristic UUID value.

BT_UUID_GUST_FACTOR
Gust Factor Characteristic.

BT_UUID_POLLEN_CONCENTRATION_VAL
Pollen Concentration Characteristic UUID value.

BT_UUID_POLLEN_CONCENTRATION
Pollen Concentration Characteristic.

BT_UUID_UV_INDEX_VAL
UV Index Characteristic UUID value.

BT_UUID_UV_INDEX
UV Index Characteristic.

BT_UUID_IRRADIANCE_VAL
Irradiance Characteristic UUID value.

BT_UUID_IRRADIANCE
Irradiance Characteristic.

BT_UUID_RAINFALL_VAL
Rainfall Characteristic UUID value.

BT_UUID_RAINFALL
Rainfall Characteristic.

BT_UUID_WIND_CHILL_VAL
Wind Chill Characteristic UUID value.

BT_UUID_WIND_CHILL
Wind Chill Characteristic.

BT_UUID_HEAT_INDEX_VAL
Heat Index Characteristic UUID value.

BT_UUID_HEAT_INDEX
Heat Index Characteristic.
BT_UUID_DEW_POINT_VAL
Dew Point Characteristic UUID value.

BT_UUID_DEW_POINT
Dew Point Characteristic.

BT_UUID_GATT_TREND_VAL
GATT Characteristic Trend UUID Value.

BT_UUID_GATT_TREND
GATT Characteristic Trend.

BT_UUID_DESC_VALUE_CHANGED_VAL
Descriptor Value Changed Characteristic UUID value.

BT_UUID_DESC_VALUE_CHANGED
Descriptor Value Changed Characteristic.

BT_UUID_GATT_AEHRLL_VAL
GATT Characteristic Aerobic Heart Rate Low Limit UUID Value.

BT_UUID_GATT_AEHRLL
GATT Characteristic Aerobic Heart Rate Lower Limit.

BT_UUID_GATT_AETHR_VAL
GATT Characteristic Aerobic Threshold UUID Value.

BT_UUID_GATT_AETHR
GATT Characteristic Aerobic Threshold.

BT_UUID_GATT_AGE_VAL
GATT Characteristic Age UUID Value.

BT_UUID_GATT_AGE
GATT Characteristic Age.

BT_UUID_GATT_ANHRLL_VAL
GATT Characteristic Anaerobic Heart Rate Lower Limit UUID Value.

BT_UUID_GATT_ANHRLL
GATT Characteristic Anaerobic Heart Rate Lower Limit.

BT_UUID_GATT_ANHRUL_VAL
GATT Characteristic Anaerobic Heart Rate Upper Limit UUID Value.

BT_UUID_GATT_ANHRUL
GATT Characteristic Anaerobic Heart Rate Upper Limit.
BT_UUID_GATT_ANTHR_VAL
GATT Characteristic Anaerobic Threshold UUID Value.

BT_UUID_GATT_ANTHR
GATT Characteristic Anaerobic Threshold.

BT_UUID_GATT_AEHRUL_VAL
GATT Characteristic Aerobic Heart Rate Upper Limit UUID Value.

BT_UUID_GATT_AEHRUL
GATT Characteristic Aerobic Heart Rate Upper Limit.

BT_UUID_GATT_DATE_BIRTH_VAL
GATT Characteristic Date of Birth UUID Value.

BT_UUID_GATT_DATE_BIRTH
GATT Characteristic Date of Birth.

BT_UUID_GATT_DATE_THRASS_VAL
GATT Characteristic Date of Threshold Assessment UUID Value.

BT_UUID_GATT_DATE_THRASS
GATT Characteristic Date of Threshold Assessment.

BT_UUID_GATT_EMAIL_VAL
GATT Characteristic Email Address UUID Value.

BT_UUID_GATT_EMAIL
GATT Characteristic Email Address.

BT_UUID_GATT_FBHRLL_VAL
GATT Characteristic Fat Burn Heart Rate Lower Limit UUID Value.

BT_UUID_GATT_FBHRLL
GATT Characteristic Fat Burn Heart Rate Lower Limit.

BT_UUID_GATT_FBHRUL_VAL
GATT Characteristic Fat Burn Heart Rate Upper Limit UUID Value.

BT_UUID_GATT_FBHRUL
GATT Characteristic Fat Burn Heart Rate Upper Limit.

BT_UUID_GATT_FIRST_NAME_VAL
GATT Characteristic First Name UUID Value.

BT_UUID_GATT_FIRST_NAME
GATT Characteristic First Name.
BT_UUID_GATT_5ZHRL_VAL
GATT Characteristic Five Zone Heart Rate Limits UUID Value.

BT_UUID_GATT_5ZHRL
GATT Characteristic Five Zone Heart Rate Limits.

BT_UUID_GATT_GENDER_VAL
GATT Characteristic Gender UUID Value.

BT_UUID_GATT_GENDER
GATT Characteristic Gender.

BT_UUID_GATT_HR_MAX_VAL
GATT Characteristic Heart Rate Max UUID Value.

BT_UUID_GATT_HR_MAX
GATT Characteristic Heart Rate Max.

BT_UUID_GATT_HEIGHT_VAL
GATT Characteristic Height UUID Value.

BT_UUID_GATT_HEIGHT
GATT Characteristic Height.

BT_UUID_GATT_HC_VAL
GATT Characteristic Hip Circumference UUID Value.

BT_UUID_GATT_HC
GATT Characteristic Hip Circumference.

BT_UUID_GATT_LAST_NAME_VAL
GATT Characteristic Last Name UUID Value.

BT_UUID_GATT_LAST_NAME
GATT Characteristic Last Name.

BT_UUID_GATT_MRHR_VAL
GATT Characteristic Maximum Recommended Heart Rate> UUID Value.

BT_UUID_GATT_MRHR
GATT Characteristic Maximum Recommended Heart Rate.

BT_UUID_GATT_RHR_VAL
GATT Characteristic Resting Heart Rate UUID Value.

BT_UUID_GATT_RHR
GATT Characteristic Resting Heart Rate.
BT_UUID_GATT_AEANTHR_VAL
GATT Characteristic Sport Type for Aerobic and Anaerobic Thresholds UUID Value.

BT_UUID_GATT_AEANTHR
GATT Characteristic Sport Type for Aerobic and Anaerobic Threshold.

BT_UUID_GATT_3ZHRL_VAL
GATT Characteristic Three Zone Heart Rate Limits UUID Value.

BT_UUID_GATT_3ZHRL
GATT Characteristic Three Zone Heart Rate Limits.

BT_UUID_GATT_2ZHRL_VAL
GATT Characteristic Two Zone Heart Rate Limits UUID Value.

BT_UUID_GATT_2ZHRL
GATT Characteristic Two Zone Heart Rate Limits.

BT_UUID_GATT_VO2_MAX_VAL
GATT Characteristic VO2 Max UUID Value.

BT_UUID_GATT_VO2_MAX
GATT Characteristic VO2 Max.

BT_UUID_GATT_WC_VAL
GATT Characteristic Waist Circumference UUID Value.

BT_UUID_GATT_WC
GATT Characteristic Waist Circumference.

BT_UUID_GATT_WEIGHT_VAL
GATT Characteristic Weight UUID Value.

BT_UUID_GATT_WEIGHT
GATT Characteristic Weight.

BT_UUID_GATT_DBCHINC_VAL
GATT Characteristic Database Change Increment UUID Value.

BT_UUID_GATT_DBCHINC
GATT Characteristic Database Change Increment.

BT_UUID_GATT_USRIDX_VAL
GATT Characteristic User Index UUID Value.

BT_UUID_GATT_USRIDX
GATT Characteristic User Index.
BT_UUID_GATT_BCF_VAL
GATT Characteristic Body Composition Feature UUID Value.

BT_UUID_GATT_BCF
GATT Characteristic Body Composition Feature.

BT_UUID_GATT_BCM_VAL
GATT Characteristic Body Composition Measurement UUID Value.

BT_UUID_GATT_BCM
GATT Characteristic Body Composition Measurement.

BT_UUID_GATT_WM_VAL
GATT Characteristic Weight Measurement UUID Value.

BT_UUID_GATT_WM
GATT Characteristic Weight Measurement.

BT_UUID_GATT_WSF_VAL
GATT Characteristic Weight Scale Feature UUID Value.

BT_UUID_GATT_WSF
GATT Characteristic Weight Scale Feature.

BT_UUID_GATT_USRCP_VAL
GATT Characteristic User Control Point UUID Value.

BT_UUID_GATT_USRCP
GATT Characteristic User Control Point.

BT_UUID_MAGN_FLUX_DENSITY_2D_VAL
Magnetic Flux Density - 2D Characteristic UUID value.

BT_UUID_MAGN_FLUX_DENSITY_2D
Magnetic Flux Density - 2D Characteristic.

BT_UUID_MAGN_FLUX_DENSITY_3D_VAL
Magnetic Flux Density - 3D Characteristic UUID value.

BT_UUID_MAGN_FLUX_DENSITY_3D
Magnetic Flux Density - 3D Characteristic.

BT_UUID_GATT_LANG_VAL
GATT Characteristic Language UUID Value.

BT_UUID_GATT_LANG
GATT Characteristic Language.
BT_UUID_BAR_PRESSURE_TREND_VAL
Barometric Pressure Trend Characteristic UUID value.

BT_UUID_BAR_PRESSURE_TREND
Barometric Pressure Trend Characteristic.

BT_UUID_BMS_CONTROL_POINT_VAL
Bond Management Control Point UUID value.

BT_UUID_BMS_CONTROL_POINT
Bond Management Control Point.

BT_UUID_BMS_FEATURE_VAL
Bond Management Feature UUID value.

BT_UUID_BMS_FEATURE
Bond Management Feature.

BT_UUID_CENTRAL_ADDR_RES_VAL
Central Address Resolution Characteristic UUID value.

BT_UUID_CENTRAL_ADDR_RES
Central Address Resolution Characteristic.

BT_UUID_CGM_MEASUREMENT_VAL
CGM Measurement Characteristic value.

BT_UUID_CGM_MEASUREMENT
CGM Measurement Characteristic.

BT_UUID_CGM_FEATURE_VAL
CGM Feature Characteristic value.

BT_UUID_CGM_FEATURE
CGM Feature Characteristic.

BT_UUID_CGM_STATUS_VAL
CGM Status Characteristic value.

BT_UUID_CGM_STATUS
CGM Status Characteristic.

BT_UUID_CGM_SESSION_START_TIME_VAL
CGM Session Start Time Characteristic value.

BT_UUID_CGM_SESSION_START_TIME
CGM Session Start Time.
BT_UUID_CGM_SESSION_RUN_TIME_VAL
CGM Session Run Time Characteristic value.

BT_UUID_CGM_SESSION_RUN_TIME
CGM Session Run Time.

BT_UUID_CGM_SPECIFIC_OPS_CONTROL_POINT_VAL
CGM Specific Ops Control Point Characteristic value.

BT_UUID_CGM_SPECIFIC_OPS_CONTROL_POINT
CGM Specific Ops Control Point.

BT_UUID_GATT_IPC_VAL
GATT Characteristic Indoor Positioning Configuration UUID Value.

BT_UUID_GATT_IPC
GATT Characteristic Indoor Positioning Configuration.

BT_UUID_GATT_LAT_VAL
GATT Characteristic Latitude UUID Value.

BT_UUID_GATT_LAT
GATT Characteristic Latitude.

BT_UUID_GATT_LON_VAL
GATT Characteristic Longitude UUID Value.

BT_UUID_GATT_LON
GATT Characteristic Longitude.

BT_UUID_GATT_LNCOORD_VAL
GATT Characteristic Local North Coordinate UUID Value.

BT_UUID_GATT_LNCOORD
GATT Characteristic Local North Coordinate.

BT_UUID_GATT_LECOORD_VAL
GATT Characteristic Local East Coordinate UUID Value.

BT_UUID_GATT_LECOORD
GATT Characteristic Local East Coordinate.

BT_UUID_GATT_FN_VAL
GATT Characteristic Floor Number UUID Value.

BT_UUID_GATT_FN
GATT Characteristic Floor Number.
BT_UUID_GATT_ALT_VAL
GATT Characteristic Altitude UUID Value.

BT_UUID_GATT_ALT
GATT Characteristic Altitude.

BT_UUID_GATT_UNCERTAINTY_VAL
GATT Characteristic Uncertainty UUID Value.

BT_UUID_GATT_UNCERTAINTY
GATT Characteristic Uncertainty.

BT_UUID_GATT_LOC_NAME_VAL
GATT Characteristic Location Name UUID Value.

BT_UUID_GATT_LOC_NAME
GATT Characteristic Location Name.

BT_UUID_URI_VAL
URI UUID value.

BT_UUID_URI
URI.

BT_UUID_HTTP_HEADERS_VAL
HTTP Headers UUID value.

BT_UUID_HTTP_HEADERS
HTTP Headers.

BT_UUID_HTTP_STATUS_CODE_VAL
HTTP Status Code UUID value.

BT_UUID_HTTP_STATUS_CODE
HTTP Status Code.

BT_UUID_HTTP_ENTITY_BODY_VAL
HTTP Entity Body UUID value.

BT_UUID_HTTP_ENTITY_BODY
HTTP Entity Body.

BT_UUID_HTTP_CONTROL_POINT_VAL
HTTP Control Point UUID value.

BT_UUID_HTTP_CONTROL_POINT
HTTP Control Point.
BT_UUID_HTTPS_SECURITY_VAL
HTTPS Security UUID value.

BT_UUID_HTTPS_SECURITY
HTTPS Security.

BT_UUID_GATT_TDS_CP_VAL
GATT Characteristic TDS Control Point UUID Value.

BT_UUID_GATT_TDS_CP
GATT Characteristic TDS Control Point.

BT_UUID_OTS_FEATURE_VAL
OTS Feature Characteristic UUID value.

BT_UUID_OTS_FEATURE
OTS Feature Characteristic.

BT_UUID_OTS_NAME_VAL
OTS Object Name Characteristic UUID value.

BT_UUID_OTS_NAME
OTS Object Name Characteristic.

BT_UUID_OTS_TYPE_VAL
OTS Object Type Characteristic UUID value.

BT_UUID_OTS_TYPE
OTS Object Type Characteristic.

BT_UUID_OTS_SIZE_VAL
OTS Object Size Characteristic UUID value.

BT_UUID_OTS_SIZE
OTS Object Size Characteristic.

BT_UUID_OTS_FIRST_CREATED_VAL
OTS Object First-Created Characteristic UUID value.

BT_UUID_OTS_FIRST_CREATED
OTS Object First-Created Characteristic.

BT_UUID_OTS_LAST_MODIFIED_VAL
OTS Object Last-Modified Characteristic UUID value.

BT_UUID_OTS_LAST_MODIFIED
OTS Object Last-Modified Characteristic.
**BT_UUID_OTS_ID_VAL**
OTS Object ID Characteristic UUID value.

**BT_UUID_OTS_ID**
OTS Object ID Characteristic.

**BT_UUID_OTS_PROPERTIES_VAL**
OTS Object Properties Characteristic UUID value.

**BT_UUID_OTS_PROPERTIES**
OTS Object Properties Characteristic.

**BT_UUID_OTS_ACTION_CP_VAL**
OTS Object Action Control Point Characteristic UUID value.

**BT_UUID_OTS_ACTION_CP**
OTS Object Action Control Point Characteristic.

**BT_UUID_OTS_LIST_CP_VAL**
OTS Object List Control Point Characteristic UUID value.

**BT_UUID_OTS_LIST_CP**
OTS Object List Control Point Characteristic.

**BT_UUID_OTS_LIST_FILTER_VAL**
OTS Object List Filter Characteristic UUID value.

**BT_UUID_OTS_LIST_FILTER**
OTS Object List Filter Characteristic.

**BT_UUID_OTS_CHANGED_VAL**
OTS Object Changed Characteristic UUID value.

**BT_UUID_OTS_CHANGED**
OTS Object Changed Characteristic.

**BT_UUID_GATT_RPAO_VAL**
GATT Characteristic Resolvable Private Address Only UUID Value.

**BT_UUID_GATT_RPAO**
GATT Characteristic Resolvable Private Address Only.

**BT_UUID_OTS_TYPE_UNSPECIFIED_VAL**
OTS Unspecified Object Type UUID value.

**BT_UUID_OTS_TYPE_UNSPECIFIED**
OTS Unspecified Object Type.
**6.1. Bluetooth**

- **BT_UUID_OTS_DIRECTORY_LISTING_VAL**
  OTS Directory Listing UUID value.

- **BT_UUID_OTS_DIRECTORY_LISTING**
  OTS Directory Listing.

- **BT_UUID_GATT_FMF_VAL**
  GATT Characteristic Fitness Machine Feature UUID Value.

- **BT_UUID_GATT_FMF**
  GATT Characteristic Fitness Machine Feature.

- **BT_UUID_GATT_TD_VAL**
  GATT Characteristic Treadmill Data UUID Value.

- **BT_UUID_GATT_TD**
  GATT Characteristic Treadmill Data.

- **BT_UUID_GATT_CTD_VAL**
  GATT Characteristic Cross Trainer Data UUID Value.

- **BT_UUID_GATT_CTD**
  GATT Characteristic Cross Trainer Data.

- **BT_UUID_GATT_STPCD_VAL**
  GATT Characteristic Step Climber Data UUID Value.

- **BT_UUID_GATT_STPCD**
  GATT Characteristic Step Climber Data.

- **BT_UUID_GATT_STRCD_VAL**
  GATT Characteristic Stair Climber Data UUID Value.

- **BT_UUID_GATT_STRCD**
  GATT Characteristic Stair Climber Data.

- **BT_UUID_GATT_RD_VAL**
  GATT Characteristic Rower Data UUID Value.

- **BT_UUID_GATT_RD**
  GATT Characteristic Rower Data.

- **BT_UUID_GATT_IBD_VAL**
  GATT Characteristic Indoor Bike Data UUID Value.

- **BT_UUID_GATT_IBD**
  GATT Characteristic Indoor Bike Data.
BT_UUID_GATT_TRSTAT_VAL
GATT Characteristic Training Status UUID Value.

BT_UUID_GATT_TRSTAT
GATT Characteristic Training Status.

BT_UUID_GATT_SSR_VAL
GATT Characteristic Supported Speed Range UUID Value.

BT_UUID_GATT_SSR
GATT Characteristic Supported Speed Range.

BT_UUID_GATT_SIR_VAL
GATT Characteristic Supported Inclination Range UUID Value.

BT_UUID_GATT_SIR
GATT Characteristic Supported Inclination Range.

BT_UUID_GATT_SRLR_VAL
GATT Characteristic Supported Resistance Level Range UUID Value.

BT_UUID_GATT_SRLR
GATT Characteristic Supported Resistance Level Range.

BT_UUID_GATT_SHRR_VAL
GATT Characteristic Supported Heart Rate Range UUID Value.

BT_UUID_GATT_SHRR
GATT Characteristic Supported Heart Rate Range.

BT_UUID_GATT_SPR_VAL
GATT Characteristic Supported Power Range UUID Value.

BT_UUID_GATT_SPR
GATT Characteristic Supported Power Range.

BT_UUID_GATT_FMCP_VAL
GATT Characteristic Fitness Machine Control Point UUID Value.

BT_UUID_GATT_FMCP
GATT Characteristic Fitness Machine Control Point.

BT_UUID_GATT_FMS_VAL
GATT Characteristic Fitness Machine Status UUID Value.

BT_UUID_GATT_FMS
GATT Characteristic Fitness Machine Status.
6.1. Bluetooth

BT_UUID_MESH_PROV_DATA_IN_VAL
Mesh Provisioning Data In UUID value.

BT_UUID_MESH_PROV_DATA_IN
Mesh Provisioning Data In.

BT_UUID_MESH_PROV_DATA_OUT_VAL
Mesh Provisioning Data Out UUID value.

BT_UUID_MESH_PROV_DATA_OUT
Mesh Provisioning Data Out.

BT_UUID_MESH_PROXY_DATA_IN_VAL
Mesh Proxy Data In UUID value.

BT_UUID_MESH_PROXY_DATA_IN
Mesh Proxy Data In.

BT_UUID_MESH_PROXY_DATA_OUT_VAL
Mesh Proxy Data Out UUID value.

BT_UUID_MESH_PROXY_DATA_OUT
Mesh Proxy Data Out.

BT_UUID_GATT_NNN_VAL
GATT Characteristic New Number Needed UUID Value.

BT_UUID_GATT_NNN
GATT Characteristic New Number Needed.

BT_UUID_GATT_AC_VAL
GATT Characteristic Average Current UUID Value.

BT_UUID_GATT_AC
GATT Characteristic Average Current.

BT_UUID_GATT_AV_VAL
GATT Characteristic Average Voltage UUID Value.

BT_UUID_GATT_AV
GATT Characteristic Average Voltage.

BT_UUID_GATTBOOLEAN_VAL
GATT Characteristic Boolean UUID Value.

BT_UUID_GATTBOOLEAN
GATT Characteristic Boolean.
BT_UUID_GATT_CRFDP_VAL
GATT Characteristic Chromatic Distance From Planckian UUID Value.

BT_UUID_GATT_CRFDP
GATT Characteristic Chromatic Distance From Planckian.

BT_UUID_GATT_CRCOORDS_VAL
GATT Characteristic Chromaticity Coordinates UUID Value.

BT_UUID_GATT_CRCOORDS
GATT Characteristic Chromaticity Coordinates.

BT_UUID_GATT_CRCCT_VAL
GATT Characteristic Chromaticity In CCT And Duv Values UUID Value.

BT_UUID_GATT_CRCCT
GATT Characteristic Chromaticity In CCT And Duv Values.

BT_UUID_GATT_CRT_VAL
GATT Characteristic Chromaticity Tolerance UUID Value.

BT_UUID_GATT_CRT
GATT Characteristic Chromaticity Tolerance.

BT_UUID_GATT_CIEIDX_VAL
GATT Characteristic CIE 13.3-1995 Color Rendering Index UUID Value.

BT_UUID_GATT_CIEIDX
GATT Characteristic CIE 13.3-1995 Color Rendering Index.

BT_UUID_GATT_COEFFICIENT_VAL
GATT Characteristic Coefficient UUID Value.

BT_UUID_GATT_COEFFICIENT
GATT Characteristic Coefficient.

BT_UUID_GATT_CCTEMP_VAL
GATT Characteristic Correlated Color Temperature UUID Value.

BT_UUID_GATT_CCTEMP
GATT Characteristic Correlated Color Temperature.

BT_UUID_GATT_COUNT16_VAL
GATT Characteristic Count 16 UUID Value.

BT_UUID_GATT_COUNT16
GATT Characteristic Count 16.
6.1. Bluetooth

- **BT_UUID_GATT_COUNT24_VAL**
  - GATT Characteristic Count 24 UUID Value.

- **BT_UUID_GATT_COUNT24**
  - GATT Characteristic Count 24.

- **BT_UUID_GATT_CNTRCODE_VAL**
  - GATT Characteristic Country Code UUID Value.

- **BT_UUID_GATT_CNTRCODE**
  - GATT Characteristic Country Code.

- **BT_UUID_GATT_DATEUTC_VAL**
  - GATT Characteristic Date UTC UUID Value.

- **BT_UUID_GATT_DATEUTC**
  - GATT Characteristic Date UTC.

- **BT_UUID_GATT_EC_VAL**
  - GATT Characteristic Electric Current UUID Value.

- **BT_UUID_GATT_EC**
  - GATT Characteristic Electric Current.

- **BT_UUID_GATT_ECR_VAL**
  - GATT Characteristic Electric Current Range UUID Value.

- **BT_UUID_GATT_ECR**
  - GATT Characteristic Electric Current Range.

- **BT_UUID_GATT_ECSPEC_VAL**

- **BT_UUID_GATT_ECSPEC**

- **BT_UUID_GATT_ECSTAT_VAL**

- **BT_UUID_GATT_ECSTAT**
  - GATT Characteristic Electric Current Statistics.

- **BT_UUID_GATT_ENERGY_VAL**
  - GATT Characteristic Energy UUID Value.

- **BT_UUID_GATT_ENERGY**
  - GATT Characteristic Energy.
BT_UUID_GATT_EPOD_VAL
GATT Characteristic Energy In A Period Of Day UUID Value.

BT_UUID_GATT_EPOD
GATT Characteristic Energy In A Period Of Day.

BT_UUID_GATT_EVTSTAT_VAL
GATT Characteristic Event Statistics UUID Value.

BT_UUID_GATT_EVTSTAT
GATT Characteristic Event Statistics.

BT_UUID_GATT_FSTR16_VAL
GATT Characteristic Fixed String 16 UUID Value.

BT_UUID_GATT_FSTR16
GATT Characteristic Fixed String 16.

BT_UUID_GATT_FSTR24_VAL
GATT Characteristic Fixed String 24 UUID Value.

BT_UUID_GATT_FSTR24
GATT Characteristic Fixed String 24.

BT_UUID_GATT_FSTR36_VAL
GATT Characteristic Fixed String 36 UUID Value.

BT_UUID_GATT_FSTR36
GATT Characteristic Fixed String 36.

BT_UUID_GATT_FSTR8_VAL
GATT Characteristic Fixed String 8 UUID Value.

BT_UUID_GATT_FSTR8
GATT Characteristic Fixed String 8.

BT_UUID_GATT_GENLVL_VAL
GATT Characteristic Generic Level UUID Value.

BT_UUID_GATT_GENLVL
GATT Characteristic Generic Level.

BT_UUID_GATT_GTIN_VAL
GATT Characteristic Global Trade Item Number UUID Value.

BT_UUID_GATT_GTIN
GATT Characteristic Global Trade Item Number.
BT_UUID_GATT_ILLUM_VAL
GATT Characteristic Illuminance UUID Value.

BT_UUID_GATT_ILLUM
GATT Characteristic Illuminance.

BT_UUID_GATT_LUMEFF_VAL
GATT Characteristic Luminous Efficacy UUID Value.

BT_UUID_GATT_LUMEFF
GATT Characteristic Luminous Efficacy.

BT_UUID_GATT_LUMNRG_VAL
GATT Characteristic Luminous Energy UUID Value.

BT_UUID_GATT_LUMNRG
GATT Characteristic Luminous Energy.

BT_UUID_GATT_LUMEXP_VAL
GATT Characteristic Luminous Exposure UUID Value.

BT_UUID_GATT_LUMEXP
GATT Characteristic Luminous Exposure.

BT_UUID_GATT_LUMFLX_VAL
GATT Characteristic Luminous Flux UUID Value.

BT_UUID_GATT_LUMFLX
GATT Characteristic Luminous Flux.

BT_UUID_GATT_LUMFLXR_VAL
GATT Characteristic Luminous Flux Range UUID Value.

BT_UUID_GATT_LUMFLXR
GATT Characteristic Luminous Flux Range.

BT_UUID_GATT_LUMINT_VAL
GATT Characteristic Luminous Intensity UUID Value.

BT_UUID_GATT_LUMINT
GATT Characteristic Luminous Intensity.

BT_UUID_GATT_MASSFLOW_VAL
GATT Characteristic Mass Flow UUID Value.

BT_UUID_GATT_MASSFLOW
GATT Characteristic Mass Flow.
BT_UUID_GATT_PERLGHT_VAL
GATT Characteristic Perceived Lightness UUID Value.

BT_UUID_GATT_PERLGHT
GATT Characteristic Perceived Lightness.

BT_UUID_GATT_PER8_VAL
GATT Characteristic Percentage 8 UUID Value.

BT_UUID_GATT_PER8
GATT Characteristic Percentage 8.

BT_UUID_GATT_PWR_VAL
GATT Characteristic Power UUID Value.

BT_UUID_GATT_PWR
GATT Characteristic Power.

BT_UUID_GATT_PWRSPEC_VAL
GATT Characteristic Power Specification UUID Value.

BT_UUID_GATT_PWRSPEC
GATT Characteristic Power Specification.

BT_UUID_GATT_RRICR_VAL
GATT Characteristic Relative Runtime In A Current Range UUID Value.

BT_UUID_GATT_RRICR
GATT Characteristic Relative Runtime In A Current Range.

BT_UUID_GATT_RRIGLR_VAL
GATT Characteristic Relative Runtime In A Generic Level Range UUID Value.

BT_UUID_GATT_RRIGLR
GATT Characteristic Relative Runtime In A Generic Level Range.

BT_UUID_GATT_RVIVR_VAL
GATT Characteristic Relative Value In A Voltage Range UUID Value.

BT_UUID_GATT_RVIVR
GATT Characteristic Relative Value In A Voltage Range.

BT_UUID_GATT_RVIIR_VAL
GATT Characteristic Relative Value In A Illuminance Range UUID Value.

BT_UUID_GATT_RVIIR
GATT Characteristic Relative Value In A Illuminance Range.
BT_UUID_GATT_RVIPOD_VAL
GATT Characteristic Relative Value In A Period Of Day UUID Value.

BT_UUID_GATT_RVIPOD
GATT Characteristic Relative Value In A Period Of Day.

BT_UUID_GATT_RVITR_VAL
GATT Characteristic Relative Value In A Temperature Range UUID Value.

BT_UUID_GATT_RVITR
GATT Characteristic Relative Value In A Temperature Range.

BT_UUID_GATT_TEMP8_VAL
GATT Characteristic Temperature 8 UUID Value.

BT_UUID_GATT_TEMP8
GATT Characteristic Temperature 8.

BT_UUID_GATT_TEMP8_IPOD_VAL
GATT Characteristic Temperature 8 In A Period Of Day UUID Value.

BT_UUID_GATT_TEMP8_IPOD
GATT Characteristic Temperature 8 In A Period Of Day.

BT_UUID_GATT_TEMP8_STAT_VAL
GATT Characteristic Temperature 8 Statistics UUID Value.

BT_UUID_GATT_TEMP8_STAT
GATT Characteristic Temperature 8 Statistics.

BT_UUID_GATT_TEMP_RNG_VAL
GATT Characteristic Temperature Range UUID Value.

BT_UUID_GATT_TEMP_RNG
GATT Characteristic Temperature Range.

BT_UUID_GATT_TEMP_STAT_VAL
GATT Characteristic Temperature Statistics UUID Value.

BT_UUID_GATT_TEMP_STAT
GATT Characteristic Temperature Statistics.

BT_UUID_GATT_TIM_DC8_VAL
GATT Characteristic Time Decihour 8 UUID Value.

BT_UUID_GATT_TIM_DC8
GATT Characteristic Time Decihour 8.
BT_UUID_GATT_TIM_EXP8_VAL
GATT Characteristic Time Exponential 8 UUID Value.

BT_UUID_GATT_TIM_EXP8
GATT Characteristic Time Exponential 8.

BT_UUID_GATT_TIM_H24_VAL
GATT Characteristic Time Hour 24 UUID Value.

BT_UUID_GATT_TIM_H24
GATT Characteristic Time Hour 24.

BT_UUID_GATT_TIM_MS24_VAL
GATT Characteristic Time Millisecond 24 UUID Value.

BT_UUID_GATT_TIM_MS24
GATT Characteristic Time Millisecond 24.

BT_UUID_GATT_TIM_S16_VAL
GATT Characteristic Time Second 16 UUID Value.

BT_UUID_GATT_TIM_S16
GATT Characteristic Time Second 16.

BT_UUID_GATT_TIM_S8_VAL
GATT Characteristic Time Second 8 UUID Value.

BT_UUID_GATT_TIM_S8
GATT Characteristic Time Second 8.

BT_UUID_GATT_V_VAL
GATT Characteristic Voltage UUID Value.

BT_UUID_GATT_V
GATT Characteristic Voltage.

BT_UUID_GATT_V_SPEC_VAL
GATT Characteristic Voltage Specification UUID Value.

BT_UUID_GATT_V_SPEC
GATT Characteristic Voltage Specification.

BT_UUID_GATT_V_STAT_VAL
GATT Characteristic Voltage Statistics UUID Value.

BT_UUID_GATT_V_STAT
GATT Characteristic Voltage Statistics.
BT_UUID_GATT_VOLF_VAL
GATT Characteristic Volume Flow UUID Value.

BT_UUID_GATT_VOLF
GATT Characteristic Volume Flow.

BT_UUID_GATT_CRCORD_VAL
GATT Characteristic Chromaticity Coordinate (not Coordinates) UUID Value.

BT_UUID_GATT_CRCORD
GATT Characteristic Chromaticity Coordinate (not Coordinates)

BT_UUID_GATT_RCF_VAL
GATT Characteristic RC Feature UUID Value.

BT_UUID_GATT_RCF
GATT Characteristic RC Feature.

BT_UUID_GATT_RCSET_VAL
GATT Characteristic RC Settings UUID Value.

BT_UUID_GATT_RCSET
GATT Characteristic RC Settings.

BT_UUID_GATT_RCCP_VAL
GATT Characteristic Reconnection Configuration Control Point UUID Value.

BT_UUID_GATT_RCCP
GATT Characteristic Reconnection Configuration Control Point.

BT_UUID_GATT_IDD_SC_VAL
GATT Characteristic IDD Status Changed UUID Value.

BT_UUID_GATT_IDD_SC
GATT Characteristic IDD Status Changed.

BT_UUID_GATT_IDD_S_VAL
GATT Characteristic IDD Status UUID Value.

BT_UUID_GATT_IDD_S
GATT Characteristic IDD Status.

BT_UUID_GATT_IDD_AS_VAL
GATT Characteristic IDD Announciation Status UUID Value.

BT_UUID_GATT_IDD_AS
GATT Characteristic IDD Announciation Status.
BT_UUID_GATT_IDD_F_VAL
GATT Characteristic IDD Features UUID Value.

BT_UUID_GATT_IDD_F
GATT Characteristic IDD Features.

BT_UUID_GATT_IDD_SRCP_VAL
GATT Characteristic IDD Status Reader Control Point UUID Value.

BT_UUID_GATT_IDD_SRCP
GATT Characteristic IDD Status Reader Control Point.

BT_UUID_GATT_IDD_CCP_VAL
GATT Characteristic IDD Command Control Point UUID Value.

BT_UUID_GATT_IDD_CCP
GATT Characteristic IDD Command Control Point.

BT_UUID_GATT_IDD_CD_VAL
GATT Characteristic IDD Command Data UUID Value.

BT_UUID_GATT_IDD_CD
GATT Characteristic IDD Command Data.

BT_UUID_GATT_IDD_RACP_VAL
GATT Characteristic IDD Record Access Control Point UUID Value.

BT_UUID_GATT_IDD_RACP
GATT Characteristic IDD Record Access Control Point.

BT_UUID_GATT_IDD_HD_VAL
GATT Characteristic IDD History Data UUID Value.

BT_UUID_GATT_IDD_HD
GATT Characteristic IDD History Data.

BT_UUID_GATT_CLIENT_FEATURES_VAL
GATT Characteristic Client Supported Features UUID value.

BT_UUID_GATT_CLIENT_FEATURES
GATT Characteristic Client Supported Features.

BT_UUID_GATT_DB_HASH_VAL
GATT Characteristic Database Hash UUID value.

BT_UUID_GATT_DB_HASH
GATT Characteristic Database Hash.
BT_UUID_GATT_BSS_CP_VAL
GATT Characteristic BSS Control Point UUID Value.

BT_UUID_GATT_BSS_CP
GATT Characteristic BSS Control Point.

BT_UUID_GATT_BSS_R_VAL
GATT Characteristic BSS Response UUID Value.

BT_UUID_GATT_BSS_R
GATT Characteristic BSS Response.

BT_UUID_GATT_EMG_ID_VAL
GATT Characteristic Emergency ID UUID Value.

BT_UUID_GATT_EMG_ID
GATT Characteristic Emergency ID.

BT_UUID_GATT_EMG_TXT_VAL
GATT Characteristic Emergency Text UUID Value.

BT_UUID_GATT_EMG_TXT
GATT Characteristic Emergency Text.

BT_UUID_GATT_ACS_S_VAL
GATT Characteristic ACS Status UUID Value.

BT_UUID_GATT_ACS_S
GATT Characteristic ACS Status.

BT_UUID_GATT_ACS_DI_VAL
GATT Characteristic ACS Data In UUID Value.

BT_UUID_GATT_ACS_DI
GATT Characteristic ACS Data In.

BT_UUID_GATT_ACS_DON_VAL
GATT Characteristic ACS Data Out Notify UUID Value.

BT_UUID_GATT_ACS_DON
GATT Characteristic ACS Data Out Notify.

BT_UUID_GATT_ACS_DOI_VAL
GATT Characteristic ACS Data Out Indicate UUID Value.

BT_UUID_GATT_ACS_DOI
GATT Characteristic ACS Data Out Indicate.
BT_UUID_GATT_ACS_CP_VAL
GATT Characteristic ACS Control Point UUID Value.

BT_UUID_GATT_ACS_CP
GATT Characteristic ACS Control Point.

BT_UUID_GATT_EBPM_Val
GATT Characteristic Enhanced Blood Pressure Measurement UUID Value.

BT_UUID_GATT_EBPM
GATT Characteristic Enhanced Blood Pressure Measurement.

BT_UUID_GATT_EICP_Val
GATT Characteristic Enhanced Intermediate Cuff Pressure UUID Value.

BT_UUID_GATT_EICP
GATT Characteristic Enhanced Intermediate Cuff Pressure.

BT_UUID_GATT_BPR_Val
GATT Characteristic Blood Pressure Record UUID Value.

BT_UUID_GATT_BPR
GATT Characteristic Blood Pressure Record.

BT_UUID_GATT_RU_Val
GATT Characteristic Registered User UUID Value.

BT_UUID_GATT_RU
GATT Characteristic Registered User.

BT_UUID_GATT_BR_EDR_HD_Val
GATT Characteristic BR-EDR Handover Data UUID Value.

BT_UUID_GATT_BR_EDR_HD
GATT Characteristic BR-EDR Handover Data.

BT_UUID_GATT_BT_SIG_D_Val
GATT Characteristic Bluetooth SIG Data UUID Value.

BT_UUID_GATT_BT_SIG_D
GATT Characteristic Bluetooth SIG Data.

BT_UUID_GATT_SERVER_FEATURES_Val
GATT Characteristic Server Supported Features UUID value.

BT_UUID_GATT_SERVER_FEATURES
GATT Characteristic Server Supported Features.
BT_UUID_GATT_PHY_AMF_VAL
GATT Characteristic Physical Activity Monitor Features UUID Value.

BT_UUID_GATT_PHY_AMF
GATT Characteristic Physical Activity Monitor Features.

BT_UUID_GATT_GEN_AID_VAL
GATT Characteristic General Activity Instantaneous Data UUID Value.

BT_UUID_GATT_GEN_AID
GATT Characteristic General Activity Instantaneous Data.

BT_UUID_GATT_GEN_ASD_VAL
GATT Characteristic General Activity Summary Data UUID Value.

BT_UUID_GATT_GEN_ASD
GATT Characteristic General Activity Summary Data.

BT_UUID_GATT_CR_AID_VAL
GATT Characteristic CardioRespiratory Activity Instantaneous Data UUID Value.

BT_UUID_GATT_CR_AID
GATT Characteristic CardioRespiratory Activity Instantaneous Data.

BT_UUID_GATT_CR_ASD_VAL
GATT Characteristic CardioRespiratory Activity Summary Data UUID Value.

BT_UUID_GATT_CR_ASD
GATT Characteristic CardioRespiratory Activity Summary Data.

BT_UUID_GATT_SC_ASD_VAL
GATT Characteristic Step Counter Activity Summary Data UUID Value.

BT_UUID_GATT_SC_ASD
GATT Characteristic Step Counter Activity Summary Data.

BT_UUID_GATT_SLP_AID_VAL
GATT Characteristic Sleep Activity Instantaneous Data UUID Value.

BT_UUID_GATT_SLP_AID
GATT Characteristic Sleep Activity Instantaneous Data.

BT_UUID_GATT_SLP_ASD_VAL
GATT Characteristic Sleep Activity Summary Data UUID Value.

BT_UUID_GATT_SLP_ASD
GATT Characteristic Sleep Activity Summary Data.
BT_UUID_GATT_PHY_AMCP_VAL
GATT Characteristic Physical Activity Monitor Control Point UUID Value.

BT_UUID_GATT_PHY_AMCP
GATT Characteristic Physical Activity Monitor Control Point.

BT_UUID_GATT_ACS_VAL
GATT Characteristic Activity Current Session UUID Value.

BT_UUID_GATT_ACS
GATT Characteristic Activity Current Session.

BT_UUID_GATT_PHY_ASDESC_VAL
GATT Characteristic Physical Activity Session Descriptor UUID Value.

BT_UUID_GATT_PHY_ASDESC
GATT Characteristic Physical Activity Session Descriptor.

BT_UUID_GATT_PREF_U_VAL
GATT Characteristic Preffered Units UUID Value.

BT_UUID_GATT_PREF_U
GATT Characteristic Preffered Units.

BT_UUID_GATT_HRES_H_VAL
GATT Characteristic High Resolution Height UUID Value.

BT_UUID_GATT_HRES_H
GATT Characteristic High Resolution Height.

BT_UUID_GATT_MID_NAME_VAL
GATT Characteristic Middle Name UUID Value.

BT_UUID_GATT_MID_NAME
GATT Characteristic Middle Name.

BT_UUID_GATT_STRDLEN_VAL
GATT Characteristic Stride Length UUID Value.

BT_UUID_GATT_STRDLEN
GATT Characteristic Stride Length.

BT_UUID_GATT_HANDEDNESS_VAL
GATT Characteristic Handedness UUID Value.

BT_UUID_GATT_HANDEDNESS
GATT Characteristic Handedness.
BT_UUID_GATT_DEVICE_WP_VAL
GATT Characteristic Device Wearing Position UUID Value.

BT_UUID_GATT_DEVICE_WP
GATT Characteristic Device Wearing Position.

BT_UUID_GATT_4ZHRL_VAL
GATT Characteristic Four Zone Heart Rate Limit UUID Value.

BT_UUID_GATT_4ZHRL
GATT Characteristic Four Zone Heart Rate Limit.

BT_UUID_GATT_HIET_VAL
GATT Characteristic High Intensity Exercise Threshold UUID Value.

BT_UUID_GATT_HIET
GATT Characteristic High Intensity Exercise Threshold.

BT_UUID_GATT_AG_VAL
GATT Characteristic Activity Goal UUID Value.

BT_UUID_GATT_AG
GATT Characteristic Activity Goal.

BT_UUID_GATT_SIN_VAL
GATT Characteristic Sedentary Interval Notification UUID Value.

BT_UUID_GATT_SIN
GATT Characteristic Sedentary Interval Notification.

BT_UUID_GATT_CI_VAL
GATT Characteristic Caloric Intake UUID Value.

BT_UUID_GATT_CI
GATT Characteristic Caloric Intake.

BT_UUID_GATT_TMAPR_VAL
GATT Characteristic TMAP Role UUID Value.

BT_UUID_GATT_TMAPR
GATT Characteristic TMAP Role.

BT_UUID_AICS_STATE_VAL
Audio Input Control Service State value.

BT_UUID_AICS_STATE
Audio Input Control Service State.
BT_UUID_AICS_GAIN_SETTINGS_VAL
Audio Input Control Service Gain Settings Properties value.

BT_UUID_AICS_GAIN_SETTINGS
Audio Input Control Service Gain Settings Properties.

BT_UUID_AICS_INPUT_TYPE_VAL
Audio Input Control Service Input Type value.

BT_UUID_AICS_INPUT_TYPE
Audio Input Control Service Input Type.

BT_UUID_AICS_INPUT_STATUS_VAL
Audio Input Control Service Input Status value.

BT_UUID_AICS_INPUT_STATUS
Audio Input Control Service Input Status.

BT_UUID_AICS_CONTROL_VAL
Audio Input Control Service Control Point value.

BT_UUID_AICS_CONTROL
Audio Input Control Service Control Point.

BT_UUID_AICS_DESCRIPTION_VAL
Audio Input Control Service Input Description value.

BT_UUID_AICS_DESCRIPTION
Audio Input Control Service Input Description.

BT_UUID_VCS_STATE_VAL
Volume Control Setting value.

BT_UUID_VCS_STATE
Volume Control Setting.

BT_UUID_VCS_CONTROL_VAL
Volume Control Control point value.

BT_UUID_VCS_CONTROL
Volume Control Control point.

BT_UUID_VCS_FLAGS_VAL
Volume Control Flags value.

BT_UUID_VCS_FLAGS
Volume Control Flags.
BT_UUID_VOCS_STATE_VAL
   Volume Offset State value.

BT_UUID_VOCS_STATE
   Volume Offset State.

BT_UUID_VOCS_LOCATION_VAL
   Audio Location value.

BT_UUID_VOCS_LOCATION
   Audio Location.

BT_UUID_VOCS_CONTROL_VAL
   Volume Offset Control Point value.

BT_UUID_VOCS_CONTROL
   Volume Offset Control Point.

BT_UUID_VOCS_DESCRIPTION_VAL
   Volume Offset Audio Output Description value.

BT_UUID_VOCS_DESCRIPTION
   Volume Offset Audio Output Description.

BT_UUID_CSIS_SET_SIRK_VAL
   Set Identity Resolving Key value.

BT_UUID_CSIS_SET_SIRK
   Set Identity Resolving Key.

BT_UUID_CSIS_SET_SIZE_VAL
   Set size value.

BT_UUID_CSIS_SET_SIZE
   Set size.

BT_UUID_CSIS_SET_LOCK_VAL
   Set lock value.

BT_UUID_CSIS_SET_LOCK
   Set lock.

BT_UUID_CSIS_RANK_VAL
   Rank value.

BT_UUID_CSIS_RANK
   Rank.

6.1. Bluetooth
BT_UUID_GATT_EDKM_VAL
GATT Characteristic Encrypted Data Key Material UUID Value.

BT_UUID_GATT_EDKM
GATT Characteristic Encrypted Data Key Material.

BT_UUID_GATT_AE32_VAL
GATT Characteristic Apparent Energy 32 UUID Value.

BT_UUID_GATT_AE32
GATT Characteristic Apparent Energy 32.

BT_UUID_GATT_AP_VAL
GATT Characteristic Apparent Power UUID Value.

BT_UUID_GATT_AP
GATT Characteristic Apparent Power.

BT_UUID_GATT_CO2CONC_VAL
GATT Characteristic CO2 Concentration UUID Value.

BT_UUID_GATT_CO2CONC
GATT Characteristic CO2 Concentration.

BT_UUID_GATT_COS_VAL
GATT Characteristic Cosine of the Angle UUID Value.

BT_UUID_GATT_COS
GATT Characteristic Cosine of the Angle.

BT_UUID_GATT_DEVTF_VAL
GATT Characteristic Device Time Feature UUID Value.

BT_UUID_GATT_DEVTF
GATT Characteristic Device Time Feature.

BT_UUID_GATT_DEVTP_VAL
GATT Characteristic Device Time Parameters UUID Value.

BT_UUID_GATT_DEVTP
GATT Characteristic Device Time Parameters.

BT_UUID_GATT_DEVT_VAL
GATT Characteristic Device Time UUID Value.

BT_UUID_GATT_DEVT
GATT Characteristic String.
BT_UUID_GATT_DEVTCP_VAL
  GATT Characteristic Device Time Control Point UUID Value.

BT_UUID_GATT_DEVTCP
  GATT Characteristic Device Time Control Point.

BT_UUID_GATT_TCLD_VAL
  GATT Characteristic Time Change Log Data UUID Value.

BT_UUID_GATT_TCLD
  GATT Characteristic Time Change Log Data.

BT_UUID_MCS_PLAYER_NAME_VAL
  Media player name value.

BT_UUID_MCS_PLAYER_NAME
  Media player name.

BT_UUID_MCS_ICON_OBJ_ID_VAL
  Media Icon Object ID value.

BT_UUID_MCS_ICON_OBJ_ID
  Media Icon Object ID.

BT_UUID_MCS_ICON_URL_VAL
  Media Icon URL value.

BT_UUID_MCS_ICON_URL
  Media Icon URL.

BT_UUID_MCS_TRACK_CHANGED_VAL
  Track Changed value.

BT_UUID_MCS_TRACK_CHANGED
  Track Changed.

BT_UUID_MCS_TRACK_TITLE_VAL
  Track Title value.

BT_UUID_MCS_TRACK_TITLE
  Track Title.

BT_UUID_MCS_TRACK_DURATION_VAL
  Track Duration value.

BT_UUID_MCS_TRACK_DURATION
  Track Duration.

6.1. Bluetooth
BT_UUID_MCS_TRACK_POSITION_VAL
Track Position value.

BT_UUID_MCS_TRACK_POSITION
Track Position.

BT_UUID_MCS_PLAYBACK_SPEED_VAL
Playback Speed value.

BT_UUID_MCS_PLAYBACK_SPEED
Playback Speed.

BT_UUID_MCS_SEEKING_SPEED_VAL
Seeking Speed value.

BT_UUID_MCS_SEEKING_SPEED
Seeking Speed.

BT_UUID_MCS_TRACK_SEGMENTS_OBJ_ID_VAL
Track Segments Object ID value.

BT_UUID_MCS_TRACK_SEGMENTS_OBJ_ID
Track Segments Object ID.

BT_UUID_MCS_CURRENT_TRACK_OBJ_ID_VAL
Current Track Object ID value.

BT_UUID_MCS_CURRENT_TRACK_OBJ_ID
Current Track Object ID.

BT_UUID_MCS_NEXT_TRACK_OBJ_ID_VAL
Next Track Object ID value.

BT_UUID_MCS_NEXT_TRACK_OBJ_ID
Next Track Object ID.

BT_UUID_MCS_PARENT_GROUP_OBJ_ID_VAL
Parent Group Object ID value.

BT_UUID_MCS_PARENT_GROUP_OBJ_ID
Parent Group Object ID.

BT_UUID_MCS_CURRENT_GROUP_OBJ_ID_VAL
Group Object ID value.

BT_UUID_MCS_CURRENT_GROUP_OBJ_ID
Group Object ID.
BT_UUID_MCS_PLAYING_ORDER_VAL
Playing Order value.

BT_UUID_MCS_PLAYING_ORDER
Playing Order.

BT_UUID_MCS_PLAYING_ORDERS_VAL
Playing Orders supported value.

BT_UUID_MCS_PLAYING_ORDERS
Playing Orders supported.

BT_UUID_MCS_MEDIA_STATE_VAL
Media State value.

BT_UUID_MCS_MEDIA_STATE
Media State.

BT_UUID_MCS_MEDIA_CONTROL_POINT_VAL
Media Control Point value.

BT_UUID_MCS_MEDIA_CONTROL_POINT
Media Control Point.

BT_UUID_MCS_MEDIA_CONTROL_OPCODES_VAL
Media control opcodes supported value.

BT_UUID_MCS_MEDIA_CONTROL_OPCODES
Media control opcodes supported.

BT_UUID_MCS_SEARCH_RESULTS_OBJ_ID_VAL
Search result object ID value.

BT_UUID_MCS_SEARCH_RESULTS_OBJ_ID
Search result object ID.

BT_UUID_MCS_SEARCH_CONTROL_POINT_VAL
Search control point value.

BT_UUID_MCS_SEARCH_CONTROL_POINT
Search control point.

BT_UUID_GATT_E32_VAL
GATT Characteristic Energy 32 UUID Value.

BT_UUID_GATT_E32
GATT Characteristic Energy 32.
BT_UUID_OTS_TYPE_MPL_ICON_VAL
Media Player Icon Object Type value.

BT_UUID_OTS_TYPE_MPL_ICON
Media Player Icon Object Type.

BT_UUID_OTS_TYPE_TRACK_SEGMENT_VAL
Track Segments Object Type value.

BT_UUID_OTS_TYPE_TRACK_SEGMENT
Track Segments Object Type.

BT_UUID_OTS_TYPE_TRACK_VAL
Track Object Type value.

BT_UUID_OTS_TYPE_TRACK
Track Object Type.

BT_UUID_OTS_TYPE_GROUP_VAL
Group Object Type value.

BT_UUID_OTS_TYPE_GROUP
Group Object Type.

BT_UUID_GATT_CTEE_VAL
GATT Characteristic Constant Tone Extension Enable UUID Value.

BT_UUID_GATT_CTEE
GATT Characteristic Constant Tone Extension Enable.

BT_UUID_GATT_ACTEML_VAL
GATT Characteristic Advertising Constant Tone Extension Minimum Length UUID Value.

BT_UUID_GATT_ACTEML
GATT Characteristic Advertising Constant Tone Extension Minimum Length.

BT_UUID_GATT_ACTEMTC_VAL
GATT Characteristic Advertising Constant Tone Extension Minimum Transmit Count UUID Value.

BT_UUID_GATT_ACTEMTC
GATT Characteristic Advertising Constant Tone Extension Minimum Transmit Count.

BT_UUID_GATT_ACTETD_VAL
GATT Characteristic Advertising Constant Tone Extension Transmit Duration UUID Value.
BT_UUID_GATT_ACTETD
GATT Characteristic Advertising Constant Tone Extension Transmit Duration.

BT_UUID_GATT_ACTEI_VAL
GATT Characteristic Advertising Constant Tone Extension Interval UUID Value.

BT_UUID_GATT_ACTEI
GATT Characteristic Advertising Constant Tone Extension Interval.

BT_UUID_GATT_ACTEP_VAL
GATT Characteristic Advertising Constant Tone Extension PHY UUID Value.

BT_UUID_GATT_ACTEP
GATT Characteristic Advertising Constant Tone Extension PHY.

BT_UUID_TBS_PROVIDER_NAME_VAL
Bearer Provider Name value.

BT_UUID_TBS_PROVIDER_NAME
Bearer Provider Name.

BT_UUID_TBS_UCI_VAL
Bearer UCI value.

BT_UUID_TBS_UCI
Bearer UCI.

BT_UUID_TBS_TECHNOLOGY_VAL
Bearer Technology value.

BT_UUID_TBS_TECHNOLOGY
Bearer Technology.

BT_UUID_TBS_URI_LIST_VAL
Bearer URI Prefixes Supported List value.

BT_UUID_TBS_URI_LIST
Bearer URI Prefixes Supported List.

BT_UUID_TBS_SIGNAL_STRENGTH_VAL
Bearer Signal Strength value.

Status flags value.

BT_UUID_TBS_STATUS_FLAGS
Status flags.

BT_UUID_TBS_INCOMING_URI_VAL
Incoming Call Target Caller ID value.

BT_UUID_TBS_INCOMING_URI
Incoming Call Target Caller ID.

BT_UUID_TBS_CALL_STATE_VAL
Call State value.

BT_UUID_TBS_CALL_STATE
Call State.

BT_UUID_TBS_CALL_CONTROL_POINT_VAL
Call Control Point value.

BT_UUID_TBS_CALL_CONTROL_POINT
Call Control Point.

BT_UUID_TBS_OPTIONAL_OPCODES_VAL
Optional Opcodes value.

BT_UUID_TBS_OPTIONAL_OPCODES
Optional Opcodes.

BT_UUID_TBS_TERMINATE_REASON_VAL
Terminate reason value
BT_UUID_TBS_TERMINATE_REASON
    BT_UUID_TBS_TERMINATE_REASON.
    Terminate reason

BT_UUID_TBS_INCOMING_CALL_VAL
    Incoming Call value.

BT_UUID_TBS_INCOMING_CALL
    Incoming Call.

BT_UUID_TBS_FRIENDLY_NAME_VAL
    Incoming Call Friendly name value.

BT_UUID_TBS_FRIENDLY_NAME
    Incoming Call Friendly name.

BT_UUID_MICS_MUTE_VAL
    Microphone Control Service Mute value.

BT_UUID_MICS_MUTE
    Microphone Control Service Mute.

BT_UUID_ASCS_ASE_SNK_VAL
    Audio Stream Endpoint Sink Characteristic value.

BT_UUID_ASCS_ASE_SNK
    Audio Stream Endpoint Sink Characteristic.

BT_UUID_ASCS_ASE_SRC_VAL
    Audio Stream Endpoint Source Characteristic value.

BT_UUID_ASCS_ASE_SRC
    Audio Stream Endpoint Source Characteristic.

BT_UUID_ASCS_ASE_CP_VAL
    Audio Stream Endpoint Control Point Characteristic value.

BT_UUID_ASCS_ASE_CP
    Audio Stream Endpoint Control Point Characteristic.

BT_UUID_BASS_CONTROL_POINT_VAL
    Broadcast Audio Scan Service Scan State value.

BT_UUID_BASS_CONTROL_POINT
    Broadcast Audio Scan Service Scan State.

BT_UUID_BASS_RECV_STATE_VAL
    Broadcast Audio Scan Service Receive State value.

6.1. Bluetooth
Enums

Bluetooth UUID types.

**Values:**

- `BT_UUID_TYPE_16` - UUID type 16-bit.
- `BT_UUID_TYPE_32` - UUID type 32-bit.
- `BT_UUID_TYPE_128` - UUID type 128-bit.

Functions

**int bt_uuid_cmp(const struct bt_uuid *u1, const struct bt_uuid *u2)**

Compare Bluetooth UUIDs.

Compares 2 Bluetooth UUIDs, if the types are different both UUIDs are first converted to 128 bits format before comparing.

**Parameters**

- `u1` – First Bluetooth UUID to compare
- `u2` – Second Bluetooth UUID to compare

**Returns**

- negative value if `u1 < u2`, 0 if `u1 == u2`, else positive

**bool bt_uuid_create(struct bt_uuid *uuid, const uint8_t *data, uint8_t data_len)**

Create a `bt_uuid` from a little-endian data buffer.

Create a `bt_uuid` from a little-endian data buffer. The `data_len` parameter is used to determine whether the UUID is in 16, 32 or 128 bit format (length 2, 4 or 16). Note: 32 bit format is not allowed over the air.

**Parameters**

- `uuid` – Pointer to the `bt_uuid` variable
- `data` – pointer to UUID stored in little-endian data buffer
- `data_len` – length of the UUID in the data buffer

**Returns**

- true if the data was valid and the UUID was successfully created.

**void bt_uuid_to_str(const struct bt_uuid *uuid, char *str, size_t len)**

Convert Bluetooth UUID to string.

Converts Bluetooth UUID to string. UUID can be in any format, 16-bit, 32-bit or 128-bit.

**Parameters**

- `uuid` – Bluetooth UUID
- `str` – pointer where to put converted string
- `len` – length of str
struct bt_uuid
#include <uuid.h> This is a ‘tentative’ type and should be used as a pointer only.

struct bt_uuid_16
#include <uuid.h>

Public Members

struct bt_uuid uuid
UUID generic type.

uint16_t val
UUID value, 16-bit in host endianness.

struct bt_uuid_32
#include <uuid.h>

Public Members

struct bt_uuid uuid
UUID generic type.

uint32_t val
UUID value, 32-bit in host endianness.

struct bt_uuid_128
#include <uuid.h>

Public Members

struct bt_uuid uuid
UUID generic type.

uint8_t val[16]
UUID value, 128-bit in little-endian format.

Bluetooth: Basic Audio Profile

This document describes how to run Basic Audio Profile functionality which includes:
- Capabilities and Endpoint discovery
- Audio Stream Endpoint procedures

Commands

6.1. Bluetooth
bap --help
Subcommands:
  init
  select_broadcast :<stream>
  create_broadcast :[preset <preset_name>] [enc <broadcast_code>]
  start_broadcast :
  stop_broadcast :
  delete_broadcast :
  broadcast_scan :<on, off>
  create_broadcast_sink :0x<broadcast_id>
  sync_broadcast :0x<bis_index> [[0x<bis_index> 0x<bis_index>] ...]
  stop_broadcast_sink :
  term_broadcast_sink :

</table>

Example Central  
Connect and establish a stream:
Or using connect command:

```
uart:~$ bt init
uart:~$ bap init
uart:~$ bt connect <address>
uart:~$ gatt exchange-mtu
uart:~$ bap discover sink
uart:~$ bap config sink 0
uart:~$ bap qos
uart:~$ bap enable
```

Disconnect and release:

```
uart:~$ bap disable
uart:~$ bap release
```

**Example Peripheral**  Listen:

```
uart:~$ bt init
uart:~$ bap init
uart:~$ bt advertise on
```

Server initiated disable and release:

```
uart:~$ bap disable
uart:~$ bap release
```

**Example Broadcast Source**  Create and establish a broadcast source stream:

```
uart:~$ bap init
uart:~$ bap create_broadcast
uart:~$ bap start_broadcast
```

Stop and release a broadcast source stream:

```
uart:~$ bap stop_broadcast
uart:~$ bap delete_broadcast
```

**Example Broadcast Sink**  Scan for and establish a broadcast sink stream. The command `bap create_broadcast_sink 0xEF6716` will either use existing periodic advertising sync (if exist) or start scanning and sync to the periodic advertising before syncing to the BIG.

```
uart:~$ bap init
uart:~$ bap broadcast_scan on
Found broadcaster with ID 0xEF6716 and addr 3D:A5:F9:35:0B:19 (random) and sid 0x00
uart:~$ bap create_broadcast_sink 0xEF6716
Attempting to PA sync to the broadcaster
PA synced to broadcast with broadcast ID 0xEF6716
Attempting to sync to the BIG
Received BASE from sink 0x20031fac:
```

uart:~$ bap_sync_broadcast 0x01

Stop and release a broadcast sink stream:

uart:~$ bap stop_broadcast_sink
uart:~$ bap term_broadcast_sink

Init  The init command register local PAC records which are necessary to be able to configure stream and properly manage capabilities in use.

Table 9: State Machine Transitions

<table>
<thead>
<tr>
<th>Depends</th>

<th>Next States</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>any</td>
<td>none</td>
</tr>
</tbody>
</table>

uart:~$ bap init

Discover PAC(s) and ASE(s)  Once connected the discover command discover PAC records and ASE characteristics representing remote endpoints.
Table 10: State Machine Transitions

<table>
<thead>
<tr>
<th>Depends</th>
<th>Allowed States</th>
<th>Next States</th>
</tr>
</thead>
<tbody>
<tr>
<td>init</td>
<td>any</td>
<td>any</td>
</tr>
</tbody>
</table>

**Note:** Use command `gatt exchange-mtu` to make sure the MTU is configured properly.

```bash
uart:~$ gatt exchange-mtu
Exchange pending
uart:~$ bap discover [type: sink, source]
uart:~$ bap discover sink

data #3: type 0x04 len 2
  00000000: 50 |P | |
meta #0: type 0x02 len 2
```

(continues on next page)
Configure Codec  The `config` command attempts to configure a stream for the given direction using a preset codec configuration which can either be passed directly or in case it is omitted the default preset is used.

Table 11: State Machine Transitions

<table>
<thead>
<tr>

ASE config: preset 16_2_1

Configure Stream QoS  The `stream_qos` Sets a new stream QoS.

```sh
uart:~$ bap stream_qos <interval> [framing] [latency] [pd] [sdu] [phy] [rtn]
uart:~$ bap stream_qos 10
```

Configure QoS  The `qos` command attempts to configure the stream QoS using the preset configuration, each individual QoS parameter can be set with use optional parameters.

Table 12: State Machine Transitions

Bluetooth: Broadcast Audio Profile Broadcast Assistant

This document describes how to run the BAP Broadcast Assistant functionality. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

The Broadcast Assistant is responsible for offloading scan for a resource restricted device, such that scanning does not drain the battery. The Broadcast Assistant shall support scanning for periodic advertisements and may optionally support the periodic advertisements synchronization transfer (PAST) protocol.

The Broadcast Assistant will typically be phones or laptops. The Broadcast Assistant scans for periodic advertisements and transfer information to the server.

It is necessary to have BT_DEBUG_BAP_BROADCAST_ASSISTANT enabled for using the Broadcast Assistant interactively.

When the Bluetooth stack has been initialized (`bt init`), and a device has been connected, the Broadcast Assistant can discover BASS on the connected device calling `bap_broadcast_assistant discover`, which will start a discovery for the BASS UUIDs and store the handles, and subscribe to all notifications.
Example usage

**Setup**

```
uart:~$ bt init
uart:~$ bap init
```

**When connected**

**Start scanning for periodic advertisements for a server:**

```
uart:~$ bap_broadcast_assistant discover
BASS discover done with 1 recv states
```

**Note:** The Broadcast Assistant will not actually start scanning for periodic advertisements, as that feature is still, at the time of writing, not implemented.

```
uart:~$ bap_broadcast_assistant scan_start true
BASS scan start successful
Found broadcaster with ID 0x05BD38 and addr 1E:4D:0A:AA:6E:49 (random) and sid 0x00
```

**Adding a source to the receive state with add_src:**

```
uart:~$ bap_broadcast_assistant add_src 11:22:33:44:55:66 public 5 1 1
[0]: BIS sync 0, metadata_len 0
```

**Adding a source to the receive state with add_broadcast_id (recommended):**

```
uart:~$ bap_broadcast_assistant add_broadcast_id 0x05BD38 true
[DEVICE]: 1E:4D:0A:AA:6E:49 (random), AD evt type 5, RSSI -28 Broadcast Audio Source C:0 S:0 D:0 SR E:1 Prim: LE 1M, Secn: LE 2M, Interval: 0x03c0 (1200000 us), SID: 0x0
Found BAP broadcast source with address 1E:4D:0A:AA:6E:49 (random) and ID 0x05BD38
```

(continues on next page)
BASS recv state: src_id 0, addr 1E:4D:0A:AA:6E:49 (random), sid 0, sync_state 0, encrypt_state 0

[0]: BIS sync 0x0000, metadata_len 0
BASS add source successful

BASS recv state: src_id 0, addr 1E:4D:0A:AA:6E:49 (random), sid 0, sync_state 2, encrypt_state 0

[0]: BIS sync 0x0000, metadata_len 0

BASS recv state: src_id 0, addr 1E:4D:0A:AA:6E:49 (random), sid 0, sync_state 2, encrypt_state 0

[0]: BIS sync 0x0001, metadata_len 4
Metadata length 2, type 2, data: 0100

Modifying a receive state:

```
uart:~$ bap_broadcast_assistant mod_src 0 true 0x03c0 0x02
```
BASS modify source successful

BASS recv state: src_id 0, addr 1E:4D:0A:AA:6E:49 (random), sid 0, sync_state 2, encrypt_state 0

[0]: BIS sync 0x0001, metadata_len 4
Metadata length 2, type 2, data: 0100

Bluetooth: Broadcast Audio Profile Scan Delegator

This document describes how to run the Scan Delegator functionality. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

The Scan Delegator may optionally support the periodic advertisements synchronization transfer (PAST) protocol.

The Scan Delegator server typically resides on devices that have inputs or outputs.

It is necessary to have `BT_DEBUG_BAP_SCAN_DELEGATOR` enabled for using the Scan Delegator interactively.

The Scan Delegator can currently only set the sync state of a receive state, but does not actually support syncing with periodic advertisements yet.

```
bap_scan_delegator --help
bap_scan_delegator - Bluetooth BAP Scan Delegator shell commands
Subcommands:
   init :Initialize the service and register callbacks
   synced :Set server scan state <src_id> <pa_synced> <bis_syncs> <enc_state>
```

Example Usage

**Setup**

```
uart:~$ bt init
uart:~$ bt advertise on
Advertising started
```

When connected Set sync state for a source:

```
uart:~$ bap_scan_delegator synced 0 1 3 0
```
Bluetooth: Common Audio Profile Shell

This document describes how to run the Common Audio Profile functionality.

**CAP Acceptor**  The Acceptor will typically be a resource-constrained device, such as a headset, earbud or hearing aid. The Acceptor can initialize a Coordinated Set Identification Service instance, if it is in a pair with one or more other CAP Acceptors.

**Using the CAP Acceptor**  When the Bluetooth stack has been initialized (`bt init`), the Acceptor can be registered by calling `cap_acceptor init`, which will register the CAS and CSIS services, as well as register callbacks.

```
cap_acceptor --help
```

```
cap_acceptor - Bluetooth CAP acceptor shell commands
Subcommands:

init :Initialize the service and register callbacks [size <int>]
[rank <int>] [not-lockable] [sirk <data>]
lock :Lock the set
release :Release the set [force]
print_sirk :Print the currently used SIRK
set_sirk_rsp :Set the response used in SIRK requests <accept, accept_enc,
reject, oob>
```

Besides initializing the CAS and the CSIS, there are also commands to lock and release the CSIS instance, as well as printing and modifying access to the SIRK of the CSIS.

**CAP Initiator**  The Initiator will typically be a resource-rich device, such as a phone or PC. The Initiator can discover CAP Acceptors’s CAS and optional CSIS services. The CSIS service can be read to provide information about other CAP Acceptors in the same Coordinated Set. The Initiator can execute stream control procedures on sets of devices, either ad-hoc or Coordinated, and thus provides an easy way to set up multiple streams on multiple devices at once.

**Using the CAP Initiator**  When the Bluetooth stack has been initialized (`bt init`), the Initiator can discover CAS and the optionally included CSIS instance by calling (`cap_initiator discover`).

```
cap_initiator --help
```

```
cap_initiator - Bluetooth CAP initiator shell commands
Subcommands:

discover :Discover CAS
unicast_start :Unicast Start [csip] [sinks <cnt> (default 1)] [sources <cnt>
(default 1)] [conns <cnt> | all] (default 1)]
unicast_list :Unicast list streams
unicast_update :Unicast Update <all | stream [stream...]]>
unicast_stop :Unicast stop streams <all | stream [stream...]]>
unicast_cancel :Unicast cancel current procedure
```

Before being able to perform any stream operation, the device must also perform the `bap discover` operation to discover the ASEs and PAC records. The `bap init` command also needs to be called.

**When connected**  Discovering CAS and CSIS on a device:

```
uart:~$ cap_initiator discover
discovery completed with CSIS
```

Discovering ASEs and PAC records on a device:
Both of the above commands should be done for each device that you want to use in the set. To use multiple devices, simply connect to more and then use `bt select` the device to execute the commands on.

Once all devices have been connected and the respective discovery commands have been called, the `cap_initiator unicast_start` command can be used to put one or more streams into the streaming state.

To stop all the streams that has been started, the `cap_initiator unicast_stop` command can be used.

**CAP Commander** The Commander will typically be a either co-located with a CAP Initiator or be on a separate resource-rich mobile device, such as a phone or smartwatch. The Commander can discover CAP Acceptors's CAS and optional CSIS services. The CSIS service can be read to provide information about other CAP Acceptors in the same Coordinated Set. The Commander can provide information about broadcast sources to CAP Acceptors or coordinate capture and rendering information such as mute or volume states.
Using the CAP Commander  When the Bluetooth stack has been initialized (bt init), the Commander can discover CAS and the optionally included CSIS instance by calling (cap_commander discover).

<table>
<thead>
<tr>
<th>Subcommands:</th>
</tr>
</thead>
<tbody>
<tr>
<td>discover</td>
</tr>
<tr>
<td>change_volume</td>
</tr>
<tr>
<td>change_volume_offset</td>
</tr>
</tbody>
</table>

Before being able to perform any stream operation, the device must also perform the bap discover operation to discover the ASEs and PAC records. The bap init command also needs to be called.

When connected  Discovering CAS and CSIS on a device:

```
uart:~$ cap_commander discover
discovery completed with CSIS
```

Setting the volume on all connected devices:

```
uart:~$ vcp_vol_ctlr discover
VCP discover done with 1 VOCS and 1 AICS
uart:~$ cap_commander change_volume 15
uart:~$ cap_commander change_volume 15
Setting volume to 15 on 2 connections
VCP volume 15, mute 0
VCP vo1_set done
VCP volume 15, mute 0
VCP flags 0x01
VCP vo1_set done
Volume change completed
```

Setting the volume offset on one or more connected devices. The offsets are set by connection index, so connection index 0 gets the first offset, and index 1 gets the second offset, etc.:

```
uart:~$ bt connect <device A>
Connected: <device A>
uart:~$ cap_commander discover
discovery completed with CSIS
uart:~$ vcp_vol_ctlr discover
VCP discover done with 1 VOCS and 1 AICS
uart:~$
uart:~$ bt connect <device B>
Connected: <device B>
uart:~$ cap_commander discover
discovery completed with CSIS
uart:~$ vcp_vol_ctlr discover
VCP discover done with 1 VOCS and 1 AICS
uart:~$
uart:~$ cap_commander change_volume_offset 10
Setting volume offset on 1 connections
VOCS inst 0x200140a4 offset 10
Offset set for inst 0x200140a4
Volume offset change completed
uart:~$
uart:~$ cap_commander change_volume_offset 10 15
Setting volume offset on 2 connections
Offset set for inst 0x200140a4
```

(continues on next page)
Bluetooth: Call Control Profile

This document describes how to run the call control functionality, both as a client and as a (telephone bearer service (TBS)) server. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

**Telephone Bearer Service Client** The telephone bearer service client will typically exist on a resource restricted device, such as headphones, but may also exist on e.g. phones or laptops. The call control client will also thus typically be the advertiser. The client can control the states of calls on a server using the call control point.

It is necessary to have `BT_DEBUG_TBS_CLIENT` enabled for using the client interactively.

**Using the telephone bearer service client** When the Bluetooth stack has been initialized (`bt init`), and a device has been connected, the telephone bearer service client can discover TBS on the connected device calling `tbs_client discover`, which will start a discovery for the TBS UUIDs and store the handles, and optionally subscribe to all notifications (default is to subscribe to all).

Since a server may have multiple TBS instances, most of the `tbs_client` commands will take an index (starting from 0) as input. Joining calls require at least 2 call IDs, and all call indexes shall be on the same TBS instance.

A server may also have a GTBS instance, which is an abstraction layer for all the telephone bearers on the server. If the server has both GTBS and TBS, the client may subscribe and use either when sending requests if `BT_TBS_CLIENT_GTBS` is enabled.
read_current_calls :Read the current calls [{instance_index, gtbs}]
read_ccid :Read the CCID [{instance_index, gtbs}]
read_status_flags :Read the in feature and status value [{instance_index, gtbs}]
read_uri :Read the incoming call target URI [{instance_index, gtbs}]
read_call_state :Read the call state [{instance_index, gtbs}]
read_remote_uri :Read the incoming remote URI [{instance_index, gtbs}]
read_friendly_name :Read the friendly name of an incoming call [{instance_index, gtbs}]
read_optional_opcodes :Read the optional opcodes [{instance_index, gtbs}]

In the following examples, notifications from GTBS is ignored, unless otherwise specified.

Example usage

Setup

uart:~$ bt init
uart:~$ bt advertise on
Advertising started

When connected  Placing a call:

uart:~$ tbs_client discover
<dbg> bt_tbs_client.primary_discover_func: Discover complete, found 1 instances (GTBS found)
<dbg> bt_tbs_client.discover_func: Setup complete for 1 / 1 TBS
<dbg> bt_tbs_client.discover_func: Setup complete GTBS
uart:~$ tbs_client originate 0 tel:123
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the dialing state with URI tel:123
<dbg> bt_tbs_client.call_cp_notify_handler: Status: success for the originate opcode for call 0x00
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the alerting state with URI tel:123
<call answered by peer device, and status notified by TBS server>
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the active state with URI tel:123

Placing a call on GTBS:

uart:~$ tbs_client originate 0 tel:123
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the dialing state with URI tel:123
<dbg> bt_tbs_client.call_cp_notify_handler: Status: success for the originate opcode for call 0x00
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the alerting state with URI tel:123
<call answered by peer device, and status notified by TBS server>
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the active state with URI tel:123

(continues on next page)
It is necessary to set an outgoing caller ID before placing a call.

Accepting incoming call from peer device:

Terminating call:

**Telephone Bearer Service (TBS)** The telephone bearer service is a service that typically resides on devices that can make calls, including calls from apps such as Skype, e.g. (smart)phones and PCs.

It is necessary to have `BT_DEBUG_TBS` enabled for using the TBS server interactively.

**Using the telephone bearer service** TBS can be controlled locally, or by a remote device (when in a call). For example a remote device may initiate a call to the device with the TBS server, or the TBS server may initiate a call to remote device, without a TBS_CLIENT client. The TBS implementation is capable of fully controlling any call.
### Example Usage

#### Setup

```
uart:~$ bt init
```

#### When connected  Answering a call for a peer device originated by a client:

```
<dbg> bt_tbs.write_call_cp: Index 0: Processing the originate opcode
<dbg> bt_tbs.originate_call: New call with call index 1
<dbg> bt_tbs.write_call_cp: Index 0: Processed the originate opcode with status success for...
uart:~$ tbs remote_answer 1
TBS succeeded for call_id: 1
```

#### Incoming call from a peer device, accepted by client:

```
uart:~$ tbs incoming 0 tel:123 tel:456 Peter
TBS succeeded for call_id: 4
<dbg> bt_tbs.bt_tbs_remote_incoming: New call with call index 4
<dbg> bt_tbs.write_call_cp: Index 0: Processed the accept opcode with status success for...
```

### Bluetooth: Coordinated Set Identification Profile

This document describes how to run the coordinated set identification functionality, both as a client and as a server. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

#### Set Coordinator (Client)  The client will typically be a resource-rich device, such as a smartphone or a laptop. The client is able to lock and release members of a coordinated set. While the coordinated set is locked, no other clients may lock the set.

To lock a set, the client must connect to each of the set members it wants to lock. This implementation will always try to connect to all the members of the set, and at the same time. Thus if the set size is 3, then BT_MAX_CONN shall be at least 3.

If the locks on set members shall persists through disconnects, it is necessary to bond with the set members. If you need to bond with multiple set members, make sure that BT_MAX_PAIRED is correctly configured.

#### Using the Set Coordinator  When the Bluetooth stack has been initialized (bt init), and a set member device has been connected, the call control client can be initialized by calling csip_set_coordinator init, which will start a discovery for the TBS uuids and store the handles, and optionally subscribe to all notifications (default is to subscribe to all).
Once the client has connected and discovered the handles, then it can read the set information, which is needed to identify other set members. The client can then scan for and connect to the remaining set members, and once all the members have been connected to, it can lock and release the set.

It is necessary to enable `BT_DEBUG_CSIP_SET_COORDINATOR` to properly use the set coordinator.

```
csip_set_coordinator --help
```

### Subcommands:

- `init`: Initialize CSIP_SET_COORDINATOR
- `discover`: Run discover for CSIS on peer device [member_index]
- `discover_members`: Scan for set members <set_pointer>
- `lock_set`: Lock set
- `release_set`: Release set
- `lock`: Lock specific member [member_index]
- `release`: Release specific member [member_index]
- `lock_get`: Get the lock value of the specific member and instance [member_index [inst_idx]]

### Example usage

#### Setup

```
uart:~$ init
```
```
```

#### When connected  Discovering sets on a device:

```
uart:~$ csip_set_coordinator init
```
```
<dbg> bt_csip_set_coordinator.primary_discover_func: [ATTRIBUTE] handle 0x0048
<dbg> bt_csip_set_coordinator.primary_discover_func: Discover complete, found 1 instances
<dbg> bt_csip_set_coordinator.discover_func: Setup complete for 1 / 1
Found 1 sets on device
```
```
uart:~$ csip_set_coordinator discover_sets
```
```
<dbg> bt_csip_set_coordinator.Set SIRK
36 04 9a dc 66 3a a1 01 73 3e 01 |6...f:..
1d 9a 2f 41 01 73 3e 01 |..A.s>
<dbg> bt_csip_set_coordinator.csip_set_coordinator_discover_sets_read_set_size_cb: 2
<dbg> bt_csip_set_coordinator.csip_set_coordinator_discover_sets_read_set_lock_cb: 1
<dbg> bt_csip_set_coordinator.csip_set_coordinator_discover_sets_read_rank_cb: 1
Set size 2 (pointer: 0x566fdfe8)
```

Discover set members, based on the set pointer above:

```
uart:~$ csip_set_coordinator discover_members 0x566fdfe8
```
```
<dbg> bt_csip_set_coordinator.csip_found: Found CSIS advertiser with address...
<dbg> bt_csip_set_coordinator.is_set_member: hash: 0x33ccb1, prand 0x5bfe6a
<dbg> bt_csip_set_coordinator.is_discovered: 34:02:86:03:86:c0 (public)
<dbg> bt_csip_set_coordinator.is_discovered: 34:13:e8:b3:7f:9e (public)
<dbg> bt_csip_set_coordinator.csip_found: Found member (2 / 2)
Discovered 2/2 set members
```

Lock set members:

```
uart:~$ csip_set_coordinator lock_set
```
```
<dbg> bt_csip_set_coordinator.bt_csip_set_coordinator_lock_set: Connecting to...
```
(continues on next page)
Release set members:

```
>>> csip_set_coordinator release_set
<dbg> bt_csip_set_coordinator.csip_set_coordinator_release_highest_rank: Releasing member
<dbg> bt_csip_set_coordinator.notify_func: Instance 0 lock was released
<dbg> bt_csip_set_coordinator.csip_set_coordinator_release_highest_rank: Releasing member
<dbg> bt_csip_set_coordinator.notify_func: Instance 0 lock was released
Set released
```

**Coordinated Set Member (Server)** The server on devices that are part of a set, consisting of at least two devices, e.g. a pair of earbuds.

**Using the Set Member**

```
csip_set_member --help
```

*register*: Initialize the service and register callbacks [size <int>]

*update_psri*: Update the advertised PSRI

*lock*: Lock the set

*release*: Release the set [force]

*print_sirk*: Print the currently used SIRK

*set_sirk_rsp*: Set the response used in SIRK requests <accept, accept_enc, reject, oob>

**Example Usage**

**Setup**

```
uart:~$ bt init
uart:~$ csip_set_member register
```
Bluetooth: Gaming Audio Profile Shell

This document describes how to run the Gaming Audio Profile shell functionality. Unlike most other low-layer profiles, GMAP is a profile that exists and has a service (GMAS) on all devices. Thus both the initiator and acceptor (or central and peripheral) should do a discovery of the remote device’s GMAS to see what GMAP roles and features they support.

Using the GMAP Shell  When the Bluetooth stack has been initialized (bt init), the GMAS can be registered by by calling gmap init. It is also strongly suggested to enable BAP via bap init.

```
gmap --help
```

gmap - Bluetooth GMAP shell commands

Subcommands:
  init    :[none]
  set_role :[ugt | ugg | bgr | bgs]
  discover :[none]
  ac_1    :<sink preset>
  ac_2    :<source preset>
  ac_3    :<sink preset> <source preset>
  ac_4    :<sink preset>
  ac_5    :<sink preset> <source preset>
  ac_6_i  :<sink preset>
  ac_6_ii :<sink preset>
  ac_7_ii :<sink preset> <source preset>
  ac_8_i  :<sink preset> <source preset>
  ac_8_ii :<sink preset> <source preset>
  ac_11_i :<sink preset> <source preset>
  ac_11_ii :<sink preset> <source preset>
  ac_12   :<preset>
  ac_13   :<preset>
  ac_14   :<preset>

The set_role command can be used to change the role at runtime, assuming that the device supports the role (the GMAP roles depend on some BAP configurations).

Example Central with GMAP UGT role  Connect and establish Gaming Audio streams using Audio Configuration (AC) 3 (some logging has been omitted for clarity):

```
uart:~$ bt init
uart:~$ bap init
uart:~$ gmap init
uart:~$ bt connect <address>
uart:~$ gatt exchange-mtu
uart:~$ bap discover
Discover complete: err 0
uart:~$ cap_initiator discover
discovery completed with CSIS
uart:~$ gmap discover
```

gmap discovered for conn 0x2001c7d8:
role 0xf
  ugg_feat 0x07
  ugt_feat 0x0f
  bgs_feat 0x81
  bgr_feat 0x03
uart:~$ gmap ac_3 32_2_gr 32_2_gs
Starting 2 streams for AC_3
stream 0x20020060 config operation rsp_code 0 reason 0
stream 0x200204d0 config operation rsp_code 0 reason 0

```

(continues on next page)
stream 0x20020060 qos operation rsp_code 0 reason 0
Stream 0x20020060 enabled
stream 0x200204d0 enable operation rsp_code 0 reason 0
Stream 0x200204d0 enabled
stream 0x20020060 enable operation rsp_code 0 reason 0
Stream 0x20020060 started
stream 0x200204d0 start operation rsp_code 0 reason 0
Stream 0x200204d0 started
Unicast start completed
uart:~$ bap start_sine
Started transmitting on default_stream 0x20020060
[0]: stream 0x20020060 : TX LC3: 80 (seq_num 24800)

Bluetooth: Isochronous Channels

Commands

iso --help
iso - Bluetooth ISO shell commands
Subcommands:
  cig_create :[dir=tx,rx,txrx] [interval] [packing] [framing] [latency] [sdu]
               [phy] [rtn]
  cig_term :Terminate the CIG
  connect :Connect ISO Channel
  listen :<dir=tx,rx,txrx> [security level]
  send :Send to ISO Channel [count]
  disconnect :Disconnect ISO Channel
  create-big :Create a BIG as a broadcaster [enc <broadcast code>]
  broadcast :Broadcast on ISO channels
  sync-big :Synchronize to a BIG as a receiver <BIS bitfield> [mse] [timeout]
             [enc <broadcast code>]
  term-big :Terminate a BIG

1. [Central] Create CIG:

Requires to be connected:

uart:~$ iso cig_create
CIG created

2. [Peripheral] Listen to ISO connections

uart:~$ iso listen txrx

3. [Central] Connect ISO channel:

uart:~$ iso connect
ISO Connect pending...
ISO Channel 0x20000f88 connected

4. Send data:

uart:~$ iso send
send: 40 bytes of data
ISO sending...

5. Disconnect ISO channel:

uart:~$ iso disconnect
ISO Disconnect pending...
ISO Channel 0x20000f88 disconnected with reason 0x16

6.1. Bluetooth
Media control for Generic Audio Content Control

This document describes how to run the media control functionality, using the shell, both as a client and as a server.

The media control server consists of two parts. There is a media player (mpl) that contains the logic to handle media, and there is a media control service (mcs) that serves as a GATT-based interface to the player. The media control client consists of one part, the GATT-based client (mcc).

The media control server may include an object transfer service (ots) and the media control client may include an object transfer client (otc). When these are included, a richer set of functionality is available.

The media control server and client both implement the Generic Media Control Service (only), and do not use any underlying Media Control Services.

Note that in the examples below, in many cases the debug output has been removed and long outputs may have been shortened to make the examples shorter and clearer.

Also note that this documentation does not list all shell commands, it just shows examples of some of them. The set of commands is exploratory from the mcc shell and the mpl shell, by typing mcc or mpl and pressing TAB. A help text for each command can be found by doing mcc <command> help or mpl <command> help.

Overview

A media player has a name and an icon that allows identification of the player for the user.

The content of the media player is structured into tracks and groups. A media player has a number of groups. A group contains tracks and other groups. (In this implementation, a group only contains tracks, not other groups.) Tracks can be divided into segments.

An active player will have a current track. This is the track that is playing now (if the player is playing). The current track has a title, a duration (given in hundredths of a second) and a position - the current position of the player within the track.

There is also a current group (the group of the current track), a parent group (the parent group of the current group) and a next track.

The media player is in a state, which will be one of playing, paused, seeking or inactive. When playing, playback happens at a given playback speed, and the tracks are played according to the playing order, which is one of the playing orders supported. Track changes are signalled as notifications of the track changed characteristic. When seeking (fast forward or fast rewind), the track position is moved according to the seeking speed.

The opcodes supported tells which operations are supported by the player by writing to the media control point. There is also a search control point that allows to search for groups and tracks according to various criteria, with the result returned in the search results.

Finally, the content control ID is used to associate the media player with an audio stream.

Media Control Client (MCP) The media control client is used to control, and to get information from, a media control server. Control is done by writing to one of the two control points, or by writing to other writable characteristics. Getting information is done by reading characteristics, or by configuring the server to send notifications.

Using the media control client Before use, the media control client must be initialized by the command mcc init.

To achieve a connection to the peer, the bt commands must be used - bt init followed by bt advertise on (or bt connect if the server is advertising).
When the media control client is connected to a media control server, the client can discover the server's Generic Media Control Service, by giving the command `mcc discover_mcs`. This will store the handles of the service, and (optionally, but default) subscribe to all notifications.

After discovery, the media control client can read and write characteristics, including the media control point and the search control point.

**Example usage**

**Setup**

```
uart:~$ bt init
Bluetooth initialized

uart:~$ mcc init
MCC init complete

uart:~$ bt advertise on
Advertising started
```

**When connected  Service discovery (GMCS and included OTS):**

```
uart:~$ mcc discover_mcs
<dbg> bt_mcc.bt_mcc_discover_mcs: start discovery of MCS primary service
<dbg> bt_mcc.discover_primary_func: [ATTRIBUTE] handle 0x00ae
<dbg> bt_mcc.discover_primary_func: Primary discovery complete
<dbg> bt_mcc.discover_primary_func: UUID: 2800
<dbg> bt_mcc.discover_primary_func: UUID: 8fd7
<dbg> bt_mcc.discover_primary_func: Start discovery of MCS characteristics
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b0
<dbg> bt_mcc.discover_mcs_char_func: Player name, UUID: 8fa0
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b2
<dbg> bt_mcc.discover_mcs_char_func: Icon Object, UUID: 8fa1

<dbg> bt_mcc.discover_mcs_char_func: Subscribing - handle: 0x00b6 
[...]
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00ea
<dbg> bt_mcc.discover_mcs_char_func: Content Control ID, UUID: 8fb5
<dbg> bt_mcc.discover_mcs_char_func: Setup complete for MCS
<dbg> bt_mcc.discover_mcs_char_func: Start discovery of included services
<dbg> bt_mcc.discover_include_func: [ATTRIBUTE] handle 0x00af
<dbg> bt_mcc.discover_include_func: Include UUID 1825
<dbg> bt_mcc.discover_include_func: Discover include complete for MCS: OTS
<dbg> bt_mcc.discover_include_func: Start discovery of OTS characteristics
<dbg> bt_mcc.discover_otc_char_func: [ATTRIBUTE] handle 0x009c
<dbg> bt_mcc.discover_otc_char_func: OTS Features 
[...]
<dbg> bt_mcc.discover_otc_char_func: [ATTRIBUTE] handle 0x00ac
<dbg> bt_mcc.discover_otc_char_func: Object Size
Discovery complete
<dbg> bt.otc.bt.otc_register: 0
<dbg> bt.otc.bt.otc_register: L2CAP psm 0x 25 sec_level 1 registered
<dbg> bt.mcc.discover_otc_char_func: Setup complete for OTS 1 / 1
```

Reading characteristics - the player name and the track duration as examples:
uart:~$ mcc read_player_name
Player name: My media player
4d 79 20 6d 65 64 69 61 20 70 6c 61 79 65 72 |My media player

uart:~$ mcc read_track_duration
Track duration: 6300

Note that the value of some characteristics may be truncated due to being too long to fit in the ATT packet. Increasing the ATT MTU may help:

uart:~$ mcc read_track_title
Track title: Interlude #1 (Song for
uart:~$ gatt exchange-mtu
Exchange pending
Exchange successful
uart:~$ mcc read_track_title
Track title: Interlude #1 (Song for Alison)

Writing characteristics - track position as an example:

The track position is where the player “is” in the current track. Read the track position, change it by writing to it, confirm by reading it again.

uart:~$ mcc read_track_position
Track Position: 0

uart:~$ mcc set_track_position 500
Track Position: 500

uart:~$ mcc read_track_position
Track Position: 500

Controlling the player via the control point:

Writing to the control point allows the client to request the server to do operations like play, pause, fast forward, change track, change group and so on. Some operations (e.g. goto track) take an argument. Currently, raw opcode values are used as input to the control point shell command. These opcode values can be found in the mpl.h header file.

Send the play command (opcode “1”), the command to go to track (opcode “52”) number three, and the pause command (opcode “2”):

uart:~$ mcc set_cp 1
Media State: 1
Operation: 1, result: 1
Operation: 1, param: 0

uart:~$ mcc set_cp 52 3
Track changed
Track title: Interlude #3 (Levanto Seventy)
Track duration: 7800
Track Position: 0
Current Track Object ID: 0x000000000104
Next Track Object ID: 0x000000000105
Operation: 52, result: 1
Operation: 52, param: 3

uart:~$ mcc set_cp 2
Media State: 2
Operation: 2, result: 1
Operation: 2, param: 0
Using the included object transfer client  When object transfer is supported by both the client and the server, a larger set of characteristics is available. These include object IDs for the various track and group objects. These IDs can be used to select and download the corresponding objects from the server's object transfer service.

Read the object ID of the current group object:

```
uart:$ mcc read_current_group_obj_id
Current Group Object ID: 0x000000000107
```

Select the object with that ID:

```
uart:$ mcc ots_select 0x107
Selecting object succeeded
```

Read the object's metadata:

```
uart:$ mcc ots_read_metadata
Reading object metadata succeeded
<inf> bt_mcc: Object's meta data:
<inf> bt_mcc: Current size :35
<inf> bt_ots: Displaying 1 metadata records ---
<inf> bt_ots: Object ID: 0x000000000107
<inf> bt_ots: Object name: Joe Pass - Guitar Inte
<inf> bt_ots: Object Current Size: 35
<inf> bt_ots: Object Allocate Size: 35
<inf> bt_ots: Type: Group Obj Type
<inf> bt_ots: Properties:0x4
<inf> bt_ots: - read permitted
```

Read the object itself:

The object received is a group object. It consists of a series of records consisting of a type (track or group) and an object ID.

```
uart:$ mcc ots_read_current_group_object
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000102
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000103
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000104
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000105
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000106
```

Search  The search control point takes as its input a sequence of search control items, each consisting of length, type (e.g. track name or artist name) and parameter (the track name or artist name to search for). If the result is successful, the search results are stored in an object in the object transfer service. The ID of the search results ID object can be read from the search results object ID characteristic. The search result object can then be downloaded as for the current group object above. (Note that the search results object ID is empty until a search has been done.)

This implementation has a working implementation of the search functionality interface and the server-side search control point parameter parsing. But the actual searching is faked, the same results are returned no matter what is searched for.

There are two commands for search, one (mcc set_scp_raw) allows to input the search control point parameter (the sequence of search control items) as a string. The other (mcc set_scp_ioptest) does preset IOP test searches and takes the round number of the IOP search control point test as a parameter.

Before the search, the search results object ID is empty

6.1. Bluetooth
Run the search corresponding to the fourth round of the IOP test:

The search control point parameter generated by this command and parameter has one search control item. The length field (first octet) is 16 (0x10). (The length of the length field itself is not included.) The type field (second octet) is 0x04 (search for a group name). The parameter (the group name to search for) is “TSPX_Group_Name”.

After the successful search, the search results object ID has a value:

Media Control Service (MCS)  The media control service (mcs) and the associated media player (mpl) typically reside on devices that can provide access to, and serve, media content, like PCs and smartphones.

As mentioned above, the media player (mpl) has the player logic, while the media control service (mcs) has the GATT-based interface. This separation is done so that the media player can also be used without the GATT-based interface.

Using the media control service and the media player  The media control service and the media player are in general controlled remotely, from the media control client.

Before use, the media control client must be initialized by the command mpl init.

As for the client, the bt commands are used for connecting - bt init followed by bt connect <address> <address type> (or bt advertise on if the server is advertising).

Example Usage

Setup

When connected  Control is done from the client.

The server will give debug output related to the various operations performed by the client.
Example: Debug output by the server when the client gives the “next track” command:

```
[00:13:29.932,373] <dbg> bt_mcs.control_point_write: Opcode: 49
[00:13:29.932,403] <dbg> bt_mpl.paused_state_operation_handler: Operation opcode: 49
[00:13:29.932,495] <dbg> bt_mpl.do_next_track: Track ID before: 0x000000000104
[00:13:29.932,586] <dbg> bt_mpl.do_next_track: Track ID after: 0x000000000105
[00:13:29.932,617] <dbg> bt_mpl.paused_state_operation_handler: Operation opcode: 49
[00:13:29.932,708] <dbg> bt_mpl.do_next_track: Track ID after: 0x000000000105
[00:13:29.932,800] <dbg> bt_mpl.mpl_track_changed_cb: Notifying track change
[00:13:29.932,861] <dbg> bt_mpl.mpl_track_position_cb: Notifying track position: 0
[00:13:29.933,044] <dbg> bt_mpl.mpl_current_track_id_cb: Notifying current track ID:
[00:13:29.933,258] <dbg> bt_mpl.mpl_next_track_id_cb: Notifying next track ID:
```

Some server commands are available. These commands force notifications of the various characteristics, for testing that the client receives notifications. The values sent in the notifications caused by these testing commands are independent of the media player, so they do not correspond the actual values of the characteristics nor to the actual state of the media player.

Example: Force (fake value) notification of the track duration:

```
uart:~$ mpl duration_changed_cb
[00:15:17.491,058] <dbg> bt_mcs.mpl_track_duration_cb: Notifying track duration: 12000
```

### Bluetooth: Telephone and Media Audio Profile Shell

This document describes how to run the Telephone and Media Audio Profile functionality. Unlike most other low-layer profiles, TMAP is a profile that exists and has a service (TMAS) on all devices. Thus both the initiator and acceptor (or central and peripheral) should do a discovery of the remote device’s TMAS to see what TMAP roles they support.

**Using the TMAP Shell**  When the Bluetooth stack has been initialized (`bt init`), the TMAS can be registered by calling `tmap init`.

```
tmap --help
mmap - Bluetooth TMAP shell commands
Subcommands:
  init :Initialize and register the TMAS
  discover :Discover TMAS on remote device
```

### Bluetooth: Public Broadcast Profile Shell

This document describes how to run the Public Broadcast Profile functionality. PBP does not have an associated service. Its purpose is to enable a faster, more efficient discovery of Broadcast Sources that are transmitting audio with commonly used codec configurations.

**Using the PBP Shell**  When the Bluetooth stack has been initialized (`bt init`), the Public Broadcast Profile is ready to run. To set the Public Broadcast Announcement features call `pbp set_features`.

6.1. Bluetooth
pbp --help
pbp - Bluetooth PBP shell commands
Subcommands:
  set_features : Set the Public Broadcast Announcement features

6.1.11 Bluetooth Shell

The Bluetooth Shell is an application based on the Shell module. It offer a collection of commands made to easily interact with the Bluetooth stack.

Bluetooth Shell Setup and Usage

First you need to build and flash your board with the Bluetooth shell. For how to do that, see the Getting Started Guide. The Bluetooth shell itself is located in tests/bluetooth/shell/.

When it’s done, connect to the CLI using your favorite serial terminal application. You should see the following prompt:

uart:~$

For more details on general usage of the shell, see Shell.

The first step is enabling Bluetooth. To do so, use the bt init command. The following message is printed to confirm Bluetooth has been initialized.

uart:~$ bt init
Bluetooth initialized
Settings Loaded
[00:02:26.771,148] <inf> fs_nvs: nvs_mount: 8 Sectors of 4096 bytes
[00:02:26.771,148] <inf> fs_nvs: nvs_mount: alloc wra: 0, fe8
[00:02:26.771,179] <inf> fs_nvs: nvs_mount: data wra: 0, 0
[00:02:26.777,984] <inf> bt_hci_core: hci_vs_init: HW Platform: Nordic Semiconductor → (0x0002)
[00:02:26.778,015] <inf> bt_hci_core: hci_vs_init: HW Variant: nRF52x (0x0002)
[00:02:26.778,045] <inf> bt_hci_core: hci_vs_init: Firmware: Standard Bluetooth controller → (0x00) Version 3.2 Build 99
[00:02:26.778,656] <inf> bt_hci_core: bt_init: No ID address. App must call settings_load()
[00:02:26.794,769] <inf> bt_hci_core: bt_dev_show_info: HCI: version 5.3 (0x0c) revision → 0x0000, manufacturer 0x05f1
[00:02:26.794,799] <inf> bt_hci_core: bt_dev_show_info: LMP: version 5.3 (0x0c) subver → 0xffff

Identities

Identities are a Zephyr host concept, allowing a single physical device to behave like multiple logical Bluetooth devices.

The shell allows the creation of multiple identities, to a maximum that is set by the Kconfig symbol CONFIG_BT_ID_MAX. To create a new identity, use bt id-create command. You can then use it by selecting it with its ID bt id-select <id>. Finally, you can list all the available identities with id-show.
Scan for devices

Start scanning by using the `bt scan` command. Depending on the environment you’re in, you may see a lot of lines printed on the shell. To stop the scan, run `bt scan off`, the scrolling should stop.

Here is an example of what you can expect:

```
uart:~$ bt scan on
Bluetooth active scan enabled
[DEVICE]: CB:01:1A:2D:6E:AE (random), AD evt type 0, RSSI -78 C:1 S:1 D:0 SR:0 E:0 Prim:
  → LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 28:C2:EE:59:85:5B (random), AD evt type 3, RSSI -62 C:0 S:0 D:0 SR:0 E:0 Prim:
  → LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: E3:72:76:87:2F:E8 (random), AD evt type 3, RSSI -74 C:0 S:0 D:0 SR:0 E:0 Prim:
  → LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 1E:19:25:8A:CB:84 (random), AD evt type 3, RSSI -67 C:0 S:0 D:0 SR:0 E:0 Prim:
  → LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 26:42:F3:D5:A0:86 (random), AD evt type 3, RSSI -73 C:0 S:0 D:0 SR:0 E:0 Prim:
  → LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 0C:61:D1:B9:5D:9E (random), AD evt type 3, RSSI -87 C:0 S:0 D:0 SR:0 E:0 Prim:
  → LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
uart:~$ bt scan off
Scan successfully stopped
```

As you can see, this can lead to a high number of results. To reduce that number and easily find a specific device, you can enable scan filters. There are four types of filters: by name, by RSSI, by address and by periodic advertising interval. To apply a filter, use the `bt scan-set-filter` command followed by the type of filters. You can add multiple filters by using the commands again.

For example, if you want to look only for devices with the name `test shell`:

```
uart:~$ bt scan-filter-set name "test shell"
```

Or if you want to look for devices at a very close range:

```
uart:~$ bt scan-filter-set rssi -40
RSSI cutoff set at -40 dB
```

Finally, if you want to remove all filters:

```
uart:~$ bt scan-filter-clear all
```

You can use the command `bt scan on` to create an active scanner, meaning that the scanner will ask the advertisers for more information by sending a scan request packet. Alternatively, you can create a passive scanner by using the `bt scan passive` command, so the scanner will not ask the advertiser for more information.

Connecting to a device

To connect to a device, you need to know its address and type of address and use the `bt connect` command with the address and the type as arguments.

Here is an example:
You can list the active connections of the shell using the `bt connections` command. The shell maximum number of connections is defined by `CONFIG_BT_MAX_CONN`. You can disconnect from a connection with the `bt disconnect <address: XX:XX:XX:XX:XX:XX> <type: (public|random)>` command.

**Note:** If you were scanning just before, you can connect to the last scanned device by simply running the `bt connect` command.

Alternatively, you can use the `bt connect-name <name>` command to automatically enable scanning with a name filter and connect to the first match.

### Advertising

Begin advertising by using the `bt advertise on` command. This will use the default parameters and advertise a resolvable private address with the name of the device. You can choose to use the identity address instead by running the `bt advertise on identity` command. To stop advertising use the `bt advertise off` command.

To enable more advanced features of advertising, you should create an advertiser using the `bt adv-create` command. Parameters for the advertiser can be passed either at the creation of it or by using the `bt adv-param` command. To begin advertising with this newly created advertiser, use the `bt adv-start` command, and then the `bt adv-stop` command to stop advertising.

When using the custom advertisers, you can choose if it will be connectable or scannable. This leads to four options: `conn-scan`, `conn-nscan`, `nconn-scan` and `nconn-nscan`. Those parameters are mandatory when creating an advertiser or updating its parameters.

For example, if you want to create a connectable and scannable advertiser and start it:

```
uart:~$ bt adv-create conn-scan
Created adv id: 0, adv: 0x200022f0
uart:~$ bt adv-start
Advertiser[0] 0x200022f0 set started
```

You may notice that with this, the custom advertiser does not advertise the device name; you need to enable it. Continuing from the previous example:

```
uart:~$ bt adv-stop
Advertiser set stopped
uart:~$ bt adv-param conn-scan name
uart:~$ bt adv-start
Advertiser[0] 0x200022f0 set started
```

You should now see the name of the device in the advertising data. You can also set the advertising data manually by using the `bt adv-data` command. The following example shows how to set the advertiser name with it:

```
uart:~$ bt adv-create conn-scan
Created adv id: 0, adv: 0x20002348
uart:~$ bt adv-data 1009426C7565746F6F74682D5368656C6C
```

(continues on next page)
The data must be formatted according to the Bluetooth Core Specification (see version 5.3, vol. 3, part C, 11). In this example, the first octet is the size of the data (the data and one octet for the data type), the second one is the type of data, 0x09 is the Complete Local Name and the remaining data are the name in ASCII. So, on the other device you should see the name Bluetooth-Shell.

When advertising, if others devices use an active scanner, you may receive scan request packets. To visualize those packets, you can add scan-reports to the parameters of your advertiser.

**Directed Advertising**  It is possible to use directed advertising on the shell if you want to reconnect to a device. The following example demonstrates how to create a directed advertiser with the address specified right after the parameter directed. The low parameter indicates that we want to use the low duty cycle mode, and the dir-rpa parameter is required if the remote device is privacy-enabled and supports address resolution of the target address in directed advertisement.

```
uart:~$ bt adv-create conn-scan directed D7:54:03:CE:F3:B4 random low dir-rpa
Created adv id: 0, adv: 0x20002348
```

After that, you can start the advertiser and then the target device will be able to reconnect.

**Extended Advertising**  Let's now have a look at some extended advertising features. To enable extended advertising, use the ext-adv parameter.

```
uart:~$ bt adv-create conn-nscan ext-adv name-ad
Created adv id: 0, adv: 0x200022f0
```

This will create an extended advertiser, that is connectable and non-scannable.

**Filter Accept List**

It's possible to create a list of allowed addresses that can be used to connect to those addresses automatically. Here is how to do it:

```
uart:~$ bt fal-add 66:C8:B0:2A:05:73 random
uart:~$ bt fal-connect on
```

The shell will then connect to the first available device. In the example, if both devices are advertising at the same time, we will connect to the first address added to the list.

The Filter Accept List can also be used for scanning or advertising by using the option fal. For example, if we want to scan for a bunch of selected addresses, we can set up a Filter Accept List:

```
uart:~$ bt fal-add 65:4B:9E:83:AF:73 random
uart:~$ bt fal-add 5D:85:50:1C:72:64 random
uart:~$ bt scan on fal
```

You should see only those three addresses reported by the scanner.
Enabling security

When connected to a device, you can enable multiple levels of security, here is the list for Bluetooth LE:

- 1 No encryption and no authentication;
- 2 Encryption and no authentication;
- 3 Encryption and authentication;
- 4 Bluetooth LE Secure Connection.

To enable security, use the `bt security <level>` command. For levels requiring authentication (level 3 and above), you must first set the authentication method. To do it, you can use the `bt auth all` command. After that, when you will set the security level, you will be asked to confirm the passkey on both devices. On the shell side, do it with the command `bt auth-passkey-confirm`.

Pairing

Enabling authentication requires the devices to be bondable. By default the shell is bondable. You can make the shell not bondable using `bt bondable off`. You can list all the devices you are paired with using the command `bt bonds`.

The maximum number of paired devices is set using `CONFIG_BT_MAX_PAIRED`. You can remove a paired device using `bt clear <address: XX:XX:XX:XX:XX:XX> <type: (public|random)>` or remove all paired devices with the command `bt clear all`.

GATT

The following examples assume that you have two devices already connected.

To perform service discovery on the client side, use the `gatt discover` command. This should print all the services that are available on the GATT server.

On the server side, you can register pre-defined test services using the `gatt register` command. When done, you should see the newly added services on the client side when running the discovery command.

You can now subscribe to those new services on the client side. Here is an example on how to subscribe to the test service:

```
uart:~$ gatt subscribe 26 25
Subscribed
```

The server can now notify the client with the command `gatt notify`.

Another option available through the GATT command is initiating the MTU exchange. To do it, use the `gatt exchange-mtu` command. To update the shell maximum MTU, you need to update Kconfig symbols in the configuration file of the shell. For more details, see `bluetooth_mtu_update_sample`.

L2CAP

The `l2cap` command exposes parts of the L2CAP API. The following example shows how to register a LE PSM, connect to it from another device and send 3 packets of 14 octets each.

The example assumes that the two devices are already connected.

On device A, register the LE PSM:

```
uart:~$ l2cap register 29
L2CAP psm 41 sec_level 1 registered
```
On device B, connect to the registered LE PSM and send data:

```
uart:~$ l2cap connect 29
Chan sec: 1
L2CAP connection pending
Channel 0x20000210 connected
Channel 0x20000210 status 1
uart:~$ l2cap send 3 14
Rem 2
Rem 1
Rem 0
Outgoing data channel 0x20000210 transmitted
Outgoing data channel 0x20000210 transmitted
Outgoing data channel 0x20000210 transmitted
```

On device A, you should have received the data:

```
Incoming conn 0x20002398
Channel 0x20000210 status 1
Channel 0x20000210 connected
Channel 0x20000210 requires buffer
Incoming data channel 0x20000210 len 14
00000000: ff ff ff ff ff ff ff ff ff ff ff ff ff ff |........ ...... |
Channel 0x20000210 requires buffer
Incoming data channel 0x20000210 len 14
00000000: ff ff ff ff ff ff ff ff ff ff ff ff ff ff |........ ...... |
Channel 0x20000210 requires buffer
Incoming data channel 0x20000210 len 14

```

**Logging**

You can configure the logging level per module at runtime. This depends on the maximum logging level that is compiled in. To configure, use the `log` command. Here are some examples:

- List the available modules and their current logging level

```
uart:~$ log status
```

- Disable logging for `bt_hci_core`

```
uart:~$ log disable bt_hci_core
```

- Enable error logs for `bt_att` and `bt_smp`

```
uart:~$ log enable err bt_att bt_smp
```

- Disable logging for all modules

```
uart:~$ log disable
```

- Enable warning logs for all modules

```
uart:~$ log enable wrn
```

## 6.2 Controller Area Network (CAN) Bus Protocols
6.2.1 ISO-TP Transport Protocol

Overview

ISO-TP is a transport protocol defined in the ISO-Standard ISO15765-2 Road vehicles - Diagnostic communication over Controller Area Network (DoCAN). Part2: Transport protocol and network layer services. As its name already implies, it is originally designed, and still used in road vehicle diagnostic over Controller Area Networks. Nevertheless, it's not limited to applications in road vehicles or the automotive domain.

This transport protocol extends the limited payload data size for classical CAN (8 bytes) and CAN FD (64 bytes) to theoretically four gigabytes. Additionally, it adds a flow control mechanism to influence the sender's behavior. ISO-TP segments packets into small fragments depending on the payload size of the CAN frame. The header of those segments is called Protocol Control Information (PCI).

Packets smaller or equal to seven bytes on Classical CAN are called single-frames (SF). They don't need to fragment and do not have any flow-control.

Packets larger than that are segmented into a first-frame (FF) and as many consecutive-frames (CF) as required. The FF contains information about the length of the entire payload data and additionally, the first few bytes of payload data. The receiving peer sends back a flow-control-frame (FC) to either deny, postpone, or accept the following consecutive frames. The FC also defines the conditions of sending, namely the block-size (BS) and the minimum separation time between frames (STmin). The block size defines how many CF the sender is allowed to send, before he has to wait for another FC.

API Reference

Related code samples

ISO-TP library
Use ISO-TP library to exchange messages between two boards.

group can_isotp
CAN ISO-TP Protocol.

ISO-TP message ID flags
**ISOTP_MSG_EXT_ADDR**
Message uses ISO-TP extended addressing (first payload byte of CAN frame)

**ISOTP_MSG_FIXED_ADDR**
Message uses ISO-TP fixed addressing (according to SAE J1939).
Only valid in combination with **ISOTP_MSG_IDE**.

**ISOTP_MSG_IDE**
Message uses extended (29-bit) CAN ID.

**ISOTP_MSG_FDF**
Message uses CAN FD format (FDF)

**ISOTP_MSG_BRS**
Message uses CAN FD Baud Rate Switch (BRS).
Only valid in combination with **ISOTP_MSG_FDF**.

**Defines**

**ISOTP_N_OK**
Completed successfully.

**ISOTP_N_TIMEOUT_A**
Ar/As has timed out.

**ISOTP_N_TIMEOUT_BS**
Reception of next FC has timed out.

**ISOTP_N_TIMEOUT_CR**
Cr has timed out.

**ISOTP_N_WRONG_SN**
Unexpected sequence number.

**ISOTP_N_INVALID_FS**
Invalid flow status received.

**ISOTP_N_UNEXP_PDU**
Unexpected PDU received.

**ISOTP_N_WFT_OVRN**
Maximum number of WAIT flowStatus PDUs exceeded.

**ISOTP_N_BUFFER_OVFLW**
FlowStatus OVFLW PDU was received.

6.2. Controller Area Network (CAN) Bus Protocols
ISOTP_N_ERROR
   General error.

ISOTP_NO_FREE_FILTER
   Implementation specific errors.
   Can't bind or send because the CAN device has no filter left

ISOTP_NO_NET_BUF_LEFT
   No net buffer left to allocate.

ISOTP_NO_BUF_DATA_LEFT
   Not sufficient space in the buffer left for the data.

ISOTP_NO_CTX_LEFT
   No context buffer left to allocate.

ISOTP_RECV_TIMEOUT
   Timeout for recv.

ISOTP_FIXED_ADDR_SA_POS
   Position of fixed source address (SA)

ISOTP_FIXED_ADDR_SA_MASK
   Mask to obtain fixed source address (SA)

ISOTP_FIXED_ADDR_TA_POS
   Position of fixed target address (TA)

ISOTP_FIXED_ADDR_TA_MASK
   Mask to obtain fixed target address (TA)

ISOTP_FIXED_ADDR_PRIO_POS
   Position of priority in fixed addressing mode.

ISOTP_FIXED_ADDR_PRIO_MASK
   Mask for priority in fixed addressing mode.

ISOTP_FIXED_ADDR_RX_MASK
   CAN filter RX mask to match any priority and source address (SA)

**Typedefs**

typedef void (*isotp_tx_callback_t)(int error_nr, void *arg)
   Transmission callback.
   This callback is called when a transmission is completed.

   **Param error_nr**
      ISOTP_N_OK on success, ISOTP_N_* on error
**Param arg**

Callback argument passed to the send function

**Functions**

```c
int isotp_bind(struct isotp_recv_ctx *rctx, const struct device *can_dev, const struct isotp_msg_id *rx_addr, const struct isotp_msg_id *tx_addr, const struct isotp_fc_opts *opts, k_timeout_t timeout)
```

Bind an address to a receiving context.

This function binds an RX and TX address combination to an RX context. When data arrives from the specified address, it is buffered and can be read by calling isotp_recv. When calling this routine, a filter is applied in the CAN device, and the context is initialized. The context must be valid until calling unbind.

**Parameters**

- `rctx` – Context to store the internal states.
- `can_dev` – The CAN device to be used for sending and receiving.
- `rx_addr` – Identifier for incoming data.
- `tx_addr` – Identifier for FC frames.
- `opts` – Flow control options.
- `timeout` – Timeout for FF SF buffer allocation.

**Return values**

- `ISOTP_N_OK` – on success
- `ISOTP_NO_FREE_FILTER` – if CAN device has no filters left.

```c
void isotp_unbind(struct isotp_recv_ctx *rctx)
```

Unbind a context from the interface.

This function removes the binding from isotp_bind. The filter is detached from the CAN device, and if a transmission is ongoing, buffers are freed. The context can be discarded safely after calling this function.

**Parameters**

- `rctx` – Context that should be unbound.

```c
int isotp_recv(struct isotp_recv_ctx *rctx, uint8_t *data, size_t len, k_timeout_t timeout)
```

Read out received data from fifo.

This function reads the data from the receive FIFO of the context. It blocks if the FIFO is empty. If an error occurs, the function returns a negative number and leaves the data buffer unchanged.

**Parameters**

- `rctx` – Context that is already bound.
- `data` – Pointer to a buffer where the data is copied to.
- `len` – Size of the buffer.
- `timeout` – Timeout for incoming data.

**Return values**

- `Number` – of bytes copied on success
- `ISOTP_RECV_TIMEOUT` – when “timeout” timed out
Get the net buffer on data reception.
This function reads incoming data into net-buffers. It blocks until the entire packet is received, BS is reached, or an error occurred. If BS was zero, the data is in a single `net_buf`. Otherwise, the data is fragmented in chunks of BS size. The net-buffers are referenced and must be freed with `net_buf_unref` after the data is processed.

**Parameters**
- `rctx` – Context that is already bound.
- `buffer` – Pointer where the `net_buf` pointer is written to.
- `timeout` – Timeout for incoming data.

**Return values**
- Remaining – data length for this transfer if BS > 0, 0 for BS = 0
- ISOTP_RECV_TIMEOUT – when “timeout” timed out
- ISOTP_N_* – on error

Send data.
This function is used to send data to a peer that listens to the tx_addr. An internal workqueue is used to transfer the segmented data. Data and context must be valid until the transmission has finished. If a complete_cb is given, this function is non-blocking, and the callback is called on completion with the return value as a parameter.

**Parameters**
- `sctx` – Context to store the internal states.
- `can_dev` – The CAN device to be used for sending and receiving.
- `data` – Data to be sent.
- `len` – Length of the data to be sent.
- `rx_addr` – Identifier for FC frames.
- `tx_addr` – Identifier for outgoing frames the receiver listens on.
- `complete_cb` – Function called on completion or NULL.
- `cb_arg` – Argument passed to the complete callback.

**Return values**
- ISOTP_N_OK – on success
- ISOTP_N_* – on error

```c
#include <isotp.h>
ISO-TP message id struct.
Used to pass addresses to the bind and send functions.
```
Public Members

union isotp_msg_id
  CAN identifier.
  
  If ISO-TP fixed addressing is used, isotp_bind ignores SA and priority sections and modifies TA section in flow control frames.

uint8_t ext_addr
  ISO-TP extended address (if used)

uint8_t dl
  ISO-TP frame data length (TX_DL for TX address or RX_DL for RX address).
  Valid values are 8 for classical CAN or 8, 12, 16, 20, 24, 32, 48 and 64 for CAN FD.
  0 will be interpreted as 8 or 64 (if ISOTP_MSG_FDF is set).
  The value for incoming transmissions (RX_DL) is determined automatically based on the received first frame and does not need to be set during initialization.

uint8_t flags
  Flags.

See also:

  ISOTP_MSG_FLAGS.

struct isotp_fc_opts
  #include <isotp.h> ISO-TP frame control options struct.
  Used to pass the options to the bind and send functions.

Public Members

uint8_t bs
  Block size.
  Number of CF PDUs before next CF is sent

uint8_t stmin
  Minimum separation time.
  Min time between frames

6.3 Networking

The networking section contains information regarding the network stack of the Zephyr kernel. Use the information to understand the principles behind the operation of the stacks and how they were implemented.
6.3.1 Overview

- **Supported Features**
- **Source Tree Layout**

**Supported Features**

The networking IP stack is modular and highly configurable via build-time configuration options. You can minimize system memory consumption by enabling only those network features required by your application. Almost all features can be disabled if not needed.

- **IPv6** The support for IPv6 is enabled by default. Various IPv6 sub-options can be enabled or disabled depending on networking needs.
  - Developer can set the number of unicast and multicast IPv6 addresses that are active at the same time.
  - The IPv6 address for the device can be set either statically or dynamically using SLAAC (Stateless Address Auto Configuration) (RFC 4862).
  - The system also supports multiple IPv6 prefixes and the maximum IPv6 prefix count can be configured at build time.
  - The IPv6 neighbor cache can be disabled if not needed, and its size can be configured at build time.
  - The IPv6 neighbor discovery support (RFC 4861) is enabled by default.
  - Multicast Listener Discovery v2 support (RFC 3810) is enabled by default.
  - IPv6 header compression (6lo) is available for IPv6 connectivity for Bluetooth IPSP (RFC 7668) and IEEE 802.15.4 networks (RFC 4944).

- **IPv4** The legacy IPv4 is supported by the networking stack. It cannot be used by IEEE 802.15.4 or Bluetooth IPSP as those network technologies support only IPv6. IPv4 can be used in Ethernet based networks. By default IPv4 support is disabled.
  - DHCP (Dynamic Host Configuration Protocol) client is supported (RFC 2131).
  - The IPv4 address can also be configured manually. Static IPv4 addresses are supported by default.

- **Dual stack support.** The networking stack allows a developer to configure the system to use both IPv6 and IPv4 at the same time.

- **UDP** User Datagram Protocol (RFC 768) is supported. The developer can send UDP datagrams (client side support) or create a listener to receive UDP packets destined to certain port (server side support).

- **TCP** Transmission Control Protocol (RFC 793) is supported. Both server and client roles can be used the application. The amount of TCP sockets that are available to applications can be configured at build time.

- **BSD Sockets API** Support for a subset of a BSD sockets compatible API is implemented. Both blocking and non-blocking datagram (UDP) and stream (TCP) sockets are supported.

- **Secure Sockets API** Experimental support for TLS/DTLS secure protocols and configuration options for sockets API. Secure functions for the implementation are provided by mbedTLS library.

- **MQTT** Message Queue Telemetry Transport (ISO/IEC PRF 20922) is supported. A sample mqtt-publisher client application for MQTT v3.1.1 is implemented.
Zephyr Project Documentation, Release 3.6.0-rc3

- **CoAP** Constrained Application Protocol (RFC 7252) is supported. Both coap-client and coap-server sample applications are implemented.

- **LWM2M** OMA Lightweight Machine-to-Machine Protocol (LwM2M specification 1.0.2) is supported via the “Bootstrap”, “Client Registration”, “Device Management & Service Enablement” and “Information Reporting” interfaces. The required core LwM2M objects are implemented as well as several IPSO Smart Objects. (LwM2M specification 1.1.1) is supported in similar manner when enabled with a Kconfig option. lwm2m-client sample implements the library as an example.

- **DNS** Domain Name Service (RFC 1035) client functionality is supported. Applications can use the DNS API to query domain name information or IP addresses from the DNS server. Both IPv4 (A) and IPv6 (AAAA) records can be queried. Both multicast DNS (mDNS) (RFC 6762) and link-local multicast name resolution (LLMNR) (RFC 4795) are supported.

- **Network Management API.** Applications can use network management API to listen management events generated by core stack when for example IP address is added to the device, or network interface is coming up etc.

- **Wi-Fi Management API.** Applications can use Wi-Fi management API to manage the interface, in example to connect to Wi-Fi network and to scan available Wi-Fi networks.

- **Wi-Fi Network Manager API.** Wi-Fi Network Managers can now register themselves to the Wi-Fi stack. The Network Managers can then implement the Wi-Fi Management API and manage the Wi-Fi interface.

- **Multiple Network Technologies.** The Zephyr OS can be configured to support multiple network technologies at the same time simply by enabling them in Kconfig: for example, Ethernet, Wi-Fi and 802.15.4 support. Note that no automatic IP routing functionality is provided between these technologies. Applications can send data according to their needs to desired network interface.

- **Minimal Copy Network Buffer Management.** It is possible to have minimal copy network data path. This means that the system tries to avoid copying application data when it is sent to the network.

- **Virtual LAN support.** Virtual LANs (VLANs) allow partitioning of physical ethernet networks into logical networks. See VLAN support for more details.

- **Network traffic classification.** The sent and received network packets can be prioritized depending on application needs. See traffic classification for more details.

- **Time Sensitive Networking.** The gPTP (generalized Precision Time Protocol) is supported. See gPTP support for more details.

- **Network shell.** The network shell provides helpers for figuring out network status, enabling/disabling features, and issuing commands like ping or DNS resolving. The net-shell is useful when developing network software. See network shell for more details.

Additionally these network technologies (link layers) are supported in Zephyr OS v1.7 and later:

- IEEE 802.15.4
- Bluetooth
- Ethernet
- SLIP (IP over serial line). Used for testing with QEMU. It provides ethernet interface to host system (like Linux) and test applications can be run in Linux host and send network data to Zephyr OS device.

**Source Tree Layout**

The networking stack source code tree is organized as follows:
subsys/net/ip/
This is where the IP stack code is located.

subsys/net/12/
This is where the IP stack layer 2 code is located. This includes generic support for Bluetooth IPSP adaptation, Ethernet, IEEE 802.15.4 and Wi-Fi.

subsys/net/lib/
Application-level protocols (DNS, MQTT, etc.) and additional stack components (BSD Sockets, etc.).

include/net/
Public API header files. These are the header files applications need to include to use IP networking functionality.

samples/net/
Sample networking code. This is a good reference to get started with network application development.

tests/net/
Test applications. These applications are used to verify the functionality of the IP stack, but are not the best source for sample code (see samples/net instead).

6.3.2 Network Stack Architecture

Network Packet Processing Statistics

This page describes how to get information about network packet processing statistics inside network stack.

Network stack contains infrastructure to figure out how long the network packet processing takes either in sending or receiving path. There are two Kconfig options that control this. For transmit (TX) path the option is called CONFIG_NET_PKT_TXTIME_STATS and for receive (RX) path the options is called CONFIG_NET_PKT_RXTIME_STATS. Note that for TX, all kind of network packet statistics is collected. For RX, only UDP, TCP or raw packet type network packet statistics is collected.

After enabling these options, the net stats network shell command will show this information:

<table>
<thead>
<tr>
<th>Statistic</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Avg TX net_pkt (11484)</td>
<td>time 67 us</td>
</tr>
<tr>
<td>Avg RX net_pkt (11474)</td>
<td>time 43 us</td>
</tr>
</tbody>
</table>

Note: The values above and below are from emulated qemu_x86 board and UDP traffic

The TX time tells how long it took for network packet from its creation to when it was sent to the network. The RX time tells the time from its creation to when it was passed to the application. The values are in microseconds. The statistics will be collected per traffic class if there are more than one transmit or receive queues defined in the system. These are controlled by CONFIG_NET_TC_TX_COUNT and CONFIG_NET_TC_RX_COUNT options.

If you enable CONFIG_NET_PKT_TXTIME_STATS_DETAIL or CONFIG_NET_PKT_RXTIME_STATS_DETAIL options, then additional information for TX or RX network packets are collected when the network packet traverses the IP stack.

After enabling these options, the net stats will show this information:

<table>
<thead>
<tr>
<th>Statistic</th>
<th>Value</th>
<th>Queue Times</th>
</tr>
</thead>
<tbody>
<tr>
<td>Avg TX net_pkt (18902)</td>
<td>time 63 us</td>
<td>[0-&gt;22-&gt;15-&gt;23=60 us]</td>
</tr>
<tr>
<td>Avg RX net_pkt (18892)</td>
<td>time 42 us</td>
<td>[0-&gt;9-&gt;6-&gt;11-&gt;13=39 us]</td>
</tr>
</tbody>
</table>
The numbers inside the brackets contain information how many microseconds it took for a network packet to go from previous state to next.

In the TX example above, the values are averages over 18902 packets and contain this information:

- Packet was created by application so the time is 0.
- Packet is about to be placed to transmit queue. The time it took from network packet creation to this state, is 22 microseconds in this example.
- The correct TX thread is invoked, and the packet is read from the transmit queue. It took 15 microseconds from previous state.
- The network packet was just sent and the network stack is about to free the network packet. It took 23 microseconds from previous state.
- In total it took on average 60 microseconds to get the network packet sent. The value 63 tells also the same information, but is calculated differently so there is slight difference because of rounding errors.

In the RX example above, the values are averages over 18892 packets and contain this information:

- Packet was created network device driver so the time is 0.
- Packet is about to be placed to receive queue. The time it took from network packet creation to this state, is 9 microseconds in this example.
- The correct RX thread is invoked, and the packet is read from the receive queue. It took 6 microseconds from previous state.
- The network packet is then processed and placed to correct socket queue. It took 11 microseconds from previous state.
- The last value tells how long it took from there to the application. Here the value is 13 microseconds.
- In total it took on average 39 microseconds to get the network packet sent. The value 42 tells also the same information, but is calculated differently so there is slight difference because of rounding errors.

The Zephyr network stack is a native network stack specifically designed for Zephyr OS. It consists of layers, each meant to provide certain services to other layers. Network stack functionality is highly configurable via Kconfig options.

### High level overview of the network stack

- **Network data flow**
  - Data receiving (RX)
  - Data sending (TX)
- Network packet processing statistics

### High level overview of the network stack

The network stack is layered and consists of the following parts:

- **Network Application.** The network application can either use the provided application-level protocol libraries or access the BSD socket API directly to create a network connection, send or receive data, and close a connection. The application can also use the network management API to configure the network and set related parameters such as network link options, starting a scan (when applicable), listen network configuration events, etc.
Fig. 12: Network stack overview
The network interface API can be used to set IP address to a network interface, taking the
network interface down, etc.

- **Network Protocols.** This provides implementations for various protocols such as
  - Application-level network protocols like CoAP, LWM2M, and MQTT. See application protocols chapter for information about them.
  - Core network protocols like IPv6, IPv4, UDP, TCP, ICMPv4, and ICMPv6. You access these protocols by using the BSD socket API.

- **Network Interface Abstraction.** This provides functionality that is common in all the network interfaces, such as setting network interface down, etc. There can be multiple network interfaces in the system. See network interface overview for more details.

- **L2 Network Technologies.** This provides a common API for sending and receiving data to and from an actual network device. See L2 overview for more details. These network technologies include Ethernet, IEEE 802.15.4, Bluetooth, CANBUS, etc. Some of these technologies support IPv6 header compression (6Lo), see RFC 6282 for details. For example ARP for IPv4 is done by the Ethernet component.

- **Network Device Drivers.** The actual low-level device drivers handle the physical sending or receiving of network packets.

**Network data flow**

An application typically consists of one or more threads that execute the application logic. When using the BSD socket API, the following things will happen.

**Data receiving (RX)**

1. A network data packet is received by a device driver.

2. The device driver allocates enough network buffers to store the received data. The network packet is placed in the proper RX queue (implemented by k_fifo). By default there is only one receive queue in the system, but it is possible to have up to 8 receive queues. These queues will process incoming packets with different priority. See Traffic Classification for more details. The receive queues also act as a way to separate the data processing pipeline (bottom-half) as the device driver is running in an interrupt context and it must do its processing as fast as possible.

3. The network packet is then passed to the correct L2 driver. The L2 driver can check if the packet is proper and modify it if needed, e.g. strip L2 header and frame check sequence, etc.

4. The packet is processed by a network interface. The network statistics are collected if enabled by CONFIG_NET_STATISTICS.

5. The packet is then passed to L3 processing. If the packet is IP based, then the L3 layer checks if the packet is a proper IPv6 or IPv4 packet.

6. A socket handler then finds an active socket to which the network packet belongs and puts it in a queue for that socket, in order to separate the networking code from the application. Typically the application is run in userspace context and the network stack is run in kernel context.

7. The application will then receive the data and can process it as needed. The application should have used the BSD socket API to create a socket that will receive the data.

**Data sending (TX)**

1. The application should use the BSD socket API when sending the data.

6.3. Networking
Receiving UDP packet

1. Packet received from the network
2. Allocate buffers and put packet to RX queue
3. Network packet passed to correct L2 driver, Ethernet headers stripped and packet checked
4. Passed to Network Interface for further processing
5. IPv4 headers parsed and stripped
6. UDP headers parsed and stripped. Packet added to socket queue
7. Packet retrieved from socket queue. Data copied into application buffers.
8.Recv returns

Chapter 6. Connectivity
Sending UDP packet

1. Application calls send() from socket API.
2. Net_packet structure created, user data copied to it. Packet marshalled to kernel space.
3. UDP protocol header is added in front of the data.
4. IPv4 headers added in front.
5. The network stack checks if interface is set up and enabled and sends the data.
6. The network packet is classified and placed to proper transmit queue. Packet checked and L2 headers for the network packet are added.
7. Device driver retrieves packet from the FIFO and sends it to the network.
8. Data physically sent.

Fig. 14: Network TX data flow
2. The application data is prepared for sending to kernel space and then copied to internal net_buf structures.

3. Depending on the socket type, a protocol header is added in front of the data. For example, if the socket is a UDP socket, then a UDP header is constructed and placed in front of the data.

4. An IP header is added to the network packet for a UDP or TCP packet.

5. The network stack will check that the network interface is properly set for the network packet, and also will make sure that the network interface is enabled before the data is queued to be sent.

6. The network packet is then classified and placed to the proper transmit queue (implemented by kfifo). By default there is only one transmit queue in the system, but it is possible to have up to 8 transmit queues. These queues will process the sent packets with different priority. See Traffic Classification for more details. After the transmit packet classification, the packet is checked by the correct L2 layer module. The L2 module will do additional checks for the data and it will also create any L2 headers for the network packet. If everything is ok, the data is given to the network device driver to be sent out.

7. The device driver will send the packet to the network.

Note that in both the TX and RX data paths, the queues (kfifo’s) form separation points where data is passed from one thread to another. These threads might run in different contexts (kernel vs. userspace) and with different priorities.

Network packet processing statistics

See information about network processing statistics here.

6.3.3 Network Configuration Guide

- Network Buffer Configuration Options
- Connection Options
- Socket Options
- TLS Options
- IPv4/6 Options
- TCP Options
- Traffic Class Options
- Stack Size Options

This document describes how various network configuration options can be set according to available resources in the system.

Network Buffer Configuration Options

The network buffer configuration options control how much data we are able to either send or receive at the same time.

CONFIG_NET_PKT_RX_COUNT
Maximum amount of network packets we can receive at the same time.
CONFIG_NET_PKT_TX_COUNT
Maximum amount of network packet sends pending at the same time.

CONFIG_NET_BUF_RX_COUNT
How many network buffers are allocated for receiving data. Each net_buf contains a small header and either a fixed or variable length data buffer. The CONFIG_NET_BUF_DATA_SIZE is used when CONFIG_NET_BUF_FIXED_DATA_SIZE is set. This is the default setting. The default size of the buffer is 128 bytes.

The CONFIG_NET_BUF_VARIABLE_DATA_SIZE is an experimental setting. There each net_buf data portion is allocated from a memory pool and can be the amount of data we have received from the network. When data is received from the network, it is placed into net_buf data portion. Depending on device resources and desired network usage, user can tweak the size of the fixed buffer by setting CONFIG_NET_BUF_DATA_SIZE, and the size of the data pool size by setting CONFIG_NET_BUF_DATA_POOL_SIZE if variable size buffers are used.

When using the fixed size data buffers, the memory consumption of network buffers can be tweaked by selecting the size of the data part according to what kind of network data we are receiving. If one sets the data size to 256, but only receives packets that are 32 bytes long, then we are “wasting” 224 bytes for each packet because we cannot utilize the remaining data. One should not set the data size too low because there is some overhead involved for each net_buf. For these reasons the default network buffer size is set to 128 bytes.

The variable size data buffer feature is marked as experimental as it has not received as much testing as the fixed size buffers. Using variable size data buffers tries to improve memory utilization by allocating minimum amount of data we need for the network data. The extra cost here is the amount of time that is needed when dynamically allocating the buffer from the memory pool.

For example, in Ethernet the maximum transmission unit (MTU) size is 1500 bytes. If one wants to receive two full frames, then the net_pkt RX count should be set to 2, and net_buf RX count to (1500 / 128) * 2 which is 24. If TCP is being used, then these values need to be higher because we can queue the packets internally before delivering to the application.

CONFIG_NET_BUF_TX_COUNT
How many network buffers are allocated for sending data. This is similar setting as the receive buffer count but for sending.

Connection Options

CONFIG_NET_MAX_CONN
This option tells how many network connection endpoints are supported. For example each TCP connection requires one connection endpoint. Similarly each listening UDP connection requires one connection endpoint. Also various system services like DHCP and DNS need connection endpoints to work. The network shell command net conn can be used at runtime to see the network connection information.

CONFIG_NET_MAX_CONTEXTS
Number of network contexts to allocate. Each network context describes a network 5-tuple that is used when listening or sending network traffic. Each BSD socket in the system uses one network context.

Socket Options

CONFIG_NET_SOCKETS_POLL_MAX
Maximum number of supported poll() entries. One needs to select proper value here depending on how many BSD sockets are polled in the system.

CONFIG_POSIX_MAX_FDS
Maximum number of open file descriptors, this includes files, sockets, special devices, etc.
One needs to select proper value here depending on how many BSD sockets are created in the system.

**CONFIG_NET_SOCKETPAIR_BUFFER_SIZE**
This option is used by socketpair() function. It sets the size of the internal intermediate buffer, in bytes. This sets the limit how large messages can be passed between two socket-pair endpoints.

**TLS Options**

**CONFIG_NET_SOCKETS_TLS_MAX_CONTEXTS**
Maximum number of TLS/DTLS contexts. Each TLS/DTLS connection needs one context.

**CONFIG_NET_SOCKETS_TLS_MAX_CREDENTIALS**
This variable sets maximum number of TLS/DTLS credentials that can be used with a specific socket.

**CONFIG_NET_SOCKETS_TLS_MAX_CIPHERSUITES**
Maximum number of TLS/DTLS ciphersuites per socket. This variable sets maximum number of TLS/DTLS ciphersuites that can be used with a specific socket, if set explicitly by a socket option. By default, all ciphersuites that are available in the system are available to the socket.

**CONFIG_NET_SOCKETS_TLS_MAX_APP_PROTOCOLS**
Maximum number of supported application layer protocols. This variable sets maximum number of supported application layer protocols over TLS/DTLS that can be set explicitly by a socket option. By default, no supported application layer protocol is set.

**CONFIG_NET_SOCKETS_TLS_MAX_CLIENT_SESSION_COUNT**
This variable specifies maximum number of stored TLS/DTLS sessions, used for TLS/DTLS session resumption.

**CONFIG_TLS_MAX_CREDENTIALS_NUMBER**
Maximum number of TLS credentials that can be registered. Make sure that this value is high enough so that all the certificates can be loaded to the store.

**IPv4/6 Options**

**CONFIG_NET_IF_MAX_IPV4_COUNT**
Maximum number of IPv4 network interfaces in the system. This tells how many network interfaces there will be in the system that will have IPv4 enabled. For example if you have two network interfaces, but only one of them can use IPv4 addresses, then this value can be set to 1. If both network interface could use IPv4, then the setting should be set to 2.

**CONFIG_NET_IF_MAX_IPV6_COUNT**
Maximum number of IPv6 network interfaces in the system. This is similar setting as the IPv4 count option but for IPv6.

**TCP Options**

**CONFIG_NET_TCP_TIME_WAIT_DELAY**
How long to wait in TCP **TIME_WAIT** state (in milliseconds). To avoid a (low-probability) issue when delayed packets from previous connection get delivered to next connection reusing the same local/remote ports, RFC 793 (TCP) suggests to keep an old, closed connection in a special **TIME_WAIT** state for the duration of 2*MSL (Maximum Segment Lifetime). The RFC suggests to use MSL of 2 minutes, but notes

*This is an engineering choice, and may be changed if experience indicates it is desirable to do so.*
For low-resource systems, having large MSL may lead to quick resource exhaustion (and related DoS attacks). At the same time, the issue of packet misdelivery is largely alleviated in the modern TCP stacks by using random, non-repeating port numbers and initial sequence numbers. Due to this, Zephyr uses much lower value of 1500ms by default. Value of 0 disables TIME_WAIT state completely.

**CONFIG_NET_TCP_RETRY_COUNT**

Maximum number of TCP segment retransmissions. The following formula can be used to determine the time (in ms) that a segment will be be buffered awaiting retransmission:

\[ \sum_{n=0}^{\text{NET_TCP_RETRY_COUNT}} (1 \ll n) \times \text{NET_TCP_INIT_RETRANSMISSION_TIMEOUT} \]

With the default value of 9, the IP stack will try to retransmit for up to 1:42 minutes. This is as close as possible to the minimum value recommended by RFC 1122 (1:40 minutes). Only 5 bits are dedicated for the retransmission count, so accepted values are in the 0-31 range. It's highly recommended to not go below 9, though.

Should a retransmission timeout occur, the receive callback is called with -ETIMEDOUT error code and the context is dereferenced.

**CONFIG_NET_TCP_MAX_SEND_WINDOW_SIZE**

Maximum sending window size to use. This value affects how the TCP selects the maximum sending window size. The default value 0 lets the TCP stack select the value according to amount of network buffers configured in the system. Note that if there are multiple active TCP connections in the system, then this value might require finetuning (lowering), otherwise multiple TCP connections could easily exhaust net_buf pool for the queued TX data.

**CONFIG_NET_TCP_MAX_RECV_WINDOW_SIZE**

Maximum receive window size to use. This value defines the maximum TCP receive window size. Increasing this value can improve connection throughput, but requires more receive buffers available in the system for efficient operation. The default value 0 lets the TCP stack select the value according to amount of network buffers configured in the system.

**CONFIG_NET_TCP_RECV_QUEUE_TIMEOUT**

How long to queue received data (in ms). If we receive out-of-order TCP data, we queue it. This value tells how long the data is kept before it is discarded if we have not been able to pass the data to the application. If set to 0, then receive queueing is not enabled. The value is in milliseconds.

Note that we only queue data sequentially in current version i.e., there should be no holes in the queue. For example, if we receive SEQs 5,4,3,6 and are waiting SEQ 2, the data in segments 3,4,5,6 is queued (in this order), and then given to application when we receive SEQ 2. But if we receive SEQs 5,4,3,7 then the SEQ 7 is discarded because the list would not be sequential as number 6 is be missing.

**Traffic Class Options**

It is possible to configure multiple traffic classes (queues) when receiving or sending network data. Each traffic class queue is implemented as a thread with different priority. This means that higher priority network packet can be placed to a higher priority network queue in order to send or receive it faster or slower. Because of thread scheduling latencies, in practice the fastest way to send a packet out, is to directly send the packet without using a dedicated traffic class thread. This is why by default the `CONFIG_NET_TC_TX_COUNT` option is set to 0 if userspace is not enabled. If userspace is enabled, then the minimum TX traffic class count is 1. Reason for this is that the userspace application does not have enough permissions to deliver the message directly.

In receiving side, it is recommended to have at least one receiving traffic class queue. Reason is that typically the network device driver is running in IRQ context when it receives the packet,
in which case it should not try to deliver the network packet directly to the upper layers, but to place the packet to the traffic class queue. If the network device driver is not running in IRQ context when it gets the packet, then the RX traffic class option `CONFIG_NET_TC_RX_COUNT` could be set to 0.

**Stack Size Options**

There several network specific threads in a network enabled system. Some of the threads might depend on a configure option which can be used to enable or disable a feature. Each thread stack size is optimized to allow normal network operations.

The network management API is using a dedicated thread by default. The thread is responsible to deliver network management events to the event listeners that are setup in the system if the `CONFIG_NET_MGMT` and `CONFIG_NET_MGMT_EVENT` options are enabled. If the options are enabled, the user is able to register a callback function that the net_mgmt thread is calling for each network management event. By default the net_mgmt event thread stack size is rather small. The idea is that the callback function does minimal things so that new events can be delivered to listeners as fast as possible and they are not lost. The net_mgmt event thread stack size is controlled by `CONFIG_NET_MGMT_EVENT_QUEUE_SIZE` option. It is recommended to not do any blocking operations in the callback function.

The network thread stack utilization can be monitored from kernel shell by the `kernel threads` command.

### 6.3.4 Networking with the host system

**Networking with native_sim board**

<p>| <strong>Prerequisites</strong> |</p>
<table>
<thead>
<tr>
<th><strong>Basic Setup</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 - Create Ethernet interface</td>
</tr>
<tr>
<td>Step 2 - Start app in native_sim board</td>
</tr>
<tr>
<td>Step 3 - Connect to console (optional)</td>
</tr>
</tbody>
</table>

This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in a native_sim board.

In this example, the sockets-echo-server sample application from the Zephyr source distribution is run in native_sim board. The Zephyr native_sim board instance is connected to a Linux host using a tuntap device which is modeled in Linux as an Ethernet network interface.

**Prerequisites** On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

**Basic Setup** For the steps below, you will need three terminal windows:

- Terminal #1 is terminal window with net-tools being the current directory (`cd net-tools`)
- Terminal #2 is your usual Zephyr development terminal, with the Zephyr environment initialized.
• Terminal #3 is the console to the running Zephyr native_sim instance (optional).

**Step 1 - Create Ethernet interface**  
Before starting native_sim with network emulation, a network interface should be created.

In terminal #1, type:

```
./net-setup.sh
```

You can tweak the behavior of the net-setup.sh script. See various options by running `net-setup.sh` like this:

```
./net-setup.sh --help
```

**Step 2 - Start app in native_sim board**  
Build and start the echo_server sample application.

In terminal #2, type:

```
w west build -b native_sim samples/net/sockets/echo_server
west build -t run
```

**Step 3 - Connect to console (optional)**  
The console window should be launched automatically when the Zephyr instance is started but if it does not show up, you can manually connect to the console. The native_sim board will print a string like this when it starts:

```
UART connected to pseudotty: /dev/pts/5
```

You can manually connect to it like this:

```
screen /dev/pts/5
```

**Networking with QEMU Ethernet**

- **Prerequisites**
- **Basic Setup**
  - Step 1 - Create Ethernet interface
  - Step 2 - Start app in QEMU board

This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in QEMU.

In this example, the sockets-echo-server sample application from the Zephyr source distribution is run in QEMU. The Zephyr instance is connected to a Linux host using a tuntap device which is modeled in Linux as an Ethernet network interface.

**Prerequisites**  
On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```
Basic Setup  

For the steps below, you will need two terminal windows:

- Terminal #1 is terminal window with net-tools being the current directory (`cd net-tools`)
- Terminal #2 is your usual Zephyr development terminal, with the Zephyr environment initialized.

When configuring the Zephyr instance, you must select the correct Ethernet driver for QEMU connectivity:

- For `qemu_x86`, select Intel(R) PRO/1000 Gigabit Ethernet driver. Driver is called `e1000` in Zephyr source tree.
- For `qemu_cortex_m3`, select TI Stellaris MCU family ethernet driver Ethernet driver. Driver is called `stellaris` in Zephyr source tree.
- For `mps2_an385`, select SMSC911x/9220 Ethernet driver Ethernet driver. Driver is called `smsc911x` in Zephyr source tree.
- For `qemu_cortex_a53`, Intel(R) PRO/1000 Gigabit Ethernet driver Ethernet driver is selected by default.

Step 1 - Create Ethernet interface  

Before starting QEMU with network connectivity, a network interface should be created in the host system.

In terminal #1, type:

```
./net-setup.sh
```

You can tweak the behavior of the `net-setup.sh` script. See various options by running `net-setup.sh` like this:

```
./net-setup.sh --help
```

Step 2 - Start app in QEMU board  

Build and start the sockets-echo-server sample application. In this example, the qemu_x86 board is used.

In terminal #2, type:

```
west build -b qemu_x86 samples/net/sockets/echo_server -- -DEXTRA_CONF_FILE=overlay-e1000.conf
west build -t run
```

Exit QEMU by pressing CTRL+A x.

Networking with QEMU

- Prerequisites
- Basic Setup
  - Step 1 - Create helper socket
  - Step 2 - Start TAP device routing daemon
  - Step 3 - Start app in QEMU
  - Step 4 - Run apps on host
  - Step 5 - Stop supporting daemons
- Setting up Zephyr and NAT/masquerading on host to access Internet
Network connection between two QEMU VMs
- Terminal #1:
- Terminal #2:

Running multiple QEMU VMs of the same sample
- Terminal #1:
- Terminal #2:

This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in a QEMU virtual machine (built for Zephyr targets such as qemu_x86 and qemu_cortex_m3). Some virtual ARM boards (such as qemu_cortex_a53) only support a single UART, in this case QEMU Ethernet is preferred, see Networking with QEMU Ethernet for details.

In this example, the sockets-echo-server sample application from the Zephyr source distribution is run in QEMU. The QEMU instance is connected to a Linux host using a serial port, and SLIP is used to transfer data between the Zephyr application and Linux (over a chain of virtual connections).

Prerequisites On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```bash
git clone https://github.com/zephyrproject-rtos/net-tools
cd net-tools
make
```

Note: If you get an error about AX_CHECK_COMPILE_FLAG, install package autoconf-archive package on Debian/Ubuntu.

Basic Setup For the steps below, you will need at least 4 terminal windows:

- Terminal #1 is your usual Zephyr development terminal, with the Zephyr environment initialized.
- Terminals #2, #3, and #4 are terminal windows with net-tools being the current directory (cd net-tools)

Step 1 - Create helper socket Before starting QEMU with network emulation, a Unix socket for the emulation should be created.
In terminal #2, type:

```
./loop-socat.sh
```

Step 2 - Start TAP device routing daemon In terminal #3, type:

```
sudo ./loop-slip-tap.sh
```

For applications requiring DNS, you may need to restart the host's DNS server at this point, as described in Setting up Zephyr and NAT/masquerading on host to access Internet.

6.3. Networking
**Step 3 - Start app in QEMU**  Build and start the echo_server sample application.

In terminal #1, type:

```
west build -b qemu_x86 samples/net/sockets/echo_server
west build -t run
```

If you see an error from QEMU about unix:/tmp/slip.sock, it means you missed Step 1 above.

**Step 4 - Run apps on host**  Now in terminal #4, you can run various tools to communicate with the application running in QEMU.

You can start with pings:

```
ping 192.0.2.1
ping6 2001:db8::1
```

You can use the netcat ("nc") utility, connecting using UDP:

```
echo foobar | nc -6 -u 2001:db8::1 4242
```

```
echo foobar | nc -6 -u 192.0.2.1 4242
```

If echo_server is compiled with TCP support (now enabled by default for the echo_server sample, CONFIG_NET_TCP=y):

```
echo foobar | nc -6 -q2 2001:db8::1 4242
```

**Note:** Use Ctrl+C to exit.

You can also use the telnet command to achieve the above.

**Step 5 - Stop supporting daemons**  When you are finished with network testing using QEMU, you should stop any daemons or helpers started in the initial steps, to avoid possible networking or routing problems such as address conflicts in local network interfaces. For example, stop them if you switch from testing networking with QEMU to using real hardware, or to return your host laptop to normal Wi-Fi use.

To stop the daemons, press Ctrl+C in the corresponding terminal windows (you need to stop both loop-slip-tap.sh and loop-socat.sh).

Exit QEMU by pressing CTRL+A x.

**Setting up Zephyr and NAT/masquerading on host to access Internet**  To access the internet from a Zephyr application, some additional setup on the host may be required. This setup is common for both application running in QEMU and on real hardware, assuming that a development board is connected to the development host. If a board is connected to a dedicated router, it should not be needed.

To access the internet from a Zephyr application using IPv4, a gateway should be set via DHCP or configured manually. For applications using the "Settings" facility (with the config option CONFIG_NET_CONFIG_SETTINGS enabled), set the CONFIG_NET_CONFIG_MY_IPV4_GW option to the IP address of the gateway. For apps not using the "Settings" facility, set up the gateway by calling the net_if_ipv4_set_gw() at runtime.
To access the internet from a custom application running in QEMU, NAT (masquerading) should be set up for QEMU's source address. Assuming 192.0.2.1 is used, the following command should be run as root:

```
iptables -t nat -A POSTROUTING -j MASQUERADE -s 192.0.2.1
```

Additionally, IPv4 forwarding should be enabled on the host, and you may need to check that other firewall (iptables) rules don't interfere with masquerading. To enable IPv4 forwarding the following command should be run as root:

```
sysctl -w net.ipv4.ip_forward=1
```

Some applications may also require a DNS server. A number of Zephyr-provided samples assume by default that the DNS server is available on the host (IP 192.0.2.2), which, in modern Linux distributions, usually runs at least a DNS proxy. When running with QEMU, it may be required to restart the host's DNS, so it can serve requests on the newly created TAP interface. For example, on Debian-based systems:

```
service dnsmasq restart
```

An alternative to relying on the host's DNS server is to use one in the network. For example, 8.8.8.8 is a publicly available DNS server. You can configure it using `CONFIG_DNS_SERVER1` option.

### Network connection between two QEMU VMs

Unlike the VM-to-Host setup described above, VM-to-VM setup is automatic. For sample applications that support this mode (such as the `echo_server` and `echo_client` samples), you will need two terminal windows, set up for Zephyr development.

**Terminal #1:**

```
w west build -b qemu_x86 samples/net/sockets/echo_server
```

This will start QEMU, waiting for a connection from a client QEMU.

**Terminal #2:**

```
w west build -b qemu_x86 samples/net/sockets/echo_client
```

This will start a second QEMU instance, where you should see logging of data sent and received in both.

### Running multiple QEMU VMs of the same sample

If you find yourself wanting to run multiple instances of the same Zephyr sample application, which do not need to talk to each other, use the `QEMU_INSTANCE` argument.

Start `socat` and `tunslip6` manually (instead of using the `loop-xxx.sh` scripts) for as many instances as you want. Use the following as a guide, replacing MAIN or OTHER.

**Terminal #1:**

```
$ socat PTY,link=/tmp/slip.devMAIN UNIX-LISTEN:/tmp/slip.sockMAIN
$ $ZEPHYR_BASE/../net-tools/tunslip6 -t tapMAIN -T -s /tmp/slip.devMAIN \
    -d 2001:db8::1/64
# Now run Zephyr
make -Cbuild run QEMU_INSTANCE=MAIN
```
USB Device Networking

- **Basic Setup**
  - Choosing IP addresses
  - Setting IPv4 address and routing
  - Setting IPv6 address and routing
- Testing connection

This page describes how to set up networking between a Linux host and a Zephyr application running on USB supported devices.

The board is connected to Linux host using USB cable and provides an Ethernet interface to the host. The sockets-echo-server application from the Zephyr source distribution is run on supported board. The board is connected to a Linux host using a USB cable providing an Ethernet interface to the host.

**Basic Setup**  To communicate with the Zephyr application over a newly created Ethernet interface, we need to assign IP addresses and set up a routing table for the Linux host. After plugging a USB cable from the board to the Linux host, the cdc_ether driver registers a new Ethernet device with a provided MAC address.

You can check that network device is created and MAC address assigned by running dmesg from the Linux host.

```
cdc_ether 1-2.7:1.0 eth0: register 'cdc_ether' at usb-0000:00:01.2-2.7, CDC Ethernet Device, 00:00:5e:00:53:01
```

We need to set it up and assign IP addresses as explained in the following section.

**Choosing IP addresses**  To establish network connection to the board we need to choose IP address for the interface on the Linux host.

It make sense to choose addresses in the same subnet we have in Zephyr application. IP addresses usually set in the project configuration files and may be checked also from the shell with following commands. Connect a serial console program (such as puTTY) to the board, and enter this command to the Zephyr shell:

```
shell> net iface
```

```bash
Interface 0xa800e580 (Ethernet)
============================
Link addr : 00:00:5E:00:53:00
MTU : 1500
IPv6 unicast addresses (max 2):
  fe80::200:5eff:fe00:5300 autoconf preferred infinite
  2001:db8::2 manual preferred infinite
...```

(continues on next page)
This command shows that one IPv4 address and two IPv6 addresses have been assigned to the board. We can use either IPv4 or IPv6 for network connection depending on the board network configuration.

Next step is to assign IP addresses to the new Linux host interface, in the following steps:

**Setting IPv4 address and routing**

```bash
# ip address add dev enx00005e005301 192.0.2.2
# ip link set enx00005e005301 up
# ip route add 192.0.2.0/24 dev enx00005e005301
```

**Setting IPv6 address and routing**

```bash
# ip address add dev enx00005e005301 2001:db8::2
# ip link set enx00005e005301 up
# ip -6 route add 2001:db8::/64 dev enx00005e005301
```

**Testing connection** From the host we can test the connection by pinging Zephyr IP address of the board with:

```bash
$ ping 192.0.2.1
PING 192.0.2.1 (192.0.2.1) 56(84) bytes of data.
64 bytes from 192.0.2.1: icmp_seq=1 ttl=64 time=2.30 ms
64 bytes from 192.0.2.1: icmp_seq=2 ttl=64 time=1.43 ms
64 bytes from 192.0.2.1: icmp_seq=3 ttl=64 time=2.45 ms
...```

**Networking with QEMU User**

- **Introduction**
- **Using SLIRP with Zephyr**
- **Limitations**

This page is intended to serve as a starting point for anyone interested in using QEMU SLIRP with Zephyr.

**Introduction** SLIRP is a network backend which provides the complete TCP/IP stack within QEMU and uses that stack to implement a virtual NAT’d network. As there are no dependencies on the host, SLIRP is simple to setup.

By default, QEMU uses the 10.0.2.X/24 network and runs a gateway at 10.0.2.2. All traffic intended for the host network has to travel through this gateway, which will filter out packets based on the QEMU command line parameters. This gateway also functions as a DHCP server for all GOS, allowing them to be automatically assigned with an IP address starting from 10.0.2.15.

Using SLIRP with Zephyr  In order to use SLIRP with Zephyr, the user has to set the Kconfig option to enable User Networking.

```plaintext
CONFIG_NET_QEMU_USER=y
```

Once this configuration option is enabled, all QEMU launches will use SLIRP. In the default configuration, Zephyr only enables User Networking, and does not pass any arguments to it. This means that the Guest will only be able to communicate to the QEMU gateway, and any data intended for the host machine will be dropped by QEMU.

In general, QEMU User Networking can take in a lot of arguments including,

- Information about host/guest port forwarding. This must be provided to create a communication channel between the guest and host.
- Information about network to use. This may be valuable if the user does not want to use the default 10.0.2.X network.
- Tell QEMU to start DHCP server at user-defined IP address.
- ID and other information.

As this information varies with every use case, it is difficult to come up with good defaults that work for all. Therefore, Zephyr Implementation offloads this to the user, and expects that they will provide arguments based on requirements. For this, there is a Kconfig string which can be populated by the user.

```plaintext
CONFIG_NET_QEMU_USER_EXTRA_ARGS="net=192.168.0.0/24,hostfwd=tcp::8080-:8080"
```

This option is appended as-is to the QEMU command line. Therefore, any problems with this command line will be reported by QEMU only. Here's what this particular example will do,

- Make QEMU use the 192.168.0.0/24 network instead of the default.
- Enable forwarding of any TCP data received from port 8080 of host to port 8080 of guest, and vice versa.

Limitations  If the user does not have any specific networking requirements other than the ability to access a web page from the guest, user networking (slirp) is a good choice. However, it has several limitations

- There is a lot of overhead so the performance is poor.
- The guest is not directly accessible from the host or the external network.
- In general, ICMP traffic does not work (so you cannot use ping within a guest).
- As port mappings need to be defined before launching qemu, clients which use dynamically generated ports cannot communicate with external network.
- There is a bug in the SLIRP implementation which filters out all IPv6 packets from the guest. See https://bugs.launchpad.net/qemu/+bug/1724590 for details. Therefore, IPv6 will not work with User Networking.

Networking with multiple Zephyr instances

- **Prerequisites**
- **Basic Setup**
  - Step 1 - Create configuration files
  - Step 2 - Create Ethernet interfaces
This page describes how to set up a virtual network between multiple Zephyr instances. The Zephyr instances could be running inside QEMU or could be native_sim board processes. The Linux host can be used to route network traffic between these systems.

**Prerequisites** On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

**Basic Setup** For the steps below, you will need five terminal windows:

- Terminal #1 and #2 are terminal windows with net-tools being the current directory (cd net-tools)
- Terminal #3, where you setup bridging in Linux host
- Terminal #4 and #5 are your usual Zephyr development terminal, with the Zephyr environment initialized.

As there are multiple ways to setup the Zephyr network, the example below uses qemu_x86 board with e1000 Ethernet controller and native_sim board to simplify the setup instructions. You can use other QEMU boards and drivers if needed, see Networking with QEMU Ethernet for details. You can also use two or more native_sim board Zephyr instances and connect them together.

**Step 1 - Create configuration files** Before starting QEMU with network connectivity, a network interfaces for each Zephyr instance should be created in the host system. The default setup for creating network interface cannot be used here as that is for connecting one Zephyr instance to Linux host.

For Zephyr instance #1, create file called `zephyr1.conf` to net-tools project, or to some other suitable directory.

```
# Configuration file for setting IP addresses for a network interface.
INTERFACE="$1"
HWADDR="00:00:5e:00:53:11"
IPV6_ADDR_1="2001:db8:100::2"
IPV6_ROUTE_1="2001:db8:100::/64"
IPV4_ADDR_1="198.51.100.2/24"
IPV4_ROUTE_1="198.51.100.0/24"
ip link set dev $INTERFACE up
ip link set dev $INTERFACE address $HWADDR
ip -6 address add $IPV6_ADDR_1 dev $INTERFACE nodad
ip -6 route add $IPV6_ROUTE_1 dev $INTERFACE
ip address add $IPV4_ADDR_1 dev $INTERFACE
ip route add $IPV4_ROUTE_1 dev $INTERFACE > /dev/null 2>&1
```

For Zephyr instance #2, create file called `zephyr2.conf` to net-tools project, or to some other suitable directory.

```
# Configuration file for setting IP addresses for a network interface.
INTERFACE="$1"
HWADDR="00:00:5e:00:53:22"
IPV6_ADDR_1="2001:db8:200::2"
IPV6_ROUTE_1="2001:db8:200::/64"
IPV4_ADDR_1="203.0.113.2/24"
```

(continues on next page)
Step 2 - Create Ethernet interfaces

The following net-setup.sh commands should be typed in net-tools directory (cd net-tools).

In terminal #1, type:

```
./net-setup.sh -c zephyr1.conf -i zeth.1
```

In terminal #2, type:

```
./net-setup.sh -c zephyr2.conf -i zeth.2
```

Step 3 - Setup network bridging

In terminal #3, type:

```
sudo brctl addbr zeth-br
sudo brctl addif zeth-br zeth.1
sudo brctl addif zeth-br zeth.2
sudo ifconfig zeth-br up
```

Step 4 - Start Zephyr instances

In this example we start sockets-echo-server and sockets-echo-client sample applications. You can use other applications too as needed.

In terminal #4, if you are using QEMU, type this:

```
w west build -d build/server -b qemu_x86 -t run \samples/net/sockets/echo_server -- \ -DEXTRA_CONF_FILE=overlay-e1000.conf \ -DCONFIG_NET_CONFIG_MY_IPV4_ADDR="198.51.100.1" \ -DCONFIG_NET_CONFIG_PEER_IPV4_ADDR="203.0.113.1" \ -DCONFIG_NET_CONFIG_MY_IPV6_ADDR="2001:db8:100::1" \ -DCONFIG_NET_CONFIG_PEER_IPV6_ADDR="2001:db8:200::1" \ -DCONFIG_NET_CONFIG_MY_IPV4_GW="203.0.113.1" \ -DCONFIG_ETH_QEMU_IFACE_NAME="zeth.1" \ -DCONFIG_ETH_QEMU_EXTRA_ARGS="mac=00:00:5e:00:53:01"
```

or if you want to use native_sim board, type this:

```
w west build -d build/server -b native_sim -t run \samples/net/sockets/echo_server -- \ -DCONFIG_NET_CONFIG_MY_IPV4_ADDR="198.51.100.1" \ -DCONFIG_NET_CONFIG_PEER_IPV4_ADDR="203.0.113.1" \ -DCONFIG_NET_CONFIG_MY_IPV6_ADDR="2001:db8:100::1" \ -DCONFIG_NET_CONFIG_PEER_IPV6_ADDR="2001:db8:200::1" \ -DCONFIG_NET_CONFIG_MY_IPV4_GW="203.0.113.1" \ -DCONFIG_ETH_NATIVE_POSIX_DRV_NAME="zeth.1" \ -DCONFIG_ETH_NATIVE_POSIX_MAC_ADDR="00:00:5e:00:53:01" \ -DCONFIG_ETH_NATIVE_POSIX_RANDOM_MAC=n
```

In terminal #5, if you are using QEMU, type this:
Networking with QEMU and IEEE 802.15.4

**Basic Setup**

- **Step 1 - Compile and start echo-server**
- **Step 2 - Compile and start echo-client**

This page describes how to set up a virtual network between two QEMUs that are connected together via UART and are running IEEE 802.15.4 link layer between them. Note that this only works in Linux host.

**Basic Setup**  For the steps below, you will need two terminal windows:

- Terminal #1 is terminal window with echo-server Zephyr sample application.
- Terminal #2 is terminal window with echo-client Zephyr sample application.

If you want to capture the transferred network data, you must compile the monitor_15_4 program in net-tools directory.

Open a terminal window and type:

```bash
cd $ZEPHYR_BASE/../net-tools
make monitor_15_4
```

**Step 1 - Compile and start echo-server**  In terminal #1, type:

```bash
west build -b qemu_x86 -d build/server samples/net/sockets/echo_server -- \
-DEXTRA_CONF_FILE=overlay-qemu_802154.conf \
-west build -t server -d build/server
```

or if you want to use native_sim board, type this:

```bash
west build -d build/client -b native_sim -t run \
samples/net/sockets/echo_client -- \
-DEXTRA_CONF_FILE=overlay-e1000.conf \
-DCONFIG_NET_CONFIG_MY_IPV4_ADDR="203.0.113.1" \
-DCONFIG_NET_CONFIG_PEER_IPV4_ADDR="198.51.100.1" \
-DCONFIG_NET_CONFIG_MY_IPV6_ADDR="2001:db8:200::1" \
-DCONFIG_NET_CONFIG_PEER_IPV6_ADDR="2001:db8:100::1" \
-DCONFIG_NET_CONFIG_MY_IPV4_GW="198.51.100.1" \
-DCONFIG_ETH_QEMU_IFACE_NAME="zeth.2" \
-DCONFIG_ETH_QEMU_EXTRA_ARGS="mac=00:00:5e:00:53:02"
```

Also if you have firewall enabled in your host, you need to allow traffic between zeth.1, zeth.2 and zeth-br interfaces.

Networking with QEMU and IEEE 802.15.4

**Basic Setup**

For the steps below, you will need two terminal windows:

- Terminal #1 is terminal window with echo-server Zephyr sample application.
- Terminal #2 is terminal window with echo-client Zephyr sample application.

If you want to capture the transferred network data, you must compile the monitor_15_4 program in net-tools directory.

Open a terminal window and type:

```bash
 cd $ZEPHYR_BASE/../net-tools
 make monitor_15_4
```

**Step 1 - Compile and start echo-server**  In terminal #1, type:

```bash
 west build -b qemu_x86 -d build/server samples/net/sockets/echo_server -- \
 -DEXTRA_CONF_FILE=overlay-qemu_802154.conf \
 west build -t server -d build/server
```
If you want to capture the network traffic between the two QEMUs, type:

```
west build -b qemu_x86 -d build/server samples/net/sockets/echo_server -- -G'Unix Makefiles
-DEXTRA_CONF_FILE=overlay-qemu_802154.conf -DPCAP=capture.pcap
west build -t server -d build/server
```

Note that the make must be used for server target if packet capture option is set in command line. The build/server/capture.pcap file will contain the transferred data.

**Step 2 - Compile and start echo-client**  In terminal #2, type:

```
west build -b qemu_x86 -d build/client samples/net/sockets/echo_client -- -DEXTRA_CONF_FILE=overlay-qemu_802154.conf
west build -t client -d build/client
```

You should see data passed between the two QEMUs. Exit QEMU by pressing CTRL+A x.

### Networking with Arm FVP User Mode

- **Introduction**
- **Using Arm FVP User Mode Networking with Zephyr**
- **Limitations**

This page is intended to serve as a starting point for anyone interested in using Arm FVP user mode networking with Zephyr.

**Introduction**  User mode networking emulates a built-in IP router and DHCP server, and routes TCP and UDP traffic between the guest and host. It uses the user mode socket layer of the host to communicate with other hosts. This allows the use of a significant number of IP network services without requiring administrative privileges, or the installation of a separate driver on the host on which the model is running.

By default, Arm FVP uses the 172.20.51.0/24 network and runs a gateway at 172.20.51.254. This gateway also functions as a DHCP server for the GOS, allowing it to be automatically assigned with an IP address 172.20.51.1.

**Using Arm FVP User Mode Networking with Zephyr**  Arm FVP user mode networking can be enabled in any applications and it doesn’t need any configurations on the host system. This feature has been enabled in DHCPv4 client sample. See dhcpv4-client sample application.

**Limitations**

- You can use TCP and UDP over IP, but not ICMP (ping).
- User mode networking does not support forwarding UDP ports on the host to the model.
- You can only use DHCP within the private network.
- You can only make inward connections by mapping TCP ports on the host to the model. This is common to all implementations that provide host connectivity using NAT.
- Operations that require privileged source ports, for example NFS in its default configuration, do not work.
• If setup fails, or the parameter syntax is incorrect, there is no error reporting.

While developing networking software, it is usually necessary to connect and exchange data with the host system like a Linux desktop computer. Depending on what board is used for development, the following options are possible:

• QEMU using SLIP (Serial Line Internet Protocol).
  – Here IP packets are exchanged between Zephyr and the host system via serial port. This is the legacy way of transferring data. It is also quite slow so use it only when necessary. See Networking with QEMU for details.

• QEMU using built-in Ethernet driver.
  – Here IP packets are exchanged between Zephyr and the host system via QEMU’s built-in Ethernet driver. Not all QEMU boards support built-in Ethernet so in some cases, you might need to use the SLIP method for host connectivity. See Networking with QEMU Ethernet for details.

• QEMU using SLIRP (Qemu User Networking).
  – QEMU User Networking is implemented using “slirp”, which provides a full TCP/IP stack within QEMU and uses that stack to implement a virtual NAT’d network. As this support is built into QEMU, it can be used with any model and requires no admin privileges on the host machine, unlike TAP. However, it has several limitations including performance which makes it less valuable for practical purposes. See Networking with QEMU User for details.

• Arm FVP (User Mode Networking).
  – User mode networking emulates a built-in IP router and DHCP server, and routes TCP and UDP traffic between the guest and host. It uses the user mode socket layer of the host to communicate with other hosts. This allows the use of a significant number of IP network services without requiring administrative privileges, or the installation of a separate driver on the host on which the model is running. See Networking with Arm FVP User Mode for details.

• native_sim board.
  – The Zephyr instance can be executed as a user space process in the host system. This is the most convenient way to debug the Zephyr system as one can attach host debugger directly to the running Zephyr instance. This requires that there is an adaptation driver in Zephyr for interfacing with the host system. An Ethernet driver exists in Zephyr for this purpose. See Networking with native_sim board for details.

• USB device networking.
  – Here, the Zephyr instance is run on a real board and the connectivity to the host system is done via USB. See USB Device Networking for details.

• Connecting multiple Zephyr instances together.
  – If you have multiple Zephyr instances, either QEMU or native_sim ones, and want to create a connection between them, see Networking with multiple Zephyr instances for details.

• Simulating IEEE 802.15.4 network between two QEMUs.
  – Here, two Zephyr instances are running and there is IEEE 802.15.4 link layer run over an UART between them. See Networking with QEMU and IEEE 802.15.4 for details.

6.3.5 Monitor Network Traffic
It is useful to be able to monitor the network traffic especially when debugging a connectivity issues or when developing new protocol support in Zephyr. This page describes how to set up a way to capture network traffic so that user is able to use Wireshark or similar tool in remote host to see the network packets sent or received by a Zephyr device.

See also the net-capture sample application from the Zephyr source distribution for configuration options that need to be enabled.

**Host Configuration**

The instructions here describe how to setup a Linux host to capture Zephyr network RX and TX traffic. Similar instructions should work also in other operating systems. On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

The net-tools project provides a configure file to setup IP-to-IP tunnel interface so that we can transfer monitoring data from Zephyr to host.

In terminal #1, type:

```
./net-setup.sh -c zeth-tunnel.conf
```

This script will create following IPIP tunnel interfaces:

<table>
<thead>
<tr>
<th>Interface name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>zeth-ip6ip</td>
<td>IPv6-over-IP4 tunnel</td>
</tr>
<tr>
<td>zeth-ipip</td>
<td>IPv4-over-IP4 tunnel</td>
</tr>
<tr>
<td>zeth-ipip6</td>
<td>IPv4-over-IP6 tunnel</td>
</tr>
<tr>
<td>zeth-ip6ip6</td>
<td>IPv6-over-IP6 tunnel</td>
</tr>
</tbody>
</table>

Zephyr will send captured network packets to one of these interfaces. The actual interface will depend on how the capturing is configured. You can then use Wireshark to monitor the proper network interface.

After the tunneling interfaces have been created, you can use for example `net-capture.py` script from net-tools project to print or save the captured network packets. The `net-capture.py` provides an UDP listener, it can print the captured data to screen and optionally can also save the data to a pcap file.

```
$ ./net-capture.py -i zeth-ip6ip -w capture.pcap
```

The `net-capture.py` has following command line options:
Listen captured network data from Zephyr and save it optionally to pcap file.

```
./net-capture.py \
  -i | --interface <network interface>  
      Listen this interface for the data
[-p | --port <UDP port>]  
      UDP port (default is 4242) where the capture data is received
[-q | --quiet]  
      Do not print packet information
[-t | --type <L2 type of the data>]  
      Scapy L2 type name of the UDP payload, default is Ether
[-w | --write <pcap file name>]  
      Write the received data to file in PCAP format
```

Instead of the `net-capture.py` script, you can for example use `netcat` to provide an UDP listener so that the host will not send port unreachable message to Zephyr:

```
nc -l -u 2001:db8:200::2 4242 > /dev/null
```

The IP address above is the inner tunnel endpoint, and can be changed and it depends on how the Zephyr is configured. Zephyr will send UDP packets containing the captured network packets to the configured IP tunnel, so we need to terminate the network connection like this.

### Zephyr Configuration

In this example, we use the `native_sim` board. You can also use any other board that supports networking.

In terminal #3, type:

```
west build -b native_sim samples/net/capture -- -DCONFIG_NATIVE_UART_AUTOATTACH_DEFAULT=true  
  --CMD="gnome-terminal -- screen %s"
```

To see the Zephyr console and shell, start Zephyr instance like this:

```
build/zephyr/zephyr.exe -attach_uart
```

Any other application can be used too, just make sure that suitable configuration options are enabled (see `samples/net/capture/prj.conf` file for examples).

The network capture can be configured automatically if needed, but currently the sample application does not do that. User has to use `net-shell` to setup and enable the monitoring.

The network packet monitoring needs to be setup first. The `net-shell` has `net capture setup` command for doing that. The command syntax is

```
net capture setup <remote-ip-addr> <local-ip-addr> <peer-ip-addr>  
  <remote> is the (outer) endpoint IP address  
  <local> is the (inner) local IP address  
  <peer> is the (inner) peer IP address  
Local and Peer IP addresses can have UDP port number in them (optional)  
like 198.0.51.2:9000 or [2001:db8:100::2]:4242
```

In Zephyr console, type:

```
net capture setup 192.0.2.2 2001:db8:200::1 2001:db8:200::2
```

This command will create the tunneling interface. The 192.0.2.2 is the remote host where the tunnel is terminated. The address is used to select the local network interface where the tunneling interface is attached to. The 2001:db8:200::1 tells the local IP address for the tunnel, the 2001:db8:200::2 is the peer IP address where the captured network packets are sent. The port numbers for UDP packet can be given in the setup command like this for IPv6-over-IPv4 tunneling.
net capture setup 192.0.2.2 [2001:db8:200::1]:9999 [2001:db8:200::2]:9998

and like this for IPv4-over-IPv4 tunnel

net capture setup 192.0.2.2 198.51.100.1:9999 198.51.100.2:9998

If the port number is omitted, then 4242 UDP port is used as a default.

The current monitoring configuration can be checked like this:

<table>
<thead>
<tr>
<th>Device</th>
<th>Capture</th>
<th>Tunnel</th>
</tr>
</thead>
<tbody>
<tr>
<td>NET_CAPTURE0</td>
<td>-</td>
<td>1 [2001:db8:200::1]:4242 [2001:db8:200::2]:4242</td>
</tr>
</tbody>
</table>

which will print the current configuration. As we have not yet enabled monitoring, the Capture iface is not set.

Then we need to enable the network packet monitoring like this:

```
net capture enable 2
```

The 2 tells the network interface which traffic we want to capture. In this example, the 2 is the native_sim board Ethernet interface. Note that we send the network traffic to the same interface that we are monitoring in this example. The monitoring system avoids to capture already captured network traffic as that would lead to recursion. You can use net iface command to see what network interfaces are available. Note that you cannot capture traffic from the tunnel interface as that would cause recursion loop. The captured network traffic can be sent to some other network interface if configured so. Just set the <remote-ip-addr> option properly in net capture setup so that the IP tunnel is attached to desired network interface. The capture status can be checked again like this:

```
net capture
```

After enabling the monitoring, the system will send captured (either received or sent) network packets to the tunnel interface for further processing.

The monitoring can be disabled like this:

```
net capture disable
```

which will turn currently running monitoring off. The monitoring setup can be cleared like this:

```
net capture cleanup
```

It is not necessary to use net-shell for configuring the monitoring. The network capture API functions can be called by the application if needed.

**Wireshark Configuration**

The Wireshark tool can be used to monitor the captured network traffic in a useful way.

You can monitor either the tunnel interfaces or the zeth interface. In order to see the actual captured data inside an UDP packet, see Wireshark decapsulate UDP document for instructions.
Zephyr provides support for the standard BSD socket APIs (defined in `include/zephyr/net/socket.h`) for the applications to use. See BSD socket API for more details.

Apart of the standard API, Zephyr provides a set of custom networking APIs and libraries for the application to use. See the list below for details.

**Note:** The legacy connectivity API in `include/zephyr/net/net_context.h` should not be used by applications.

### Network APIs

**BSD Sockets**

- **Overview**
- **Secure Sockets**
  - TLS credentials subsystem
  - Secure Socket Creation
  - Secure Sockets options
- **Socket offloading**
  - Offloaded socket creation
  - Dealing with multiple offloaded interfaces
- **API Reference**
  - BSD Sockets
  - TLS Credentials

---

**Overview**  Zephyr offers an implementation of a subset of the BSD Sockets API (a part of the POSIX standard). This API allows to reuse existing programming experience and port existing simple networking applications to Zephyr.

Here are the key requirements and concepts which governed BSD Sockets compatible API implementation for Zephyr:

- Has minimal overhead, similar to the requirement for other Zephyr subsystems.
- Is namedpaced by default, to avoid name conflicts with well-known names like `close()`, which may be part of libc or other POSIX compatibility libraries. If enabled by `CONFIG_NET_SOCKETS_POSIX_NAMES`, it will also expose native POSIX names.

BSD Sockets compatible API is enabled using `CONFIG_NET_SOCKETS` config option and implements the following operations: `socket()`, `close()`, `recv()`, `recvfrom()`, `send()`, `sendto()`, `connect()`, `bind()`, `listen()`, `accept()`, `fcntl()`, `getsockopt()`, `setsockopt()`, `poll()`, `select()`, `getaddrinfo()`, `getnameinfo()`.

Based on the namespacing requirements above, these operations are by default exposed as functions with `zsock_` prefix, e.g. `zsock_socket()` and `zsock_close()`. If the config option `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined, all the functions will be also exposed as aliases without the prefix. This includes the functions like `close()` and `fcntl()` (which may conflict with functions in libc or other libraries, for example, with the filesystem libraries).
Another entailment of the design requirements above is that the Zephyr API aggressively employs the short-read/short-write property of the POSIX API whenever possible (to minimize complexity and overheads). POSIX allows for calls like `recv()` and `send()` to actually process (receive or send) less data than requested by the user (on SOCK_STREAM type sockets). For example, a call `recv(sock, 1000, 0)` may return 100, meaning that only 100 bytes were read (short read), and the application needs to retry call(s) to receive the remaining 900 bytes.

The BSD Sockets API uses file descriptors to represent sockets. File descriptors are small integers, consecutively assigned from zero, shared among sockets, files, special devices (like stdin/stdout), etc. Internally, there is a table mapping file descriptors to internal object pointers. The file descriptor table is used by the BSD Sockets API even if the rest of the POSIX subsystem (filesystem, stdin/stdout) is not enabled.

See sockets-echo-server and sockets-echo-client sample applications to learn how to create a simple server or client BSD socket based application.

**Secure Sockets** Zephyr provides an extension of standard POSIX socket API, allowing to create and configure sockets with TLS protocol types, facilitating secure communication. Secure functions for the implementation are provided by mbedTLS library. Secure sockets implementation allows use of both TLS and DTLS protocols with standard socket calls. See `net_ip_protocol_secure` type for supported secure protocol versions.

To enable secure sockets, set the `CONFIG_NET_SOCKETS_SOCKOPT_TLS` option. To enable DTLS support, use `CONFIG_NET_SOCKETS_ENABLE_DTLS` option.

**TLS credentials subsystem** TLS credentials must be registered in the system before they can be used with secure sockets. See `tls_credential_add()` for more information.

When a specific TLS credential is registered in the system, it is assigned with numeric value of type `sec_tag_t`, called a tag. This value can be used later on to reference the credential during secure socket configuration with socket options.

The following TLS credential types can be registered in the system:

- `TLS_CREDENTIAL_CA_CERTIFICATE`
- `TLS_CREDENTIAL_SERVER_CERTIFICATE`
- `TLS_CREDENTIAL_PRIVATE_KEY`
- `TLS_CREDENTIAL_PSK`
- `TLS_CREDENTIAL_PSK_ID`

An example registration of CA certificate (provided in `ca_certificate` array) looks like this:

```c
ret = tls_credential_add(CA_CERTIFICATE_TAG, TLS_CREDENTIAL_CA_CERTIFICATE, ca_certificate, sizeof(ca_certificate));
```

By default certificates in DER format are supported. PEM support can be enabled in mbedTLS settings.

**Secure Socket Creation** A secure socket can be created by specifying secure protocol type, for instance:

```c
sock = socket(AF_INET, SOCK_STREAM, IPPROTO_TLS_1_2);
```

Once created, it can be configured with socket options. For instance, the CA certificate and hostname can be set:
Once configured, socket can be used just like a regular TCP socket.

Several samples in Zephyr use secure sockets for communication. For a sample use see e.g. echo-server sample application or HTTP GET sample application.

**Secure Sockets options** Secure sockets offer the following options for socket management:

Related code samples

**HTTP GET using plain sockets**
Implement an HTTP(S) client using plain BSD sockets.

**HTTP client**
Implement an HTTP(S) client that issues a variety of HTTP requests.

---

**group secure_sockets_options**

**Socket options for TLS**

**SOL_TLS**
Protocol level for TLS.
Here, the same socket protocol level for TLS as in Linux was used.

**TLS_SEC_TAG_LIST**
Socket option to select TLS credentials to use.
It accepts and returns an array of sec_tag_t that indicate which TLS credentials should be used with specific socket.

**TLS_HOSTNAME**
Write-only socket option to set hostname.
It accepts a string containing the hostname (may be NULL to disable hostname verification). By default, hostname check is enforced for TLS clients.

**TLS_CIPHERSUITE_LIST**
Socket option to select ciphersuites to use.
It accepts and returns an array of integers with IANA assigned ciphersuite identifiers. If not set, socket will allow all ciphersuites available in the system (mbedTLS default behavior).
TLS_CIPHERSUITE_USED
Read-only socket option to read a ciphersuite chosen during TLS handshake.
It returns an integer containing an IANA assigned ciphersuite identifier of chosen ciphersuite.

TLS_PEER_VERIFY
Write-only socket option to set peer verification level for TLS connection.
This option accepts an integer with a peer verification level, compatible with mbedTLS values:
• 0 - none
• 1 - optional
• 2 - required
If not set, socket will use mbedTLS defaults (none for servers, required for clients).

TLS_DTLS_ROLE
Write-only socket option to set role for DTLS connection.
This option is irrelevant for TLS connections, as for them role is selected based on connect()/listen() usage. By default, DTLS will assume client role. This option accepts an integer with a TLS role, compatible with mbedTLS values:
• 0 - client
• 1 - server

TLS_ALPN_LIST
Socket option for setting the supported Application Layer Protocols.
It accepts and returns a const char array of NULL terminated strings representing the supported application layer protocols listed during the TLS handshake.

TLS_DTLS_HANDSHAKE_TIMEOUT_MIN
Socket option to set DTLS min handshake timeout.
The timeout starts at min, and upon retransmission the timeout is doubled until max is reached. Min and max arguments are separate options. The time unit is ms.

TLS_DTLS_HANDSHAKE_TIMEOUT_MAX
Socket option to set DTLS max handshake timeout.
The timeout starts at min, and upon retransmission the timeout is doubled until max is reached. Min and max arguments are separate options. The time unit is ms.

TLS_CERT_NOCOPY
Socket option for preventing certificates from being copied to the mbedTLS heap if possible.
The option is only effective for DER certificates and is ignored for PEM certificates.

TLS_NATIVE
TLS socket option to use with offloading.
The option instructs the network stack only to offload underlying TCP/UDP communication. The TLS/DTLS operation is handled by a native TLS/DTLS socket implementation from Zephyr.
Note, that this option is only applicable if socket dispatcher is used (CON-
FIG_NET_SOCKETS_OFFLOAD_DISPATCHER is enabled). In such case, it should be the
first socket option set on a newly created socket. After that, the application may
use SO_BINDTODEVICE to choose the dedicated network interface for the underlying
TCP/UDP socket.

**TLS_SESSION_CACHE**

Socket option to control TLS session caching on a socket.

Accepted values:

- 0 - Disabled.
- 1 - Enabled.

**TLS_SESSION_CACHE_PURGE**

Write-only socket option to purge session cache immediately.

This option accepts any value.

**TLS_DTLS_CID**

Write-only socket option to control DTLS CID.

The option accepts an integer, indicating the setting. Accepted values for the option
are: 0, 1 and 2. Effective when set before connecting to the socket.

- 0 - DTLS CID will be disabled.
- 1 - DTLS CID will be enabled, and a 0 length CID value to be sent to the peer.
- 2 - DTLS CID will be enabled, and the most recent value set with
TLS_DTLS_CID_VALUE will be sent to the peer. Otherwise, a random value
will be used.

**TLS_DTLS_CID_STATUS**

Read-only socket option to get DTLS CID status.

The option accepts a pointer to an integer, indicating the setting upon return. Returned
vaules for the option are:

- 0 - DTLS CID is disabled.
- 1 - DTLS CID is received on the downlink.
- 2 - DTLS CID is sent to the uplink.
- 3 - DTLS CID is used in both directions.

**TLS_DTLS_CID_VALUE**

Socket option to set or get the value of the DTLS connection ID to be used for the DTLS
session.

The option accepts a byte array, holding the CID value.

**TLS_DTLS_PEER_CID_VALUE**

Read-only socket option to get the value of the DTLS connection ID received from the
peer.

The option accepts a pointer to a byte array, holding the CID value upon return. The
optlen returned will be 0 if the peer did not provide a connection ID, otherwise will
contain the length of the CID value.
**TLS_DTLS_HANDSHAKE_ON_CONNECT**

Socket option to configure DTLS socket behavior on `connect()`. If set, DTLS `connect()` will execute the handshake with the configured peer. This is the default behavior. Otherwise, DTLS `connect()` will only configure peer address (as with regular UDP socket) and will not attempt to execute DTLS handshake. The handshake will take place in consecutive `send()`/`recv()` call.

**TLS_PEER_VERIFY_NONE**

Peer verification disabled.

**TLS_PEER_VERIFY_OPTIONAL**

Peer verification optional.

**TLS_PEER_VERIFY_REQUIRED**

Peer verification required.

**TLS_DTLS_ROLE_CLIENT**

Client role in a DTLS session.

**TLS_DTLS_ROLE_SERVER**

Server role in a DTLS session.

**TLS_CERT_NOCOPY_NONE**

Cert duplicated in heap.

**TLS_CERT_NOCOPY_OPTIONAL**

Cert not copied in heap if DER.

**TLS_SESSION_CACHE_DISABLED**

Disable TLS session caching.

**TLS_SESSION_CACHE_ENABLED**

Enable TLS session caching.

**TLS_DTLS_CID_DISABLED**

CID is disabled

**TLS_DTLS_CID_SUPPORTED**

CID is supported.

**TLS_DTLS_CID_ENABLED**

CID is enabled

**TLS_DTLS_CID_STATUS_DISABLED**

CID is disabled.

**TLS_DTLS_CID_STATUS_DOWNLINK**

CID is in use by us.
TLS_DTLS_CID_STATUS_UPLINK
CID is in use by peer.

TLS_DTLS_CID_STATUS_BIDIRECTIONAL
CID is in use by us and peer.

**Socket offloading** Zephyr allows to register custom socket implementations (called offloaded sockets). This allows for seamless integration for devices which provide an external IP stack and expose socket-like API.

Socket offloading can be enabled with `CONFIG_NET_SOCKETS_OFFLOAD` option. A network driver that wants to register a new socket implementation should use `NET_SOCKET_OFFLOAD_REGISTER` macro. The macro accepts the following parameters:

- **socket_name**
  An arbitrary name for the socket implementation.

- **prio**
  Socket implementation's priority. The higher the priority, the earlier this particular implementation will be processed when creating a new socket. Lower numeric value indicates higher priority.

- **_family**
  Socket family implemented by the offloaded socket. `AF_UNSPEC` indicates any family.

- **_is_supported**
  A filtering function, used to verify whether a particular socket family, type and protocol are supported by the offloaded socket implementation.

- **_handler**
  A function compatible with `socket()` API, used to create an offloaded socket.

Every offloaded socket implementation should also implement a set of socket APIs, specified in `socket_op_vtable` struct.

The function registered for socket creation should allocate a new file descriptor using `z_reserve_fd()` function. Any additional actions, specific to the creation of a particular offloaded socket implementation should take place after the file descriptor is allocated. As a final step, if the offloaded socket was created successfully, the file descriptor should be finalized with `z_finalize_fd()` function. The finalize function allows to register a `socket_op_vtable` structure implementing socket APIs for an offloaded socket along with an optional socket context data pointer.

Finally, when an offloaded network interface is initialized, it should indicate that the interface is offloaded with `net_if_socket_offload_set()` function. The function registers the function used to create an offloaded socket (the same as the one provided in `NET_SOCKET_OFFLOAD_REGISTER`) at the network interface.

**Offloaded socket creation** When application creates a new socket with `socket()` function, the network stack iterates over all registered socket implementations (native and offloaded). Higher priority socket implementations are processed first. For each registered socket implementation, an address family is verified, and if it matches (or the socket was registered as `AF_UNSPEC`), the corresponding `_is_supported` function is called to verify the remaining socket parameters. The first implementation that fulfills the socket requirements (i.e. `_is_supported` returns true) will create a new socket with its `_handler` function.

The above indicates the importance of the socket priority. If multiple socket implementations support the same set of socket family/type/protocol, the first implementation processed by the system will create a socket. Therefore it's important to give the highest priority to the implementation that should be the system default.
The socket priority for native socket implementation is configured with Kconfig. Use CONFIG_NET_SOCKETS_TLS_PRIORITY to set the priority for the native TLS sockets. Use CONFIG_NET_SOCKETS_PRIORITY_DEFAULT to set the priority for the remaining native sockets.

**Dealing with multiple offloaded interfaces**  As the socket() function does not allow to specify which network interface should be used by a socket, it's not possible to choose a specific implementation in case multiple offloaded socket implementations, supporting the same type of sockets, are available. The same problem arises when both native and offloaded sockets are available in the system.

To address this problem, a special socket implementation (called socket dispatcher) was introduced. The sole reason for this module is to postpone the socket creation for until the first operation on a socket is performed. This leaves an opening to use SO_BINDTODEVICE socket option, to bind a socket to a particular network interface (and thus offloaded socket implementation). The socket dispatcher can be enabled with CONFIG_NET_SOCKETS_OFFLOAD_DISPATCHER Kconfig option.

When enabled, the application can specify the network interface to use with setsockopt() function:

```c
/* A "dispatcher" socket is created */
sock = socket(AF_INET, SOCK_DGRAM, IPPROTO_UDP);

struct ifreq ifreq = {
    .ifr_name = "SimpleLink"
};

/* The socket is "dispatched" to a particular network interface
   *(offloaded or not). */
setsockopt(sock, SOL_SOCKET, SO_BINDTODEVICE, &ifreq, sizeof(ifreq));
```

Similarly, if TLS is supported by both native and offloaded sockets, TLS_NATIVE socket option can be used to indicate that a native TLS socket should be created. The underlying socket can then be bound to a particular network interface:

```c
/* A "dispatcher" socket is created */
sock = socket(AF_INET, SOCK_STREAM, IPPROTO_TLS_1_2);

int tls_native = 1;

/* The socket is "dispatched" to a native TLS socket implementation.
   * The underlying socket is a "dispatcher" socket now. */
setsockopt(sock, SOL_TLS, TLS_NATIVE, &tls_native, sizeof(tls_native));

struct ifreq ifreq = {
    .ifr_name = "SimpleLink"
};

/* The underlying socket is "dispatched" to a particular network interface
   *(offloaded or not). */
setsockopt(sock, SOL_SOCKET, SO_BINDTODEVICE, &ifreq, sizeof(ifreq));
```

In case no SO_BINDTODEVICE socket option is used on a socket, the socket will be dispatched according to the default priority and filtering rules on a first socket API call.

**API Reference**
BSD Sockets

Related code samples

AWS IoT Core MQTT
Connect to AWS IoT Core and publish messages using MQTT.

Asynchronous echo server using poll()
Implement an asynchronous IPv4/IPv6 TCP echo server using BSD sockets and poll().

Asynchronous echo server using select()
Implement an asynchronous IPv4/IPv6 TCP echo server using BSD sockets and select().

Dumb HTTP server
Implement a simple, portable, HTTP server using BSD sockets.

Dumb HTTP server (multi-threaded)
Implement a simple HTTP server supporting simultaneous connections using BSD sockets.

Echo client (advanced)
Implement a client that sends IP packets, waits for data to be sent back, and verifies it.

Echo server (advanced)
Implement a UDP/TCP server that sends received packets back to the sender.

Echo server (service)
Implements a simple IPv4/IPv6 TCP echo server using BSD sockets and socket service API.

Echo server (simple)
Implements a simple IPv4/IPv6 TCP echo server using BSD sockets.

HTTP GET using plain sockets
Implement an HTTP(S) client using plain BSD sockets.

HTTP client
Implement an HTTP(S) client that issues a variety of HTTP requests.

Large HTTP download
Download a large file from a web server using BSD sockets.

Microsoft Azure IoT Hub MQTT
Connect to Azure IoT Hub and publish messages using MQTT.

Modbus TCP server
Implement a Modbus TCP server exposing Modbus commands to control LEDs.

Modbus TCP-to-serial gateway
Implement a gateway between an Ethernet TCP-IP network and a Modbus serial line.

Network management socket
Listen to network management events using a network management socket.

Packet socket
Use raw packet sockets over Ethernet.

SNTP client
Use SNTP to get the current time from the host.

SocketCAN
Send and receive raw CAN frames using BSD sockets API.

Socketpair
Implement communication between threads using socket pairs.

TCP sample for TTCN-3 based sanity check
Use TTCN-3 to validate the functionality of the TCP stack.

TagoIO HTTP Post
Send random temperature values to TagoIO IoT Cloud Platform using HTTP.
UDP sender using SO_TXTIME
   Control the transmission time of a packet using SO_TXTIME socket option.

Video TCP server sink
   Capture video frames and send them over the network to a TCP client.

WebSocket Client
   Implement a Websocket client that connects to a Websocket server.

mDNS responder
   Listen and respond to mDNS queries.

---

group bsd_sockets
   BSD Sockets compatible API.

Socket APIs available if CONFIG_NET_SOCKETS_POSIX_NAMES is enabled

static inline int socket(int family, int type, int proto)
   POSIX wrapper for zsock_socket.

static inline int socketpair(int family, int type, int proto, int sv[2])
   POSIX wrapper for zsock_socketpair.

static inline int close(int sock)
   POSIX wrapper for zsock_close.

static inline int shutdown(int sock, int how)
   POSIX wrapper for zsock_shutdown.

static inline int bind(int sock, const struct sockaddr *addr, socklen_t addrlen)
   POSIX wrapper for zsock_bind.

static inline int connect(int sock, const struct sockaddr *addr, socklen_t addrlen)
   POSIX wrapper for zsock_connect.

static inline int listen(int sock, int backlog)
   POSIX wrapper for zsock_listen.

static inline int accept(int sock, struct sockaddr *addr, socklen_t *addrlen)
   POSIX wrapper for zsock_accept.

static inline ssize_t send(int sock, const void *buf, size_t len, int flags)
   POSIX wrapper for zsock_send.

static inline ssize_t sendto(int sock, const void *buf, size_t len, int flags, const struct sockaddr *dest_addr, socklen_t addrlen)
   POSIX wrapper for zsock_sendto.

static inline ssize_t sendmsg(int sock, const struct msghdr *message, int flags)
   POSIX wrapper for zsock_sendmsg.

static inline ssize_t recvfrom(int sock, void *buf, size_t max_len, int flags, struct sockaddr *src_addr, socklen_t *addrlen)
   POSIX wrapper for zsock_recvfrom.
static inline ssize_t recvmsg(int sock, struct msghdr *msg, int flags)
    POSIX wrapper for zsock_recvmsg.
static inline int poll(struct zsock_pollfd *fds, int nfds, int timeout)
    POSIX wrapper for zsock_poll.
static inline int getsockopt(int sock, int level, int optname, void *optval, socklen_t *optlen)
    POSIX wrapper for zsock_getsockopt.
static inline int setsockopt(int sock, int level, int optname, const void *optval, socklen_t optlen)
    POSIX wrapper for zsock_setsockopt.
static inline int getpeername(int sock, struct sockaddr *addr, socklen_t *addrlen)
    POSIX wrapper for zsock_getpeername.
static inline int getsockname(int sock, struct sockaddr *addr, socklen_t *addrlen)
    POSIX wrapper for zsock_getsockname.
static inline int getaddrinfo(const char *host, const char *service, const struct zsock_addrinfo *hints, struct zsock_addrinfo **res)
    POSIX wrapper for zsock_getaddrinfo.
static inline void freeaddrinfo(struct zsock_addrinfo *ai)
    POSIX wrapper for zsock_freeaddrinfo.
static inline const char *gai_strerror(int errcode)
    POSIX wrapper for zsock_gai_strerror.
static inline int getnameinfo(const struct sockaddr *addr, socklen_t addrlen, char *host, socklen_t hostlen, char *serv, socklen_t servlen, int flags)
    POSIX wrapper for zsock_getnameinfo.
static inline int gethostname(char *buf, size_t len)
    POSIX wrapper for zsock_gethostname.
static inline int inet_pton(sa_family_t family, const char *src, void *dst)
    POSIX wrapper for zsock_inet_pton.
static inline char *inet_ntop(sa_family_t family, const void *src, char *dst, size_t size)
    POSIX wrapper for zsock_inet_ntop.

pollfd
    POSIX wrapper for zsock_pollfd.
addrrinfo
    POSIX wrapper for zsock_addrrinfo.

POLLIN
    POSIX wrapper for ZSOCK_POLLIN.
POLLOUT
    POSIX wrapper for ZSOCK_POLLOUT.
POLLERR
    POSIX wrapper for ZSOCK_POLLERR.
POLLHUP
   POSIX wrapper for ZSOCK_POLLHUP.

POLLNVAL
   POSIX wrapper for ZSOCK_POLLNVAL.

MSG_PEEK
   POSIX wrapper for ZSOCK_MSG_PEEK.

MSG_CTRUNC
   POSIX wrapper for ZSOCK_MSG_CTRUNC.

MSG_TRUNC
   POSIX wrapper for ZSOCK_MSG_TRUNC.

MSG_DONTWAIT
   POSIX wrapper for ZSOCK_MSG_DONTWAIT.

MSG_WAITALL
   POSIX wrapper for ZSOCK_MSG_WAITALL.

SHUT_RD
   POSIX wrapper for ZSOCK_SHUT_RD.

SHUT_WR
   POSIX wrapper for ZSOCK_SHUT_WR.

SHUT_RDWR
   POSIX wrapper for ZSOCK_SHUT_RDWR.

EAI_BADFLAGS
   POSIX wrapper for DNS_EAI_BADFLAGS.

EAI_NONAME
   POSIX wrapper for DNS_EAI_NONAME.

EAI_AGAIN
   POSIX wrapper for DNS_EAI_AGAIN.

EAI_FAIL
   POSIX wrapper for DNS_EAI_FAIL.

EAI_NODATA
   POSIX wrapper for DNS_EAI_NODATA.

EAI_MEMORY
   POSIX wrapper for DNS_EAI_MEMORY.
EAI_SYSTEM
    POSIX wrapper for DNS_EAI_SYSTEM.

EAI_SERVICE
    POSIX wrapper for DNS_EAI_SERVICE.

EAI_SOCKTYPE
    POSIX wrapper for DNS_EAI_SOCKTYPE.

EAI_FAMILY
    POSIX wrapper for DNS_EAI_FAMILY.

Options for poll()

ZSOCK_POLLIN
    zsock_poll: Poll for readability

ZSOCK_POLLPRI
    zsock_poll: Poll for exceptional condition

ZSOCK_POLLOUT
    zsock_poll: Poll for writability

ZSOCK_POLLERR
    zsock_poll: Poll results in error condition (output value only)

ZSOCK_POLLHUP
    zsock_poll: Poll detected closed connection (output value only)

ZSOCK_POLLNVAL
    zsock_poll: Invalid socket (output value only)

Options for sending and receiving data

ZSOCK_MSG_PEEK
    zsock_recv: Read data without removing it from socket input queue

ZSOCK_MSG_CTRUNC
    zsock_recvmsg: Control data buffer too small.

ZSOCK_MSG_TRUNC
    zsock_recv: return the real length of the datagram, even when it was longer than the passed buffer

ZSOCK_MSG_DONTWAIT
    zsock_recv/zsock_send: Override operation to non-blocking
ZSOCK_MSG_WAITALL
    zsock_recv: block until the full amount of data can be returned

Options for shutdown() function

ZSOCK_SHUT_RD
    zsock_shutdown: Shut down for reading

ZSOCK_SHUT_WR
    zsock_shutdown: Shut down for writing

ZSOCK_SHUT_RDWR
    zsock_shutdown: Shut down for both reading and writing

Flags for getaddrinfo() hints

AI_PASSIVE
    Address for bind() (vs for connect())

AI_CANONNAME
    Fill in ai_canonname.

AI_NUMERICHOST
    Assume host address is in numeric notation, don't DNS lookup.

AI_V4MAPPED
    May return IPv4 mapped address for IPv6

AI_ALL
    May return both native IPv6 and mapped IPv4 address for IPv6.

AI_ADDRCONFIG
    IPv4/IPv6 support depends on local system config.

AI_NUMERICSERV
    Assume service (port) is numeric.

Flags for getnameinfo()

NI_NUMERICHOST
    zsock_getnameinfo(): Resolve to numeric address.

NI_NUMERICSERV
    zsock_getnameinfo(): Resolve to numeric port number.
NI_NOFQDN
   zsock_getnameinfo(): Return only hostname instead of FQDN

NI_NAMEREQD
   zsock_getnameinfo(): Dummy option for compatibility

NI_DGRAM
   zsock_getnameinfo(): Dummy option for compatibility

NI_MAXHOST
   zsock_getnameinfo(): Max supported hostname length

Network interface name description

IFNAMSIZ
   Network interface name length.

Socket level options (SOL_SOCKET)

SOL_SOCKET
   Socket-level option.

SO_DEBUG
   Recording debugging information (ignored, for compatibility)

SO_REUSEADDR
   address reuse

SO_TYPE
   Type of the socket.

SO_ERROR
   Async error.

SO_DONTROUTE
   Bypass normal routing and send directly to host (ignored, for compatibility)

SO_BROADCAST
   Transmission of broadcast messages is supported (ignored, for compatibility)

SO_SNDBUF
   Size of socket send buffer.

SO_RCVBUF
   Size of socket recv buffer.
SO_KEEPALIVE
   Enable sending keep-alive messages on connections.

SO_OOBINLINE
   Place out-of-band data into receive stream (ignored, for compatibility)

SO_PRIORITY
   Socket priority.

SO_LINGER
   Socket lingers on close (ignored, for compatibility)

SO_REUSEPORT
   Allow multiple sockets to reuse a single port.

SO_RCVLOWAT
   Receive low watermark (ignored, for compatibility)

SO_SNDLOWAT
   Send low watermark (ignored, for compatibility)

SO_RCVTIMEO
   Receive timeout Applies to receive functions like recv(), but not to connect()

SO_SNDTIMEO
   Send timeout.

SO_BINDTODEVICE
   Bind a socket to an interface.

SO_ACCEPTCONN
   Socket accepts incoming connections (ignored, for compatibility)

SO_TIMESTAMPING
   Timestamp TX packets.

SO_PROTOCOL
   Protocol used with the socket.

SO_DOMAIN
   Domain used with SOCKET.

SO.SOCKS5
   Enable SOCKS5 for Socket.

SO_TXTIME
   Socket TX time (when the data should be sent)

SCM_TXTIME
   Socket TX time (same as SO_TXTIME)
TCP level options (IPPROTO_TCP)

TCP_NODELAY
Disable TCP buffering (ignored, for compatibility)

TCP_KEEPIDLE
Start keepalives after this period (seconds)

TCP_KEEPINTVL
Interval between keepalives (seconds)

TCP_KEEPCNT
Number of keepalives before dropping connection.

IPv4 level options (IPPROTO_IP)

IP_TOS
Set or receive the Type-Of-Service value for an outgoing packet.

IP_TTL
Set or receive the Time-To-Live value for an outgoing packet.

IP_PKTINFO
Pass an IP_PKTINFO ancillary message that contains a pktinfo structure that supplies some information about the incoming packet.

IP_MULTICAST_TTL
Set IPv4 multicast TTL value.

IP_ADD_MEMBERSHIP
Join IPv4 multicast group.

IP_DROP_MEMBERSHIP
Leave IPv4 multicast group.

IPv6 level options (IPPROTO_IPV6)

IPV6_UNICAST_HOPS
Set the unicast hop limit for the socket.

IPV6_MULTICAST_HOPS
Set the multicast hop limit for the socket.

IPV6_ADD_MEMBERSHIP
Join IPv6 multicast group.
IPV6_DROP_MEMBERSHIP
Leave IPv6 multicast group.

IPV6_V6ONLY
Don’t support IPv4 access.

IPV6_RECV_PKTINFO
Pass an IPV6_RECV_PKTINFO ancillary message that contains an in6_pktinfo structure that supplies some information about the incoming packet.
See RFC 3542.

IPV6_TCLASS
Set or receive the traffic class value for an outgoing packet.

Backlog size for listen()

SOMAXCONN
listen: The maximum backlog queue length

Defines

ZSOCK_FD_SETSIZE
Number of file descriptors which can be added to zsock_fd_set.

fd_set

FD_SETSIZE

zsock_timeval

Typedefs

typedef struct zsock_fd_set zsock_fd_set

Functions

void *zsock_get_context_object(int sock)
Obtain a file descriptor’s associated net context.

With CONFIG_USERSPACE enabled, the kernel’s object permission system must apply to socket file descriptors. When a socket is opened, by default only the caller has permission, access by other threads will fail unless they have been specifically granted permission.

This is achieved by tagging data structure definitions that implement the underlying object associated with a network socket file descriptor with ‘__net_socket’. All
pointers to instances of these will be known to the kernel as kernel objects with type
K_OBJ_NET_SOCKET.

This API is intended for threads that need to grant access to the object associated with
a particular file descriptor to another thread. The returned pointer represents the under-
lying K_OBJ_NET_SOCKET and may be passed to APIs like k_object_access_grant().

In a system like Linux which has the notion of threads running in processes in a shared
virtual address space, this sort of management is unnecessary as the scope of file de-
scriptors is implemented at the process level.

However in Zephyr the file descriptor scope is global, and MPU-based systems are not
able to implement a process-like model due to the lack of memory virtualization hard-
ware. They use discrete object permissions and memory domains instead to define
thread access scope.

User threads will have no direct access to the returned object and will fault if they try
to access its memory; the pointer can only be used to make permission assignment
calls, which follow exactly the rules for other kernel objects like device drivers and
IPC.

Parameters

• sock – file descriptor

Returns

pointer to associated network socket object, or NULL if the file descriptor
wasn't valid or the caller had no access permission

int zsock_socket(int family, int type, int proto)
Create a network socket.

See POSIX.1-2017 article for normative description. This function is also exposed as
socket() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

If CONFIG_USERSPACE is enabled, the caller will be granted access to the context object
associated with the returned file descriptor.

See also:

zsock_get_context_object()

int zsock_socketpair(int family, int type, int proto, int *sv)
Create an unnamed pair of connected sockets.

See POSIX.1-2017 article for normative description. This function is also exposed as
socketpair() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_close(int sock)
Close a network socket.

Close a network socket. This function is also exposed as close() if CON-
FIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic
POSIX close() function).

int zsock_shutdown(int sock, int how)
Shutdown socket send/receive operations.

See POSIX.1-2017 article for normative description, but currently this function has no
effect in Zephyr and provided solely for compatibility with existing code. This function
is also exposed as shutdown() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_bind(int sock, const struct sockaddr *addr, socklen_t addrlen)
Bind a socket to a local network address.

See POSIX.1-2017 article for normative description. This function is also exposed as
bind() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.
int zsock_connect(int sock, const struct sockaddr *addr, socklen_t addrlen)
    Connect a socket to a peer network address.
    See POSIX.1-2017 article for normative description. This function is also exposed as connect() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_listen(int sock, int backlog)
    Set up a STREAM socket to accept peer connections.
    See POSIX.1-2017 article for normative description. This function is also exposed as listen() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_accept(int sock, struct sockaddr *addr, socklen_t *addrlen)
    Accept a connection on listening socket.
    See POSIX.1-2017 article for normative description. This function is also exposed as accept() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

ssize_t zsock_sendto(int sock, const void *buf, size_t len, int flags, const struct sockaddr *dest_addr, socklen_t addrlen)
    Send data to an arbitrary network address.
    See POSIX.1-2017 article for normative description. This function is also exposed as sendto() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline ssize_t zsock_send(int sock, const void *buf, size_t len, int flags)
    Send data to a connected peer.
    See POSIX.1-2017 article for normative description. This function is also exposed as send() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

ssize_t zsock_sendmsg(int sock, const struct msghdr *msg, int flags)
    Send data to an arbitrary network address.
    See POSIX.1-2017 article for normative description. This function is also exposed as sendmsg() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

ssize_t zsock_recvfrom(int sock, void *buf, size_t max_len, int flags, struct sockaddr *src_addr, socklen_t *addrlen)
    Receive data from an arbitrary network address.
    See POSIX.1-2017 article for normative description. This function is also exposed as recvfrom() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

ssize_t zsock_recvmsg(int sock, struct msghdr *msg, int flags)
    Receive a message from an arbitrary network address.
    See POSIX.1-2017 article for normative description. This function is also exposed as recvmsg() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline ssize_t zsock_recv(int sock, void *buf, size_t max_len, int flags)
    Receive data from a connected peer.
    See POSIX.1-2017 article for normative description. This function is also exposed as recv() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_fcntl(int sock, int cmd, int flags)
    Control blocking/non-blocking mode of a socket.
    This functions allow to (only) configure a socket for blocking or non-blocking operation (O_NONBLOCK). This function is also exposed as fcntl() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX fcntl() function).
int zsock_ioctl(int sock, unsigned long request, va_list ap)
Control underlying socket parameters.

See POSIX.1-2017 article for normative description. This function enables querying or manipulating underlying socket parameters. Currently supported @p request values include ZFD_IOCTL_FIONBIO, and ZFD_IOCTL_FIONREAD, to set non-blocking mode, and query the number of bytes available to read, respectively. This function is also exposed as ioctl() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX ioctl() function).

int zsock_poll(struct zsock_pollfd *fds, int nfds, int timeout)
Efficiently poll multiple sockets for events.

See POSIX.1-2017 article for normative description. This function is also exposed as poll() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX poll() function).

int zsock_getsockopt(int sock, int level, int optname, void *optval, socklen_t *optlen)
Get various socket options.

See POSIX.1-2017 article for normative description. In Zephyr this function supports a subset of socket options described by POSIX, but also some additional options available in Linux (some options are dummy and provided to ease porting of existing code). This function is also exposed as getsockopt() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_setsockopt(int sock, int level, int optname, const void *optval, socklen_t optlen)
Set various socket options.

See POSIX.1-2017 article for normative description. In Zephyr this function supports a subset of socket options described by POSIX, but also some additional options available in Linux (some options are dummy and provided to ease porting of existing code). This function is also exposed as setsockopt() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getpeername(int sock, struct sockaddr *addr, socklen_t *addrlen)
Get peer name.

See POSIX.1-2017 article for normative description. This function is also exposed as getpeername() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getsockname(int sock, struct sockaddr *addr, socklen_t *addrlen)
Get socket name.

See POSIX.1-2017 article for normative description. This function is also exposed as getsockname() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_gethostname(char *buf, size_t len)
Get local host name.

See POSIX.1-2017 article for normative description. This function is also exposed as gethostname() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline char *zsock_inet_ntop(sa_family_t family, const void *src, char *dst, size_t size)
Convert network address from internal to numeric ASCII form.

See POSIX.1-2017 article for normative description. This function is also exposed as inet_ntop() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_inet_pton(sa_family_t family, const char *src, void *dst)
Convert network address from numeric ASCII form to internal representation.

See POSIX.1-2017 article for normative description. This function is also exposed as inet_pton() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.
int zsock_getaddrinfo(const char *host, const char *service, const struct zsock_addrinfo *hints, struct zsock_addrinfo **res)

Resolve a domain name to one or more network addresses.

See POSIX.1-2017 article for normative description. This function is also exposed as getaddrinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

void zsock_freeaddrinfo(struct zsock_addrinfo *ai)

Free results returned by zsock_getaddrinfo()

See POSIX.1-2017 article for normative description. This function is also exposed as freeaddrinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

code>const char *zsock_gai_strerror(int errcode)

Convert zsock_getaddrinfo() error code to textual message.

See POSIX.1-2017 article for normative description. This function is also exposed as gai_strerror() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getnameinfo(const struct sockaddr *addr, socklen_t addrlen, char *host, socklen_t hostlen, char *serv, socklen_t servlen, int flags)

Resolve a network address to a domain name or ASCII address.

See POSIX.1-2017 article for normative description. This function is also exposed as getnameinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_select(int nfds, zsock_fd_set *readfds, zsock_fd_set *writefds, zsock_fd_set *exceptfds, struct zsock_timeval *timeout)

Legacy function to poll multiple sockets for events.

See POSIX.1-2017 article for normative description. This function is provided to ease porting of existing code and not recommended for usage due to its inefficiency, use zsock_poll() instead. In Zephyr this function works only with sockets, not arbitrary file descriptors. This function is also exposed as select() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX select() function).

void ZSOCK_FD_ZERO(zsock_fd_set *set)

Initialize (clear) fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as FD_ZERO() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int ZSOCK_FD_ISSET(int fd, zsock_fd_set *set)

Check whether socket is a member of fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as FD_ISSET() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

void ZSOCK_FD_CLR(int fd, zsock_fd_set *set)

Remove socket from fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as FD_CLR() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

void ZSOCK_FD_SET(int fd, zsock_fd_set *set)

Add socket to fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as FD_SET() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline int select(int nfds, zsock_fd_set *readfds, zsock_fd_set *writefds, zsock_fd_set *exceptfds, struct timeval *timeout)
static inline void FD_ZERO(zsock_fd_set *set)
static inline int FD_ISSET(int fd, zsock_fd_set *set)
static inline void FD_CLR(int fd, zsock_fd_set *set)
static inline void FD_SET(int fd, zsock_fd_set *set)

struct zsock_pollfd
#include <socket.h> Definition of the monitored socket/file descriptor.
An array of these descriptors is passed as an argument to poll().

Public Members

int fd
Socket descriptor.

short events
Requested events.

short revents
Returned events.

struct zsock_addrinfo
#include <socket.h> Definition used when querying address information.
A linked list of these descriptors is returned by getaddrinfo(). The struct is also passed
as hints when calling the getaddrinfo() function.

Public Members

struct zsock_addrinfo *ai_next
Pointer to next address entry.

int ai_flags
Additional options.

int ai_family
Address family of the returned addresses.

int ai_socktype
Socket type, for example SOCK_STREAM or SOCK_DGRAM.

int ai_protocol
Protocol for addresses, 0 means any protocol.

socklen_t ai_addrlen
Length of the socket address.
struct sockaddr *ai_addr
    Pointer to the address.

char *ai_canonname
    Optional official name of the host.

struct ifreq
    #include <socket.h> Interface description structure.

    Public Members

    char ifr_name[Z_DEVICE_MAX_NAME_LEN]
        Network interface name.

struct in_pktinfo
    #include <socket.h> Incoming IPv4 packet information.
    Used as ancillary data when calling recvmsg() and IP_PKTINFO socket option is set.

    Public Members

    unsigned int ipi_ifindex
        Network interface index.

    struct in_addr ipi_spec_dst
        Local address.

    struct in_addr ipi_addr
        Header Destination address.

struct ip_mreqn
    #include <socket.h> Struct used when joining or leaving a IPv4 multicast group.

    Public Members

    struct in_addr imr_multiaddr
        IP multicast group address.

    struct in_addr imr_address
        IP address of local interface.

    int imr_ifindex
        Network interface index.

struct ipv6_mreq
    #include <socket.h> Struct used when joining or leaving a IPv6 multicast group.
Public Members

struct `in6_addr` `ipv6mr_multiaddr`
IPv6 multicast address of group.

int `ipv6mr_ifindex`
Network interface index of the local IPv6 address.

struct `in6_pktinfo`

#include `<socket.h>`
Incoming IPv6 packet information.
Used as ancillary data when calling `recvmsg()` and IPV6_RECVPKTINFO socket option is set.

Public Members

struct `in6_addr` `ipi6_addr`
Destination IPv6 address.

unsigned int `ipi6_ifindex`
Receive interface index.

struct `zsock_fd_set`

#include `<socket_select.h>`

TLS Credentials

Related code samples

AWS IoT Core MQTT
Connect to AWS IoT Core and publish messages using MQTT.

Dumb HTTP server (multi-threaded)
Implement a simple HTTP server supporting simultaneous connections using BSD sockets.

Echo client (advanced)
Implement a client that sends IP packets, waits for data to be sent back, and verifies it.

Echo server (advanced)
Implement a UDP/TCP server that sends received packets back to the sender.

HTTP GET using plain sockets
Implement an HTTP(S) client using plain BSD sockets.

HTTP client
Implement an HTTP(S) client that issues a variety of HTTP requests.

Large HTTP download
Download a large file from a web server using BSD sockets.

Microsoft Azure IoT Hub MQTT
Connect to Azure IoT Hub and publish messages using MQTT.

TagoIO HTTP Post
Send random temperature values to TagoIO IoT Cloud Platform using HTTP.
group tls_credentials
 TLS credentials management.

Typedefs

typedef int sec_tag_t
 Secure tag, a reference to TLS credential.
 Secure tag can be used to reference credential after it was registered in the system.

Note: Some TLS credentials come in pairs:
• TLS_CREDENTIAL_SERVER_CERTIFICATE with TLS_CREDENTIAL_PRIVATE_KEY,
• TLS_CREDENTIAL_PSK with TLS_CREDENTIAL_PSK_ID. Such pairs of credentials
  must be assigned the same secure tag to be correctly handled in the system.

Note: Negative values are reserved for internal use.

Enums

enum tls_credential_type
 TLS credential types.
 Values:

 enumerator TLS_CREDENTIAL_NONE
  Unspecified credential.

 enumerator TLS_CREDENTIAL_CA_CERTIFICATE
  A trusted CA certificate.
  Use this to authenticate remote servers. Used with certificate-based ciphersuites.

 enumerator TLS_CREDENTIAL_SERVER_CERTIFICATE
  A public server certificate.
  Use this to register your own server certificate. Should be registered together with
  a corresponding private key. Used with certificate-based ciphersuites.

 enumerator TLS_CREDENTIAL_PRIVATE_KEY
  Private key.
  Should be registered together with a corresponding public certificate. Used with
  certificate-based ciphersuites.

 enumerator TLS_CREDENTIAL_PSK
  Pre-shared key.
  Should be registered together with a corresponding PSK identity. Used with PSK-based ciphersuites.
enumerator TLS_CREDENTIAL_PSK_ID
    Pre-shared key identity.
    Should be registered together with a corresponding PSK. Used with PSK-based ciphersuites.

Functions

int tlsCredentialAdd(const void *cred, size_t credlen)
    Add a TLS credential.
    This function adds a TLS credential, that can be used by TLS/DTLS for authentication.

Parameters

- tag – A security tag that credential will be referenced with.
- type – A TLS/DTLS credential type.
- cred – A TLS/DTLS credential.
- credlen – A TLS/DTLS credential length.

Return values

- 0 – TLS credential successfully added.
- -EACCES – Access to the TLS credential subsystem was denied.
- -ENOMEM – Not enough memory to add new TLS credential.
- -EEXIST – TLS credential of specific tag and type already exists.

int tlsCredentialGet(void *cred, size_t *credlen)
    Get a TLS credential.
    This function gets an already registered TLS credential, referenced by tag secure tag of type.

Parameters

- tag – A security tag of requested credential.
- type – A TLS/DTLS credential type of requested credential.
- cred – A buffer for TLS/DTLS credential.
- credlen – A buffer size on input. TLS/DTLS credential length on output.

Return values

- 0 – TLS credential successfully obtained.
- -EACCES – Access to the TLS credential subsystem was denied.
- -ENOENT – Requested TLS credential was not found.
- -EFBIG – Requested TLS credential does not fit in the buffer provided.

int tlsCredentialDelete()
    Delete a TLS credential.
    This function removes a TLS credential, referenced by tag secure tag of type.

Parameters

- tag – A security tag corresponding to removed credential.
• type – A TLS/DTLS credential type of removed credential.

**Return values**

• 0 – TLS credential successfully deleted.
• -EACCES – Access to the TLS credential subsystem was denied.
• -ENOENT – Requested TLS credential was not found.

**IPv4/IPv6 Primitives and Helpers**

- Overview
  - API Reference

**Overview**  
Miscellaneous defines and helper functions for IP addresses and IP protocols.

**API Reference**

group ip_4_6  
IPv4/IPv6 primitives and helpers.

**Defines**

**PF_UNSPEC**
Unspecified protocol family.

**PF_INET**
IP protocol family version 4.

**PF_INET6**
IP protocol family version 6.

**PF_PACKET**
Packet family.

**PF_CAN**
Controller Area Network.

**PF_NET_MGMT**
Network management info.

**PF_LOCAL**
Inter-process communication

**PF_UNIX**
Inter-process communication
AF_UNSPEC
Unspecified address family.

AF_INET
IP protocol family version 4.

AF_INET6
IP protocol family version 6.

AF_PACKET
Packet family.

AF_CAN
Controller Area Network.

AF_NET_MGMT
Network management info.

AF_LOCAL
Inter-process communication

AF_UNIX
Inter-process communication

ntohs(x)
Convert 16-bit value from network to host byte order.

Parameters
• x – The network byte order value to convert.

Returns
Host byte order value.

ntohl(x)
Convert 32-bit value from network to host byte order.

Parameters
• x – The network byte order value to convert.

Returns
Host byte order value.

ntohll(x)
Convert 64-bit value from network to host byte order.

Parameters
• x – The network byte order value to convert.

Returns
Host byte order value.

htons(x)
Convert 16-bit value from host to network byte order.

Parameters
• x – The host byte order value to convert.
**Returns**
Network byte order value.

`htonl(x)`
Convert 32-bit value from host to network byte order.

**Parameters**
- `x` – The host byte order value to convert.

**Returns**
Network byte order value.

`htonl1(x)`
Convert 64-bit value from host to network byte order.

**Parameters**
- `x` – The host byte order value to convert.

**Returns**
Network byte order value.

**NET_IPV6_ADDR_SIZE**

**NET_IPV4_ADDR_SIZE**

**ALIGN_H(x)**

**ALIGN_D(x)**

**CMMSG_FISTHDR(msghdr)**

**CMMSG_NXTHDR(msghdr, cmsg)**

**CMMSG_DATA(cmsg)**

**CMMSG_SPACE(length)**

**CMMSG_LEN(length)**

**INET_ADDRSTRLEN**
Max length of the IPv4 address as a string.
Defined by POSIX.

**INET6_ADDRSTRLEN**
Max length of the IPv6 address as a string.
Takes into account possible mapped IPv4 addresses.

**NET_MAX_PRIORITIES**

`net_ipaddr_copy(dest, src)`
Copy an IPv4 or IPv6 address.

**Parameters**
- `dest` – Destination IP address.
- `src` – Source IP address.

**Returns**
Destination address.
**Typedefs**

typedef unsigned short int sa_family_t
  Socket address family type.

typedef size_t socklen_t
  Length of a socket address.

**Enums**

define enum net_ip_protocol
  Protocol numbers from IANA/BSD.
  *Values:*

  enumerator IPPROTO_IP = 0
    IP protocol (pseudo-val for setsockopt())

  enumerator IPPROTO_ICMP = 1
    ICMP protocol

  enumerator IPPROTO_IGMP = 2
    IGMP protocol

  enumerator IPPROTO_IPIP = 4
    IPIP tunnels

  enumerator IPPROTO_TCP = 6
    TCP protocol

  enumerator IPPROTO_UDP = 17
    UDP protocol

  enumerator IPPROTO_IPV6 = 41
    IPv6 protocol

  enumerator IPPROTO_ICMPV6 = 58
    ICMPv6 protocol.

  enumerator IPPROTO_RAW = 255
    RAW IP packets

define enum net_ip_protocol_secure
  Protocol numbers for TLS protocols.
  *Values:*

  enumerator IPPROTO_TLS_1_0 = 256
    TLS 1.0 protocol.
enumerator IPPROTO_TLS_1_1 = 257
    TLS 1.1 protocol.

enumerator IPPROTO_TLS_1_2 = 258
    TLS 1.2 protocol.

enumerator IPPROTO_DTLS_1_0 = 272
    DTLS 1.0 protocol.

enumerator IPPROTO_DTLS_1_2 = 273
    DTLS 1.2 protocol.

definition of net_sock_type
    Socket type.
    Values:

    enumerator SOCK_STREAM = 1
        Stream socket type

    enumerator SOCK_DGRAM
        Datagram socket type.

    enumerator SOCK_RAW
        RAW socket type

definition of net_ip_mtu
    Values:

    enumerator NET_IPV6_MTU = 1280
        IPv6 MTU length.
        We must be able to receive this size IPv6 packet without fragmentation.

    enumerator NET_IPV4_MTU = 576
        IPv4 MTU length.
        We must be able to receive this size IPv4 packet without fragmentation.

definition of net_priority
    Network packet priority settings described in IEEE 802.1Q Annex I.1.
    Values:

    enumerator NET_PRIORITY_BK = 1
        Background (lowest)

    enumerator NET_PRIORITY_BE = 0
        Best effort (default)

    enumerator NET_PRIORITY_EE = 2
        Excellent effort
enumerator NET_PRIORITY_CA = 3
    Critical applications

enumerator NET_PRIORITY_VI = 4
    Video, < 100 ms latency and jitter.

enumerator NET_PRIORITY_VO = 5
    Voice, < 10 ms latency and jitter

enumerator NET_PRIORITY_IC = 6
    Internetwork control

enumerator NET_PRIORITY_NC = 7
    Network control (highest)

define enum net_addr_state
    What is the current state of the network address.
    Values:
    enumerator NET_ADDR_ANY_STATE = -1
        Default (invalid) address type.
    enumerator NET_ADDR_TENTATIVE = 0
        Tentative address
    enumerator NET_ADDR_PREFERRED
        Preferred address
    enumerator NET_ADDR_DEPRECATED
        Deprecated address

define enum net_addr_type
    How the network address is assigned to network interface.
    Values:
    enumerator NET_ADDR_ANY = 0
        Default value.
        This is not a valid value.
    enumerator NET_ADDR_AUTOCONF
        Auto configured address.
    enumerator NET_ADDR_DHCP
        Address is from DHCP.
    enumerator NET_ADDR_MANUAL
        Manually set address.
enumerator NET_ADDR_OVERRIDEABLE
  Manually set address which is overridable by DHCP.

Functions

static inline bool net_ipv6_is_addr_loopback(struct in6_addr *addr)
  Check if the IPv6 address is a loopback address (::1).

  Parameters
  • addr – IPv6 address

  Returns
  True if address is a loopback address, False otherwise.

static inline bool net_ipv6_is_addr_mcast(const struct in6_addr *addr)
  Check if the IPv6 address is a multicast address.

  Parameters
  • addr – IPv6 address

  Returns
  True if address is multicast address, False otherwise.

struct net_if_addr *net_if_ipv6_addr_lookup(const struct in6_addr *addr, struct net_if **iface)

static inline bool net_ipv6_is_my_addr(struct in6_addr *addr)
  Check if IPv6 address is found in one of the network interfaces.

  Parameters
  • addr – IPv6 address

  Returns
  True if address was found, False otherwise.

struct net_if_mcast_addr *net_if_ipv6_maddr_lookup(const struct in6_addr *addr, struct net_if **iface)

static inline bool net_ipv6_is_my_maddr(struct in6_addr *maddr)
  Check if IPv6 multicast address is found in one of the network interfaces.

  Parameters
  • maddr – Multicast IPv6 address

  Returns
  True if address was found, False otherwise.

static inline bool net_ipv6_is_prefix(const uint8_t *addr1, const uint8_t *addr2, uint8_t length)
  Check if two IPv6 addresses are same when compared after prefix mask.

  Parameters
  • addr1 – First IPv6 address.
  • addr2 – Second IPv6 address.
  • length – Prefix length (max length is 128).

  Returns
  True if IPv6 prefixes are the same, False otherwise.
static inline bool \textbf{net_ipv4_is_addr_loopback}(\textit{struct in_addr *addr})
\begin{align*}
\text{Check if the IPv4 address is a loopback address (127.0.0.0/8).}
\end{align*}

\textbf{Parameters}
\begin{itemize}
\item \textit{addr} – IPv4 address
\end{itemize}

\textbf{Returns}
True if address is a loopback address, False otherwise.

static inline bool \textbf{net_ipv4_is_addr_unspecified}(\textit{const struct in_addr *addr})
\begin{align*}
\text{Check if the IPv4 address is unspecified (all bits zero)}
\end{align*}

\textbf{Parameters}
\begin{itemize}
\item \textit{addr} – IPv4 address.
\end{itemize}

\textbf{Returns}
True if the address is unspecified, false otherwise.

static inline bool \textbf{net_ipv4_is_addr_mcast}(\textit{const struct in_addr *addr})
\begin{align*}
\text{Check if the IPv4 address is a multicast address.}
\end{align*}

\textbf{Parameters}
\begin{itemize}
\item \textit{addr} – IPv4 address
\end{itemize}

\textbf{Returns}
True if address is multicast address, False otherwise.

static inline bool \textbf{net_ipv4_is_ll_addr}(\textit{const struct in_addr *addr})
\begin{align*}
\text{Check if the given IPv4 address is a link local address.}
\end{align*}

\textbf{Parameters}
\begin{itemize}
\item \textit{addr} – A valid pointer on an IPv4 address
\end{itemize}

\textbf{Returns}
True if it is, false otherwise.

static inline void \textbf{net_ipv4_addr_copy_raw}(\textit{uint8_t *dest, const uint8_t *src})
\begin{align*}
\text{Copy an IPv4 address raw buffer.}
\end{align*}

\textbf{Parameters}
\begin{itemize}
\item \textit{dest} – Destination IP address.
\item \textit{src} – Source IP address.
\end{itemize}

static inline void \textbf{net_ipv6_addr_copy_raw}(\textit{uint8_t *dest, const uint8_t *src})
\begin{align*}
\text{Copy an IPv6 address raw buffer.}
\end{align*}

\textbf{Parameters}
\begin{itemize}
\item \textit{dest} – Destination IP address.
\item \textit{src} – Source IP address.
\end{itemize}

static inline bool \textbf{net_ipv4_addr_cmp}(\textit{const struct in_addr *addr1, const struct in_addr *addr2})
\begin{align*}
\text{Compare two IPv4 addresses.}
\end{align*}

\textbf{Parameters}
\begin{itemize}
\item \textit{addr1} – Pointer to IPv4 address.
\item \textit{addr2} – Pointer to IPv4 address.
\end{itemize}

\textbf{Returns}
True if the addresses are the same, false otherwise.
static inline bool net_ipv4_addr_cmp_raw(const uint8_t *addr1, const uint8_t *addr2)
  Compare two raw IPv4 address buffers.

Parameters
  • addr1 – Pointer to IPv4 address buffer.
  • addr2 – Pointer to IPv4 address buffer.

Returns
  True if the addresses are the same, false otherwise.

static inline bool net_ipv6_addr_cmp(const struct in6_addr *addr1, const struct in6_addr *addr2)
  Compare two IPv6 addresses.

Parameters
  • addr1 – Pointer to IPv6 address.
  • addr2 – Pointer to IPv6 address.

Returns
  True if the addresses are the same, false otherwise.

static inline bool net_ipv6_addr_cmp_raw(const uint8_t *addr1, const uint8_t *addr2)
  Compare two raw IPv6 address buffers.

Parameters
  • addr1 – Pointer to IPv6 address buffer.
  • addr2 – Pointer to IPv6 address buffer.

Returns
  True if the addresses are the same, false otherwise.

static inline bool net_ipv6_is_ll_addr(const struct in6_addr *addr)
  Check if the given IPv6 address is a link local address.

Parameters
  • addr – A valid pointer on an IPv6 address

Returns
  True if it is, false otherwise.

static inline bool net_ipv6_is_sl_addr(const struct in6_addr *addr)
  Check if the given IPv6 address is a site local address.

Parameters
  • addr – A valid pointer on an IPv6 address

Returns
  True if it is, false otherwise.

static inline bool net_ipv6_is_ula_addr(const struct in6_addr *addr)
  Check if the given IPv6 address is a unique local address.

Parameters
  • addr – A valid pointer on an IPv6 address

Returns
  True if it is, false otherwise.
static inline bool net_ipv6_is_global_addr(const struct in6_addr *addr)
    Check if the given IPv6 address is a global address.

Parameters
• addr – A valid pointer on an IPv6 address

Returns
True if it is, false otherwise.

const struct in6_addr *net_ipv6_unspecified_address(void)
    Return pointer to any (all bits zeros) IPv6 address.

Returns
Any IPv6 address.

const struct in_addr *net_ipv4_unspecified_address(void)
    Return pointer to any (all bits zeros) IPv4 address.

Returns
Any IPv4 address.

const struct in_addr *net_ipv4_broadcast_address(void)
    Return pointer to broadcast (all bits ones) IPv4 address.

Returns
Broadcast IPv4 address.

bool net_if_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
static inline bool net_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
    Check if the given address belongs to same subnet that has been configured for the interface.

Parameters
• iface – A valid pointer on an interface
• addr – IPv4 address

Returns
True if address is in same subnet, false otherwise.

bool net_if_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
static inline bool net_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
    Check if the given IPv4 address is a broadcast address.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr – IPv4 address

Returns
True if address is a broadcast address, false otherwise.

struct net_if_addr *net_if_ipv4_addr_lookup(const struct in_addr *addr, struct net_if **iface)
static inline bool net_ipv4_is_my_addr(const struct in_addr *addr)
    Check if the IPv4 address is assigned to any network interface in the system.

Parameters
• addr – A valid pointer on an IPv4 address
Returns
True if IPv4 address is found in one of the network interfaces, False otherwise.

static inline bool net_ipv6_is_addr_unspecified(const struct in6_addr *addr)
Check if the IPv6 address is unspecified (all bits zero)

Parameters
• addr – IPv6 address.

Returns
True if the address is unspecified, false otherwise.

static inline bool net_ipv6_is_addr_solicited_node(const struct in6_addr *addr)
Check if the IPv6 address is solicited node multicast address FF02:0:0:0:0:1:FFXX:XXXX defined in RFC 3513.

Parameters
• addr – IPv6 address.

Returns
True if the address is solicited node address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_scope(const struct in6_addr *addr, int scope)
Check if the IPv6 address is a given scope multicast address (FFyx::).

Parameters
• addr – IPv6 address
• scope – Scope to check

Returns
True if the address is in given scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_global(const struct in6_addr *addr)
Check if the IPv6 address is a global multicast address (FFxE::/16).

Parameters
• addr – IPv6 address.

Returns
True if the address is global multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_iface(const struct in6_addr *addr)
Check if the IPv6 address is a interface scope multicast address (FFx1::).

Parameters
• addr – IPv6 address.

Returns
True if the address is a interface scope multicast address, false otherwise.
static inline bool net_ipv6_is_addr_mcast_link(const struct in6_addr *addr)
Check if the IPv6 address is a link local scope multicast address (FFx2::).

Parameters
• addr – IPv6 address.

Returns
True if the address is a link local scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_mesh(const struct in6_addr *addr)
Check if the IPv6 address is a mesh-local scope multicast address (FFx3::).

Parameters
• addr – IPv6 address.

Returns
True if the address is a mesh-local scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_site(const struct in6_addr *addr)
Check if the IPv6 address is a site scope multicast address (FFx5::).

Parameters
• addr – IPv6 address.

Returns
True if the address is a site scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_org(const struct in6_addr *addr)
Check if the IPv6 address is an organization scope multicast address (FFx8::).

Parameters
• addr – IPv6 address.

Returns
True if the address is an organization scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_group(const struct in6_addr *addr, const struct in6_addr *group)
Check if the IPv6 address belongs to certain multicast group.

Parameters
• addr – IPv6 address.
• group – Group id IPv6 address, the values must be in network byte order

Returns
True if the IPv6 multicast address belongs to given multicast group, false otherwise.

static inline bool net_ipv6_is_addr_mcast_all_nodes_group(const struct in6_addr *addr)
Check if the IPv6 address belongs to the all nodes multicast group.

Parameters
• addr – IPv6 address

Returns
True if the IPv6 multicast address belongs to the all nodes multicast group, false otherwise.
static inline bool net_ipv6_is_addr_mcast_iface_all_nodes(const struct in6_addr *addr)

Check if the IPv6 address is a interface scope all nodes multicast address (FF01::1).

**Parameters**

- `addr` – IPv6 address.

**Returns**

True if the address is a interface scope all nodes multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_link_all_nodes(const struct in6_addr *addr)

Check if the IPv6 address is a link local scope all nodes multicast address (FF02::1).

**Parameters**

- `addr` – IPv6 address.

**Returns**

True if the address is a link local scope all nodes multicast address, false otherwise.

static inline void net_ipv6_addr_create_solicited_node(const struct in6_addr *src, struct in6_addr *dst)

Create solicited node IPv6 multicast address FF02:0:0:0:1:FFXX:XXXX defined in RFC 3513.

**Parameters**

- `src` – IPv6 address.
- `dst` – IPv6 address.

static inline void net_ipv6_addr_create(struct in6_addr *addr, uint16_t addr0, uint16_t addr1, uint16_t addr2, uint16_t addr3, uint16_t addr4, uint16_t addr5, uint16_t addr6, uint16_t addr7)

Construct an IPv6 address from eight 16-bit words.

**Parameters**

- `addr` – IPv6 address
- `addr0` – 16-bit word which is part of the address
- `addr1` – 16-bit word which is part of the address
- `addr2` – 16-bit word which is part of the address
- `addr3` – 16-bit word which is part of the address
- `addr4` – 16-bit word which is part of the address
- `addr5` – 16-bit word which is part of the address
- `addr6` – 16-bit word which is part of the address
- `addr7` – 16-bit word which is part of the address

static inline void net_ipv6_addr_create_ll_allnodes_mcast(struct in6_addr *addr)

Create link local allnodes multicast IPv6 address.

**Parameters**

- `addr` – IPv6 address
static inline void net_ipv6_addr_create_ll_allrouters_mcast(struct in6_addr *addr)
Create link local allrouters multicast IPv6 address.

Parameters
• addr – IPv6 address

static inline void net_ipv6_addr_create_v4Mapped(const struct in_addr *addr4, struct in6_addr *addr6)
Create IPv4 mapped IPv6 address.

Parameters
• addr4 – IPv4 address
• addr6 – IPv6 address to be created

static inline bool net_ipv6_addr_is_v4Mapped(const struct in6_addr *addr)
Is the IPv6 address an IPv4 mapped one.
The v4 mapped addresses look like ::ffff:a.b.c.d

Parameters
• addr – IPv6 address

Returns
True if IPv6 address is a IPv4 mapped address, False otherwise.

static inline void net_ipv6_addr_create_iid(struct in6_addr *addr, struct net_linkaddr *lladdr)
Create IPv6 address interface identifier.

Parameters
• addr – IPv6 address
• lladdr – Link local address

static inline bool net_ipv6_addr_based_on_ll(const struct in6_addr *addr, const struct net_linkaddr *lladdr)
Check if given address is based on link layer address.

Returns
True if it is, False otherwise

static inline struct sockaddr_in6 *net_sin6(const struct sockaddr *addr)
Get sockaddr_in6 from sockaddr.
This is a helper so that the code calling this function can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to IPv6 socket address

static inline struct sockaddr_in *net_sin(const struct sockaddr *addr)
Get sockaddr_in from sockaddr.
This is a helper so that the code calling this function can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to IPv4 socket address
static inline struct sockaddr_in6_ptr *net_sin6_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_in6_ptr from sockaddr_ptr.
This is a helper so that the code calling this function can be made shorter.

**Parameters**
- **addr** – Socket address

**Returns**
Pointer to IPv6 socket address

static inline struct sockaddr_in_ptr *net_sin_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_in_ptr from sockaddr_ptr.
This is a helper so that the code calling this function can be made shorter.

**Parameters**
- **addr** – Socket address

**Returns**
Pointer to IPv4 socket address

static inline struct sockaddr_ll_ptr *net_sll_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_ll_ptr from sockaddr_ptr.
This is a helper so that the code calling this function can be made shorter.

**Parameters**
- **addr** – Socket address

**Returns**
Pointer to linklayer socket address

static inline struct sockaddr_can_ptr *net_can_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_can_ptr from sockaddr_ptr.
This is a helper so that the code needing this functionality can be made shorter.

**Parameters**
- **addr** – Socket address

**Returns**
Pointer to CAN socket address

int net_addr_pton(sa_family_t family, const char *src, void *dst)
Convert a string to IP address.

**Note:** This function doesn’t do precise error checking, do not use for untrusted strings.

**Parameters**
- **family** – IP address family (AF_INET or AF_INET6)
- **src** – IP address in a null terminated string
- **dst** – Pointer to struct in_addr if family is AF_INET or pointer to struct in6_addr if family is AF_INET6

**Returns**
0 if ok, < 0 if error
char *net_addr_ntop(sa_family_t family, const void *src, char *dst, size_t size)
Convert IP address to string form.

Parameters
- family – IP address family (AF_INET or AF_INET6)
- src – Pointer to struct in_addr if family is AF_INET or pointer to struct
  in6_addr if family is AF_INET6
- dst – Buffer for IP address as a null terminated string
- size – Number of bytes available in the buffer

Returns
- dst pointer if ok, NULL if error

bool net_ipaddr_parse(const char *str, size_t str_len, struct sockaddr *addr)
Parse a string that contains either IPv4 or IPv6 address and optional port, and store
the information in user supplied sockaddr struct.

Syntax of the IP address string: 192.0.2.1:80 192.0.2.42 [2001:db8::2] 2001:db::42 Note that the str_len parameter is used to restrict the amount
of characters that are checked. If the string does not contain port number, then the port
number in sockaddr is not modified.

Parameters
- str – String that contains the IP address.
- str_len – Length of the string to be parsed.
- addr – Pointer to user supplied struct sockaddr.

Returns
- True if parsing could be done, false otherwise.

static inline int32_t net_tcp_seq_cmp(uint32_t seq1, uint32_t seq2)
Compare TCP sequence numbers.

This function compares TCP sequence numbers, accounting for wraparound effects.

Parameters
- seq1 – First sequence number
- seq2 – Seconds sequence number

Returns
- < 0 if seq1 < seq2, 0 if seq1 == seq2, > 0 if seq > seq2

static inline bool net_tcp_seq_greater(uint32_t seq1, uint32_t seq2)
Check that one TCP sequence number is greater.

This is convenience function on top of net_tcp_seq_cmp().

Parameters
- seq1 – First sequence number
- seq2 – Seconds sequence number

Returns
- True if seq > seq2

int net_bytes_from_str(uint8_t *buf, int buf_len, const char *src)
Convert a string of hex values to array of bytes.

The syntax of the string is “ab:02:98:fa:42:01”
Parameters

- `buf` – Pointer to memory where the bytes are written.
- `buf_len` – Length of the memory area.
- `src` – String of bytes.

Returns

0 if ok, <0 if error

```c
int net_tx_priority2tc(enum net_priority prio)
```

Convert Tx network packet priority to traffic class so we can place the packet into correct Tx queue.

Parameters

- `prio` – Network priority

Returns

Tx traffic class that handles that priority network traffic.

```c
int net_rx_priority2tc(enum net_priority prio)
```

Convert Rx network packet priority to traffic class so we can place the packet into correct Rx queue.

Parameters

- `prio` – Network priority

Returns

Rx traffic class that handles that priority network traffic.

```c
static inline enum net_priority net_vlan2priority(uint8_t priority)
```

Convert network packet VLAN priority to network packet priority so we can place the packet into correct queue.

Parameters

- `priority` – VLAN priority

Returns

Network priority

```c
static inline uint8_t net_priority2vlan(enum net_priority priority)
```

Convert network packet priority to network packet VLAN priority.

Parameters

- `priority` – Packet priority

Returns

VLAN priority (PCP)

```c
const char *net_family2str(sa_family_t family)
```

Return network address family value as a string.

This is only usable for debugging.

Parameters

- `family` – Network address family code

Returns

Network address family as a string, or NULL if family is unknown.

```c
struct in6_addr
```

`#include <net_ip.h>` IPv6 address struct.
struct in_addr
    #include <net_ip.h> IPv4 address struct.

struct sockaddr_in6
    #include <net_ip.h> Socket address struct for IPv6.

struct sockaddr_in6_ptr
    #include <net_ip.h>

struct sockaddr_in
    #include <net_ip.h> Socket address struct for IPv4.

struct sockaddr_in_ptr
    #include <net_ip.h>

struct sockaddr_ll
    #include <net_ip.h> Socket address struct for packet socket.

struct sockaddr_ll_ptr
    #include <net_ip.h>

struct sockaddr_can_ptr
    #include <net_ip.h>

struct iovec
    #include <net_ip.h>

struct msghdr
    #include <net_ip.h>

struct cmsghdr
    #include <net_ip.h>

struct sockaddr
    #include <net_ip.h> Generic sockaddr struct.
    Must be cast to proper type.

struct net_tuple
    #include <net_ip.h> IPv6/IPv4 network connection tuple.

**Public Members**

struct net_addr *remote_addr
    IPv6/IPv4 remote address.

struct net_addr *local_addr
    IPv6/IPv4 local address.
**Overview** The DNS resolver implements a basic DNS resolver according to IETF RFC1035 on Domain Implementation and Specification. Supported DNS answers are IPv4/IPv6 addresses and CNAME.

If a CNAME is received, the DNS resolver will create another DNS query. The number of additional queries is controlled by the CONFIG_DNS_RESOLVER_ADDITIONAL QUERIES Kconfig variable.

The multicast DNS (mDNS) client resolver support can be enabled by setting CONFIG_MDNS_RESOLVER Kconfig option. See IETF RFC6762 for more details about mDNS.

The link-local multicast name resolution (LLMNR) client resolver support can be enabled by setting the CONFIG_LLMNR_RESOLVER Kconfig variable. See IETF RFC4795 for more details about LLMNR.

For more information about DNS configuration variables, see: subsys/net/lib/dns/Kconfig. The DNS resolver API can be found at include/zephyr/net/dns_resolve.h.

**Sample usage** See dns-resolve sample application for details.

**API Reference**

**Related code samples**

**AWS IoT Core MQTT**
Connect to AWS IoT Core and publish messages using MQTT.

**DNS resolve**
Resolve an IP address for a given hostname.

**TagoIO HTTP Post**
Send random temperature values to TagoIO IoT Cloud Platform using HTTP.

**group dns_resolve**
DNS resolving library.
Defines

**DNS_MAX_NAME_SIZE**

Max size of the resolved name.

TypeDefs

typedef void (*dns_resolve_cb_t)(enum dns_resolve_status status, struct dns_addrinfo *info, void *user_data)

DNS resolve callback.

The DNS resolve callback is called after a successful DNS resolving. The resolver can call this callback multiple times, one for each resolved address.

**Param status**
The status of the query: DNS_EAI_INPROGRESS returned for each resolved address DNS_EAI_ALLDONE mark end of the resolving, info is set to NULL in this case DNS_EAI_CANCELED if the query was canceled manually or timeout happened DNS_EAI_FAIL if the name cannot be resolved by the server DNS_EAI_NODATA if there is no such name other values means that an error happened.

**Param info**
Query results are stored here.

**Param user_data**
The user data given in *dns_resolve_name()* call.

Enums

enum dns_query_type

DNS query type enum.

Values:

- enumerator DNS_QUERY_TYPE_A = 1
  IPv4 query.

- enumerator DNS_QUERY_TYPE_AAAA = 28
  IPv6 query.

enum dns_resolve_status

Status values for the callback.

Values:

- enumerator DNS_EAI_BADFLAGS = -1
  Invalid value for ai_flags field.

- enumerator DNS_EAI_NONAME = -2
  NAME or SERVICE is unknown.
enumerator DNS_EAI_AGAIN = -3
Temporary failure in name resolution.

enumerator DNS_EAI_FAIL = -4
Non-recoverable failure in name res.

enumerator DNS_EAI_NODATA = -5
No address associated with NAME.

enumerator DNS_EAI_FAMILY = -6
ai_family not supported

enumerator DNS_EAI_SOCKTYPE = -7
ai_socktype not supported

enumerator DNS_EAI_SERVICE = -8
SRV not supported for ai_socktype.

enumerator DNS_EAI_ADDRFAMILY = -9
Address family for NAME not supported.

enumerator DNS_EAI_MEMORY = -10
Memory allocation failure.

enumerator DNS_EAI_SYSTEM = -11
System error returned in errno.

enumerator DNS_EAI_OVERFLOW = -12
Argument buffer overflow.

enumerator DNS_EAI_INPROGRESS = -100
Processing request in progress.

enumerator DNS_EAI_CANCELED = -101
Request canceled.

enumerator DNS_EAI_NOTCANCELED = -102
Request not canceled.

enumerator DNS_EAI_ALLDONE = -103
All requests done.

enumerator DNS_EAI_IDN_ENCODE = -105
IDN encoding failed.

enum dns_resolve_context_state
Values:
Functions

int dns_resolve_init(struct dns_resolve_context *ctx, const char *dns_servers_str[], const struct sockaddr *dns_servers_sa[])
Init DNS resolving context.

This function sets the DNS server address and initializes the DNS context that is used by the actual resolver. DNS server addresses can be specified either in textual form, or as struct sockaddr (or both). Note that the recommended way to resolve DNS names is to use the dns_get_addr_info() API. In that case user does not need to call dns_resolve_init() as the DNS servers are already setup by the system.

Parameters

- ctx – DNS context. If the context variable is allocated from the stack, then the variable needs to be valid for the whole duration of the resolving. Caller does not need to fill the variable beforehand or edit the context afterwards.
- dns_servers_str – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4 : 10.0.9.1 IPv4 + port : 10.0.9.1:5353 IPv6 : [2001:db8::22:42] IPv6 + port : [2001:db8::22:42]:5353
- dns_servers_sa – DNS server addresses as struct sockaddr. The array is NULL terminated. Port numbers are optional in struct sockaddr, the default will be used if set to 0.

Returns

0 if ok, <0 if error.

int dns_resolve_init_default(struct dns_resolve_context *ctx)
Init DNS resolving context with default Kconfig options.

Parameters

- ctx – DNS context.

Returns

0 if ok, <0 if error.

int dns_resolve_close(struct dns_resolve_context *ctx)
Close DNS resolving context.

This releases DNS resolving context and marks the context unusable. Caller must call the dns_resolve_init() again to make context usable.

Parameters

- ctx – DNS context

Returns

0 if ok, <0 if error.
int dns_resolve_reconfigure(struct dns_resolve_context *ctx, const char *servers_str[], const struct sockaddr *servers_sa[])

Reconfigure DNS resolving context.
Reconfigures DNS context with new server list.

Parameters
• ctx – DNS context
• servers_str – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4: 10.0.9.1 IPv4 + port: 10.0.9.1:5353 IPv6: 2001:db8::22:42 IPv6 + port: [2001:db8::22:42]:5353
• servers_sa – DNS server addresses as struct sockaddr. The array is NULL terminated. Port numbers are optional in struct sockaddr, the default will be used if set to 0.

Returns
0 if ok, <0 if error.

int dns_resolve_cancel(struct dns_resolve_context *ctx, uint16_t dns_id)

Cancel a pending DNS query.
This releases DNS resources used by a pending query.

Parameters
• ctx – DNS context
• dns_id – DNS id of the pending query

Returns
0 if ok, <0 if error.

int dns_resolve_cancel_with_name(struct dns_resolve_context *ctx, uint16_t dns_id, const char *query_name, enum dns_query_type query_type)

Cancel a pending DNS query using id, name and type.
This releases DNS resources used by a pending query.

Parameters
• ctx – DNS context
• dns_id – DNS id of the pending query
• query_name – Name of the resource we are trying to query (hostname)
• query_type – Type of the query (A or AAAA)

Returns
0 if ok, <0 if error.

int dns_resolve_name(struct dns_resolve_context *ctx, const char *query, enum dns_query_type type, uint16_t *dns_id, dns_resolve_cb_t cb, void *user_data, int32_t timeout)

Resolve DNS name.
This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response.
Parameters

- **ctx** – DNS context
- **query** – What the caller wants to resolve.
- **type** – What kind of data the caller wants to get.
- **dns_id** – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
- **cb** – Callback to call after the resolving has finished or timeout has happened.
- **user_data** – The user data.
- **timeout** – The timeout value for the query. Possible values: SYS_FOREVER_MS: the query is tried forever, user needs to cancel it manually if it takes too long time to finish >0: start the query and let the system timeout it after specified ms

Returns

0 if resolving was started ok, < 0 otherwise

```c
struct dns_resolve_context *dns_resolve_get_default(void)
```

Get default DNS context.

The system level DNS context uses DNS servers that are defined in project config file. If no DNS servers are defined by the user, then resolving DNS names using default DNS context will do nothing. The configuration options are described in subsys/net/lib/dns/Kconfig file.

**Returns**

Default DNS context.

```c
static inline int dns_get_addr_info(const char *query, enum dns_query_type type, uint16_t *dns_id, dns_resolve_cb_t cb, void *user_data, int32_t timeout)
```

Get IP address info from DNS.

This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response. This variant uses system wide DNS servers.

Parameters

- **query** – What the caller wants to resolve.
- **type** – What kind of data the caller wants to get.
- **dns_id** – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
- **cb** – Callback to call after the resolving has finished or timeout has happened.
- **user_data** – The user data.
- **timeout** – The timeout value for the connection. Possible values: SYS_FOREVER_MS: the query is tried forever, user needs to cancel it manually if it takes too long time to finish >0: start the query and let the system timeout it after specified ms
Returns
0 if resolving was started ok, < 0 otherwise

static inline int dns_cancel_addr_info(uint16_t dns_id)
Cancel a pending DNS query.
This releases DNS resources used by a pending query.

Parameters
• dns_id – DNS id of the pending query

Returns
0 if ok, <0 if error.

struct dns_addrinfo
#include <dns_resolve.h> Address info struct is passed to callback that gets all the results.

struct dns_resolve_context
#include <dns_resolve.h> DNS resolve context structure.

Public Members

struct sockaddr dns_server
DNS server information.

struct net_context *net_ctx
Connection to the DNS server.

uint8_t is_mdns
Is this server mDNS one.

uint8_t is_llmnr
Is this server LLMNR one.

struct k_mutex lock
Prevent concurrent access.

k_timeout_t buf_timeout
This timeout is also used when a buffer is required from the buffer pools.

enum dns_resolve_context_state state
Is this context in use.

struct dns_pending_query
#include <dns_resolve.h> Result callbacks.
We have multiple callbacks here so that it is possible to do multiple queries at the same time.
Contents of this structure can be inspected and changed only when the lock is held.
Public Members

struct k_work_delayable timer
    Timeout timer.

struct dns_resolve_context *ctx
    Back pointer to ctx, needed in timeout handler.

dns_resolve_cb_t cb
    Result callback.
    A null value indicates the slot is not in use.

void *user_data
    User data.

k_timeout_t timeout
    TX timeout.

const char *query
    String containing the thing to resolve like www.example.com.
    This is set to a non-null value when the query is started, and is not used thereafter.

    If the query completed at a point where the work item was still pending the pointer is cleared to indicate that the query is complete, but release of the query slot will be deferred until a request for a slot determines that the work item has been released.

enum dns_query_type query_type
    Query type.

uint16_t id
    DNS id of this query.

uint16_t query_hash
    Hash of the DNS name + query type we are querying.
    This hash is calculated so we can match the response that we are receiving.
    This is needed mainly for mDNS which is setting the DNS id to 0, which means that the id alone cannot be used to find correct pending query.

Network Management

- Overview
- Requesting a defined procedure
- Listening to network events
- Defining a network management procedure
- Signaling a network event
Overview. The Network Management APIs allow applications, as well as network layer code itself, to call defined network routines at any level in the IP stack, or receive notifications on relevant network events. For example, by using these APIs, application code can request a scan be done on a Wi-Fi- or Bluetooth-based network interface, or request notification if a network interface IP address changes.

The Network Management API implementation is designed to save memory by eliminating code at build time for management routines that are not used. Distinct and statically defined APIs for network management procedures are not used. Instead, defined procedure handlers are registered by using a `NET_MGMT_REGISTER_REQUEST_HANDLER` macro. Procedure requests are done through a single `net_mgmt()` API that invokes the registered handler for the corresponding request.

The current implementation is experimental and may change and improve in future releases.

Requesting a defined procedure. All network management requests are of the form `net_mgmt(mgmt_request, ...)`. The `mgmt_request` parameter is a bit mask that tells which stack layer is targeted, if a `net_if` object is implied, and the specific management procedure being requested. The available procedure requests depend on what has been implemented in the stack.

To avoid extra cost, all `net_mgmt()` calls are direct. Though this may change in a future release, it will not affect the users of this function.

Listening to network events. You can receive notifications on network events by registering a callback function and specifying a set of events used to filter when your callback is invoked. The callback will have to be unique for a pair of layer and code, whereas on the command part it will be a mask of events.

At runtime two functions are available, `net_mgmt_add_event_callback()` for registering the callback function, and `net_mgmt_del_event_callback()` for unregistering a callback. A helper function, `net_mgmt_init_event_callback()`, can be used to ease the initialization of the callback structure.

Additionally `NET_MGMT_REGISTER_EVENT_HANDLER` can be used to register a callback handler at compile time.

When an event occurs that matches a callback's event set, the associated callback function is invoked with the actual event code. This makes it possible for different events to be handled by the same callback function, if desired.

Warning: Event set filtering allows false positives for events that have the same layer and layer code. A callback handler function must check the event code (passed as an argument) against the specific network events it will handle, regardless of how many events were in the set passed to `net_mgmt_init_event_callback()`.

Note that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened. The callback handler function can be shared between different layer events.

(False positives can occur for events which have the same layer and layer code.)

An example follows.
/*
 * Set of events to handle.
 * See e.g. include/net/net_event.h for some NET_EVENT_xxx values.
 */
#define EVENT_IFACE_SET (NET_EVENT_IF_xxx | NET_EVENT_IF_yyy)
#define EVENT_IPV4_SET (NET_EVENT_IPV4_xxx | NET_EVENT_IPV4_yyy)

struct net_mgmt_event_callback iface_callback;
struct net_mgmt_event_callback ipv4_callback;

void callback_handler(struct net_mgmt_event_callback *cb,
                      uint32_t mgmt_event,
                      struct net_if *iface)
{
    if (mgmt_event == NET_EVENT_IF_xxx) {
        /* Handle NET_EVENT_IF_xxx */
    } else if (mgmt_event == NET_EVENT_IF_yyy) {
        /* Handle NET_EVENT_IF_yyy */
    } else if (mgmt_event == NET_EVENT_IPV4_xxx) {
        /* Handle NET_EVENT_IPV4_xxx */
    } else if (mgmt_event == NET_EVENT_IPV4_yyy) {
        /* Handle NET_EVENT_IPV4_yyy */
    } else {
        /* Spurious (false positive) invocation. */
    }
}

void register_cb(void)
{
    net_mgmt_init_event_callback(&iface_callback, callback_handler,
                                  EVENT_IFACE_SET);
    net_mgmt_init_event_callback(&ipv4_callback, callback_handler,
                                  EVENT_IPV4_SET);
    net_mgmt_add_event_callback(&iface_callback);
    net_mgmt_add_event_callback(&ipv4_callback);
}

Or similarly using NET_MGMT_REGISTER_EVENT_HANDLER.

Note: The info and info_length arguments are only usable if CONFIG_NET_MGMT_EVENT_INFO is enabled. Otherwise these are NULL and zero.

static void event_handler(uint32_t mgmt_event, struct net_if *iface,
                          void *info, size_t info_length,
                          void *user_data)
{
    if (mgmt_event == NET_EVENT_IF_xxx) {
        /* Handle NET_EVENT_IF_xxx */
    } else if (mgmt_event == NET_EVENT_IF_yyy) {
        /* Handle NET_EVENT_IF_yyy */
    } else if (mgmt_event == NET_EVENT_IPV4_xxx) {
        /* Handle NET_EVENT_IPV4_xxx */
    } else if (mgmt_event == NET_EVENT_IPV4_yyy) {
        /* Handle NET_EVENT_IPV4_yyy */
    } else {
        /* Spurious (false positive) invocation. */
    }
}
} else {
    /* Spurious (false positive) invocation. */
}

NET_MGMT_REGISTER_EVENT_HANDLER(iface_event_handler, EVENT_IFACE_SET, event_handler, NULL);
NET_MGMT_REGISTER_EVENT_HANDLER(ipv4_event_handler, EVENT_IPV4_SET, event_handler, NULL);

See include/zephyr/net/net_event.h for available generic core events that can be listened to.

**Defining a network management procedure** You can provide additional management procedures specific to your stack implementation by defining a handler and registering it with an associated mgmt_request code.

Management request code are defined in relevant places depending on the targeted layer or eventually, if L2 is the layer, on the technology as well. For instance, all IP layer management request code will be found in the include/zephyr/net/net_event.h header file. But in case of an L2 technology, let's say Ethernet, these would be found in include/zephyr/net/ethernet.h

You define your handler modeled with this signature:

```
static int your_handler(uint32_t mgmt_event, struct net_if *iface, void *data, size_t len);
```

and then register it with an associated mgmt_request code:

```
NET_MGMT_REGISTER_REQUEST_HANDLER(<mgmt_request code>, your_handler);
```

This new management procedure could then be called by using:

```
net_mgmt(<mgmt_request code>, ...);
```

**Signaling a network event** You can signal a specific network event using the net_mgmt_event_notify() function and provide the network event code. See include/zephyr/net/net_mgmt.h for details. As for the management request code, event code can be also found on specific L2 technology mgmt headers, for example include/zephyr/net/ieee802154_mgmt.h would be the right place if 802.15.4 L2 is the technology one wants to listen to events.

**API Reference**

**Related code samples**

**DHCPv4 client**
Start a DHCPv4 client to obtain an IPv4 address from a DHCPv4 server.

**DNS resolve**
Resolve an IP address for a given hostname.

**IPv4 autoconf client**
Perform IPv4 autoconfiguration and self-assign a random IPv4 address.

**Telnet console**
Access Zephyr shell over telnet.
group net_mgmt

Network Management.

Defines

net_mgmt(_mgmt_request, _iface, _data, _len)

NET_MGMT_DEFINE_REQUEST_HANDLER(_mgmt_request)

NET_MGMT_REGISTER_REQUEST_HANDLER(_mgmt_request, _func)

NET_MGMT_REGISTER_EVENT_HANDLER(_name, _event_mask, _func, _user_data)

Define a static network event handler.

Parameters

• _name – Name of the event handler.
• _event_mask – A mask of network events on which the passed handler should be called in case those events come. Note that only the command part is treated as a mask, matching one to several commands. Layer and layer code will be made of an exact match. This means that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened.
• _func – The function to be called upon network events being emitted.
• _user_data – User data passed to the handler being called on network events.

Typedefs

typedef int (*net_mgmt_request_handler_t)(uint32_t mgmt_request, struct net_if *iface, void *data, size_t len)

Signature which all Net MGMT request handler need to follow.

Param mgmt_request
The exact request value the handler is being called through

Param iface
A valid pointer on struct net_if if the request is meant to be tight to a network interface. NULL otherwise.

Param data
A valid pointer on a data understood by the handler. NULL otherwise.

Param len
Length in byte of the memory pointed by data.

typedef void (*net_mgmt_event_handler_t)(struct net_mgmt_event_callback *cb, uint32_t mgmt_event, struct net_if *iface)

Define the user's callback handler function signature.

Param cb
Original struct net_mgmt_event_callback owning this handler.

Param mgmt_event
The network event being notified.
## Param iface
A pointer on a struct `net_if` to which the event belongs to, if it's an event on an iface. NULL otherwise.

typedef void (*net_mgmt_event_static_handler_t)(uint32_t mgmt_event, struct net_if *iface, void *info, size_t info_length, void *user_data)

Define the user's callback handler function signature.

### Param mgmt_event
The network event being notified.

### Param iface
A pointer on a struct `net_if` to which the event belongs to, if it's an event on an iface. NULL otherwise.

### Param info
A valid pointer on a data understood by the handler. NULL otherwise.

### Param info_length
Length in bytes of the memory pointed by `info`.

### Param user_data
Data provided by the user to the handler.

## Functions

### static inline void net_mgmt_init_event_callback(struct net_mgmt_event_callback *cb, net_mgmt_event_handler_t handler, uint32_t mgmt_event_mask)
Helper to initialize a struct `net_mgmt_event_callback` properly.

**Parameters**
- `cb` – A valid application's callback structure pointer.
- `handler` – A valid handler function pointer.
- `mgmt_event_mask` – A mask of relevant events for the handler

### void net_mgmt_add_event_callback(struct net_mgmt_event_callback *cb)
Add a user callback.

**Parameters**
- `cb` – A valid pointer on user's callback to add.

### void net_mgmt_del_event_callback(struct net_mgmt_event_callback *cb)
Delete a user callback.

**Parameters**
- `cb` – A valid pointer on user's callback to delete.

### void net_mgmt_event_notify_with_info(uint32_t mgmt_event, struct net_if *iface, const void *info, size_t length)
Used by the system to notify an event.

**Note:** info and length are disabled if CONFIG_NET_MGMT_EVENT_INFO is not defined.

**Parameters**
- `mgmt_event` – The actual network event code to notify
• iface – a valid pointer on a struct net_if if only the event is based on an iface. NULL otherwise.
• info – a valid pointer on the information you want to pass along with the event. NULL otherwise. Note the data pointed there is normalized by the related event.
• length – size of the data pointed by info pointer.

static inline void net_mgmt_event_notify(uint32_t mgmt_event, struct net_if *iface)

int net_mgmt_event_wait(uint32_t mgmt_event_mask, uint32_t *raised_event, struct net_if **iface, const void **info, size_t *info_length, k_timeout_t timeout)

Used to wait synchronously on an event mask.

Parameters
• mgmt_event_mask – A mask of relevant events to wait on.
• raised_event – a pointer on a uint32_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.
• iface – a pointer on a place holder for the iface on which the event has originated from. This is valid if only the event mask has bit NET_MGMT_IFACE_BIT set relevantly, depending on events the caller wants to listen to.
• info – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.
• info_length – tells how long the info memory area is. Only valid if the info is not NULL.
• timeout – A timeout delay. K_FOREVER can be used to wait indefinitely.

Returns
0 on success, a negative error code otherwise. -ETIMEDOUT will be specifically returned if the timeout kick-in instead of an actual event.

int net_mgmt_event_wait_on_iface(struct net_if *iface, uint32_t mgmt_event_mask, uint32_t *raised_event, const void **info, size_t *info_length, k_timeout_t timeout)

Used to wait synchronously on an event mask for a specific iface.

Parameters
• iface – a pointer on a valid network interface to listen event to
• mgmt_event_mask – A mask of relevant events to wait on. Listened to events should be relevant to iface events and thus have the bit NET_MGMT_IFACE_BIT set.
• raised_event – a pointer on a uint32_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.
• info – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.
• info_length – tells how long the info memory area is. Only valid if the info is not NULL.
• timeout – A timeout delay. K_FOREVER can be used to wait indefinitely.
Returns

0 on success, a negative error code otherwise. -ETIMEDOUT will be specifically returned if the timeout kick-in instead of an actual event.

void net_mgmt_event_init(void)

Used by the core of the network stack to initialize the network event processing.

struct net_event_ipv6_addr
#include <net_event.h> Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_ADDR_ADD, NET_EVENT_IPV6_ADDR_DEL, NET_EVENT_IPV6_MADDR_ADD and NET_EVENT_IPV6_MADDR_DEL when CONFIG_NET_MGMT_EVENT_INFO enabled and event generator pass the information.

struct net_event_ipv6_nbr
#include <net_event.h> Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_NBR_ADD and NET_EVENT_IPV6_NBR_DEL when CONFIG_NET_MGMT_EVENT_INFO enabled and event generator pass the information.

Note: : idx will be ‘-1’ in case of NET_EVENT_IPV6_NBR_DEL event.

struct net_event_ipv6_route
#include <net_event.h> Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_ROUTE_ADD and NET_EVENT_IPV6_ROUTE_DEL when CONFIG_NET_MGMT_EVENT_INFO enabled and event generator pass the information.

struct net_event_ipv6_prefix
#include <net_event.h> Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_PREFIX_ADD and NET_EVENT_IPV6_PREFIX_DEL when CONFIG_NET_MGMT_EVENT_INFO is enabled and event generator pass the information.

struct net_event_l4_hostname
#include <net_event.h> Network Management event information structure Used to pass information on NET_EVENT_HOSTNAME_CHANGED event when CONFIG_NET_MGMT_EVENT_INFO is enabled and event generator pass the information.

struct net_mgmt_event_callback
#include <net_mgmt.h> Network Management event callback structure Used to register a callback into the network management event part, in order to let the owner of this struct to get network event notification based on given event mask.

Public Members

sys_snnode_t node

Meant to be used internally, to insert the callback into a list.

So nobody should mess with it.
net_mgmt_event_handler_t handler

Actual callback function being used to notify the owner.

struct k_sem *sync_call

Semaphore meant to be used internally for the synchronous net_mgmt_event_wait() function.

uint32_t event_mask

A mask of network events on which the above handler should be called in case those events come.

Note that only the command part is treated as a mask, matching one to several commands. Layer and layer code will be made of an exact match. This means that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened.

uint32_t raised_event

Internal place holder when a synchronous event wait is successfully unlocked on a event.

union net_mgmt_event_callback

A mask of network events on which the above handler should be called in case those events come.

Such mask can be modified whenever necessary by the owner, and thus will affect the handler being called or not.

Network Statistics

- Overview
- API Reference

Overview

Network statistics are collected if CONFIG_NET_STATISTICS is set. Individual component statistics for IPv4 or IPv6 can be turned off if those statistics are not needed. See various options in subsys/net/ip/Kconfig.stats file for details.

By default, the system collects network statistics per network interface. This can be controlled by CONFIG_NET_STATISTICS_PER_INTERFACE option.

The CONFIG_NET_STATISTICS_USER_API option can be set if the application wants to collect statistics for further processing. The network management interface API is used for that. See Network Management for details.

The CONFIG_NET_STATISTICS ETHERNET option can be set to collect generic Ethernet statistics. If the CONFIG_NET_STATISTICS_ETHERNET_VENDOR option is set, then Ethernet device driver can collect Ethernet device specific statistics. These statistics can then be transferred to application for processing.

If the CONFIG_NET_SHELL option is set, then network shell can show statistics information with net stats command.
**Network statistics**
Query and display network statistics from a user application.

**Wi-Fi shell**
Test Wi-Fi functionality using the Wi-Fi shell module.

```c

// net_stats.h

// Defines
#define NET_TC_TX_STATS_COUNT
#define NET_TC_RX_STATS_COUNT

// Typedefs
typedef uint32_t net_stats_t;
// Network statistics counter.

struct net_stats_bytes
#include <net_stats.h> // Number of bytes sent and received.

// Public Members
net_stats_t sent
// Number of bytes sent.

net_stats_t received
// Number of bytes received.

struct net_stats_pkts
#include <net_stats.h> // Number of network packets sent and received.

// Public Members
net_stats_t tx
// Number of packets sent.

net_stats_t rx
// Number of packets received.

struct net_stats_ip
#include <net_stats.h> // IP layer statistics.
```

2384 Chapter 6. Connectivity
Public Members

`net_stats_t recv`
Number of received packets at the IP layer.

`net_stats_t sent`
Number of sent packets at the IP layer.

`net_stats_t forwarded`
Number of forwarded packets at the IP layer.

`net_stats_t drop`
Number of dropped packets at the IP layer.

```
struct net_stats_ip_errors
#include <net_stats.h> IP layer error statistics.
```

Public Members

`net_stats_t vhlerr`
Number of packets dropped due to wrong IP version or header length.

`net_stats_t hblenerr`
Number of packets dropped due to wrong IP length, high byte.

`net_stats_t lblenerr`
Number of packets dropped due to wrong IP length, low byte.

`net_stats_t fragerr`
Number of packets dropped because they were IP fragments.

`net_stats_t chkerr`
Number of packets dropped due to IP checksum errors.

`net_stats_t protoerr`
Number of packets dropped because they were neither ICMP, UDP nor TCP.

```
struct net_stats_icmp
#include <net_stats.h> ICMP statistics.
```

Public Members

`net_stats_t recv`
Number of received ICMP packets.

`net_stats_t sent`
Number of sent ICMP packets.
`net_stats_t drop`
  Number of dropped ICMP packets.

`net_stats_t typeerr`
  Number of ICMP packets with a wrong type.

`net_stats_t chkerr`
  Number of ICMP packets with a bad checksum.

```c
struct net_stats_tcp
#include <net_stats.h> TCP statistics.
```

**Public Members**

```c
struct net_stats_bytes bytes
Amount of received and sent TCP application data.

net_stats_t resent
Amount of retransmitted data.

net_stats_t drop
Number of dropped packets at the TCP layer.

net_stats_t recv
Number of received TCP segments.

net_stats_t sent
Number of sent TCP segments.

net_stats_t seg_drop
Number of dropped TCP segments.

net_stats_t chkerr
Number of TCP segments with a bad checksum.

net_stats_t acknowl
Number of received TCP segments with a bad ACK number.

net_stats_t rsterr
Number of received bad TCP RST (reset) segments.

net_stats_t rst
Number of received TCP RST (reset) segments.

net_stats_t rexmit
Number of retransmitted TCP segments.
net_stats_t conndrop
Number of dropped connection attempts because too few connections were available.

net_stats_t connrst
Number of connection attempts for closed ports, triggering a RST.

struct net_stats_udp
#include <net_stats.h> UDP statistics.

Public Members

net_stats_t drop
Number of dropped UDP segments.

net_stats_t recv
Number of received UDP segments.

net_stats_t sent
Number of sent UDP segments.

net_stats_t chkerr
Number of UDP segments with a bad checksum.

struct net_stats_ipv6_nd
#include <net_stats.h> IPv6 neighbor discovery statistics.

struct net_stats_ipv6_mld
#include <net_stats.h> IPv6 multicast listener daemon statistics.

Public Members

net_stats_t recv
Number of received IPv6 MLD queries.

net_stats_t sent
Number of sent IPv6 MLD reports.

net_stats_t drop
Number of dropped IPv6 MLD packets.

struct net_stats_ipv4_igmp
#include <net_stats.h> IPv4 IGMP daemon statistics.
Public Members

*net_stats_t* `recv`
Number of received IPv4 IGMP queries.

*net_stats_t* `sent`
Number of sent IPv4 IGMP reports.

*net_stats_t* `drop`
Number of dropped IPv4 IGMP packets.

```c
struct net_stats_tx_time
#include <net_stats.h> Network packet transfer times for calculating average TX time.

struct net_stats_rx_time
#include <net_stats.h> Network packet receive times for calculating average RX time.

struct net_stats_tc
#include <net_stats.h> Traffic class statistics.

struct net_stats_pm
#include <net_stats.h> Power management statistics.

struct net_stats
#include <net_stats.h> All network statistics in one struct.
```

Public Members

*net_stats_t* `processing_error`
Count of malformed packets or packets we do not have handler for.

```c
struct net_stats_bytes bytes
This calculates amount of data transferred through all the network interfaces.

struct net_stats_ip_errors ip_errors
IP layer errors.

struct net_stats_eth_errors
#include <net_stats.h> Ethernet error statistics.

struct net_stats_eth_flow
#include <net_stats.h> Ethernet flow control statistics.

struct net_stats_eth_csum
#include <net_stats.h> Ethernet checksum statistics.

struct net_stats_eth_hw_timestamp
#include <net_stats.h> Ethernet hardware timestamp statistics.
```
struct net_stats_eth
   #include <net_stats.h> All Ethernet specific statistics.

struct net_stats_ppp
   #include <net_stats.h> All PPP specific statistics.

Public Members

net_stats_t drop
   Number of received and dropped PPP frames.

net_stats_t chkerr
   Number of received PPP frames with a bad checksum.

struct net_stats_sta_mgmt
   #include <net_stats.h> All Wi-Fi management statistics.

Public Members

net_stats_t beacons_rx
   Number of received beacons.

net_stats_t beacons_miss
   Number of missed beacons.

struct net_stats_wifi
   #include <net_stats.h> All Wi-Fi specific statistics.

Network Timeout

Overview
Zephyr's network infrastructure mostly uses the millisecond-resolution uptime clock to track timeouts, with both deadlines and durations measured with 32-bit unsigned values. The 32-bit value rolls over at 49 days 17 hours 2 minutes 47.296 seconds.

Timeout processing is often affected by latency, so that the time at which the timeout is checked may be some time after it should have expired. Handling this correctly without arbitrary expectations of maximum latency requires that the maximum delay that can be directly represented be a 31-bit non-negative number (INT32_MAX), which overflows at 24 days 20 hours 31 minutes 23.648 seconds.

Most network timeouts are shorter than the delay rollover, but a few protocols allow for delays that are represented as unsigned 32-bit values counting seconds, which corresponds to a 42-bit millisecond count.
The net_timeout API provides a generic timeout mechanism to correctly track the remaining time for these extended-duration timeouts.

**Use**  The simplest use of this API is:

1. Configure a network timeout using `net_timeout_set()`.
2. Use `net_timeout_evaluate()` to determine how long it is until the timeout occurs. Schedule a timeout to occur after this delay.
3. When the timeout callback is invoked, use `net_timeout_evaluate()` again to determine whether the timeout has completed, or whether there is additional time remaining. If the latter, reschedule the callback.
4. While the timeout is running, use `net_timeout_remaining()` to get the number of seconds until the timeout expires. This may be used to explicitly update the timeout, which should be done by canceling any pending callback and restarting from step 1 with the new timeout.

The `net_timeout` contains a `sys_snode_t` that allows multiple timeout instances to be aggregated to share a single kernel timer element. The application must use `net_timeout_evaluate()` on all instances to determine the next timeout event to occur.

`net_timeout_deadline()` may be used to reconstruct the full-precision deadline of the timeout. This exists primarily for testing but may have use in some applications, as it does allow a millisecond-resolution calculation of remaining time.

**API Reference**

`group net_timeout`

Network long timeout primitives and helpers.

**Defines**

`NET_TIMEOUT_MAX_VALUE`

Divisor used to support ms resolution timeouts.

Because delays are processed in work queues which are not invoked synchronously with clock changes we need to be able to detect timeouts after they occur, which requires comparing “deadline” to “now” with enough “slop” to handle any observable latency due to “now” advancing past “deadline”.

The simplest solution is to use the native conversion of the well-defined 32-bit unsigned difference to a 32-bit signed difference, which caps the maximum delay at INT32_MAX. This is compatible with the standard mechanism for detecting completion of deadlines that do not overflow their representation.

**Functions**

`void net_timeout_set(struct net_timeout *timeout, uint32_t lifetime, uint32_t now)`

Configure a network timeout structure.

**Parameters**

- `timeout` – a pointer to the timeout state.
- `lifetime` – the duration of the timeout in seconds.
- `now` – the time at which the timeout started counting down, in milliseconds. This is generally a captured value of `k_uptime_get_320`. 
int64_t net_timeout_deadline(const struct net_timeout *timeout, int64_t now)
Return the 64-bit system time at which the timeout will complete.

**Note:** Correct behavior requires invocation of `net_timeout_evaluate()` at its specified intervals.

**Parameters**

- `timeout` – state a pointer to the timeout state, initialized by `net_timeout_set()` and maintained by `net_timeout_evaluate()`.
- `now` – the full-precision value of `k_uptime_get()` relative to which the deadline will be calculated.

**Returns**

the value of `k_uptime_get()` at which the timeout will expire.

uint32_t net_timeout_remaining(const struct net_timeout *timeout, uint32_t now)
Calculate the remaining time to the timeout in whole seconds.

**Note:** This function rounds the remaining time down, i.e. if the timeout will occur in 3500 milliseconds the value 3 will be returned.

**Note:** Correct behavior requires invocation of `net_timeout_evaluate()` at its specified intervals.

**Parameters**

- `timeout` – a pointer to the timeout state
- `now` – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from `k_uptime_get_32()`.

**Return values**

- `0` – if the timeout has completed.
- `positive` – the remaining duration of the timeout, in seconds.

uint32_t net_timeout_evaluate(struct net_timeout *timeout, uint32_t now)
Update state to reflect elapsed time and get new delay.

This function must be invoked periodically to (1) apply the effect of elapsed time on what remains of a total delay that exceeded the maximum representable delay, and (2) determine that either the timeout has completed or that the infrastructure must wait a certain period before checking again for completion.

**Parameters**

- `timeout` – a pointer to the timeout state
- `now` – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from `k_uptime_get_32()`.

**Return values**

- `0` – if the timeout has completed
• positive – the maximum delay until the state of this timeout should be re-evaluated, in milliseconds.

```c
struct net_timeout
#include <net_timeout.h> Generic struct for handling network timeouts.
```

Except for the linking node, all access to state from these objects must go through the defined API.

### Public Members

```c
sys_snode_t node
```

Used to link multiple timeouts that share a common timer infrastructure.

For examples a set of related timers may use a single delayed work structure, which is always scheduled at the shortest time to a timeout event.

### Networking Context

The net_context API is not meant for application use. Application should use BSD Sockets API instead.

### Promiscuous Mode

#### Overview

Promiscuous mode is a mode for a network interface controller that causes it to pass all traffic it receives to the application rather than passing only the frames that the controller is specifically programmed to receive. This mode is normally used for packet sniffing as used to diagnose network connectivity issues by showing an application all the data being transferred over the network. (See the Wikipedia article on promiscuous mode for more information.)

The network promiscuous APIs are used to enable and disable this mode, and to wait for and receive a network data to arrive. Not all network technologies or network device drivers support promiscuous mode.

#### Sample usage

First the promiscuous mode needs to be turned ON by the application like this:

```c
ret = net_promisc_mode_on(iface);
if (ret < 0) {
    if (ret == -EALREADY) {
        printf("Promiscuous mode already enabled\n");
    } else {
        printf("Cannot enable promiscuous mode for ",
              "interface %p (%d)\n", iface, ret);
    }
}
```

If there is no error, then the application can start to wait for network data:
```
while (true) {
    pkt = net_promisc_mode_wait_data(K_FOREVER);
    if (pkt) {
        print_info(pkt);
    }
    net_pkt_unref(pkt);
}
```

Finally the promiscuous mode can be turned OFF by the application like this:

```
ret = net_promisc_mode_off(iface);
if (ret < 0) {
    if (ret == -EALREADY) {
        printf("Promiscuous mode already disabled\n");
    } else {
        printf("Cannot disable promiscuous mode for "
            "interface %p (%d)\n", iface, ret);
    }
}
```

See net-promiscuous-mode for a more comprehensive example.

### API Reference

#### Related code samples

**Promiscuous mode**

Enable promiscuous mode on all interfaces and print information about incoming packets.

**group promiscuous**

Promiscuous mode support.

**Functions**

- static inline struct *net_pkt* net_promisc_mode_wait_data(*k_timeout_t* timeout)
  
  Start to wait received network packets.

  **Parameters**

  - `timeout` – How long to wait before returning.

  **Returns**

  Received `net_pkt`, NULL if not received any packet.

- static inline int net_promisc_mode_on(struct *net_if* iface)
  
  Enable promiscuous mode for a given network interface.

  **Parameters**

  - `iface` – Network interface

  **Returns**

  0 if ok, <0 if error

- static inline int net_promisc_mode_off(struct *net_if* iface)
  
  Disable promiscuous mode for a given network interface.

  **Parameters**

  - `iface` – Network interface
Simple Network Time Protocol Library

Overview  The SNTP library implements IETF RFC4330 (Simple Network Time Protocol v4). SNTP provides a way to synchronize clocks in computer networks.

API Reference  

Related code samples  

AWS IoT Core MQTT  
Connect to AWS IoT Core and publish messages using MQTT.

SNTP client  
Use SNTP to get the current time from the host.

group snntp  
Simple Network Time Protocol API.

Functions  

int snntp_init(struct snntp_ctx *ctx, struct sockaddr *addr, socklen_t addr_len)  
Initialize SNTP context.

Parameters  

- ctx – Address of sntp context.
- addr – IP address of NTP/SNTP server.
- addr_len – IP address length of NTP/SNTP server.

Returns  

0 if ok, <0 if error.

int snntp_query(struct snntp_ctx *ctx, uint32_t timeout, struct snntp_time *time)  
Perform SNTP query.

Parameters  

- ctx – Address of sntp context.
- timeout – Timeout of waiting for sntp response (in milliseconds).
- time – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

Returns  

0 if ok, <0 if error (-ETIMEDOUT if timeout).
void sntp_close(struct sntp_ctx *ctx)
   Release SNTP context.

   Parameters
   • ctx – Address of sntp context.

int sntp_simple(const char *server, uint32_t timeout, struct sntp_time *time)
   Convenience function to query SNTP in one-shot fashion.

   Convenience wrapper which calls getaddrinfo(), sntp_init(), sntp_query(), and sntp_close().

   Parameters
   • server – Address of server in format addr[:port]
   • timeout – Query timeout
   • time – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

   Returns
   0 if ok, <0 if error (-ETIMEDOUT if timeout).

struct sntp_time
   #include <sntp.h> Time as returned by SNTP API, fractional seconds since 1 Jan 1970.

struct sntp_ctx
   #include <sntp.h> SNTP context.

Public Members

struct sntp_time expected_orig_ts
   Timestamp when the request was sent from client to server.

   This is used to check if the originated timestamp in the server reply matches the one in client request.

SOCKS5 Proxy Support

• Overview
• SOCKS5 API
• SOCKS5 Proxy Usage in MQTT

Overview    The SOCKS library implements SOCKS5 support, which allows Zephyr to connect to peer devices via a network proxy.

See this SOCKS5 Wikipedia article for a detailed overview of how SOCKS5 works.

For more information about the protocol itself, see IETF RFC1928 SOCKS Protocol Version 5.
SOCKS5 API  The SOCKS5 support is enabled by CONFIG_SOCKS Kconfig variable. Application wanting to use the SOCKS5 must set the SOCKS5 proxy host address by calling setsockopt() like this:

```c
static int set_proxy(int sock, const struct sockaddr *proxy_addr,
    socklen_t proxy_addrlen)
{
    int ret;
    ret = setsockopt(sock, SOL_SOCKET, SO_SOCKS5, proxy_addr, proxy_addrlen);
    if (ret < 0) {
        return -errno;
    }
    return 0;
}
```

SOCKS5 Proxy Usage in MQTT  For MQTT client, there is mqtt_client_set_proxy() API that the application can call to setup SOCKS5 proxy. See mqtt-publisher sample application for usage example.

Trickle Timer Library

- **Overview**
- **API Reference**

Overview  The Trickle timer library implements IETF RFC6206 (Trickle Algorithm). The Trickle algorithm allows nodes in a lossy shared medium (e.g., low-power and lossy networks) to exchange information in a highly robust, energy efficient, simple, and scalable manner.

API Reference

group trickle
    Trickle algorithm library.

Typedefs

typedef void (*net_trickle_cb_t)(struct net_trickle *trickle, bool do_suppress, void *user_data)
    Trickle timer callback.
The callback is called after Trickle timeout expires.

    **Param trickle**
    The trickle context to use.

    **Param do_suppress**
    Is TX allowed (true) or not (false).

    **Param user_data**
    The user data given in net_trickle_start() call.
Functions

int net_trickle_create(struct net_trickle *trickle, uint32_t Imin, uint8_t Imax, uint8_t k)
Create a Trickle timer.

Parameters
• trickle – Pointer to Trickle struct.
• Imin – Imin configuration parameter in ms.
• Imax – Max number of doublings.
• k – Redundancy constant parameter. See RFC 6206 for details.

Returns
Return 0 if ok and <0 if error.

int net_trickle_start(struct net_trickle *trickle, net_trickle_cb_t cb, void *user_data)
Start a Trickle timer.

Parameters
• trickle – Pointer to Trickle struct.
• cb – User callback to call at time T within the current trickle interval
• user_data – User pointer that is passed to callback.

Returns
Return 0 if ok and <0 if error.

int net_trickle_stop(struct net_trickle *trickle)
Stop a Trickle timer.

Parameters
• trickle – Pointer to Trickle struct.

Returns
Return 0 if ok and <0 if error.

void net_trickle_consistency(struct net_trickle *trickle)
To be called by the protocol handler when it hears a consistent network transmission.

Parameters
• trickle – Pointer to Trickle struct.

void net_trickle_inconsistency(struct net_trickle *trickle)
To be called by the protocol handler when it hears an inconsistent network transmission.

Parameters
• trickle – Pointer to Trickle struct.

static inline bool net_trickle_is_running(struct net_trickle *trickle)
Check if the Trickle timer is running or not.

Parameters
• trickle – Pointer to Trickle struct.

Returns
Return True if timer is running and False if not.
struct net_trickle

#include <trickle.h> The variable names are taken directly from RFC 6206 when applicable.

Note that the struct members should not be accessed directly but only via the Trickle API.

Public Members

uint32_t Imin
    Min interval size in ms.

uint8_t Imax
    Max number of doublings.

uint8_t k
    Redundancy constant.

uint32_t I
    Current interval size.

uint32_t Istart
    Start of the interval in ms.

uint8_t c
    Consistency counter.

uint32_t Imax_abs
    Max interval size in ms (not doublings)

net_trickle_cb_t cb
    Callback to be called when timer expires.

Websocket Client API

- Overview
- Websocket Transport
- API Reference

Overview  The Websocket client library allows Zephyr to connect to a Websocket server. The Websocket client API can be used directly by application to establish a Websocket connection to server, or it can be used as a transport for other network protocols like MQTT.

See this Websocket Wikipedia article for a detailed overview of how Websocket works.
For more information about the protocol itself, see IETF RFC6455 The WebSocket Protocol.
Websocket Transport  The Websocket API allows it to be used as a transport for other high level protocols like MQTT. The Zephyr MQTT client library can be configured to use Websocket transport by enabling CONFIG_MQTT_LIB_WEBSOCKET and CONFIG_WEBSOCKET_CLIENT Kconfig options.

First a socket needs to be created and connected to the Websocket server:

```c
sock = socket(family, SOCK_STREAM, IPPROTO_TCP);
...
ret = connect(sock, addr, addr_len);
...```

The Websocket transport socket is then created like this:

```c
ws_sock = websocket_connect(sock, &config, timeout, user_data);
```

The Websocket transport socket can then be used to send or receive data, and the Websocket client API will encapsulate the sent or received data to/from Websocket packet payload. Both the websocket_xxx() API or normal BSD socket API functions can be used to send and receive application data.

```c
ret = websocket_send_msg(ws_sock, buf_to_send, buf_len, WEBSOCKET_OPCODE_DATA_BINARY, true, true, K_FOREVER);
...
ret = send(ws_sock, buf_to_send, buf_len, 0);
```

If normal BSD socket functions are used, then currently only TEXT data is supported. In order to send BINARY data, the websocket_send_msg() must be used.

When done, the Websocket transport socket must be closed. User should handle the lifecycle(close/reuse) of tcp socket after websocket_disconnect.

```c
ret = close(ws_sock);
or
ret = websocket_disconnect(ws_sock);
```

API Reference

Related code samples

WebSocket Client

Implement a Websocket client that connects to a Websocket server.

group websocket

WebSocket API.

Defines

WEBSOCKET_FLAG_FINAL

Message type values.

Returned in websocket_recv_msg() Final frame

WEBSOCKET_FLAG_TEXT

Textual data
WEBSOCKET_FLAG_BINARY
  Binary data

WEBSOCKET_FLAG_CLOSE
  Closing connection.

WEBSOCKET_FLAG_PING
  Ping message

WEBSOCKET_FLAG_PONG
  Pong message

**Typedefs**

typedef int (*websocket_connect_cb_t)(int ws_sock, struct http_request *req, void *user_data)
  Callback called after Websocket connection is established.

  **Param ws_sock**
  Websocket id

  **Param req**
  HTTP handshake request

  **Param user_data**
  A valid pointer on some user data or NULL

  **Return**
  0 if ok, <0 if there is an error and connection should be aborted

**Enums**

enum websocket_opcode
  **Values:**

  enumerator WEBSOCKET_OPCODE_CONTINUE = 0x00

  enumerator WEBSOCKET_OPCODE_DATA_TEXT = 0x01

  enumerator WEBSOCKET_OPCODE_DATA_BINARY = 0x02

  enumerator WEBSOCKET_OPCODE_CLOSE = 0x08

  enumerator WEBSOCKET_OPCODE_PING = 0x09

  enumerator WEBSOCKET_OPCODE_PONG = 0x0A
Functions

```c
int websocket_connect(int http_sock, struct websocket_request *req, int32_t timeout, void *user_data)
```

Connect to a server that provides Websocket service.

The callback is called after connection is established. The returned value is a new socket descriptor that can be used to send / receive data using the BSD socket API.

**Parameters**

- `http_sock` – Socket id to the server. Note that this socket is used to do HTTP handshakes etc. The actual Websocket connectivity is done via the returned websocket id. Note that the http_sock must not be closed after this function returns as it is used to deliver the Websocket packets to the Websocket server.
- `req` – Websocket request. User should allocate and fill the request data.
- `timeout` – Max timeout to wait for the connection. The timeout value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.
- `user_data` – User specified data that is passed to the callback.

**Returns**

Websocket id to be used when sending/receiving Websocket data.

```c
int websocket_send_msg(int ws_sock, const uint8_t *payload, size_t payload_len, enum websocket_opcode opcode, bool mask, bool final, int32_t timeout)
```

Send websocket msg to peer.

The function will automatically add websocket header to the message.

**Parameters**

- `ws_sock` – Websocket id returned by `websocket_connect()`.
- `payload` – Websocket data to send.
- `payload_len` – Length of the data to be sent.
- `opcode` – Operation code (text, binary, ping, pong, close)
- `mask` – Mask the data, see RFC 6455 for details
- `final` – Is this final message for this message send. If final == false, then the first message must have valid opcode and subsequent messages must have opcode WEBSOCKET_OPCODE_CONTINUE. If final == true and this is the only message, then opcode should have proper opcode (text or binary) set.
- `timeout` – How long to try to send the message. The value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.

**Returns**

<0 if error, >=0 amount of bytes sent

```c
int websocket_recv_msg(int ws_sock, uint8_t *buf, size_t buf_len, uint32_t *message_type, uint64_t *remaining, int32_t timeout)
```

Receive websocket msg from peer.

The function will automatically remove websocket header from the message.

**Parameters**

- `ws_sock` – Websocket id returned by `websocket_connect()`.
- `buf` – Buffer where websocket data is read.
• **buf_len** – Length of the data buffer.
• **message_type** – Type of the message.
• **remaining** – How much there is data left in the message after this read.
• **timeout** – How long to try to receive the message. The value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.

**Return values**
• \( \geq 0 \) – amount of bytes received.
• -EAGAIN – on timeout.
• -ENOTCONN – on socket close.
• -errno – other negative errno value in case of failure.

```c
int websocket_disconnect(int ws_sock)
```
Close websocket.
One must call `websocket_connect()` after this call to re-establish the connection.

**Parameters**
• **ws_sock** – Websocket id returned by `websocket_connect()`.

```c
static inline void websocket_init(void)
```

```c
struct websocket_request
```
`#include <websocket.h>` Websocket client connection request.
This contains all the data that is needed when doing a Websocket connection request.

**Public Members**

```c
cnst char *host
```
Host of the Websocket server when doing HTTP handshakes.

```c
cnst char *url
```
URL of the Websocket.

```c
http_header_cb_t optional_headers_cb
```
User supplied callback function to call when optional headers need to be sent.
This can be NULL, in which case the optional_headers field in `http_request` is used.
The idea of this optional_headers callback is to allow user to send more HTTP header data that is practical to store in allocated memory.

```c
cnst char **optional_headers
```
A NULL terminated list of any optional headers that should be added to the HTTP request.
May be NULL. If the optional_headers_cb is specified, then this field is ignored.

```c
websocket_connect_cb_t cb
```
User supplied callback function to call when a connection is established.
const struct http_parser_settings *http_cb
  User supplied list of callback functions if the calling application wants to know the parsing status or the HTTP fields during the handshake.
  This is optional parameter and normally not needed but is useful if the caller wants to know something about the fields that the server is sending.

uint8_t *tmp_buf
  User supplied buffer where HTTP connection data is stored.

size_t tmp_buf_len
  Length of the user supplied temp buffer.

Network Packet Capture

- Overview
- Sample usage
- API Reference

Overview  The net_capture API allows user to monitor the network traffic in one of the Zephyr network interfaces and send that traffic to external system for analysis. The monitoring can be setup either manually using net-shell or automatically by using the net_capture API.

Sample usage  See net-capture sample application and Monitor Network Traffic for details.

API Reference
Related code samples
Network packet capture
  Capture network packets and send them to a remote host via IPIP tunnel.

group net_capture
  Network packet capture support functions.

Functions

int net_capture_setup(const char *remote_addr, const char *my_local_addr, const char *peer_addr, const struct device **dev)
  Setup network packet capturing support.

Parameters

- remote_addr – The value tells the tunnel remote/outer endpoint IP address. The IP address can be either IPv4 or IPv6 address. This address is used to select the network interface where the tunnel is created.
- my_local_addr – The local/inner IP address of the tunnel. Can contain also port number which is used as UDP source port.
• **peer_addr** – The peer/inner IP address of the tunnel. Can contain also port number which is used as UDP destination port.

• **dev** – Network capture device. This is returned to the caller.

**Returns**

0 if ok, <0 if network packet capture setup failed

static inline int net_capture_cleanup(const struct device *dev)

Cleanup network packet capturing support.

This should be called after the capturing is done and resources can be released.

**Parameters**

• **dev** – Network capture device. User must allocate using the `net_capture_setup()` function.

**Returns**

0 if ok, <0 if network packet capture cleanup failed

static inline int net_capture_enable(const struct device *dev, struct net_if *iface)

Enable network packet capturing support.

This creates tunnel network interface where all the captured packets are pushed. The captured network packets are placed in UDP packets that are sent to tunnel peer.

**Parameters**

• **dev** – Network capture device

• **iface** – Network interface we are starting to capture packets.

**Returns**

0 if ok, <0 if network packet capture enable failed

static inline bool net_capture_is_enabled(const struct device *dev)

Is network packet capture enabled or disabled.

**Parameters**

• **dev** – Network capture device

**Returns**

True if enabled, False if network capture is disabled.

static inline int net_capture_disable(const struct device *dev)

Disable network packet capturing support.

**Parameters**

• **dev** – Network capture device

**Returns**

0 if ok, <0 if network packet capture disable failed

### Network Buffer Management

### Network Buffer

- **Overview**
- **Creating buffers**
- **Common Operations**
- **Reference Counting**
Overview  Network buffers are a core concept of how the networking stack (as well as the Bluetooth stack) pass data around. The API for them is defined in include/zephyr/net/buf.h:

Creating buffers  Network buffers are created by first defining a pool of them:

```c
NET_BUF_POOL_DEFINE(pool_name, buf_count, buf_size, user_data_size, NULL);
```

The pool is a static variable, so if it’s needed to be exported to another module a separate pointer is needed.

Once the pool has been defined, buffers can be allocated from it with:

```c
buf = net_buf_alloc(&pool_name, timeout);
```

There is no explicit initialization function for the pool or its buffers, rather this is done implicitly as `net_buf_alloc()` gets called.

If there is a need to reserve space in the buffer for protocol headers to be prepended later, it’s possible to reserve this headroom with:

```c
net_buf_reserve(buf, headroom);
```

In addition to actual protocol data and generic parsing context, network buffers may also contain protocol-specific context, known as user data. Both the maximum data and user data capacity of the buffers is compile-time defined when declaring the buffer pool.

The buffers have native support for being passed through `k_fifo` kernel objects. This is a very practical feature when the buffers need to be passed from one thread to another. However, since a `net_buf` may have a fragment chain attached to it, instead of using the `k_fifo_put()` and `k_fifo_get()` APIs, special `net_buf_put()` and `net_buf_get()` APIs must be used when passing buffers through FIFOs. These APIs ensure that the buffer chains stay intact. The same applies for passing buffers through a singly linked list, in which case the `net_buf_slist_put()` and `net_buf_slist_get()` functions must be used instead of `sys_slist_append()` and `sys_slist_get()`.

Common Operations  The network buffer API provides some useful helpers for encoding and decoding data in the buffers. To fully understand these helpers it’s good to understand the basic names of operations used with them:

Add  Add data to the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Requires that there is enough tailroom in the buffer. Some examples of APIs for adding data:

```c
void *net_buf_add(struct net_buf *buf, size_t len);
void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len);
uint8_t *net_buf_add_u8(struct net_buf *buf, uint8_t value);
void net_buf_add_le16(struct net_buf *buf, uint16_t value);
void net_buf_add_le32(struct net_buf *buf, uint32_t value);
```

Remove  Remove data from the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Some examples of APIs for removing data:
Push
Prepend data to the beginning of the buffer. Modifies both the data length value as well as the data pointer. Requires that there is enough headroom in the buffer. Some examples of APIs for pushing data:

```c
void *net_buf_push(struct net_buf *buf, size_t len);
void *net_buf_push_mem(struct net_buf *buf, const void *mem, size_t len);
void net_buf_push_u8(struct net_buf *buf, uint8_t value);
void net_buf_push_le16(struct net_buf *buf, uint16_t value);

Pull
Remove data from the beginning of the buffer. Modifies both the data length value as well as the data pointer. Some examples of APIs for pulling data:

```c
void *net_buf_pull(struct net_buf *buf, size_t len);
void *net_buf_pull_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_pull_u8(struct net_buf *buf);
uint16_t net_buf_pull_le16(struct net_buf *buf);
uint32_t net_buf_pull_le32(struct net_buf *buf);
```

The Add and Push operations are used when encoding data into the buffer, whereas the Remove and Pull operations are used when decoding data from a buffer.

**Reference Counting** Each network buffer is reference counted. The buffer is initially acquired from a free buffers pool by calling `net_buf_alloc()`, resulting in a buffer with reference count 1. The reference count can be incremented with `net_buf_ref()` or decremented with `net_buf_unref()`. When the count drops to zero the buffer is automatically placed back to the free buffers pool.

**API Reference**

*group net_buf*

Network buffer library.

**Defines**

`NET_BUF_SIMPLE_DEFINE(_name, _size)`

Define a `net_buf_simple` stack variable.

This is a helper macro which is used to define a `net_buf_simple` object on the stack.

**Parameters**

- `_name` – Name of the `net_buf_simple` object.
- `_size` – Maximum data storage for the buffer.

`NET_BUF_SIMPLE_DEFINE_STATIC(_name, _size)`

Define a static `net_buf_simple` variable.

This is a helper macro which is used to define a static `net_buf_simple` object.

**Parameters**

- `_name` – Name of the `net_buf_simple` object.
• _size – Maximum data storage for the buffer.

**NET_BUF_SIMPLE(_size)**

Define a *net_buf_simple* stack variable and get a pointer to it.

This is a helper macro which is used to define a *net_buf_simple* object on the stack and the get a pointer to it as follows:

```c
struct net_buf_simple *my_buf = NET_BUF_SIMPLE(10);
```

After creating the object it needs to be initialized by calling *net_buf_simple_init()*.

**Parameters**

• _size – Maximum data storage for the buffer.

**Returns**

Pointer to stack-allocated *net_buf_simple* object.

**NET_BUF_EXTERNAL_DATA**

Flag indicating that the buffer’s associated data pointer, points to externally allocated memory.

Therefore once ref goes down to zero, the pointed data will not need to be deallocated. This never needs to be explicitly set or unset by the *net_buf* API user. Such *net_buf* is exclusively instantiated via *net_buf_alloc_with_data()* function. Reference count mechanism however will behave the same way, and ref count going to 0 will free the *net_buf* but no the data pointer in it.

**NET_BUF_POOL_HEAP_DEFINE(_name, _count, _ud_size, _destroy)**

Define a new pool for buffers using the heap for the data.

Defines a *net_buf_pool* struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through *net_buf_alloc*. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from the heap using k_malloc, so CONFIG_HEAP_MEM_POOL_SIZE must be set to a positive value. This kind of pool does not support blocking on the data allocation, so the timeout passed to *net_buf_alloc* will be always treated as K_NO_WAIT when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling *net_buf_destroy()* to complete the process of returning the buffer to the pool.

**Parameters**

• _name – Name of the pool variable.

• _count – Number of buffers in the pool.

• _ud_size – User data space to reserve per buffer.

• _destroy – Optional destroy callback when buffer is freed.

**NET_BUF_POOL_FIXED_DEFINE(_name, _count, _data_size, _ud_size, _destroy)**

Define a new pool for buffers based on fixed-size data.

Defines a *net_buf_pool* struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through *net_buf_alloc*. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.
The data payload of the buffers will be allocated from a byte array of fixed sized chunks. This kind of pool does not support blocking on the data allocation, so the timeout passed to net_buf_alloc will be always treated as K_NO_WAIT when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling `net_buf_destroy()` to complete the process of returning the buffer to the pool.

**Parameters**

- `__name` – Name of the pool variable.
- `__count` – Number of buffers in the pool.
- `__data_size` – Maximum data payload per buffer.
- `__ud_size` – User data space to reserve per buffer.
- `__destroy` – Optional destroy callback when buffer is freed.

```c
NET_BUF_POOL_VAR_DEFINE(__name, __count, __data_size, __ud_size, __destroy)
```

Define a new pool for buffers with variable size payloads.

Defines a `net_buf_pool` struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through `net_buf_alloc`. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be based on a memory pool from which variable size payloads may be allocated.

If provided with a custom destroy callback this callback is responsible for eventually calling `net_buf_destroy()` to complete the process of returning the buffer to the pool.

**Parameters**

- `__name` – Name of the pool variable.
- `__count` – Number of buffers in the pool.
- `__data_size` – Total amount of memory available for data payloads.
- `__ud_size` – User data space to reserve per buffer.
- `__destroy` – Optional destroy callback when buffer is freed.

```c
NET_BUF_POOL_DEFINE(__name, __count, __data_size, __ud_size, __destroy)
```

Define a new pool for buffers.

Defines a `net_buf_pool` struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through `net_buf_alloc`. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

If provided with a custom destroy callback this callback is responsible for eventually calling `net_buf_destroy()` to complete the process of returning the buffer to the pool.

**Parameters**

- `__name` – Name of the pool variable.
- `__count` – Number of buffers in the pool.
- `__size` – Maximum data size for each buffer.
- `__ud_size` – Amount of user data space to reserve.
- `__destroy` – Optional destroy callback when buffer is freed.
**Typedefs**

typedef struct net_buf *(net_buf_allocator_cb)(k_timeout_t timeout, void *user_data)
Network buffer allocator callback.

The allocator callback is called when net_buf_append_bytes needs to allocate a new net_buf.

**Param timeout**
Affects the action taken should the net_buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

**Param user_data**
The user data given in net_buf_append_bytes call.

**Return**
pointer to allocated net_buf or NULL on error.

**Functions**

static inline void net_buf_simple_init(struct net_buf_simple *buf, size_t reserve_head)
Initialize a net_buf_simple object.

This needs to be called after creating a net_buf_simple object using the NET_BUF_SIMPLE macro.

**Parameters**

- buf – Buffer to initialize.
- reserve_head – Headroom to reserve.

void net_buf_simple_init_with_data(struct net_buf_simple *buf, void *data, size_t size)
Initialize a net_buf_simple object with data.

Initialized buffer object with external data.

**Parameters**

- buf – Buffer to initialize.
- data – External data pointer
- size – Amount of data the pointed data buffer if able to fit.

static inline void net_buf_simple_reset(struct net_buf_simple *buf)
Reset buffer.

Reset buffer data so it can be reused for other purposes.

**Parameters**

- buf – Buffer to reset.

void net_buf_simple_clone(const struct net_buf_simple *original, struct net_buf_simple *clone)
Clone buffer state, using the same data buffer.

Initializes a buffer to point to the same data as an existing buffer. Allows operations on the same data without altering the length and offset of the original.

**Parameters**

- original – Buffer to clone.
• clone – The new clone.

```c
void *net_buf_simple_add(struct net_buf_simple *buf, size_t len)
```

Prepare data to be added at the end of the buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `len` – Number of bytes to increment the length with.

**Returns**

The original tail of the buffer.

```c
void *net_buf_simple_add_mem(struct net_buf_simple *buf, const void *mem, size_t len)
```

Copy given number of bytes from memory to the end of the buffer. Increments the data length of the buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `mem` – Location of data to be added.
- `len` – Length of data to be added.

**Returns**

The original tail of the buffer.

```c
uint8_t *net_buf_simple_add_u8(struct net_buf_simple *buf, uint8_t val)
```

Add (8-bit) byte at the end of the buffer. Increments the data length of the buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – byte value to be added.

**Returns**

Pointer to the value added

```c
void net_buf_simple_add_le16(struct net_buf_simple *buf, uint16_t val)
```

Add 16-bit value at the end of the buffer. Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 16-bit value to be added.

```c
void net_buf_simple_add_be16(struct net_buf_simple *buf, uint16_t val)
```

Add 16-bit value at the end of the buffer. Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

- `buf` – Buffer to update.
- `val` – 16-bit value to be added.
void net_buf_simple_add_le24(struct net_buf_simple *buf, uint32_t val)
Add 24-bit value at the end of the buffer.
Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be added.

void net_buf_simple_add_be24(struct net_buf_simple *buf, uint32_t val)
Add 24-bit value at the end of the buffer.
Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be added.

void net_buf_simple_add_le32(struct net_buf_simple *buf, uint32_t val)
Add 32-bit value at the end of the buffer.
Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be added.

void net_buf_simple_add_be32(struct net_buf_simple *buf, uint32_t val)
Add 32-bit value at the end of the buffer.
Adds 32-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be added.

void net_buf_simple_add_le48(struct net_buf_simple *buf, uint64_t val)
Add 48-bit value at the end of the buffer.
Adds 48-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be added.

void net_buf_simple_add_be48(struct net_buf_simple *buf, uint64_t val)
Add 48-bit value at the end of the buffer.
Adds 48-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be added.
void net_buf_simple_add_le64(struct net_buf_simple *buf, uint64_t val)
Add 64-bit value at the end of the buffer.
Adds 64-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be added.

void net_buf_simple_add_be64(struct net_buf_simple *buf, uint64_t val)
Add 64-bit value at the end of the buffer.
Adds 64-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be added.

void *net_buf_simple_remove_mem(struct net_buf_simple *buf, size_t len)
Remove data from the end of the buffer.
Removes data from the end of the buffer by modifying the buffer length.

Parameters
• buf – Buffer to update.
• len – Number of bytes to remove.

Returns
New end of the buffer data.

uint8_t net_buf_simple_remove_u8(struct net_buf_simple *buf)
Remove a 8-bit value from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 8-bit values.

Parameters
• buf – A valid pointer on a buffer.

Returns
The 8-bit removed value

uint16_t net_buf_simple_remove_le16(struct net_buf_simple *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 16-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from little endian to host endian.

uint16_t net_buf_simple_remove_be16(struct net_buf_simple *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 16-bit big endian data.

Parameters
- buf – A valid pointer on a buffer.

**Returns**
16-bit value converted from big endian to host endian.

```c
uint32_t net_buf_simple_remove_le24(struct net_buf_simple *buf)
```

Remove and convert 24 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 24-bit little endian data.

**Parameters**
- buf – A valid pointer on a buffer.

**Returns**
24-bit value converted from little endian to host endian.

```c
uint32_t net_buf_simple_remove_be24(struct net_buf_simple *buf)
```

Remove and convert 24 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 24-bit big endian data.

**Parameters**
- buf – A valid pointer on a buffer.

**Returns**
32-bit value converted from little endian to host endian.

```c
uint32_t net_buf_simple_remove_le32(struct net_buf_simple *buf)
```

Remove and convert 32 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 32-bit little endian data.

**Parameters**
- buf – A valid pointer on a buffer.

**Returns**
32-bit value converted from big endian to host endian.

```c
uint32_t net_buf_simple_remove_be32(struct net_buf_simple *buf)
```

Remove and convert 32 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 32-bit big endian data.

**Parameters**
- buf – A valid pointer on a buffer.

**Returns**
48-bit value converted from little endian to host endian.

```c
uint64_t net_buf_simple_remove_le48(struct net_buf_simple *buf)
```

Remove and convert 48 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 48-bit little endian data.

**Parameters**
- buf – A valid pointer on a buffer.

**Returns**
48-bit value converted from little endian to host endian.
uint64_t net_buf_simple_remove_be48(struct net_buf_simple *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 48-bit big endian data.

Parameters

• buf – A valid pointer on a buffer.

Returns

48-bit value converted from big endian to host endian.

uint64_t net_buf_simple_remove_le64(struct net_buf_simple *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 64-bit little endian data.

Parameters

• buf – A valid pointer on a buffer.

Returns

64-bit value converted from little endian to host endian.

uint64_t net_buf_simple_remove_be64(struct net_buf_simple *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 64-bit big endian data.

Parameters

• buf – A valid pointer on a buffer.

Returns

64-bit value converted from big endian to host endian.

void *net_buf_simple_push(struct net_buf_simple *buf, size_t len)
Prepare data to be added to the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters

• buf – Buffer to update.

• len – Number of bytes to add to the beginning.

Returns

The new beginning of the buffer data.

void *net_buf_simple_push_mem(struct net_buf_simple *buf, const void *mem, size_t len)
Copy given number of bytes from memory to the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters

• buf – Buffer to update.

• mem – Location of data to be added.

• len – Length of data to be added.

Returns

The new beginning of the buffer data.
void net_buf_simple_push_le16(struct net_buf_simple *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.
Adds 16-bit value in little endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 16-bit value to be pushed to the buffer.

void net_buf_simple_push_be16(struct net_buf_simple *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.
Adds 16-bit value in big endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 16-bit value to be pushed to the buffer.

void net_buf_simple_push_u8(struct net_buf_simple *buf, uint8_t val)
Push 8-bit value to the beginning of the buffer.
Adds 8-bit value the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 8-bit value to be pushed to the buffer.

void net_buf_simple_push_le24(struct net_buf_simple *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.
Adds 24-bit value in little endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be pushed to the buffer.

void net_buf_simple_push_be24(struct net_buf_simple *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.
Adds 24-bit value in big endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be pushed to the buffer.

void net_buf_simple_push_le32(struct net_buf_simple *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.
Adds 32-bit value in little endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be pushed to the buffer.

void net_buf_simple_push_be32(struct net_buf_simple *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.
Adds 32-bit value in big endian format to the beginning of the buffer.

Parameters
• **buf** – Buffer to update.
• **val** – 32-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_le48(struct net_buf_simple *buf, uint64_t val)
```

Push 48-bit value in little endian format to the beginning of the buffer.

Parameters

• **buf** – Buffer to update.
• **val** – 48-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_be48(struct net_buf_simple *buf, uint64_t val)
```

Push 48-bit value in big endian format to the beginning of the buffer.

Parameters

• **buf** – Buffer to update.
• **val** – 48-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_le64(struct net_buf_simple *buf, uint64_t val)
```

Push 64-bit value in little endian format to the beginning of the buffer.

Parameters

• **buf** – Buffer to update.
• **val** – 64-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_be64(struct net_buf_simple *buf, uint64_t val)
```

Push 64-bit value in big endian format to the beginning of the buffer.

Parameters

• **buf** – Buffer to update.
• **val** – 64-bit value to be pushed to the buffer.

```c
void *net_buf_simple_pull(struct net_buf_simple *buf, size_t len)
```

Remove data from the beginning of the buffer.

Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

Parameters

• **buf** – Buffer to update.
• **len** – Number of bytes to remove.

Returns

New beginning of the buffer data.

```c
void *net_buf_simple_pull_mem(struct net_buf_simple *buf, size_t len)
```

Remove data from the beginning of the buffer.

Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

Parameters

• **buf** – Buffer to update.
• `len` – Number of bytes to remove.

**Returns**
Pointer to the old location of the buffer data.

`uint8_t net_buf_simple_pull_u8(struct net_buf_simple *buf)`
Remove a 8-bit value from the beginning of the buffer.
Same idea as with `net_buf_simple_pull()`, but a helper for operating on 8-bit values.

**Parameters**
• `buf` – A valid pointer on a buffer.

**Returns**
The 8-bit removed value

`uint16_t net_buf_simple_pull_le16(struct net_buf_simple *buf)`
Remove and convert 16 bits from the beginning of the buffer.
Same idea as with `net_buf_simple_pull()`, but a helper for operating on 16-bit little endian data.

**Parameters**
• `buf` – A valid pointer on a buffer.

**Returns**
16-bit value converted from little endian to host endian.

`uint16_t net_buf_simple_pull_be16(struct net_buf_simple *buf)`
Remove and convert 16 bits from the beginning of the buffer.
Same idea as with `net_buf_simple_pull()`, but a helper for operating on 16-bit big endian data.

**Parameters**
• `buf` – A valid pointer on a buffer.

**Returns**
16-bit value converted from big endian to host endian.

`uint32_t net_buf_simple_pull_le24(struct net_buf_simple *buf)`
Remove and convert 24 bits from the beginning of the buffer.
Same idea as with `net_buf_simple_pull()`, but a helper for operating on 24-bit little endian data.

**Parameters**
• `buf` – A valid pointer on a buffer.

**Returns**
24-bit value converted from little endian to host endian.

`uint32_t net_buf_simple_pull_be24(struct net_buf_simple *buf)`
Remove and convert 24 bits from the beginning of the buffer.
Same idea as with `net_buf_simple_pull()`, but a helper for operating on 24-bit big endian data.

**Parameters**
• `buf` – A valid pointer on a buffer.

**Returns**
24-bit value converted from big endian to host endian.
uint32_t net_buf_simple_pull_le32(struct net_buf_simple *buf)
Remove and convert 32 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 32-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.

uint32_t net_buf_simple_pull_be32(struct net_buf_simple *buf)
Remove and convert 32 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 32-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from big endian to host endian.

uint64_t net_buf_simple_pull_le48(struct net_buf_simple *buf)
Remove and convert 48 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 48-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.

uint64_t net_buf_simple_pull_be48(struct net_buf_simple *buf)
Remove and convert 48 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 48-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from big endian to host endian.

uint64_t net_buf_simple_pull_le64(struct net_buf_simple *buf)
Remove and convert 64 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 64-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from little endian to host endian.

uint64_t net_buf_simple_pull_be64(struct net_buf_simple *buf)
Remove and convert 64 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 64-bit big endian data.
Parameters

• buf – A valid pointer on a buffer.

Returns

64-bit value converted from big endian to host endian.

static inline uint8_t *net_buf_simple_tail(struct net_buf_simple *buf)
Get the tail pointer for a buffer.
Get a pointer to the end of the data in a buffer.

Parameters

• buf – Buffer.

Returns

Tail pointer for the buffer.

size_t net_buf_simple_headroom(struct net_buf_simple *buf)
Check buffer headroom.
Check how much free space there is in the beginning of the buffer.
buf A valid pointer on a buffer

Returns

Number of bytes available in the beginning of the buffer.

size_t net_buf_simple_tailroom(struct net_buf_simple *buf)
Check buffer tailroom.
Check how much free space there is at the end of the buffer.

Parameters

• buf – A valid pointer on a buffer

Returns

Number of bytes available at the end of the buffer.

uint16_t net_buf_simple_max_len(struct net_buf_simple *buf)
Check maximum net_buf_simple::len value.
This value is depending on the number of bytes being reserved as headroom.

Parameters

• buf – A valid pointer on a buffer

Returns

Number of bytes usable behind the net_buf_simple::data pointer.

static inline void net_buf_simple_save(struct net_buf_simple *buf, struct net_buf_simple_state *state)
Save the parsing state of a buffer.
Saves the parsing state of a buffer so it can be restored later.

Parameters

• buf – Buffer from which the state should be saved.
• state – Storage for the state.

static inline void net_buf_simple_restore(struct net_buf_simple *buf, struct net_buf_simple_state *state)
Restore the parsing state of a buffer.
Restores the parsing state of a buffer from a state previously stored by net_buf_simple_save().
Parameters

- **buf** – Buffer to which the state should be restored.
- **state** – Stored state.

```c
struct net_buf_pool *net_buf_pool_get(int id)
```

Looks up a pool based on its ID.

Parameters

- **id** – Pool ID (e.g. from buf->pool_id).

Returns

Pointer to pool.

```c
int net_buf_id(struct net_buf *buf)
```

Get a zero-based index for a buffer.

This function will translate a buffer into a zero-based index, based on its placement in its buffer pool. This can be useful if you want to associate an external array of metadata contexts with the buffers of a pool.

Parameters

- **buf** – Network buffer.

Returns

Zero-based index for the buffer.

```c
struct net_buf *net_buf_alloc_fixed(struct net_buf_pool *pool, k_timeout_t timeout)
```

Allocate a new fixed buffer from a pool.

Parameters

- **pool** – Which pool to allocate the buffer from.
- **timeout** – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for `net_buf_alloc()` to fail (return NULL) even if it was given K_FOREVER.

Returns

New buffer or NULL if out of buffers.

```c
static inline struct net_buf *net_buf_alloc(struct net_buf_pool *pool, k_timeout_t timeout)
```

Parameters

- **pool** – Which pool to allocate the buffer from.
- **timeout** – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for `net_buf_alloc()` to fail (return NULL) even if it was given K_FOREVER.

Returns

New buffer or NULL if out of buffers.

```c
struct net_buf *net_buf_alloc_len(struct net_buf_pool *pool, size_t size, k_timeout_t timeout)
```

Allocate a new variable length buffer from a pool.
Parameters

- **pool** – Which pool to allocate the buffer from.
- **size** – Amount of data the buffer must be able to fit.
- **timeout** – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for `net_buf_alloc()` to fail (return NULL) even if it was given K_FOREVER.

Returns

New buffer or NULL if out of buffers.

```c
struct net_buf *net_buf_alloc_with_data(struct net_buf_pool *pool, void *data, size_t size, k_timeout_t timeout)
```

Allocate a new buffer from a pool but with external data pointer.

Allocate a new buffer from a pool, where the data pointer comes from the user and not from the pool.

Parameters

- **pool** – Which pool to allocate the buffer from.
- **data** – External data pointer
- **size** – Amount of data the pointed data buffer if able to fit.
- **timeout** – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for `net_buf_alloc()` to fail (return NULL) even if it was given K_FOREVER.

Returns

New buffer or NULL if out of buffers.

```c
struct net_buf *net_buf_get(struct k_fifo *fifo, k_timeout_t timeout)
```

Get a buffer from a FIFO.

This function is NOT thread-safe if the buffers in the FIFO contain fragments.

Parameters

- **fifo** – Which FIFO to take the buffer from.
- **timeout** – Affects the action taken should the FIFO be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Returns

New buffer or NULL if the FIFO is empty.

```c
static inline void net_buf_destroy(struct net_buf *buf)
```

Destroy buffer from custom destroy callback.

This helper is only intended to be used from custom destroy callbacks. If no custom destroy callback is given to NET_BUF_POOL_*.DEFINE() then there is no need to use this API.

Parameters

- **buf** – Buffer to destroy.
void net_buf_reset(struct net_buf *buf)

Reset buffer.
Reset buffer data and flags so it can be reused for other purposes.

Parameters
• buf – Buffer to reset.

void net_buf_simple_reserve(struct net_buf_simple *buf, size_t reserve)

Initialize buffer with the given headroom.
The buffer is not expected to contain any data when this API is called.

Parameters
• buf – Buffer to initialize.
• reserve – How much headroom to reserve.

void net_buf_slist_put(sys_slist_t *list, struct net_buf *buf)

Put a buffer into a list.
If the buffer contains follow-up fragments this function will take care of inserting them as well into the list.

Parameters
• list – Which list to append the buffer to.
• buf – Buffer.

struct net_buf *net_buf_slist_get(sys_slist_t *list)

Get a buffer from a list.
If the buffer had any fragments, these will automatically be recovered from the list as well and be placed to the buffer’s fragment list.

Parameters
• list – Which list to take the buffer from.

Returns
New buffer or NULL if the FIFO is empty.

void net_buf_put(struct k_fifo *fifo, struct net_buf *buf)

Put a buffer to the end of a FIFO.
If the buffer contains follow-up fragments this function will take care of inserting them as well into the FIFO.

Parameters
• fifo – Which FIFO to put the buffer to.
• buf – Buffer.

void net_buf_unref(struct net_buf *buf)

Decrements the reference count of a buffer.
The buffer is put back into the pool if the reference count reaches zero.

Parameters
• buf – A valid pointer on a buffer

struct net_buf *net_buf_ref(struct net_buf *buf)

Increment the reference count of a buffer.

Parameters
Struct net_buf *net_buf_clone(struct net_buf *buf, k_timeout_t timeout)
Clone buffer.
Duplicate given buffer including any data and headers currently stored.

Parameters
- buf – A valid pointer on a buffer
- timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Returns
Cloned buffer or NULL if out of buffers.

static inline void *net_buf_user_data(const struct net_buf *buf)
Get a pointer to the user data of a buffer.

Parameters
- buf – A valid pointer on a buffer

Returns
Pointer to the user data of the buffer.

static inline void net_buf_reserve(struct net_buf *buf, size_t reserve)
Initialize buffer with the given headroom.
The buffer is not expected to contain any data when this API is called.

Parameters
- buf – Buffer to initialize.
- reserve – How much headroom to reserve.

static inline void *net_buf_add(struct net_buf *buf, size_t len)
Prepare data to be added at the end of the buffer.
Increments the data length of a buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- len – Number of bytes to increment the length with.

Returns
The original tail of the buffer.

static inline void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len)
Copies the given number of bytes to the end of the buffer.
Increments the data length of the buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- mem – Location of data to be added.
- len – Length of data to be added

Returns
The original tail of the buffer.
static inline uint8_t *net_buf_add_u8(struct net_buf *buf, uint8_t val)
Add (8-bit) byte at the end of the buffer.
Increments the data length of the buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- val – byte value to be added.

Returns
Pointer to the value added

static inline void net_buf_add_le16(struct net_buf *buf, uint16_t val)
Add 16-bit value at the end of the buffer.
Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- val – 16-bit value to be added.

static inline void net_buf_add_be16(struct net_buf *buf, uint16_t val)
Add 16-bit value at the end of the buffer.
Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- val – 16-bit value to be added.

static inline void net_buf_add_le24(struct net_buf *buf, uint32_t val)
Add 24-bit value at the end of the buffer.
Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- val – 24-bit value to be added.

static inline void net_buf_add_be24(struct net_buf *buf, uint32_t val)
Add 24-bit value at the end of the buffer.
Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- val – 24-bit value to be added.

static inline void net_buf_add_le32(struct net_buf *buf, uint32_t val)
Add 32-bit value at the end of the buffer.
Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
• val – 32-bit value to be added.

static inline void net_buf_add_be32(struct net_buf *buf, uint32_t val)
Add 32-bit value at the end of the buffer.

Adds 32-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

• buf – Buffer to update.
• val – 32-bit value to be added.

static inline void net_buf_add_le48(struct net_buf *buf, uint64_t val)
Add 48-bit value at the end of the buffer.

Adds 48-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

• buf – Buffer to update.
• val – 48-bit value to be added.

static inline void net_buf_add_be48(struct net_buf *buf, uint64_t val)
Add 48-bit value at the end of the buffer.

Adds 48-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

• buf – Buffer to update.
• val – 48-bit value to be added.

static inline void net_buf_add_le64(struct net_buf *buf, uint64_t val)
Add 64-bit value at the end of the buffer.

Adds 64-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

• buf – Buffer to update.
• val – 64-bit value to be added.

static inline void net_buf_add_be64(struct net_buf *buf, uint64_t val)
Add 64-bit value at the end of the buffer.

Adds 64-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**

• buf – Buffer to update.
• val – 64-bit value to be added.

static inline void *net_buf_remove_mem(struct net_buf *buf, size_t len)
Remove data from the end of the buffer.

Removes data from the end of the buffer by modifying the buffer length.

**Parameters**

• buf – Buffer to update.
• len – Number of bytes to remove.
Returns
New end of the buffer data.

static inline uint8_t net_buf_remove_u8(struct net_buf *buf)
Remove a 8-bit value from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 8-bit values.

Parameters
• buf – A valid pointer on a buffer.

Returns
The 8-bit removed value

static inline uint16_t net_buf_remove_le16(struct net_buf *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 16-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from little endian to host endian.

static inline uint16_t net_buf_remove_be16(struct net_buf *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 16-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from big endian to host endian.

static inline uint32_t net_buf_remove_be24(struct net_buf *buf)
Remove and convert 24 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 24-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from big endian to host endian.

static inline uint32_t net_buf_remove_le24(struct net_buf *buf)
Remove and convert 24 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 24-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.
static inline uint32_t net_buf_remove_le32(struct net_buf *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 32-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.

static inline uint32_t net_buf_remove_be32(struct net_buf *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 32-bit big endian data.

Parameters
• buf – A valid pointer on a buffer

Returns
32-bit value converted from big endian to host endian.

static inline uint64_t net_buf_remove_le48(struct net_buf *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 48-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.

static inline uint64_t net_buf_remove_be48(struct net_buf *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 48-bit big endian data.

Parameters
• buf – A valid pointer on a buffer

Returns
48-bit value converted from big endian to host endian.

static inline uint64_t net_buf_remove_le64(struct net_buf *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 64-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from little endian to host endian.

static inline uint64_t net_buf_remove_be64(struct net_buf *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 64-bit big endian data.
Parameters
  • buf – A valid pointer on a buffer

Returns
  64-bit value converted from big endian to host endian.

static inline void *net_buf_push(struct net_buf *buf, size_t len)
Prepare data to be added at the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters
  • buf – Buffer to update.
  • len – Number of bytes to add to the beginning.

Returns
  The new beginning of the buffer data.

static inline void *net_buf_push_mem(struct net_buf *buf, const void *mem, size_t len)
Copies the given number of bytes to the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters
  • buf – Buffer to update.
  • mem – Location of data to be added.
  • len – Length of data to be added.

Returns
  The new beginning of the buffer data.

static inline void net_buf_push_u8(struct net_buf *buf, uint8_t val)
Push 8-bit value to the beginning of the buffer.
Adds 8-bit value the beginning of the buffer.

Parameters
  • buf – Buffer to update.
  • val – 8-bit value to be pushed to the buffer.

static inline void net_buf_push_le16(struct net_buf *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.
Adds 16-bit value in little endian format to the beginning of the buffer.

Parameters
  • buf – Buffer to update.
  • val – 16-bit value to be pushed to the buffer.

static inline void net_buf_push_be16(struct net_buf *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.
Adds 16-bit value in big endian format to the beginning of the buffer.

Parameters
  • buf – Buffer to update.
  • val – 16-bit value to be pushed to the buffer.
static inline void net_buf_push_le24(struct net_buf *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.
	Add 24-bit value in little endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 24-bit value to be pushed to the buffer.

static inline void net_buf_push_be24(struct net_buf *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.
	Add 24-bit value in big endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 24-bit value to be pushed to the buffer.

static inline void net_buf_push_le32(struct net_buf *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.
	Add 32-bit value in little endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 32-bit value to be pushed to the buffer.

static inline void net_buf_push_be32(struct net_buf *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.
	Add 32-bit value in big endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 32-bit value to be pushed to the buffer.

static inline void net_buf_push_le48(struct net_buf *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.
	Add 48-bit value in little endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 48-bit value to be pushed to the buffer.

static inline void net_buf_push_be48(struct net_buf *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.
	Add 48-bit value in big endian format to the beginning of the buffer.

Parameters
- buf – Buffer to update.
- val – 48-bit value to be pushed to the buffer.

static inline void net_buf_push_le64(struct net_buf *buf, uint64_t val)
Push 64-bit value to the beginning of the buffer.
	Add 64-bit value in little endian format to the beginning of the buffer.

Parameters
• **buf** – Buffer to update.
• **val** – 64-bit value to be pushed to the buffer.

static inline void *net_buf_pull_mem(struct net_buf *buf, size_t len)
Remove data from the beginning of the buffer.
Removes data from the beginning of the buffer by modifying the data pointer and
buffer length.

Parameters
• **buf** – Buffer to update.
• **len** – Number of bytes to remove.

Returns
New beginning of the buffer data.

static inline uint8_t net_buf_pull_u8(struct net_buf *buf)
Remove a 8-bit value from the beginning of the buffer.
Same idea as with `net_buf_pull()`, but a helper for operating on 8-bit values.

Parameters
• **buf** – A valid pointer on a buffer.

Returns
The 8-bit removed value

static inline uint16_t net_buf_pull_le16(struct net_buf *buf)
Remove and convert 16 bits from the beginning of the buffer.
Same idea as with `net_buf_pull()`, but a helper for operating on 16-bit little endian data.

Parameters
• **buf** – A valid pointer on a buffer.

Returns
16-bit value converted from little endian to host endian.
static inline uint16_t net_buf_pull_be16(struct net_buf *buf)
    Remove and convert 16 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 16-bit big endian data.

    Parameters
    • buf – A valid pointer on a buffer.

    Returns
    16-bit value converted from big endian to host endian.

static inline uint32_t net_buf_pull_le24(struct net_buf *buf)
    Remove and convert 24 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 24-bit little endian data.

    Parameters
    • buf – A valid pointer on a buffer.

    Returns
    24-bit value converted from little endian to host endian.

static inline uint32_t net_buf_pull_be24(struct net_buf *buf)
    Remove and convert 24 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 24-bit big endian data.

    Parameters
    • buf – A valid pointer on a buffer.

    Returns
    24-bit value converted from big endian to host endian.

static inline uint32_t net_buf_pull_le32(struct net_buf *buf)
    Remove and convert 32 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 32-bit little endian data.

    Parameters
    • buf – A valid pointer on a buffer.

    Returns
    32-bit value converted from little endian to host endian.

static inline uint32_t net_buf_pull_be32(struct net_buf *buf)
    Remove and convert 32 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 32-bit big endian data.

    Parameters
    • buf – A valid pointer on a buffer.

    Returns
    32-bit value converted from big endian to host endian.

static inline uint64_t net_buf_pull_le48(struct net_buf *buf)
    Remove and convert 48 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 48-bit little endian data.

    Parameters
    • buf – A valid pointer on a buffer.

    Returns
    48-bit value converted from little endian to host endian.
static inline uint64_t net_buf_pull_be48(struct net_buf *buf)
    Remove and convert 48 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 48-bit big endian data.
    Parameters
    • buf – A valid pointer on a buffer
    Returns
    48-bit value converted from big endian to host endian.

static inline uint64_t net_buf_pull_le64(struct net_buf *buf)
    Remove and convert 64 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 64-bit little endian data.
    Parameters
    • buf – A valid pointer on a buffer.
    Returns
    64-bit value converted from little endian to host endian.

static inline uint64_t net_buf_pull_be64(struct net_buf *buf)
    Remove and convert 64 bits from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 64-bit big endian data.
    Parameters
    • buf – A valid pointer on a buffer
    Returns
    64-bit value converted from big endian to host endian.

static inline size_t net_buf_tailroom(struct net_buf *buf)
    Check buffer tailroom.
    Check how much free space there is at the end of the buffer.
    Parameters
    • buf – A valid pointer on a buffer
    Returns
    Number of bytes available at the end of the buffer.

static inline size_t net_buf_headroom(struct net_buf *buf)
    Check buffer headroom.
    Check how much free space there is in the beginning of the buffer.
    buf A valid pointer on a buffer
    Returns
    Number of bytes available in the beginning of the buffer.

static inline uint16_t net_buf_max_len(struct net_buf *buf)
    Check maximum net_buf::len value.
    This value is depending on the number of bytes being reserved as headroom.
    Parameters
    • buf – A valid pointer on a buffer
    Returns
    Number of bytes usable behind the net_buf::data pointer.
static inline uint8_t *net_buf_tail(struct net_buf *buf)
  Get the tail pointer for a buffer.
  Get a pointer to the end of the data in a buffer.

  Parameters
  • buf – Buffer.

  Returns
  Tail pointer for the buffer.

struct net_buf *net_buf_frag_last(struct net_buf *frags)
  Find the last fragment in the fragment list.

  Returns
  Pointer to last fragment in the list.

void net_buf_frag_insert(struct net_buf *parent, struct net_buf *frag)
  Insert a new fragment to a chain of bufs.
  Insert a new fragment into the buffer fragments list after the parent.
  Note: This function takes ownership of the fragment reference so the caller is not re-
  quired to unref.

  Parameters
  • parent – Parent buffer/fragment.
  • frag – Fragment to insert.

struct net_buf *net_buf_frag_add(struct net_buf *head, struct net_buf *frag)
  Add a new fragment to the end of a chain of bufs.
  Append a new fragment into the buffer fragments list.
  Note: This function takes ownership of the fragment reference so the caller is not re-
  quired to unref.

  Parameters
  • head – Head of the fragment chain.
  • frag – Fragment to add.

  Returns
  New head of the fragment chain. Either head (if head was non-NULL) or
  frag (if head was NULL).

struct net_buf *net_buf_frag_del(struct net_buf *parent, struct net_buf *frag)
  Delete existing fragment from a chain of bufs.

  Parameters
  • parent – Parent buffer/fragment, or NULL if there is no parent.
  • frag – Fragment to delete.

  Returns
  Pointer to the buffer following the fragment, or NULL if it had no further
  fragments.

size_t net_buf_linearize(void *dst, size_t dst_len, struct net_buf *src, size_t offset, size_t len)
  Copy bytes from net_buf chain starting at offset to linear buffer.
  Copy (extract) len bytes from src net_buf chain, starting from offset in it, to a linear
  buffer dst. Return number of bytes actually copied, which may be less than requested,
  if net_buf chain doesn't have enough data, or destination buffer is too small.
Parameters
- \texttt{dst} – Destination buffer
- \texttt{dst\_len} – Destination buffer length
- \texttt{src} – Source \texttt{net\_buf} chain
- \texttt{offset} – Starting offset to copy from
- \texttt{len} – Number of bytes to copy

Returns
number of bytes actually copied

\begin{verbatim}
size_t net_buf_append_bytes(struct net_buf *buf, size_t len, const void *value, 
k_timeout_t timeout, net_buf_allocator_cb allocate_cb, void *user_data)
\end{verbatim}

Append data to a list of \texttt{net\_buf}.
If there is not enough space in the \texttt{net\_buf} then more \texttt{net\_buf} will be added, unless there are no free \texttt{net\_buf} and timeout occurs. If not allocator is provided it attempts to allocate from the same pool as the original buffer.

Parameters
- \texttt{buf} – Network buffer.
- \texttt{len} – Total length of input data
- \texttt{value} – Data to be added
- \texttt{timeout} – Timeout is passed to the \texttt{net\_buf} allocator callback.
- \texttt{allocate\_cb} – When a new \texttt{net\_buf} is required, use this callback.
- \texttt{user\_data} – A user data pointer to be supplied to the allocate\_cb. This pointer is can be anything from a mem\_pool or a \texttt{net\_pkt}, the logic is left up to the allocate\_cb function.

Returns
Length of data actually added. This may be less than input length if other timeout than K\_FOREVER was used, and there were no free fragments in a pool to accommodate all data.

\begin{verbatim}
size_t net_buf_data_match(const struct net_buf *buf, size_t offset, const void *data, size_t len)
\end{verbatim}

Match data with a \texttt{net\_buf}'s content.

Compare data with a content of a \texttt{net\_buf}. Provide information about the number of bytes matching between both. If needed, traverse through multiple buffer fragments.

Parameters
- \texttt{buf} – Network buffer
- \texttt{offset} – Starting offset to compare from
- \texttt{data} – Data buffer for comparison
- \texttt{len} – Number of bytes to compare

Returns
The number of bytes compared before the first difference.

\begin{verbatim}
static inline struct net_buf *net_buf_skip(struct net_buf *buf, size_t len)
\end{verbatim}

Skip N number of bytes in a \texttt{net\_buf}.

Skip N number of bytes starting from fragment's offset. If the total length of data is placed in multiple fragments, this function will skip from all fragments until it reaches N number of bytes. Any fully skipped buffers are removed from the \texttt{net\_buf} list.
Parameters

- buf – Network buffer.
- len – Total length of data to be skipped.

Returns

Pointer to the fragment or NULL and pos is 0 after successful skip, NULL and pos is 0xffff otherwise.

static inline size_t net_buf_frags_len(struct net_buf *buf)
Calculate amount of bytes stored in fragments.

Calculates the total amount of data stored in the given buffer and the fragments linked to it.

Parameters

- buf – Buffer to start off with.

Returns

Number of bytes in the buffer and its fragments.

struct net_buf_simple
#include <buf.h> Simple network buffer representation.

This is a simpler variant of the net_buf object (in fact net_buf uses net_buf_simple internally). It doesn't provide any kind of reference counting, user data, dynamic allocation, or in general the ability to pass through kernel objects such as FIFOs.

The main use of this is for scenarios where the meta-data of the normal net_buf isn't needed and causes too much overhead. This could be e.g. when the buffer only needs to be allocated on the stack or when the access to and lifetime of the buffer is well controlled and constrained.

Public Members

uint8_t *data
Pointer to the start of data in the buffer.

uint16_t len
Length of the data behind the data pointer.
To determine the max length, use net_buf_simple_max_len(), not size!

uint16_t size
Amount of data that net_buf_simple::__buf can store.

struct net_buf_simple_state
#include <buf.h> Parsing state of a buffer.

This is used for temporarily storing the parsing state of a buffer while giving control of the parsing to a routine which we don’t control.

Public Members
uint16_t offset
    Offset of the data pointer from the beginning of the storage.

uint16_t len
    Length of data.

struct net_buf
    #include <buf.h> Network buffer representation.
    This struct is used to represent network buffers. Such buffers are normally defined
    through the NET_BUF_POOL_\*_DEFINE() APIs and allocated using the net_buf_alloc() API.

Public Members

    sys_snode_t node
        Allow placing the buffer into sys_slist_t.

    struct net_buf *frags
        Fragments associated with this buffer.

    uint8_t ref
        Reference count.

    uint8_t flags
        Bit-field of buffer flags.

    uint8_t pool_id
        Where the buffer should go when freed up.

    uint8_t *data
        Pointer to the start of data in the buffer.

    uint16_t len
        Length of the data behind the data pointer.

    uint16_t size
        Amount of data that this buffer can store.

    uint8_t user_data[]
        System metadata for this buffer.

struct net_buf_data_cb
    #include <buf.h>

struct net_buf_data_alloc
    #include <buf.h>
struct net_buf_pool

#include <buf.h> Network buffer pool representation.
This struct is used to represent a pool of network buffers.

Public Members

struct k_lifo free
   LIFO to place the buffer into when free.

const uint16_t buf_count
   Number of buffers in pool.

uint16_t uninit_count
   Number of uninitialized buffers.

void (*const destroy)(struct net_buf *buf)
   Optional destroy callback when buffer is freed.

const struct net_buf_data_alloc *alloc
   Data allocation handlers.

Packet Management

• API Reference

Overview Network packets are the main data the networking stack manipulates. Such data is represented through the net_pkt structure which provides a means to hold the packet, write and read it, as well as necessary metadata for the core to hold important information. Such an object is called net_pkt in this document.

The data structure and the whole API around it are defined in include/zephyr/net/net_pkt.h.
**Architectural notes**  There are two network packets flows within the stack, TX for the transmission path, and RX for the reception one. In both paths, each net_pkt is written and read from the beginning to the end, or more specifically from the headers to the payload.

### Memory management

**Allocation**  All net_pkt objects come from a pre-defined pool of struct net_pkt. Such pool is defined via

```c
NET_PKT_SLAB_DEFINE(name, count)
```

Note, however, one will rarely have to use it, as the core provides already two pools, one for the TX path and one for the RX path.

Allocating a raw net_pkt can be done through:

```c
pkt = net_pkt_alloc(timeout);
```

However, by its nature, a raw net_pkt is useless without a buffer and needs various metadata information to become relevant as well. It requires at least to get the network interface it is meant to be sent through or through which it was received. As this is a very common operation, a helper exist:

```c
pkt = net_pkt_alloc_on_iface(iface, timeout);
```

A more complete allocator exists, where both the net_pkt and its buffer can be allocated at once:

```c
pkt = net_pkt_alloc_with_buffer(iface, size, family, proto, timeout);
```

See below how the buffer is allocated.

**Buffer allocation**  The net_pkt object does not define its own buffer, but instead uses an existing object for this: net_buf. (See Network Buffer for more information). However, it mostly hides the usage of such a buffer because net_pkt brings network awareness to buffer allocation and, as we will see later, its operation too.

To allocate a buffer, a net_pkt needs to have at least its network interface set. This works if the family of the packet is unknown at the time of buffer allocation. Then one could do:

```c
net_pkt_alloc_buffer(pkt, size, proto, timeout);
```

Where proto could be 0 if unknown (there is no IPPROTO_UNSPEC).

As seen previously, the net_pkt and its buffer can be allocated at once via `net_pkt_alloc_with_buffer()`. It is actually the most widely used allocator.

The network interface, the family, and the protocol of the packet are used by the buffer allocation to determine if the requested size can be allocated. Indeed, the allocator will use the network interface to know the MTU and then the family and protocol for the headers space (if only these 2 are specified). If the whole fits within the MTU, the allocated space will be of the requested size plus, eventually, the headers space. If there is insufficient MTU space, the requested size will be shrunk so the possible headers space and new size will fit within the MTU.

For instance, on an Ethernet network interface, with an MTU of 1500 bytes:

```c
pkt = net_pkt_alloc_with_buffer(iface, 800, AF_INET4, IPPROTO_UDP, K_FOREVER);
```

will successfully allocate 800 + 20 + 8 bytes of buffer for the new net_pkt where:
pkt = net_pkt_alloc_with_buffer(iface, 1600, AF_INET4, IPPROTO_UDP, K_FOREVER);

will successfully allocate 1500 bytes, and where 20 + 8 bytes (IPv4 + UDP headers) will not be used for the payload.

On the receiving side, when the family and protocol are not known:

 pkt = net_pkt_rx_alloc_with_buffer(iface, 800, AF_UNSPEC, 0, K_FOREVER);

will allocate 800 bytes and no extra header space. But a:

 pkt = net_pkt_rx_alloc_with_buffer(iface, 1600, AF_UNSPEC, 0, K_FOREVER);

will allocate 1514 bytes, the MTU + Ethernet header space.

One can increase the amount of buffer space allocated by calling net_pkt_alloc_buffer(), as it will take into account the existing buffer. It will also account for the header space if net_pkt's family is a valid one, as well as the proto parameter. In that case, the newly allocated buffer space will be appended to the existing one, and not inserted in the front. Note however such a use case is rather limited. Usually, one should know from the start how much size should be requested.

**Deallocation**  Each net_pkt is reference counted. At allocation, the reference is set to 1. The reference count can be incremented with net_pkt_ref() or decremented with net_pkt_unref(). When the count drops to zero the buffer is also un-referenced and net_pkt is automatically placed back into the free net_pkt_slabs.

If net_pkt's buffer is needed even after net_pkt deallocation, one will need to reference once more all the chain of net_buf before calling last net_pkt_unref. See Network Buffer for more information.

**Operations**  There are two ways to access the net_pkt buffer, explained in the following sections: basic read/write access and data access, the latter being the preferred way.

**Read and Write access**  As said earlier, though net_pkt uses net_buf for its buffer, it provides its own API to access it. Indeed, a network packet might be scattered over a chain of net_buf objects, the functions provided by net_buf are then limited for such case. Instead, net_pkt provides functions which hide all the complexity of potential non-contiguous access.

Data movement into the buffer is made through a cursor maintained within each net_pkt. All read/write operations affect this cursor. Note as well that read or write functions are strict on their length parameters: if it cannot r/w the given length it will fail. Length is not interpreted as an upper limit, it is instead the exact amount of data that must be read or written.

As there are two paths, TX and RX, there are two access modes: write and overwrite. This might sound a bit unusual, but is in fact simple and provides flexibility.

In write mode, whatever is written in the buffer affects the length of actual data present in the buffer. Buffer length should not be confused with the buffer size which is a limit any mode cannot pass. In overwrite mode then, whatever is written must happen on valid data, and will not affect the buffer length. By default, a newly allocated net_pkt is on write mode, and its cursor points to the beginning of its buffer.

Let's see now, step by step, the functions and how they behave depending on the mode.

When freshly allocated with a buffer of 500 bytes, a net_pkt has 0 length, which means no valid data is in its buffer. One could verify this by:

 len = net_pkt_get_len(pkt);
Now, let's write 8 bytes:

```c
net_pkt_write(pkt, data, 8);
```

The buffer length is now 8 bytes. There are various helpers to write a byte, or big endian uint16_t, uint32_t.

```c
net_pkt_write_u8(pkt, &foo);
net_pkt_write_be16(pkt, &ba);
net_pkt_write_be32(pkt, &bar);
```

Logically, net_pkt's length is now 15. But if we try to read at this point, it will fail because there is nothing to read at the cursor where we are at in the net_pkt. It is possible, while in write mode, to read what has been already written by resetting the cursor of the net_pkt. For instance:

```c
net_pkt_cursor_init(pkt);
net_pkt_read(pkt, data, 15);
```

This will reset the cursor of the pkt to the beginning of the buffer and then let you read the actual 15 bytes present. The cursor is then again pointing at the end of the buffer.

To set a large area with the same byte, a memset function is provided:

```c
net_pkt_memset(pkt, 0, 5);
```

Our net_pkt has now a length of 20 bytes.

Switching between modes can be achieved via `net_pkt_set_overwrite()` function. It is possible to switch mode back and forth at any time. The net_pkt will be set to overwrite and its cursor reset:

```c
net_pkt_set_overwrite(pkt, true);
net_pkt_cursor_init(pkt);
```

Now the same operators can be used, but it will be limited to the existing data in the buffer, i.e. 20 bytes.

If it is necessary to know how much space is available in the net_pkt call:

```c
net_pkt_available_buffer(pkt);
```

Or, if headers space needs to be accounted for, call:

```c
net_pkt_available_payload_buffer(pkt, proto);
```

If you want to place the cursor at a known position use the function `net_pkt_skip()`. For example, to go after the IP header, use:

```c
net_pkt_cursor_init(pkt);
net_pkt_skip(pkt, net_pkt_ip_header_len(pkt));
```

**Data access** Though the API shown previously is rather simple, it involves always copying things to and from the net_pkt buffer. In many occasions, it is more relevant to access the information stored in the buffer contiguously, especially with network packets which embed headers. These headers are, most of the time, a known fixed set of bytes. It is then more natural to have a structure representing a certain type of header. In addition to this, if it is known the header size appears in a contiguous area of the buffer, it will be way more efficient to cast the actual position in the buffer to the type of header. Either for reading or writing the fields of such header, accessing it directly will save memory.

Net pkt comes with a dedicated API for this, built on top of the previously described API. It is able to handle both contiguous and non-contiguous access transparently.
There are two macros used to define a data access descriptor: `NET_PKT_DATA_ACCESS_DEFINE` when it is not possible to tell if the data will be in a contiguous area, and `NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE` when it is guaranteed the data is in a contiguous area.

Let's take the example of IP and UDP. Both IPv4 and IPv6 headers are always found at the beginning of the packet and are small enough to fit in a net_buf of 128 bytes (for instance, though 64 bytes could be chosen).

```c
NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE(ipv4_access, struct net_ipv4_hdr);
struct net_ipv4_hdr *ipv4_hdr;
ipv4_hdr = (struct net_ipv4_hdr *)net_pkt_get_data(pkt, &ipv4_access);
```

It would be the same for struct `net_ipv4_hdr`. For a UDP header it is likely not to be in a contiguous area in IPv6 for instance so:

```c
NET_PKT_DATA_ACCESS_DEFINE(udp_access, struct net_udp_hdr);
struct net_udp_hdr *udp_hdr;
udp_hdr = (struct net_udp_hdr *)net_pkt_get_data(pkt, &udp_access);
```

At this point, the cursor of the net_pkt points at the beginning of the requested data. On the RX path, these headers will be read but not modified so to proceed further the cursor needs to advance past the data. There is a function dedicated for this:

```c
net_pkt_acknowledge_data(pkt, &ipv4_access);
```

On the TX path, however, the header fields have been modified. In such a case:

```c
net_pkt_set_data(pkt, &ipv4_access);
```

If the data are in a contiguous area, it will advance the cursor relevantly. If not, it will write the data and the cursor will be updated. Note that `net_pkt_set_data()` could be used in the RX path as well, but it is slightly faster to use `net_pkt_acknowledge_data()` as this one does not care about contiguity at all, it just advances the cursor via `net_pkt_skip()` directly.

**API Reference**

**Related code samples**

**Dumb HTTP server**

Implement a simple, portable, HTTP server using BSD sockets.

**Dumb HTTP server (multi-threaded)**

Implement a simple HTTP server supporting simultaneous connections using BSD sockets.

**group net_pkt**

Network packet management library.

**Defines**

`NET_PKT_SLAB_DEFINE(name, count)`

Create a `net_pkt` slab.

A `net_pkt` slab is used to store meta-information about network packets. It must be coupled with a data fragment pool (`NET_PKT_DATA_POOL_DEFINE`) used to store the actual packet data. The macro can be used by an application to define additional custom per-context TX packet slabs (see `net_context_setup_pools()`).
Parameters

- **name** – Name of the slab.
- **count** – Number of net_pkt in this slab.

\[
{\text{NET_PKT_TX_SLAB_DEFINE}}(\text{name, count})
\]

\[
{\text{NET_PKT_DATA_POOL_DEFINE}}(\text{name, count})
\]

Create a data fragment net_buf pool.

A net_buf pool is used to store actual data for network packets. It must be coupled with a net_pkt slab (NET_PKT_SLAB_DEFINE) used to store the packet meta-information. The macro can be used by an application to define additional custom per-context TX packet pools (see net_context_setup_pools()).

Parameters

- **name** – Name of the pool.
- **count** – Number of net_buf in this pool.

\[
{\text{net_pkt_print_frags}}(\text{pkt})
\]

Print fragment list and the fragment sizes.

Only available if debugging is activated.

Parameters

- **pkt** – Network pkt.

\[
{\text{NET_PKT_DATA_ACCESS_DEFINE}}(_{\text{name, _type}})
\]

\[
{\text{NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE}}(_{\text{name, _type}})
\]

Functions

\[
\text{struct net_buf} \ast \text{net_pkt_get_reserve_rx_data}(\text{size_t min_len, k_timeout_t timeout})
\]

Get RX DATA buffer from pool.

Normally you should use net_pkt_get_frag() instead.

Normally this version is not useful for applications but is mainly used by network fragmentation code.

Parameters

- **min_len** – Minimum length of the requested fragment.
- **timeout** – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns

Network buffer if successful, NULL otherwise.

\[
\text{struct net_buf} \ast \text{net_pkt_get_reserve_tx_data}(\text{size_t min_len, k_timeout_t timeout})
\]

Get TX DATA buffer from pool.

Normally you should use net_pkt_get_frag() instead.

Normally this version is not useful for applications but is mainly used by network fragmentation code.

Parameters

- **min_len** – Minimum length of the requested fragment.
timeout – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns
Network buffer if successful, NULL otherwise.

struct net_buf *net_pkt_get_frag(struct net_pkt *pkt, size_t min_len, k_timeout_t timeout)

Get a data fragment that might be from user specific buffer pool or from global DATA pool.

Parameters
• pkt – Network packet.
• min_len – Minimum length of the requested fragment.
• timeout – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns
Network buffer if successful, NULL otherwise.

void net_pkt_unref(struct net_pkt *pkt)

Place packet back into the available packets slab.

Releases the packet to other use. This needs to be called by application after it has finished with the packet.

Parameters
• pkt – Network packet to release.

struct net_pkt *net_pkt_ref(struct net_pkt *pkt)

Increase the packet ref count.

Mark the packet to be used still.

Parameters
• pkt – Network packet to ref.

Returns
Network packet if successful, NULL otherwise.

struct net_buf *net_pkt_frag_ref(struct net_buf *frag)

Increase the packet fragment ref count.

Mark the fragment to be used still.

Parameters
• frag – Network fragment to ref.

Returns
a pointer on the referenced Network fragment.

void net_pkt_frag_unref(struct net_buf *frag)

Decrease the packet fragment ref count.

Parameters
• frag – Network fragment to unreff.
struct net_buf *net_pkt_frag_del(struct net_pkt *pkt, struct net_buf *parent, struct net_buf *frag)

Delete existing fragment from a packet.

Parameters

• pkt – Network packet from which frag belongs to.
• parent – parent fragment of frag, or NULL if none.
• frag – Fragment to delete.

Returns

Pointer to the following fragment, or NULL if it had no further fragments.

void net_pkt_frag_add(struct net_pkt *pkt, struct net_buf *frag)

Add a fragment to a packet at the end of its fragment list.

Parameters

• pkt – pkt Network packet where to add the fragment
• frag – Fragment to add

void net_pkt_frag_insert(struct net_pkt *pkt, struct net_buf *frag)

Insert a fragment to a packet at the beginning of its fragment list.

Parameters

• pkt – pkt Network packet where to insert the fragment
• frag – Fragment to insert

void net_pkt_compact(struct net_pkt *pkt)

Compact the fragment list of a packet.

After this there is no more any free space in individual fragments.

Parameters

• pkt – Network packet.

void net_pkt_get_info(struct k_mem_slab **rx, struct k_mem_slab **tx, struct net_buf_pool **rx_data, struct net_buf_pool **tx_data)

Get information about predefined RX, TX and DATA pools.

Parameters

• rx – Pointer to RX pool is returned.
• tx – Pointer to TX pool is returned.
• rx_data – Pointer to RX DATA pool is returned.
• tx_data – Pointer to TX DATA pool is returned.

struct net_pkt *net_pkt_alloc(k_timeout_t timeout)

Allocate an initialized net_pkt.

for the time being, 2 pools are used. One for TX and one for RX. This allocator has to be used for TX.

Parameters

• timeout – Maximum time to wait for an allocation.

Returns

a pointer to a newly allocated net_pkt on success, NULL otherwise.
struct net_pkt *net_pkt_alloc_from_slab(struct k_mem_slab *slab, k_timeout_t timeout)
Allocate an initialized \texttt{net_pkt} from a specific slab.

Unlike \texttt{net_pkt_alloc()} which uses core slabs, this one will use an external slab (see \texttt{NET_PKT_SLAB_DEFINE()}). Do not use it unless you know what you are doing. Basically, only \texttt{net_context} should be using this, in order to allocate packet and then buffer on its local slab/pool (if any).

**Parameters**

- \texttt{slab} – The slab to use for allocating the packet
- \texttt{timeout} – Maximum time to wait for an allocation.

**Returns**

A pointer to a newly allocated \texttt{net_pkt} on success, NULL otherwise.

struct net_pkt *net_pkt_alloc_rx(k_timeout_t timeout)
Allocate an initialized \texttt{net_pkt} for RX.

For the time being, 2 pools are used. One for TX and one for RX. This allocator has to be used for RX.

**Parameters**

- \texttt{timeout} – Maximum time to wait for an allocation.

**Returns**

A pointer to a newly allocated \texttt{net_pkt} on success, NULL otherwise.

struct net_pkt *net_pkt_alloc_on_iface(struct net_if *iface, k_timeout_t timeout)
Allocate a network packet for a specific network interface.

**Parameters**

- \texttt{iface} – The network interface the packet is supposed to go through.
- \texttt{timeout} – Maximum time to wait for an allocation.

**Returns**

A pointer to a newly allocated \texttt{net_pkt} on success, NULL otherwise.

struct net_pkt *net_pkt_alloc_on_iface_rx(struct net_if *iface, k_timeout_t timeout)
int net_pkt_alloc_buffer(struct net_pkt *pkt, size_t size, enum net_ip_protocol proto, k_timeout_t timeout)
Allocate buffer for a \texttt{net_pkt}.

Such allocator will take into account space necessary for headers, MTU, and existing buffer (if any). Beware that, due to all these criteria, the allocated size might be smaller/bigger than requested one.

**Parameters**

- \texttt{pkt} – The network packet requiring buffer to be allocated.
- \texttt{size} – The size of buffer being requested.
- \texttt{proto} – The IP protocol type (can be 0 for none).
- \texttt{timeout} – Maximum time to wait for an allocation.

**Returns**

0 on success, negative errno code otherwise.

int net_pkt_alloc_buffer_raw(struct net_pkt *pkt, size_t size, k_timeout_t timeout)
Allocate buffer for a \texttt{net_pkt}, of specified size, w/o any additional preconditions.

The actual buffer size may be larger than requested one if fixed size buffers are in use.
Parameters

- `pkt` – The network packet requiring buffer to be allocated.
- `size` – The size of buffer being requested.
- `timeout` – Maximum time to wait for an allocation.

Returns

0 on success, negative errno code otherwise.

```c
struct net_pkt  *net_pkt_alloc_with_buffer(struct net_if  *iface, size_t size,
                                          sa_family_t family, enum net_ip_protocol proto,
                                          k_timeout_t timeout)
```

Allocate a network packet and buffer at once.

Parameters

- `iface` – The network interface the packet is supposed to go through.
- `size` – The size of buffer.
- `family` – The family to which the packet belongs.
- `proto` – The IP protocol type (can be 0 for none).
- `timeout` – Maximum time to wait for an allocation.

Returns

A pointer to a newly allocated `net_pkt` on success, NULL otherwise.

```c
struct net_pkt  *net_pkt_rx_alloc_with_buffer(struct net_if  *iface, size_t size,
                                             sa_family_t family, enum net_ip_protocol proto,
                                             k_timeout_t timeout)
```

void `net_pkt_append_buffer(struct net_pkt  *pkt, struct net_buf  *buffer)`

Append a buffer in packet.

Parameters

- `pkt` – Network packet where to append the buffer
- `buffer` – Buffer to append

```c
size_t net_pkt_available_buffer(struct net_pkt  *pkt)
```

Get available buffer space from a `pkt`.

Note: Reserved bytes (headroom) in any of the fragments are not considered to be available.

```c
size_t net_pkt_available_payload_buffer(struct net_pkt  *pkt, enum net_ip_protocol proto)
```

Get available buffer space for payload from a `pkt`.

Unlike `net_pkt_available_buffer()`, this will take into account the headers space.
Note: Reserved bytes (headroom) in any of the fragments are not considered to be available.

Parameters

- `pkt` – The `net_pkt` which payload buffer availability should be evaluated
- `proto` – The IP protocol type (can be 0 for none).

Returns

the amount of buffer available for payload

```c
void net_pkt_trim_buffer(struct net_pkt *pkt)
```
Trim `net_pkt` buffer.
This will basically check for unused buffers and deallocate them relevantly

Parameters

- `pkt` – The `net_pkt` which buffer will be trimmed

```c
int net_pkt_remove_tail(struct net_pkt *pkt, size_t length)
```
Remove `length` bytes from tail of packet.
This function does not take packet cursor into account. It is a helper to remove unneeded bytes from tail of packet (like appended CRC). It takes care of buffer deallocation if removed bytes span whole buffer(s).

Parameters

- `pkt` – Network packet
- `length` – Number of bytes to be removed

Return values

- 0 – On success.
- -EINVAL – If packet length is shorter than `length`.

```c
void net_pkt_cursor_init(struct net_pkt *pkt)
```
Initialize `net_pkt` cursor.
This will initialize the `net_pkt` cursor from its buffer.

Parameters

- `pkt` – The `net_pkt` whose cursor is going to be initialized

```c
static inline void net_pkt_cursor_backup(struct net_pkt *pkt, struct net_pkt_cursor *backup)
```
Backup `net_pkt` cursor.

Parameters

- `pkt` – The `net_pkt` whose cursor is going to be backed up
- `backup` – The cursor where to backup `net_pkt` cursor

```c
static inline void net_pkt_cursor_restore(struct net_pkt *pkt, struct net_pkt_cursor *backup)
```
Restore `net_pkt` cursor from a backup.

Parameters

- `pkt` – The `net_pkt` whose cursor is going to be restored
- `backup` – The cursor from where to restore `net_pkt` cursor
static inline void *net_pkt_cursor_get_pos(struct net_pkt *pkt)
    Returns current position of the cursor.

    Parameters
    • pkt – The net_pkt whose cursor position is going to be returned

    Returns
    cursor’s position

int net_pkt_skip(struct net_pkt *pkt, size_t length)
    Skip some data from a net_pkt.
    net_pkt’s cursor should be properly initialized Cursor position will be updated after
    the operation. Depending on the value of pkt->overwrite bit, this function will af-
    fect the buffer length or not. If it’s true, it will advance the cursor to the requested
    length. If it’s false, it will do the same but if the cursor was already also at the end of
    existing data, it will increment the buffer length. So in this case, its behavior is just
    like net_pkt_write or net_pkt_memset, difference being that it will not affect the buffer
    content itself (which may be just garbage then).

    Parameters
    • pkt – The net_pkt whose cursor will be updated to skip given amount of
          data from the buffer.
    • length – Amount of data to skip in the buffer

    Returns
    0 in success, negative errno code otherwise.

int net_pkt_memset(struct net_pkt *pkt, int byte, size_t length)
    Memset some data in a net_pkt.
    net_pkt’s cursor should be properly initialized and, if needed, positioned using
    net_pkt_skip. Cursor position will be updated after the operation.

    Parameters
    • pkt – The net_pkt whose buffer to fill starting at the current cursor posi-
          tion.
    • byte – The byte to write in memory
    • length – Amount of data to memset with given byte

    Returns
    0 in success, negative errno code otherwise.

int net_pkt_copy(struct net_pkt *pkt_dst, struct net_pkt *pkt_src, size_t length)
    Copy data from a packet into another one.
    Both net_pkt cursors should be properly initialized and, if needed, positioned using
    net_pkt_skip. The cursors will be updated after the operation.

    Parameters
    • pkt_dst – Destination network packet.
    • pkt_src – Source network packet.
    • length – Length of data to be copied.

    Returns
    0 on success, negative errno code otherwise.
struct *net_pkt_clone(struct *pkt, k_timeout_t timeout)
    Clone pkt and its buffer.
    The cloned packet will be allocated on the same pool as the original one.

Parameters
    • pkt – Original pkt to be cloned
    • timeout – Timeout to wait for free buffer

Returns
    NULL if error, cloned packet otherwise.

struct *net_pkt_rx_clone(struct *pkt, k_timeout_t timeout)
    Clone pkt and its buffer.
    The cloned packet will be allocated on the RX packet poll.

Parameters
    • pkt – Original pkt to be cloned
    • timeout – Timeout to wait for free buffer

Returns
    NULL if error, cloned packet otherwise.

struct *net_pkt_shallow_clone(struct *pkt, k_timeout_t timeout)
    Clone pkt and increase the refcount of its buffer.

Parameters
    • pkt – Original pkt to be shallow cloned
    • timeout – Timeout to wait for free packet

Returns
    NULL if error, cloned packet otherwise.

int net_pkt_read(struct *pkt, void *data, size_t length)
    Read some data from a net_pkt.
    net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
    • pkt – The network packet from where to read some data
    • data – The destination buffer where to copy the data
    • length – The amount of data to copy

Returns
    0 on success, negative errno code otherwise.

static inline int net_pkt_read_u8(struct *pkt, uint8_t *data)

int net_pkt_read_be16(struct *pkt, uint16_t *data)
    Read uint16_t big endian data from a net_pkt.
    net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
    • pkt – The network packet from where to read
    • data – The destination uint16_t where to copy the data
Returns
0 on success, negative errno code otherwise.

int net_pkt_read_le16(struct net_pkt *pkt, uint16_t *data)
Read uint16_t little endian data from a net_pkt.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to read
• data – The destination uint16_t where to copy the data

Returns
0 on success, negative errno code otherwise.

int net_pkt_read_be32(struct net_pkt *pkt, uint32_t *data)
Read uint32_t big endian data from a net_pkt.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to read
• data – The destination uint32_t where to copy the data

Returns
0 on success, negative errno code otherwise.

int net_pkt_write(struct net_pkt *pkt, const void *data, size_t length)
Write data into a net_pkt.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet where to write
• data – Data to be written
• length – Length of the data to be written

Returns
0 on success, negative errno code otherwise.

static inline int net_pkt_write_u8(struct net_pkt *pkt, uint8_t data)
static inline int net_pkt_write_be16(struct net_pkt *pkt, uint16_t data)
static inline int net_pkt_write_be32(struct net_pkt *pkt, uint32_t data)
static inline int net_pkt_write_le32(struct net_pkt *pkt, uint32_t data)
static inline int net_pkt_write_le16(struct net_pkt *pkt, uint16_t data)

size_t net_pkt_remaining_data(struct net_pkt *pkt)
Get the amount of data which can be read from current cursor position.

Parameters
• pkt – Network packet

Returns
Amount of data which can be read from current pkt cursor
int net_pkt_update_length(struct net pkt *pkt, size_t length)
Update the overall length of a packet.

Unlike net pkt pull() below, this does not take packet cursor into account. It's mainly
a helper dedicated for ipv4 and ipv6 input functions. It shrinks the overall length by
given parameter.

Parameters

• pkt – Network packet
• length – The new length of the packet

Returns

0 on success, negative errno code otherwise.

int net_pkt_pull(struct net pkt *pkt, size_t length)
Remove data from the packet at current location.

net pkt's cursor should be properly initialized and, eventually, properly positioned us-
ing net_pkt_skip/read/write. Note that net pkt's cursor is reset by this function.

Parameters

• pkt – Network packet
• length – Number of bytes to be removed

Returns

0 on success, negative errno code otherwise.

uint16_t net_pkt_get_current_offset(struct net pkt *pkt)
Get the actual offset in the packet from its cursor.

Parameters

• pkt – Network packet.

Returns

a valid offset on success, 0 otherwise as there is nothing that can be done
to evaluate the offset.

bool net_pkt_is_contiguous(struct net pkt *pkt, size_t size)
Check if a data size could fit contiguously.

net pkt's cursor should be properly initialized and, if needed, positioned using
net_pkt_skip.

Parameters

• pkt – Network packet.
• size – The size to check for contiguity

Returns

ture if that is the case, false otherwise.

size_t net_pkt_get_contiguous_len(struct net pkt *pkt)
Get the contiguous buffer space.

Parameters

• pkt – Network packet

Returns

The available contiguous buffer space in bytes starting from the current
cursor position. 0 in case of an error.
void *net_pkt_get_data(struct net_pkt *pkt, struct net_pkt_data_access *access)

Get data from a network packet in a contiguous way.

net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Unlike other functions, cursor position will not be updated after the operation.

Parameters

• pkt – The network packet from where to get the data.
• access – A pointer to a valid net_pkt_data_access describing the data to get in a contiguous way.

Returns

a pointer to the requested contiguous data, NULL otherwise.

int net_pkt_set_data(struct net_pkt *pkt, struct net_pkt_data_access *access)

Set contiguous data into a network packet.

net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

• pkt – The network packet to where the data should be set.
• access – A pointer to a valid net_pkt_data_access describing the data to set.

Returns

0 on success, a negative errno otherwise.

static inline int net_pkt_acknowledge_data(struct net_pkt *pkt, struct net_pkt_data_access *access)

Acknowledge previously contiguous data taken from a network packet Packet needs to be set to overwrite mode.

struct net_pkt_cursor

#include <net_pkt.h>

Public Members

struct net_buf *buf

Current net_buf pointer by the cursor.

uint8_t *pos

Current position in the data buffer of the net_buf.

struct net_pkt

#include <net_pkt.h> Network packet.

Note that if you add new fields into net_pkt, remember to update net_pkt_clone() function.

- **API Reference**

**Overview**  Virtual LAN (VLAN) is a partitioned and isolated computer network at the data link layer (OSI layer 2). For ethernet network this refers to IEEE 802.1Q

In Zephyr, each individual VLAN is modeled as a virtual network interface. This means that there is an ethernet network interface that corresponds to a real physical ethernet port in the system. A virtual network interface is created for each VLAN, and this virtual network interface connects to the real network interface. This is similar to how Linux implements VLANs. The `eth0` is the real network interface and `vlan0` is a virtual network interface that is run on top of `eth0`.

VLAN support must be enabled at compile time by setting option `CONFIG_NET_VLAN` and `CONFIG_NET_VLAN_COUNT` to reflect how many network interfaces there will be in the system. For example, if there is one network interface without VLAN support, and two with VLAN support, the `CONFIG_NET_VLAN_COUNT` option should be set to 3.
Even if VLAN is enabled in a prj.conf file, the VLAN needs to be activated at runtime by the application. The VLAN API provides a `net_eth_vlan_enable()` function to do that. The application needs to give the network interface and desired VLAN tag as a parameter to that function. The VLAN tagging for a given network interface can be disabled by a `net_eth_vlan_disable()` function. The application needs to configure the VLAN network interface itself, such as setting the IP address, etc.

See also the VLAN sample application for API usage example. The source code for that sample application can be found at `samples/net/vlan`.

The net-shell module contains `net_vlan add` and `net_vlan del` commands that can be used to enable or disable VLAN tags for a given network interface.

See the IEEE 802.1Q spec for more information about ethernet VLANs.

---

### API Reference

### Related code samples

**Virtual LAN**

Setup two virtual LAN networks and use net-shell to view the networks’ settings.

```c

```
Returns
Priority code point.

static inline uint16_t net_eth_vlan_set_vid(uint16_t tci, uint16_t vid)
Set VLAN identifier to TCI.

Parameters
• tci – VLAN tag control information.
• vid – VLAN identifier.

Returns
New TCI value.

static inline uint16_t net_eth_vlan_set_dei(uint16_t tci, bool dei)
Set Drop Eligible Indicator to TCI.

Parameters
• tci – VLAN tag control information.
• dei – Drop eligible indicator.

Returns
New TCI value.

static inline uint16_t net_eth_vlan_set_pcp(uint16_t tci, uint8_t pcp)
Set Priority Code Point to TCI.

Parameters
• tci – VLAN tag control information.
• pcp – Priority code point.

Returns
New TCI value.

Link Layer Discovery Protocol

Overview
The Link Layer Discovery Protocol (LLDP) is a vendor-neutral link layer protocol used by network devices for advertising their identity, capabilities, and neighbors on a wired Ethernet network.

For more information, see this LLDP Wikipedia article.

API Reference

Related code samples

Link Layer Discovery Protocol (LLDP)
Enable LLDP support and setup VLANs.

group lldp
LLDP definitions and helpers.
Defines

```c
net_lldp_set_lldpdu(iface)
```
Set LLDP protocol data unit (LLDPDU) for the network interface.

**Parameters**
- `iface` – Network interface

**Returns**
- `<0 if error, index in lldp array if iface is found there`

```c
net_lldp_unset_lldpdu(iface)
```
Unset LLDP protocol data unit (LLDPDU) for the network interface.

**Parameters**
- `iface` – Network interface

Typedefs

```c
typedef enum net_verdict (*net_lldp_recv_cb_t)(struct net_if *iface, struct net_pkt *pkt)

LLDP Receive packet callback.
```
Callback gets called upon receiving packet. It is responsible for freeing packet or indicating to the stack that it needs to free packet by returning correct net_verdict.

**Returns:**
- `NET_DROP`, if packet was invalid, rejected or we want the stack to free it. In this case the core stack will free the packet.
- `NET_OK`, if the packet was accepted, in this case the ownership of the `net_pkt` goes to callback and core network stack will forget it.

Enums

```c
enum net_lldp_tlv_type
```
TLV Types.
Please refer to table 8-1 from IEEE 802.1AB standard.

**Values:**
- `LLDP_TLV_END_LLDPDU = 0`
  End Of LLDPDU (optional)
- `LLDP_TLV_CHASSIS_ID = 1`
  Chassis ID (mandatory)
- `LLDP_TLV_PORT_ID = 2`
  Port ID (mandatory)
- `LLDP_TLV_TTL = 3`
  Time To Live (mandatory)
enumerator LLDP_TLV_PORT_DESC = 4
Port Description (optional)

enumerator LLDP_TLV_SYSTEM_NAME = 5
System Name (optional)

enumerator LLDP_TLV_SYSTEM_DESC = 6
System Description (optional)

enumerator LLDP_TLV_SYSTEM_CAPABILITIES = 7
System Capability (optional)

enumerator LLDP_TLV_MANAGEMENT_ADDR = 8
Management Address (optional)

enumerator LLDP_TLV_ORG_SPECIFIC = 127
Org specific TLVs (optional)

Functions

int net_lldp_config(struct net_if *iface, const struct net_lldpdu *lldpdu)
Set the LLDP data unit for a network interface.

Parameters
• iface – Network interface
• lldpdu – LLDP data unit struct

Returns
0 if ok, <0 if error

int net_lldp_config_optional(struct net_if *iface, const uint8_t *tlv, size_t len)
Set the Optional LLDP TLVs for a network interface.

Parameters
• iface – Network interface
• tlv – LLDP optional TLVs following mandatory part
• len – Length of the optional TLVs

Returns
0 if ok, <0 if error

void net_lldp_init(void)
Initialize LLDP engine.

int net_lldp_register_callback(struct net_if *iface, net_lldp_recv_cb_t cb)
Register LLDP Rx callback function.

Parameters
• iface – Network interface
• cb – Callback function

Returns
0 if ok, <0 if error
enum net_verdict net_lldp_recv(struct net_if *iface, struct net_pkt *pkt)
    Parse LLDP packet.

    Parameters
    • iface – Network interface
    • pkt – Network packet

    Returns
    Return the policy for network buffer

struct net_lldp_chassis_tlv
    #include <lldp.h> Chassis ID TLV, see chapter 8.5.2 in IEEE 802.1AB.

    Public Members

    uint16_t type_length
        7 bits for type, 9 bits for length

    uint8_t subtype
        ID subtype.

    uint8_t (*value)[NET_LLDP_CHASSIS_ID_VALUE_LEN]
        Chassis ID value.

struct net_lldp_port_tlv
    #include <lldp.h> Port ID TLV, see chapter 8.5.3 in IEEE 802.1AB.

    Public Members

    uint16_t type_length
        7 bits for type, 9 bits for length

    uint8_t subtype
        ID subtype.

    uint8_t (*value)[NET_LLDP_PORT_ID_VALUE_LEN]
        Port ID value.

struct net_lldp_time_to_live_tlv
    #include <lldp.h> Time To Live TLV, see chapter 8.5.4 in IEEE 802.1AB.

    Public Members

    uint16_t type_length
        7 bits for type, 9 bits for length
uint16_t ttl

Time To Live (TTL) value.

struct net_lldpdu

#include <lldp.h> LLDP Data Unit (LLDPDU) shall contain the following ordered TLVs as stated in “8.2 LLDPDU format” from the IEEE 802.1AB.

Public Members

struct net_lldp_chassis_tlv chassis_id

Mandatory Chassis TLV.

struct net_lldp_port_tlv port_id

Mandatory Port TLV.

struct net_lldp_time_to_live_tlv ttl

Mandatory TTL TLV.

IEEE 802.1Qav

Overview Credit-based shaping is an alternative scheduling algorithm used in network schedulers to achieve fairness when sharing a limited network resource. Zephyr has support for configuring a credit-based shaper described in the IEEE 802.1Qav-2009 standard. Zephyr does not implement the actual shaper; it only provides a way to configure the shaper implemented by the Ethernet device driver.

Enabling 802.1Qav To enable 802.1Qav shaper, the Ethernet device driver must declare that it supports credit-based shaping. The Ethernet driver’s capability function must return ETHERNET_QAV value for this purpose. Typically also priority queues ETHERNET_PRIORITY_QUEUES need to be supported.

static enum ethernet_hw_caps eth_get_capabilities(const struct device *dev) {
    ARG_UNUSED(dev);

    return ETHERNET_QAV | ETHERNET_PRIORITY_QUEUES |
        ETHERNET_HW_VLAN | ETHERNET_LINK_10BASE_T |
        ETHERNET_LINK_100BASE_T;
}

See sam-e70-xplained board Ethernet driver drivers/ethernet/eth_sam_gmac.c for an example.

Configuring 802.1Qav The application can configure the credit-based shaper like this:

#include <zephyr/net/net_if.h>
#include <zephyr/net/ethernet.h>
#include <zephyr/net/ethernet_mgmt.h>

static void qav_set_status(struct net_if *iface,
    int queue_id, bool enable)

(continues on next page)
Overview  Ethernet is a networking technology commonly used in local area networks (LAN). For more information, see this Ethernet Wikipedia article.

Zephyr supports following Ethernet features:
• 10, 100 and 1000 Mbit/sec links
• Auto negotiation
• Half/full duplex
• Promiscuous mode
• TX and RX checksum offloading
• MAC address filtering
• Virtual LANs
• Priority queues
• IEEE 802.1AS (gPTP)
• IEEE 802.1Qav (credit based shaping)
• LLDP (Link Layer Discovery Protocol)

Not all Ethernet device drivers support all of these features. You can see what is supported by `net iface net-shell` command. It will print currently supported Ethernet features.

API Reference

Related code samples

Inter-VM Shared Memory (ivshmem) Ethernet
Communicate with another “cell” in the Jailhouse hypervisor using IVSHMEM Ethernet.

Packet socket
Use raw packet sockets over Ethernet.

UDP sender using SO_TXTIME
Control the transmission time of a packet using SO_TXTIME socket option.

---

group ethernet

Ethernet support functions.

Defines

ETH_NET_DEVICE_INIT(dev_id, name, init_fn, pm, data, config, prio, api, mtu)
Create an Ethernet network interface and bind it to network device.

Parameters

• dev_id – Network device id.
• name – The name this instance of the driver exposes to the system.
• init_fn – Address to the init function of the driver.
• pm – Reference to struct pm_device associated with the device. (optional).
• data – Pointer to the device's private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• mtu – Maximum transfer unit in bytes for this network interface.

6.3. Networking
ETH_NET_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, prio, api, mtu)
Like ETH_NET_DEVICE_INIT but taking metadata from a devicetree.
Create an Ethernet network interface and bind it to network device.

Parameters
- node_id – The devicetree node identifier.
- init_fn – Address to the init function of the driver.
- pm – Reference to struct pm_device associated with the device. (optional).
- data – Pointer to the device's private data.
- config – The address to the structure containing the configuration information for this instance of the driver.
- prio – The initialization level at which configuration occurs.
- api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- mtu – Maximum transfer unit in bytes for this network interface.

ETH_NET_DEVICE_DT_INST_DEFINE(inst, ...)
Like ETH_NET_DEVICE_DT_DEFINE for an instance of a DT_DRV_COMPAT compatible.

Parameters
- inst – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to ETH_NET_DEVICE_DT_DEFINE.
- ... – other parameters as expected by ETH_NET_DEVICE_DT_DEFINE.

Enums

enum ethernet_hw_caps
Ethernet hardware capabilities.
Values:

enumerator ETHERNET_HW_TX_CHKSUM_OFFLOAD = BIT(0)
TX Checksum offloading supported for all of IPv4, UDP, TCP.

denumerator ETHERNET_HW_RX_CHKSUM_OFFLOAD = BIT(1)
RX Checksum offloading supported for all of IPv4, UDP, TCP.

denumerator ETHERNET_HW_VLAN = BIT(2)
VLAN supported.

denumerator ETHERNET_AUTO_NEGOTIATION_SET = BIT(3)
Enabling/disabling auto negotiation supported.

denumerator ETHERNET_LINK_10BASE_T = BIT(4)
10 Mbits link supported

denumerator ETHERNET_LINK_100BASE_T = BIT(5)
100 Mbits link supported
enumerator ETHERNET_LINK_1000BASE_T = BIT(6)
    1 Gbits link supported

enumerator ETHERNET_DUPLEX_SET = BIT(7)
    Changing duplex (half/full) supported.

enumerator ETHERNET_PTP = BIT(8)
    IEEE 802.1AS (gPTP) clock supported.

enumerator ETHERNET_QAV = BIT(9)
    IEEE 802.1Qav (credit-based shaping) supported.

enumerator ETHERNET_PROMISC_MODE = BIT(10)
    Promiscuous mode supported.

enumerator ETHERNET_PRIORITY_QUEUES = BIT(11)
    Priority queues available.

enumerator ETHERNET_HW_FILTERING = BIT(12)
    MAC address filtering supported.

enumerator ETHERNET_LLDP = BIT(13)
    Link Layer Discovery Protocol supported.

enumerator ETHERNET_HW_VLAN_TAG_STRIP = BIT(14)
    VLAN Tag stripping.

enumerator ETHERNET_DSA_SLAVE_PORT = BIT(15)
    DSA switch.

enumerator ETHERNET_DSA_MASTER_PORT = BIT(16)

enumerator ETHERNET_QBV = BIT(17)
    IEEE 802.1Qbv (scheduled traffic) supported.

enumerator ETHERNET_QBU = BIT(18)
    IEEE 802.1Qbu (frame preemption) supported.

enumerator ETHERNET_TXTIME = BIT(19)
    TXTIME supported.

enumerator ETHERNET_TXINJECTION_MODE = BIT(20)
    TX-Injection supported.

enum ethernet_if_types
    Types of Ethernet L2.

Values:
enumerator L2_ETH_IF_TYPE_ETHERNET
IEEE 802.3 Ethernet (default)

enumerator L2_ETH_IF_TYPE_WIFI
IEEE 802.11 Wi-Fi.

enum ethernet_flags
Values:

enumerator ETH_CARRIER_UP

Functions

void ethernet_init(struct net_if *iface)
Initialize Ethernet L2 stack for a given interface.

Parameters
• iface – A valid pointer to a network interface

void net_eth_ipv4_mcast_to_mac_addr(const struct in_addr *ipv4_addr, struct net_eth_addr *mac_addr)
Convert IPv4 multicast address to Ethernet address.

Parameters
• ipv4_addr – IPv4 multicast address
• mac_addr – Output buffer for Ethernet address

void net_eth_ipv6_mcast_to_mac_addr(const struct in6_addr *ipv6_addr, struct net_eth_addr *mac_addr)
Convert IPv6 multicast address to Ethernet address.

Parameters
• ipv6_addr – IPv6 multicast address
• mac_addr – Output buffer for Ethernet address

static inline enum ethernet_hw_caps net_eth_get_hw_capabilities(struct net_if *iface)
Return ethernet device hardware capability information.

Parameters
• iface – Network interface

Returns
Hardware capabilities

static inline int net_eth_vlan_enable(struct net_if *iface, uint16_t tag)
Add VLAN tag to the interface.

Parameters
• iface – Interface to use.
• tag – VLAN tag to add

Returns
0 if ok, <0 if error
static inline int net_eth_vlan_disable(struct net_if *iface, uint16_t tag)
    Remove VLAN tag from the interface.

    Parameters
    • iface – Interface to use.
    • tag – VLAN tag to remove

    Returns
    0 if ok, <0 if error

static inline uint16_t net_eth_get_vlan_tag(struct net_if *iface)
    Return VLAN tag specified to network interface.

    Parameters
    • iface – Network interface.

    Returns
    VLAN tag for this interface or NET_VLAN_TAG_UNSPEC if VLAN is not configured for that interface.

static inline struct net_if *net_eth_get_vlan_iface(struct net_if *iface, uint16_t tag)
    Return network interface related to this VLAN tag.

    Parameters
    • iface – Master network interface. This is used to get the pointer to ethernet L2 context
    • tag – VLAN tag

    Returns
    Network interface related to this tag or NULL if no such interface exists.

static inline bool net_eth_is_vlan_enabled(struct ethernet_context *ctx, struct net_if *iface)
    Check if VLAN is enabled for a specific network interface.

    Parameters
    • ctx – Ethernet context
    • iface – Network interface

    Returns
    True if VLAN is enabled for this network interface, false if not.

static inline bool net_eth_get_vlan_status(struct net_if *iface)
    Get VLAN status for a given network interface (enabled or not).

    Parameters
    • iface – Network interface

    Returns
    True if VLAN is enabled for this network interface, false if not.

void net_eth_carrier_on(struct net_if *iface)
    Inform ethernet L2 driver that ethernet carrier is detected.
    This happens when cable is connected.

    Parameters
    • iface – Network interface
void net_eth_carrier_off(struct net_if *iface)
  Inform ethernet L2 driver that ethernet carrier was lost.
  This happens when cable is disconnected.

Parameters
• iface – Network interface

int net_eth_promisc_mode(struct net_if *iface, bool enable)
  Set promiscuous mode either ON or OFF.

Parameters
• iface – Network interface
• enable – on (true) or off (false)

Returns
  0 if mode set or unset was successful, <0 otherwise.

int net_eth_txinjection_mode(struct net_if *iface, bool enable)
  Set TX-Injection mode either ON or OFF.

Parameters
• iface – Network interface
• enable – on (true) or off (false)

Returns
  0 if mode set or unset was successful, <0 otherwise.

static inline const struct device *net_eth_get_ptp_clock(struct net_if *iface)
  Return PTP clock that is tied to this ethernet network interface.

Parameters
• iface – Network interface

Returns
  Pointer to PTP clock if found, NULL if not found or if this ethernet interface
does not support PTP.

const struct device *net_eth_get_ptp_clock_by_index(int index)
  Return PTP clock that is tied to this ethernet network interface index.

Parameters
• index – Network interface index

Returns
  Pointer to PTP clock if found, NULL if not found or if this ethernet interface
index does not support PTP.

static inline int net_eth_get_ptp_port(struct net_if *iface)
  Return PTP port number attached to this interface.

Parameters
• iface – Network interface

Returns
  Port number, no such port if < 0

static inline void net_eth_set_ptp_port(struct net_if *iface, int port)
  Set PTP port number attached to this interface.

Parameters
• **iface** – Network interface
• **port** – Port number to set

```c
static inline bool net_eth_type_is_wifi(struct net_if *iface)
Check if the Ethernet L2 network interface can perform Wi-Fi.
```

**Parameters**
• **iface** – Pointer to network interface

**Returns**
True if interface supports Wi-Fi, False otherwise.

```c
struct ethernet_t1s_param
#include <ethernet.h>
```

**Public Members**

```c
enum ethernet_t1s_param_type type
    Type of T1S parameter.

bool enable
    T1S PLCA enabled.

uint8_t node_id
    T1S PLCA node id range: 0 to 254.

uint8_t node_count
    T1S PLCA node count range: 1 to 255.

uint8_t burst_count
    T1S PLCA burst count range: 0x0 to 0xFF.

uint8_t burst_timer
    T1S PLCA burst timer.

uint8_t to_timer
    T1S PLCA TO value.
```

```c
struct ethernet_qav_param
#include <ethernet.h>
```

**Public Members**

```c
int queue_id
    ID of the priority queue to use.

enum ethernet_qav_param_type type
    Type of Qav parameter.
```
bool enabled
   True if Qav is enabled for queue.

unsigned int delta_bandwidth
   Delta Bandwidth (percentage of bandwidth)

unsigned int idle_slope
   Idle Slope (bits per second)

unsigned int oper_idle_slope
   Oper Idle Slope (bits per second)

unsigned int traffic_class
   Traffic class the queue is bound to.

struct ethernet_qbv_param
   #include <ethernet.h>

Public Members

int port_id
   Port id.

enum ethernet_qbv_param_type type
   Type of Qbv parameter.

enum ethernet_qbv_state_type state
   What state (Admin/Oper) parameters are these.

bool enabled
   True if Qbv is enabled or not.

bool gate_status[NET_TC_TX_COUNT]
   True = open, False = closed.

enum ethernet_gate_state_operation operation
   GateState operation.

uint32_t time_interval
   Time interval ticks (nanoseconds)

uint16_t row
   Gate control list row.

uint32_t gate_control_list_len
   Number of entries in gate control list.
struct *net_ptp_extended_time* base_time
   Base time.

struct *net_ptp_time* cycle_time
   Cycle time.

uint32_t extension_time
   Extension time (nanoseconds)

struct ethernet_qbu_param
   #include <ethernet.h>

**Public Members**

int port_id
   Port id.

denum ethernet_qbu_param_type type
   Type of Qbu parameter.

uint32_t hold_advance
   Hold advance (nanoseconds)

uint32_t release_advance
   Release advance (nanoseconds)

denum ethernet_qbu_preempt_status frame_preempt_statuses[NET_TC_TX_COUNT]
   sequence of framePreemptionAdminStatus values.

bool enabled
   True if Qbu is enabled or not.

bool link_partner_status
   Link partner status (from Qbr)

uint8_t additional_fragment_size
   Additional fragment size (from Qbr).
   The minimum non-final fragment size is (additional_fragment_size + 1) * 64 octets

struct ethernet_filter
   #include <ethernet.h>

**Public Members**

denum ethernet_filter_type type
   Type of filter.
struct net_eth_addr mac_address
    MAC address to filter.

bool set
    Set (true) or unset (false) the filter.

struct ethernet_txtime_param
    #include <ethernet.h>

Public Members

enum ethernet_txtime_param_type type
    Type of TXTIME parameter.

int queue_id
    Queue number for configuring TXTIME.

bool enable_txtime
    Enable or disable TXTIME per queue.

struct ethernet_api
    #include <ethernet.h>

Public Members

struct net_if_api iface_api
    The net_if_api must be placed in first position in this struct so that we are compatible with network interface API.

int (*start)(const struct device *dev)
    Start the device.

int (*stop)(const struct device *dev)
    Stop the device.

enum ethernet_hw_caps (*get_capabilities)(const struct device *dev)
    Get the device capabilities.

int (*set_config)(const struct device *dev, enum ethernet_config_type type, const struct ethernet_config *config)
    Set specific hardware configuration.

int (*get_config)(const struct device *dev, enum ethernet_config_type type, struct ethernet_config *config)
    Get hardware specific configuration.
int (*send)(const struct device *dev, struct net_pkt *pkt)
   Send a network packet.

struct ethernet_context
#include <ethernet.h> Ethernet L2 context that is needed for VLAN.

Public Members

atomic_t flags
   Flags representing ethernet state, which are accessed from multiple threads.

struct k_work carrier_work
   Carrier ON/OFF handler worker.
   This is used to create network interface UP/DOWN event when ethernet L2 driver
   notices carrier ON/OFF situation. We must not create another network manage-
   ment event from inside management handler thus we use worker thread to trigger
   the UP/DOWN event.

struct net_if *iface
   Network interface.

enum net_l2_flags ethernet_l2_flags
   This tells what L2 features does ethernet support.

bool is_net_carrier_up
   Is network carrier up.

bool is_init
   Is this context already initialized.

enum ethernet_if_types eth_if_type
   Types of Ethernet network interfaces.

group ethernet_mii
   Ethernet MII (media independent interface) functions.

Defines

MII_BMCR
   Basic Mode Control Register.

MII_BMSR
   Basic Mode Status Register.

MII_PHYID1R
   PHY ID 1 Register.
MII_PHYID2R
PHY ID 2 Register.

MII_ANAR
Auto-Negotiation Advertisement Register.

MII_ANLPAR
Auto-Negotiation Link Partner Ability Reg.

MII_ANER
Auto-Negotiation Expansion Register.

MII_ANNPTR
Auto-Negotiation Next Page Transmit Register.

MII_ANLPRNPR
Auto-Negotiation Link Partner Received Next Page Reg.

MII_1KTCR
1000BASE-T Control Register

MII_1KSTSR
1000BASE-T Status Register

MII_MMD_ACR
MMD Access Control Register.

MII_MMD_AADR
MMD Access Address Data Register.

MII_ESTAT
Extended Status Register.

MII_BMCR_RESET
PHY reset.

MII_BMCR_LOOPBACK
enable loopback mode

MII_BMCR_SPEED_LSB
10=1000Mbps 01=100Mbps; 00=10Mbps

MII_BMCR_AUTONEG_ENABLE
Auto-Negotiation enable.

MII_BMCR_POWER_DOWN
power down mode
MII_BMCR_ISOLATE
   isolate electrically PHY from MII

MII_BMCR_AUTONEG_RESTART
   restart auto-negotiation

MII_BMCR_DUPLEX_MODE
   full duplex mode

MII_BMCR_SPEED_MSB
   10=1000Mbps 01=100Mbps; 00=10Mbps

MII_BMCR_SPEED_MASK
   Link Speed Field.

MII_BMCR_SPEED_10
   select speed 10 Mb/s

MII_BMCR_SPEED_100
   select speed 100 Mb/s

MII_BMCR_SPEED_1000
   select speed 1000 Mb/s

MII_BMSR_100BASE_T4
   100BASE-T4 capable

MII_BMSR_100BASE_X_FULL
   100BASE-X full duplex capable

MII_BMSR_100BASE_X_HALF
   100BASE-X half duplex capable

MII_BMSR_10_FULL
   10 Mb/s full duplex capable

MII_BMSR_10_HALF
   10 Mb/s half duplex capable

MII_BMSR_100BASE_T2_FULL
   100BASE-T2 full duplex capable

MII_BMSR_100BASE_T2_HALF
   100BASE-T2 half duplex capable

MII_BMSR_EXTEND_STATUS
   extend status information in reg 15

6.3. Networking
MII_BMSR_MF_PREAMB_SUPPR
PHY accepts management frames with preamble suppressed.

MII_BMSR_AUTONEG_COMPLETE
Auto-negotiation process completed.

MII_BMSR_REMOTE_FAULT
remote fault detected

MII_BMSR_AUTONEG_ABILITY
PHY is able to perform Auto-Negotiation.

MII_BMSR_LINK_STATUS
link is up

MII_BMSR_JABBER_DETECT
jabber condition detected

MII_BMSR_EXTEND_CAPAB
extended register capabilities

MII_ADVERTISE_100_HALF
try for 100BASE-X support

MII_ADVERTISE_10_FULL
try for 10 Mb/s full duplex support
IEEE 802.15.4

**Introduction**  IEEE 802.15.4 is a technical standard which defines the operation of low-rate wireless personal area networks (LR-WPANs). For a more detailed overview of this standard, see the IEEE 802.15.4 Wikipedia article.

The most recent version of the standard is accessible through the IEEE GET Program. You need to create a free IEEE account and can then downloading it.

We're currently following the IEEE 802.15.4-2020 specification. This version is backwards compatible with IEEE 802.15.4-2015, parts of which are contained in the Thread protocol stack. The
2020 version also includes prior extensions that were accepted into the standard, namely IEEE 802.15.4g (SUN FSK) and IEEE 802.15.4e (TSCH) which are of relevance to industrial IoT and automation. For recent developments in UWB ranging technology, see IEEE 802.15.4z which is not yet integrated into the standard's mainline.

Whenever sections from the standard are cited in the documentation, they refer to IEEE 802.15.4-2020 section, table and figure numbering - unless otherwise specified.

Zephyr supports both, native IEEE 802.15.4 and Thread, with 6LoWPAN. Zephyr’s Thread protocol implementation is based on OpenThread. The IPv6 header compression in 6LoWPAN is shared among native IEEE 802.15.4 and the Bluetooth IPSP (IP support profile).

API Reference

IEEE 802.15.4 API Overview  Gives an introduction and overview over the whole IEEE 802.15.4 subsystem and all of its APIs, configuration and user interfaces for all audiences.

Related code samples

802.15.4 "serial-radio"  Implement a slip-radio device for Contiki-based border routers.

802.15.4 USB  Implement a device that exposes an IEEE 802.15.4 radio over USB.

group ieee802154
IEEE 802.15.4 native and OpenThread L2, configuration, management and driver APIs.

The IEEE 802.15.4 and Thread subsystems comprise the OpenThread L2 subsystem, the native IEEE 802.15.4 L2 subsystem (“Soft” MAC), a mostly vendor and protocol agnostic driver API shared between the OpenThread and native L2 stacks (“Hard” MAC and PHY) as well as several APIs to configure the subsystem (shell, net management, Kconfig, devicetree, etc.).

The OpenThread subsystem API integrates the external OpenThread stack into Zephyr. It builds upon Zephyr’s native IEEE 802.15.4 driver API.

The native IEEE 802.15.4 subsystem APIs are exposed at different levels and address several audiences:

• shell (end users, application developers):
  – a set of IEEE 802.15.4 shell commands (see shell> ieee802154 help)

• application API (application developers):
  – IPv6, DGRAM and RAW sockets for actual peer-to-peer, multicast and broadcast data exchange between nodes including connection specific configuration (sample coming soon, see https://github.com/linux-wpan/wpan-tools/tree/master/examples for now which inspired our API and therefore has a similar socket API),
  – Kconfig and devicetree configuration options (net config library extension, subsystem-wide MAC and PHY Kconfig/DT options, driver/vendor specific Kconfig/DT options, watch out for options prefixed with IEEE802154/ieee802154),
  – Network Management: runtime configuration of the IEEE 802.15.4 protocols stack at the MAC (L2) and PHY (L1) levels (see IEEE 802.15.4 Net Management),

• L2 integration (subsystem contributors):
  – see IEEE 802.15.4 L2
– implementation of Zephyr’s internal L2-level socket and network context abstractions (context/socket operations, see Network L2 Abstraction Layer),
– protocol-specific extension to the interface structure (see Network Interface abstraction layer)
– protocol-specific extensions to the network packet structure (see Network Packet Library),

• OpenThread and native IEEE 802.15.4 share a common driver API (driver maintainers/contributors):
  – see IEEE 802.15.4 Drivers
  – a basic, mostly PHY-level driver API to be implemented by all drivers,
  – several “hard MAC” (hardware/firmware offloading) extension points for performance critical or timing sensitive aspects of the protocol

IEEE 802.15.4 Management API  This is the main subsystem-specific API of interest to IEEE 802.15.4 application developers as it allows to configure the IEEE 802.15.4 subsystem at runtime. Other relevant interfaces for application developers are the typical shell, socket, Kconfig and devicetree APIs that can be accessed through Zephyr’s generic subsystem-independent documentation. Look out for IEEE802154/ieee802154 prefixes there.

```
group ieee802154_mgmt
  
  IEEE 802.15.4 net management library.
  
  The IEEE 802.15.4 net management library provides runtime configuration features that applications can interface with directly.
  
  Most of these commands are also accessible via shell commands. See the shell’s help feature (shell> ieee802154 help).
```

Note: All section, table and figure references are to the IEEE 802.15.4-2020 standard.

Command Macros

IEEE 802.15.4 net management commands.

These IEEE 802.15.4 subsystem net management commands can be called by applications via Network Management macro.

All attributes and parameters are given in CPU byte order (scalars) or big endian (byte arrays) unless otherwise specified.

The following IEEE 802.15.4 MAC management service primitives are referenced in this enumeration:

• MLME-ASSOCIATE.request, see section 8.2.3
• MLME-DISASSOCIATE.request, see section 8.2.4
• MLME-SET/GET.request, see section 8.2.6
• MLME-SCAN.request, see section 8.2.11

The following IEEE 802.15.4 MAC data service primitives are referenced in this enumeration:

• MLME-DATA.request, see section 8.3.2
MAC PIB attributes (mac.../sec...): see sections 8.4.3 and 9.5. PHY PIB attributes (phy...): see section 11.3. Both are accessed through MLME-SET/GET primitives.

- **NET_REQUEST_IEEE802154_SET_ACK**
  
  Sets AckTx for all subsequent MLME-DATA (aka TX) requests.

- **NET_REQUEST_IEEE802154_UNSET_ACK**
  
  Unsets AckTx for all subsequent MLME-DATA requests.

- **NET_REQUEST_IEEE802154_PASSIVE_SCAN**
  
  MLME-SCAN(PASSIVE, ...) request.
  
  See [ieee802154_req_params](#) for associated command parameters.

- **NET_REQUEST_IEEE802154_ACTIVE_SCAN**
  
  MLME-SCAN(ACTIVE, ...) request.
  
  See [ieee802154_req_params](#) for associated command parameters.

- **NET_REQUEST_IEEE802154_CANCEL_SCAN**
  
  Cancels an ongoing MLME-SCAN(...) command (non-standard).

- **NET_REQUEST_IEEE802154_ASSOCIATE**
  
  MLME-ASSOCIATE(...) request.

- **NET_REQUEST_IEEE802154_DISASSOCIATE**
  
  MLME-DISASSOCIATE(...) request.

- **NET_REQUEST_IEEE802154_SET_CHANNEL**
  
  MLME-SET(phyCurrentChannel) request.

- **NET_REQUEST_IEEE802154_GET_CHANNEL**
  
  MLME-GET(phyCurrentChannel) request.

- **NET_REQUEST_IEEE802154_SET_PAN_ID**
  
  MLME-SET(macPanId) request.

- **NET_REQUEST_IEEE802154_GET_PAN_ID**
  
  MLME-GET(macPanId) request.

- **NET_REQUEST_IEEE802154_SET_EXT_ADDR**
  
  Sets the extended interface address (non-standard), see sections 7.1 and 8.4.3.1, in big endian byte order.

- **NET_REQUEST_IEEE802154_GET_EXT_ADDR**
  
  like MLME-GET(macExtendedAddress) but in big endian byte order

- **NET_REQUEST_IEEE802154_SET_SHORT_ADDR**
  
  MLME-SET(macShortAddress) request, only allowed for co-ordinators.
NET_REQUEST_IEEE802154_GET_SHORT_ADDR
MLME-GET(macShortAddress) request.

NET_REQUEST_IEEE802154_GET_TX_POWER
MLME-SET(phyUnicastTxPower/phyBroadcastTxPower) request (currently not distin-
guished)

NET_REQUEST_IEEE802154_SET_TX_POWER
MLME-GET(phyUnicastTxPower/phyBroadcastTxPower) request.

NET_REQUEST_IEEE802154_SET_SECURITY_SETTINGS
Configures basic sec* MAC PIB attributes, implies macSecurityEnabled=true.
See ieee802154_security_params for associated command parameters.

NET_REQUEST_IEEE802154_GET_SECURITY_SETTINGS
Gets the configured sec* attributes.
See ieee802154_security_params for associated command parameters.

Event Macros

IEEE 802.15.4 net management events.
These IEEE 802.15.4 subsystem net management events can be subscribed to by
applications via net_mgmt_init_event_callback, net_mgmt_add_event_callback and
net_mgmt_del_event_callback.

NET_EVENT_IEEE802154_SCAN_RESULT
Signals the result of the NET_REQUEST_IEEE802154_ACTIVE_SCAN or
NET_REQUEST_IEEE802154_PASSIVE_SCAN net management commands.
See ieee802154_req_params for associated event parameters.

struct ieee802154_req_params
#include <ieee802154_mgmt.h> Scanning parameters.
Used to request a scan and get results as well, see section 8.2.11.2

Public Members

uint32_t channel_set
The set of channels to scan, use above macros to manage it.

uint32_t duration
Duration of scan, per-channel, in milliseconds.

uint16_t channel
Current channel in use as a result.
uint16_t pan_id
   Current pan_id in use as a result.

union ieee802154_req_params
   Result address.

uint8_t len
   length of address

uint8_t lqi
   Link quality information, between 0 and 255.

struct ieee802154_security_params
   #include <ieee802154_mgmt.h> Security parameters.
   Used to setup the link-layer security settings, see tables 9-9 and 9-10 in section 9.5.

IEEE 802.15.4 Driver API  This is the main API of interest to IEEE 802.15.4 driver developers.

group ieee802154_driver
   IEEE 802.15.4 driver API.

   This API provides a common representation of vendor-specific hardware and firmware to
   the native IEEE 802.15.4 L2 and OpenThread stacks. Application developers should never
   interface directly with this API. It is of interest to driver maintainers only.

   The IEEE 802.15.4 driver API consists of two separate parts:
   • a basic, mostly PHY-level driver API to be implemented by all drivers,
   • several optional MAC-level extension points to offload performance critical or timing
     sensitive aspects at MAC level to the driver hardware or firmware (“hard” MAC).

   Implementing the basic driver API will ensure integration with the native L2 stack as well as
   basic support for OpenThread. Depending on the hardware, offloading to vendor-specific
   hardware or firmware features may be required to achieve full compliance with the Thread
   protocol or IEEE 802.15.4 subprotocols (e.g. fast enough ACK packages, precise timing of
   timed TX/RX in the TSCH or CSL subprotocols).

   Whether or not MAC-level offloading extension points need to be implemented is to be de-
   cided by individual driver maintainers. Upper layers SHOULD provide a “soft” MAC fall-
   back whenever possible.

   Note: All section, table and figure references are to the IEEE 802.15.4-2020 standard.

IEEE 802.15.4, section 7.4.2: MAC header information elements

eenum ieee802154_ie_type
   Information Element Types.
   See sections 7.4.2.1 and 7.4.3.1.
   Values:
enumerator IEEE802154_IE_TYPE_HEADER = 0x0
enumerator IEEE802154_IE_TYPE_PAYLOAD

enum ieee802154_header_ie_element_id
    Header Information Element IDs.
    See section 7.4.2.1, table 7-7, partial list, only IEs actually used are implemented.
    Values:

enumerator IEEE802154_HEADER_IE_ELEMENT_ID_VENDOR_SPECIFIC_IE = 0x00
enumerator IEEE802154_HEADER_IE_ELEMENT_ID_CSL_IE = 0x1a
enumerator IEEE802154_HEADER_IE_ELEMENT_ID_RIT_IE = 0x1b
enumerator IEEE802154_HEADER_IE_ELEMENT_ID_RENDEZVOUS_TIME_IE = 0x1d
enumerator IEEE802154_HEADER_IE_ELEMENT_ID_TIME_CORRECTION_IE = 0x1e
enumerator IEEE802154_HEADER_IE_ELEMENT_ID_HEADER_TERMINATION_1 = 0x7e
enumerator IEEE802154_HEADER_IE_ELEMENT_ID_HEADER_TERMINATION_2 = 0x7f

static inline int16_t ieee802154_header_ie_get_time_correction_us(struct ieee802154_header_ie_time_correction *ie)
    Retrieve the time correction value in microseconds from a Time Correction IE, see section 7.4.2.7.
    Parameters
    • ie – [in] pointer to the Time Correction IE structure
    Returns
    The time correction value in microseconds.

static inline void ieee802154_header_ie_set_element_id(struct ieee802154_header_ie *ie, uint8_t element_id)
    Set the element ID of a header IE.
    Parameters
    • ie – [in] pointer to a header IE
    • element_id – [in] IE element id in CPU byte order

static inline uint8_t ieee802154_header_ie_get_element_id(struct ieee802154_header_ie *ie)
    Get the element ID of a header IE.
    Parameters
    • ie – [in] pointer to a header IE
    Returns
    header IE element id in CPU byte order
IEEE802154_HEADER_IE_HEADER_LENGTH

The header IE's header length (2 bytes).

IEEE802154_DEFINE_HEADER_IE_VENDOR_SPECIFIC(_vendor_oui, _vendor_specific_info, _vendor_specific_info_len)

Define a vendor specific header IE, see section 7.4.2.3.
Example usage (all parameters in little endian):

```c
uint8_t vendor_specific_info[] = {...some vendor specific IE content...};
struct ieee802154_header_ie header_ie = IEEE802154_DEFINE_HEADER_IE_VENDOR_SPECIFIC(
    {0x9b, 0xb8, 0xea}, vendor_specific_info, sizeof(vendor_specific_info));
```

Parameters

- _vendor_oui – an initializer for a 3 byte vendor oui array in little endian
- _vendor_specific_info – pointer to a variable length uint8_t array with the vendor specific IE content
- _vendor_specific_info_len – the length of the vendor specific IE content (in bytes)

IEEE802154_DEFINE_HEADER_IE_CSL_REDUCED(_csl_phase, _csl_period)

Define a reduced CSL IE, see section 7.4.2.3.
Example usage (all parameters in CPU byte order):

```c
uint16_t csl_phase = ...;
uint16_t csl_period = ...;
struct ieee802154_header_ie header_ie = IEEE802154_DEFINE_HEADER_IE_CSL_REDUCED(csl_phase, csl_period);
```

Parameters

- _csl_phase – CSL phase in CPU byte order
- _csl_period – CSL period in CPU byte order

IEEE802154_DEFINE_HEADER_IE_CSL_FULL(_csl_phase, _csl_period, _csl_rendezvous_time)

Define a full CSL IE, see section 7.4.2.3.
Example usage (all parameters in CPU byte order):

```c
uint16_t csl_phase = ...;
uint16_t csl_period = ...;
uint16_t csl_rendezvous_time = ...;
struct ieee802154_header_ie header_ie = IEEE802154_DEFINE_HEADER_IE_CSL_REDUCED(csl_phase, csl_period, csl_rendezvous_time);
```

Parameters

- _csl_phase – CSL phase in CPU byte order
- _csl_period – CSL period in CPU byte order
- _csl_rendezvous_time – CSL rendezvous time in CPU byte order
IEEE802154_DEFINE_HEADER_IE_TIME_CORRECTION(_ack, _time_correction_us)

Define a Time Correction IE, see section 7.4.2.7.

Example usage (parameter in CPU byte order):

```c
uint16_t time_sync_info = ...;
structieee802154_header_ie header_ie =
IEEE802154_DEFINE_HEADER_IE_TIME_CORRECTION(true, time_sync_info);
```

Parameters

- _ack – whether or not the enhanced ACK frame that receives this IE is an
  ACK (true) or NACK (false)
- _time_correction_us – the positive or negative deviation from expected
  RX time in microseconds

IEEE802154_TIME_CORRECTION_HEADER_IE_LEN

The length in bytes of a “Time Correction” header IE.

IEEE802154_HEADER_TERMINATION_1_HEADER_IE_LEN

The length in bytes of a “Header Termination 1” header IE.

IEEE 802.15.4-2020, Section 10: General PHY requirements

enum ieee802154_phy_channel_page

PHY channel pages, see section 10.1.3.

A device driver must support the mandatory channel pages, frequency bands and
channels of at least one IEEE 802.15.4 PHY.

Channel page and number assignments have developed over several versions of the
standard and are not particularly well documented. Therefore some notes about pe-
culiarities of channel pages and channel numbering:

- The 2006 version of the standard had a read-only phyChannelsSupported PHY PIB
  attribute that represented channel page/number combinations as a bitmap. This
  attribute was removed in later versions of the standard as the number of channels
  increased beyond what could be represented by a bit map. That's the reason why
  it was decided to represent supported channels as a combination of channel pages
  and ranges instead.

- In the 2020 version of the standard, 13 channel pages are explicitly defined, but
  up to 32 pages could in principle be supported. This was a hard requirement in
  the 2006 standard. In later standards it is implicit from field specifications, e.g. the
  MAC PIB attribute macChannelPage (section 8.4.3.4, table 8-100) or channel page
  fields used in the SRM protocol (see section 8.2.26.5).

- ASK PHY (channel page one) was deprecated in the 2015 version of the standard.
  The 2020 version of the standard is a bit ambivalent whether channel page one
  disappeared as well or should be interpreted as O-QPSK now (see section 10.1.3.3).
  In Zephyr this ambivalence is resolved by deprecating channel page one.

- For some PHYS the standard doesn’t clearly specify a channel page, namely the
  GFSK, RS-GFSK, CMB and TASK PHYS. These are all rather new and left out in our
  list as long as no driver wants to implement them.
Warning: The bit numbers are not arbitrary but represent the channel page numbers as defined by the standard. Therefore do not change the bit numbering.

Values:

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_ZERO_OQPSK_2450_BPSK_868_915 = BIT(0)
  Channel page zero supports the 2.4G channels of the O-QPSK PHY and all channels from the BPSK PHYs initially defined in the 2003 editions of the standard.
  For channel page zero, 16 channels are available in the 2450 MHz band (channels 11-26, O-QPSK), 10 in the 915 MHz band (channels 1-10, BPSK), and 1 in the 868 MHz band (channel 0, BPSK).
  You can retrieve the channels supported by a specific driver on this page via IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_RANGES attribute.
  see section 10.1.3.3

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_ONE_DEPRECATED = BIT(1)
  Formerly ASK PHY - deprecated in IEEE 802.15.4-2015.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_TWO_OQPSK_868_915 = BIT(2)
  O-QPSK PHY - 868 MHz and 915 MHz bands, see section 10.1.3.3.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_THREE_CSS = BIT(3)
  CSS PHY - 2450 MHz band, see section 10.1.3.4.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_FOUR_HRP_UWB = BIT(4)
  UWB PHY - SubG, low and high bands, see section 10.1.3.5.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_FIVE_OQPSK_780 = BIT(5)
  O-QPSK PHY - 780 MHz band, see section 10.1.3.2.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_SIX_RESERVED = BIT(6)
  reserved - not currently assigned

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_SEVEN_MSK = BIT(7)
  MSK PHY - 780 MHz and 2450 MHz bands, see sections 10.1.3.6, 10.1.3.7.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_EIGHT_LRP_UWB = BIT(8)
  LRP UWB PHY, see sections 10.1.3.8.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_NINE_SUN_PREDEFINED = BIT(9)
  SUN FSK/OFDM/O-QPSK PHYs - predefined bands, operating modes and channels, see sections 10.1.3.9.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_TEN_SUN_FSK_GENERIC = BIT(10)
  SUN FSK/OFDM/O-QPSK PHYs - generic modulation and channel description, see sections 10.1.3.9, 7.4.4.11.
enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_ELEVEN_OQPSK_2380 = BIT(11)
O-QPSK PHY - 2380 MHz band, see section 10.1.3.10.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_TWELVE_LECIM = BIT(12)
LECIM DSSS/FSK PHYs, see section 10.1.3.11.

enumerator IEEE802154_ATTR_PHY_CHANNEL_PAGE_THIRTEEN_RCC = BIT(13)
RCC PHY, see section 10.1.3.12.

IEEE802154_DEFINE_PHY_SUPPORTED_CHANNELS(drv_attr, from, to)
Allocate memory for the supported channels driver attribute with a single channel range constant across all driver instances.
This is what most IEEE 802.15.4 drivers need.
Example usage:

IEEE802154_DEFINE_PHY_SUPPORTED_CHANNELS(drv_attr, 11, 26);

The attribute may then be referenced like this:

... &drv_attr.phy_supported_channels ...

See ieee802154_attr_get_channel_page_and_range() for a further shortcut that can be combined with this macro.

Parameters

- drv_attr – name of the local static variable to be declared for the local attributes structure
- from – the first channel to be supported
- to – the last channel to be supported

IEEE 802.15.4-2020, Section 15: HRP UWB PHY

For HRP UWB the symbol period is derived from the preamble symbol period (T_psym), see section 11.3, table 11-1 and section 15.2.5, table 15-4 (confirmed in IEEE 802.15.4z, section 15.1). Choosing among those periods cannot be done based on channel page and channel alone. The mean pulse repetition frequency must also be known, see the ‘UwbPrf’ parameter of the MCPS-DATA.request primitive (section 8.3.2, table 8-88) and the preamble parameters for HRP-ERDEV length 91 codes (IEEE 802.15.4z, section 15.2.6.2, table 15-7b).

enum ieee802154_phy_hrp_uwb_nominal_prf

represents the nominal pulse rate frequency of an HRP UWB PHY

Values:

eenumerator IEEE802154_PHY_HRP_UWB_PRF_OFF = 0
standard modes, see section 8.3.2, table 8-88.

eenumerator IEEE802154_PHY_HRP_UWB_NOMINAL_4_M = BIT(0)

enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_16_M = BIT(1)
enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_64_M = BIT(2)

enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_64_M_BPRF = BIT(3)
    enhanced ranging device (ERDEV) modes not specified in table 8-88, see IEEE 802.15.4z, section 15.1, section 15.2.6.2, table 15-7b, section 15.3.4.2 and section 15.3.4.3.

enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_128_M_HPRF = BIT(4)

enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_256_M_HPRF = BIT(5)

IEEE802154_PHY_HRP_UWB_PRF4_TPSYM_SYMBOL_PERIOD_NS
    Nominal PRF 4MHz symbol period.

IEEE802154_PHY_HRP_UWB_PRF16_TPSYM_SYMBOL_PERIOD_NS
    Nominal PRF 16MHz symbol period.

IEEE802154_PHY_HRP_UWB_PRF64_TPSYM_SYMBOL_PERIOD_NS
    Nominal PRF 64MHz symbol period.

IEEE802154_PHY_HRP_UWB_ERDEV_TPSYM_SYMBOL_PERIOD_NS
    ERDEV symbol period.

IEEE802154_PHY_HRP_UWB_RDEV
    RDEV device mask.

IEEE802154_PHY_HRP_UWB_ERDEV
    ERDEV device mask.

IEEE 802.15.4 Driver API

enum iee802154_hw_caps
    IEEE 802.15.4 driver capabilities.
    Any driver properties that can be represented in binary form should be modeled as capabilities. These are called “hardware” capabilities for historical reasons but may also represent driver firmware capabilities (e.g. MAC offloading features).
    Values:

enumerator IEEE802154_HW_ENERGY_SCAN = BIT(0)
    Energy detection (ED) supported (optional)

enumerator IEEE802154_HW_FCS = BIT(1)
    Frame checksum verification supported.

enumerator IEEE802154_HW_FILTER = BIT(2)
    Filtering of PAN ID, extended and short address supported.
enumerator IEEE802154_HW_PROMISC = BIT(3)
   Promiscuous mode supported.

enumerator IEEE802154_HW_CSMA = BIT(4)
   CSMA-CA procedure supported on TX.

enumerator IEEE802154_HW_TX_RX_ACK = BIT(5)
   Waits for ACK on TX if AR bit is set in TX pkt.

enumerator IEEE802154_HW_RETRANSMISSION = BIT(6)
   Supports retransmission on TX ACK timeout.

enumerator IEEE802154_HW_RX_TX_ACK = BIT(7)
   Sends ACK on RX if AR bit is set in RX pkt.

enumerator IEEE802154_HW_TXTIME = BIT(8)
   TX at specified time supported.

enumerator IEEE802154_HW_SLEEP_TO_TX = BIT(9)
   TX directly from sleep supported.

@note This HW capability does not conform to the requirements
specified in #61227 as it closely couples the driver to OpenThread's
capability and device model which is different from Zephyr's:
- "Sleeping" is a well defined term in Zephyr related to internal
  power and thread management and different from "RX off" as
  defined in OT.
- Currently all OT-capable drivers have the "sleep to TX" capability
  anyway plus we expect future drivers to implement it ootb as well,
  so no information is actually conveyed by this capability.
- The `start()`/`stop()` API of a net device controls the
  interface's operational state. Drivers MUST respond with
  -ENETDOWN when calling `tx()` while their operational state is
  "DOWN", only devices in the "UP" state MAY transmit packets (RFC
  2863).
- A migration path has been defined in #63670 for actual removal of
  this capability in favor of a standard compliant
  `configure(rx_on/rx_off)` call, see there for details.

@deprecated Drivers and L2 SHALL not introduce additional references
to this capability and remove existing ones as outlined in #63670.

enumerator IEEE802154_HW_RXTIME = BIT(10)
   Timed RX window scheduling supported.

enumerator IEEE802154_HW_TXSEC = BIT(11)
   TX security supported (key management, encryption and authentication)

enumerator IEEE802154_RX_ON_WHEN_IDLE = BIT(12)
   RxOnWhenIdle handling supported.

enum ieee802154_filter_type
Filter type, see ieee802154_radio_api::filter.

**Values:**

- enumerator IEEE802154_FILTER_TYPE_IEEE_ADDR
- enumerator IEEE802154_FILTER_TYPE_SHORT_ADDR
- enumerator IEEE802154_FILTER_TYPE_PAN_ID
- enumerator IEEE802154_FILTER_TYPE_SRC_IEEE_ADDR
- enumerator IEEE802154_FILTER_TYPE_SRC_SHORT_ADDR

```c
enum ieee802154_event
```

Driver events, see IEEE802154_CONFIG_EVENT_HANDLER.

**Values:**

- enumerator IEEE802154_EVENT_TX_STARTED
  - Data transmission started.
- enumerator IEEE802154_EVENT_RX_FAILED
  - Data reception failed.
- enumerator IEEE802154_EVENT_RX_OFF
  - An RX slot ended, requires IEEE802154_HW_RXTIME.

**Note:** This event SHALL not be triggered by drivers when RX is synchronously
switched off due to a call to stop() or an RX slot being configured.

```c
enum ieee802154_rx_fail_reason
```

RX failed event reasons, see IEEE802154_EVENT_RX_FAILED.

**Values:**

- enumerator IEEE802154_RX_FAIL_NOT_RECEIVED
  - Nothing received.
- enumerator IEEE802154_RX_FAIL_INVALID_FCS
  - Frame had invalid checksum.
- enumerator IEEE802154_RX_FAIL_ADDR_FILTERED
  - Address did not match.
- enumerator IEEE802154_RX_FAIL_OTHER
  - General reason.
enum ieee802154_tx_mode
IEEE 802.15.4 Transmission mode.

Values:

enumerator IEEE802154_TX_MODE_DIRECT
Transmit packet immediately, no CCA.

enumerator IEEE802154_TX_MODE_CCA
Perform CCA before packet transmission.

enumerator IEEE802154_TX_MODE_CSMA_CA
Perform full CSMA/CA procedure before packet transmission.

Note: requires IEEE802154_HW_CSMA capability.

enumerator IEEE802154_TX_MODE_TXTIME
Transmit packet in the future, at the specified time, no CCA.

Note: requires IEEE802154_HW_TXTIME capability.

enumerator IEEE802154_TX_MODE_TXTIME_CCA
Transmit packet in the future, perform CCA before transmission.

Note: requires IEEE802154_HW_TXTIME capability.

Note: Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread specification 1.2.0, ch. 3.2.6.3).

enumerator IEEE802154_TX_MODE_COMMON_COUNT
Number of modes defined in ieee802154_tx_mode.

enumerator IEEE802154_TX_MODE_PRIV_START = IEEE802154_TX_MODE_COMMON_COUNT
This and higher values are specific to the protocol- or driver-specific extensions.

enum ieee802154_fpb_mode
IEEE 802.15.4 Frame Pending Bit table address matching mode.

Values:

enumerator IEEE802154_FPB_ADDR_MATCH_THREAD
The pending bit shall be set only for addresses found in the list.

enumerator IEEE802154_FPB_ADDR_MATCH_ZIGBEE
The pending bit shall be cleared for short addresses found in the list.
enum ieee802154_config_type
IEEE 802.15.4 driver configuration types.

Values:

enumerator IEEE802154_CONFIG_AUTO_ACK_FPB
Indicates how the driver should set the Frame Pending bit in ACK responses for Data Requests.
If enabled, the driver should determine whether to set the bit or not based on the information provided with IEEE802154_CONFIG_ACK_FPB config and FPB address matching mode specified. Otherwise, Frame Pending bit should be set to 1 (see section 6.7.3).

Note: requires IEEE802154_HW_TX_RX_ACK capability and is available in any interface operational state.

enumerator IEEE802154_CONFIG_ACK_FPB
Indicates whether to set ACK Frame Pending bit for specific address or not.
Disabling the Frame Pending bit with no address provided (NULL pointer) should disable it for all enabled addresses.

Note: requires IEEE802154_HW_TX_RX_ACK capability and is available in any interface operational state.

enumerator IEEE802154_CONFIG_PAN_COORDINATOR
Indicates whether the device is a PAN coordinator.
This influences packet filtering.

Note: Available in any interface operational state.

enumerator IEEE802154_CONFIG_PROMISCUOUS
Enable/disable promiscuous mode.

Note: Available in any interface operational state.

enumerator IEEE802154_CONFIG_EVENT_HANDLER
Specifies new IEEE 802.15.4 driver event handler.
Specifying NULL as a handler will disable events notification.

Note: Available in any interface operational state.

enumerator IEEE802154_CONFIG_MAC_KEYS
Updates MAC keys, key index and the per-key frame counter for drivers supporting transmit security offloading, see section 9.5, tables 9-9 and 9-10.
The key configuration SHALL NOT be accepted if the frame counter (in case frame counter per key is true) is not strictly larger than the current frame counter associated with the same key, see sections 8.2.2, 9.2.4 g/h) and 9.4.3.

**Note:** Requires `IEEE802154_HW_TX_SEC` capability and is available in any interface operational state.

enumerator `IEEE802154_CONFIG_FRAME_COUNTER`

Sets the current MAC frame counter value associated with the interface for drivers supporting transmit security offloading, see section 9.5, table 9-8, secFrameCounter.

**Note:** Requires `IEEE802154_HW_TX_SEC` capability and is available in any interface operational state.

**Warning:** The frame counter MUST NOT be accepted if it is not strictly greater than the current frame counter associated with the interface, see sections 8.2.2, 9.2.4 g/h) and 9.4.3. Otherwise the replay protection provided by the frame counter may be compromised. Drivers SHALL return -EINVAL in case the configured frame counter does not conform to this requirement.

enumerator `IEEE802154_CONFIG_FRAME_COUNTER_IF_LARGER`

Sets the current MAC frame counter value if the provided value is greater than the current one.

**Note:** Requires `IEEE802154_HW_TX_SEC` capability and is available in any interface operational state.

**Warning:** This configuration option does not conform to the requirements specified in #61227 as it is redundant with `IEEE802154_CONFIG_FRAME_COUNTER`, and will therefore be deprecated in the future.

enumerator `IEEE802154_CONFIG_RX_SLOT`

Set or unset a radio reception window (RX slot).

This can be used for any scheduled reception, e.g.: Zigbee GP device, CSL, TSCH, etc.

The start and duration parameters of the RX slot are relative to the network subsystem's local clock. If the start parameter of the RX slot is -1 then any previously configured RX slot SHALL be canceled immediately. If the start parameter is any value in the past (including 0) or the duration parameter is zero then the receiver SHALL remain off forever until the RX slot has either been removed or re-configured to point to a future start time. If an RX slot is configured while the previous RX slot is still scheduled, then the previous slot SHALL be cancelled and the new slot scheduled instead.

RX slots MAY be programmed while the driver is “DOWN”. If any past or future RX slot is configured when calling `start()` then the interface SHALL be placed in “UP” state.
state but the receiver SHALL not be started.

The driver SHALL take care to start/stop the receiver autonomously, asynchronously and automatically around the RX slot. The driver SHALL resume power just before the RX slot and suspend it again after the slot unless another programmed event forces the driver not to suspend. The driver SHALL switch to the programmed channel before the RX slot and back to the channel set with set_channel() after the RX slot. If the driver interface is “DOWN” when the start time of an RX slot arrives, then the RX slot SHALL not be observed and the receiver SHALL remain off.

If the driver is “UP” while configuring an RX slot, the driver SHALL turn off the receiver immediately and (possibly asynchronously) put the driver into the lowest possible power saving mode until the start of the RX slot. If the driver is “UP” while the RX slot is deleted, then the driver SHALL enable the receiver immediately. The receiver MUST be ready to receive packets before returning from the configure() operation in this case.

This behavior means that setting an RX slot implicitly sets the MAC PIB attribute macRxOnWhenIdle (see section 8.4.3.1, table 8-94) to “false” while deleting the RX slot implicitly sets macRxOnWhenIdle to “true”.

**Note:** requires \textit{IEEE802154_HW_RXTIME} capability and is available in any interface operational state.

**Note:** Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread specification 1.2.0, ch. 3.2.6.3).

enumerator \textit{IEEE802154_CONFIG_CSL_PERIOD}

Enables or disables a device as a CSL receiver and configures its CSL period.

Configures the CSL period in units of 10 symbol periods. Values greater than zero enable CSL if the driver supports it and the device starts to operate as a CSL receiver. Setting this to zero disables CSL on the device. If the driver does not support CSL, the configuration call SHALL return -ENOTSUP.

See section 7.4.2.3 and section 8.4.3.6, table 8-104, macCslPeriod.

To offload CSL receiver timing to the driver the upper layer SHALL combine several configuration options in the following way:

i. Use \textit{IEEE802154_CONFIG_ENH_ACK_HEADER_IE} once with an appropriate pre-filled CSL IE and the CSL phase set to an arbitrary value or left uninitialized. The CSL phase SHALL be injected on-the-fly by the driver at runtime as outlined in 2. below. Adding a short and extended address will inform the driver of the specific CSL receiver to which it SHALL inject CSL IEs. If no addresses are given then the CSL IE will be injected into all enhanced ACK frames as soon as CSL is enabled. This configuration SHALL be done before enabling CSL by setting a CSL period greater than zero.

ii. Configure \textit{IEEE802154_CONFIG_EXPECTED_RX_TIME} immediately followed by \textit{IEEE802154_CONFIG_CSL_PERIOD}. To prevent race conditions, the upper layer SHALL ensure that the receiver is not enabled during or between the two calls (e.g. by a previously configured RX slot) nor SHALL a frame be transmitted concurrently.
The expected RX time SHALL point to the end of SFD of an ideally timed RX frame in an arbitrary past or future CSL channel sample, i.e. whose “end of SFD” arrives exactly at the locally predicted time inside the CSL channel sample.

The driver SHALL derive CSL anchor points and the CSL phase from the given expected RX time as follows:

\[
\text{cslAnchorPointNs} = \text{last expected RX time} + \text{PHY-specific PHR duration in ns}
\]

\[
\text{startOfMhrNs} = \text{start of MHR of the frame containing the CSL IE relative to the local network clock}
\]

\[
\text{cslPhase} = (\text{startOfMhrNs} - \text{cslAnchorPointNs}) / (10 \times \text{PHY specific symbol period in ns}) \mod \text{cslPeriod}
\]

The driver SHALL set the CSL phase in the IE configured in 1. and inject that IE on-the-fly into outgoing enhanced ACK frames if the destination address conforms to the IE’s address filter.

iii. Use IEEE802154_CONFIG_RX_SLOT periodically to schedule each CSL channel sample early enough before its start time. The size of the CSL channel sample SHALL take relative clock drift and scheduling uncertainties with respect to CSL transmitters into account as specified by the standard such that at least the full SHR of a legitimate RX frame is guaranteed to land inside the channel sample.

To this avail, the last configured expected RX time plus an integer number of CSL periods SHALL point to a fixed offset of the RX slot (not necessarily its center):

\[
\text{expectedRxTimeNs}_N = \text{last expected RX time} + N \times (\text{cslPeriod} \times 10 \times \text{PHY-specific symbol period in ns})
\]

\[
\text{expectedRxTimeNs}_N - \text{rxSlot}_N.\text{start} = \text{const for all } N
\]

While the configured CSL period is greater than zero, drivers SHOULD validate the offset of the expected RX time inside each RX slot accordingly. If the driver finds that the offset varies from slot to slot, drivers SHOULD log the difference but SHALL nevertheless accept and schedule the RX slot with a zero success value to work around minor implementation or rounding errors in upper layers.

Configure and start a CSL receiver:

Configure and start a CSL receiver:

Configure and start a CSL receiver:

Disable CSL on the receiver:

(continues on next page)
Update the CSL period to a new value:

```
| v
| ---------------------
| | 
| v | v
v v v
```

Note:
Confusingly the standard calls the CSL receiver “CSL coordinator” (i.e. “coordinating the CSL protocol timing”, see section 6.12.2.2), although, typically, a CSL coordinator is NOT also an IEEE 802.15.4 FFD coordinator or PAN coodinator but a simple RFD end device (compare the device roles outlined in sections 5.1, 5.3, 5.5 and 6.1). To avoid confusion we therefore prefer calling CSL coordinators (typically an RFD end device) “CSL receivers” and CSL peer devices (typically FFD coordinators or PAN coordinators) “CSL transmitters”. Also note that at this time, we do NOT support unsynchronized transmission with CSL wake up frames as specified in section 6.12.2.4.4.

Note:  Available in any interface operational state.

Note:  Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread specification 1.2.0, ch. 3.2.6.3).

**enumerator** IEEE802154_CONFIGEXPECTED_RX_TIME

Configure a timepoint at which an RX frame is expected to arrive.

Configure the nanosecond resolution timepoint relative to the network subsystem's local clock at which an RX frame's end of SFD (i.e. equivalently its end of SHR, start of PHR, or in the case of PHYs with RDEV or ERDEV capability the RMARKER) is expected to arrive at the local antenna assuming perfectly synchronized local and remote network clocks and zero distance between antennas.

This parameter MAY be used to offload parts of timing sensitive TDMA (e.g. TSCH, beacon-enabled PAN including DSME), low-energy (e.g. CSL, RIT) or ranging (TDoA) protocols to the driver. In these protocols, medium access is tightly controlled such that the expected arrival time of a frame can be predicted within a well-defined time window. This feature will typically be combined with IEEE802154_CONFIG_RX SLOT although this is not a hard requirement.

The “expected RX time” MAY be interpreted slightly differently depending on the protocol context:

- CSL phase (i.e. time to the next expected CSL transmission) or anchor time (i.e. any arbitrary timepoint with “zero CSL phase”) SHALL be derived by adding the PHY header duration to the expected RX time to calculate the “start of MHR”
(“first symbol of MAC”, see section 6.12.2.1) required by the CSL protocol, compare IEEE802154_CONFIG_CSL_PERIOD.

- In TSCH the expected RX time MAY be set to macTsRxOffset + macTsRxWait / 2. Then the time correction SHALL be calculated as the expected RX time minus actual arrival timestamp, see section 6.5.4.3.
- In ranging applications, time difference of arrival (TDOA) MAY be calculated inside the driver comparing actual RMARKER timestamps against the assumed synchronized time at which the ranging frame was sent, see IEEE 802.15.4z. In case of periodic protocols (e.g. CSL channel samples, periodic beacons of a single PAN, periodic ranging “blinks”), a single timestamp at any time in the past or in the future may be given from which other expected timestamps can be derived by adding or subtracting multiples of the RX period. See e.g. the CSL documentation in this API.

Additionally this parameter MAY be used by drivers to discipline their local representation of a distributed network clock by deriving synchronization instants related to a remote representation of the same clock (as in PTP).

**Note:** Available in any interface operational state.

**Note:** Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread specification 1.2.0, ch. 3.2.6.3).

**enumerator** IEEE802154_CONFIG_ENH_ACK_HEADER_IE

Adds a header information element (IE) to be injected into enhanced ACK frames generated by the driver if the given destination address filter matches.

Drivers implementing the IEEE802154_HW_RX_TX_ACK capability generate ACK frames autonomously. Setting this configuration will ask the driver to inject the given preconfigured header IE when generating enhanced ACK frames where appropriate by the standard. IEs for all other frame types SHALL be provided by L2.

The driver shall return -ENOTSUP in the following cases:
- It does not support the IEEE802154_HW_RX_TX_ACK,
- It does not support header IE injection,
- It cannot inject the runtime fields on-the-fly required for the given IE element ID (see list below).

Enhanced ACK header IEs (element IDs in parentheses) that either need to be rejected or explicitly supported and parsed by the driver because they require on-the-fly timing information injection are:
- CSL IE (0x1a)
- Rendezvous Time IE (0x1d)
- Time Correction IE (0x1e)

Drivers accepting this configuration option SHALL check the list of configured IEs for each outgoing enhanced ACK frame, select the ones appropriate for the received frame based on their element ID, inject any required runtime information on-the-fly and include the selected IEs into the enhanced ACK frame's MAC header.

Drivers supporting enhanced ACK header IE injection SHALL autonomously inject header termination IEs as required by the standard.

A destination short address and extended address MAY be given by L2 to filter the devices to which the given IE is included. Setting the short address to the broadcast address and the extended address to NULL will inject the given IE into all ACK frames unless a more specific filter is also present for any given destination device
(fallback configuration). L2 SHALL take care to either set both address fields to valid device addresses or none.

This configuration type may be called several times with distinct element IDs and/or addresses. The driver SHALL either store all configured IE/address combinations or return -ENOMEM if no additional configuration can be stored.

Configuring a header IE with a previously configured element ID and address filter SHALL override the previous configuration. This implies that repetition of the same header IE/address combination is NOT supported.

Configuring an existing element ID/address filter combination with the header IE's length field set to zero SHALL remove that configuration. SHALL remove the fallback configuration if no address is given.

Configuring a header IE for an address filter with the header IE pointer set to NULL SHALL remove all header IE's for that address filter. SHALL remove ALL header IE configuration (including but not limited to fallbacks) if no address is given.

If any of the deleted configurations didn’t previously exist, then the call SHALL be ignored. Whenever the length field is set to zero, the content fields MUST NOT be accessed by the driver.

L2 SHALL minimize the space required to keep IE configuration inside the driver by consolidating address filters and by removing configuration that is no longer required.

**Note:** requires IEEE802154_HW_RX_TX_ACK capability and is available in any interface operational state. Currently we only support header IEs but that may change in the future.

**Note:** Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread specification 1.2.0, ch. 3.2.6.3).

**Note:** Required for Thread 1.2 Link Metrics feature (see Thread specification 1.2.0, ch. 4.11.3.3).

enumerator IEEE802154_CONFIG_RX_ON_WHEN_IDLE

Enable/disable RxOnWhenIdle MAC PIB attribute (Table 8-94).

Since there is no clear guidance in IEEE 802.15.4 specification about the definition of an “idle period”, this implementation expects that drivers use the RxOnWhenIdle attribute to determine next radio state (false -> off, true -> receive) in the following scenarios:

- Finalization of a regular frame reception task, provided that:
  - The frame is received without errors and passes the filtering and it's not an spurious ACK.
  - ACK is not requested or transmission of ACK is not possible due to internal conditions.
- Finalization of a frame transmission or transmission of an ACK frame, when ACK is not requested in the transmitted frame.
- Finalization of the reception operation of a requested ACK due to:
  - ACK timeout expiration.
  - Reception of an invalid ACK or not an ACK frame.
  - Reception of the proper ACK, unless the transmitted frame was a Data Request Command and the frame pending bit on the received ACK is set to true.
In this case the radio platform implementation SHOULD keep the receiver on until a determined timeout which triggers an idle period start.

- Finalization of a stand alone CCA task.
- Finalization of a CCA operation with busy result during CSMA/CA procedure.
- Finalization of an Energy Detection task.
- Finalization of a scheduled radio reception window (see `IEEE802154_CONFIG_RX_SLOT`).

enumerator `IEEE802154_CONFIG_COMMON_COUNT`  
Number of types defined in ieee802154_config_type.

enumerator `IEEE802154_CONFIG_PRIV_START = IEEE802154_CONFIG_COMMON_COUNT`  
This and higher values are specific to the protocol- or driver-specific extensions.

enum `ieee802154_attr`  
IEEE 80.15.4 driver attributes.

See `ieee802154_attr_value` and `ieee802154_radio_api` for usage details.

Values:

enumerator `IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_PAGES`  
Retrieves a bit field with supported channel pages.

This attribute SHALL be implemented by all drivers.

enumerator `IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_RANGES`  
Retrieves a pointer to the array of supported channel ranges within the currently configured channel page.

This attribute SHALL be implemented by all drivers.

enumerator `IEEE802154_ATTR_PHY_HRP_UWB_SUPPORTED_PRFS`  
Retrieves a bit field with supported HRP UWB nominal pulse repetition frequencies.

This attribute SHALL be implemented by all devices that support channel page four (HRP UWB).

enumerator `IEEE802154_ATTR_COMMON_COUNT`  
Number of attributes defined in ieee802154_attr.

enumerator `IEEE802154_ATTR_PRIV_START = IEEE802154_ATTR_COMMON_COUNT`  
This and higher values are specific to the protocol- or driver-specific extensions.

typedef void (*energy_scan_done_cb_t)(const struct `device` *dev, int16_t max_ed)  
Energy scan callback.

typedef void (*ieee802154_event_cb_t)(const struct `device` *dev, enum `ieee802154_event` evt, void *event_params)  
Driver event callback.
static inline int ieee802154_attr_get_channel_page_and_range(enum ieee802154_attr attr, const enum ieee802154_phy_channel_page phy_supported_channel_page, const struct ieee802154_phy_supported_channels *phy_supported_channels, struct ieee802154_attr_value *value)

Helper function to handle channel page and range to be called from drivers' attr_get() implementation.

This only applies to drivers with a single channel page.

**Parameters**
- **attr** – The attribute to be retrieved.
- **phy_supported_channel_page** – The driver's unique channel page.
- **phy_supported_channels** – Pointer to the structure that contains the driver's channel range or ranges.
- **value** – The pointer to the value struct provided by the user.

**Return values**
- 0 – if the attribute could be resolved
- -ENOENT – if the attribute could not be resolved

IEEE802154_HW_CAPS_BITS_COMMON_COUNT
Number of bits used by ieee802154_hw_caps type.

IEEE802154_HW_CAPS_BITS_PRIV_START
This and higher values are specific to the protocol- or driver-specific extensions.

IEEE802154_CONFIG_RX_SLOT_NONE
Configuring an RX slot with the start parameter set to this value will cancel and delete any previously configured RX slot.

IEEE802154_CONFIG_RX_SLOT_OFF
Configuring an RX slot with this start parameter while the driver is “down”, will keep RX off when the driver is being started.

Configuring an RX slot with this start value while the driver is “up” will immediately switch RX off until either the slot is deleted, see IEEE802154_CONFIG_RX_SLOT_NONE or a slot with a future start parameter is configured and that start time arrives.

IEEE 802.15.4 driver utils

static inline bool ieee802154_is_ar_flag_set(struct net_buf *frag)
Check if the AR flag is set on the frame inside the given Network Packet Library.

**Parameters**
- **frag** – A valid pointer on a net_buf structure, must not be NULL, and its length should be at least 1 byte (ImmAck frames are the shortest supported frames with 3 bytes excluding FCS).
IEEE 802.15.4 driver callbacks

enum net_verdict ieee802154_handle_ack(struct net_if *iface, struct net_pkt *pkt)

IEEE 802.15.4 driver ACK handling callback into L2 that drivers must call when receiving an ACK package.

The IEEE 802.15.4 standard prescribes generic procedures for ACK handling on L2 (MAC) level. L2 stacks therefore have to provide a fast and re-usable generic implementation of this callback for drivers to call when receiving an ACK packet.

Note: This function is part of Zephyr’s 802.15.4 stack driver -> L2 “inversion-of-control” adaptation API and must be implemented by all IEEE 802.15.4 L2 stacks.

**Warning:** Deviating from other functions in the net stack returning net_verdict, this function will not unref the package even if it returns NET_OK.

Parameters

- **iface** – A valid pointer on a network interface that received the packet
- **pkt** – A valid pointer on a packet to check

Returns

NET_OK if L2 handles the ACK package, NET_CONTINUE or NET_DROP otherwise.

void ieee802154_init(struct net_if *iface)

IEEE 802.15.4 driver initialization callback into L2 called by drivers to initialize the active L2 stack for a given interface.

Drivers must call this function as part of their own initialization routine.

Note: This function is part of Zephyr’s 802.15.4 stack driver -> L2 “inversion-of-control” adaptation API and must be implemented by all IEEE 802.15.4 L2 stacks.

Parameters

- **iface** – A valid pointer on a network interface

IEEE 802.15.4-2020, Section 6: MAC functional description

IEEE802154_PHY_SYMBOLS_PER_SECOND(symbol_period_ns)

The symbol period (and therefore symbol rate) is defined in section 6.1: “Some of the timing parameters in definition of the MAC are in units of PHY symbols.

For PHYs that have multiple symbol periods, the duration to be used for the MAC parameters is defined in that PHY clause.”

This is not necessarily the true physical symbol period, so take care to use this macro only when either the symbol period used for MAC timing is the same as the physical symbol period or if you actually mean the MAC timing symbol period.

PHY specific symbol periods are defined in PHY specific sections below.
IEEE 802.15.4-2020, Section 8: MAC services

**IEEE802154_MAC_A_BASE_SLOT_DURATION**
The number of PHY symbols forming a superframe slot when the superframe order is equal to zero, see sections 8.4.2, table 8-93, aBaseSlotDuration and section 6.2.1.

**IEEE802154_MAC_A_NUM_SUPERFRAME_SLOTS**
The number of slots contained in any superframe, see section 8.4.2, table 8-93, aNumSuperframeSlots.

**IEEE802154_MAC_A_BASE_SUPERFRAME_DURATION**
The number of PHY symbols forming a superframe when the superframe order is equal to zero, see section 8.4.2, table 8-93, aBaseSuperframeDuration.

**IEEE802154_MAC_A_UNIT_BACKOFF_PERIOD** *(turnaround_time)*
MAC PIB attribute aUnitBackoffPeriod, see section 8.4.2, table 8-93, in symbol periods, valid for all PHYs except SUN PHY in the 920 MHz band.

**IEEE802154_MAC_RESPONSE_WAIT_TIME_DEFAULT**
Default macResponseWaitTime in multiples of aBaseSuperframeDuration as defined in section 8.4.3.1, table 8-94.

IEEE 802.15.4-2020, Section 11: PHY services

**IEEE802154_PHY_A_TURNAROUND_TIME_DEFAULT**
Default PHY PIB attribute aTurnaroundTime, in PHY symbols, see section 11.3, table 11-1.

**IEEE802154_PHY_A_TURNAROUND_TIME_1MS**(symbol_periodNs)
PHY PIB attribute aTurnaroundTime for SUN, RS-GFSK, TVWS, and LECIM FSK PHY, in PHY symbols, see section 11.3, table 11-1.

**IEEE802154_PHY_A_CCA_TIME**
PHY PIB attribute aCcaTime, in PHY symbols, all PHYs except for SUN O-QPSK, see section 11.3, table 11-1.

IEEE 802.15.4-2020, Section 12: O-QPSK PHY

**IEEE802154_PHY_OQPSK_868MHZ_SYMBOL_PERIOD_NS**
O-QPSK 868Mhz band symbol period, see section 12.3.3.

**IEEE802154_PHY_OQPSK_780_TO_2450MHZ_SYMBOL_PERIOD_NS**
O-QPSK 780MHz, 915MHz, 2380MHz and 2450MHz bands symbol period, see section 12.3.3.

IEEE 802.15.4-2020, Section 13: BPSK PHY
IEEE802154_PHY_BPSK_868MHZ_SYMBOL_PERIOD_NS
BPSK 868MHz band symbol period, see section 13.3.3.

IEEE802154_PHY_BPSK_915MHZ_SYMBOL_PERIOD_NS
BPSK 915MHz band symbol period, see section 13.3.3.

IEEE 802.15.4-2020, Section 19: SUN FSK PHY

IEEE802154_PHY_SUN_FSK_863MHZ_915MHZ_SYMBOL_PERIOD_NS
SUN FSK 863Mhz and 915MHz band symbol periods, see section 19.1, table 19-1.

IEEE802154_PHY_SUN_FSK_PHR_LEN
SUN FSK PHY header length, in bytes, see section 19.2.4.

struct ieee802154_header_ie_vendor_specific
#include <ieee802154_ie.h> Vendor Specific Header IE, see section 7.4.2.3.

struct ieee802154_header_ie_csl_full
#include <ieee802154_ie.h> Full CSL IE, see section 7.4.2.3.

struct ieee802154_header_ie_csl_reduced
#include <ieee802154_ie.h> Reduced CSL IE, see section 7.4.2.3.

struct ieee802154_header_ie_csl
#include <ieee802154_ie.h> Generic CSL IE, see section 7.4.2.3.

struct ieee802154_header_ie_rit
#include <ieee802154_ie.h> RIT IE, see section 7.4.2.4.

struct ieee802154_header_ie_rendezvous_time_full
#include <ieee802154_ie.h> Full Rendezvous Time IE, see section 7.4.2.6 (macCslInterval is nonzero).

struct ieee802154_header_ie_rendezvous_time_reduced
#include <ieee802154_ie.h> Reduced Rendezvous Time IE, see section 7.4.2.6 (macCslInterval is zero).

struct ieee802154_header_ie_rendezvous_time
#include <ieee802154_ie.h> Rendezvous Time IE, see section 7.4.2.6.

struct ieee802154_header_ie_time_correction
#include <ieee802154_ie.h> Time Correction IE, see section 7.4.2.7.

struct ieee802154_header_ie
#include <ieee802154_ie.h>
struct ieee802154_phy_channel_range
   
   #include <ieee802154_radio.h> Represents a supported channel range, see ieee802154_phy_supported_channels.

struct ieee802154_phy_supported_channels
   
   #include <ieee802154_radio.h> Represents a list of channels supported by a driver for a given interface, see IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_RANGES.

Public Members

const struct ieee802154_phy_channel_range *const ranges
   Pointer to an array of channel range structures.

Warning: The pointer must be valid and constant throughout the life of the interface.

const uint8_t num_ranges
   The number of currently available channel ranges.

struct ieee802154_filter
   
   #include <ieee802154_radio.h> Filter value, see ieee802154_radio_api::filter.

Public Members

uint8_t *ieee_addr
   Extended address, in little endian.

uint16_t short_addr
   Short address, in CPU byte order.

uint16_t pan_id
   PAN ID, in CPU byte order.

struct ieee802154_key
   
   #include <ieee802154_radio.h> Key configuration for transmit security offloading, see IEEE802154_CONFIG_MAC_KEYS.

Public Members

uint8_t *key_value
   Key material.

uint32_t key_frame_counter
   Initial value of frame counter associated with the key, see section 9.4.3.
bool frame_counter_per_key
   Indicates if per-key frame counter should be used, see section 9.4.3.

uint8_t key_id_mode
   Key Identifier Mode, see section 9.4.2.3, Table 9-7.

uint8_t *key_id
   Key Identifier, see section 9.4.4.

struct ieee802154_config
#include <ieee802154_radio.h> IEEE 802.15.4 driver configuration data.

Public Members

struct ieee802154_config auto_ack_fpb
   see IEEE802154_CONFIG_AUTO_ACK_FPB

struct ieee802154_config ack_fpb
   see IEEE802154_CONFIG_ACK_FPB

bool pan_coordinator
   see IEEE802154_CONFIG_PAN_COORDINATOR

bool promiscuous
   see IEEE802154_CONFIG_PROMISCUOUS

bool rx_on_when_idle
   see IEEE802154_CONFIG_RX_ON_WHEN_IDLE

ieee802154_event_cb_t event_handler
   see IEEE802154_CONFIG_EVENT_HANDLER

struct ieee802154_key *mac_keys
   see IEEE802154_CONFIG_MAC_KEYS
   Pointer to an array containing a list of keys used for MAC encryption. Refer to secKeyIdLookupDescriptor and secKeyDescriptor in IEEE 802.15.4
   The key_value field points to a buffer containing the 16 byte key. The buffer SHALL be copied by the driver before returning from the call.
   The variable length array is terminated by key_value field set to NULL.

uint32_t frame_counter
   see IEEE802154_CONFIG_FRAME_COUNTER

net_time_t start
   Nanosecond resolution timestamp relative to the network subsystem’s local clock defining the start of the RX window during which the receiver is expected to be listening (i.e.
not including any driver startup times).

Configuring an rx_slot with the start attribute set to -1 will cancel and delete any previously active rx slot.

- **net_time_t duration**
  Nanosecond resolution duration of the RX window relative to the above RX window start time during which the receiver is expected to be listening (i.e. not including any shutdown times). Only positive values larger than or equal zero are allowed.
  Setting the duration to zero will disable the receiver, no matter what the start parameter.

- **struct ieee802154_config rx_slot**
  see IEEE802154_CONFIG_RX_SLOT

- **uint32_t csl_period**
  see IEEE802154_CONFIG_CSL_PERIOD
  in CPU byte order

- **net_time_t expected_rx_time**
  see IEEE802154_CONFIG_EXPECTED_RX_TIME

- **struct ieee802154_header_ie *header_ie**
  Pointer to the header IE, see section 7.4.2.1, figure 7-21.
  Certain header IEs may be incomplete if they require timing information to be injected at runtime on-the-fly, see the list in IEEE802154_CONFIG_ENH_ACK_HEADER_IE.

- **const uint8_t *ext_addr**
  Filters the devices that will receive this IE by extended address.
  MAY be set to NULL to configure a fallback for all devices (implies that short_addr MUST also be set to IEEE802154_BROADCAST_ADDRESS).
  in big endian

- **uint16_t short_addr**
  Filters the devices that will receive this IE by short address.
  MAY be set to IEEE802154_BROADCAST_ADDRESS to configure a fallback for all devices (implies that ext_addr MUST also set to NULL in this case).
  in CPU byte order

- **bool purge_ie**
  Flag for purging enh ACK header IEs.
  When flag is set to true, driver should remove all existing header IEs, and all other entries in config should be ignored. This means that purging current header IEs and configuring a new one in the same call is not allowed.

- **struct ieee802154_config ack_ie**
  see IEEE802154_CONFIG_ENH_ACK_HEADER_IE
union ieee802154_config
    Configuration data.

struct ieee802154_attr_value
    #include <ieee802154_radio.h> IEEE 802.15.4 driver attribute values.
    This structure is reserved to scalar and structured attributes that originate in the driver
    implementation and can neither be implemented as boolean ieee802154_hw_caps nor
    be derived directly or indirectly by the MAC (L2) layer. In particular this structure
    MUST NOT be used to return configuration data that originate from L2.

    Note: To keep this union reasonably small, any attribute requiring a large memory
    area, SHALL be provided pointing to static memory allocated by the driver and valid
    throughout the lifetime of the driver instance.

Public Members

uint32_t phy_supported_channel_pages
    A bit field that represents the supported channel pages, see
    ieee802154_phy_channel_page.

    Note: To keep the API extensible as required by the standard, supported pages
    are modeled as a bitmap to support drivers that implement runtime switching be-
    tween multiple channel pages.

    Note: Currently none of the Zephyr drivers implements more than one channel
    page at runtime, therefore only one bit will be set and the current channel page
    (see the PHY PIB attribute phyCurrentPage, section 11.3, table 11-2) is considered
    to be read-only, fixed and “well known” via the supported channel pages attribute.

const struct ieee802154_phy_supported_channels *phy_supported_channels
    Pointer to a structure representing channel ranges currently available on the se-
    lected channel page.

    The selected channel page corresponds to the phyCurrentPage PHY PIB attribute,
    see the description of phy_supported_channel_pages above. Currently it can be re-
    trieved via the IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_PAGES attribute.

    Most drivers will expose a single channel page with a single, often zero-based, fixed
    channel range.

    Some notable exceptions:
    • The legacy channel page (zero) exposes ranges in different bands and even
      PHYs that are usually not implemented by a single driver.
    • SUN and LECIM PHYs specify a large number of bands and operating modes
      on a single page with overlapping channel ranges each. Some of these ranges
      are not zero-based or contain “holes”. This explains why several ranges may
      be necessary to represent all available channels.
    • UWB PHYs often support partial channel ranges on the same channel page de-
      pending on the supported bands.
In these cases, drivers may expose custom configuration attributes (Kconfig, device-tree, runtime, ...) that allow switching between sub-ranges within the same channel page (e.g. switching between SubG and 2.4G bands on channel page zero or switching between multiple operating modes in the SUN or LECIM PHYs.

**Warning:** The pointer must be valid and constant throughout the life of the interface.

```c
uint32_t phy_hrp_uwb_supported_nominal_prfs
```

A bit field representing supported HRP UWB pulse repetition frequencies (PRF), see enum ieee802154_phy_hrp_uwb_nominal_prf.

**Note:** Currently none of the Zephyr HRP UWB drivers implements more than one nominal PRF at runtime, therefore only one bit will be set and the current PRF (UwbPrf, MCPS-DATA.request, section 8.3.2, table 8-88) is considered to be read-only, fixed and “well known” via the supported PRF attribute.

```c
struct ieee802154_radio_api
```

#include `<ieee802154_radio.h>` IEEE 802.15.4 driver interface API.

While L1-level driver features are exclusively implemented by drivers and MAY be mandatory to support certain application requirements, L2 features SHOULD be optional by default and only need to be implemented for performance optimization or precise timing as deemed necessary by driver maintainers. Fallback implementations (“Soft MAC”) SHOULD be provided in the driver-independent L2 layer for all L2/MAC features especially if these features are not implemented in vendor hardware/firmware by a majority of existing in-tree drivers. If, however, a driver offers offloading opportunities then L2 implementations SHALL delegate performance critical or resource intensive tasks to the driver.

All drivers SHALL support two externally observable interface operational states: “UP” and “DOWN”. Drivers MAY additionally support a “TESTING” interface state (see continuous_carrier()).

The following rules apply:

- An interface is considered “UP” when it is able to transmit and receive packets, “DOWN” otherwise (see precise definitions of the corresponding ifOperStatus values in RFC 2863, section 3.1.14, net_if_oper_state and the continuous_carrier() exception below). A device that has its receiver temporarily disabled during “UP” state due to an active receive window configuration is still considered “UP”.

- Upper layers will assume that the interface managed by the driver is “UP” after a call to start() returned zero or -EALREADY. Upper layers assume that the interface is “DOWN” after calling stop() returned zero or -EALREADY.

- The driver SHALL block start()/stop() calls until the interface fully transitioned to the new state (e.g. the receiver is operational, ongoing transmissions were finished, etc.). Drivers SHOULD yield the calling thread (i.e. “sleep”) if waiting for the new state without CPU interaction is possible.

- Drivers are responsible of guaranteeing atomicity of state changes. Appropriate means of synchronization SHALL be implemented (locking, atomic flags, ...).

- While the interface is “DOWN”, the driver SHALL be placed in the lowest possible power state. The driver MAY return from a call to stop() before it reaches the
lowest possible power state, i.e. manage power asynchronously. While the interface is “UP”, the driver SHOULD autonomously and asynchronously transition to lower power states whenever possible. If the driver claims to support timed RX/TX capabilities and the upper layers configure an RX slot, then the driver SHALL immediately transition (asynchronously) to the lowest possible power state until the start of the RX slot or until a scheduled packet needs to be transmitted.

• The driver SHALL NOT change the interface’s “UP”/“DOWN” state on its own. Initially, the interface SHALL be in the “DOWN” state.

• Drivers that implement the optional continuous_carrier() operation will be considered to be in the RFC 2863 “testing” ifOperStatus state if that operation returns zero. This state is active until either start() or stop() is called. If continuous_carrier() returns a non-zero value then the previous state is assumed by upper layers.

• If calls to start()/stop() return any other value than zero or -EALREADY, upper layers will consider the interface to be in a “lowerLayerDown” state as defined in RFC 2863.

• The RFC 2863 “dormant”, “unknown” and “notPresent” ifOperStatus states are currently not supported. The “lowerLevelUp” state.

• The ed_scan(), cca() and tx() operations SHALL only be supported in the “UP” state and return -ENETDOWN in any other state. See the function-level API documentation below for further details.

Note: This structure is called “radio” API for backwards compatibility. A better name would be “IEEE 802.15.4 driver API” as typical drivers will not only implement L1/radio (PHY) features but also L2 (MAC) features if the vendor-specific driver hardware or firmware offers offloading opportunities.

Note: In case of devices that support timed RX/TX, the “UP” state is not equal to “receiver enabled”. If a receive window (i.e. RX slot, see IEEE802154_CONFIG_RX_SLOT) is configured before calling start() then the receiver will not be enabled when transitioning to the “UP” state. Configuring a receive window while the interface is “UP” will cause the receiver to be disabled immediately until the configured reception time has arrived.

Public Members

struct net_if_api iface_api

network interface API

Note: Network devices must extend the network interface API. It is therefore mandatory to place it at the top of the driver API struct so that it can be cast to a network interface.

enum ieee802154_hw_caps (*get_capabilities)(const struct device *dev)

Get the device driver capabilities.

Note: Implementations SHALL be isr-ok and MUST NOT sleep. MAY be called in
any interface state once the driver is fully initialized ("ready").

**Param dev**  
pointer to IEEE 802.15.4 driver device

**Return**  
Bit field with all supported device driver capabilities.

```c
int (*cca)(const struct device *dev)
```

Clear Channel Assessment - Check channel's activity.

**Note:** Implementations SHALL be **isr-ok** and MAY **sleep**. SHALL return **-ENETDOWN** unless the interface is “UP”.

**Param dev**  
pointer to IEEE 802.15.4 driver device

**Retval 0**  
the channel is available

**Retval -EBUSY**  
The channel is busy.

**Retval -EWOULDBLOCK**  
The operation is called from ISR context but temporarily cannot be executed without blocking.

**Retval -ENETDOWN**  
The interface is not “UP”.

**Retval -ENOTSUP**  
CCA is not supported by this driver.

**Retval -EIO**  
The CCA procedure could not be executed.

```c
int (*set_channel)(const struct device *dev, uint16_t channel)
```

Set current channel.

**Note:** Implementations SHALL be **isr-ok** and MAY **sleep**. SHALL return **-EIO** unless the interface is either “UP” or “DOWN”.

**Param dev**  
pointer to IEEE 802.15.4 driver device

**Param channel**  
the number of the channel to be set in CPU byte order

**Retval 0**  
channel was successfully set

**Retval -EALREADY**  
The previous channel is the same as the requested channel.

**Retval -EINVAL**  
The given channel is not within the range of valid channels of the driver's current channel page, see the IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_RANGES driver attribute.

**Retval -EWOULDBLOCK**  
The operation is called from ISR context but temporarily cannot be executed without blocking.

**Retval -ENOTSUP**  
The given channel is within the range of valid channels of the driver's current channel page but unsupported by the current driver.
int (*filter)(const struct device *dev, bool set, enum ieee802154_filter_type type, const struct ieee802154_filter *filter)
Set/Unset PAN ID, extended or short address filters.

Note: requires IEEE802154_HW_FILTER capability.

Note: Implementations SHALL be isr-ok and MAY sleep. SHALL return -EIO unless the interface is either “UP” or “DOWN”.

Param dev
pointer to IEEE 802.15.4 driver device
Param set
true to set the filter, false to remove it
Param type
the type of entity to be added/removed from the filter list (a PAN ID or a source/destination address)
Param filter
the entity to be added/removed from the filter list
Retval 0
The filter was successfully added/removed.
Retval -EINVAL
The given filter entity or filter entity type was not valid.
Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.
Retval -ENOMEM
Setting/removing this filter or filter type is not supported by this driver.
Retval -EIO
Error while setting/removing the filter.

int (*set_txpower)(const struct device *dev, int16_t dbm)
Set TX power level in dbm.

Note: Implementations SHALL be isr-ok and MAY sleep. SHALL return -EIO unless the interface is either “UP” or “DOWN”.

Param dev
pointer to IEEE 802.15.4 driver device
Param dbm
TX power in dbm
Retval 0
The TX power was successfully set.
Retval -EINVAL
The given dbm value is invalid or not supported by the driver.
Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.
Retval -EIO
The TX power could not be set.
int (*tx)(const struct device *dev, enum ieee802154_tx_mode mode, struct net_pkt *pkt, struct net_buf *frag)

Transmit a packet fragment as a single frame.

Depending on the level of offloading features supported by the driver, the frame MAY not be fully encrypted/authenticated or it MAY not contain an FCS. It is the responsibility of L2 implementations to prepare the frame according to the offloading capabilities announced by the driver and to decide whether CCA, CSMA/CA, ACK or retransmission procedures need to be executed outside (“soft MAC”) or inside (“hard MAC”) the driver.

All frames originating from L2 SHALL have all required IEs pre-allocated and pre-filled such that the driver does not have to parse and manipulate IEs at all. This includes ACK packets if the driver does not have the IEEE802154_HW_RX_TX_ACK capability. Also see IEEE802154_CONFIG_ENH_ACK_HEADER_IE for drivers that have the IEEE802154_HW_RX_TX_ACK capability.

IEs that cannot be prepared by L2 unless the TX time is known (e.g. CSL IE, Rendezvous Time IE, Time Correction IE, ...) SHALL be sent in any of the timed TX modes with appropriate timing information pre-filled in the IE such that drivers do not have to parse and manipulate IEs at all unless the frame is generated by the driver itself.

In case any of the timed TX modes is supported and used (see ieee802154_hw_caps and ieee802154_tx_mode), the driver SHALL take responsibility of scheduling and sending the packet at the precise programmed time autonomously without further interaction by upper layers. The call to tx() will block until the package has either been sent successfully (possibly including channel acquisition and packet acknowledgment) or a terminal transmission error occurred. The driver SHALL sleep and keep power consumption to the lowest possible level until the scheduled transmission time arrives or during any other idle waiting time.

Note: Implementations MAY sleep and will usually NOT be isr-ok - especially when timed TX, CSMA/CA, retransmissions, auto-ACK or any other offloading feature is supported that implies considerable idle waiting time. SHALL return -ENETDOWN unless the interface is “UP”.

Warning: The driver SHALL NOT take ownership of the given network packet and frame (fragment) buffer. Any data required by the driver including the actual frame content must be read synchronously and copied internally if needed at a later time (e.g. the contents of IEs required for protocol configuration, states of frame counters, sequence numbers, etc). Both, the packet and the buffer MAY be re-used or released by upper layers immediately after the function returns.

Param dev
pointer to IEEE 802.15.4 driver device

Param mode
the transmission mode, some of which require specific offloading capabilities.

Param pkt
pointer to the network packet to be transmitted.

Param frag
pointer to a network buffer containing a single fragment with the frame data to be transmitted

Retval 0
The frame was successfully sent or scheduled. If the driver supports
ACK offloading and the frame requested acknowledge (AR bit set), this means that the packet was successfully acknowledged by its peer.

Retval -EINVAL
Invalid packet (e.g. an expected IE is missing or the encryption/authentication state is not as expected).

Retval -EBUSY
The frame could not be sent because the medium was busy (CSMA/CA or CCA offloading feature only).

Retval -ENOMSG
The frame was not confirmed by an ACK packet (TX ACK offloading feature only).

Retval -ENOBUFFS
The frame could not be scheduled due to missing internal resources (timed TX offloading feature only).

Retval -ENETDOWN
The interface is not “UP”.

Retval -ENOTSUP
The given TX mode is not supported.

Retval -EIO
The frame could not be sent due to some unspecified driver error (e.g. the driver being busy).

int (*start)(const struct device *dev)
Start the device.

Upper layers will assume the interface is “UP” if this operation returns with zero or -EALREADY. The interface is placed in receive mode before returning from this operation unless an RX slot has been configured (even if it lies in the past, see IEEE802154_CONFIG_RX_SLOT).

Note: Implementations SHALL be isr-ok and MAY sleep. MAY be called in any interface state once the driver is fully initialized (“ready”).

Param dev
pointer to IEEE 802.15.4 driver device

Retval 0
The driver was successfully started.

Retval -EALREADY
The driver was already “UP”.

Retval -EWOULD_BLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.

Retval -EIO
The driver could not be started.

int (*stop)(const struct device *dev)
Stop the device.

Upper layers will assume the interface is “DOWN” if this operation returns with zero or -EALREADY. The driver switches off the receiver before returning if it was previously on. The driver enters the lowest possible power mode after this operation is called. This MAY happen asynchronously (i.e. after the operation already returned control).

Note: Implementations SHALL be isr-ok and MAY sleep. MAY be called in any interface state once the driver is fully initialized (“ready”).
**Param dev**  
pointer to IEEE 802.15.4 driver device  

**Retval 0**  
The driver was successfully stopped.

**Retval -EWOULDBLOCK**  
The operation is called from ISR context but temporarily cannot be executed without blocking.

**Retval -EALREADY**  
The driver was already “DOWN”.

**Retval -EIO**  
The driver could not be stopped.

```c
int (*continuous_carrier)(const struct device *dev)
```
Start continuous carrier wave transmission.

The method blocks until the interface has started to emit a continuous carrier. To leave this mode, `start()` or `stop()` should be called, which will put the driver back into the “UP” or “DOWN” states, respectively.

**Note:** Implementations MAY sleep and will usually NOT be isr-ok. MAY be called in any interface state once the driver is fully initialized (“ready”).

**Param dev**  
pointer to IEEE 802.15.4 driver device  

**Retval 0**  
continuous carrier wave transmission started

**Retval -EALREADY**  
The driver was already in “TESTING” state and emitting a continuous carrier.

**Retval -EIO**  
not started

```c
int (*configure)(const struct device *dev, enum ieee802154_config_type type, const struct ieee802154_config *config)
```
Set or update driver configuration.

The method blocks until the interface has been reconfigured atomically with respect to ongoing package reception, transmission or any other ongoing driver operation.

**Note:** Implementations SHALL be isr-ok and MAY sleep. MAY be called in any interface state once the driver is fully initialized (“ready”). Some configuration options may not be supported in all interface operational states, see the detailed specifications in `ieee802154_config_type`. In this case the operation returns -EACCES.

**Param dev**  
pointer to IEEE 802.15.4 driver device

**Param type**  
the configuration type to be set

**Param config**  
the configuration parameters to be set for the given configuration type

**Retval 0**  
configuration successful

**Retval -EINVAL**  
The configuration parameters are invalid for the given configuration type.
Retval -ENOTSUP
The given configuration type is not supported by this driver.

Retval -EACCES
The given configuration type is supported by this driver but cannot be configured in the current interface operational state.

Retval -ENOMEM
The configuration cannot be saved due to missing memory resources.

Retval -ENOENT
The resource referenced in the configuration parameters cannot be found in the configuration.

Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.

Retval -EIO
An internal error occurred while trying to configure the given configuration parameter.

```c
int (*ed_scan)(const struct device *dev, uint16_t duration, energy_scan_done_cb_t done_cb)
```

Run an energy detection scan.

**Note:** requires IEEE802154_HW_ENERGY_SCAN capability

**Note:** The radio channel must be set prior to calling this function.

**Note:** Implementations SHALL be **isr-ok** and MAY **sleep**. SHALL return -ENETDOWN unless the interface is “UP”.

- **Param dev**
  pointer to IEEE 802.15.4 driver device
- **Param duration**
  duration of energy scan in ms
- **Param done_cb**
  function called when the energy scan has finished
- **Retval 0**
  the energy detection scan was successfully scheduled
- **Retval -EBUSY**
  the energy detection scan could not be scheduled at this time
- **Retval -EALREADY**
  a previous energy detection scan has not finished yet.
- **Retval -ENETDOWN**
  The interface is not “UP”.
- **Retval -ENOTSUP**
  This driver does not support energy scans.
- **Retval -EIO**
  The energy detection procedure could not be executed.

```c
net_time_t (*get_time)(const struct device *dev)
```

Get the current time in nanoseconds relative to the network subsystem’s local uptime clock as represented by this network interface.

See **net_time_t** for semantic details.
Note: requires IEEE802154_HW_TXTIME and/or IEEE802154_HW_RXTIME capabilities. Implementations SHALL be isr-ok and MUST NOT sleep. MAY be called in any interface state once the driver is fully initialized (“ready”).

**Param dev**
pointer to IEEE 802.15.4 driver device

**Return**
nanoseconds relative to the network subsystem’s local clock, -1 if an error occurred or the operation is not supported

```c
uint8_t (*get_sch_acc)(const struct device *dev)
```

Get the current estimated worst case accuracy (maximum ± deviation from the nominal frequency) of the network subsystem’s local clock used to calculate tolerances and guard times when scheduling delayed receive or transmit radio operations.

The deviation is given in units of PPM (parts per million).

Note: requires IEEE802154_HW_TXTIME and/or IEEE802154_HW_RXTIME capabilities.

**Note:** Implementations may estimate this value based on current operating conditions (e.g. temperature). Implementations SHALL be isr-ok and MUST NOT sleep. MAY be called in any interface state once the driver is fully initialized (“ready”).

**Param dev**
pointer to IEEE 802.15.4 driver device

**Return**
current estimated clock accuracy in PPM

```c
int (*attr_get)(const struct device *dev, enum ieee802154_attr attr, struct ieee802154_attr_value *value)
```

Get the value of a driver specific attribute.

Note: This function SHALL NOT return any values configurable by the MAC (L2) layer. It is reserved to non-boolean (i.e. scalar or structured) attributes that originate from the driver implementation and cannot be directly or indirectly derived by L2. Boolean attributes SHALL be implemented as ieee802154_hw_caps.

**Note:** Implementations SHALL be isr-ok and MUST NOT sleep. MAY be called in any interface state once the driver is fully initialized (“ready”).

**Retval 0**
The requested attribute is supported by the driver and the value can be retrieved from the corresponding ieee802154_attr_value member.

**Retval -ENOENT**
The driver does not provide the requested attribute. The value structure has not been updated with attribute data. The content of the value attribute is undefined.
IEEE 802.15.4 L2 / Native Stack API  This documents the IEEE 802.15.4 L2 native stack, which neither applications nor drivers will ever access directly. It is called internally by Zephyr’s upper network layers (L3+), its socket and network context abstractions. This API is therefore of interest to IEEE 802.15.4 subsystem contributors only.

**group ieee802154_l2**

IEEE 802.15.4 L2 APIs.

This API provides integration with Zephyr’s sockets and network contexts. **Application and driver developers should never interface directly with this API.** It is of interest to subsystem maintainers only.

The API implements and extends the following structures:

- implements Zephyr’s internal L2-level socket and network context abstractions (context/socket operations, see *Network L2 Abstraction Layer*),
- protocol-specific extension to the interface structure (see *Network Interface abstraction layer*)
- protocol-specific extensions to the network packet structure (see *Network Packet Library*),

**Note:** All section, table and figure references are to the IEEE 802.15.4-2020 standard.

**Defines**

IEEE802154_MAX_PHY_PACKET_SIZE

Represents the PHY constant aMaxPhyPacketSize, see section 11.3.

**Note:** Currently only 127 byte sized packets are supported although some PHYs (e.g. SUN, MSK, LECIM, …) support larger packet sizes. Needs to be changed once those PHYs should be fully supported.

IEEE802154_FCS_LENGTH

Represents the frame check sequence length, see section 7.2.1.1.

**Note:** Currently only a 2 byte FCS is supported although some PHYs (e.g. SUN, TVWS, …) optionally support a 4 byte FCS. Needs to be changed once those PHYs should be fully supported.

IEEE802154_MTU

IEEE 802.15.4 “hardware” MTU (not to be confused with L3/IP MTU), i.e. the actual payload available to the next higher layer.

This is equivalent to the IEEE 802.15.4 MAC frame length minus checksum bytes which is again equivalent to the PHY payload aka PSDU length minus checksum bytes. This definition exists for compatibility with the same concept in Linux and Zephyr’s L3. It is not a concept from the IEEE 802.15.4 standard.

6.3. Networking 2515
IEEE802154_SHORT_ADDR_LENGTH
IEEE 802.15.4 short address length.

IEEE802154_EXT_ADDR_LENGTH
IEEE 802.15.4 extended address length.

IEEE802154_MAX_ADDR_LENGTH
IEEE 802.15.4 maximum address length.

IEEE802154_NO_CHANNEL
A special channel value that symbolizes “all” channels or “any” channel - depending on context.

IEEE802154_BROADCAST_ADDRESS
Represents the IEEE 802.15.4 broadcast short address, see sections 6.1 and 8.4.3, table 8-94, macShortAddress.

IEEE802154_NO_SHORT_ADDRESS_ASSIGNED
Represents a special IEEE 802.15.4 short address that indicates that a device has been associated with a coordinator but did not receive a short address, see sections 6.4.1 and 8.4.3, table 8-94, macShortAddress.

IEEE802154_BROADCAST_PAN_ID
Represents the IEEE 802.15.4 broadcast PAN ID, see section 6.1.

IEEE802154_SHORT_ADDRESS_NOT_ASSOCIATED
Represents a special value of the macShortAddress MAC PIB attribute, while the device is not associated, see section 8.4.3, table 8-94.

IEEE802154_PAN_ID_NOT_ASSOCIATED
Represents a special value of the macPanId MAC PIB attribute, while the device is not associated, see section 8.4.3, table 8-94.

Enums

enum ieee802154_device_role

Values:

enumerator IEEE802154_DEVICE_ROLE_ENDDEVICE
enumerator IEEE802154_DEVICE_ROLE_COORDINATOR
enumerator IEEE802154_DEVICE_ROLE_PAN_COORDINATOR
struct ieee802154_security_ctx

#include <ieee802154.h> Interface-level security attributes, see section 9.5.

Public Members

uint32_t frame_counter

Interface-level outgoing frame counter, section 9.5, table 9-8, secFrameCounter.
Only used when the driver does not implement key-specific frame counters.

uint8_t key[16]

Interface-level frame encryption security key material.
Currently native L2 only supports a single secKeySource, see section 9.5, table 9-9, in combination with secKeyMode zero (implicit key mode), see section 9.4.2.3, table 9-7.

Warning: This is no longer in accordance with the 2015+ versions of the standard and needs to be extended in the future for full security procedure compliance.

uint8_t key_len

Length in bytes of the interface-level security key material.

uint8_t level

Frame security level, possible values are defined in section 9.4.2.2, table 9-6.

Warning: Currently native L2 allows to configure one common security level for all frame types, commands and information elements. This is no longer in accordance with the 2015+ versions of the standard and needs to be extended in the future for full security procedure compliance.

uint8_t key_mode

Frame security key mode.
Currently only implicit key mode is partially supported, see section 9.4.2.3, table 9-7, secKeyMode.

Warning: This is no longer in accordance with the 2015+ versions of the standard and needs to be extended in the future for full security procedure compliance.

struct ieee802154_context

#include <ieee802154.h> IEEE 802.15.4 L2 context.

Public Members
uint16_t pan_id
PAN ID.
The identifier of the PAN on which the device is operating. If this value is 0xffff, the device is not associated. See section 8.4.3.1, table 8-94, macPanId.
in CPU byte order

uint16_t channel
Channel Number.
The RF channel to use for all transmissions and receptions, see section 11.3, table 11-2, phyCurrentChannel. The allowable range of values is PHY dependent as defined in section 10.1.3.
in CPU byte order

uint16_t short_addr
Short Address (in CPU byte order)
Range:
• 0x0000–0xffff: associated, short address was assigned
• 0xfffe: associated but no short address assigned
• 0xffff: not associated (default),
See section 6.4.1, table 6-4 (Usage of the shart address) and section 8.4.3.1, table 8-94, macShortAddress.

uint8_t ext_addr[8]
Extended Address (in little endian)
The extended address is device specific, usually permanently stored on the device and immutable.
See section 8.4.3.1, table 8-94, macExtendedAddress.

struct net_linkaddr_storage linkaddr
Link layer address (in big endian)

struct ieee802154_security_ctx sec_ctx
Security context.

struct ieee802154_req_params *scan_ctx
Pointer to scanning parameters and results, guarded by scan_ctx_lock.

struct k_sem scan_ctx_lock
Used to maintain integrity of data for all fields in this struct unless otherwise documented on field level.

uint8_t coord_ext_addr[8]
Coordinator extended address.
see section 8.4.3.1, table 8-94, macCoordExtendedAddress, the address of the coordinator through which the device is associated.
A value of zero indicates that a coordinator extended address is unknown (default).
in little endian
uint16_t coord_short_addr
Coordinator short address.
see section 8.4.3.1, table 8-94, macCoordShortAddress, the short address assigned
to the coordinator through which the device is associated.
A value of 0xfffe indicates that the coordinator is only using its extended address.
A value of 0xffffff indicates that this value is unknown.
in CPU byte order

int16_t tx_power
Transmission power in dBm.

enum net_l2_flags flags
L2 flags.

uint8_t sequence
Data sequence number.
The sequence number added to the transmitted Data frame or MAC command, see
section 8.4.3.1, table 8-94, macDsn.

uint8_t device_role
Device Role.
See section 6.1: A device may be operating as end device (0), coordinator (1), or
PAN coordinator (2). If no device role is explicitly configured then the device will
be treated as an end device.
A value of 3 is undefined.
Can be read/set via ieee802154_device_role.

uint8_t ack_requested
ACK requested flag, guarded by ack_lock.

uint8_t ack_seq
ACK expected sequence number, guarded by ack_lock.

struct k_sem ack_lock
ACK lock, guards ack_* fields.

struct k_sem ctx_lock
Context lock.
This lock guards all mutable context attributes unless otherwise mentioned on at-
tribute level.

OpenThread L2 Adaptation Layer API  Zephyr’s OpenThread L2 platform adaptation layer
glues the external OpenThread stack together with Zephyr’s IEEE 802.15.4 protocol agnostic
driver API. This API is of interest to OpenThread L2 subsystem contributors only.
The OpenThread API is part of the Thread protocol subsystem and documented there.
Thread protocol

- Overview
- Internet connectivity
- Sample usage
- Thread related APIs
  - OpenThread Driver API
  - OpenThread L2 Adaptation Layer API

Overview  
Thread is a low-power mesh networking technology, designed specifically for home automation applications. It is an IPv6-based standard, which uses 6LoWPAN technology over IEEE 802.15.4 protocol. IP connectivity lets you easily connect a Thread mesh network to the internet with a Thread Border Router.

The Thread specification provides a high level of network security. Mesh networks built with Thread are secure - only authenticated devices can join the network and all communications within the mesh are encrypted. More information about Thread protocol can be found at [Thread Group website](https://www.threadgroup.org).

Zephyr integrates an open source Thread protocol implementation called OpenThread, documented on the [OpenThread website](https://openthread.io).

Internet connectivity  
A Thread Border Router is required to connect mesh network to the internet. An open source implementation of Thread Border Router is provided by the OpenThread community. See [OpenThread Border Router guide](https://openthread.io/developer/guides/border-router) for instructions on how to set up a Border Router.

Sample usage  
You can try using OpenThread with the Zephyr Echo server and Echo client samples, which provide out-of-the-box configuration for OpenThread. To enable OpenThread support in these samples, build them with `overlay-ot.conf` overlay config file. See [sockets-echo-server](https://github.com/zephyrproject-adoptium/zephyr/tree/main/samples/sockets-echo-server) and [sockets-echo-client](https://github.com/zephyrproject-adoptium/zephyr/tree/main/samples/sockets-echo-client) samples for details.

Thread related APIs

OpenThread Driver API  
OpenThread L2 uses Zephyr’s protocol agnostic IEEE 802.15.4 driver API internally. This API is of interest to [driver developers](https://zephyrproject.io) that want to support OpenThread. The driver API is part of the [IEEE 802.15.4 Driver API](https://zephyrproject.io/developer/guides/ieee-802-15-4-driver-api) subsystem and documented there.

OpenThread L2 Adaptation Layer API  
Zephyr’s OpenThread L2 platform adaptation layer glues the external OpenThread stack together with Zephyr’s IEEE 802.15.4 protocol agnostic driver API. This API is of interest to OpenThread L2 [subsystem contributors](https://zephyrproject.io) only.

Related code samples

OpenThread co-processor  
Build a Thread border-router using OpenThread’s co-processor designs.
**group** openthread

OpenThread Layer 2 abstraction layer.

**Defines**

`OPENTHREAD_L2_CTX_TYPE`

**Functions**

`int openthread_state_changed_cb_register(struct openthread_context *ot_context, struct openthread_state_changed_cb *cb)`

Registers callbacks which will be called when certain configuration or state changes occur within OpenThread.

**Parameters**
- `ot_context` – the OpenThread context to register the callback with.
- `cb` – callback struct to register.

`int openthread_state_changed_cb_unregister(struct openthread_context *ot_context, struct openthread_state_changed_cb *cb)`

Unregisters OpenThread configuration or state changed callbacks.

**Parameters**
- `ot_context` – the OpenThread context to unregister the callback from.
- `cb` – callback struct to unregister.

`void openthread_set_state_changed_cb(otStateChangedCallback cb)`

Sets function which will be called when certain configuration or state changes within OpenThread.

*Deprecated:* Use `openthread_state_changed_cb_register()` instead.

**Parameters**
- `cb` – function to call in callback procedure.

`k_tid_t openthread_thread_id_get(void)`

Get OpenThread thread identification.

`struct openthread_context *openthread_get_default_context(void)`

Get pointer to default OpenThread context.

**Return values**
- `!NULL` – On success.
- `NULL` – On failure.

`struct otInstance *openthread_get_default_instance(void)`

Get pointer to default OpenThread instance.

**Return values**
- `!NULL` – On success.
int openthread_start(struct openthread_context *ot_context)
Starts the OpenThread network.

Depends on active settings: it uses stored network configuration, start joining procedure or uses default network configuration. Additionally when the device is MTD, it sets the SED mode to properly attach the network.

Parameters

- ot_context –

void openthread_api_mutex_lock(struct openthread_context *ot_context)
Lock internal mutex before accessing OT API.

OpenThread API is not thread-safe, therefore before accessing any API function, it’s needed to lock the internal mutex, to prevent the OpenThread thread from preempting the API call.

Parameters

- ot_context – Context to lock.

int openthread_api_mutex_try_lock(struct openthread_context *ot_context)
Try to lock internal mutex before accessing OT API.

This function behaves like openthread_api_mutex_lock() provided that the internal mutex is unlocked. Otherwise, it exists immediately and returns a negative value.

Parameters

- ot_context – Context to lock.

Return values

- 0 – On success.
- <0 – On failure.

void openthread_api_mutex_unlock(struct openthread_context *ot_context)
Unlock internal mutex after accessing OT API.

Parameters

- ot_context – Context to unlock.

struct openthread_state_changed_cb

#include <openthread.h> OpenThread state change callback
OpenThread state change callback structure

Used to register a callback in the callback list. As many callbacks as needed can be added as long as each of them are unique pointers of struct openthread_state_changed_cb. Beware such structure should not be allocated on stack.

Public Members

void (*state_changed_cb)(otChangedFlags flags, struct openthread_context *ot_context, void *user_data)
Callback for notifying configuration or state changes.
**Param flags**
as per OpenThread otStateChangedCallback() aFlags parameter. See https://openthread.io/reference/group/api-instance#otstatechangedcallback

**Param ot_context**
the OpenThread context the callback is registered with.

**Param user_data**
Data to pass to the callback.

```c
void *user_data
User data if required.
```

```c
sys_snodo_t node
Internally used field for list handling.
```

- user must not directly modify

**Point-to-Point Protocol (PPP) Support**

**Overview**
Point-to-Point Protocol (PPP) is a data link layer (layer 2) communications protocol used to establish a direct connection between two nodes. PPP is used over many types of serial links since IP packets cannot be transmitted over a modem line on their own, without some data link protocol.

In Zephyr, each individual PPP link is modelled as a network interface. This is similar to how Linux implements PPP.

PPP support must be enabled at compile time by setting option `CONFIG_NET_L2_PPP`. The PPP implementation supports only these protocols:

- LCP (Link Control Protocol, RFC1661)
- HDLC (High-level data link control, RFC1662)
- IPCP (IP Control Protocol, RFC1332)
- IPV6CP (IPv6 Control Protocol, RFC5072)

For using PPP with a cellular modem, see cellular-modem sample for additional information.

**Testing**
See the net-tools README file for more details on how to test the Zephyr PPP against pppd running in Linux.

**Wi-Fi Management**

**Overview**
The Wi-Fi management API is used to manage Wi-Fi networks. It supports below modes:

- IEEE802.11 Station (STA)
- IEEE802.11 Access Point (AP)
Only personal mode security is supported with below types:

- Open
- WPA2-PSK
- WPA3-PSK-256
- WPA3-SAE

The Wi-Fi management API is implemented in the `wifi_mgmt` module as a part of the networking L2 stack. Currently, two types of Wi-Fi drivers are supported:

- Networking or socket offloaded drivers
- Native L2 Ethernet drivers

**API Reference**

*group wifi_mgmt*

Wi-Fi Management API.

**Wi-Fi utility functions.**

Utility functions for the Wi-Fi subsystem.

`int wifi_utils_parse_scan_bands(char *scan_bands_str, uint8_t *band_map)`

Convert a band specification string to a bitmap representing the bands.

The function will parse a string which specifies Wi-Fi frequency band values as a comma separated string and convert it to a bitmap. The string can use the following characters to represent the bands:

- 2: 2.4 GHz
- 5: 5 GHz
- 6: 6 GHz

For the bitmap generated refer to `wifi_frequency_bands` for bit position of each band.

E.g. a string “2,5,6” will be converted to a bitmap value of 0x7

**Parameters**

- `scan_bands_str` – String which spe.
- `band_map` – Pointer to the bitmap variable to be updated.

**Return values**

- 0 – on success.
- -errno – value in case of failure.

`int wifi_utils_parse_scan_ssids(char *scan_ssids_str, const char *ssids[], uint8_t num_ssids)`

Append a string containing an SSID to an array of SSID strings.

**Parameters**

- `scan_ssids_str` – string to be appended in the list of scanned SSIDs.
- `ssids` – Pointer to an array where the SSIDs pointers are to be stored.
- `num_ssids` – Maximum number of SSIDs that can be stored.
Return values

- 0 – on success.
- -errno – value in case of failure.

```c
int wifi_utils_parse_scan_chan(char *scan_chan_str, struct wifi_band_channel *chan,
                               uint8_t max_channels)
```

Convert a string containing a specification of scan channels to an array.

The function will parse a string which specifies channels to be scanned as a string and convert it to an array.

The channel string has to be formatted using the colon (:), comma(,), hyphen (-) and underscore (_) delimiters as follows:

- A colon identifies the value preceding it as a band. A band value (2: 2.4 GHz, 5: 5 GHz 6: 6 GHz) has to precede the channels in that band (e.g. 2: etc)
- Hyphens (-) are used to identify channel ranges (e.g. 2-7, 32-48 etc)
- Commas are used to separate channel values within a band. Channels can be specified as individual values (2,6,48 etc) or channel ranges using hyphens (1-14, 32-48 etc)
- Underscores (_) are used to specify multiple band-channel sets (e.g. 2:1,2_5:36,40 etc)
- No spaces should be used anywhere, i.e. before/after commas, before/after hyphens etc.

An example channel specification specifying channels in the 2.4 GHz and 5 GHz bands is as below: 2:1,5,7,9-11_5:36-48,100,163-167

Parameters

- `scan_chan_str` – List of channels expressed in the format described above.
- `chan` – Pointer to an array where the parsed channels are to be stored.
- `max_channels` – Maximum number of channels to store

Return values

- 0 – on success.
- -errno – value in case of failure.

```c
bool wifi_utils_validate_chan(uint16_t chan)
```

Validate a channel against a band.

Parameters

- `band` – Band to validate the channel against.
- `chan` – Channel to validate.

Return values

- true – if the channel is valid for the band.
- false – if the channel is not valid for the band.

```c
bool wifi_utils_validate_chan_2g(uint16_t chan)
```

Validate a channel against the 2.4 GHz band.

Parameters

- `chan` – Channel to validate.

Return values

6.3. Networking
bool wifi_utils_validate_chan_5g(uint16_t chan)
Validate a channel against the 5 GHz band.

Parameters
• chan – Channel to validate.

Return values
• true – if the channel is valid for the band.
• false – if the channel is not valid for the band.

bool wifi_utils_validate_chan_6g(uint16_t chan)
Validate a channel against the 6 GHz band.

Parameters
• chan – Channel to validate.

Return values
• true – if the channel is valid for the band.
• false – if the channel is not valid for the band.

**Typedefs**

typedef void (*scan_result_cb_t)(struct net_if *iface, int status, struct wifi_scan_result *entry)

Scan result callback.

**Param iface**
Network interface

**Param status**
Scan result status
**Enums**

enum wifi_security_type
IEEE 802.11 security types.

*Values:*

enumerator WIFI_SECURITY_TYPE_NONE = 0
No security.

enumerator WIFI_SECURITY_TYPE_PSK
WPA2-PSK security.

enumerator WIFI_SECURITY_TYPE_PSK_SHA256
WPA2-PSK-SHA256 security.

enumerator WIFI_SECURITY_TYPE_SAE
WPA3-SAE security.

enumerator WIFI_SECURITY_TYPE_WAPI
GB 15629.11-2003 WAPI security.

enumerator WIFI_SECURITY_TYPE_EAP
EAP security - Enterprise.

enumerator WIFI_SECURITY_TYPE_WEP
WEP security.

enumerator WIFI_SECURITY_TYPE_WPA_PSK
WPA-PSK security.

enumerator WiFi_SECURITY_TYPE_UNKNOWN

enumerator WIFI_SECURITY_TYPE_MAX = WiFi_SECURITY_TYPE_UNKNOWN.wifi_security_type_MAX

enum wifi_mfp_options
IEEE 802.11w - Management frame protection.

*Values:*

enumerator WIFI_MFP_DISABLE = 0
MFP disabled.

enumerator WIFI_MFP_OPTIONAL
MFP optional.
enumerator WIFI_MFP_REQUIRED
   MFP required.

enumerator __WIFI_MFP_AFTER_LAST

enumerator WIFI_MFP_MAX = __WIFI_MFP_AFTER_LAST - 1

enumerator WIFI_MFP_UNKNOWN

enum wifi_frequency_bands
   IEEE 802.11 operational frequency bands (not exhaustive).
   Values:

   enumerator WIFI_FREQ_BAND_2_4_GHZ = 0
      2.4 GHz band.

   enumerator WIFI_FREQ_BAND_5_GHZ
      5 GHz band.

   enumerator WIFI_FREQ_BAND_6_GHZ
      6 GHz band (Wi-Fi 6E, also extends to 7GHz).

   enumerator __WIFI_FREQ_BAND_AFTER_LAST
      Number of frequency bands available.

   enumerator WIFI_FREQ_BAND_MAX = __WIFI_FREQ_BAND_AFTER_LAST - 1
      Highest frequency band available.

   enumerator WIFI_FREQ_BAND_UNKNOWN
      Invalid frequency band.

enum wifi_iface_state
   Wi-Fi interface states.
   Based on https://w1.fi/wpa_supplicant/devel/defs_8h.html#a4aeb27c1e4abd046df3064ea9756f0bc
   Values:

   enumerator WIFI_STATE_DISCONNECTED = 0
      Interface is disconnected.

   enumerator WIFI_STATE_INTERFACE_DISABLED
      Interface is disabled (administratively).

   enumerator WIFI_STATE_INACTIVE
      No enabled networks in the configuration.

   enumerator WIFI_STATE_SCANNING
      Interface is scanning for networks.
enumerator WIFI_STATE_AUTHENTICATING
    Authentication with a network is in progress.

enumerator WIFI_STATE_ASSOCIATING
    Association with a network is in progress.

enumerator WIFI_STATE_ASSOCIATED
    Association with a network completed.

enumerator WIFI_STATE_4WAY_HANDSHAKE
    4-way handshake with a network is in progress.

enumerator WIFI_STATE_GROUP_HANDSHAKE
    Group Key exchange with a network is in progress.

enumerator WIFI_STATE_COMPLETED
    All authentication completed, ready to pass data.

enumerator __WIFI_STATE_AFTER_LAST

enumerator WIFI_STATE_MAX = __WIFI_STATE_AFTER_LAST - 1

enumerator WIFI_STATE_UNKNOWN

enum wifi_iface_mode
    Wi-Fi interface modes.

Based on https://w1.fi/wpa_supplicant/devel/defs_8h.html#a4aeb27c1e4abd046df3064ea9756f0bc

Values:

enumerator WIFI_MODE_INFRA = 0
    Infrastructure station mode.

enumerator WIFI_MODE_IBSS = 1
    IBSS (ad-hoc) station mode.

enumerator WIFI_MODE_AP = 2
    AP mode.

enumerator WIFI_MODE_P2P_GO = 3
    P2P group owner mode.

enumerator WIFI_MODE_P2P_GROUPFORMATION = 4
    P2P group formation mode.

enumerator WIFI_MODE_MESH = 5
    802.11s Mesh mode.
enumerator __WIFI_MODE_AFTER_LAST

eumerator WIFI_MODE_MAX = __WIFI_MODE_AFTER_LAST - 1

enumerator WIFI_MODE_UNKNOWN

enum wifi_link_mode
    Wi-Fi link operating modes.
    As per https://en.wikipedia.org/wiki/Wi-Fi#Versions_and_generations.
    Values:

    enumerator WIFI_0 = 0
        802.11 (legacy).

    enumerator WIFI_1
        802.11b.

    enumerator WIFI_2
        802.11a.

    enumerator WIFI_3
        802.11g.

    enumerator WIFI_4
        802.11n.

    enumerator WIFI_5
        802.11ac.

    enumerator WIFI_6
        802.11ax.

    enumerator WIFI_6E
        802.11ax 6GHz.

    enumerator WIFI_7
        802.11be.

enumerator __WIFI_LINK_MODE_AFTER_LAST

eenumerator WIFI_LINK_MODE_MAX = __WIFI_LINK_MODE_AFTER_LAST - 1

enumerator WIFI_LINK_MODE_UNKNOWN

enum wifi_scan_type
    Wi-Fi scanning types.
    Values:
enumerator WIFI_SCAN_TYPE_ACTIVE = 0
    Active scanning (default).

eumerator WIFI_SCAN_TYPE_PASSIVE
    Passive scanning.

enum wifi_ps
    Wi-Fi power save states.
    Values:

eenumerator WIFI_PS_DISABLED = 0
    Power save disabled.

eenumerator WIFI_PS_ENABLED
    Power save enabled.

e enumerator wifi_ps_mode
    Wi-Fi power save modes.
    Values:

eenumerator WIFI_PS_MODE_LEGACY = 0
    Legacy power save mode.

eenumerator WIFI_PS_MODE_WMM
    WMM power save mode.

enum wifi_operational_modes
    Wifi operational mode.
    Values:

eenumerator WIFI_STA_MODE = BIT(0)
    STA mode setting enable.

eenumerator WIFI_MONITOR_MODE = BIT(1)
    Monitor mode setting enable.

eenumerator WIFI_TX_INJECTION_MODE = BIT(2)
    TX injection mode setting enable.

eenumerator WIFI_PROMISCUOUS_MODE = BIT(3)
    Promiscuous mode setting enable.

eenumerator WIFI_AP_MODE = BIT(4)
    AP mode setting enable.

eenumerator WIFI_SOFTAP_MODE = BIT(5)
    Softap mode setting enable.
enum wifi_filter
   Mode filter settings.
   Values:

   enumerator WIFI_PACKET_FILTER_ALL = BIT(0)
      Support management, data and control packet sniffing.

   enumerator WIFI_PACKET_FILTER_MGMT = BIT(1)
      Support only sniffing of management packets.

   enumerator WIFI_PACKET_FILTER_DATA = BIT(2)
      Support only sniffing of data packets.

   enumerator WIFI_PACKET_FILTER_CTRL = BIT(3)
      Support only sniffing of control packets.

enum wifi_twt_operation
   Wi-Fi Target Wake Time (TWT) operations.
   Values:

   enumerator WIFI_TWT_SETUP = 0
      TWT setup operation.

   enumerator WIFI_TWT_TEARDOWN
      TWT teardown operation.

enum wifi_twt_negotiation_type
   Wi-Fi Target Wake Time (TWT) negotiation types.
   Values:

   enumerator WIFI_TWT_INDIVIDUAL = 0
      TWT individual negotiation.

   enumerator WIFI_TWT_BROADCAST
      TWT broadcast negotiation.

   enumerator WIFI_TWT_WAKE_TBTT
      TWT wake TBTT negotiation.

enum wifi_twt_setup_cmd
   Wi-Fi Target Wake Time (TWT) setup commands.
   Values:

   enumerator WIFI_TWT_SETUP_CMD_REQUEST = 0
      TWT setup request.

   enumerator WIFI_TWT_SETUP_CMD_SUGGEST
      TWT setup suggest (parameters can be changed by AP)
enumerator WIFI_TWT_SETUP_CMD_DEMAND
   TWT setup demand (parameters can not be changed by AP)

enumerator WIFI_TWT_SETUP_CMD_GROUPING
   TWT setup grouping (grouping of TWT flows)

enumerator WIFI_TWT_SETUP_CMD_ACCEPT
   TWT setup accept (parameters accepted by AP)

enumerator WIFI_TWT_SETUP_CMD_ALTERNATE
   TWT setup alternate (alternate parameters suggested by AP)

enumerator WIFI_TWT_SETUP_CMD_DICTATE
   TWT setup dictate (parameters dictated by AP)

enumerator WIFI_TWT_SETUP_CMD_REJECT
   TWT setup reject (parameters rejected by AP)

enum wifi_twt_setup_resp_status
   Wi-Fi Target Wake Time (TWT) negotiation status.

   Values:

   enumerator WIFI_TWT_RESP_RECEIVED = 0
      TWT response received for TWT request.

   enumerator WIFI_TWT_RESP_NOT_RECEIVED
      TWT response not received for TWT request.

enum wifi_twt_fail_reason
   Target Wake Time (TWT) error codes.

   Values:

   enumerator WIFI_TWT_FAIL_UNSPECIFIED
      Unspecified error.

   enumerator WIFI_TWT_FAIL_CMD_EXEC_FAIL
      Command execution failed.

   enumerator WIFI_TWT_FAIL_OPERATION_NOT_SUPPORTED
      Operation not supported.

   enumerator WIFI_TWT_FAIL_UNABLE_TO_GET_IFACE_STATUS
      Unable to get interface status.

   enumerator WIFI_TWT_FAIL_DEVICE_NOT_CONNECTED
      Device not connected to AP.
enumerator WIFI_TWT_FAIL_PEER_NOT_HE_CAPAB
   Peer not HE (802.11ax/Wi-Fi 6) capable.

enumerator WIFI_TWT_FAIL_PEER_NOT_TWT_CAPAB
   Peer not TWT capable.

enumerator WIFI_TWT_FAIL_OPERATION_IN_PROGRESS
   A TWT flow is already in progress.

enumerator WIFI_TWT_FAIL_INVALID_FLOW_ID
   Invalid negotiated flow id.

enumerator WIFI_TWT_FAIL_IP_NOT_ASSIGNED
   IP address not assigned or configured.

enumerator WIFI_TWT_FAIL_FLOW_ALREADY_EXISTS
   Flow already exists.

enum wifi_twt_teardown_status
   Wi-Fi Target Wake Time (TWT) teardown status.
   Values:

   enumerator WIFI_TWT_TEARDOWN_SUCCESS = 0
      TWT teardown success.

   enumerator WIFI_TWT_TEARDOWN_FAILED
      TWT teardown failure.

enum wifi_ps_param_type
   Wi-Fi power save parameters.
   Values:

   enumerator WIFI_PS_PARAM_STATE
      Power save state.

   enumerator WIFI_PS_PARAM_LISTEN_INTERVAL
      Power save listen interval.

   enumerator WIFI_PS_PARAM_WAKEUP_MODE
      Power save wakeup mode.

   enumerator WIFI_PS_PARAM_MODE
      Power save mode.

   enumerator WIFI_PS_PARAM_TIMEOUT
      Power save timeout.
enum wifi_ps_wakeup_mode
    Wi-Fi power save modes.
    Values:

    enumerator WIFI_PS_WAKEUP_MODE_DTIM = 0
        DTIM based wakeup.

    enumerator WIFI_PS_WAKEUP_MODE_LISTEN_INTERVAL
        Listen interval based wakeup.

enum wifi_config_ps_param_fail_reason
    Wi-Fi power save error codes.
    Values:

    enumerator WIFI_PS_PARAM_FAIL_UNSPECIFIED
        Unspecified error.

    enumerator WIFI_PS_PARAM_FAIL_CMD_EXEC_FAIL
        Command execution failed.

    enumerator WIFI_PS_PARAM_FAIL_OPERATION_NOT_SUPPORTED
        Parameter not supported.

    enumerator WIFI_PS_PARAM_FAIL_UNABLE_TO_GET_IFACE_STATUS
        Unable to get interface status.

    enumerator WIFI_PS_PARAM_FAIL_DEVICE_NOT_CONNECTED
        Device not connected to AP.

    enumerator WIFI_PS_PARAM_FAIL_DEVICE_CONNECTED
        Device already connected to AP.

    enumerator WIFI_PS_PARAM_LISTEN_INTERVAL_RANGE_INVALID
        Listen interval out of range.

enum net_request_wifi_cmd
    Wi-Fi management commands.
    Values:

    enumerator NET_REQUEST_WIFI_CMD_SCAN = 1
        Scan for Wi-Fi networks.

    enumerator NET_REQUEST_WIFI_CMD_CONNECT
        Connect to a Wi-Fi network.

    enumerator NET_REQUEST_WIFI_CMD_DISCONNECT
        Disconnect from a Wi-Fi network.
enumerator NET_REQUEST_WIFI_CMD_AP_ENABLE
    Enable AP mode.

enumerator NET_REQUEST_WIFI_CMD_AP_DISABLE
    Disable AP mode.

enumerator NET_REQUEST_WIFI_CMD_IFACE_STATUS
    Get interface status.

enumerator NET_REQUEST_WIFI_CMD_PS
    Set power save status.

enumerator NET_REQUEST_WIFI_CMD_PS_MODE
    Set power save mode.

enumerator NET_REQUEST_WIFI_CMD_TWT
    Setup or teardown TWT flow.

enumerator NET_REQUEST_WIFI_CMD_PS_CONFIG
    Get power save config.

enumerator NET_REQUEST_WIFI_CMD_REG_DOMAIN
    Set or get regulatory domain.

enumerator NET_REQUEST_WIFI_CMD_PS_TIMEOUT
    Set power save timeout.

enumerator NET_REQUEST_WIFI_CMD_MODE
    Set or get Mode of operation.

enumerator NET_REQUEST_WIFI_CMD_PACKET_FILTER
    Set or get packet filter setting for current mode.

enumerator NET_REQUEST_WIFI_CMD_CHANNEL
    Set or get Wi-Fi channel for Monitor or TX-Injection mode.

enumerator NET_REQUEST_WIFI_CMD_AP_STA_DISCONNECT
    Disconnect a STA from AP.

enumerator NET_REQUEST_WIFI_CMD_VERSION
    Get Wi-Fi driver and Firmware versions.

enumerator NET_REQUEST_WIFI_CMD_MAX

enum net_event_wifi_cmd
    Wi-Fi management events.
    
    Values:
enumerator NET_EVENT_WIFI_CMD_SCAN_RESULT = 1
Scan results available.

enumerator NET_EVENT_WIFI_CMD_SCAN_DONE
Scan done.

enumerator NET_EVENT_WIFI_CMD_CONNECT_RESULT
Connect result.

enumerator NET_EVENT_WIFI_CMD_DISCONNECT_RESULT
Disconnect result.

enumerator NET_EVENT_WIFI_CMD_IFACE_STATUS
Interface status.

enumerator NET_EVENT_WIFI_CMD_TWT
TWT events.

enumerator NET_EVENT_WIFI_CMD_TWT_SLEEP_STATE
TWT sleep status: awake or sleeping, can be used by application to determine if it can send data or not.

enumerator NET_EVENT_WIFI_CMD_RAW_SCAN_RESULT
Raw scan results available.

enumerator NET_EVENT_WIFI_CMD_DISCONNECT_COMPLETE
Disconnect complete.

enumerator NET_EVENT_WIFI_CMD_AP_ENABLE_RESULT
AP mode enable result.

enumerator NET_EVENT_WIFI_CMD_AP_DISABLE_RESULT
AP mode disable result.

enumerator NET_EVENT_WIFI_CMD_AP_STA_CONNECTED
STA connected to AP.

enumerator NET_EVENT_WIFI_CMD_AP_STA_DISCONNECTED
STA disconnected from AP.

enum wifi_conn_status
Wi-Fi connect result codes.
To be overlaid on top of wifi_status in the connect result event for detailed status.
Values:

enumerator WIFI_STATUS_CONN_SUCCESS = 0
Connection successful.
enumerator WIFI_STATUS_CONN_FAIL
    Connection failed - generic failure.

enumerator WIFI_STATUS_CONN_WRONG_PASSWORD
    Connection failed - wrong password.

enumerator WIFI_STATUS_CONN_TIMEOUT
    Connection timed out.

enumerator WIFI_STATUS_CONN_AP_NOT_FOUND
    Connection failed - AP not found.

e num wifi_disconn_reason
    Wi-Fi disconnect reason codes.
    To be overlaid on top of wifi_status in the disconnect result event for detailed reason.
    Values:

enumerator WIFI_REASON_DISCONN_UNSPECIFIED = 0
    Unspecified reason.

enumerator WIFI_REASON_DISCONN_USER_REQUEST
    Disconnected due to user request.

enumerator WIFI_REASON_DISCONN_AP_LEAVING
    Disconnected due to AP leaving.

enumerator WIFI_REASON_DISCONN_INACTIVITY
    Disconnected due to inactivity.

e num wifi_ap_status
    Wi-Fi AP mode result codes.
    To be overlaid on top of wifi_status in the AP mode enable or disable result event for detailed status.
    Values:

enumerator WIFI_STATUS_AP_SUCCESS = 0
    AP mode enable or disable successful.

enumerator WIFI_STATUS_AP_FAIL
    AP mode enable or disable failed - generic failure.

enumerator WIFI_STATUS_AP_CHANNEL_NOT_SUPPORTED
    AP mode enable failed - channel not supported.

enumerator WIFI_STATUS_AP_CHANNEL_NOT_ALLOWED
    AP mode enable failed - channel not allowed.
enumerator WIFI_STATUS_AP_SSID_NOT_ALLOWED
    AP mode enable failed - SSID not allowed.

denumerator WIFI_STATUS_AP_AUTH_TYPE_NOT_SUPPORTED
    AP mode enable failed - authentication type not supported.

denumerator WIFI_STATUS_AP_OP_NOT_SUPPORTED
    AP mode enable failed - operation not supported.

denumerator WIFI_STATUS_AP_OP_NOT_PERMITTED
    AP mode enable failed - operation not permitted.

d enum wifi_mgmt_op
    Generic get/set operation for any command.
    Values:

d enumerator WIFI_MGMT_GET = 0
    Get operation.

d enumerator WIFI_MGMT_SET = 1
    Set operation.

d enum wifi_twt_sleep_state
    Wi-Fi TWT sleep states.
    Values:

d enumerator WIFI_TWT_STATE_SLEEP = 0
    TWT sleep state: sleeping.

d enumerator WIFI_TWT_STATE_AWAKE = 1
    TWT sleep state: awake.

Functions

d const char *wifi_security_txt(enum wifi_security_type security)
    Helper function to get user-friendly security type name.

d const char *wifi_mfp_txt(enum wifi_mfp_options mfp)
    Helper function to get user-friendly MFP name.

d const char *wifi_band_txt(enum wifi_frequency_bands band)
    Helper function to get user-friendly frequency band name.

d const char *wifi_state_txt(enum wifi_iface_state state)
    Helper function to get user-friendly interface state name.

d const char *wifi_mode_txt(enum wifi_iface_mode mode)
    Helper function to get user-friendly interface mode name.

d const char *wifi_link_mode_txt(enum wifi_link_mode link_mode)
    Helper function to get user-friendly link mode name.
const char *wifi_ps_txt(enum wifi_ps ps_name)
  Helper function to get user-friendly ps name.
const char *wifi_ps_mode_txt(enum wifi_ps_mode ps_mode)
  Helper function to get user-friendly ps mode name.
const char *wifi_twt_operation_txt(enum wifi_twt_operation twt_operation)
  Helper function to get user-friendly twt operation name.
const char *wifi_twt_negotiation_type_txt(enum wifi_twt_negotiation_type
twt_negotiation)
  Helper function to get user-friendly twt negotiation type name.
const char *wifi_twt_setup_cmd_txt(enum wifi_twt_setup_cmd twt_setup)
  Helper function to get user-friendly twt setup cmd name.
static inline const char *wifi_twt_get_err_code_str(int16_t err_no)
  Helper function to get user-friendly TWT error code name.
const char *wifi_ps_wakeup_mode_txt(enum wifi_ps_wakeup_mode ps_wakeup_mode)
  Helper function to get user-friendly ps wakeup mode name.
static inline const char *wifi_ps_get_config_err_code_str(int16_t err_no)
  Helper function to get user-friendly power save error code name.
void wifi_mgmt_raise_connect_result_event(struct net_if *iface, int status)
  Wi-Fi management connect result event.

  Parameters
  • iface – Network interface
  • status – Connect result status
void wifi_mgmt_raise_disconnect_result_event(struct net_if *iface, int status)
  Wi-Fi management disconnect result event.

  Parameters
  • iface – Network interface
  • status – Disconnect result status
void wifi_mgmt_raise_iface_status_event(struct net_if *iface, struct wifi_iface_status *
iface_status)
  Wi-Fi management interface status event.

  Parameters
  • iface – Network interface
  • iface_status – Interface status
void wifi_mgmt_raise_twt_event(struct net_if *iface, struct wifi_twt_params *
twt_params)
  Wi-Fi management TWT event.

  Parameters
  • iface – Network interface
  • twt_params – TWT parameters
void wifi_mgmt_raise_twt_sleep_state(struct net_if *iface, int twt_sleep_state)
  Wi-Fi management TWT sleep state event.

  Parameters
• iface – Network interface
• twt_sleep_state – TWT sleep state

```c
void wifi_mgmt_raise_raw_scan_result_event(struct net_if *iface, struct wifi_raw_scan_result *raw_scan_info)
```

Wi-Fi management raw scan result event.

**Parameters**
- iface – Network interface
- raw_scan_info – Raw scan result

```c
void wifi_mgmt_raise_disconnect_complete_event(struct net_if *iface, int status)
```

Wi-Fi management disconnect complete event.

**Parameters**
- iface – Network interface
- status – Disconnect complete status

```c
void wifi_mgmt_raise_ap_enable_result_event(struct net_if *iface, enum wifi_ap_status status)
```

Wi-Fi management AP mode enable result event.

**Parameters**
- iface – Network interface
- status – AP mode enable result status

```c
void wifi_mgmt_raise_ap_disable_result_event(struct net_if *iface, enum wifi_ap_status status)
```

Wi-Fi management AP mode disable result event.

**Parameters**
- iface – Network interface
- status – AP mode disable result status

```c
void wifi_mgmt_raise_ap_sta_connected_event(struct net_if *iface, struct wifi_ap_sta_info *sta_info)
```

Wi-Fi management AP mode STA connected event.

**Parameters**
- iface – Network interface
- sta_info – STA information

```c
void wifi_mgmt_raise_ap_sta_disconnected_event(struct net_if *iface, struct wifi_ap_sta_info *sta_info)
```

Wi-Fi management AP mode STA disconnected event.

**Parameters**
- iface – Network interface
- sta_info – STA information

```
struct wifi_version
#include <wifi_mgmt.h> Wi-Fi version.
```
Public Members

const char *drv_version
Driver version.

const char *fw_version
Firmware version.

struct wifi_band_channel
#include <wifi_mgmt.h> Wi-Fi structure to uniquely identify a band-channel pair.

Public Members

uint8_t band
Frequency band.

uint8_t channel
Channel.

struct wifi_scan_params
#include <wifi_mgmt.h> Wi-Fi scan parameters structure.
Used to specify parameters which can control how the Wi-Fi scan is performed.

Public Members

enum wifi_scan_type scan_type
Scan type, see enum wifi_scan_type.
The scan_type is only a hint to the underlying Wi-Fi chip for the preferred mode of scan. The actual mode of scan can depend on factors such as the Wi-Fi chip implementation support, regulatory domain restrictions etc.

uint8_t bands
Bitmap of bands to be scanned.
Refer to wifi_frequency_bands for bit position of each band.

uint16_t dwell_time_active
Active scan dwell time (in ms) on a channel.

uint16_t dwell_time_passive
Passive scan dwell time (in ms) on a channel.

const char *ssids[1]
Array of SSID strings to scan.
uint16_t max_bss_cnt

Specifies the maximum number of scan results to return.

These results would be the BSSIDs with the best RSSI values, in all the scanned channels. This should only be used to limit the number of returned scan results, and cannot be counted upon to limit the scan time, since the underlying Wi-Fi chip might have to scan all the channels to find the max_bss_cnt number of APs with the best signal strengths. A value of 0 signifies that there is no restriction on the number of scan results to be returned.

struct wifi_band_channel band_chan[1]

Channel information array indexed on Wi-Fi frequency bands and channels within that band.

E.g. to scan channel 6 and 11 on the 2.4 GHz band, channel 36 on the 5 GHz band:

```c
chan[0] = {WIFI_FREQ_BAND_2_4_GHZ, 6};
chan[1] = {WIFI_FREQ_BAND_2_4_GHZ, 11};
chan[2] = {WIFI_FREQ_BAND_5_GHZ, 36};
```

This list specifies the channels to be considered for scan. The underlying Wi-Fi chip can silently omit some channels due to various reasons such as channels not conforming to regulatory restrictions etc. The invoker of the API should ensure that the channels specified follow regulatory rules.

struct wifi_scan_result

#include <wifi_mgmt.h> Wi-Fi scan result, each result is provided to the net_mgmt_event_callback via its info attribute (see net_mgmt.h)

Public Members

uint8_t ssid[WIFI_SSID_MAX_LEN]

SSID.

uint8_t ssid_length

SSID length.

uint8_t band

Frequency band.

uint8_t channel

Channel.

enum wifi_security_type security

Security type.

enum wifi_mfp_options mfp

MFP options.

int8_t rssi

RSSI.
uint8_t mac[WIFI_MAC_ADDR_LEN]
BSSID.

uint8_t mac_length
BSSID length.

struct wifi_connect_req_params
#include <wifi_mgmt.h> Wi-Fi connect request parameters.

Public Members

const uint8_t *ssid
SSID.

uint8_t ssid_length
SSID length.

const uint8_t *psk
Pre-shared key.

uint8_t psk_length
Pre-shared key length.

const uint8_t *sae_password
SAE password (same as PSK but with no length restrictions), optional.

uint8_t sae_password_length
SAE password length.

uint8_t band
Frequency band.

uint8_t channel
Channel.

denum wifi_security_type security
Security type.

denum wifi_mfp_options mfp
MFP options.

int timeout
Connect timeout in seconds, SYS_FOREVER_MS for no timeout.

struct wifi_status
#include <wifi_mgmt.h> Generic Wi-Fi status for commands and events.

struct wifi_iface_status
#include <wifi_mgmt.h> Wi-Fi interface status.
Public Members

int state
    Interface state, see enum wifi_iface_state.

unsigned int ssid_len
    SSID length.

char ssid[WIFI_SSID_MAX_LEN]
    SSID.

char bssid[WIFI_MAC_ADDR_LEN]
    BSSID.

denum wifi_frequency_bands band
    Frequency band.

unsigned int channel
    Channel.

denum wifi_iface_mode iface_mode
    Interface mode, see enum wifi_iface_mode.

denum wifi_link_mode link_mode
    Link mode, see enum wifi_link_mode.

denum wifi_security_type security
    Security type, see enum wifi_security_type.

denum wifi_mfp_options mfp
    MFP options, see enum wifi_mfp_options.

int rssi
    RSSI.

unsigned char dtim_period
    DTIM period.

unsigned short beacon_interval
    Beacon interval.

bool twt_capable
    is TWT capable?

struct wifi_ps_params
    #include <wifi_mgmt.h> Wi-Fi power save parameters.
Public Members

enum wifi_ps_wakeup_mode wakeup_mode
    Wi-Fi power save wakeup mode.

enum wifi_ps_mode mode
    Wi-Fi power save mode.

unsigned int timeout_ms
    Wi-Fi power save timeout.
    This is the time out to wait after sending a TX packet before going back to power
    save (in ms) to receive any replies from the AP. Zero means this feature is disabled.
    It's a tradeoff between power consumption and latency.

enum wifi_ps_param_type type
    Wi-Fi power save type.

enum wifi_config_ps_param_fail_reason fail_reason
    Wi-Fi power save fail reason.

struct wifi_twt_params
    #include <wifi_mgmt.h> Wi-Fi TWT parameters.

Public Members

enum wifi_twt_operation operation
    TWT operation, see enum wifi_twt_operation.

enum wifi_twt_negotiation_type negotiation_type
    TWT negotiation type, see enum wifi_twt_negotiation_type.

enum wifi_twt_setup_cmd setup_cmd
    TWT setup command, see enum wifi_twt_setup_cmd.

enum wifi_twt_setup_resp_status resp_status
    TWT setup response status, see enum wifi_twt_setup_resp_status.

enum wifi_twt_teardown_status teardown_status
    TWT teardown cmd status, see enum wifi_twt_teardown_status.

uint8_t dialog_token
    Dialog token, used to map requests to responses.

uint8_t flow_id
    Flow ID, used to map setup with teardown.
uint64_t twt_interval
    Interval = Wake up time + Sleeping time.

bool responder
    Requestor or responder.

bool trigger
    Trigger enabled or disabled.

bool implicit
    Implicit or explicit.

bool announce
    Announced or unannounced.

uint32_t twt_wake_interval
    Wake up time.

struct wifi_twt_params setup
    Setup specific parameters.

bool teardown_all
    Teardown all flows.

struct wifi_twt_params teardown
    Teardown specific parameters.

enum wifi_twt_fail_reason fail_reason
    TWT fail reason, see enum wifi_twt_fail_reason.

struct wifi_twt_flow_info
    #include <wifi_mgmt.h> Wi-Fi TWT flow information.

Public Members

uint64_t twt_interval
    Interval = Wake up time + Sleeping time.

uint8_t dialog_token
    Dialog token, used to map requests to responses.

uint8_t flow_id
    Flow ID, used to map setup with teardown.

enum wifi_twt_negotiation_type negotiation_type
    TWT negotiation type, see enum wifi_twt_negotiation_type.
bool responder
  Requestor or responder.

bool trigger
  Trigger enabled or disabled.

bool implicit
  Implicit or explicit.

bool announce
  Announced or unannounced.

uint32_t twt_wake_interval
  Wake up time.

struct wifi_ps_config
  #include <wifi_mgmt.h> Wi-Fi power save configuration.

Public Members

cchar num_twt_flows
  Number of TWT flows.

struct wifi_twt_flow_info twt_flows[8]
  TWT flow details.

struct wifi_ps_params ps_params
  Power save configuration.

struct wifi_reg_chan_info
  #include <wifi_mgmt.h> Per-channel regulatory attributes.

Public Members

unsigned short center_frequency
  Center frequency in MHz.

unsigned short max_power
  Maximum transmission power (in dBm)

unsigned short supported
  Is channel supported or not.

unsigned short passive_only
  Passive transmissions only.
unsigned short dfs
   Is a DFS channel.

struct wifi_reg_domain
   #include <wifi_mgmt.h> Regulatory domain information or configuration.

Public Members

bool force
   Ignore all other regulatory hints over this one.

uint8_t country_code[WIFI_COUNTRY_CODE_LEN]

unsigned int num_channels
   Number of channels supported.

struct wifi_reg_chan_info *chan_info
   Channels information.

struct wifi_raw_scan_result
   #include <wifi_mgmt.h> Wi-Fi raw scan result.

Public Members

int8_t rssi
   RSSI.

int frame_length
   Frame length.

unsigned short frequency
   Frequency.

uint8_t data[NUM_WIFI_MGMT_RAW_SCAN_RESULT_LENGTH]
   Raw scan data.

struct wifi_ap_sta_info
   #include <wifi_mgmt.h> AP mode - connected STA details.

Public Members

enum wifi_link_mode link_mode
   Link mode, see enum wifi_link_mode.
uint8_t mac[WIFI_MAC_ADDR_LEN]
    MAC address.

uint8_t mac_length
    MAC address length.

bool twt_capable
    is TWT capable?

    Get or set operation.

struct wifi_mgmt_ops
    #include <wifi_mgmt.h> Wi-Fi management API.

Public Members

int (*scan)(const struct device *dev, struct wifi_scan_params *params, scan_result_cb_t cb)
    Scan for Wi-Fi networks.

    **Param dev**
    Pointer to the device structure for the driver instance.

    **Param params**
    Scan parameters

    **Param cb**
    Callback to be called for each result cb parameter is the cb that should be called for each result by the driver. The wifi mgmt part will take care of raising the necessary event etc.

    **Return**
    0 if ok, < 0 if error

int (*connect)(const struct device *dev, struct wifi_connect_req_params *params)
    Connect to a Wi-Fi network.

    **Param dev**
    Pointer to the device structure for the driver instance.

6.3. Networking
Param params
   Connect parameters
Return
   0 if ok, < 0 if error

int (*disconnect)(const struct device *dev)
Disconnect from a Wi-Fi network.
   Param dev
      Pointer to the device structure for the driver instance.
   Return
      0 if ok, < 0 if error

int (*ap_enable)(const struct device *dev, struct wifi_connect_req_params *params)
Enable AP mode.
   Param dev
      Pointer to the device structure for the driver instance.
   Param params
      AP mode parameters
   Return
      0 if ok, < 0 if error

int (*ap_disable)(const struct device *dev)
Disable AP mode.
   Param dev
      Pointer to the device structure for the driver instance.
   Return
      0 if ok, < 0 if error

int (*ap_sta_disconnect)(const struct device *dev, const uint8_t *mac)
Disconnect a STA from AP.
   Param dev
      Pointer to the device structure for the driver instance.
   Param mac
      MAC address of the STA to disconnect
   Return
      0 if ok, < 0 if error

int (*iface_status)(const struct device *dev, struct wifi_iface_status *status)
Get interface status.
   Param dev
      Pointer to the device structure for the driver instance.
   Param status
      Interface status
   Return
      0 if ok, < 0 if error

int (*get_stats)(const struct device *dev, struct net_stats_wifi *stats)
Get Wi-Fi statistics.
   Param dev
      Pointer to the device structure for the driver instance.
   Param stats
      Wi-Fi statistics
   Return
      0 if ok, < 0 if error
int (*set_power_save)(const struct device *dev, struct wifi_ps_params *params)
Set power save status.
  
  **Param dev**
  Pointer to the device structure for the driver instance.
  
  **Param params**
  Power save parameters
  
  **Return**
  0 if ok, < 0 if error

int (*set_twt)(const struct device *dev, struct wifi_twt_params *params)
Setup or teardown TWT flow.
  
  **Param dev**
  Pointer to the device structure for the driver instance.
  
  **Param params**
  TWT parameters
  
  **Return**
  0 if ok, < 0 if error

int (*get_power_save_config)(const struct device *dev, struct wifi_ps_config *config)
Get power save config.
  
  **Param dev**
  Pointer to the device structure for the driver instance.
  
  **Param config**
  Power save config
  
  **Return**
  0 if ok, < 0 if error

int (*reg_domain)(const struct device *dev, struct wifi_reg_domain *reg_domain)
Set or get regulatory domain.
  
  **Param dev**
  Pointer to the device structure for the driver instance.
  
  **Param reg_domain**
  Regulatory domain
  
  **Return**
  0 if ok, < 0 if error

int (*filter)(const struct device *dev, struct wifi_filter_info *filter)
Set or get packet filter settings for monitor and promiscuous modes.
  
  **Param dev**
  Pointer to the device structure for the driver instance.
  
  **Param packet**
  Filter settings
  
  **Return**
  0 if ok, < 0 if error

int (*mode)(const struct device *dev, struct wifi_mode_info *mode)
Set or get mode of operation.
  
  **Param dev**
  Pointer to the device structure for the driver instance.
  
  **Param mode**
  Settings
  
  **Return**
  0 if ok, < 0 if error

int (*channel)(const struct device *dev, struct wifi_channel_info *channel)
Set or get current channel of operation.

**Param dev**
- Pointer to the device structure for the driver instance.

**Param channel**
- settings

**Return**
- 0 if ok, < 0 if error

```c
int (*get_version)(const struct device *dev, struct wifi_version *params)
```

Get Version of WiFi driver and Firmware.

The driver that implements the `get_version` function must not use stack to allocate the version information pointers that are returned as `params` struct members. The version pointer parameters should point to a static memory either in ROM (preferred) or in RAM.

**Param dev**
- Pointer to the device structure for the driver instance

**Param params**
- Version parameters

**Return**
- 0 if ok, < 0 if error

```c
struct net_wifi_mgmt_offload
    #include <wifi_mgmt.h> Wi-Fi management offload API.
```

### Public Members

```c
struct ethernet_api wifi_iface
```

Mandatory to get in first position.

A network device should indeed provide a pointer on such `net_if_api` structure. So we make current structure pointer that can be casted to a `net_if_api` structure pointer. Ethernet API

```c
const struct wifi_mgmt_ops *const wifi_mgmt_api
```

Wi-Fi management API.

```c
void *wifi_drv_ops
```

Wi-Fi supplicant driver API.

### Protocols

#### CoAP

- **Overview**
- **Sample Usage**
  - CoAP Server
  - CoAP Client
- **Testing**
Overview  The Constrained Application Protocol (CoAP) is a specialized web transfer protocol for use with constrained nodes and constrained (e.g., low-power, lossy) networks. It provides a convenient API for RESTful Web services that support CoAP's features. For more information about the protocol itself, see IETF RFC7252 The Constrained Application Protocol.

Zephyr provides a CoAP library which supports client and server roles. The library can be enabled with CONFIG_COAP Kconfig option and is configurable as per user needs. The Zephyr CoAP library is implemented using plain buffers. Users of the API create sockets for communication and pass the buffer to the library for parsing and other purposes. The library itself doesn't create any sockets for users.

On top of CoAP, Zephyr has support for LWM2M “Lightweight Machine 2 Machine” protocol, a simple, low-cost remote management and service enablement mechanism. See Lightweight M2M (LWM2M) for more information.

Supported RFCs:
- RFC7252: The Constrained Application Protocol (CoAP)
- RFC6690: Constrained RESTful Environments (CoRE) Link Format
- RFC7959: Block-Wise Transfers in the Constrained Application Protocol (CoAP)
- RFC7641: Observing Resources in the Constrained Application Protocol (CoAP)

Note: Not all parts of these RFCs are supported. Features are supported based on Zephyr requirements.

Sample Usage

CoAP Server

Note: A CoAP server subsystem is available, the following is for creating a custom server implementation.

To create a CoAP server, resources for the server need to be defined. The .well-known/core resource should be added before all other resources that should be included in the responses of the .well-known/core resource.

```c
static struct coap_resource resources[] = {
    { .get = well_known_core_get,
      .path = COAP_WELL_KNOWN_CORE_PATH,
    },
    { .get = sample_get,
      .post = sample_post,
      .del = sample_del,
      .put = sample_put,
      .path = sample_path
    },
    { }
};
```
An application reads data from the socket and passes the buffer to the CoAP library to parse the message. If the CoAP message is proper, the library uses the buffer along with resources defined above to call the correct callback function to handle the CoAP request from the client. It's the callback function's responsibility to either reply or act according to CoAP request.

```c
coap_packet_parse(&request, data, data_len, options, opt_num);
```

```c
coap_handle_request(&request, resources, options, opt_num, client_addr, client_addr_len);
```

If `CONFIG_COAP_URI_WILDCARD` enabled, server may accept multiple resources using MQTT-like wildcard style:

- the plus symbol represents a single-level wild card in the path;
- the hash symbol represents the multi-level wild card in the path.

```c
static const char *const led_set[] = { "led","+","set", NULL }
static const char *const btn_get[] = { "button","#", NULL }
static const char *const no_wc[] = { "test","+1", NULL }
```

It accepts /led/0/set, led/1234/set, led/any/set, /button/door/1, /test/+1, but returns -ENOENT for /led/1, /test/21, /test/1.

This option is enabled by default, disable it to avoid unexpected behaviour with resource path like '/some_resource/+/#'.

### CoAP Client

**Note:** A CoAP client subsystem is available, the following is for creating a custom client implementation.

If the CoAP client knows about resources in the CoAP server, the client can start prepare CoAP requests and wait for responses. If the client doesn’t know about resources in the CoAP server, it can request resources through the .well-known/core CoAP message.

```c
/* Initialize the CoAP message */
char *path = "test";
struct coap_packet request;
uint8_t data[100];
uint8_t payload[20];

coap_packet_init(&request, data, sizeof(data),
                 1, COAP_TYPE_CON, 8, coap_next_token(),
                 COAP_METHOD_GET, coap_next_id());

/* Append options */
coap_packet_append_option(&request, COAP_OPTION_URI_PATH,
                          path, strlen(path));

/* Append Payload marker if you are going to add payload */
coap_packet_append_payload_marker(&request);

/* Append payload */
coap_packet_append_payload(&request, (uint8_t *)payload,
                           sizeof(payload) - 1);

/* send over sockets */
```

**Testing** There are various ways to test Zephyr CoAP library.
**libcoap**  libcoap implements a lightweight application-protocol for devices that are resource constrained, such as by computing power, RF range, memory, bandwidth, or network packet sizes. Sources can be found here libcoap. libcoap has a script (examples/etsi_coaptest.sh) to test coap-server functionality in Zephyr.

See the net-tools project for more details

The coap-server sample can be built and executed on QEMU as described in *Networking with QEMU*.

Use this command on the host to run the libcoap implementation of the ETSI test cases:

```
sudo ./libcoap/examples/etsi_coaptest.sh -i tap0 2001:db8::1
```

**TTCN3**  Eclipse has TTCN3 based tests to run against CoAP implementations.

Install eclipse-titan and set symbolic links for titan tools

```
sudo apt-get install eclipse-titan
cd /usr/share/titan
sudo ln -s /usr/bin bin
sudo ln /usr/bin/titanver bin
sudo ln -s /usr/bin/mctr_cli bin
sudo ln -s /usr/include/titan include
sudo ln -s /usr/lib/titan lib
export TTCN3_DIR=/usr/share/titan
git clone https://gitlab.eclipse.org/eclipse/titan/titan.misc.git
cd titan.misc
```

Follow the instruction to setup CoAP test suite from here:

- https://gitlab.eclipse.org/eclipse/titan/titan.misc

After the build is complete, the coap-server sample can be built and executed on QEMU as described in *Networking with QEMU*.

Change the client (test suite) and server (Zephyr coap-server sample) addresses in coap.cfg file as per your setup.

Execute the test cases with following command.

```
ttcn3_start coaptests coap.cfg
```

Sample output of ttcn3 tests looks like this.

```
Verdict statistics: 0 none (0.00 %), 10 pass (100.00 %), 0 inconc (0.00 %), 0 fail (0.00 %),
   0 error (0.00 %).
Test execution summary: 10 test cases were executed. Overall verdict: pass
```

**API Reference**

**Related code samples**

**CoAP client**  Use the CoAP library to implement a client that fetches a resource.

**CoAP service**  Use the CoAP server subsystem to register CoAP resources.

6.3. Networking 2559
group coap

COAP library.

Defines

COAP_REQUEST_MASK

COAP_VERSION_1

COAP_MAKE_RESPONSE_CODE(class, det)

Utility macro to create a CoAP response code.

Parameters

- **class** – Class of the response code (ex. 2, 4, 5, ...)
- **det** – Detail of the response code

Returns

Response code literal

COAP_CODE_EMPTY

COAP_TOKEN_MAX_LEN

GET_BLOCK_NUM(v)

GET_BLOCK_SIZE(v)

GET_MORE(v)

COAP_WELL_KNOWN_CORE_PATH

This resource should be added before all other resources that should be included in the responses of the .well-known/core resource if is to be used with coap_well_known_core_get.

Typedefs

typedef int (*coap_method_t)(struct coap_resource *resource, struct coap_packet *request, struct sockaddr *addr, socklen_t addr_len)

Type of the callback being called when a resource's method is invoked by the remote entity.

typedef void (*coap_notify_t)(struct coap_resource *resource, struct coap_observer *observer)

Type of the callback being called when a resource's has observers to be informed when an update happens.
typedef int (*coap_reply_t)(const struct coap_packet *response, struct coap_reply *reply, const struct sockaddr *from)

    Helper function to be called when a response matches the a pending request.

    When sending blocks, the callback is only executed when the reply of the last block is received. i.e. it is not called when the code of the reply is ‘continue’ (2.31).

Enums

define coap_option_num

    Set of CoAP packet options we are aware of.

    Users may add options other than these to their packets, provided they know how to format them correctly. The only restriction is that all options must be added to a packet in numeric order.

    Refer to RFC 7252, section 12.2 for more information.

   Request-Tag (RFC 9175)

enum coap_method
   Available request methods.
   To be used when creating a request or a response.
   Values:

enumerator COAP_METHOD_GET = 1
   GET.

enumerator COAP_METHOD_POST = 2
   POST.

enumerator COAP_METHOD_PUT = 3
   PUT.
enumerator COAP_METHOD_DELETE = 4
    DELETE.

enumerator COAP_METHOD_FETCH = 5
    FETCH.

enumerator COAP_METHOD_PATCH = 6
    PATCH.

enumerator COAP_METHOD_IPATCH = 7
    IPATCH.

enum coap_msgtype
    CoAP packets may be of one of these types.
    Values:
    enumerator COAP_TYPE_CON = 0
        Confirmable message.
        The packet is a request or response the destination end-point must acknowledge.
    enumerator COAP_TYPE_NON_CON = 1
        Non-confirmable message.
        The packet is a request or response that doesn’t require acknowledgements.
    enumerator COAP_TYPE_ACK = 2
        Acknowledge.
        Response to a confirmable message.
    enumerator COAP_TYPE_RESET = 3
        Reset.
        Rejecting a packet for any reason is done by sending a message of this type.

enum coap_response_code
    Set of response codes available for a response packet.
    To be used when creating a response.
    Values:
    enumerator COAP_RESPONSE_CODE_OK = ((2 « 5) | (0))
        2.00 - OK

evernemerator COAP_RESPONSE_CODE_PROXYING_NOT_SUPPORTED = ((5 « 5) | (5))
    5.05 - Proxying Not Supported

class coap_content_format
    Set of Content-Format option values for CoAP.
    To be used when encoding or decoding a Content-Format option.
    Values:

    enumerator COAP_CONTENT_FORMAT_TEXT_PLAIN = 0
        text/plain; charset=utf-8

    enumerator COAP_CONTENT_FORMAT_APP_LINK_FORMAT = 40
        application/link-format

enumerator COAP_CONTENT_FORMAT_APP_MERGE_PATCH_JSON = 52
    application/merge-patch+json

enumerator COAP_CONTENT_FORMAT_APP_CBOR = 60
    application/cbor

enum coap_block_size
    Represents the size of each block that will be transferred using block-wise transfers [RFC7959]:
    Each entry maps directly to the value that is used in the wire.
    Values:

enumerator COAP_BLOCK_16         16-byte block size
enumerator COAP_BLOCK_32         32-byte block size
enumerator COAP_BLOCK_64         64-byte block size
enumerator COAP_BLOCK_128        128-byte block size
enumerator COAP_BLOCK_256        256-byte block size
enumerator COAP_BLOCK_512        512-byte block size
enumerator COAP_BLOCK_1024       1024-byte block size

Functions

uint8_t coap_header_get_version(const struct coap_packet *cpkt)
    Returns the version present in a CoAP packet.

Parameters
    • cpkt – CoAP packet representation

Returns
    the CoAP version in packet
uint8_t coap_header_get_type(const struct coap_packet *cpkt)

Returns the type of the CoAP packet.

Parameters
- cpkt – CoAP packet representation

Returns
the type of the packet

uint8_t coap_header_get_token(const struct coap_packet *cpkt, uint8_t *token)

Returns the token (if any) in the CoAP packet.

Parameters
- cpkt – CoAP packet representation
- token – Where to store the token, must point to a buffer containing at least COAP_TOKEN_MAX_LEN bytes

Returns
Token length in the CoAP packet (0 - COAP_TOKEN_MAX_LEN).

uint8_t coap_header_get_code(const struct coap_packet *cpkt)

Returns the code of the CoAP packet.

Parameters
- cpkt – CoAP packet representation

Returns
the code present in the packet

int coap_header_set_code(const struct coap_packet *cpkt, uint8_t code)

Modifies the code of the CoAP packet.

Parameters
- cpkt – CoAP packet representation
- code – CoAP code

Returns
0 on success, -EINVAL on failure

uint16_t coap_header_get_id(const struct coap_packet *cpkt)

Returns the message id associated with the CoAP packet.

Parameters
- cpkt – CoAP packet representation

Returns
the message id present in the packet

const uint8_t *coap_packet_get_payload(const struct coap_packet *cpkt, uint16_t *len)

Returns the data pointer and length of the CoAP packet.

Parameters
- cpkt – CoAP packet representation
- len – Total length of CoAP payload

Returns
data pointer and length if payload exists NULL pointer and length set to 0 in case there is no payload

6.3. Networking
bool coap_uri_path_match(const char *const *path, struct coap_option *options, uint8_t opt_num)

Verify if CoAP URI path matches with provided options.

Parameters

• path – Null-terminated array of strings.
• options – Parsed options from coap_packet_parse()
• opt_num – Number of options

Returns

true if the CoAP URI path matches, false otherwise.

int coap_packet_parse(struct coap_packet *cpkt, uint8_t *data, uint16_t len, struct coap_option *options, uint8_t opt_num)

Parses the CoAP packet in data, validating it and initializing cpkt. 

Data must remain valid while cpkt is used.

Parameters

• cpkt – Packet to be initialized from received data.
• data – Data containing a CoAP packet, its data pointer is positioned on the start of the CoAP packet.
• len – Length of the data
• options – Parse options and cache its details.
• opt_num – Number of options

Return values

• 0 – in case of success.
• -EINVAL – in case of invalid input args.
• -EBADMSG – in case of malformed coap packet header.
• -EILSEQ – in case of malformed coap options.

int coap_packet_set_path(struct coap_packet *cpkt, const char *path)

Parses provided coap path (with/without query) or query and appends that as options to the cpkt.

Parameters

• cpkt – Packet to append path and query options for.
• path – Null-terminated string of coap path, query or both.

Return values

0 – in case of success or negative in case of error.

int coap_packet_init(struct coap_packet *cpkt, uint8_t *data, uint16_t max_len, uint8_t ver, uint8_t type, uint8_t token_len, const uint8_t *token, uint8_t code, uint16_t id)

Creates a new CoAP Packet from input data.

Parameters

• cpkt – New packet to be initialized using the storage from data.
• data – Data that will contain a CoAP packet information
• max_len – Maximum allowable length of data
• ver – CoAP header version
- **type** – CoAP header type
- **token_len** – CoAP header token length
- **token** – CoAP header token
- **code** – CoAP header code
- **id** – CoAP header message id

**Returns**

0 in case of success or negative in case of error.

```c
int coap_ack_init(struct coap_packet *cpkt, const struct coap_packet *req, uint8_t *data, uint16_t max_len, uint8_t code)
```

Create a new CoAP Acknowledgment message for given request.

This function works like `coap_packet_init`, filling CoAP header type, CoAP header token, and CoAP header message id fields according to acknowledgment rules.

**Parameters**

- **cpkt** – New packet to be initialized using the storage from `data`.
- **req** – CoAP request packet that is being acknowledged
- **data** – Data that will contain a CoAP packet information
- **max_len** – Maximum allowable length of data
- **code** – CoAP header code

**Returns**

0 in case of success or negative in case of error.

```c
uint8_t *coap_next_token(void)
```

Returns a randomly generated array of 8 bytes, that can be used as a message's token.

**Returns**

a 8-byte pseudo-random token.

```c
uint16_t coap_next_id(void)
```

Helper to generate message ids.

**Returns**

a new message id

```c
int coap_find_options(const struct coap_packet *cpkt, uint16_t code, struct coap_option *options, uint16_t veclen)
```

Return the values associated with the option of value `code`.

**Parameters**

- **cpkt** – CoAP packet representation
- **code** – Option number to look for
- **options** – Array of `coap_option` where to store the value of the options found
- **veclen** – Number of elements in the options array

**Returns**

The number of options found in packet matching code, negative on error.

```c
int coap_packet_append_option(struct coap_packet *cpkt, uint16_t code, const uint8_t *value, uint16_t len)
```

Appends an option to the packet.
Note: options can be added out of numeric order of their codes. But it’s more efficient to add them in order.

**Parameters**

- `cpkt` – Packet to be updated
- `code` – Option code to add to the packet, see `coap_option_num`
- `value` – Pointer to the value of the option, will be copied to the packet
- `len` – Size of the data to be added

**Returns**

0 in case of success or negative in case of error.

```c
int coap_packet_remove_option(struct coap_packet *cpkt, uint16_t code)
```

Remove an option from the packet.

**Parameters**

- `cpkt` – Packet to be updated
- `code` – Option code to remove from the packet, see `coap_option_num`

**Returns**

0 in case of success or negative in case of error.

```c
unsigned int coap_option_value_to_int(const struct coap_option *option)
```

Converts an option to its integer representation.

Assumes that the number is encoded in the network byte order in the option.

**Parameters**

- `option` – Pointer to the option value, retrieved by `coap_find_options()`

**Returns**

The integer representation of the option

```c
int coap_append_option_int(struct coap_packet *cpkt, uint16_t code, unsigned int val)
```

Appends an integer value option to the packet.

The option must be added in numeric order of their codes, and the least amount of bytes will be used to encode the value.

**Parameters**

- `cpkt` – Packet to be updated
- `code` – Option code to add to the packet, see `coap_option_num`
- `val` – Integer value to be added

**Returns**

0 in case of success or negative in case of error.

```c
int coap_packet_append_payload_marker(struct coap_packet *cpkt)
```

Append payload marker to CoAP packet.

**Parameters**

- `cpkt` – Packet to append the payload marker (0xFF)

**Returns**

0 in case of success or negative in case of error.

```c
int coap_packet_append_payload(struct coap_packet *cpkt, const uint8_t *payload, uint16_t payload_len)
```

Append payload to CoAP packet.
Parameters

- `pkt` – Packet to append the payload
- `payload` – CoAP packet payload
- `payload_len` – CoAP packet payload len

Returns

0 in case of success or negative in case of error.

```c
bool coap_packet_is_request(const struct coap_packet *pkt);
```

Check if a CoAP packet is a CoAP request.

Parameters

- `pkt` – Packet to be checked.

Returns

true if the packet is a request, false otherwise.

```c
int coap_handle_request_len(struct coap_packet *pkt, struct coap_resource *resources, size_t resources_len, struct coap_option *options, uint8_t opt_num, struct sockaddr *addr, socklen_t addr_len);
```

When a request is received, call the appropriate methods of the matching resources.

Parameters

- `pkt` – Packet received
- `resources` – Array of known resources
- `resources_len` – Number of resources in the array
- `options` – Parsed options from `coap_packet_parse()`
- `opt_num` – Number of options
- `addr` – Peer address
- `addr_len` – Peer address length

Return values

- `>= 0` in case of success.
- `-ENOTSUP` – in case of invalid request code.
- `-EPERM` – in case resource handler is not implemented.
- `-ENOENT` – in case the resource is not found.

```c
int coap_handle_request(struct coap_packet *pkt, struct coap_resource *resources, coap_option *options, uint8_t opt_num, struct sockaddr *addr, socklen_t addr_len);
```

When a request is received, call the appropriate methods of the matching resources.

Parameters

- `pkt` – Packet received
- `resources` – Array of known resources (terminated with empty resource)
- `options` – Parsed options from `coap_packet_parse()`
- `opt_num` – Number of options
- `addr` – Peer address
- `addr_len` – Peer address length

Return values
• >= – 0 in case of success.
• -ENOTSUP – in case of invalid request code.
• -EPERM – in case resource handler is not implemented.
• -ENOENT – in case the resource is not found.

static inline uint16_t coap_block_size_to_bytes(enum coap_block_size block_size)

Helper for converting the enumeration to the size expressed in bytes.

Parameters
• block_size – The block size to be converted

Returns
The size in bytes that the block_size represents

int coap_block_transfer_init(struct coap_block_context *ctx, enum coap_block_size block_size, size_t total_size)

Initializes the context of a block-wise transfer.

Parameters
• ctx – The context to be initialized
• block_size – The size of the block
• total_size – The total size of the transfer, if known

Returns
0 in case of success or negative in case of error.

int coap_append_descriptive_block_option(struct coap_packet *cpkt, struct coap_block_context *ctx)

Append BLOCK1 or BLOCK2 option to the packet.
If the CoAP packet is a request then BLOCK1 is appended otherwise BLOCK2 is appended.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the block option

Returns
0 in case of success or negative in case of error.

bool coap_has_descriptive_block_option(struct coap_packet *cpkt)

Check if a descriptive block option is set in the packet.
If the CoAP packet is a request then an available BLOCK1 option would be checked otherwise a BLOCK2 option would be checked.

Parameters
• cpkt – Packet to be checked.

Returns
true if the corresponding block option is set, false otherwise.

int coap_remove_descriptive_block_option(struct coap_packet *cpkt)

Remove BLOCK1 or BLOCK2 option from the packet.
If the CoAP packet is a request then BLOCK1 is removed otherwise BLOCK2 is removed.

Parameters
• cpkt – Packet to be updated.
Returns
0 in case of success or negative in case of error.

int coap_append_block1_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append BLOCK1 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Block1 option

Returns
0 in case of success or negative in case of error.

int coap_append_block2_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append BLOCK2 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Block2 option

Returns
0 in case of success or negative in case of error.

int coap_append_size1_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append SIZE1 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Size1 option

Returns
0 in case of success or negative in case of error.

int coap_append_size2_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append SIZE2 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Size2 option

Returns
0 in case of success or negative in case of error.

int coap_get_option_int(const struct coap_packet *cpkt, uint16_t code)
Get the integer representation of a CoAP option.

Parameters
• cpkt – Packet to be inspected
• code – CoAP option code

Returns
Integer value >= 0 in case of success or negative in case of error.
int coap_get_block1_option(const struct coap_packet *cpkt, bool *has_more, uint8_t *block_number)

Get the block size, more flag and block number from the CoAP block1 option.

Parameters
• cpkt – Packet to be inspected
• has_more – Is set to the value of the more flag
• block_number – Is set to the number of the block

Returns
Integer value of the block size in case of success or negative in case of error.

int coap_get_block2_option(const struct coap_packet *cpkt, uint8_t *block_number)

Get values from CoAP block2 option.
Decode block number and block size from option. Ignore the has_more flag as it should always be zero on queries.

Parameters
• cpkt – Packet to be inspected
• block_number – Is set to the number of the block

Returns
Integer value of the block size in case of success or negative in case of error.

int coap_update_from_block(const struct coap_packet *cpkt, struct coap_block_context *ctx)

Retrieves BLOCK{1,2} and SIZE{1,2} from cpkt and updates ctx accordingly.

Parameters
• cpkt – Packet in which to look for block-wise transfers options
• ctx – Block context to be updated

Returns
0 in case of success or negative in case of error.

int coap_next_block_for_option(const struct coap_packet *cpkt, struct coap_block_context *ctx, enum coap_option_num option)

Updates ctx according to option set in cpkt so after this is called the current entry indicates the correct offset in the body of data being transferred.

Parameters
• cpkt – Packet in which to look for block-wise transfers options
• ctx – Block context to be updated
• option – Either COAP_OPTION_BLOCK1 or COAP_OPTION_BLOCK2

Returns
The offset in the block-wise transfer, 0 if the transfer has finished or a negative value in case of an error.

size_t coap_next_block(const struct coap_packet *cpkt, struct coap_block_context *ctx)

Updates ctx so after this is called the current entry indicates the correct offset in the body of data being transferred.

Parameters
• cpkt – Packet in which to look for block-wise transfers options
• ctx – Block context to be updated
Returns
The offset in the block-wise transfer, 0 if the transfer has finished.

```c
void coap_observer_init(struct coap_observer *observer, const struct coap_packet *request, const struct sockaddr *addr)
```

Indicates that the remote device referenced by `addr`, with `request`, wants to observe a resource.

**Parameters**
- `observer` – Observer to be initialized
- `request` – Request on which the observer will be based
- `addr` – Address of the remote device

```c
bool coap_register_observer(struct coap_resource *resource, struct coap_observer *observer)
```

After the observer is initialized, associate the observer with an resource.

**Parameters**
- `resource` – Resource to add an observer
- `observer` – Observer to be added

**Returns**
true if this is the first observer added to this resource.

```c
bool coap_remove_observer(struct coap_resource *resource, struct coap_observer *observer)
```

Remove this observer from the list of registered observers of that resource.

**Parameters**
- `resource` – Resource in which to remove the observer
- `observer` – Observer to be removed

**Returns**
true if the observer was found and removed.

```c
struct coap_observer *coap_find_observer(struct coap_observer *observers, size_t len, const struct sockaddr *addr, const uint8_t *token, uint8_t token_len)
```

Returns the observer that matches address `addr` and has token `token`.

**Parameters**
- `observers` – Pointer to the array of observers
- `len` – Size of the array of observers
- `addr` – Address of the endpoint observing a resource
- `token` – Pointer to the token
- `token_len` – Length of valid bytes in the token

**Returns**
A pointer to a observer if a match is found, NULL otherwise.

```c
struct coap_observer *coap_find_observer_by_addr(struct coap_observer *observers, size_t len, const struct sockaddr *addr)
```

Returns the observer that matches address `addr`. 

6.3. Networking 2575
Note: The function `coap_find_observer()` should be preferred if both the observer's address and token are known.

### Parameters
- `observers` – Pointer to the array of observers
- `len` – Size of the array of observers
- `addr` – Address of the endpoint observing a resource

### Returns
A pointer to a observer if a match is found, NULL otherwise.

```c
struct coap_observer *coap_find_observer_by_token(struct coap_observer *observers, size_t len, const uint8_t *token, uint8_t token_len)
```

Returns the observer that has token `token`.

Note: The function `coap_find_observer()` should be preferred if both the observer's address and token are known.

### Parameters
- `observers` – Pointer to the array of observers
- `len` – Size of the array of observers
- `token` – Pointer to the token
- `token_len` – Length of valid bytes in the token

### Returns
A pointer to a observer if a match is found, NULL otherwise.

```c
struct coap_observer *coap_observer_next_unused(struct coap_observer *observers, size_t len)
```

Returns the next available observer representation.

### Parameters
- `observers` – Pointer to the array of observers
- `len` – Size of the array of observers

### Returns
A pointer to a observer if there's an available observer, NULL otherwise.

```c
void coap_reply_init(struct coap_reply *reply, const struct coap_packet *request)
```

Indicates that a reply is expected for `request`.

### Parameters
- `reply` – Reply structure to be initialized
- `request` – Request from which `reply` will be based

```c
int coap_pending_init(struct coap_pending *pending, const struct coap_packet *request, const struct sockaddr *addr, const struct coap_transmission_parameters *params)
```
Initialize a pending request with a request.

The request's fields are copied into the pending struct, so request doesn't have to live
for as long as the pending struct lives, but “data” that needs to live for at least that long.

**Parameters**

- **pending** – Structure representing the waiting for a confirmation message,
  initialized with data from request
- **request** – Message waiting for confirmation
- **addr** – Address to send the retransmission
- **params** – Pointer to the CoAP transmission parameters struct, or NULL to
  use default values

**Returns**

0 in case of success or negative in case of error.

```c
struct coap_pending *coap_pending_next_unused(struct coap_pending *pendings, size_t len)
```

Returns the next available pending struct, that can be used to track the retransmission
status of a request.

**Parameters**

- **pendings** – Pointer to the array of coap_pending structures
- **len** – Size of the array of coap_pending structures

**Returns**

pointer to a free coap_pending structure, NULL in case none could be found.

```c
struct coap_reply *coap_reply_next_unused(struct coap_reply *replies, size_t len)
```

Returns the next available reply struct, so it can be used to track replies and notifications
received.

**Parameters**

- **replies** – Pointer to the array of coap_reply structures
- **len** – Size of the array of coap_reply structures

**Returns**

pointer to a free coap_reply structure, NULL in case none could be found.

```c
struct coap_pending *coap_pending_received(const struct coap_packet *response, struct coap_pending *pendings, size_t len)
```

After a response is received, returns if there is any matching pending request exits.

User has to clear all pending retransmissions related to that response by calling
coap_pending_clear().

**Parameters**

- **response** – The received response
- **pendings** – Pointer to the array of coap_reply structures
- **len** – Size of the array of coap_reply structures

**Returns**

pointer to the associated coap_pending structure, NULL in case none could
be found.
After a response is received, call coap_reply_t handler registered in coap_reply structure.

**Parameters**
- `response` – A response received
- `from` – Address from which the response was received
- `replies` – Pointer to the array of coap_reply structures
- `len` – Size of the array of coap_reply structures

**Returns**
Pointer to the reply matching the packet received, NULL if none could be found.

struct coap_pending *coap_pending_next_to_expire(struct coap_pending *pendings, size_t len)

Returns the next pending about to expire, pending->timeout informs how many ms to next expiration.

**Parameters**
- `pendings` – Pointer to the array of coap_pending structures
- `len` – Size of the array of coap_pending structures

**Returns**
The next coap_pending to expire, NULL if none is about to expire.

bool coap_pending_cycle(struct coap_pending *pending)

After a request is sent, user may want to cycle the pending retransmission so the timeout is updated.

**Parameters**
- `pending` – Pending representation to have its timeout updated

**Returns**
false if this is the last retransmission.

void coap_pending_clear(struct coap_pending *pending)

Cancels the pending retransmission, so it again becomes available.

**Parameters**
- `pending` – Pending representation to be canceled

void coap_pendings_clear(struct coap_pending *pendings, size_t len)

Cancels all pending retransmissions, so they become available again.

**Parameters**
- `pendings` – Pointer to the array of coap_pending structures
- `len` – Size of the array of coap_pending structures

size_t coap_pendings_count(struct coap_pending *pendings, size_t len)

Count number of pending requests.

**Parameters**
- `len` – Number of elements in array.
- `pendings` – Array of pending requests.
Returns
count of elements where timeout is not zero.

void coap_reply_clear(struct coap_reply *reply)
Cancels awaiting for this reply, so it becomes available again.
User responsibility to free the memory associated with data.

Parameters
• reply – The reply to be canceled

void coap_replies_clear(struct coap_reply *replies, size_t len)
Cancels all replies, so they become available again.

Parameters
• replies – Pointer to the array of coap_reply structures
• len – Size of the array of coap_reply structures

int coap_resource_notify(struct coap_resource *resource)
Indicates that this resource was updated and that the notify callback should be called for every registered observer.

Parameters
• resource – Resource that was updated

Returns
0 in case of success or negative in case of error.

bool coap_request_is_observe(const struct coap_packet *request)
Returns if this request is enabling observing a resource.

Parameters
• request – Request to be checked

Returns
True if the request is enabling observing a resource, False otherwise

struct coap_transmission_parameters coap_get_transmission_parameters(void)
Get currently active CoAP transmission parameters.

Returns
CoAP transmission parameters structure.

void coap_set_transmission_parameters(const struct coap_transmission_parameters *params)
Set CoAP transmission parameters.

Parameters
• params – Pointer to the transmission parameters structure.

int coap_well_known_core_get(struct coap_resource *resource, const struct coap_packet *request, struct coap_packet *response, uint8_t *data, uint16_t data_len)
Build a CoAP response for a .well-known/core CoAP request.

Parameters
• resource – Array of known resources, terminated with an empty resource
• request – A pointer to the .well-known/core CoAP request
• response – A pointer to a CoAP response, will be initialized
• **data** – A data pointer to be used to build the CoAP response
• **data_len** – The maximum length of the data buffer

**Returns**
0 in case of success or negative in case of error.

```c
int coap_well_known_core_get_len(struct coap_resource *resources, size_t resources_len, const struct coap_packet *request, struct coap_packet *response, uint8_t *data, uint16_t data_len)
```

Build a CoAP response for a `.well-known/core` CoAP request.

**Parameters**
• **resources** – Array of known resources
• **resources_len** – Number of resources in the array
• **request** – A pointer to the `.well-known/core` CoAP request
• **response** – A pointer to a CoAP response, will be initialized
• **data** – A data pointer to be used to build the CoAP response
• **data_len** – The maximum length of the data buffer

**Returns**
0 in case of success or negative in case of error.

```c
struct coap_resource
#include <coap.h> Description of CoAP resource.
CoAP servers often want to register resources, so that clients can act on them, by fetching their state or requesting updates to them.

**Public Members**

```c
coap_method_t get
```
Which function to be called for each CoAP method.

```c
struct coap_observer
#include <coap.h> Represents a remote device that is observing a local resource.
```

```c
struct coap_packet
#include <coap.h> Representation of a CoAP Packet.
```

**Public Members**

```c
uint8_t *data
User allocated buffer.
```

```c
uint16_t offset
CoAP lib maintains offset while adding data.
```

```c
uint16_t max_len
Max CoAP packet data length.
```
uint8_t hdr_len
    CoAP header length.

uint16_t opt_len
    Total options length (delta + len + value)

uint16_t delta
    Used for delta calculation in CoAP packet.

struct coap_option
    #include <coap.h> Representation of a CoAP option.

    Public Members

    uint16_t delta
        Option delta.

    uint8_t len
        Option length.

    uint8_t value[12]
        Option value.

struct coap_transmission_parameters
    #include <coap.h> CoAP transmission parameters.

    Public Members

    uint32_t ack_timeout
        Initial ACK timeout.
        Value is used as a base value to retry pending CoAP packets.

    uint16_t coap_backoff_percent
        Set CoAP retry backoff factor.
        A value of 200 means a factor of 2.0.

    uint8_t max_retransmission
        Maximum number of retransmissions.

struct coap_pending
    #include <coap.h> Represents a request awaiting for an acknowledgment (ACK).

    Public Members

6.3. Networking
struct sockaddr addr
    Remote address.

int64_t t0
    Time when the request was sent.

uint32_t timeout
    Timeout in ms.

uint16_t id
    Message id.

uint8_t *data
    User allocated buffer.

uint16_t len
    Length of the CoAP packet.

uint8_t retries
    Number of times the request has been sent.

struct coap_transmission_parameters params
    Transmission parameters.

struct coap_reply
    #include <coap.h> Represents the handler for the reply of a request, it is also used when observing resources.

struct coap_block_context
    #include <coap.h> Represents the current state of a block-wise transaction.

struct coap_core_metadata
    #include <coap_link_format.h> In case you want to add attributes to the resources included in the ‘well-known/core’ “virtual” resource, the ‘user_data’ field should point to a valid coap_core_metadata structure.

CoAP client

- Overview
- Sample Usage
- API Reference

Overview  The CoAP client library allows application to send CoAP requests and parse CoAP responses. The library can be enabled with CONFIG_COAP_CLIENT Kconfig option. The application is notified about the response via a callback that is provided to the API in the request. The CoAP client handles the communication over sockets. As the CoAP client doesn’t create socket it is using, the application is responsible for creating the socket. Plain UDP or DTLS sockets are supported.
**Sample Usage** The following is an example of a CoAP client initialization and request sending:

```c
static struct coap_client;
struct coap_client_request req = { 0 };

coap_client_init(&client, NULL);
req.method = COAP_METHOD_GET;
req.confirmable = true;
req.path = "test";
req.fmt = COAP_CONTENT_FORMAT_TEXT_PLAIN;
req.cb = response_cb;
req.payload = NULL;
req.len = 0;
/* Sock is a file descriptor referencing a socket, address is the sockaddr struct for the
destination address of the request or NULL if the socket is already connected. */
ret = coap_client_req(&client, sock, &address, &req, -1);
```

Before any requests can be sent, the CoAP client needs to be initialized. After initialization, the application can send a CoAP request and wait for the response. Currently only one request can be sent for a single CoAP client at a time. There can be multiple CoAP clients.

The callback provided in the callback will be called in following cases:

- There is a response for the request
- The request failed for some reason

The callback contains a flag `last_block`, which indicates if there is more data to come in the response and means that the current response is part of a blockwise transfer. When the `last_block` is set to true, the response is finished and the client is ready for the next request after returning from the callback.

If the server responds to the request, the library provides the response to the application through the response callback registered in the request structure. As the response can be a blockwise transfer and the client calls the callback once per each block, the application should be to process all of the blocks to be able to process the response.

The following is an example of a very simple response handling function:

```c
void response_cb(int16_t code, size_t offset, const uint8_t *payload, size_t len,
                 bool last_block, void *user_data)
{
    if (code >= 0) {
        LOG_INF("CoAP response from server %d", code);
        if (last_block) {
            LOG_INF("Last packet received");
        }
    } else {
        LOG_ERR("Error in sending request %d", code);
    }
}
```

**API Reference**

*group coap_client*

CoAP client API.

**Defines**
typedef void (\*coap_client_response_cb_t\)(int16_t result_code, size_t offset, const uint8_t \*payload, size_t len, bool last_block, void \*user_data)

Callback for CoAP request.

This callback is called for responses to CoAP client requests. It is used to indicate errors, response codes from server or to deliver payload. Blockwise transfers cause this callback to be called sequentially with increasing payload offset and only partial content in buffer pointed by payload parameter.

**Param result_code**
Result code of the response. Negative if there was a failure in send.

**coap_response_code** for positive.

**Param offset**
Payload offset from the beginning of a blockwise transfer.

**Param payload**
Buffer containing the payload from the response. NULL for empty payload.

**Param len**
Size of the payload.

**Param last_block**
Indicates the last block of the response.

**Param user_data**
User provided context.

### Functions

**int coap_client_init(struct coap_client *client, const char *info)**
Initialize the CoAP client.

**Parameters**

- **info** – [in] Name for the receiving thread of the client. Setting this NULL will result as default name of “coap_client”.

**Returns**

int Zero on success, otherwise a negative error code.

**int coap_client_req(struct coap_client *client, int sock, const struct sockaddr *addr,**

**struct coap_client_request *req,**

**struct coap_transmission_parameters *params)**

Send CoAP request.

Operation is handled asynchronously using a background thread. If the socket isn’t connected to a destination address, user must provide a destination address, otherwise the address should be set as NULL. Once the callback is called with last block set as true, socket can be closed or used for another query.

**Parameters**

- **client** – Client instance.
• **sock** – Open socket file descriptor.
• **addr** – the destination address of the request, NULL if socket is already connected.
• **req** – CoAP request structure
• **params** – Pointer to transmission parameters structure or NULL to use default values.

**Returns**
zero when operation started successfully or negative error code otherwise.

```c
struct coap_client_request
#include <coap_client.h> Representation of a CoAP client request.
```

**Public Members**

```c
eenum coap_method method
  Method of the request.

bool confirmable
  CoAP Confirmable/Non-confirmable message.

const char *path
  Path of the requested resource.

eenum coap_content_format fmt
  Content format to be used.

uint8_t *payload
  User allocated buffer for send request.

size_t len
  Length of the payload.

coop_client_response_cb_t cb
  Callback when response received.

struct coap_client_option *options
  Extra options to be added to request.

uint8_t num_options
  Number of extra options.

void *user_data
  User provided context.
```

```c
#include <coap_client.h> Representation of extra options for the CoAP client request.
```
CoAP server

- **Overview**
- **Setup**
- **Sample Usage**
- **Observable resources**
- **CoAP Events**
- **CoRE Link Format**
- **API Reference**

**Overview**  Zephyr comes with a batteries-included CoAP server, which uses services to listen for CoAP requests. The CoAP services handle communication over sockets and pass requests to registered CoAP resources.

**Setup**  Some configuration is required to make sure services can be started using the CoAP server. The `CONFIG_COAP_SERVER` option should be enabled in your project:

```makefile
Listing 1: prj.conf
CONFIG_COAP_SERVER=y
```

All services are added to a predefined linker section and all resources for each service also get their respective linker sections. If you would have a service `my_service` it has to be prefixed with `coap_resource_` and added to a linker file:

```makefile
Listing 2: sections-ram.ld
#include <zephyr/linker/iterable_sections.h>
ITERABLE_SECTION_RAM(coap_resource_my_service, 4)
```

Add this linker file to your application using CMake:

```makefile
Listing 3: CMakeLists.txt
zephyr_linker_sources(DATA_SECTIONS sections-ram.ld)
```

You can now define your service as part of the application:

```c
Listing 4: service.c
#include <zephyr/net/coap_service.h>
static const uint16_t my_service_port = 5683;

COAP_SERVICE_DEFINE(my_service, "0.0.0.0", &my_service_port, COAP_SERVICE_AUTOSTART);
```

**Note:** Services defined with the `COAP_SERVICE_AUTOSTART` flag will be started together with the CoAP server thread. Services can be manually started and stopped with `coap_service_start` and `coap_service_stop` respectively.

**Sample Usage**  The following is an example of a CoAP resource registered with our service:
#include <zephyr/net/coap_service.h>

```c
static int my_get(struct coap_resource *resource, struct coap_packet *request, 
                  struct sockaddr *addr, socklen_t addr_len)
{
    static const char *msg = "Hello, world!";
    uint8_t data[CONFIG_COAP_SERVER_MESSAGE_SIZE];
    struct coap_packet response;
    uint16_t id;
    uint8_t token[COAP_TOKEN_MAX_LEN];
    uint8_t tkl, type;

    type = coap_header_get_type(request);
    id = coap_header_get_id(request);
    tkl = coap_header_get_token(request, token);

    /* Determine response type */
    type = (type == COAP_TYPE_CON) ? COAP_TYPE_ACK : COAP_TYPE_NON_CON;

    coap_packet_init(&response, data, sizeof(data), COAP_VERSION_1, type, tkl, token, 
                     COAP_RESPONSE_CODE_CONTENT, id);

    /* Set content format */
    coap_append_option_int(&response, COAP_OPTION_CONTENT_FORMAT, 
                           COAP_CONTENT_FORMAT_TEXT_PLAIN);

    /* Append payload */
    coap_packet_append_payload_marker(&response);
    coap_packet_append_payload(&response, (uint8_t *)msg, sizeof(msg));

    /* Send to response back to the client */
    return coap_resource_send(resource, &response, addr, addr_len, NULL);
}

static int my_put(struct coap_resource *resource, struct coap_packet *request, 
                   struct sockaddr *addr, socklen_t addr_len)
{
    /* ... Handle the incoming request ... */

    /* Return a CoAP response code as a shortcut for an empty ACK message */
    return COAP_RESPONSE_CODE_CHANGED;
}

static const char * const my_resource_path[] = { "test", NULL };

COAP_RESOURCE_DEFINE(my_resource, my_service, {
    .path = my_resource_path,
    .get = my_get,
    .put = my_put,
});```

**Note:** As demonstrated in the example above, a CoAP resource handler can return response codes to let the server respond with an empty ACK response.

**Observable resources** The CoAP server provides logic for parsing observe requests and stores these using the runtime data of CoAP services. An example using a temperature sensor can look like:
```c
#include <zephyr/kernel.h>
#include <zephyr/drivers/sensor.h>
#include <zephyr/net/coap_service.h>

static void notifyObservers(struct k_work *work);
K_WORK_DELAYABLE_DEFINE(temp_work, notifyObservers);

static int send_temperature(struct coap_resource *resource, const struct sockaddr *addr, socklen_t addr_len, uint16_t age, uint16_t id, const uint8_t *token, uint8_t tkl, bool is_response) {
    const struct device *dev = DEVICE_DT_GET(DT_ALIAS(ambient_temp0));
    uint8_t data[CONFIG_COAP_SERVER_MESSAGE_SIZE];
    struct coap_packet response;
    char payload[14];
    struct sensor_value value;
    double temp;
    uint8_t type;

    /* Determine response type */
    type = is_response ? COAP_TYPE_ACK : COAP_TYPE_CON;

    if (!is_response) {
        id = coap_next_id();
    }

    coap_packet_init(&response, data, sizeof(data), COAP_VERSION_1, type, tkl, token, COAP_RESPONSE_CODE_CONTENT, id);

    if (age >= 2U) {
        coap_append_option_int(&response, COAP_OPTION_OBSERVE, age);
    }

    /* Set content format */
    coap_append_option_int(&response, COAP_OPTION_CONTENT_FORMAT, COAP_CONTENT_FORMAT_TEXT_PLAIN);

    /* Get the sensor data */
    sensor_sample_fetch_chan(dev, SENSOR_CHAN_AMBIENT_TEMP);
    sensor_channel_get(dev, SENSOR_CHAN_AMBIENT_TEMP, &value);
    temp = sensor_value_to_double(&value);

    snprintf(payload, sizeof(payload), "%0.2f°C", temp);

    /* Append payload */
    coap_packet_append_payload_marker(&response);
    coap_packet_append_payload(&response, (uint8_t*)payload, strlen(payload));

    return coap_resource_send(resource, &response, addr, addr_len, NULL);
}

static int temp_get(struct coap_resource *resource, struct coap_packet *request, struct sockaddr *addr, socklen_t addr_len) {
    uint8_t token[COAP_TOKEN_MAX_LEN];
    uint16_t id;
    uint8_t tkl;
    int r;

    /* Let the CoAP server parse the request and add/remove observers if needed */
    r = coap_resource_parse_observe(resource, request, addr);
```
id = coap_header_get_id(request);
tkl = coap_header_get_token(request, token);

return send_temperature(resource, addr, addr_len, r == 0 ? resource->age : 0,
   id, token, tkl, true);
}

static void temp_notify(struct coap_resource *resource, struct coap_observer *observer)
{
  send_temperature(resource, &observer->addr, sizeof(observer->addr), resource->age, 0,
   observer->token, observer->tkl, false);
}

static const char * const temp_resource_path[] = { "sensors", "temp1", NULL };
COAP_RESOURCE_DEFINE(temp_resource, my_service, {
  .path = temp_resource_path,
  .get = temp_get,
  .notify = temp_notify,
});

static void notifyObservers(struct k_work *work)
{
  if (sys_slist_is_empty(&temp_resource.observers)) {
    return;
  }

  coap_resource_notify(&temp_resource);
  k_work_reschedule(&temp_work, K_SECONDS(1));
}

CoAP Events  By enabling CONFIG_NET_MGMT_EVENT the user can register for CoAP events. The
following example simply prints when an event occurs.

#include <zephyr/sys/printk.h>
#include <zephyr/net/coap_mgmt.h>
#include <zephyr/net/coap_service.h>

#define COAP_EVENTS_SET (NET_EVENT_COAP_OBSERVER_ADDED | NET_EVENT_COAP_OBSERVER_REMOVED | 
   NET_EVENT_COAP_SERVICE_STARTED | NET_EVENT_COAP_SERVICE_STOPPED)

void coap_event_handler(uint32_t mgmt_event, struct net_if *iface,
   void *info, size_t info_length, void *user_data)
{
  switch (mgmt_event) {
    case NET_EVENT_COAP_OBSERVER_ADDED:
      printk("CoAP observer added");
      break;
    case NET_EVENT_COAP_OBSERVER_REMOVED:
      printk("CoAP observer removed");
      break;
    case NET_EVENT_COAP_SERVICE_STARTED:
      if (info != NULL && info_length == sizeof(struct net_event_coap_service)) {
        struct net_event_coap_service *net_event = info;

        printk("CoAP service %s started", net_event->service->name);
      } else {
        printk("CoAP service started");
      }
  }
}
break;
case NET_EVENT_COAP_SERVICE_STOPPED:
    if (info != NULL && info_length == sizeof(struct net_event_coap_service)) {
        struct net_event_coap_service *net_event = info;
        printk("CoAP service %s stopped", net_event->service->name);
    } else {
        printk("CoAP service stopped");
    }
break;
}
NET_MGMT_REGISTER_EVENT_HANDLER(coap_events, COAP_EVENTS_SET, coap_event_handler, NULL);

CoRE Link Format  The CONFIG_COAP_SERVER_WELL_KNOWN_CORE option enables handling the well-known/core GET requests by the server. This allows clients to get a list of hypermedia links to other resources hosted in that server.

CoAP service
Use the CoAP server subsystem to register CoAP resources.

(group coap_service
    CoAP Service API.
    
    CoAP Service configuration flags
    
    COAP_SERVICE_AUTOSTART
    Start the service on boot.

    Defines
    
    COAP_RESOURCE_DEFINE(_name, _service, ...)
    Define a static CoAP resource owned by the service named _service.

    static const struct gpio_dt_spec led = GPIO_DT_SPEC_GET(DT_ALIAS(led0), gpios);
    static int led_put(struct coap_resource *resource, struct coap_packet *request,
                        struct sockaddr *addr, socklen_t addr_len)
    {
        const uint8_t *payload;
        uint16_t payload_len;

        payload = coap_packet_get_payload(request, &payload_len);
        if (payload_len != 1) {
            (continues on next page)
return COAP_RESPONSE_CODE_BAD_REQUEST;
}
if (gpio_pin_set_dt(&led, payload[0]) < 0) {
    return COAP_RESPONSE_CODE_INTERNAL_ERROR;
}
return COAP_RESPONSE_CODE_CHANGED;
}
COAP_RESOURCE_DEFINE(my_resource, my_service, {
    .put = led_put,
    });

Note: The handlers registered with the resource can return a CoAP response code to reply with an acknowledge without any payload, nothing is sent if the return value is 0 or negative. As seen in the example.

Parameters

- _name – Name of the resource.
- _service – Name of the associated service.

COAP_SERVICE_DEFINE(_name, _host, _port, _flags)
Define a CoAP service with static resources.

See also:

COAP_SERVICE_FLAGS.

Note: The _host parameter can be NULL. If not, it is used to specify an IP address either in IPv4 or IPv6 format a fully-qualified hostname or a virtual host, otherwise the any address is used.

Note: The _port parameter must be non-NULL. It points to a location that specifies the port number to use for the service. If the specified port number is zero, then an ephemeral port number will be used and the actual port number assigned will be written back to memory. For ephemeral port numbers, the memory pointed to by _port must be writeable.

Parameters

- _name – Name of the service.
- _host – IP address or hostname associated with the service.
- _port – [inout] Pointer to port associated with the service.
- _flags – Configuration flags

COAP_SERVICE_COUNT(_dst)
Count the number of CoAP services.

Parameters
• _dst – [out] Pointer to location where result is written.

**COAP_SERVICE_RESOURCE_COUNT(_service)**
Count CoAP service static resources.

**Parameters**
• _service – Pointer to a service.

**COAP_SERVICE_HAS_RESOURCE(_service, _resource)**
Check if service has the specified resource.

**Parameters**
• _service – Pointer to a service.
• _resource – Pointer to a resource.

**COAP_SERVICE_FOREACH(_it)**
Iterate over all CoAP services.

**Parameters**
• _it – Name of iterator (of type CoAP service API)

**COAP_RESOURCE_FOREACH(_service, _it)**
Iterate over static CoAP resources associated with a given _service.

**Note:** This macro requires that _service is defined with **COAP_SERVICE_DEFINE**.

**Parameters**
• _service – Name of CoAP service
• _it – Name of iterator (of type coap_resource)

**COAP_SERVICE_FOREACH_RESOURCE(_service, _it)**
Iterate over all static resources associated with _service.

**Note:** This macro is suitable for a _service defined with **COAP_SERVICE_DEFINE**.

**Parameters**
• _service – Pointer to CoAP service
• _it – Name of iterator (of type coap_resource)

**Functions**

```c
int coap_service_start(const struct coap_service *service)
Start the provided service.
```

**Note:** This function is suitable for a service defined with **COAP_SERVICE_DEFINE**.

**Parameters**
• service – Pointer to CoAP service

**Return values**
int coap_service_stop(const struct coap_service *service)
Stop the provided service.

Note: This function is suitable for a service defined with COAP_SERVICE_DEFINE.

Parameters
• service – Pointer to CoAP service

Return values
• 0 – in case of success.
• -EALREADY – in case the service isn’t running.

int coap_service_is_running(const struct coap_service *service)
Query the provided service running state.

Note: This function is suitable for a service defined with COAP_SERVICE_DEFINE.

Parameters
• service – Pointer to CoAP service

Return values
• 1 – if the service is running
• 0 – if the service is stopped
• negative – in case of an error.

int coap_service_send(const struct coap_service *service, const struct coap_packet *cpkt, const struct sockaddr *addr, socklen_t addr_len, const struct coap_transmission_parameters *params)
Send a CoAP message from the provided service.

Note: This function is suitable for a service defined with COAP_SERVICE_DEFINE.

Parameters
• service – Pointer to CoAP service
• cpkt – CoAP Packet to send
• addr – Peer address
• addr_len – Peer address length
• params – Pointer to transmission parameters structure or NULL to use default values.

Returns
0 in case of success or negative in case of error.
int coap_resource_send(const struct coap_resource *resource, const struct coap_packet *cpkt, const struct sockaddr *addr, socklen_t addr_len, const struct coap_transmission_parameters *params)

Send a CoAP message from the provided resource.

**Note:** This function is suitable for a resource defined with `COAP_RESOURCE_DEFINE`.

**Parameters**

- **resource** – Pointer to CoAP resource
- **cpkt** – CoAP Packet to send
- **addr** – Peer address
- **addr_len** – Peer address length
- **params** – Pointer to transmission parameters structure or NULL to use default values.

**Returns**

0 in case of success or negative in case of error.

int coap_resource_parse_observe(struct coap_resource *resource, const struct coap_packet *request, const struct sockaddr *addr)

Parse a CoAP observe request for the provided resource.

If the observe option value is equal to 0, an observer will be added, if the value is equal to 1, an existing observer will be removed.

**Note:** This function is suitable for a resource defined with `COAP_RESOURCE_DEFINE`.

**Parameters**

- **resource** – Pointer to CoAP resource
- **request** – CoAP request to parse
- **addr** – Peer address

**Returns**

the observe option value in case of success or negative in case of error.

int coap_resource_remove_observer_by_addr(struct coap_resource *resource, const struct sockaddr *addr)

Lookup an observer by address and remove it from the resource.

**Note:** This function is suitable for a resource defined with `COAP_RESOURCE_DEFINE`.

**Parameters**

- **resource** – Pointer to CoAP resource
- **addr** – Peer address

**Returns**

0 in case of success or negative in case of error.
int coap_resource_remove_observer_by_token(struct coap_resource *resource, const uint8_t *token, uint8_t token_len)

Lookup an observer by token and remove it from the resource.

**Note:** This function is suitable for a resource defined with `COAP_RESOURCE_DEFINE`.

**Parameters**
- `resource` – Pointer to CoAP resource
- `token` – Pointer to the token
- `token_len` – Length of valid bytes in the token

**Returns**
0 in case of success or negative in case of error.

**group coap_mgmt**
CoAP Manager Events.

**Defines**

```c
#include <coap_mgmt.h>
```

CoAP Service event structure.

**Enums**

```c
eenum net_event_coap_cmd

*Values:*

enumerator `NET_EVENT_COAP_CMD_SERVICE_STARTED` = 1
enumerator `NET_EVENT_COAP_CMD_SERVICE_STOPPED`
enumerator `NET_EVENT_COAP_CMD_OBSERVER_ADDED`
enumerator `NET_EVENT_COAP_CMD_OBSERVER_REMOVED`
```

`struct net_event_coap_service`

*#include <coap_mgmt.h>* CoAP Service event structure.
HTTP client

Overview The HTTP client library allows you to send HTTP requests and parse HTTP responses. The library communicates over the sockets API but it does not create sockets on its own. It can be enabled with CONFIG_HTTP_CLIENT Kconfig option.

The application must be responsible for creating a socket and passing it to the library. Therefore, depending on the application's needs, the library can communicate over either a plain TCP socket (HTTP) or a TLS socket (HTTPS).

Sample Usage The API of the HTTP client library has a single function.

The following is an example of a request structure created correctly:

```c
struct http_request req = {0};
static uint8_t recv_buf[512];

req.method = HTTP_GET;
req.url = "/";
req.host = "localhost";
req.protocol = "HTTP/1.1";
req.response = response_cb;
req.recv_buf = recv_buf;
req.recv_buf_len = sizeof(recv_buf);

/* sock is a file descriptor referencing a socket that has been connected *
 * to the HTTP server. */
ret = http_client_req(sock, &req, 5000, NULL);
```

If the server responds to the request, the library provides the response to the application through the response callback registered in the request structure. As the library can provide the response in chunks, the application must be able to process these.

Together with the structure containing the response data, the callback function also provides information about whether the library expects to receive more data.

The following is an example of a very simple response handling function:

```c
static void response_cb(struct http_response *rsp,
                        enum http_final_call final_data,
                        void *user_data)
{
    if (final_data == HTTP_DATA_MORE) {
        LOG_INF("Partial data received (%zd bytes)", rsp->data_len);
    } else if (final_data == HTTP_DATA_FINAL) {
        LOG_INF("All the data received (%zd bytes)", rsp->data_len);
    }
}
```

(continues on next page)
See HTTP client sample application for more information about the library usage.

#### Typedefs

typedef int (*http_payload_cb_t)(int sock, struct http_request *req, void *user_data)
Callback used when data needs to be sent to the server.

- **Param sock**
  Socket id of the connection

- **Param req**
  HTTP request information

- **Param user_data**
  User specified data specified in `http_client_req()`

**Return**

>=0 amount of data sent, in this case `http_client_req()` should continue sending data, <0 if `http_client_req()` should return the error code to the caller.

typedef int (*http_header_cb_t)(int sock, struct http_request *req, void *user_data)
Callback can be used if application wants to construct additional HTTP headers when the HTTP request is sent.

Usage of this is optional.

- **Param sock**
  Socket id of the connection

- **Param req**
  HTTP request information
**Param user_data**  
User specified data specified in `http_client_req()`

**Return**  
>=0 amount of data sent, in this case `http_client_req()` should continue sending data, <0 if `http_client_req()` should return the error code to the caller.

typedef void (*http_response_cb_t)(struct http_response *rsp, enum http_final_call final_data, void *user_data)

Callback used when data is received from the server.

**Param rsp**  
HTTP response information

**Param final_data**  
Does this data buffer contain all the data or is there still more data to come.

**Param user_data**  
User specified data specified in `http_client_req()`

**Enums**

enum http_final_call

*Values:*

enumerator HTTP_DATA_MORE = 0

enumerator HTTP_DATA_FINAL = 1

**Functions**

int http_client_req(int sock, struct http_request *req, int32_t timeout, void *user_data)

Do a HTTP request.

The callback is called when data is received from the HTTP server. The caller must have created a connection to the server before calling this function so `connect()` call must have been done successfully for the socket.

**Parameters**

- `sock` – Socket id of the connection.
- `req` – HTTP request information
- `timeout` – Max timeout to wait for the data. The timeout value cannot be 0 as there would be no time to receive the data. The timeout value is in milliseconds.
- `user_data` – User specified data that is passed to the callback.

**Returns**

<0 if error, >=0 amount of data sent to the server

struct http_response

`#include <client.h>` HTTP response from the server.
Public Members

const struct http_parser_settings *http_cb
HTTP parser settings for the application usage.

http_response_cb_t cb
User provided HTTP response callback which is called when a response is received
to a sent HTTP request.

uint8_t *body_frag_start
Start address of the body fragment contained in the recv_buf.

recv_buffer that contains header + body

|------------------ body_frag_len ------------------|
|--------------------- data len --------------------|
---------------------------------------------------------------
..header | header | body | body..
---------------------------------------------------------------
↑ ↑
recv_buf body_frag_start

recv_buffer that contains body only

|------------------ body_frag_len ------------------|
|--------------------- data len --------------------|
---------------------------------------------------------------

size_t body_frag_len
Length of the body fragment contained in the recv_buf.

uint8_t *recv_buf
Where the response is stored, this is to be provided by the user.

size_t recv_buf_len
Response buffer maximum length.

size_t data_len
Length of the data in the result buf.
If the value is larger than recv_buf_len, then it means that the data is truncated
and could not be fully copied into recv_buf. This can only happen if the user did
not set the response callback. If the callback is set, then the HTTP client API will
call response callback many times so that all the data is delivered to the user. Will
be zero in the event of a null response.

size_t content_length
HTTP Content-Length field value.
Will be set to zero in the event of a null response.
size_t processed
Amount of data given to the response callback so far, including the current data
given to the callback.
This should be equal to the content_length field once the entire body has been
received. Will be zero if a null response is given.

uint16_t http_status_code
Numeric HTTP status code which corresponds to the textual description.
Set to zero if null response is given. Otherwise, will be a 3-digit integer code if valid
HTTP response is given.

struct http_client_internal_data
#include <client.h> HTTP client internal data that the application should not touch.

Public Members

struct http_parser parser
HTTP parser context.

struct http_parser_settings parser_settings
HTTP parser settings.

struct http_response response
HTTP response specific data (filled by http_client_req() when data is received)

void *user_data
User data.

int sock
HTTP socket.

struct http_request
#include <client.h> HTTP client request.
This contains all the data that is needed when doing a HTTP request.

Public Members

struct http_client_internal_data internal
HTTP client request internal data.

enum http_method method
The HTTP method: GET, HEAD, OPTIONS, POST, ...

http_response_cb_t response
User supplied callback function to call when response is received.
const struct http_parser_settings *http_cb
    User supplied list of HTTP callback functions if the calling application wants to know the parsing status or the HTTP fields.
    This is optional and normally not needed.

uint8_t *recv_buf
    User supplied buffer where received data is stored.

size_t recv_buf_len
    Length of the user supplied receive buffer.

const char *url
    The URL for this request, for example: /index.html.

const char *protocol
    The HTTP protocol, for example “HTTP/1.1”.

const char **header_fields
    The HTTP header fields (application specific) The Content-Type may be specified here or in the next field.
    Depending on your application, the Content-Type may vary, however some header fields may remain constant through the application’s life cycle. This is a NULL terminated list of header fields.

const char *content_type_value
    The value of the Content-Type header field, may be NULL.

const char *host
    Hostname to be used in the request.

const char *port
    Port number to be used in the request.

http_payload_cb_t payload_cb
    User supplied callback function to call when payload needs to be sent.
    This can be NULL in which case the payload field in http_request is used. The idea of this payload callback is to allow user to send more data that is practical to store in allocated memory.

const char *payload
    Payload, may be NULL.

size_t payload_len
    Payload length is used to calculate Content-Length.
    Set to 0 for chunked transfers.

http_header_cb_t optional_headers_cb
    User supplied callback function to call when optional headers need to be sent.

6.3. Networking
This can be NULL, in which case the optional_headers field in `http_request` is used. The idea of this optional_headers callback is to allow user to send more HTTP header data that is practical to store in allocated memory.

```c
const char **optional_headers
```

A NULL terminated list of any optional headers that should be added to the HTTP request.

May be NULL. If the optional_headers_cb is specified, then this field is ignored. Note that there are two similar fields that contain headers, the header_fields above and this optional_headers. This is done like this to support Websocket use case where Websocket will use header_fields variable and any optional application specific headers will be placed into this field.

Lightweight M2M (LWM2M)

- **API Reference**

**Overview**
Lightweight Machine to Machine (LwM2M) is an application layer protocol designed with device management, data reporting and device actuation in mind. Based on CoAP/UDP, LwM2M is a standard defined by the Open Mobile Alliance and suitable for constrained devices by its use of CoAP packet-size optimization and a simple, stateless flow that supports a REST API.

One of the key differences between LwM2M and CoAP is that an LwM2M client initiates the connection to an LwM2M server. The server can then use the REST API to manage various interfaces with the client.

LwM2M uses a simple resource model with the core set of objects and resources defined in the specification.

The LwM2M library can be enabled with `CONFIG_LWM2M` Kconfig option.

**Example LwM2M object and resources: Device**

The server could query the Manufacturer resource for Device object instance 0 (the default and only instance) by sending a READ 3/0/0 operation to the client.

The full list of registered objects and resource IDs can be found in the LwM2M registry.

Zephyr’s LwM2M library lives in the `subsys/net/lib/lwm2m`, with a client sample in `samples/net/lwm2m_client`. For more information about the provided sample see: `lwm2m-client`. The sample can be configured to use normal unsecure network sockets or sockets secured via DTLS.

The Zephyr LwM2M library implements the following items:

- engine to process networking events and core functions
- RD client which performs BOOTSTRAP and REGISTRATION functions
- SenML CBOR, SenML JSON, CBOR, TLV, JSON, and plain text formatting functions
- LwM2M Technical Specification Enabler objects such as Security, Server, Device, Firmware Update, etc.
- Extended IPSO objects such as Light Control, Temperature Sensor, and Timer

By default, the library implements LwM2M specification 1.0.2 and can be set to LwM2M specification 1.1.1 with a Kconfig option.

For more information about LwM2M visit OMA Specworks LwM2M.

**Sample usage**

To use the LwM2M library, start by creating an LwM2M client context `lwm2m_ctx` structure:
Create callback functions for LwM2M resource executions:

```c
static int device_reboot_cb(uint16_t obj_inst_id, uint8_t *args,
                            uint16_t args_len)
{
    LOG_INF("Device rebooting.");
    LOG_PANIC();
    sys_reboot(0);
    return 0; /* won't reach this */
}
```

The LwM2M RD client can send events back to the sample. To receive those events, setup a callback function:

```c
static void rd_client_event(struct lwm2m_ctx *client,
                            enum lwm2m_rd_client_event client_event)
{
    switch (client_event) {
        case LWM2M_RD_CLIENT_EVENT_NONE:
            /* do nothing */
            break;
        case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_FAILURE:
            LOG_DBG("Bootstrap registration failure!");
            break;
        case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_COMPLETE:
            LOG_DBG("Bootstrap registration complete");
            break;
        case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_TRANSFER_COMPLETE:
            LOG_DBG("Bootstrap transfer complete");
            break;
        case LWM2M_RD_CLIENT_EVENT_REGISTRATION_FAILURE:
            LOG_DBG("Registration failure!");
            break;
        case LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE:
            LOG_DBG("Registration complete");
            break;
        case LWM2M_RD_CLIENT_EVENT_REG_TIMEOUT:
            LOG_DBG("Registration timeout!");
            break;
        case LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE:
            LOG_DBG("Registration update complete");
            break;
        case LWM2M_RD_CLIENT_EVENT_DEREGISTER_FAILURE:
            LOG_DBG("Deregister failure!");
            break;
        case LWM2M_RD_CLIENT_EVENT_DISCONNECT:
            LOG_DBG("Disconnected");
            break;
    }
}
```
Next we assign Security resource values to let the client know where and how to connect as well as set the Manufacturer and Reboot resources in the Device object with some data and the callback we defined above:

```c
/*
 * Server URL of default Security object = 0/0/0
 * Use leshan.eclipse.org server IP (5.39.83.206) for connection
 */
lwm2m_set_string(&LWM2M_OBJ(0, 0, 0), "coap://5.39.83.206");

/*
 * Security Mode of default Security object = 0/0/2
 * 3 = NoSec mode (no security beware!)
 */
lwm2m_set_u8(&LWM2M_OBJ(0, 0, 2), 3);

#define CLIENT_MANUFACTURER "Zephyr Manufacturer"

/*
 * Manufacturer resource of Device object = 3/0/0
 * We use lwm2m_set_res_data() function to set a pointer to the
 * CLIENT_MANUFACTURER string.
 * Note the LWM2M_RES_DATA_FLAG_RO flag which stops the engine from
 * trying to assign a new value to the buffer.
 */
lwm2m_set_res_data(&LWM2M_OBJ(3, 0, 0), CLIENT_MANUFACTURER,
                   sizeof(CLIENT_MANUFACTURER),
                   LWM2M_RES_DATA_FLAG_RO);

/* Reboot resource of Device object = 3/0/4 */
lwm2m_register_exec_callback(&LWM2M_OBJ(3, 0, 4), device_reboot_cb);
```

Lastly, we start the LwM2M RD client (which in turn starts the LwM2M engine). The second parameter of `lwm2m_rd_client_start()` is the client endpoint name. This is important as it needs to be unique per LwM2M server:

```c
(void)memset(&client, 0x0, sizeof(client));
lwm2m_rd_client_start(&client, "unique-endpoint-name", 0, rd_client_event);
```

**LwM2M security modes** The Zephyr LwM2M library can be used either without security or use DTLS to secure the communication channel. When using DTLS with the LwM2M engine, PSK (Pre-Shared Key) and X.509 certificates are the security modes that can be used to secure the communication. The engine uses LwM2M Security object (Id 0) to read the stored credentials and feed keys from the security object into the TLS credential subsystem, see secure sockets documentation. Enable the `CONFIG_LWM2M_DTLS_SUPPORT` Kconfig option to use the security.
Depending on the selected mode, the security object must contain following data:

**PSK**

Security Mode (Resource ID 2) set to zero (Pre-Shared Key mode). Identity (Resource ID 3) contains PSK ID in binary form. Secret key (Resource ID 5) contains the PSK key in binary form. If the key or identity is provided as a hex string, it must be converted to binary before storing into the security object.

**X509**

When X509 certificates are used, set Security Mode (ID 2) to 2 (Certificate mode). Identity (ID 3) is used to store the client certificate and Secret key (ID 5) must have a private key associated with the certificate. Server Public Key resource (ID 4) must contain a server certificate or CA certificate used to sign the certificate chain. If the CONFIGMBEDTLS_PEM_CERTIFICATE_FORMAT Kconfig option is enabled, certificates and private key can be entered in PEM format. Otherwise, they must be in binary DER format.

**NoSec**

When no security is used, set Security Mode (Resource ID 2) to 3 (NoSec).

In all modes, Server URI resource (ID 0) must contain the full URI for the target server. When DNS names are used, the DNS resolver must be enabled.

When DTLS is used, following options are recommended to reduce DTLS handshake traffic when connection is re-established:

- CONFIG_LWMS_LWM2MloggedIn enables DTLS Connection Identifier support. When server supports it, this completely removes the handshake when device resumes operation after long idle period. Greatly helps when NAT mappings have timed out.
- CONFIG_LWMS_LWM2M_TLS_SESSION_CACHING uses session cache when before falling back to full DTLS handshake. Reduces few packets from handshake, when session is still cached on server side. Most significant effect is to avoid full registration.

LwM2M stack provides callbacks in the `lwm2m_ctx` structure. They are used to feed keys from the LwM2M security object into the TLS credential subsystem. By default, these callbacks can be left as NULL pointers, in which case default callbacks are used. When an external TLS stack, or non-default socket options are required, you can overwrite the `lwm2m_ctx.load_credentials()` or `lwm2m_ctx.set_socketoptions()` callbacks.

An example of setting up the security object for PSK mode:

```c
/* "00102030405060708090a0b0c0d0e0f" */
static unsigned char client_psk[] = {
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
    0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f
};

static const char client_identity[] = "Client_identity";

lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 0), "coaps://lwm2m.example.com");
lwm2m_set_u8(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 2), LWM2M_SECURITY_PSK);
/* Set the client identity as a string, but this could be binary as well */
lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 3), client_identity);
/* Set the client pre-shared key (PSK) */
lwm2m_set_opaque(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 5), client_psk, sizeof(client_psk));
```

An example of setting up the security object for X509 certificate mode:

```c
static const char certificate[] = "-----BEGIN CERTIFICATE-----\nMIIB6jCCAY+gAw...
static const char key[] = "-----BEGIN EC PRIVATE KEY-----\nG7hC...
static const char root_ca[] = "-----BEGIN CERTIFICATE-----\nMIIBaz....

lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 0), "coaps://lwm2m.example.com");
```

(continues on next page)
lwm2m_set_u8(LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 2), LWM2M_SECURITY_CERT);
lwm2m_set_string(LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 3), certificate);
lwm2m_set_string(LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 5), key);
lwm2m_set_string(LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 4), root_ca);

Before calling lwm2m_rd_client_start() assign the tls_tag # where the LwM2M library should store the DTLS information prior to connection (normally a value of 1 is ok here).

(void)memset(&client, 0x0, sizeof(client));
client.tls_tag = 1; /* <---- */
lwm2m_rd_client_start(&client, "endpoint-name", 0, rd_client_event);

For a more detailed LwM2M client sample see: lwm2m-client.

**Multi-thread usage** Writing a value to a resource can be done using functions like lwm2m_set_u8. When writing to multiple resources, the function lwm2m_registry_lock will ensure that the client halts until all writing operations are finished:

lwm2m_registry_lock();
lwm2m_set_u32(LWM2M_OBJ(1, 0, 1), 60);
lwm2m_set_u8(LWM2M_OBJ(5, 0, 3), 0);
lwm2m_set_f64(LWM2M_OBJ(3303, 0, 5700), value);
lwm2m_registry_unlock();

This is especially useful if the server is composite-observing the resources being written to. Locking will then ensure that the client only updates and sends notifications to the server after all operations are done, resulting in fewer messages in general.

**Support for time series data** LwM2M version 1.1 adds support for SenML CBOR and SenML JSON data formats. These data formats add support for time series data. Time series formats can be used for READ, NOTIFY and SEND operations. When data cache is enabled for a resource, each write will create a timestamped entry in a cache, and its content is then returned as a content in READ, NOTIFY or SEND operation for a given resource.

Data cache is only supported for resources with a fixed data size.

Supported resource types:

- Signed and unsigned 8-64-bit integers
- Float
- Boolean

**Enabling and configuring** Enable data cache by selecting CONFIG_LWM2M_RESOURCE_DATA_CACHE_SUPPORT. Application needs to allocate an array of lwm2m_time_series_elem structures and then enable the cache by calling lwm2m_engine_enable_cache() for a given resource. Each resource must be enabled separately and each resource needs their own storage.

    /* Allocate data cache storage */
    static struct lwm2m_time_series_elem temperature_cache[10];
    /* Enable data cache */
    lwm2m_engine_enable_cache(LWM2M_PATH(IPSO_OBJECT_TEMP_SENSOR_ID, 0, SENSOR_VALUE_RID), temperature_cache, ARRAY_SIZE(temperature_cache));

LwM2M engine have room for four resources that have cache enabled. Limit can be increased by changing CONFIG_LWM2M_MAX_CACHED_RESOURCES. This affects a static memory usage of engine.
Data caches depends on one of the SenML data formats `CONFIG_LWM2M_RW_SENML_CBOR_SUPPORT` or `CONFIG_LWM2M_RW_SENML_JSON_SUPPORT` and needs `CONFIG_POSIX_CLOCK` so it can request a timestamp from the system and `CONFIG_RING_BUFFER` for ring buffer.

**Read and Write operations**  
Full content of data cache is written into a payload when any READ, SEND or NOTIFY operation internally reads the content of a given resource. This has a side effect that any read callbacks registered for a that resource are ignored when cache is enabled. Data is written into a cache when any of the `lwm2m_set_*` functions are called. To filter the data entering the cache, application may register a validation callback using `lwm2m_register_validate_callback()`.

**Limitations**  
Cache size should be manually set so small that the content can fit normal packets sizes. When cache is full, new values are dropped.

**LwM2M engine and application events**  
The Zephyr LwM2M engine defines events that can be sent back to the application through callback functions. The engine state machine shows when the events are spawned. Events depicted in the diagram are listed in the table. The events are prefixed with `LWM2M_RD_CLIENT_EVENT_`.

### Table 21: LwM2M RD Client events

<table>
<thead>
<tr>
<th>Event ID</th>
<th>Event Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>NONE</td>
<td>No event</td>
</tr>
<tr>
<td>1</td>
<td>BOOT-STRAP_REG_FAILURE</td>
<td>Bootstrap registration failed. Occurs if there is a timeout or failure in bootstrap registration.</td>
</tr>
<tr>
<td>2</td>
<td>BOOT-STRAP_REG_COMPLETE</td>
<td>Bootstrap registration complete. Occurs after successful bootstrap registration.</td>
</tr>
<tr>
<td>3</td>
<td>BOOT-STRAP_TRANSPORT</td>
<td>Bootstrap finish command received from the server.</td>
</tr>
<tr>
<td>4</td>
<td>REGISTRATION_FAILURE</td>
<td>Registration to LwM2M server failed. Occurs if there is a failure in the registration.</td>
</tr>
<tr>
<td>5</td>
<td>REGISTRATION_COMPLETE</td>
<td>Registration to LwM2M server successful. Occurs after a successful registration reply from the LwM2M server or when session resumption is used.</td>
</tr>
<tr>
<td>6</td>
<td>REG_TIMEOUT</td>
<td>Registration or registration update timeout. Occurs if there is a timeout during registration. Client have lost connection to the server.</td>
</tr>
<tr>
<td>7</td>
<td>REG_UPDATE_COMPLETE</td>
<td>Registration update completed. Occurs after successful registration update reply from the LwM2M server.</td>
</tr>
<tr>
<td>8</td>
<td>DEREGISTRATION_FAILURE</td>
<td>Deregistration to LwM2M server failed. Occurs if there is a timeout or failure in the deregistration.</td>
</tr>
<tr>
<td>9</td>
<td>DISCONNECT</td>
<td>LwM2M client have de-registered from server and is now stopped. Triggered only if the application have requested the client to stop.</td>
</tr>
<tr>
<td>10</td>
<td>QUEUE_MODE_RX_OFF</td>
<td>Used only in queue mode, not actively listening for incoming packets. In queue mode the client is not required to actively listen for the incoming packets after a configured time period.</td>
</tr>
<tr>
<td>11</td>
<td>ENGINE_SUSPEND</td>
<td>Indicate that client has now paused as a result of calling <code>lwm2m_engine_pause()</code>. State machine is no longer running and the handler thread is suspended. All timers are stopped so notifications are not triggered.</td>
</tr>
<tr>
<td>12</td>
<td>SERVER_DISASSOCIATE</td>
<td>Server have executed the disable command. Client will deregister and stay idle for the disable period.</td>
</tr>
<tr>
<td>13</td>
<td>NETWORK_ERROR</td>
<td>Sending messages to the network failed too many times. Client cannot reach any servers or fallback to bootstrap. LwM2M engine cannot recover and have stopped.</td>
</tr>
</tbody>
</table>
LwM2M engine state machine

Fig. 15: State machine for the LwM2M engine
The LwM2M client engine handles most of the state transitions automatically. The application needs to handle only the events that indicate that the client have stopped or is in a state where it cannot recover.

<table>
<thead>
<tr>
<th>Event Name</th>
<th>How application should react</th>
</tr>
</thead>
<tbody>
<tr>
<td>NONE</td>
<td>Ignore the event.</td>
</tr>
<tr>
<td>BOOT-STRAP_REG_FAIL</td>
<td>Try to recover network connection. Then restart the client by calling <code>lwm2m_rd_client_start()</code>. This might also indicate configuration issue.</td>
</tr>
<tr>
<td>BOOT-STRAP_REG_COMPLETE</td>
<td>No actions needed</td>
</tr>
<tr>
<td>BOOT-STRAP_TRANSFER_COMPLETE</td>
<td>No actions needed</td>
</tr>
<tr>
<td>REGISTRATION_FAILURE</td>
<td>No actions needed</td>
</tr>
<tr>
<td>REGISTRATION_COMPLETE</td>
<td>No actions needed. Application can send or receive data.</td>
</tr>
<tr>
<td>REG_TIMEOUT</td>
<td>No actions needed. Client proceeds to re-registration automatically. Cannot send or receive data.</td>
</tr>
<tr>
<td>REG_UPDATE_COMPLETE</td>
<td>No actions needed. Application can send or receive data.</td>
</tr>
<tr>
<td>DEREGISTRATION_FAILURE</td>
<td>No actions needed. Client proceeds to idle state automatically. Cannot send or receive data.</td>
</tr>
</tbody>
</table>
| DISCONNECT                | Engine have stopped as a result of calling `lwm2m_rd_client_stop()`. If connection is required, the application should restart the client by calling `lwm2m_rd_client_start()`.
| QUEUE_MODE_RX_OFF         | No actions needed. Application can send but cannot receive data. Any data transmission will trigger a registration update. |
| ENGINE_SUSPENDED          | Engine can be resumed by calling `lwm2m_engine_resume()`. Cannot send or receive data.         |
| SERVER_DISABLED           | No actions needed. Client will re-register once the disable period is over. Cannot send or receive data. |
| NETWORK_ERROR             | Try to recover network connection. Then restart the client by calling `lwm2m_rd_client_start()`. This might also indicate configuration issue. |

Sending of data in the table above refers to calling `lwm2m_send_cb()` or by writing into of of the observed resources where observation would trigger a notify message. Receiving of data refers to receiving read, write or execute operations from the server. Application can register callbacks for these operations.

### Configuring lifetime and activity period

In LwM2M engine, there are three Kconfig options and one runtime value that configures how often the client will send LwM2M Update message.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>LwM2M registration lifetime</td>
<td>The lifetime parameter in LwM2M specifies how long a device's registration with an LwM2M server remains valid. Device is expected to send LwM2M Update message before the lifetime expires.</td>
</tr>
<tr>
<td>CONFIG_LWM2M_ENGIN</td>
<td>Default lifetime value, unless set by the bootstrap server. Also defines lower limit that client accepts as a lifetime.</td>
</tr>
<tr>
<td>CONFIG_LWM2M_UPDATE</td>
<td>How long the client can stay idle before sending a next update.</td>
</tr>
<tr>
<td>CONFIG_LWM2M_SECON</td>
<td>Minimum time margin to send the update message before the registration lifetime expires.</td>
</tr>
</tbody>
</table>
By default, the client uses `CONFIG_LWM2M_SECONDS_TO_UPDATE_EARLY` to calculate how many seconds before the expiration of lifetime it is going to send the registration update. The problem with default mode is when the server changes the lifetime of the registration. This is then affecting the period of updates the client is doing. If this is used with the QUEUE mode, which is typical in IPv4 networks, it is also affecting the period of when the device is reachable from the server.

When also the `CONFIG_LWM2M_UPDATE_PERIOD` is set, time to send the update message is the earliest when any of these values expire. This allows setting long lifetime for the registration and configure the period accurately, even if server changes the lifetime parameter.

In runtime, the update frequency is limited to once in 15 seconds to avoid flooding.

**LwM2M shell** For testing the client it is possible to enable Zephyr’s shell and LwM2M specific commands which support changing the state of the client. Operations supported are read, write and execute resources. Client start, stop, pause and resume are also available. The feature is enabled by selecting `CONFIG_LWM2M_SHELL`. The shell is meant for testing so productions systems should not enable it.

One imaginable scenario, where to use the shell, would be executing client side actions over UART when a server side tests would require those. It is assumed that not all tests are able to trigger required actions from the server side.

```bash
uart:~$ lwm2m
lwm2m - LwM2M commands
Subcommands:
    send :send PATHS
        LwM2M SEND operation
    exec :exec PATH [PARAM]
```

(continues on next page)
Execute a resource

**read** :read PATH [OPTIONS]
Read value from LwM2M resource
- `x` Read value as hex stream (default)
- `s` Read value as string
- `b` Read value as bool (1/0)
- `uX` Read value as uintX_t
- `sX` Read value as intX_t
- `f` Read value as float
- `t` Read value as time_t

**write** :write PATH [OPTIONS] VALUE
Write into LwM2M resource
- `s` Write value as string (default)
- `b` Write value as bool
- `uX` Write value as uintX_t
- `sX` Write value as intX_t
- `f` Write value as float
- `t` Write value as time_t

**create** :create PATH
Create object or resource instance

**delete** :delete PATH
Delete object or resource instance

**cache** :cache PATH NUM
Enable data cache for resource
PATH is LwM2M path
NUM how many elements to cache

**start** :start EP_NAME [BOOTSTRAP FLAG]
Start the LwM2M RD (Registration / Discovery) Client
- `b` Set the bootstrap flag (default 0)

**stop** :stop [OPTIONS]
Stop the LwM2M RD (De-register) Client
- `f` Force close the connection

**update** :Trigger Registration Update of the LwM2M RD Client

**pause** :LwM2M engine thread pause
**resume** :LwM2M engine thread resume
**lock** :Lock the LwM2M registry
**unlock** :Unlock the LwM2M registry

**API Reference**

**Related code samples**

**LwM2M client**
Implement a LwM2M client that connects to a LwM2M server.

**group lwm2m_api**
LwM2M high-level API.
LwM2M high-level interface is defined in this header.
Note: The implementation assumes UDP module is enabled.

Note: For more information refer to Technical Specification OMA-TS-LightweightM2M_Core-V1_1-1-20190617-A

LwM2M Objects managed by OMA for LwM2M tech specification.

Objects in this range have IDs from 0 to 1023.

**LWM2M_OBJECT_SECURITY_ID**
Security object.

**LWM2M_OBJECT_SERVER_ID**
Server object.

**LWM2M_OBJECT_ACCESS_CONTROL_ID**
Access Control object.

**LWM2M_OBJECT_DEVICE_ID**
Device object.

**LWM2M_OBJECT_CONNECTIVITY_MONITORING_ID**
Connectivity Monitoring object.

**LWM2M_OBJECT_FIRMWARE_ID**
Firmware object.

**LWM2M_OBJECT_LOCATION_ID**
Location object.

**LWM2M_OBJECT_CONNECTIVITY_STATISTICS_ID**
Connectivity Statistics object.

**LWM2M_OBJECT_SOFTWARE_MANAGEMENT_ID**
Software Management object.

**LWM2M_OBJECT_PORTFOLIO_ID**
Portfolio object.

**LWM2M_OBJECT_BINARYAPPDATACONTAINER_ID**
Binary App Data Container object.

**LWM2M_OBJECT_EVENT_LOG_ID**
Event Log object.

**LWM2M_OBJECT_OSCORE_ID**
OSCORE object.
LWM2M_OBJECT_GATEWAY_ID
Gateway object.

**LwM2M Objects produced by 3rd party Standards Development Organizations.**

IPSO_OBJECT_GENERIC_SENSOR_ID
IPSO Generic Sensor object.

IPSO_OBJECT_TEMP_SENSOR_ID
IPSO Temperature Sensor object.

IPSO_OBJECT_HUMIDITY_SENSOR_ID
IPSO Humidity Sensor object.

IPSO_OBJECT_LIGHT_CONTROL_ID
IPSO Light Control object.

IPSO_OBJECT_ACCELEROMETER_ID
IPSO Accelerometer object.

IPSO_OBJECT_VOLTAGE_SENSOR_ID
IPSO Voltage Sensor object.

IPSO_OBJECT_CURRENT_SENSOR_ID
IPSO Current Sensor object.

IPSO_OBJECT_PRESSURE_ID
IPSO Pressure Sensor object.

IPSO_OBJECT_BUZZER_ID
IPSO Buzzer object.

IPSO_OBJECT_TIMER_ID
IPSO Timer object.

IPSO_OBJECT_ONOFF_SWITCH_ID
IPSO On/Off Switch object.

IPSO_OBJECT_PUSH_BUTTON_ID
IPSO Push Button object.

UCIFI_OBJECT_BATTERY_ID
uCIFI Battery object
IPSO_OBJECT_FILLING_LEVEL_SENSOR_ID
IPSO Filling Level Sensor object.

**Power source types used for the “Available Power Sources” resource of**
the LwM2M Device object (3/0/6).

- **LWM2M_DEVICE_PWR_SRC_TYPE_DC_POWER**
  DC power.
- **LWM2M_DEVICE_PWR_SRC_TYPE_BAT_INT**
  Internal battery.
- **LWM2M_DEVICE_PWR_SRC_TYPE_BAT_EXT**
  External battery.
- **LWM2MDEVICE_PWR_SRC_TYPE_FUEL_CELL**
  Fuel cell.
- **LWM2M_DEVICE_PWR_SRC_TYPE_PWR_OVER_ETH**
  Power over Ethernet.
- **LWM2MDEVICE_PWR_SRC_TYPE_USB**
  USB.
- **LWM2MDEVICE_PWR_SRC_TYPE_AC_POWER**
  AC (mains) power.
- **LWM2MDEVICE_PWR_SRC_TYPE_SOLAR**
  Solar.
- **LWM2MDEVICE_PWR_SRC_TYPE_MAX**
  Max value for Available Power Source type.

**Error codes used for the “Error Code” resource of the LwM2M Device**
object.
An LwM2M client can register one of the following error codes via the
`lwm2m_device_add_err()` function.

- **LWM2M_DEVICE_ERROR_NONE**
  No error.
- **LWM2M_DEVICE_ERROR_LOW_POWER**
  Low battery power.
- **LWM2M_DEVICE_ERROR_EXT_POWER_SUPPLY_OFF**
  External power supply off.
LWM2M_DEVICE_ERROR_GPS_FAILURE  
GPS module failure.

LWM2M_DEVICE_ERROR_LOW_SIGNAL_STRENGTH  
Low received signal strength.

LWM2MDEVICE_ERROR_OUT_OF_MEMORY  
Out of memory.

LWM2M DEVICE_ERROR_SMS_FAILURE  
SMS failure.

LWM2M_DEVICE_ERROR_NETWORK_FAILURE  
IP Connectivity failure.

LWM2MDEVICE_ERROR_PERIPHERAL_FAILURE  
Peripheral malfunction.

Battery status codes used for the “Battery Status” resource (3/0/20)
of the LwM2M Device object.
As the battery status changes, an LwM2M client can set one of the following codes via:
lwm2m_engine_set_u8(“3/0/20”, [battery status])

LWM2M_DEVICE_BATTERY_STATUS_NORMAL  
The battery is operating normally and not on power.

LWM2M_DEVICE_BATTERY_STATUS_CHARGING  
The battery is currently charging.

LWM2M_DEVICE_BATTERY_STATUS_CHARGE_COMP  
The battery is fully charged and the charger is still connected.

LWM2M_DEVICE_BATTERY_STATUS_DAMAGED  
The battery has some problem.

LWM2M_DEVICE_BATTERY_STATUS_LOW  
The battery is low on charge.

LWM2M_DEVICE_BATTERY_STATUS_NOT_INST  
The battery is not installed.

LWM2M_DEVICE_BATTERY_STATUS_UNKNOWN  
The battery information is not available.
LWM2M Firmware Update object states

An LwM2M client or the LwM2M Firmware Update object use the following codes to represent the LwM2M Firmware Update state (5/0/3).

STATE_IDLE
   Idle.
   Before downloading or after successful updating.

STATE_DOWNLOADING
   Downloading.
   The data sequence is being downloaded.

STATE_DOWNLOADED
   Downloaded.
   The whole data sequence has been downloaded.

STATE_UPDATING
   Updating.
   The device is being updated.

LWM2M Firmware Update object result codes

After processing a firmware update, the client sets the result via one of the following codes via lwm2m_engine_set_u8("5/0/5", [result code])

RESULT_DEFAULT
   Initial value.

RESULT_SUCCESS
   Firmware updated successfully.

RESULT_NO_STORAGE
   Not enough flash memory for the new firmware package.

RESULT_OUT_OF_MEM
   Out of RAM during downloading process.

RESULT_CONNECTION_LOST
   Connection lost during downloading process.

RESULT_INTEGRITY_FAILED
   Integrity check failure for new downloaded package.

RESULT_UNSUP_FW
   Unsupported package type.
RESULT_INVALID_URI
Invalid URI.

RESULT_UPDATE_FAILED
Firmware update failed.

RESULT_UNSUP_PROTO
Unsupported protocol.

Defines

LWM2M_OBJLNK_MAX_ID
Maximum value for Objlnk resource fields.

LWM2M_RES_DATA_READ_ONLY
Resource read-only value bit.

LWM2M_RES_DATA_FLAG_RO
Resource read-only flag.

LWM2M_HAS_RES_FLAG(res, f)
Read resource flags helper macro.

LWM2M_RD_CLIENT_EVENT_REG_UPDATE_FAILURE
Define for old event name keeping backward compatibility.

LWM2M_RD_CLIENT_FLAG_BOOTSTRAP
Run bootstrap procedure in current session.

LWM2M_MAX_PATH_STR_SIZE
LwM2M path maximum length.

Typedefs

typedef void (*lwm2m_socket_fault_cb_t)(int error)
Callback function called when a socket error is encountered.

Param error
Error code

typedef void (*lwm2m_observe_cb_t)(enum lwm2m_observe_event event, struct lwm2m_obj_path *path, void *user_data)
Observe callback indicating observer adds and deletes, and notification ACKs and time-outs.

Param event
[in] Observer add/delete or notification ack/timeout

Param path
[in] LwM2M path
**Param user_data**

[in] Pointer to user_data buffer, as provided in `send_traceable_notification()`. Used to determine for which data the ACKed/timed out notification was.

```c
typedef void (*lwm2m_ctx_event_cb_t)(struct lwm2m_ctx *ctx, enum lwm2m_rd_client_event event)
```

Asynchronous RD client event callback.

- **Param ctx**
  - [in] LwM2M context generating the event

- **Param event**
  - [in] LwM2M RD client event code

```c
typedef void *(*lwm2m_engine_get_data_cb_t)(uint16_t obj_inst_id, uint16_t res_id, uint16_t res_inst_id, size_t *data_len)
```

Asynchronous callback to get a resource buffer and length.

Prior to accessing the data buffer of a resource, the engine can use this callback to get the buffer pointer and length instead of using the resource's data buffer.

The client or LwM2M objects can register a function of this type via:

- `lwm2m_engine_register_read_callback()`
- `lwm2m_engine_register_pre_write_callback()`

- **Param obj_inst_id**
  - [in] Object instance ID generating the callback.

- **Param res_id**
  - [in] Resource ID generating the callback.

- **Param res_inst_id**
  - [in] Resource instance ID generating the callback (typically 0 for non-multi instance resources).

- **Param data_len**
  - [out] Length of the data buffer.

- **Return**
  - Callback returns a pointer to the data buffer or NULL for failure.

```c
typedef int (*lwm2m_engine_set_data_cb_t)(uint16_t obj_inst_id, uint16_t res_id, uint16_t res_inst_id, uint8_t *data, uint16_t data_len, bool last_block, size_t total_size)
```

Asynchronous callback when data has been set to a resource buffer.

After changing the data of a resource buffer, the LwM2M engine can make use of this callback to pass the data back to the client or LwM2M objects.

A function of this type can be registered via:

- `lwm2m_engine_register_validate_callback()`
- `lwm2m_engine_register_post_write_callback()`

- **Param obj_inst_id**
  - [in] Object instance ID generating the callback.

- **Param res_id**
  - [in] Resource ID generating the callback.

- **Param res_inst_id**
  - [in] Resource instance ID generating the callback (typically 0 for non-multi instance resources).

- **Param data**
  - [in] Pointer to data.
Param data_len
   [in] Length of the data.

Param last_block
   [in] Flag used during block transfer to indicate the last block of data. For non-block transfers this is always false.

Param total_size
   [in] Expected total size of data for a block transfer. For non-block transfers this is 0.

Return
   Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

typedef int (*lwm2m_engine_user_cb_t)(uint16_t obj_inst_id)
   Asynchronous event notification callback.
   Various object instance and resource-based events in the LwM2M engine can trigger a callback of this function type: object instance create, and object instance delete.
   Register a function of this type via: lwm2m_engine_register_create_callback()
     lwm2m_engine_register_delete_callback()

   Param obj_inst_id
      [in] Object instance ID generating the callback.

   Return
      Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

typedef int (*lwm2m_engine_execute_cb_t)(uint16_t obj_inst_id, uint8_t *args, uint16_t args_len)
   Asynchronous execute notification callback.
   Resource executes trigger a callback of this type.
   Register a function of this type via: lwm2m_engine_register_exec_callback()

   Param obj_inst_id
      [in] Object instance ID generating the callback.

   Param args
      [in] Pointer to execute arguments payload. (This can be NULL if no arguments are provided)

   Param args_len
      [in] Length of argument payload in bytes.

   Return
      Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

typedef void (*lwm2m_send_cb_t)(enum lwm2m_send_status status)
   Callback returning send status.

Enums

enum lwm2m_observe_event
   Observe callback events.

Values:
enumerator LWM2M_OBSERVE_EVENT_OBSERVER_ADDED
   Observer added.

enumerator LWM2M_OBSERVE_EVENT_OBSERVER_REMOVED
   Observer removed.

enumerator LWM2M_OBSERVE_EVENT_NOTIFY_ACK
   Notification ACKed.

enumerator LWM2M_OBSERVE_EVENT_NOTIFY_TIMEOUT
   Notification timed out.

enum lwm2m_socket_states
   Different traffic states of the LwM2M socket.
   This information can be used to give hints for the network interface that can decide
   what kind of power management should be used.
   These hints are given from CoAP layer messages, so usage of DTLS might affect the
   actual number of expected datagrams.
   Values:

   enumerator LWM2M_SOCKET_STATE_ONGOING
      Ongoing traffic is expected.

   enumerator LWM2M_SOCKET_STATE_ONE_RESPONSE
      One response is expected for the next message.

   enumerator LWM2M_SOCKET_STATE_LAST
      Next message is the last one.

   enumerator LWM2M_SOCKET_STATE_NO_DATA
      No more data is expected.

enum lwm2m_rd_client_event
   LwM2M RD client events.
   LwM2M client events are passed back to the event_cb function in
   lwm2m_rd_client_start()
   Values:

   enumerator LWM2M_RD_CLIENT_EVENT_NONE

   enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_FAILURE

   enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_COMPLETE

   enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_TRANSFER_COMPLETE

   enumerator LWM2M_RD_CLIENT_EVENT_REGISTRATION_FAILURE

6.3. Networking
enumerator LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE
enumerator LWM2M_RD_CLIENT_EVENT_REG_TIMEOUT
enumerator LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE
enumerator LWM2M_RD_CLIENT_EVENT_DEREGISTER_FAILURE
enumerator LWM2M_RD_CLIENT_EVENT_DISCONNECT
enumerator LWM2M_RD_CLIENT_EVENT_QUEUE_MODE_RX_OFF
enumerator LWM2M_RD_CLIENT_EVENT_ENGINE_SUSPENDED
enumerator LWM2M_RD_CLIENT_EVENT_NETWORK_ERROR
enumerator LWM2M_RD_CLIENT_EVENT_REG_UPDATE
enumerator LWM2M_RD_CLIENT_EVENT_DEREGISTER
enumerator LWM2M_RD_CLIENT_EVENT_SERVER.Disabled

enum lwm2m_send_status
LwM2M send status.
LwM2M send status are generated back to the lwm2m_send_cb_t function in lwm2m_send_cb()

Values:

enumerator LWM2M_SEND_STATUS_SUCCESS
enumerator LWM2M_SEND_STATUS_FAILURE
enumerator LWM2M_SEND_STATUS_TIMEOUT

enum lwm2m_security_mode_e
Security modes as defined in LwM2M Security object.

Values:

enumerator LWM2M_SECURITY_PSK = 0
Pre-Shared Key mode.
enumerator LWM2M_SECURITY_RAW_PK = 1
Raw Public Key mode.
enumerator LWM2M_SECURITY_CERT = 2
Certificate mode.
enumerator LWM2M_SECURITY_NOSEC = 3
  NoSec mode.

enumerator LWM2M_SECURITY_CERT_EST = 4
  Certificate mode with EST.

Functions

int lwm2m_device_add_err(uint8_t error_code)
  Register a new error code with LwM2M Device object.

  Parameters

  Returns
  0 for success or negative in case of error.

void lwm2m_firmware_set_write_cb(lwm2m_engine_set_data_cb_t cb)
  Set data callback for firmware block transfer.

  Parameters
  • cb – [in] A callback function to receive the block transfer data

lwm2m_engine_set_data_cb_t lwm2m_firmware_get_write_cb(void)
  Get the data callback for firmware block transfer writes.

  Returns
  A registered callback function to receive the block transfer data

void lwm2m_firmware_set_write_cb_inst(uint16_t obj_inst_id, lwm2m_engine_set_data_cb_t cb)
  Set data callback for firmware block transfer.

  Parameters
  • obj_inst_id – [in] Object instance ID
  • cb – [in] A callback function to receive the block transfer data

lwm2m_engine_set_data_cb_t lwm2m_firmware_get_write_cb_inst(uint16_t obj_inst_id)
  Get the data callback for firmware block transfer writes.

  Parameters
  • obj_inst_id – [in] Object instance ID

  Returns
  A registered callback function to receive the block transfer data

void lwm2m_firmware_set_cancel_cb(lwm2m_engine_user_cb_t cb)
  Set callback for firmware update cancel.

  Parameters
  • cb – [in] A callback function to perform actions on firmware update cancel.

6.3. Networking

```c
lwm2m_engine_user_cb_t lwm2m_firmware_get_cancel_cb(void)
Get a callback for firmware update cancel.
```

**Returns**
A registered callback function perform actions on firmware update cancel.

```c
void lwm2m_firmware_set_cancel_cb_inst(uint16_t obj_inst_id, lwm2m_engine_user_cb_t cb)
Set data callback for firmware update cancel.
LwM2M clients use this function to register a callback to perform actions on firmware update cancel.
```

**Parameters**

- obj_inst_id – [in] Object instance ID

```c
lwm2m_engine_user_cb_t lwm2m_firmware_get_cancel_cb_inst(uint16_t obj_inst_id)
Get the callback for firmware update cancel.
```

**Parameters**

- obj_inst_id – [in] Object instance ID

**Returns**
A registered callback function perform actions on firmware update cancel.

```c
void lwm2m_firmware_set_update_cb(lwm2m_engine_execute_cb_t cb)
Set data callback to handle firmware update execute events.
LwM2M clients use this function to register a callback for receiving the update resource “execute” operation on the LwM2M Firmware Update object.
```

**Parameters**

- cb – [in] A callback function to receive the execute event.

```c
lwm2m_engine_execute_cb_t lwm2m_firmware_get_update_cb(void)
Get the event callback for firmware update execute events.
```

**Returns**
A registered callback function to receive the execute event.

```c
void lwm2m_firmware_set_update_cb_inst(uint16_t obj_inst_id, lwm2m_engine_execute_cb_t cb)
Set data callback to handle firmware update execute events.
LwM2M clients use this function to register a callback for receiving the update resource “execute” operation on the LwM2M Firmware Update object.
```

**Parameters**

- obj_inst_id – [in] Object instance ID
- cb – [in] A callback function to receive the execute event.

```c
lwm2m_engine_execute_cb_t lwm2m_firmware_get_update_cb_inst(uint16_t obj_inst_id)
Get the event callback for firmware update execute events.
```

**Parameters**

- obj_inst_id – [in] Object instance ID

**Returns**
A registered callback function to receive the execute event.
int lwm2m_swmgmt_set_activate_cb(uint16_t obj_inst_id, lwm2m_engine_execute_cb_t cb)
Set callback to handle software activation requests.
The callback will be executed when the LWM2M execute operation gets called on the corresponding object's Activate resource instance.

Parameters
• obj_inst_id – [in] The instance number to set the callback for.
• cb – [in] A callback function to receive the execute event.

Returns
0 on success, otherwise a negative integer.

int lwm2m_swmgmt_set_deactivate_cb(uint16_t obj_inst_id, lwm2m_engine_execute_cb_t cb)
Set callback to handle software deactivation requests.
The callback will be executed when the LWM2M execute operation gets called on the corresponding object's Deactivate resource instance.

Parameters
• obj_inst_id – [in] The instance number to set the callback for.
• cb – [in] A callback function to receive the execute event.

Returns
0 on success, otherwise a negative integer.

int lwm2m_swmgmt_set_install_package_cb(uint16_t obj_inst_id, lwm2m_engine_execute_cb_t cb)
Set callback to handle software install requests.
The callback will be executed when the LWM2M execute operation gets called on the corresponding object's Install resource instance.

Parameters
• obj_inst_id – [in] The instance number to set the callback for.
• cb – [in] A callback function to receive the execute event.

Returns
0 on success, otherwise a negative integer.

int lwm2m_swmgmt_set_delete_package_cb(uint16_t obj_inst_id, lwm2m_engine_execute_cb_t cb)
Set callback to handle software uninstall requests.
The callback will be executed when the LWM2M execute operation gets called on the corresponding object's Uninstall resource instance.

Parameters
• obj_inst_id – [in] The instance number to set the callback for.
• cb – [in] A callback function for handling the execute event.

Returns
0 on success, otherwise a negative integer.

int lwm2m_swmgmt_set_read_package_version_cb(uint16_t obj_inst_id, lwm2m_engine_get_data_cb_t cb)
Set callback to read software package.
The callback will be executed when the LWM2M read operation gets called on the corresponding object.
Parameters

- obj_inst_id – [in] The instance number to set the callback for.
- cb – [in] A callback function for handling the read event.

Returns

0 on success, otherwise a negative integer.

```c
int lwm2m_swmgmt_set_write_package_cb(uint16_t obj_inst_id, lwm2m_engine_set_data_cb_t cb)
```

Set data callback for software management block transfer.

The callback will be executed when the LWM2M block write operation gets called on the corresponding object’s resource instance.

Parameters

- obj_inst_id – [in] The instance number to set the callback for.
- cb – [in] A callback function for handling the block write event.

Returns

0 on success, otherwise a negative integer.

```c
int lwm2m_swmgmt_install_completed(uint16_t obj_inst_id, int error_code)
```

Function to be called when a Software Management object instance completed the Install operation.

return 0 on success, otherwise a negative integer.

Parameters

- error_code – [in] The result code of the operation. Zero on success otherwise it should be a negative integer.

```c
void lwm2m_event_log_set_read_log_data_cb(lwm2m_engine_get_data_cb_t cb)
```

Set callback to read log data.

The callback will be executed when the LWM2M read operation gets called on the corresponding object.

Parameters

- cb – [in] A callback function for handling the read event.

```c
int lwm2m_engine_update_observer_min_period(struct lwm2m_ctx *client_ctx, const char *pathstr, uint32_t period_s)
```

Change an observer's pmin value.

*Deprecated:*

Use `lwm2m_update_observer_min_period()` instead.

LwM2M clients use this function to modify the pmin attribute for an observation being made. Example to update the pmin of a temperature sensor value being observed:

```c
lwm2m_engine_update_observer_min_period("client_ctx, 3303/0/5700", 5);
```

Parameters

- client_ctx – [in] LwM2M context
- pathstr – [in] LwM2M path string “obj/obj-inst/res”
- period_s – [in] Value of pmin to be given (in seconds).
### Returns

0 for success or negative in case of error.

```c
int lwm2m_update_observer_min_period(struct lwm2m_ctx *client_ctx, const struct lwm2m_obj_path *path, uint32_t period_s)
```

Change an observer's pmin value.

LwM2M clients use this function to modify the pmin attribute for an observation being made. Example to update the pmin of a temperature sensor value being observed:

```c
lwm2m_update_observer_min_period(client_ctx, &LWM2M_OBJ(3303, 0, 5700), 5);
```

**Parameters**

- `client_ctx` – [in] LwM2M context
- `path` – [in] LwM2M path as a struct
- `period_s` – [in] Value of pmin to be given (in seconds).

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_update_observer_max_period(struct lwm2m_ctx *client_ctx, const char *pathstr, uint32_t period_s)
```

Change an observer's pmax value.

**Deprecated:**

Use `lwm2m_update_observer_max_period()` instead.

LwM2M clients use this function to modify the pmax attribute for an observation being made. Example to update the pmax of a temperature sensor value being observed:

```c
lwm2m_engine_update_observer_max_period("client_ctx, 3303/0/5700", 5);
```

**Parameters**

- `client_ctx` – [in] LwM2M context
- `pathstr` – [in] LwM2M path string “obj/obj-inst/res”
- `period_s` – [in] Value of pmax to be given (in seconds).

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_update_observer_max_period(struct lwm2m_ctx *client_ctx, const struct lwm2m_obj_path *path, uint32_t period_s)
```

Change an observer's pmax value.

LwM2M clients use this function to modify the pmax attribute for an observation being made. Example to update the pmax of a temperature sensor value being observed:

```c
lwm2m_update_observer_max_period(client_ctx, &LWM2M_OBJ(3303, 0, 5700), 5);
```

**Parameters**

- `client_ctx` – [in] LwM2M context
- `path` – [in] LwM2M path as a struct
- `period_s` – [in] Value of pmax to be given (in seconds).

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_create_obj_inst(const char *pathstr)
```

Create an LwM2M object instance.
LwM2M clients use this function to create non-default LwM2M objects: Example to create first temperature sensor object: `lwm2m_engine_create_obj_inst("3303/0")`;

**Parameters**
- `pathstr` – [in] LwM2M path string “obj/obj-inst”

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_create_object_inst(const struct lwm2m_obj_path *path)
```
Create an LwM2M object instance.

LwM2M clients use this function to create non-default LwM2M objects: Example to create first temperature sensor object: `lwm2m_create_obj_inst(&LWM2M_OBJ(3303, 0));`

**Parameters**
- `path` – [in] LwM2M path as a struct

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_delete_obj_inst(const char *pathstr)
```
Delete an LwM2M object instance.

**Deprecated:**
Use `lwm2m_delete_obj_inst()` instead.

LwM2M clients use this function to delete LwM2M objects.

**Parameters**
- `pathstr` – [in] LwM2M path string “obj/obj-inst”

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_delete_object_inst(const struct lwm2m_obj_path *path)
```
Delete an LwM2M object instance.

LwM2M clients use this function to delete LwM2M objects.

**Parameters**
- `path` – [in] LwM2M path as a struct

**Returns**
0 for success or negative in case of error.

```c
void lwm2m_registry_lock(void)
```
Locks the registry for this thread.

Use this function before writing to multiple resources. This halts the lwm2m main thread until all the write-operations are finished.

```c
void lwm2m_registry_unlock(void)
```
Unlocks the registry previously locked by `lwm2m_registry_lock()`.

```c
int lwm2m_engine_set_opaque(const char *pathstr, const char *data_ptr, uint16_t data_len)
```
Set resource (instance) value (opaque buffer)
Zephyr Project Documentation, Release 3.6.0-rc3

Deprecated:
Use `lwm2m_set_opaque()` instead.

Parameters
- `data_ptr` – [in] Data buffer
- `data_len` – [in] Length of buffer

Returns
0 for success or negative in case of error.

```c
int lwm2m_set_opaque(const struct lwm2m_obj_path *path, const char *data_ptr, uint16_t data_len)
```

Set resource (instance) value (opaque buffer)

Parameters
- `path` – [in] LwM2M path as a struct
- `data_ptr` – [in] Data buffer
- `data_len` – [in] Length of buffer

Returns
0 for success or negative in case of error.

```c
int lwm2m_engine_set_string(const char *pathstr, const char *data_ptr)
```

Set resource (instance) value (string)

Deprecated:
Use `lwm2m_set_string()` instead.

Parameters
- `data_ptr` – [in] NULL terminated char buffer

Returns
0 for success or negative in case of error.

```c
int lwm2m_set_string(const struct lwm2m_obj_path *path, const char *data_ptr)
```

Set resource (instance) value (string)

Parameters
- `path` – [in] LwM2M path as a struct
- `data_ptr` – [in] NULL terminated char buffer

Returns
0 for success or negative in case of error.

```c
int lwm2m_engine_set_u8(const char *pathstr, uint8_t value)
```

Set resource (instance) value (u8)

Deprecated:
Use `lwm2m_set_u8()` instead.

Parameters
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
  • **value** – [in] u8 value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_set_u8(const struct lwm2m_obj_path *path, uint8_t value)
```
Set resource (instance) value (u8)

**Parameters**
• **path** – [in] LwM2M path as a struct
  • **value** – [in] u8 value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_set_u16(const char *pathstr, uint16_t value)
```
Set resource (instance) value (u16)

*Deprecated:*
Use `lwm2m_set_u16()` instead.

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
  • **value** – [in] u16 value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_set_u16(const struct lwm2m_obj_path *path, uint16_t value)
```
Set resource (instance) value (u16)

**Parameters**
• **path** – [in] LwM2M path as a struct
  • **value** – [in] u16 value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_set_u32(const char *pathstr, uint32_t value)
```
Set resource (instance) value (u32)

*Deprecated:*
Use `lwm2m_set_u32()` instead.

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
  • **value** – [in] u32 value

**Returns**
0 for success or negative in case of error.
int lwm2m_set_u32(const struct lwm2m_obj_path *path, uint32_t value)
Set resource (instance) value (u32)

Parameters
• path – [in] LwM2M path as a struct
• value – [in] u32 value

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_u64(const char *pathstr, uint64_t value)
Set resource (instance) value (u64)

Deprecated:
Use lwm2m_set_u64() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] u64 value

Returns
0 for success or negative in case of error.

int lwm2m_set_u64(const struct lwm2m_obj_path *path, uint64_t value)
Set resource (instance) value (u64)

Deprecated:
Unsigned 64bit value type does not exits. This is internally handled as a int64_t.
Use lwm2m_set_s64() instead.

Parameters
• path – [in] LwM2M path as a struct
• value – [in] u64 value

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_s8(const char *pathstr, int8_t value)
Set resource (instance) value (s8)

Deprecated:
Use lwm2m_set_s8() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] s8 value

Returns
0 for success or negative in case of error.
int lwm2m_set_s8(const struct lwm2m_obj_path *path, int8_t value)
Set resource (instance) value (s8)

**Parameters**
- *path* – [in] LwM2M path as a struct
- *value* – [in] s8 value

**Returns**
0 for success or negative in case of error.

int lwm2m_engine_set_s16(const char *pathstr, int16_t value)
Set resource (instance) value (s16)

*Deprecated:*
Use `lwm2m_set_s16()` instead.

**Parameters**
- *value* – [in] s16 value

**Returns**
0 for success or negative in case of error.

int lwm2m_set_s16(const struct lwm2m_obj_path *path, int16_t value)
Set resource (instance) value (s16)

**Parameters**
- *path* – [in] LwM2M path as a struct
- *value* – [in] s16 value

**Returns**
0 for success or negative in case of error.

int lwm2m_engine_set_s32(const char *pathstr, int32_t value)
Set resource (instance) value (s32)

*Deprecated:*
Use `lwm2m_set_s32()` instead.

**Parameters**
- *value* – [in] s32 value

**Returns**
0 for success or negative in case of error.

int lwm2m_set_s32(const struct lwm2m_obj_path *path, int32_t value)
Set resource (instance) value (s32)

**Parameters**
- *path* – [in] LwM2M path as a struct
- *value* – [in] s32 value

**Returns**
0 for success or negative in case of error.
int lwm2m_engine_set_s64(const char *pathstr, int64_t value)
Set resource (instance) value (s64)

 Deprecated:
Use lwm2m_set_s64() instead.

 Parameters
 • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
 • value – [in] s64 value

 Returns
0 for success or negative in case of error.

int lwm2m_set_s64(const struct lwm2m_obj_path *path, int64_t value)
Set resource (instance) value (s64)

 Parameters
 • path – [in] LwM2M path as a struct
 • value – [in] s64 value

 Returns
0 for success or negative in case of error.

int lwm2m_engine_set_bool(const char *pathstr, bool value)
Set resource (instance) value (bool)

 Deprecated:
Use lwm2m_set_bool() instead.

 Parameters
 • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
 • value – [in] bool value

 Returns
0 for success or negative in case of error.

int lwm2m_set_bool(const struct lwm2m_obj_path *path, bool value)
Set resource (instance) value (bool)

 Parameters
 • path – [in] LwM2M path as a struct
 • value – [in] bool value

 Returns
0 for success or negative in case of error.

int lwm2m_engine_set_float(const char *pathstr, const double *value)
Set resource (instance) value (double)

 Deprecated:
Use lwm2m_set_f64() instead.

 Parameters
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”  
• **value** – [in] double value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_set_f64(const struct lwm2m_obj_path *path, const double value);
```
Set resource (instance) value (double)

**Parameters**
• **path** – [in] LwM2M path as a struct  
• **value** – [in] double value

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_set_objlnk(const char *pathstr, const struct lwm2m_objlnk *value);
```
Set resource (instance) value (Objlnk)

*Deprecated:*
Use `lwm2m_set_objlnk()` instead.

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”  
• **value** – [in] pointer to the `lwm2m_objlnk` structure

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_set_objlnk(const struct lwm2m_obj_path *path, const struct lwm2m_objlnk *value);
```
Set resource (instance) value (Objlnk)

**Parameters**
• **path** – [in] LwM2M path as a struct  
• **value** – [in] pointer to the `lwm2m_objlnk` structure

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_set_time(const char *pathstr, time_t value);
```
Set resource (instance) value (Time)

*Deprecated:*
Use `lwm2m_set_time()` instead.

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”  
• **value** – [in] Epoch timestamp

**Returns**
0 for success or negative in case of error.
int lwm2m_set_time(const struct lwm2m_obj_path *path, time_t value)
Set resource (instance) value (Time)

Parameters
- path – [in] LwM2M path as a struct
- value – [in] Epoch timestamp

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_opaque(const char *pathstr, void *buf, uint16_t buflen)
Get resource (instance) value (opaque buffer)

Deprecated:
Use lwm2m_get_opaque() instead.

Parameters
- buf – [out] Data buffer to copy data into
- buflen – [in] Length of buffer

Returns
0 for success or negative in case of error.

int lwm2m_get_opaque(const struct lwm2m_obj_path *path, void *buf, uint16_t buflen)
Get resource (instance) value (opaque buffer)

Parameters
- path – [in] LwM2M path as a struct
- buf – [out] Data buffer to copy data into
- buflen – [in] Length of buffer

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_string(const char *pathstr, void *str, uint16_t buflen)
Get resource (instance) value (string)

Deprecated:
Use lwm2m_get_string() instead.

Parameters
- str – [out] String buffer to copy data into
- buflen – [in] Length of buffer

Returns
0 for success or negative in case of error.
int lwm2m_get_string(const struct lwm2m_obj_path *path, void *str, uint16_t buflen)
Get resource (instance) value (string)

Parameters
• path – [in] LwM2M path as a struct
• str – [out] String buffer to copy data into
• buflen – [in] Length of buffer

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_u8(const char *pathstr, uint8_t *value)
Get resource (instance) value (u8)

Deprecated:
Use lwm2m_get_u8() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res/(res-inst)”
• value – [out] u8 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_u8(const struct lwm2m_obj_path *path, uint8_t *value)
Get resource (instance) value (u8)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] u8 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_u16(const char *pathstr, uint16_t *value)
Get resource (instance) value (u16)

Deprecated:
Use lwm2m_get_u16() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res/(res-inst)”
• value – [out] u16 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_u16(const struct lwm2m_obj_path *path, uint16_t *value)
Get resource (instance) value (u16)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] u16 buffer to copy data into
Returns
0 for success or negative in case of error.

int lwm2m_engine_get_u32(const char *pathstr, uint32_t *value)
Get resource (instance) value (u32)

Deprecated:
Use lwm2m_get_u32() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] u32 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_u32(const struct lwm2m_obj_path *path, uint32_t *value)
Get resource (instance) value (u32)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] u32 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_u64(const char *pathstr, uint64_t *value)
Get resource (instance) value (u64)

Deprecated:
Use lwm2m_get_u64() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] u64 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_u64(const struct lwm2m_obj_path *path, uint64_t *value)
Get resource (instance) value (u64)

Deprecated:
Unsigned 64bit value type does not exits. This is internally handled as a int64_t.
Use lwm2m_get_s64() instead.

Parameters
• path – [in] LwM2M path as a struct
• value – [out] u64 buffer to copy data into

Returns
0 for success or negative in case of error.
int lwm2m_engine_get_s8(const char *pathstr, int8_t *value)
Get resource (instance) value (s8)

*Deprecated*: Use `lwm2m_get_s8()` instead.

**Parameters**
- `value` – [out] s8 buffer to copy data into

**Returns**
0 for success or negative in case of error.

int lwm2m_get_s8(const struct lwm2m_obj_path *path, int8_t *value)
Get resource (instance) value (s8)

**Parameters**
- `path` – [in] LwM2M path as a struct
- `value` – [out] s8 buffer to copy data into

**Returns**
0 for success or negative in case of error.

int lwm2m_engine_get_s16(const char *pathstr, int16_t *value)
Get resource (instance) value (s16)

*Deprecated*: Use `lwm2m_get_s16()` instead.

**Parameters**
- `value` – [out] s16 buffer to copy data into

**Returns**
0 for success or negative in case of error.

int lwm2m_get_s16(const struct lwm2m_obj_path *path, int16_t *value)
Get resource (instance) value (s16)

**Parameters**
- `path` – [in] LwM2M path as a struct
- `value` – [out] s16 buffer to copy data into

**Returns**
0 for success or negative in case of error.

int lwm2m_engine_get_s32(const char *pathstr, int32_t *value)
Get resource (instance) value (s32)

*Deprecated*: Use `lwm2m_get_s32()` instead.

**Parameters**
• **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• **value** – [out] s32 buffer to copy data into

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_get_s32(const struct lwm2m_obj_path *path, int32_t *value)
```
Get resource (instance) value (s32)

**Parameters**
- **path** – [in] LwM2M path as a struct
- **value** – [out] s32 buffer to copy data into

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_get_s64(const char *pathstr, int64_t *value)
```
Get resource (instance) value (s64)

**Deprecated:**
Use `lwm2m_get_s64()` instead.

**Parameters**
- **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- **value** – [out] s64 buffer to copy data into

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_get_s64(const char *pathstr, int64_t *value)
```
Get resource (instance) value (s64)

**Parameters**
- **path** – [in] LwM2M path as a struct
- **value** – [out] s64 buffer to copy data into

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_get_bool(const char *pathstr, bool *value)
```
Get resource (instance) value (bool)

**Deprecated:**
Use `lwm2m_get_bool()` instead.

**Parameters**
- **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- **value** – [out] bool buffer to copy data into

**Returns**
0 for success or negative in case of error.
int lwm2m_get_bool(const struct lwm2m_obj_path *path, bool *value)
Get resource (instance) value (bool)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] bool buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_float(const char *pathstr, double *buf)
Get resource (instance) value (double)

Deprecated:
Use lwm2m_get_f64() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res/(res-inst)”
• buf – [out] double buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_f64(const struct lwm2m_obj_path *path, double *value)
Get resource (instance) value (double)

Parameters
• path – [in] LwM2M path as a struct
• value – [out] double buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_objlnk(const char *pathstr, struct lwm2m_objlnk *buf)
Get resource (instance) value (Objlnk)

Deprecated:
Use lwm2m_get_objlnk() instead.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res/(res-inst)”
• buf – [out] lwm2m_objlnk buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_get_objlnk(const struct lwm2m_obj_path *path, struct lwm2m_objlnk *buf)
Get resource (instance) value (Objlnk)

Parameters
• path – [in] LwM2M path as a struct
• buf – [out] lwm2m_objlnk buffer to copy data into

Returns
0 for success or negative in case of error.
int lwm2m_engine_get_time(const char *pathstr, time_t *buf)
Get resource (instance) value (Time)

*Deprecated:*
Use *lwm2m_get_time()* instead.

**Parameters**
- **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- **buf** – [out] time_t pointer to copy data

**Returns**
0 for success or negative in case of error.

int lwm2m_get_time(const struct lwm2m_obj_path *path, time_t *buf)
Get resource (instance) value (Time)

**Parameters**
- **path** – [in] LwM2M path as a struct
- **buf** – [out] time_t pointer to copy data

**Returns**
0 for success or negative in case of error.

int lwm2m_engine_register_read_callback(const char *pathstr, lwm2m_engine_get_data_cb_t cb)
Set resource (instance) read callback.

*Deprecated:*
Use *lwm2m_register_read_callback()* instead.

LwM2M clients can use this to set the callback function for resource reads when data handling in the LwM2M engine needs to be bypassed. For example reading back opaque binary data from external storage.

This callback should not generally be used for any data that might be observed as engine does not have any knowledge of data changes.

When separate buffer for data should be used, use *lwm2m_engine_set_res_buf()* instead to set the storage.

**Parameters**
- **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- **cb** – [in] Read resource callback

**Returns**
0 for success or negative in case of error.

int lwm2m_register_read_callback(const struct lwm2m_obj_path *path, lwm2m_engine_get_data_cb_t cb)
Set resource (instance) read callback.

LwM2M clients can use this to set the callback function for resource reads when data handling in the LwM2M engine needs to be bypassed. For example reading back opaque binary data from external storage.

This callback should not generally be used for any data that might be observed as engine does not have any knowledge of data changes.
When separate buffer for data should be used, use `lwm2m_engine_set_res_buf()` instead to set the storage.

**Parameters**
- `path` – [in] LwM2M path as a struct
- `cb` – [in] Read resource callback

**Returns**
- 0 for success or negative in case of error.

```c
int lwm2m_engine_register_pre_write_callback(const char *pathstr, lwm2m_engine_get_data_cb_t cb)
```

Set resource (instance) pre-write callback.

**Deprecated:**
Use `lwm2m_register_pre_write_callback()` instead.

This callback is triggered before setting the value of a resource. It can pass a special data buffer to the engine so that the actual resource value can be calculated later, etc.

**Parameters**
- `cb` – [in] Pre-write resource callback

**Returns**
- 0 for success or negative in case of error.

```c
int lwm2m_register_pre_write_callback(const struct lwm2m_obj_path *path, lwm2m_engine_get_data_cb_t cb)
```

Set resource (instance) pre-write callback.

This callback is triggered before setting the value of a resource. It can pass a special data buffer to the engine so that the actual resource value can be calculated later, etc.

**Parameters**
- `path` – [in] LwM2M path as a struct
- `cb` – [in] Pre-write resource callback

**Returns**
- 0 for success or negative in case of error.

```c
int lwm2m_engine_register_validate_callback(const char *pathstr, lwm2m_engine_set_data_cb_t cb)
```

Set resource (instance) validation callback.

**Deprecated:**
Use `lwm2m_register_validate_callback()` instead.

This callback is triggered before setting the value of a resource to the resource data buffer. The callback allows an LwM2M client or object to validate the data before writing and notify an error if the data should be discarded for any reason (by returning a negative error code).

**Note:** All resources that have a validation callback registered are initially decoded into a temporary validation buffer. Make sure that CON-
FIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE is large enough to store each of the validated resources (individually).

### Parameters

- **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- **cb** – [in] Validate resource data callback

### Returns

0 for success or negative in case of error.

```c
int lwm2m_register_validate_callback(const struct lwm2m_obj_path *path,
                                      lwm2m_engine_set_data_cb_t cb)
```

Set resource (instance) validation callback.

This callback is triggered before setting the value of a resource to the resource data buffer.

The callback allows an LwM2M client or object to validate the data before writing and notify an error if the data should be discarded for any reason (by returning a negative error code).

**Note:** All resources that have a validation callback registered are initially decoded into a temporary validation buffer. Make sure that CONFIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE is large enough to store each of the validated resources (individually).

### Parameters

- **path** – [in] LwM2M path as a struct
- **cb** – [in] Validate resource data callback

### Returns

0 for success or negative in case of error.

```c
int lwm2m_engine_register_post_write_callback(const char *pathstr,
                                               lwm2m_engine_set_data_cb_t cb)
```

Set resource (instance) post-write callback.

**Deprecated:**

Use `lwm2m_register_post_write_callback()` instead.

This callback is triggered after setting the value of a resource to the resource data buffer.

It allows an LwM2M client or object to post-process the value of a resource or trigger other related resource calculations.

### Parameters

- **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- **cb** – [in] Post-write resource callback

### Returns

0 for success or negative in case of error.
int lwm2m_register_post_write_callback(const struct lwm2m_obj_path *path, lwm2m_engine_set_data_cb_t cb)

Set resource (instance) post-write callback.
This callback is triggered after setting the value of a resource to the resource data buffer.
It allows an LwM2M client or object to post-process the value of a resource or trigger other related resource calculations.

Parameters
• path – [in] LwM2M path as a struct
• cb – [in] Post-write resource callback

Returns
0 for success or negative in case of error.

int lwm2m_engine_register_exec_callback(const char *pathstr, lwm2m_engine_execute_cb_t cb)

Set resource execute event callback.

Deprecated:
Use lwm2m_register_exec_callback() instead.
This event is triggered when the execute method of a resource is enabled.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res”
• cb – [in] Execute resource callback

Returns
0 for success or negative in case of error.

int lwm2m_register_exec_callback(const struct lwm2m_obj_path *path, lwm2m_engine_execute_cb_t cb)

Set resource execute event callback.
This event is triggered when the execute method of a resource is enabled.

Parameters
• path – [in] LwM2M path as a struct
• cb – [in] Execute resource callback

Returns
0 for success or negative in case of error.

int lwm2m_engine_register_create_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)

Set object instance create event callback.

Deprecated:
Use lwm2m_register_create_callback instead.
This event is triggered when an object instance is created.

Parameters
• obj_id – [in] LwM2M object id
• cb – [in] Create object instance callback
Returns
0 for success or negative in case of error.

```c
int lwm2m_register_create_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)
```

Set object instance create event callback.
This event is triggered when an object instance is created.

**Parameters**
- `obj_id` – [in] LwM2M object id
- `cb` – [in] Create object instance callback

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_register_delete_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)
```

Set object instance delete event callback.

*Deprecated:*
Use `lwm2m_register_delete_callback` instead
This event is triggered when an object instance is deleted.

**Parameters**
- `obj_id` – [in] LwM2M object id
- `cb` – [in] Delete object instance callback

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_register_delete_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)
```

Set object instance delete event callback.
This event is triggered when an object instance is deleted.

**Parameters**
- `obj_id` – [in] LwM2M object id
- `cb` – [in] Delete object instance callback

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_set_res_buf(const char *pathstr, void *buffer_ptr, uint16_t buffer_len, uint16_t data_len, uint8_t data_flags)
```

Set data buffer for a resource.

*Deprecated:*
Use `lwm2m_set_res_buf()` instead.
Use this function to set the data buffer and flags for the specified LwM2M resource.

**Parameters**
- `buffer_ptr` – [in] Data buffer pointer
- `buffer_len` – [in] Length of buffer
- `data_len` – [in] Length of existing data in the buffer
• **data_flags** – [in] Data buffer flags (such as read-only, etc)

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_set_res_buf(const struct lwm2m_obj_path *path, void *buffer_ptr, uint16_t buffer_len, uint16_t data_len, uint8_t data_flags)
```

Set data buffer for a resource.

Use this function to set the data buffer and flags for the specified LwM2M resource.

**Parameters**

- `path` – [in] LwM2M path as a struct
- `buffer_ptr` – [in] Data buffer pointer
- `buffer_len` – [in] Length of buffer
- `data_len` – [in] Length of existing data in the buffer
- `data_flags` – [in] Data buffer flags (such as read-only, etc)

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_set_res_data(const char *pathstr, void *data_ptr, uint16_t data_len, uint8_t data_flags)
```

Set data buffer for a resource.

Use this function to set the data buffer and flags for the specified LwM2M resource.

**Deprecated:**

Use `lwm2m_set_res_buf()` instead, so you can define buffer size and data size separately.

**Parameters**

- `data_ptr` – [in] Data buffer pointer
- `data_len` – [in] Length of buffer
- `data_flags` – [in] Data buffer flags (such as read-only, etc)

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_set_res_data_len(const char *pathstr, uint16_t data_len)
```

Update data size for a resource.

**Deprecated:**

Use `lwm2m_set_res_data_len()` instead.

Use this function to set the new size of data in the buffer if you write to a buffer received by `lwm2m_engine_get_res_buf()`.

**Parameters**

- `data_len` – [in] Length of data

**Returns**

0 for success or negative in case of error.
int lwm2m_set_res_data_len(const struct lwm2m_obj_path *path, uint16_t data_len)
Update data size for a resource.

Use this function to set the new size of data in the buffer if you write to a buffer received by `lwm2m_engine_get_res_buf()`.

Parameters
- `path` – [in] LwM2M path as a struct
- `data_len` – [in] Length of data

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_res_buf(const char *pathstr, void **buffer_ptr, uint16_t *buffer_len, uint16_t *data_len, uint8_t *data_flags)
Get data buffer for a resource.

Deprecated:
Use `lwm2m_get_res_buf()` instead.

Use this function to get the data buffer information for the specified LwM2M resource.
If you directly write into the buffer, you must use `lwm2m_engine_set_res_data_len()` function to update the new size of the written data.
All parameters except `pathstr` can NULL if you don’t want to read those values.

Parameters
- `buffer_ptr` – [out] Data buffer pointer
- `buffer_len` – [out] Length of buffer
- `data_len` – [out] Length of existing data in the buffer
- `data_flags` – [out] Data buffer flags (such as read-only, etc)

Returns
0 for success or negative in case of error.

int lwm2m_get_res_buf(const struct lwm2m_obj_path *path, void **buffer_ptr, uint16_t *buffer_len, uint16_t *data_len, uint8_t *data_flags)
Get data buffer for a resource.

Use this function to get the data buffer information for the specified LwM2M resource.
If you directly write into the buffer, you must use `lwm2m_set_res_data_len()` function to update the new size of the written data.
All parameters, except for the `pathstr`, can be NULL if you don’t want to read those values.

Parameters
- `path` – [in] LwM2M path as a struct
- `buffer_ptr` – [out] Data buffer pointer
- `buffer_len` – [out] Length of buffer
- `data_len` – [out] Length of existing data in the buffer
- `data_flags` – [out] Data buffer flags (such as read-only, etc)

Returns
0 for success or negative in case of error.
int lwm2m_engine_get_res_data(const char *pathstr, void **data_ptr, uint16_t *data_len, uint8_t *data_flags)
Get data buffer for a resource.
Use this function to get the data buffer information for the specified LwM2M resource.

 Deprecated:
Use lwm2m_get_res_buf() as it can tell you the size of the buffer as well.

 Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(res-inst)”
• data_ptr – [out] Data buffer pointer
• data_len – [out] Length of existing data in the buffer
• data_flags – [out] Data buffer flags (such as read-only, etc)

 Returns
0 for success or negative in case of error.

int lwm2m_engine_create_res_inst(const char *pathstr)
Create a resource instance.

 Deprecated:
Use lwm2m_create_res_inst() instead.

LwM2M clients use this function to create multi-resource instances:
Example to create 0 instance of device available power sources:
lwm2m_engine_create_res_inst("3/0/6/0");

 Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res/res-inst”

 Returns
0 for success or negative in case of error.

int lwm2m_create_res_inst(const struct lwm2m_obj_path *path)
Create a resource instance.

LwM2M clients use this function to create multi-resource instances:
Example to create 0 instance of device available power sources:
lwm2m_create_res_inst(&LWM2M_OBJ(3, 0, 6, 0));

 Parameters
• path – [in] LwM2M path as a struct

 Returns
0 for success or negative in case of error.

int lwm2m_engine_delete_res_inst(const char *pathstr)
Delete a resource instance.

 Deprecated:
Use lwm2m_delete_res_inst() instead.

Use this function to remove an existing resource instance

 Parameters
• \texttt{pathstr} – [in] LwM2M path string “obj/obj-inst/res/res-inst”

**Returns**
0 for success or negative in case of error.

\texttt{int lwm2m_delete_res_inst(const struct lwm2m_obj_path *}\
\texttt{path)}

Delete a resource instance.

Use this function to remove an existing resource instance

**Parameters**
• \texttt{path} – [in] LwM2M path as a struct

**Returns**
0 for success or negative in case of error.

\texttt{int lwm2m_update_device_service_period(uint32_t period_ms)}

Update the period of the device service.

Change the duration of the periodic device service that notifies the current time.

**Parameters**
• \texttt{period_ms} – [in] New period for the device service (in milliseconds)

**Returns**
0 for success or negative in case of error.

\texttt{bool lwm2m_engine_path_is_observed(const char *}\
\texttt{pathstr)}

Check whether a path is observed.

*Deprecated:*
Use \texttt{lwm2m_path_is_observed()} instead.

**Parameters**
• \texttt{pathstr} – [in] LwM2M path string to check, e.g. “3/0/1”

**Returns**
true when there exists an observation of the same level or lower as the given path, false if it doesn’t or path is not a valid LwM2M-path. E.g. true if path refers to a resource and the parent object has an observation, false for the inverse.

\texttt{bool lwm2m_path_is_observed(const struct lwm2m_obj_path *}\
\texttt{path)}

Check whether a path is observed.

**Parameters**
• \texttt{path} – [in] LwM2M path as a struct to check

**Returns**
true when there exists an observation of the same level or lower as the given path, false if it doesn’t or path is not a valid LwM2M-path. E.g. true if path refers to a resource and the parent object has an observation, false for the inverse.

\texttt{int lwm2m_engine_stop(struct lwm2m_ctx *}\
\texttt{client_ctx)}

Stop the LwM2M engine.

LwM2M clients normally do not need to call this function as it is called within lwm2m_rd_client. However, if the client does not use the RD client implementation, it will need to be called manually.

**Parameters**
int lwm2m_engine_start(struct lwm2m_ctx *client_ctx)

Start the LwM2M engine.

LwM2M clients normally do not need to call this function as it is called by lwm2m_rd_client_start(). However, if the client does not use the RD client implementation, it will need to be called manually.

Parameters

- **client_ctx** – [in] LwM2M context

Returns

- 0 for success or negative in case of error.

void lwm2m_acknowledge(struct lwm2m_ctx *client_ctx)

Acknowledge the currently processed request with an empty ACK.

LwM2M engine by default sends piggybacked responses for requests. This function allows to send an empty ACK for a request earlier (from the application callback). The LwM2M engine will then send the actual response as a separate CON message after all callbacks are executed.

Parameters

- **client_ctx** – [in] LwM2M context

int lwm2m_rd_client_start(struct lwm2m_ctx *client_ctx, const char *ep_name, uint32_t flags, lwm2m_ctx_event_cb_t event_cb, lwm2m_observe_cb_t observe_cb)

Start the LwM2M RD (Registration / Discovery) Client.

The RD client sits just above the LwM2M engine and performs the necessary actions to implement the “Registration interface”. For more information see Section “Client Registration Interface” of LwM2M Technical Specification.

NOTE: lwm2m_engine_start() is called automatically by this function.

Parameters

- **client_ctx** – [in] LwM2M context
- **ep_name** – [in] Registered endpoint name
- **flags** – [in] Flags used to configure current LwM2M session.
- **event_cb** – [in] Client event callback function
- **observe_cb** – [in] Observe callback function called when an observer was added or deleted, and when a notification was acked or has timed out

Returns

- 0 for success, -EINPROGRESS when client is already running or negative error codes in case of failure.

int lwm2m_rd_client_stop(struct lwm2m_ctx *client_ctx, lwm2m_ctx_event_cb_t event_cb, bool deregister)

Stop the LwM2M RD (De-register) Client.

The RD client sits just above the LwM2M engine and performs the necessary actions to implement the “Registration interface”. For more information see Section “Client Registration Interface” of the LwM2M Technical Specification.
Parameters

- **client_ctx** – [in] LwM2M context
- **event_cb** – [in] Client event callback function
- **deregister** – [in] True to deregister the client if registered. False to force close the connection.

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_pause(void)
```

Suspend the LwM2M engine Thread.

Suspend LwM2M engine. Use case could be when network connection is down. LwM2M Engine indicate before it suspend by LWM2M_RD_CLIENT_EVENT_ENGINE_SUSPENDED event.

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_resume(void)
```

Resume the LwM2M engine thread.

Resume suspended LwM2M engine. After successful resume call engine will do full registration or registration update based on suspended time. Event's LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE or LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE indicate that client is connected to server.

**Returns**

0 for success or negative in case of error.

```c
void lwm2m_rd_client_update(void)
```

Trigger a Registration Update of the LwM2M RD Client.

```c
char *lwm2m_path_log_buf(char *buf, struct lwm2m_obj_path *path)
```

Helper function to print path objects' contents to log.

**Parameters**

- **buf** – [in] The buffer to use for formatting the string
- **path** – [in] The path to stringify

**Returns**

Resulting formatted path string

```c
int lwm2m_engine_send(struct lwm2m_ctx *ctx, char const *path_list[], uint8_t path_list_size, bool confirmation_request)
```

LwM2M SEND operation to given path list

**Deprecated:**

Use `lwm2m_send_cb()` instead.

**Parameters**

- **ctx** – LwM2M context
- **path_list** – LwM2M Path string list
- **path_list_size** – Length of path list. Max size is CONFIG_LWM2M_COMPOSITE_PATH_LIST_SIZE
- **confirmation_request** – True request confirmation for operation.
Returns
0 for success or negative in case of error.

```c
int lwm2m_send(struct lwm2m_ctx *ctx, const struct lwm2m_obj_path path_list[], uint8_t path_list_size, bool confirmation_request)
```

LwM2M SEND operation to given path list

 Deprecated:
Use `lwm2m_send_cb()` instead.

**Parameters**
- `ctx` – LwM2M context
- `path_list` – LwM2M path struct list
- `path_list_size` – Length of path list. Max size is `CONFIG_LWM2M_COMPOSITE_PATH_LIST_SIZE`
- `confirmation_request` – True request confirmation for operation.

Returns
0 for success or negative in case of error.

```c
int lwm2m_send_cb(struct lwm2m_ctx *ctx, const struct lwm2m_obj_path path_list[], uint8_t path_list_size, lwm2m_send_cb_t reply_cb)
```

LwM2M SEND operation to given path list asynchronously with confirmation callback

**Parameters**
- `ctx` – LwM2M context
- `path_list` – LwM2M path struct list
- `path_list_size` – Length of path list. Max size is `CONFIG_LWM2M_COMPOSITE_PATH_LIST_SIZE`
- `reply_cb` – Callback triggered with confirmation state or NULL if not used

Returns
0 for success or negative in case of error.

```c
struct lwm2m_ctx *lwm2m_rd_client_ctx(void)
```

Returns LwM2M client context

```c
int lwm2m_engine_enable_cache(char const *resource_path, struct lwm2m_time_series_elem *data_cache, size_t cache_len)
```

Enable data cache for a resource.

 Deprecated:
Use `lwm2m_enable_cache` instead

Application may enable caching of resource data by allocating buffer for LwM2M engine to use. Buffer must be size of struct `lwm2m_time_series_elem` times `cache_len`

**Parameters**
- `resource_path` – LwM2M resourcepath string “obj/obj-inst/res(/res-inst)”
• data_cache – Pointer to Data cache array
• cache_len – number of cached entries

Returns
0 for success or negative in case of error.

int lwm2m_enable_cache(const struct lwm2m_obj_path *path, struct lwm2m_time_series_elem *data_cache, size_t cache_len)

Enable data cache for a resource.
Application may enable caching of resource data by allocating buffer for LwM2M engine to use. Buffer must be size of struct lwm2m_time_series_elem times cache_len

Parameters
• path – LwM2M path to resource as a struct
• data_cache – Pointer to Data cache array
• cache_len – number of cached entries

Returns
0 for success or negative in case of error.

int lwm2m_security_mode(struct lwm2m_ctx *ctx)

Read security mode from selected security object instance.
This data is valid only if RD client is running.

Parameters
• ctx – Pointer to client context.

Returns
int Positive values are lwm2m_security_mode_e, negative error codes otherwise.

int lwm2m_set_default_sockopt(struct lwm2m_ctx *ctx)

Set default socket options for DTLS connections.
The engine calls this when lwm2m_ctx::set_socketoptions is not overwritten. You can call this from the overwritten callback to set extra options after or before defaults.

Parameters
• ctx – Client context

Returns
0 for success or negative in case of error.

struct lwm2m_obj_path

#include <lwm2m.h> LwM2M object path structure.

Public Members

uint16_t obj_id
Object ID.

uint16_t obj_inst_id
Object instance ID.
Zephyr Project Documentation, Release 3.6.0-rc3

- **uint16_t res_id**
  Resource ID.

- **uint16_t res_inst_id**
  Resource instance ID.

- **uint8_t level**
  Path level (0-4).
  Ex. 4 = resource instance.

```
struct lwm2m_ctx
#include <lwm2m.h>
LwM2M context structure to maintain information for a single LwM2M connection.
```

**DTLS related information**

Available only when `CONFIG_LWM2M_DTLS_SUPPORT` is enabled and `lwm2m_ctx::use_dtls` is set to true.

- **int tls_tag**
  TLS tag is set by client as a reference used when the LwM2M engine calls `tls_credential_(add|delete)`

- **char *desthostname**
  Destination hostname.
  When MBEDTLS SNI is enabled socket must be set with destination server hostname.

- **uint16_t desthostnamelen**
  Destination hostname length.

- **bool hostname_verify**
  Flag to indicate if hostname verification is enabled.

- **int (*load_credentials)(struct lwm2m_ctx *client_ctx)**
  Custom load_credentials function.
  Client can set load_credentials function as a way of overriding the default behavior of `load_tls_credential()` in `lwm2m_engine.c`

**Public Members**

- **struct sockaddr remote_addr**
  Destination address storage.

- **void *processed_req**
  A pointer to currently processed request, for internal LwM2M engine use.
  The underlying type is `struct lwm2m_message`, but since it's declared in a private header and not exposed to the application, it's stored as a void pointer.
int (*set_socketoptions)(struct lwm2m_ctx *client_ctx)

Custom socket options.
Client can override default socket options by providing a callback that is called after a socket is created and before connect.

bool use_dtls
Flag to indicate if context should use DTLS.
Enabled via the use of coaps:// protocol prefix in connection information. NOTE: requires CONFIG_LWM2M_DTLS_SUPPORT

bool connection_suspended
Flag to indicate that the socket connection is suspended.
With queue mode, this will tell if there is a need to reconnect.

bool buffer_client_messages
Flag to indicate that the client is buffering Notifications and Send messages.
True value buffer Notifications and Send messages.

int sec_obj_inst
Current index of Security Object used for server credentials.

int srv_obj_inst
Current index of Server Object used in this context.

bool bootstrap_mode
Flag to enable BOOTSTRAP interface.
See Section “Bootstrap Interface” of LwM2M Technical Specification for more information.

int sock_fd
Socket File Descriptor.

lwm2m_socket_fault_cb_t fault_cb
Socket fault callback.
LwM2M processing thread will call this callback in case of socket errors on receive.

lwm2m_observe_cb_t observe_cb
Callback for new or cancelled observations, and acknowledged or timed out notifications.

lwm2m_ctx_event_cb_t event_cb
Callback for client events.

uint8_t validate_buf[CONFIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE]
Validation buffer.
Used as a temporary buffer to decode the resource value before validation. On successful validation, its content is copied into the actual resource buffer.
void (*set_socket_state)(int fd, enum lwm2m_socket_states state)

Callback to indicate transmission states.

Client application may request LwM2M engine to indicate hints about transmission states and use that information to control various power saving modes.

struct lwm2m_time_series_elem
    #include <lwm2m.h> LwM2M Time series data structure.

Public Members

time_t t
    Cached data Unix timestamp.

struct lwm2m_objlnk
    #include <lwm2m.h> LWM2M Objlnk resource type structure.

Public Members

uint16_t obj_id
    Object ID.

uint16_t obj_inst
    Object instance ID.

MQTT

Overview  MQTT (Message Queuing Telemetry Transport) is an application layer protocol which works on top of the TCP/IP stack. It is a lightweight publish/subscribe messaging transport for machine-to-machine communication. For more information about the protocol itself, see http://mqtt.org/.

Zephyr provides an MQTT client library built on top of BSD sockets API. The library can be enabled with CONFIG_MQTT_LIB Kconfig option and is configurable at a per-client basis, with support for MQTT versions 3.1.0 and 3.1.1. The Zephyr MQTT implementation can be used with either plain sockets communicating over TCP, or with secure sockets communicating over TLS. See BSD Sockets for more information about Zephyr sockets.

MQTT clients require an MQTT server to connect to. Such a server, called an MQTT Broker, is responsible for managing client subscriptions and distributing messages published by clients. There are many implementations of MQTT brokers, one of them being Eclipse Mosquitto. See https://mosquitto.org/ for more information about the Eclipse Mosquitto project.
Sample usage

To create an MQTT client, a client context structure and buffers need to be defined:

```c
/* Buffers for MQTT client. */
static uint8_t rx_buffer[256];
static uint8_t tx_buffer[256];

/* MQTT client context */
static struct mqtt_client client_ctx;
```

Multiple MQTT client instances can be created in the application and managed independently. Additionally, a structure for MQTT Broker address information is needed. This structure must be accessible throughout the lifespan of the MQTT client and can be shared among MQTT clients:

```c
/* MQTT Broker address information. */
static struct sockaddr_storage broker;
```

An MQTT client library will notify MQTT events to the application through a callback function created to handle respective events:

```c
void mqtt_evt_handler(struct mqtt_client *client,
                      const struct mqtt_evt *evt)
{
    switch (evt->type) {
        /* Handle events here. */
    }
}
```

For a list of possible events, see API Reference.

The client context structure needs to be initialized and set up before it can be used. An example configuration for TCP transport is shown below:

```c
mqtt_client_init(&client_ctx);

/* MQTT client configuration */
client_ctx.broker = &broker;
client_ctx.evt_cb = mqtt_evt_handler;
client_ctx.client_id.utf8 = (uint8_t *)"zephyr_mqtt_client";
client_ctx.client_id.size = sizeof("zephyr_mqtt_client") - 1;
client_ctx.password = NULL;
client_ctx.user_name = NULL;
client_ctx.protocol_version = MQTT_VERSION_3_1_1;
client_ctx.transport.type = MQTT_TRANSPORT_NON_SECURE;

/* MQTT buffers configuration */
client_ctx.rx_buf = rx_buffer;
client_ctx.rx_buf_size = sizeof(rx_buffer);
client_ctx.tx_buf = tx_buffer;
client_ctx.tx_buf_size = sizeof(tx_buffer);
```

After the configuration is set up, the MQTT client can connect to the MQTT broker. Call the mqtt_connect function, which will create the appropriate socket, establish a TCP/TLS connection, and send an MQTT CONNECT message. When notified, the application should call the mqtt_input function to process the response received. Note, that mqtt_input is a non-blocking function, therefore the application should use socket poll to wait for the response. If the connection was successful, MQTT_EVT_CONNACK will be notified to the application through the callback function.

```c
rc = mqtt_connect(&client_ctx);
if (rc != 0) {
    return rc;
}
```

(continues on next page)
In the above code snippet, the MQTT callback function should set the connected flag upon a successful connection. If the connection fails at the MQTT level or a timeout occurs, the connection will be aborted, and the underlying socket closed.

After the connection is established, an application needs to call `mqtt_input` and `mqtt_live` functions periodically to process incoming data and upkeep the connection. If an MQTT message is received, an MQTT callback function will be called and an appropriate event notified.

The connection can be closed by calling the `mqtt_disconnect` function.

Zephyr provides sample code utilizing the MQTT client API. See `mqtt-publisher` for more information.

**Using MQTT with TLS** The Zephyr MQTT library can be used with TLS transport for secure communication by selecting a secure transport type (`MQTT_TRANSPORT_SECURE`) and some additional configuration information:

```c
client_ctx.transport.type = MQTT_TRANSPORT_SECURE;
struct mqtt_sec_config *tls_config = &client_ctx.transport.tls.config;

tls_config->peer_verify = TLS_PEER_VERIFY_REQUIRED;
tls_config->cipher_list = NULL;
tls_config->sec_tag_list = m_sec_tags;
tls_config->sec_tag_count = ARRAY_SIZE(m_sec_tags);
tls_config->hostname = MQTT_BROKER_HOSTNAME;
```

In this sample code, the `m_sec_tags` array holds a list of tags, referencing TLS credentials that the MQTT library should use for authentication. We do not specify `cipher_list`, to allow the use of all cipher suites available in the system. We set `hostname` field to broker hostname, which is required for server authentication. Finally, we enforce peer certificate verification by setting the `peer_verify` field.

Note, that TLS credentials referenced by the `m_sec_tags` array must be registered in the system first. For more information on how to do that, refer to secure sockets documentation.

An example of how to use TLS with MQTT is also present in `mqtt-publisher` sample application.

**API Reference**

**Related code samples**

**AWS IoT Core MQTT**
Connect to AWS IoT Core and publish messages using MQTT.

**MQTT publisher**
Send MQTT PUBLISH messages to an MQTT server.

**Microsoft Azure IoT Hub MQTT**
Connect to Azure IoT Hub and publish messages using MQTT.
**group mqtt_socket**

MQTT Client Implementation.

**Note:** The implementation assumes TCP module is enabled.

**Note:** By default the implementation uses MQTT version 3.1.1.

**Defines**

**MQTT_UTF8_LITERAL** (literal)

Initialize UTF-8 encoded string from C literal string.

Use it as follows:

```c
struct mqtt_utf8 password = MQTT_UTF8_LITERAL("my_pass");
```

**Parameters**

- **literal** – **[in]** Literal string from which to generate `mqtt_utf8` object.

**Typedefs**

typedef void (*`mqtt_evt_cb_t`)(struct `mqtt_client` *client, const struct `mqtt_evt` *evt)

Asynchronous event notification callback registered by the application.

**Param client**

**[in]** Identifies the client for which the event is notified.

**Param evt**

**[in]** Event description along with result and associated parameters (if any).

** Enums**

define `mqtt_evt_type`

MQTT Asynchronous Events notified to the application from the module through the callback registered by the application.

**Values**:

- **enumerator MQTT_EVT_CONNACK**

  Acknowledgment of connection request.

  Event result accompanying the event indicates whether the connection failed or succeeded.

- **enumerator MQTT_EVT_DISCONNECT**

  Disconnection Event.

  MQTT Client Reference is no longer valid once this event is received for the client.
enumerator MQTT_EVT_PUBLISH
Publish event received when message is published on a topic client is subscribed to.

**Note:** PUBLISH event structure only contains payload size, the payload data parameter should be ignored. Payload content has to be read manually with `mqtt_read_publish_payload` function.

enumerator MQTT_EVT_PUBACK
Acknowledgment for published message with QoS 1.

enumerator MQTT_EVT_PUBREC
Reception confirmation for published message with QoS 2.

enumerator MQTT_EVT_PUBREL
Release of published message with QoS 2.

enumerator MQTT_EVT_PUBCOMP
Confirmation to a publish release message with QoS 2.

enumerator MQTT_EVT_SUBACK
Acknowledgment to a subscribe request.

enumerator MQTT_EVT_UNSUBACK
Acknowledgment to a unsubscribe request.

enumerator MQTT_EVT_PINGRESP
Ping Response from server.

defines mqtt_version
MQTT version protocol level.

*Values:*

enumerator MQTT_VERSION_3_1_0 = 3
Protocol level for 3.1.0.

enumerator MQTT_VERSION_3_1_1 = 4
Protocol level for 3.1.1.

defines mqtt_qos
MQTT Quality of Service types.

*Values:*

enumerator MQTT_QOS_0_AT_MOST_ONCE = 0x00
Lowest Quality of Service, no acknowledgment needed for published message.
enumerator \texttt{MQTT\_QOS\_1\_AT\_LEAST\_ONCE} = 0x01
Medium Quality of Service, if acknowledgment expected for published message, duplicate messages permitted.

enumerator \texttt{MQTT\_QOS\_2\_EXACTLY\_ONCE} = 0x02
Highest Quality of Service, acknowledgment expected and message shall be published only once.
Message not published to interested parties unless client issues a PUBREL.

enum \texttt{mqtt\_conn\_return\_code}
MQTT CONNACK return codes.
\textit{Values:}

enumerator \texttt{MQTT\_CONNECTION\_ACCEPTED} = 0x00
Connection accepted.

enumerator \texttt{MQTT\_UNACCEPTABLE\_PROTOCOL\_VERSION} = 0x01
The Server does not support the level of the MQTT protocol requested by the Client.

enumerator \texttt{MQTT\_IDENTIFIER\_REJECTED} = 0x02
The Client identifier is correct UTF-8 but not allowed by the Server.

enumerator \texttt{MQTT\_SERVER\_UNAVAILABLE} = 0x03
The Network Connection has been made but the MQTT service is unavailable.

enumerator \texttt{MQTT\_BAD\_USER\_NAME\_OR\_PASSWORD} = 0x04
The data in the user name or password is malformed.

enumerator \texttt{MQTT\_NOT\_AUTHORIZED} = 0x05
The Client is not authorized to connect.

enum \texttt{mqtt\_suback\_return\_code}
MQTT SUBACK return codes.
\textit{Values:}

enumerator \texttt{MQTT\_SUBACK\_SUCCESS\_QoS\_0} = 0x00
Subscription with QoS 0 succeeded.

enumerator \texttt{MQTT\_SUBACK\_SUCCESS\_QoS\_1} = 0x01
Subscription with QoS 1 succeeded.

enumerator \texttt{MQTT\_SUBACK\_SUCCESS\_QoS\_2} = 0x02
Subscription with QoS 2 succeeded.

enumerator \texttt{MQTT\_SUBACK\_FAILURE} = 0x80
Subscription for a topic failed.
enum mqtt_transport_type
MQTT transport type.

Values:

enumerator MQTT_TRANSPORT_NON_SECURE
Use non secure TCP transport for MQTT connection.

enumerator MQTT_TRANSPORT_NUM
Shall not be used as a transport type.
Indicator of maximum transport types possible.

Functions

void mqtt_client_init(struct mqtt_client *client)
Initializes the client instance.

Note: Shall be called to initialize client structure, before setting any client parameters and before connecting to broker.

Parameters

• client – [in] Client instance for which the procedure is requested. Shall not be NULL.

int mqtt_connect(struct mqtt_client *client)
API to request new MQTT client connection.

Note: This memory is assumed to be resident until mqtt_disconnect is called.

Note: Any subsequent changes to parameters like broker address, user name, device id, etc. have no effect once MQTT connection is established.

Note: Default protocol revision used for connection request is 3.1.1. Please set client.protocol_version = MQTT_VERSION_3_1_0 to use protocol 3.1.0.

Note: Please modify CONFIG_MQTT_KEEPALIVE time to override default of 1 minute.

Parameters

• client – [in] Client instance for which the procedure is requested. Shall not be NULL.

Returns
0 or a negative error code (errno.h) indicating reason of failure.
int mqtt_publish(struct mqtt_client *client, const struct mqtt_publish_param *param)
API to publish messages on topics.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.
• param – [in] Parameters to be used for the publish message. Shall not be NULL.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_publish_qos1_ack(struct mqtt_client *client, const struct mqtt_puback_param *param)
API used by client to send acknowledgment on receiving QoS1 publish message.
Should be called on reception of MQTT_EVT_PUBLISH with QoS level MQTT_QOS_1_AT_LEAST_ONCE.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.
• param – [in] Identifies message being acknowledged.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_publish_qos2_receive(struct mqtt_client *client, const struct mqtt_pubrec_param *param)
API used by client to send acknowledgment on receiving QoS2 publish message.
Should be called on reception of MQTT_EVT_PUBLISH with QoS level MQTT_QOS_2_EXACTLY_ONCE.

Parameters
• client – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.
• param – [in] Identifies message being acknowledged.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_publish_qos2_release(struct mqtt_client *client, const struct mqtt_pubrel_param *param)
API used by client to request release of QoS2 publish message.
Should be called on reception of MQTT_EVT_PUBREC.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.
• param – [in] Identifies message being released.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_publish_qos2_complete(struct mqtt_client *client, const struct mqtt_pubcomp_param *param)
API used by client to send acknowledgment on receiving QoS2 publish release message.
Should be called on reception of MQTT_EVT_PUBREL.

6.3. Networking
Parameters

- **client** – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.
- **param** – [in] Identifies message being completed.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_subscribe(struct mqtt_client *client, const struct mqtt_subscription_list *param)
```

API to request subscription of one or more topics on the connection.

Parameters

- **client** – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.
- **param** – [in] Subscription parameters. Shall not be NULL.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_unsubscribe(struct mqtt_client *client, const struct mqtt_subscription_list *param)
```

API to request unsubscription of one or more topics on the connection.

**Note:** QoS included in topic description is unused in this API.

Parameters

- **client** – [in] Identifies client instance for which procedure is requested.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_ping(struct mqtt_client *client)
```

API to send MQTT ping.

The use of this API is optional, as the library handles the connection keep-alive on its own, see `mqtt_live`.

Parameters

- **client** – [in] Identifies client instance for which procedure is requested.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_disconnect(struct mqtt_client *client)
```

API to disconnect MQTT connection.

Parameters

- **client** – [in] Identifies client instance for which procedure is requested.

Returns

0 or a negative error code (errno.h) indicating reason of failure.
int mqtt_abort(struct mqtt_client *client)
  API to abort MQTT connection.
  This will close the corresponding transport without closing the connection gracefully
  at the MQTT level (with disconnect message).

  **Parameters**
  - client – [in] Identifies client instance for which procedure is requested.

  **Returns**
  0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_live(struct mqtt_client *client)
  This API should be called periodically for the client to be able to keep the connection
  alive by sending Ping Requests if need be.

  **Note:** Application shall ensure that the periodicity of calling this function makes
  it possible to respect the Keep Alive time agreed with the broker on connection.
  mqtt_connect for details on Keep Alive time.

  **Parameters**
  - client – [in] Client instance for which the procedure is requested. Shall
    not be NULL.

  **Returns**
  0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_keepalive_time_left(const struct mqtt_client *client)
  Helper function to determine when next keep alive message should be sent.
  Can be used for instance as a source for poll timeout.

  **Parameters**
  - client – [in] Client instance for which the procedure is requested.

  **Returns**
  Time in milliseconds until next keep alive message is expected to be sent.
  Function will return -1 if keep alive messages are not enabled.

int mqtt_input(struct mqtt_client *client)
  Receive an incoming MQTT packet.
  The registered callback will be called with the packet content.

  **Note:** In case of PUBLISH message, the payload has to be read separately with
  mqtt_read_publish_payload function. The size of the payload to read is provided in
  the publish event structure.

  **Note:** This is a non-blocking call.

  **Parameters**
  - client – [in] Client instance for which the procedure is requested. Shall
    not be NULL.

  **Returns**
  0 or a negative error code (errno.h) indicating reason of failure.
int mqtt_read_publish_payload(struct mqtt_client *client, void *buffer, size_t length)
Read the payload of the received PUBLISH message.
This function should be called within the MQTT event handler, when MQTT PUBLISH message is notified.

Note: This is a non-blocking call.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.
• buffer – [out] Buffer where payload should be stored.
• length – [in] Length of the buffer, in bytes.

Returns
Number of bytes read or a negative error code (errno.h) indicating reason of failure.

int mqtt_read_publish_payload_blocking(struct mqtt_client *client, void *buffer, size_t length)
Blocking version of mqtt_read_publish_payload function.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.
• buffer – [out] Buffer where payload should be stored.
• length – [in] Length of the buffer, in bytes.

Returns
Number of bytes read or a negative error code (errno.h) indicating reason of failure.

int mqtt_readall_publish_payload(struct mqtt_client *client, uint8_t *buffer, size_t length)
Blocking version of mqtt_read_publish_payload function which runs until the required number of bytes are read.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.
• buffer – [out] Buffer where payload should be stored.
• length – [in] Number of bytes to read.

Returns
0 if success, otherwise a negative error code (errno.h) indicating reason of failure.

struct mqtt_utf8
#include <mqtt.h> Abstracts UTF-8 encoded strings.

Public Members
const uint8_t *utf8
  Pointer to UTF-8 string.

uint32_t size
  Size of UTF string, in bytes.

struct mqtt_binstr
  #include <mqtt.h> Abstracts binary strings.

Public Members

uint8_t *data
  Pointer to binary stream.

uint32_t len
  Length of binary stream.

struct mqtt_topic
  #include <mqtt.h> Abstracts MQTT UTF-8 encoded topic that can be subscribed to or published.

Public Members

struct mqtt_utf8 topic
  Topic on to be published or subscribed to.

uint8_t qos
  Quality of service requested for the subscription. 
  mqtt_qos for details.

struct mqtt_publish_message
  #include <mqtt.h> Parameters for a publish message.

Public Members

struct mqtt_topic topic
  Topic on which data was published.

struct mqtt_binstr payload
  Payload on the topic published.

struct mqtt_connack_param
  #include <mqtt.h> Parameters for a connection acknowledgment (CONNACK).
Public Members

uint8_t session_present_flag
The Session Present flag enables a Client to establish whether the Client and Server have a consistent view about whether there is already stored Session state.

enum mqtt_conn_return_code return_code
The appropriate non-zero Connect return code indicates if the Server is unable to process a connection request for some reason.

struct mqtt_puback_param
#include <mqtt.h> Parameters for MQTT publish acknowledgment (PUBACK).

Public Members

uint16_t message_id
Message id of the PUBLISH message being acknowledged.

struct mqtt_pubrec_param
#include <mqtt.h> Parameters for MQTT publish receive (PUBREC).

Public Members

uint16_t message_id
Message id of the PUBLISH message being acknowledged.

struct mqtt_pubrel_param
#include <mqtt.h> Parameters for MQTT publish release (PUBREL).

Public Members

uint16_t message_id
Message id of the PUBREC message being acknowledged.

struct mqtt_pubcomp_param
#include <mqtt.h> Parameters for MQTT publish complete (PUBCOMP).

Public Members

uint16_t message_id
Message id of the PUBREL message being acknowledged.

struct mqtt_suback_param
#include <mqtt.h> Parameters for MQTT subscription acknowledgment (SUBACK).
**Public Members**

`uint16_t message_id`

Message id of the SUBSCRIBE message being acknowledged.

**struct mqtt_binstr return_codes**

Return codes indicating maximum QoS level granted for each topic in the subscription list.

**struct mqtt_unsuback_param**

#include `<mqtt.h>` Parameters for MQTT unsubscribe acknowledgment (UNSUBACK).

**Public Members**

`uint16_t message_id`

Message id of the UNSUBSCRIBE message being acknowledged.

**struct mqtt_publish_param**

#include `<mqtt.h>` Parameters for a publish message (PUBLISH).

**Public Members**

**struct mqtt_publish_message message**

Messages including topic, QoS and its payload (if any) to be published.

`uint16_t message_id`

Message id used for the publish message.

Redundant for QoS 0.

`uint8_t dup_flag`

Duplicate flag.

If 1, it indicates the message is being retransmitted. Has no meaning with QoS 0.

`uint8_t retain_flag`

Retain flag.

If 1, the message shall be stored persistently by the broker.

**struct mqtt_subscription_list**

#include `<mqtt.h>` List of topics in a subscription request.

**Public Members**

**struct mqtt_topic *list**

Array containing topics along with QoS for each.
### Public Members

```c
union mqtt_evt_param

#include <mqtt.h> Defines event parameters notified along with asynchronous events to the application.
```

### Public Members

```c
struct mqtt_connack_param connack

Parameters accompanying MQTT_EVT_CONNACK event.
```

```c
struct mqtt_publish_param publish

Parameters accompanying MQTT_EVT_PUBLISH event.
```

**Note:** PUBLISH event structure only contains payload size, the payload data parameter should be ignored. Payload content has to be read manually with `mqtt_read_publish_payload` function.

```c
struct mqtt_puback_param puback

Parameters accompanying MQTT_EVT_PUBACK event.
```

```c
struct mqtt_pubrec_param pubrec

Parameters accompanying MQTT_EVT_PUBREC event.
```

```c
struct mqtt_pubrel_param pubrel

Parameters accompanying MQTT_EVT_PUBREL event.
```

```c
struct mqtt_pubcomp_param pubcomp

Parameters accompanying MQTT_EVT_PUBCOMP event.
```

```c
struct mqtt_suback_param suback

Parameters accompanying MQTT_EVT_SUBACK event.
```

```c
struct mqtt_unsuback_param unsuback

Parameters accompanying MQTT_EVT_UNSUBACK event.
```

```c
struct mqtt_evt

#include <mqtt.h> Defines MQTT asynchronous event notified to the application.
```

### Public Members
enum mqtt_evt_type type
    Identifies the event.

union mqtt_evt_param param
    Contains parameters (if any) accompanying the event.

int result
    Event result.
    0 or a negative error code (errno.h) indicating reason of failure.

struct mqtt_sec_config
    #include <mqtt.h> TLS configuration for secure MQTT transports.

Public Members

int peer_verify
    Indicates the preference for peer verification.

uint32_t cipher_count
    Indicates the number of entries in the cipher list.

const int *cipher_list
    Indicates the list of ciphers to be used for the session.
    May be NULL to use the default ciphers.

uint32_t sec_tag_count
    Indicates the number of entries in the sec tag list.

const sec_tag_t *sec_tag_list
    Indicates the list of security tags to be used for the session.

const char *hostname
    Peer hostname for ceritificate verification.
    May be NULL to skip hostname verification.

int cert_nocopy
    Indicates the preference for copying certificates to the heap.

struct mqtt_transport
    #include <mqtt.h> MQTT transport specific data.

Public Members

6.3. Networking
enum mqtt_transport_type type
    Transport type selection for client instance.

    mqtt_transport_type for possible values. MQTT_TRANSPORT_MAX is not a valid type.

int sock
    Socket descriptor.

struct mqtt_internal
    #include <mqtt.h> MQTT internal state.

Public Members

struct sys_mutex mutex
    Internal.
    Mutex to protect access to the client instance.

uint32_t last_activity
    Internal.
    Wall clock value (in milliseconds) of the last activity that occurred. Needed for periodic PING.

uint32_t state
    Internal.
    Client's state in the connection.

uint32_t rx_buf_datalen
    Internal.
    Packet length read so far.

uint32_t remaining_payload
    Internal.
    Remaining payload length to read.

struct mqtt_client
    #include <mqtt.h> MQTT Client definition to maintain information relevant to the client.

Public Members

struct mqtt_internal internal
    MQTT client internal state.

struct mqtt_transport transport
    MQTT transport configuration and data.
struct `mqtt_utf8` client_id
  Unique client identification to be used for the connection.

const void *`broker`
  Broker details, for example, address, port.
  Address type should be compatible with transport used.

struct `mqtt_utf8` *`user_name`
  User name (if any) to be used for the connection.
  NULL indicates no user name.

struct `mqtt_utf8` *`password`
  Password (if any) to be used for the connection.
  Note that if password is provided, user name shall also be provided. NULL indicates no password.

struct `mqtt_topic` *`will_topic`
  Will topic and QoS.
  Can be NULL.

struct `mqtt_utf8` *`will_message`
  Will message.
  Can be NULL. Non NULL value valid only if will topic is not NULL.

`mqtt_evt_cb_t` `evt_cb`
  Application callback registered with the module to get MQTT events.

uint8_t *`rx_buf`
  Receive buffer used for MQTT packet reception in RX path.

uint32_t `rx_buf_size`
  Size of receive buffer.

uint8_t *`tx_buf`
  Transmit buffer used for creating MQTT packet in TX path.

uint32_t `tx_buf_size`
  Size of transmit buffer.

uint16_t `keepalive`
  Keepalive interval for this client in seconds.
  Default is CONFIG_MQTT_KEEPALIVE.

uint8_t `protocol_version`
  MQTT protocol version.
int8_t unacked_ping
Unanswered PINGREQ count on this connection.

uint8_t will_retain
Will retain flag, 1 if will message shall be retained persistently.

uint8_t clean_session
Clean session flag indicating a fresh (1) or a retained session (0).
Default is CONFIG_MQTT_CLEAN_SESSION.

MQTT-SN

- Overview
- Sample usage
- Deviations from the standard
- API Reference

Overview  MQTT-SN is a variant of the well-known MQTT protocol - see MQTT.
In contrast to MQTT, MQTT-SN does not require a TCP transport, but is designed to be used over any message-based transport. Originally, it was mainly created with ZigBee in mind, but others like Bluetooth, UDP or even a UART can be used just as well.

Zephyr provides an MQTT-SN client library built on top of BSD sockets API. The library can be enabled with CONFIG_MQTT_SN_LIB Kconfig option and is configurable at a per-client basis, with support for MQTT-SN version 1.2. The Zephyr MQTT-SN implementation can be used with any message-based transport, but support for UDP is already built-in.

The MQTT-SN spec v1.2 can be found here: [https://www.oasis-open.org/committees/download.php/66091/MQTT-SN_spec_v1.2.pdf](https://www.oasis-open.org/committees/download.php/66091/MQTT-SN_spec_v1.2.pdf)

Sample usage  To create an MQTT-SN client, a client context structure and buffers need to be defined:

```c
/* Buffers for MQTT client. */
static uint8_t rx_buffer[256];
static uint8_t tx_buffer[256];

/* MQTT-SN client context */
static struct mqtt_sn_client client;
```

Multiple MQTT-SN client instances can be created in the application and managed independently. Additionally, a structure for the transport is needed as well. The library already comes with an example implementation for UDP.

```c
/* MQTT Broker address information. */
static struct mqtt_sn_transport tp;
```
The MQTT-SN library will inform clients about certain events using a callback.

```c
static void evt_cb(struct mqtt_sn_client *client, const struct mqtt_sn_evt *evt)
{
    switch(evt->type) {
    /* Handle events here. */
    }
}
```

For a list of possible events, see *API Reference*.

The client context structure needs to be initialized and set up before it can be used. An example configuration for UDP transport is shown below:

```c
struct mqtt_sn_data client_id = MQTT_SN_DATA_STRING_LITERAL("ZEPHYR");
struct sockaddr_in gateway = {0};

uint8_t tx_buf[256];
uint8_t rx_buf[256];

mqtt_sn_transport_udp_init(&tp, (struct sockaddr*)&gateway, sizeof((gateway)));
mqtt_sn_client_init(&client, &client_id, &tp.tp, evt_cb, tx_buf, sizeof(tx_buf), rx_buf,
                    sizeof(rx_buf));
```

After the configuration is set up, the MQTT-SN client can connect to the gateway. While the MQTT-SN protocol offers functionality to discover gateways through an advertisement mechanism, this is not implemented yet in the library.

Call the `mqtt_sn_connect` function, which will send a CONNECT message. The application should periodically call the `mqtt_sn_input` function to process the response received. The application does not have to call `mqtt_sn_input` if it knows that no data has been received (e.g. when using Bluetooth). Note that `mqtt_sn_input` is a non-blocking function, if the transport struct contains a poll compatible function pointer. If the connection was successful, `MQTT_SN_EVT_CONNECTED` will be notified to the application through the callback function.

```c
err = mqtt_sn_connect(client, false, true);
__ASSERT(err == 0, "mqtt_sn_connect() failed %d", err);

while (!) {
    mqtt_sn_input(&client);
    if (connected) {
        mqtt_sn_publish(&client, MQTT_SN_QOS_0, &topic_p, false, &pubdata);
    }
    k_sleep(K_MSEC(500));
}
```

In the above code snippet, the event handler function should set the connected flag upon a successful connection. If the connection fails at the MQTT level or a timeout occurs, the connection will be aborted.

After the connection is established, an application needs to call `mqtt_input` function periodically to process incoming data. Connection upkeep, on the other hand, is done automatically using a `k_work` item. If a MQTT message is received, an MQTT callback function will be called and an appropriate event notified.

The connection can be closed by calling the `mqtt_sn_disconnect` function. This has no effect on the transport, however. If you want to close the transport (e.g. the socket), call `mqtt_sn_client_deinit`, which will deinit the transport as well.

Zephyr provides sample code utilizing the MQTT-SN client API. See mqtt-sn-publisher for more information.
Deviations from the standard  Certain parts of the protocol are not yet supported in the library. * Pre-defined topic IDs * QoS -1 - it's most useful with predefined topics * Gateway discovery using ADVERTISE, SEARCHGW and GWINFO messages. * Setting the will topic and message after the initial connect * Forwarder Encapsulation

API Reference

Related code samples

MQTT-SN publisher
Send MQTT-SN PUBLISH messages to an MQTT-SN gateway.

group mqtt_sn_socket
MQTT-SN Client Implementation.
MQTT-SN Client's Application interface is defined in this header. Targets protocol version 1.2.

Defines

MQTT_SN_DATA_STRING_LITERAL(literal)
Initialize memory buffer from C literal string.
Use it as follows:
struct mqtt_sn_data topic = MQTT_SN_DATA_STRING_LITERAL("/zephyr");

Parameters

• literal – [in] Literal string from which to generate mqtt_sn_data object.

MQTT_SN_DATA_BYTES(...)Initialize memory buffer from single bytes.
Use it as follows:
struct mqtt_sn_data data = MQTT_SN_DATA_BYTES(0x13, 0x37);

Typedefs
typedef void (*mqtt_sn_evt_cb_t)(struct mqtt_sn_client *client, const struct mqtt_sn_evt *evt)
Asynchronous event notification callback registered by the application.

Param client
[in] Identifies the client for which the event is notified.

Param evt
[in] Event description along with result and associated parameters (if any).

Enums
enum mqtt_sn_qos
Quality of Service.
QoS 0-2 work the same as basic MQTT, QoS -1 is an MQTT-SN addition. QOS -1 is not supported yet.
Values:

enumerator MQTT_SN_QOS_0
  QOS 0.

enumerator MQTT_SN_QOS_1
  QOS 1.

enumerator MQTT_SN_QOS_2
  QOS 2.

enumerator MQTT_SN_QOS_M1
  QOS -1.

enum mqtt_sn_topic_type
  MQTT-SN topic types.
  Values:

enumerator MQTT_SN_TOPIC_TYPE_NORMAL
  Normal topic.
  It allows usage of any valid UTF-8 string as a topic name.

enumerator MQTT_SN_TOPIC_TYPE_PREDEF
  Pre-defined topic.
  It allows usage of a two-byte identifier representing a topic name for which the
  corresponding topic name is known in advance by both the client and the gate-
  way/server.

enumerator MQTT_SN_TOPIC_TYPE_SHORT
  Short topic.
  It allows usage of a two-byte string as a topic name.

enum mqtt_sn_return_code
  MQTT-SN return codes.
  Values:

enumerator MQTT_SN_CODE_ACCEPTED = 0x00
  Accepted.

enumerator MQTT_SN_CODE_REJECTED_CONGESTION = 0x01
  Rejected: congestion.

enumerator MQTT_SN_CODE_REJECTED_TOPIC_ID = 0x02
  Rejected: Invalid Topic ID.

enumerator MQTT_SN_CODE_REJECTED_NOTSUP = 0x03
  Rejected: Not Supported.
enum mqtt_sn_evt_type
   Event types that can be emitted by the library.
   Values:

   enumerator MQTT_SN_EVT_CONNECTED
      Connected to a gateway.

   enumerator MQTT_SN_EVT_DISCONNECTED
      Disconnected.

   enumerator MQTT_SN_EVT_ASLEEP
      Entered ASLEEP state.

   enumerator MQTT_SN_EVT_AWAKE
      Entered AWAKE state.

   enumerator MQTT_SN_EVT_PUBLISH
      Received a PUBLISH message.

   enumerator MQTT_SN_EVT_PINGRESP
      Received a PINGRESP.

Functions

int mqtt_sn_client_init(struct mqtt_sn_client *client, const struct mqtt_sn_data
                        *client_id, struct mqtt_sn_transport *transport, mqtt_sn_evt_cb_t
                        evt_cb, void *tx, size_t txsz, void *rx, size_t rxsz)

Initialize a client.

Parameters

- client – The MQTT-SN client to initialize.
- client_id – The ID to be used by the client.
- transport – The transport to be used by the client.
- evt_cb – The event callback function for the client.
- tx – Pointer to the transmit buffer.
- txsz – Size of the transmit buffer.
- rx – Pointer to the receive buffer.
- rxsz – Size of the receive buffer.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

void mqtt_sn_client_deinit(struct mqtt_sn_client *client)

Deinitialize the client.

This removes all topics and publishes, and also de-inits the transport.

Parameters

- client – The MQTT-SN client to deinitialize.
int mqtt_sn_connect(struct mqtt_sn_client *client, bool will, bool clean_session)
    Connect the client.

Parameters
    • client – The MQTT-SN client to connect.
    • will – Flag indicating if a Will message should be sent.
    • clean_session – Flag indicating if a clean session should be started.

Returns
    0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_sn_disconnect(struct mqtt_sn_client *client)
    Disconnect the client.

Parameters
    • client – The MQTT-SN client to disconnect.

Returns
    0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_sn_sleep(struct mqtt_sn_client *client, uint16_t duration)
    Set the client into sleep state.

Parameters
    • client – The MQTT-SN client to be put to sleep.
    • duration – Sleep duration (in seconds).

Returns
    0 on success, negative errno code on failure.

int mqtt_sn_subscribe(struct mqtt_sn_client *client, enum mqtt_sn_qos qos, struct mqtt_sn_data *topic_name)
    Subscribe to a given topic.

Parameters
    • client – The MQTT-SN client that should subscribe.
    • qos – The desired quality of service for the subscription.
    • topic_name – The name of the topic to subscribe to.

Returns
    0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_sn_unsubscribe(struct mqtt_sn_client *client, enum mqtt_sn_qos qos, struct mqtt_sn_data *topic_name)
    Unsubscribe from a topic.

Parameters
    • client – The MQTT-SN client that should unsubscribe.
    • qos – The quality of service used when subscribing.
    • topic_name – The name of the topic to unsubscribe from.

Returns
    0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_sn_publish(struct mqtt_sn_client *client, enum mqtt_sn_qos qos, struct mqtt_sn_data *topic_name, bool retain, struct mqtt_sn_data *data)
    Publish a value.

If the topic is not yet registered with the gateway, the library takes care of it.
Parameters

- client – The MQTT-SN client that should publish.
- qos – The desired quality of service for the publish.
- topic_name – The name of the topic to publish to.
- retain – Flag indicating if the message should be retained by the broker.
- data – The data to be published.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_sn_input(struct mqtt_sn_client *client)
```

Check the transport for new incoming data.

Call this function periodically, or if you have good reason to believe there is any data. If the client's transport struct contains a poll-function, this function is non-blocking.

Parameters

- client – The MQTT-SN client to check for incoming data.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_sn_get_topic_name(struct mqtt_sn_client *client, uint16_t id, struct mqtt_sn_data *topic_name)
```

Get topic name by topic ID.

Parameters

- topic_name – [out] Will be assigned to topic name.

Returns

0 on success, -ENOENT if topic ID doesn’t exist, or -EINVAL on invalid arguments.

```c
struct mqtt_sn_data
#include <mqtt_sn.h> Abstracts memory buffers.
```

Public Members

```c
const uint8_t *data
```

Pointer to data.

```c
uint16_t size
```

Size of data, in bytes.

```c
union mqtt_sn_evt_param
#include <mqtt_sn.h> Event metadata.
```
Public Members

struct mqtt_sn_data data
   The payload data associated with the event.

enum mqtt_sn_topic_type topic_type
   The type of topic for the event.

uint16_t topic_id
   The identifier for the topic of the event.

struct mqtt_sn_evt_param publish
   Structure holding publish event details.

struct mqtt_sn_evt
   #include <mqtt_sn.h> MQTT-SN event structure to be handled by the event callback.

Public Members

enum mqtt_sn_evt_type type
   Event type.

union mqtt_sn_evt_param param
   Event parameters.

struct mqtt_sn_transport
   #include <mqtt_sn.h> Structure to describe an MQTT-SN transport.
   MQTT-SN does not require transports to be reliable or to hold a connection. Transports just need to be frame-based, so you can use UDP, ZigBee, or even a simple UART, given some kind of framing protocol is used.

Public Members

int (*init)(struct mqtt_sn_transport *transport)
   Will be called once on client init to initialize the transport.
   Use this to open sockets or similar. May be NULL.

void (*deinit)(struct mqtt_sn_transport *transport)
   Will be called on client deinit.
   Use this to close sockets or similar. May be NULL.

int (*msg_send)(struct mqtt_sn_client *client, void *buf, size_t sz)
   Will be called by the library when it wants to send a message.
ssize_t (*recv)(struct mqtt_sn_client *client, void *buffer, size_t length)
   Will be called by the library when it wants to receive a message.
   Implementations should follow recv conventions.

int (*poll)(struct mqtt_sn_client *client)
   Check if incoming data is available.
   If poll() returns a positive number, recv must not block.
   May be NULL, but recv should not block then either.
   Return
       Positive number if data is available, or zero if there is none. Negative
       values signal errors.

struct mqtt_sn_client
   #include <mqtt_sn.h> Structure describing an MQTT-SN client.

Public Members

struct mqtt_sn_data client_id
   1-23 character unique client ID

struct mqtt_sn_data will_topic
   Topic for Will message.
   Must be initialized before connecting with will=true

struct mqtt_sn_data will_msg
   Will message.
   Must be initialized before connecting with will=true

enum mqtt_sn_qos will_qos
   Quality of Service for the Will message.

bool will_retain
   Flag indicating if the will message should be retained by the broker.

struct mqtt_sn_transport *transport
   Underlying transport to be used by the client.

struct net_buf_simple tx
   Buffer for outgoing data.

struct net_buf_simple rx
   Buffer for incoming data.

mqtt_sn_evt_cb_t evt_cb
   Event callback.
uint16_t next_msg_id
Message ID for the next message to be sent.

sys_slist_t publish
List of pending publish messages.

sys_slist_t topic
List of registered topics.

int state
Current state of the MQTT-SN client.

int64_t last_ping
Timestamp of the last ping request.

uint8_t ping_retries
Number of retries for failed ping attempts.

struct k_work_delayable process_work
Delayable work structure for processing MQTT-SN events.

TFTP Zephyr provides a simple TFTP client library that can enabled with CONFIG_MQTT_SN_LIB Kconfig option.
See TFTP client sample application for more information about the library usage.

API Reference Related code samples
TFTP client
Use the TFTP client library to get/put files from/to a TFTP server.

group tftp_client
TFTP Client Implementation.

TFTP client error codes.

TFTPC_SUCCESS
Success.

TFTPC_DUPLICATE_DATA
Duplicate data received.

TFTPC_BUFFER_OVERFLOW
User buffer is too small.

TFTPC_UNKNOWN_FAILURE
Unknown failure.
TFTPC_REMOTE_ERROR
Remote server error.

TFTPC_RETRIES_EXHAUSTED
Retries exhausted.

Defines

TFTP_BLOCK_SIZE
RFC1350: the file is sent in fixed length blocks of 512 bytes.
Each data packet contains one block of data, and must be acknowledged by an ac-
knowledged packet before the next packet can be sent. A data packet of less than
512 bytes signals termination of a transfer.

TFTP_HEADER_SIZE
RFC1350: For non-request TFTP message, the header contains 2-byte operation code
plus 2-byte block number or error code.

TFTPC_MAX_BUF_SIZE
Maximum amount of data that can be sent or received.

Typedefs

typedef void (*tftp_callback_t)(const struct tftp_evt *evt)
TFTP event notification callback registered by the application.

Param evt
[in] Event description along with result and associated parameters (if any).

Enums

enum tftp_evt_type
TFTP Asynchronous Events notified to the application from the module through the
callback registered by the application.

Values:

enumerator TFTP_EVT_DATA
DATA event when data is received from remote server.

Note: DATA event structure contains payload data and size.

enumerator TFTP_EVT_ERROR
ERROR event when error is received from remote server.

Note: ERROR event structure contains error code and message.
Functions

```c
int tftp_get(struct tftpc *client, const char *remote_file, const char *mode)
This function gets data from a “file” on the remote server.
```

**Note:** This function blocks until the transfer is completed or network error happens. The integrity of the client structure must be ensured until the function returns.

**Parameters**
- `client` – Client information of type `tftpc`.
- `remote_file` – Name of the remote file to get.
- `mode` – TFTP Client “mode” setting.

**Return values**
- `size` – size of data being received if the operation completed successfully.
- `TFTPC_BUFFER_OVERFLOW` – if the file is larger than the user buffer.
- `TFTPC_REMOTE_ERROR` – if the server failed to process our request.
- `TFTPC_RETRIES_EXHAUSTED` – if the client timed out waiting for server.
- `-EINVAL` – if `client` is NULL.

```c
int tftp_put(struct tftpc *client, const char *remote_file, const char *mode, const uint8_t *user_buf, uint32_t user_buf_size)
This function puts data to a “file” on the remote server.
```

**Note:** This function blocks until the transfer is completed or network error happens. The integrity of the client structure must be ensured until the function returns.

**Parameters**
- `client` – Client information of type `tftpc`.
- `remote_file` – Name of the remote file to put.
- `mode` – TFTP Client “mode” setting.
- `user_buf` – Data buffer containing the data to put.
- `user_buf_size` – Length of the data to put.

**Return values**
- `size` – size of data being sent if the operation completed successfully.
- `TFTPC_REMOTE_ERROR` – if the server failed to process our request.
- `TFTPC_RETRIES_EXHAUSTED` – if the client timed out waiting for server.
- `-EINVAL` – if `client` or `user_buf` is NULL or if `user_buf_size` is zero.

```c
struct tftp_data_param
#include <tftp.h> Parameters for data event.
```

6.3. Networking 2685
Public Members

uint8_t *data_ptr
   Pointer to binary data.

uint32_t len
   Length of binary data.

struct tftp_error_param
   #include <tftp.h> Parameters for error event.

Public Members

char *msg
   Error message.

int code
   Error code.

union tftp_evt_param
   #include <tftp.h> Defines event parameters notified along with asynchronous events to
   the application.

Public Members

struct tftp_data_param data
   Parameters accompanying TFTP_EVT_DATA event.

struct tftp_error_param error
   Parameters accompanying TFTP_EVT_ERROR event.

struct tftp_evt
   #include <tftp.h> Defines TFTP asynchronous event notified to the application.

Public Members

enum tftp_evt_type type
   Identifies the event.

union tftp_evt_param param
   Contains parameters (if any) accompanying the event.

struct tftpc
   #include <tftp.h> TFTP client definition to maintain information relevant to the client.
Note: Application must initialize server and callback before calling GET or PUT API with the tftpc structure.

Public Members

struct sockaddr server
    Socket address pointing to the remote TFTP server.

tftp_callback_t callback
    Event notification callback.
    No notification if NULL

uint8_t tftp_buf[(512 + 4)]
    Buffer for internal usage.

Network System Management

Network Configuration Library

- Overview
- Sample usage
- API Reference

Overview  The network configuration library sets up networking devices in a semi-automatic way during the system boot, based on user-supplied Kconfig options.
The following Kconfig options affect how configuration library will setup the system:
Table 24: Kconfig options for network configuration library

<table>
<thead>
<tr>
<th>Option name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIG_NET_CONFIG_SETTINGS</td>
<td>This option controls whether the network system is configured or initialized at all. If not set, then the config library is not used for initialization and the application needs to do all the network related configuration itself. If this option is set, then the user can optionally configure static IP addresses to be set to the first network interface in the system. Typically setting static IP addresses is only usable in testing and should not be used in production code. See the config library Kconfig file sub-sys/net/lib/config/Kconfig for specific options to set the static IP addresses.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_AUTO_INIT</td>
<td>The networking system is automatically configured when the device is started.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_INIT_TIMEOUT</td>
<td>This tells how long to wait for the networking to be ready and available. If for example IPv4 address from DHCPv4 is not received within this limit, then a call to net_config_init() will return error during the device startup.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_NEED_IPV4</td>
<td>The network application needs IPv4 support to function properly. This option makes sure the network application is initialized properly in order to use IPv4. If CONFIG_NET_IPV4 is not enabled, then setting this option will automatically enable IPv4.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_NEED_IPV6</td>
<td>The network application needs IPv6 support to function properly. This option makes sure the network application is initialized properly in order to use IPv6. If CONFIG_NET_IPV6 is not enabled, then setting this option will automatically enable IPv6.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_NEED_IPV6_ROUTER</td>
<td>If IPv6 is enabled, then this option tells that the network application needs IPv6 router to exists before continuing. This means in practice that the application wants to wait until it receives IPv6 router advertisement message before continuing.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_BT_NODE</td>
<td>Enables application to operate in Bluetooth node mode which requires GATT service to be registered and start advertising as peripheral.</td>
</tr>
</tbody>
</table>
group net_config
Network configuration library.

Defines

NET_CONFIG_NEED_ROUTER
Application needs routers to be set so that connectivity to remote network is possible.
For IPv6 networks, this means that the device should receive IPv6 router advertisement message before continuing.

NET_CONFIG_NEED_IPV6
Application needs IPv6 subsystem configured and initialized.
Typically this means that the device has IPv6 address set.

NET_CONFIG_NEED_IPV4
Application needs IPv4 subsystem configured and initialized.
Typically this means that the device has IPv4 address set.

Functions

int net_config_init(const char *app_info, uint32_t flags, int32_t timeout)
Initialize this network application.
This will call net_config_init_by_iface() with NULL network interface.

Parameters
• app_info – String describing this application.
• flags – Flags related to services needed by the client.
• timeout – How long to wait the network setup before continuing the startup.

Returns
0 if ok, <0 if error.

int net_config_init_by_iface(struct net_if *iface, const char *app_info, uint32_t flags, int32_t timeout)
Initialize this network application using a specific network interface.
If network interface is set to NULL, then the default one is used in the configuration.

Parameters
• iface – Initialize networking using this network interface.
• app_info – String describing this application.
• flags – Flags related to services needed by the client.
• timeout – How long to wait the network setup before continuing the startup.

Returns
0 if ok, <0 if error.
int net_config_init_app(const struct device *dev, const char *app_info)
Initialize this network application.

If CONFIG_NET_CONFIG_AUTO_INIT is set, then this function is called automatically when the device boots. If that is not desired, unset the config option and call the function manually when the application starts.

Parameters
- dev – Network device to use. The function will figure out what network interface to use based on the device. If the device is NULL, then default network interface is used by the function.
- app_info – String describing this application.

Returns
0 if ok, <0 if error.

DHCPv4

Overview
The Dynamic Host Configuration Protocol (DHCP) is a network management protocol used on IPv4 networks. A DHCPv4 server dynamically assigns an IPv4 address and other network configuration parameters to each device on a network so they can communicate with other IP networks. See this DHCP Wikipedia article for a detailed overview of how DHCP works.

Note that Zephyr only supports DHCP client functionality.

Sample usage
See dhcpv4-client sample application for details.

API Reference
Related code samples

DHCPv4 client
Start a DHCPv4 client to obtain an IPv4 address from a DHCPv4 server.

group dhcpv4
DHCPv4.

 Enums

enum net_dhcpv4_msg_type
DHCPv4 message types.
These enumerations represent RFC2131 defined msg type codes, hence they should not be renumbered.
Additions, removal and reorders in this definition must be reflected within corresponding changes to net_dhcpv4_msg_type_name.
Values:

enumerator NET_DHCPV4_MSG_TYPE_DISCOVER = 1
enumerator NET_DHCPV4_MSG_TYPE_OFFER = 2
enumerator NET_DHCPV4_MSG_TYPE_REQUEST = 3
enumerator NET_DHCPV4_MSG_TYPE_decline = 4
enumerator NET_DHCPV4_MSG_TYPE_ACK = 5
enumerator NET_DHCPV4_MSG_TYPE_NAK = 6
enumerator NET_DHCPV4_MSG_TYPE_RELEASE = 7
enumerator NET_DHCPV4_MSG_TYPE_INFORM = 8

Functions

void net_dhcpv4_start(struct net_if *iface)
Start DHCPv4 client on an iface.
Start DHCPv4 client on a given interface. DHCPv4 client will start negotiation for IPv4 address. Once the negotiation is success IPv4 address details will be added to interface.

Parameters
  • iface – A valid pointer on an interface

void net_dhcpv4_stop(struct net_if *iface)
Stop DHCPv4 client on an iface.
Stop DHCPv4 client on a given interface. DHCPv4 client will remove all configuration obtained from a DHCP server from the interface and stop any further negotiation with the server.

Parameters
  • iface – A valid pointer on an interface

void net_dhcpv4_restart(struct net_if *iface)
Restart DHCPv4 client on an iface.
Restart DHCPv4 client on a given interface. DHCPv4 client will restart the state machine without any of the initial delays used in start.

Parameters
  • iface – A valid pointer on an interface

const char *net_dhcpv4_msg_type_name(enum net_dhcpv4_msg_type msg_type)
Return a text representation of the msg_type.

Parameters
  • msg_type – The msg_type to be converted to text

Returns
  A text representation of msg_type
Hostname Configuration

Overview

A networked device might need a hostname, for example, if the device is configured to be a mDNS responder (see DNS Resolve for details) and needs to respond to `<hostname>.local` DNS queries.

The CONFIG_NET_HOSTNAME_ENABLE must be set in order to store the hostname and enable the relevant APIs. If the option is enabled, then the default hostname is set to be `zephyr` by CONFIG_NET_HOSTNAME option.

If the same firmware image is used to flash multiple boards, then it is not practical to use the same hostname in all of the boards. In that case, one can enable CONFIG_NET_HOSTNAME_UNIQUE which will add a unique postfix to the hostname. By default the link local address of the first network interface is used as a postfix. In Ethernet networks, the link local address refers to MAC address. For example, if the link local address is `01:02:03:04:05:06`, then the unique hostname could be `zephyr010203040506`. If you want to set the prefix yourself, then call net_hostname_set_postfix() before the network interfaces are created. For example for the Ethernet networks, the initialization priority is set by CONFIG_ETH_INIT_PRIORITY so you would need to set the postfix before that. The postfix can be set only once.

API Reference

**group net_hostname**

Network hostname configuration library.

**Defines**

NET_HOSTNAME_MAX_LEN

NET_HOSTNAME_SIZE

**Functions**

**static inline const char *net_hostname_get(void)**

  Get the device hostname.
  
  Return pointer to device hostname.

  **Returns**
  
  Pointer to hostname or NULL if not set.

**static inline int net_hostname_set(char *host, size_t len)**

  Set the device hostname.

  **Parameters**
  
  - **host** – new hostname as char array.
  - **len** – Length of the hostname array.

  **Returns**
  
  0 if ok, <0 on error
static inline void net_hostname_init(void)
    Initialize and set the device hostname.

static inline int net_hostname_set_postfix(const uint8_t *hostname_postfix, int
    postfix_len)
    Set the device hostname postfix.
    Set the device hostname to some value. This is only used if CONFIG_NET_HOSTNAME_UNIQUE is set.

Parameters
    • hostname_postfix – Usually link address. The function will convert this to a string.
    • postfix_len – Length of the hostname_postfix array.

Returns
    0 if ok, <0 if error

Network Core Helpers

Overview
    The network subsystem contains two functions for sending and receiving data from the network. The net_recv_data() is typically used by network device driver when the received network data needs to be pushed up in the network stack for further processing. All the data is received via a network interface which is typically created by the device driver.

    For sending, the net_send_data() can be used. Typically applications do not call this function directly as there is the BSD Sockets API for sending and receiving network data.

API Reference

Related code samples

Telnet console
    Access Zephyr shell over telnet.

mDNS responder
    Listen and respond to mDNS queries.

group net_core
    Network core library.

Enums

enum net_verdict
    Net Verdict.
    Values:
enumerator NET_OK
Packet has been taken care of.

enumerator NET_CONTINUE
Packet has not been touched, other part should decide about its fate.

enumerator NET_DROP
Packet must be dropped.

Functions

int net_recv_data(struct net_if *iface, struct net_pkt *pkt)
Called by lower network stack or network device driver when a network packet has been received.

The function will push the packet up in the network stack for further processing.

Parameters
• iface – Network interface where the packet was received.
• pkt – Network packet data.

Returns
0 if ok, <0 if error.

int net_send_data(struct net_pkt *pkt)
Send data to network.

Send data to network. This should not be used normally by applications as it requires that the network packet is properly constructed.

Parameters
• pkt – Network packet.

Returns
0 if ok, <0 if error. If <0 is returned, then the caller needs to unref the pkt in order to avoid memory leak.

Network Interface

• Overview
• Network interface state management
• API Reference

Overview  The network interface is a nexus that ties the network device drivers and the upper part of the network stack together. All the sent and received data is transferred via a network interface. The network interfaces cannot be created at runtime. A special linker section will contain information about them and that section is populated at linking time.

Network interfaces are created by NET_DEVICE_INIT() macro. For Ethernet network, a macro called ETH_NET_DEVICE_INIT() should be used instead as it will create VLAN interfaces automatically if CONFIG_NET_VLAN is enabled. These macros are typically used in network device driver source code.
The network interface can be turned ON by calling `net_if_up()` and OFF by calling `net_if_down()`. When the device is powered ON, the network interface is also turned ON by default.

The network interfaces can be referenced either by a `struct net_if *` pointer or by a network interface index. The network interface can be resolved from its index by calling `net_if_get_by_index()` and from interface pointer by calling `net_if_get_by_iface()`.

The IP address for network devices must be set for them to be connectable. In a typical dynamic network environment, IP addresses are set automatically by DHCPv4, for example. If needed though, the application can set a device's IP address manually. See the API documentation below for functions such as `net_if_ipv4_addr_add()` that do that.

The default interface is returned by `net_if_get_default()`. What this default interface means can be configured via options like `CONFIG_NET_DEFAULT_IF_FIRST` and `CONFIG_NET_DEFAULT_IF_ETHERNET`. See Kconfig file `subsys/net/ip/Kconfig` for what options are available for selecting the default network interface.

The transmitted and received network packets can be classified via a network packet priority. This is typically done in Ethernet networks when virtual LANs (VLANs) are used. Higher priority packets can be sent or received earlier than lower priority packets. The traffic class setup can be configured by `CONFIG_NET_TC_TX_COUNT` and `CONFIG_NET_TC_RX_COUNT` options.

If the `CONFIG_NET_PROMISCUOUS_MODE` is enabled and if the underlying network technology supports promiscuous mode, then it is possible to receive all the network packets that the network device driver is able to receive. See Promiscuous Mode API for more details.

**Network interface state management**  Zephyr distinguishes between two interface states: administrative state and operational state, as described in RFC 2863. The administrative state indicates whether an interface is turned ON or OFF. This state is represented by `NET_IF_UP` flag and is controlled by the application. It can be changed by calling `net_if_up()` or `net_if_down()` functions. Network drivers or L2 implementations should not change administrative state on their own.

Bringing an interface up however not always means that the interface is ready to transmit packets. Because of that, operational state, which represents the internal interface status, was implemented. The operational state is updated whenever one of the following conditions take place:

- The interface is brought up/down by the application (administrative state changes).
- The interface is notified by the driver/L2 that PHY status has changed.
- The interface is notified by the driver/L2 that it joined/left a network.

The PHY status is represented with `NET_IF_LOWER_UP` flag and can be changed with `net_if_carrier_on()` and `net_if_carrier_off()`. By default, the flag is set on a newly initialized interface. An example of an event that changes the carrier state is Ethernet cable being plugged in or out.

The network association status is represented with `NET_IF_DORMANT` flag and can be changed with `net_if_dormant_on()` and `net_if_dormant_off()`. By default, the flag is cleared on a newly initialized interface. An example of an event that changes the dormant state is a Wi-Fi driver successfully connecting to an access point. In this scenario, driver should set the dormant state to ON during initialization, and once it detects that it connected to a Wi-Fi network, the dormant state should be set to OFF.

The operational state of an interface is updated as follows:

- `!net_if_is_admin_up()`  Interface is in `NET_IF_OPER_DOWN`.
- `net_if_is_admin_up() && !net_if_is_carrier_ok()`
Interface is in `NET_IF_OPER_DOWN` or `NET_IF_OPER_LOWERLAYERDOWN` if the interface is stacked (virtual).

- `net_if_is_admin_up() && net_if_is_carrier_ok() && net_if_is_dormant()`
  
  Interface is in `NET_IF_OPER_DORMANT`.

- `net_if_is_admin_up() && net_if_is_carrier_ok() && !net_if_is_dormant()`
  
  Interface is in `NET_IF_OPER_UP`.

Only after an interface enters `NET_IF_OPER_UP` state the `NET_IF_RUNNING` flag is set on the interface indicating that the interface is ready to be used by the application.

### API Reference

#### Related code samples

**IPv4 autoconf client**

Perform IPv4 autoconfiguration and self-assign a random IPv4 address.

**Network management socket**

Listen to network management events using a network management socket.

**Telnet console**

Access Zephyr shell over telnet.

**Virtual LAN**

Setup two virtual LAN networks and use net-shell to view the networks' settings.

---

*group net_if*

Network Interface abstraction layer.

**Defines**

`NET_DEVICE_INIT(dev_id, name, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)`

Create a network interface and bind it to network device.

**Parameters**

- `dev_id` – Network device id.
- `name` – The name this instance of the driver exposes to the system.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct `pm_device` associated with the device. (optional).
- `data` – Pointer to the device's private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `l2` – Network L2 layer for this network interface.
- `l2_ctx_type` – Type of L2 context data.
- `mtu` – Maximum transfer unit in bytes for this network interface.
NET_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)

Like NET_DEVICE_INIT but taking metadata from a devicetree node.

Create a network interface and bind it to network device.

Parameters

- `node_id` – The devicetree node identifier.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct `pm_device` associated with the device. (optional).
- `data` – Pointer to the device's private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `l2` – Network L2 layer for this network interface.
- `l2_ctx_type` – Type of L2 context data.
- `mtu` – Maximum transfer unit in bytes for this network interface.

NET_DEVICE_DT_INST_DEFINE(inst, ...)

Like NET_DEVICE_DT_DEFINE for an instance of a DT_DRV_COMPAT compatible.

Parameters

- `inst` – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to NET_DEVICE_DT_DEFINE.
- `...` – other parameters as expected by NET_DEVICE_DT_DEFINE.

NET_DEVICE_INIT_INSTANCE(dev_id, name, instance, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)

Create multiple network interfaces and bind them to network device.

If your network device needs more than one instance of a network interface, use this macro below and provide a different instance suffix each time (0, 1, 2, ... or a, b, c ... whatever works for you)

Parameters

- `dev_id` – Network device id.
- `name` – The name this instance of the driver exposes to the system.
- `instance` – Instance identifier.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct `pm_device` associated with the device. (optional).
- `data` – Pointer to the device's private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `l2` – Network L2 layer for this network interface.
- `l2_ctx_type` – Type of L2 context data.
• **mtu** – Maximum transfer unit in bytes for this network interface.

```c
NET_DEVICE_DT_DEFINE_INSTANCE(node_id, instance, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)
```

Like `NET_DEVICE_OFFLOAD_INIT` but taking metadata from a devicetree.

Create multiple network interfaces and bind them to network device. If your network device needs more than one instance of a network interface, use this macro below and provide a different instance suffix each time (0, 1, 2, ... or a, b, c ... whatever works for you)

**Parameters**
- **node_id** – The devicetree node identifier.
- **instance** – Instance identifier.
- **init_fn** – Address to the init function of the driver.
- **pm** – Reference to struct `pm_device` associated with the device. (optional).
- **data** – Pointer to the device's private data.
- **config** – The address to the structure containing the configuration information for this instance of the driver.
- **prio** – The initialization level at which configuration occurs.
- **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- **l2** – Network L2 layer for this network interface.
- **l2_ctx_type** – Type of L2 context data.
- **mtu** – Maximum transfer unit in bytes for this network interface.

```c
NET_DEVICE_DT_INST_DEFINE_INSTANCE(inst, ...)
```

Like `NET_DEVICE_DT_DEFINE_INSTANCE` for an instance of a DT_DRV_COMPAT compatible.

**Parameters**
- **inst** – Instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to `NET_DEVICE_DT_DEFINE_INSTANCE`.
- **...** – other parameters as expected by `NET_DEVICE_DT_DEFINE_INSTANCE`.

```c
NET_DEVICE_OFFLOAD_INIT(dev_id, name, init_fn, pm, data, config, prio, api, mtu)
```

Create a offloaded network interface and bind it to network device.

The offloaded network interface is implemented by a device vendor HAL or similar.

**Parameters**
- **dev_id** – Network device id.
- **name** – The name this instance of the driver exposes to the system.
- **init_fn** – Address to the init function of the driver.
- **pm** – Reference to struct `pm_device` associated with the device. (optional).
- **data** – Pointer to the device's private data.
- **config** – The address to the structure containing the configuration information for this instance of the driver.
- **prio** – The initialization level at which configuration occurs.
• **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• **mtu** – Maximum transfer unit in bytes for this network interface.

**NET_DEVICE_DT_OFFLOAD_DEFINE**(node_id, init_fn, pm, data, config, prio, api, mtu)
Like **NET_DEVICE_OFFLOAD_INIT** but taking metadata from a devicetree node.
Create a offloaded network interface and bind it to network device. The offloaded network interface is implemented by a device vendor HAL or similar.

**Parameters**
- **node_id** – The devicetree node identifier.
- **init_fn** – Address to the init function of the driver.
- **pm** – Reference to struct **pm_device** associated with the device. (optional).
- **data** – Pointer to the device's private data.
- **config** – The address to the structure containing the configuration information for this instance of the driver.
- **prio** – The initialization level at which configuration occurs.
- **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- **mtu** – Maximum transfer unit in bytes for this network interface.

**NET_DEVICE_DT_INST_OFFLOAD_DEFINE**(inst, ...)
Like **NET_DEVICE_DT_OFFLOAD_DEFINE** for an instance of a DT_DRV_COMPAT compatible.

**Parameters**
- **inst** – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to **NET_DEVICE_DT_OFFLOAD_DEFINE**.
- **...** – other parameters as expected by **NET_DEVICE_DT_OFFLOAD_DEFINE**.

**NET_IFACE_COUNT**(_dst)
Count the number of network interfaces.

**Parameters**
- **_dst** – [out] Pointer to location where result is written.

**Typedefs**

typedef int (*net_socket_create_t)(int, int, int)
A function prototype to create an offloaded socket.
The prototype is compatible with **socket()** function.

typedef void (*net_if_ip_addr_cb_t)(struct net_if *iface, struct net_if_addr *addr, void *user_data)
Callback used while iterating over network interface IP addresses.

**Param iface**
Pointer to the network interface the address belongs to

**Param addr**
Pointer to current IP address

6.3. Networking
**Param user_data**
A valid pointer to user data or NULL

typedef void (*net_if_mcast_callback_t)(struct net_if *iface, const struct net_addr *addr, bool is_joined)
Defining a callback that is called whenever an IPv6 or IPv4 multicast address group is joined or left.

**Param iface**
A pointer to a struct net_if to which the multicast address is attached.

**Param addr**
IP multicast address.

**Param is_joined**
True if the multicast group is joined, false if group is left.

typedef void (*net_if_link_callback_t)(struct net_if *iface, struct net_linkaddr *dst, int status)
Define callback that is called after a network packet has been sent.

**Param iface**
A pointer to a struct net_if to which the net_pkt was sent to.

**Param dst**
Link layer address of the destination where the network packet was sent.

**Param status**
Send status, 0 is ok, < 0 error.

typedef void (*net_if_cb_t)(struct net_if *iface, void *user_data)
Callback used while iterating over network interfaces.

**Param iface**
Pointer to current network interface

**Param user_data**
A valid pointer to user data or NULL

**Enums**

enum net_if_flag
Network interface flags.

*Values:*

enumeration NET_IF_UP
Interface is admin up.

enumeration NET_IF_POINTOPOINT
Interface is pointto point.

enumeration NET_IF_PROMISC
Interface is in promiscuous mode.
enumerator **NET_IF_NO_AUTO_START**
Do not start the interface immediately after initialization.
This requires that either the device driver or some other entity will need to manually take the interface up when needed. For example for Ethernet this will happen when the driver calls the *net_eth_carrier_on()* function.

enumerator **NET_IF_SUSPENDED**
Power management specific: interface is being suspended.

enumerator **NET_IF_FORWARD_MULTICASTS**
Flag defines if received multicasts of other interface are forwarded on this interface.
This activates multicast routing / forwarding for this interface.

enumerator **NET_IF_IPV4**
Interface supports IPv4.

denumerator **NET_IF_IPV6**
Interface supports IPv6.

denumerator **NET_IF_RUNNING**
Interface up and running (ready to receive and transmit).

denumerator **NET_IF_LOWER_UP**
Driver signals L1 is up.

denumerator **NET_IF_DORMANT**
Driver signals dormant.

denumerator **NET_IF_IPV6_NO_ND**
IPv6 Neighbor Discovery disabled.

denumerator **NET_IF_IPV6_NO_MLD**
IPv6 Multicast Listener Discovery disabled.

denumerator **NET_IF_NO_TX_LOCK**
Mutex locking on TX data path disabled on the interface.

enum **net_if_oper_state**
Network interface operational status (RFC 2863).
*Values:*

enumerator **NET_IF_OPER_UNKNOWN**

enumerator **NET_IF_OPER_NOTPRESENT**

enumerator **NET_IF_OPER_DOWN**
enumerator NET_IF_OPER_LOWERLAYERDOWN
enumerator NET_IF_OPER_TESTING
enumerator NET_IF_OPER_DORMANT
enumerator NET_IF_OPER_UP

Functions

static inline void net_if_lock(struct net_if *iface)
static inline void net_if_unlock(struct net_if *iface)
static inline bool net_if_flag_is_set(struct net_if *iface, enum net_if_flag value)
  Check if a value in network interface flags is set.
  Parameters
  • iface – Pointer to network interface
  • value – Flag value
  Returns
  True if the value is set, false otherwise
static inline void net_if_tx_lock(struct net_if *iface)
static inline void net_if_tx_unlock(struct net_if *iface)
static inline void net_if_flag_set(struct net_if *iface, enum net_if_flag value)
  Set a value in network interface flags.
  Parameters
  • iface – Pointer to network interface
  • value – Flag value
static inline bool net_if_flag_test_and_set(struct net_if *iface, enum net_if_flag value)
  Test and set a value in network interface flags.
  Parameters
  • iface – Pointer to network interface
  • value – Flag value
  Returns
  true if the bit was set, false if it wasn't.
static inline void net_if_flag_clear(struct net_if *iface, enum net_if_flag value)
  Clear a value in network interface flags.
  Parameters
  • iface – Pointer to network interface
  • value – Flag value
static inline bool net_if_flag_test_and_clear(struct net_if *iface, enum net_if_flag value)

Test and clear a value in network interface flags.

Parameters
• iface – Pointer to network interface
• value – Flag value

Returns
true if the bit was set, false if it wasn’t.

static inline enum net_if_oper_state net_if_oper_state_set(struct net_if *iface, enum net_if_oper_state oper_state)

Set an operational state on an interface.

Parameters
• iface – Pointer to network interface
• oper_state – Operational state to set

Returns
The new operational state of an interface

static inline enum net_if_oper_state net_if_oper_state(struct net_if *iface)

Get an operational state of an interface.

Parameters
• iface – Pointer to network interface

Returns
Operational state of an interface

enum net_verdict net_if_send_data(struct net_if *iface, struct net_pkt *pkt)

Send a packet through a net iface.

return verdict about the packet

Parameters
• iface – Pointer to a network interface structure
• pkt – Pointer to a net packet to send

static inline const struct net_l2 *net_if_l2(struct net_if *iface)

Get a pointer to the interface L2.

Parameters
• iface – a valid pointer to a network interface structure

Returns
a pointer to the iface L2

enum net_verdict net_if_recv_data(struct net_if *iface, struct net_pkt *pkt)

Input a packet through a net iface.

Parameters
• iface – Pointer to a network interface structure
• pkt – Pointer to a net packet to input

Returns
verdict about the packet
static inline void *net_if_l2_data(struct net_if *iface)

Get a pointer to the interface L2 private data.

Parameters

• iface – a valid pointer to a network interface structure

Returns

a pointer to the iface L2 data

static inline const struct device *net_if_get_device(struct net_if *iface)

Get an network interface's device.

Parameters

• iface – Pointer to a network interface structure

Returns

a pointer to the device driver instance

void net_if_queue_tx(struct net_if *iface, struct net_pkt *pkt)

Queue a packet to the net interface TX queue.

Parameters

• iface – Pointer to a network interface structure

• pkt – Pointer to a net packet to queue

static inline bool net_if_is_ip_offloaded(struct net_if *iface)

Return the IP offload status.

Parameters

• iface – Network interface

Returns

True if IP offloading is active, false otherwise.

bool net_if_is_offloaded(struct net_if *iface)

Return offload status of a given network interface.

Parameters

• iface – Network interface

Returns

True if IP or socket offloading is active, false otherwise.

static inline struct net_offload *net_if_offload(struct net_if *iface)

Return the IP offload plugin.

Parameters

• iface – Network interface

Returns

NULL if there is no offload plugin defined, valid pointer otherwise

static inline bool net_if_is_socket_offloaded(struct net_if *iface)

Return the socket offload status.

Parameters

• iface – Network interface

Returns

True if socket offloading is active, false otherwise.
static inline void net_if_socket_offload_set(struct net_if *iface, net_socket_create_t socket_offload)

Set the function to create an offloaded socket.

Parameters
- iface – Network interface
- socket_offload – A function to create an offloaded socket

static inline net_socket_create_t net_if_socket_offload(struct net_if *iface)

Return the function to create an offloaded socket.

Parameters
- iface – Network interface

Returns
- NULL if the interface is not socket offloaded, valid pointer otherwise

static inline struct net_linkaddr *net_if_get_link_addr(struct net_if *iface)

Get an network interface's link address.

Parameters
- iface – Pointer to a network interface structure

Returns
- a pointer to the network link address

static inline struct net_if_config *net_if_get_config(struct net_if *iface)

Return network configuration for this network interface.

Parameters
- iface – Pointer to a network interface structure

Returns
- Pointer to configuration

static inline void net_if_start_dad(struct net_if *iface)

Start duplicate address detection procedure.

Parameters
- iface – Pointer to a network interface structure

void net_if_start_rs(struct net_if *iface)

Start neighbor discovery and send router solicitation message.

Parameters
- iface – Pointer to a network interface structure

static inline void net_if_stop_rs(struct net_if *iface)

Stop neighbor discovery.

Parameters
- iface – Pointer to a network interface structure

static inline int net_if_set_link_addr(struct net_if *iface, uint8_t *addr, uint8_t len, enum net_link_type type)

Set a network interface's link address.

Parameters
- iface – Pointer to a network interface structure
• `addr` – A pointer to a uint8_t buffer representing the address. The buffer
  must remain valid throughout interface lifetime.
• `len` – length of the address buffer
• `type` – network bearer type of this link address

**Returns**
0 on success

```c
static inline uint16_t net_if_get_mtu(struct net_if *iface)
```
Get an network interface’s MTU.

**Parameters**
• `iface` – Pointer to a network interface structure

**Returns**
the MTU

```c
static inline void net_if_set_mtu(struct net_if *iface, uint16_t mtu)
```
Set an network interface’s MTU.

**Parameters**
• `iface` – Pointer to a network interface structure
• `mtu` – New MTU, note that we store only 16 bit mtu value.

```c
static inline void net_if_addr_set_lf(struct net_if_addr *ifaddr, bool is_infinite)
```
Set the infinite status of the network interface address.

**Parameters**
• `ifaddr` – IP address for network interface
• `is_infinite` – Infinite status

```c
struct net_if *net_if_get_by_link_addr(struct net_linkaddr *ll_addr)
```
Get an interface according to link layer address.

**Parameters**
• `ll_addr` – Link layer address.

**Returns**
Network interface or NULL if not found.

```c
struct net_if *net_if_lookup_by_dev(const struct device *dev)
```
Find an interface from it’s related device.

**Parameters**
• `dev` – A valid struct device pointer to relate with an interface

**Returns**
a valid struct `net_if` pointer on success, NULL otherwise

```c
static inline struct net_if_config *net_if_config_get(struct net_if *iface)
```
Get network interface IP config.

**Parameters**
• `iface` – Interface to use.

**Returns**
NULL if not found or pointer to correct config settings.
void net_if_router_rm(struct net_if_router *router)
    Remove a router from the system.

Parameters
    • router – Pointer to existing router

void net_if_set_default(struct net_if *iface)
    Set the default network interface.

Parameters
    • iface – New default interface, or NULL to revert to the one set by Kconfig.

struct net_if *net_if_get_default(void)
    Get the default network interface.

Returns
    Default interface or NULL if no interfaces are configured.

struct net_if *net_if_get_first_by_type(const struct net_l2 *l2)
    Get the first network interface according to its type.

Parameters
    • l2 – Layer 2 type of the network interface.

Returns
    First network interface of a given type or NULL if no such interfaces was found.

struct net_if *net_if_get_first_up(void)
    Get the first network interface which is up.

Returns
    First network interface which is up or NULL if all interfaces are down.

int net_if_config_ipv6_get(struct net_if *iface, struct net_if_ipv6 **ipv6)
    Allocate network interface IPv6 config.
    This function will allocate new IPv6 config.

Parameters
    • iface – Interface to use.
    • ipv6 – Pointer to allocated IPv6 struct is returned to caller.

Returns
    0 if ok, <0 if error

int net_if_config_ipv6_put(struct net_if *iface)
    Release network interface IPv6 config.

Parameters
    • iface – Interface to use.

Returns
    0 if ok, <0 if error

struct net_if_addr *net_if_ipv6_addr_lookup(const struct in6_addr *addr, struct net_if **iface)
    Check if this IPv6 address belongs to one of the interfaces.

Parameters
    • addr – IPv6 address
    • iface – Pointer to interface is returned
Returns
Pointer to interface address, NULL if not found.

struct net_if_addr *net_if_ipv6_addr_lookup_by_iface(struct net_if *iface, struct in6_addr *addr)

Check if this IPv6 address belongs to this specific interfaces.

Parameters
• iface – Network interface
• addr – IPv6 address

Returns
Pointer to interface address, NULL if not found.

int net_if_ipv6_addr_lookup_by_index(const struct in6_addr *addr)

Check if this IPv6 address belongs to one of the interface indices.

Parameters
• addr – IPv6 address

Returns
>0 if address was found in given network interface index, all other values mean address was not found

struct net_if_addr *net_if_ipv6_addr_add(struct net_if *iface, struct in6_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)

Add a IPv6 address to an interface.

Parameters
• iface – Network interface
• addr – IPv6 address
• addr_type – IPv6 address type
• vlifetime – Validity time for this address

Returns
Pointer to interface address, NULL if cannot be added

bool net_if_ipv6_addr_add_by_index(int index, struct in6_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)

Add a IPv6 address to an interface by index.

Parameters
• index – Network interface index
• addr – IPv6 address
• addr_type – IPv6 address type
• vlifetime – Validity time for this address

Returns
True if ok, false if address could not be added

void net_if_ipv6_addr_update_lifetime(struct net_if_addr *ifaddr, uint32_t vlifetime)

Update validity lifetime time of an IPv6 address.

Parameters
• ifaddr – Network IPv6 address
• vlifetime – Validity time for this address
bool net_if_ipv6_addr_rm(struct net_if *iface, const struct in6_addr *addr)
Remove an IPv6 address from an interface.

Parameters
- iface – Network interface
- addr – IPv6 address

Returns
True if successfully removed, false otherwise

bool net_if_ipv6_addr_rm_by_index(int index, const struct in6_addr *addr)
Remove an IPv6 address from an interface by index.

Parameters
- index – Network interface index
- addr – IPv6 address

Returns
True if successfully removed, false otherwise

void net_if_ipv6_addr_foreach(struct net_if *iface, net_if_ip_addr_cb_t cb, void *user_data)
Go through all IPv6 addresses on a network interface and call callback for each used address.

Parameters
- iface – Pointer to the network interface
- cb – User-supplied callback function to call
- user_data – User specified data

struct net_if_mcast_addr *net_if_ipv6_maddr_add(struct net_if *iface, const struct in6_addr *addr)
Add a IPv6 multicast address to an interface.

Parameters
- iface – Network interface
- addr – IPv6 multicast address

Returns
Pointer to interface multicast address, NULL if cannot be added

bool net_if_ipv6_maddr_rm(struct net_if *iface, const struct in6_addr *addr)
Remove an IPv6 multicast address from an interface.

Parameters
- iface – Network interface
- addr – IPv6 multicast address

Returns
True if successfully removed, false otherwise

struct net_if_mcast_addr *net_if_ipv6_maddr_lookup(const struct in6_addr *addr, struct net_if **iface)
Check if this IPv6 multicast address belongs to a specific interface or one of the interfaces.

Parameters
- addr – IPv6 address
• **iface** – If *iface is null, then pointer to interface is returned, otherwise the *iface value needs to be matched.

**Returns**

Pointer to interface multicast address, NULL if not found.

`void net_if_mcast_mon_register(struct net_if_mcast_monitor *mon, struct net_if *iface, net_if_mcast_callback_t cb)`

Register a multicast monitor.

**Parameters**

- **mon** – Monitor handle. This is a pointer to a monitor storage structure which should be allocated by caller, but does not need to be initialized.
- **iface** – Network interface
- **cb** – Monitor callback

`void net_if_mcast_mon_unregister(struct net_if_mcast_monitor *mon)`

Unregister a multicast monitor.

**Parameters**

- **mon** – Monitor handle

`void net_if_mcast_mon(struct net_if *iface, const struct net_addr *addr, bool is_joined)`

Call registered multicast monitors.

**Parameters**

- **iface** – Network interface
- **addr** – Multicast address
- **is_joined** – Is this multicast address group joined (true) or not (false)

`void net_if_ipv6_maddr_join(struct net_if *iface, struct net_if_mcast_addr *addr)`

Mark a given multicast address to be joined.

**Parameters**

- **iface** – Network interface the address belongs to
- **addr** – IPv6 multicast address

`static inline bool net_if_ipv6_maddr_is_joined(struct net_if_mcast_addr *addr)`

Check if given multicast address is joined or not.

**Parameters**

- **addr** – IPv6 multicast address

**Returns**

True if address is joined, False otherwise.

`void net_if_ipv6_maddr_leave(struct net_if *iface, struct net_if_mcast_addr *addr)`

Mark a given multicast address to be left.

**Parameters**

- **iface** – Network interface the address belongs to
- **addr** – IPv6 multicast address

`struct net_if_ipv6_prefix *net_if_ipv6_prefix_get(struct net_if *iface, struct in6_addr *addr)`

Return prefix that corresponds to this IPv6 address.
Parameters

• iface – Network interface
• addr – IPv6 address

Returns

Pointer to prefix, NULL if not found.

struct net_if_ipv6_prefix *net_if_ipv6_prefix_lookup(struct net_if *iface, struct in6_addr *addr, uint8_t len)

Check if this IPv6 prefix belongs to this interface.

Parameters

• iface – Network interface
• addr – IPv6 address
• len – Prefix length

Returns

Pointer to prefix, NULL if not found.

struct net_if_ipv6_prefix *net_if_ipv6_prefix_add(struct net_if *iface, struct in6_addr *prefix, uint8_t len, uint32_t lifetime)

Add a IPv6 prefix to an network interface.

Parameters

• iface – Network interface
• prefix – IPv6 address
• len – Prefix length
• lifetime – Prefix lifetime in seconds

Returns

Pointer to prefix, NULL if the prefix was not added.

bool net_if_ipv6_prefix_rm(struct net_if *iface, struct in6_addr *addr, uint8_t len)

Remove an IPv6 prefix from an interface.

Parameters

• iface – Network interface
• addr – IPv6 prefix address
• len – Prefix length

Returns

True if successfully removed, false otherwise

static inline void net_if_ipv6_prefix_set_lf(struct net_if_ipv6_prefix *prefix, bool is_infinite)

Set the infinite status of the prefix.

Parameters

• prefix – IPv6 address
• is_infinite – Infinite status

void net_if_ipv6_prefix_set_timer(struct net_if_ipv6_prefix *prefix, uint32_t lifetime)

Set the prefix lifetime timer.

Parameters

• prefix – IPv6 address
• lifetime – Prefix lifetime in seconds

void net_if_ipv6_prefix_unset_timer(struct net_if_ipv6_prefix *prefix)
Unset the prefix lifetime timer.

Parameters
• prefix – IPv6 address

bool net_if_ipv6_addr_onlink(struct net_if **iface, struct in6_addr *addr)
Check if this IPv6 address is part of the subnet of our network interface.

Parameters
• iface – Network interface. This is returned to the caller. The iface can be NULL in which case we check all the interfaces.
• addr – IPv6 address

Returns
True if address is part of our subnet, false otherwise

static inline struct in6_addr *net_if_router_ipv6(struct net_if_router *router)
Get the IPv6 address of the given router.

Parameters
• router – a network router

Returns
pointer to the IPv6 address, or NULL if none

struct net_if_router *net_if_ipv6_router_lookup(struct net_if *iface, struct in6_addr *addr)
Check if IPv6 address is one of the routers configured in the system.

Parameters
• iface – Network interface
• addr – IPv6 address

Returns
Pointer to router information, NULL if cannot be found

struct net_if_router *net_if_ipv6_router_find_default(struct net_if *iface, struct in6_addr *addr)
Find default router for this IPv6 address.

Parameters
• iface – Network interface. This can be NULL in which case we go through all the network interfaces to find a suitable router.
• addr – IPv6 address

Returns
Pointer to router information, NULL if cannot be found

void net_if_ipv6_router_update_lifetime(struct net_if_router *router, uint16_t lifetime)
Update validity lifetime time of a router.

Parameters
• router – Network IPv6 address
• lifetime – Lifetime of this router.
Add IPv6 router to the system.

**Parameters**
- `iface` – Network interface
- `addr` – IPv6 address
- `router_lifetime` – Lifetime of the router

**Returns**
Pointer to router information, NULL if could not be added

Remove IPv6 router from the system.

**Parameters**
- `router` – Router information.

**Returns**
True if successfully removed, false otherwise

Get IPv6 hop limit specified for a given interface.

This is the default value but can be overridden by the user.

**Parameters**
- `iface` – Network interface

**Returns**
Hop limit

Set the default IPv6 hop limit of a given interface.

**Parameters**
- `iface` – Network interface
- `hop_limit` – New hop limit

Get IPv6 multicast hop limit specified for a given interface.

This is the default value but can be overridden by the user.

**Parameters**
- `iface` – Network interface

**Returns**
Hop limit

Set the default IPv6 multicast hop limit of a given interface.

**Parameters**
- `iface` – Network interface
- `hop_limit` – New hop limit
static inline void net_if_ipv6_set_base_reachable_time(struct net_if *iface, uint32_t reachable_time)

Set IPv6 reachable time for a given interface.

**Parameters**
- **iface** – Network interface
- **reachable_time** – New reachable time

static inline uint32_t net_if_ipv6_get_reachable_time(struct net_if *iface)

Get IPv6 reachable timeout specified for a given interface.

**Parameters**
- **iface** – Network interface

**Returns**
Reachable timeout

uint32_t net_if_ipv6_calc_reachable_time(struct net_ifIpv6 *ipv6)

Calculate next reachable time value for IPv6 reachable time.

**Parameters**
- **ipv6** – IPv6 address configuration

**Returns**
Reachable time

static inline void net_if_ipv6_set_reachable_time(struct net_ifIpv6 *ipv6)

Set IPv6 reachable time for a given interface.

This requires that base reachable time is set for the interface.

**Parameters**
- **ipv6** – IPv6 address configuration

static inline void net_if_ipv6_set_retrans_timer(struct net_if *iface, uint32_t retrans_timer)

Set IPv6 retransmit timer for a given interface.

**Parameters**
- **iface** – Network interface
- **retrans_timer** – New retransmit timer

static inline uint32_t net_if_ipv6_get_retrans_timer(struct net_if *iface)

Get IPv6 retransmit timer specified for a given interface.

**Parameters**
- **iface** – Network interface

**Returns**
Retransmit timer

static inline const struct in6_addr *net_if_ipv6_select_src_addr(struct net_if *iface, const struct in6_addr *dst)

Get a IPv6 source address that should be used when sending network data to destination.

**Parameters**
- **iface** – Interface that was used when packet was received. If the interface is not known, then NULL can be given.
• dst – IPv6 destination address

Returns
Pointer to IPv6 address to use, NULL if no IPv6 address could be found.

static inline struct net_if *net_if_ipv6_select_src_iface(const struct in6_addr *dst)
Get a network interface that should be used when sending IPv6 network data to destination.

Parameters
• dst – IPv6 destination address

Returns
Pointer to network interface to use, NULL if no suitable interface could be found.

struct in6_addr *net_if_ipv6_get_ll(struct net_if *iface, enum net_addr_state addr_state)
Get a IPv6 link local address in a given state.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr_state – IPv6 address state (preferred, tentative, deprecated)

Returns
Pointer to link local IPv6 address, NULL if no proper IPv6 address could be found.

struct in6_addr *net_if_ipv6_get_ll_addr(enum net_addr_state state, struct net_if **iface)
Return link local IPv6 address from the first interface that has a link local address matching give state.

Parameters
• state – IPv6 address state (ANY, TENTATIVE, PREFERRED, DEPRECATED)
• iface – Pointer to interface is returned

Returns
Pointer to IPv6 address, NULL if not found.

void net_if_ipv6_dad_failed(struct net_if *iface, const struct in6_addr *addr)
Stop IPv6 Duplicate Address Detection (DAD) procedure if we find out that our IPv6 address is already in use.

Parameters
• iface – Interface where the DAD was running.
• addr – IPv6 address that failed DAD

struct in6_addr *net_if_ipv6_get_global_addr(enum net_addr_state state, struct net_if **iface)
Return global IPv6 address from the first interface that has a global IPv6 address matching the given state.

Parameters
• state – IPv6 address state (ANY, TENTATIVE, PREFERRED, DEPRECATED)
• iface – Caller can give an interface to check. If iface is set to NULL, then all the interfaces are checked. Pointer to interface where the IPv6 address is defined is returned to the caller.
Returns
   Pointer to IPv6 address, NULL if not found.

int net_if_config_ipv4_get(struct net_if *iface, struct net_if_ipv4 **ipv4)
Allocate network interface IPv4 config.
This function will allocate new IPv4 config.

Parameters
   • iface – Interface to use.
   • ipv4 – Pointer to allocated IPv4 struct is returned to caller.

Returns
   0 if ok, <0 if error

int net_if_config_ipv4_put(struct net_if *iface)
Release network interface IPv4 config.

Parameters
   • iface – Interface to use.

Returns
   0 if ok, <0 if error

uint8_t net_if_ipv4_get_ttl(struct net_if *iface)
Get IPv4 time-to-live value specified for a given interface.

Parameters
   • iface – Network interface

Returns
   Time-to-live

void net_if_ipv4_set_ttl(struct net_if *iface, uint8_t ttl)
Set IPv4 time-to-live value specified to a given interface.

Parameters
   • iface – Network interface
   • ttl – Time-to-live value

uint8_t net_if_ipv4_get_mcast_ttl(struct net_if *iface)
Get IPv4 multicast time-to-live value specified for a given interface.

Parameters
   • iface – Network interface

Returns
   Time-to-live

void net_if_ipv4_set_mcast_ttl(struct net_if *iface, uint8_t ttl)
Set IPv4 multicast time-to-live value specified to a given interface.

Parameters
   • iface – Network interface
   • ttl – Time-to-live value

struct net_addr *net_if_ipv4_addr_lookup(const struct in_addr *addr, struct net_if **iface)
Check if this IPv4 address belongs to one of the interfaces.

Parameters
   • addr – IPv4 address
   • iface – Interface to search through
• addr – IPv4 address
• iface – Interface is returned

Returns
Pointer to interface address, NULL if not found.

struct net_if_addr *net_if_ipv4_addr_add(struct net_if *iface, struct in_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)

Add a IPv4 address to an interface.

Parameters
• iface – Network interface
• addr – IPv4 address
• addr_type – IPv4 address type
• vlifetime – Validity time for this address

Returns
Pointer to interface address, NULL if cannot be added

bool net_if_ipv4_addr_rm(struct net_if *iface, const struct in_addr *addr)

Remove a IPv4 address from an interface.

Parameters
• iface – Network interface
• addr – IPv4 address

Returns
True if successfully removed, false otherwise

int net_if_ipv4_addr_lookup_by_index(const struct in_addr *addr)
Check if this IPv4 address belongs to one of the interface indices.

Parameters
• addr – IPv4 address

Returns
>0 if address was found in given network interface index, all other values mean address was not found

bool net_if_ipv4_addr_add_by_index(int index, struct in_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)

Add a IPv4 address to an interface by network interface index.

Parameters
• index – Network interface index
• addr – IPv4 address
• addr_type – IPv4 address type
• vlifetime – Validity time for this address

Returns
True if ok, false if the address could not be added

bool net_if_ipv4_addr_rm_by_index(int index, const struct in_addr *addr)
Remove a IPv4 address from an interface by interface index.

Parameters
• index – Network interface index
• addr – IPv4 address

**Returns**
True if successfully removed, false otherwise

```c
void net_if_ipv4_addr_foreach(struct net_if *iface, net_if_ip_addr_cb_t cb, void *user_data)
```

Go through all IPv4 addresses on a network interface and call callback for each used address.

**Parameters**
- iface – Pointer to the network interface
- cb – User-supplied callback function to call
- user_data – User specified data

```c
struct net_if_mcast_addr *net_if_ipv4_maddr_add(struct net_if *iface, const struct in_addr *addr)
```

Add a IPv4 multicast address to an interface.

**Parameters**
- iface – Network interface
- addr – IPv4 multicast address

**Returns**
Pointer to interface multicast address, NULL if cannot be added

```c
bool net_if_ipv4_maddr_rm(struct net_if *iface, const struct in_addr *addr)
```

Remove an IPv4 multicast address from an interface.

**Parameters**
- iface – Network interface
- addr – IPv4 multicast address

**Returns**
True if successfully removed, false otherwise

```c
struct net_if_mcast_addr *net_if_ipv4_maddr_lookup(const struct in_addr *addr, struct net_if **iface)
```

Check if this IPv4 multicast address belongs to a specific interface or one of the interfaces.

**Parameters**
- addr – IPv4 address
- iface – If *iface is null, then pointer to interface is returned, otherwise the *iface value needs to be matched.

**Returns**
Pointer to interface multicast address, NULL if not found.

```c
void net_if_ipv4_maddr_join(struct net_if *iface, struct net_if_mcast_addr *addr)
```

Mark a given multicast address to be joined.

**Parameters**
- iface – Network interface the address belongs to
- addr – IPv4 multicast address
static inline bool net_if_ipv4_maddr_is Joined(struct net_if_mcast_addr *addr)
    Check if given multicast address is joined or not.

Parameters
  • addr – IPv4 multicast address

Returns
  True if address is joined, False otherwise.

void net_if_ipv4_maddr_leave(struct net_if *iface, struct net_if_mcast_addr *addr)
Mark a given multicast address to be left.

Parameters
  • iface – Network interface the address belongs to
  • addr – IPv4 multicast address

static inline struct in_addr *net_if_router_ipv4(struct net_if_router *router)
Get the IPv4 address of the given router.

Parameters
  • router – a network router

Returns
  pointer to the IPv4 address, or NULL if none

struct net_if_router *net_if_ipv4_router_lookup(struct net_if *iface, struct in_addr *addr)
Check if IPv4 address is one of the routers configured in the system.

Parameters
  • iface – Network interface
  • addr – IPv4 address

Returns
  Pointer to router information, NULL if cannot be found

struct net_if_router *net_if_ipv4_router_find_default(struct net_if *iface, struct in_addr *addr)
Find default router for this IPv4 address.

Parameters
  • iface – Network interface. This can be NULL in which case we go through all the network interfaces to find a suitable router.
  • addr – IPv4 address

Returns
  Pointer to router information, NULL if cannot be found

struct net_if_router *net_if_ipv4_router_add(struct net_if *iface, struct in_addr *addr,
                         bool is_default, uint16_t router_lifetime)
Add IPv4 router to the system.

Parameters
  • iface – Network interface
  • addr – IPv4 address
  • is_default – Is this router the default one
  • router_lifetime – Lifetime of the router
Returns
Pointer to router information, NULL if could not be added

bool net_if_ipv4_router_rm(struct net_if *router)
Remove IPv4 router from the system.

Parameters
• router – Router information.

Returns
True if successfully removed, false otherwise.

bool net_if_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
Check if the given IPv4 address belongs to local subnet.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr – IPv4 address

Returns
True if address is part of local subnet, false otherwise.

bool net_if_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
Check if the given IPv4 address is a broadcast address.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr – IPv4 address, this should be in network byte order

Returns
True if address is a broadcast address, false otherwise.

static inline struct net_if *
net_if_ipv4_select_src_iface(const struct in_addr *dst)
Get a network interface that should be used when sending IPv4 network data to destination.

Parameters
• dst – IPv4 destination address

Returns
Pointer to network interface to use, NULL if no suitable interface could be found.

static inline const struct in_addr *
net_if_ipv4_select_src_addr(struct net_if *iface, const struct in_addr *dst)
Get a IPv4 source address that should be used when sending network data to destination.

Parameters
• iface – Interface to use when sending the packet. If the interface is not known, then NULL can be given.
• dst – IPv4 destination address

Returns
Pointer to IPv4 address to use, NULL if no IPv4 address could be found.

struct in_addr *
net_if_ipv4_get_ll(struct net_if *iface, enum net_addr_state addr_state)
Get a IPv4 link local address in a given state.

Parameters
• `iface` – Interface to use. Must be a valid pointer to an interface.
• `addr_state` – IPv4 address state (preferred, tentative, deprecated)

**Returns**
Pointer to link local IPv4 address, NULL if no proper IPv4 address could be found.

```c
struct in_addr *net_if_ipv4_get_global_addr(struct net_if *iface, enum net_addr_state addr_state)
```

Get a IPv4 global address in a given state.

**Parameters**
• `iface` – Interface to use. Must be a valid pointer to an interface.
• `addr_state` – IPv4 address state (preferred, tentative, deprecated)

**Returns**
Pointer to link local IPv4 address, NULL if no proper IPv4 address could be found.

```c
struct in_addr net_if_ipv4_get_netmask(struct net_if *iface)
```

Get IPv4 netmask of an interface.

**Parameters**
• `iface` – Interface to use.

**Returns**
The netmask set on the interface, unspecified address if not found.

```c
void net_if_ipv4_set_netmask(struct net_if *iface, const struct in_addr *netmask)
```

Set IPv4 netmask for an interface.

**Parameters**
• `iface` – Interface to use.
• `netmask` – IPv4 netmask

```c
bool net_if_ipv4_set_netmask_by_index(int index, const struct in_addr *netmask)
```

Set IPv4 netmask for an interface index.

**Parameters**
• `index` – Network interface index
• `netmask` – IPv4 netmask

**Returns**
True if netmask was added, false otherwise.

```c
void net_if_ipv4_set_gw(struct net_if *iface, const struct in_addr *gw)
```

Set IPv4 gateway for an interface.

**Parameters**
• `iface` – Interface to use.
• `gw` – IPv4 address of an gateway

```c
bool net_if_ipv4_set_gw_by_index(int index, const struct in_addr *gw)
```

Set IPv4 gateway for an interface index.

**Parameters**
• `index` – Network interface index
• `gw` – IPv4 address of an gateway
struct net_if *net_if_select_src_iface(const struct sockaddr *dst)
Get a network interface that should be used when sending IPv6 or IPv4 network data to destination.

Parameters
• dst – IPv6 or IPv4 destination address

Returns
True if gateway was added, false otherwise.

void net_if_register_link_cb(struct net_if_link_cb *link, net_if_link_callback_t cb)
Register a link callback.

Parameters
• link – Caller specified handler for the callback.
• cb – Callback to register.

void net_if_unregister_link_cb(struct net_if_link_cb *link)
Unregister a link callback.

Parameters
• link – Caller specified handler for the callback.

void net_if_call_link_cb(struct net_if *iface, struct net_linkaddr *lladdr, int status)
Call a link callback function.

Parameters
• iface – Network interface.
• lladdr – Destination link layer address
• status – 0 is ok, < 0 error

bool net_if_need_calc_rx_checksum(struct net_if *iface)
Check if received network packet checksum calculation can be avoided or not.

For example many ethernet devices support network packet offloading in which case the IP stack does not need to calculate the checksum.

Parameters
• iface – Network interface

Returns
True if checksum needs to be calculated, false otherwise.

bool net_if_need_calc_tx_checksum(struct net_if *iface)
Check if network packet checksum calculation can be avoided or not when sending the packet.

For example many ethernet devices support network packet offloading in which case the IP stack does not need to calculate the checksum.

Parameters
• iface – Network interface

Returns
True if checksum needs to be calculated, false otherwise.
struct net_if *net_if_get_by_index(int index)
Get interface according to index.
This is a syscall only to provide access to the object for purposes of assigning permissions.

Parameters
• index – Interface index

Returns
Pointer to interface or NULL if not found.

int net_if_get_by_iface(struct net_if *iface)
Get interface index according to pointer.

Parameters
• iface – Pointer to network interface

Returns
Interface index

void net_if_foreach(net_if_cb_t cb, void *user_data)
Go through all the network interfaces and call callback for each interface.

Parameters
• cb – User-supplied callback function to call
• user_data – User specified data

int net_if_up(struct net_if *iface)
Bring interface up.

Parameters
• iface – Pointer to network interface

Returns
0 on success

static inline bool net_if_is_up(struct net_if *iface)
Check if interface is is up and running.

Parameters
• iface – Pointer to network interface

Returns
True if interface is up, False if it is down.

int net_if_down(struct net_if *iface)
Bring interface down.

Parameters
• iface – Pointer to network interface

Returns
0 on success

static inline bool net_if_is_admin_up(struct net_if *iface)
Check if interface was brought up by the administrator.

Parameters
• iface – Pointer to network interface

Returns
True if interface is admin up, false otherwise.
void net_if_carrier_on(struct net_if *iface)
Underlying network device has detected the carrier (cable connected).
The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

Parameters
  • iface – Pointer to network interface

void net_if_carrier_off(struct net_if *iface)
Underlying network device has lost the carrier (cable disconnected).
The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

Parameters
  • iface – Pointer to network interface

static inline bool net_if_is_carrier_ok(struct net_if *iface)
Check if carrier is present on network device.

Parameters
  • iface – Pointer to network interface

Returns
  True if carrier is present, false otherwise.

void net_if_dormant_on(struct net_if *iface)
Mark interface as dormant.
Dormant state indicates that the interface is not ready to pass packets yet, but is waiting for some event (for example Wi-Fi network association).
The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

Parameters
  • iface – Pointer to network interface

void net_if_dormant_off(struct net_if *iface)
Mark interface as not dormant.
The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

Parameters
  • iface – Pointer to network interface

static inline bool net_if_is_dormant(struct net_if *iface)
Check if the interface is dormant.

Parameters
  • iface – Pointer to network interface

Returns
  True if interface is dormant, false otherwise.

static inline int net_if_set_promisc(struct net_if *iface)
Set network interface into promiscuous mode.
Note that not all network technologies will support this.

Parameters
• iface – Pointer to network interface

Returns
0 on success, <0 if error
static inline void net_if_unset_promisc(struct net_if *iface)
Set network interface into normal mode.

Parameters
• iface – Pointer to network interface

static inline bool net_if_is_promisc(struct net_if *iface)
Check if promiscuous mode is set or not.

Parameters
• iface – Pointer to network interface

Returns
True if interface is in promisc mode, False if interface is not in promiscuous mode.

static inline bool net_if_are_pending_tx_packets(struct net_if *iface)
Check if there are any pending TX network data for a given network interface.

Parameters
• iface – Pointer to network interface

Returns
True if there are pending TX network packets for this network interface, False otherwise.

bool net_if_is_wifi(struct net_if *iface)
Check if the network interface supports Wi-Fi.

Parameters
• iface – Pointer to network interface

Returns
True if interface supports Wi-Fi, False otherwise.

struct net_if *net_if_get_first_wifi(void)
Get first Wi-Fi network interface.

Returns
Pointer to network interface, NULL if not found.

int net_if_get_name(struct net_if *iface, char *buf, int len)
Get network interface name.
If interface name support is not enabled, empty string is returned.

Parameters
• iface – Pointer to network interface
• buf – User supplied buffer
• len – Length of the user supplied buffer

Returns
Length of the interface name copied to buf, -EINVAL if invalid parameters, -ERANGE if name cannot be copied to the user supplied buffer, -ENOTSUP if interface name support is disabled,
int net_if_set_name(struct net_if *iface, const char *buf)
    Set network interface name.
    Normally this function is not needed to call as the system will automatically assign a
    name to the network interface.

    Parameters
    • iface – Pointer to network interface
    • buf – User supplied name

    Returns
    0 name is set correctly -ENOTSUP interface name support is disabled -
    EINVAL if invalid parameters are given, -ENAMETOOLONG if name is too
    long

int net_if_get_by_name(const char *name)
    Get interface index according to its name.

    Parameters
    • name – Name of the network interface

    Returns
    Interface index

struct net_if_addr
    #include <net_if.h> Network Interface unicast IP addresses.
    Stores the unicast IP addresses assigned to this network interface.

    Public Members

    struct net_addr address
        IP address.

    enum net_addr_type addr_type
        How the IP address was set.

    enum net_addr_state addr_state
        What is the current state of the address.

    uint8_t is_infinite
        Is the IP address valid forever.

    uint8_t is_used
        Is this IP address used or not.

    uint8_t is_mesh_local
        Is this IP address usage limited to the subnet (mesh) or not.

struct net_if_mcast_addr
    #include <net_if.h> Network Interface multicast IP addresses.
    Stores the multicast IP addresses assigned to this network interface.
**Public Members**

struct net_addr address  
IP address.

uint8_t is_used  
Is this multicast IP address used or not.

uint8_t is_joined  
Did we join to this group.

struct net_if_ipv6_prefix  
#include <net_if.h> Network Interface IPv6 prefixes.
Stores the IPV6 prefixes assigned to this network interface.

**Public Members**

struct net_timeout lifetime  
Prefix lifetime.

struct in6_addr prefix  
IPv6 prefix.

struct net_if *iface  
Backpointer to network interface where this prefix is used.

uint8_t len  
Prefix length.

uint8_t is_infinite  
Is the IP prefix valid forever.

uint8_t is_used  
Is this prefix used or not.

struct net_if_router  
#include <net_if.h> Information about routers in the system.
Stores the router information.

**Public Members**

sys_snode_t node  
Slist lifetime timer node.

struct net_addr address  
IP address.

6.3. Networking
struct *iface

Network interface the router is connected to.

uint32_t life_start

Router life timer start.

uint16_t lifetime

Router lifetime.

uint8_t is_used

Is this router used or not.

uint8_t is_default

Is default router.

uint8_t is_infinite

Is the router valid forever.

struct net_if_ipv6

#include <net_if.h>

Public Members

struct net_if_addr unicast[NET_IF_MAX_IPV6_ADDR]

Unicast IP addresses.

struct net_if_mcast_addr mcast[NET_IF_MAX_IPV6_MADDR]

Multicast IP addresses.

struct net_if_ipv6_prefix prefix[NET_IF_MAX_IPV6_PREFIX]

Prefixes.

uint32_t base_reachable_time

Default reachable time (RFC 4861, page 52)

uint32_t reachable_time

Reachable time (RFC 4861, page 20)

uint32_t retrans_timer

Retransmit timer (RFC 4861, page 52)

uint8_t hop_limit

IPv6 hop limit.

uint8_t mcast_hop_limit

IPv6 multicast hop limit.
Public Members

```c
struct net_if_addr unicast[NET_IF_MAX_IPV4_ADDR]
    Unicast IP addresses.

struct net_if_mcast_addr mcast[NET_IF_MAX_IPV4_MADDR]
    Multicast IP addresses.

struct in_addr gw
    Gateway.

struct in_addr netmask
    Netmask.

uint8_t ttl
    IPv4 time-to-live.

uint8_t mcast_ttl
    IPv4 time-to-live for multicast packets.
```

```c
struct net_if_ip
    #include <net_if.h> Network interface IP address configuration.

struct net_if_config
    #include <net_if.h> IP and other configuration related data for network interface.

struct net_traffic_class
    #include <net_if.h> Network traffic class.
    Traffic classes are used when sending or receiving data that is classified with different priorities. So some traffic can be marked as high priority and it will be sent or received first. Each network packet that is transmitted or received goes through a fifo to a thread that will transmit it.

Public Members

```c
struct k_fifo fifo
    Fifo for handling this Tx or Rx packet.

struct k_thread handler
    Traffic class handler thread.

k_thread_stack_t *stack
    Stack for this handler.

struct net_if_dev
    #include <net_if.h> Network Interface Device structure.
    Used to handle a network interface on top of a device driver instance. There can be many net_if_dev instance against the same device.
Such interface is mainly to be used by the link layer, but is also tight to a network context: it then makes the relation with a network context and the network device. Because of the strong relationship between a device driver and such network interface, each `net_if_dev` should be instantiated by one of the network device init macros found in net_if.h.

**Public Members**

```c
const struct device *dev
    The actually device driver instance the `net_if` is related to.

const struct net_l2 *const l2
    Interface's L2 layer.

void *l2_data
    Interface's private L2 data pointer.

struct net_linkaddr link_addr
    The hardware link address.

uint16_t mtu
    The hardware MTU.

enum net_if_oper_state oper_state
    RFC 2863 operational status.
```

```c
struct net_if
    #include <net_if.h> Network Interface structure.
    Used to handle a network interface on top of a `net_if_dev` instance. There can be many `net_if` instance against the same `net_if_dev` instance.

**Public Members**

```c
struct net_if_dev *if_dev
    The `net_if_dev` instance the `net_if` is related to.

struct net_if_config config
    Network interface instance configuration.

struct net_if_mcast_monitor
    #include <net_if.h> Multicast monitor handler struct.
    Stores the multicast callback information. Caller must make sure that the variable pointed by this is valid during the lifetime of registration. Typically this means that the variable cannot be allocated from stack.
```
Public Members

```c
sys_snodi node
   Node information for the slist.

struct net_if *iface
   Network interface.

net_if_mcast_callback_t cb
   Multicast callback.
```

```c
struct net_if_link_cb
   #include <net_if.h> Link callback handler struct.
   Stores the link callback information. Caller must make sure that the variable pointed by this is valid during the lifetime of registration. Typically this means that the variable cannot be allocated from stack.
```

Public Members

```c
sys_snodi node
   Node information for the slist.

net_if_link_callback_t cb
   Link callback.
```

L2 Layer Management

- **Overview**
- **L2 layer API**
- **Network Device drivers**
  - Ethernet device driver
  - IEEE 802.15.4 device driver
- **API Reference**

**Overview**  The L2 stack is designed to hide the whole networking link-layer part and the related device drivers from the upper network stack. This is made through a `net_if` declared in include/zephyr/net/net_if.h.

The upper layers are unaware of implementation details beyond the `net_if` object and the generic API provided by the L2 layer in include/zephyr/net/net_l2.h as `net_l2`.

Only the L2 layer can talk to the device driver, linked to the `net_if` object. The L2 layer dictates the API provided by the device driver, specific for that device, and optimized for working together.

Currently, there are L2 layers for Ethernet, IEEE 802.15.4 Soft-MAC, Bluetooth IPSP, CANBUS, OpenThread, Wi-Fi, and a dummy layer example that can be used as a template for writing a new one.
L2 layer API  In order to create an L2 layer, or a driver for a specific L2 layer, one needs to understand how the L3 layer interacts with it and how the L2 layer is supposed to behave. See also network stack architecture for more details. The generic L2 API has these functions:

-recv(): All device drivers, once they receive a packet which they put into a net_pkt, will push this buffer to the network stack via net_recv_data(). At this point, the network stack does not know what to do with it. Instead, it passes the buffer along to the L2 stack’s recv() function for handling. The L2 stack does what it needs to do with the packet, for example, parsing the link layer header, or handling link-layer only packets. The recv() function will return NET_DROP in case of an erroneous packet, NET_OK if the packet was fully consumed by the L2, or NET_CONTINUE if the network stack should then handle it.

-send(): Similar to receive function, the network stack will call this function to actually send a network packet. All relevant link-layer content will be generated and added by this function. The send() function returns the number of bytes sent, or a negative error code if there was a failure sending the network packet.

-enable(): This function is used to enable/disable traffic over a network interface. The function returns <0 if error and >=0 if no error.

-get_flags(): This function will return the capabilities of an L2 driver, for example whether the L2 supports multicast or promiscuous mode.

Network Device drivers  Network device drivers fully follows Zephyr device driver model as a basis. Please refer to Device Driver Model.

There are, however, two differences:

- The driver_api pointer must point to a valid net_if_api pointer.

- The network device driver must use NET_DEVICE_INIT_INSTANCE() or ETH_NET_DEVICE_INIT() for Ethernet devices. These macros will call the DEVICE_DEFINE() macro, and also instantiate a unique net_if related to the created device driver instance.

Implementing a network device driver depends on the L2 stack it belongs to: Ethernet, IEEE 802.15.4, etc. In the next section, we will describe how a device driver should behave when receiving or sending a network packet. The rest is hardware dependent and is not detailed here.

Ethernet device driver  On reception, it is up to the device driver to fill-in the network packet with as many data buffers as required. The network packet itself is a net_pkt and should be allocated through net_pkt_rx_alloc_with_buffer(). Then all data buffers will be automatically allocated and filled by net_pkt_write().

After all the network data has been received, the device driver needs to call net_recv_data(). If that call fails, it will be up to the device driver to unreference the buffer via net_pkt_unref().

On sending, the device driver send function will be called, and it is up to the device driver to send the network packet all at once, with all the buffers.

Each Ethernet device driver will need, in the end, to call ETH_NET_DEVICE_INIT() like this:

```
ETH_NET_DEVICE_INIT(..., CONFIG_ETH_INIT_PRIORITY,
                         &the_valid_net_if_api_instance, 1500);
```

IEEE 802.15.4 device driver  Device drivers for IEEE 802.15.4 L2 work basically the same as for Ethernet. What has been described above, especially for recv(), applies here as well. There are two specific differences however:

- It requires a dedicated device driver API: ieee802154_radio_api, which overloads net_if_api. This is because 802.15.4 L2 needs more from the device driver
than just send() and recv() functions. This dedicated API is declared in include/zephyr/net/ieee802154_radio.h. Each and every IEEE 802.15.4 device driver must provide a valid pointer on such relevantly filled-in API structure.

- Sending a packet is slightly different than in Ethernet. Most IEEE 802.15.4 PHYs support relatively small frames only, 127 bytes all inclusive: frame header, payload and frame checksum. Buffers to be sent over the radio will often not fit this frame size limitation, e.g. a buffer containing an IPv6 packet will often have to be split into several fragments and IP6 packet headers and fragments need to be compressed using a protocol like 6LoWPAN before being passed on to the radio driver. Additionally the IEEE 802.15.4 standard defines medium access (e.g. CSMA/CA), frame retransmission, encryption and other pre-processing procedures (e.g. addition of information elements) that individual radio drivers should not have to care about. This is why the ieee802154_radio_api requires a tx function pointer which differs from the net_if_api send function pointer. Zephyr's native IEEE 802.15.4 L2 implementation provides a generic ieee802154_send() instead, meant to be given as net_if send function. The implementation of ieee802154_send() takes care of IEEE 802.15.4 standard packet preparation procedures, splitting the packet into possibly compressed, encrypted and otherwise pre-processed fragment buffers, sending one buffer at a time through ieee802154_radio_api tx function and unreferencing the network packet only when the transmission as a whole was either successful or failed.

Interaction between IEEE 802.15.4 radio device drivers and L2 is bidirectional:

- **L2 -> L1:** Methods as ieee802154_send() and several IEEE 802.15.4 net management calls will call into the driver, e.g. to send a packet over the radio link or re-configure the driver at runtime. These incoming calls will all be handled by the methods in the ieee802154_radio_api.

- **L1 -> L2:** There are several situations in which the driver needs to initiate calls into the L2/MAC layer. Zephyr's IEEE 802.15.4 L1 -> L2 adaptation API employs an “inversion-of-control” pattern in such cases avoids duplication of complex logic across independent driver implementations and ensures implementation agnostic loose coupling and clean separation of concerns between MAC (L2) and PHY (L1) whenever reverse information transfer or close co-operation between hardware and L2 is required. During driver initialization, for example, the driver calls ieee802154_init() to pass the interface's MAC address as well as other hardware-related configuration to L2. Similarly, drivers may indicate performance or timing critical radio events to L2 that require close integration with the hardware (e.g. ieee802154_handle_ack()). Calls from L1 into L2 are not implemented as methods in ieee802154_radio_api but are standalone functions declared and documented as such in include/zephyr/net/ieee802154_radio.h. The API documentation will clearly state which functions must be implemented by all L2 stacks as part of the L1 -> L2 “inversion-of-control” adaptation API.

Note: Standalone functions in include/zephyr/net/ieee802154_radio.h that are not explicitly documented as callbacks are considered to be helper functions within the PHY (L1) layer implemented independently of any specific L2 stack, see for example ieee802154_is_ar_flag_set().

As all net interfaces, IEEE 802.15.4 device driver implementations will have to call NET_DEVICE_INIT_INSTANCE() in the end:

```c
NET_DEVICE_INIT_INSTANCE(...,
    the_device_init_prio,
    &the_valid_ieee802154_radio_api_instance,
    IEEE802154_L2,
    NET_L2_GET_CTX_TYPE(IEEE802154_L2), 125);
```

**API Reference**

**Related code samples**

**Link Layer Discovery Protocol (LLDP)**

Enable LLDP support and setup VLANs.

---

6.3. Networking 2733
Virtual LAN
Setup two virtual LAN networks and use net-shell to view the networks’ settings.

`group net_12`
Network Layer 2 abstraction layer.

**Enums**

`enum net_12_flags`
L2 flags.

*Values:*

- Enumerator `NET_L2_MULTICAST = BIT(0)`
  IP multicast supported.

- Enumerator `NET_L2_MULTICAST_SKIP_JOIN_SOLICIT_NODE = BIT(1)`
  Do not join solicited node multicast group.

- Enumerator `NET_L2_PROMISC_MODE = BIT(2)`
  Is promiscuous mode supported.

- Enumerator `NET_L2_POINT_TO_POINT = BIT(3)`
  Is this L2 point-to-point with tunneling so no need to have IP address etc to network interface.

`struct net_12`

*#include <net_l2.h>* Network L2 structure.

Used to provide an interface to lower network stack.

**Public Members**

`enum net_verdict (*recv)(struct net_if *iface, struct net_pkt *pkt)`
This function is used by net core to get iface’s L2 layer parsing what’s relevant to itself.

`int (*send)(struct net_if *iface, struct net_pkt *pkt)`
This function is used by net core to push a packet to lower layer (interface’s L2), which in turn might work on the packet relevantly.

(adding proper header etc...) Returns a negative error code, or the number of bytes sent otherwise.

`int (*enable)(struct net_if *iface, bool state)`
This function is used to enable/disable traffic over a network interface.

The function returns <0 if error and >=0 if no error:

`enum net_l2_flags (*get_flags)(struct net_if *iface)`
Return L2 flags for the network interface.
Network Traffic Offloading

- **Network Offloading**
  - Overview
  - API Reference
- **Socket Offloading**
  - Overview

Network Offloading

**Overview** The network offloading API provides hooks that a device vendor can use to provide an alternate implementation for an IP stack. This means that the actual network connection creation, data transfer, etc., is done in the vendor HAL instead of the Zephyr network stack.

**API Reference**

*group net_offload*

Network offloading interface.

Socket Offloading

**Overview** In addition to the network offloading API, Zephyr allows offloading of networking functionality at the socket API level. With this approach, vendors who provide an alternate implementation of the networking stack, exposing socket API for their networking devices, can easily integrate it with Zephyr.

See [drivers/wifi/simplelink/simplelink_sockets.c](#) for a sample implementation on how to integrate network offloading at socket level.

Link Layer Address Handling

- **Overview**
- **API Reference**

**Overview** The link layer addresses are set for network interfaces so that L2 connectivity works correctly in the network stack. Typically the link layer addresses are 6 bytes long like in Ethernet but for IEEE 802.15.4 the link layer address length is 8 bytes.

**API Reference**

*group net_linkaddr*

Network link address library.
Defines

**NET_LINK_ADDR_MAX_LENGTH**

Maximum length of the link address.

Enums

```c
enum net_link_type
{
    NET_LINK_UNKNOWN = 0,
    NET_LINK_IEEE802154,
    NET_LINK_BLUETOOTH,
    NET_LINK_ETHERNET,
    NET_LINK_DUMMY,
    NET_LINK_CANBUS_RAW,
}
```

*Type of the link address. This indicates the network technology that this address is used in. Note that in order to save space we store the value into a uint8_t variable, so please do not introduce any values > 255 in this enum.*

*Values:*

- **NET_LINK_UNKNOWN**
  - Unknown link address type.
- **NET_LINK_IEEE802154**
  - IEEE 802.15.4 link address.
- **NET_LINK_BLUETOOTH**
  - Bluetooth IPSP link address.
- **NET_LINK_ETHERNET**
  - Ethernet link address.
- **NET_LINK_DUMMY**
  - Dummy link address.
  - Used in testing apps and loopback support.
- **NET_LINK_CANBUS_RAW**
  - CANBUS link address.

Functions

```c
static inline bool net_linkaddr_cmp(struct net_linkaddr *lladdr1, struct net_linkaddr *lladdr2)
```

*Compare two link layer addresses.*

**Parameters**

- **lladdr1** – Pointer to a link layer address
- **lladdr2** – Pointer to a link layer address

**Returns**

*True if the addresses are the same, false otherwise.*
static inline int net_linkaddr_set(struct net_linkaddr_storage *lladdr_store, uint8_t *new_addr, uint8_t new_len)

Set the member data of a link layer address storage structure.

**Parameters**

- `lladdr_store` – The link address storage structure to change.
- `new_addr` – Array of bytes containing the link address.
- `new_len` – Length of the link address array. This value should always be <= NET_LINK_ADDR_MAX_LENGTH.

**Public Members**

uint8_t *addr
The array of byte representing the address.

uint8_t len
Length of that address array.

uint8_t type
What kind of address is this for.

**Public Members**

uint8_t type
What kind of address is this for.

uint8_t len
The real length of the ll address.

uint8_t addr[6]
The array of bytes representing the address.
Ethernet Management

- Overview
- API Reference

**Overview** Ethernet management API provides functions to manage the Ethernet network interface low level status. The caller of these functions can:

- raise carrier ON or carrier OFF management events
- raise VLAN enabled or VLAN disabled management events

Typically the carrier OFF event would be generated by the Ethernet device driver when it notices that the Ethernet cable is disconnected. The carrier ON event would be generated if the Ethernet device driver notices that the Ethernet cable is re-connected.

Currently the VLAN events are generated by the Ethernet L2 layer when a specific VLAN tag is either enabled or disabled.

The user application can monitor these events if it needs to act when the corresponding status changes.

**API Reference**

*group ethernet_mgmt*

Ethernet library.

**Functions**

- **void ethernet_mgmt_raise_carrier_on_event(struct net_if *iface)**
  
  Raise CARRIER_ON event when Ethernet is connected.

  **Parameters**
  - *iface* – Ethernet network interface.

- **void ethernet_mgmt_raise_carrier_off_event(struct net_if *iface)**
  
  Raise CARRIER_OFF event when Ethernet is disconnected.

  **Parameters**
  - *iface* – Ethernet network interface.

- **void ethernet_mgmt_raise_vlan_enabled_event(struct net_if *iface, uint16_t tag)**
  
  Raise VLAN_ENABLED event when VLAN is enabled.

  **Parameters**
  - *iface* – Ethernet network interface.
  - *tag* – VLAN tag which is enabled.

- **void ethernet_mgmt_raise_vlan_disabled_event(struct net_if *iface, uint16_t tag)**
  
  Raise VLAN_DISABLED event when VLAN is disabled.

  **Parameters**
  - *iface* – Ethernet network interface.
  - *tag* – VLAN tag which is disabled.
Traffic Classification

Overview  Traffic classification is an automated process that categorizes computer network traffic according to various parameters. For Zephyr, the VLAN priority code point (PCP) is used to classify both received and sent network packets. See more information about VLAN priority at IEEE 802.1Q.

By default, all network traffic is treated equal in Zephyr. If desired, the option CONFIG_NET_TC_TX_COUNT can be used to set the number of transmit queues. The option CONFIG_NET_TC_RX_COUNT can be used to set the number of receive queues. Each traffic class queue corresponds to a specific kernel work queue. Each kernel work queue has a priority. The VLAN priority is mapped to a certain traffic class according to rules specified in IEEE 802.1Q spec chapter I.3, chapter 8.6.6 table 8-4, and chapter 34.5 table 34-1. Each traffic class is in turn mapped to a certain kernel work queue. The maximum number of traffic classes for both Rx and Tx is 8.

See subsys/net/ip/net_tc.c for details of how various mappings are done.

Network Packet Filtering

Overview  The Network Packet Filtering facility provides the infrastructure to construct custom rules for accepting and/or denying packet transmission and reception. This can be used to create a basic firewall, control network traffic, etc.

The CONFIG_NET_PKT_FILTER must be set in order to enable the relevant APIs.

Both the transmission and reception paths may have a list of filter rules. Each rule is made of a set of conditions and a packet outcome. Every packet is subjected to the conditions attached to a rule. When all the conditions for a given rule are true then the packet outcome is immediately determined as specified by the current rule and no more rules are considered. If one condition is false then the next rule in the list is considered.

Packet outcome is either NET_OK to accept the packet or NET_DROP to drop it.

A rule is represented by a npf_rule object. It can be inserted to, appended to or removed from a rule list contained in a npf_rule_list object using npf_insert_rule(), npf_append_rule(), and npf_remove_rule(). Currently, two such rule lists exist: npf_send_rules for outgoing packets, and npf_recv_rules for incoming packets.

If a filter rule list is empty then NET_OK is assumed. If a non-empty rule list runs to the end then NET_DROP is assumed. However it is recommended to always terminate a non-empty rule list with an explicit default termination rule, either npf_default_ok or npf_default_drop.

Rule conditions are represented by a npf_test. This structure can be embedded into a larger structure when a specific condition requires extra test data. It is up to the test function for such conditions to retrieve the outer structure from the provided npf_test structure pointer.

Convenience macros are provided in include/zephyr/net/net_pkt_filter.h to statically define condition instances for various conditions, and NPF_RULE() to create a rule instance to tie them.

Examples  Here’s an example usage:
static NPF_SIZE_MAX(maxsize_200, 200);
static NPF_ETH_TYPE_MATCH(ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(small_ip_pkt, NET_OK, ip_packet, maxsize_200);

void install_my_filter(void)
{
  npf_insert_recv_rule(&npf_default_drop);
  npf_insert_recv_rule(&small_ip_pkt);
}

The above would accept IP packets that are 200 bytes or smaller, and drop all other packets.

Another (less efficient) way to achieve the same result could be:

static NPF_SIZE_MIN(minsize_201, 201);
static NPF_ETH_TYPE_UNMATCH(not_ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(reject_big_pkts, NET_DROP, minsize_201);
static NPF_RULE(reject_non_ip, NET_DROP, not_ip_packet);

void install_my_filter(void) {
  npf_append_recv_rule(&reject_big_pkts);
  npf_append_recv_rule(&reject_non_ip);
  npf_append_recv_rule(&npf_default_ok);
}

API Reference

group net_pkt_filter

Network Packet Filter API.

Defines

npf_insert_send_rule(rule)
npf_insert_recv_rule(rule)
npf_append_send_rule(rule)
npf_append_recv_rule(rule)
npf_remove_send_rule(rule)
npf_remove_recv_rule(rule)
npf_remove_all_send_rules()
npf_remove_all_recv_rules()

NPF_RULE(_name, _result, ...)

Statically define one packet filter rule.

This creates a rule from a variable amount of filter conditions. This rule can then be inserted or appended to the rule list for a given network packet path.

Example:
The above would accept IP packets that are 200 bytes or smaller, and drop all other packets.

Another (less efficient) way to create the same result could be:

```
static NPF_SIZE_MIN(minsize_201, 201);
static NPF_ETH_TYPE_UNMATCH(not_ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(reject_big_pkts, NET_DROP, minsize_201);
static NPF_RULE(reject_non_ip, NET_DROP, not_ip_packet);
void install_my_filter(void) {
    npf_append_recv_rule(&reject_big_pkts);
    npf_append_recv_rule(&reject_non_ip);
    npf_append_recv_rule(&npf_default_ok);
}
```

The first rule in the list for which all conditions are true determines the fate of the packet. If one condition is false then the next rule in the list is evaluated.

**Parameters**

- `_name` – Name for this rule.
- `_result` – Fate of the packet if all conditions are true, either `NET_OK` or `NET_DROP`.
- `...` – List of conditions for this rule.

**Functions**

`void npf_insert_rule(struct npf_rule_list *rules, struct npf_rule *rule)`

Insert a rule at the front of given rule list.

**Parameters**

- `rules` – the affected rule list
- `rule` – the rule to be inserted

`void npf_append_rule(struct npf_rule_list *rules, struct npf_rule *rule)`

Append a rule at the end of given rule list.

**Parameters**

- `rules` – the affected rule list
- `rule` – the rule to be appended

`bool npf_remove_rule(struct npf_rule_list *rules, struct npf_rule *rule)`

Remove a rule from the given rule list.

**Parameters**
• rules – the affected rule list
• rule – the rule to be removed

Return values
true – if given rule was found in the rule list and removed

bool npf_remove_all_rules(struct npf_rule_list *rules)
Remove all rules from the given rule list.

Parameters
• rules – the affected rule list

Return values
true – if at least one rule was removed from the rule list

Variables

struct npf_rule npf_default_ok
Default rule list termination for accepting a packet.

struct npf_rule npf_default_drop
Default rule list termination for rejecting a packet.

struct npf_rule_list npf_send_rules
rule list applied to outgoing packets

struct npf_rule_list npf_recv_rules
rule list applied to incoming packets

struct npf_rule_list npf_local_in_recv_rules
rule list applied for local incoming packets

struct npf_rule_list npf_ipv4_recv_rules
rule list applied for IPv4 incoming packets

struct npf_rule_list npf_ipv6_recv_rules
rule list applied for IPv6 incoming packets

struct npf_test
#include <net_pkt_filter.h> common filter test structure to be embedded into larger structures

Public Members

npf_test_fn_t *fn
packet condition test function

struct npf_rule
#include <net_pkt_filter.h> filter rule structure
Public Members

defined net_verdict result
result if all tests pass

defined uint32_t nb_tests
number of tests for this rule

struct npf_test *tests[]
pointers to npf_test instances

struct npf_rule_list
#include <net_pkt_filter.h> rule set for a given test location

group npf_basic_cond

Defines

#define NPF_IFACE_MATCH(_name, _iface)
Statically define an “interface match” packet filter condition.

Parameters
• _name – Name of the condition
• _iface – Interface to match

#define NPF_IFACE_UNMATCH(_name, _iface)
Statically define an “interface unmatch” packet filter condition.

Parameters
• _name – Name of the condition
• _iface – Interface to exclude

#define NPF_ORIG_IFACE_MATCH(_name, _iface)
Statically define an “orig interface match” packet filter condition.

Parameters
• _name – Name of the condition
• _iface – Interface to match

#define NPF_ORIG_IFACE_UNMATCH(_name, _iface)
Statically define an “orig interface unmatch” packet filter condition.

Parameters
• _name – Name of the condition
• _iface – Interface to exclude

#define NPF_SIZE_MIN(_name, _size)
Statically define a “data minimum size” packet filter condition.

Parameters
• _name – Name of the condition
• _size – Lower bound of the packet’s data size
NPF_SIZE_MAX(_name, _size)
Statically define a “data maximum size” packet filter condition.

Parameters
- _name – Name of the condition
- _size – Higher bound of the packet’s data size

NPF_SIZE_BOUNDS(_name, _min_size, _max_size)
Statically define a “data bounded size” packet filter condition.

Parameters
- _name – Name of the condition
- _min_size – Lower bound of the packet’s data size
- _max_size – Higher bound of the packet’s data size

NPF_IP_SRC_ADDR_ALLOWLIST(_name, _ip_addr_array, _ip_addr_num, _af)
Statically define a “ip address allowlist” packet filter condition.
This tests if the packet source ip address matches any of the ip addresses contained in the provided set.

Parameters
- _name – Name of the condition
- _ip_addr_array – Array of struct in_addr or struct in6_addr items to test against
- _ip_addr_num – number of IP addresses in the array
- _af – Addresses family type (AF_INET / AF_INET6) in the array

NPF_IP_SRC_ADDR_BLOCKLIST(_name, _ip_addr_array, _ip_addr_num, _af)
Statically define a “ip address blocklist” packet filter condition.
This tests if the packet source ip address matches any of the ip addresses contained in the provided set.

Parameters
- _name – Name of the condition
- _ip_addr_array – Array of struct in_addr or struct in6_addr items to test against
- _ip_addr_num – number of IP addresses in the array
- _af – Addresses family type (AF_INET / AF_INET6) in the array

group npf_eth_cond

Defines

NPF_ETH_SRC_ADDR_MATCH(_name, _addr_array)
Statically define a “source address match” packet filter condition.
This tests if the packet source address matches any of the Ethernet addresses contained in the provided set.

Parameters
- _name – Name of the condition
• `_addr_array` – Array of `struct net_eth_addr` items to test against

NPF_ETH_SRC_ADDR_UNMATCH(\_name, \_addr\_array)

Statically define a “source address unmatch” packet filter condition.

This tests if the packet source address matches none of the Ethernet addresses contained in the provided set.

**Parameters**

- `_name` – Name of the condition
- `_addr_array` – Array of `struct net_eth_addr` items to test against

NPF_ETH_DST_ADDR_MATCH(\_name, \_addr\_array)

Statically define a “destination address match” packet filter condition.

This tests if the packet destination address matches any of the Ethernet addresses contained in the provided set.

**Parameters**

- `_name` – Name of the condition
- `_addr_array` – Array of `struct net_eth_addr` items to test against

NPF_ETH_DST_ADDR_UNMATCH(\_name, \_addr\_array)

Statically define a “destination address unmatch” packet filter condition.

This tests if the packet destination address matches none of the Ethernet addresses contained in the provided set.

**Parameters**

- `_name` – Name of the condition
- `_addr_array` – Array of `struct net_eth_addr` items to test against

NPF_ETH_SRC_ADDR_MASK_MATCH(\_name, \_addr\_array, ...)

Statically define a “source address match with mask” packet filter condition.

This tests if the packet source address matches any of the Ethernet addresses contained in the provided set after applying specified mask.

**Parameters**

- `_name` – Name of the condition
- `_addr_array` – Array of `struct net_eth_addr` items to test against
- ... – up to 6 mask bytes

NPF_ETH_DST_ADDR_MASK_MATCH(\_name, \_addr\_array, ...)

Statically define a “destination address match with mask” packet filter condition.

This tests if the packet destination address matches any of the Ethernet addresses contained in the provided set after applying specified mask.

**Parameters**

- `_name` – Name of the condition
- `_addr_array` – Array of `struct net_eth_addr` items to test against
- ... – up to 6 mask bytes

NPF_ETH_TYPE_MATCH(\_name, \_type)

Statically define an “Ethernet type match” packet filter condition.

**Parameters**

- `_name` – Name of the condition
- **_type** – Ethernet type to match

```c
NPF_ETH_TYPE_UNMATCH(_name, _type)
```

Statically define an “Ethernet type unmatch” packet filter condition.

**Parameters**

- **_name** – Name of the condition
- **_type** – Ethernet type to exclude

**Network Shell**

Network shell provides helpers for figuring out network status, enabling/disabling features, and issuing commands like ping or DNS resolving. Note that net-shell should probably not be used in production code as it will require extra memory. See also *generic shell* for detailed shell information.

The following net-shell commands are implemented:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>net allocs</td>
<td>Print network memory allocations. Only available if CONFIG_NET_DEBUG_NET_PKT_ALLOC is set.</td>
</tr>
<tr>
<td>net arp</td>
<td>Print information about IPv4 ARP cache. Only available if CONFIG_NET_ARP is set in IPv4 enabled networks.</td>
</tr>
<tr>
<td>net capture</td>
<td>Monitor network traffic. See <em>Monitor Network Traffic</em> for details.</td>
</tr>
<tr>
<td>net conn</td>
<td>Print information about network connections.</td>
</tr>
<tr>
<td>net dns</td>
<td>Show how DNS is configured. The command can also be used to resolve a DNS name. Only available if CONFIG_DNS_RESOLVER is set.</td>
</tr>
<tr>
<td>net events</td>
<td>Enable network event monitoring. Only available if CONFIG_NET_MGMT_EVENT_MONITOR is set.</td>
</tr>
<tr>
<td>net gptp</td>
<td>Print information about gPTP support. Only available if CONFIG_NET_GPTP is set.</td>
</tr>
<tr>
<td>net iface</td>
<td>Print information about network interfaces.</td>
</tr>
<tr>
<td>net ipv6</td>
<td>Print IPv6 specific information and configuration. Only available if CONFIG_NET_IPV6 is set.</td>
</tr>
<tr>
<td>net mem</td>
<td>Print information about network memory usage. The command will print more information if CONFIG_NET_BUF_POOL_USAGE is set.</td>
</tr>
<tr>
<td>net nbr</td>
<td>Print neighbor information. Only available if CONFIG_NET_IPV6 is set.</td>
</tr>
<tr>
<td>net ping</td>
<td>Ping a network host.</td>
</tr>
<tr>
<td>net route</td>
<td>Show IPv6 network routes. Only available if CONFIG_NET_ROUTE is set.</td>
</tr>
<tr>
<td>net sockets</td>
<td>Show network socket information and statistics. Only available if CONFIG_NET_SOCKETS_OBJ_CORE and CONFIG_OBJ_CORE are set.</td>
</tr>
<tr>
<td>net stats</td>
<td>Show network statistics.</td>
</tr>
<tr>
<td>net tcp</td>
<td>Connect/send data/close TCP connection. Only available if CONFIG_NET_TCP is set.</td>
</tr>
<tr>
<td>net vlan</td>
<td>Show Ethernet virtual LAN information. Only available if CONFIG_NET_VLAN is set.</td>
</tr>
</tbody>
</table>

**TLS Credentials Shell**

The TLS Credentials shell provides a command-line interface for managing installed TLS credentials.

**Commands**

**Buffer Credential (buf)**

Buffer data incrementally into the credential buffer so that it can be added using the *Add Credential (add)* command.

Alternatively, clear the credential buffer.
Usage To append `<DATA>` to the credential buffer, use:

```
cred buf <DATA>
```

Use this as many times as needed to load the full credential into the credential buffer, then use the `Add Credential (add)` command to store it.

To clear the credential buffer, use:

```
cred buf clear
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;DATA&gt;</code></td>
<td>Text data to be appended to credential buffer. It can be either text, or base64-encoded binary. See <code>Add Credential (add)</code> and <code>Storage/Retrieval Formats</code> for details.</td>
</tr>
</tbody>
</table>

**Add Credential (add)** Add a TLS credential to the TLS Credential store.

Credential contents can be provided in-line with the call to `cred add`, or will otherwise be sourced from the credential buffer.

Usage To add a TLS credential using the data from the credential buffer, use:

```
cred add <SECTAG> <TYPE> <BACKEND> <FORMAT>
```

To add a TLS credential using data provided with the same command, use:

```
cred add <SECTAG> <TYPE> <BACKEND> <FORMAT> <DATA>
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;SECTAG&gt;</code></td>
<td>The sectag to use for the new credential. Can be any non-negative integer.</td>
</tr>
<tr>
<td><code>&lt;TYPE&gt;</code></td>
<td>The type of credential to add. See <code>Credential Types</code> for valid values.</td>
</tr>
<tr>
<td><code>&lt;BACKEND&gt;</code></td>
<td>Reserved. Must always be <code>DEFAULT</code> (case-insensitive).</td>
</tr>
<tr>
<td><code>&lt;FORMAT&gt;</code></td>
<td>Specifies the storage format of the provided credential. See <code>Storage/Retrieval Formats</code> for valid values.</td>
</tr>
<tr>
<td><code>&lt;DATA&gt;</code></td>
<td>If provided, this argument will be used as the credential data, instead of any data in the credential buffer. Can be either text, or base64-encoded binary.</td>
</tr>
</tbody>
</table>

**Delete Credential (del)** Delete a specified credential from the credential store.

Usage To delete a credential matching a specified sectag and credential type (if it exists), use:

```
cred del <SECTAG> <TYPE>
```

6.3. Networking
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;SECTAG&gt;</td>
<td>The sectag of the credential to delete. Can be any non-negative integer.</td>
</tr>
<tr>
<td>&lt;TYPE&gt;</td>
<td>The type of credential to delete. See Credential Types for valid values.</td>
</tr>
</tbody>
</table>

Get Credential Contents (get)  Retrieve and print the contents of a specified credential.

Usage  To retrieve and print a credential matching a specified sectag and credential type (if it exists), use:

```
cred get <SECTAG> <TYPE> <FORMAT>
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;SECTAG&gt;</td>
<td>The sectag of the credential to get. Can be any non-negative integer.</td>
</tr>
<tr>
<td>&lt;TYPE&gt;</td>
<td>The type of credential to get. See Credential Types for valid values.</td>
</tr>
<tr>
<td>&lt;FORMAT&gt;</td>
<td>Specifies the retrieval format for the provided credential. See Storage/Retrieval Formats for valid values.</td>
</tr>
</tbody>
</table>

List Credentials (list)  List TLS credentials in the credential store.

Usage  To list all available credentials, use:

```
cred list
```

To list all credentials with a specified sectag, use:

```
cred list <SECTAG>
```

To list all credentials with a specified credential type, use:

```
cred list any <TYPE>
```

To list all credentials with a specified credential type and sectag, use:

```
cred list <SECTAG> <TYPE>
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;SECTAG&gt;</td>
<td>Optional. If provided, only list credentials with this sectag. Pass any or omit to allow any sectag. Otherwise, can be any non-negative integer.</td>
</tr>
<tr>
<td>&lt;TYPE&gt;</td>
<td>Optional. If provided, only list credentials with this credential type. Pass any or omit to allow any credential type. Otherwise, see Credential Types for valid values.</td>
</tr>
</tbody>
</table>
**Output**  The command outputs all matching credentials in the following (CSV-compliant) format:

```
<SECTAG>,<TYPE>,<DIGEST>,<STATUS>
```

Where:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;SECTAG&gt;</td>
<td>The sectag of the listed credential. A non-negative integer.</td>
</tr>
<tr>
<td>&lt;TYPE&gt;</td>
<td>Credential type short-code (see <strong>Credential Types</strong> for details) of the listed credential.</td>
</tr>
<tr>
<td>&lt;DIGEST&gt;</td>
<td>A string digest representing the credential contents. The exact nature of this digest may vary depending on credentials storage backend, but currently for all backends this is a base64 encoded SHA256 hash of the raw credential contents (so different storage formats for essentially identical credentials will have different digests).</td>
</tr>
<tr>
<td>&lt;STATUS&gt;</td>
<td>Status code indicating success or failure with generating a digest of the listed credential. 0 if successful, negative error code specific to the storage backend otherwise. Lines for which status is not zero will be printed with error formatting.</td>
</tr>
</tbody>
</table>

After the list is printed, a final summary of the found credentials will be printed in the form:

```
<N> credentials found.
```

Where <N> is the number of credentials found, and is zero if none are found.

**Credential Types**  The following keywords (case-insensitive) may be used to specify a credential type:

<table>
<thead>
<tr>
<th>Keyword(s)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CA_CERT, CA</td>
<td>A trusted CA certificate.</td>
</tr>
<tr>
<td>SERVER_CERT, SELF_CERT, CLIENT_CERT, CLIENT, SELF, SERV</td>
<td>Self or server certificate.</td>
</tr>
<tr>
<td>PRI- VATE_KEY, PK</td>
<td>A private key.</td>
</tr>
<tr>
<td>PRE_SHARED_ , PSK</td>
<td>A pre-shared key.</td>
</tr>
<tr>
<td>PRE_SHARED_ , PSK_ID</td>
<td>ID for pre-shared key.</td>
</tr>
</tbody>
</table>

**Storage/Retrieval Formats**  The *tls_credentials* module treats stored credentials as arbitrary binary buffers.

For convenience, the TLS credentials shell offers four formats for providing and later retrieving these buffers using the shell.

These formats and their (case-insensitive) keywords are as follows:
### Key-word Meaning

<table>
<thead>
<tr>
<th>Key-word</th>
<th>Meaning</th>
<th>Behavior during storage</th>
<th>Behavior during retrieval</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIN</td>
<td>Credential is handled by shell as base64 and stored without NULL termination.</td>
<td>Data entered into shell will be decoded from base64 into raw binary before storage. No terminator will be appended.</td>
<td>Stored data will be encoded into base64 before being printed.</td>
</tr>
<tr>
<td>BINT</td>
<td>Credential is handled by shell as base64 and stored with NULL termination.</td>
<td>Data entered into shell will be decoded from base64 into raw binary and a NULL terminator will be appended before storage.</td>
<td>NULL terminator will be truncated from stored data before said data is encoded into base64 and then printed.</td>
</tr>
<tr>
<td>STR</td>
<td>Credential is handled by shell as literal string and stored without NULL termination.</td>
<td>Text data entered into shell will be passed into storage as-written, without a NULL terminator.</td>
<td>Stored data will be printed as text. Non-printable characters will be printed as ?</td>
</tr>
<tr>
<td>STRT</td>
<td>Credential is handled by shell as literal string and stored with NULL termination.</td>
<td>Text data entered into shell will be passed into storage as-written, with a NULL terminator.</td>
<td>NULL terminator will be truncated from stored data before said data is printed as text. Non-printable characters will be printed as ?</td>
</tr>
</tbody>
</table>

The BIN format can be used to install credentials of any type, since base64 can be used to encode any conceivable binary buffer. The remaining three formats are provided for convenience in special use-cases.

For example:

- To install printable pre-shared-keys, use STR to enter the PSK without first encoding it. This ensures it is stored without a NULL terminator.
- To install DER-formatted X.509 certificates (or other raw-binary credentials, such as non-printable PSKs) base64-encode the binary and use the BIN format.
- To install PEM-formatted X.509 certificates or certificate chains, base64 encode the full PEM string (including new-lines and -----BEGIN X ----- / -----END X----- markers), and then use the BINT format to make sure the stored string is NULL-terminated. This is required because Zephyr does not support multi-line strings in the shell. Otherwise, the STRT format could be used for this purpose without base64 encoding. It is possible to use BIN instead if you manually encode a NULL terminator into the base64.

### Time Sensitive Networking

#### generic Precision Time Protocol (gPTP)

- **Overview**
- **Supported features**
- **Supported hardware**
- **Enabling the stack**
- **Application interfaces**
- **Testing**
- **API Reference**
Overview   This gPTP stack supports the protocol and procedures as defined in the IEEE 802.1AS-2011 standard (Timing and Synchronization for Time-Sensitive Applications in Bridged Local Area Networks).

Supported features The stack handles communications and state machines defined in the IEEE 802.1AS-2011 standard. Mandatory requirements for a full-duplex point-to-point link endpoint, as defined in Annex A of the standard, are supported.

The stack is in principle capable of handling communications on multiple network interfaces (also defined as “ports” in the standard) and thus act as a 802.1AS bridge. However, this mode of operation has not been validated on the Zephyr OS.

Supported hardware Although the stack itself is hardware independent, Ethernet frame timestamping support must be enabled in ethernet drivers.

Boards supported:
- frdm_k64f
- nucleo_h743zi_board
- nucleo_h745zi_q_board
- nucleo_f767zi_board
- sam_e70_xplained
- native_sim (only usable for simple testing, limited capabilities due to lack of hardware clock)
- qemu_x86 (emulated, limited capabilities due to lack of hardware clock)

Enabling the stack The following configuration option must me enabled in prj.conf file.
- CONFIG_NET_GPTP

Application interfaces Only two Application Interfaces as defined in section 9 of the standard are available:
- ClockTargetPhaseDiscontinuity interface (gptp_register_phase_dis_cb())
- ClockTargetEventCapture interface (gptp_event_capture())

Testing The stack has been informally tested using the OpenAVnu gPTP and Linux ptp4l daemons. The gPTP sample application from the Zephyr source distribution can be used for testing.

API Reference Related code samples
gPTP Enable gPTP support and monitor functionality using net-shell.

-group gptp
generic Precision Time Protocol (gPTP) support
**Typedefs**

typedef void (*gptp_phase_dis_callback_t)(uint8_t *gm_identity, uint16_t *time_base, struct gptp_scaled_ns *last_gm_ph_change, double *last_gm_freq_change)

Define callback that is called after a phase discontinuity has been sent by the grandmaster.

**Param gm_identity**
A pointer to first element of a ClockIdentity array. The size of the array is GPTP_CLOCK_ID_LEN.

**Param time_base**
A pointer to the value of timeBaseIndicator of the current grandmaster.

**Param last_gm_ph_change**
A pointer to the value of lastGmPhaseChange received from grandmaster.

**Param last_gm_freq_change**
A pointer to the value of lastGmFreqChange received from the grandmaster.

typedef void (*gptp_port_cb_t)(int port, struct net_if *iface, void *user_data)

Callback used while iterating over gPTP ports.

**Param port**
Port number

**Param iface**
Pointer to network interface

**Param user_data**
A valid pointer to user data or NULL

**Functions**

void gptp_register_phase_dis_cb(struct gptp_phase_dis_cb *phase_dis, gptp_phase_dis_callback_t cb)

Register a phase discontinuity callback.

**Parameters**
- **phase_dis** – Caller specified handler for the callback.
- **cb** – Callback to register.

void gptp_unregister_phase_dis_cb(struct gptp_phase_dis_cb *phase_dis)

Unregister a phase discontinuity callback.

**Parameters**
- **phase_dis** – Caller specified handler for the callback.

void gptp_call_phase_dis_cb(void)

Call a phase discontinuity callback function.

int gptp_event_capture(struct net_ptp_time *slave_time, bool *gm_present)

Get gPTP time.

**Parameters**
- **slave_time** – A pointer to structure where timestamp will be saved.
• **gm_present** – A pointer to a boolean where status of the presence of a grand master will be saved.

**Returns**
Error code. 0 if no error.

```c
char *gptp_sprint_clock_id(const uint8_t *clk_id, char *output, size_t output_len)
```
Utility function to print clock id to a user supplied buffer.

**Parameters**
- `clk_id` – Clock id
- `output` – Output buffer
- `output_len` – Output buffer len

**Returns**
Pointer to output buffer

```c
void gptp_foreach_port(gptp_port_cb_t cb, void *user_data)
```
Go through all the gPTP ports and call callback for each of them.

**Parameters**
- `cb` – User-supplied callback function to call
- `user_data` – User specified data

```c
struct gptp_domain *gptp_get_domain(void)
```
Get gPTP domain.

This contains all the configuration / status of the gPTP domain.

**Returns**
Pointer to domain or NULL if not found.

```c
void gptp_clk_src_time_invoke(struct gptp_clk_src_time_invoke_params *arg)
```
This interface is used by the ClockSource entity to provide time to the ClockMaster entity of a time-aware system.

**Parameters**
- `arg` – Current state and parameters of the ClockSource entity.

```c
struct gptp_hdr *gptp_get_hdr(struct net_pkt *pkt)
```
Return pointer to gPTP packet header in network packet.

**Parameters**
- `pkt` – Network packet (received or sent)

**Returns**
Pointer to gPTP header.

```c
struct gptp_scaled_ns
```

```
#include <gptp.h> Scaled Nanoseconds.
```

**Public Members**

```c
int32_t high
```
High half.
int64_t low
    Low half.

struct gptp_uscaled_ns
    #include <gptp.h> UScaled Nanoseconds.

Public Members

    uint32_t high
        High half.

    uint64_t low
        Low half.

struct gptp_port_identity
    #include <gptp.h> Port Identity.

Public Members

    uint8_t clk_id[GPTP_CLOCK_ID_LEN]
        Clock identity of the port.

    uint16_t port_number
        Number of the port.

struct gptp_flags
    #include <gptp.h>

Public Members

    uint8_t octets[2]
        Byte access.

    uint16_t all
        Whole field access.

struct gptp_hdr
    #include <gptp.h>

Public Members

    uint8_t message_type
        Type of the message.
uint8_t transport_specific
   Transport specific, always 1.

uint8_t ptp_version
   Version of the PTP, always 2.

uint8_t reserved0
   Reserved field.

uint8_t reserved1
   Reserved field.

struct gptp_flags flags
   Message flags.

int64_t correction_field
   Correction Field.
   The content depends of the message type.

uint32_t reserved2
   Reserved field.

struct gptp_port_identity port_id
   Port Identity of the sender.

uint16_t sequence_id
   Sequence Id.

uint8_t control
   Control value.
   Sync: 0, Follow-up: 2, Others: 5.

int8_t log_msg_interval
   Message Interval in Log2 for Sync and Announce messages.

struct gptp_phase_dis_cb
   #include <gptp.h> Phase discontinuity callback structure.
   Stores the phase discontinuity callback information. Caller must make sure that the
   variable pointed by this is valid during the lifetime of registration. Typically this means
   that the variable cannot be allocated from stack.
Public Members

`sys_snodet` node
Node information for the slist.

`gptp_phase_dis_callback_t` cb
Phase discontinuity callback.

```c
#include <gptp.h>
ClockSourceTime invoke function parameters.
Parameters passed by ClockSourceTime.invoke function.
```

Public Members

double last_gm_freq_change
Frequency change on the last Time Base Indicator Change.

```c
struct net_ptp_extended_time src_time
The time this function is invoked.
```

```c
struct gptp_scaled_ns last_gm_phase_change
Phase change on the last Time Base Indicator Change.
```

```c
uint16_t time_base_indicator
Time Base - changed only if Phase or Frequency changes.
```

Network time representation in the network stack

API Reference

`group net_time`

Defines

```c
NET_TIME_MAX
The largest positive time value that can be represented by net_time_t.
```

```c
NET_TIME_MIN
The smallest negative time value that can be represented by net_time_t.
```

```c
NET_TIME_SEC_MAX
The largest positive number of seconds that can be safely represented by net_time_t.
```

```c
NET_TIME_SEC_MIN
The smallest negative number of seconds that can be safely represented by net_time_t.
```
**Typedefs**

typedef int64_t net_time_t

Any occurrence of net_time_t specifies a concept of nanosecond resolution scalar time span, future (positive) or past (negative) relative time or absolute timestamp referred to some local network uptime reference clock that does not wrap during uptime and is - in a certain, well-defined sense - common to all local network interfaces, sometimes even to remote interfaces on the same network.

This type is EXPERIMENTAL. Usage is currently restricted to representation of time within the network subsystem.

Timed network protocols (PTP, TDMA, ...) usually require several local or remote interfaces to share a common notion of elapsed time within well-defined tolerances. Network uptime therefore differs from time represented by a single hardware counter peripheral in that it will need to be represented in several distinct hardware peripherals with different frequencies, accuracy and precision. To co-operate, these hardware counters will have to be "syntonized" or "disciplined" (i.e. frequency and phase locked) with respect to a common local or remote network reference time signal. Be aware that while syntonized clocks share the same frequency and phase, they do not usually share the same epoch (zero-point).

This also explains why network time, if represented as a cycle value of some specific hardware counter, will never be “precise” but only can be “good enough” with respect to the tolerances (resolution, drift, jitter) required by a given network protocol. All counter peripherals involved in a timed network protocol must comply with these tolerances.

Please use specific cycle/tick counter values rather than net_time_t whenever possible especially when referring to the kernel system clock or values of any single counter peripheral.

net_time_t cannot represent general clocks referred to an arbitrary epoch as it only covers roughly +/- ~290 years. It also cannot be used to represent time according to a more complex timescale (e.g. including leap seconds, time adjustments, complex calendars or time zones). In these cases you may use timespec (C11, POSIX.1-2001), timeval (POSIX.1-2001) or broken down time as in tm (C90). The advantage of net_time_t over these structured time representations is lower memory footprint, faster and simpler scalar arithmetics and easier conversion from/to low-level hardware counter values. Also net_time_t can be used in the network stack as well as in applications while POSIX concepts cannot. Converting net_time_t from/to structured time representations is possible in a limited way but - except for timespec - requires concepts that must be implemented by higher-level APIs. Utility functions converting from/to timespec will be provided as part of the net_time_t API as and when needed.

If you want to represent more coarse grained scalar time in network applications, use time_t (C99, POSIX.1-2001) which is specified to represent seconds or suseconds_t (POSIX.1-2001) for microsecond resolution. Kernel k_ticks_t and cycles (both specific to Zephyr) have an unspecified resolution but are useful to represent kernel timer values and implement high resolution spinning.

If you need even finer grained time resolution, you may want to look at (g)PTP concepts, see net_ptp_extended_time.

The reason why we don’t use int64_t directly to represent scalar nanosecond resolution times in the network stack is that it has been shown in the past that fields using generic type will often not be used correctly (e.g. with the wrong resolution or to represent underspecified concepts of time with unclear syntonization semantics).
Any API that exposes or consumes net_time_t values SHALL ensure that it maintains the specified contract including all protocol specific tolerances and therefore clients can rely on common semantics of this type. This makes times coming from different hardware peripherals and even from different network nodes comparable within well-defined limits and therefore net_time_t is the ideal intermediate building block for timed network protocols.

### Precision Time Protocol (PTP) time format

- **Overview**
- **API Reference**

**Overview** The PTP time struct can store time information in high precision format (nanoseconds). The extended timestamp format can store the time in fractional nanoseconds accuracy. The PTP time format is used in *generic Precision Time Protocol (gPTP)* implementation.

**API Reference**

**Related code samples**

**gPTP**

Enable gPTP support and monitor functionality using net-shell.

**group ptp_time**

Precision Time Protocol time specification.

**Functions**

static inline net_time_t net_ptp_time_to_ns(struct net_ptp_time *ts)

Convert a PTP timestamp to a nanosecond precision timestamp, both related to the local network reference clock.

**Note:** Only timestamps representing up to ~290 years can be converted to nanosecond timestamps. Larger timestamps will return the maximum representable nanosecond precision timestamp.

**Parameters**

- ts – the PTP timestamp

**Returns**

the corresponding nanosecond precision timestamp

static inline struct net_ptp_time ns_to_net_ptp_time(net_time_t nsec)

Convert a nanosecond precision timestamp to a PTP timestamp, both related to the local network reference clock.

**Parameters**

- nsec – a nanosecond precision timestamp

**Returns**

the corresponding PTP timestamp
struct net_ptp_time

#include <ptp_time.h> (Generalized) Precision Time Protocol Timestamp format.

This structure represents a timestamp according to the Precision Time Protocol standard (“PTP”, IEEE 1588, section 5.3.3), the Generalized Precision Time Protocol standard (“gPTP”, IEEE 802.1AS, section 6.4.3.4), or any other well-defined context in which precision structured timestamps are required on network messages in Zephyr.

Seconds are encoded as a 48 bits unsigned integer. Nanoseconds are encoded as a 32 bits unsigned integer.

In the context of (g)PTP, timestamps designate the time, relative to a local clock (“LocalClock”) at which the message timestamp point passes a reference plane marking the boundary between the PTP Instance and the network medium (IEEE 1855, section 7.3.4.2; IEEE 802.1AS, section 8.4.3).

The exact definitions of the message timestamp point and reference plane depends on the network medium and use case.

For (g)PTP the media-specific message timestamp points and reference planes are defined in the standard. In non-PTP contexts specific to Zephyr, timestamps are measured relative to the same local clock but with a context-specific message timestamp point and reference plane, defined below per use case.

A “LocalClock” is a freerunning clock, embedded into a well-defined entity (e.g. a PTP Instance) and provides a common time to that entity relative to an arbitrary epoch (IEEE 1855, section 3.1.26, IEEE 802.1AS, section 3.16).

In Zephyr, the local clock is usually any instance of a kernel system clock driver, counter driver, RTC API driver or low-level counter/timer peripheral (e.g. an ethernet peripheral with hardware timestamp support or a radio timer) with sufficient precision for the context in which it is used.

See IEEE 802.1AS, Annex B for specific performance requirements regarding conformance of local clocks in the gPTP context. See IEEE 1588, Annex A, section A5.4 for general performance requirements regarding PTP local clocks. See IEEE 802.15.4-2020, section 15.7 for requirements in the context of ranging applications and ibid., section 6.7.6 for the relation between guard times and clock accuracy which again influence the precision required for subprotocols like CSL, TSCH, RIT, etc.

Applications that use timestamps across different subsystems or media must ensure that they understand the definition of the respective reference planes and interpret timestamps accordingly. Applications must further ensure that timestamps are either all referenced to the same local clock or convert between clocks based on sufficiently precise conversion algorithms.

Timestamps may be measured on ingress (RX timestamps) or egress (TX timestamps) of network messages. Timestamps can also be used to schedule a network message to a well-defined point in time in the future at which it is to be sent over the medium (timed TX). A future timestamp and a duration, both referenced to the local clock, may be given to specify a time window at which a network device should expect incoming messages (RX window).

In Zephyr this timestamp structure is currently used in the following contexts:

- gPTP for Full Duplex Point-to-Point IEEE 802.3 links (IEEE 802.1AS, section 11): the reference plane and message timestamp points are as defined in the standard.
- IEEE 802.15.4 timed TX and RX: Timestamps designate the point in time at which the end of the last symbol of the start-of-frame delimiter (SFD) (or equivalently, the start of the first symbol of the PHY header) is at the local antenna. The standard also refers to this as the “RMARKER” (IEEE 802.15.4-2020, section 6.9.1) or “symbol boundary” (ibid., section 6.5.2), depending on the context. In the context of beacon timestamps, the difference between the timestamp measurement plane and the...
reference plane is defined by the MAC PIB attribute “macSyncSymbolOffset”, ibid., section 8.4.3.1, table 8-94.

If further use cases are added to Zephyr using this timestamp structure, their clock performance requirements, message timestamp points and reference plane definition SHALL be added to the above list.

**Public Members**

```c
union net_ptp_time
  Seconds encoded on 48 bits.

uint32_t nanosecond
  Nanoseconds.
```

```c
struct net_ptp_extended_time

#include <ptp_time.h> Generalized Precision Time Protocol Extended Timestamp format.

This structure represents an extended timestamp according to the Generalized Precision Time Protocol standard (IEEE 802.1AS), see section 6.4.3.5.

Seconds are encoded as 48 bits unsigned integer. Fractional nanoseconds are encoded as 48 bits, their unit is 2*(-16) ns.

A precise definition of PTP timestamps and their uses in Zephyr is given in the description of net_ptp_time.

**Public Members**

```c
union net_ptp_extended_time
  Seconds encoded on 48 bits.

union net_ptp_extended_time
  Fractional nanoseconds on 48 bits.
```

**Generic GSM Modem**

**Overview**  The generic GSM modem driver allows the user to connect Zephyr to a GSM modem which provides a data connection to cellular operator’s network. The Zephyr uses PPP (Point-to-Point Protocol) to connect to the GSM modem using UART. Note that some cellular modems have proprietary offloading support using AT commands, but usually those modems also support 3GPP standards and provide PPP connection to them. See GSM modem sample application how to setup Zephyr to use the GSM modem.

The GSM muxing, that is defined in GSM 07.10, and which allows mixing of AT commands and PPP traffic, is also supported in this version of Zephyr. One needs to enable CONFIG_GSM_MUX and CONFIG_UART_MUX configuration options to enable muxing.

**zperf: Network Traffic Generator**
Overview  
zperf is a shell utility which allows to generate network traffic in Zephyr. The tool may be used to evaluate network bandwidth.

zperf is compatible with iPerf_2.0.5. Note that in newer iPerf versions, an error message like this is printed and the server reported statistics are missing.

LAST PACKET NOT RECEIVED!!!

zperf can be enabled in any application, a dedicated sample is also present in Zephyr. See zperf sample application for details.

Sample Usage  
If Zephyr acts as a client, iPerf must be executed in server mode. For example, the following command line must be used for UDP testing:

```
$ iperf -s -l 1K -u -V -B 2001:db8::2
```

For TCP testing, the command line would look like this:

```
$ iperf -s -l 1K -V -B 2001:db8::2
```

In the Zephyr console, zperf can be executed as follows:

```
zperf udp upload 2001:db8::2 5001 10 1K 1M
```

For TCP the zperf command would look like this:

```
zperf tcp upload 2001:db8::2 5001 10 1K 1M
```

If the IP addresses of Zephyr and the host machine are specified in the config file, zperf can be started as follows:

```
zperf udp upload2 v6 10 1K 1M
```

or like this if you want to test TCP:

```
zperf tcp upload2 v6 10 1K 1M
```

If Zephyr is acting as a server, set the download mode as follows for UDP:

```
zperf udp download 5001
```

or like this for TCP:

```
zperf tcp download 5001
```

and in the host side, iPerf must be executed with the following command line if you are testing UDP:

```
$ iperf -l 1K -u -V -c 2001:db8::1 -p 5001
```

and this if you are testing TCP:

```
$ iperf -l 1K -V -c 2001:db8::1 -p 5001
```

iPerf output can be limited by using the -b option if Zephyr is not able to receive all the packets in orderly manner.
6.3.7 Connection Manager

Overview

Connection Manager is a collection of optional Zephyr features that aim to allow applications to monitor and control connectivity (access to IP-capable networks) with minimal concern for the specifics of underlying network technologies.

Using Connection Manager, applications can use a single abstract API to control network association and monitor Internet access, and avoid excessive use of technology-specific boilerplate.

This allows an application to potentially support several very different connectivity technologies (for example, Wi-Fi and LTE) with a single codebase.

Applications can also use Connection Manager to generically manage and use multiple connectivity technologies simultaneously.

Structure  Connection Manager is split into the following two subsystems:

- **Connectivity monitoring** (header file include/zephyr/net/conn_mgr_monitoring.h) monitors all available Zephyr network interfaces (ifaces) and triggers network management events indicating when IP connectivity is gained or lost.

- **Connectivity control** (header file include/zephyr/net/conn_mgr_connectivity.h) provides an abstract API for controlling iface network association.

![Fig. 18: A simplified view of how Connection Manager integrates with Zephyr and the application. See here for a more detailed version.](image)

See here for a more detailed version.
Connectivity monitoring

Connectivity monitoring tracks all available ifaces (whether or not they support Connectivity control) as they transition through various operational states and acquire or lose assigned IP addresses.

Each available iface is considered ready if it meets the following criteria:

- The iface is admin-up
  - This means the iface has been instructed to become operational-up (ready for use). This is done by a call to `net_if_up()`.
- The iface is oper-up
  - This means the interface is completely ready for use; It is online, and if applicable, has associated with a network.
  - See Network interface state management for details.
- The iface has at least one assigned IP address
  - Both IPv4 and IPv6 addresses are acceptable. This condition is met as soon as one or both of these is assigned.
  - See Network Interface for details on iface IP assignment.
- The iface has not been ignored
  - Ignored ifaces are always treated as unready.
  - See Ignoring ifaces for more details.

Note: Typically, iface state and IP assignment are updated either by the iface's L2 implementation or bound connectivity implementation.

See Implement iface state reporting for details.

A ready iface ceases to be ready the moment any of the above conditions is lost.

When at least one iface is ready, the NET_EVENT_L4_CONNECTED network management event is triggered, and IP connectivity is said to be ready.

Afterwards, ifaces can become ready or unready without firing additional events, so long as there always remains at least one ready iface.

When there are no longer any ready ifaces left, the NET_EVENT_L4_DISCONNECTED network management event is triggered, and IP connectivity is said to be unready.

Usage Connectivity monitoring is enabled if the CONFIG_NET_CONNECTION_MANAGER Kconfig option is enabled.

To receive connectivity updates, create and register a listener for the NET_EVENT_L4_CONNECTED and NET_EVENT_L4_DISCONNECTED network management events:

```c
/* Callback struct where the callback will be stored */
struct net_mgmt_event_callback l4_callback;

/* Callback handler */
static void l4_event_handler(struct net_mgmt_event_callback *cb,
                             uint32_t event, struct net_if *iface)
{
    if (event == NET_EVENT_L4_CONNECTED) {
        LOG_INF("Network connectivity gained!");
    } else if (event == NET_EVENT_L4_DISCONNECTED) {
```

(continues on next page)
LOG_INF("Network connectivity lost!");
}

/* Otherwise, it's some other event type we didn't register for. */
}

/* Call this before Connection Manager monitoring initializes */
static void my_application_setup(void)
{
    /* Configure the callback struct to respond to (at least) the L4_CONNECTED
     * and L4_DISCONNECTED events.
     * *
     * Note that the callback may also be triggered for events other than those
     * specified here!
     * (See the net_mgmt documentation)
     */
    net_mgmt_init_event_callback(&l4_callback, l4_event_handler,
        NET_EVENT_L4_CONNECTED | NET_EVENT_L4_DISCONNECTED);

    /* Register the callback */
    net_mgmt_add_event_callback(&l4_callback);
}

See Listening to network events for more details on listening for net_mgmt events.

**Note:** To avoid missing initial connectivity events, you should register your listener(s) before Connection Manager monitoring initializes. See Avoiding missed notifications for strategies to ensure this.

**Avoiding missed notifications** Connectivity monitoring may trigger events immediately upon initialization.

If your application registers its event listeners after connectivity monitoring initializes, it is possible to miss this first wave of events, and not be informed the first time network connectivity is gained.

If this is a concern, your application should register its event listeners before connectivity monitoring initializes.

Connectivity monitoring initializes using the SYS_INIT APPLICATION initialization priority specified by the CONFIG_NET_CONNECTION_MANAGER_MONITOR_PRIORITY Kconfig option.

You can register your callbacks before this initialization by using SYS_INIT with an earlier initialization priority than this value, for instance priority 0:

```c
static int my_application_setup(void)
{
    /* Register callbacks here */
    return 0;
}

SYS_INIT(my_application_setup, APPLICATION, 0);
```

If this is not feasible, you can instead request that connectivity monitoring resend the latest connectivity events at any time by calling `conn_mg_mon_resend_status()`:

```c
2764 Chapter 6. Connectivity
```
Ignoring ifaces  
Applications can request that ifaces be ignored by Connection Manager by calling `conn_mgr_ignore_iface()` with the iface to be ignored.

Alternatively, an entire L2 implementation can be ignored by calling `conn_mgr_ignore_l2()`.

This has the effect of individually ignoring all the ifaces using that L2 implementation.

While ignored, the iface is treated by Connection Manager as though it were unready for network traffic, no matter its actual state.

This may be useful, for instance, if your application has configured one or more ifaces that cannot (or for whatever reason should not) be used to contact the wider Internet.

*Bulk convenience functions* optionally skip ignored ifaces.

See `conn_mgr_ignore_iface()` and `conn_mgr_watch_iface()` for more details.

**Connectivity monitoring API** Include header file `include/zephyr/net/conn_mgr_monitoring.h` to access these.

*group* conn_mgr

Connection Manager API.

**Functions**

void *conn mgr_mon_resend_status*(void)

Resend either NET_L4_CONNECTED or NET_L4_DISCONNECTED depending on whether connectivity is currently available.

void *conn mgr_ignore_iface*(struct net if *iface)

Mark an iface to be ignored by conn_mgr.

Ignoring an iface forces conn_mgr to consider it unready/disconnected.

This means that events related to the iface connecting/disconnecting will not be fired, and if the iface was connected before being ignored, events will be fired as though it disconnected at that moment.

**Parameters**

- iface – iface to be ignored.

void *conn mgr_watch_iface*(struct net if *iface)

Watch (stop ignoring) an iface.

conn_mgr will no longer be forced to consider the iface unready/disconnected.

Events related to the iface connecting/disconnecting will no longer be blocked, and if the iface was connected before being watched, events will be fired as though it connected in that moment.

All ifaces default to watched at boot.
Parameters

• iface – iface to no longer ignore.

bool conn_mgr_is_iface_ignored(struct net_if *iface)
Check whether the provided iface is currently ignored.

Parameters

• iface – The iface to check.

Return values

• true – if the iface is being ignored by conn_mgr.
• false – if the iface is being watched by conn_mgr.

void conn_mgr_ignore_l2(const struct net_l2 *l2)
Mark an L2 to be ignored by conn_mgr.

This is a wrapper for conn_mgr_ignore_iface that ignores all ifaces that use the L2.

Parameters

• l2 – L2 to be ignored.

void conn_mgr_watch_l2(const struct net_l2 *l2)
Watch (stop ignoring) an L2.

This is a wrapper for conn_mgr_watch_iface that watches all ifaces that use the L2.

Parameters

• l2 – L2 to watch.

Connectivity control

Many network interfaces require a network association procedure to be completed before being usable.

For such ifaces, connectivity control can provide a generic API to request network association (conn_mgr_if_connect()) and disassociation (conn_mgr_if_disconnect()). Network interfaces implement support for this API by binding themselves to a connectivity implementation.

Using this API, applications can associate with networks with minimal technology-specific boilerplate.

Connectivity control also provides the following additional features:

• Standardized persistence and timeout behaviors during association.

• Bulk functions for controlling the admin state and network association of all available ifaces simultaneously.

• Optional convenience automations for common connectivity actions.

Basic operation The following sections outline the basic operation of Connection Manager’s connectivity control.

Binding Before an iface can be commanded to associate or disassociate using Connection Manager, it must first be bound to a connectivity implementation. Binding is performed by the provider of the iface, not by the application (see Binding an iface to an implementation), and can be thought of as an extension of the iface declaration.
Once an iface is bound, all connectivity commands passed to it (such as `conn mgr if connect()` or `conn mgr if disconnect()` will be routed to the corresponding implementation function in the connectivity implementation.

**Note:** To avoid inconsistent behavior, all connectivity implementations must adhere to the implementation guidelines.

**Connecting** Once a bound iface is admin-up (see Network interface state management), `conn mgr if connect()` can be called to cause it to associate with a network.

If association succeeds, the connectivity implementation will mark the iface as operational-up (see Network interface state management).

If association fails unrecoverably, the fatal error event will be triggered.

You can configure an optional timeout for this process.

**Note:** The `conn mgr if connect()` function is intentionally minimalistic, and does not take any kind of configuration. Each connectivity implementation should provide a way to pre-configure or automatically configure any required association settings or credentials. See Allow connectivity pre-configuration for details.

**Connection loss** If connectivity is lost due to external factors, the connectivity implementation will mark the iface as operational-down.

Depending on whether persistence is set, the iface may then attempt to reconnect.

**Manual disconnection** The application can also request that connectivity be intentionally abandoned by calling `conn mgr if disconnect()`.

In this case, the connectivity implementation will disassociate the iface from its network and mark the iface as operational-down (see Network interface state management). A new connection attempt will not be initiated, regardless of whether persistence is enabled.

**Timeouts and Persistence** Connection Manager requires that all connectivity implementations support the following standard key features:

- **Connection timeouts**
- **Connection persistence**

These features describe how ifaces should behave during connect and disconnect events. You can individually set them for each iface.

**Note:** It is left to connectivity implementations to successfully and accurately implement these two features as described below. See Implementing timeouts and persistence for more details from the connectivity implementation perspective.

**Connection Timeouts** When `conn mgr if connect()` is called on an iface, a connection attempt begins.

The connection attempt continues indefinitely until it succeeds, unless a timeout has been specified for the iface (using `conn mgr if set timeout()`).
In that case, the connection attempt will be abandoned if the timeout elapses before it succeeds. If this happens, the timeout event is raised.

**Connection Persistence** Each iface also has a connection persistence setting that you can enable or disable by setting the `CONN_MGR_IF_PERSISTENT` flag with `conn_mgr_binding_set_flag()`. This setting specifies how the iface should handle unintentional connection loss.

If persistence is enabled, any unintentional connection loss will initiate a new connection attempt, with a new timeout if applicable.

Otherwise, the iface will not attempt to reconnect.

**Note:** Persistence not does affect connection attempt behavior. Only the timeout setting affects this.

For instance, if a connection attempt on an iface times out, the iface will not attempt to reconnect, even if it is persistent.

Conversely, if there is not a specified timeout, the iface will try to connect forever until it succeeds, even if it is not persistent.

See *Persistence during connection attempts* for the equivalent implementation guideline.

**Control events** Connectivity control triggers network management events to inform the application of important state changes.

See *Trigger connectivity control events* for the corresponding connectivity implementation guideline.

**Fatal Error** The `NET_EVENT_CONN_IF_FATAL_ERROR` event is raised when an iface encounters an error from which it cannot recover (meaning any subsequent attempts to associate are guaranteed to fail, and all such attempts should be abandoned).

Handlers of this event will be passed a pointer to the iface for which the fatal error occurred. Individual connectivity implementations may also pass an application-specific data pointer.

**Timeout** The `NET_EVENT_CONN_IF_TIMEOUT` event is raised when an iface association attempt times out.

Handlers of this event will be passed a pointer to the iface that timed out attempting to associate.

**Listening for control events** You can listen for control events as follows:

```c
/* Declare a net_mgmt callback struct to store the callback */
struct net_mgmt_event_callback
    my_conn_evt_callback;

/* Declare a handler to receive control events */
static void
    my_conn_evt_handler(struct net_mgmt_event_callback *cb,
        uint32_t event, struct net_if *iface)
{
    if (event == NET_EVENT_CONN_IF_TIMEOUT) {
        /* Timeout occurred, handle it */
    } else if (event == NET_EVENT_CONN_IF_FATAL_ERROR) {
        /* Fatal error occurred, handle it */
    }
}
```

(continues on next page)
int main()
{
    /* Configure the callback struct to respond to (at least) the CONN_IF_TIMEOUT * and CONN_IF_FATAL_ERROR events.
     * Note that the callback may also be triggered for events other than those specified here!
     * (See the net_mgmt documentation)
    */
    net_mgmt_init_event_callback(
        &conn_mgr_conn_callback,
        conn_mgr_conn_handler,
        NET_EVENT_CONN_IF_TIMEOUT | NET_EVENT_CONN_IF_FATAL_ERROR
    );
    /* Register the callback */
    net_mgmt_add_event_callback(&conn_mgr_conn_callback);
    return 0;
}

See Listening to network events for more details on listening for net_mgmt events.

**Automated behaviors**  There are a few actions related to connectivity that are (by default at least) performed automatically for the user.

**Automatic admin-up**

In Zephyr, ifaces are automatically taken admin-up (see Network interface state management for details on iface states) during initialization.

Applications can disable this behavior by setting the NET_IF_NO_AUTO_START interface flag with net_if_flag_set().

**Automatic connect**

By default, Connection Manager will automatically connect any bound iface that becomes admin-up.

Applications can disable this by setting the CONN_MGR_IF_NO_AUTO_CONNECT connectivity flag with conn_mgr_if_set_flag().

**Automatic admin-down**

By default, Connection Manager will automatically take any bound iface admin-down if it has given up on associating.

Applications can disable this for all ifaces by disabling the CONFIG_NET_CONNECTION_MANAGER_AUTO_IF_DOWN Kconfig option, or for individual ifaces by setting the CONN_MGR_IF_NO_AUTO_DOWN connectivity flag with conn_mgr_if_set_flag().

---

6.3. Networking 2769
Connectivity control API Include header file include/zephyr/net/conn mgr_connectivity.h to access these.

group conn mgr_connectivity
  Connection Manager Connectivity API.

Defines

NET_EVENT_CONN_IF_TIMEOUT
  net_mgmt event raised when a connection attempt times out

NET_EVENT_CONN_IF_FATAL_ERROR
  net_mgmt event raised when a non-recoverable connectivity error occurs on an iface

CONN_MGR_IF_NO_TIMEOUT
  Value to use with conn_mgr_if_set_timeout and conn_mgr_conn_binding::timeout to indicate no timeout.

Enums

enum net_event_conn_cmd
  Values:

  enumerator NET_EVENT_CONN_CMD_IF_TIMEOUT = 1

enumerator NET_EVENT_CONN_CMD_IF_FATAL_ERROR

enum conn mgr_if_flag
  Per-iface connectivity flags. Values:

  enumerator CONN_MGR_IF_PERSISTENT
    Persistent.
    When set, indicates that the connectivity implementation bound to this iface should attempt to persist connectivity by automatically reconnecting after connection loss.

  enumerator CONN_MGR_IF_NO_AUTO_CONNECT
    No auto-connect.
    When set, conn mgr will not automatically attempt to connect this iface when it reaches admin-up.

  enumerator CONN_MGR_IF_NO_AUTO_DOWN
    No auto-down.
    When set, conn mgr will not automatically take the iface admin-down when it stops trying to connect, even if CONFIG_NET_CONNECTION_MANAGER_AUTO_IF_DOWN is enabled.
Functions

int conn_mgr_if_connect(struct net_if *iface)
Connect interface.
If the provided iface has been bound to a connectivity implementation, initiate network connect/association.
Automatically takes the iface admin-up (by calling net_if_up) if it isn’t already.
Non-Blocking.

Parameters
• iface – Pointer to network interface

Return values
• 0 – on success.
• -ESHUTDOWN – if the iface is not admin-up.
• -ENOTSUP – if the iface does not have a connectivity implementation.
• implementation-specific – status code otherwise.

int conn_mgr_if_disconnect(struct net_if *iface)
Disconnect interface.
If the provided iface has been bound to a connectivity implementation, disconnect/dissociate it from the network, and cancel any pending attempts to connect/associate.
Does nothing if the iface is currently admin-down.

Parameters
• iface – Pointer to network interface

Return values
• 0 – on success.
• -ENOTSUP – if the iface does not have a connectivity implementation.
• implementation-specific – status code otherwise.

bool conn mgr_if_is_bound (struct net_if *iface)
Check whether the provided network interface supports connectivity / has been bound to a connectivity implementation.

Parameters
• iface – Pointer to the iface to check.

Return values
• true – if connectivity is supported (a connectivity implementation has been bound).
• false – otherwise.

int conn_mgr_if_set_opt(struct net_if *iface, int optname, const void *optval, size_t optlen)
Set implementation-specific connectivity options.
If the provided iface has been bound to a connectivity implementation that supports it, implementation-specific connectivity options related to the iface.

Parameters
• **iface** – Pointer to the network interface.
• **optname** – Integer value representing the option to set. The meaning of values is up to the `conn_mgr_conn_api` implementation. Some settings may affect multiple ifaces.
• **optval** – Pointer to the value to be assigned to the option.
• **optlen** – Length (in bytes) of the value to be assigned to the option.

**Return values**

• **0** – if successful.
• **-ENOTSUP** – if `conn_mgr_if_set_opt` not implemented by the iface.
• **-ENOBUFS** – if `optlen` is too long.
• **-EINVAL** – if NULL `optval` pointer provided.
• **-ENOPROTOOPT** – if the optname is not recognized.
• **implementation-specific** – error code otherwise.

```c
int conn_mgr_if_set_opt(struct net_if *iface, int optname, void *optval, size_t *optlen)
```

Get implementation-specific connectivity options.

If the provided iface has been bound to a connectivity implementation that supports it, retrieves implementation-specific connectivity options related to the iface.

`optlen` will always be set to the total number of bytes written, regardless of whether an error is returned, even if zero bytes were written.

**Parameters**

• **iface** – Pointer to the network interface.
• **optname** – Integer value representing the option to set. The meaning of values is up to the `conn_mgr_conn_api` implementation. Some settings may be shared by multiple ifaces.
• **optval** – Pointer to where the retrieved value should be stored.
• **optlen** – Pointer to length (in bytes) of the destination buffer available for storing the retrieved value. If the available space is less than what is needed, -ENOBUFS is returned. If the available space is invalid, -EINVAL is returned.

**Return values**

• **0** – if successful.
• **-ENOTSUP** – if `conn_mgr_if_set_opt` is not implemented by the iface.
• **-ENOBUFS** – if retrieval buffer is too small.
• **-EINVAL** – if invalid retrieval buffer length is provided, or if NULL `optval` or `optlen` pointer provided.
• **-ENOPROTOOPT** – if the optname is not recognized.
• **implementation-specific** – error code otherwise.

```c
bool conn_mgr_if_get_flag(struct net_if *iface, enum conn_mgr_if_flag flag)
```

Check the value of connectivity flags.

If the provided iface is bound to a connectivity implementation, retrieves the value of the specified connectivity flag associated with that iface.

**Parameters**
• iface -- Pointer to the network interface to check.
• flag -- The flag to check.

Returns
True if the flag is set, otherwise False. Also returns False if the provided iface is not bound to a connectivity implementation, or the requested flag doesn't exist.

int conn_mgr_if_set_flag(struct net_if *iface, enum conn_mgr_if_flag flag, bool value)
Set the value of a connectivity flags.
If the provided iface is bound to a connectivity implementation, sets the value of the specified connectivity flag associated with that iface.

Parameters
• iface -- Pointer to the network interface to modify.
• flag -- The flag to set.
• value -- Whether the flag should be enabled or disabled.

Return values
• 0 -- on success.
• -EINVAL -- if the flag does not exist.
• -ENOTSUP -- if the provided iface is not bound to a connectivity implementation.

int conn_mgr_if_get_timeout(struct net_if *iface)
Get the connectivity timeout for an iface.
If the provided iface is bound to a connectivity implementation, retrieves the timeout setting in seconds for it.

Parameters
• iface -- Pointer to the iface to check.

Returns
int - The connectivity timeout value (in seconds) if it could be retrieved, otherwise CONN_MGR_IF_NO_TIMEOUT.

int conn_mgr_if_set_timeout(struct net_if *iface, int timeout)
Set the connectivity timeout for an iface.
If the provided iface is bound to a connectivity implementation, sets the timeout setting in seconds for it.

Parameters
• iface -- Pointer to the network interface to modify.
• timeout -- The timeout value to set (in seconds). Pass CONN_MGR_IF_NO_TIMEOUT to disable the timeout.

Return values
• 0 -- on success.
• -ENOTSUP -- if the provided iface is not bound to a connectivity implementation.
**Bulk API** Connectivity control provides several bulk functions allowing all ifaces to be controlled at once.

You can restrict these functions to operate only on non-ignored ifaces if desired.

Include header file `include/zephyr/net/conn_mgr_connectivity.h` to access these.

**group** conn_mgr_connectivity_bulk

Connection Manager Bulk API.

**Functions**

```c
int conn_mgr_all_if_up(bool skip_ignored)
Convenience function that takes all available ifaces into the admin-up state.
Essentially a wrapper for `net_if_up`.

**Parameters**
- **skip_ignored** – If true, only affect ifaces that aren't ignored by conn mgr. Otherwise, affect all ifaces.

**Returns**
0 if all net_if_up calls returned 0, otherwise the first nonzero value returned by a net_if_up call.
```

```c
int conn_mgr_all_if_down(bool skip_ignored)
Convenience function that takes all available ifaces into the admin-down state.
Essentially a wrapper for `net_if_down`.

**Parameters**
- **skip_ignored** – If true, only affect ifaces that aren't ignored by conn mgr. Otherwise, affect all ifaces.

**Returns**
0 if all net_if_down calls returned 0, otherwise the first nonzero value returned by a net_if_down call.
```

```c
int conn_mgr_all_if_connect(bool skip_ignored)
Convenience function that takes all available ifaces into the admin-up state, and connects those that support connectivity.
Essentially a wrapper for `net_if_up` and `conn_mgr_if_connect`.

**Parameters**
- **skip_ignored** – If true, only affect ifaces that aren't ignored by conn mgr. Otherwise, affect all ifaces.

**Returns**
0 if all net_if_up and conn_mgr_if_connect calls returned 0, otherwise the first nonzero value returned by either net_if_up or conn_mgr_if_connect.
```

```c
int conn_mgr_all_if_disconnect(bool skip_ignored)
Convenience function that disconnects all available ifaces that support connectivity without putting them into admin-down state (unless auto-down is enabled for the iface).
Essentially a wrapper for `net_if_down`.

**Parameters**
- **skip_ignored** – If true, only affect ifaces that aren't ignored by conn mgr. Otherwise, affect all ifaces.
```
Returns
0 if all net_if_up and conn_mngr_if_connect calls returned 0, otherwise the first nonzero value returned by either net_if_up or conn_mngr_if_connect.

Connectivity Implementations

Overview Connectivity implementations are technology-specific modules that allow specific Zephyr ifaces to support Connectivity Control. They are responsible for translating generic connectivity control API calls into hardware-specific operations. They are also responsible for implementing standardized persistence and timeout behaviors.

See the implementation guidelines for details on writing conformant connectivity implementations.

Architecture The implementation API allows connectivity implementations to be defined at build time using CONN_MGR_CONN_DEFINE.

This creates a static instance of the conn_mngr_conn_impl struct, which then stores a reference to the passed in conn_mngr_conn_api struct (which should be populated with implementation callbacks).

Once defined, you can reference implementations by name and bind them to any unbound iface using CONN_MGR_BIND_CONN. Make sure not to accidentally bind two connectivity implementations to a single iface.

Once the iface is bound, connectivity control API functions can be called on the iface, and they will be translated to the corresponding implementation functions in conn_mngr_conn_api.

Binding an iface does not directly modify its iface struct.

Instead, an instance of conn_mngr_conn_binding is created and appended an internal iterable section.

This binding structure will contain a reference to the bound iface, the connectivity implementation it is bound to, as well as a pointer to a per-iface context pointer.

This iterable section can then be iterated over to find out what (if any) connectivity implementation has been bound to a given iface. This search process is used by most of the functions in the connectivity control API. As such, these functions should be called sparingly, due to their relatively high search cost.

A single connectivity implementation may be bound to multiple ifaces. See Do not instance implementations for more details.

Context Pointer Since a single connectivity implementation may be shared by several Zephyr ifaces, each binding instantiates a context container (of configurable type) unique to that binding. Each binding is then instantiated with a reference to that container, which implementations can then use to access per-iface state information.

See also Do not access bindings without locking them and Do not instance implementations.

Defining an implementation A connectivity implementation may be defined as follows:

```c
/* Create the API implementation functions */
int my_connect_impl(struct conn_mngr_conn_binding *const binding) {
    /* Cause your underlying technology to associate */
}
int my_disconnect_impl(struct conn_mngr_conn_binding *const binding) {
    /* Cause your underlying technology to disassociate */
}
```
Fig. 19: A detailed view of how Connection Manager integrates with Zephyr and the application. See here for a simplified version.
void my_init_impl(struct conn_mgr_conn_binding *const binding) {
    /* Perform any required initialization for your underlying technology */
}

/* Declare the API struct */
static struct conn_mgr_conn_api my_impl_api = {
    .connect = my_connect_impl,
    .disconnect = my_disconnect_impl,
    .init = my_init_impl,
    /* ... so on */
};

/* Define the implementation (named MY_CONNECTIVITY_IMPL) */
CONN_MGR_CONN_DEFINE(MY_CONNECTIVITY_IMPL, &my_impl_api);

---

**Note:** This does not work unless you also declare the context pointer type.

---

### Declaring an implementation publicly
Once defined, you can make a connectivity implementation available to other compilation units by declaring it (in a header file) as follows:

**Listing 4: my_connectivity_header.h**

```
CONN_MGR_CONN_DECLARE_PUBLIC(MY_CONNECTIVITY_IMPL);
```

The header file that contains this declaration must be included in any compilation units that need to reference the implementation.

### Declaring a context type
For `CONN_MGR_CONN_DEFINE` to work, you must declare a corresponding context pointer type. This is because all connectivity bindings contain a *Context Pointer* of their associated context pointer type.

If you are using `CONN_MGR_CONN_DECLARE_PUBLIC`, declare this type alongside the declaration:

**Listing 5: my_connectivity_impl.h**

```
#define MY_CONNECTIVITY_IMPL_CTX_TYPE struct my_context_type *
CONN_MGR_CONN_DECLARE_PUBLIC(MY_CONNECTIVITY_IMPL);
```

Then, make sure to include the header file before calling `CONN_MGR_CONN_DEFINE`:

**Listing 6: my_connectivity_impl.c**

```
#include "my_connectivity_impl.h"
CONN_MGR_CONN_DEFINE(MY_CONNECTIVITY_IMPL, &my_impl_api);
```

Otherwise, it is sufficient to simply declare the context pointer type immediately before the call to `CONN_MGR_CONN_DEFINE`:

```
#define MY_CONNECTIVITY_IMPL_CTX_TYPE struct my_context_type *
CONN_MGR_CONN_DEFINE(MY_CONNECTIVITY_IMPL, &my_impl_api);
```

**Note:** Naming is important. Your context pointer type declaration must use the same name as your implementation declaration, but with _CTX_TYPE appended.
In the previous example, the context type is named `MY_CONNECTIVITY_IMPL_CTX_TYPE`, because `MY_CONNECTIVITY_IMPL` was used as the connectivity implementation name.

If your connectivity implementation does not need a context pointer, simply declare the type as:

```c
#define MY_CONNECTIVITY_IMPL_CTX_TYPE void *
```

### Binding an iface to an implementation

A defined connectivity implementation may be bound to an iface by calling `CONN_MGR_BIND_CONN` anywhere after the iface’s device definition:

```c
/* Define an iface */
NET_DEVICE_INIT(my_iface,
   /* ... the specifics here don't matter ... */
);

/* Now bind MY_CONNECTIVITY_IMPL to that iface --
   * the name used should match with the above
   */
CONN_MGR_BIND_CONN(my_iface, MY_CONNECTIVITY_IMPL);
```

### Connectivity implementation guidelines

Rather than implement all features centrally, Connection Manager relies on each connectivity implementation to implement many behaviors and features individually.

This approach allows Connection Manager to remain lean, and allows each connectivity implementation to choose the most appropriate approach to these behaviors for itself. However, it relies on trust that all connectivity implementations will faithfully implement the features that have been delegated to them.

To maintain consistency between all connectivity implementations, observe the following guidelines when writing your own implementation:

**Completely implement timeout and persistence**  All connectivity implementations must offer complete support for `timeout and persistence`, such that a user can disable or enable these features, regardless of the inherent behavior of the underlying technology. In other words, no matter how the underlying technology behaves, your implementation must make it appear to the end user to behave exactly as specified in the `Timeouts and Persistence` section.

See [Implementing timeouts and persistence](#) for a detailed technical discussion on implementing timeouts and persistence.

**Conform to API specifications**  Each implementation API function you implement should behave as-described in the corresponding connectivity control API function.

For example, your implementation of `conn_mgr_conn_api.connect` should conform to the behavior described for `conn_mgr_if_connect()`.

**Allow connectivity pre-configuration**  Connectivity implementations should provide means for applications to pre-Configure all necessary connection parameters (for example, network SSID, or PSK, if applicable), before the call to `conn_mgr_if_connect()`. It should not be necessary to provide this information as part of, or following the `conn_mgr_if_connect()` call, although implementations should await this information if it is not provided.
Await valid connectivity configuration  If network association fails because the application pre-configured invalid connection parameters, or did not configure connection parameters at all, this should be treated as a network failure.

In other words, the connectivity implementation should not give up on the connection attempt, even if valid connection parameters have not been configured.

Instead, the connectivity implementation should asynchronously wait for valid connection parameters to be configured, either indefinitely, or until the configured connectivity timeout elapses.

Implement iface state reporting  All connectivity implementations must keep bound iface state up to date.

To be specific:

- Set the iface to dormant, carrier-down, or both during binding init.
  - See Network interface state management for details regarding iface carrier and dormant states.

- Update dormancy and carrier state so that the iface is non-dormant and carrier-up whenever (and only when) association is complete and connectivity is ready.

- Set the iface either to dormant or to carrier-down as soon as interruption of service is detected.
  - It is acceptable to gate this behind a small timeout (separate from the connection timeout) for network technologies where service is commonly intermittent.

- If the technology also handles IP assignment, ensure those IP addresses are assigned to the iface.

Note: iface state updates do not necessarily need to be performed directly by connectivity implementations.

For instance:

- IP assignment is not necessary if DHCP is used for the iface.

- The connectivity implementation does not need to update iface dormancy if the underlying L2 implementation already does so.

Do not use iface state as implementation state  Zephyr ifaces may be accessed from other threads without respecting the binding mutex. As such, Zephyr iface state may change unpredictably during connectivity implementation callbacks.

Therefore, do not base implementation behaviors on iface state.

Keep iface state updated to reflect network availability, but do not read iface state for any purpose.

If you need to keep track of dormancy or IP assignment, use a separate state variable stored in the context pointer.

Remain non-interferent  Connectivity implementations should not prevent applications from interacting directly with associated technology-specific APIs.

In other words, it should be possible for an application to directly use your underlying technology without breaking your connectivity implementation.
If exceptions to this are absolutely necessary, they should be constrained to specific API calls and should be documented.

**Note:** While connectivity implementations must not break, it is acceptable for implementations to have potentially unexpected behavior if applications attempt to directly control the association state.

For instance, if an application directly instructs an underlying technology to disassociate, it would be acceptable for the connectivity implementation to interpret this as an unexpected connection loss and immediately attempt to re-associate.

**Remain non-blocking** All connectivity implementation callbacks should be non-blocking.

For instance, calls to `conn_mgr_conn_api.connect` should initiate a connection process and return immediately.

One exception is `conn_mgr_conn_api.init`, whose implementations are permitted to block.

However, bear in mind that blocking during this callback will delay system init, so still consider offloading time-consuming tasks to a background thread.

**Make API immediately ready** Connectivity implementations must be ready to receive API calls immediately after `conn_mgr_conn_api.init`.

For instance, a call to `conn_mgr_conn_api.connect` must eventually lead to an association attempt, even if called immediately after `conn_mgr_conn_api.init`.

If the underlying technology cannot be made ready for connect commands immediately when `conn_mgr_conn_api.init` is called, calls to `conn_mgr_conn_api.connect` must be queued in a non-blocking fashion, and then executed later when ready.

**Do not store state information outside the context pointer** Connection Manager provides a context pointer to each binding.

Connectivity implementations should store all state information in this context pointer.

The only exception is connectivity implementations that are meant to be bound to only a single iface. Such implementations may use statically declared state instead.

See also **Do not instance implementations**.

**Access ifaces only through binding structs** Do not use statically declared ifaces or externally acquire references to ifaces.

For example, do not use `net_if_get_default()` under the assumption that the bound iface will be the default iface.

Instead, always use the `iface pointer` provided by the relevant `binding struct`. See also **Do not access bindings without locking them**.

**Make implementations optional at compile-time** Connectivity implementations should provide a Kconfig option to enable or disable the implementation without affecting bound iface availability.

In other words, it should be possible to configure builds that include Connectivity Manager, as well as the iface that would have been bound to the implementation, but not the implementation itself, nor its binding.
Do not instance implementations  Do not declare a separate connectivity implementation for every iface you are going to bind to.

Instead, bind one global connectivity implementation to all of your ifaces, and use the context pointer to store state relevant to individual ifaces.

See also Do not access bindings without locking them and Access ifaces only through binding structs.

Do not access bindings without locking them  Bindings may be accessed and modified at random by multiple threads, so modifying or reading from a binding without first locking it may lead to unpredictable behavior.

This applies to all descendents of the binding, including anything in the context container.

Make sure to unlock the binding when you are done accessing it.

Note:  A possible exception to this rule is if the resource in question is inherently thread-safe.

However, be careful taking advantage of this exception. It may still be possible to create a race condition, for instance when accessing multiple thread-safe resources simultaneously.

Therefore, it is recommended to simply always lock the binding, whether or not the resource being accessed is inherently thread-safe.

Do not disable built-in features  Do not attempt to prevent the use of built-in features (such as Timeouts and Persistence or Automated behaviors).

All connectivity implementations must fully support these features. Implementations must not attempt to force certain features to be always enabled or always disabled.

Trigger connectivity control events  Connectivity control network management events are not triggered automatically by Connection Manager.

Connectivity implementations must trigger these events themselves.

Trigger NET_EVENT_CONN_CMD_IF_TIMEOUT when a connection timeout occurs. See Timeout for details.

Trigger NET_EVENT_CONN_IF_FATAL_ERROR when a fatal (non-recoverable) connection error occurs. See Fatal Error for details.

See Network Management for details on firing network management events.

Implementing timeouts and persistence  First, see Timeouts and Persistence for a high-level description of the expected behavior of timeouts and persistence.

Connectivity implementations must fully conform to that description, regardless of the behavior of the underlying connectivity technology.

Sometimes this means writing extra logic in the connectivity implementation to fake certain behaviors. The following sections discuss various common edge-cases and nuances and how to handle them.
Inherently persistent technologies  If the underlying technology automatically attempts to reconnect or retry connection after connection loss or failure, the connectivity implementation must manually cancel such attempts when they are in conflict with timeout or persistence settings.

For example:

- If the underlying technology automatically attempts to reconnect after losing connection, and persistence is disabled for the iface, the connectivity implementation should immediately cancel this reconnection attempt.
- If a connection attempt times out on an iface whose underlying technology does not have a built-in timeout, the connectivity implementation must simulate a timeout by cancelling the connection attempt manually.

Technologies that give up on connection attempts  If the underlying technology has no mechanism to retry connection attempts, or would give up on them before the user-configured timeout, or would not reconnect after connection loss, the connectivity implementation must manually re-request connection to counteract these deviances.

- If your underlying technology is not persistent, you must manually trigger reconnect attempts when persistence is enabled.
- If your underlying technology does not support a timeout, you must manually cancel connection attempts if the timeout is enabled.
- If your underlying technology forces a timeout, you must manually trigger a new connection attempts if that timeout is shorter than the Connection Manager timeout.

Technologies with association retry  Many underlying technologies do not usually associate in a single attempt.

Instead, these underlying technologies may need to make multiple back-to-back association attempts in a row, usually with a small delay.

In these situations, the connectivity implementation should treat this series of back-to-back association sub-attempts as a single unified connection attempt.

For instance, after a sub-attempt failure, persistence being disabled should not prevent further sub-attempts, since they all count as one single overall connection attempt. See also Persistence during connection attempts.

At which point a series of failed sub-attempts should be considered a failure of the connection attempt as a whole is up to each implementation to decide.

If the connection attempt crosses this threshold, but the configured timeout has not yet elapsed, or there is no timeout, sub-attempts should continue.

Persistence during connection attempts  Persistence should not affect any aspect of implementation behavior during a connection attempt. Persistence should only affect whether or not connection attempts are automatically triggered after a connection loss.

The configured timeout should fully determine whether connection retry should be performed.

Implementation API  Include header file include/zephyr/net/conn_mgr_connectivity_impl.h to access these.

Only for use by connectivity implementations.

\[ \text{group conn_mgr_connectivity_impl} \]

Connection Manager Connectivity Implementation API.
Defines

CON_MGR_CONN_DEFINE(conn_id, conn_api)
Define a conn_mgr connectivity implementation that can be bound to network devices.

Parameters
- conn_id – The name of the new connectivity implementation
- conn_api – A pointer to a conn_mgr_conn_api struct

CON_MGR_CONN_DECLARE_PUBLIC(conn_id)
Helper macro to make a conn_mgr connectivity implementation publicly available.

CON_MGR_BIND_CONN_INST(dev_id, inst, conn_id)
Associate a connectivity implementation with an existing network device instance.

Parameters
- dev_id – Network device id.
- inst – Network device instance.
- conn_id – Name of the connectivity implementation to associate.

CON_MGR_BIND_CONN(dev_id, conn_id)
Associate a connectivity implementation with an existing network device.

Parameters
- dev_id – Network device id.
- conn_id – Name of the connectivity implementation to associate.

Functions

static inline struct conn_mgr_conn_binding *conn_mgr_if_get_binding(struct net_if *iface)
Retrieves the conn_mgr binding struct for a provided iface if it exists.
Bindings for connectivity implementations with missing API structs are ignored.
For use only by connectivity implementations.

Parameters
- iface -- bound network interface to obtain the binding struct for.

Returns
struct conn_mgr_conn_binding* Pointer to the retrieved binding struct if it exists, NULL otherwise.

static inline void conn_mgr_binding_lock(struct conn_mgr_conn_binding *binding)
Lock the passed-in binding, making it safe to access.
Call this whenever accessing binding data, unless inside a conn_mgr_conn_api callback, where it is called automatically by conn_mgr.
Reentrant.
For use only by connectivity implementations.

Parameters
- binding -- Binding to lock
static inline void conn_mgr_binding_unlock(struct conn_mgr_conn_binding *binding)
Unlocks the passed-in binding.
Call this after any call to conn_mgr_binding_lock once done accessing binding data.
Reentrant.
For use only by connectivity implementations.

Parameters
• binding -- Binding to unlock

static inline void conn_mgr_binding_set_flag(struct conn_mgr_conn_binding *binding, enum conn_mgr_if_flag flag, bool value)
Set the value of the specified connectivity flag for the provided binding.
Can be used from any thread or callback without calling conn_mgr_binding_lock.
For use only by connectivity implementations

Parameters
• binding -- The binding to check
• flag -- The flag to check
• value -- New value for the specified flag

static inline bool conn_mgr_binding_get_flag(struct conn_mgr_conn_binding *binding, enum conn_mgr_if_flag flag)
Check the value of the specified connectivity flag for the provided binding.
Can be used from any thread or callback without calling conn_mgr_binding_lock.
For use only by connectivity implementations

Parameters
• binding -- The binding to check
• flag -- The flag to check

Returns
bool The value of the specified flag

struct conn_mgr_conn_api
#include <conn_mgr_connectivity_impl.h> Connectivity Manager Connectivity API structure.
Used to provide generic access to network association parameters and procedures

Public Members

int (*connect)(struct conn_mgr_conn_binding *const binding)
When called, the connectivity implementation should start attempting to establish
connectivity (association with a network) for the bound iface pointed to by if_conn-
>iface.
Must be non-blocking.
Called by conn_mgr_if_connect.
int (*disconnect)(struct conn_mgr_conn_binding *const binding)
    When called, the connectivity implementation should disconnect (dissasociate), or
    stop any in-progress attempts to associate to a network, the bound iface pointed to
    by if_conn->iface.
    Must be non-blocking.
    Called by conn_mgr_if_disconnect.

void (*init)(struct conn_mgr_conn_binding *const binding)
    Called once for each iface that has been bound to a connectivity implementation
    using this API.
    Connectivity implementations should use this callback to perform any required
    per-bound-iface initialization.
    Implementations may choose to gracefully handle invalid buffer lengths with par-
    tial writes, rather than raise errors, if deemed appropriate.

int (*set_opt)(struct conn_mgr_conn_binding *const binding, int optname, const void *
    optval, size_t *optlen)
    Implementation callback for conn_mgr_if_set_opt.
    Used to set implementation-specific connectivity settings.
    Calls to conn_mgr_if_set_opt on an iface will result in calls to this callback with the
    conn_mgr_conn_binding struct bound to that iface.
    It is up to the connectivity implementation to interpret optname. Options can be
    specific to the bound iface (pointed to by if_conn->iface), or can apply to the whole
    connectivity implementation.
    See the description of conn_mgr_if_set_opt for more details. set_opt implementa-
    tions should conform to that description.
    Implementations may choose to gracefully handle invalid buffer lengths with par-
    tial reads, rather than raise errors, if deemed appropriate.

int (*get_opt)(struct conn_mgr_conn_binding *const binding, int optname, void *
    optval, size_t *optlen)
    Implementation callback for conn_mgr_if_set_opt.
    Used to retrieve implementation-specific connectivity settings.
    Calls to conn_mgr_if_set_opt on an iface will result in calls to this callback with the
    conn_mgr_conn_binding struct bound to that iface.
    It is up to the connectivity implementation to interpret optname. Options can be
    specific to the bound iface (pointed to by if_conn->iface), or can apply to the whole
    connectivity implementation.
    See the description of conn_mgr_if_set_opt for more details. get_opt implementa-
    tions should conform to that description.

struct conn_mgr_conn_impl
    #include <conn_mgr_connectivity_impl.h> Connectivity Implementation struct.
    Declares a conn_mgr connectivity layer implementation with the provided API

Public Members
struct conn_mgr_conn_api *api
  The connectivity API used by the implementation.

struct conn_mgr_conn_binding
#include <conn mgr_connectivity_impl.h> Connectivity Manager network interface
binding structure.
  Binds a conn_mgr connectivity implementation to an iface / network device. Stores
per-iface state for the connectivity implementation.

Generic connectivity state

uint32_t flags
  Connectivity flags.
  Public boolean state and configuration values supported by all bindings. See
conn_mgr_if_flag for options.

int timeout
  Timeout (seconds)
  Indicates to the connectivity implementation how long it should attempt to estab-
lish connectivity for during a connection attempt before giving up.
  The connectivity implementation should give up on establishing connectivity after
this timeout, even if persistence is enabled.
  Set to CONN_MGR_IF_NO_TIMEOUT to indicate that no timeout should be used.

Public Members

struct net_if *iface
  The network interface the connectivity implementation is bound to.

const struct conn_mgr_conn_impl *impl
  The connectivity implementation the network device is bound to.

void *ctx
  Pointer to private, per-iface connectivity context.

6.4 LoRa and LoRaWAN

6.4.1 Overview

LoRa (abbrev. for Long Range) is a proprietary low-power wireless communication protocol
developed by the Semtech Corporation.
LoRa acts as the physical layer (PHY) based on the chirp spread spectrum (CSS) modulation tech-
nique.
LoRaWAN (for Long Range Wide Area Network) defines a networking layer on top of the LoRa
PHY.
Zephyr provides APIs for LoRa to send raw data packets directly over the wireless interface as well as APIs for LoRaWAN to connect the end device to the internet through a gateway.

The Zephyr implementation is based on Semtech's LoRaMac-node library, which is included as a Zephyr module.

The LoRaWAN specification is published by the LoRa Alliance.

### 6.4.2 Configuration Options

**LoRa PHY**

Related configuration options can be found under `drivers/lora/Kconfig`.

- `CONFIG_LORA`
- `CONFIG_LORA_SHELL`
- `CONFIG_LORA_INIT_PRIORITY`

**LoRaWAN**

Related configuration options can be found under `subsys/lorawan/Kconfig`.

- `CONFIG_LORAWAN`
- `CONFIG_LORAWAN_SYSTEM_MAX_RX_ERROR`
- `CONFIG_LORAMAC_REGION_AS923`
- `CONFIG_LORAMAC_REGION_AU915`
- `CONFIG_LORAMAC_REGION_CN470`
- `CONFIG_LORAMAC_REGION_CN779`
- `CONFIG_LORAMAC_REGION_EU433`
- `CONFIG_LORAMAC_REGION_EU868`
- `CONFIG_LORAMAC_REGION_KR920`
- `CONFIG_LORAMAC_REGION_IN865`
- `CONFIG_LORAMAC_REGION_US915`
- `CONFIG_LORAMAC_REGION_RU864`

### 6.4.3 API Reference

**LoRa PHY**

**Related code samples**

**LoRa receive**

Receive packets in both synchronous and asynchronous mode using the LoRa radio.

**LoRa send**

Transmit a preconfigured payload every second using the LoRa radio.

`group lora_api`
Enums

enum lora_signal_bandwidth
LoRa signal bandwidth.
Values:
enumator BW_125_KHZ = 0
enumator BW_250_KHZ
enumator BW_500_KHZ

enum lora_datarate
LoRa data-rate.
Values:
enumator SF_6 = 6
enumator SF_7
enumator SF_8
enumator SF_9
enumator SF_10
enumator SF_11
enumator SF_12

enum lora_coding_rate
LoRa coding rate.
Values:
enumator CR_4_5 = 1
enumator CR_4_6 = 2
enumator CR_4_7 = 3
enumator CR_4_8 = 4
### Functions

**lora_config**

```c
static inline int lora_config(const struct device *dev, struct lora_modem_config *config)
```

Configure the LoRa modem.

**Parameters**

- `dev` – LoRa device
- `config` – Data structure containing the intended configuration for the modem

**Returns**

0 on success, negative on error

**lora_send**

```c
static inline int lora_send(const struct device *dev, uint8_t *data, uint32_t data_len)
```

Send data over LoRa.

**Parameters**

- `dev` – LoRa device
- `data` – Data to be sent
- `data_len` – Length of the data to be sent

**Returns**

0 on success, negative on error

**lora_send_async**

```c
static inline int lora_send_async(const struct device *dev, uint8_t *data, uint32_t data_len, struct k_poll_signal *async)
```

Asynchronously send data over LoRa.

**Parameters**

- `dev` – LoRa device
- `data` – Data to be sent
- `data_len` – Length of the data to be sent
- `async` – A pointer to a valid and ready to be signaled struct `k_poll_signal`.
  (Note: if NULL this function will not notify the end of the transmission).

**Returns**

0 on success, negative on error

**lora_recv**

```c
static inline int lora_recv(const struct device *dev, uint8_t *data, uint8_t size, k_timeout_t timeout, int16_t *rssi, int8_t *snr)
```

Receive data over LoRa.

**Parameters**

- `dev` – LoRa device
- `data` – Data to be sent
- `size` – Length of the data to be sent
- `timeout` – Timeout for receiving data
- `rssi` – Received Signal Strength Indicator
- `snr` – Signal-to-Noise Ratio

**Returns**

0 on success, negative on error

---

6.4. LoRa and LoRaWAN
- dev – LoRa device
- data – Buffer to hold received data
- size – Size of the buffer to hold the received data. Max size allowed is 255.
- timeout – Duration to wait for a packet.
- rssi – RSSI of received data
- snr – SNR of received data

**Returns**
Length of the data received on success, negative on error

static inline int lora_recv_async(const struct device *dev, lora_recv_cb cb)
Receive data asynchronously over LoRa.
Receive packets continuously under the configuration previously setup by lora_config.
Reception is cancelled by calling this function again with cb = NULL. This can be done within the callback handler.

**Parameters**
- dev – Modem to receive data on.
- cb – Callback to run on receiving data. If NULL, any pending asynchronous receptions will be cancelled.

**Returns**
0 when reception successfully setup, negative on error

static inline int lora_test_cw(const struct device *dev, uint32_t frequency, int8_t tx_power, uint16_t duration)
Transmit an unmodulated continuous wave at a given frequency.

**Note:** Only use this functionality in a test setup where the transmission does not interfere with other devices.

**Parameters**
- dev – LoRa device
- frequency – Output frequency (Hertz)
- tx_power – TX power (dBm)
- duration – Transmission duration in seconds.

**Returns**
0 on success, negative on error

struct lora_modem_config
#include <lora.h> Structure containing the configuration of a LoRa modem.

**Public Members**

- uint32_t frequency
  Frequency in Hz to use for transceiving.
typedef enum {
    lora_signal_bandwidth, bandwidth
} lora_signal_bandwidth;

typedef enum {
    lora_datarate, datarate
} lora_datarate;

typedef enum {
    lora_coding_rate, coding_rate
} lora_coding_rate;

uint16_t preamble_len
    Length of the preamble.

int8_t tx_power
    TX-power in dBm to use for transmission.

bool tx
    Set to true for transmission, false for receiving.

bool iq_inverted
    Invert the In-Phase and Quadrature (IQ) signals.
    Normally this should be set to false. In advanced use-cases where a differentiation
    is needed between “uplink” and “downlink” traffic, the IQ can be inverted to create
    two different channels on the same frequency

bool public_network
    Sets the sync-byte to use:

    - false: for using the private network sync-byte
    - true: for using the public network sync-byte

    The public network sync-byte is only intended for advanced usage. Normally the private network sync-byte
    should be used for peer to peer communications and the LoRaWAN APIs should
    be used for interacting with a public network.

LoRaWAN

Related code samples

LoRaWAN class A device
    Join a LoRaWAN network and send a message periodically.

define lorawan_api

Defines

LW_RECV_PORT_ANY
    Flag to indicate receiving on any port.

6.4. LoRa and LoRaWAN
**Typedefs**

typedef uint8_t (*lorawan_battery_level_cb_t)(void)
Defines the battery level callback handler function signature.

- **Retval 0**: if the node is connected to an external power source
- **Retval 1..254**: battery level, where 1 is the minimum and 254 is the maximum value
- **Retval 255**: if the node was not able to measure the battery level

typedef void (*lorawan_dr_changed_cb_t)(enum lorawan_datarate dr)
Defines the datarate changed callback handler function signature.

- **Param dr**: Updated datarate.

**Enums**

eenum lorawan_class
LoRaWAN class types.

- **Values**:
  - enumerator LORAWAN_CLASS_A = 0x00
    - Class A device.
  - enumerator LORAWAN_CLASS_B = 0x01
    - Class B device.
  - enumerator LORAWAN_CLASS_C = 0x02
    - Class C device.

eenum lorawan_act_type
LoRaWAN activation types.

- **Values**:
  - enumerator LORAWAN_ACT_OTAA = 0
    - Over-the-Air Activation (OTAA)
  - enumerator LORAWAN_ACT_ABP
    - Activation by Personalization (ABP)

eenum lorawan_datarate
LoRaWAN datarate types.

- **Values**:
  - enumerator LORAWAN_DR_0 = 0
    - DR0 data rate.
enumerator LORAWAN_DR_1
   DR1 data rate.
enumerator LORAWAN_DR_2
   DR2 data rate.
enumerator LORAWAN_DR_3
   DR3 data rate.
enumerator LORAWAN_DR_4
   DR4 data rate.
enumerator LORAWAN_DR_5
   DR5 data rate.
enumerator LORAWAN_DR_6
   DR6 data rate.
enumerator LORAWAN_DR_7
   DR7 data rate.
enumerator LORAWAN_DR_8
   DR8 data rate.
enumerator LORAWAN_DR_9
   DR9 data rate.
enumerator LORAWAN_DR_10
   DR10 data rate.
enumerator LORAWAN_DR_11
   DR11 data rate.
enumerator LORAWAN_DR_12
   DR12 data rate.
enumerator LORAWAN_DR_13
   DR13 data rate.
enumerator LORAWAN_DR_14
   DR14 data rate.
enumerator LORAWAN_DR_15
   DR15 data rate.

enum lorawan_region
   LoRaWAN region types.
   Values:
enumerator LORAWAN_REGION_AS923
    Asia 923 MHz frequency band.

enumerator LORAWAN_REGION_AU915
    Australia 915 MHz frequency band.

enumerator LORAWAN_REGION_CN470
    China 470 MHz frequency band.

enumerator LORAWAN_REGION_CN779
    China 779 MHz frequency band.

enumerator LORAWAN_REGION_EU433
    Europe 433 MHz frequency band.

enumerator LORAWAN_REGION_EU868
    Europe 868 MHz frequency band.

enumerator LORAWAN_REGION_KR920
    South Korea 920 MHz frequency band.

enumerator LORAWAN_REGION_IN865
    India 865 MHz frequency band.

enumerator LORAWAN_REGION_US915
    United States 915 MHz frequency band.

enumerator LORAWAN_REGION_RU864
    Russia 864 MHz frequency band.

enum lorawan_message_type
    LoRaWAN message types.
    Values:

    enumerator LORAWAN_MSG_UNCONFIRMED = 0
        Unconfirmed message.

    enumerator LORAWAN_MSG_CONFIRMED
        Confirmed message.

Functions

void lorawan_register_battery_level_callback(lorawan_battery_level_cb_t cb)
    Register a battery level callback function.
    Provide the LoRaWAN stack with a function to be called whenever a battery level needs
    to be read.
    Should no callback be provided the lorawan backend will report 255.

    Parameters
• cb – Pointer to the battery level function

```c
void lorawan_register_downlink_callback(struct lorawan_downlink_cb *cb)
```
Register a callback to be run on downlink packets.

**Parameters**

• cb – Pointer to structure containing callback parameters

```c
void lorawan_register_dr_changed_callback(lorawan_dr_changed_cb_t cb)
```
Register a callback to be called when the datarate changes.

The callback is called once upon successfully joining a network and again each time the datarate changes due to ADR.

**Parameters**

• cb – Pointer to datarate update callback

```c
int lorawan_join(const struct lorawan_join_config *config)
```
Join the LoRaWAN network.

Join the LoRaWAN network using OTAA or AWB.

**Parameters**

• config – Configuration to be used

**Returns**

0 if successful, negative errno code if failure

```c
int lorawan_start(void)
```
Start the LoRaWAN stack.

This function need to be called before joining the network.

**Returns**

0 if successful, negative errno code if failure

```c
int lorawan_send(uint8_t port, uint8_t *data, uint8_t len, enum lorawan_message_type type)
```
Send data to the LoRaWAN network.

Send data to the connected LoRaWAN network.

**Parameters**

• port – Port to be used for sending data. Must be set if the payload is not empty.

• data – Data buffer to be sent

• len – Length of the buffer to be sent. Maximum length of this buffer is 255 bytes but the actual payload size varies with region and datarate.

• type – Specifies if the message shall be confirmed or unconfirmed. Must be one of lorawan_message_type.

**Returns**

0 if successful, negative errno code if failure

```c
int lorawan_set_class(enum lorawan_class dev_class)
```
Set the current device class.

Change the current device class. This function may be called before or after a network connection has been established.

**Parameters**

• dev_class – New device class
Returns
0 if successful, negative errno code if failure

int lorawan_set_conf_msg_tries(uint8_t tries)
Set the number of tries used for transmissions.

Parameters
• tries – Number of tries to be used

Returns
0 if successful, negative errno code if failure

void lorawan_enable_adr(bool enable)
Enable Adaptive Data Rate (ADR)
Control whether adaptive data rate (ADR) is enabled. When ADR is enabled, the data rate is treated as a default data rate that will be used if the ADR algorithm has not established a data rate. ADR should normally only be enabled for devices with stable RF conditions (i.e., devices in a mostly static location).

Parameters
• enable – Enable or Disable adaptive data rate.

int lorawan_set_datarate(enum lorawan_datarate dr)
Set the default data rate.
Change the default data rate.

Parameters
• dr – Data rate used for transmissions

Returns
0 if successful, negative errno code if failure

enum lorawan_datarate lorawan_get_min_datarate(void)
Get the minimum possible datarate.
The minimum possible datarate may change in response to a TxParamSetupReq command from the network server.

Returns
Minimum possible data rate

void lorawan_get_payload_sizes(uint8_t *max_next_payload_size, uint8_t *max_payload_size)
Get the current payload sizes.
Query the current payload sizes. The maximum payload size varies with datarate, while the current payload size can be less due to MAC layer commands which are inserted into uplink packets.

Parameters
• max_next_payload_size – Maximum payload size for the next transmission
• max_payload_size – Maximum payload size for this datarate

int lorawan_set_region(enum lorawan_region region)
Set the region and frequency to be used.
Control the LoRa region and frequency settings. This should be called before lorawan_start(). If you only have support for a single region selected via Kconfig, this function does not need to be called at all.

Parameters
• **region** – The region to be selected

**Returns**
0 if successful, negative errno otherwise

```c
struct lorawan_join_otaa
#include <lorawan.h> LoRaWAN join parameters for over-the-Air activation (OTAA)
```

Note that all of the fields use LoRaWAN 1.1 terminology.

All parameters are optional if a secure element is present in which case the values stored in the secure element will be used instead.

**Public Members**

```c
tuint8_t *join_eui
    Join EUI.

tuint8_t *nwk_key
    Network Key.

tuint8_t *app_key
    Application Key.

tuint16_t dev_nonce
    Device Nonce.

    Starting with LoRaWAN 1.0.4 the DevNonce must be monotonically increasing for each OTAA join with the same EUI. The DevNonce should be stored in non-volatile memory by the application.
```

```c
struct lorawan_join_abp
#include <lorawan.h> LoRaWAN join parameters for activation by personalization (ABP)
```

**Public Members**

```c
tuint32_t dev_addr
    Device address on the network.

tuint8_t *app_skey
    Application session key.

tuint8_t *nwk_skey
    Network session key.

tuint8_t *app_eui
    Application EUI.
```

```c
struct lorawan_join_config
#include <lorawan.h> LoRaWAN join parameters.
```
Public Members

struct lorawan_join_otaa otaa
   OTAA join parameters.

struct lorawan_join_abp abp
   ABP join parameters.

union lorawan_join_config
   Join parameters.

uint8_t *dev_eui
   Device EUI.
   Optional if a secure element is present.

enum lorawan_act_type mode
   Activation mode.

struct lorawan_downlink_cb
   #include <lorawan.h> LoRaWAN downlink callback parameters.

Public Members

uint16_t port
   Port to handle messages for:

   • Port 0: TX packet acknowledgements
   • Ports 1-255: Standard downlink port
   • LW_RECV_PORT_ANY: All downlinks

void (*cb)(uint8_t port, bool data_pending, int16_t rssi, int8_t snr, uint8_t len, const uint8_t *data)
   Callback function to run on downlink data.

Note: Callbacks are run on the system workqueue, and should therefore be as short as possible.

   Param port
      Port message was sent on
   Param data_pending
      Network server has more downlink packets pending
   Param rssi
      Received signal strength in dBm
   Param snr
      Signal to Noise ratio in dBm
   Param len
      Length of data received, will be 0 for ACKs
   Param data
      Data received, will be NULL for ACKs
**6.5 USB**

**USB device support**

**6.5.1 USB device support**

- **Overview**
- Supported USB classes
  - Audio
  - Bluetooth HCI USB transport layer
  - CDC ACM
    - Console over CDC ACM UART
    - CDC ACM UART as backend
    - POSIX default tty ECHO mitigation
  - DFU
  - USB Human Interface Devices (HID) support
  - Mass Storage Class
  - Networking
- **Binary Device Object Store (BOS) support**
- **Implementing a non-standard USB class**
- **Interface number and endpoint address assignment**
- **Testing over USPIP in native_sim**
- **USB Vendor and Product identifiers**

**Overview**

The USB device stack is a hardware independent interface between USB device controller driver and USB device class drivers or customer applications. It is a port of the LPCUSB device stack and has been modified and expanded over time. It provides the following functionalities:

- Uses the **USB device controller driver API** provided by the device controller drivers to interact with the USB device controller.
- Responds to standard device requests and returns standard descriptors, essentially handling ‘Chapter 9’ processing, specifically the standard device requests in table 9-3 from the universal serial bus specification revision 2.0.
- Provides a programming interface to be used by USB device classes or customer applications. The APIs is described in include/zephyr/usb/usb_device.h
The device stack and USB device controller driver API have some limitations, such as not being able to support more than one controller instance at runtime and only supporting one USB device configuration. We are actively working on new USB support, which means we will continue to maintain the device stack described here until all supported USB classes are ported, but do not expect any new features or enhancements.

**Supported USB classes**

**Audio** There is an experimental implementation of the Audio class. It follows specification version 1.00 (bcdADC 0x0100) and supports synchronous synchronisation type only. See usb-audio-headphones-microphone and usb-audio-headset samples for reference.

**Bluetooth HCI USB transport layer** Bluetooth HCI USB transport layer implementation uses *HCI RAW channel* to expose HCI interface to the host. It is not fully in line with the description in the Bluetooth specification and consists only of an interface with the endpoint configuration:

- HCI commands through control endpoint (host-to-device only)
- HCI events through interrupt IN endpoint
- ACL data through one bulk IN and one bulk OUT endpoints

A second interface for the voice channels has not been implemented as there is no support for this type in *Bluetooth*. It is not a big problem under Linux if HCI USB transport layer is the only interface that appears in the configuration, the btusb driver would not try to claim a second (isochronous) interface. The consequence is that if HCI USB is used in a composite configuration and is the first interface, then the Linux btusb driver will claim both the first and the next interface, preventing other composite functions from working. Because of this problem, HCI USB should not be used in a composite configuration. This problem is fixed in the implementation for new USB support.

**CDC ACM** The CDC ACM class is used as backend for different subsystems in Zephyr. However, its configuration may not be easy for the inexperienced user. Below is a description of the different use cases and some pitfalls.

The interface for CDC ACM user is *Universal Asynchronous Receiver-Transmitter (UART) driver API*. But there are two important differences in behavior to a real UART controller:

- Data transfer is only possible after the USB device stack has been initialized and started, until then any data is discarded
- If device is connected to the host, it still needs an application on the host side which requests the data
- The CDC ACM poll out implementation follows the API and blocks when the TX ring buffer is full only if the hw-flow-control property is enabled and called from a non-ISR context.

The devicetree compatible property for CDC ACM UART is zephyr,cdc-acm-uart. CDC ACM support is automatically selected when USB device support is enabled and a compatible node in the devicetree sources is present. If necessary, CDC ACM support can be explicitly disabled by CONFIG_USB_CDC_ACM. About four CDC ACM UART instances can be defined and used, limited by the maximum number of supported endpoints on the controller.

CDC ACM UART node is supposed to be child of a USB device controller node. Since the designation of the controller nodes varies from vendor to vendor, and our samples and application should be as generic as possible, the default USB device controller is usually assigned an zephyr_udc0 node label. Often, CDC ACM UART is described in a devicetree overlay file and looks like this:
Samples usb-cdc-acm and usb-hid-cdc have similar overlay files. And since no special properties are present, it may seem overkill to use devicetree to describe CDC ACM UART. The motivation behind using devicetree is the easy interchangeability of a real UART controller and CDC ACM UART in applications.

**Console over CDC ACM UART** With the CDC ACM UART node from above and `zephyr_console` property of the chosen node, we can describe that CDC ACM UART is to be used with the console. A similar overlay file is used by the usb-cdc-acm-console sample.

```c
/ {
    chosen {
        zephyr,console = &cdc_acm_uart0;
    };
}
```

Before the application uses the console, it is recommended to wait for the DTR signal:

```c
const struct device *const dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_console));
uint32_t dtr = 0;
if (usb_enable(NULL)) {
    return;
}
while (!dtr) {
    uart_line_ctrl_get(dev, UART_LINE_CTRL_DTR, &dtr);
    k_sleep(K_MSEC(100));
}
printk("nuqneH\\n");
```

**CDC ACM UART as backend** As for the console sample, it is possible to configure CDC ACM UART as backend for other subsystems by setting `Chosen nodes` properties.

List of few Zephyr specific chosen properties which can be used to select CDC ACM UART as backend for a subsystem or application:

- `zephyr,bt-c2h-uart` used in Bluetooth, for example see bluetooth-hci-uart-sample
- `zephyr,ot-uart` used in OpenThread, for example see coprocessor
- `zephyr,shell-uart` used by shell for serial backend, for example see samples/subsys/shell/shell_module
- `zephyr,uart-mcumgr` used by smp-svr sample

**6.5. USB**
POSIX default tty ECHO mitigation  POSIX systems, like Linux, default to enabling ECHO on tty devices. Host side application can disable ECHO by calling `open()` on the tty device and issuing `ioctl()` (preferably via `tcsetattr()`) to disable echo if it is not desired. Unfortunately, there is an inherent race between the `open()` and `ioctl()` where the ECHO is enabled and any characters received (even if host application does not call `read()`) will be echoed back. This issue is especially visible when the CDC ACM port is used without any real UART on the other side because there is no arbitrary delay due to baud rate.

To mitigate the issue, Zephyr CDC ACM implementation arms IN endpoint with ZLP after device is configured. When the host reads the ZLP, which is pretty much the best indication that host application has opened the tty device, Zephyr will force `CONFIG_CDC_ACM_TX_DELAY_MS` milliseconds delay before real payload is sent. This should allow sufficient time for first, and only first, application that opens the tty device to disable ECHO if ECHO is not desired. If ECHO is not desired at all from CDC ACM device it is best to set up udev rule to disable ECHO as soon as device is connected.

ECHO is particularly unwanted when CDC ACM instance is used for Zephyr shell, because the control characters to set color sent back to shell are interpreted as (invalid) command and user will see garbage as a result. While minicom does disable ECHO by default, on exit with reset it will restore the termios settings to whatever was set on entry. Therefore, if minicom is the first application to open the tty device, the exit with reset will enable ECHO back and thus set up a problem for the next application (which cannot be mitigated at Zephyr side). To prevent the issue it is recommended either to leave minicom without reset or to disable ECHO before minicom is started.

DFU  USB DFU class implementation is tightly coupled to `Device Firmware Upgrade` and `MCU-Boot API`. This means that the target platform must support the `Flash Image API`.

See `usb-dfu` sample for reference.

USB Human Interface Devices (HID) support  HID support abuses `Device Driver Model` simply to allow applications to use the `device_get_binding()`. Note that there is no HID device API as such, instead the interface is provided by `hid_ops`. The default instance name is HID_n, where n can be {0, 1, 2, ...} depending on the `CONFIG_USB_HID_DEVICE_COUNT`.

Each HID instance requires a HID report descriptor. The interface to the core and the report descriptor must be registered using `usb_hid_register_device()`.

As the USB HID specification is not only used by the USB subsystem, the USB HID API reference is split into two parts, `Human Interface Devices (HID)` and `USB HID Class API`. HID helper macros from `Human Interface Devices (HID)` should be used to compose a HID report descriptor. Macro names correspond to those used in the USB HID specification.

For the HID class interface, an IN interrupt endpoint is required for each instance, an OUT interrupt endpoint is optional. Thus, the minimum implementation requirement for `hid_ops` is to provide `int_in_ready` callback.

```
#define REPORT_ID 1
static bool configured;
static const struct device *hdev;

static void int_in_ready_cb(const struct device *dev) {
    static uint8_t report[2] = {REPORT_ID, 0};
    if (hid_int_ep_write(hdev, report, sizeof(report), NULL)) {
        LOG_ERR("Failed to submit report");
    } else {
        report[1]++;
    }
}
```
static void status_cb(enum usb_dc_status_code status, const uint8_t *param)
{
    if (status == USB_DC_RESET) {
        configured = false;
    }

    if (status == USB_DC_CONFIGURED && !configured) {
        int_in_ready_cb(hdev);
        configured = true;
    }
}

static const uint8_t hid_report_desc[] = {
    HID_USAGE_PAGE(HID_USAGE_GEN_DESKTOP),
    HID_USAGE(HID_USAGE_GEN_DESKTOP_UNDEFINED),
    HID_COLLECTION(HID_COLLECTION_APPLICATION),
    HID_LOGICAL_MIN8(0x00),
    HID_LOGICAL_MAX16(0xFF, 0x00),
    HID_REPORT_ID(REPORT_ID),
    HID_REPORT_SIZE(8),
    HID_REPORT_COUNT(1),
    HID_USAGE(HID_USAGE_GEN_DESKTOP_UNDEFINED),
    HID_INPUT(0x02),
    HID_END_COLLECTION,
};

static const struct hid_ops my_ops = {
    .int_in_ready = int_in_ready_cb,
};

int main(void)
{
    int ret;

    hdev = device_get_binding("HID_0");
    if (hdev == NULL) {
        return -ENODEV;
    }

    usb_hid_register_device(hdev, hid_report_desc, sizeof(hid_report_desc), &my_ops);

    ret = usb_hid_init(hdev);
    if (ret) {
        return ret;
    }

    return usb_enable(status_cb);
}

If the application wishes to receive output reports via the OUT interrupt endpoint, it must enable CONFIG_ENABLE_HID_INT_OUT_EP and provide int_out_ready callback. The disadvantage of this is that Kconfig options such as CONFIG_ENABLE_HID_INT_OUT_EP or CONFIG_HID_INTERRUPT_EP_MPS apply to all instances. This design issue will be fixed in the HID class implementation for the new USB support.

See usb-hid or usb-hid-mouse sample for reference.
Mass Storage Class MSC follows Bulk-Only Transport specification and uses Disk Access to access and expose a RAM disk, emulated block device on a flash partition, or SD card to the host. Only one disk instance can be exported at a time.

The disc to be used by the implementation is set by the CONFIG_MASS_STORAGE_DISK_NAME and should be the same as the name used by the disc access driver that the application wants to expose to the host. SD card disk drivers use options CONFIG_MMC_VOLUME_NAME or CONFIG_SDMMC_VOLUME_NAME, and flash and RAM disk drivers use node property disk-name to set the disk name.

For the emulated block device on a flash partition, the flash partition and flash disk to be used must be described in the devicetree. If a storage partition is already described at the board level, application devicetree overlay must also delete storage_partition node first. CONFIG_MASS_STORAGE_DISK_NAME should be the same as disk-name property.

```
/delete-node/ &storage_partition;

&mx25r64 {
    partitions {
        compatible = "fixed-partitions";
        #address-cells = <1>;
        #size-cells = <1>;
        storage_partition: partition0 {
            label = "storage";
            reg = <0x00000000 0x00020000>;
        }
    }

    &msc_disk0 {
        compatible = "zephyr,flash-disk";
        partition = <&storage_partition>;
        disk-name = "NAND";
        cache-size = <4096>;
    }
};
```

The disk-property “NAND” may be confusing, but it is simply how some file systems identifies the disc. Therefore, if the application also accesses the file system on the exposed disc, default names should be used, see usb-mass sample for reference.

Networking There are three implementations that work in a similar way, providing a virtual Ethernet connection between the remote (USB host) and Zephyr network support.

- CDC ECM class, enabled with CONFIG_USB_DEVICE_NETWORK_ECM
- CDC EEM class, enabled with CONFIG_USB_DEVICE_NETWORK_EEM
- RNDIS support, enabled with CONFIG_USB_DEVICE_NETWORK_RNDIS

See zperf or socket-dumb-http-server for reference. Typically, users will need to add a configuration file overlay to the build, such as samples/net/zperf/overlay-netusb.conf.

Applications using RNDIS support should enable CONFIG_USB_DEVICE_OS_DESC for a better user experience on a host running Microsoft Windows OS.

Binary Device Object Store (BOS) support

BOS handling can be enabled with Kconfig option CONFIG_USB_DEVICE_BOS. This option also has the effect of changing device descriptor bcdUSB to 0210. The application should register descrip-
tors such as Capability Descriptor using `usb_bos_register_cap()`. Registered descriptors are added to the root BOS descriptor and handled by the stack.

See webusb sample for reference.

### Implementing a non-standard USB class

The configuration of USB device is done in the stack layer.

The following structures and callbacks need to be defined:

- Part of USB Descriptor table
- USB Endpoint configuration table
- USB Device configuration structure
- Endpoint callbacks
- Optionally class, vendor and custom handlers

For example, for the USB loopback application:

```c
struct usb_loopback_config {
    struct usb_if_descriptor if0;
    struct usb_ep_descriptor if0_out_ep;
    struct usb_ep_descriptor if0_in_ep;
} __packed;

USBD_CLASS_DESCR_DEFINE(primary, 0) struct usb_loopback_config loopback_cfg = {
    /* Interface descriptor 0 */
    .if0 = {
        .bLength = sizeof(struct usb_if_descriptor),
        .bDescriptorType = USB_DESC_INTERFACE,
        .bInterfaceNumber = 0,
        .bAlternateSetting = 0,
        .bNumEndpoints = 2,
        .bInterfaceClass = USB_BCC_VENDOR,
        .bInterfaceSubClass = 0,
        .bInterfaceProtocol = 0,
        .iInterface = 0,
    },

    /* Data Endpoint OUT */
    .if0_out_ep = {
        .bLength = sizeof(struct usb_ep_descriptor),
        .bDescriptorType = USB_DESC_ENDPOINT,
        .bEndpointAddress = LOOPBACK_OUT_EP_ADDR,
        .bmAttributes = USB_DC_EP_BULK,
        .wMaxPacketSize = sys_cpu_to_le16(CONFIG_LOOPBACK_BULK_EP_MPS),
        .bInterval = 0x00,
    },

    /* Data Endpoint IN */
    .if0_in_ep = {
        .bLength = sizeof(struct usb_ep_descriptor),
        .bDescriptorType = USB_DESC_ENDPOINT,
        .bEndpointAddress = LOOPBACK_IN_EP_ADDR,
        .bmAttributes = USB_DC_EP_BULK,
        .wMaxPacketSize = sys_cpu_to_le16(CONFIG_LOOPBACK_BULK_EP_MPS),
        .bInterval = 0x00,
    },
};
```

### Endpoint configuration:

6.5. USB
static struct usb_ep_cfg_data ep_cfg[] = {
    { .ep_cb = loopback_out_cb,
      .ep_addr = LOOPBACK_OUT_EP_ADDR,
    },
    { .ep_cb = loopback_in_cb,
      .ep_addr = LOOPBACK_IN_EP_ADDR,
    },
};

USB Device configuration structure:

USBD_DEFINE_CFG_DATA(loopback_config) = {
    .usb_device_description = NULL,
    .interface_config = loopback_interface_config,
    .interface_descriptor = &loopback_cfg.if0,
    .cb_usb_status = loopback_status_cb,
    .interface = {
        .class_handler = NULL,
        .custom_handler = NULL,
        .vendor_handler = loopback_vendor_handler,
    },
    .num_endpoints = ARRAY_SIZE(ep_cfg),
    .endpoint = ep_cfg,
};

The vendor device requests are forwarded by the USB stack core driver to the class driver through the registered vendor handler:

For the loopback class driver, loopback_vendor_handler() processes the vendor requests:

static int loopback_vendor_handler(struct usb_setup_packet *setup,
      int32_t *len, uint8_t **data) {
    LOG_DBG("Class request: bRequest 0x%x bmRequestType 0x%x len %d",
            setup->bRequest, setup->bmRequestType, *len);
    if (setup->RequestType.recipient != USB_REQTYPE_RECIPIENT_DEVICE) {
        return -ENOTSUP;
    }
    if (usb_reqtype_is_to_device(setup) &&
        setup->bRequest == 0x5b) {
        LOG_DBG("Host-to-Device, data %p", *data);
        /*
         * Copy request data in loopback_buf buffer and reuse
         * it later in control device-to-host transfer.
         */
        memcpy(loopback_buf, *data,
               MIN(sizeof(loopback_buf), setup->wLength));
        return 0;
    }
    if ((usb_reqtype_is_to_host(setup)) &&
        (setup->bRequest == 0x5c)) {
        LOG_DBG("Device-to-Host, wLength %d, data %p",
                 setup->wLength, *data);
        *data = loopback_buf;
        *len = MIN(sizeof(loopback_buf), setup->wLength);
        return 0;
    }
}

(continues on next page)
The class driver waits for the `USB_DC_CONFIGURED` device status code before transmitting any data.

### Interface number and endpoint address assignment

In USB terminology, a function is a device that provides a capability to the host, such as a HID class device that implements a keyboard. A function contains a collection of interfaces; at least one interface is required. An interface may contain device endpoints; for example, at least one input endpoint is required to implement a HID class device, and no endpoints are required to implement a USB DFU class. A USB device that combines functions is a multifunction USB device, for example, a combination of a HID class device and a CDC ACM device.

With Zephyr RTOS USB support, various combinations are possible with built-in USB classes/functions or custom user implementations. The limitation is the number of available device endpoints. Each device endpoint is uniquely addressable. The endpoint address is a combination of endpoint direction and endpoint number, a four-bit value. Endpoint number zero is used for the default control method to initialize and configure a USB device. By specification, a maximum of 15 IN and 15 OUT device endpoints are also available for use in functions. The actual number depends on the device controller used. Not all controllers support the maximum number of endpoints and all endpoint types. For example, a device controller might support one IN and one OUT isochronous endpoint, but only for endpoint number 8, resulting in endpoint addresses 0x88 and 0x08. Also, one controller may be able to have IN/OUT endpoints on the same endpoint number, interrupt IN endpoint 0x81 and bulk OUT endpoint 0x01, while the other may only be able to handle one endpoint per endpoint number. Information about the number of interfaces, interface associations, endpoint types, and addresses is provided to the host by the interface, interface specific, and endpoint descriptors.

Host driver for specific function, uses interface and endpoint descriptor to obtain endpoint addresses, types, and other properties. This allows function host drivers to be generic, for example, a multi-function device consisting of one or more CDC ACM and one or more CDC ECM class implementations is possible and no specific drivers are required.

Interface and endpoint descriptors of built-in USB class/function implementations in Zephyr RTOS typically have default interface numbers and endpoint addresses assigned in ascending order. During initialization, default interface numbers may be reassigned based on the number of interfaces in a given configuration. Endpoint addresses are reassigned based on controller capabilities, since certain endpoint combinations are not possible with every controller, and the number of interfaces in a given configuration. This also means that the device side class/function in the Zephyr RTOS must check the actual interface and endpoint descriptor values at runtime. This mechanism also allows as to provide generic samples and generic multifunction samples that are limited only by the resources provided by the controller, such as the number of endpoints and the size of the endpoint FIFOs.

There may be host drivers for a specific function, for example in the Linux Kernel, where the function driver does not read interface and endpoint descriptors to check interface numbers or endpoint addresses, but instead uses hardcoded values. Therefore, the host driver cannot be used in a generic way, meaning it cannot be used with different device controllers and different device configurations in combination with other functions. This may also be because the driver is designed for a specific hardware and is not intended to be used with a clone of this specific hardware. On the contrary, if the driver is generic in nature and should work with different hardware variants, then it must not use hardcoded interface numbers and endpoint addresses. It is not possible to disable endpoint reassignment in Zephyr RTOS, which may prevent you from implementing a hardware-clone firmware. Instead, if possible, the host driver implementation should be fixed to use values from the interface and endpoint descriptor.
Testing over USPIP in native_sim

A virtual USB controller implemented through USBIP might be used to test the USB device stack. Follow the general build procedure to build the USB sample for the native_sim configuration.

Run built sample with:

```
west build -t run
```

In a terminal window, run the following command to list USB devices:

```
$ usbip list -r localhost
Exportable USB devices
======================
- 127.0.0.1
  1-1: unknown vendor : unknown product (2fe3:0100)
    : /sys/devices/pci0000:00/0000:00:01.2/usb1/1-1
    : (Defined at Interface level) (00/00/00)
    : 0 - Vendor Specific Class / unknown subclass / unknown protocol (ff/00/00)
```

In a terminal window, run the following command to attach the USB device:

```
$ sudo usbip attach -r localhost -b 1-1
```

The USB device should be connected to your Linux host, and verified with the following commands:

```
$ sudo usbip port
Imported USB devices
====================
Port 00: <Port in Use> at Full Speed(12Mbps)
  unknown vendor : unknown product (2fe3:0100)
    -> usbip://localhost:3240/1-1
    -> remote bus/dev 001/002
$ lsusb -d 2fe3:0100
Bus 007 Device 004: ID 2fe3:0100
```

USB Vendor and Product identifiers

The USB Vendor ID for the Zephyr project is 0x2FE3. This USB Vendor ID must not be used when a vendor integrates Zephyr USB device support into its own product.

Each USB sample has its own unique Product ID. The USB maintainer, if one is assigned, or otherwise the Zephyr Technical Steering Committee, may allocate other USB Product IDs based on well-motivated and documented requests.

The following Product IDs are currently used:
The USB device descriptor field `bcdDevice` (Device Release Number) represents the Zephyr kernel major and minor versions as a binary coded decimal value.

### 6.5.2 USB device support APIs

#### USB device controller driver API

The USB device controller driver API is described in `include/zephyr/drivers/usb/usb_dc.h` and sometimes referred to as the `usb_dc` API.

This API has some limitations by design, it does not follow *Device Driver Model* and is being replaced by a new UDC driver API.

#### API reference

*group* _usb_device_controller_api_

USB Device Controller API.

#### Typedefs

```c
typedef void (*usb_dc_ep_callback)(uint8_t ep, enum usb_dc_ep_cb_status_code cb_status)
```

Callback function signature for the USB Endpoint status.

```c
typedef void (*usb_dc_status_callback)(enum usb_dc_status_code cb_status, const uint8_t *param)
```

Callback function signature for the device.

#### Enums

```c
enum usb_dc_status_code
```

USB Driver Status Codes.

Status codes reported by the registered device status callback.
Values:

enumerator USB_DC_ERROR
    USB error reported by the controller.

enumerator USB_DC_RESET
    USB reset.

enumerator USB_DC_CONNECTED
    USB connection established, hardware enumeration is completed.

enumerator USB_DC_CONFIGURED
    USB configuration done.

enumerator USB_DC_DISCONNECTED
    USB connection lost.

enumerator USB_DC_SUSPEND
    USB connection suspended by the HOST.

enumerator USB_DC_RESUME
    USB connection resumed by the HOST.

enumerator USB_DC_INTERFACE
    USB interface selected.

enumerator USB_DC_SET_HALT
    Set Feature ENDPOINT_HALT received.

enumerator USB_DC_CLEAR_HALT
    Clear Feature ENDPOINT_HALT received.

enumerator USB_DC_SOF
    Start of Frame received.

enumerator USB_DC_UNKNOWN
    Initial USB connection status.

enum usb_dc_ep_cb_status_code
    USB Endpoint Callback Status Codes.
    Status Codes reported by the registered endpoint callback.
    Values:

enumerator USB_DC_EP_SETUP
    SETUP received.

enumerator USB_DC_EP_DATA_OUT
    Out transaction on this EP, data is available for read.
enumerator USB_DC_EP_DATA_IN
   In transaction done on this EP.

enum usb_dc_ep_transfer_type
USB Endpoint Transfer Type.
Values:

enumerator USB_DC_EP_CONTROL = 0
   Control type endpoint.

enumerator USB_DC_EP_ISOCHRONOUS
   Isochronous type endpoint.

enumerator USB_DC_EP_BULK
   Bulk type endpoint.

enumerator USB_DC_EP_INTERRUPT
   Interrupt type endpoint

enum usb_dc_ep_synchronozation_type
USB Endpoint Synchronization Type.

---

**Note:** Valid only for Isochronous Endpoints

---

Values:

enumerator USB_DC_EP_NO_SYNCHRONIZATION = (0U « 2U)
   No Synchronization.

enumerator USB_DC_EPASYNCHRONOUS = (1U « 2U)
   Asynchronous.

enumerator USB_DC_EP_ADAPTIVE = (2U « 2U)
   Adaptive.

enumerator USB_DC_EP_SYNCHRONOUS = (3U « 2U)
   Synchronous.

---

**Functions**

int usb_dc_attach(void)
   Attach USB for device connection.
Function to attach USB for device connection. Upon success, the USB PLL is enabled, and the USB device is now capable of transmitting and receiving on the USB bus and of generating interrupts.

---

**Returns**
   0 on success, negative errno code on fail.
int usb_dc_detach(void)
   Detach the USB device.

   Function to detach the USB device. Upon success, the USB hardware PLL is powered
down and USB communication is disabled.

   Returns
   0 on success, negative errno code on fail.

int usb_dc_reset(void)
   Reset the USB device.

   This function returns the USB device and firmware back to it's initial state. N.B. the
USB PLL is handled by the usb_detach function

   Returns
   0 on success, negative errno code on fail.

int usb_dc_set_address(const uint8_t addr)
   Set USB device address.

   Parameters
   • addr – [in] Device address

   Returns
   0 on success, negative errno code on fail.

void usb_dc_set_status_callback(const usb_dc_status_callback cb)
   Set USB device controller status callback.

   Function to set USB device controller status callback. The registered callback is used
to report changes in the status of the device controller. The status code are described
by the usb_dc_status_code enumeration.

   Parameters
   • cb – [in] Callback function

int usb_dc_ep_check_cap(const struct usb_dc_ep_cfg_data *const cfg)
   check endpoint capabilities

   Function to check capabilities of an endpoint. usb_dc_ep_cfg_data structure provides
the endpoint configuration parameters: endpoint address, endpoint maximum packet
size and endpoint type. The driver should check endpoint capabilities and return 0 if
the endpoint configuration is possible.

   Parameters
   • cfg – [in] Endpoint config

   Returns
   0 on success, negative errno code on fail.

int usb_dc_ep_configure(const struct usb_dc_ep_cfg_data *const cfg)
   Configure endpoint.

   Function to configure an endpoint. usb_dc_ep_cfg_data structure provides the end-
point configuration parameters: endpoint address, endpoint maximum packet size
and endpoint type.

   Parameters
   • cfg – [in] Endpoint config

   Returns
   0 on success, negative errno code on fail.
int usb_dc_ep_set_stall(const uint8_t ep)
Set stall condition for the selected endpoint.

Parameters

• ep  – [in] Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_clear_stall(const uint8_t ep)
Clear stall condition for the selected endpoint.

Parameters

• ep  – [in] Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_is_stalled(const uint8_t ep, uint8_t *const stalled)
Check if the selected endpoint is stalled.

Parameters

• ep  – [in] Endpoint address corresponding to the one listed in the device configuration table

• stalled  – [out] Endpoint stall status

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_halt(const uint8_t ep)
Halt the selected endpoint.

Parameters

• ep  – [in] Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_enable(const uint8_t ep)
Enable the selected endpoint.
Function to enable the selected endpoint. Upon success interrupts are enabled for the corresponding endpoint and the endpoint is ready for transmitting/receiving data.

Parameters

• ep  – [in] Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_disable(const uint8_t ep)
Disable the selected endpoint.
Function to disable the selected endpoint. Upon success interrupts are disabled for the corresponding endpoint and the endpoint is no longer able for transmitting/receiving data.

Parameters
- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table

**Returns**
0 on success, negative errno code on fail.

```c
int usb_dc_ep_flush(const uint8_t ep)
```
Flush the selected endpoint.

This function flushes the FIFOs for the selected endpoint.

**Parameters**
- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table

**Returns**
0 on success, negative errno code on fail.

```c
int usb_dc_ep_write(const uint8_t ep, const uint8_t *const data, const uint32_t data_len, uint32_t *const ret_bytes)
```
Write data to the specified endpoint.

This function is called to write data to the specified endpoint. The supplied `usb_ep_callback` function will be called when data is transmitted out.

**Parameters**
- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
- **data** – [in] Pointer to data to write
- **data_len** – [in] Length of the data requested to write. This may be zero for a zero length status packet.
- **ret_bytes** – [out] Bytes scheduled for transmission. This value may be NULL if the application expects all bytes to be written

**Returns**
0 on success, negative errno code on fail.

```c
int usb_dc_ep_read(const uint8_t ep, uint8_t *const data, const uint32_t max_data_len, uint32_t *const read_bytes)
```
Read data from the specified endpoint.

This function is called by the endpoint handler function, after an OUT interrupt has been received for that EP. The application must only call this function through the supplied `usb_ep_callback` function. This function clears the ENDPOINT NAK, if all data in the endpoint FIFO has been read, so as to accept more data from host.

**Parameters**
- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
- **data** – [in] Pointer to data buffer to write to
- **max_data_len** – [in] Max length of data to read
- **read_bytes** – [out] Number of bytes read. If data is NULL and `max_data_len` is 0 the number of bytes available for read should be returned.

**Returns**
0 on success, negative errno code on fail.
int usb_dc_ep_set_callback(const uint8_t ep, const usb_dc_ep_callback cb)

Set callback function for the specified endpoint.

Function to set callback function for notification of data received and available to application or transmit done on the selected endpoint, NULL if callback not required by application code. The callback status code is described by usb_dc_ep_cb_status_code.

Parameters
- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
- **cb** – [in] Callback function

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_read_wait(uint8_t ep, uint8_t *data, uint32_t max_data_len, uint32_t *read_bytes)

Read data from the specified endpoint.

This is similar to usb_dc_ep_read, the difference being that, it doesn't clear the endpoint NAKs so that the consumer is not bogged down by further upcalls till he is done with the processing of the data. The caller should reactivate ep by invoking usb_dc_ep_read_continue() do so.

Parameters
- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
- **data** – [in] Pointer to data buffer to write to
- **max_data_len** – [in] Max length of data to read
- **read_bytes** – [out] Number of bytes read. If data is NULL and max_data_len is 0 the number of bytes available for read should be returned.

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_read_continue(uint8_t ep)

Continue reading data from the endpoint.

Clear the endpoint NAK and enable the endpoint to accept more data from the host. Usually called after usb_dc_ep_read_wait() when the consumer is fine to accept more data. Thus these calls together act as a flow control mechanism.

Parameters
- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_mps(uint8_t ep)

Get endpoint max packet size.

Parameters
- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table

Returns
Endpoint max packet size (mps)
int usb_dc_wakeup_request(void)
    Start the host wake up procedure.
    Function to wake up the host if it's currently in sleep mode.

    Returns
    0 on success, negative errno code on fail.

struct usb_dc_ep_cfg_data
#include <usb_dc.h> USB Endpoint Configuration.
Structure containing the USB endpoint configuration.

Public Members

uint8_t ep_addr
    The number associated with the EP in the device configuration structure IN EP = 0x80 | <endpoint number> OUT EP = 0x00 | <endpoint number>

uint16_t ep_mps
    Endpoint max packet size.

defined usb_dc_ep_transfer_type ep_type
    Endpoint Transfer Type.
    May be Bulk, Interrupt, Control or Isochronous

USB device stack API

API reference    There are two ways to transmit data, using the ‘low’ level read/write API or the ‘high’ level transfer API.

Low level API    To transmit data to the host, the class driver should call usb_write(). Upon completion the registered endpoint callback will be called. Before sending another packet the class driver should wait for the completion of the previous write. When data is received, the registered endpoint callback is called. usb_read() should be used for retrieving the received data. For CDC ACM sample driver this happens via the OUT bulk endpoint handler (cdc_acm_bulk_out) mentioned in the endpoint array (cdc_acm_ep_data).

High level API    The usb_transfer method can be used to transfer data to/from the host. The transfer API will automatically split the data transmission into one or more USB transaction(s), depending endpoint max packet size. The class driver does not have to implement endpoint callback and should set this callback to the generic usb_transfer_ep_callback.

Typedefs

typedef void (*usb_ep_callback)(uint8_t ep, enum usb_dc_ep_cb_status_code cb_status)
Callback function signature for the USB Endpoint status.

typedef int (*usb_request_handler)(struct usb_setup_packet *setup, int32_t *transfer_len, uint8_t **payload_data)
Callback function signature for class specific requests.
Function which handles Class specific requests corresponding to an interface number specified in the device descriptor table. For host to device direction the ‘len’ and ‘payload_data’ contain the length of the received data and the pointer to the received data respectively. For device to host class requests, ‘len’ and ‘payload_data’ should be set by the callback function with the length and the address of the data to be transmitted buffer respectively.

typedef void (*usb_interface_config)(struct usb_desc_header *head, uint8_t bInterfaceNumber)
Function for interface runtime configuration.
typedef void (*usb_transfer_callback)(uint8_t ep, int tsize, void *priv)

Callback function signature for transfer completion.

Functions

int usb_set_config(const uint8_t *usb_descriptor)

Configure USB controller.

Function to configure USB controller. Configuration parameters must be valid or an error is returned

Parameters

• usb_descriptor – [in] USB descriptor table

Returns

0 on success, negative errno code on fail

int usb_deconfig(void)

Deconfigure USB controller.

This function returns the USB device to it’s initial state

Returns

0 on success, negative errno code on fail

int usb_enable(uint8_t ep, const uint8_t *data, uint32_t data_len, uint32_t *bytes_ret)

Write data to the specified endpoint.

Function to write data to the specified endpoint. The supplied usb_ep_callback will be called when transmission is done.

Parameters

• ep – [in] Endpoint address corresponding to the one listed in the device configuration table

Configure USB controller.

Function to configure USB controller. Configuration parameters must be valid or an error is returned

Parameters

• usb_descriptor – [in] USB descriptor table

Returns

0 on success, negative errno code on fail
• **data** – [in] Pointer to data to write
• **data_len** – [in] Length of data requested to write. This may be zero for a zero length status packet.
• **bytes_ret** – [out] Bytes written to the EP FIFO. This value may be NULL if the application expects all bytes to be written

**Returns**
0 on success, negative errno code on fail

```c
int usb_read(uint8_t ep, uint8_t *data, uint32_t max_data_len, uint32_t *ret_bytes);
```

Read data from the specified endpoint.

This function is called by the Endpoint handler function, after an OUT interrupt has been received for that EP. The application must only call this function through the supplied usb_ep_callback function.

**Parameters**
• **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
• **data** – [in] Pointer to data buffer to write to
• **max_data_len** – [in] Max length of data to read
• **ret_bytes** – [out] Number of bytes read. If data is NULL and max_data_len is 0 the number of bytes available for read is returned.

**Returns**
0 on success, negative errno code on fail

```c
int usb_ep_set_stall(uint8_t ep);
```

Set STALL condition on the specified endpoint.

This function is called by USB device class handler code to set stall condition on endpoint.

**Parameters**
• **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table

**Returns**
0 on success, negative errno code on fail

```c
int usb_ep_clear_stall(uint8_t ep);
```

Clears STALL condition on the specified endpoint.

This function is called by USB device class handler code to clear stall condition on endpoint.

**Parameters**
• **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table

**Returns**
0 on success, negative errno code on fail

```c
int usb_ep_read_wait(uint8_t ep, uint8_t *data, uint32_t max_data_len, uint32_t *read_bytes);
```

Read data from the specified endpoint.

This is similar to `usb_ep_read`, the difference being that, it doesn't clear the endpoint NAKs so that the consumer is not bogged down by further upcalls till he is done with the processing of the data. The caller should reactivate ep by invoking `usb_ep_read_continue()` do so.
Parameters

- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
- **data** – [in] Pointer to data buffer to write to
- **max_data_len** – [in] Max length of data to read
- **read_bytes** – [out] Number of bytes read. If data is NULL and max_data_len is 0, the number of bytes available for read should be returned.

Returns

0 on success, negative errno code on fail.

```c
int usb_ep_read_continue(uint8_t ep)
```

Continue reading data from the endpoint.

Clear the endpoint NAK and enable the endpoint to accept more data from the host. Usually called after `usb_ep_read_wait()` when the consumer is fine to accept more data. Thus these calls together acts as flow control mechanism.

Parameters

- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table

Returns

0 on success, negative errno code on fail.

```c
void usb_transfer_ep_callback(uint8_t ep, enum usb_dc_ep_cb_status_code)
```

Transfer management endpoint callback.

If a USB class driver wants to use high-level transfer functions, driver needs to register this callback as usb endpoint callback.

```c
int usb_transfer(uint8_t ep, uint8_t *data, size_t dlen, unsigned int flags, usb_transfer_callback cb, void *priv)
```

Start a transfer.

Start a USB transfer to/from the data buffer. This function is asynchronous and can be executed in IRQ context. The provided callback will be called on transfer completion (or error) in thread context.

Parameters

- **ep** – [in] Endpoint address corresponding to the one listed in the device configuration table
- **data** – [in] Pointer to data buffer to write-to/read-from
- **dlen** – [in] Size of data buffer
- **flags** – [in] Transfer flags (USB_TRANS_READ, USB_TRANS_WRITE...)
- **cb** – [in] Function called on transfer completion/failure
- **priv** – [in] Data passed back to the transfer completion callback

Returns

0 on success, negative errno code on fail.

```c
int usb_transfer_sync(uint8_t ep, uint8_t *data, size_t dlen, unsigned int flags)
```

Start a transfer and block-wait for completion.

Synchronous version of `usb_transfer`, wait for transfer completion before returning. A return value of zero can also mean that transfer was cancelled or that the endpoint is not ready. This is due to the design of transfers and `usb_dc` API.
Parameters

- **ep** – **[in]** Endpoint address corresponding to the one listed in the device configuration table
- **data** – **[in]** Pointer to data buffer to write-to/read-from
- **dlen** – **[in]** Size of data buffer
- **flags** – **[in]** Transfer flags

Returns

number of bytes transferred on success, negative errno code on fail.

```c
void usb_cancel_transfer(uint8_t ep)
```
Cancel any ongoing transfer on the specified endpoint.

Parameters

- **ep** – **[in]** Endpoint address corresponding to the one listed in the device configuration table

```c
void usb_cancel_transfers(void)
```
Cancel all ongoing transfers.

```c
bool usb_transfer_is_busy(uint8_t ep)
```
Check that transfer is ongoing for the endpoint.

Parameters

- **ep** – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns

true if transfer is ongoing, false otherwise.

```c
int usb_wakeup_request(void)
```
Start the USB remote wakeup procedure.

Function to request a remote wakeup. This feature must be enabled in configuration, otherwise it will always return -ENOTSUP error.

Returns

0 on success, negative errno code on fail, i.e. when the bus is already active.

```c
bool usb_get_remote_wakeup_status(void)
```
Get status of the USB remote wakeup feature.

Returns

true if remote wakeup has been enabled by the host, false otherwise.

```c
struct usb_ep_cfg_data
```

#include <usb_device.h> USB Endpoint Configuration.

This structure contains configuration for the endpoint.

Public Members

```c
usb_ep_callback ep_cb
```
Callback function for notification of data received and available to application or transmit done, NULL if callback not required by application code.
uint8_t ep_addr

The number associated with the EP in the device configuration structure IN EP = 0x80 | <endpoint number> OUT EP = 0x00 | <endpoint number>

struct usb_interface_cfg_data

#include <usb_device.h> USB Interface Configuration.
This structure contains USB interface configuration.

**Public Members**

`usb_request_handler class_handler`
Handler for USB Class specific Control (EP 0) communications.

`usb_request_handler vendor_handler`
Handler for USB Vendor specific commands.

`usb_request_handler custom_handler`
The custom request handler gets a first chance at handling the request before it is handed over to the ‘chapter 9’ request handler.

return 0 on success, -EINVAL if the request has not been handled by the custom handler and instead needs to be handled by the core USB stack. Any other error code to denote failure within the custom handler.

struct usb_cfg_data

#include <usb_device.h> USB device configuration.
The Application instantiates this with given parameters added using the “usb_set_config” function. Once this function is called changes to this structure will result in undefined behavior. This structure may only be updated after calls to usb_deconfig

**Public Members**

cnst uint8_t *usb_device_description
USB device description, see [http://www.beyondlogic.org/usbnutshell/usb5.shtml#DeviceDescriptors](http://www.beyondlogic.org/usbnutshell/usb5.shtml#DeviceDescriptors).

void *interface_descriptor
Pointer to interface descriptor.

`usb_interface_config interface_config`
Function for interface runtime configuration.

void (*cb_usb_status)(struct usb_cfg_data *cfg, enum usb_dc_status_code cb_status, const uint8_t *param)
Callback to be notified on USB connection status change.
struct `usb_interface_cfg_data` *interface*

USB interface (Class) handler and storage space.

`uint8_t` num_endpoints

Number of individual endpoints in the device configuration.

struct `usb_ep_cfg_data` *endpoint

Pointer to an array of endpoint structs of length equal to the number of EP associated with the device description, not including control endpoints.

### USB HID Class API

USB device specific part for HID support defined in include/zephyr/usb/class/usb_hid.h.

### API Reference

#### USB HID (Human Interface Device)

Use USB HID driver to enumerate as a raw HID device.

---

**group** `usb_hid_device_api`

#### Typedefs

typedef int (*`hid_cb_t`)(const struct `device` *dev, struct usb_setup_packet *setup, int32_t *len, uint8_t **data)

typedef void (*`hid_int_ready_callback`)(const struct `device` *dev)

typedef void (*`hid_protocol_cb_t`)(const struct `device` *dev, uint8_t protocol)

typedef void (*`hid_idle_cb_t`)(const struct `device` *dev, uint16_t report_id)

#### Functions

void `usb_hid_register_device`(const struct `device` *dev, const uint8_t *desc, size_t size, const struct `hid_ops` *op)

Register HID device.

**Parameters**

- dev – [in] Pointer to USB HID device
- desc – [in] Pointer to HID report descriptor
- size – [in] Size of HID report descriptor
- op – [in] Pointer to USB HID device interrupt struct
int hid_int_ep_write(const struct device *dev, const uint8_t *data, uint32_t data_len, uint32_t *bytes_ret)

Write to USB HID interrupt endpoint buffer.

Parameters
- `dev` – [in] Pointer to USB HID device
- `data` – [in] Pointer to data buffer
- `data_len` – [in] Length of data to copy

Returns
0 on success, negative errno code on fail.

int hid_int_ep_read(const struct device *dev, uint8_t *data, uint32_t max_data_len, uint32_t *ret_bytes)

Read from USB HID interrupt endpoint buffer.

Parameters
- `dev` – [in] Pointer to USB HID device
- `data` – [in] Pointer to data buffer
- `max_data_len` – [in] Max length of data to copy
- `ret_bytes` – [out] Number of bytes to copy. If data is NULL and max_data_len is 0 the number of bytes available in the buffer will be returned.

Returns
0 on success, negative errno code on fail.

int usb_hid_set_proto_code(const struct device *dev, uint8_t proto_code)

Set USB HID class Protocol Code.

Should be called before `usb_hid_init()`.

Parameters
- `dev` – [in] Pointer to USB HID device
- `proto_code` – [in] Protocol Code to be used for bInterfaceProtocol

Returns
0 on success, negative errno code on fail.

int usb_hid_init(const struct device *dev)

Initialize USB HID class support.

Parameters
- `dev` – [in] Pointer to USB HID device

Returns
0 on success, negative errno code on fail.

struct hid_ops

#include <usb_hid.h> USB HID device interface.

Binary Device Object Store (BOS) support API

API reference
group usb_bos
    USB Binary Device Object Store support.

Defines

USB_DEVICE_BOS_DESC_DEFINE_CAP
    Helper macro to place the BOS compatibility descriptor in the right memory section.

Enums

define usb_bos_capability_types
    Device capability type codes.
    Values:

    enumerator USB_BOS_CAPABILITY_EXTENSION = 0x02
    enumerator USB_BOS_CAPABILITY_PLATFORM = 0x05

Functions

void usb_bos_register_cap(struct usb_bos_platform_descriptor *hdr)
    Register BOS capability descriptor.
    This function should be used by the application to register BOS capability descriptors
    before the USB device stack is enabled.

    Parameters
        • hdr – [in] Pointer to BOS capability descriptor

 struct usb_bos_capability_lpm
    #include <bos.h> BOS USB 2.0 extension capability descriptor.

 struct usb_bos_platform_descriptor
    #include <bos.h> BOS platform capability descriptor.

 struct usb_bos_capability_webusb
    #include <bos.h> WebUSB specific part of platform capability descriptor.

 struct usb_bos_capability_msos
    #include <bos.h> Microsoft OS 2.0 descriptor specific part of platform capability descriptor.

New experimental USB support
6.5.3 New experimental USB device support

Overview

The new USB device support is experimental. It consists of USB device controller (UDC) driver API and USB device stack (next) API. The new device stack brings support for multiple device controllers, support for multiple configurations, and dynamic registration of class instances to a configuration at runtime. The stack also provides a specific class API that should be used to implement the functions (classes). It will replace USB device support.

If you would like to play around with the new device support, or the new USB support in general, please try usb-shell sample. The sample is mainly to help test the capabilities of the stack and correct implementation of the USB controller drivers.

Supported USB classes

**Bluetooth HCI USB transport layer**  See bluetooth-hci-usb-sample sample for reference. To build the sample for the new device support, set the configuration `-DCONF_FILE=usbd_next_prj.conf` either directly or via west.

**CDC ACM**  CDC ACM implementation has support for multiple instances. Description from CDC ACM also applies to the new implementation. See usb-cdc-acm sample for reference. To build the sample for the new device support, set the configuration `-DCONF_FILE=usbd_next_prj.conf` either directly or via west.

**Mass Storage Class**  See usb-mass sample for reference. To build the sample for the new device support, set the configuration `-DCONF_FILE=usbd_next_prj.conf` either directly or via west.

**Networking**  At the moment only CDC ECM class is implemented and has support for multiple instances. It provides a virtual Ethernet connection between the remote (USB host) and Zephyr network support.

See zperf for reference. To build the sample for the new device support, set the configuration overlay file `-DDEXTRA_CONF_FILE=overlay-usbd_next_ecm.conf` and devicetree overlay file `-DDTC_OVERLAY_FILE="usbd_next_ecm.overlay` either directly or via west.

6.5.4 New USB device support APIs

**USB device controller (UDC) driver API**

The USB device controller driver API is described in include/zephyr/drivers/usb/udc.h and referred to as the UDC driver API.

UDC driver API is experimental and is subject to change without notice. It is a replacement for USB device controller driver API. If you wish to port an existing driver to UDC driver API, or add a new driver, please use drivers/usb/udc/udc_skeleton.c as a starting point.

**API reference**

*group udc_api*

New USB device controller (UDC) driver API.
Functions

static inline bool udc_is_initialized(const struct device *dev)

Checks whether the controller is initialized.

Parameters
  • dev – [in] Pointer to device struct of the driver instance

Returns
  true if controller is initialized, false otherwise

static inline bool udc_is_enabled(const struct device *dev)

Checks whether the controller is enabled.

Parameters
  • dev – [in] Pointer to device struct of the driver instance

Returns
  true if controller is enabled, false otherwise

static inline bool udc_is_suspended(const struct device *dev)

Checks whether the controller is suspended.

Parameters
  • dev – [in] Pointer to device struct of the driver instance

Returns
  true if controller is suspended, false otherwise

int udc_init(const struct device *dev, udc_event_cb_t event_cb)

Initialize USB device controller.

Initialize USB device controller and control IN/OUT endpoint. After initialization con-
troller driver should be able to detect power state of the bus and signal power state
changes.

Parameters
  • dev – [in] Pointer to device struct of the driver instance
  • event_cb – [in] Event callback from the higher layer (USB device stack)

Return values
  • -EINVAL – on parameter error (no callback is passed)
  • -EALREADY – already initialized

Returns
  0 on success, all other values should be treated as error.

int udc_enable(const struct device *dev)

Enable USB device controller.

Enable powered USB device controller and allow host to recognize and enumerate the
device.

Parameters
  • dev – [in] Pointer to device struct of the driver instance

Return values
  • -EPERM – controller is not initialized
  • -EALREADY – already enabled
Returns
0 on success, all other values should be treated as error.

int udc_disable(const struct device *dev)
Disable USB device controller.
Disable enabled USB device controller. The driver should continue to detect power state changes.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
-EALREADY – already disabled

Returns
0 on success, all other values should be treated as error.

int udc_shutdown(const struct device *dev)
Poweroff USB device controller.
Shut down the controller completely to reduce energy consumption or to change the role of the controller.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
-EALREADY – controller is not initialized

Returns
0 on success, all other values should be treated as error.

static inline struct udc_device_caps udc_caps(const struct device *dev)
Get USB device controller capabilities.
Obtain the capabilities of the controller such as full speed (FS), high speed (HS), and more.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Returns
USB device controller capabilities.

enum udc_bus_speed udc_device_speed(const struct device *dev)
Get actual USB device speed.
The function should be called after the reset event to determine the actual bus speed.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Returns
USB device controller capabilities.

static inline int udc_set_address(const struct device *dev, const uint8_t addr)
Set USB device address.
Set address of enabled USB device.

Parameters
• dev – [in] Pointer to device struct of the driver instance
• addr – [in] USB device address
Return values
- EPERM – controller is not enabled (or not initialized)

Returns
0 on success, all other values should be treated as error.

static inline int udc_test_mode(const struct device *dev, const uint8_t mode, const bool dryrun)

Enable Test Mode.
For compliance testing, high-speed controllers must support test modes. A particular
test is enabled by a SetFeature(TEST_MODE) request. To disable a test mode, device
needs to be power cycled.

Parameters
- dev – [in] Pointer to device struct of the driver instance
- mode – [in] Test mode
- dryrun – [in] Verify that a particular mode can be enabled, but do not
  enable test mode

Return values
- ENOTSUP – Test mode is not supported

Returns
0 on success, all other values should be treated as error.

static inline int udc_host_wakeup(const struct device *dev)

Initiate host wakeup procedure.
Initiate host wakeup. Only possible when the bus is suspended.

Parameters
- dev – [in] Pointer to device struct of the driver instance

Return values
- EPERM – controller is not enabled (or not initialized)

Returns
0 on success, all other values should be treated as error.

int udc_ep_try_config(const struct device *dev, const uint8_t ep, const uint8_t attributes,
                      uint16_t *const mps, const uint8_t interval)

Try an endpoint configuration.
Try an endpoint configuration based on endpoint descriptor. This function may modify
wMaxPacketSize descriptor fields of the endpoint. All properties of the descriptor, such
as direction, and transfer type, should be set correctly. If wMaxPacketSize value is zero,
 it will be updated to maximum buffer size of the endpoint.

Parameters
- dev – [in] Pointer to device struct of the driver instance
- ep – [in] Endpoint address (same as bEndpointAddress)
- attributes – [in] Endpoint attributes (same as bmAttributes)
- mps – [in] Maximum packet size (same as wMaxPacketSize)
- interval – [in] Polling interval (same as bInterval)

Return values
- EINVAL – on wrong parameter
- ENOTSUP – endpoint configuration not supported
Configure and enable endpoint.

Parameters

- `dev` – [in] Pointer to device struct of the driver instance
- `ep` – [in] Endpoint address (same as bEndpointAddress)
- `attributes` – [in] Endpoint attributes (same as bmAttributes)
- `mps` – [in] Maximum packet size (same as wMaxPacketSize)
- `interval` – [in] Polling interval (same as bInterval)

Return values

- `-EINVAL` – on wrong parameter (control IN/OUT endpoint)
- `-EPERM` – controller is not initialized
- `-ENODEV` – endpoint configuration not found
- `-EALREADY` – endpoint is already enabled

Returns

0 on success, all other values should be treated as error.

Configure and make an endpoint ready for use. Valid for all endpoints except control IN/OUT.

disable

Disable endpoint.

Parameters

- `dev` – [in] Pointer to device struct of the driver instance
- `ep` – [in] Endpoint address

Return values

- `-EINVAL` – on wrong parameter (control IN/OUT endpoint)
- `-ENODEV` – endpoint configuration not found
- `-EALREADY` – endpoint is already disabled
- `-EPERM` – controller is not initialized

Returns

0 on success, all other values should be treated as error.

Halt endpoint.

Parameters

- `dev` – [in] Pointer to device struct of the driver instance
- `ep` – [in] Endpoint address

Return values

- `-EINVAL` – on wrong parameter (control IN/OUT endpoint)
- `-ENODEV` – endpoint configuration not found
- `-EALREADY` – endpoint is already disabled
- `-EPERM` – controller is not initialized

Returns

0 on success, all other values should be treated as error.
• -ENOMEM – endpoint configuration not found
• -ENOTSUP – not supported (e.g. isochronous endpoint)
• -EPERM – controller is not enabled

Returns
0 on success, all other values should be treated as error.

int udc_ep_clear_halt(const struct device *dev, const uint8_t ep)
Clear endpoint halt.
Valid for all endpoints.

Parameters
• dev – [in] Pointer to device struct of the driver instance
• ep – [in] Endpoint address

Return values
• -ENOMEM – endpoint configuration not found
• -ENOTSUP – not supported (e.g. isochronous endpoint)
• -EPERM – controller is not enabled

Returns
0 on success, all other values should be treated as error.

int udc_ep_enqueue(const struct device *dev, struct net_buf *const buf)
Queue USB device controller request.
Add request to the queue. If the queue is empty, the request buffer can be claimed by
the controller immediately.

Parameters
• dev – [in] Pointer to device struct of the driver instance
• buf – [in] Pointer to UDC request buffer

Return values
• -ENOMEM – endpoint configuration not found
• -EACCES – endpoint is not enabled (TBD)
• -EBUSY – request can not be queued
• -EPERM – controller is not initialized

Returns
0 on success, all other values should be treated as error.

int udc_ep_dequeue(const struct device *dev, const uint8_t ep)
Remove all USB device controller requests from endpoint queue.
UDC_EVT_EP_REQUEST event will be generated when the driver releases claimed
buffer, no new requests will be claimed, all requests in the queue will passed as
chained list of the event variable buf. The endpoint queue is empty after that.

Parameters
• dev – [in] Pointer to device struct of the driver instance
• ep – [in] Endpoint address

Return values
• -ENOMEM – endpoint configuration not found
Zephyr Project Documentation, Release 3.6.0-rc3

- EACCES – endpoint is not disabled
- EPERM – controller is not initialized

Returns
0 on success, all other values should be treated as error.

```c
struct net_buf *udc_ep_buf_alloc(const struct device *dev, const uint8_t ep, const size_t size)
```
Allocate UDC request buffer.
Allocate a new buffer from common request buffer pool.

Parameters
- `dev` – [in] Pointer to device struct of the driver instance
- `ep` – [in] Endpoint address
- `size` – [in] Size of the request buffer

Returns
pointer to allocated request or NULL on error.

```c
int udc_ep_buf_free(const struct device *dev, struct net_buf *const buf)
```
Free UDC request buffer.
Put the buffer back into the request buffer pool.

Parameters
- `dev` – [in] Pointer to device struct of the driver instance
- `buf` – [in] Pointer to UDC request buffer

Returns
0 on success, all other values should be treated as error.

```c
static inline void udc_ep_buf_set_zlp(struct net_buf *const buf)
```
Set ZLP flag in requests metadata.
The controller should send a ZLP at the end of the transfer.

Parameters
- `buf` – [in] Pointer to UDC request buffer

```c
static inline struct udc_buf_info *udc_get_buf_info(const struct net_buf *const buf)
```
Get requests metadata.

Parameters
- `buf` – [in] Pointer to UDC request buffer

Returns
pointer to metadata structure.

USB device stack (next) API

New USB device stack API is experimental and is subject to change without notice.

Defines

USB_BSTRING_LENGTH(s)
USB_STRING_DESCRIPTOR_LENGTH(s)
USBD_NUMOF_INTERFACES_MAX
USBD_CCTX_REGISTERED
USB Class instance registered flag.
USBD_DEVICE_DEFINE(device_name, uhc_dev, vid, pid)
USBD_CONFIGURATION_DEFINE(name, attrib, power)
USBD_DESC_LANG_DEFINE(name)
Create a string descriptor node and language string descriptor.
This macro defines a descriptor node and a string descriptor that, when added to the device context, is automatically used as the language string descriptor zero. Both descriptor node and descriptor are defined with static-storage-class specifier. Default and currently only supported language ID is 0x0409 English (United States). If string descriptors are used, it is necessary to add this descriptor as the first one to the USB device context.

Parameters

• name – Language string descriptor node identifier.

USBD_DESC_STRING_DEFINE(d_name, d_string, d_utype)

USBD_DESC_MANUFACTURER_DEFINE(d_name, d_string)
Create a string descriptor node and manufacturer string descriptor.
This macro defines a descriptor node and a string descriptor that, when added to the device context, is automatically used as the manufacturer string descriptor. Both descriptor node and descriptor are defined with static-storage-class specifier.
Parameters

- d_name – String descriptor node identifier.
- d_string – ASCII7 encoded manufacturer string literal

`USBD_DESC_PRODUCT_DEFINE(d_name, d_string)`

Create a string descriptor node and product string descriptor.

This macro defines a descriptor node and a string descriptor that, when added to the
device context, is automatically used as the product string descriptor. Both descriptor
node and descriptor are defined with static-storage-class specifier.

Parameters

- d_name – String descriptor node identifier.
- d_string – ASCII7 encoded product string literal

`USBD_DESC_SERIAL_NUMBER_DEFINE(d_name, d_string)`

Create a string descriptor node and serial number string descriptor.

This macro defines a descriptor node and a string descriptor that, when added to the
device context, is automatically used as the serial number string descriptor. The string
literal parameter is used as a placeholder, the unique number is obtained from hwinfo.
Both descriptor node and descriptor are defined with static-storage-class specifier.

Parameters

- d_name – String descriptor node identifier.
- d_string – ASCII7 encoded serial number string literal placeholder

`USBD_DEFINE_CLASS(class_name, class_api, class_data)`

`VENDOR_REQ_DEFINE(_reqs, _len)`

Helper to declare request table of `usbd_cctx_vendor_req`.

Parameters

- _reqs – Pointer to the vendor request field
- _len – Number of supported vendor requests

`USBD_VENDOR_REQ(_reqs...)`

Helper to declare supported vendor requests.

Parameters

- _reqs – Variable number of vendor requests

Enums

enum usbd_desc_usage_type

Values:

- enumerator USBD_DUT_STRING_LANG
- enumerator USBD_DUT_STRING_MANUFACTURER
- enumerator USBD_DUT_STRING_PRODUCT
enumerator USBD_OUT_STRING_SERIAL_NUMBER

enumerator USBD_OUT_STRING_INTERFACE

enum usbd_ch9_state
    USB device support middle layer runtime state.
    Part of USB device states without suspended and powered states, as it is better to track
    them separately.
    Values:
        enumerator USBD_STATE_DEFAULT = 0
        enumerator USBD_STATE_ADDRESS
        enumerator USBD_STATE_CONFIGURED

Functions

int usbd_add_descriptor(struct usbd_contex *uds_ctx, struct usbd_desc_node *dn)
Add common USB descriptor.
Add common descriptor like string or bos.
    Parameters
        • uds_ctx – [in] Pointer to USB device support context
        • dn – [in] Pointer to USB descriptor node
    Returns
        0 on success, other values on fail.
int usbd_add_configuration(struct usbd_contex *uds_ctx, struct usbd_config_node *cd)
Add a USB device configuration.
    Parameters
        • uds_ctx – [in] Pointer to USB device support context
        • cd – [in] Pointer to USB configuration node
    Returns
        0 on success, other values on fail.
int usbd_register_class(struct usbd_contex *uds_ctx, const char *name, uint8_t cfg)
Register an USB class instance.
An USB class implementation can have one or more instances. To identify the instances
we use device drivers API. Device names have a prefix derived from the name of the
class, for example CDC_ACM for CDC ACM class instance, and can also be easily iden-
tified in the shell. Class instance can only be registered when the USB device stack is
disabled. Registered instances are initialized at initialization of the USB device stack,
and the interface descriptors of each instance are adapted to the whole context.
    Parameters
        • uds_ctx – [in] Pointer to USB device support context
        • name – [in] Class instance name
• cfg – [in] Configuration value (similar to bConfigurationValue)

**Returns**
0 on success, other values on fail.

```c
int usbd_unregister_class(struct usbd_context *uds_ctx, const char *name, uint8_t cfg)
```

Unregister an USB class instance.

USB class instance will be removed and will not appear on the next start of the stack. Instance can only be unregistered when the USB device stack is disabled.

**Parameters**
- uds_ctx – [in] Pointer to USB device support context
- name – [in] Class instance name
- cfg – [in] Configuration value (similar to bConfigurationValue)

**Returns**
0 on success, other values on fail.

```c
int usbd_init(struct usbd_context *uds_ctx)
```

Initialize USB device.

Initialize USB device descriptors and configuration, initialize USB device controller. Class instances should be registered before they are involved. However, the stack should also initialize without registered instances, even if the host would complain about missing interfaces.

**Parameters**
- uds_ctx – [in] Pointer to USB device support context

**Returns**
0 on success, other values on fail.

```c
int usbd_enable(struct usbd_context *uds_ctx)
```

Enable the USB device support and registered class instances.

This function enables the USB device support.

**Parameters**
- uds_ctx – [in] Pointer to USB device support context

**Returns**
0 on success, other values on fail.

```c
int usbd_disable(struct usbd_context *uds_ctx)
```

Disable the USB device support.

This function disables the USB device support.

**Parameters**
- uds_ctx – [in] Pointer to USB device support context

**Returns**
0 on success, other values on fail.

```c
int usbd_shutdown(struct usbd_context *const uds_ctx)
```

Shutdown the USB device support.

This function completely disables the USB device support.

**Parameters**
- uds_ctx – [in] Pointer to USB device support context
Returns
0 on success, other values on fail.

int usbd_ep_set_halt(struct usbd_contex *uds_ctx, uint8_t ep)
Halt endpoint.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• ep – [in] Endpoint address

Returns
0 on success, or error from udc_ep_set_halt()

int usbd_ep_clear_halt(struct usbd_contex *uds_ctx, uint8_t ep)
Clear endpoint halt.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• ep – [in] Endpoint address

Returns
0 on success, or error from udc_ep_clear_halt()

bool usbd_ep_is_halted(struct usbd_contex *uds_ctx, uint8_t ep)
Checks whether the endpoint is halted.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• ep – [in] Endpoint address

Returns
true if endpoint is halted, false otherwise

struct net_buf *usbd_ep_ctrl_buf_alloc(struct usbd_contex *const uds_ctx, const uint8_t ep, const size_t size)
Allocate buffer for USB device control request.
Allocate a new buffer from controller's driver buffer pool.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• ep – [in] Endpoint address
• size – [in] Size of the request buffer

Returns
pointer to allocated request or NULL on error.

struct net_buf *usbd_ep_buf_alloc(const struct usbd_class_node *const c_nd, const uint8_t ep, const size_t size)
Allocate buffer for USB device request.
Allocate a new buffer from controller's driver buffer pool.

Parameters
• c_nd – [in] Pointer to USB device class node
• ep – [in] Endpoint address
• size – [in] Size of the request buffer
Returns
pointer to allocated request or NULL on error.

int usbd_ep_ctrl_enqueue(struct usbd_contex *const uds_ctx, struct net_buf *const buf)
Queue USB device control request.
Add control request to the queue.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• buf – [in] Pointer to UDC request buffer

Returns
0 on success, all other values should be treated as error.

int usbd_ep_enqueue(const struct usbd_class_node *const c_nd, struct net_buf *const buf)
Queue USB device request.
Add request to the queue.

Parameters
• c_nd – [in] Pointer to USB device class node
• buf – [in] Pointer to UDC request buffer

Returns
0 on success, or error from udc_ep_enqueue()

int usbd_ep_dequeue(struct usbd_contex *uds_ctx, const uint8_t ep)
Remove all USB device controller requests from endpoint queue.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• ep – [in] Endpoint address

Returns
0 on success, or error from udc_ep_dequeue()

int usbd_ep_buf_free(struct usbd_contex *uds_ctx, struct net_buf *buf)
Free USB device request buffer.
Put the buffer back into the request buffer pool.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• buf – [in] Pointer to UDC request buffer

Returns
0 on success, all other values should be treated as error.

bool usbd_is_suspended(struct usbd_contex *uds_CTX)
Checks whether the USB device controller is suspended.

Parameters
• uds_ctx – [in] Pointer to USB device support context

Returns
ture if endpoint is halted, false otherwise
int usbd_wakeup_request(struct usbd_contex *uds_ctx)
    Initiate the USB remote wakeup (TBD)

    Returns
    0 on success, other values on fail.

int usbd_device_set_bcd(struct usbd_contex *const uds_ctx, const uint16_t bcd)
    Set USB device descriptor value bcdUSB.

    Parameters
    • uds_ctx – [in] Pointer to USB device support context
    • bcd – [in] bcdUSB value

    Returns
    0 on success, other values on fail.

int usbd_device_set_vid(struct usbd_contex *const uds_ctx, const uint16_t vid)
    Set USB device descriptor value idVendor.

    Parameters
    • uds_ctx – [in] Pointer to USB device support context
    • vid – [in] idVendor value

    Returns
    0 on success, other values on fail.

int usbd_device_set_pid(struct usbd_contex *const uds_ctx, const uint16_t pid)
    Set USB device descriptor value idProduct.

    Parameters
    • uds_ctx – [in] Pointer to USB device support context
    • pid – [in] idProduct value

    Returns
    0 on success, other values on fail.

int usbd_device_set_code_triple(struct usbd_contex *const uds_ctx, const uint8_t base_class, const uint8_t subclass, const uint8_t protocol)
    Set USB device descriptor code triple Base Class, SubClass, and Protocol.

    Parameters
    • uds_ctx – [in] Pointer to USB device support context
    • base_class – [in] bDeviceClass value
    • subclass – [in] bDeviceSubClass value
    • protocol – [in] bDeviceProtocol value

    Returns
    0 on success, other values on fail.

int usbd_config_attrib_rwup(struct usbd_contex *const uds_ctx, const uint8_t cfg, const bool enable)
    Setup USB device configuration attribute Remote Wakeup.

    Parameters
    • uds_ctx – [in] Pointer to USB device support context
    • cfg – [in] Configuration number
    • enable – [in] Sets attribute if true, clears it otherwise
Returns
0 on success, other values on fail.

int usbd_config_attrib_self(struct usbd_context *const uds_ctx, const uint8_t cfg, const bool enable)
Setup USB device configuration attribute Self-powered.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• cfg – [in] Configuration number
• enable – [in] Sets attribute if true, clears it otherwise

Returns
0 on success, other values on fail.

int usbd_config_maxpower(struct usbd_context *const uds_ctx, const uint8_t cfg, const uint8_t power)
Setup USB device configuration power consumption.

Parameters
• uds_ctx – [in] Pointer to USB device support context
• cfg – [in] Configuration number
• power – [in] Maximum power consumption value (bMaxPower)

Returns
0 on success, other values on fail.

struct usbd_desc_node
#include <usbd.h> Descriptor node.
Descriptor node is used to manage descriptors that are not directly part of a structure, such as string or bos descriptors.

Public Members

sys_dnode_t node
  slist node struct

unsigned int idx
  Descriptor index, required for string descriptors.

unsigned int utype
  Descriptor usage type (not bDescriptorType)

unsigned int utf16le
  If not set, string descriptor must be converted to UTF16LE.

unsigned int custom_sn
  If not set, device stack obtains SN using the hwininfo API.

void *desc
  Pointer to a descriptor.
struct usbd_config_node
#include <usbd.h> Device configuration node.

Configuration node is used to manage device configurations, at least one configuration is required. It does not have an index, instead bConfigurationValue of the descriptor is used for identification.

Public Members

sys_snode_t node
    slist node struct

void *desc
    Pointer to configuration descriptor.

sys_slist_t class_list
    List of registered classes (functions)

struct usbd_ch9_data
#include <usbd.h> USB device support middle layer runtime data.

Public Members

struct usb_setup_packet setup
    Setup packet, up-to-date for the respective control request.

int ctrl_type
    Control type, internally used for stage verification.

enum usbd_ch9_state state
    Protocol state of the USB device stack.

uint32_t ep_halt
    Halted endpoints bitmap.

uint8_t configuration
    USB device stack selected configuration.

bool post_status
    Post status stage work required, e.g. set new device address

uint8_t alternate[16U]
    Array to track interfaces alternate settings.

struct usbd_status
#include <usbd.h> USB device support status.
Public Members

unsigned int initialized
  USB device support is initialized.

unsigned int enabled
  USB device support is enabled.

unsigned int suspended
  USB device is suspended.

unsigned int rwup
  USB remote wake-up feature is enabled.

struct usbd_contex
  #include <usbd.h> USB device support runtime context.
  Main structure that organizes all descriptors, configuration, and interfaces. An UDC device must be assigned to this structure.

Public Members

cnst char *name
  Name of the USB device.

struct k_mutex mutex
  Access mutex.

cnst struct device *dev
  Pointer to UDC device.

struct usbd_ch9_data ch9_data
  Middle layer runtime data.

sys_dlist_t descriptors
  slist to manage descriptors like string, bos

sys_slist_t configs
  slist to manage device configurations

struct usbd_status status
  Status of the USB device support.

void *desc
  Pointer to device descriptor.

struct usbd_cctx_vendor_req
  #include <usbd.h> Vendor Requests Table.
Public Members

const uint8_t *reqs
   Array of vendor requests supported by the class.

uint8_t len
   Length of the array.

struct usbd_class_api
   #include <usbd.h> USB device support class instance API.

Public Members

void (*feature_halt)(struct usbd_class_node *const node, uint8_t ep, bool halted)
   Feature halt state update handler.

void (*update)(struct usbd_class_node *const node, uint8_t iface, uint8_t alternate)
   Configuration update handler.

int (*control_to_dev)(struct usbd_class_node *const node, const struct usb_setup_packet *const setup, const struct net_buf *const buf)
   USB control request handler to device.

int (*control_to_host)(struct usbd_class_node *const node, const struct usb_setup_packet *const setup, struct net_buf *const buf)
   USB control request handler to host.

int (*request)(struct usbd_class_node *const node, struct net_buf *buf, int err)
   Endpoint request completion event handler.

void (*suspended)(struct usbd_class_node *const node)
   USB power management handler suspended.

void (*resumed)(struct usbd_class_node *const node)
   USB power management handler resumed.

void (*sof)(struct usbd_class_node *const node)
   Start of Frame.

void (*enable)(struct usbd_class_node *const node)
   Class associated configuration is selected.

void (*disable)(struct usbd_class_node *const node)
   Class associated configuration is disabled.

int (*init)(struct usbd_class_node *const node)
   Initialization of the class implementation.
void (*shutdown)(struct usbd_class_node *const node)
    Shutdown of the class implementation.

struct usbd_class_data
    #include <usbd.h> USB device support class data.

Public Members

struct usbd_contex *uds_ctx
    Pointer to USB device stack context structure.

void *desc
    Pointer to a class implementation descriptor that should end with a nil descriptor
    (bLength = 0 and bDescriptorType = 0).

const struct usbd_cctx_vendor_req *v_reqs
    Supported vendor request table, can be NULL.

uint32_t ep_assigned
    Bitmap of all endpoints assigned to the instance.
    The IN endpoints are mapped in the upper halfword.

uint32_t ep_active
    Bitmap of the enabled endpoints of the instance.
    The IN endpoints are mapped in the upper halfword.

uint32_t iface_bm
    Bitmap of the bInterfaceNumbers of the class instance.

atomic_t state
    Variable to store the state of the class instance.

void *priv
    Pointer to private data.

struct usbd_class_node
    #include <usbd.h>

Public Members

sys_snode_t node
    Node information for the slist.

const char *name
    Name of the USB device class instance.
const struct usbd_class_api *api
   Pointer to device support class API.

struct usbd_class_data *data
   Pointer to USB device support class data.

6.5.5 USB host support APIs

USB host controller (UHC) driver API

The USB host controller driver API is described in include/zephyr/drivers/usb/uhc.h and referred to as the UHC driver API.

UHC driver API is experimental and is subject to change without notice.

Driver API reference

group uhc_api
   USB host controller (UHC) driver API.

Defines

UHC_STATUS_INITIALIZED
   Controller is initialized by uhc_init()

UHC_STATUS_ENABLED
   Controller is enabled and all API functions are available.

Typedefs

typedef int (*uhc_event_cb_t)(const struct device *dev, const struct uhc_event *const event)
   Callback to submit UHC event to higher layer.
   At the higher level, the event is to be inserted into a message queue.

   Param dev
      [in] Pointer to device struct of the driver instance

   Param event
      [in] Point to event structure

   Return
      0 on success, all other values should be treated as error.

Enums
enum uhc_control_stage
    USB control transfer stage.
    
    Values:
    
    enumerator UHC_CONTROL_STAGE_SETUP = 0
    enumerator UHC_CONTROL_STAGE_DATA
    enumerator UHC_CONTROL_STAGE_STATUS

enum uhc_event_type
    USB host controller event types.
    
    Values:
    
    enumerator UHC_EVT_DEV_CONNECTED_LS
        Low speed device connected.
    enumerator UHC_EVT_DEV_CONNECTED_FS
        Full speed device connected.
    enumerator UHC_EVT_DEV_CONNECTED_HS
        High speed device connected.
    enumerator UHC_EVT_DEV_REMOVED
        Device (peripheral) removed.
    enumerator UHC_EVT_RESETED
        Bus reset operation finished.
    enumerator UHC_EVT_SUSPENDED
        Bus suspend operation finished.
    enumerator UHC_EVT_RESUMED
        Bus resume operation finished.
    enumerator UHC_EVT_RWUP
        Remote wakeup signal.
    enumerator UHC_EVT_EP_REQUEST
        Endpoint request result event.
    enumerator UHC_EVT_ERROR
        Non-correctable error event, requires attention from higher levels or application.
static inline bool uhc_is_initialized(const struct device *dev)
Checks whether the controller is initialized.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Returns
ture if controller is initialized, false otherwise

static inline bool uhc_is_enabled(const struct device *dev)
Checks whether the controller is enabled.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Returns
ture if controller is enabled, false otherwise

static inline int uhc_bus_reset(const struct device *dev)
Reset USB bus.
Perform USB bus reset, controller may emit UHC_EVT_RESETED at the end of reset signaling.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
-EBUSY – if the controller is already performing a bus operation

Returns
0 on success, all other values should be treated as error.

static inline int uhc_sof_enable(const struct device *dev)
Enable Start of Frame generator.

Enable SOF generator.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
-EALREADY – if already enabled

Returns
0 on success, all other values should be treated as error.

static inline int uhc_bus_suspend(const struct device *dev)
Suspend USB bus.
Disable SOF generator and emit UHC_EVT_SUSPENDED event when USB bus is suspended.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
-EALREADY – if already suspended

Returns
0 on success, all other values should be treated as error.
static inline int uhc_bus_resume(const struct device *dev)
    Resume USB bus.
    Signal resume for at least 20ms, emit UHC_EVT_RESUMED at the end of USB bus resume signaling. The SoF generator should subsequently start within 3ms.

Parameters
• dev – [in] Pointer to device struct of the driver instance

Return values
-EBUSY – if the controller is already performing a bus operation

Returns
0 on success, all other values should be treated as error.

struct uhc_transfer *uhc_xfer_alloc(const struct device *dev, const uint8_t addr, const uint8_t ep, const uint8_t attrib, const uint16_t mps, const uint16_t timeout, void *const udev, void *const cb)

Allocate UHC transfer.
Allocate a new transfer from common transfer pool. Transfer has no buffer after allocation, but can be allocated and added from different pools.

Parameters
• dev – [in] Pointer to device struct of the driver instance
• addr – [in] Device (peripheral) address
• ep – [in] Endpoint address
• attrib – [in] Endpoint attributes
• mps – [in] Maximum packet size of the endpoint
• timeout – [in] Timeout in number of frames
• udev – [in] Opaque pointer to USB device
• cb – [in] Transfer completion callback

Returns
pointer to allocated transfer or NULL on error.

struct uhc_transfer *uhc_xfer_alloc_with_buf(const struct device *dev, const uint8_t addr, const uint8_t ep, const uint8_t attrib, const uint16_t mps, const uint16_t timeout, void *const udev, void *const cb, size_t size)

Allocate UHC transfer with buffer.
Allocate a new transfer from common transfer pool with buffer.

Parameters
• dev – [in] Pointer to device struct of the driver instance
• addr – [in] Device (peripheral) address
• ep – [in] Endpoint address
• attrib – [in] Endpoint attributes
• mps – [in] Maximum packet size of the endpoint
• timeout – [in] Timeout in number of frames
• udev – [in] Opaque pointer to USB device
• **cb** – [in] Transfer completion callback
• **size** – [in] Size of the buffer

**Returns**
pointer to allocated transfer or NULL on error.

```c
int uhc_xfer_free(const struct device *dev, struct uhc_transfer *const xfer)
```
Free UHC transfer and any buffers.
Free any buffers and put the transfer back into the transfer pool.

**Parameters**
• **dev** – [in] Pointer to device struct of the driver instance
• **xfer** – [in] Pointer to UHC transfer

**Returns**
0 on success, all other values should be treated as error.

```c
int uhc_xfer_buf_add(const struct device *dev, struct uhc_transfer *const xfer, struct net_buf *buf)
```
Add UHC transfer buffer.
Add a previously allocated buffer to the transfer.

**Parameters**
• **dev** – [in] Pointer to device struct of the driver instance
• **xfer** – [in] Pointer to UHC transfer
• **buf** – [in] Pointer to UHC request buffer

**Returns**
pointer to allocated request or NULL on error.

```c
struct net_buf *uhc_xfer_buf_alloc(const struct device *dev, const size_t size)
```
Allocate UHC transfer buffer.
Allocate a new buffer from common request buffer pool and assign it to the transfer if the xfer parameter is not NULL.

**Parameters**
• **dev** – [in] Pointer to device struct of the driver instance
• **size** – [in] Size of the request buffer

**Returns**
pointer to allocated request or NULL on error.

```c
void uhc_xfer_buf_free(const struct device *dev, struct net_buf *const buf)
```
Free UHC request buffer.
Put the buffer back into the request buffer pool.

**Parameters**
• **dev** – [in] Pointer to device struct of the driver instance
• **buf** – [in] Pointer to UHC request buffer

```c
int uhc_ep_enqueue(const struct device *dev, struct uhc_transfer *const xfer)
```
Queue USB host controller transfer.
Add transfer to the queue. If the queue is empty, the transfer can be claimed by the controller immediately.

**Parameters**
\begin{itemize}
  \item \texttt{dev} – \texttt{[in]} Pointer to device struct of the driver instance
  \item \texttt{xfer} – \texttt{[in]} Pointer to UHC transfer
\end{itemize}

\textbf{Return values}
- \texttt{EPERM} – controller is not initialized

\textbf{Returns}
0 on success, all other values should be treated as error.

\begin{verbatim}
int uhc_ep_dequeue(const struct device *dev, struct uhc_transfer *const xfer)
Remove a USB host controller transfers from queue.
Not implemented yet.
\end{verbatim}

\textbf{Parameters}
\begin{itemize}
  \item \texttt{dev} – \texttt{[in]} Pointer to device struct of the driver instance
  \item \texttt{xfer} – \texttt{[in]} Pointer to UHC transfer
\end{itemize}

\textbf{Return values}
- \texttt{EPERM} – controller is not initialized

\textbf{Returns}
0 on success, all other values should be treated as error.

\begin{verbatim}
int uhc_init(const struct device *dev, uhc_event_cb_t event_cb)
Initialize USB host controller.
\end{verbatim}

\textbf{Parameters}
\begin{itemize}
  \item \texttt{dev} – \texttt{[in]} Pointer to device struct of the driver instance
  \item \texttt{event_cb} – \texttt{[in]} Event callback from the higher layer (USB host stack)
\end{itemize}

\textbf{Return values}
\begin{itemize}
  \item \texttt{EINVAL} – on parameter error (no callback is passed)
  \item \texttt{EALREADY} – already initialized
\end{itemize}

\textbf{Returns}
0 on success, all other values should be treated as error.

\begin{verbatim}
int uhc_enable(const struct device *dev)
Enable USB host controller.
Enable powered USB host controller and allow host stack to recognize and enumerate devices.
\end{verbatim}

\textbf{Parameters}
\begin{itemize}
  \item \texttt{dev} – \texttt{[in]} Pointer to device struct of the driver instance
\end{itemize}

\textbf{Return values}
\begin{itemize}
  \item \texttt{EPERM} – controller is not initialized
  \item \texttt{EALREADY} – already enabled
\end{itemize}

\textbf{Returns}
0 on success, all other values should be treated as error.

\begin{verbatim}
int uhc_disable(const struct device *dev)
Disable USB host controller.
Disable enabled USB host controller.
\end{verbatim}
• **dev** – [in] Pointer to device struct of the driver instance

**Return values**
- **EALREADY** – already disabled

**Returns**
0 on success, all other values should be treated as error.

```c
int uhc_shutdown(const struct device *dev)
```
Poweroff USB host controller.

Shut down the controller completely to reduce energy consumption or to change the role of the controller.

**Parameters**

• **dev** – [in] Pointer to device struct of the driver instance

**Return values**
- **EALREADY** – controller is already uninitialized

**Returns**
0 on success, all other values should be treated as error.

```c
static inline struct uhc_device_caps uhc_caps(const struct device *dev)
```
Get USB host controller capabilities.

Obtain the capabilities of the controller such as high speed (HS), and more.

**Parameters**

• **dev** – [in] Pointer to device struct of the driver instance

**Returns**
USB host controller capabilities.

```c
struct uhc_transfer
```

#include <uhc.h> UHC endpoint buffer info.

This structure is mandatory for all UHC request. It contains the meta data about the request and FIFOs to store *net_buf* structures for each request.

The members of this structure should not be used directly by a higher layer (host stack).

**Public Members**

```c
sys_dnode_t node
dlist node
```

```c
uint8_t setup_pkt[8]
```
Control transfer setup packet.

```c
struct net_buf *buf
```
Transfer data buffer.

```c
uint8_t addr
```
Device (peripheral) address.

```c
uint8_t ep
```
Endpoint to which request is associated.
uint8_t attrib
   Endpoint attributes (TBD)

uint16_t mps
   Maximum packet size.

uint16_t timeout
   Timeout in number of frames.

unsigned int queued
   Flag marks request buffer is queued.

unsigned int stage
   Control stage status, up to the driver to use it or not.

void *udev
   Pointer to USB device (opaque for the UHC)

void *cb
   Pointer to transfer completion callback (opaque for the UHC)

int err
   Transfer result, 0 on success, other values on error.

struct uhc_event
   #include <uhc.h> USB host controller event.
   Common structure for all events that originate from the UHC driver and are passed to
   higher layer using message queue and a callback (uhc_event_cb_t) provided by higher
   layer during controller initialization (uhc_init).

Public Members

sys_snodet node
   slist node for the message queue

enum uhc_event_type type
   Event type.

int status
   Event status value, if any.

struct uhc_transfer *xfer
   Pointer to request used only for UHC_EVT_EP_REQUEST.

const struct device *dev
   Pointer to controller’s device struct.
struct uhc_device_caps
#include <uhc.h> USB host controller capabilities.
This structure is mainly intended for the USB host stack.

Public Members

uint32_t hs
USB high speed capable controller.

struct uhc_data
#include <uhc.h> Common UHC driver data structure.
Mandatory structure for each UHC controller driver. To be implemented as device's private data (device->data).

Public Members

struct uhc_device_caps caps
Controller capabilities.

struct k_mutex mutex
Driver access mutex.

sys_dlist_t ctrl_xfers
dlist for control transfers

sys_dlist_t bulk_xfers
dlist for bulk transfers

uhc_event_cb_t event_cb
Callback to submit an UHC event to upper layer.

atomic_t status
USB host controller status.

void *priv
Driver private data.

USB Power Delivery support

6.5.6 USB-C device stack

The USB-C device stack is a hardware independent interface between a Type-C Port Controller (TCPC) and customer applications. It is a port of the Google ChromeOS Type-C Port Manager (TCPM) stack. It provides the following functionalities:

- Uses the APIs provided by the Type-C Port Controller drivers to interact with the Type-C Port Controller.
• Provides a programming interface that’s used by a customer applications. The APIs is described in include/zephyr/usb_c/usbc.h

Currently the device stack supports implementation of Sink only and Source only devices. Dual Role Power (DRP) devices are not yet supported.

List of samples for different purposes.

Implementing a Sink Type-C and Power Delivery USB-C device

The configuration of a USB-C Device is done in the stack layer and devicetree.

The following devicetree, structures and callbacks need to be defined:

• Devicetree usb-c-connector node referencing a TCPC
• Devicetree vbus node referencing a VBUS measurement device
• User defined structure that encapsulates application specific data
• Policy callbacks

For example, for the Sample USB-C Sink application:

Each Physical Type-C port is represented in the devicetree by a usb-c-connector compatible node:

```c
port1: usbc-port@1 {
    compatible = "usb-c-connector";
    reg = <1>;
    tcpc = &ucpd1;
    vbus = &vbus1;
    power-role = "sink";
    sink-pdos = <PDO_FIXED(5000, 100, 0)>;
};
```

VBUS is measured by a device that's referenced in the devicetree by a usb-c-vbus-adc compatible node:

```c
vbus1: vbus {
    compatible = "zephyr,usb-c-vbus-adc";
    io-channels = <&adc2 8>;
    output-ohms = <49900>;
    full-ohms = <(330000 + 49900)>;
};
```

A user defined structure is defined and later registered with the subsystem and can be accessed from callback through an API:

```c
/**
 * @brief A structure that encapsulates Port data.
 */
static struct port0_data_t {
    /** Sink Capabilities */
    uint32_t snk_caps[DT_PROP_LEN(USBC_PORT0_NODE, sink_pdos)];
    /** Number of Sink Capabilities */
    int snk_cap_cnt;
    /** Source Capabilities */
    uint32_t src_caps[PDO_MAX_DATA_OBJECTS];
    /** Number of Source Capabilities */
    int src_cap_cnt;
    /** Power Supply Ready flag */
    atomic_t ps_ready;
} port0_data = {
    .snk_caps = {DT_FOREACH_PROP_ELEM(USBC_PORT0_NODE, sink_pdos, SINK_PDO)},
    (continues on next page)
These callbacks are used by the subsystem to set or get application specific data:

```c
static int port0_policy_cb_get_snk_cap(const struct device *dev,
    uint32_t **pdos,
    int *num_pdos)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    *pdos = dpm_data->snk_caps;
    *num_pdos = dpm_data->snk_cap_cnt;
    return 0;
}

static void port0_policy_cb_set_src_cap(const struct device *dev,
    const uint32_t *pdos,
    const int num_pdos)
{
    struct port0_data_t *dpm_data;
    int num;
    int i;
    dpm_data = usbc_get_dpm_data(dev);
    num = num_pdos;
    if (num > PDO_MAX_DATA_OBJECTS) {
        num = PDO_MAX_DATA_OBJECTS;
    }
    for (i = 0; i < num; i++) {
        dpm_data->src_caps[i] = *(pdos + i);
    }
    dpm_data->src_cap_cnt = num;
}

static uint32_t port0_policy_cb_get_rdo(const struct device *dev)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    return build_rdo(dpm_data);
}
```

This callback is used by the subsystem to query if a certain action can be taken:

```c
bool port0_policy_check(const struct device *dev,
    const enum usbc_policy_check_t policy_check)
{
    switch (policy_check) {
    case CHECK_POWER_ROLE_SWAP:
        /* Reject power role swaps */
        return false;
    case CHECK_DATA_ROLE_SWAP_TO_DFP:
        /* Reject data role swap to DFP */
        return false;
    }
    return true;
}
```

(continues on next page)
return false;

case CHECK_DATA_ROLE_SWAP_TO_UFP:
    /* Accept data role swap to UFP */
    return true;

case CHECK_SNK_AT_DEFAULT_LEVEL:
    /* This device is always at the default power level */
    return true;

default:
    /* Reject all other policy checks */
    return false;

} // end port0_policy_notify

This callback is used by the subsystem to notify the application of an event:

static void port0_notify(const struct device *dev, const enum usbc_policy_notify_t policy_notify)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);

    switch (policy_notify) {
    case PROTOCOL_ERROR:
        break;
    case MSG_DISCARDED:
        break;
    case MSG_ACCEPT_RECEIVED:
        break;
    case MSG_REJECTED_RECEIVED:
        break;
    case MSG_NOT_SUPPORTED_RECEIVED:
        break;
    case TRANSITION_PS:
        atomic_set_bit(&dpm_data->ps_ready, 0);
        break;
    case PD_CONNECTED:
        break;
    case NOT_PD_CONNECTED:
        break;
    case POWER_CHANGE_0A0:

        break;
    case POWER_CHANGE_1A5:
        LOG_INF("PWR 1A5");
        break;
    case POWER_CHANGE_3A0:
        LOG_INF("PWR 3A0");
        break;
    case DATA_ROLE_IS_UFP:
        break;
    case DATA_ROLE_IS_DFP:
        break;
    case PORT_PARTNER_NOT_RESPONSIVE:
        LOG_INF("Port Partner not PD Capable");
        break;
    case SNK_TRANSITION_TO_DEFAULT:
        break;
    case HARD_RESET_RECEIVED:
        break;
    case CHECK_DATA_ROLE_SWAP_TO_UFP:
        /* Accept data role swap to UFP */
        return true;
    case CHECK_SNK_AT_DEFAULT_LEVEL:
        /* This device is always at the default power level */
        return true;
    default:
        /* Reject all other policy checks */
        return false;
    }

} // end port0_notify

(continues on next page)
break;
case SENDER_RESPONSE_TIMEOUT:
    break;
case SOURCE_CAPABILITIES_RECEIVED:
    break;
}

Registering the callbacks:

/* Register USB-C Callbacks */

/* Register Policy Check callback */
usbc_set_policy_cb_check(usbc_port0, port0_policy_check);
/* Register Policy Notify callback */
usbc_set_policy_cb_notify(usbc_port0, port0_notify);
/* Register Policy Get Sink Capabilities callback */
usbc_set_policy_cb_get_snk_cap(usbc_port0, port0_policy_cb_get_snk_cap);
/* Register Policy Set Source Capabilities callback */
usbc_set_policy_cb_set_src_cap(usbc_port0, port0_policy_cb_set_src_cap);
/* Register Policy Get Request Data Object callback */
usbc_set_policy_cb_get_rdo(usbc_port0, port0_policy_cb_get_rdo);

Register the user defined structure:

/* Set Application port data object. This object is passed to the policy callbacks */
port0_data.ps_ready = ATOMIC_INIT(0);
usbc_set_dpm_data(usbc_port0, &port0_data);

Start the USB-C subsystem:

/* Start the USB-C Subsystem */
usbc_start(usbc_port0);

Implementing a Source Type-C and Power Delivery USB-C device

The configuration of a USB-C Device is done in the stack layer and devicetree.
Define the following devicetree, structures and callbacks:
• Devicetree usb-c-connector node referencing a TCPC
• Devicetree vbus node referencing a VBUS measurement device
• User defined structure that encapsulates application specific data
• Policy callbacks

For example, for the Sample USB-C Source application:

Each Physical Type-C port is represented in the devicetree by a usb-c-connector compatible node:

port1: usbc-port@1 {
    compatible = "usb-c-connector";
    reg = <1>;
    tcpc = <&ucpd1>;
    vbus = <&vbus>;
    power-role = "source";
    typec-power-opmode = "3.0A";
    source-pdos = <PDO_FIXED(5000, 100, 0) PDO_FIXED(9000, 100, 0) PDO_
Zephyr Project Documentation, Release 3.6.0-rc3

(--FIXED(15000, 100, 0));

VBUS is measured by a device that's referenced in the devicetree by a `usb-c-vbus-adc` compatible node:

```c
vbus1: vbus {
    compatible = "zephyr,usb-c-vbus-adc";
    io-channels = <&adc1 9>;
    output-ohms = <49900>;
    full-ohms = <(330000 + 49900)>;
    /* Pin B13 is used to control VBUS Discharge for Port1 */
    discharge-gpios = <&gpiob 13 GPIO_ACTIVE_HIGH>;
};
```

A user defined structure is defined and later registered with the subsystem and can be accessed from callback through an API:

```c
/**
 * @brief A structure that encapsulates Port data.
 */
static struct port0_data_t {
    /** Source Capabilities */
    uint32_t src_caps[DT_PROP_LEN(USBC_PORT0_NODE, source_pdos)];
    /** Number of Source Capabilities */
    int src_cap_cnt;
    /** CC Rp value */
    int rp;
    /** Sink Request RDO */
    union pd_rdo sink_request;
    /** Requested Object Pos */
    int obj_pos;
    /** VCONN CC line*/
    enum tc_cc_polarity vconn_pol;
    /** True if power supply is ready */
    bool ps_ready;
    /** True if power supply should transition to a new level */
    bool ps_tran_start;
    /** Log Sink Requested RDO to console */
    atomic_t show_sink_request;
} port0_data = {
    .rp = DT_ENUM_IDX(USBC_PORT0_NODE, typec_power_opmode),
    .src_caps = {DT_FOREACH_PROP_ELEM(USBC_PORT0_NODE, source_pdos, SOURCE_PDO),
                .src_cap_cnt = DT_PROP_LEN(USBC_PORT0_NODE, source_pdos),
};
```

These callbacks are used by the subsystem to set or get application specific data:

```c
/**
 * @brief PE calls this function when it needs to set the Rp on CC
 */
int port0_policy_cb_get_src_rp(const struct device *dev,
    enum tc_rp_value *rp)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    *rp = dpm_data->rp;
    return 0;
}
```
```c
/**
 * @brief PE calls this function to Enable (5V) or Disable (0V) the Power Supply
 */
int port0_policy_cb_src_en(const struct device *dev, bool en)
{
    source_ctrl_set(en ? SOURCE_5V : SOURCE_0V);
    return 0;
}

/** *
 * @brief PE calls this function to Enable or Disable VCONN *
 */
int port0_policy_cb_vconn_en(const struct device *dev,
                             enum tc_cc_polarity pol,
                             bool en)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    dpm_data->vconn_pol = pol;

    if (en == false) {
        /* Disable VCONN on CC1 and CC2 */
        vconn_ctrl_set(VCONN_OFF);
    } else if (pol == TC_POLARITY_CC1) {
        /* set VCONN on CC1 */
        vconn_ctrl_set(VCONN1_ON);
    } else {
        /* set VCONN on CC2 */
        vconn_ctrl_set(VCONN2_ON);
    }

    return 0;
}

/** *
 * @brief PE calls this function to get the Source Caps that will be sent to the Sink *
 */
int port0_policy_cb_get_src_caps(const struct device *dev,
                                  const uint32_t **pdos,
                                  uint32_t *num_pdos)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    *pdos = dpm_data->src_caps;
    *num_pdos = dpm_data->src_cap_cnt;

    return 0;
}

/** *
 * @brief PE calls this function to verify that a Sink's request if valid *
 */
static enum usbc_snk_req_reply_t port0_policy_cb_check_sink_request(const struct device *dev,
                                                                     const uint32_t request_msg)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    union pd_fixed_supply_pdo_source pdo;
    uint32_t obj_pos;

    // Continue on next page
```

(continues from previous page)
```c
uint32_t op_current;

dpm_data->sink_request.raw_value = request_msg;
obj_pos = dpm_data->sink_request.fixed.object_pos;
op_current =
    PD_CONVERT_FIXED_PDO_CURRENT_TO_MA(dpm_data->sink_request.fixed.operating_current);

if (obj_pos == 0 || obj_pos > dpm_data->src_cap_cnt) {
    return SNK_REQUEST_REJECT;
}

pdo.raw_value = dpm_data->src_caps[obj_pos - 1];
if (dpm_data->sink_request.fixed.operating_current > pdo.max_current) {
    return SNK_REQUEST_REJECT;
}

dpm_data->obj_pos = obj_pos;
atomic_set_bit(&port0_data.show_sink_request, 0);

/**< Clear PS ready. This will be set to true after PS is ready after
* it transitions to the new level.
*/
port0_data.ps_ready = false;
    return SNK_REQUEST_VALID;
}

/**
* @brief PE calls this function to check if the Power Supply is at the requested
* level
*/
static bool port0_policy_cb_is_ps_ready(const struct device *dev) {
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);

    /* Return true to inform that the Power Supply is ready */
    return dpm_data->ps_ready;
}

/**
* @brief PE calls this function to check if the Present Contract is still
* valid
*/
static bool port0_policy_cb_present_contract_is_valid(const struct device *dev,
    const uint32_t present_contract) {
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    union pd_fixed_supply_pdo_source pdo;
    union pd_rdo request;
    uint32_t obj_pos;
    uint32_t op_current;

    request.raw_value = present_contract;
    obj_pos = request.fixed.object_pos;
op_current = PD_CONVERT_FIXED_PDO_CURRENT_TO_MA(request.fixed.operating_current);
```

if (obj_pos == 0 || obj_pos > dpm_data->src_cap_cnt) {
  return false;
}

pdo.raw_value = dpm_data->src_caps[obj_pos - 1];
if (request.fixed.operating_current > pdo.max_current) {
  return false;
}
return true;

This callback is used by the subsystem to query if a certain action can be taken:

```c
bool port0_policy_check(const struct device *dev,
                        const enum usbc_policy_check_t policy_check)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    switch (policy_check) {
    case CHECK_POWER_ROLE_SWAP:
        /* Reject power role swaps */
        return false;
    case CHECK_DATA_ROLE_SWAP_TO_DFP:
        /* Accept data role swap to DFP */
        return true;
    case CHECK_DATA_ROLE_SWAP_TO_UFP:
        /* Reject data role swap to UFP */
        return false;
    case CHECK_SRC_PS_AT_DEFAULT_LEVEL:
        /* This check is sent from the PE_SRC_Transition_to_default
         * state and requires the following:
         * 1: Vconn should be turned ON
         * 2: Return TRUE when Power Supply is at default level
         */
        /* Power on VCONN */
        vconn_ctrl_set(dpm_data->vconn_pol);
        /* PS should be at default level after receiving a Hard Reset */
        return true;
    default:
        /* Reject all other policy checks */
        return false;
    }
}
```

This callback is used by the subsystem to notify the application of an event:

```c
static void port0_notify(const struct device *dev,
                         const enum usbc_policy_notify_t policy_notify)
{
    struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
    switch (policy_notify) {
    case PROTOCOL_ERROR:
        break;
    (continues on next page)
case MSG_DISCARDED:
    break;

case MSG_ACCEPT_RECEIVED:
    break;

case MSG_REJECTED_RECEIVED:
    break;

case MSG_NOT_SUPPORTED_RECEIVED:
    break;

case TRANSITION_PS:
    dpm_data->ps_tran_start = true;
    break;

case PD_CONNECTED:
    break;

case NOT_PD_CONNECTED:
    break;

case DATA_ROLE_IS_UFP:
    break;

case DATA_ROLE_IS_DFP:
    break;

case PORT_PARTNER_NOT_RESPONSIVE:
    LOG_INF("Port Partner not PD Capable");
    break;

case HARD_RESET_RECEIVED:
    /*
     * This notification is sent from the PE_SRC_Transition_to_default
     * state and requires the following:
     * 1: Vconn should be turned OFF
     * 2: Reset of the local hardware
     */

    /* Power off VCONN */
    vconn_ctrl_set(VCONN_OFF);
    /* Transition PS to Default level */
    source_ctrl_set(SOURCE_5V);
    break;

default:
    }
}  

Registering the callbacks:

    /* Register USB-C Callbacks */

    /* Register Policy Check callback */
    usbc_set_policy_cb_check(usbc_port0, port0_policy_check);
    /* Register Policy Notify callback */
    usbc_set_policy_cb_notify(usbc_port0, port0_notify);
    /* Register Policy callback to set the Rp on CC lines */
    usbc_set_policy_cb_get_src_rp(usbc_port0, port0_policy_cb_get_src_rp);
    /* Register Policy callback to enable or disable power supply */
    usbc_set_policy_cb_src_en(usbc_port0, port0_policy_cb_src_en);
    /* Register Policy callback to enable or disable vconn */
    usbc_set_vconn_control_cb(usbc_port0, port0_policy_cb_vconn_en);
    /* Register Policy callback to send the source caps to the sink */
    usbc_set_policy_cb_get_src_caps(usbc_port0, port0_policy_cb_get_src_caps);
    /* Register Policy callback to check if the sink request is valid */
    usbc_set_policy_cb_check_sink_request(usbc_port0, port0_policy_cb_check_sink_request);
    /* Register Policy callback to check if the power supply is ready */
    usbc_set_policy_cb_is_ps_ready(usbc_port0, port0_policy_cb_is_ps_ready);
    /* Register Policy callback to check if Present Contract is still valid */
(continues on next page)
usbc_set_policy_cb_present_contract_is_valid(usbc_port0, port0_policy_cb_present_contract_is_valid);

Register the user defined structure:

```
/* Set Application port data object. This object is passed to the policy callbacks */
usbc_set_dpm_data(usbc_port0, &port0_data);
```

Start the USB-C subsystem:

```
/* Start the USB-C Subsystem */
usbc_start(usbc_port0);
```

#### Defines

**FIXED_5V_100MA_RDO**
This Request Data Object (RDO) value can be returned from the policy_cb_get_rdo if 5V@100mA with the following options are sufficient for the Sink to operate.

The RDO is configured as follows: Maximum operating current 100mA Operating current 100mA Unchunked Extended Messages Not Supported No USB Suspend Not USB Communications Capable No capability mismatch Don’t giveback Object position 1 (5V PDO)

#### Enums

**enum usbc_policy_request_t**
Device Policy Manager requests.

**Values:**

- **enumerator REQUEST_NOP**
  No request.
enumerator REQUEST_TC_DISABLED
    Request Type-C layer to transition to Disabled State.

enumerator REQUEST_TC_ERROR_RECOVERY
    Request Type-C layer to transition to Error Recovery State.

enumerator REQUEST_TC_END
    End of Type-C requests.

enumerator REQUEST_PE_DR_SWAP
    Request Policy Engine layer to perform a Data Role Swap.

enumerator REQUEST_PE_HARD_RESET_SEND
    Request Policy Engine layer to send a hard reset.

enumerator REQUEST_PE_SOFT_RESET_SEND
    Request Policy Engine layer to send a soft reset.

enumerator REQUEST_PE_GET_SRC_CAPS
    Request Policy Engine layer to get Source Capabilities from port partner.

enumerator REQUEST_GET_SNK_CAPS
    Request Policy Engine to get Sink Capabilities from port partner.

enumerator REQUEST_PE_GOTO_MIN
    Request Policy Engine to request the port partner to source minimum power.

defined enum usbc_policy_notify_t
    Device Policy Manager notifications.
    
    Values:

enumerator MSG_ACCEPT_RECEIVED
    Power Delivery Accept message was received.

enumerator MSG_REJECTED_RECEIVED
    Power Delivery Reject message was received.

enumerator MSG_DISCARDED
    Power Delivery discarded the message being transmitted.

enumerator MSG_NOT_SUPPORTED_RECEIVED
    Power Delivery Not Supported message was received.

enumerator DATA_ROLE_IS_UFP
    Data Role has been set to Upstream Facing Port (UFP)

enumerator DATA_ROLE_IS_DFP
    Data Role has been set to Downstream Facing Port (DFP)
enumerator PD_CONNECTED
   A PD Explicit Contract is in place.

enumerator NOT_PD_CONNECTED
   No PD Explicit Contract is in place.

enumerator TRANSITION_PS
   Transition the Power Supply.

enumerator PORT_PARTNER_NOT_RESPONSIVE
   Port partner is not responsive.

enumerator PROTOCOL_ERROR
   Protocol Error occurred.

enumerator SNK_TRANSITION_TO_DEFAULT
   Transition the Sink to default.

enumerator HARD_RESET_RECEIVED
   Hard Reset Received.

enumerator POWER_CHANGE_0A0
   Sink SubPower state at 0V.

enumerator POWER_CHANGE_DEF
   Sink SubPower state a 5V / 500mA.

enumerator POWER_CHANGE_1A5
   Sink SubPower state a 5V / 1.5A.

enumerator POWER_CHANGE_3A0
   Sink SubPower state a 5V / 3A.

enumerator SENDER_RESPONSE_TIMEOUT
   Sender Response Timeout.

enumerator SOURCE_CAPABILITIES_RECEIVED
   Source Capabilities Received.

enum usbc_policy_check_t
   Device Policy Manager checks.
   Values:

   enumerator CHECK_POWER_ROLE_SWAP
      Check if Power Role Swap is allowed.

   enumerator CHECK_DATA_ROLE_SWAP_TO_DFP
      Check if Data Role Swap to DFP is allowed.
enumerator CHECK_DATA_ROLE_SWAP_TO_UFP
Check if Data Role Swap to UFP is allowed.

enumerator CHECK_SNK_AT_DEFAULT_LEVEL
Check if Sink is at default level.

enumerator CHECK_VCONN_CONTROL
Check if should control VCONN.

enumerator CHECK_SRC_PS_AT_DEFAULT_LEVEL
Check if Source Power Supply is at default level.

enum usbc_policy_wait_t
Device Policy Manager Wait message notifications.
Values:

enumerator WAIT_SINK_REQUEST
The port partner is unable to meet the sink request at this time.

enumerator WAIT_POWER_ROLE_SWAP
The port partner is unable to do a Power Role Swap at this time.

enumerator WAIT_DATA_ROLE_SWAP
The port partner is unable to do a Data Role Swap at this time.

enumerator WAIT_VCONN_SWAP
The port partner is unable to do a VCONN Swap at this time.

enum usbc_snk_req_reply_t
Device Policy Manager’s response to a Sink Request.
Values:

enumerator SNK_REQUEST_VALID
The sink port partner’s request can be met.

enumerator SNK_REQUEST_REJECT
The sink port partner’s request can not be met.

enumerator SNK_REQUEST_WAIT
The sink port partner’s request can be met at a later time.

Functions

int usbc_start(const struct device *dev)
Start the USB-C Subsystem.

Parameters
  • dev – Runtime device structure
Return values
0 – on success

int usbc_suspend(const struct device *dev)
Suspend the USB-C Subsystem.

Parameters
• dev – Runtime device structure

Return values
0 – on success

int usbc_request(const struct device *dev, const enum usbc_policy_request_t req)
Make a request of the USB-C Subsystem.

Parameters
• dev – Runtime device structure
• req – request

Return values
0 – on success

void usbc_bypass_next_sleep(const struct device *dev)

void usbc_set_dpm_data(const struct device *dev, void *dpm_data)
Set pointer to Device Policy Manager (DPM) data.

Parameters
• dev – Runtime device structure
• dpm_data – pointer to dpm data

void *usbc_get_dpm_data(const struct device *dev)
Get pointer to Device Policy Manager (DPM) data.

Parameters
• dev – Runtime device structure

Return values
• pointer – to dpm data that was set with usbc_set_dpm_data
• NULL – if dpm data was not set

void usbc_set_vconn_control_cb(const struct device *dev, const tcpc_vconn_control_cb_t cb)
Set the callback used to set VCONN control.

Parameters
• dev – Runtime device structure
• cb – VCONN control callback

void usbc_set_vconn_discharge_cb(const struct device *dev, const tcpc_vconn_discharge_cb_t cb)
Set the callback used to discharge VCONN.

Parameters
• dev – Runtime device structure
• cb – VCONN discharge callback
void usbc_set_policy_cb_check(const struct device *dev, const policy_cb_check_t cb)
Set the callback used to check a policy.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_notify(const struct device *dev, const policy_cb_notify_t cb)
Set the callback used to notify Device Policy Manager of a policy change.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_wait_notify(const struct device *dev, const policy_cb_wait_notify_t cb)
Set the callback used to notify Device Policy Manager of WAIT message reception.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_get_snk_cap(const struct device *dev, const policy_cb_get_snk_cap_t cb)
Set the callback used to get the Sink Capabilities.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_set_src_cap(const struct device *dev, const policy_cb_set_src_cap_t cb)
Set the callback used to store the received Port Partner’s Source Capabilities.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_get_rdo(const struct device *dev, const policy_cb_get_rdo_t cb)
Set the callback used to get the Request Data Object (RDO)

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_is_snk_at_default(const struct device *dev, const policy_cb_is_snk_at_default_t cb)
Set the callback used to check if the sink power supply is at the default level.

Parameters
• dev – Runtime device structure
• cb – callback
void usbc_set_policy_cb_get_src_rp(const struct device *dev, const
policy_cb_get_src_rp_t cb)
Set the callback used to get the Rp value that should be placed on the CC lines.

Parameters
• dev – USB-C Connector Instance
• cb – callback

void usbc_set_policy_cb_src_en(const struct device *dev, const
policy_cb_src_en_t cb)
Set the callback used to enable VBUS.

Parameters
• dev – USB-C Connector Instance
• cb – callback

void usbc_set_policy_cb_get_src_caps(const struct device *dev, const
policy_cb_get_src_caps_t cb)
Set the callback used to get the Source Capabilities from the Device Policy Manager.

Parameters
• dev – USB-C Connector Instance
• cb – callback

void usbc_set_policy_cb_check_sink_request(const struct device *dev, const
policy_cb_check_sink_request_t cb)
Set the callback used to check if Sink request is valid.

Parameters
• dev – USB-C Connector Instance
• cb – callback

void usbc_set_policy_cb_is_ps_ready(const struct device *dev, const
policy_is_ps_ready_t cb)
Set the callback used to check if Source Power Supply is ready.

Parameters
• dev – USB-C Connector Instance
• cb – callback

void usbc_set_policy_cb_present_contract_is_valid(const struct device *dev, const
policy_present_contract_is_valid_t cb)
Set the callback to check if present Contract is still valid.

Parameters
• dev – USB-C Connector Instance
• cb – callback

void usbc_set_policy_cb_change_src_caps(const struct device *dev, const
policy_change_src_caps_t cb)
Set the callback used to request that a different set of Source Caps be sent to the Sink.

Parameters
• dev – USB-C Connector Instance
void usbc_set_policy_cb_set_port_partner_snk_cap(const struct device *dev, const policy_cb_set_port_partner_snk_cap_t cb)

Set the callback used to store the Capabilities received from a Sink Port Partner.

**Parameters**
- **dev** – USB-C Connector Instance
- **cb** – callback

**SINK callback reference**

group sink_callbacks

**Typedefs**

typedef int (*policy_cb_get_snk_cap_t)(const struct device *dev, uint32_t **pdos, int *num_pdos)

Callback type used to get the Sink Capabilities.

- **Param dev**
  USB-C Connector Instance
- **Param pdos**
  pointer where pdos are stored
- **Param num_pdos**
  pointer where number of pdos is stored
- **Return**
  0 on success

typedef void (*policy_cb_set_src_cap_t)(const struct device *dev, const uint32_t *pdos, const int num_pdos)

Callback type used to report the received Port Partner’s Source Capabilities.

- **Param dev**
  USB-C Connector Instance
- **Param pdos**
  pointer to the partner’s source pdos
- **Param num_pdos**
  number of source pdos

typedef bool (*policy_cb_check_t)(const struct device *dev, const enum usbc_policy_check_t policy_check)

Callback type used to check a policy.

- **Param dev**
  USB-C Connector Instance
- **Param policy_check**
  policy to check
- **Return**
  true if policy is currently allowed by the device policy manager
typedef bool (*policy_cb_wait_notify_t)(const struct device *dev, const enum usbc_policy_wait_t wait_notify)

Callback type used to notify Device Policy Manager of WAIT message reception.

**Param dev**
USB-C Connector Instance

**Param wait_notify**
wait notification

**Return**
return true if the PE should wait and resend the message

typedef void (*policy_cb_notify_t)(const struct device *dev, const enum usbc_policy_notify_t policy_notify)

Callback type used to notify Device Policy Manager of a policy change.

**Param dev**
USB-C Connector Instance

**Param policy_notify**
policy notification

typedef uint32_t (*policy_cb_get_rdo_t)(const struct device *dev)

Callback type used to get the Request Data Object (RDO)

**Param dev**
USB-C Connector Instance

**Return**
RDO

typedef bool (*policy_cb_is_snk_at_default_t)(const struct device *dev)

Callback type used to check if the sink power supply is at the default level.

**Param dev**
USB-C Connector Instance

**Return**
true if power supply is at default level

**SOURCE callback reference**

**group source_callbacks**

**Typedefs**

typedef int (*policy_cb_get_src_caps_t)(const struct device *dev, const uint32_t **pdos, uint32_t *num_pdos)

Callback type used to get the Source Capabilities from the Device Policy Manager.

**Param dev**
USB-C Connector Instance

**Param pdos**
pointer to source capability pdos
**Param num_pdos**
pointer to number of source capability pdos

**Return**
0 on success

typedef enum _usbc_snk_req_reply_t (*policy_cb_check_sink_request_t)(const struct device *dev, const uint32_t request_msg)
Callback type used to check if Sink request is valid.

**Param dev**
USB-C Connector Instance

**Param request_msg**
request message to check

**Return**
sink request reply

typedef bool (*policy_cb_is_ps_ready_t)(const struct device *dev)
Callback type used to check if Source Power Supply is ready.

**Param dev**
USB-C Connector Instance

**Return**
true if power supply is ready, else false

typedef bool (*policy_cb_present_contract_is_valid_t)(const struct device *dev, const uint32_t present_contract)
Callback type used to check if present Contract is still valid.

**Param dev**
USB-C Connector Instance

**Param present_contract**
present contract

**Return**
true if present contract is still valid

typedef bool (*policy_cb_change_src_caps_t)(const struct device *dev)
Callback type used to request that a different set of Source Caps be sent to the Sink.

**Param dev**
USB-C Connector Instance

**Return**
true if a different set of Cource Caps is available

typedef void (*policy_cb_set_port_partner_snk_cap_t)(const struct device *dev, const uint32_t *pdos, const int num_pdos)
Callback type used to report the Capabilities received from a Sink Port Partner.

**Param dev**
USB-C Connector Instance

**Param pdos**
pointer to sink cap pdos

**Param num_pdos**
number of sink cap pdos
typedef int (*policy_cb_get_src_rp_t)(const struct device *dev, enum tc_rp_value *rp)

Callback type used to get the Rp value that should be placed on the CC lines.

- **Param dev**
  USB-C Connector Instance

- **Param rp**
  rp value

- **Return**
  0 on success

typedef int (*policy_cb_src_en_t)(const struct device *dev, bool en)

Callback type used to enable VBUS.

- **Param dev**
  USB-C Connector Instance

- **Param en**
  true if VBUS should be enabled, else false to disable it

- **Return**
  0 on success

**Common sections related to USB support**

### 6.5.7 Human Interface Devices (HID)

Common USB HID part that can be used outside of USB support, defined in header file `include/zephyr/usb/class/hid.h`.

**HID types reference**

- `group usb_hid_definitions`
  - hid.h API
    - **USB HID types and values**

- `USB HID_VERSION`
  - HID Specification release v1.11.

- `USB_DESC_HID`
  - USB HID Class HID descriptor type.

- `USB_DESC_HID_REPORT`
  - USB HID Class Report descriptor type.

- `USB_DESC_HID_PHYSICAL`
  - USB HID Class physical descriptor type.

- `USB_HID_GET_REPORT`
  - USB HID Class GetReport bRequest value.
USB_HID_GET_IDLE
  USB HID Class GetIdle bRequest value.

USB_HID_GET_PROTOCOL
  USB HID Class GetProtocol bRequest value.

USB_HID_SET_REPORT
  USB HID Class SetReport bRequest value.

USB_HID_SET_IDLE
  USB HID Class SetIdle bRequest value.

USB_HID_SET_PROTOCOL
  USB HID Class SetProtocol bRequest value.

HID_BOOT_IFACE_CODE_NONE
  USB HID Boot Interface Protocol (bInterfaceProtocol) Code None.

HID_BOOT_IFACE_CODE_KEYBOARD

HID_BOOT_IFACE_CODE_MOUSE

HID_PROTOCOL_BOOT
  USB HID Class Boot protocol code.

HID_PROTOCOL_REPORT
  USB HID Class Report protocol code.

HID_ITEM_TYPE_MAIN
  HID Main item type.

HID_ITEM_TYPE_GLOBAL
  HID Global item type.

HID_ITEM_TYPE_LOCAL
  HID Local item type.

HID_ITEM_TAG_INPUT
  HID Input item tag.

HID_ITEM_TAG_OUTPUT
  HID Output item tag.

HID_ITEM_TAG_COLLECTION
  HID Collection item tag.
HID_ITEM_TAG_FEATURE
    HID Feature item tag.

HID_ITEM_TAG_COLLECTION_END
    HID End Collection item tag.

HID_ITEM_TAG_USAGE_PAGE
    HID Usage Page item tag.

HID_ITEM_TAG_LOGICAL_MIN
    HID Logical Minimum item tag.

HID_ITEM_TAG_LOGICAL_MAX
    HID Logical Maximum item tag.

HID_ITEM_TAG_PHYSICAL_MIN
    HID Physical Minimum item tag.

HID_ITEM_TAG_PHYSICAL_MAX
    HID Physical Maximum item tag.

HID_ITEM_TAG_UNIT_EXPONENT
    HID Unit Exponent item tag.

HID_ITEM_TAG_UNIT
    HID Unit item tag.

HID_ITEM_TAG_REPORT_SIZE
    HID Report Size item tag.

HID_ITEM_TAG_REPORT_ID
    HID Report ID item tag.

HID_ITEM_TAG_REPORT_COUNT
    HID Report count item tag.

HID_ITEM_TAG_USAGE
    HID Usage item tag.

HID_ITEM_TAG_USAGE_MIN
    HID Usage Minimum item tag.

HID_ITEM_TAG_USAGE_MAX
    HID Usage Maximum item tag.

HID_COLLECTION_PHYSICAL
    Physical collection type.
HID_COLLECTION_APPLICATION
    Application collection type.

HID_COLLECTION_LOGICAL
    Logical collection type.

HID_COLLECTION_REPORT
    Report collection type.

HID_COLLECTION_NAMED_ARRAY
    Named Array collection type.

HID_COLLECTION_USAGE_SWITCH
    Usage Switch collection type.

HID_COLLECTION_MODIFIER
    Modifier collection type.

HID_USAGE_GEN_DESKTOP
    HID Generic Desktop Controls Usage page.

HID_USAGE_GEN_KEYBOARD
    HID Keyboard Usage page.

HID_USAGE_GEN_LEDS
    HID LEDs Usage page.

HID_USAGE_GEN_BUTTON
    HID Button Usage page.

HID_USAGE_GEN_DESKTOP_UNDEFINED
    HID Generic Desktop Undefined Usage ID.

HID_USAGE_GEN_DESKTOP_POINTER
    HID Generic Desktop Pointer Usage ID.

HID_USAGE_GEN_DESKTOP_MOUSE
    HID Generic Desktop Mouse Usage ID.

HID_USAGE_GEN_DESKTOP_JOYSTICK
    HID Generic Desktop Joystick Usage ID.

HID_USAGE_GEN_DESKTOP_GAMEPAD
    HID Generic Desktop Gamepad Usage ID.

HID_USAGE_GEN_DESKTOP_KEYBOARD
    HID Generic Desktop Keyboard Usage ID.
HID_USAGE_GEN_DESKTOP_KEYPAD
HID Generic Desktop Keypad Usage ID.

HID_USAGE_GEN_DESKTOP_X
HID Generic Desktop X Usage ID.

HID_USAGE_GEN_DESKTOP_Y
HID Generic Desktop Y Usage ID.

HID_USAGE_GEN_DESKTOP_WHEEL
HID Generic Desktop Wheel Usage ID.

HID items reference

group usb_hid_items

Defines

HID_ITEM(bTag, bType, bSize)
Define HID short item.

Parameters
• bTag – Item tag
• bType – Item type
• bSize – Item data size

Returns
HID Input item

HID_INPUT(a)
Define HID Input item with the data length of one byte.

For usage examples, see
HID_MOUSE_REPORT_DESC(), HID_KEYBOARD_REPORT_DESC()

Parameters
• a – Input item data

Returns
HID Input item

HID_OUTPUT(a)
Define HID Output item with the data length of one byte.

For usage examples, see
HID_KEYBOARD_REPORT_DESC()

Parameters
• a – Output item data

Returns
HID Output item

6.5. USB
HID_FEATURE(a)
Define HID Feature item with the data length of one byte.

Parameters
• a – Feature item data

Returns
HID Feature item

HID_COLLECTION(a)
Define HID Collection item with the data length of one byte.
For usage examples, see HID_MOUSE_REPORT_DESC(), HID_KEYBOARD_REPORT_DESC()

Parameters
• a – Collection item data

Returns
HID Collection item

HID_END_COLLECTION
Define HID End Collection (non-data) item.
For usage examples, see HID_MOUSE_REPORT_DESC(), HID_KEYBOARD_REPORT_DESC()

Returns
HID End Collection item

HID_USAGE_PAGE(page)
Define HID Usage Page item.
For usage examples, see HID_MOUSE_REPORT_DESC(), HID_KEYBOARD_REPORT_DESC()

Parameters
• page – Usage Page

Returns
HID Usage Page item

HID_LOGICAL_MIN8(a)
Define HID Logical Minimum item with the data length of one byte.
For usage examples, see HID_MOUSE_REPORT_DESC(), HID_KEYBOARD_REPORT_DESC()

Parameters
• a – Minimum value in logical units

Returns
HID Logical Minimum item

HID_LOGICAL_MAX8(a)
Define HID Logical Maximum item with the data length of one byte.
For usage examples, see HID_MOUSE_REPORT_DESC(), HID_KEYBOARD_REPORT_DESC()

Parameters
• a – Maximum value in logical units
Returns
HID Logical Maximum item

HID_LOGICAL_MIN16(a, b)
Define HID Logical Minimum item with the data length of two bytes.

Parameters
• a – Minimum value lower byte
• b – Minimum value higher byte

Returns
HID Logical Minimum item

HID_LOGICAL_MAX16(a, b)
Define HID Logical Maximum item with the data length of two bytes.

Parameters
• a – Minimum value lower byte
• b – Minimum value higher byte

Returns
HID Logical Maximum item

HID_LOGICAL_MIN32(a, b, c, d)
Define HID Logical Minimum item with the data length of four bytes.

Parameters
• a – Minimum value lower byte
• b – Minimum value low middle byte
• c – Minimum value high middle byte
• d – Minimum value higher byte

Returns
HID Logical Minimum item

HID_LOGICAL_MAX32(a, b, c, d)
Define HID Logical Maximum item with the data length of four bytes.

Parameters
• a – Minimum value lower byte
• b – Minimum value low middle byte
• c – Minimum value high middle byte
• d – Minimum value higher byte

Returns
HID Logical Maximum item

HID_REPORT_SIZE(size)
Define HID Report Size item with the data length of one byte.

For usage examples, see HID_MOUSE_REPORT_DESC(), HID_KEYBOARD_REPORT_DESC()

Parameters
• size – Report field size in bits

Returns
HID Report Size item
HID_REPORT_ID(id)
Define HID Report ID item with the data length of one byte.

Parameters
• id – Report ID

Returns
HID Report ID item

HID_REPORT_COUNT(count)
Define HID Report Count item with the data length of one byte.
For usage examples, see HID_MOUSE_REPORT_DESC(), HID_KEYBOARD_REPORT_DESC()

Parameters
• count – Number of data fields included in the report

Returns
HID Report Count item

HID_USAGE(idx)
Define HID Usage Index item with the data length of one byte.
For usage examples, see HID_MOUSE_REPORT_DESC(), HID_KEYBOARD_REPORT_DESC()

Parameters
• idx – Number of data fields included in the report

Returns
HID Usage Index item

HID_USAGE_MIN8(a)
Define HID Usage Minimum item with the data length of one byte.
For usage examples, see HID_MOUSE_REPORT_DESC(), HID_KEYBOARD_REPORT_DESC()

Parameters
• a – Starting Usage

Returns
HID Usage Minimum item

HID_USAGE_MAX8(a)
Define HID Usage Maximum item with the data length of one byte.
For usage examples, see HID_MOUSE_REPORT_DESC(), HID_KEYBOARD_REPORT_DESC()

Parameters
• a – Ending Usage

Returns
HID Usage Maximum item

HID_USAGE_MIN16(a, b)
Define HID Usage Minimum item with the data length of two bytes.
For usage examples, see HID_MOUSE_REPORT_DESC(), HID_KEYBOARD_REPORT_DESC()

Parameters
• a – Starting Usage lower byte
• b – Starting Usage higher byte

**Returns**
HID Usage Minimum item

```c
HID_USAGE_MAX16(a, b)
```

Define HID Usage Maximum item with the data length of two bytes.

For usage examples, see `HID_MOUSE_REPORT_DESC()`, `HID_KEYBOARD_REPORT_DESC()`

**Parameters**
• a – Ending Usage lower byte
• b – Ending Usage higher byte

**Returns**
HID Usage Maximum item

### HID Mouse and Keyboard report descriptors

The pre-defined Mouse and Keyboard report descriptors can be used by a HID device implementation or simply as examples.

**group usb_hid_mk_report_desc**

**Defines**

```c
HID_MOUSE_REPORT_DESC(bcント)
```

Simple HID mouse report descriptor for n button mouse.

**Parameters**

• `bcント` – Button count. Allowed values from 1 to 8.

```c
HID_KEYBOARD_REPORT_DESC()
```

Simple HID keyboard report descriptor.

** Enums **

```c
eenum hid_kbd_code
```

HID keyboard button codes.

**Values:**

```c
enumerator HID_KEY_A = 4
enumerator HID_KEY_B = 5
enumerator HID_KEY_C = 6
enumerator HID_KEY_D = 7
```
enumerator HID_KEY_E = 8
enumerator HID_KEY_F = 9
enumerator HID_KEY_G = 10
enumerator HID_KEY_H = 11
enumerator HID_KEY_I = 12
enumerator HID_KEY_J = 13
enumerator HID_KEY_K = 14
enumerator HID_KEY_L = 15
enumerator HID_KEY_M = 16
enumerator HID_KEY_N = 17
enumerator HID_KEY_O = 18
enumerator HID_KEY_P = 19
enumerator HID_KEY_Q = 20
enumerator HID_KEY_R = 21
enumerator HID_KEY_S = 22
enumerator HID_KEY_T = 23
enumerator HID_KEY_U = 24
enumerator HID_KEY_V = 25
enumerator HID_KEY_W = 26
enumerator HID_KEY_X = 27
enumerator HID_KEY_Y = 28
enumerator HID_KEY_Z = 29

Hardware Support

7.1 Architecture-related Guides

7.1.1 Zephyr support status on ARC processors

Overview

This page describes current state of Zephyr for ARC processors and some future plans. Please note that

• plans are given without exact deadlines
• software features require corresponding hardware to be present and configured the proper way
• not all the features can be enabled at the same time

Support status

Legend: Y - yes, supported; N - no, not supported; WIP - Work In Progress; TBD - to be decided
## Processor families

<table>

### Notes

7.1.2 Arm Cortex-M Developer Guide

**Overview**

This page contains detailed information about the status of the Arm Cortex-M architecture porting in the Zephyr RTOS and describes key aspects when developing Zephyr applications for Arm Cortex-M-based platforms.

---

<sup>6</sup> Currently only ARC VPX scalar port is supported. The support of VPX vector pipeline, VCCM, STU is not included in this port, and require additional development and/or other runtime integration.

<sup>1</sup> Usage of CCMs is limited on SMP systems.

<sup>2</sup> Except the systems with secure features (SecureShield) due to HW limitation.

<sup>3</sup> We only support save/restore ACCL/ACCH registers in task's context. Rest of DSP/AGU registers save/restore isn't implemented but kernel itself does not use these registers. This allows single task per core to use DSP/AGU safely.

<sup>5</sup> Single-thread kernel is support only for single core targets.

<sup>4</sup> QEMU doesn't support all the ARC processor's HW features. For the detailed info please check the ARC QEMU documentation.
# Key supported features

The table below summarizes the status of key OS features in the different Arm Cortex-M implementation variants.

Notes

OS features

Threads

**Thread stack alignment** Each Zephyr thread is defined with its own stack memory. By default, Cortex-M enforces a double word thread stack alignment, see CONFIG_STACK_ALIGN_DOUBLE_WORD. If MPU-based HW-assisted stack overflow detection (CONFIG_MPU_STACK_GUARD) is enabled, thread stacks need to be aligned with a larger value, reflected by CONFIG_ARM_MPU_REGION_MIN_ALIGN_AND_SIZE. In Arm v6-M and Arm v7-M architecture variants, thread stacks are additionally required to be align with a value equal to their size, in applications that need to support user mode (CONFIG_USERSPACE). The thread stack sizes in that case need to be a power of two. This is all reflected by CONFIG_MPU_REQUIRES_POWER_OF_TWO_ALIGNMENT, that is enforced in Arm v6-M and Arm v7-M builds with user mode support.

**Stack pointers** While executing in thread mode the processor is using the Process Stack Pointer (PSP). The processor uses the Main Stack Pointer (MSP) while executing in handler mode, that is, while servicing exceptions and HW interrupts. Using PSP in thread mode facilitates thread stack pointer manipulation during thread context switching, without affecting the current execution context flow in handler mode.

In Arm Cortex-M builds a single interrupt stack memory is shared among exceptions and interrupts. The size of the interrupt stack needs to be selected taking into consideration nested interrupts, each pushing an additional stack frame. Developers can modify the interrupt stack size using CONFIG_ISR_STACK_SIZE.

The interrupt stack is also used during early boot so the kernel can initialize the main thread’s stack before switching to the main thread.

**Thread context switching** In Arm Cortex-M builds, the PendSV exception is used in order to trigger a context switch to a different thread. PendSV exception is always present in Cortex-M implementations. PendSV is configured with the lowest possible interrupt priority level, in all Cortex-M variants. The main reasons for that design are

- to utilize the tail chaining feature of Cortex-M processors, and thus limit the number of context switch operations that occur.
- to not impact the interrupt latency observed by HW interrupts.

As a result, context switch in Cortex-M is non-atomic, i.e. it may be preempted by HW interrupts, however, a context-switch operation must be completed before a new thread context-switch may start.

Typically a thread context-switch will perform the following operations

- When switching-out the current thread, the processor stores
  - the callee-saved registers (R4 - R11) in the thread’s container for callee-saved registers, which is located in kernel memory
  - the thread’s current operation mode
    * user or privileged execution mode
    * presence of an active floating point context

---

1 SysTick is optional in Cortex-M1
2 Stack limit checking only in Secure builds in Cortex-M23
the EXC_RETURN value of the current handler context (PendSV)
– the floating point callee-saved registers (S16 - S31) in the thread's container for FP callee-saved registers, if the current thread has an active FP context
– the PSP of the current thread which points to the beginning of the current thread's exception stack frame. The latter contains the caller-saved context and the return address of the switched-out thread.

• When switching-in a new thread the processor
  – restores the new thread's callee-saved registers from the thread's container for callee-saved registers
  – restores the new thread's operation mode
  – restores the FP callee-saved registers if the switched-in thread had an active FP context before being switched-out
  – re-programs the dynamic MPU regions to allow a user thread access its stack and application memories, and/or programs a stack-overflow MPU guard at the bottom of the thread's privileged stack
  – restores the PSP for the incoming thread and re-programs the stack pointer limit register (if applicable, see CONFIG_BUILTIN_STACK_GUARD)
  – optionally does a stack limit checking for the switched-in thread, if sentinel-based stack limit checking is enabled (see CONFIG_STACK_SENTINEL).

PendSV exception return sequence restores the new thread's caller-saved registers and the return address, as part of unstacking the exception stack frame.

The implementation of the context-switch mechanism is present in arch/arm/core/swap_helper.S.

Stack limit checking (Arm v8-M) Armv8-M and Armv8.1-M variants support stack limit checking using the MSPLIM and PSPLIM core registers. The feature is enabled when CONFIG_BUILTIN_STACK_GUARD is set. When stack limit checking is enabled, both the thread's privileged or user stack, as well as the interrupt stack are guarded by PSPLIM and MSPLIM registers, respectively. MSPLIM is configured once during kernel boot, while PSLIM is re-programmed during every thread context-switch or during system calls, when the thread switches from using its default stack to using its privileged stack, and vice versa. PSPLIM re-programming

• has a relatively low runtime overhead (programming is done with MSR instructions)
• does not impact interrupt latency
• does not require any memory areas to be reserved for stack guards
• does not make use of MPU regions

It is, therefore, considered as a lightweight but very efficient stack overflow detection mechanism in Cortex-M applications.

Stack overflows trigger the dedicated UsageFault exception provided by Arm v8-M.

Interrupt handling features This section describes certain aspects around exception and interrupt handling in Arm Cortex-M.

Interrupt priority levels The number of available (configurable) interrupt priority levels is determined by the number of implemented interrupt priority bits in NVIC; this needs to be described for each Cortex-M platform using DeviceTree.
Reserved priority levels  A number of interrupt priority levels are reserved for the OS.

By design, system fault exceptions have the highest priority level. In Baseline Cortex-M, this is actually enforced by hardware, as HardFault is the only available processor fault exception, and its priority is higher than any configurable exception priority.

In Mainline Cortex-M, the available fault exceptions (e.g. MemManageFault, UsageFault, etc.) are assigned the highest configurable priority level. (CONFIG_CPU_CORTEX_M_HAS_PROGRAMMABLE_FAULT_PRIOS signifies explicitly that the Cortex-M implementation supports configurable fault priorities.)

This priority level is never shared with HW interrupts (an exception to this rule is described below). As a result, processor faults occurring in regular ISRs will be handled by the corresponding fault handler and will not escalate to a HardFault, similar to processor faults occurring in thread mode.

SVC exception is normally configured with the highest configurable priority level (an exception to this rule will be described below). SVCs are used by the Zephyr kernel to dispatch system calls, trigger runtime system errors (e.g. Kernel oops or panic), or implement IRQ offloading.

In Baseline Cortex-M the priority level of SVC may be shared with other exceptions or HW interrupts that are also given the highest configurable priority level (As a result of this, kernel runtime errors during interrupt handling will escalate to HardFault. Additional logic in the fault handling routines ensures that such runtime errors are detected successfully).

In Mainline Cortex-M, however, the SVC priority level is reserved, thus normally it is only shared with the fault exceptions of configurable priority. This simplifies the fault handling routines in Mainline Cortex-M architecture, since runtime kernel errors are serviced by the SVC handler (i.e no HardFault escalation, even if the kernel errors occur in ISR context).

HW interrupts in Mainline Cortex-M builds are allocated a priority level lower than the SVC.

One exception to the above rules is when Zephyr applications support Zero Latency Interrupts (ZLIs). Such interrupts are designed to have a priority level higher than any HW or system interrupt. If the ZLI feature is enabled in Mainline Cortex-M builds (see CONFIG_ZERO_LATENCY_IRQS), then

- ZLIs are assigned the highest configurable priority level
- SVCs are assigned the second highest configurable priority level
- Regular HW interrupts are assigned priority levels lower than SVC.

The priority level configuration in Cortex-M is implemented in include/arch/arm/exception.h.

Locking and unlocking IRQs  In Baseline Cortex-M locking interrupts is implemented using the PRIMASK register.

```
arch_irq_lock()
```

will set the PRIMASK register to 1, eventually, masking all IRQs with configurable priority. While this fulfills the OS requirement of locking interrupts, the consequence is that kernel runtime errors (triggering SVCs) will escalate to HardFault.

In Mainline Cortex-M locking interrupts is implemented using the BASEPRI register (Mainline Cortex-M builds select CONFIG_CPU_CORTEX_M_HAS_BASEPRI to signify that BASEPRI register is implemented.). By modifying BASEPRI (or BASEPRI_MAX) arch_irq_lock() masks all system and HW interrupts with the exception of
This allows zero latency interrupts to be triggered inside OS critical sections. Additionally, this allows system (processor and kernel) faults to be handled by Zephyr in exactly the same way, regardless of whether IRQs have been locked or not when the error occurs. It also allows for system calls to be dispatched while IRQs are locked.

**Note:** Mainline Cortex-M fault handling is designed and configured in a way that all processor and kernel faults are handled by the corresponding exception handlers and never result in HardFault escalation. In other words, a HardFault may only occur in Zephyr applications that have modified the default fault handling configurations. The main reason for this design was to reserve the HardFault exception for handling exceptional error conditions in safety critical applications.

**Dynamic direct interrupts** Cortex-M builds support the installation of direct interrupt service routines during runtime. Direct interrupts are designed for performance-critical interrupt handling and do not go through all of the common Zephyr interrupt handling code.

Direct dynamic interrupts are enabled via switching on `CONFIG_DYNAMIC_DIRECT_INTERRUPTS`.

**Zero Latency interrupts** As described above, in Mainline Cortex-M applications, the Zephyr kernel reserves the highest configurable interrupt priority level for its own use (SVC). SVCs will not be masked by interrupt locking. Zero-latency interrupt can be used to set up an interrupt at the highest interrupt priority which will not be blocked by interrupt locking. To use the ZLI feature `CONFIG_ZERO_LATENCY_IRQS` needs to be enabled.

Zero latency IRQs have minimal interrupt latency, as they will always preempt regular HW or system interrupts.

Note, however, that since ZLI ISRs will run at a priority level higher than the kernel exceptions they cannot use any kernel functionality. Additionally, since the ZLI interrupt priority level is equal to processor fault priority level, faults occurring in ZLI ISRs will escalate to HardFault and will not be handled in the same way as regular processor faults. Developers need to be aware of this limitation.

**CPU Idling** The Cortex-M architecture port implements both `k_cpu_idle()` and `k_cpu_atomic_idle()`. The implementation is present in `arch/arm/core/cpu_idle.S`.

In both implementations, the processor will attempt to put the core to low power mode. In `k_cpu_idle()` the processor ends up executing WFI (Wait For Interrupt) instruction, while in `k_cpu_atomic_idle()` the processor will execute a WFE (Wait For Event) instruction.

When using the CPU idling API in Cortex-M it is important to note the following:

- Both `k_cpu_idle()` and `k_cpu_atomic_idle()` are assumed to be invoked with interrupts locked. This is taken care of by the kernel if the APIs are called by the idle thread.
- After waking up from low power mode, both functions will restore interrupts unconditionally, that is, regardless of the interrupt lock status before the CPU idle API was called.

The Zephyr CPU Idling mechanism is detailed in `CPU Idling`. 
Memory protection features  This section describes certain aspects around memory protection features in Arm Cortex-M applications.

User mode system calls  User mode is supported in Cortex-M platforms that implement the standard (Arm) MPU or a similar core peripheral logic for memory access policy configuration and control, such as the NXP MPU for Kinetis platforms. (Currently, CONFIG_ARCH_HAS_USERSPACE is selected if CONFIG_ARM_MPU is enabled by the user in the board default Kconfig settings).

A thread performs a system call by triggering a (synchronous) SVC exception, where

- up to 5 arguments are placed on registers R1 - R5
- system call ID is placed on register R6.

The SVC Handler will branch to the system call preparation logic, which will perform the following operations

- switch the thread’s PSP to point to the beginning of the thread’s privileged stack area, optionally reprogramming the PSPLIM if stack limit checking is enabled
- modify CONTROL register to switch to privileged mode
- modify the return address in the SVC exception stack frame, so that after exception return the system call dispatcher is executed (in thread privileged mode)

Once the system call execution is completed the system call dispatcher will restore the user’s original PSP and PSPLIM and switch the CONTROL register back to unprivileged mode before returning back to the caller of the system call.

System calls execute in thread mode and can be preempted by interrupts at any time. A thread may also be context-switched-out while doing a system call; the system call will resume as soon as the thread is switched-in again.

The system call dispatcher executes at SVC priority, therefore it cannot be preempted by HW interrupts (with the exception of ZLIs), which may observe some additional interrupt latency if they occur during a system call preparation.

MPU-assisted stack overflow detection  Cortex-M platforms with MPU may enable CONFIG_MPU_STACK_GUARD to enable the MPU-based stack overflow detection mechanism. The following points need to be considered when enabling the MPU stack guards

- stack overflows are triggering processor faults as soon as they occur
- the mechanism is essential for detecting stack overflows in supervisor threads, or user threads in privileged mode; stack overflows in threads in user mode will always be detected regardless of CONFIG_MPU_STACK_GUARD being set.
- stack overflows are always detected, however, the mechanism does not guarantee that no memory corruption occurs when supervisor threads overflow their stack memory
- CONFIG_MPU_STACK_GUARD will normally reserve one MPU region for programming the stack guard (in certain Arm v8-M configurations with CONFIG_MPU_GAP_FILLING enabled 2 MPU regions are required to implement the guard feature)
- MPU guards are re-programmed at every context-switch, adding a small overhead to the thread swap routine. Compared, however, to the CONFIG_BUILTIN_STACK_GUARD feature, no re-programming occurs during system calls.
- When CONFIG_HW_STACK_PROTECTION is enabled on Arm v8-M platforms the native stack limit checking mechanism is used by default instead of the MPU-based stack overflow detection mechanism; users may override this setting by manually enabling CONFIG_MPU_STACK_GUARD in these scenarios.
Memory map and MPU considerations

**Fixed MPU regions**  By default, when `CONFIG_ARM_MPU` is enabled a set of fixed MPU regions are programmed during system boot.

- One MPU region programs the entire flash area as read-execute. User can override this setting by enabling `CONFIG_MPU_ALLOW_FLASH_WRITE`, which programs the flash with RWX permissions. If `CONFIG_USERSPACE` is enabled unprivileged access on the entire flash area is allowed.

- One MPU region programs the entire SRAM area with privileged-only RW permissions. That is, an MPU region is utilized to disallow execute permissions on SRAM. (An exception to this setting is when `CONFIG_MPU_GAP_FILLING` is disabled (Arm v8-M only); in that case no SRAM MPU programming is done so the access is determined by the default Arm memory map policies, allowing for privileged-only RWX permissions on SRAM).

- All the memory regions defined in the devicetree with the property `zephyr,memory-attr` defining the MPU permissions for the memory region. See the next section for more details.

The above MPU regions are defined in `soc/arm/common/cortex_m/arm_mpu_regions`. Alternative MPU configurations are allowed by enabling `CONFIG_CPU_HAS_CUSTOM_FIXED_SOC_MPU_REGIONS`. When enabled, this option signifies that the Cortex-M SoC will define and configure its own fixed MPU regions in the SoC definition.

**Fixed MPU regions defined in devicetree**  When the property `zephyr,memory-attr` is present in a memory node, a new MPU region will be allocated and programmed during system boot. When used with the `zephyr,memory-region` devicetree compatible, it will result in a linker section being generated associated to that MPU region.

For example, to define a new non-cacheable memory region in devicetree:

```c
sram_no_cache: memory@20300000 {
    compatible = "zephyr,memory-region", "mmio-sram";
    reg = <0x20300000 0x100000>;
    zephyr,memory-region = "SRAM_NO_CACHE";
    zephyr,memory-attr = <( DT_MEM_ARM(ATR_MPU_RAM_NOCACHE) )>;
};
```

This will automatically create a new MPU entry in with the correct name, base, size and attributes gathered directly from the devicetree.

**Static MPU regions**  Additional static MPU regions may be programmed once during system boot. These regions are required to enable certain features

- a RX region to allow execution from SRAM, when `CONFIG_ARCH_HAS_RAMFUNC_SUPPORT` is enabled and users have defined functions to execute from SRAM.

- a RX region for relocating text sections to SRAM, when `CONFIG_CODE_DATA_RELOCATION_SRAM` is enabled

- a no-cache region to allow for a none-cacheable SRAM area, when `CONFIG_NOCACHE_MEMORY` is enabled

- a possibly unprivileged RW region for GCOV code coverage accounting area, when `CONFIG_COVERAGE_GCOV` is enabled

- a no-access region to implement null pointer dereference detection, when `CONFIG_NULL_PTR_EXCEPTION_DETECTION_MPU` is enabled

The boundaries of these static MPU regions are derived from symbols exposed by the linker, in `include/linker/linker-defs.h`.
Dynamic MPU regions  Certain thread-specific MPU regions may be re-programmed dynamically, at each thread context switch:

- an unprivileged RW region for the current thread's stack area (for user threads)
- a read-only region for the MPU stack guard
- unprivileged RW regions for the partitions of the current thread's application memory domain.

Considerations  The number of available MPU regions for a Cortex-M platform is a limited resource. Most platforms have 8 MPU regions, while some Cortex-M33 or Cortex-M7 platforms may have up to 16 MPU regions. Therefore there is a relatively strict limitation on how many fixed, static and dynamic MPU regions may be programmed simultaneously. For platforms with 8 available MPU regions it might not be possible to enable all the aforementioned features that require MPU region programming. In most practical applications, however, only a certain set of features is required and 8 MPU regions are, in many cases, sufficient.

In Arm v8-M processors the MPU architecture does not allow programmed MPU regions to overlap. CONFIG_MPU_GAP_FILLING controls whether the fixed MPU region covering the entire SRAM is programmed. When it does, a full SRAM area partitioning is required, in order to program the static and the dynamic MPU regions. This increases the total number of required MPU regions. When CONFIG_MPU_GAP_FILLING is not enabled the fixed MPU region covering the entire SRAM is not programmed, thus, the static and dynamic regions are simply programmed on top of the always-existing background region (full-SRAM partitioning is not required). Note, however, that the background SRAM region allows execution from SRAM, so when CONFIG_MPU_GAP_FILLING is not set Zephyr is not protected against attacks that attempt to execute malicious code from SRAM.

Floating point Services  Both unshared and shared FP registers mode are supported in Cortex-M (see Floating Point Services for more details).

When FPU support is enabled in the build (CONFIG_FPU is enabled), the sharing FP registers mode (CONFIG_FPU_SHARING) is enabled by default. This is done as some compiler configurations may activate a floating point context by generating FP instructions for any thread, regardless of whether floating point calculations are performed, and that context must be preserved when switching such threads in and out.

The developers can still disable the FP sharing mode in their application projects, and switch to Unshared FP registers mode, if it is guaranteed that the image code does not generate FP instructions outside the single thread context that is allowed (and supposed) to do so.

Under FPU sharing mode, the callee-saved FPU registers are saved and restored in context-switch, if the corresponding threads have an active FP context. This adds some runtime overhead on the swap routine. In addition to the runtime overhead, the sharing FPU mode

- requires additional memory for each thread to save the callee-saved FP registers
- requires additional stack memory for each thread, to stack the caller-saved FP registers, upon exception entry, if an FP context is active. Note, however, that since lazy stacking is enabled, there is no runtime overhead of FP context stacking in regular interrupts (FP state preservation is only activated in the swap routine in PendSV interrupt).

Misc

Chain-loadable images  Cortex-M applications may either be standalone images or chain-loadable, for instance, by a bootloader. Application images chain-loadable by bootloaders (or other applications) normally occupy a specific area in the flash denoted as their code partition. CONFIG_USE_DT_CODE_PARTITION will ensure that a Zephyr chain-loadable image will be linked into its code partition, specified in DeviceTree.
HW initialization at boot  In order to boot properly, chain-loaded applications may require that the core Arm hardware registers and peripherals are initialized in their reset values. Enabling CONFIG_INIT_ARCH_HW_AT_BOOT Zephyr to force the initialization of the internal Cortex-M architectural state during boot to the reset values as specified by the corresponding Arm architecture manual.

Software vector relaying  In Cortex-M platforms that implement the VTOR register (see CONFIG_CPU_CORTEX_M_HAS_VTOR), chain-loadable images relocate the Cortex-M vector table by updating the VTOR register with the offset of the image vector table.

Baseline Cortex-M platforms without VTOR register might not be able to relocate their vector table which remains at a fixed location. Therefore, a chain-loadable image will require an alternative way to route HW interrupts and system exceptions to its own vector table; this is achieved with software vector relaying.

When a bootloader image enables CONFIG_SW_VECTOR_RELAY it is able to relay exceptions and interrupts based on a vector table pointer that is set by the chain-loadable application. The latter sets the CONFIG_SW_VECTOR_RELAY_CLIENT option to instruct the boot sequence to set the vector table pointer in SRAM so that the bootloader can forward the exceptions and interrupts to the chain-loadable image's software vector table.

While this feature is intended for processors without VTOR register, it may also be used in Mainline Cortex-M platforms.

Code relocation  Cortex-M support the code relocation feature. When CONFIG_CODE_DATA_RELOCATION_SRAM is selected, Zephyr will relocate .text, data and .bss sections from the specified files and place it in SRAM. It is possible to relocate only parts of the code sections into SRAM, without relocating the whole image text and data sections. More details on the code relocation feature can be found in Code And Data Relocation.

Linking Cortex-M applications

Most Cortex-M platforms make use of the default Cortex-M GCC linker script in include/arch/arm/cortex-m/scripts/linked.ld, although it is possible for platforms to use a custom linker script as well.

CMSIS

Cortex-M CMSIS headers are hosted in a standalone module repository: zephyrproject-rtos/cortex-m. CONFIG_CPU_CORTEX_M selects CONFIG_HAS_CMSIS_CORE to signify that CMSIS headers are available for all supported Cortex-M variants.

Testing

A list of unit tests for the Cortex-M porting and miscellaneous features is present in tests/arch/arm/. The tests suites are continuously extended and new test suites are added, in an effort to increase the coverage of the Cortex-M architecture support in Zephyr.
QEMU

We use QEMU to verify the implemented features of the Cortex-M architecture port in Zephyr. Adequate coverage is achieved by defining and utilizing a list of QEMU targets, each with a specific architecture variant and Arm peripheral support list.

The table below lists the QEMU platform targets defined in Zephyr along with the corresponding Cortex-M implementation variant and the peripherals these targets emulate.

Maintainers & Collaborators

The status of the Arm Cortex-M architecture port in Zephyr is: maintained. The updated list of maintainers and collaborators for Cortex-M can be found in MAINTAINERS.yml.

7.1.3 Zephyr support status on RISC-V processors

Overview

This page describes current state of Zephyr for RISC-V processors. Currently, there's support for some boards, as well as Qemu support and support for some FPGA implementations such as neorv32 and litex_vexriscv.

Zephyr support includes PMP, user mode, several ISA extensions as well as semihosting.

User mode and PMP support

When the platform has Physical Memory Protection (PMP) support, enabling it on Zephyr allows user space support and stack protection to be selected.

ISA extensions

It's possible to set in Zephyr which ISA extensions (RV32/64I(E)MAFD(G)QC) are available on a given platform, by setting the appropriate RISCV_ISA_* kconfig. Look at arch/riscv/Kconfig.isa for more information.

Note that Zephyr SDK toolchain support may not be defined for all combinations.
SMP support

SMP is supported on RISC-V, but currently only on Qemu platforms. In order to test the SMP support, one can use `qemu_riscv32_smp` or `qemu_riscv64_smp` boards.

7.1.4 Semihosting Guide

Overview

Semihosting is a mechanism that enables code running on ARM and RISC-V targets to communicate and use the Input/Output facilities on a host computer that is running a debugger or emulator.

More complete documentation on the available functionality is available at the ARM Github documentation.

The RISC-V functionality borrows from the ARM definitions, as described at the RISC-V Github documentation.

File Operations

Semihosting enables files on the host computer to be opened, read, and modified by an application. This can be useful when attempting to validate the behaviour of code across datasets that are larger than what can fit into ROM of an emulated platform. File paths can be either absolute, or relative to the directory of the running process.

```c
const char *path = "./data.bin";
long file_len, bytes_read, fd;
uint8_t buffer[16];

/* Open the data file for reading */
fd = semihost_open(path, SEMIHOST_OPEN_RB);
if (fd < 0)
  return -ENOENT;

/* Read all data from the file */
file_len = semihost_flen(fd);
while(file_len > 0)
  bytes_read = semihost_read(fd, buffer, MIN(file_len, sizeof(buffer)));
  if (bytes_read < 0)
    break;
/* Process read data */
do_data_processing(buffer, bytes_read);
/* Update remaining length */
file_len -= bytes_read;
/* Close the file */
semihost_close(fd);
```

7.1.5 Additional Functionality

Additional functionality is available by running semihosting instructions directly with `semihost_exec()` with one of the instructions defined in `semihost_instr`. For complete documentation on the required arguments and return codes, see the ARM Github documentation.
API Reference

\textit{group} semihost

\textbf{Enums}

\textbf{enum} semihost\_instr

Semihosting instructions.

\textit{Values}:

- \textbf{enumerator} SEMIHOST\_OPEN = 0x01
  
  Open a file or stream on the host system.

- \textbf{enumerator} SEMIHOST\_ISTTY = 0x09
  
  Check whether a file is associated with a stream/terminal.

- \textbf{enumerator} SEMIHOST\_WRITE = 0x05
  
  Write to a file or stream.

- \textbf{enumerator} SEMIHOST\_READ = 0x06
  
  Read from a file at the current cursor position.

- \textbf{enumerator} SEMIHOST\_CLOSE = 0x02
  
  Closes a file on the host which has been opened by SEMIHOST\_OPEN.

- \textbf{enumerator} SEMIHOST\_FLEN = 0x0C
  
  Get the length of a file.

- \textbf{enumerator} SEMIHOST\_SEEK = 0x0A
  
  Set the file cursor to a given position in a file.

- \textbf{enumerator} SEMIHOST\_TMPNAM = 0x0D
  
  Get a temporary absolute file path to create a temporary file.

- \textbf{enumerator} SEMIHOST\_REMOVE = 0x0E
  
  Remove a file on the host system.
  
  Possibly insecure!

- \textbf{enumerator} SEMIHOST\_RENAME = 0x0F
  
  Rename a file on the host system.
  
  Possibly insecure!

- \textbf{enumerator} SEMIHOST\_WRITEC = 0x03
  
  Write one character to the debug terminal.

- \textbf{enumerator} SEMIHOST\_WRITE0 = 0x04
  
  Write a NULL terminated string to the debug terminal.
enumerator SEMIHOST_READC = 0x07
   Read one character from the debug terminal.

enumerator SEMIHOST_CLOCK = 0x10

enumerator SEMIHOST_ELAPSED = 0x30

enumerator SEMIHOST_TICKFREQ = 0x31

enumerator SEMIHOST_TIME = 0x11

enumerator SEMIHOST_ERRNO = 0x13
   Retrieve the errno variable from semihosting operations.

enumerator SEMIHOST_GET_CMDLINE = 0x15
   Get commandline parameters for the application to run with.

enumerator SEMIHOST_HEAPINFO = 0x16

enumerator SEMIHOST_ISSERROR = 0x08

enumerator SEMIHOST_SYSTEM = 0x12

e num semihost_open_mode
   Modes to open a file with.
   Behaviour corresponds to equivalent fopen strings. i.e. SEMIHOST_OPEN_RB_PLUS == "rb+"
   Values:

enumerator SEMIHOST_OPEN_R = 0

enumerator SEMIHOST_OPEN_RB = 1

enumerator SEMIHOST_OPEN_R_PLUS = 2

enumerator SEMIHOST_OPEN_RB_PLUS = 3

enumerator SEMIHOST_OPEN_W = 4

enumerator SEMIHOST_OPEN_WB = 5

enumerator SEMIHOST_OPEN_W_PLUS = 6

enumerator SEMIHOST_OPEN_WB_PLUS = 7

enumerator SEMIHOST_OPEN_A = 8
enumerator SEMIHOST_OPEN_AB = 9
enumerator SEMIHOST_OPEN_A_PLUS = 10
enumerator SEMIHOST_OPEN_AB_PLUS = 11

Functions

long semihost_exec(enum semihost_instr instr, void *args)
    Manually execute a semihosting instruction.
    Parameters
    • instr – instruction code to run
    • args – instruction specific arguments
    Returns
    integer return code of instruction

char semihost_poll_in(void)
    Read a byte from the console.
    Returns
    char byte read from the console.

void semihost_poll_out(char c)
    Write a byte to the console.
    Parameters
    • c – byte to write to console

long semihost_open(const char *path, long mode)
    Open a file on the host system.
    Parameters
    • path – file path to open. Can be absolute or relative to current directory
              of the running process.
    • mode – value from semihost_open_mode.
    Return values
    • handle – positive handle on success.
    • -1 – on failure.

long semihost_close(long fd)
    Close a file.
    Parameters
    • fd – handle returned by semihost_open.
    Return values
    • 0 – on success.
    • -1 – on failure.
long semihost_flen(long fd)
Query the size of a file.

Parameters
- fd – handle returned by semihost_open.

Return values
- positive – file size on success.
- -1 – on failure.

long semihost_seek(long fd, long offset)
Seeks to an absolute position in a file.

Parameters
- fd – handle returned by semihost_open.
- offset – offset from the start of the file in bytes.

Return values
- 0 – on success.
- -errno – negative error code on failure.

long semihost_read(long fd, void *buf, long len)
Read the contents of a file into a buffer.

Parameters
- fd – handle returned by semihost_open.
- buf – buffer to read data into.
- len – number of bytes to read.

Return values
- read – number of bytes read on success.
- -errno – negative error code on failure.

long semihost_write(long fd, const void *buf, long len)
Write the contents of a buffer into a file.

Parameters
- fd – handle returned by semihost_open.
- buf – buffer to write data from.
- len – number of bytes to write.

Return values
- 0 – on success.
- -errno – negative error code on failure.

7.1.6 x86 Developer Guide

Overview
This page contains information on certain aspects when developing for x86-based platforms.
Virtual Memory

During very early boot, page tables are loaded so technically the kernel is executing in virtual address space. By default, physical and virtual memory are identity mapped and thus giving the appearance of execution taking place in physical address space. The physical address space is marked by kconfig `CONFIG_SRAM_BASE_ADDRESS` and `CONFIG_SRAM_SIZE` while the virtual address space is marked by `CONFIG_KERNEL_VM_BASE` and `CONFIG_KERNEL_VM_SIZE`. Note that `CONFIG_SRAM_OFFSET` controls where the Zephyr kernel is being placed in the memory, and its counterpart `CONFIG_KERNEL_VM_OFFSET`.

Separate Virtual Address Space from Physical Address Space  On 32-bit x86, it is possible to have separate physical and virtual address space. Code and data are linked in virtual address space, but are still loaded in physical memory. However, during boot, code and data must be available and also addressable in physical address space before `vm_enter` inside `arch/x86/core/ia32/crt0.S`. After `vm_enter`, code execution is done via virtual addresses and data can be referred via their virtual addresses. This is possible as the page table generation script (`arch/x86/gen_mmu.py`) identity maps the physical addresses at the page directory level, in addition to mapping virtual addresses to the physical memory. Later in the boot process, the entries for identity mapping at the page directory level are cleared in `z_x86_mmu_init()`, effectively removing the identity mapping of physical memory. This unmapping must be done for userspace isolation or else they would be able to access restricted memory via physical addresses. Since the identity mapping is done at the page directory level, there is no need to allocate additional space for the page table. However, additional space may still be required for additional page directory table.

There are restrictions on where virtual address space can be:

- Physical and virtual address spaces must be disjoint. This is required as the entries in page directory table will be cleared. If they are not disjoint, it would clear the entries needed for virtual addresses.
  - If `CONFIG_X86_PAE` is enabled (=y), each address space must reside in their own 1GB region, due to each entry of PDP (Page Directory Pointer) covers 1GB of memory. For example:
    - Assuming `CONFIG_SRAM_OFFSET` and `CONFIG_KERNEL_VM_OFFSET` are both `0x0`.
    - `CONFIG_SRAM_BASE_ADDRESS == 0x00000000` and `CONFIG_KERNEL_VM_BASE = 0x40000000` is valid, while `CONFIG_SRAM_BASE_ADDRESS == 0x00000000` and `CONFIG_KERNEL_VM_BASE = 0x20000000` is not.
  - If `CONFIG_X86_PAE` is disabled (=n), each address space must reside in their own 4MB region, due to each entry of PD (Page Directory) covers 4MB of memory.
  - Both `CONFIG_SRAM_BASE_ADDRESS` and `CONFIG_KERNEL_VM_BASE` must also align with the starting addresses of targeted regions.

Specifying Additional Memory Mappings at Build Time

The page table generation script (`arch/x86/gen_mmu.py`) generates the necessary multi-level page tables for code execution and data access using the kernel image produced by the first linker pass. Additional command line arguments can be passed to the script to generate additional memory mappings. This is useful for static mappings and/or device MMIO access during very early boot. To pass extra command line arguments to the script, populate a CMake list named `X86_EXTRA_GEN_MMU_ARGUMENTS` in the board configuration file. Here is an example:

```makefile
set(X86_EXTRA_GEN_MMU_ARGUMENTS
    -m map 0xA0000000,0x2000
    -m map 0x80000000,0x400000,LWUX,0xB0000000)
```
The argument --map takes the following value: `<physical address>,<size>[,<flags:LUWX>[,"<virtual address>"]],` where:

- `<physical address>` is the physical address of the mapping. (Required)
- `<size>` is the size of the region to be mapped. (Required)
- `<flags>` is the flag associated with the mapping: (Optional)
  - `L`: Large page at the page directory level.
  - `U`: Allow userspace access.
  - `W`: Read/write.
  - `X`: Allow execution.
  - `D`: Cache disabled.
  
  * Default is small page (4KB), supervisor only, read only, and execution disabled.
- `<virtual address>` is the virtual address of the mapping. (Optional)

Note that specifying additional memory mappings requires larger storage space for the pre-allocated page tables (both kernel and per-domain tables). `CONFIG_X86_EXTRA_PAGE_TABLE_PAGES` is needed to specify how many more memory pages to be reserved for the page tables. If the needed space is not exactly the same as required space, the `gen_mmu.py` script will print out a message indicating what needs to be the value for the kconfig.

## 7.2 Barriers API

```
7.2. Barriers API 2905
```

```
group barrier_apis

Functions

ALWAYS_INLINE static void barrier_dmem_fence_full(void)
  Full/sequentially-consistent data memory barrier.
  This routine acts as a synchronization fence between threads and prevents re-ordering
  of data accesses instructions across the barrier instruction.

ALWAYS_INLINE static void barrier_dsync_fence_full(void)
  Full/sequentially-consistent data synchronization barrier.
  This routine acts as a synchronization fence between threads and prevents re-
  ordering of data accesses instructions across the barrier instruction like `barrier_dmem_fence_full()
  `, but has the additional effect of blocking execution of any fur-
  ther instructions, not just loads or stores, or both, until synchronization is complete.

  **Note:** When not supported by hardware or architecture, this instruction falls back to
  a full/sequentially-consistent data memory barrier.

ALWAYS_INLINE static void barrier_isync_fence_full(void)
  Full/sequentially-consistent instruction synchronization barrier.
  This routine is used to guarantee that any subsequent instructions are fetched and to
  ensure any previously executed context-changing operations, such as writes to sys-
  tem control registers, have completed by the time the routine completes. In hardware
terms, this might mean that the instruction pipeline is flushed, for example.
```
Note: When not supported by hardware or architecture, this instruction falls back to a compiler barrier.

7.3 Cache Interface

This is a high-level guide to cache interface and Kconfig options related to cache controllers. See Cache API for API reference material.

Zephyr has different Kconfig options to control how the cache controller is implemented and controlled.

- \texttt{CONFIG\_CPU\_HAS\_DCACHE} / \texttt{CONFIG\_CPU\_HAS\_ICACHE}: these hidden options should be selected at SoC / platform level when the CPU actually supports a data or instruction cache. The cache controller can be in the core or can be an external cache controller for which a driver is provided.

These options have the goal to document an available feature and should be set whether we plan to support and use the caches in Zephyr or not.

- \texttt{CONFIG\_DCACHE} / \texttt{CONFIG\_ICACHE}: these options must be selected when support for data or instruction cache is present and working in zephyr.

All the code paths related to cache control must be conditionally enabled depending on these symbols. When the symbol is set the cache is considered enabled and used.

These symbols say nothing about the actual API interface exposed to the user. For example a platform using the data cache can enable the \texttt{CONFIG\_DCACHE} symbol and use some HAL exported function in some platform-specific code to enable and manage the d-cache.

- \texttt{CONFIG\_CACHE\_MANAGEMENT}: this option must be selected when the cache operations are exposed to the user through a standard API (see Cache API).

When this option is enabled we assume that all the cache functions are implemented in the architectural code or in an external cache controller driver.

- \texttt{CONFIG\_ARCH\_CACHE} / \texttt{CONFIG\_EXTERNAL\_CACHE}: mutually exclusive options for \texttt{CACHE\_TYPE} used to define whether the cache operations are implemented at arch level or using an external cache controller with a provided driver.

  - \texttt{CONFIG\_ARCH\_CACHE}: the cache API is implemented by the arch code
  
  - \texttt{CONFIG\_EXTERNAL\_CACHE}: the cache API is implemented by a driver that supports the external cache controller. In this case the driver must be located as usual in the \texttt{drivers/ cache/ directory}.

7.3.1 Cache API

\texttt{group} cache\_interface

\texttt{Functions}

\texttt{ALWAYS\_INLINE static void sys\_cache\_data\_enable(void)}

Enable the d-cache.

Enable the data cache
ALWAYS_INLINE static void sys_cache_data_disable(void)
   Disable the d-cache.
   Disable the data cache

ALWAYS_INLINE static void sys_cache_instr_enable(void)
   Enable the i-cache.
   Enable the instruction cache

ALWAYS_INLINE static void sys_cache_instr_disable(void)
   Disable the i-cache.
   Disable the instruction cache

ALWAYS_INLINE static int sys_cache_data_flush_all(void)
   Flush the d-cache.
   Flush the whole data cache.

   **Return values**
   * 0 – If succeeded.
   * -ENOTSUP – If not supported.
   * -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_instr_flush_all(void)
   Flush the i-cache.
   Flush the whole instruction cache.

   **Return values**
   * 0 – If succeeded.
   * -ENOTSUP – If not supported.
   * -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_data_invd_all(void)
   Invalidate the d-cache.
   Invalidate the whole data cache.

   **Return values**
   * 0 – If succeeded.
   * -ENOTSUP – If not supported.
   * -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_instr_invd_all(void)
   Invalidate the i-cache.
   Invalidate the whole instruction cache.

   **Return values**
   * 0 – If succeeded.
   * -ENOTSUP – If not supported.
   * -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_data_flush_and_invd_all(void)
   Flush and Invalidate the d-cache.
   Flush and Invalidate the whole data cache.

7.3. Cache Interface
Return values
- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_instr_flush_and_invd_all(void)
Flush and Invalidate the i-cache.

Flush and Invalidate the whole instruction cache.

Return values
- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

int sys_cache_data_flush_range(void *addr, size_t size)
Flush an address range in the d-cache.
Flush the specified address range of the data cache.

Note: the cache operations act on cache line. When multiple data structures share
the same cache line being flushed, all the portions of the data structures sharing the
same line will be flushed. This is usually not a problem because writing back is a
non-destructive process that could be triggered by hardware at any time, so having an
aligned addr or a padded size is not strictly necessary.

Parameters
- addr – Starting address to flush.
- size – Range size.

Return values
- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_instr_flush_range(void *addr, size_t size)
Flush an address range in the i-cache.
Flush the specified address range of the instruction cache.

Note: the cache operations act on cache line. When multiple data structures share
the same cache line being flushed, all the portions of the data structures sharing the
same line will be flushed. This is usually not a problem because writing back is a
non-destructive process that could be triggered by hardware at any time, so having an
aligned addr or a padded size is not strictly necessary.

Parameters
- addr – Starting address to flush.
- size – Range size.

Return values
• 0 – If succeeded.
• -ENOTSUP – If not supported.
• -errno – Negative errno for other failures.

int sys_cache_data_invd_range(void *addr, size_t size)
Invalidates an address range in the d-cache.

Invalidate the specified address range of the data cache.

**Note:** the cache operations act on cache line. When multiple data structures share the same cache line being invalidated, all the portions of the non-read-only data structures sharing the same line will be invalidated as well. This is a destructive process that could lead to data loss and/or corruption. When `addr` is not aligned to the cache line and/or `size` is not a multiple of the cache line size the behaviour is undefined.

**Parameters**
- `addr` – Starting address to invalidate.
- `size` – Range size.

**Return values**
- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

ALWAYS_INLINE static int sys_cache_instr_invd_range(void *addr, size_t size)
Invalidates an address range in the i-cache.

Invalidate the specified address range of the instruction cache.

**Note:** the cache operations act on cache line. When multiple data structures share the same cache line being invalidated, all the portions of the non-read-only data structures sharing the same line will be invalidated as well. This is a destructive process that could lead to data loss and/or corruption. When `addr` is not aligned to the cache line and/or `size` is not a multiple of the cache line size the behaviour is undefined.

**Parameters**
- `addr` – Starting address to invalidate.
- `size` – Range size.

**Return values**
- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

int sys_cache_data_flush_and_invd_range(void *addr, size_t size)
Flush and Invalidate an address range in the d-cache.

Flush and Invalidate the specified address range of the data cache.
**Note:** the cache operations act on cache line. When multiple data structures share the same cache line being flushed, all the portions of the data structures sharing the same line will be flushed before being invalidated. This is usually not a problem because writing back is a non-destructive process that could be triggered by hardware at any time, so having an aligned `addr` or a padded size is not strictly necessary.

**Parameters**
- `addr` – Starting address to flush and invalidate.
- `size` – Range size.

**Return values**
- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

```c
ALWAYS_INLINE static int sys_cache_instr_flush_and_invnd_range(void *addr, size_t size)
```
Flush and Invalidate an address range in the i-cache.
Flush and Invalidate the specified address range of the instruction cache.

**Note:** the cache operations act on cache line. When multiple data structures share the same cache line being flushed, all the portions of the data structures sharing the same line will be flushed before being invalidated. This is usually not a problem because writing back is a non-destructive process that could be triggered by hardware at any time, so having an aligned `addr` or a padded size is not strictly necessary.

**Parameters**
- `addr` – Starting address to flush and invalidate.
- `size` – Range size.

**Return values**
- 0 – If succeeded.
- -ENOTSUP – If not supported.
- -errno – Negative errno for other failures.

```c
ALWAYS_INLINE static size_t sys_cache_data_line_size_get(void)
```
Get the the d-cache line size.
The API is provided to get the data cache line.
The cache line size is calculated (in order of priority):

- At run-time when `CONFIG_DCACHE_LINE_SIZE_DETECT` is set.
- At compile time using the value set in `CONFIG_DCACHE_LINE_SIZE`.
- At compile time using the `d-cache-line-size` CPU0 property of the DT.
- 0 otherwise

**Return values**
• **size** – Size of the d-cache line.
• **0** – If the d-cache is not enabled.

`ALWAYS_INLINE static size_t sys_cache_instr_line_size_get(void)`
Get the i-cache line size.
The API is provided to get the instruction cache line.
The cache line size is calculated (in order of priority):

• At run-time when `CONFIG_ICACHE_LINE_SIZE_DETECT` is set.
• At compile time using the value set in `CONFIG_ICACHE_LINE_SIZE`.
• At compile time using the `i-cache-line-size` CPU0 property of the DT.
• **0** otherwise

**Return values**
• **size** – Size of the d-cache line.
• **0** – If the d-cache is not enabled.

`ALWAYS_INLINE static bool sys_cache_is_ptr_cached(void *ptr)`
Test if a pointer is in cached region.
Some hardware may map the same physical memory twice so that it can be seen in both (incoherent) cached mappings and a coherent “shared” area. This tests if a particular pointer is within the cached, coherent area.

**Parameters**
• **ptr** – Pointer

**Return values**
• **True** – if pointer is in cached region.
• **False** – if pointer is not in cached region.

`ALWAYS_INLINE static bool sys_cache_is_ptr_uncached(void *ptr)`
Test if a pointer is in un-cached region.
Some hardware may map the same physical memory twice so that it can be seen in both (incoherent) cached mappings and a coherent “shared” area. This tests if a particular pointer is within the un-cached, incoherent area.

**Parameters**
• **ptr** – Pointer

**Return values**
• **True** – if pointer is not in cached region.
• **False** – if pointer is in cached region.

`ALWAYS_INLINE static void *sys_cache_cached_ptr_get(void *ptr)`
Return cached pointer to a RAM address.
This function takes a pointer to any addressable object (either in cacheable memory or not) and returns a pointer that can be used to refer to the same memory through the L1 data cache. Data read through the resulting pointer will reflect locally cached values on the current CPU if they exist, and writes will go first into the cache and be written back later.
See also:
arch_uncached_ptr()

Note: This API returns the same pointer if CONFIG_CACHE_DOUBLEMAP is not enabled.

Parameters
• ptr – A pointer to a valid C object

Returns
A pointer to the same object via the L1 dcache

ALWAYS_INLINE static void *sys_cache_uncached_ptr_get(void *ptr)
Return uncached pointer to a RAM address.
This function takes a pointer to any addressable object (either in cacheable memory or not) and returns a pointer that can be used to refer to the same memory while bypassing the L1 data cache. Data in the L1 cache will not be inspected nor modified by the access.

See also:
arch_cached_ptr()

Note: This API returns the same pointer if CONFIG_CACHE_DOUBLEMAP is not enabled.

Parameters
• ptr – A pointer to a valid C object

Returns
A pointer to the same object bypassing the L1 dcache

7.4 Zephyr’s device emulators/simulators

7.4.1 Overview
Zephyr includes in its codebase a set of device emulators/simulators. With this we refer to SW components which are built together with the embedded SW and present themselves as devices of a given class to the rest of the system.
These device emulators/simulators can be built for any target which has sufficient RAM and flash, even if some may have extra functionality which is only available in some targets.

Note:
Zephyr also includes and uses many other types of simulators/emulators, including CPU and platform simulators, radio simulators, and several build targets which allow running the embedded code in the development host.
Some of Zephyr communication controllers/drivers include also either loopback modes or loopback devices.
This page does not cover any of these.

Note: Drivers which are specific to some platform, like for example the native_sim specific drivers which emulate a peripheral class by connecting to host APIs are not covered by this page.

7.4.2 Available Emulators

ADC emulator
- A fake driver which pretends to be actual ADC, and can be used for testing higher-level API for ADC devices.
  - Main Kconfig option: CONFIG_ADC_EMUL
  - DT binding: zephyr,adc-emul

DMA emulator
- Emulated DMA controller
  - Main Kconfig option: CONFIG_DMA_EMUL
  - DT binding: zephyr,dma-emul

EEPROM emulator
- Emulate an EEPROM on a flash partition
  - Main Kconfig option: CONFIG_EEPROM_EMULATOR
  - DT binding: zephyr,emu-eeprom

EEPROM simulator
- Emulate an EEPROM on RAM
  - Main Kconfig option: CONFIG_EEPROM_SIMULATOR
  - DT binding: zephyr,sim-eeprom
  - Note: For native targets it is also possible to keep the content as a file on the host filesystem.

External bus and bus connected peripheral emulators
  - Documentation
  - Allow emulating external buses like I2C or SPI and peripherals connected to them.

Flash simulator
- Emulate a flash on RAM
  - Main Kconfig option: CONFIG_FLASH_SIMULATOR
  - DT binding: zephyr,sim-flash
  - Note: For native targets it is also possible to keep the content as a file on the host filesystem. Check the native_sim flash simulator section.

GPIO emulator
- Emulated GPIO controllers which can be driven from SW
  - Main Kconfig option: CONFIG_GPIO_EMUL
  - DT binding: zephyr,gpio-emul

I2C emulator
7.5 External Bus and Bus Connected Peripherals Emulators

7.5.1 Overview

Zephyr supports a simple emulator framework to support testing of external peripheral drivers without requiring real hardware.

Emulators are used to emulate external hardware devices, to support testing of various subsystems. For example, it is possible to write an emulator for an I2C compass such that it appears on the I2C bus and can be used just like a real hardware device.

Emulators often implement special features for testing. For example a compass may support returning bogus data if the I2C bus speed is too high, or may return invalid measurements if calibration has not yet been completed. This allows for testing that high-level code can handle these situations correctly. Test coverage can therefore approach 100% if all failure conditions are emulated.

7.5.2 Concept

The diagram below shows application code / high-level tests at the top. This is the ultimate application we want to run.

Below that are peripheral drivers, such as the AT24 EEPROM driver. We can test peripheral drivers using an emulation driver connected via a emulated I2C controller/emulator which passes I2C traffic from the AT24 driver to the AT24 simulator.

Separately we can test the STM32 and NXP I2C drivers on real hardware using API tests. These require some sort of device attached to the bus, but with this, we can validate much of the driver functionality.

Putting the two together, we can test the application and peripheral code entirely on native_sim. Since we know that the I2C driver on the real hardware works, we should expect the application and peripheral drivers to work on the real hardware also.
Using the above framework we can test an entire application (e.g. Embedded Controller) on native_sim using emulators for all non-chip drivers.

With this approach we can:

- Write individual tests for each driver (green), covering all failure modes, error conditions, etc.
- Ensure 100% test coverage for drivers (green)
- Write tests for combinations of drivers, such as GPIOs provided by an I2C GPIO expander driver talking over an I2C bus, with the GPIOs controlling a charger. All of this can work in the emulated environment or on real hardware.
- Write a complex application that ties together all of these pieces and runs on native_sim. We can develop on a host, use source-level debugging, etc.
- Transfer the application to any board which provides the required features (e.g. I2C, enough GPIOs), by adding Kconfig and devicetree fragments.

### 7.5.3 Creating a Device Driver Emulator

The emulator subsystem is modeled on the Device Driver Model. You create an emulator instance using one of the `EMUL_DT_DEFINE()` or `EMUL_DT_INST_DEFINE()` APIs.

Emulators for peripheral devices reuse the same devicetree node as the real device driver. This means that your emulator defines `DT_DRV_COMPAT` using the same compat value from the real driver.

```c
/* From drivers/sensor/bm160/bm160.c */
#define DT_DRV_COMPAT bosch_bmi160

/* From drivers/sensor/bmi160/emul_bmi160.c */
#define DT_DRV_COMPAT bosch_bmi160
```
The `EMUL_DT_DEFINE()` function accepts two API types:

1. `bus_api` - This points to the API for the upstream bus that the emulator connects to. The `bus_api` parameter is required. The supported emulated bus types include I2C, SPI, and eSPI.

2. `_backend_api` - This points to the device-class specific backend API for the emulator. The `_backend_api` parameter is optional.

The diagram below demonstrates the logical organization of the `bus_api` and `_backend_api` using the BC1.2 charging detector driver as the model device-class.

![Diagram showing the logical organization of API functions for BC1.2 charging detector driver]

The real code is shown in green, while the emulator code is shown in yellow.

The `bus_api` connects the BC1.2 emulators to the `native_sim` I2C controller. The real BC1.2 drivers are unchanged and operate exactly as if there was a physical I2C controller present in the system. The `native_sim` I2C controller uses the `bus_api` to initiate register reads and writes to the emulator.

The `_backend_api` provides a mechanism for tests to manipulate the emulator out of band. Each device class defines its own API functions. The backend API functions focus on high-level behavior and do not provide hooks for specific emulators.

In the case of the BC1.2 charging detector the backend API provides functions to simulate connecting and disconnecting a charger to the emulated BC1.2 device. Each emulator is responsible for updating the correct vendor specific registers and potentially signalling an interrupt.

Example test flow:

1. Test registers BC1.2 detection callback using the Zephyr BC1.2 driver API.
2. Test connects a charger using the BC1.2 emulator backend.
3. Test verifies B1.2 detection callback invoked with correct charger type.
4. Test disconnects a charger using the BC1.2 emulator backend. With this architecture, the same test can be used with all supported drivers in the same driver class.

7.5.4 Available Emulators

Zephyr includes the following emulators:

- I2C emulator driver, allowing drivers to be connected to an emulator so that tests can be performed without access to the real hardware
- SPI emulator driver, which does the same for SPI
- eSPI emulator driver, which does the same for eSPI. The emulator is being developed to support more functionalities.

7.5.5 Samples

Here are some examples present in Zephyr:

1. Bosch BMI160 sensor driver connected via both I2C and SPI to an emulator:

```
west build -b native_sim tests/drivers/sensor/accel/
```

2. The same test can be built with a second EEPROM which is an Atmel AT24 EEPROM driver connected via I2C to an emulator:

```
west build -b native_sim tests/drivers/eeprom/api -- -DDTC_OVERLAY_FILE=at2x_emul.
 DOVERLAY_CONFIG=at2x_emul.conf
```

API Reference

**group io_emulators**

Emulators used to test drivers and higher-level code that uses them.

**Defines**

- **EMUL_DT_NAME_GET(node_id)**
  
  Use the devicetree node identifier as a unique name.

  **Parameters**

  - node_id – A devicetree node identifier

- **EMUL_DT_DEFINE(node_id, init_fn, data_ptr, cfg_ptr, bus_api, _backend_api)**

  Define a new emulator.

  This adds a new struct emul to the linker list of emulations. This is typically used in your emulator's `DT_INST_FOREACH_STATUS_OKAY()` clause.

  **Parameters**

  - node_id – Node ID of the driver to emulate (e.g. `DT_DRV_INST(n)`); the node_id MUST have a corresponding `DEVICE_DT_DEFINE()`.

  - init_fn – function to call to initialise the emulator (see emul_init type-def)
• data_ptr – emulator-specific data
• cfg_ptr – emulator-specific configuration data
• bus_api – emulator-specific bus api
• _backend_api – emulator-specific backend api

EMUL_DT_INST_DEFINE(inst, ...
Like EMUL_DT_DEFINE(), but uses an instance of a DT_DRV_COMPAT compatible instead of a node identifier.

Parameters
• inst – instance number. The node_id argument to EMUL_DT_DEFINE is set to DT_DRV_INST(inst).
• ... – other parameters as expected by EMUL_DT_DEFINE.

EMUL_DT_GET(node_id)
Get a const struct emul* from a devicetree node identifier.

Returns a pointer to an emulator object created from a devicetree node, if any device was allocated by an emulator implementation.

If no such device was allocated, this will fail at linker time. If you get an error that looks like undefined reference to __device_dts_ord_<N>, that is what happened. Check to make sure your emulator implementation is being compiled, usually by enabling the Kconfig options it requires.

Parameters
• node_id – A devicetree node identifier

Returns
A pointer to the emul object created for that node

EMUL_DT_GET_OR_NULL(node_id)
Utility macro to obtain an optional reference to an emulator.

If the node identifier refers to a node with status okay, this returns EMUL_DT_GET(node_id). Otherwise, it returns NULL.

Parameters
• node_id – A devicetree node identifier

Returns
a emul reference for the node identifier, which may be NULL.

Typedefs

typedef int (*emul_init_t)(const struct emul *emul, const struct device *parent)
Standard callback for emulator initialisation providing the initialiser record and the device that calls the emulator functions.

Param emul
Emulator to init

Param parent
Parent device that is using the emulator
Enums

```
enum emul_bus_type
    The types of supported buses.

Values:

enumerator EMUL_BUS_TYPE_I2C
enumerator EMUL_BUS_TYPE_ESPI
enumerator EMUL_BUS_TYPE_SPI
enumerator EMUL_BUS_TYPE_NONE
```

Functions

```
int emul_init_for_bus(const struct device *dev)
    Set up a list of emulators.

Parameters
    • dev – Device the emulators are attached to (e.g. an I2C controller)

Returns
    0 if OK
    negative value on error
```

```
const struct emul *emul_get_binding(const char *name)
    Retrieve the emul structure for an emulator by name.

Emulator objects are created via the EMUL_DT_DEFINE() macro and placed in memory by the linker. If the emulator structure is needed for custom API calls, it can be retrieved by the name that the emulator exposes to the system (this is the devicetree node's label by default).

Parameters
    • name – Emulator name to search for. A null pointer, or a pointer to an empty string, will cause NULL to be returned.

Returns
    pointer to emulator structure; NULL if not found or cannot be used.
```

```
struct emul_link_for_bus
    #include <emul.h> Structure uniquely identifying a device to be emulated.
```

```
struct emul_list_for_bus
    #include <emul.h> List of emulators attached to a bus.
```

Public Members
const struct emul_link_for_bus *children
   Identifiers for children of the node.

unsigned int num_children
   Number of children of the node.

struct no_bus_emul
   #include <emul.h> Emulator API stub when an emulator is not actually placed on a bus.

struct emul
   #include <emul.h> An emulator instance - represents the target emulated device/peripheral that is interacted with through an emulated bus.
   Instances of emulated bus nodes (e.g. i2c_emul) and emulators (i.e. struct emul) are exactly 1..1

Public Members

emul_init_t init
   function used to initialise the emulator state

const struct device *dev
   handle to the device for which this provides low-level emulation

const void *cfg
   Emulator-specific configuration data.

void *data
   Emulator-specific data.

enum emul_bus_type bus_type
   The bus type that the emulator is attached to.

const void *backend_api
   Address of the API structure exposed by the emulator instance.

union bus
   #include <emul.h> Pointer to the emulated bus node.

Public Members

struct i2c_emul *i2c
struct espi_emul *espi
struct spi_emul *spi
struct no_bus_emul *none
7.6 Peripherals

7.6.1 1-Wire Bus

Overview

1-Wire is a low speed half-duplex serial bus using only a single wire plus ground for both data transmission and device power supply. Similarly to I2C, 1-Wire uses a bidirectional open-collector data line, and is a single master multidrop bus. This means one master initiates all data exchanges with the slave devices. The 1-Wire bus supports longer bus lines than I2C, while it reaches speeds of up to 15.4 kbps in standard mode and up to 125 kbps in overdrive mode. Reliable communication in standard speed configuration is possible with 10 nodes over a bus length of 100 meters. Using overdrive speed, 3 nodes on a bus of 10 meters length are expected to work solid. Optimized timing parameters and fewer nodes on the bus may allow to reach larger bus extents.

The implementation details are specified in the BOOK OF IBUTTON STANDARDS.

![Fig. 1: A typical 1-Wire bus topology](image)

**W1 Master API**  Zephyr’s 1-Wire Master API is used to interact with 1-Wire slave devices like temperature sensors and serial memories.

In Zephyr this API is split into the following layers.

- The link layer handles basic communication functions such as bus reset, presence detect and bit transfer operations. It is the only hardware-dependent layer in Zephyr. This layer is supported by a driver using the Zephyr Universal Asynchronous Receiver-Transmitter (UART) interface, which should work on most Zephyr platforms. In the future, a GPIO/Timer based driver and hardware specific drivers might be added.

- The 1-Wire network layer handles all means for slave identification and bus arbitration. This includes ROM commands like Match ROM, or Search ROM.
  - All slave devices have a unique 64-bit identification number, which includes a 8-bit 1-Wire Family Code and a 8-bit CRC.
  - In order to find slaves on the bus, the standard specifies an search algorithm which successively detects all slaves on the bus. This algorithm is described in detail by Maxim’s Applicationnote 187.

- Transport layer and Presentation layer functions are not implemented in the generic 1-Wire driver and therefore must be handled in individual slave drivers.

The 1-Wire API is considered experimental.
Configuration Options

Related configuration options:
- CONFIG_W1
- CONFIG_W1_NET

API Reference

1-Wire data link layer

_group w1_data_link
1-Wire data link layer

Functions

`int w1_reset_bus(const struct device *dev)`
Reset the 1-Wire bus to prepare slaves for communication.

This routine resets all 1-Wire bus slaves such that they are ready to receive a command. Connected slaves answer with a presence pulse once they are ready to receive data.

In case the driver supports both standard speed and overdrive speed, the reset routine takes care of sending either a short or a long reset pulse depending on the current state. The speed can be changed using `w1_configure()`.

**Parameters**
- `dev` – **[in]** Pointer to the device structure for the driver instance.

**Return values**
- 0 – If no slaves answer with a present pulse.
- 1 – If at least one slave answers with a present pulse.
- `-errno` – Negative error code on error.

`int w1_read_bit(const struct device *dev)`
Read a single bit from the 1-Wire bus.

**Parameters**
- `dev` – **[in]** Pointer to the device structure for the driver instance.

**Return values**
- `rx_bit` – The read bit value on success.
- `-errno` – Negative error code on error.

`int w1_write_bit(const struct device *dev, const bool bit)`
Write a single bit to the 1-Wire bus.

**Parameters**
- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `bit` – Transmitting bit value 1 or 0.

**Return values**
- 0 – If successful.
- `-errno` – Negative error code on error.
int w1_read_byte(const struct device *dev)
Read a single byte from the 1-Wire bus.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Return values
• rx_byte – The read byte value on success.
• -errno – Negative error code on error.

int w1_write_byte(const struct device *dev, uint8_t byte)
Write a single byte to the 1-Wire bus.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• byte – Transmitting byte.

Return values
• 0 – If successful.
• -errno – Negative error code on error.

int w1_read_block(const struct device *dev, uint8_t *buffer, size_t len)
Read a block of data from the 1-Wire bus.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• buffer – [out] Pointer to receive buffer.
• len – Length of receiving buffer (in bytes).

Return values
• 0 – If successful.
• -errno – Negative error code on error.

int w1_write_block(const struct device *dev, const uint8_t *buffer, size_t len)
Write a block of data from the 1-Wire bus.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• buffer – [in] Pointer to transmitting buffer.
• len – Length of transmitting buffer (in bytes).

Return values
• 0 – If successful.
• -errno – Negative error code on error.

size_t w1_get_slave_count(const struct device *dev)
Get the number of slaves on the bus.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Return values
• slave_count – Positive Number of connected 1-Wire slaves on success.
• -errno – Negative error code on error.
int w1_configure(const struct device *dev, enum w1_settings_type type, uint32_t value)

Configure parameters of the 1-Wire master.

Allowed configuration parameters are defined in enum w1_settings_type, but master devices may not support all types.

**Parameters**

- **dev** – [in] Pointer to the device structure for the driver instance.
- **type** – Enum specifying the setting type.
- **value** – The new value for the passed settings type.

**Return values**

- **0** – If successful.
- **-ENOTSUP** – The master doesn't support the configuration of the supplied type.
- **-EIO** – General input / output error, failed to configure master devices.

1-Wire network layer

**group w1_network**

1-Wire network layer

1-Wire ROM Commands

**W1_CMD_SKIP_ROM**

This command allows the bus master to read the slave devices without providing their ROM code.

**W1_CMD_MATCH_ROM**

This command allows the bus master to address a specific slave device by providing its ROM code.

**W1_CMD_RESUME**

This command allows the bus master to resume a previous read out from where it left off.

**W1_CMD_READ_ROM**

This command allows the bus master to read the ROM code from a single slave device.

This command should be used when there is only a single slave device on the bus.

**W1_CMD_SEARCH_ROM**

This command allows the bus master to discover the addresses (i.e., ROM codes) of all slave devices on the bus.

**W1_CMD_SEARCH_ALARM**

This command allows the bus master to identify which devices have experienced an alarm condition.
This command allows the bus master to address all devices on the bus and then switch them to overdrive speed.

This command allows the bus master to address a specific device and switch it to overdrive speed.

**CRC Defines**

**W1_CRC8_SEED**
Seed value used to calculate the 1-Wire 8-bit crc.

**W1_CRC8_POLYNOMIAL**
Polynomial used to calculate the 1-Wire 8-bit crc.

**W1_CRC16_SEED**
Seed value used to calculate the 1-Wire 16-bit crc.

**W1_CRC16_POLYNOMIAL**
Polynomial used to calculate the 1-Wire 16-bit crc.

**Defines**

**W1_SEARCH_ALL_FAMILIES**
This flag can be passed to searches in order to not filter on family ID.

**W1_ROM_INIT_ZERO**
Initialize all `w1_rom` struct members to zero.

**Typedefs**

typedef void (*w1_search_callback_t)(struct `w1_rom` rom, void *user_data)
Define the application callback handler function signature for searches.

**Param rom**
found The ROM of the found slave.

**Param user_data**
User data provided to the `w1_search_bus()` call.
int w1_read_rom(const struct device *dev, struct w1_rom *rom)
Read Peripheral 64-bit ROM.

This procedure allows the 1-Wire bus master to read the peripherals' 64-bit ROM without using the Search ROM procedure. This command can be used as long as not more than a single peripheral is connected to the bus. Otherwise data collisions occur and a faulty ROM is read.

Parameters
- **dev** – [in] Pointer to the device structure for the driver instance.
- **rom** – [out] Pointer to the ROM structure.

Return values
- 0 – If successful.
- -ENODEV – In case no slave responds to reset.
- -errno – Other negative error code in case of invalid crc and communication errors.

int w1_match_rom(const struct device *dev, const struct w1_slave_config *config)
Select a specific slave by broadcasting a selected ROM.

This routine allows the 1-Wire bus master to select a slave identified by its unique ROM, such that the next command will target only this single selected slave.

This command is only necessary in multidrop environments, otherwise the Skip ROM command can be issued. Once a slave has been selected, to reduce the communication overhead, the resume command can be used instead of this command to communicate with the selected slave.

Parameters
- **dev** – [in] Pointer to the device structure for the driver instance.
- **config** – [in] Pointer to the slave specific 1-Wire config.

Return values
- 0 – If successful.
- -ENODEV – In case no slave responds to reset.
- -errno – Other negative error code on error.

int w1_resume_command(const struct device *dev)
Select the slave last addressed with a Match ROM or Search ROM command.

This routine allows the 1-Wire bus master to re-select a slave device that was already addressed using a Match ROM or Search ROM command.

Parameters
- **dev** – Pointer to the device structure for the driver instance.

Return values
- 0 – If successful.
- -ENODEV – In case no slave responds to reset.
- -errno – Other negative error code on error.
int w1_skip_rom(const struct device *dev, const struct w1_slave_config *config)
Select all slaves regardless of ROM.
This routine sets up the bus slaves to receive a command. It is usually used when there is only one peripheral on the bus to avoid the overhead of the Match ROM command. But it can also be used to concurrently write to all slave devices.

Parameters
- dev – [in] Pointer to the device structure for the driver instance.
- config – [in] Pointer to the slave specific 1-Wire config.

Return values
- 0 – If successful.
- -ENODEV – In case no slave responds to reset.
- -errno – Other negative error code on error.

int w1_reset_select(const struct device *dev, const struct w1_slave_config *config)
In single drop configurations use Skip Select command, otherwise use Match ROM command.

Parameters
- dev – [in] Pointer to the device structure for the driver instance.
- config – [in] Pointer to the slave specific 1-Wire config.

Return values
- 0 – If successful.
- -ENODEV – In case no slave responds to reset.
- -errno – Other negative error code on error.

int w1_write_read(const struct device *dev, const struct w1_slave_config *config, const uint8_t *write_buf, size_t write_len, uint8_t *read_buf, size_t read_len)
Write then read data from the 1-Wire slave with matching ROM.
This routine uses w1_reset_select to select the given ROM. Then writes given data and reads the response back from the slave.

Parameters
- dev – [in] Pointer to the device structure for the driver instance.
- config – [in] Pointer to the slave specific 1-Wire config.
- write_buf – [in] Pointer to the data to be written.
- write_len – Number of bytes to write.
- read_buf – [out] Pointer to storage for read data.
- read_len – Number of bytes to read.

Return values
- 0 – If successful.
- -ENODEV – In case no slave responds to reset.
- -errno – Other negative error code on error.
int w1_search_bus(const struct device *dev, uint8_t command, uint8_t family, w1_search_callback_t callback, void *user_data)

Search 1-wire slaves on the bus.

This function searches slaves on the 1-wire bus, with the possibility to search either all slaves or only slaves that have an active alarm state. If a callback is passed, the callback is called for each found slave.

Note: Filtering on families is not supported.

Parameters

- dev – [in] Pointer to the device structure for the driver instance.
- command – Can either be W1_SEARCH_ALARM or W1_SEARCH_ROM.
- family – W1_SEARCH_ALL_FAMILIES searches all families, filtering on a specific family is not yet supported.
- callback – Application callback handler function to be called for each found slave.
- user_data – [in] User data to pass to the application callback handler function.

Return values

- slave_count – Number of slaves found.
- -errno – Negative error code on error.

static inline int w1_search_rom(const struct device *dev, w1_search_callback_t callback, void *user_data)

Search for 1-Wire slave on bus.

This routine can discover unknown slaves on the bus by scanning for the unique 64-bit registration number.

Parameters

- dev – [in] Pointer to the device structure for the driver instance.
- callback – Application callback handler function to be called for each found slave.
- user_data – [in] User data to pass to the application callback handler function.

Return values

- slave_count – Number of slaves found.
- -errno – Negative error code on error.

static inline int w1_search_alarm(const struct device *dev, w1_search_callback_t callback, void *user_data)

Search for 1-Wire slaves with an active alarm.

This routine searches 1-Wire slaves on the bus, which currently have an active alarm.

Parameters

- dev – [in] Pointer to the device structure for the driver instance.
- callback – Application callback handler function to be called for each found slave.
• **user_data** – [in] User data to pass to the application callback handler function.

**Return values**

• **slave_count** – Number of slaves found.
• **-errno** – Negative error code on error.

static inline uint64_t w1_rom_to_uint64(const struct w1_rom *rom)

Function to convert a `w1_rom` struct to an uint64_t.

**Parameters**

• **rom** – [in] Pointer to the ROM struct.

**Return values**

• **rom64** – The ROM converted to an unsigned integer in endianness.

static inline void w1_uint64_to_rom(const uint64_t rom64, struct w1_rom *rom)

Function to write an uint64_t to struct `w1_rom` pointer.

**Parameters**

• **rom64** – Unsigned 64 bit integer representing the ROM in host endianness.
• **rom** – [out] The ROM struct pointer.

static inline uint8_t w1_crc8(const uint8_t *src, size_t len)

Compute CRC-8 checksum as defined in the 1-Wire specification.

The 1-Wire of CRC 8 variant is using 0x31 as its polynomial with the initial value set to 0x00. This CRC is used to check the correctness of the unique 56-bit ROM.

**Parameters**

• **src** – [in] Input bytes for the computation.
• **len** – Length of the input in bytes.

**Return values**

• **crc** – The computed CRC8 value.

static inline uint16_t w1_crc16(const uint16_t seed, const uint8_t *src, const size_t len)

Compute 1-Wire variant of CRC 16.

The 16-bit 1-Wire crc variant is using the reflected polynomial function $X^{16} + X^{15} + X^{2} + 1$ with the initial value set to 0x0000. See also APPLICATION NOTE 27: “UNDERSTANDING AND USING CYCLIC REDUNDANCY CHECKS WITH MAXIM 1-WIRE AND IBUTTON PRODUCTS” https://www.maximintegrated.com/en/design/technical-documents/app-notes/2/27.html

**Parameters**

• **seed** – Init value for the CRC, it is usually set to 0x0000.
• **src** – [in] Input bytes for the computation.
• **len** – Length of the input in bytes.

**Return values**

• **crc** – The computed CRC16 value.

```c
#include <w1.h>

struct w1_rom
```

#include `<w1.h>` `w1_rom` struct.
Public Members

uint8_t family
   The 1-Wire family code identifying the slave device type.
   An incomplete list of family codes is available at: https://www.maximintegrated.com/en/app-notes/index.mvp/id/155 others are documented in the respective device data sheet.

uint8_t serial[6]
   The serial together with the family code composes the unique 56-bit id.

uint8_t crc
   8-bit checksum of the 56-bit unique id.

struct w1_slave_config
   #include <w1.h> Node specific 1-wire configuration struct.
   This struct is passed to network functions, such that they can configure the bus to address the specific slave using the selected speed.

Public Members

struct w1_rom rom
   Unique 1-Wire ROM.

uint32_t overdrive
   overdrive speed is used if set to 1.

1-Wire generic functions and helpers Functions that are not directly related to any of the networking layers.

Related code samples

1-Wire scanner
   Scan for 1-Wire devices and print their family ID and serial number.

group w1_interface
   1-Wire Interface

 Enums

enum w1_settings_type
   Defines the 1-Wire master settings types, which are runtime configurable.
   Values:

   enumerator W1_SETTING_SPEED
      Overdrive speed is enabled in case a value of 1 is passed and disabled passing 0.
enumerator W1_SETTING_STRONG_PULLUP

The strong pullup resistor is activated immediately after the next written data block by passing a value of 1, and deactivated passing 0.

enumerator W1_SETTINGS_TYPE_COUNT

Number of different settings types.

Functions

static inline int w1_lock_bus(const struct device *dev)

Lock the 1-wire bus to prevent simultaneous access.

This routine locks the bus to prevent simultaneous access from different threads. The calling thread waits until the bus becomes available. A thread is permitted to lock a mutex it has already locked.

Parameters

• dev – [in] Pointer to the device structure for the driver instance.

Return values

• 0 – If successful.
• -errno – Negative error code on error.

static inline int w1_unlock_bus(const struct device *dev)

Unlock the 1-wire bus.

This routine unlocks the bus to permit access to bus line.

Parameters

• dev – [in] Pointer to the device structure for the driver instance.

Return values

• 0 – If successful.
• -errno – Negative error code on error.

7.6.2 Analog-to-Digital Converter (ADC)

Overview

API Reference

Related code samples

Analog-to-Digital Converter (ADC)

Read analog inputs from ADC channels.

group adc_interface

ADC driver APIs.
Defines

ADC_CHANNEL_CFG_DT(node_id)
Get ADC channel configuration from a given devicetree node.

This returns a static initializer for a struct `adc_channel_cfg` filled with data from a given devicetree node.

Example devicetree fragment:

```plaintext
&adc {
    #address-cells = <1>;
    #size-cells = <0>;

    channel@0 {
        reg = <0>;
        zephyr,gain = "ADC_GAIN_1_6";
        zephyr,reference = "ADC_REF_INTERNAL";
        zephyr,acquisition-time = <ADC_ACQ_TIME(ADC_ACQ_TIME_MICROSECONDS, 20)>;
        zephyr,input-positive = <NRF_SAADC_AIN6>;
        zephyr,input-negative = <NRF_SAADC_AIN7>;
    }

    channel@1 {
        reg = <1>;
        zephyr,gain = "ADC_GAIN_1_6";
        zephyr,reference = "ADC_REF_INTERNAL";
        zephyr,acquisition-time = <ADC_ACQ_TIME_DEFAULT>;
        zephyr,input-positive = <NRF_SAADC_AIN0>;
    }
}
```

Example usage:

```c
static const struct adc_channel_cfg ch0_cfg_dt = ADC_CHANNEL_CFG_DT(DT_CHILD(DT_NODELABEL(adc), channel_0));
static const struct adc_channel_cfg ch1_cfg_dt = ADC_CHANNEL_CFG_DT(DT_CHILD(DT_NODELABEL(adc), channel_1));
```

// Initializes 'ch0_cfg_dt' to:
// {
//   .channel_id = 0,
//   .gain = ADC_GAIN_1_6,
//   .reference = ADC_REF_INTERNAL,
//   .acquisition_time = ADC_ACQ_TIME(ADC_ACQ_TIME_MICROSECONDS, 20),
//   .differential = true,
//   .input_positive = NRF_SAADC_AIN6,
//   .input_negative = NRF_SAADC_AIN7,
// }
// and 'ch1_cfg_dt' to:
// {
//   .channel_id = 1,
//   .gain = ADC_GAIN_1_6,
//   .reference = ADC_REF_INTERNAL,
//   .acquisition_time = ADC_ACQ_TIME_DEFAULT,
//   .input_positive = NRF_SAADC_AIN0,
// }
```

Parameters

- **node_id** – Devicetree node identifier.

Returns

Static initializer for an `adc_channel_cfg` structure.
Get ADC io-channel information from devicetree.

This returns a static initializer for an `adc_dt_spec` structure given a devicetree node and a channel index. The node must have the “io-channels” property defined.

Example devicetree fragment:

```
/ {
    zephyr,user {
        io-channels =<&adc0 1>, &adc0 3>;
    };

&adc0 {
    #address-cells = <1>;
    #size-cells = <0>;

class03 {
    reg = <3>;
    zephyr,gain = "ADC_GAIN_1_5";
    zephyr,reference = "ADC_REF_VDD_1_4";
    zephyr,vref-mv = <750>;
    zephyr,acquisition-time = <ADC_ACQ_TIME_DEFAULT>;
    zephyr,resolution = <12>;
    zephyr,oversampling = <4>;
};
}
```

Example usage:

```
static const struct adc_dt_spec adc_chan0 = ADC_DT_SPEC_GET_BY_IDX(DT_PATH(zephyr_user), 0);
static const struct adc_dt_spec adc_chan1 = ADC_DT_SPEC_GET_BY_IDX(DT_PATH(zephyr_user), 1));
```

// Initializes 'adc_chan0' to:
// { 
//   .dev = DEVICE_DT_GET(DT_NODELABEL(adc0)),
//   .channel_id = 1,
// } 
// and 'adc_chan1' to:
// { 
//   .dev = DEVICE_DT_GET(DT_NODELABEL(adc0)),
//   .channel_id = 3,
//   .channel_cfg_dt_node_exists = true,
//   .channel_cfg = {
//     .channel_id = 3,
//     .gain = ADC_GAIN_1_5,
//     .reference = ADC_REF_VDD_1_4,
//     .acquisistion_time = ADC_ACQ_TIME_DEFAULT,
//   },
//   .vref_mv = 750,
//   .resolution = 12,
//   .oversampling = 4,
// }

See also:

`ADC_DT_SPEC_GET()`

Parameters
• node_id – Devicetree node identifier.
• idx – Channel index.

**Returns**
Static initializer for an `adc_dt_spec` structure.

`ADC_DT_SPEC_INST_GET_BY_IDX(inst, idx)`
Get ADC io-channel information from a DT_DRV_COMPAT devicetree instance.

**See also:**
`ADC_DT_SPEC_GET_BY_IDX()`

**Parameters**
• inst – DT_DRV_COMPAT instance number
• idx – Channel index.

**Returns**
Static initializer for an `adc_dt_spec` structure.

`ADC_DT_SPEC_GET(node_id)`
Equivalent to `ADC_DT_SPEC_GET_BY_IDX(node_id, 0)`.

**See also:**
`ADC_DT_SPEC_GET_BY_IDX()`

**Parameters**
• node_id – Devicetree node identifier.

**Returns**
Static initializer for an `adc_dt_spec` structure.

`ADC_DT_SPEC_INST_GET(inst)`
Equivalent to `ADC_DT_SPEC_INST_GET_BY_IDX(inst, 0)`.

**See also:**
`ADC_DT_SPEC_GET()`

**Parameters**
• inst – DT_DRV_COMPAT instance number

**Returns**
Static initializer for an `adc_dt_spec` structure.

**Typedefs**

typedef enum `adc_action` (*`adc_sequence_callback`)*
(const struct `device` *dev, const struct `adc_sequence` *sequence, uint16_t sampling_index)

Type definition of the optional callback function to be called after a requested sampling is done.
**Param dev**
Pointer to the device structure for the driver instance.

**Param sequence**
Pointer to the sequence structure that triggered the sampling. This parameter points to a copy of the structure that was supplied to the call that started the sampling sequence, thus it cannot be used with the `CONTAINER_OF()` macro to retrieve some other data associated with the sequence. Instead, the `adc_sequence_options::user_data` field should be used for such purpose.

**Param sampling_index**
Index (0-65535) of the sampling done.

**Return**
Action to be performed by the driver. See `adc_action`.

```c
typedef int (*adc_api_channel_setup)(const struct device *dev, const struct adc_channel_cfg *channel_cfg)
```
Type definition of ADC API function for configuring a channel.
See `adc_channel_setup()` for argument descriptions.

```c
typedef int (*adc_api_read)(const struct device *dev, const struct adc_sequence *sequence)
```
Type definition of ADC API function for setting a read request.
See `adc_read()` for argument descriptions.

```c
typedef int (*adc_api_read_async)(const struct device *dev, const struct adc_sequence *sequence, struct k_poll_signal *async)
```
Type definition of ADC API function for setting an asynchronous read request.
See `adc_read_async()` for argument descriptions.

**Enums**

```c
enum adc_gain
```
ADC channel gain factors.

**Values:**

- enumerator `ADC_GAIN_1_6`
  x 1/6.

- enumerator `ADC_GAIN_1_5`
  x 1/5.

- enumerator `ADC_GAIN_1_4`
  x 1/4.

- enumerator `ADC_GAIN_1_3`
  x 1/3.

- enumerator `ADC_GAIN_2_5`
  x 2/5.
enumerator ADC_GAIN_1_2
x 1/2.

enumerator ADC_GAIN_2_3
x 2/3.

enumerator ADC_GAIN_4_5
x 4/5.

enumerator ADC_GAIN_1
x 1.

enumerator ADC_GAIN_2
x 2.

enumerator ADC_GAIN_3
x 3.

enumerator ADC_GAIN_4
x 4.

enumerator ADC_GAIN_6
x 6.

enumerator ADC_GAIN_8
x 8.

enumerator ADC_GAIN_12
x 12.

enumerator ADC_GAIN_16
x 16.

enumerator ADC_GAIN_24
x 24.

enumerator ADC_GAIN_32
x 32.

enumerator ADC_GAIN_64
x 64.

enumerator ADC_GAIN_128
x 128.

enum adc_reference
ADC references.
Values:
enumerator ADC_REF_VDD_1
    VDD.

denumerator ADC_REF_VDD_1_2
    VDD/2.

denumerator ADC_REF_VDD_1_3
    VDD/3.

denumerator ADC_REF_VDD_1_4
    VDD/4.

denumerator ADC_REF_INTERNAL
    Internal.

denumerator ADC_REF_EXTERNAL0
    External, input 0.

denumerator ADC_REF_EXTERNAL1
    External, input 1.

enum adc_action
    Action to be performed after a sampling is done.
    Values:
        enumerator ADC_ACTION_CONTINUE = 0
            The sequence should be continued normally.

        enumerator ADC_ACTION_REPEAT
            The sampling should be repeated.

                New samples or sample should be read from the ADC and written in the same place
                as the recent ones.

        enumerator ADC_ACTION_FINISH
            The sequence should be finished immediately.

Functions

int adc_gain_invert(enum adc_gain gain, int32_t *value)
    Invert the application of gain to a measurement value.
    For example, if the gain passed in is ADC_GAIN_1_6 and the referenced value is 10, the
    value after the function returns is 60.

    Parameters
        • gain – the gain used to amplify the input signal.
        • value – a pointer to a value that initially has the effect of the applied gain
          but has that effect removed when this function successfully returns. If
          the gain cannot be reversed the value remains unchanged.
Return values

- 0 – if the gain was successfully reversed
- -EINVAL – if the gain could not be interpreted

```c
int adc_channel_setup(const struct device *dev, const struct adc_channel_cfg *channel_cfg)
```

Configure an ADC channel.

It is required to call this function and configure each channel before it is selected for a read request.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `channel_cfg` – Channel configuration.

Return values

- 0 – On success.
- -EINVAL – If a parameter with an invalid value has been provided.

```c
static inline int adc_channel_setup_dt(const struct adc_dt_spec *spec)
```

Configure an ADC channel from a struct `adc_dt_spec`.

See also:

`adc_channel_setup()`

Parameters

- `spec` – ADC specification from Devicetree.

Returns

A value from `adc_channel_setup()` or -ENOTSUP if information from Devicetree is not valid.

```c
int adc_read(const struct device *dev, const struct adc_sequence *sequence)
```

Set a read request.

If invoked from user mode, any sequence struct options for callback must be NULL.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `sequence` – Structure specifying requested sequence of samplings.

Return values

- 0 – On success.
- -EINVAL – If a parameter with an invalid value has been provided.
- -ENOMEM – If the provided buffer is too small to hold the results of all requested samplings.
- -ENOTSUP – If the requested mode of operation is not supported.
- -EBUSY – If another sampling was triggered while the previous one was still in progress. This may occur only when samplings are done with intervals, and it indicates that the selected interval was too small. All requested samples are written in the buffer, but at least some of them were taken with an extra delay compared to what was scheduled.
**static inline int adc_read_dt(const struct adc_dt_spec *spec, const struct adc_sequence *sequence)**

Set a read request from a struct *adc_dt_spec*.

**See also:**
*adc_read()*

**Parameters**
- `spec` – ADC specification from Devicetree.
- `sequence` – Structure specifying requested sequence of samplings.

**Returns**
A value from *adc_read()*.

**int adc_read_async(const struct device *dev, const struct adc_sequence *sequence, struct k_poll_signal *async)**

Set an asynchronous read request.

If invoked from user mode, any sequence struct options for callback must be NULL.

**Note:** This function is available only if CONFIG_ADC_ASYNC is selected.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `sequence` – Structure specifying requested sequence of samplings.
- `async` – Pointer to a valid and ready to be signaled struct *k_poll_signal*. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

**Returns**
0 on success, negative error code otherwise. See *adc_read()* for a list of possible error codes.

**static inline uint16_t adc_ref_internal(const struct device *dev)**

Get the internal reference voltage.

Returns the voltage corresponding to ADC_REF_INTERNAL, measured in millivolts.

**Returns**
a positive value is the reference voltage value. Returns zero if reference voltage information is not available.

**static inline int adc_raw_to_millivolts(int32_t ref_mv, enum adc_gain gain, uint8_t resolution, int32_t *valp)**

Convert a raw ADC value to millivolts.

This function performs the necessary conversion to transform a raw ADC measurement to a voltage in millivolts.

**Parameters**
- `ref_mv` – the reference voltage used for the measurement, in millivolts. This may be from *adc_ref_internal()* or a known external reference.
- `gain` – the ADC gain configuration used to sample the input
• **resolution** – the number of bits in the absolute value of the sample. For differential sampling this needs to be one less than the resolution in struct `adc_sequence`.

• **valp** – pointer to the raw measurement value on input, and the corresponding millivolt value on successful conversion. If conversion fails the stored value is left unchanged.

**Return values**

- 0 – on successful conversion
- EINVAL – if the gain is not reversible

```c
static inline int adc_raw_to_millivolts_dt(const struct adc_dt_spec *spec, int32_t *valp)
```

Convert a raw ADC value to millivolts using information stored in a struct `adc_dt_spec`.

**See also:**

`adc_raw_to_millivolts()`

**Parameters**

- **spec** – [in] ADC specification from Devicetree.
- **valp** – [inout] Pointer to the raw measurement value on input, and the corresponding millivolt value on successful conversion. If conversion fails the stored value is left unchanged.

**Returns**

A value from `adc_raw_to_millivolts()` or -ENOTSUP if information from Devicetree is not valid.

```c
static inline int adc_sequence_init_dt(const struct adc_dt_spec *spec, struct adc_sequence *seq)
```

Initialize a struct `adc_sequence` from information stored in struct `adc_dt_spec`.

Note that this function only initializes the following fields:

- `adc_sequence::channels`
- `adc_sequence::resolution`
- `adc_sequence::oversampling`

Other fields should be initialized by the caller.

**Parameters**

- **spec** – [in] ADC specification from Devicetree.
- **seq** – [out] Sequence to initialize.

**Return values**

- 0 – On success
- -ENOTSUP – If spec does not have valid channel configuration

```c
static inline bool adc_is_ready_dt(const struct adc_dt_spec *spec)
```

Validate that the ADC device is ready.

**Parameters**

- **spec** – ADC specification from devicetree
Return values

true – if the ADC device is ready for use and false otherwise.

struct adc_channel_cfg

#include <adc.h> Structure for specifying the configuration of an ADC channel.

Public Members

enum adc_gain gain
Gain selection.

enum adc_reference reference
Reference selection.

uint16_t acquisition_time
Acquisition time.

Use the ADC_ACQ_TIME macro to compose the value for this field or pass
ADC_ACQ_TIME_DEFAULT to use the default setting for a given hardware (e.g.
when the hardware does not allow to configure the acquisition time). Particular
drivers do not necessarily support all the possible units. Value range is 0-16383 for
a given unit.

uint8_t channel_id
Channel identifier.

This value primarily identifies the channel within the ADC API - when a read re-
quest is done, the corresponding bit in the “channels” field of the “adc_sequence”
structure must be set to include this channel in the sampling. For hardware that
does not allow selection of analog inputs for given channels, but rather have dedi-
cated ones, this value also selects the physical ADC input to be used in the sampling.
Otherwise, when it is needed to explicitly select an analog input for the channel,
or two inputs when the channel is a differential one, the selection is done in “in-
put_positive” and “input_negative” fields. Particular drivers indicate which one of
the above two cases they support by selecting or not a special hidden Kconfig op-
tion named ADC_CONFIGURABLE_INPUTS. If this option is not selected, the macro
CONFIG_ADC_CONFIGURABLE_INPUTS is not defined and consequently the men-
tioned two fields are not present in this structure. While this API allows identifiers
from range 0-31, particular drivers may support only a limited number of channel
 identifiers (dependent on the underlying hardware capabilities or configured via
a dedicated Kconfig option).

uint8_t differential
Channel type: single-ended or differential.

struct adc_dt_spec

#include <adc.h> Container for ADC channel information specified in devicetree.

See also:
ADC_DT_SPEC_GET_BY_IDX
See also:
ADC_DT_SPEC_GET

7.6. Peripherals
Public Members

const struct device *dev
   Pointer to the device structure for the ADC driver instance used by this io-channel.

uint8_t channel_id
   ADC channel identifier used by this io-channel.

bool channel_cfg_dt_node_exists
   Flag indicating whether configuration of the associated ADC channel is provided as a child node of the corresponding ADC controller in devicetree.

struct adc_channel_cfg channel_cfg
   Configuration of the associated ADC channel specified in devicetree.
   This field is valid only when channel_cfg_dt_node_exists is set to true.

uint16_t vref_mv
   Voltage of the reference selected for the channel or 0 if this value is not provided in devicetree.
   This field is valid only when channel_cfg_dt_node_exists is set to true.

uint8_t resolution
   ADC resolution to be used for that channel.
   This field is valid only when channel_cfg_dt_node_exists is set to true.

uint8_t oversampling
   Oversampling setting to be used for that channel.
   This field is valid only when channel_cfg_dt_node_exists is set to true.

struct adc_sequence_options
   #include <adc.h> Structure defining additional options for an ADC sampling sequence.

Public Members

uint32_t interval_us
   Interval between consecutive samplings (in microseconds), 0 means sample as fast as possible, without involving any timer.
   The accuracy of this interval is dependent on the implementation of a given driver. The default routine that handles the intervals uses a kernel timer for this purpose, thus, it has the accuracy of the kernel's system clock. Particular drivers may use some dedicated hardware timers and achieve a better precision.

adc_sequence_callback callback
   Callback function to be called after each sampling is done.
   Optional - set to NULL if it is not needed.
void *user_data
     Pointer to user data.
     It can be used to associate the sequence with any other data that is needed in the callback function.

uint16_t extra_samplings
     Number of extra samplings to perform (the total number of samplings is 1 + extra_samplings).

struct adc_sequence
     #include <adc.h> Structure defining an ADC sampling sequence.

Public Members

const struct adc_sequence_options *options
     Pointer to a structure defining additional options for the sequence.
     If NULL, the sequence consists of a single sampling.

uint32_t channels
     Bit-mask indicating the channels to be included in each sampling of this sequence.
     All selected channels must be configured with adc_channel_setup() before they are used in a sequence. The least significant bit corresponds to channel 0.

void *buffer
     Pointer to a buffer where the samples are to be written.
     Samples from subsequent samplings are written sequentially in the buffer. The number of samples written for each sampling is determined by the number of channels selected in the “channels” field. The values written to the buffer represent a sample from each selected channel starting from the one with the lowest ID. The buffer must be of an appropriate size, taking into account the number of selected channels and the ADC resolution used, as well as the number of samplings contained in the sequence.

size_t buffer_size
     Specifies the actual size of the buffer pointed by the “buffer” field (in bytes).
     The driver must ensure that samples are not written beyond the limit and it must return an error if the buffer turns out to be not large enough to hold all the requested samples.

uint8_t resolution
     ADC resolution.
     For single-ended channels the sample values are from range: 0 .. 2^resolution - 1, for differential ones:
     • 2^(resolution-1) .. 2^(resolution-1) - 1.

uint8_t oversampling
     Oversampling setting.
Each sample is averaged from \(2^{\text{oversampling}}\) conversion results. This feature may be unsupported by a given ADC hardware, or in a specific mode (e.g. when sampling multiple channels).

```c
bool calibrate
```

Perform calibration before the reading is taken if requested.

The impact of channel configuration on the calibration process is specific to the underlying hardware. ADC implementations that do not support calibration should ignore this flag.

```c
struct adc_driver_api
#include <adc.h> ADC driver API.
```

This is the mandatory API any ADC driver needs to expose.

## 7.6.3 Auxiliary Display (auxdisplay)

### Overview

Auxiliary Displays are text-based displays that have simple interfaces for displaying textual, numeric or alphanumeric data, as opposed to the Display Interface, auxiliary displays do not support custom graphical output to displays (and most often monochrome), the most advanced custom feature supported is generation of custom characters. These inexpensive displays are commonly found with various configurations and sizes, a common display size is 16 characters by 2 lines.

This API is unstable and subject to change.

### Configuration Options

Related configuration options:

- CONFIG_AUXDISPLAY
- CONFIG_AUXDISPLAY_INIT_PRIORITY

### API Reference

#### Related code samples

**Auxiliary display**

Output ”Hello World” to an auxiliary display.

```c
group auxdisplay_interface
Auxiliary (Text) Display Interface.
```

**Defines**

- AUXDISPLAY_LIGHT_NOT_SUPPORTED
  Used for minimum and maximum brightness/backlight values if not supported.
**Typedefs**

typedef uint32_t auxdisplay_mode_t

Used to describe the mode of an auxiliary (text) display.

**Enums**

define auxdisplay_position

Used for moving the cursor or display position.

*Values:*

enumerator AUXDISPLAY_POSITION_ABSOLUTE = 0

Moves to specified X,Y position.

enumerator AUXDISPLAY_POSITION_RELATIVE

Shifts current position by +/- X,Y position, does not take display direction into consideration.

enumerator AUXDISPLAY_POSITION_RELATIVE_DIRECTION

Shifts current position by +/- X,Y position, takes display direction into consideration.

enumerator AUXDISPLAY_POSITION_COUNT

**enum auxdisplay_direction**

Used for setting character append position.

*Values:*

enumerator AUXDISPLAY_DIRECTION_RIGHT = 0

Each character will be placed to the right of existing characters.

enumerator AUXDISPLAY_DIRECTION_LEFT

Each character will be placed to the left of existing characters.

enumerator AUXDISPLAY_DIRECTION_COUNT

**Functions**

int auxdisplay_display_on(const struct device *dev)

Turn display on.

**Parameters**

- dev – Auxiliary display device instance

**Return values**

- 0 – on success.
- -ENOSYS – if not supported/implemented.

7.6. Peripherals
int auxdisplay_display_off(const struct device *dev)
Turn display off.

Parameters
• dev – Auxiliary display device instance

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -errno – Negative errno code on other failure.

int auxdisplay_cursor_set_enabled(const struct device *dev, bool enabled)
Set cursor enabled status on an auxiliary display.

Parameters
• dev – Auxiliary display device instance
• enabled – True to enable cursor, false to disable

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -errno – Negative errno code on other failure.

int auxdisplay_position_blinking_set_enabled(const struct device *dev, bool enabled)
Set cursor blinking status on an auxiliary display.

Parameters
• dev – Auxiliary display device instance
• enabled – Set to true to enable blinking position, false to disable

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -errno – Negative errno code on other failure.

int auxdisplay_cursor_shift_set(const struct device *dev, uint8_t direction, bool display_shift)
Set cursor shift after character write and display shift.

Parameters
• dev – Auxiliary display device instance
• direction – Sets the direction of the display when characters are written
• display_shift – If true, will shift the display when characters are written (which makes it look like the display is moving, not the cursor)

Return values
• 0 – on success.
• -ENOSYS – if not supported/implemented.
• -EINVAL – if provided argument is invalid.
• -errno – Negative errno code on other failure.
int auxdisplay_cursor_position_set(const struct device *dev, enum auxdisplay_position type, int16_t x, int16_t y)

Set cursor (and write position) on an auxiliary display.

**Parameters**
- *dev* – Auxiliary display device instance
- *type* – Type of move, absolute or offset
- *x* – Exact or offset X position
- *y* – Exact or offset Y position

**Return values**
- 0 – on success.
- -ENOSYS – if not supported/implemented.
- -EINVAL – if provided argument is invalid.
- -errno – Negative errno code on other failure.

int auxdisplay_cursor_position_get(const struct device *dev, int16_t *x, int16_t *y)

Get current cursor on an auxiliary display.

**Parameters**
- *dev* – Auxiliary display device instance
- *x* – Will be updated with the exact X position
- *y* – Will be updated with the exact Y position

**Return values**
- 0 – on success.
- -ENOSYS – if not supported/implemented.
- -EINVAL – if provided argument is invalid.
- -errno – Negative errno code on other failure.

int auxdisplay_display_position_set(const struct device *dev, enum auxdisplay_position type, int16_t x, int16_t y)

Set display position on an auxiliary display.

**Parameters**
- *dev* – Auxiliary display device instance
- *type* – Type of move, absolute or offset
- *x* – Exact or offset X position
- *y* – Exact or offset Y position

**Return values**
- 0 – on success.
- -ENOSYS – if not supported/implemented.
- -EINVAL – if provided argument is invalid.
- -errno – Negative errno code on other failure.

int auxdisplay_display_position_get(const struct device *dev, int16_t *x, int16_t *y)

Get current display position on an auxiliary display.

**Parameters**
• `dev` – Auxiliary display device instance
• `x` – Will be updated with the exact X position
• `y` – Will be updated with the exact Y position

Return values
• `0` – on success.
• `-ENOSYS` – if not supported/implemented.
• `-EINVAL` – if provided argument is invalid.
• `-errno` – Negative errno code on other failure.

```c
int auxdisplay_capabilities_get(const struct device *dev, struct auxdisplay_capabilities *capabilities)
```

Fetch capabilities (and details) of auxiliary display.

Parameters
• `dev` – Auxiliary display device instance
• `capabilities` – Will be updated with the details of the auxiliary display

Return values
• `0` – on success.
• `-errno` – Negative errno code on other failure.

```c
int auxdisplay_clear(const struct device *dev)
```

Clear display of auxiliary display and return to home position (note that this does not reset the display configuration, e.g. custom characters and display mode will persist).

Parameters
• `dev` – Auxiliary display device instance

Return values
• `0` – on success.
• `-errno` – Negative errno code on other failure.

```c
int auxdisplay_brightness_get(const struct device *dev, uint8_t *brightness)
```

Get the current brightness level of an auxiliary display.

Parameters
• `dev` – Auxiliary display device instance
• `brightness` – Will be updated with the current brightness

Return values
• `0` – on success.
• `-ENOSYS` – if not supported/implemented.
• `-errno` – Negative errno code on other failure.

```c
int auxdisplay_brightness_set(const struct device *dev, uint8_t brightness)
```

Update the brightness level of an auxiliary display.

Parameters
• `dev` – Auxiliary display device instance
• `brightness` – The brightness level to set
Return values

- \(0\) – on success.
- \(-\text{ENOSYS}\) – if not supported/implemented.
- \(-\text{EINVAL}\) – if provided argument is invalid.
- \(-\text{errno}\) – Negative errno code on other failure.

### auxdisplay_backlight_get

```c
int auxdisplay_backlight_get(const struct device *dev, uint8_t *backlight)
```

Get the backlight level details of an auxiliary display.

**Parameters**

- `dev` – Auxiliary display device instance
- `backlight` – Will be updated with the current backlight level

**Return values**

- \(0\) – on success.
- \(-\text{ENOSYS}\) – if not supported/implemented.
- \(-\text{errno}\) – Negative errno code on other failure.

### auxdisplay_backlight_set

```c
int auxdisplay_backlight_set(const struct device *dev, uint8_t backlight)
```

Update the backlight level of an auxiliary display.

**Parameters**

- `dev` – Auxiliary display device instance
- `backlight` – The backlight level to set

**Return values**

- \(0\) – on success.
- \(-\text{ENOSYS}\) – if not supported/implemented.
- \(-\text{EINVAL}\) – if provided argument is invalid.
- \(-\text{errno}\) – Negative errno code on other failure.

### auxdisplay_is_busy

```c
int auxdisplay_is_busy(const struct device *dev)
```

Check if an auxiliary display driver is busy.

**Parameters**

- `dev` – Auxiliary display device instance

**Return values**

- \(1\) – on success and display busy.
- \(0\) – on success and display not busy.
- \(-\text{ENOSYS}\) – if not supported/implemented.
- \(-\text{errno}\) – Negative errno code on other failure.

### auxdisplay_custom_character_set

```c
int auxdisplay_custom_character_set(const struct device *dev, struct auxdisplay_character *character)
```

Sets a custom character in the display, the custom character struct must contain the pixel data for the custom character to add and valid custom character index, if successful then the character_code variable in the struct will be set to the character code that can be used with the `auxdisplay_write()` function to show it.

A character must be valid for a display consisting of a uint8 array of size character width by character height, values should be 0x00 for pixel off or 0xff for pixel on, if
a display supports shades then values between 0x00 and 0xff may be used (display driver dependent).

Parameters
- dev – Auxiliary display device instance
- character – Pointer to custom character structure

Return values
- 0 – on success.
- -ENOSYS – if not supported/implemented.
- -EINVAL – if provided argument is invalid.
- -errno – Negative errno code on other failure.

int auxdisplay_write(const struct device *dev, const uint8_t *data, uint16_t len)
Write data to auxiliary display screen at current position.

Parameters
- dev – Auxiliary display device instance
- data – Text data to write
- len – Length of text data to write

Return values
- 0 – on success.
- -EINVAL – if provided argument is invalid.
- -errno – Negative errno code on other failure.

int auxdisplay_custom_command(const struct device *dev, struct auxdisplay_custom_data *data)
Send a custom command to the display (if supported by driver)

Parameters
- dev – Auxiliary display device instance
- data – Custom command structure (this may be extended by specific drivers)

Return values
- 0 – on success.
- -ENOSYS – if not supported/implemented.
- -EINVAL – if provided argument is invalid.
- -errno – Negative errno code on other failure.

struct auxdisplay_light

#include <auxdisplay.h> Light levels for brightness and/or backlight.
If not supported by a display/driver, both minimum and maximum will be AUXDISPLAY_LIGHT_NOT_SUPPORTED.

Public Members

```c
uint8_t minimum
   Minimum light level supported.

uint8_t maximum
   Maximum light level supported.
```

```c
struct auxdisplay_capabilities
   #include <auxdisplay.h> Structure holding display capabilities.

Public Members

```c
uint16_t columns
   Number of character columns.

uint16_t rows
   Number of character rows.
```

```c
auxdisplay_mode_t mode
   Display-specific data (e.g. 4-bit or 8-bit mode for HD44780-based displays)
```

```c
struct auxdisplay_light brightness
   Brightness details for display (if supported)

struct auxdisplay_light backlight
   Backlight details for display (if supported)
```

```c
uint8_t custom_characters
   Number of custom characters supported by display (0 if unsupported)

uint8_t custom_character_width
   Width (in pixels) of a custom character, supplied custom characters should match.

uint8_t custom_character_height
   Height (in pixels) of a custom character, supplied custom characters should match.
```

```c
struct auxdisplay_custom_data
   #include <auxdisplay.h> Structure for a custom command.

   This may be extended by specific drivers.

Public Members

```c
uint8_t *data
   Raw command data to be sent.
```
7.6.4 Audio

Audio Codec

Overview The Audio Codec API provides access to digital audio codecs.

Configuration Options Related configuration options:
  • CONFIG_AUDIO_CODEC

API Reference

group audio_codec_interface
  Abstraction for audio codecs.

Typedefs

typedef void (*audio_codec_error_callback_t)(const struct device *dev, uint32_t errors)
  Callback for error interrupt.

  Param dev
  Pointer to the codec device

  Param errors
  Device errors (bitmask of audio_codec_error_type values)
Enums

enum audio_pcm_rate_t
   PCM audio sample rates.
   Values:

   enumerator AUDIO_PCM_RATE_8K = 8000
      8 kHz sample rate

   enumerator AUDIO_PCM_RATE_16K = 16000
      16 kHz sample rate

   enumerator AUDIO_PCM_RATE_24K = 24000
      24 kHz sample rate

   enumerator AUDIO_PCM_RATE_32K = 32000
      32 kHz sample rate

   enumerator AUDIO_PCM_RATE_44P1K = 44100
      44.1 kHz sample rate

   enumerator AUDIO_PCM_RATE_48K = 48000
      48 kHz sample rate

   enumerator AUDIO_PCM_RATE_96K = 96000
      96 kHz sample rate

   enumerator AUDIO_PCM_RATE_192K = 192000
      192 kHz sample rate

enum audio_pcm_width_t
   PCM audio sample bit widths.
   Values:

   enumerator AUDIO_PCM_WIDTH_16_BITS = 16
      16-bit sample width

   enumerator AUDIO_PCM_WIDTH_20_BITS = 20
      20-bit sample width

   enumerator AUDIO_PCM_WIDTH_24_BITS = 24
      24-bit sample width

   enumerator AUDIO_PCM_WIDTH_32_BITS = 32
      32-bit sample width

enum audio_dai_type_t
   Digital Audio Interface (DAI) type.
   Values:
enumerator AUDIO_DAI_TYPE_I2S
   I2S Interface.

enumerator AUDIO_DAI_TYPE_INVALID
   Other interfaces can be added here.

enum audio_property_t
   Codec properties that can be set by audio_codec_set_property().
   Values:

   enumerator AUDIO_PROPERTY_OUTPUT_VOLUME
      Output volume.

   enumerator AUDIO_PROPERTY_OUTPUT_MUTE
      Output mute/unmute.

enum audio_channel_t
   Audio channel identifiers to use in audio_codec_set_property().
   Values:

   enumerator AUDIO_CHANNEL_FRONT_LEFT
      Front left channel.

   enumerator AUDIO_CHANNEL_FRONT_RIGHT
      Front right channel.

   enumerator AUDIO_CHANNEL_LFE
      Low frequency effect channel.

   enumerator AUDIO_CHANNEL_FRONT_CENTER
      Front center channel.

   enumerator AUDIO_CHANNEL_REAR_LEFT
      Rear left channel.

   enumerator AUDIO_CHANNEL_REAR_RIGHT
      Rear right channel.

   enumerator AUDIO_CHANNEL_REAR_CENTER
      Rear center channel.

   enumerator AUDIO_CHANNEL_SIDE_LEFT
      Side left channel.

   enumerator AUDIO_CHANNEL_SIDE_RIGHT
      Side right channel.
enumerator AUDIO_CHANNEL_ALL
  All channels.

genode audio_codec_error_type
  Codec error type.
  Values:

  enumerator AUDIO_CODEC_ERROR_OVERCURRENT = BIT(0)
    Output over-current.

  enumerator AUDIO_CODEC_ERROR_OVERTEMPERATURE = BIT(1)
    Codec over-temperature.

  enumerator AUDIO_CODEC_ERROR_UNDervoltage = BIT(2)
    Power low voltage.

  enumerator AUDIO_CODEC_ERROR_OVERvoltage = BIT(3)
    Power high voltage.

  enumerator AUDIO_CODEC_ERROR_DC = BIT(4)
    Output direct-current.

Functions

static inline int audio_codec_configure(const struct device *dev, struct audio_codec_cfg *cfg)
  Configure the audio codec.
  Configure the audio codec device according to the configuration parameters provided as input
  Parameters
    • dev – Pointer to the device structure for codec driver instance.
    • cfg – Pointer to the structure containing the codec configuration.
  Returns
    0 on success, negative error code on failure

static inline void audio_codec_start_output(const struct device *dev)
  Set codec to start output audio playback.
  Setup the audio codec device to start the audio playback
  Parameters
    • dev – Pointer to the device structure for codec driver instance.

static inline void audio_codec_stop_output(const struct device *dev)
  Set codec to stop output audio playback.
  Setup the audio codec device to stop the audio playback
  Parameters
    • dev – Pointer to the device structure for codec driver instance.
static inline int audio_codec_set_property(const struct device *dev, audio_property_t property, audio_channel_t channel, audio_property_value_t val)

Set a codec property defined by audio_property_t.
Set a property such as volume level, clock configuration etc.

Parameters
   • dev – Pointer to the device structure for codec driver instance.
   • property – The codec property to set
   • channel – The audio channel for which the property has to be set
   • val – pointer to a property value of type audio_codec_property_value_t

Returns
0 on success, negative error code on failure

static inline int audio_codec_apply_properties(const struct device *dev)

Atomically apply any cached properties.
Following one or more invocations of audio_codec_set_property, that may have been
cached by the driver, audio_codec_apply_properties can be invoked to apply all the
properties as atomic as possible

Parameters
   • dev – Pointer to the device structure for codec driver instance.

Returns
0 on success, negative error code on failure

static inline int audio_codec_clear_errors(const struct device *dev)

Clear any codec errors.
Clear all codec errors. If an error interrupt exists, it will be de-asserted.

Parameters
   • dev – Pointer to the device structure for codec driver instance.

Returns
0 on success, negative error code on failure

static inline int audio_codec_register_error_callback(const struct device *dev,
audio_codec_error_callback_t cb)

Register a callback function for codec error.
The callback will be called from a thread, so I2C or SPI operations are safe. However,
the thread’s stack is limited and defined by the driver. It is currently up to the caller to
to ensure that the callback does not overflow the stack.

Parameters
   • dev – Pointer to the audio codec device
   • cb – The function that should be called when an error is detected fires

Returns
0 if successful, negative errno code if failure.

union audio_dai_cfg_t
#include <codec.h> Digital Audio Interface Configuration.
Configuration is dependent on DAI type
Public Members

struct i2s_config i2s
    I2S configuration.

struct audio_codec_cfg
    #include <codec.h> Codec configuration parameters.

Public Members

uint32_t mclk_freq
    MCLK input frequency in Hz.

    audio_dai_type_t dai_type
    Digital interface type.

    audio_dai_cfg_t dai_cfg
    DAI configuration info.

union audio_property_value_t
    #include <codec.h> Codec property values.

Public Members

int vol
    Volume level in 0.5dB resolution.

bool mute
    Mute if true, unmute if false.

Digital Microphone (DMIC)

Overview  The audio DMIC interface provides access to digital microphones.

Configuration Options  Related configuration options:
    • CONFIG_AUDIO_DMIC

API Reference  Related code samples

Digital Microphone (DMIC)
    Perform PDM transfers using different configurations.

X-NUCLEO-IKS02A1 shield - MEMS microphone
    Acquire audio using the digital MEMS microphone on X-NUCLEO-IKS02A1 shield.
group audio_dmic_interface
   Abstraction for digital microphones.

Enums

enum dmic_state
   DMIC driver states.
   Values:
   
   enumerator DMIC_STATE_UNINIT
      Uninitialized.
   
   enumerator DMIC_STATE_INITIALIZED
      Initialized.
   
   enumerator DMIC_STATE_CONFIGURED
      Configured.
   
   enumerator DMIC_STATE_ACTIVE
      Active.
   
   enumerator DMIC_STATE_PAUSED
      Paused.
   
   enumerator DMIC_STATE_ERROR
      Error.

enum dmic_trigger
   DMIC driver trigger commands.
   Values:
   
   enumerator DMIC_TRIGGER_STOP
      Stop stream.
   
   enumerator DMIC_TRIGGER_START
      Start stream.
   
   enumerator DMIC_TRIGGER_PAUSE
      Pause stream.
   
   enumerator DMIC_TRIGGER_RELEASE
      Release paused stream.
   
   enumerator DMIC_TRIGGER_RESET
      Reset stream.
enum pdm_lr
    PDM Channels LEFT / RIGHT.
    Values:
    enumerator PDM_CHAN_LEFT
        Left channel.
    enumerator PDM_CHAN_RIGHT
        Right channel.

Functions

static inline uint32_t dmic_build_channel_map(uint8_t channel, uint8_t pdm, enum pdm_lr lr)
    Build the channel map to populate struct pdm_chan_cfg.
    Returns the map of PDM controller and LEFT/RIGHT channel shifted to the bit position corresponding to the input logical channel value
    Parameters
    • channel – The logical channel number
    • pdm – The PDM hardware controller number
    • lr – LEFT/RIGHT channel within the chosen PDM hardware controller
    Returns
    Bit-map containing the PDM and L/R channel information

static inline void dmic_parse_channel_map(uint32_t channel_map_lo, uint32_t channel_map_hi, uint8_t channel, uint8_t *pdm, enum pdm_lr *lr)
    Helper function to parse the channel map in pdm_chan_cfg.
    Returns the PDM controller and LEFT/RIGHT channel corresponding to the channel map and the logical channel provided as input
    Parameters
    • channel_map_lo – Lower order/significant bits of the channel map
    • channel_map_hi – Higher order/significant bits of the channel map
    • channel – The logical channel number
    • pdm – Pointer to the PDM hardware controller number
    • lr – Pointer to the LEFT/RIGHT channel within the PDM controller
    Returns
    Bit-map containing the clock skew information

7.6. Peripherals
static inline int dmic_configure(const struct device *dev, struct dmic_cfg *cfg)
Configure the DMIC driver and controller(s)
Configures the DMIC driver device according to the number of channels, channel mapping, PDM I/O configuration, PCM stream configuration, etc.

Parameters

- **dev** – Pointer to the device structure for DMIC driver instance
- **cfg** – Pointer to the structure containing the DMIC configuration

Returns
0 on success, a negative error code on failure

static inline int dmic_trigger(const struct device *dev, enum dmic_trigger cmd)
Send a command to the DMIC driver.
Sends a command to the driver to perform a specific action

Parameters

- **dev** – Pointer to the device structure for DMIC driver instance
- **cmd** – The command to be sent to the driver instance

Returns
0 on success, a negative error code on failure

static inline int dmic_read(const struct device *dev, uint8_t stream, void **buffer, size_t *size, int32_t timeout)
Read received decimated PCM data stream.
Optionally waits for audio to be received and provides the received audio buffer from the requested stream

Parameters

- **dev** – Pointer to the device structure for DMIC driver instance
- **stream** – Stream identifier
- **buffer** – Pointer to the received buffer address
- **size** – Pointer to the received buffer size
- **timeout** – Timeout in milliseconds to wait in case audio is not yet received, or SYS_FOREVER_MS

Returns
0 on success, a negative error code on failure

struct pdm_io_cfg

#include <dmic.h> PDM Input/Output signal configuration.

Parameters common to all PDM controllers

uint32_t min_pdm_clk_freq
Minimum clock frequency supported by the mic.

uint32_t max_pdm_clk_freq
Maximum clock frequency supported by the mic.
Parameters unique to each PDM controller

uint8_t pdm_clk_pol
Bit mask to optionally invert PDM clock.

uint8_t pdm_data_pol
Bit mask to optionally invert mic data.

uint32_t pdm_clk_skew
Collection of clock skew values for each PDM port.

struct pcm_stream_cfg
#include <dmic.h> Configuration of the PCM streams to be output by the PDM hardware.

Note: if either pcm_rate or pcm_width is set to 0 for a stream, the stream would be disabled

Public Members

uint32_t pcm_rate
PCM sample rate of stream.

uint8_t pcm_width
PCM sample width of stream.

uint16_t block_size
PCM sample block size per transfer.

struct k_mem_slab *mem_slab
SLAB for DMIC driver to allocate buffers for stream.

struct pdm_chan_cfg
#include <dmic.h> Mapping/ordering of the PDM channels to logical PCM output channel.

Since each controller can have 2 audio channels (stereo), there can be a total of 8x2=16 channels. The actual number of channels shall be described in act_num-chan.

If 2 streams are enabled, the channel order will be the same for both streams.

Each channel is described as a 4-bit number, the least significant bit indicates LEFT/RIGHT selection of the PDM controller.

The most significant 3 bits indicate the PDM controller number:
• bits 0-3 are for channel 0, bit 0 indicates LEFT or RIGHT
• bits 4-7 are for channel 1, bit 4 indicates LEFT or RIGHT and so on.

CONSTRAINT: The LEFT and RIGHT channels of EACH PDM controller needs to be ad-
jacent to each other.

**Requested channel map**

`uint32_t req_chan_map_lo`
Channels 0 to 7.

`uint32_t req_chan_map_hi`
Channels 8 to 15.

**Actual channel map that the driver could configure**

`uint32_t act_chan_map_lo`
Channels 0 to 7.

`uint32_t act_chan_map_hi`
Channels 8 to 15.

**Public Members**

`uint8_t req_num_chan`
Requested number of channels.

`uint8_t act_num_chan`
Actual number of channels that the driver could configure.

`uint8_t req_num_streams`
Requested number of streams for each channel.

`uint8_t act_num_streams`
Actual number of streams that the driver could configure.

```c
struct dmic_cfg
#include <dmic.h> // Input configuration structure for the DMIC configuration API.
```

**Public Members**

```c
struct pcm_stream_cfg *streams
Array of pcm_stream_cfg for application to provide configuration for each stream.
```
Inter-IC Sound (I2S) Bus

Overview  The I2S (Inter-IC Sound) API provides support for the standard I2S interface as well as common non-standard extensions such as PCM Short/Long Frame Sync and Left/Right Justified Data Formats.

Configuration Options  Related configuration options:
  • CONFIG_I2S

API Reference  Related code samples

I2S echo
  Process an audio stream to add an echo effect.

I2S output
  Send I2S output stream

USB Audio asynchronous explicit feedback sample
  USB Audio 2 explicit feedback sample playing audio on I2S.

group i2s_interface
  I2S (Inter-IC Sound) Interface.

  The I2S API provides support for the standard I2S interface standard as well as common non-standard extensions such as PCM Short/Long Frame Sync, Left/Right Justified Data Format.

Defines

I2S_FMT_DATA_FORMAT_SHIFT
  Data Format bit field position.

I2S_FMT_DATA_FORMAT_MASK
  Data Format bit field mask.

I2S_FMT_DATA_FORMAT_I2S
  Standard I2S Data Format.

  Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The MSB is always sent one clock period after the WS changes. Left channel data are sent first indicated by WS = 0, followed by right channel data indicated by WS = 1.

I2S_FMT_DATA_FORMAT_PCM_SHORT

PCM Short Frame Sync Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the falling edge of the clock signal (SCK). The falling edge of the frame sync signal (WS) indicates the start of the PCM word. The frame sync is one clock cycle long. An arbitrary number of data words can be sent in one frame.

| SCK | WS | SD | | Word 1 | | Word 2 | | Word 3 | | Word n |
|-----|----|----|-----|-----|-----|-----|-----|-----|
|     |    |    |     |     |     |     |     |     |

I2S_FMT_DATA_FORMAT_PCM_LONG

PCM Long Frame Sync Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the falling edge of the clock signal (SCK). The rising edge of the frame sync signal (WS) indicates the start of the PCM word. The frame sync has an arbitrary length, however it has to fall before the start of the next frame. An arbitrary number of data words can be sent in one frame.

| SCK | WS | SD | | Word 1 | | Word 2 | | Word 3 | | Word n |
|-----|----|----|-----|-----|-----|-----|-----|-----|
|     |    |    |     |     |     |     |     |     |

I2S_FMT_DATA_FORMAT_LEFT_JUSTIFIED

Left Justified Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The bits within the data word are left justified such that the MSB is always sent in the clock period following the WS transition. Left channel data are sent first indicated by WS = 1, followed by right channel data indicated by WS = 0.

| SCK | WS | SD | | Left channel | | Right channel |
|-----|----|----|-----|-----|-----|
|     |    |    |     |     |     |

I2S_FMT_DATA_FORMAT_RIGHT_JUSTIFIED

Right Justified Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal.
The bits within the data word are right justified such that the LSB is always sent in the clock period preceding the WS transition. Left channel data are sent first indicated by WS = 1, followed by right channel data indicated by WS = 0.

| Left channel | Right channel |

I2S_FMT_DATA_ORDER_MSB
Send MSB first.

I2S_FMT_DATA_ORDER_LSB
Send LSB first.

I2S_FMT_DATA_ORDER_INV
Invert bit ordering, send LSB first.

I2S_FMT_CLK_FORMAT_SHIFT
Data Format bit field position.

I2S_FMT_CLK_FORMAT_MASK
Data Format bit field mask.

I2S_FMT_BIT_CLK_INV
Invert bit clock.

I2S_FMT_FRAME_CLK_INV
Invert frame clock.

I2S_FMT_CLK_NF_NB
Normal Frame, Normal Bit Clk.

I2S_FMT_CLK_NF_IB
Normal Frame, Inverted Bit Clk.

I2S_FMT_CLK_IF_NB
Inverted Frame, Normal Bit Clk.

I2S_FMT_CLK_IF_IB
Inverted Frame, Inverted Bit Clk.

I2S_FMT_BIT_CLK_CONT
Run bit clock continuously.

I2S_FMT_BIT_CLK_GATED
Run bit clock when sending data only.
I2S_OPT_BIT_CLK_MASTER
I2S driver is bit clock master.

I2S_OPT_BIT_CLK_SLAVE
I2S driver is bit clock slave.

I2S_OPT_FRAME_CLK_MASTER
I2S driver is frame clock master.

I2S_OPT_FRAME_CLK_SLAVE
I2S driver is frame clock slave.

I2S_OPT_LOOPBACK
Loop back mode.
In loop back mode RX input will be connected internally to TX output. This is used primarily for testing.

I2S_OPT_PINGPONG
Ping pong mode.
In ping pong mode TX output will keep alternating between a ping buffer and a pong buffer. This is normally used in audio streams when one buffer is being populated while the other is being played (DMAed) and vice versa. So, in this mode, 2 sets of buffers fixed in size are used. Static Arrays are used to achieve this and hence they are never freed.

**Typedefs**

typedef uint8_t i2s_fmt_t
I2S data stream format options.

typedef uint8_t i2s_opt_t
I2S configuration options.

** Enums**

enum i2s_dir
I2C Direction.

*Values:*

enumerator I2S_DIR_RX
Receive data.

enumerator I2S_DIR_TX
Transmit data.

enumerator I2S_DIR_BOTH
Both receive and transmit data.
enum i2s_state

Interface state.

Values:

enumerator I2S_STATE_NOT_READY
The interface is not ready.

The interface was initialized but is not yet ready to receive / transmit data. Call i2s_configure() to configure interface and change its state to READY.

enumerator I2S_STATE_READY
The interface is ready to receive / transmit data.

enumerator I2S_STATE_RUNNING
The interface is receiving / transmitting data.

enumerator I2S_STATE_STOPPING
The interface is draining its transmit queue.

enumerator I2S_STATE_ERROR
TX buffer underrun or RX buffer overrun has occurred.

enum i2s_trigger_cmd

Trigger command.

Values:

enumerator I2S_TRIGGER_START
Start the transmission / reception of data.

If I2S_DIR_TX is set some data has to be queued for transmission by the i2s_write() function. This trigger can be used in READY state only and changes the interface state to RUNNING.

enumerator I2S_TRIGGER_STOP
Stop the transmission / reception of data.

Stop the transmission / reception of data at the end of the current memory block. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When the current TX / RX block is transmitted / received the state is changed to READY. Subsequent START trigger will resume transmission / reception where it stopped.

enumerator I2S_TRIGGER_DRAIN
Empty the transmit queue.

Send all data in the transmit queue and stop the transmission. If the trigger is applied to the RX queue it has the same effect as I2S_TRIGGER_STOP. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When all TX blocks are transmitted the state is changed to READY.
enumerator **I2S_TRIGGER_DROP**  
Discard the transmit / receive queue.

Stop the transmission / reception immediately and discard the contents of the respective queue. This trigger can be used in any state other than NOT_READY and changes the interface state to READY.

enumerator **I2S_TRIGGER_PREPARE**  
Prepare the queues after underrun/overrun error has occurred.

This trigger can be used in ERROR state only and changes the interface state to READY.

### Functions

```c
int i2s_configure(const struct device *dev, enum i2s_dir dir, const struct i2s_config *cfg)
```

Configure operation of a host I2S controller.

The dir parameter specifies if Transmit (TX) or Receive (RX) direction will be configured by data provided via cfg parameter.

The function can be called in NOT_READY or READY state only. If executed successfully the function will change the interface state to READY.

If the function is called with the parameter cfg->frame_clk_freq set to 0 the interface state will be changed to NOT_READY.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX, TX, or both, as defined by I2S_DIR_. The I2S_DIR_BOTH value may not be supported by some drivers. For those, the RX and TX streams need to be configured separately.
- `cfg` – Pointer to the structure containing configuration parameters.

**Return values**

- `0` – If successful.
- `-EINVAL` – Invalid argument.
- `-ENOSYS` – I2S_DIR_BOTH value is not supported.

```c
static inline const struct i2s_config *i2s_config_get(const struct device *dev, enum i2s_dir dir)
```

Fetch configuration information of a host I2S controller.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance
- `dir` – Stream direction: RX or TX as defined by I2S_DIR_*

**Return values**

- Pointer to the structure containing configuration parameters, or NULL if un-configured

```c
static inline int i2s_read(const struct device *dev, void **mem_block, size_t *size)
```

Read data from the RX queue.

Data received by the I2S interface is stored in the RX queue consisting of memory blocks preallocated by this function from rx_mem_slab (as defined by i2s_configure).
Ownership of the RX memory block is passed on to the user application which has to release it.

The data is read in chunks equal to the size of the memory block. If the interface is in READY state the number of bytes read can be smaller.

If there is no data in the RX queue the function will block waiting for the next RX memory block to fill in. This operation can timeout as defined by i2s_configure. If the timeout value is set to K_NO_WAIT the function is non-blocking.

Reading from the RX queue is possible in any state other than NOT_READY. If the interface is in the ERROR state it is still possible to read all the valid data stored in RX queue. Afterwards the function will return -EIO error.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **mem_block** – Pointer to the RX memory block containing received data.
- **size** – Pointer to the variable storing the number of bytes read.

Return values

- **0** – If successful.
- **-EIO** – The interface is in NOT_READY or ERROR state and there are no more data blocks in the RX queue.
- **-EBUSY** – Returned without waiting.
- **-EAGAIN** – Waiting period timed out.

```c
int i2s_buf_read(const struct device *dev, void *buf, size_t *size)
```

Read data from the RX queue into a provided buffer.

Data received by the I2S interface is stored in the RX queue consisting of memory blocks preallocated by this function from rx_mem_slab (as defined by i2s_configure). Calling this function removes one block from the queue which is copied into the provided buffer and then freed.

The provided buffer must be large enough to contain a full memory block of data, which is parameterized for the channel via i2s_configure().

This function is otherwise equivalent to i2s_read().

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **buf** – Destination buffer for read data, which must be at least as large as the configured memory block size for the RX channel.
- **size** – Pointer to the variable storing the number of bytes read.

Return values

- **0** – If successful.
- **-EIO** – The interface is in NOT_READY or ERROR state and there are no more data blocks in the RX queue.
- **-EBUSY** – Returned without waiting.
- **-EAGAIN** – Waiting period timed out.

```c
static inline int i2s_write(const struct device *dev, void *mem_block, size_t size)
```

Write data to the TX queue.

Data to be sent by the I2S interface is stored first in the TX queue. TX queue consists of memory blocks preallocated by the user from tx_mem_slab (as defined by
i2s_configure). This function takes ownership of the memory block and will release it when all data are transmitted.

If there are no free slots in the TX queue the function will block waiting for the next TX memory block to be send and removed from the queue. This operation can timeout as defined by i2s_configure. If the timeout value is set to K_NO_WAIT the function is non-blocking.

Writing to the TX queue is only possible if the interface is in READY or RUNNING state.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **mem_block** – Pointer to the TX memory block containing data to be sent.
- **size** – Number of bytes to write. This value has to be equal or smaller than the size of the memory block.

**Return values**

- **0** – If successful.
- **-EIO** – The interface is not in READY or RUNNING state.
- **-EBUSY** – Returned without waiting.
- **-EAGAIN** – Waiting period timed out.

```
int i2s_buf_write(const struct device *dev, void *buf, size_t size)
```

Write data to the TX queue from a provided buffer.

This function acquires a memory block from the I2S channel TX queue and copies the provided data buffer into it. It is otherwise equivalent to `i2s_write()`.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **buf** – Pointer to a buffer containing the data to transmit.
- **size** – Number of bytes to write. This value has to be equal or smaller than the size of the channel’s TX memory block configuration.

**Return values**

- **0** – If successful.
- **-EIO** – The interface is not in READY or RUNNING state.
- **-EBUSY** – Returned without waiting.
- **-EAGAIN** – Waiting period timed out.
- **-ENOMEM** – No memory in TX slab queue.
- **-EINVAL** – Size parameter larger than TX queue memory block.

```
int i2s_trigger(const struct device *dev, enum i2s_dir dir, enum i2s_trigger_cmd cmd)
```

Send a trigger command.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **dir** – Stream direction: RX, TX, or both, as defined by I2S_DIR_*.
- **cmd** – Trigger command.

**Return values**
• 0 – If successful.
• -EINVAL – Invalid argument.
• -EIO – The trigger cannot be executed in the current state or a DMA channel cannot be allocated.
• -ENOMEM – RX/TX memory block not available.
• -ENOSYS – I2S_DIR_BOTH value is not supported.

struct i2s_config

```c
#include <i2s.h> Interface configuration options.
```

Memory slab pointed to by the mem_slab field has to be defined and initialized by the user. For I2S driver to function correctly number of memory blocks in a slab has to be at least 2 per queue. Size of the memory block should be multiple of frame_size where frame_size = (channels * word_size_bytes). As an example 16 bit word will occupy 2 bytes, 24 or 32 bit word will occupy 4 bytes.

Please check Zephyr Kernel Primer for more information on memory slabs.

**Remark**

When I2S data format is selected parameter channels is ignored, number of words in a frame is always 2.

**Public Members**

```c
uint8_t word_size
    Number of bits representing one data word.
```

```c
uint8_t channels
    Number of words per frame.
```

```c
i2s_fmt_t format
    Data stream format as defined by I2S_FMT_* constants.
```

```c
i2s_opt_t options
    Configuration options as defined by I2S_OPT_* constants.
```

```c
uint32_t frame_clk_freq
    Frame clock (WS) frequency, this is sampling rate.
```

```c
struct k_mem_slab *mem_slab
    Memory slab to store RX/TX data.
```

```c
size_t block_size
    Size of one RX/TX memory block (buffer) in bytes.
```

7.6. Peripherals
**Digital Audio Interface (DAI)**

**Overview**  The DAI (Digital Audio Interface) is a generic high level API for audio drivers. It can be configured with bespoke data for vendor specific configuration.

**Configuration Options**  Related configuration options:
- `CONFIG_DAI`

**API Reference**

**group dai_interface**

DAI Interface.

The DAI API provides support for the standard I2S (SSP) and its common variants. It supports also DMIC, HDA and SDW backends. The API has a config function with bespoke data argument for device/vendor specific config. There are also optional timestamping functions to get device specific audio clock time.

**Defines**

`DAI_FORMAT_CLOCK_PROVIDER_MASK`

Used to extract the clock configuration from the format attribute of struct `dai_config`.

`DAI_FORMAT_PROTOCOL_MASK`

Used to extract the protocol from the format attribute of struct `dai_config`.

`DAI_FORMAT_CLOCK_INVERSION_MASK`

Used to extract the clock inversion from the format attribute of struct `dai_config`.

** Enums**

**enum dai_clock_provider**

DAI clock configurations.

This is used to describe all of the possible clock-related configurations w.r.t the DAI and the codec.

**Values:**

- `DAI_CBP_CFP = (0 « 12)`
  - codec BCLK provider, codec FSYNC provider
  - codec BCLK consumer, codec FSYNC provider
enumerator DAI_CBC_CFP = (2 « 12)
codec BCLK provider, codec FSYNC consumer

denumerator DAI_CB_P_CFC = (3 « 12)
codec BCLK consumer, codec FSYNC consumer

denumerator DAI_CBC_CFC = (4 « 12)

d enum dai_protocol
DAI protocol.
The communication between the DAI and the CODEC may use different protocols depending on the scenario.

Values:

denumerator DAI_PROTO_I2S = 1
I2S.

denumerator DAI_PROTO_RIGHT_J
Right Justified.

denumerator DAI_PROTO_LEFT_J
Left Justified.

denumerator DAI_PROTO_DSP_A
TDM, FSYNC asserted 1 BCLK early.

denumerator DAI_PROTO_DSP_B
TDM, FSYNC asserted at the same time as MSB.

denumerator DAI_PROTO_PDM
Pulse Density Modulation.

d enum dai_clock_inversion
DAI clock inversion.
Some applications may require a different clock polarity (FSYNC/BCLK) compared to the default one chosen based on the protocol.

Values:

denumerator DAI_INVERSION_NB_NF = 0
no BCLK inversion, no FSYNC inversion
no BCLK inversion, FSYNC inversion

denumerator DAI_INVERSION_NB_IF = (2 « 8)
BCLK inversion, no FSYNC inversion.

denumerator DAI_INVERSION_IB_NF = (3 « 8)
BCLK inversion, FSYNC inversion.
enumerator DAI_INVERSION_IB_IF = (4 * 8)

denum dai_type

Types of DAI.
The type of the DAI. This ID type is used to configure bespoke DAI HW settings.
DAIs have a lot of physical link feature variability and therefore need different configuration data to cater for different use cases. We usually need to pass extra bespoke configuration prior to DAI start.

Values:

enumerator DAI_LEGACY_I2S = 0
    Legacy I2S compatible with i2s.h.

enumerator DAI_INTEL_SSP
    Intel SSP.

enumerator DAI_INTEL_DMIC
    Intel DMIC.

enumerator DAI_INTEL_HDA
    Intel HD/A.

enumerator DAI_INTEL_ALH
    Intel ALH.

enumerator DAI_IMX_SAI
    i.MX SAI

enumerator DAI_IMX_ESAI
    i.MX ESAI

enumerator DAI_AMD_BT
    Amd BT.

enumerator DAI_AMD_SP
    Amd SP.

enumerator DAI_AMD_DMIC
    Amd DMIC.

enumerator DAI_MEDIATEK_AFE
    Mtk AFE.

enumerator DAI_INTEL_SSP_NHLT
    nhlt ssp

enumerator DAI_INTEL_DMIC_NHLT
    nhlt ssp

enumerator DAI_INTEL_SSP_NHLT
    nhlt ssp

enumerator DAI_INTEL_DMIC_NHLT
    nhlt ssp

enumerator DAI_INTEL_SSP_NHLT
    nhlt ssp
enumerator DAI_INTEL_HDA_NHLT
  nhlt Intel HD/A

enumerator DAI_INTEL_ALH_NHLT
  nhlt Intel ALH

enum dai_dir
  DAI Direction.
  Values:

  enumerator DAI_DIR_TX = 0
    Transmit data.

  enumerator DAI_DIR_RX
    Receive data.

  enumerator DAI_DIR_BOTH
    Both receive and transmit data.

enum dai_state
  Interface state.
  Values:

  enumerator DAI_STATE_NOT_READY = 0
    The interface is not ready.
    The interface was initialized but is not yet ready to receive / transmit data. Call dai_config_set() to configure interface and change its state to READY.

  enumerator DAI_STATE_READY
    The interface is ready to receive / transmit data.

  enumerator DAI_STATE_RUNNING
    The interface is receiving / transmitting data.

  enumerator DAI_STATE_PRE_RUNNING
    The interface is clocking but not receiving / transmitting data.

  enumerator DAI_STATE_PAUSED
    The interface paused.

  enumerator DAI_STATE_STOPPING
    The interface is draining its transmit queue.

  enumerator DAI_STATE_ERROR
    TX buffer underrun or RX buffer overrun has occurred.
```markdown
enum dai_trigger_cmd

Trigger command.

Values:

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DAI_TRIGGER_START</td>
<td>Start the transmission / reception of data.</td>
</tr>
<tr>
<td></td>
<td>If DAI_DIR_TX is set some data has to be queued for transmission by the dai_write() function. This trigger can be used in READY state only and changes the interface state to RUNNING.</td>
</tr>
<tr>
<td>DAI_TRIGGER_PRE_START</td>
<td>Optional - Pre Start the transmission / reception of data.</td>
</tr>
<tr>
<td></td>
<td>Allows the DAI and downstream codecs to prepare for audio Tx/Rx by starting any required clocks for downstream PLL/FLL locking.</td>
</tr>
<tr>
<td>DAI_TRIGGER_STOP</td>
<td>Stop the transmission / reception of data.</td>
</tr>
<tr>
<td></td>
<td>Stop the transmission / reception of data at the end of the current memory block. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When the current TX / RX block is transmitted / received the state is changed to READY. Subsequent START trigger will resume transmission / reception where it stopped.</td>
</tr>
<tr>
<td>DAI_TRIGGER_PAUSE</td>
<td>Pause the transmission / reception of data.</td>
</tr>
<tr>
<td></td>
<td>Pause the transmission / reception of data at the end of the current memory block. Behavior is implementation specific but usually this state doesn't completely stop the clocks or transmission. The DAI could be transmitting 0's (silence), but it is not consuming data from outside.</td>
</tr>
<tr>
<td>DAI_TRIGGER_POST_STOP</td>
<td>Optional - Post Stop the transmission / reception of data.</td>
</tr>
<tr>
<td></td>
<td>Allows the DAI and downstream codecs to shutdown cleanly after audio Tx/Rx by stopping any required clocks for downstream audio completion.</td>
</tr>
<tr>
<td>DAI_TRIGGER_DRAIN</td>
<td>Empty the transmit queue.</td>
</tr>
<tr>
<td></td>
<td>Send all data in the transmit queue and stop the transmission. If the trigger is applied to the RX queue it has the same effect as DAI_TRIGGER_STOP. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When all TX blocks are transmitted the state is changed to READY.</td>
</tr>
<tr>
<td>DAI_TRIGGER_DROP</td>
<td>Discard the transmit / receive queue.</td>
</tr>
</tbody>
</table>
```

Stop the transmission / reception immediately and discard the contents of the respective queue. This trigger can be used in any state other than NOT_READY and changes the interface state to READY.

enumerator DAI_TRIGGER_PREPARE
Prepare the queues after underrun/overrun error has occurred.
This trigger can be used in ERROR state only and changes the interface state to READY.

enumerator DAI_TRIGGER_RESET
Reset.
This trigger frees resources and moves the driver back to initial state.

enumerator DAI_TRIGGER_COPY
Copy.
This trigger prepares for data copying.

**Functions**

static inline int dai_probe(const struct device *dev)
Probe operation of DAI driver.
The function will be called to power up the device and update for example possible reference count of the users. It can be used also to initialize internal variables and memory allocation.

**Parameters**
- *dev – Pointer to the device structure for the driver instance.

**Return values**
- 0 – If successful.

static inline int dai_remove(const struct device *dev)
Remove operation of DAI driver.
The function will be called to unregister/unbind the device, for example to power down the device or decrease the usage reference count.

**Parameters**
- *dev – Pointer to the device structure for the driver instance.

**Return values**
- 0 – If successful.

static inline int dai_config_set(const struct device *dev, const struct dai_config *cfg, const void *bespoke_cfg)
Configure operation of a DAI driver.
The dir parameter specifies if Transmit (TX) or Receive (RX) direction will be configured by data provided via cfg parameter.
The function can be called in NOT_READY or READY state only. If executed successfully the function will change the interface state to READY.
If the function is called with the parameter cfg->frame_clk_freq set to 0 the interface state will be changed to NOT_READY.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `cfg` – Pointer to the structure containing configuration parameters.
- `bespoke_cfg` – Pointer to the structure containing bespoke config.

**Return values**
- `0` – If successful.
- `-EINVAL` – Invalid argument.
- `-ENOSYS` – DAI_DIR_BOTH value is not supported.

```c
static inline int dai_config_get(const struct device *dev, struct dai_config *cfg, enum dai_dir dir)
```

Fetch configuration information of a DAI driver.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance
- `cfg` – Pointer to the config structure to be filled by the instance
- `dir` – Stream direction: RX or TX as defined by DAI_DIR_*

**Return values**
- `0` – if success, negative if invalid parameters or DAI un-configured

```c
static inline const struct dai_properties *dai_get_properties(const struct device *dev, enum dai_dir dir, int stream_id)
```

Fetch properties of a DAI driver.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance
- `dir` – Stream direction: RX or TX as defined by DAI_DIR_*
- `stream_id` – Stream id: some drivers may have stream specific properties, this id specifies the stream.

**Return values**
- Pointer to the structure containing properties, or NULL if error or no properties

```c
static inline int dai_trigger(const struct device *dev, enum dai_dir dir, enum dai_trigger_cmd cmd)
```

Send a trigger command.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX, TX, or both, as defined by DAI_DIR_* The DAI_DIR_BOTH value may not be supported by some drivers. For those, triggering need to be done separately for the RX and TX streams.
- `cmd` – Trigger command.

**Return values**
- `0` – If successful.
- `-EINVAL` – Invalid argument.
• -EIO – The trigger cannot be executed in the current state or a DMA channel cannot be allocated.
• -ENOMEM – RX/TX memory block not available.
• -ENOSYS – DAI_DIR_BOTH value is not supported.

static inline int dai_ts_config(const struct device *dev, struct dai_ts_cfg *cfg)
Configures timestamping in attached DAI.

Optional method.

Parameters
• dev – Component device.
• cfg – Timestamp config.

Return values
0 – If successful.

static inline int dai_ts_start(const struct device *dev, struct dai_ts_cfg *cfg)
Starts timestamping.

Optional method

Parameters
• dev – Component device.
• cfg – Timestamp config.

Return values
0 – If successful.

static inline int dai_ts_stop(const struct device *dev, struct dai_ts_cfg *cfg)
Stops timestamping.

Optional method.

Parameters
• dev – Component device.
• cfg – Timestamp config.

Return values
0 – If successful.

static inline int dai_ts_get(const struct device *dev, struct dai_ts_cfg *cfg, struct dai_ts_data *tsd)
Gets timestamp.

Optional method.

Parameters
• dev – Component device.
• cfg – Timestamp config.
• tsd – Receives timestamp data.

Return values
0 – If successful.
struct dai_properties
#include <dai.h> DAI properties.
This struct is used with APIs get_properties function to query DAI properties like fifo address and dma handshake. These are needed for example to setup dma outside the driver code.

Public Members

uint32_t fifo_address
Fifo hw address for e.g. when connecting to dma.

uint32_t fifo_depth
Fifo depth.

uint32_t dma_hs_id
DMA handshake id.

uint32_t reg_init_delay
Delay for initializing registers.

int stream_id
Stream ID.

struct dai_config
#include <dai.h> Main DAI config structure.
Generic DAI interface configuration options.

Public Members

enum dai_type type
Type of the DAI.

uint32_t dai_index
Index of the DAI.

uint8_t channels
Number of audio channels, words in frame.

uint32_t rate
Frame clock (WS) frequency, sampling rate.

uint16_t format
DAI specific data stream format.
uint8_t options
    DAI specific configuration options.

typedef uint8_t word_size
    Number of bits representing one data word.

typsizet block_size
    Size of one RX/TX memory block (buffer) in bytes.

typedef uint16_t link_config
    DAI specific link configuration.

struct dai_ts_cfg
    #include <dai.h> DAI timestamp configuration.

Public Members

uint32_t walclk_rate
    Rate in Hz, e.g.
    192000000

int type
    Type of the DAI (SSP, DMIC, HDA, etc.).

int direction
    Direction (playback/capture)

int index
    Index for SSPx to select correct timestamp register.

int dma_id
    DMA instance id.

int dma_chan_index
    Used DMA channel index.

int dma_chan_count
    Number of channels in single DMA.

struct dai_ts_data
    #include <dai.h> DAI timestamp data.

Public Members

uint64_t walclk
    Wall clock.
uint64_t sample
Sample count.

uint32_t walclk_rate
Rate in Hz, e.g.
19200000

7.6.5 Battery Backed RAM (BBRAM)

The BBRAM APIs allow interfacing with the unique properties of this memory region. The following common types of BBRAM properties are easily accessed via this API:

- IBBR (invalid) state - check that the BBRAM is not corrupt.
- VSBY (voltage standby) state - check if the BBRAM is using standby voltage.
- VCC (active power) state - check if the BBRAM is on normal power.
- Size - get the size (in bytes) of the BBRAM region.

Along with these, the API provides a means for reading and writing to the memory region via \texttt{bbram\_read()} and \texttt{bbram\_write()} respectively. Both functions are expected to only succeed if the BBRAM is in a valid state and the operation is bounded to the memory region.

API Reference

\texttt{group bbram\_interface}\n\texttt{BBRAM Interface.}\n
**Typedefs**

typedef int (*\texttt{bbram\_api\_check\_invalid\_t})(const struct \texttt{device} *\texttt{dev})
API template to check if the BBRAM is invalid.

\texttt{See also:}\n\texttt{bbram\_check\_invalid}\n
typedef int (*\texttt{bbram\_api\_check\_standby\_power\_t})(const struct \texttt{device} *\texttt{dev})
API template to check for standby power failure.

\texttt{See also:}\n\texttt{bbram\_check\_standby\_power}\n
typedef int (*\texttt{bbram\_api\_check\_power\_t})(const struct \texttt{device} *\texttt{dev})
API template to check for VCC1 power failure.

\texttt{See also:}\n\texttt{bbram\_check\_power}
typedef int (*bbram_api_get_size_t)(const struct device *dev, size_t *size)
    API template to check the size of the BBRAM.

    See also:
    bbram_get_size

typedef int (*bbram_api_read_t)(const struct device *dev, size_t offset, size_t size, uint8_t *data)
    API template to read from BBRAM.

    See also:
    bbram_read

typedef int (*bbram_api_write_t)(const struct device *dev, size_t offset, size_t size, const uint8_t *data)
    API template to write to BBRAM.

    See also:
    bbram_write

Functions

int bbram_check_invalid(const struct device *dev)
    Check if BBRAM is invalid.
    Check if “Invalid Battery-Backed RAM” status is set then reset the status bit. This may occur as a result to low voltage at the VBAT pin.

    Parameters
    • dev – [in] BBRAM device pointer.

    Returns
    0 if the Battery-Backed RAM data is valid, -EFAULT otherwise.

int bbram_check_standby_power(const struct device *dev)
    Check for standby (Volt SBY) power failure.
    Check if the V standby power domain is turned on after it was off then reset the status bit.

    Parameters
    • dev – [in] BBRAM device pointer.

    Returns
    0 if V SBY power domain is in normal operation.

int bbram_check_power(const struct device *dev)
    Check for V CC1 power failure.
    This will return an error if the V CC1 power domain is turned on after it was off and reset the status bit.

    Parameters
• dev – [in] BBRAM device pointer.

Returns
0 if the V CC1 power domain is in normal operation, -EFAULT otherwise.

int bbram_get_size(const struct device *dev, size_t *size)
Get the size of the BBRAM (in bytes).

Parameters
• dev – [in] BBRAM device pointer.
• size – [out] Pointer to write the size to.

Returns
0 for success, -EFAULT otherwise.

int bbram_read(const struct device *dev, size_t offset, size_t size, uint8_t *data)
Read bytes from BBRAM.

Parameters
• dev – [in] The BBRAM device pointer to read from.
• offset – [in] The offset into the RAM address to start reading from.
• size – [in] The number of bytes to read.
• data – [out] The buffer to load the data into.

Returns
0 on success, -EFAULT if the address range is out of bounds.

int bbram_write(const struct device *dev, size_t offset, size_t size, const uint8_t *data)
Write bytes to BBRAM.

Parameters
• dev – [in] The BBRAM device pointer to write to.
• offset – [in] The offset into the RAM address to start writing to.
• size – [in] The number of bytes to write.
• data – [out] Pointer to the start of data to write.

Returns
0 on success, -EFAULT if the address range is out of bounds.

int bbram_emul_set_invalid(const struct device *dev, bool is_invalid)
Set the emulated BBRAM driver's invalid state.
Calling this will affect the emulated behavior of bbram_check_invalid().

Parameters
• dev – [in] The emulated device to modify
• is_invalid – [in] The new invalid state

Returns
0 on success, negative values on error.

int bbram_emul_set_standby_power_state(const struct device *dev, bool failure)
Set the emulated BBRAM driver's standby power state.
Calling this will affect the emulated behavior of bbram_check_standby_power().

Parameters
• dev – [in] The emulated device to modify
• failure – [in] Whether or not standby power failure should be emulated

**Returns**
0 on success, negative values on error.

```c
int bbram_emul_set_power_state(const struct device *dev, bool failure)
```

Set the emulated BBRAM driver's power state.

Calling this will affect the emulated behavior of `bbram_check_power()`.

**Parameters**

• dev – [in] The emulated device to modify

• failure – [in] Whether or not a power failure should be emulated

**Returns**
0 on success, negative values on error.

```c
struct bbram_driver_api
#include <bbram.h>
```

### 7.6.6 BC1.2 Devices (Experimental)

The Battery Charging specification, currently at revision 1.2, is commonly referred to as just BC1.2. BC1.2 defines limits and detection mechanisms for USB devices to draw current exceeding the USB 2.0 specification limit of 0.5A, 2.5W.

The BC1.2 specification uses the term Charging Port for the device that supplies VBUS on the USB connection and the term Portable Device for the device that sinks current from the USB connection.

**Note that the BC1.2 Specification** uses the acronym PD for Portable Device. This should not be confused with the USB-C Power Delivery, which also uses the acronym PD.

On many devices, BC1.2 is the fallback mechanism to determine the connected charger capability on USB type C ports when the attached type-C partner does not support Power Delivery.

**Key parameters from the BC1.2 Specification** include:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Symbol</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed PD (portable device) Current Draw from Charging Port</td>
<td>IDEV_CHG</td>
<td>1.5 A</td>
</tr>
<tr>
<td>Charging Downstream Port Rated Current</td>
<td>ICDP</td>
<td>1.5 - 5.0 A</td>

</tbody>
</table>

While the ICDP and IDCP rated currents go up to 5.0 A, the BC1.2 current is limited by the IDEV_CHG parameter. So the BC1.2 support is capped at 1.5 A in the Zephyr implementation when using portable-device mode.

**Basic Operation**

The BC1.2 device driver provides only two APIs, `bc12_set_role()` and `bc12_set_result_cb()`. The application calls `bc12_set_role()` to transition the BC1.2 device to either a disconnected, portable-device, or charging port mode.
For the disconnected state, the BC1.2 driver powers down the detection chip. The power down operation is vendor specific.

The application calls `bc12_set_role()` with the type set to `BC12_PORTABLE_DEVICE` when both the following conditions are true:

- The application configured the port as an upstream facing port, i.e. a USB device port.
- The application detects VBUS on the USB connection.

For portable-device mode, the BC1.2 driver powers up the detection chip and starts charger detection. At completion of the charger detection, the BC1.2 driver notifies the callback registered with `bc12_set_result_cb()`. By default, the BC1.2 driver clamps the current to 1.5A to comply with the BC1.2 specification.

To comply with the USB 2.0 specification, when the driver detects a SDP (Standard Downstream Port) charging partner or if BC1.2 detection fails, the driver reports the available current as ISUSP (2.5 mA). The application may increase the current draw to IUNIT (100 mA) when the connected USB host resumes the USB bus and may increase the current draw to ICFG_MAX (500 mA) when the USB host configures the USB device.

Charging port mode is used by the application when the USB port is configured as a downstream facing port, i.e. a USB host port. For charging port mode, the BC1.2 driver powers up the detection chip and configures the charger type specified by a devicetree property. If the driver supports detection of plug and unplug events, the BC1.2 driver notifies the callback registered with `bc12_set_result_cb()` to indicate the current connection state of the portable device partner.

### Configuration Options

Related configuration options:

- `CONFIG_USB_BC12`

### API Reference

**group b12_interface**

BC1.2 driver APIs.

**BC1.2 constants**

**BC12_CHARGER_VOLTAGE_UV**

BC1.2 USB charger voltage.

**BC12_CHARGER_MIN_CURR_UA**

BC1.2 USB charger minimum current.

Set to match the Isusp of 2.5 mA parameter. This is returned by the driver when either BC1.2 detection fails, or the attached partner is a SDP (standard downstream port).

The application may increase the current draw after determining the USB device state of suspended/unconfigured/configured. Suspended: 2.5 mA Unconfigured: 100 mA Configured: 500 mA (USB 2.0)

**BC12_CHARGER_MAX_CURR_UA**

BC1.2 USB charger maximum current.
Typedefs

typedef void (*bc12_callback_t)(const struct device *dev, struct bc12_partner_state *state, void *user_data)

BC1.2 callback for charger configuration.

**Param dev**
BC1.2 device which is notifying of the new charger state.

**Param state**
Current state of the BC1.2 client, including BC1.2 type detected, voltage, and current limits. If NULL, then the partner charger is disconnected or the BC1.2 device is operating in host mode.

**Param user_data**
Requester supplied data which is passed along to the callback.

Enums

enum bc12_role
BC1.2 device role.

*Values:*

enumerator BC12_DISCONNECTED
enumerator BC12_PORTABLE_DEVICE
enumerator BC12_CHARGING_PORT

enum bc12_type
BC1.2 charging partner type.

*Values:*

enumerator BC12_TYPE_NONE
No partner connected.

enumerator BC12_TYPE_SDG
Standard Downstream Port.

enumerator BC12_TYPE_DCP
Dedicated Charging Port.

enumerator BC12_TYPE_CDP
Charging Downstream Port.

enumerator BC12_TYPE_PROPRIETARY
Proprietary charging port.

enumerator BC12_TYPE_UNKNOWN
Unknown charging port, BC1.2 detection failed.
enumerator BC12_TYPE_COUNT
Count of valid BC12 types.

Functions

int bc12_set_role(const struct device *dev, enum bc12_role role)
Set the BC1.2 role.

Parameters
• dev – Pointer to the device structure for the BC1.2 driver instance.
• role – New role for the BC1.2 device.

Return values
• 0 – If successful.
• -EIO – general input/output error.

int bc12_set_result_cb(const struct device *dev, bc12_callback_t cb, void *user_data)
Register a callback for BC1.2 results.

Parameters
• dev – Pointer to the device structure for the BC1.2 driver instance.
• cb – Function pointer for the result callback.
• user_data – Requester supplied data which is passed along to the call-back.

Return values
• 0 – If successful.
• -EIO – general input/output error.

struct bc12_partner_state
#include <usb_bc12.h> BC1.2 detected partner state.

Param bc12_role
Current role of the BC1.2 device.

Param type
Charging partner type. Valid when bc12_role is BC12_PORTABLE_DEVICE.

Param current_ma
Current, in uA, that the charging partner provides. Valid when bc12_role is BC12_PORTABLE_DEVICE.

Param voltage_mv
Voltage, in uV, that the charging partner provides. Valid when bc12_role is BC12_PORTABLE_DEVICE.

Param pd_partner_connected
True if a PD partner is currently connected. Valid when bc12_role is BC12_CHARGING_PORT.

group b12_emulator_backend
BC1.2 backend emulator APIs.
Functions

static inline int bc12_emul_set_charging_partner(const struct emul *target, enum bc12_type partner_type)

Set the charging partner type connected to the BC1.2 device.
The corresponding BC1.2 emulator updates the vendor specific registers to simulate connection of the specified charging partner type. The emulator also generates an interrupt for processing by the real driver, if supported.

Parameters
- **target** – Pointer to the emulator structure for the BC1.2 emulator instance.
- **partner_type** – The simulated partner type. Set to BC12_TYPE_NONE to disconnect the charging partner.

Return values
- **0** – If successful.
- **-EINVAL** – if the partner type is not supported.

static inline int bc12_emul_set_pd_partner(const struct emul *target, bool connected)

Set the portable device partner state.
The corresponding BC1.2 emulator updates the vendor specific registers to simulate connection or disconnection of a portable device partner. The emulator also generates an interrupt for processing by the real driver, if supported.

Parameters
- **target** – Pointer to the emulator structure for the BC1.2 emulator instance.
- **connected** – If true, emulate a connection of a portable device partner. If false, emulate a disconnect event.

Return values
- **0** – If successful.
- **-EINVAL** – if the connection/disconnection of PD partner is not supported.

7.6.7 Clock Control

Overview

The clock control API provides access to clocks in the system, including the ability to turn them on and off.

Configuration Options

Related configuration options:
- **CONFIG_CLOCK_CONTROL**
Related code samples

**LiteX clock control driver**
Use LiteX clock control driver to generate multiple clock signals.

---

*groupp* clock_control_interface
Clock Control Interface.

**Defines**

CLOCK_CONTROL_SUBSYS_ALL

**Typedefs**

typedef void *clock_control_subsys_t

clock_control_subsys_t is a type to identify a clock controller sub-system.
Such data pointed is opaque and relevant only to the clock controller driver instance being used.

typedef void *clock_control_subsys_rate_t

clock_control_subsys_rate_t is a type to identify a clock controller sub-system rate.
Such data pointed is opaque and relevant only to set the clock controller rate of the driver instance being used.

typedef void (*clock_control_cb_t)(const struct device *dev, clock_control_subsys_t subsys, void *user_data)
Callback called on clock started.

**Param dev**
Device structure whose driver controls the clock.

**Param subsys**
Opaque data representing the clock.

**Param user_data**
User data.

typedef int (*clock_control)(const struct device *dev, clock_control_subsys_t sys)

typedef int (*clock_control_get)(const struct device *dev, clock_control_subsys_t sys, uint32_t *rate)

typedef int (*clock_control_async_on_fn)(const struct device *dev, clock_control_subsys_t sys, clock_control_cb_t cb, void *user_data)

typedef enum clock_control_status (*clock_control_get_status_fn)(const struct device *dev, clock_control_subsys_t sys)
typedef int (*clock_control_set)(const struct device *dev, clock_control_subsys_t sys, clock_control_subsys_rate_t rate)

typedef int (*clock_control_configure_fn)(const struct device *dev, clock_control_subsys_t sys, void *data)

Enums

define clock_control_status
    Current clock status.
    Values:
    enumerator CLOCK_CONTROL_STATUS_STARTING
    enumerator CLOCK_CONTROL_STATUS_OFF
    enumerator CLOCK_CONTROL_STATUS_ON
    enumerator CLOCK_CONTROL_STATUS_UNKNOWN

Functions

static inline int clock_control_on(const struct device *dev, clock_control_subsys_t sys)
    Enable a clock controlled by the device.
    On success, the clock is enabled and ready when this function returns. This function
    may sleep, and thus can only be called from thread context.
    Use clock_control_async_on() for non-blocking operation.
    Parameters
    • dev – Device structure whose driver controls the clock.
    • sys – Opaque data representing the clock.
    Returns
    0 on success, negative errno on failure.

static inline int clock_control_off(const struct device *dev, clock_control_subsys_t sys)
    Disable a clock controlled by the device.
    This function is non-blocking and can be called from any context. On success, the clock
    is disabled when this function returns.
    Parameters
    • dev – Device structure whose driver controls the clock
    • sys – Opaque data representing the clock
    Returns
    0 on success, negative errno on failure.
static inline int clock_control_async_on(const struct device *dev, clock_control_subsys_t sys, clock_control_cb_t cb, void *user_data)

Request clock to start with notification when clock has been started.
Function is non-blocking and can be called from any context. User callback is called when clock is started.

**Parameters**
- dev – Device.
- sys – A pointer to an opaque data representing the sub-system.
- cb – Callback.
- user_data – User context passed to the callback.

**Return values**
- 0 – if start is successfully initiated.
- -EALREADY – if clock was already started and is starting or running.
- -ENOTSUP – If the requested mode of operation is not supported.
- -ENOSYS – if the interface is not implemented.
- other – negative errno on vendor specific error.

static inline enum clock_control_status clock_control_get_status(const struct device *dev, clock_control_subsys_t sys)

Get clock status.

**Parameters**
- dev – Device.
- sys – A pointer to an opaque data representing the sub-system.

**Returns**
Status.

static inline int clock_control_get_rate(const struct device *dev, clock_control_subsys_t sys, uint32_t *rate)

Obtain the clock rate of given sub-system.

**Parameters**
- dev – Pointer to the device structure for the clock controller driver instance
- sys – A pointer to an opaque data representing the sub-system
- rate – [out] Subsystem clock rate

**Return values**
- 0 – on successful rate reading.
- -EAGAIN – if rate cannot be read. Some drivers do not support returning the rate when the clock is off.
- -ENOTSUP – if reading the clock rate is not supported for the given sub-system.
- -ENOSYS – if the interface is not implemented.
static inline int clock_control_set_rate(const struct device *dev, clock_control_subsys_t sys, clock_control_subsys_rate_t rate)

Set the rate of the clock controlled by the device.

On success, the new clock rate is set and ready when this function returns. This function may sleep, and thus can only be called from thread context.

Parameters

- dev – Device structure whose driver controls the clock.
- sys – Opaque data representing the clock.
- rate – Opaque data representing the clock rate to be used.

Return values

- -EALREADY – if clock was already in the given rate.
- -ENOTSUP – If the requested mode of operation is not supported.
- -ENOSYS – if the interface is not implemented.
- other – negative errno on vendor specific error.

static inline int clock_control_configure(const struct device *dev, clock_control_subsys_t sys, void *data)

Configure a source clock.

This function is non-blocking and can be called from any context. On success, the selected clock is configured as per caller's request.

It is caller's responsibility to ensure that subsequent calls to the API provide the right information to allows clock_control driver to perform the right action (such as using the right clock source on clock_control_get_rate call).

data is implementation specific and could be used to convey supplementary information required for expected clock configuration.

Parameters

- dev – Device structure whose driver controls the clock
- sys – Opaque data representing the clock
- data – Opaque data providing additional input for clock configuration

Return values

- 0 – On success
- -ENOSYS – If the device driver does not implement this call
- -errno – Other negative errno on failure.

struct clock_control_driver_api

#include <clock_control.h>

7.6.8 Controller Area Network (CAN)

CAN Controller
Overview

Controller Area Network is a two-wire serial bus specified by the Bosch CAN Specification, Bosch CAN with Flexible Data-Rate specification and the ISO 11898-1:2003 standard. CAN is mostly known for its application in the automotive domain. However, it is also used in home and industrial automation and other products.

Warning: CAN controllers can only initialize when the bus is in the idle (recessive) state for at least 11 recessive bits. Therefore you have to make sure that CAN RX is high, at least for a short time. This is also necessary for loopback mode.

The bit-timing as defined in ISO 11898-1:2003 looks as following:

A single bit is split into four segments.

- Sync_Seg: The nodes synchronize at the edge of the Sync_Seg. It is always one time quantum in length.
- Prop_Seg: The signal propagation delay of the bus and other delays of the transceiver and node.
- Phase_Seg1 and Phase_Seg2: Define the sampling point. The bit is sampled at the end of Phase_Seg1.

The bit-rate is calculated from the time of a time quantum and the values defined above. A bit has the length of Sync_Seg plus Prop_Seg plus Phase_Seg1 plus Phase_Seg2 multiplied by the time of single time quantum. The bit-rate is the inverse of the length of a single bit.

A bit is sampled at the sampling point. The sample point is between Phase_Seg1 and PhaseSeg2 and therefore is a parameter that the user needs to choose. The CiA recommends setting the sample point to 87.5% of the bit.

The resynchronization jump width (SJW) defines the amount of time quantum the sample point can be moved. The sample point is moved when resynchronization is needed.

The timing parameters (SJW, bitrate and sampling point, or bitrate, Prop_Seg, Phase_Seg1 and Phase_Seg2) are initially set from the device-tree and can be changed at run-time from the timing-API.

CAN uses so-called identifiers to identify the frame instead of addresses to identify a node. This identifier can either have 11-bit width (Standard or Basic Frame) or 29-bit in case of an Extended Frame. The Zephyr CAN API supports both Standard and Extended identifiers concurrently. A CAN frame starts with a dominant Start Of Frame bit. After that, the identifiers follow. This phase is called the arbitration phase. During the arbitration phase, write collisions are allowed. They resolve by the fact that dominant bits override recessive bits. Nodes monitor the bus and notice when their transmission is being overridden and in case, abort their transmission. This effectively gives lower number identifiers priority over higher number identifiers.
Filters are used to whitelist identifiers that are of interest for the specific node. An identifier that doesn’t match any filter is ignored. Filters can either match exactly or a specified part of the identifier. This method is called masking. As an example, a mask with 11 bits set for standard or 29 bits set for extended identifiers must match perfectly. Bits that are set to zero in the mask are ignored when matching an identifier. Most CAN controllers implement a limited number of filters in hardware. The number of filters is also limited in Kconfig to save memory.

Errors may occur during transmission. In case a node detects an erroneous frame, it partially overrides the current frame with an error-frame. Error-frames can either be error passive or error active, depending on the state of the controller. In case the controller is in error active state, it sends six consecutive dominant bits, which is a violation of the stuffing rule that all nodes can detect. The sender may resend the frame right after.

An initialized node can be in one of the following states:

- Error-active
- Error-passive
- Bus-off

After initialization, the node is in the error-active state. In this state, the node is allowed to send active error frames, ACK, and overload frames. Every node has a receive- and transmit-error counter. If either the receive- or the transmit-error counter exceeds 127, the node changes to error-passive state. In this state, the node is not allowed to send error-active frames anymore. If the transmit-error counter increases further to 255, the node changes to the bus-off state. In this state, the node is not allowed to send any dominant bits to the bus. Nodes in the bus-off state may recover after receiving 128 occurrences of 11 concurrent recessive bits.

You can read more about CAN bus in this CAN Wikipedia article.

Zephyr supports following CAN features:
- Standard and Extended Identifiers
- Filters with Masking
- Loopback and Silent mode
- Remote Request

**Sending** The following code snippets show how to send data.

This basic sample sends a CAN frame with standard identifier 0x123 and eight bytes of data. When passing NULL as the callback, as shown in this example, the send function blocks until the frame is sent and acknowledged by at least one other node or an error occurred. The timeout only takes effect on acquiring a mailbox. When a transmitting mailbox is assigned, sending cannot be canceled.

```c
struct can_frame frame = {
    .flags = 0,
    .id = 0x123,
    .dlc = 8,
    .data = {1,2,3,4,5,6,7,8}
};
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
int ret;
ret = can_send(can_dev, &frame, K_MSEC(100), NULL, NULL);
if (ret != 0) {
    LOG_ERR("Sending failed [%d]", ret);
}
```

This example shows how to send a frame with extended identifier 0x1234567 and two bytes of data. The provided callback is called when the message is sent, or an error occurred. Passing
void tx_callback(const struct device *dev, int error, void *user_data)
{
    char *sender = (char *)user_data;
    if (error != 0) {
        LOG_ERR("Sending failed [%d]\Sender: %s\n", error, sender);
    }
}

int send_function(const struct device *can_dev)
{
    struct can_frame frame = {
        .flags = CAN_FRAME_IDE,
        .id = 0x1234567,
        .dlc = 2
    };
    frame.data[0] = 1;
    frame.data[1] = 2;
    return can_send(can_dev, &frame, K_FOREVER, tx_callback, "Sender 1");
}

Receiving Frames are only received when they match a filter. The following code snippets show how to receive frames by adding filters.

Here we have an example for a receiving callback as used for can_add_rx_filter(). The user data argument is passed when the filter is added.

void rx_callback_function(const struct device *dev, struct can_frame *frame, void *user_data)
{
    ... do something with the frame ...
}

The following snippet shows how to add a filter with a callback function. It is the most efficient but also the most critical way to receive messages. The callback function is called from an interrupt context, which means that the callback function should be as short as possible and must not block. Adding callback functions is not allowed from userspace context.

The filter for this example is configured to match the identifier 0x123 exactly.

const struct can_filter my_filter = {
    .flags = 0U,
    .id = 0x123,
    .mask = CAN_STD_ID_MASK
};
int filter_id;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
filter_id = can_add_rx_filter(can_dev, rx_callback_function, callback_arg, &my_filter);
if (filter_id < 0) {
    LOG_ERR("Unable to add rx filter [%d]", filter_id);
}

Here an example for can_add_rx_filter_msgq() is shown. With this function, it is possible to receive frames synchronously. This function can be called from userspace context. The size of the message queue should be as big as the expected backlog.
The filter for this example is configured to match the extended identifier 0x1234567 exactly.

```c
const struct can_filter my_filter = {
    .flags = CAN_FILTER_IDE,
    .id = 0x1234567,
    .mask = CAN_EXT_ID_MASK
};

CAN_MSGQ_DEFINE(my_can_msgq, 2);
struct can_frame rx_frame;
int filter_id;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));

filter_id = can_add_rx_filter_msgq(can_dev, &my_can_msgq, &my_filter);
if (filter_id < 0) {
    LOG_ERR("Unable to add rx msgq [%d]", filter_id);
    return;
}

while (true) {
    k_msgq_get(&my_can_msgq, &rx_frame, K_FOREVER);
    ... do something with the frame ...
}

can_remove_rx_filter() removes the given filter.

can_remove_rx_filter(can_dev, filter_id);
```

**Setting the bitrate**  The bitrate and sampling point is initially set at runtime. To change it from the application, one can use the `can_set_timing()` API. The `can_calc_timing()` function can calculate timing from a bitrate and sampling point in permille. The following example sets the bitrate to 250k baud with the sampling point at 87.5%.

```c
struct can_timing timing;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));

int ret;

ret = can_calc_timing(can_dev, &timing, 250000, 875);
if (ret > 0) {
    LOG_INF("Sample-Point error: %d", ret);
}

if (ret < 0) {
    LOG_ERR("Failed to calc a valid timing");
    return;
}

ret = can_stop(can_dev);
if (ret != 0) {
    LOG_ERR("Failed to stop CAN controller");
}

ret = can_set_timing(can_dev, &timing);
if (ret != 0) {
    LOG_ERR("Failed to set timing");
}

ret = can_start(can_dev);
if (ret != 0) {
    LOG_ERR("Failed to start CAN controller");
}
```

---

**7.6. Peripherals**
A similar API exists for calculating and setting the timing for the data phase for CAN FD capable controllers. See `can_set_timing_data()` and `can_calc_timing_data()`.

**SocketCAN** Zephyr additionally supports SocketCAN, a BSD socket implementation of the Zephyr CAN API. SocketCAN brings the convenience of the well-known BSD Socket API to Controller Area Networks. It is compatible with the Linux SocketCAN implementation, where many other high-level CAN projects build on top. Note that frames are routed to the network stack instead of passed directly, which adds some computation and memory overhead.

**Samples** We have two ready-to-build samples demonstrating use of the Zephyr CAN API: Zephyr CAN counter sample and SocketCAN sample.

#### CAN controller configuration

```c
int can_get_core_clock(const struct device *dev, uint32_t *rate)

Get the CAN core clock rate.

  Returns the CAN core clock rate. One time quantum is 1/(core clock rate).

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `rate` – **[out]** CAN core clock rate in Hz.

**Returns**

0 on success, or a negative error code on error

```c
int can_get_max_bitrate(const struct device *dev, uint32_t *max_bitrate)

Get the maximum supported bitrate.

Get the maximum supported bitrate for the CAN controller/transceiver combination.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `max_bitrate` – **[out]** Maximum supported bitrate in bits/s

**Return values**

- 0 – If successful.
- -EIO – General input/output error.
- -ENOSYS – If this function is not implemented by the driver.
const struct can_timing *can_get_timing_min(const struct device *dev)
Get the minimum supported timing parameter values.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.

**Returns**

Pointer to the minimum supported timing parameter values.

const struct can_timing *can_get_timing_max(const struct device *dev)
Get the maximum supported timing parameter values.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.

**Returns**

Pointer to the maximum supported timing parameter values.

int can_calc_timing(const struct device *dev, struct can_timing *res, uint32_t bitrate, uint16_t sample_pnt)
Calculate timing parameters from bitrate and sample point.

Calculate the timing parameters from a given bitrate in bits/s and the sampling point in permill (1/1000) of the entire bit time. The bitrate must always match perfectly. If no result can be reached for the given parameters, -EINVAL is returned.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `res` – [out] Result is written into the `can_timing` struct provided.
- `bitrate` – Target bitrate in bits/s.
- `sample_pnt` – Sampling point in permill of the entire bit time.

**Return values**

- 0 – or positive sample point error on success.
- -EINVAL – if the requested bitrate or sample point is out of range.
- -ENOTSUP – if the requested bitrate is not supported.
- -EIO – if `can_get_core_clock()` is not available.

const struct can_timing *can_get_timing_data_min(const struct device *dev)
Get the minimum supported timing parameter values for the data phase.

Same as `can_get_timing_min()` but for the minimum values for the data phase.

**Note:** CONFIG_CAN_FD_MODE must be selected for this function to be available.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.

**Returns**

Pointer to the minimum supported timing parameter values, or NULL if CAN FD support is not implemented by the driver.
const struct can_timing *can_get_timing_data_max(const struct device *dev)
Get the maximum supported timing parameter values for the data phase.
Same as can_get_timing_max() but for the maximum values for the data phase.

**Note:** CONFIG_CAN_FD_MODE must be selected for this function to be available.

**Parameters**
- dev – Pointer to the device structure for the driver instance.

**Returns**
Pointer to the maximum supported timing parameter values, or NULL if CAN FD support is not implemented by the driver.

int can_calc_timing_data(const struct device *dev, struct can_timing *res, uint32_t bitrate, uint16_t sample_pnt)
Calculate timing parameters for the data phase.
Same as can_calc_timing() but with the maximum and minimum values from the data phase.

**Note:** CONFIG_CAN_FD_MODE must be selected for this function to be available.

**Parameters**
- dev – Pointer to the device structure for the driver instance.
- res – [out] Result is written into the can_timing struct provided.
- bitrate – Target bitrate for the data phase in bits/s
- sample_pnt – Sampling point for the data phase in permille of the entire bit time.

**Return values**
- 0 – or positive sample point error on success.
- -EINVAL – if the requested bitrate or sample point is out of range.
- -ENOTSUP – if the requested bitrate is not supported.
- -EIO – if can_get_core_clock() is not available.

int can_set_timing_data(const struct device *dev, const struct can_timing *timing_data)
Configure the bus timing for the data phase of a CAN FD controller.

**See also:**
can_set_timing()
### Return values

- **0** – If successful.
- **-EBUSY** – if the CAN controller is not in stopped state.
- **-EINVAL** – if the requested bitrate is out of range.
- **-ENOTSUP** – if the requested bitrate not supported by the CAN controller/transceiver combination.
- **-ERANGE** – if the resulting sample point is off by more than +/- 5%.
- **-EIO** – General input/output error, failed to set bitrate.

```c
int can_set_bitrate_data(const struct device *dev, uint32_t bitrate_data)
```

Set the bitrate for the data phase of the CAN FD controller.

CAN in Automation (CiA) 301 v4.2.0 recommends a sample point location of 87.5% percent for all bitrates. However, some CAN controllers have difficulties meeting this for higher bitrates.

This function defaults to using a sample point of 75.0% for bitrates over 800 kbit/s, 80.0% for bitrates over 500 kbit/s, and 87.5% for all other bitrates. This is in line with the sample point locations used by the Linux kernel.

### See also:

`can_set_bitrate()`

**Note:** `CONFIG_CAN_FD_MODE` must be selected for this function to be available.

### Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **bitrate_data** – Desired data phase bitrate.

### Return values

- **0** – If successful.
- **-EBUSY** – if the CAN controller is not in stopped state.
- **-EINVAL** – if the requested bitrate is out of range.
- **-ENOTSUP** – if the timing parameters are not supported by the driver.
- **-ENOSYS** – if CAN FD support is not implemented by the driver.

```c
int can_calc_prescaler(const struct device *dev, struct can_timing *timing, uint32_t bitrate)
```

Fill in the prescaler value for a given bitrate and timing.

Fill the prescaler value in the timing struct. The sjw, prop_seg, phase_seg1 and phase_seg2 must be given.

The returned bitrate error is remainder of the division of the clock rate by the bitrate times the timing segments.

### Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **timing** – Result is written into the `can_timing` struct provided.
- **bitrate** – Target bitrate.
Return values

- 0 – or positive bitrate error.
- Negative – error code on error.

`int can_set_timing(const struct device *dev, const struct can_timing *timing)`

Configure the bus timing of a CAN controller.

See also:

`can_set_timing_data()`

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `timing` – Bus timings.

Return values

- 0 – If successful.
- -EBUSY – if the CAN controller is not in stopped state.
- -ENOTSUP – if the timing parameters are not supported by the driver.
- -EIO – General input/output error, failed to configure device.

`int can_get_capabilities(const struct device *dev, can_mode_t *cap)`

Get the supported modes of the CAN controller.

The returned capabilities may not necessarily be supported at the same time (e.g. some CAN controllers support both CAN_MODE_LOOPBACK and CAN_MODE_LISTENONLY, but not at the same time).

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `cap` – [out] Supported capabilities.

Return values

- 0 – If successful.
- -EIO – General input/output error, failed to get capabilities.

`const struct device *can_get_transceiver(const struct device *dev)`

Get the CAN transceiver associated with the CAN controller.

Get a pointer to the device structure for the CAN transceiver associated with the CAN controller.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Returns

Pointer to the device structure for the associated CAN transceiver driver instance, or NULL if no transceiver is associated.

`int can_start(const struct device *dev)`

Start the CAN controller.

Bring the CAN controller out of CAN_STATE_STOPPED. This will reset the RX/TX error counters, enable the CAN controller to participate in CAN communication, and enable the CAN tranceiver, if supported.
Starting the CAN controller resets all the CAN controller statistics.

See also:
`can_stop()`

See also:
`can_transceiver_enable()`

Parameters
- `dev` – Pointer to the device structure for the driver instance.

Return values
- 0 – if successful.
- `EALREADY` – if the device is already started.
- `EIO` – General input/output error; failed to start device.

```c
int can_stop(const struct device *dev)
```
Stop the CAN controller.
Bring the CAN controller into `CAN_STATE_STOPPED`. This will disallow the CAN controller from participating in CAN communication, abort any pending CAN frame transmissions, and disable the CAN transceiver, if supported.

See also:
`can_start()`

See also:
`can_transceiver_disable()`

Parameters
- `dev` – Pointer to the device structure for the driver instance.

Return values
- 0 – if successful.
- `EALREADY` – if the device is already stopped.
- `EIO` – General input/output error; failed to stop device.

```c
int can_stop(const struct device *dev)
```

Set the CAN controller to the given operation mode.

Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `mode` – Operation mode.

Return values
- 0 – If successful.
- `EBUSY` – if the CAN controller is not in stopped state.
- `EIO` – General input/output error; failed to configure device.
**can_mode_t** `can_get_mode(const struct device *dev)`

Get the operation mode of the CAN controller.

**Parameters**

- *dev* – Pointer to the device structure for the driver instance.

**Returns**

Current operation mode.

**int** `can_set_bitrate(const struct device *dev, uint32_t bitrate)`

Set the bitrate of the CAN controller.

CAN in Automation (CiA) 301 v4.2.0 recommends a sample point location of 87.5% percent for all bitrates. However, some CAN controllers have difficulties meeting this for higher bitrates.

This function defaults to using a sample point of 75.0% for bitrates over 800 kbit/s, 80.0% for bitrates over 500 kbit/s, and 87.5% for all other bitrates. This is in line with the sample point locations used by the Linux kernel.

**See also:**

`can_set_bitrate_data()`

**Parameters**

- *dev* – Pointer to the device structure for the driver instance.
- *bitrate* – Desired arbitration phase bitrate.

**Return values**

- 0 – If successful.
- -EBUSY – if the CAN controller is not in stopped state.
- -EINVAL – if the requested bitrate is out of range.
- -ENOTSUP – if the requested bitrate not supported by the CAN controller/transceiver combination.
- -ERANGE – if the resulting sample point is off by more than +/- 5%.
- -EIO – General input/output error, failed to set bitrate.

**Transmitting CAN frames**

**int** `can_send(const struct device *dev, const struct can_frame *frame, k_timeout_t timeout, can_tx_callback_t callback, void *user_data)`

Queue a CAN frame for transmission on the CAN bus.

Queue a CAN frame for transmission on the CAN bus with optional timeout and completion callback function.

Queued CAN frames are transmitted in order according to their priority:

- The lower the CAN-ID, the higher the priority.
- Data frames have higher priority than Remote Transmission Request (RTR) frames with identical CAN-IDs.
- Frames with standard (11-bit) identifiers have higher priority than frames with extended (29-bit) identifiers with identical base IDs (the higher 11 bits of the extended identifier).
• Transmission order for queued frames with the same priority is hardware dependent.

By default, the CAN controller will automatically retry transmission in case of lost bus arbitration or missing acknowledge. Some CAN controllers support disabling automatic retransmissions via CAN_MODE_ONE_SHOT.

**Note:** If transmitting segmented messages spanning multiple CAN frames with identical CAN-IDs, the sender must ensure to only queue one frame at a time if FIFO order is required.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **frame** – CAN frame to transmit.
- **timeout** – Timeout waiting for an empty TX mailbox or K_FOREVER.
- **callback** – Optional callback for when the frame was sent or a transmission error occurred. If NULL, this function is blocking until frame is sent. The callback must be NULL if called from user mode.
- **user_data** – User data to pass to callback function.

**Return values**

- 0 – if successful.
- -EINVAL – if an invalid parameter was passed to the function.
- -ENOTSUP – if an unsupported parameter was passed to the function.
- -ENETDOWN – if the CAN controller is in stopped state.
- -ENETUNREACH – if the CAN controller is in bus-off state.
- -EBUSY – if CAN bus arbitration was lost (only applicable if automatic retransmissions are disabled).
- -EIO – if a general transmit error occurred (e.g. missing ACK if automatic retransmissions are disabled).
- -EAGAIN – on timeout.

**Receiving CAN frames**

```
static inline int can_add_rx_filter(const struct device *dev, can_rx_callback_t callback, void *user_data, const struct can_filter *filter)
```

Add a callback function for a given CAN filter.

Add a callback to CAN identifiers specified by a filter. When a received CAN frame matching the filter is received by the CAN controller, the callback function is called in interrupt context.

If a received frame matches more than one filter (i.e., the filter IDs/masks or flags overlap), the priority of the match is hardware dependent.

The same callback function can be used for multiple filters.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
• **callback** – This function is called by the CAN controller driver whenever a frame matching the filter is received.

• **user_data** – User data to pass to callback function.

• **filter** – Pointer to a `can_filter` structure defining the filter.

### Return values

• **filter_id** – on success.

• **-ENOSPC** – if there are no free filters.

• **-EINVAL** – if the requested filter type is invalid.

• **-ENOTSUP** – if the requested filter type is not supported.

```c
int can_add_rx_filter_msgq(const struct device *dev, struct k_msgq *msgq, const struct can_filter *filter)
```

Simple wrapper function for adding a message queue for a given filter.

Wrapper function for `can_add_rx_filter()` which puts received CAN frames matching the filter in a message queue instead of calling a callback.

If a received frame matches more than one filter (i.e., the filter IDs/masks or flags overlap), the priority of the match is hardware dependent.

The same message queue can be used for multiple filters.

**Note:** The message queue must be initialized before calling this function and the caller must have appropriate permissions on it.

---

**Warning:** Message queue overruns are silently ignored and overrun frames discarded. Custom error handling can be implemented by using `can_add_rx_filter()` and `k_msgq_put()` directly.

### Parameters

• **dev** – Pointer to the device structure for the driver instance.

• **msgq** – Pointer to the already initialized `k_msgq` struct.

• **filter** – Pointer to a `can_filter` structure defining the filter.

### Return values

• **filter_id** – on success.

• **-ENOSPC** – if there are no free filters.

• **-ENOTSUP** – if the requested filter type is not supported.

```c
void can_remove_rx_filter(const struct device *dev, int filter_id)
```

Remove a CAN RX filter.

This routine removes a CAN RX filter based on the filter ID returned by `can_add_rx_filter()` or `can_add_rx_filter_msgq()`.

### Parameters

• **dev** – Pointer to the device structure for the driver instance.

• **filter_id** – Filter ID
int can_get_max_filters(const struct device *dev, bool ide)
Get maximum number of RX filters.
Get the maximum number of concurrent RX filters for the CAN controller.

Parameters
- dev – Pointer to the device structure for the driver instance.
- ide – Get the maximum standard (11-bit) CAN ID filters if false, or extended (29-bit) CAN ID filters if true.

Return values
- Positive – number of maximum concurrent filters.
- -EIO – General input/output error.
- -ENOSYS – If this function is not implemented by the driver.

CAN_MSGQ_DEFINE(name, max_frames)
Statically define and initialize a CAN RX message queue.
The message queue's ring buffer contains space for max_frames CAN frames.

See also:
can_add_rx_filter_msgq()

Parameters
- name – Name of the message queue.
- max_frames – Maximum number of CAN frames that can be queued.

CAN bus error reporting and handling

int can_get_state(const struct device *dev, enum can_state *state, struct can_bus_err_cnt *err_cnt)
Get current CAN controller state.
Returns the current state and optionally the error counter values of the CAN controller.

Parameters
- dev – Pointer to the device structure for the driver instance.
- state – [out] Pointer to the state destination enum or NULL.
- err_cnt – [out] Pointer to the err_cnt destination structure or NULL.

Return values
- 0 – If successful.
- -EIO – General input/output error, failed to get state.

int can_recover(const struct device *dev, k_timeout_t timeout)
Recover from bus-off state.
Recover the CAN controller from bus-off state to error-active state.

Note: CONFIG_CAN_AUTO_BUS_OFF_RECOVERY must be deselected for this function to be available.
Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `timeout` – Timeout for waiting for the recovery or K_FOREVER.

Return values

- 0 – on success.
- -ENETDOWN – if the CAN controller is in stopped state.
- -EAGAIN – on timeout.

```c
static inline void can_set_state_change_callback(const struct device *dev, can_state_change_callback_t callback, void *user_data)
```

Set a callback for CAN controller state change events.

Set the callback for CAN controller state change events. The callback function will be called in interrupt context.

Only one callback can be registered per controller. Calling this function again over-
rides any previously registered callback.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `callback` – Callback function.
- `user_data` – User data to pass to callback function.

CAN statistics

```c
uint32_t can_stats_get_bit_errors(const struct device *dev)
```

Get the bit error counter for a CAN device.

The bit error counter is incremented when the CAN controller is unable to transmit either a dominant or a recessive bit.

**Note:** CONFIG_CAN_STATS must be selected for this function to be available.

```c
uint32_t can_stats_get_bit0_errors(const struct device *dev)
```

Get the bit0 error counter for a CAN device.

The bit0 error counter is incremented when the CAN controller is unable to transmit a dominant bit.

See also:

`can_stats_get_bit_errors()`

**Note:** CONFIG_CAN_STATS must be selected for this function to be available.
Parameters

• dev – Pointer to the device structure for the driver instance.

Returns

bit0 error counter

uint32_t can_stats_get_bit1_errors(const struct device *dev)
Get the bit1 error counter for a CAN device.

The bit1 error counter is incremented when the CAN controller is unable to transmit
a recessive bit.

See also:

can_stats_get_bit_errors()

Note: CONFIG_CAN_STATS must be selected for this function to be available.

Parameters

• dev – Pointer to the device structure for the driver instance.

Returns

bit1 error counter

uint32_t can_stats_get_stuff_errors(const struct device *dev)
Get the stuffing error counter for a CAN device.

The stuffing error counter is incremented when the CAN controller detects a bit stuffing
error.

Note: CONFIG_CAN_STATS must be selected for this function to be available.

Parameters

• dev – Pointer to the device structure for the driver instance.

Returns

stufing error counter

uint32_t can_stats_get_crc_errors(const struct device *dev)
Get the CRC error counter for a CAN device.

The CRC error counter is incremented when the CAN controller detects a frame with
an invalid CRC.

Note: CONFIG_CAN_STATS must be selected for this function to be available.

Parameters

• dev – Pointer to the device structure for the driver instance.

Returns

CRC error counter
```c
uint32_t can_stats_get_form_errors(const struct device *dev)
Get the form error counter for a CAN device.
The form error counter is incremented when the CAN controller detects a fixed-form bit field containing illegal bits.

**Note:** CONFIG_CAN_STATS must be selected for this function to be available.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.

**Returns**
- Form error counter
```
```c
uint32_t can_stats_get_ack_errors(const struct device *dev)
Get the acknowledge error counter for a CAN device.
The acknowledge error counter is incremented when the CAN controller does not monitor a dominant bit in the ACK slot.

**Note:** CONFIG_CAN_STATS must be selected for this function to be available.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.

**Returns**
- Acknowledge error counter
```
```c
uint32_t can_stats_get_rx_overruns(const struct device *dev)
Get the RX overrun counter for a CAN device.
The RX overrun counter is incremented when the CAN controller receives a CAN frame matching an installed filter but lacks the capacity to store it (either due to an already full RX mailbox or a full RX FIFO).

**Note:** CONFIG_CAN_STATS must be selected for this function to be available.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.

**Returns**
- RX overrun counter
```

### CAN utility functions

```c
static inline uint8_t can_dlc_to_bytes(uint8_t dlc)
Convert from Data Length Code (DLC) to the number of data bytes.

**Parameters**
- `dlc` – Data Length Code (DLC).

**Return values**
- Number – of bytes.
```
static inline uint8_t can_bytes_to_dlc(uint8_t num_bytes)
    Convert from number of bytes to Data Length Code (DLC)

Parameters
• num_bytes – Number of bytes.

Return values
Data – Length Code (DLC).

static inline bool can_frame_matches_filter(const struct can_frame *frame,
                                             const struct can_filter *filter)
    Check if a CAN frame matches a CAN filter.

Parameters
• frame – CAN frame.
• filter – CAN filter.

Returns
true if the CAN frame matches the CAN filter, false otherwise

CAN frame definitions

CAN_STD_ID_MASK
    Bit mask for a standard (11-bit) CAN identifier.

CAN_MAX_STD_ID
    Maximum value for a standard (11-bit) CAN identifier.

CAN_EXT_ID_MASK
    Bit mask for an extended (29-bit) CAN identifier.

CAN_MAX_EXT_ID
    Maximum value for an extended (29-bit) CAN identifier.

CAN_MAX_DLC
    Maximum data length code for CAN 2.0A/2.0B.

CANFD_MAX_DLC
    Maximum data length code for CAN FD.

CAN controller mode flags

CAN_MODE_NORMAL
    Normal mode.

CAN_MODE_LOOPBACK
    Controller is in loopback mode (receives own frames).
CAN_MODE_LISTENONLY
Controller is not allowed to send dominant bits.

CAN_MODE_FD
Controller allows transmitting/receiving CAN FD frames.

CAN_MODE_ONE_SHOT
Controller does not retransmit in case of lost arbitration or missing ACK.

CAN_MODE_3_SAMPLES
Controller uses triple sampling mode.

CAN frame flags

CAN_FRAME_IDE
Frame uses extended (29-bit) CAN ID.

CAN_FRAME_RTR
Frame is a Remote Transmission Request (RTR)

CAN_FRAME_FDF
Frame uses CAN FD format (FDF)

CAN_FRAME_BRS
Frame uses CAN FD Baud Rate Switch (BRS).
Only valid in combination with CAN_FRAME_FDF.

CAN_FRAME_ESI
CAN FD Error State Indicator (ESI).
Indicates that the transmitting node is in error-passive state. Only valid in combination with CAN_FRAME_FDF.

CAN filter flags

CAN_FILTER_IDE
Filter matches frames with extended (29-bit) CAN IDs.

Defines

CAN_STATS_BIT_ERROR_INC(dev_)
Increment the bit error counter for a CAN device.
The bit error counter is incremented when the CAN controller is unable to transmit either a dominant or a recessive bit.
See also:

\texttt{CAN\_STATS\_BIT0\_ERROR\_INC()}

See also:

\texttt{CAN\_STATS\_BIT1\_ERROR\_INC()}

\textbf{Note:} This error counter should only be incremented if the CAN controller is unable to distinguish between failure to transmit a dominant versus failure to transmit a recessive bit. If the CAN controller supports distinguishing between the two, the bit0 or bit1 error counter shall be incremented instead.

\textbf{Parameters}

- dev_ – Pointer to the device structure for the driver instance.

\texttt{CAN\_STATS\_BIT0\_ERROR\_INC(dev_)}

Increment the bit0 error counter for a CAN device.

The bit0 error counter is incremented when the CAN controller is unable to transmit a dominant bit.

Incrementing this counter will automatically increment the bit error counter.

See also:

\texttt{CAN\_STATS\_BIT\_ERROR\_INC()}

\textbf{Parameters}

- dev_ – Pointer to the device structure for the driver instance.

\texttt{CAN\_STATS\_BIT1\_ERROR\_INC(dev_)}

Increment the bit1 (recessive) error counter for a CAN device.

The bit1 error counter is incremented when the CAN controller is unable to transmit a recessive bit.

Incrementing this counter will automatically increment the bit error counter.

See also:

\texttt{CAN\_STATS\_BIT\_ERROR\_INC()}

\textbf{Parameters}

- dev_ – Pointer to the device structure for the driver instance.

\texttt{CAN\_STATS\_STUFF\_ERROR\_INC(dev_)}

Increment the stuffing error counter for a CAN device.

The stuffing error counter is incremented when the CAN controller detects a bit stuffing error.

\textbf{Parameters}

- dev_ – Pointer to the device structure for the driver instance.

\texttt{CAN\_STATS\_CRC\_ERROR\_INC(dev_)}

Increment the CRC error counter for a CAN device.

The CRC error counter is incremented when the CAN controller detects a frame with an invalid CRC.
Parameters

• dev_ – Pointer to the device structure for the driver instance.

CAN_STATS_FORM_ERROR_INC(dev_)
Increment the form error counter for a CAN device.
The form error counter is incremented when the CAN controller detects a fixed-form bit field containing illegal bits.

Parameters

• dev_ – Pointer to the device structure for the driver instance.

CAN_STATS_ACK_ERROR_INC(dev_)
Increment the acknowledge error counter for a CAN device.
The acknowledge error counter is incremented when the CAN controller does not monitor a dominant bit in the ACK slot.

Parameters

• dev_ – Pointer to the device structure for the driver instance.

CAN_STATS_RX_OVERRUN_INC(dev_)
Increment the RX overrun counter for a CAN device.
The RX overrun counter is incremented when the CAN controller receives a CAN frame matching an installed filter but lacks the capacity to store it (either due to an already full RX mailbox or a full RX FIFO).

Parameters

• dev_ – Pointer to the device structure for the driver instance.

CAN_STATS_RESET(dev_)
Zero all statistics for a CAN device.
The driver is responsible for resetting the statistics before starting the CAN controller.

Parameters

• dev_ – Pointer to the device structure for the driver instance.

CAN_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, level, prio, api, ...)
Like DEVICE_DT_DEFINE() with CAN device specifics.
Defines a device which implements the CAN API. May generate a custom device state container struct and init_fn wrapper when needed depending on CONFIG_CAN_STATS.

Parameters

• node_id – The devicetree node identifier.
• init_fn – Name of the init function of the driver.
• pm – PM device resources reference (NULL if device does not use PM).
• data – Pointer to the device's private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• level – The initialization level. See SYS_INIT() for details.
• prio – Priority within the selected initialization level. See SYS_INIT() for details.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
CAN_DEVICE_DT_INST_DEFINE(inst, ...)

Like CAN_DEVICE_DT_DEFINE() for an instance of a DT_DRV_COMPAT compatible.

**Parameters**

- **inst** – Instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to CAN DEVICE DT DEFINE().
- **...** – Other parameters as expected by CAN_DEVICE_DT_DEFINE().

**Typedefs**

typedef uint32_t can_mode_t

Provides a type to hold CAN controller configuration flags.
The lower 24 bits are reserved for common CAN controller mode flags. The upper 8 bits are reserved for CAN controller/driver specific flags.

**See also:**

CAN_MODE_FLAGS.

typedef void (*can_tx_callback_t)(const struct device *dev, int error, void *user_data)

Defines the application callback handler function signature.

**Param dev**

Pointer to the device structure for the driver instance.

**Param error**

Status of the performed send operation. See the list of return values for can_send() for value descriptions.

**Param user_data**

User data provided when the frame was sent.

typedef void (*can_rx_callback_t)(const struct device *dev, struct can_frame *frame, void *user_data)

Defines the application callback handler function signature for receiving.

**Param dev**

Pointer to the device structure for the driver instance.

**Param frame**

Received frame.

**Param user_data**

User data provided when the filter was added.

typedef void (*can_state_change_callback_t)(const struct device *dev, enum can_state state, struct can_bus_err_cnt err_cnt, void *user_data)

Defines the state change callback handler function signature.

**Param dev**

Pointer to the device structure for the driver instance.

**Param state**

State of the CAN controller.

**Param err_cnt**

CAN controller error counter values.
**Param user_data**
User data provided the callback was set.

**Enums**

```c
enum can_state
{
    CAN_STATE_ERROR_ACTIVE,
    CAN_STATE_ERROR_WARNING,
    CAN_STATE_ERROR_PASSIVE,
    CAN_STATE_BUS_OFF,
    CAN_STATE_STOPPED,
};
```

**Public Members**

```c
struct can_frame
{
    #include <can.h>  // CAN frame structure.

    uint32_t id
    {
        Standard (11-bit) or extended (29-bit) CAN identifier.
    }

    uint8_t dlc
    {
        Data Length Code (DLC) indicating data length in bytes.
    }

    uint8_t flags
    {
        Flags.
    }

    See also:
    
    CAN_FRAME_FLAGS.

    uint16_t timestamp
    {
        Captured value of the free-running timer in the CAN controller when this frame was received.
        The timer is incremented every bit time and captured at the start of frame bit (SOF).
    }
```
Note: CONFIG_CAN_RX_TIMESTAMP must be selected for this field to be available.

```c
uint8_t data[CAN_MAX_DLEN]
    Payload data accessed as unsigned 8 bit values.
```

```c
uint32_t data_32[DIV_ROUND_UP(CAN_MAX_DLEN, sizeof(uint32_t))]
    Payload data accessed as unsigned 32 bit values.
```

```c
union can_frame
    The frame payload data.
```

```c
struct can_filter
    #include <can.h> CAN filter structure.
```

**Public Members**

```c
uint32_t id
    CAN identifier to match.
```

```c
uint32_t mask
    CAN identifier matching mask.
    If a bit in this mask is 0, the value of the corresponding bit in the id field is ignored by the filter.
```

```c
uint8_t flags
    Flags.
```

See also:

- `CAN_FILTER_FLAGS`

```c
struct can_bus_err_cnt
    #include <can.h> CAN controller error counters.
```

**Public Members**

```c
uint8_t tx_err_cnt
    Value of the CAN controller transmit error counter.
```

```c
uint8_t rx_err_cnt
    Value of the CAN controller receive error counter.
```

```c
struct can_timing
    #include <can.h> CAN bus timing structure.
    This struct is used to pass bus timing values to the configuration and bitrate calculation functions.
```
The propagation segment represents the time of the signal propagation. Phase segment 1 and phase segment 2 define the sampling point. The `prop_seg` and `phase_seg1` values affect the sampling point in the same way and some controllers only have a register for the sum of those two. The sync segment always has a length of 1 time quantum (see below).

1 time quantum (tq) has the length of 1/(core_clock / prescaler). The bitrate is defined by the core clock divided by the prescaler and the sum of the segments:

\[
\text{br} = \frac{\text{core_clock}}{\text{prescaler}} \div (1 + \text{prop}_\text{seg} + \text{phase}_\text{seg1} + \text{phase}_\text{seg2})
\]

The Synchronization Jump Width (SJW) defines the amount of time quanta the sample point can be moved. The sample point is moved when resynchronization is needed.

**Public Members**

```c
#include <can.h>

struct can_device_state
#include <can.h> CAN specific device state which allows for CAN device class specific additions.

Public Members

struct device_state devstate
Common device state.

struct stats_can stats
CAN device statistics.
```
CAN Transceiver

Overview

A CAN transceiver is an external device that converts the logic level signals from the CAN controller to the bus-levels. The bus lines are called CAN High (CAN H) and CAN Low (CAN L). The transmit wire from the controller to the transceiver is called CAN TX, and the receive wire is called CAN RX. These wires use the logic levels whereas the bus-level is interpreted differentially between CAN H and CAN L. The bus can be either in the recessive (logical one) or dominant (logical zero) state. The recessive state is when both lines, CAN H and CAN L, are roughly at the same voltage level. This state is also the idle state. To write a dominant bit to the bus, open-drain transistors tie CAN H to Vdd and CAN L to ground. The first and last node use a 120-ohm resistor between CAN H and CAN L to terminate the bus. The dominant state always overrides the recessive state. This structure is called a wired-AND.

CAN Transceiver API Reference

**group** can_transceiver

CAN Transceiver Driver APIs.

**Functions**

static inline int can_transceiver_enable(const struct device *dev, can_mode_t mode)

Enable CAN transceiver.

Enable the CAN transceiver.

**See also:**

can_start()

**Note:** The CAN transceiver is controlled by the CAN controller driver and should not normally be controlled by the application.
Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `mode` – Operation mode.

Return values

- 0 – If successful.
- -EIO – General input/output error, failed to enable device.

static inline int can_transceiver_disable(const struct device *dev)

Disable CAN transceiver.

Disable the CAN transceiver.

See also:

can_stop()

Note: The CAN transceiver is controlled by the CAN controller driver and should not normally be controlled by the application.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- 0 – If successful.
- -EIO – General input/output error, failed to disable device.

CAN Shell

- Overview
- Inspection
- Configuration
- Receiving
- Sending
- Bus Recovery

Overview  The CAN shell provides a can command with a set of subcommands for the `shell` module. It allows for testing and exploring the CAN Controller driver API through an interactive interface without having to write a dedicated application. The CAN shell can also be enabled in existing applications to aid in interactive debugging of CAN issues.

The CAN shell provides access to most CAN controller features, including inspection, configuration, sending and receiving of CAN frames, and bus recovery.

In order to enable the CAN shell, the following `Kconfig` options must be enabled:

- CONFIG_SHELL
- CONFIG_CAN
• CONFIG_CAN_SHELL

The following Kconfig options enable additional subcommands and features of the can command:

• CONFIG_CAN_FD_MODE enables CAN FD specific subcommands (e.g. for setting the timing for the CAN FD data phase).
• CONFIG_CAN_RX_TIMESTAMP enables printing of timestamps for received CAN frames.
• CONFIG_CAN_STATS enables printing of various statistics for the CAN controller in the can show subcommand. This depends on CONFIG_STATS being enabled as well.
• CONFIG_CAN_AUTO_BUS_OFF_RECOVERY enables the can recover subcommand when disabled.

For example, building the hello_world sample for the frdm_k64f with the CAN shell and CAN statistics enabled:

```bash
# From the root of the zephyr repository
west build -b frdm_k64f samples/hello_world -- -DCONFIG_SHELL=y -DCONFIG_CAN=y -DCONFIG_CAN_SHELL=y -DCONFIG_STATS=y -DCONFIG_CAN_STATS=y
```

See the shell documentation for general instructions on how to connect and interact with the shell. The CAN shell comes with built-in help (unless CONFIG_SHELL_HELP is disabled). The built-in help messages can be printed by passing -h or --help to the can command or any of its subcommands. All subcommands also support tab-completion of their arguments.

**Tip:** All of the CAN shell subcommands take the name of a CAN controller as their first argument, which also supports tab-completion. A list of all devices available can be obtained using the device list shell command when CONFIG_DEVICE_SHELL is enabled. The examples below all use the device name can@0.

**Inspection** The properties of a given CAN controller can be inspected using the can show subcommand as shown below. The properties include the core CAN clock rate, the maximum supported bitrate, the number of RX filters supported, capabilities, current mode, current state, error counters, timing limits, and more:

```
uart:~$ can show can@0  
   core clock: 144000000 Hz  
   max bitrate: 5000000 bps  
   max std filters: 15  
   max ext filters: 15  
   capabilities: normal loopback listen-only fd  
   mode: normal  
   state: stopped  
   rx errors: 0  
   tx errors: 0  
   timing: sjw 1..128, prop_seg 0..0, phase_seg1 2..256, phase_seg2 2..128, prescaler 1..512  
   timing data: sjw 1..16, prop_seg 0..0, phase_seg1 1..32, phase_seg2 1..16, prescaler 1..32  
   transceiver: passive/none  
   statistics:  
     bit errors: 0  
     bit0 errors: 0  
     bit1 errors: 0  
     stuff errors: 0  
     crc errors: 0  
     form errors: 0
```

(continues on next page)
Configuration  The CAN shell allows for configuring the CAN controller mode and timing, along with starting and stopping the processing of CAN frames.

Note: The CAN controller mode and timing can only be changed while the CAN controller is stopped, which is the initial setting upon boot-up. The initial CAN controller mode is set to normal and the initial timing is set according to the bus-speed, sample-point, bus-speed-data, and sample-point-data Devicetree properties.

Timing  The classic CAN bitrate/CAN FD arbitration phase bitrate can be configured using the can bitrate subcommand as shown below. The bitrate is specified in bits per second.

```
uart:~$ can bitrate can@0 125000
setting bitrate to 125000 bps
```

If CONFIG_CAN_FD_MODE is enabled, the data phase bitrate can be configured using the can dbitrate subcommand as shown below. The bitrate is specified in bits per second.

```
uart:~$ can dbitrate can@0 1000000
setting data bitrate to 1000000 bps
```

Both of these subcommands allow specifying an optional sample point in per mille and a (Re)Synchronization Jump Width (SJW) in Time Quanta as positional arguments. Refer to the interactive help of the subcommands for more details.

It is also possible to configure the raw bit timing using the can timing and can dtiming subcommands. Refer to the interactive help output for these subcommands for details on the required arguments.

Mode  The CAN shell allows for setting the mode of the CAN controller using the can mode subcommand. An example for enabling loopback mode is shown below.

```
uart:~$ can mode can@0 loopback
setting mode 0x00000001
```

The subcommand accepts multiple modes given on the same command line (e.g. can mode can@0 fd loopback for setting CAN FD and loopback mode). Vendor-specific modes can be specified in hexadecimal.

Starting and Stopping  After the timing and mode has been configured as needed, the CAN controller can be started using the can start subcommand as shown below. This will enable reception and transmission of CAN frames.

```
uart:~$ can start can@0
starting can@0
```

Prior to reconfiguring the timing or mode, the CAN controller needs to be stopped using the can stop subcommand as shown below:
Receiving  In order to receive CAN frames, one or more CAN RX filters need to be configured. CAN RX filters are added using the `can filter add` subcommand as shown below. The subcommand accepts a CAN ID in hexadecimal format along with an optional CAN ID mask, also in hexadecimal format, for setting which bits in the CAN ID are to be matched. Refer to the interactive help output for this subcommand for further details on the supported arguments.

The filter ID (0 in the example above) returned is to be used when removing the CAN RX filter. Received CAN frames matching the added filter(s) are printed to the shell. A few examples are shown below:

<table>
<thead>
<tr>
<th>Flags</th>
<th>ID</th>
<th>Size</th>
<th>Data bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>--</td>
<td>010</td>
<td>[8]</td>
<td>01 02 03 04 05 06 07 08</td>
</tr>
<tr>
<td>B</td>
<td>010</td>
<td>[08]</td>
<td>01 02 03 04 05 06 07 08</td>
</tr>
<tr>
<td>P</td>
<td>010</td>
<td>[03]</td>
<td>01 aa bb</td>
</tr>
<tr>
<td>--</td>
<td>00000010</td>
<td>[0]</td>
<td></td>
</tr>
<tr>
<td>--</td>
<td>010</td>
<td>[1]</td>
<td>20</td>
</tr>
<tr>
<td>--</td>
<td>010</td>
<td>[8]</td>
<td>remote transmission request</td>
</tr>
</tbody>
</table>

The columns have the following meaning:

- Flags
  - B: The frame has the CAN FD Baud Rate Switch (BRS) flag set.
  - P: The frame has the CAN FD Error State Indicator (ESI) flag set. The transmitting node is in error-passive state.
  - -: Unset flag.

- ID
  - 010: The standard (11-bit) CAN ID of the frame in hexadecimal format, here 10h.
  - 00000010: The extended (29-bit) CAN ID of the frame in hexadecimal format, here 10h.

- Size
  - [8]: The number of frame data bytes in decimal format, here a classic CAN frame with 8 data bytes.
  - [08]: The number of frame data bytes in decimal format, here a CAN FD frame with 8 data bytes.

- Data bytes
  - 01 02 03 04 05 06 07 08: The frame data bytes in hexadecimal format, here the numbers from 1 through 8.
  - remote transmission request: The frame is a Remote Transmission Request (RTR) frame and thus carries no data bytes.

**Tip:** If `CONFIG_CAN_RX_TIMESTAMP` is enabled, each line will be prepended with a timestamp from the free-running timestamp counter in the CAN controller.
Configured CAN RX filters can be removed again using the `can filter remove` subcommand as shown below. The filter ID is the ID returned by the `can filter add` subcommand (0 in the example below).

```
uart:$ can filter remove can@0 0
removing filter with ID 0
```

**Sending**  CAN frames can be queued for transmission using the `can send` subcommand as shown below. The subcommand accepts a CAN ID in hexadecimal format and optionally a number of data bytes, also specified in hexadecimal. Refer to the interactive help output for this subcommand for further details on the supported arguments.

```
uart:$ can send can@0 010 1 2 3 4 5 6 7 8
enqueuing CAN frame #2 with standard (11-bit) CAN ID 0x010, RTR 0, CAN FD 0, BRS 0, DLC 8
CAN frame #2 successfully sent
```

**Bus Recovery**  The `can recover` subcommand can be used for initiating recovery from a CAN bus-off event as shown below:

```
uart:$ can recover can@0
recovering, no timeout
```

The subcommand accepts an optional bus recovery timeout in milliseconds. If no timeout is specified, the command will wait indefinitely for the bus recovery to succeed.

---

**Note:** The `recover` subcommand is only available if `CONFIG_CAN_AUTO_BUS_OFF_RECOVERY` is disabled.

---

### 7.6.9 Chargers

The charger subsystem exposes an API to uniformly access battery charger devices.

**Basic Operation**

**Initiating a Charge Cycle**  A charge cycle is initiated or terminated using `charger_charge_enable()`.

**Properties**  Fundamentally, a property is a configurable setting, state, or quantity that a charger device can measure.

Chargers typically support multiple properties, such as temperature readings of the battery-pack or present-time current/voltage.

Properties are fetched by the client one at a time using `charger_get_prop()`. Properties are set by the client one at a time using `charger_set_prop()`.

**API Reference**

```
group charger_interface
    Charger Interface.
```
Typedefs

typedef uint16_t charger_prop_t
    A charger property's identifier.
    See charger_property for a list of identifiers

typedef int (*charger_get_property_t)(const struct device *dev, const charger_prop_t prop, union charger_propval *val)
    Callback API for getting a charger property.
    See charger_get_property() for argument description

typedef int (*charger_set_property_t)(const struct device *dev, const charger_prop_t prop, const union charger_propval *val)
    Callback API for setting a charger property.
    See charger_set_property() for argument description

typedef int (*charger_charge_enable_t)(const struct device *dev, const bool enable)
    Callback API enabling or disabling a charge cycle.
    See charger_charge_enable() for argument description

Enums

enum charger_property
    Runtime Dynamic Battery Parameters.
    Values:

    enumerator CHARGER_PROP_ONLINE = 0
        Indicates if external supply is present for the charger.
        Value should be of type enum charger_online

    enumerator CHARGER_PROP_PRESENT
        Reports whether or not a battery is present.
        Value should be of type bool

    enumerator CHARGER_PROP_STATUS
        Represents the charging status of the charger.
        Value should be of type enum charger_status

    enumerator CHARGER_PROP_CHARGE_TYPE
        Represents the charging algo type of the charger.
        Value should be of type enum charger_charge_type

    enumerator CHARGER_PROP_HEALTH
        Represents the health of the charger.
        Value should be of type enum charger_health
enumerator CHARGER_PROP_CONSTANT_CHARGE_CURRENT_UA
    Configuration of current sink used for charging in µA.

denumerator CHARGER_PROP_PRECHARGE_CURRENT_UA
    Configuration of current sink used for conditioning in µA.

denumerator CHARGER_PROP_CHARGE_TERM_CURRENT_UA
    Configuration of charge termination target in µA.

denumerator CHARGER_PROP_CONSTANT_CHARGE_VOLTAGE_UV
    Configuration of charge voltage regulation target in µV.

denumerator CHARGER_PROP_INPUT_REGULATION_CURRENT_UA
    Configuration of the input current regulation target in µA.
    This value is a rising current threshold that is regulated by reducing the charge current output

denumerator CHARGER_PROP_INPUT_REGULATION_VOLTAGE_UV
    Configuration of the input voltage regulation target in µV.
    This value is a falling voltage threshold that is regulated by reducing the charge current output

denumerator CHARGER_PROP_INPUT_CURRENT_NOTIFICATION
    Configuration to issue a notification to the system based on the input current level and timing.
    Value should be of type struct charger_input_current_notifier

denumerator CHARGER_PROP_COMMON_COUNT
    Reserved to demark end of common charger properties.

denumerator CHARGER_PROP_CUSTOM_BEGIN = CHARGER_PROP_COMMON_COUNT + 1
    Reserved to demark downstream custom properties - use this value as the actual value may change over future versions of this API.

denumerator CHARGER_PROP_MAX = UINT16_MAX
    Reserved to demark end of valid enum properties.

denum charger_online
    External supply states.
    Values:

denumerator CHARGER_ONLINE_OFFLINE = 0
    External supply not present.

denumerator CHARGER_ONLINE_FIXED
    External supply is present and of fixed output.
enumerator CHARGER_ONLINE_PROGRAMMABLE
   External supply is present and of programmable output.

enum charger_status
   Charging states.
   Values:

   enumerator CHARGER_STATUS_UNKNOWN = 0
      Charging device state is unknown.

   enumerator CHARGER_STATUS_CHARGING
      Charging device is charging a battery.

   enumerator CHARGER_STATUS_DISCHARGING
      Charging device is not able to charge a battery.

   enumerator CHARGER_STATUS_NOT_CHARGING
      Charging device is not charging a battery.

   enumerator CHARGER_STATUS_FULL
      The battery is full and the charging device will not attempt charging.

enum charger_charge_type
   Charge algorithm types.
   Values:

   enumerator CHARGER_CHARGE_TYPE_UNKNOWN = 0
      Charge type is unknown.

   enumerator CHARGER_CHARGE_TYPE_NONE
      Charging is not occurring.

   enumerator CHARGER_CHARGE_TYPE_TRICKLE
      Charging is occurring at the slowest desired charge rate, typically for battery de-
      tection or preconditioning.

   enumerator CHARGER_CHARGE_TYPE_FAST
      Charging is occurring at the fastest desired charge rate.

   enumerator CHARGER_CHARGE_TYPE_STANDARD
      Charging is occurring at a moderate charge rate.

   enumerator CHARGER_CHARGE_TYPE_ADAPTIVE

   enumerator CHARGER_CHARGE_TYPE_LONGLIFE

   enumerator CHARGER_CHARGE_TYPE_BYPASS

7.6. Peripherals
enum charger_health
Charger health conditions.
These conditions determine the ability to, or the rate of, charge
Values:

enumerator CHARGER_HEALTH_UNKNOWN = 0
Charger health condition is unknown.

enumerator CHARGER_HEALTH_GOOD
Charger health condition is good.

enumerator CHARGER_HEALTH_OVERHEAT
The charger device is overheated.

enumerator CHARGER_HEALTH_OVERVOLTAGE
The battery voltage has exceeded its overvoltage threshold.

enumerator CHARGER_HEALTH_UNSPEC_FAILURE
The battery or charger device is experiencing an unspecified failure.

enumerator CHARGER_HEALTH_COLD
The battery temperature is below the “cold” threshold.

enumerator CHARGER_HEALTH_WATCHDOG_TIMER_EXPIRE
The charger device's watchdog timer has expired.

enumerator CHARGER_HEALTH_SAFETY_TIMER_EXPIRE
The charger device's safety timer has expired.

enumerator CHARGER_HEALTH_CALIBRATION_REQUIRED
The charger device requires calibration.

enumerator CHARGER_HEALTH_WARM
The battery temperature is in the “warm” range.

enumerator CHARGER_HEALTH_COOL
The battery temperature is in the “cool” range.

enumerator CHARGER_HEALTH_HOT
The battery temperature is below the “hot” threshold.

enumerator CHARGER_HEALTH_NO_BATTERY
The charger device does not detect a battery.

enum charger_notification_severity
Charger severity levels for system notifications.
Values:
enumerator CHARGER_SEVERITY_PEAK = 0
   Most severe level, typically triggered instantaneously.

enumerator CHARGER_SEVERITY_CRITICAL
   More severe than the warning level, less severe than peak.

enumerator CHARGER_SEVERITY_WARNING
   Base severity level.

Functions

int charger_get_prop(const struct device *dev, const charger_prop_t prop, union charger_propval *val)
Fetch a battery charger property.

Parameters
   • dev – Pointer to the battery charger device
   • prop – Charger property to get
   • val – Pointer to charger_propval union

Return values
   • 0 – if successful
   • < 0 if getting property failed

int charger_set_prop(const struct device *dev, const charger_prop_t prop, const union charger_propval *val)
Set a battery charger property.

Parameters
   • dev – Pointer to the battery charger device
   • prop – Charger property to set
   • val – Pointer to charger_propval union

Return values
   • 0 – if successful
   • < 0 if setting property failed

int charger_charge_enable(const struct device *dev, const bool enable)
Enable or disable a charge cycle.

Parameters
   • dev – Pointer to the battery charger device
   • enable – true enables a charge cycle, false disables a charge cycle

Return values
   • 0 – if successful
   • -EIO – if communication with the charger failed
   • -EINVAL – if the conditions for initiating charging are invalid

struct charger_current_notifier
#include <charger.h> The input current thresholds for the charger to notify the system.
Public Members

`uint8_t severity`

The severity of the notification where CHARGER_SEVERITY_PEAK is the most severe.

`uint32_t current_ua`

The current threshold to be exceeded.

`uint32_t duration_us`

The duration of excess current before notifying the system.

union `charger_propval`

#include <charger.h> container for a charger_property value

Public Members

`enum charger_online online`

CHARGER_PROP_ONLINE.

`bool present`

CHARGER_PROP_PRESENT.

`enum charger_status status`

CHARGER_PROP_STATUS.

`enum charger_charge_type charge_type`

CHARGER_PROP_CHARGE_TYPE.

`enum charger_health health`

CHARGER_PROP_HEALTH.

`uint32_t const_charge_current_ua`

CHARGER_PROP_CONSTANT_CHARGE_CURRENT_UA.

`uint32_t precharge_current_ua`

CHARGER_PROP_PRECHARGE_CURRENT_UA.

`uint32_t charge_term_current_ua`

CHARGER_PROP_CHARGE_TERM_CURRENT_UA.

`uint32_t const_charge_voltage_uv`

CHARGER_PROP_CONSTANT_CHARGE_VOLTAGE_UV.

`uint32_t input_current_regulation_current_ua`

CHARGER_PROP_INPUT_REGULATION_CURRENT_UA.
7.6.10 Coredump Device

Overview

The coredump device is a pseudo-device driver with two types. A COREDUMP_TYPE_MEMCPY type exposes device tree bindings for memory address/size values to be included in any dump. And the driver exposes an API to add/remove dump memory regions at runtime. A COREDUMP_TYPE_CALLBACK device requires exactly one entry in the memory-regions array with a size of 0 and a desired size. The driver will statically allocate memory of the desired size and provide an API to register a callback function to fill that memory when a dump occurs.

Configuration Options

Related configuration options:

- CONFIG_COREDUMP_DEVICE

API Reference

group coredump_device_interface

Coredump pseudo-device driver APIs.

Typedefs

typedef void (*coredump_dump_callback_t)(uintptr_t dump_area, size_t dump_area_size)

Callback that occurs at dump time, data copied into dump_area will be included in the dump that is generated.

Param dump_area
Pointer to area to copy data into for inclusion in dump

Param dump_area_size
Size of available memory at dump_area

Functions
static inline bool coredump_device_register_memory(const struct device *dev, struct coredump_mem_region_node *region)

Register a region of memory to be stored in core dump at the time it is generated.

Parameters
• dev – Pointer to the device structure for the driver instance.
• region – Struct describing memory to be collected

Returns
true if registration succeeded

static inline bool coredump_device_unregister_memory(const struct device *dev, struct coredump_mem_region_node *region)

Unregister a region of memory to be stored in core dump at the time it is generated.

Parameters
• dev – Pointer to the device structure for the driver instance.
• region – Struct describing memory to be collected

Returns
true if unregistration succeeded

static inline bool coredump_device_register_callback(const struct device *dev, coredump_dump_callback_t callback)

Register a callback to be invoked at dump time.

Parameters
• dev – Pointer to the device structure for the driver instance.
• callback – Callback to be invoked at dump time

Returns
true if registration succeeded

Returns
false if registration failed

struct coredump_mem_region_node
#include <coredump.h> Structure describing a region in memory that may be stored in core dump at the time it is generated.

Instances of this are passed to the coredump_device_register_memory() and coredump_device_unregister_memory() functions to indicate addition and removal of memory regions to be captured

Public Members

sys_snodet node
Node of single-linked list, do not modify.
uintptr_t start
   Address of start of memory region.

size_t size
   Size of memory region.

7.6.11 Counter

Overview

API Reference

Related code samples

Counter Alarm
   Implement an alarm application using the counter API.

DS3231 TCXO RTC
   Interact with a DS3231 real-time clock using the counter API and dedicated driver API.

group counter_interface
   Counter Interface.

Counter device capabilities

COUNTER_CONFIG_INFO_COUNT_UP
   Counter count up flag.

Flags used by counter_top_cfg.

COUNTER_TOP_CFG_DONT_RESET
   Flag preventing counter reset when top value is changed.
   If flags is set then counter is free running while top value is updated, otherwise counter is reset (see counter_set_top_value()).

COUNTER_TOP_CFG_RESET_WHEN_LATE
   Flag instructing counter to reset itself if changing top value results in counter going out of new top value bound.
   See COUNTER_TOP_CFG_DONT_RESET.
Alarm configuration flags

Used in alarm configuration structure (counter_alarm_cfg).

COUNTER_ALARM_CFG_ABSOLUTE
Counter alarm absolute value flag.
Ticks relation to counter value. If set ticks are treated as absolute value, else it is relative to the counter reading performed during the call.

COUNTER_ALARM_CFG_EXPIRE_WHEN_LATE
Alarm flag enabling immediate expiration when driver detects that absolute alarm was set too late.
Alarm callback must be called from the same context as if it was set on time.

Counter guard period flags

Used by counter_set_guard_period and counter_get_guard_period.

COUNTER_GUARD_PERIOD_LATE_TO_SET
Identifies guard period needed for detection of late setting of absolute alarm (see counter_set_channel_alarm).

Typedefs

typedef void (*counter_alarm_callback_t)(const struct device *dev, uint8_t chan_id, uint32_t ticks, void *user_data)
   Alarm callback.
   
   Param dev
       Pointer to the device structure for the driver instance.

   Param chan_id
       Channel ID.

   Param ticks
       Counter value that triggered the alarm.

   Param user_data
       User data.

typedef void (*counter_top_callback_t)(const struct device *dev, void *user_data)
   Callback called when counter turns around.
   
   Param dev
       Pointer to the device structure for the driver instance.

   Param user_data
       User data provided in counter_set_top_value.

typedef int (*counter_api_start)(const struct device *dev)

typedef int (*counter_api_stop)(const struct device *dev)
typedef int (*counter_api_get_value)(const struct device *dev, uint32_t *ticks)

typedef int (*counter_api_get_value_64)(const struct device *dev, uint64_t *ticks)

typedef int (*counter_api_set_alarm)(const struct device *dev, uint8_t chan_id, const struct counter_alarm_cfg *alarm_cfg)

typedef int (*counter_api_cancel_alarm)(const struct device *dev, uint8_t chan_id)

typedef int (*counter_api_set_top_value)(const struct device *dev, const struct counter_top_cfg *cfg)

typedef uint32_t (*counter_api_get_pending_int)(const struct device *dev)

typedef uint32_t (*counter_api_get_top_value)(const struct device *dev)

typedef uint32_t (*counter_api_get_guard_period)(const struct device *dev, uint32_t flags)

typedef int (*counter_api_set_guard_period)(const struct device *dev, uint32_t ticks, uint32_t flags)

typedef uint32_t (*counter_api_get_freq)(const struct device *dev)

Functions

bool counter_is_counting_up(const struct device *dev)
Function to check if counter is counting up.

   Parameters
     • dev – [in] Pointer to the device structure for the driver instance.

   Return values
     • true – if counter is counting up.
     • false – if counter is counting down.

uint8_t counter_get_num_of_channels(const struct device *dev)
Function to get number of alarm channels.

   Parameters
     • dev – [in] Pointer to the device structure for the driver instance.

   Returns
     Number of alarm channels.

uint32_t counter_get_frequency(const struct device *dev)
Function to get counter frequency.

   Parameters
     • dev – [in] Pointer to the device structure for the driver instance.
Returns
Frequency of the counter in Hz, or zero if the counter does not have a fixed
frequency.

uint32_t counter_us_to_ticks(const struct device *dev, uint64_t us)
Function to convert microseconds to ticks.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Returns
Converted ticks. Ticks will be saturated if exceed 32 bits.

uint64_t counter_ticks_to_us(const struct device *dev, uint32_t ticks)
Function to convert ticks to microseconds.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• ticks – [in] Ticks.

Returns
Converted microseconds.

uint32_t counter_get_max_top_value(const struct device *dev)
Function to retrieve maximum top value that can be set.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Returns
Max top value.

int counter_start(const struct device *dev)
Start counter device in free running mode.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• Negative – errno code if failure.

int counter_stop(const struct device *dev)
Stop counter device.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• -ENOTSUP – if the device doesn’t support stopping the counter.

int counter_get_value(const struct device *dev, uint32_t *ticks)
Get current counter value.

Parameters
• dev – Pointer to the device structure for the driver instance.
• ticks – Pointer to where to store the current counter value
Return values

- 0 – If successful.
- Negative – error code on failure getting the counter value

```c
int counter_get_value_64(const struct device *dev, uint64_t *ticks)
```
Get current counter 64-bit value.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `ticks` – Pointer to where to store the current counter value

**Return values**

- 0 – If successful.
- Negative – error code on failure getting the counter value

```c
int counter_set_channel_alarm(const struct device *dev, uint8_t chan_id, const struct counter_alarm_cfg *alarm_cfg)
```
Set a single shot alarm on a channel.

After expiration alarm can be set again, disabling is not needed. When alarm expiration handler is called, channel is considered available and can be set again in that context.

**Note:** API is not thread safe.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `chan_id` – Channel ID.
- `alarm_cfg` – Alarm configuration.

**Return values**

- 0 – If successful.
- -ENOTSUP – if request is not supported (device does not support interrupts or requested channel).
- -EINVAL – if alarm settings are invalid.
- -ETIME – if absolute alarm was set too late.
- -EBUSY – if alarm is already active.

```c
int counter_cancel_channel_alarm(const struct device *dev, uint8_t chan_id)
```
Cancel an alarm on a channel.

**Note:** API is not thread safe.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `chan_id` – Channel ID.

**Return values**

- 0 – If successful.
-ENOTSUP – if request is not supported or the counter was not started yet.

```c
int counter_set_top_value(const struct device *dev, const struct counter_top_cfg *cfg)
```

Set counter top value.

Function sets top value and optionally resets the counter to 0 or top value depending on counter direction. On turnaround, counter can be reset and optional callback is periodically called. Top value can only be changed when there is no active channel alarm.

`COUNTER_TOP_CFG_DONT_RESET` prevents counter reset. When counter is running while top value is updated, it is possible that counter progresses outside the new top value. In that case, error is returned and optionally driver can reset the counter (see `COUNTER_TOP_CFG_RESET_WHEN_LATE`).

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **cfg** – Configuration. Cannot be NULL.

**Return values**

- **0** – If successful.
- -ENOTSUP – if request is not supported (e.g. top value cannot be changed or counter cannot/must be reset during top value update).
- -EBUSY – if any alarm is active.
- -ETIME – if `COUNTER_TOP_CFG_DONT_RESET` was set and new top value is smaller than current counter value (counter counting up).

```c
int counter_get_pending_int(const struct device *dev)
```

Function to get pending interrupts.

The purpose of this function is to return the interrupt status register for the device. This is especially useful when waking up from low power states to check the wake up source.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.

**Return values**

- **1** – if any counter interrupt is pending.
- **0** – if no counter interrupt is pending.

```c
uint32_t counter_get_top_value(const struct device *dev)
```

Function to retrieve current top value.

**Parameters**

- **dev** – [in] Pointer to the device structure for the driver instance.

**Returns**

Top value.

```c
int counter_set_guard_period(const struct device *dev, uint32_t ticks, uint32_t flags)
```

Set guard period in counter ticks.

When setting an absolute alarm value close to the current counter value there is a risk that the counter will have counted past the given absolute value before the driver manages to activate the alarm. If this would go unnoticed then the alarm would only expire after the timer has wrapped and reached the given absolute value again after a full timer period. This could take a long time in case of a 32 bit timer. Setting a
sufficiently large guard period will help the driver detect unambiguously whether it is late or not.

The guard period should be as many counter ticks as the driver will need at most to actually activate the alarm after the driver API has been called. If the driver finds that the counter has just passed beyond the given absolute tick value but is still close enough to fall within the guard period, it will assume that it is “late”, i.e. that the intended expiry time has already passed. Depending on the `COUNTER_ALARM_CFG_EXPIRE_WHEN_LATE` flag the driver will either ignore the alarm or expire it immediately in such a case.

If, however, the counter is past the given absolute tick value but outside the guard period, then the driver will assume that this is intentional and let the counter wrap around to/from zero before it expires.

More precisely:

- When counting upwards (see `COUNTER_CONFIG_INFO_COUNT_UP`) the given absolute tick value must be above `(now + guard_period) % top_value` to be accepted by the driver.

- When counting downwards, the given absolute tick value must be less than `(now + top_value - guard_period) % top_value` to be accepted.

Examples:

- counting upwards, now = 4950, top value = 5000, guard period = 100: absolute tick value >= `(4950 + 100) % 5000 = 50`

- counting downwards, now = 50, top value = 5000, guard period = 100: absolute tick value <= `(50 + 5000 - * 100) % 5000 = 4950`

If you need only short alarm periods, you can set the guard period very high (e.g. half of the counter top value) which will make it highly unlikely that the counter will ever unintentionally wrap.

The guard period is set to 0 on initialization (no protection).

**Parameters**

- dev – Pointer to the device structure for the driver instance.

- ticks – Guard period in counter ticks.

- flags – See `COUNTER_GUARD_PERIOD_FLAGS`.

**Return values**

- 0 – if successful.

- -ENOTSUP – if function or flags are not supported.

- -EINVAL – if ticks value is invalid.

```c
uint32_t counter_get_guard_period(const struct device *dev, uint32_t flags)
```

Return guard period.

**See also:**

`counter_set_guard_period`.

**Parameters**

- dev – Pointer to the device structure for the driver instance.
• **flags** – See `COUNTER_GUARD_PERIOD_FLAGS`.

**Returns**

Guard period given in counter ticks or 0 if function or flags are not supported.

```c
struct counter_alarm_cfg
#include <counter.h> Alarm callback structure.
```

**Public Members**

- `counter_alarm_callback_t callback`  
  Callback called on alarm (cannot be NULL).

```c
uint32_t ticks
Number of ticks that triggers the alarm.
```

It can be relative (to now) or an absolute value (see `COUNTER_ALARM_CFG_ABSOLUTE`). Both, relative and absolute, alarm values can be any value between zero and the current top value (see `counter_get_top_value`). When setting an absolute alarm value close to the current counter value there is a risk that the counter will have counted past the given absolute value before the driver manages to activate the alarm. Therefore a guard period can be defined that lets the driver decide unambiguously whether it is late or not (see `counter_set_guard_period`). If the counter is clock driven then ticks can be converted to microseconds (see `counter_ticks_to_us`). Alternatively, the counter implementation may count asynchronous events.

```c
void *user_data
User data returned in callback.
```

```c
uint32_t flags
Alarm flags (see `COUNTER_ALARM_FLAGS`).
```

```c
struct counter_top_cfg
#include <counter.h> Top value configuration structure.
```

**Public Members**

```c
uint32_t ticks
Top value.
```

```c
counter_top_callback_t callback
Callback function (can be NULL).
```

```c
void *user_data
User data passed to callback function (not valid if callback is NULL).
```

```c
uint32_t flags
Flags (see `COUNTER_TOP_FLAGS`).
```
struct counter_config_info

#include <counter.h> Structure with generic counter features.

Public Members

uint32_t max_top_value
Maximal (default) top value on which counter is reset (cleared or reloaded).

uint32_t freq
Frequency of the source clock if synchronous events are counted.

uint8_t flags
Flags (see COUNTER_FLAGS).

uint8_t channels
Number of channels that can be used for setting alarm.

7.6.12 Digital-to-Analog Converter (DAC)

Overview

The DAC API provides access to Digital-to-Analog Converter (DAC) devices.

Configuration Options

Related configuration options:

- CONFIG_DAC

API Reference

Related code samples

Digital-to-Analog Converter (DAC)
Generate an analog sawtooth signal using the DAC driver API.

group dac_interface
DAC driver APIs.
Functions

int dac_channel_setup(const struct device *dev, const struct dac_channel_cfg *channel_cfg)

Configure a DAC channel.

It is required to call this function and configure each channel before it is selected for a write request.

Parameters

• dev – Pointer to the device structure for the driver instance.
• channel_cfg – Channel configuration.

Return values

• 0 – On success.
• -EINVAL – If a parameter with an invalid value has been provided.
• -ENOTSUP – If the requested resolution is not supported.

int dac_write_value(const struct device *dev, uint8_t channel, uint32_t value)

Write a single value to a DAC channel.

Parameters

• dev – Pointer to the device structure for the driver instance.
• channel – Number of the channel to be used.
• value – Data to be written to DAC output registers.

Return values

• 0 – On success.
• -EINVAL – If a parameter with an invalid value has been provided.

struct dac_channel_cfg

#include <dac.h> Structure for specifying the configuration of a DAC channel.

Public Members

uint8_t channel_id
    Channel identifier of the DAC that should be configured.

uint8_t resolution
    Desired resolution of the DAC (depends on device capabilities).

bool buffered
    Enable output buffer for this channel.
    This is relevant for instance if the output is directly connected to the load, without an amplifier in between. The actual details on this are hardware dependent.
7.6.13 Direct Memory Access (DMA)

Overview

Direct Memory Access (Controller) is a commonly provided type of co-processor that can typically offload transferring data to and from peripherals and memory.

The DMA API is not a portable API and really cannot be as each DMA has unique memory requirements, peripheral interactions, and features. The API in effect provides a union of all useful DMA functionality drivers have needed in the tree. It can still be a good abstraction, with care, for peripheral devices for vendors where the DMA IP might be very similar but have slight variances.

Driver Implementation Expectations

Synchronization and Ownership From an API point of view, a DMA channel is a single-owner object, meaning the drivers should not attempt to wrap a channel with kernel synchronization primitives such as mutexes or semaphores. If DMA channels require mutating shared registers, those register updates should be wrapped in a spin lock.

This enables the entire API to be low-cost and callable from any call context, including ISRs where it may be very useful to start/stop/suspend/resume/reload a channel transfer.

Transfer Descriptor Memory Management Drivers should not attempt to use heap allocations of any kind. If object pools are needed for transfer descriptors then those should be setup in a way that does not break the promise of ISR-allowable calls. Many drivers choose to create a simple static descriptor array per channel with the size of the descriptor array adjustable using Kconfig.

Channel State Machine Expectations DMA channels should be viewed as state machines that the DMA API provides transition events for in the form of API calls. Every driver is expected to maintain its own channel state tracking. The busy state of the channel should be inspectable at any time with `dma_get_status()`.

A diagram showing those expected possible state transitions and their API calls is provided here for reference.

API Reference

```markdown

group dma_interface

DMA Interface.

Defines

DMA_STATUS_COMPLETE
    The DMA callback event has occurred at the completion of a transfer list.

DMA_STATUS_BLOCK
    The DMA callback has occurred at the completion of a single transfer block in a transfer list.
```

7.6. Peripherals
Fig. 2: DMA state finite state machine
DMA_MAGIC
Magic code to identify context content.

DMA_BUF_ADDR_ALIGNMENT(node)
Get the device tree property describing the buffer address alignment.
Useful when statically defining or allocating buffers for DMA usage where memory alignment often matters.

Parameters
- node – Node identifier, e.g. DT_NODELABEL(dma_0)

Returns
alignment Memory byte alignment required for DMA buffers

DMA_BUF_SIZE_ALIGNMENT(node)
Get the device tree property describing the buffer size alignment.
Useful when statically defining or allocating buffers for DMA usage where memory alignment often matters.

Parameters
- node – Node identifier, e.g. DT_NODELABEL(dma_0)

Returns
alignment Memory byte alignment required for DMA buffers

DMA_COPY_ALIGNMENT(node)
Get the device tree property describing the minimal chunk of data possible to be copied.

Parameters
- node – Node identifier, e.g. DT_NODELABEL(dma_0)

Returns
minimal Minimal chunk of data possible to be copied

TypeDefs

typedef void (*dma_callback_t)(const struct device *dev, void *user_data, uint32_t
channel, int status)
Callback function for DMA transfer completion.
If enabled, callback function will be invoked at transfer or block completion, or when an error happens. In circular mode, status indicates that the DMA device has reached either the end of the buffer (DMA_STATUS_COMPLETE) or a water mark (DMA_STATUS_BLOCK).

Param dev
Pointer to the DMA device calling the callback.

Param user_data
A pointer to some user data or NULL

Param channel
The channel number

Param status
Status of the transfer
- DMA_STATUS_COMPLETE buffer fully consumed
- DMA_STATUS_BLOCK buffer consumption reached a configured block or water mark
- A negative errno otherwise

**Enums**

```c
enum dma_channel_direction
    DMA channel direction.
    Values:

    enumerator MEMORY_TO_MEMORY = 0x0
        Memory to memory.

    enumerator MEMORY_TO_PERIPHERAL
        Memory to peripheral.

    enumerator PERIPHERAL_TO_MEMORY
        Peripheral to memory.

    enumerator PERIPHERAL_TO_PERIPHERAL
        Peripheral to peripheral.

    enumerator HOST_TO_MEMORY
        Host to memory.

    enumerator MEMORY_TO_HOST
        Memory to host.

    enumerator DMA_CHANNEL_DIRECTION_COMMON_COUNT
        Number of all common channel directions.

    enumerator DMA_CHANNEL_DIRECTION_PRIV_START = DMA_CHANNEL_DIRECTION_COMMON_COUNT
        This and higher values are dma controller or soc specific.
        Refer to the specified dma driver header file.

    enumerator DMA_CHANNEL_DIRECTION_MAX = 0x7
        Maximum allowed value (3 bit field!)

enum dma_addr_adj
    DMA address adjustment.
    Valid values for source_addr_adj and dest_addr_adj
    Values:

    enumerator DMA_ADDR_ADJ_INCREMENT
        Increment the address.
```
enumerator DMA_ADDR_ADJ_DECREMENT
    Decrement the address.

dma_channel_filter
    DMA channel attributes.
    Values:
    enumerator DMA_CHANNEL_NORMAL
    enumerator DMA_CHANNEL_PERIODIC

dma_attribute_type
    DMA attributes.
    Values:
    enumerator DMA_ATTR_BUFFER_ADDRESS_ALIGNMENT
    enumerator DMA_ATTR_BUFFER_SIZE_ALIGNMENT
    enumerator DMA_ATTR_COPY_ALIGNMENT
    enumerator DMA_ATTR_MAX_BLOCK_COUNT

Functions

static inline int dma_config(const struct device *dev, uint32_t channel, struct dma_config *config)

Configure individual channel for DMA transfer.

Parameters

• dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel to configure
• config – Data structure containing the intended configuration for the selected channel

Return values

• 0 – if successful.
• Negative – errno code if failure.

static inline int dma_reload(const struct device *dev, uint32_t channel, uint32_t src, uint32_t dst, size_t size)

Reload buffer(s) for a DMA channel.

Parameters

• dev – Pointer to the device structure for the driver instance.
• **channel** – Numeric identification of the channel to configure selected channel
• **src** – source address for the DMA transfer
• **dst** – destination address for the DMA transfer
• **size** – size of DMA transfer

**Return values**
• **0** – if successful.
• **Negative** – errno code if failure.

```c
int dma_start(const struct device *dev, uint32_t channel)
```

Enables DMA channel and starts the transfer, the channel must be configured beforehand.

Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid.

Start is allowed on channels that have already been started and must report success.

**Function properties (list may not be complete)**

**isr-ok**

**Parameters**
• **dev** – Pointer to the device structure for the driver instance.
• **channel** – Numeric identification of the channel where the transfer will be processed

**Return values**
• **0** – if successful.
• **Negative** – errno code if failure.

```c
int dma_stop(const struct device *dev, uint32_t channel)
```

Stops the DMA transfer and disables the channel.

Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid.

Stop is allowed on channels that have already been stopped and must report success.

**Function properties (list may not be complete)**

**isr-ok**

**Parameters**
• **dev** – Pointer to the device structure for the driver instance.
• **channel** – Numeric identification of the channel where the transfer was being processed

**Return values**
• **0** – if successful.
• **Negative** – errno code if failure.
int dma_suspend(const struct device *dev, uint32_t channel)
    Suspend a DMA channel transfer.
    Implementations must check the validity of the channel state and ID passed in and return -EINVAL if either are invalid.

Function properties (list may not be complete)
isr-ok

Parameters
• dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel to suspend

Return values
• 0 – If successful.
• -ENOSYS – If not implemented.
• -EINVAL – If invalid channel id or state.
• -errno – Other negative errno code failure.

int dma_resume(const struct device *dev, uint32_t channel)
    Resume a DMA channel transfer.
    Implementations must check the validity of the channel state and ID passed in and return -EINVAL if either are invalid.

Function properties (list may not be complete)
isr-ok

Parameters
• dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel to resume

Return values
• 0 – If successful.
• -ENOSYS – If not implemented
• -EINVAL – If invalid channel id or state.
• -errno – Other negative errno code failure.

int dma_request_channel(const struct device *dev, void *filter_param)
    request DMA channel.
    request DMA channel resources return -EINVAL if there is no valid channel available.

Function properties (list may not be complete)
isr-ok

Parameters
• dev – Pointer to the device structure for the driver instance.
• filter_param – filter function parameter
Return values

• *dma* – channel if successful.
• *Negative* – errno code if failure.

```c
void dma_release_channel(const struct device *dev, uint32_t channel)
```

release DMA channel.
release DMA channel resources

Function properties (list may not be complete)

`isr-ok`

Parameters

• *dev* – Pointer to the device structure for the driver instance.
• *channel* – channel number

```c
int dma_chan_filter(const struct device *dev, int channel, void *filter_param)
```

DMA channel filter.
filter channel by attribute

Parameters

• *dev* – Pointer to the device structure for the driver instance.
• *channel* – channel number
• *filter_param* – filter attribute

Return values

• *Negative* – errno code if not support

```c
static inline int dma_get_status(const struct device *dev, uint32_t channel, struct dma_status *stat)
```

get current runtime status of DMA transfer
Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid or -ENOSYS if not supported.

Function properties (list may not be complete)

`isr-ok`

Parameters

• *dev* – Pointer to the device structure for the driver instance.
• *channel* – Numeric identification of the channel where the transfer was being processed
• *stat* – a non-NULL *dma_status* object for storing DMA status

Return values

• *non-negative* – if successful.
• *Negative* – errno code if failure.
static inline int dma_get_attribute(const struct device *dev, uint32_t type, uint32_t *value)

get attribute of a dma controller

This function allows to get a device specific static or runtime attribute like required address and size alignment of a buffer. Implementations must check the validity of the type passed in and return -EINVAL if it is invalid or -ENOSYS if not supported.

Function properties (list may not be complete)

isr-ok

Parameters

• dev – Pointer to the device structure for the driver instance.
• type – Numeric identification of the attribute
• value – A non-NULL pointer to the variable where the read value is to be placed

Return values

• non-negative – if successful.
• Negative – errno code if failure.

static inline uint32_t dma_width_index(uint32_t size)

Look-up generic width index to be used in registers.

Warning: This look-up works for most controllers, but may not work for yours. Ensure your controller expects the most common register bit values before using this convenience function. If your controller does not support these values, you will have to write your own look-up inside the controller driver.

Parameters

• size – width of bus (in bytes)

Return values

common – DMA index to be placed into registers.

static inline uint32_t dma_burst_index(uint32_t burst)

Look-up generic burst index to be used in registers.

Warning: This look-up works for most controllers, but may not work for yours. Ensure your controller expects the most common register bit values before using this convenience function. If your controller does not support these values, you will have to write your own look-up inside the controller driver.

Parameters

• burst – number of bytes to be sent in a single burst

Return values

common – DMA index to be placed into registers.
struct dma_block_config

#include <dma.h> DMA block configuration structure.

Aside from source address, destination address, and block size many of these options are hardware and driver dependent.

**Public Members**

```c
uint32_t source_address
    block starting address at source
```

```c
uint32_t dest_address
    block starting address at destination
```

```c
uint32_t source_gather_interval
    Address adjustment at gather boundary.
```

```c
uint32_t dest_scatter_interval
    Address adjustment at scatter boundary.
```

```c
uint16_t dest_scatter_count
    Continuous transfer count between scatter boundaries.
```

```c
uint16_t source_gather_count
    Continuous transfer count between gather boundaries.
```

```c
uint32_t block_size
    Number of bytes to be transferred for this block.
```

```c
struct dma_block_config *next_block
    Pointer to next block in a transfer list.
```

```c
uint16_t source_gather_en
    Enable source gathering when set to 1.
```

```c
uint16_t dest_scatter_en
    Enable destination scattering when set to 1.
```

```c
uint16_t source_addr_adj
    Source address adjustment option.
```

- 0b00 increment
- 0b01 decrement
- 0b10 no change

```c
uint16_t dest_addr_adj
    Destination address adjustment.
```

- 0b00 increment
• 0b01 decrement
• 0b10 no change

uint16_t source_reload_en
Reload source address at the end of block transfer.

uint16_t dest_reload_en
Reload destination address at the end of block transfer.

uint16_t fifo_mode_control
FIFO fill before starting transfer, HW specific meaning.

uint16_t flow_control_mode
Transfer flow control mode.

• 0b0 source request service upon data availability
• 0b1 source request postponed until destination request happens

struct dma_config
#include <dma.h> DMA configuration structure.

**Public Members**

uint32_t dma_slot
Which peripheral and direction, HW specific.

uint32_t channel_direction
Direction the transfers are occurring.

• 0b000 memory to memory,
• 0b001 memory to peripheral,
• 0b010 peripheral to memory,
• 0b011 peripheral to peripheral,
• 0b100 host to memory
• 0b101 memory to host
• others hardware specific

uint32_t complete_callback_en
Completion callback enable.

• 0b0 callback invoked at transfer list completion only
• 0b1 callback invoked at completion of each block

uint32_t error_callback_en
Error callback enable.

• 0b0 error callback enabled
• 0b1 error callback disabled
uint32_t source_handshake
    Source handshake, HW specific.
    • 0b0 HW
    • 0b1 SW

uint32_t dest_handshake
    Destination handshake, HW specific.
    • 0b0 HW
    • 0b1 SW

uint32_t channel_priority
    Channel priority for arbitration, HW specific.

uint32_t source_chaining_en
    Source chaining enable, HW specific.

uint32_t dest_chaining_en
    Destination chaining enable, HW specific.

uint32_t linked_channel
    Linked channel, HW specific.

uint32_t cyclic
    Cyclic transfer list, HW specific.

uint32_t source_data_size
    Width of source data (in bytes)

uint32_t dest_data_size
    Width of destination data (in bytes)

uint32_t source_burst_length
    Source burst length in bytes.

uint32_t dest_burst_length
    Destination burst length in bytes.

uint32_t block_count
    Number of blocks in transfer list.

struct dma_block_config *head_block
    Pointer to the first block in the transfer list.

void *user_data
    Optional attached user data for callbacks.
dma_callback_t dma_callback
   Optional callback for completion and error events.

struct dma_status
   #include <dma.h> DMA runtime status structure.

Public Members

bool busy
   Is the current DMA transfer busy or idle.

enum dma_channel_direction dir
   Direction fo the transfer.

uint32_t pending_length
   Pending length to be transferred in bytes, HW specific.

uint32_t free
   Available buffers space, HW specific.

uint32_t write_position
   Write position in circular DMA buffer, HW specific.

uint32_t read_position
   Read position in circular DMA buffer, HW specific.

uint64_t total_copied
   Total copied, HW specific.

struct dma_context
   #include <dma.h> DMA context structure Note: the dma_context shall be the first member of DMA client driver Data, got by dev->data.

Public Members

int32_t magic
   magic code to identify the context

int dma_channels
   number of dma channels

atomic_t *atomic
   atomic holding bit flags for each channel to mark as used/unused

tion.

typedef void *(*display_get_framebuffer_api)(const struct device *dev)
Callback API to get framebuffer pointer See display_get_framebuffer() for argument descrip-
tion.
typedef int (*display_set_brightness_api)(const struct device *dev, const uint8_t brightness)
   Callback API to set display brightness See display_set_brightness() for argument description.

typedef int (*display_set_contrast_api)(const struct device *dev, const uint8_t contrast)
   Callback API to set display contrast See display_set_contrast() for argument description.

typedef void (*display_get_capabilities_api)(const struct device *dev, struct display_capabilities *capabilities)
   Callback API to get display capabilities See display_get_capabilities() for argument description.

typedef int (*display_set_pixel_format_api)(const struct device *dev, const enum display_pixel_format pixel_format)
   Callback API to set pixel format used by the display See display_set_pixel_format() for argument description.

typedef int (*display_set_orientation_api)(const struct device *dev, const enum display_orientation orientation)
   Callback API to set orientation used by the display See display_set_orientation() for argument description.

Enums

enum display_pixel_format
   Display pixel formats.
   Display pixel format enumeration.
   In case a pixel format consists out of multiple bytes the byte order is big endian.
   Values:

   enumerator PIXEL_FORMAT_RGB_888 = BIT(0)
      24-bit RGB

   enumerator PIXEL_FORMAT_MONO01 = BIT(1)
      Monochrome (0=Black 1=White)

   enumerator PIXEL_FORMAT_MONO10 = BIT(2)
      Monochrome (1=Black 0=White)

   enumerator PIXEL_FORMAT_ARGB_8888 = BIT(3)
      32-bit ARGB

   enumerator PIXEL_FORMAT_RGB_565 = BIT(4)
      16-bit RGB

  enumerator PIXEL_FORMAT_BGR_565 = BIT(5)
      16-bit BGR
enum display_screen_info
Display screen information.

Values:

enumerator SCREEN_INFO_MONO_VTILED = BIT(0)
If selected, one octet represents 8 pixels ordered vertically, otherwise ordered horizontally.

enumerator SCREEN_INFO_MONO_MSB_FIRST = BIT(1)
If selected, the MSB represents the first pixel, otherwise MSB represents the last pixel.

enumerator SCREEN_INFO_EPD = BIT(2)
Electrophoretic Display.

enumerator SCREEN_INFO_DOUBLE_BUFFER = BIT(3)
Screen has two alternating ram buffers.

enumerator SCREEN_INFO_X_ALIGNMENT_WIDTH = BIT(4)
Screen has x alignment constrained to width.

enum display_orientation
Enumeration with possible display orientation.

Values:

enumerator DISPLAY_ORIENTATION_NORMAL
No rotation.

enumerator DISPLAY_ORIENTATION_ROTATED_90
Rotated 90 degrees clockwise.

enumerator DISPLAY_ORIENTATION_ROTATED_180
Rotated 180 degrees clockwise.

enumerator DISPLAY_ORIENTATION_ROTATED_270
Rotated 270 degrees clockwise.

Functions

static inline int display_write(const struct device *dev, const uint16_t x, const uint16_t y, const struct display_buffer_descriptor *desc, const void *buf)
Write data to display.

Parameters

• dev – Pointer to device structure
• x – x Coordinate of the upper left corner where to write the buffer
• y – y Coordinate of the upper left corner where to write the buffer
• `desc` – Pointer to a structure describing the buffer layout
• `buf` – Pointer to buffer array

**Return values**

0 – on success else negative errno code.

static inline int display_read(const struct device *dev, const uint16_t x, const uint16_t y, const struct display_buffer_descriptor *desc, void *buf)

Read data from display.

**Parameters**

• `dev` – Pointer to device structure
• `x` – x Coordinate of the upper left corner where to read from
• `y` – y Coordinate of the upper left corner where to read from
• `desc` – Pointer to a structure describing the buffer layout
• `buf` – Pointer to buffer array

**Return values**

• 0 – on success else negative errno code.
• -ENOSYS – if not implemented.

static inline void *display_get_framebuffer(const struct device *dev)

Get pointer to framebuffer for direct access.

**Parameters**

• `dev` – Pointer to device structure

**Return values**

Pointer – to frame buffer or NULL if direct framebuffer access is not supported

static inline int display_blanking_on(const struct device *dev)

Turn display blanking on.

This function blanks the complete display. The content of the frame buffer will be retained while blanking is enabled and the frame buffer will be accessible for read and write operations.

In case backlight control is supported by the driver the backlight is turned off. The backlight configuration is retained and accessible for configuration.

In case the driver supports display blanking the initial state of the driver would be the same as if this function was called.

**Parameters**

• `dev` – Pointer to device structure

**Return values**

• 0 – on success else negative errno code.
• -ENOSYS – if not implemented.

static inline int display_blanking_off(const struct device *dev)

Turn display blanking off.

Restore the frame buffer content to the display. In case backlight control is supported by the driver the backlight configuration is restored.

**Parameters**

• `dev` – Pointer to device structure
Return values

- 0 – on success else negative errno code.
- -ENOSYS – if not implemented.

static inline int display_set_brightness(const struct device *dev, uint8_t brightness)
Set the brightness of the display.
Set the brightness of the display in steps of 1/256, where 255 is full brightness and 0 is minimal.

Parameters

- dev – Pointer to device structure
- brightness – Brightness in steps of 1/256

Return values

- 0 – on success else negative errno code.
- -ENOSYS – if not implemented.

static inline int display_set_contrast(const struct device *dev, uint8_t contrast)
Set the contrast of the display.
Set the contrast of the display in steps of 1/256, where 255 is maximum difference and 0 is minimal.

Parameters

- dev – Pointer to device structure
- contrast – Contrast in steps of 1/256

Return values

- 0 – on success else negative errno code.
- -ENOSYS – if not implemented.

static inline void display_get_capabilities(const struct device *dev, struct display_capabilities *capabilities)
Get display capabilities.

Parameters

- dev – Pointer to device structure
- capabilities – Pointer to capabilities structure to populate

static inline int display_set_pixel_format(const struct device *dev, const enum display_pixel_format pixel_format)
Set pixel format used by the display.

Parameters

- dev – Pointer to device structure
- pixel_format – Pixel format to be used by display

Return values

- 0 – on success else negative errno code.
- -ENOSYS – if not implemented.
static inline int display_set_orientation(const struct device *dev, const enum display_orientation orientation)

Set display orientation.

**Parameters**

- `dev` – Pointer to device structure
- `orientation` – Orientation to be used by display

**Return values**

- 0 – on success else negative errno code.
- -ENOSYS – if not implemented.

```c
#include <display.h>
```

Structure holding display capabilities.

**Public Members**

```c
uint16_t x_resolution
    Display resolution in the X direction.

uint16_t y_resolution
    Display resolution in the Y direction.

uint32_t supported_pixel_formats
    Bitwise or of pixel formats supported by the display.

uint32_t screen_info
    Information about display panel.

enum display_pixel_format current_pixel_format
    Currently active pixel format for the display.

enum display_orientation current_orientation
    Current display orientation.
```

```c
#include <display.h>
```

Structure to describe display data buffer layout.

**Public Members**

```c
uint32_t buf_size
    Data buffer size in bytes.

uint16_t width
    Data buffer row width in pixels.

uint16_t height
    Data buffer column height in pixels.
```
Number of pixels between consecutive rows in the data buffer.

\begin{verbatim}
#include <display.h>  
\end{verbatim}

Display driver API API which a display driver should expose.

\textbf{Grove LCD Display}  
\textbf{Related code samples}

\textbf{Grove LCD}

Display an incrementing counter and change the backlight color.

\textbf{group} grove_display

Grove display APIs.

\textbf{Defines}

- GLCD_DS_DISPLAY_ON
- GLCD_DS_DISPLAY_OFF
- GLCD_DS_CURSOR_ON
- GLCD_DS_CURSOR_OFF
- GLCD_DS_BLINK_ON
- GLCD_DS_BLINK_OFF

Functions

void glcd_print(const struct device *dev, char *data, uint32_t size)
    Send text to the screen.

    Parameters
        • dev – Pointer to device structure for driver instance.
        • data – the ASCII text to display
        • size – the length of the text in bytes

void glcd_cursor_pos_set(const struct device *dev, uint8_t col, uint8_t row)
    Set text cursor position for next additions.

    Parameters
        • dev – Pointer to device structure for driver instance.
        • col – the column for the cursor to be moved to (0-15)
        • row – the row it should be moved to (0 or 1)

void glcd_clear(const struct device *dev)
    Clear the current display.

    Parameters
        • dev – Pointer to device structure for driver instance.

void glcd_display_state_set(const struct device *dev, uint8_t opt)
    Function to change the display state.

    This function provides the user the ability to change the state of the display as per
    needed. Controlling things like powering on or off the screen, the option to display the
    cursor or not, and the ability to blink the cursor.

    Parameters
        • dev – Pointer to device structure for driver instance.
        • opt – An 8bit bitmask of GLCD_DS_* options.

uint8_t glcd_display_state_get(const struct device *dev)
    return the display feature set associated with the device

    Parameters
        • dev – the Grove LCD to get the display features set

    Returns
        the display feature set associated with the device.
void glcd_input_state_set(const struct device *dev, uint8_t opt)
    Function to change the input state.
    This function provides the user the ability to change the state of the text input. Controlling things like text entry from the left or right side, and how far to increment on new text

    Parameters
    • dev – Pointer to device structure for driver instance.
    • opt – A bitmask of GLCD_IS_* options

uint8_t glcd_input_state_get(const struct device *dev)
    return the input set associated with the device

    Parameters
    • dev – the Grove LCD to get the input features set

Returns
    the input set associated with the device.

void glcd_function_set(const struct device *dev, uint8_t opt)
    Function to set the functional state of the display.
    This function provides the user the ability to change the state of the display as per needed. Controlling things like the number of rows, dot size, and text display quality.

    Parameters
    • dev – Pointer to device structure for driver instance.
    • opt – A bitmask of GLCD_FS_* options

uint8_t glcd_function_get(const struct device *dev)
    return the function set associated with the device

    Parameters
    • dev – the Grove LCD to get the functions set

Returns
    the function features set associated with the device.

void glcd_color_select(const struct device *dev, uint8_t color)
    Set LCD background to a predefined color.

    Parameters
    • dev – Pointer to device structure for driver instance.
    • color – One of the predefined color options

void glcd_color_set(const struct device *dev, uint8_t r, uint8_t g, uint8_t b)
    Set LCD background to custom RGB color value.

    Parameters
    • dev – Pointer to device structure for driver instance.
    • r – A numeric value for the red color (max is 255)
    • g – A numeric value for the green color (max is 255)
    • b – A numeric value for the blue color (max is 255)
BBC micro:bit Display

\textit{group \texttt{mb_display}}

BBC micro:bit display APIs.

\textbf{Defines}

\texttt{MB_\texttt{IMAGE}(...)}

Generate an image object from a given array rows/columns.

This helper takes an array of 5 rows, each consisting of 5 0/1 values which correspond to the columns of that row. The value 0 means the pixel is disabled whereas a 1 means the pixel is enabled.

The pixels go from left to right and top to bottom, i.e. top-left corner is the first row’s first value, top-right is the first row’s last value, and bottom-right corner is the last value of the last (5th) row. As an example, the following would create a smiley face image:

\textbf{Parameters}

- \texttt{\_rows} – Each of the 5 rows represented as a 5-value column array.

\textbf{Returns}

Image bitmap that can be passed e.g. to \texttt{mb_display_image()}.

\textbf{ Enums }

\texttt{enum \texttt{mb_display\_mode}}

Display mode.

First 16 bits are reserved for modes, last 16 for flags.

\textit{Values:}

\begin{itemize}
  \item \texttt{MB\_DISPLAY\_MODE\_DEFAULT} - Default mode (“single” for images, “scroll” for text).
  \item \texttt{MB\_DISPLAY\_MODE\_SINGLE} - Display images sequentially, one at a time.
  \item \texttt{MB\_DISPLAY\_MODE\_SCROLL} - Display images by scrolling.
  \item \texttt{MB\_DISPLAY\_FLAG\_LOOP = BIT(16)} - Loop back to the beginning when reaching the last image.
\end{itemize}

\textbf{Functions}

\texttt{struct mb\_display *mb\_display\_get(void)}

Get a pointer to the BBC micro:bit display object.

\textbf{Returns}

Pointer to display object.
void mb_display_image(struct mb_display *disp, uint32_t mode, int32_t duration, const struct mb_image *img, uint8_t img_count)

Display one or more images on the BBC micro:bit LED display.

This function takes an array of one or more images and renders them sequentially on the micro:bit display. The call is asynchronous, i.e. the processing of the display happens in the background. If there is another image being displayed it will be canceled and the new one takes over.

**Parameters**

- **disp** – Display object.
- **mode** – One of the MB_DISPLAY_MODE_* options.
- **duration** – Duration how long to show each image (in milliseconds), or SYS_FOREVER_MS.
- **img** – Array of image bitmaps (struct mb_image objects).
- **img_count** – Number of images in ‘img’ array.

void mb_display_print(struct mb_display *disp, uint32_t mode, int32_t duration, const char *fmt, ...)

Print a string of characters on the BBC micro:bit LED display.

This function takes a printf-style format string and outputs it in a scrolling fashion to the display.

The call is asynchronous, i.e. the processing of the display happens in the background. If there is another image or string being displayed it will be canceled and the new one takes over.

**Parameters**

- **disp** – Display object.
- **mode** – One of the MB_DISPLAY_MODE_* options.
- **duration** – Duration how long to show each character (in milliseconds), or SYS_FOREVER_MS.
- **fmt** – printf-style format string
- **...** – Optional list of format arguments.

void mb_display_stop(struct mb_display *disp)

Stop the ongoing display of an image.

**Parameters**

- **disp** – Display object.

struct mb_image

#include <mb_display.h> Representation of a BBC micro:bit display image.

This struct should normally not be used directly, rather created using the MB_IMAGE() macro.

---

**Monochrome Character Framebuffer**

**Related code samples**

**Character Framebuffer shell module**

Use the CFB shell module to interact with a monochrome display.

**Character frame buffer**

Display character strings using the Character Frame Buffer (CFB).
**Custom fonts**
Generate and use a custom font.

```c
#define FONT_ENTRY_DEFINE(_name, _width, _height, _caps, _data, _fc, _lc)
```

Macro for creating a font entry.

**Parameters**
- `name` – Name of the font entry.
- `width` – Width of the font in pixels
- `height` – Height of the font in pixels.
- `caps` – Font capabilities.
- `data` – Raw data of the font.
- `fc` – Character mapped to first font element.
- `lc` – Character mapped to last font element.

**Enums**

```c
eenum cfb_display_param

enumerator CFB_DISPLAY_HEIGH = 0
enumerator CFB_DISPLAY_WIDTH
enumerator CFB_DISPLAY_PPT
enumerator CFB_DISPLAY_ROWS
enumerator CFB_DISPLAY_COLS
```

```c
eenum cfb_font_caps

enumerator CFB_FONT_MONO_VPACKED = BIT(0)
enumerator CFB_FONT_MONO_HPACKED = BIT(1)
enumerator CFB_FONT_MSB_FIRST = BIT(2)
```
Functions

int cfb_print(const struct device *dev, const char *const str, uint16_t x, uint16_t y)
Print a string into the framebuffer.

Parameters
• dev – Pointer to device structure for driver instance
• str – String to print
• x – Position in X direction of the beginning of the string
• y – Position in Y direction of the beginning of the string

Returns
0 on success, negative value otherwise

int cfb_draw_text(const struct device *dev, const char *const str, int16_t x, int16_t y)
Print a string into the framebuffer.
For compare to cfb_print, cfb_draw_text accept non tile-aligned coords and not line wrapping.

Parameters
• dev – Pointer to device structure for driver instance
• str – String to print
• x – Position in X direction of the beginning of the string
• y – Position in Y direction of the beginning of the string

Returns
0 on success, negative value otherwise

int cfb_draw_point(const struct device *dev, const struct cfb_position *pos)
Draw a point.

Parameters
• dev – Pointer to device structure for driver instance
• pos – position of the point

Returns
0 on success, negative value otherwise

int cfb_draw_line(const struct device *dev, const struct cfb_position *start, const struct cfb_position *end)
Draw a line.

Parameters
• dev – Pointer to device structure for driver instance
• start – start position of the line
• end – end position of the line

Returns
0 on success, negative value otherwise

int cfb_draw_rect(const struct device *dev, const struct cfb_position *start, const struct cfb_position *end)
Draw a rectangle.

Parameters
• dev – Pointer to device structure for driver instance
- **start** – Top-Left position of the rectangle
- **end** – Bottom-Right position of the rectangle

**Returns**
0 on success, negative value otherwise

```c
int cfb_framebuffer_clear(const struct device *dev, bool clear_display)
```
Clear framebuffer.

**Parameters**
- **dev** – Pointer to device structure for driver instance
- **clear_display** – Clear the display as well

**Returns**
0 on success, negative value otherwise

```c
int cfb_framebuffer_invert(const struct device *dev)
```
Invert Pixels.

**Parameters**
- **dev** – Pointer to device structure for driver instance

**Returns**
0 on success, negative value otherwise

```c
int cfb_invert_area(const struct device * dev, uint16_t x, uint16_t y, uint16_t width, uint16_t height)
```
Invert Pixels in selected area.

**Parameters**
- **dev** – Pointer to device structure for driver instance
- **x** – Position in X direction of the beginning of area
- **y** – Position in Y direction of the beginning of area
- **width** – Width of area in pixels
- **height** – Height of area in pixels

**Returns**
0 on success, negative value otherwise

```c
int cfb_framebuffer_finalize(const struct device *dev)
```
Finalize framebuffer and write it to display RAM, invert or reorder pixels if necessary.

**Parameters**
- **dev** – Pointer to device structure for driver instance

**Returns**
0 on success, negative value otherwise

```c
int cfb_get_display_parameter(const struct device *dev, enum cfb_display_param)
```
Get display parameter.

**Parameters**
- **dev** – Pointer to device structure for driver instance
- **cfb_display_param** – One of the display parameters

**Returns**
Display parameter value
int cfb_framebuffer_set_font(const struct device *dev, uint8_t idx)
Set font.

Parameters
• dev – Pointer to device structure for driver instance
• idx – Font index

Returns
0 on success, negative value otherwise

int cfb_set_kerning(const struct device *dev, int8_t kerning)
Set font kerning (spacing between individual letters).

Parameters
• dev – Pointer to device structure for driver instance
• kerning – Font kerning

Returns
0 on success, negative value otherwise

int cfb_get_font_size(const struct device *dev, uint8_t idx, uint8_t *width, uint8_t *height)
Get font size.

Parameters
• dev – Pointer to device structure for driver instance
• idx – Font index
• width – Pointers to the variable where the font width will be stored.
• height – Pointers to the variable where the font height will be stored.

Returns
0 on success, negative value otherwise

int cfb_get_numof_fonts(const struct device *dev)
Get number of fonts.

Parameters
• dev – Pointer to device structure for driver instance

Returns
number of fonts

int cfb_framebuffer_init(const struct device *dev)
Initialize Character Framebuffer.

Parameters
• dev – Pointer to device structure for driver instance

Returns
0 on success, negative value otherwise

struct cfb_font
#include <cfb.h>

struct cfb_position
#include <cfb.h>
7.6.15 Electrically Erasable Programmable Read-Only Memory (EEPROM)

Overview

The EEPROM API provides read and write access to Electrically Erasable Programmable Read-Only Memory (EEPROM) devices.

EEPROMs have an erase block size of 1 byte, a long lifetime, and allow overwriting data on byte-by-byte access.

Configuration Options

Related configuration options:

- CONFIG_EEPROM

API Reference

Related code samples

**EEPROM**

Store a boot count value in EEPROM.

```c
const struct device *dev, off_t offset, void *data, size_t len
```

Read data from EEPROM.

**Parameters**

- `dev` – EEPROM device
- `offset` – Address offset to read from.
- `data` – Buffer to store read data.
- `len` – Number of bytes to read.

**Returns**

0 on success, negative errno code on failure.

```c
const struct device *dev, off_t offset, const void *data, size_t len
```

Write data to EEPROM.

**Parameters**

- `dev` – EEPROM device
- `offset` – Address offset to write data to.
- `data` – Buffer with data to write.
- `len` – Number of bytes to write.

**Returns**

0 on success, negative errno code on failure.
size_t eeprom_get_size(const struct device *dev)
Get the size of the EEPROM in bytes.

Parameters
• dev – EEPROM device.

Returns
EEPROM size in bytes.

7.6.16 Enhanced Serial Peripheral Interface (eSPI) Bus

Overview
The eSPI (enhanced serial peripheral interface) is a serial bus that is based on SPI. It also features a four-wire interface (receive, transmit, clock and slave select) and three configurations: single IO, dual IO and quad IO.

The technical advancements include lower voltage signal levels (1.8V vs. 3.3V), lower pin count, and the frequency is twice as fast (66MHz vs. 33MHz) Because of its enhancements, the eSPI is used to replace the LPC (lower pin count) interface, SPI, SMBus and sideband signals.

See eSPI interface specification for additional details.

API Reference

Related code samples
Enhanced Serial Peripheral Interface (eSPI)
Use eSPI to connect to a slave device and exchange virtual wire packets.

HOST_KBC_EVT_OBE
Typedefs

typedef void (*espi_callback_handler_t)(const struct device *dev, struct espi_callback *cb, struct espi_event espi_evt)

Define the application callback handler function signature.

**Param dev**
Device struct for the eSPI device.

**Param cb**
Original struct espi_callback owning this handler.

**Param espi_evt**
event details that trigger the callback handler.

Enums

define espi_io_mode
eSPI I/O mode capabilities

*Values:*

enumerator ESPI_IO_MODE_SINGLE_LINE = BIT(0)
enumerator ESPI_IO_MODE_DUAL_LINES = BIT(1)
enumerator ESPI_IO_MODE_QUAD_LINES = BIT(2)

define espi_channel
eSPI channel.
Identifies each eSPI logical channel supported by eSPI controller. Each channel allows independent traffic, but the assignment of channel type to channel number is fixed.

Note that generic commands are not associated with any channel, so traffic over eSPI can occur if all channels are disabled or not ready.

**Values:**

- enumerator `ESPI_CHANNEL_PERIPHERAL` = `BIT(0)`
- enumerator `ESPI_CHANNEL_VWIRE` = `BIT(1)`
- enumerator `ESPI_CHANNEL_OOB` = `BIT(2)`
- enumerator `ESPI_CHANNEL_FLASH` = `BIT(3)`

**enum espi_bus_event**

- eSPI bus event.
- eSPI bus event to indicate events for which user can register callbacks

**Values:**

- enumerator `ESPI_BUS_RESET` = `BIT(0)`
- enumerator `ESPI_BUS_EVENT_CHANNEL_READY` = `BIT(1)`
- enumerator `ESPI_BUS_EVENT_VWIRE_RECEIVED` = `BIT(2)`

Functions

int espi_config(const struct device *dev, struct espi_cfg *cfg)

Configure operation of a eSPI controller.

This routine provides a generic interface to override eSPI controller capabilities.

If this eSPI controller is acting as slave, the values set here will be discovered as part through the GET_CONFIGURATION command issued by the eSPI master during initialization.

If this eSPI controller is acting as master, the values set here will be used by eSPI master to determine minimum common capabilities with eSPI slave then send via SET_CONFIGURATION command.
Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `cfg` – the device runtime configuration for the eSPI controller.

Return values

- 0 – If successful.
- -EIO – General input / output error, failed to configure device.
- -EINVAL – invalid capabilities, failed to configure device.
- -ENOTSUP – capability not supported by eSPI slave.

bool `espi_get_channel_status`(const struct device *dev, enum espi_channel ch)

Query to see if it a channel is ready.

This routine allows to check if logical channel is ready before use. Note that queries for channels not supported will always return false.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `ch` – the eSPI channel for which status is to be retrieved.

Return values

- true – If eSPI channel is ready.
- false – otherwise.

int `espi_read_request`(const struct device *dev, struct espi_request_packet *req)

Sends memory, I/O or message read request over eSPI.

This routines provides a generic interface to send a read request packet.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
• req – Address of structure representing a memory, I/O or message read request.

Return values
• 0 – If successful.
• -ENOTSUP – if eSPI controller doesn’t support raw packets and instead low memory transactions are handled by controller hardware directly.
• -EIO – General input / output error, failed to send over the bus.

int espi_write_request(const struct device *dev, struct espi_request_packet *req)
Sends memory, I/O or message write request over eSPI.
This routines provides a generic interface to send a write request packet.

Parameters
• dev – Pointer to the device structure for the driver instance.
• req – Address of structure representing a memory, I/O or message write request.

Return values
• 0 – If successful.
• -ENOTSUP – if eSPI controller doesn’t support raw packets and instead low memory transactions are handled by controller hardware directly.
• -EINVAL – General input / output error, failed to send over the bus.

int espi_read_lpc_request(const struct device *dev, enum lpc_peripheral_opcode op, uint32_t *data)
Reads SOC data from a LPC peripheral with information updated over eSPI.
This routine provides a generic interface to read a block whose information was updated by an eSPI transaction. Reading may trigger a transaction. The eSPI packet is assembled by the HW block.

Parameters
• dev – Pointer to the device structure for the driver instance.
• op – Enum representing opcode for peripheral type and read request.
• data – Parameter to be read from to the LPC peripheral.

Return values
• 0 – If successful.
• -ENOTSUP – if eSPI peripheral is off or not supported.
• -EINVAL – for unimplemented lpc opcode, but in range.

int espi_write_lpc_request(const struct device *dev, enum lpc_peripheral_opcode op, uint32_t *data)
Writes data to a LPC peripheral which generates an eSPI transaction.
This routine provides a generic interface to write data to a block which triggers an eSPI transaction. The eSPI packet is assembled by the HW block.

Parameters
• dev – Pointer to the device structure for the driver instance.
• op – Enum representing an opcode for peripheral type and write request.
• data – Represents the parameter passed to the LPC peripheral.
Return values

- 0 – If successful.
- -ENOTSUP – if eSPI peripheral is off or not supported.
- -EINVAL – for unimplemented lpc opcode, but in range.

```c
int espi_send_vwire(const struct device *dev, enum espivwire_signal signal, uint8_t level)
```

Sends system/platform signal as a virtual wire packet.

This routines provides a generic interface to send a virtual wire packet from slave to master.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `signal` – The signal to be send to eSPI master.
- `level` – The level of signal requested LOW or HIGH.

**Return values**

- 0 – If successful.
- -EIO – General input / output error, failed to send over the bus.

```c
int espi_receive_vwire(const struct device *dev, enum espivwire_signal signal, uint8_t *level)
```

Retrieves level status for a signal encapsulated in a virtual wire.

This routines provides a generic interface to request a virtual wire packet from eSPI master and retrieve the signal level.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `signal` – the signal to be requested from eSPI master.
- `level` – the level of signal requested 0b LOW, 1b HIGH.

**Return values**

- -EIO – General input / output error, failed request to master.

```c
int espi_send_oob(const struct device *dev, struct espioob_packet *pckt)
```

Sends SMBus transaction (out-of-band) packet over eSPI bus.

This routines provides an interface to encapsulate a SMBus transaction and send into packet over eSPI bus

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `pckt` – Address of the packet representation of SMBus transaction.

**Return values**

- -EIO – General input / output error, failed request to master.

```c
int espi_receive_oob(const struct device *dev, struct espioob_packet *pckt)
```

Receives SMBus transaction (out-of-band) packet from eSPI bus.

This routines provides an interface to receive and decoded a SMBus transaction from eSPI bus

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
• \texttt{pckt} – Address of the packet representation of SMBus transaction.

\textbf{Return values}

- \texttt{-EIO} – General input / output error, failed request to master.

\begin{verbatim}
int espi_read_flash(const struct device *dev, struct espi_flash_packet *pckt)
\end{verbatim}

Sends a read request packet for shared flash.

This routines provides an interface to send a request to read the flash component shared between the eSPI master and eSPI slaves.

\textbf{Parameters}

• \texttt{dev} – Pointer to the device structure for the driver instance.

• \texttt{pckt} – Address of the representation of read flash transaction.

\textbf{Return values}

- \texttt{-ENOTSUP} – eSPI flash logical channel transactions not supported.

- \texttt{-EBUSY} – eSPI flash channel is not ready or disabled by master.

- \texttt{-EIO} – General input / output error, failed request to master.

\begin{verbatim}
int espi_write_flash(const struct device *dev, struct espi_flash_packet *pckt)
\end{verbatim}

Sends a write request packet for shared flash.

This routines provides an interface to send a request to write to the flash components shared between the eSPI master and eSPI slaves.

\textbf{Parameters}

• \texttt{dev} – Pointer to the device structure for the driver instance.

• \texttt{pckt} – Address of the representation of write flash transaction.

\textbf{Return values}

- \texttt{-ENOTSUP} – eSPI flash logical channel transactions not supported.

- \texttt{-EBUSY} – eSPI flash channel is not ready or disabled by master.

- \texttt{-EIO} – General input / output error, failed request to master.

\begin{verbatim}
int espi_flash_erase(const struct device *dev, struct espi_flash_packet *pckt)
\end{verbatim}

Sends a write request packet for shared flash.

This routines provides an interface to send a request to write to the flash components shared between the eSPI master and eSPI slaves.

\textbf{Parameters}

• \texttt{dev} – Pointer to the device structure for the driver instance.

• \texttt{pckt} – Address of the representation of write flash transaction.

\textbf{Return values}

- \texttt{-ENOTSUP} – eSPI flash logical channel transactions not supported.

- \texttt{-EBUSY} – eSPI flash channel is not ready or disabled by master.

- \texttt{-EIO} – General input / output error, failed request to master.

\begin{verbatim}
static inline void espi_init_callback(struct espi_callback *callback, espi_callback_handler_t handler, enum espi_bus_event evt_type)
\end{verbatim}

Callback model.
Helper to initialize a struct `espi_callback` properly.

**Parameters**

- `callback` – A valid Application’s callback structure pointer.
- `handler` – A valid handler function pointer.

---

7.6. Peripherals 3083
• **evt_type** – indicates the eSPI event relevant for the handler. for VWIRE_RECEIVED event the data will indicate the new level asserted

```c
static inline int espi_add_callback(const struct device *dev, struct espi_callback *callback)
```

Add an application callback.

Note: enables to add as many callback as needed on the same device.

---

**Note:** Callbacks may be added to the device from within a callback handler invocation, but whether they are invoked for the current eSPI event is not specified.

---

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **callback** – A valid Application’s callback structure pointer.

**Returns**

0 if successful, negative errno code on failure.

```c
static inline int espi_remove_callback(const struct device *dev, struct espi_callback *callback)
```

Remove an application callback.

Note: enables to remove as many callbacks as added through `espi_add_callback()`.

---

**Warning:** It is explicitly permitted, within a callback handler, to remove the registration for the callback that is running, i.e. `callback`. Attempts to remove other registrations on the same device may result in undefined behavior, including failure to invoke callbacks that remain registered and unintended invocation of removed callbacks.

---

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **callback** – A valid application’s callback structure pointer.

**Returns**

0 if successful, negative errno code on failure.

```c
int espi_saf_config(const struct device *dev, const struct espi_saf_cfg *cfg)
```

Configure operation of a eSPI controller.

This routine provides a generic interface to override eSPI controller capabilities.

If this eSPI controller is acting as slave, the values set here will be discovered as part through the GET_CONFIGURATION command issued by the eSPI master during initialization.

If this eSPI controller is acting as master, the values set here will be used by eSPI master to determine minimum common capabilities with eSPI slave then send via SET_CONFIGURATION command.
Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `cfg` – the device runtime configuration for the eSPI controller.

Return values

- 0 – If successful.
- -EIO – General input / output error, failed to configure device.
- -EINVAL – invalid capabilities, failed to configure device.
- -ENOTSUP – capability not supported by eSPI slave.

```
int espi_saf_set_protection_regions(const struct device *dev, const struct espi_saf_protection *pr)
```

Set one or more SAF protection regions.

This routine provides an interface to override the default flash protection regions of the SAF controller.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `pr` – Pointer to the SAF protection region structure.

Return values

- 0 – If successful.
- -EIO – General input / output error, failed to configure device.
- -EINVAL – invalid capabilities, failed to configure device.
- -ENOTSUP – capability not supported by eSPI slave.

```
int espi_saf_activate(const struct device *dev)
```

Activate SAF block.

This routine activates the SAF block and should only be called after SAF has been configured and the eSPI Master has enabled the Flash Channel.
Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful
• -EINVAL – if failed to activate SAF.

```c
bool espi_saf_get_channel_status(const struct device *dev)
```

Query to see if SAF is ready.
This routine allows to check if SAF is ready before use.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• true – If eSPI SAF is ready.
• false – otherwise.

```c
int espi_saf_flash_read(const struct device *dev, struct espi_saf_packet *pckt)
```

Sends a read request packet for slave attached flash.
This routine provides an interface to send a request to read the flash component shared between the eSPI master and eSPI slaves.

Parameters
• dev – Pointer to the device structure for the driver instance.
• pckt – Address of the representation of read flash transaction.

Return values
• -ENOTSUP – eSPI flash logical channel transactions not supported.
• -EBUSY – eSPI flash channel is not ready or disabled by master.
• -EIO – General input / output error, failed request to master.

```c
int espi_saf_flash_write(const struct device *dev, struct espi_saf_packet *pckt)
```

Sends a write request packet for slave attached flash.
This routine provides an interface to send a request to write to the flash components shared between the eSPI master and eSPI slaves.

Parameters
• dev – Pointer to the device structure for the driver instance.
• pckt – Address of the representation of write flash transaction.

Return values
• -ENOTSUP – eSPI flash logical channel transactions not supported.
• -EBUSY – eSPI flash channel is not ready or disabled by master.
• -EIO – General input / output error, failed request to master.

```c
int espi_saf_flash_erase(const struct device *dev, struct espi_saf_packet *pckt)
```

Sends a write request packet for slave attached flash.
This routine provides an interface to send a request to write to the flash components shared between the eSPI master and eSPI slaves.

Parameters
• dev – Pointer to the device structure for the driver instance.
- `pckt` – Address of the representation of erase flash transaction.

**Return values**
- `-ENOTSUP` – eSPI flash logical channel transactions not supported.
- `-EBUSY` – eSPI flash channel is not ready or disabled by master.
- `-EIO` – General input / output error, failed request to master.

```c
int espi_saf_flash_unsuccess(const struct device *dev, struct espi_saf_packet *pckt)
```

Response unsuccessful completion for slave attached flash.

This routines provides an interface to response that transaction is invalid and return unsuccessful completion from target to controller.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `pckt` – Address of the representation of flash transaction.

**Return values**
- `-ENOTSUP` – eSPI flash logical channel transactions not supported.
- `-EBUSY` – eSPI flash channel is not ready or disabled by master.
- `-EIO` – General input / output error, failed request to master.

```c
static inline void espi_saf_init_callback(struct espi_callback *callback,
                                        espi_callback_handler_t handler,
                                        enum espi_bus_event evt_type)
```

Callback model.

```
| App | | eSPI driver | | HW | |eSPI Host| |
+-----+ +-------+-----+ +---+--+ +----+----+
| espi_init_callback |
| espi_add_callback |
```

```plaintext
(continues on next page)
```

7.6. Peripherals

---

3087
Helper to initialize a struct espi_callback properly.

**Parameters**
- **callback** – A valid Application’s callback structure pointer.
- **handler** – A valid handler function pointer.
- **evt_type** – indicates the eSPI event relevant for the handler. For VWIRE_RECEIVED event the data will indicate the new level asserted.

```c
static inline int espi_saf_add_callback(const struct device *dev, struct espi_callback *callback)
```

Add an application callback.

Note: enables to add as many callback as needed on the same device.

**Note:** Callbacks may be added to the device from within a callback handler invocation, but whether they are invoked for the current eSPI event is not specified.

**Parameters**
- **dev** – Pointer to the device structure for the driver instance.
- **callback** – A valid Application’s callback structure pointer.

**Returns**
0 if successful, negative errno code on failure.

```c
static inline int espi_saf_remove_callback(const struct device *dev, struct espi_callback *callback)
```

Remove an application callback.

Note: enables to remove as many callbacks as added through `espi_add_callback()`.
Warning: It is explicitly permitted, within a callback handler, to remove the registration for the callback that is running, i.e. callback. Attempts to remove other registrations on the same device may result in undefined behavior, including failure to invoke callbacks that remain registered and unintended invocation of removed callbacks.

Parameters

- dev – Pointer to the device structure for the driver instance.
- callback – A valid application’s callback structure pointer.

Returns

0 if successful, negative errno code on failure.

```c
struct espi_evt_data_kbc
#include <espi.h> Bit field definition of evt_data in struct espi_event for KBC.

struct espi_evt_data_acpi
#include <espi.h> Bit field definition of evt_data in struct espi_event for ACPI.

struct espi_event
#include <espi.h> eSPI event
```

Public Members

```c
enum espi_bus_event evt_type
Event type.

uint32_t evt_details
Additional details for bus event type.

uint32_t evt_data
Data associated to the event.
```

```c
struct espi_cfg
#include <espi.h> eSPI bus configuration parameters
```

Public Members

```c
enum espi_io_mode io_caps
Supported I/O mode.

enum espi_channel channel_caps
Supported channels.

uint8_t max_freq
Maximum supported frequency in MHz.
```

### 7.6.17 Entropy

#### Overview

The entropy API provides functions to retrieve entropy values from entropy hardware present on the platform. The entropy APIs are provided for use by the random subsystem and cryptographic services. They are not suitable to be used as random number generation functions.

#### API Reference

**group entropy_interface**

Entropy Interface.

**Defines**

**ENTROPY_BUSYWAIT**

Driver is allowed to busy-wait for random data to be ready.

**Typedefs**

typedef int (*entropy_get_entropy_t)(const struct device *dev, uint8_t *buffer, uint16_t length)

Callback API to get entropy.

See `entropy_get_entropy()` for argument description

**Note:** This call has to be thread safe to satisfy requirements of the random subsystem.
typedef int (*entropy_get_entropy_isr_t)(const struct device *dev, uint8_t *buffer, uint16_t length, uint32_t flags)

Callback API to get entropy from an ISR.
See `entropy_get_entropy_isr()` for argument description.

**Functions**

`int entropy_get_entropy(const struct device *dev, uint8_t *buffer, uint16_t length)`

Fills a buffer with entropy.
Blocks if required in order to generate the necessary random data.

**Parameters**
- `dev` – Pointer to the entropy device.
- `buffer` – Buffer to fill with entropy.
- `length` – Buffer length.

**Return values**
- `0` – on success.
- `-ERRNO` – errno code on error.

`static inline int entropy_get_entropy_isr(const struct device *dev, uint8_t *buffer, uint16_t length, uint32_t flags)`

Fills a buffer with entropy in a non-blocking or busy-wait manner.
Callable from ISRs.

**Parameters**
- `dev` – Pointer to the device structure.
- `buffer` – Buffer to fill with entropy.
- `length` – Buffer length.
- `flags` – Flags to modify the behavior of the call.

**Return values**
- `number` – number of bytes filled with entropy or -error.

`struct entropy_driver_api`  
`#include <entropy.h>` Entropy driver API structure.
This is the mandatory API any Entropy driver needs to expose.

**7.6.18 Error Detection And Correction (EDAC)**

Error Detection And Correction is a mechanism used to detect and correct errors while storing or reading data.

**In Band Error Correction Code (IBECC)**

**Overview** The mechanism initially found in Intel Elkhart Lake SOCs and later boards is an integrated memory controller with IBECC.
The In-Band Error Correction Code (IBECC) improves reliability by providing error detection and correction. IBECC can work for all or for specific regions of physical memory space. The IBECC is useful for memory technologies that do not support the out-of-band ECC.

IBECC adds memory overhead of 1/32 of the memory. This memory is not accessible and used to store ECC syndrome data. IBECC converts read / write transactions to two separate transactions: one for actual data and another for cache line containing ECC value.

There is a debug feature IBECC Error Injection which helps to debug and verify IBECC functionality. ECC errors are injected on the write path and cause ECC errors on the read path.

**IBECC Configuration**  There are three IBECC operation modes which can be selected by Bootloader. They are listed below:

- OPERATION_MODE = 0x0 sets functional mode to protect requests based on address range
- OPERATION_MODE = 0x1 sets functional mode to all requests not be protected and to ignore range checks
- OPERATION_MODE = 0x2 sets functional mode to protect all requests and ignore range checks

IBECC operational mode is configured through BIOS or Bootloader. For operation mode 0 there are more BIOS configuration options such as memory regions.

Due to high security risk Error Injection capability should not be enabled for production. Error Injection is only enabled for tests.

**IBECC Logging**  IBECC logs the following fields:

- Error Address
- Error Syndrome
- Error Type
  - Correctable Error (CE) - error is detected and corrected by IBECC module.
  - Uncorrectable Error (UE) - error is detected by IBECC module and not automatically corrected.

The IBECC driver provides error type for the higher-level application to implement desired policy with respect for handling those memory errors. Error syndrome is not used in the IBECC driver but provided to higher-level application.

**Usage notes**  Exceptional care needs to be taken with Non Maskable Interrupt (NMI). NMI will arrive at any time, even if the local CPU has disabled interrupts. That means that no locking mechanism can protect code against an NMI happening. Zephyr’s IPC mechanisms universally use local IRQ locking as the base layer for all higher-level synchronization primitives. So, you cannot share anything that is “protected” by a lock with an NMI, because the protection does not work. The only tool you have available for synchronization in the Zephyr API that works against an NMI is the atomic layer. This also applies to callback function which is called by NMI handler.

**Configuration option**  Related configuration option:

- CONFIG_EDAC_IBECC
**Configuration option**

Related configuration option:
- CONFIG_EDAC

**Optional interfaces**

EDAC Optional Interfaces

static inline int edac_inject_set_param1(const struct device *dev, uint64_t value)
Set injection parameter param1.

**Parameters**
- `dev` – Pointer to the device structure
- `value` – First injection parameter

**Return values**
- `-ENOSYS` – if the optional interface is not implemented
- `0` – on success, other error code otherwise

static inline int edac_inject_get_param1(const struct device *dev, uint64_t *value)
Get injection parameter param1.

Get first error injection parameter value.

**Parameters**
- `dev` – Pointer to the device structure
- `value` – Pointer to the first injection parameter

**Return values**
- `-ENOSYS` – if the optional interface is not implemented
- `0` – on success, error code otherwise

static inline int edac_inject_set_param2(const struct device *dev, uint64_t value)
Set injection parameter param2.

Set second error injection parameter value.

**Parameters**
- `dev` – Pointer to the device structure
- `value` – Second injection parameter
Return values

- ENOSYS – if the optional interface is not implemented
- 0 – on success, error code otherwise

static inline int edac_inject_get_param2(const struct device *dev, uint64_t *value)

Get injection parameter param2.

Parameters

- dev – Pointer to the device structure
- value – Pointer to the second injection parameter

Return values

- ENOSYS – if the optional interface is not implemented
- 0 – on success, error code otherwise

static inline int edac_inject_set_error_type(const struct device *dev, uint32_t error_type)

Set error type value.

Set the value of error type to be injected

Parameters

- dev – Pointer to the device structure
- error_type – Error type value

Return values

- ENOSYS – if the optional interface is not implemented
- 0 – on success, error code otherwise

static inline int edac_inject_get_error_type(const struct device *dev, uint32_t *error_type)

Get error type value.

Get the value of error type to be injected

Parameters

- dev – Pointer to the device structure
- error_type – Pointer to error type value

Return values

- ENOSYS – if the optional interface is not implemented
- 0 – on success, error code otherwise

static inline int edac_inject_error_trigger(const struct device *dev)

Set injection control.

Trigger error injection.

Parameters

- dev – Pointer to the device structure

Return values

- ENOSYS – if the optional interface is not implemented
- 0 – on success, error code otherwise
Mandatory interfaces

EDAC Mandatory Interfaces

static inline int edac_ecc_error_log_get(const struct device *dev, uint64_t *value)
Get ECC Error Log.
Read value of ECC Error Log.

Parameters
- dev – Pointer to the device structure
- value – Pointer to the ECC Error Log value

Return values
- 0 – on success, error code otherwise
- -ENOSYS – if the mandatory interface is not implemented

static inline int edac_ecc_error_log_clear(const struct device *dev)
Clear ECC Error Log.
Clear value of ECC Error Log.

Parameters
- dev – Pointer to the device structure

Return values
- 0 – on success, error code otherwise
- -ENOSYS – if the mandatory interface is not implemented

static inline int edac_parity_error_log_get(const struct device *dev, uint64_t *value)
Get Parity Error Log.
Read value of Parity Error Log.

Parameters
- dev – Pointer to the device structure
- value – Pointer to the parity Error Log value

Return values
- 0 – on success, error code otherwise
- -ENOSYS – if the mandatory interface is not implemented

static inline int edac_parity_error_log_clear(const struct device *dev)
Clear Parity Error Log.
Clear value of Parity Error Log.

Parameters
- dev – Pointer to the device structure

Return values
- 0 – on success, error code otherwise
- -ENOSYS – if the mandatory interface is not implemented

static inline int edac_errors_cor_get(const struct device *dev)
Get number of correctable errors.

Parameters
• dev – Pointer to the device structure

**Return values**

• num – Number of correctable errors
• -ENOSYS – if the mandatory interface is not implemented

static inline int edac_errors_uc_get(const struct device *dev)
Get number of uncorrectable errors.

**Parameters**

• dev – Pointer to the device structure

**Return values**

• num – Number of uncorrectable errors
• -ENOSYS – if the mandatory interface is not implemented

static inline int edac_notify_callback_set(const struct device *dev,
edac_notify_callback_f cb)
Register callback function for memory error exception.
This callback runs in interrupt context

**Parameters**

• dev – EDAC driver device to install callback
• cb – Callback function pointer

**Return values**

• 0 – on success, error code otherwise
• -ENOSYS – if the mandatory interface is not implemented

**Enums**

def edac_error_type
    EDAC error type.
    
    **Values:**
    
    • enumerator EDAC_ERROR_TYPE_DRAM_COR = BIT(0)
    Correctable error type.

    • enumerator EDAC_ERROR_TYPE_DRAM_UC = BIT(1)
    Uncorrectable error type.

**7.6.19 Flash**

**Overview**

**Flash offset concept**

Offsets used by the user API are expressed in relation to the flash memory beginning address. This rule shall be applied to all flash controller regular memory that layout is accessible via API for retrieving the layout of pages (see CONFIG_FLASH_PAGE_LAYOUT).
An exception from the rule may be applied to a vendor-specific flash dedicated-purpose region (such a region obviously can’t be covered under API for retrieving the layout of pages).

**User API Reference**

**Related code samples**

**AT45 DataFlash driver**
Use the AT45 family DataFlash driver to interact with the flash memory over SPI.

**ESP32 Flash Memory-Mapped**
Write data into scratch area and read it using flash API and memory-mapped pointer.

**Flash shell**
Explore a flash device using shell commands.

**JEDEC SPI-NOR flash**
Use the flash API to interact with an SPI NOR serial flash memory device.

**JESD216 flash**
Use the JESD216 flash API to extract information from a compatible serial memory device.

**nRF SoC flash**
Use the flash API to interact with the SoC flash.

```c
#include <zephyr/kernel.h>

#define FLASH_EX_OP_VENDOR_BASE
#define FLASH_EX_OP_IS_VENDOR(c)

typedef bool (*flash_page_cb)(const struct flash_pages_info *info, void *data)

callback type for iterating over flash pages present on a device.

The callback should return true to continue iterating, and false to halt.

See also:

flash_page_foreach()
```

**Param info**
Information for current page

**Param data**
Private data for callback

**Return**
True to continue iteration, false to halt iteration.
Enums

enum flash_ex_op_types
    Enumeration for extra flash operations.
    Values:

    enumerator FLASH_EX_OP_RESET = 0

Functions

int flash_read(const struct device *dev, off_t offset, void *data, size_t len)
    Read data from flash.
    All flash drivers support reads without alignment restrictions on the read offset, the
    read size, or the destination address.
    Parameters
        • dev – : flash dev
        • offset – : Offset (byte aligned) to read
        • data – : Buffer to store read data
        • len – : Number of bytes to read.
    Returns
        0 on success, negative errno code on fail.

int flash_write(const struct device *dev, off_t offset, const void *data, size_t len)
    Write buffer into flash memory.
    All flash drivers support a source buffer located either in RAM or SoC flash, without
    alignment restrictions on the source address. Write size and offset must be multiples
    of the minimum write block size supported by the driver.
    Any necessary write protection management is performed by the driver write imple-
    mentation itself.
    Parameters
        • dev – : flash device
        • offset – : starting offset for the write
        • data – : data to write
        • len – : Number of bytes to write
    Returns
        0 on success, negative errno code on fail.

int flash_erase(const struct device *dev, off_t offset, size_t size)
    Erase part or all of a flash memory.
    Acceptable values of erase size and offset are subject to hardware-specific multiples of
    page size and offset. Please check the API implemented by the underlying sub driver,
    for example by using flash_get_page_info_by_offs() if that is supported by your flash
    driver.
    Any necessary erase protection management is performed by the driver erase imple-
    mentation itself.
See also:
flash_get_page_info_by_offs()
See also:
flash_get_page_info_by_idx()

Parameters
- **dev** – flash device
- **offset** – erase area starting offset
- **size** – size of area to be erased

Returns
0 on success, negative errno code on fail.

```c
int flash_get_page_info_by_offs(const struct device *dev, off_t offset, struct flash_pages_info *info)
```

Get the size and start offset of flash page at certain flash offset.

Parameters
- **dev** – flash device
- **offset** – Offset within the page
- **info** – Page Info structure to be filled

Returns
0 on success, -EINVAL if page of the offset doesn’t exist.

```c
int flash_get_page_info_by_idx(const struct device *dev, uint32_t page_index, struct flash_pages_info *info)
```

Get the size and start offset of flash page of certain index.

Parameters
- **dev** – flash device
- **page_index** – Index of the page. Index are counted from 0.
- **info** – Page Info structure to be filled

Returns
0 on success, -EINVAL if page of the index doesn’t exist.

```c
size_t flash_get_page_count(const struct device *dev)
```

Get the total number of flash pages.

Parameters
- **dev** – flash device

Returns
Number of flash pages.

```c
void flash_page_foreach(const struct device *dev, flash_page_cb cb, void *data)
```

Iterate over all flash pages on a device.

This routine iterates over all flash pages on the given device, ordered by increasing start offset. For each page, it invokes the given callback, passing it the page’s information and a private data object.

Parameters
- **dev** – Device whose pages to iterate over
int flash_sfdp_read(const struct device *dev, off_t offset, void *data, size_t len)

Read data from Serial Flash Discoverable Parameters.

This routine reads data from a serial flash device compatible with the JEDEC JESD216 standard for encoding flash memory characteristics.

Availability of this API is conditional on selecting CONFIG_FLASH_JESD216_API and support of that functionality in the driver underlying dev.

Parameters
- dev – device from which parameters will be read
- offset – address within the SFDP region containing data of interest
- data – where the data to be read will be placed
- len – the number of bytes of data to be read

Return values
- 0 – on success
- -ENOTSUP – if the flash driver does not support SFDP access
- negative – values for other errors.

int flash_read_jedec_id(const struct device *dev, uint8_t *id)

Read the JEDEC ID from a compatible flash device.

Parameters
- dev – device from which id will be read
- id – pointer to a buffer of at least 3 bytes into which id will be stored

Return values
- 0 – on successful store of 3-byte JEDEC id
- -ENOTSUP – if flash driver doesn’t support this function
- negative – values for other errors

size_t flash_get_write_block_size(const struct device *dev)

Get the minimum write block size supported by the driver.

The write block size supported by the driver might differ from the write block size of memory used because the driver might implements write-modify algorithm.

Parameters
- dev – flash device

Returns
write block size in bytes.

const struct flash_parameters *flash_get_parameters(const struct device *dev)

Get pointer to flash_parameters structure.

Returned pointer points to a structure that should be considered constant through a runtime, regardless if it is defined in RAM or Flash. Developer is free to cache the structure pointer or copy its contents.

Returns
pointer to flash_parameters structure characteristic for the device.
Execute flash extended operation on given device.

Besides of standard flash operations like write or erase, flash controllers also support additional features like write protection or readout protection. These features are not available in every flash controller, what's more controllers can implement it in a different way.

It doesn't make sense to add a separate flash API function for every flash controller feature, because it could be unique (supported on small number of flash controllers) or the API won't be able to represent the same feature on every flash controller.

**Parameters**

- **dev** – Flash device
- **code** – Operation which will be executed on the device.
- **in** – Pointer to input data used by operation. If operation doesn't need any input data it could be NULL.
- **out** – Pointer to operation output data. If operation doesn't produce any output it could be NULL.

**Return values**

- 0 – on success.
- -ENOTSUP – if given device doesn't support extended operation.
- -ENOSYS – if support for extended operations is not enabled in Kconfig
- negative – value on extended operation errors.

```
struct flash_parameters

#include <flash.h> Flash memory parameters.

Contents of this structure suppose to be filled in during flash device initialization and stay constant through a runtime.

struct flash_pages_info

#include <flash.h>
```

**Implementation interface API Reference**

```
group flash_internal_interface

FLASH internal Interface.

**Typedefs**

typedef int (*flash_api_read)(const struct device *dev, off_t offset, void *data, size_t len)

typedef int (*flash_api_write)(const struct device *dev, off_t offset, const void *data, size_t len)

Flash write implementation handler type.
```
Note: Any necessary write protection management must be performed by the driver, with the driver responsible for ensuring the “write-protect” after the operation completes (successfully or not) matches the write-protect state when the operation was started.

typedef int (*flash_api_erase)(const struct device *dev, off_t offset, size_t size)

Flash erase implementation handler type.

Note: Any necessary erase protection management must be performed by the driver, with the driver responsible for ensuring the “erase-protect” after the operation completes (successfully or not) matches the erase-protect state when the operation was started.

typedef const struct flash_parameters *(*flash_api_get_parameters)(const struct device *dev)

typedef void (*flash_api_pages_layout)(const struct device *dev, const struct flash_pages_layout **layout, size_t *layout_size)

Retrieve a flash device's layout.

A flash device layout is a run-length encoded description of the pages on the device. (Here, “page” means the smallest erasable area on the flash device.)

For flash memories which have uniform page sizes, this routine returns an array of length 1, which specifies the page size and number of pages in the memory.

Layouts for flash memories with nonuniform page sizes will be returned as an array with multiple elements, each of which describes a group of pages that all have the same size. In this case, the sequence of array elements specifies the order in which these groups occur on the device.

**Param dev**
Flash device whose layout to retrieve.

**Param layout**
The flash layout will be returned in this argument.

**Param layout_size**
The number of elements in the returned layout.

typedef int (*flash_api_sfdp_read)(const struct device *dev, off_t offset, void *data, size_t len)

typedef int (*flash_api_read_jedec_id)(const struct device *dev, uint8_t *id)

typedef int (*flash_api_ex_op)(const struct device *dev, uint16_t code, const uintptr_t in, void *out)

struct flash_pages_layout
    #include <flash.h>

struct flash_driver_api
    #include <flash.h>
7.6.20 Fuel Gauge

The fuel gauge subsystem exposes an API to uniformly access battery fuel gauge devices. Currently, only reading data is supported.

Note: This API is currently experimental and this doc will be significantly changed as new features are added to the API.

Basic Operation

Properties Fundamentally, a property is a quantity that a fuel gauge device can measure. Fuel gauges typically support multiple properties, such as temperature readings of the battery-pack or present-time current/voltage.

Properties are fetched by the client one at a time using `fuel_gauge_get_prop()`, or fetched in a batch using `fuel_gauge_get_props()`.

Properties are set by the client one at a time using `fuel_gauge_set_prop()`, or set in a batch using `fuel_gauge_set_props()`.

Battery Cutoff Many fuel gauges embedded within battery packs expose a register address that when written to with a specific payload will do a battery cutoff. This battery cutoff is often referred to as ship, shelf, or sleep mode due to its utility in reducing battery drain while devices are stored or shipped.

The fuel gauge API exposes battery cutoff with the `fuel_gauge_battery_cutoff()` function.

Caching The Fuel Gauge API explicitly provides no caching for its clients.

API Reference

group fuel_gauge_interface

Fuel Gauge Interface.

Defines

SBS_GAUGE_MANUFACTURER_NAME_MAX_SIZE

Data structures for reading SBS buffer properties.

SBS_GAUGE_DEVICE_NAME_MAX_SIZE

SBS_GAUGE_DEVICE_CHEMISTRY_MAX_SIZE

Typedefs

typedef uint16_t fuel_gauge_prop_t
typedef int (*fuel_gauge_get_property_t)(const struct device *dev, fuel_gauge_prop_t prop, union fuel_gauge_prop_val *val)
    Callback API for getting a fuel_gauge property.
    See fuel_gauge_get_property() for argument description

typedef int (*fuel_gauge_set_property_t)(const struct device *dev, fuel_gauge_prop_t prop, union fuel_gauge_prop_val val)
    Callback API for setting a fuel_gauge property.
    See fuel_gauge_set_property() for argument description

typedef int (*fuel_gauge_get_buffer_property_t)(const struct device *dev, fuel_gauge_prop_t prop_type, void *dst, size_t dst_len)
    Callback API for getting a fuel_gauge buffer property.
    See fuel_gauge_get_buffer_property() for argument description

typedef int (*fuel_gauge_battery_cutoff_t)(const struct device *dev)
    Callback API for doing a battery cutoff.
    See fuel_gauge_battery_cutoff() for argument description

Enums

enum fuel_gauge_prop_type
    Values:

    enumerator FUEL_GAUGE_AVG_CURRENT = 0
        Runtime Dynamic Battery Parameters.
        Provide a 1 minute average of the current on the battery. Does not check for
        flags or whether those values are bad readings. See driver instance header for
        details on implementation and how the average is calculated. Units in uA nega-
        tive=discharging

    enumerator FUEL_GAUGE_BATTERY_CUTOFF
        Used to cutoff the battery from the system - useful for storage/shipping of devices.

    enumerator FUEL_GAUGE_CURRENT
        Battery current (uA); negative=discharging.

    enumerator FUEL_GAUGE_CHARGE_CUTOFF
        Whether the battery underlying the fuel-gauge is cut off from charge.

    enumerator FUEL_GAUGE_CYCLE_COUNT
        Cycle count in 1/100ths (number of charge/discharge cycles)

    enumerator FUEL_GAUGE_CONNECT_STATE
        Connect state of battery.
enumerator FUEL_GAUGE_FLAGS
    General Error/Runtime Flags.

enumerator FUEL_GAUGE_FULL_CHARGE_CAPACITY
    Full Charge Capacity in uAh (might change in some implementations to determine wear)

enumerator FUEL_GAUGE_PRESENT_STATE
    Is the battery physically present.

enumerator FUEL_GAUGE_REMAINING_CAPACITY
    Remaining capacity in uAh.

enumerator FUEL_GAUGE_RUNTIME_TOEMPTY
    Remaining battery life time in minutes.

enumerator FUEL_GAUGE_RUNTIME_TOFULL
    Remaining time in minutes until battery reaches full charge.

enumerator FUEL_GAUGE_SBS_MFR_ACCESS
    Retrieve word from SBS1.1 ManufacturerAccess.

enumerator FUEL_GAUGE_ABSOLUTE_STATE_OF_CHARGE
    Absolute state of charge (percent, 0-100) - expressed as % of design capacity.

enumerator FUEL_GAUGE_RELATIVE_STATE_OF_CHARGE
    Relative state of charge (percent, 0-100) - expressed as % of full charge capacity.

enumerator FUEL_GAUGE_TEMPERATURE
    Temperature in 0.1 K.

enumerator FUEL_GAUGE_VOLTAGE
    Battery voltage (uV)

enumerator FUEL_GAUGE_SBS_MODE
    Battery Mode (flags)

enumerator FUEL_GAUGE_CHARGE_CURRENT
    Battery desired Max Charging Current (uA)

enumerator FUEL_GAUGE_CHARGE_VOLTAGE
    Battery desired Max Charging Voltage (uV)

enumerator FUEL_GAUGE_STATUS
    Alarm, Status and Error codes (flags)

enumerator FUEL_GAUGE_DESIGN_CAPACITY
    Design Capacity (mAh or 10mWh)
enumerator FUEL_GAUGE_DESIGN_VOLTAGE
    Design Voltage (mV)

enumerator FUEL_GAUGE_SBS_ATRATE
    AtRate (mA or 10 mW)

counter FUEL_GAUGE_SBS_ATRATE_TIME_TO_FULL
    AtRateTimeToFull (minutes)

counter FUEL_GAUGE_SBS_ATRATE_TIME_TO_EMPTY
    AtRateTimeToEmpty (minutes)

counter FUEL_GAUGE_SBS_ATRATE_OK
    AtRateOK (boolean)

counter FUEL_GAUGE_SBS_REMAINING_CAPACITY_ALARM
    Remaining Capacity Alarm (mAh or 10mWh)

counter FUEL_GAUGE_SBS_REMAINING_TIME_ALARM
    Remaining Time Alarm (minutes)

counter FUEL_GAUGE_MANUFACTURER_NAME
    Manufacturer of pack (1 byte length + 20 bytes data)

counter FUEL_GAUGE_DEVICE_NAME
    Name of pack (1 byte length + 20 bytes data)

counter FUEL_GAUGE_DEVICE_CHEMISTRY
    Chemistry (1 byte length + 4 bytes data)

counter FUEL_GAUGE_COMMON_COUNT
    Reserved to demark end of common fuel gauge properties.

counter FUEL_GAUGE_CUSTOM_BEGIN
    Reserved to demark downstream custom properties - use this value as the actual value may change over future versions of this API.

counter FUEL_GAUGE_PROP_MAX = UINT16_MAX
    Reserved to demark end of valid enum properties.

Functions

int fuel_gauge_get_prop(const struct device *dev, fuel_gauge_prop_t prop, union fuel_gauge_prop_val *val)

Fetch a battery fuel-gauge property.

Parameters

- dev – Pointer to the battery fuel-gauge device
- prop – Type of property to be fetched from device
• val – pointer to a union `fuel_gauge_prop_val` where the property is read into from the fuel gauge device.

**Returns**

0 if successful, negative errno code if failure.

```c
int fuel_gauge_get_props(const struct device *dev, fuel_gauge_prop_t *props, union fuel_gauge_prop_val *vals, size_t len)
```

Fetch multiple battery fuel-gauge properties.

The default implementation is the same as calling `fuel_gauge_get_prop()` multiple times. A driver may implement the get_properties field of the fuel gauge driver APIs struct to override this implementation.

**Parameters**

- dev – Pointer to the battery fuel-gauge device
- props – Array of the type of property to be fetched from device, each index corresponds to the same index of the vals input array.
- vals – Pointer to array of union `fuel_gauge_prop_val` where the property is read into from the fuel gauge device. The vals array is not permuted.
- len – number of properties in props & vals array

**Returns**

0 if successful, negative errno code of first failing property

```c
int fuel_gauge_set_prop(const struct device *dev, fuel_gauge_prop_t prop, union fuel_gauge_prop_val val)
```

Set a battery fuel-gauge property.

**Parameters**

- dev – Pointer to the battery fuel-gauge device
- prop – Type of property that’s being set
- val – Value to set associated prop property.

**Returns**

0 if successful, negative errno code of first failing property

```c
int fuel_gauge_set_props(const struct device *dev, fuel_gauge_prop_t *props, union fuel_gauge_prop_val *vals, size_t len)
```

Set a battery fuel-gauge property.

**Parameters**

- dev – Pointer to the battery fuel-gauge device
- props – Array of the type of property to be set, each index corresponds to the same index of the vals input array.
- vals – Pointer to array of union `fuel_gauge_prop_val` where the property is written the fuel gauge device. The vals array is not permuted.
- len – number of properties in props array

**Returns**

`return=0` if successful. Otherwise, return array index of failing property.

```c
int fuel_gauge_get_buffer_prop(const struct device *dev, fuel_gauge_prop_t prop_type, void *dst, size_t dst_len)
```

Fetch a battery fuel-gauge buffer property.

**Parameters**
• dev – Pointer to the battery fuel-gauge device
• prop_type – Type of property to be fetched from device
• dst – byte array or struct that will hold the buffer data that is read from
  the fuel gauge
• dst_len – the length of the destination array in bytes

Returns
return=0 if successful, return < 0 if getting property failed, return 0 on suc-
cess

int fuel_gauge_battery_cutoff(const struct device *dev)
Have fuel gauge cutoff its associated battery.

Parameters
• dev – Pointer to the battery fuel-gauge device

Returns
return=0 if successful and battery cutoff is now in process, return < 0 if
failed to do battery cutoff.

union fuel_gauge_prop_val
#include <fuel_gauge.h> Property field to value/type union.

Public Members

fuel_gauge_get_property_t get_property
    Note: Historically this API allowed drivers to implement a custom multi-get/set property function, this was added so drivers could potentially optimize batch read with their specific chip.

    However, it was removed because of no existing concrete case upstream. If this need is demonstrated, we can add this back in as an API field.

Functions

int emul_fuel_gauge_set_battery_charging(const struct emul *target, uint32_t uV, int uA)
    Set charging for fuel gauge associated battery.

    Set how much the battery associated with a fuel gauge IC is charging or discharging. Where voltage is always positive and a positive or negative current denotes charging or discharging, respectively.

    Parameters
    • target – Pointer to the emulator structure for the fuel gauge emulator instance.
    • uV – Microvolts describing the battery voltage.
    • uA – Microamps describing the battery current where negative is discharging.

    Return values
    • 0 – If successful.
    • -EINVAL – if mV or mA are 0.
int emul_fuel_gauge_is_battery_cutoff(const struct emul *target, bool *cutoff)
Check if the battery has been cut off.

Parameters
• target – Pointer to the emulator structure for the fuel gauge emulator instance.
• cutoff – Pointer to bool storing variable.

Return values
• 0 – If successful.
• -ENOTSUP – if not supported by emulator.

7.6.21 GNSS (Global Navigation Satellite System)

Overview

GNSS is a general term which covers satellite systems used for navigation, like GPS (Global Positioning System). GNSS services are usually accessed through GNSS modems which receive and process GNSS signals to determine their position, or more specifically, their antennas position. They usually additionally provide a precise time synchronization mechanism, commonly named PPS (Pulse-Per-Second).

Subsystem support

The GNSS subsystem is based on the Modem modules. The GNSS subsystem covers everything from sending and receiving commands to and from the modem, to parsing, creating and processing NMEA0183 messages.

Adding support for additional NMEA0183 based GNSS modems requires little more than implementing power management and configuration for the specific GNSS modem.

Adding support for GNSS modems which use other protocols and/or busses than the usual NMEA0183 over UART is possible, but will require a bit more work from the driver developer.

Configuration Options

Related configuration options:
• CONFIG_GNSS
• CONFIG_GNSS_SATELLITES
• CONFIG_GNSS_DUMP_TO_LOG

Navigation Reference

Related code samples
GNSS
Connect to a GNSS device to obtain time, navigation data, and satellite information.

group navigation
Navigation utilities.
Functions

```c
int navigation_distance(uint64_t *distance, const struct navigation_data *p1, const struct navigation_data *p2)
```

Calculate the distance between two navigation points along the surface of the sphere they are relative to.

**Parameters**
- `distance` – Destination for calculated distance in millimeters
- `p1` – First navigation point
- `p2` – Second navigation point

**Returns**
- 0 if successful
- -EINVAL if either navigation point is invalid

```c
int navigation_bearing(uint32_t *bearing, const struct navigation_data *from, const struct navigation_data *to)
```

Calculate the bearing from one navigation point to another.

**Parameters**
- `bearing` – Destination for calculated bearing angle in millidegrees
- `from` – First navigation point
- `to` – Second navigation point

**Returns**
- 0 if successful
- -EINVAL if either navigation point is invalid

```c
struct navigation_data

#include <navigation.h> Navigation data structure.
```

The structure describes the momentary navigation details of a point relative to a sphere (commonly Earth)

**Public Members**

```c
int64_t latitude
    Latitudal position in nanodegrees (0 to +-180E9)
```

```c
int64_t longitude
    Longitudal position in nanodegrees (0 to +-180E9)
```

```c
uint32_t bearing
    Bearing angle in millidegrees (0 to 360E3)
```

```c
uint32_t speed
    Speed in millimeters per second.
```
int32_t altitude
Altitude in millimeters.

typedef int (*gnss_get_fix_rate_t)(const struct device *dev, uint32_t *fix_interval_ms)
API for getting fix rate.

typedef int (*gnss_set_periodic_config_t)(const struct device *dev, const struct gnss_periodic_config *periodic_config)
API for setting periodic tracking configuration.

typedef int (*gnss_get_periodic_config_t)(const struct device *dev, struct gnss_periodic_config *periodic_config)
API for setting periodic tracking configuration.

typedef int (*gnss_set_navigation_mode_t)(const struct device *dev, enum gnss_navigation_mode mode)
API for setting navigation mode.
typedef int (*gnss_get_navigation_mode_t)(const struct device *dev, enum gnss_navigation_mode *mode)
    API for getting navigation mode.

typedef uint32_t gnss_systems_t
    Type storing bitmask of GNSS systems.

typedef int (*gnss_set_enabled_systems_t)(const struct device *dev, gnss_systems_t systems)
    API for enabling systems.

typedef int (*gnss_get_enabled_systems_t)(const struct device *dev, gnss_systems_t *systems)
    API for getting enabled systems.

typedef int (*gnss_get_supported_systems_t)(const struct device *dev, gnss_systems_t *systems)
    API for getting enabled systems.

typedef void (*gnss_data_callback_t)(const struct device *dev, const struct gnss_data *data)
    Template for GNSS data callback.

typedef void (*gnss_satellites_callback_t)(const struct device *dev, const struct gnss_satellite *satellites, uint16_t size)
    Template for GNSS satellites callback.

Enums

enum gnss_pps_mode
    GNSS PPS modes.
    Values:
    
    enumerator GNSS_PPS_MODE_DISABLED = 0
        PPS output disabled.

    enumerator GNSS_PPS_MODE_ENABLED = 1
        PPS output always enabled.

    enumerator GNSS_PPS_MODE_ENABLED_AFTER_LOCK = 2
        PPS output enabled from first lock.

    enumerator GNSS_PPS_MODE_ENABLED_WHILE_LOCKED = 3
        PPS output enabled while locked.

enum gnss_navigation_mode
    GNSS navigation modes.
    Values:
enumerator GNSS_NAVIGATION_MODE_ZERO_DYNAMICS = 0
Dynamics have no impact on tracking.

denumerator GNSS_NAVIGATION_MODE_LOW_DYNAMICS = 1
Low dynamics have higher impact on tracking.

denumerator GNSS_NAVIGATION_MODE_BALANCED_DYNAMICS = 2
Low and high dynamics have equal impact on tracking.

denumerator GNSS_NAVIGATION_MODE_HIGH_DYNAMICS = 3
High dynamics have higher impact on tracking.

enum gnss_system
Systems contained in gnss_systems_t.
Values:

denumerator GNSS_SYSTEM_GPS = BIT(0)
Global Positioning System (GPS)

denumerator GNSS_SYSTEM_GLONASS = BIT(1)
GLObal NAvigation Satellite System (GLONASS)

denumerator GNSS_SYSTEM_GALILEO = BIT(2)
Galileo.

denumerator GNSS_SYSTEM_BEIDOU = BIT(3)
BeiDou Navigation Satellite System.

denumerator GNSS_SYSTEM_QZSS = BIT(4)
Quasi-Zenith Satellite System (QZSS)

denumerator GNSS_SYSTEM_IRNSS = BIT(5)
Indian Regional Navigation Satellite System (IRNSS)

denumerator GNSS_SYSTEM_SBAS = BIT(6)
Satellite-Based Augmentation System (SBAS)

denumerator GNSS_SYSTEM_IMES = BIT(7)
Indoor Messaging System (IMES)

enum gnss_fix_status
GNSS fix status.
Values:

denumerator GNSS_FIX_STATUS_NO_FIX = 0
No GNSS fix acquired.
enumerator GNSS_FIX_STATUS_GNSS_FIX = 1
    GNSS fix acquired.

enumerator GNSS_FIX_STATUS_DGNSS_FIX = 2
    Differential GNSS fix acquired.

enumerator GNSS_FIX_STATUS_ESTIMATED_FIX = 3
    Estimated fix acquired.

enum gnss_fix_quality
    GNSS fix quality.
    Values:

    enumerator GNSS_FIX_QUALITY_INVALID = 0
        Invalid fix.

    enumerator GNSS_FIX_QUALITY_GNSS_SPS = 1
        Standard positioning service.

    enumerator GNSS_FIX_QUALITY_DGNSS = 2
        Differential GNSS.

    enumerator GNSS_FIX_QUALITY_GNSS_PPS = 3
        Precise positioning service.

    enumerator GNSS_FIX_QUALITY_RTK = 4
        Real-time kinematic.

    enumerator GNSS_FIX_QUALITY_FLOAT_RTK = 5
        Floating real-time kinematic.

    enumerator GNSS_FIX_QUALITY_ESTIMATED = 6
        Estimated fix.

Functions

int gnss_set_fix_rate(const struct device *dev, uint32_t fix_interval_ms)
    Set the GNSS fix rate.

Parameters
    • dev – Device instance
    • fix_interval_ms – Fix interval to set in milliseconds

Returns
    0 if successful

Returns
    -errno negative errno code on failure
int gnss_get_fix_rate(const struct device *dev, uint32_t *fix_interval_ms)
Get the GNSS fix rate.

Parameters
• dev – Device instance
• fix_interval_ms – Destination for fix interval in milliseconds

Returns
0 if successful

Returns
-errno negative errno code on failure

int gnss_set_periodic_config(const struct device *dev, const struct gnss_periodic_config *config)
Set the GNSS periodic tracking configuration.

Parameters
• dev – Device instance
• config – Periodic tracking configuration to set

Returns
0 if successful

Returns
-errno negative errno code on failure

int gnss_get_periodic_config(const struct device *dev, struct gnss_periodic_config *config)
Get the GNSS periodic tracking configuration.

Parameters
• dev – Device instance
• config – Destination for periodic tracking configuration

Returns
0 if successful

Returns
-errno negative errno code on failure

int gnss_set_navigation_mode(const struct device *dev, enum gnss_navigation_mode mode)
Set the GNSS navigation mode.

Parameters
• dev – Device instance
• mode – Navigation mode to set

Returns
0 if successful

Returns
-errno negative errno code on failure

int gnss_get_navigation_mode(const struct device *dev, enum gnss_navigation_mode *mode)
Get the GNSS navigation mode.

Parameters
• dev – Device instance
int gnss_set_enabled_systems(const struct device *dev, gnss_systems_t systems)
Set enabled GNSS systems.
Parameters
• dev – Device instance
• systems – Systems to enable
Returns
0 if successful
-errno negative errno code on failure

int gnss_get_enabled_systems(const struct device *dev, gnss_systems_t *systems)
Get enabled GNSS systems.
Parameters
• dev – Device instance
• systems – Destination for enabled systems
Returns
0 if successful
-errno negative errno code on failure

int gnss_get_supported_systems(const struct device *dev, gnss_systems_t *systems)
Get supported GNSS systems.
Parameters
• dev – Device instance
• systems – Destination for supported systems
Returns
0 if successful
-errno negative errno code on failure

struct gnss_periodic_config
#include <gnss.h> GNSS periodic tracking configuration.

Note: Setting either active_time or inactive_time to 0 will disable periodic function.

Public Members

double active_time_ms
The time the GNSS will spend in the active state in ms.
uint32_t inactive_time_ms
   The time the GNSS will spend in the inactive state in ms.

struct gnss_info
   #include <gnss.h> GNSS info data structure.

   Public Members

   uint16_t satellites_cnt
      Number of satellites being tracked.

   uint16_t hdop
      Horizontal dilution of precision in 1/1000.

enum gnss_fix_status fix_status
   The fix status.

enum gnss_fix_quality fix_quality
   The fix quality.

struct gnss_time
   #include <gnss.h> GNSS time data structure.

   Public Members

   uint8_t hour
      Hour [0, 23].

   uint8_t minute
      Minute [0, 59].

   uint16_t millisecond
      Millisecond [0, 59999].

   uint8_t month_day
      Day of month [1, 31].

   uint8_t month
      Month [1, 12].

   uint8_t century_year
      Year [0, 99].

struct gnss_driver_api
   #include <gnss.h> GNSS API structure.

struct gnss_data
   #include <gnss.h> GNSS data structure.

7.6. Peripherals
Public Members

struct navigation_data nav_data
    Navigation data acquired.

struct gnss_info info
    GNSS info when navigation data was acquired.

struct gnss_time utc
    UTC time when data was acquired.

struct gnss_data_callback
    #include <gnss.h> GNSS callback structure.

Public Members

const struct device *dev
    Filter callback to GNSS data from this device if not NULL.

gnss_data_callback_t callback
    Callback called when GNSS data is published.

struct gnss_satellite
    #include <gnss.h> GNSS satellite structure.

Public Members

uint8_t prn
    Pseudo-random noise sequence.

uint8_t snr
    Signal-to-noise ratio in dB.

uint8_t elevation
    Elevation in degrees [0, 90].

uint16_t azimuth
    Azimuth relative to True North in degrees [0, 359].

dui8_t is_tracked
    True if satellite is being tracked.

struct gnss_satellites_callback
    #include <gnss.h> GNSS callback structure.
Public Members

const struct device *dev
    Filter callback to GNSS data from this device if not NULL.

gnss_satellites_callback_t callback
    Callback called when GNSS satellites is published.

7.6.22 General-Purpose Input/Output (GPIO)

Overview

Configuration Options

Related configuration options:

- CONFIG_GPIO

API Reference

Related code samples

Basic thread manipulation
    Spawn multiple threads that blink LEDs and print information to the console.

Blinky
    Blink an LED forever using the GPIO API.

Button
    Handle GPIO inputs with interrupts.

GPIO with custom Devicetree binding
    Use custom Devicetree binding to control a GPIO.

HD44780 LCD controller
    Control an HD44780-based LCD display using GPIO pins.

X-NUCLEO-53L0A1 shield
    Interact with the 7-segment display and VL53L0X ranging sensor of an X-NUCLEO-53L0A1 shield.

# group gpio_interface
    GPIO Driver APIs.

    GPIO input/output configuration flags

    GPIO_INPUT
        Enables pin as input.

    GPIO_OUTPUT
        Enables pin as output, no change to the output state.
GPIO_DISCONNECTED
Disables pin for both input and output.

GPIO_OUTPUT_LOW
Configures GPIO pin as output and initializes it to a low state.

GPIO_OUTPUT_HIGH
Configures GPIO pin as output and initializes it to a high state.

GPIO_OUTPUT_INACTIVE
Configures GPIO pin as output and initializes it to a logic 0.

GPIO_OUTPUT_ACTIVE
Configures GPIO pin as output and initializes it to a logic 1.

**GPIO interrupt configuration flags**

The GPIO_INT_* flags are used to specify how input GPIO pins will trigger interrupts. The interrupts can be sensitive to pin physical or logical level. Interrupts sensitive to pin logical level take into account GPIO_ACTIVE_LOW flag. If a pin was configured as Active Low, physical level low will be considered as logical level 1 (an active state), physical level high will be considered as logical level 0 (an inactive state). The GPIO controller should reset the interrupt status, such as clearing the pending bit, etc, when configuring the interrupt triggering properties. Applications should use the GPIO_INT_MODE_ENABLE_ONLY and GPIO_INT_MODE_DISABLE_ONLY flags to enable and disable interrupts on the pin without changing any GPIO settings.

GPIO_INT_DISABLE
Disables GPIO pin interrupt.

GPIO_INT_EDGE_RISING
Configures GPIO interrupt to be triggered on pin rising edge and enables it.

GPIO_INT_EDGE_FALLING
Configures GPIO interrupt to be triggered on pin falling edge and enables it.

GPIO_INT_EDGE_BOTH
Configures GPIO interrupt to be triggered on pin rising or falling edge and enables it.

GPIO_INT_LEVEL_LOW
Configures GPIO interrupt to be triggered on pin physical level low and enables it.

GPIO_INT_LEVEL_HIGH
Configures GPIO interrupt to be triggered on pin physical level high and enables it.

GPIO_INT_EDGE_TO_INACTIVE
Configures GPIO interrupt to be triggered on pin state change to logical level 0 and enables it.
GPIO_INT_EDGE_TO_ACTIVE
    Configures GPIO interrupt to be triggered on pin state change to logical level 1 and enables it.

GPIO_INT_LEVEL_INACTIVE
    Configures GPIO interrupt to be triggered on pin logical level 0 and enables it.

GPIO_INT_LEVEL_ACTIVE
    Configures GPIO interrupt to be triggered on pin logical level 1 and enables it.

GPIO pin active level flags

GPIO_ACTIVE_LOW
    GPIO pin is active (has logical value ‘1’) in low state.

GPIO_ACTIVE_HIGH
    GPIO pin is active (has logical value ‘1’) in high state.

GPIO pin drive flags

GPIO_OPEN_DRAIN
    Configures GPIO output in open drain mode (wired AND).

    Note: ‘Open Drain’ mode also known as ‘Open Collector’ is an output configuration which behaves like a switch that is either connected to ground or disconnected.

GPIO_OPEN_SOURCE
    Configures GPIO output in open source mode (wired OR).

    Note: ‘Open Source’ is a term used by software engineers to describe output mode opposite to ‘Open Drain’. It behaves like a switch that is either connected to power supply or disconnected. There exist no corresponding hardware schematic and the term is generally unknown to hardware engineers.

GPIO pin bias flags

GPIO_PULL_UP
    Enables GPIO pin pull-up.

GPIO_PULL_DOWN
    Enable GPIO pin pull-down.
**Defines**

`GPIO_DT_SPEC_GET_BY_IDX(node_id, prop, idx)`

Static initializer for a `gpio_dt_spec`.

This returns a static initializer for a `gpio_dt_spec` structure given a devicetree node identifier, a property specifying a GPIO and an index.

Example devicetree fragment:

```plaintext
n: node {
  foo-gpios = <&gpio0 1 GPIO_ACTIVE_LOW>,
    <&gpio1 2 GPIO_ACTIVE_LOW>;
}
```

Example usage:

```c
const struct gpio_dt_spec spec = GPIO_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n),
  foo_gpios, 1);
// Initializes 'spec' to:
// {
//   .port = DEVICE_DT_GET(DT_NODELABEL(gpio1)),
//   .pin = 2,
//   .dt_flags = GPIO_ACTIVE_LOW
// }
```

The ‘gpio’ field must still be checked for readiness, e.g. using `device_is_ready()`. It is an error to use this macro unless the node exists, has the given property, and that property specifies a GPIO controller, pin number, and flags as shown above.

**Parameters**
- `node_id` – devicetree node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – logical index into “prop”

**Returns**
static initializer for a struct `gpio_dt_spec` for the property

`GPIO_DT_SPEC_GET_BY_IDX_OR(node_id, prop, idx, default_value)`

Like `GPIO_DT_SPEC_GET_BY_IDX()`, with a fallback to a default value.

If the devicetree node identifier 'node_id' refers to a node with a property 'prop', this expands to `GPIO_DT_SPEC_GET_BY_IDX(node_id, prop, idx)`. The default_value parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

**Parameters**
- `node_id` – devicetree node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – logical index into “prop”
- `default_value` – fallback value to expand to

**Returns**
static initializer for a struct `gpio_dt_spec` for the property, or `default_value` if the node or property do not exist
**Zephyr Project Documentation, Release 3.6.0-rc3**

**GPIO_DT_SPEC_GET**(node_id, prop)
Equivalent to **GPIO_DT_SPEC_GET_BY_IDX**(node_id, prop, 0).

**See also:**
**GPIO_DT_SPEC_GET_BY_IDX()**

**Parameters**
- node_id – devicetree node identifier
- prop – lowercase-and-underscores property name

**Returns**
static initializer for a struct gpio_dt_spec for the property

**GPIO_DT_SPEC_GET_OR**(node_id, prop, default_value)
Equivalent to **GPIO_DT_SPEC_GET_BY_IDX_OR**(node_id, prop, 0, default_value).

**See also:**
**GPIO_DT_SPEC_GET_BY_IDX_OR()**

**Parameters**
- node_id – devicetree node identifier
- prop – lowercase-and-underscores property name
- default_value – fallback value to expand to

**Returns**
static initializer for a struct gpio_dt_spec for the property

**GPIO_DT_SPEC_INST_GET_BY_IDX**(inst, prop, idx)
Static initializer for a gpio_dt_spec from a DT_DRV_COMPAT instance's GPIO property at an index.

**See also:**
**GPIO_DT_SPEC_GET_BY_IDX()**

**Parameters**
- inst – DT_DRV_COMPAT instance number
- prop – lowercase-and-underscores property name
- idx – logical index into “prop”

**Returns**
static initializer for a struct gpio_dt_spec for the property

**GPIO_DT_SPEC_INST_GET_BY_IDX_OR**(inst, prop, idx, default_value)
Static initializer for a gpio_dt_spec from a DT_DRV_COMPAT instance's GPIO property at an index, with fallback.

**See also:**
**GPIO_DT_SPEC_GET_BY_IDX()**

7.6. Peripherals
Parameters

- inst – DT_DRV_COMPAT instance number
- prop – lowercase-and-underscores property name
- idx – logical index into “prop”
- default_value – fallback value to expand to

Returns

static initializer for a struct gpio_dt_spec for the property

`GPIO_DT_SPEC_INST_GET` (inst, prop)

Equivalent to `GPIO_DT_SPEC_INST_GET_BY_IDX(inst, prop, 0)`.

See also:

`GPIO_DT_SPEC_INST_GET_BY_IDX()`

Parameters

- inst – DT_DRV_COMPAT instance number
- prop – lowercase-and-underscores property name

Returns

static initializer for a struct gpio_dt_spec for the property

`GPIO_DT_SPEC_INST_GET_OR` (inst, prop, default_value)

Equivalent to `GPIO_DT_SPEC_INST_GET_BY_IDX_OR(inst, prop, 0, default_value)`.

See also:

`GPIO_DT_SPEC_INST_GET_BY_IDX()`

Parameters

- inst – DT_DRV_COMPAT instance number
- prop – lowercase-and-underscores property name
- default_value – fallback value to expand to

Returns

static initializer for a struct gpio_dt_spec for the property

`GPIO_DT_RESERVED_RANGES_NGPIOS` (node_id, ngpios)

Makes a bitmask of reserved GPIOs from DT "gpio-reserved-ranges" property and "ngpios" argument.

This macro returns the value as a bitmask of the "gpio-reserved-ranges" property. This property defines the disabled (or 'reserved') GPIOs in the range 0…ngpios-1 and is specified as an array of value’s pairs that define the start offset and size of the reserved ranges.

For example, setting “gpio-reserved-ranges = <3 2>, <10 1>;" means that GPIO offsets 3, 4 and 10 cannot be used even if ngpios = <18>.

The implementation constraint is inherited from common DT limitations: a maximum of 64 pairs can be used (with result limited to bitsize of gpio_port_pins_t type).

NB: Due to the nature of C macros, some incorrect tuple definitions (for example, overlapping or out of range) will produce undefined results.
Also be aware that if `ngpios` is less than 32 (bit size of DT int type), then all unused MSBs outside the range defined by `ngpios` will be marked as reserved too.

Example devicetree fragment:

```
Example devicetree fragment:

a {
    compatible = "some,gpio-controller";
    ngpios = <32>;
    gpio-reserved-ranges = <0 4>, <5 3>, <9 5>, <11 2>, <15 2>,
                        <18 2>, <21 1>, <23 1>, <25 4>, <30 2>;
};

b {
    compatible = "some,gpio-controller";
    ngpios = <18>;
    gpio-reserved-ranges = <3 2>, <10 1>;
};
```

Example usage:

```
Example usage:

struct some_config {
    uint32_t ngpios;
    uint32_t gpios_reserved;
};

static const struct some_config dev_cfg_a = {
    .ngpios = DT_PROP_OR(DT_LABEL(a), ngpios, 0),
    .gpios_reserved = GPIO_DT_RESERVED_RANGES_NGPIOS(DT_LABEL(a),
                                                      DT_PROP(DT_LABEL(a), ngpios)),
};

static const struct some_config dev_cfg_b = {
    .ngpios = DT_PROP_OR(DT_LABEL(b), ngpios, 0),
    .gpios_reserved = GPIO_DT_RESERVED_RANGES_NGPIOS(DT_LABEL(b),
                                                      DT_PROP(DT_LABEL(b), ngpios)),
};
```

This expands to:

```
This expands to:

struct some_config {
    uint32_t ngpios;
    uint32_t gpios_reserved;
};

static const struct some_config dev_cfg_a = {
    .ngpios = 32,
    .gpios_reserved = 0xdeadbeef,
    // 0b1101 1110 1010 1101 1011 1110 1110 1111
};

static const struct some_config dev_cfg_b = {
    .ngpios = 18,
    .gpios_reserved = 0xfffc0418,
    // 0b1111 1111 1111 1100 0000 0100 0001 1000
    // unused MSBs were marked as reserved too
};
```

**Parameters**

- `node_id` – GPIO controller node identifier.
- `ngpios` – number of GPIOs.

**Returns**

the bitmask of reserved gpios
GPIO_DT_RESERVED_RANGES(node_id)
Makes a bitmask of reserved GPIOs from the "gpio-reserved-ranges" and "ngpios" DT properties values.

Parameters
  - node_id – GPIO controller node identifier.

Returns
the bitmask of reserved gpios

GPIO_DT_INST_RESERVED_RANGES_NGPIOS(inst, ngpios)
Makes a bitmask of reserved GPIOs from a DT_DRV_COMPAT instance's "gpio-reserved-ranges" property and "ngpios" argument.

See also:
GPIO_DT_RESERVED_RANGES()

Parameters
  - inst – DT_DRV_COMPAT instance number
  - ngpios – number of GPIOs

Returns
the bitmask of reserved gpios

GPIO_DT_INST_RESERVED_RANGES(inst)
Make a bitmask of reserved GPIOs from a DT_DRV_COMPAT instance's GPIO "gpio-reserved-ranges" and "ngpios" properties.

See also:
GPIO_DT_RESERVED_RANGES()

Parameters
  - inst – DT_DRV_COMPAT instance number

Returns
the bitmask of reserved gpios

GPIO_DT_PORT_PIN_MASK_NGPIOS_EXC(node_id, ngpios)
Makes a bitmask of allowed GPIOs from DT "gpio-reserved-ranges" property and "ngpios" argument.

This macro is paired with GPIO_DT_RESERVED_RANGES_NGPIOS(), however unlike the latter, it returns a bitmask of ALLOWED gpios.

Example devicetree fragment:

```
a {
    compatible = "some,gpio-controller";
    ngpios = <32>;
    gpio-reserved-ranges = <0 8>, <9 5>, <15 16>;
};
```

Example usage:
This expands to:

```c
struct some_config {
    uint32_t port_pin_mask;
};

static const struct some_config dev_cfg = {
    .port_pin_mask = 0x80004100,
};
```

Parameters
- `node_id` – GPIO controller node identifier.
- `ngpios` – number of GPIOs

Returns
the bitmask of allowed gpios

`GPIO_DT_INST_PORT_PIN_MASK_NGPIOS_EXC(inst, ngpios)`

Makes a bitmask of allowed GPIOs from a DT_DRV_COMPAT instance's "gpio-reserved-ranges" property and "ngpios" argument.

See also:
`GPIO_DT_NGPIOS_PORT_PIN_MASK_EXC()`

Parameters
- `inst` – DT_DRV_COMPAT instance number
- `ngpios` – number of GPIOs

Returns
the bitmask of allowed gpios

`GPIO_MAX_PINS_PER_PORT`

Maximum number of pins that are supported by `gpio_port_pins_t`.

`GPIO_DT_FLAGS_MASK`

Mask for DT GPIO flags.

Typedefs

```c
typedef uint32_t gpio_port_pins_t
```

Identifies a set of pins associated with a port.
The pin with index n is present in the set if and only if the bit identified by \((1U \ll n)\) is set.

typedef uint32_t gpio_port_value_t
Provides values for a set of pins associated with a port.
The value for a pin with index n is high (physical mode) or active (logical mode) if and only if the bit identified by \((1U \ll n)\) is set. Otherwise the value for the pin is low (physical mode) or inactive (logical mode).
Values of this type are often paired with a gpio_port_pins_t value that specifies which encoded pin values are valid for the operation.

typedef uint8_t gpio_pin_t
Provides a type to hold a GPIO pin index.
This reduced-size type is sufficient to record a pin number, e.g. from a devicetree GPIOS property.

typedef uint16_t gpio_dt_flags_t
Provides a type to hold GPIO devicetree flags.
All GPIO flags that can be expressed in devicetree fit in the low 16 bits of the full flags field, so use a reduced-size type to record that part of a GPIOS property.
The lower 8 bits are used for standard flags. The upper 8 bits are reserved for SoC specific flags.

typedef uint32_t gpio_flags_t
Provides a type to hold GPIO configuration flags.
This type is sufficient to hold all flags used to control GPIO configuration, whether pin or interrupt.

typedef void (*gpio_callback_handler_t)(const struct device *port, struct gpio_callback *cb, gpio_port_pins_t pins)
Define the application callback handler function signature.

Note: cb pointer can be used to retrieve private data through CONTAINER_OF() if original struct gpio_callback is stored in another private structure.

**Param port**
Device struct for the GPIO device.

**Param cb**
Original struct gpio_callback owning this handler

**Param pins**
Mask of pins that triggers the callback handler

**Functions**

static inline bool gpio_is_ready_dt(const struct gpio_dt_spec *spec)
Validate that GPIO port is ready.

**Parameters**
- spec – GPIO specification from devicetree
Return values

- `true` – if the GPIO spec is ready for use.
- `false` – if the GPIO spec is not ready for use.

```c
int gpio_pin_interrupt_configure(const struct device *port, gpio_pin_t pin, gpio_flags_t flags)
```

Configure pin interrupt.

**Note:** This function can also be used to configure interrupts on pins not controlled directly by the GPIO module. That is, pins which are routed to other modules such as I2C, SPI, UART.

**Parameters**

- `port` – Pointer to device structure for the driver instance.
- `pin` – Pin number.
- `flags` – Interrupt configuration flags as defined by GPIO_INT_*.

**Return values**

- `0` – If successful.
- `-ENOSYS` – If the operation is not implemented by the driver.
- `-ENOTSUP` – If any of the configuration options is not supported (unless otherwise directed by flag documentation).
- `-EINVAL` – Invalid argument.
- `-EBUSY` – Interrupt line required to configure pin interrupt is already in use.
- `-EIO` – I/O error when accessing an external GPIO chip.
- `-EWOULDBLOCK` – if operation would block.

```c
static inline int gpio_pin_interrupt_configure_dt(const struct gpio_dt_spec *spec, gpio_flags_t flags)
```

Configure pin interrupts from a `gpio_dt_spec`.

This is equivalent to:

```c
gpio_pin_interrupt_configure(spec->port, spec->pin, flags);
```

The `spec->dt_flags` value is not used.

**Parameters**

- `spec` – GPIO specification from devicetree
- `flags` – interrupt configuration flags

**Returns**

a value from `gpio_pin_interrupt_configure()`

```c
int gpio_pin_configure(const struct device *port, gpio_pin_t pin, gpio_flags_t flags)
```

Configure a single pin.

**Parameters**

- `port` – Pointer to device structure for the driver instance.
- `pin` – Pin number to configure.
• **flags** – Flags for pin configuration: ‘GPIO input/output configuration flags’, ‘GPIO pin drive flags’, ‘GPIO pin bias flags’.

**Return values**

• **0** – If successful.
• **-ENOTSUP** – if any of the configuration options is not supported (unless otherwise directed by flag documentation).
• **-EINVAL** – Invalid argument.
• **-EIO** – I/O error when accessing an external GPIO chip.
• **-EWOULDBLOCK** – if operation would block.

static inline int gpio_pin_configure_dt(const struct gpio_dt_spec *spec, gpio_flags_t extra_flags)

Configure a single pin from a `gpio_dt_spec` and some extra flags.

This is equivalent to:

```
gpio_pin_configure(spec->port, spec->pin, spec->dt_flags | extra_flags);
```

**Parameters**

• `spec` – GPIO specification from devicetree
• `extra_flags` – additional flags

**Returns**

a value from `gpio_pin_configure()`

int gpio_port_get_direction(const struct device *port, gpio_port_pins_t map, gpio_port_pins_t *inputs, gpio_port_pins_t *outputs)

Get direction of select pins in a port.

Retrieve direction of each pin specified in `map`.

If `inputs` or `outputs` is NULL, then this function does not get the respective input or output direction information.

**Parameters**

• `port` – Pointer to the device structure for the driver instance.
• `map` – Bitmap of pin directions to query.
• `inputs` – Pointer to a variable where input directions will be stored.
• `outputs` – Pointer to a variable where output directions will be stored.

**Return values**

• **0** – If successful.
• **-ENOSYS** – if the underlying driver does not support this call.
• **-EIO** – I/O error when accessing an external GPIO chip.
• **-EWOULDBLOCK** – if operation would block.

static inline int gpio_pin_is_input(const struct device *port, gpio_pin_t pin)

Check if pin is configured for input.

**Parameters**

• `port` – Pointer to device structure for the driver instance.
• `pin` – Pin number to query the direction of
Return values

• 1 – if pin is configured as \texttt{GPIO\_INPUT}.
• 0 – if pin is not configured as \texttt{GPIO\_INPUT}.
• -ENOSYS – if the underlying driver does not support this call.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_is_input_dt(const struct gpio_dt_spec *spec)
Check if a single pin from \texttt{gpio_dt_spec} is configured for input.
This is equivalent to:
\begin{verbatim}
gpio_pin_is_input(spec->port, spec->pin);
\end{verbatim}

Parameters

• spec – GPIO specification from devicetree.

Returns

A value from \texttt{gpio_pin_is_input()}. 

static inline int gpio_pin_is_output(const struct device *port, gpio_pin_t pin)
Check if pin is configured for output.

Parameters

• port – Pointer to device structure for the driver instance.
• pin – Pin number to query the direction of

Return values

• 1 – if pin is configured as \texttt{GPIO\_OUTPUT}.
• 0 – if pin is not configured as \texttt{GPIO\_OUTPUT}.
• -ENOSYS – if the underlying driver does not support this call.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_is_output_dt(const struct gpio_dt_spec *spec)
Check if a single pin from \texttt{gpio_dt_spec} is configured for output.
This is equivalent to:
\begin{verbatim}
gpio_pin_is_output(spec->port, spec->pin);
\end{verbatim}

Parameters

• spec – GPIO specification from devicetree.

Returns

A value from \texttt{gpio_pin_is_output()}. 

int gpio_pin_get_config(const struct device *port, gpio_pin_t pin, gpio_flags_t *flags)
Get a configuration of a single pin.

Parameters

• port – Pointer to device structure for the driver instance.
• pin – Pin number which configuration is get.
• flags – Pointer to variable in which the current configuration will be stored if function is successful.

Return values
• 0 – If successful.
• -ENOSYS – if getting current pin configuration is not implemented by the driver.
• -EINVAL – Invalid argument.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_get_config_dt(const struct gpio_dt_spec *spec, gpio_flags_t *flags)

Get a configuration of a single pin from a gpio_dt_spec.
This is equivalent to:

gpio_pin_get_config(spec->port, spec->pin, flags);

Parameters
• spec – GPIO specification from devicetree
• flags – Pointer to variable in which the current configuration will be stored if function is successful.

Returns
a value from gpio_pin_configure()

int gpio_port_get_raw(const struct device *port, gpio_port_value_t *value)
Get physical level of all input pins in a port.
A low physical level on the pin will be interpreted as value 0. A high physical level will be interpreted as value 1. This function ignores GPIO_ACTIVE_LOW flag.
Value of a pin with index n will be represented by bit n in the returned port value.

Parameters
• port – Pointer to the device structure for the driver instance.
• value – Pointer to a variable where pin values will be stored.

Return values
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_port_get(const struct device *port, gpio_port_value_t *value)
Get logical level of all input pins in a port.
Get logical level of an input pin taking into account GPIO_ACTIVE_LOW flag. If pin is configured as Active High, a low physical level will be interpreted as logical value 0. If pin is configured as Active Low, a low physical level will be interpreted as logical value 1.
Value of a pin with index n will be represented by bit n in the returned port value.

Parameters
• port – Pointer to the device structure for the driver instance.
• **value** – Pointer to a variable where pin values will be stored.

**Return values**
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

```c
int gpio_port_set_masked_raw(const struct device *port, gpio_port_pins_t mask,
                            gpio_port_value_t value)
```

Set physical level of output pins in a port.

Writing value 0 to the pin will set it to a low physical level. Writing value 1 will set it to a high physical level. This function ignores GPIO_ACTIVE_LOW flag.

Pin with index n is represented by bit n in mask and value parameter.

**Parameters**
• **port** – Pointer to the device structure for the driver instance.
• **mask** – Mask indicating which pins will be modified.
• **value** – Value assigned to the output pins.

**Return values**
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

```c
static inline int gpio_port_set_masked(const struct device *port,
                                        gpio_port_pins_t mask,
                                        gpio_port_value_t value)
```

Set logical level of output pins in a port.

Set logical level of an output pin taking into account GPIO_ACTIVE_LOW flag. Value 0 sets the pin in logical 0 / inactive state. Value 1 sets the pin in logical 1 / active state.

If pin is configured as Active High, the default, setting it in inactive state will force the pin to a low physical level. If pin is configured as Active Low, setting it in inactive state will force the pin to a high physical level.

Pin with index n is represented by bit n in mask and value parameter.

**Parameters**
• **port** – Pointer to the device structure for the driver instance.
• **mask** – Mask indicating which pins will be modified.
• **value** – Value assigned to the output pins.

**Return values**
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

```c
int gpio_port_set_bits_raw(const struct device *port,
                           gpio_port_pins_t pins)
```

Set physical level of selected output pins to high.

**Parameters**
• **port** – Pointer to the device structure for the driver instance.
• **pins** – Value indicating which pins will be modified.

**Return values**
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_port_set_bits(const struct device *port, gpio_port_pins_t pins)
Set logical level of selected output pins to active.

Parameters
• port – Pointer to the device structure for the driver instance.
• pins – Value indicating which pins will be modified.

Return values
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

int gpio_port_clear_bits_raw(const struct device *port, gpio_port_pins_t pins)
Set physical level of selected output pins to low.

Parameters
• port – Pointer to the device structure for the driver instance.
• pins – Value indicating which pins will be modified.

Return values
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_port_clear_bits(const struct device *port, gpio_port_pins_t pins)
Set logical level of selected output pins to inactive.

Parameters
• port – Pointer to the device structure for the driver instance.
• pins – Value indicating which pins will be modified.

Return values
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

int gpio_port_toggle_bits(const struct device *port, gpio_port_pins_t pins)
Toggle level of selected output pins.

Parameters
• port – Pointer to the device structure for the driver instance.
• pins – Value indicating which pins will be modified.

Return values
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.
static inline int gpio_port_set_clr_bits_raw(const struct device *port, gpio_port_pins_t set_pins, gpio_port_pins_t clear_pins)

Set physical level of selected output pins.

Parameters

- port – Pointer to the device structure for the driver instance.
- set_pins – Value indicating which pins will be set to high.
- clear_pins – Value indicating which pins will be set to low.

Return values

- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

static inline int gpio_port_set_clr_bits(const struct device *port, gpio_port_pins_t set_pins, gpio_port_pins_t clear_pins)

Set logical level of selected output pins.

Parameters

- port – Pointer to the device structure for the driver instance.
- set_pins – Value indicating which pins will be set to active.
- clear_pins – Value indicating which pins will be set to inactive.

Return values

- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_get_raw(const struct device *port, gpio_pin_t pin)

Get physical level of an input pin.

A low physical level on the pin will be interpreted as value 0. A high physical level will be interpreted as value 1. This function ignores GPIO_ACTIVE_LOW flag.

Parameters

- port – Pointer to the device structure for the driver instance.
- pin – Pin number.

Return values

- 1 – If pin physical level is high.
- 0 – If pin physical level is low.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_get(const struct device *port, gpio_pin_t pin)

Get logical level of an input pin.

Get logical level of an input pin taking into account GPIO_ACTIVE_LOW flag. If pin is configured as Active High, a low physical level will be interpreted as logical value 0. If pin is configured as Active Low, a low physical level will be interpreted as logical value 1.

Note: If pin is configured as Active High, the default, gpio_pin_get() function is equivalent to gpio_pin_get_raw().
Parameters
• **port** – Pointer to the device structure for the driver instance.
• **pin** – Pin number.

Return values
• 1 – If pin logical value is 1 / active.
• 0 – If pin logical value is 0 / inactive.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_get_dt(const struct gpio_dt_spec *spec)
Get logical level of an input pin from a gpio_dt_spec.
This is equivalent to:
```
gpio_pin_get(spec->port, spec->pin);
```

Parameters
• **spec** – GPIO specification from devicetree

Returns
a value from gpio_pin_get()

static inline int gpio_pin_set_raw(const struct device *port, gpio_pin_t pin, int value)
Set physical level of an output pin.
Writing value 0 to the pin will set it to a low physical level. Writing any value other than 0 will set it to a high physical level. This function ignores GPIO_ACTIVE_LOW flag.

Parameters
• **port** – Pointer to the device structure for the driver instance.
• **pin** – Pin number.
• **value** – Value assigned to the pin.

Return values
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_set(const struct device *port, gpio_pin_t pin, int value)
Set logical level of an output pin.
Set logical level of an output pin taking into account GPIO_ACTIVE_LOW flag. Value 0 sets the pin in logical 0 / inactive state. Any value other than 0 sets the pin in logical 1 / active state. If pin is configured as Active High, the default, setting it in inactive state will force the pin to a low physical level. If pin is configured as Active Low, setting it in inactive state will force the pin to a high physical level.

Note: If pin is configured as Active High, gpio_pin_set() function is equivalent to gpio_pin_set_raw().

Parameters
• **port** – Pointer to the device structure for the driver instance.
• **pin** – Pin number.
• **value** – Value assigned to the pin.
**Return values**

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

```c
static inline int gpio_pin_set_dt(const struct gpio_dt_spec *spec, int value);
```

Set logical level of a output pin from a `gpio_dt_spec`.

This is equivalent to:

```
gpio_pin_set(spec->port, spec->pin, value);
```

**Parameters**

- **spec** – GPIO specification from devicetree
- **value** – Value assigned to the pin.

**Returns**

A value from `gpio_pin_set()`

```c
static inline int gpio_pin_toggle(const struct device *port, gpio_pin_t pin);
```

Toggle pin level.

**Parameters**

- **port** – Pointer to the device structure for the driver instance.
- **pin** – Pin number.

**Return values**

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

```c
static inline int gpio_pin_toggle_dt(const struct gpio_dt_spec *spec);
```

Toggle pin level from a `gpio_dt_spec`.

This is equivalent to:

```
gpio_pin_toggle(spec->port, spec->pin);
```

**Parameters**

- **spec** – GPIO specification from devicetree

**Returns**

A value from `gpio_pin_toggle()`

```c
static inline void gpio_init_callback(struct gpio_callback *callback,
                                       gpio_callback_handler_t handler,
                                       gpio_port_pins_t pin_mask);
```

Helper to initialize a struct `gpio_callback` properly.

**Parameters**

- **callback** – A valid Application's callback structure pointer.
- **handler** – A valid handler function pointer.
- **pin_mask** – A bit mask of relevant pins for the handler
static inline int gpio_add_callback(const struct device *port, struct gpio_callback *callback)

Add an application callback.

Note: enables to add as many callback as needed on the same port.

Note: Callbacks may be added to the device from within a callback handler invocation, but whether they are invoked for the current GPIO event is not specified.

Parameters

- port – Pointer to the device structure for the driver instance.
- callback – A valid Application's callback structure pointer.

Return values

- 0 – If successful
- -ENOSYS – If driver does not implement the operation
- -errno – Other negative errno code on failure.

static inline int gpio_add_callback_dt(const struct gpio_dt_spec *spec, struct gpio_callback *callback)

Add an application callback.

This is equivalent to:

gpio_add_callback(spec->port, callback);

Parameters

- spec – GPIO specification from devicetree.
- callback – A valid application's callback structure pointer.

Returns

a value from gpio_add_callback().

static inline int gpio_remove_callback(const struct device *port, struct gpio_callback *callback)

Remove an application callback.

Note: enables to remove as many callbacks as added through gpio_add_callback().

Warning: It is explicitly permitted, within a callback handler, to remove the registration for the callback that is running, i.e. callback. Attempts to remove other registrations on the same device may result in undefined behavior, including failure to invoke callbacks that remain registered and unintended invocation of removed callbacks.

Parameters

- port – Pointer to the device structure for the driver instance.
- callback – A valid application's callback structure pointer.

Return values
- If successful
- -ENOSYS – If driver does not implement the operation
- -errno – Other negative errno code on failure.

static inline int gpio_remove_callback_dt(const struct gpio_dt_spec *spec, struct gpio_callback *callback)
Remove an application callback.
This is equivalent to:

```c
gpio_remove_callback(spec->port, callback);
```

Parameters
• spec – GPIO specification from devicetree.
• callback – A valid application’s callback structure pointer.

Returns
a value from gpio_remove_callback().

int gpio_get_pending_int(const struct device *dev)
Function to get pending interrupts.
The purpose of this function is to return the interrupt status register for the device.
This is especially useful when waking up from low power states to check the wake up source.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• status – != 0 if at least one gpio interrupt is pending.
• 0 – if no gpio interrupt is pending.
• -ENOSYS – If driver does not implement the operation

7.6. Peripherals
Public Members

const struct device *port
   GPIO device controlling the pin.

gpio_pin_t pin
   The pin's number on the device.

gpio_dt_flags_t dt_flags
   The pin's configuration flags as specified in devicetree.

struct gpio_driver_config
   #include <gpio.h> This structure is common to all GPIO drivers and is expected to be
   the first element in the object pointed to by the config field in the device structure.

Public Members

gpio_port_pins_t port_pin_mask
   Mask identifying pins supported by the controller.
   Initialization of this mask is the responsibility of device instance generation in the
   driver.

struct gpio_driver_data
   #include <gpio.h> This structure is common to all GPIO drivers and is expected to be
   the first element in the driver's struct driver_data declaration.

Public Members

gpio_port_pins_t invert
   Mask identifying pins that are configured as active low.
   Management of this mask is the responsibility of the wrapper functions in this
   header.

struct gpio_callback
   #include <gpio.h> GPIO callback structure.
   Used to register a callback in the driver instance callback list. As many callbacks
   as needed can be added as long as each of them are unique pointers of struct
   gpio_callback. Beware such structure should not be allocated on stack.
   Note: To help setting it, see gpio_init_callback() below

Public Members

sys_snode_t node
   This is meant to be used in the driver and the user should not mess with it (see
   drivers/gpio/gpio_utils.h)
\texttt{gpio\_callback\_handler\_t} \texttt{handler}

Actual callback function being called when relevant.

\texttt{gpio\_port\_pins\_t} \texttt{pin\_mask}

A mask of pins the callback is interested in, if 0 the callback will never be called.

Such \texttt{pin\_mask} can be modified whenever necessary by the owner, and thus will affect the handler being called or not. The selected pins must be configured to trigger an interrupt.

### 7.6.23 Hardware Information

#### Overview

The HW Info API provides access to hardware information such as device identifiers and reset cause flags.

Reset cause flags can be used to determine why the device was reset; for example due to a watchdog timeout or due to power cycling. Different devices support different subset of flags. Use \texttt{hwinfo\_get\_supported\_reset\_cause()} to retrieve the flags that are supported by that device.

#### Configuration Options

Related configuration options:

- \texttt{CONFIG\_HWINFO}

#### API Reference

\textit{group} \texttt{hwinfo\_interface}

Hardware Information Interface.

#### Reset cause flags

- \texttt{RESET\_PIN}

  External pin.

- \texttt{RESET\_SOFTWARE}

  Software reset.

- \texttt{RESET\_BROWNOUT}

  Brownout (drop in voltage)

- \texttt{RESET\_POR}

  Power-on reset (POR)
RESET_WATCHDOG
Watchdog timer expiration.

RESET_DEBUG
Debug event.

RESET_SECURITY
Security violation.

RESET_LOW_POWER_WAKE
Waking up from low power mode.

RESET_CPU_LOCKUP
CPU lock-up detected.

RESET_PARITY
Parity error.

RESET_PLL
PLL error.

RESET_CLOCK
Clock error.

RESET_HARDWARE
Hardware reset.

RESET_USER
User reset.

RESET_TEMPERATURE
Temperature reset.

Functions

ssize_t hwinfo_get_device_id(uint8_t *buffer, size_t length)
Copy the device id to a buffer.

This routine copies “length” number of bytes of the device ID to the buffer. If the device ID is smaller then length, the rest of the buffer is left unchanged. The ID depends on the hardware and is not guaranteed unique.

Drivers are responsible for ensuring that the ID data structure is a sequence of bytes. The returned ID value is not supposed to be interpreted based on vendor-specific assumptions of byte order. It should express the identifier as a raw byte sequence, doing any endian conversion necessary so that a hex representation of the bytes produces the intended serial number.

Parameters

• buffer – Buffer to write the ID to.
• length – Max length of the buffer.
Return values

- **size** – of the device ID copied.
- **-ENOSYS** – if there is no implementation for the particular device.
- **any** – negative value on driver specific errors.

```c
int hwinfo_get_reset_cause(uint32_t *cause)
```

Retrieve cause of device reset.

This routine retrieves the flags that indicate why the device was reset.

On some platforms the reset cause flags accumulate between successive resets and this routine may return multiple flags indicating all reset causes since the device was powered on. If you need to retrieve the cause only for the most recent reset call `hwinfo_clear_reset_cause` after calling this routine to clear the hardware flags before the next reset event.

Successive calls to this routine will return the same value, unless `hwinfo_clear_reset_cause` has been called.

**Parameters**

- **cause** – OR'd `reset cause` flags

**Return values**

- **zero** – if successful.
- **-ENOSYS** – if there is no implementation for the particular device.
- **any** – negative value on driver specific errors.

```c
int hwinfo_clear_reset_cause(void)
```

Clear cause of device reset.

Clears reset cause flags.

**Return values**

- **zero** – if successful.
- **-ENOSYS** – if there is no implementation for the particular device.
- **any** – negative value on driver specific errors.

```c
int hwinfo_get_supported_reset_cause(uint32_t *supported)
```

Get supported reset cause flags.

Retrieves all `reset_cause` flags that are supported by this device.

**Parameters**

- **supported** – OR'd `reset cause` flags that are supported

**Return values**

- **zero** – if successful.
- **-ENOSYS** – if there is no implementation for the particular device.
- **any** – negative value on driver specific errors.
7.6.24 I2C EEPROM Target

Overview

API Reference

group i2c_eeprom_target_api

I2C EEPROM Target Driver API.

Functions

int eeprom_target_program(const struct device *dev, const uint8_t *eeprom_data, unsigned int length)

Program memory of the virtual EEPROM.

Parameters

• dev – Pointer to the device structure for the driver instance.
• eeprom_data – Pointer of data to program into the virtual eeprom memory
• length – Length of data to program into the virtual eeprom memory

Return values

• 0 – If successful.
• -EINVAL – Invalid data size

int eeprom_target_read(const struct device *dev, uint8_t *eeprom_data, unsigned int offset)

Read single byte of virtual EEPROM memory.

Parameters

• dev – Pointer to the device structure for the driver instance.
• eeprom_data – Pointer of byte where to store the virtual eeprom memory
• offset – Offset into EEPROM memory where to read the byte

Return values

• 0 – If successful.
• -EINVAL – Invalid data pointer or offset

int eeprom_target_set_addr(const struct device *dev, uint8_t addr)

Change the address of eeprom taget at runtime.

Parameters

• dev – Pointer to the device structure for the driver instance.
• addr – New address to assign to the eeprom target devide

Return values

• 0 – Is successful
• -EINVAL – If parameters are invalid
• -EIO – General input / output error during i2c_taget_register
• -ENOSYS – If target mode is not implemented
7.6.25 Improved Inter-Integrated Circuit (I3C) Bus

I3C (Improved Inter-Integrated Circuit) is a two-signal shared peripheral interface bus. Devices on the bus can operate in two roles: as a “controller” that initiates transactions and controls the clock, or as a “target” that responds to transaction commands.

Currently, the API is based on the I3C Specification version 1.1.1.

- **I3C Controller API**
  - In-Band Interrupt (IBI)
  - Device Tree
  - Device Drivers for I3C Devices
  - I2C Devices under I3C Bus
- **Configuration Options**
- **API Reference**

**I3C Controller API**

Zephyr's I3C controller API is used when an I3C controller controls the bus, in particular the start and stop conditions and the clock. This is the most common mode, used to interact with I3C target devices such as sensors.

Due to the nature of the I3C, there are devices on the bus where they may not have addresses when powered on. Therefore, an additional dynamic address assignment needs to be carried out by the I3C controller. Because of this, the controller needs to maintain separate structures to keep track of device status. This can be done at build time, for example, by creating arrays of device descriptors for both I3C and I2C devices:

```c
static struct i3c_device_desc i3c_device_array[] = I3C_DEVICE_ARRAY_DT_INST(inst);
static struct i3c_i2c_device_desc i2c_device_array[] = I3C_I2C_DEVICE_ARRAY_DT_INST(inst);
```

The macros `I3CDEVICE_ARRAY_DT_INST` and `I3CI2CDEVICE_ARRAY_DT_INST` are helper macros to aid in create arrays of device descriptors corresponding to the devicetree nodes under the I3C controller.

Here is a list of generic steps for initializing the I3C controller and the I3C bus inside the device driver initialization function:

1. Initialize the data structure of the I3C controller device driver instance. The usual device defining macros such as `DEVICE_DT_INST_DEFINE` can be used, and the initialization function provided as a parameter to the macro.

   - The `i3c_addrSlots` and `i3c_dev_list` are structures to aid in address assignments and device list management. If this is being used, this struct needs to be initialized by calling `i3c_addrSlotsInit()`. These two structures can also be used with various helper functions.

   - Initialize the device descriptors if needed by the controller driver.

2. Initialize the hardware, including but not limited to:

   - Setup pin mux and directions.
   - Setup the clock for the controller.
   - Power on the hardware.
   - Configure the hardware (e.g. SCL clock frequency).
3. Perform bus initialization. There is a generic helper function, \texttt{i3c\_bus\_init()}, which performs the following steps. This function can be used if the controller does not require any special handling during bus initialization.

1. Do \texttt{RSTDAA} to reset dynamic addresses of connected devices. If any connected devices have already been assigned an address, the bookkeeping data structures do not have records of these, for example, at power-on. So it is a good idea to reset and assign them new addresses.

2. Do \texttt{DISEC} to disable any events from devices.

3. Do \texttt{SETDASA} to use static addresses as dynamic address if so desired.
   - \texttt{SETAASA} may not be supported for all connected devices to assign static addresses as dynamic addresses.
   - BCR and DCR need to be obtained separately to populate the relevant fields in the I3C target device descriptor struct.

4. Do \texttt{ENTDAA} to start dynamic address assignment, if there are still devices without addresses.
   - If there is a device waiting for address, it will send its Provisioned ID, BCR, and DCR back. Match the received Provisioned ID to the list of registered I3C devices.
     - If there is a match, assign an address (either from the stated static address if \texttt{SETDASA} has not been done, or use a free address).
       - Also, set the BCR and DCR fields in the device descriptor struct.
     - If there is no match, depending on policy, it can be assigned a free address, or the device driver can stop the assignment process and errors out.
       - Note that the I3C API requires device descriptor to function. A device without a device descriptor cannot be accessed through the API.
     - This step can be skipped if there is no connected devices requiring DAA.

5. These are optional but highly recommended:
   - Do \texttt{GETMRL} and \texttt{GETMWL} to get maximum read/write length.
   - Do \texttt{GETMXDS} to get maximum read/write speed and maximum read turnaround time.
   - The helper function, \texttt{i3c\_bus\_init()}, would retrieve basic device information such as BCR, DCR, MRL and MWL.

6. Do \texttt{ENEC} to re-enable events from devices.
   - The helper function, \texttt{i3c\_bus\_init()}, only re-enables hot-join events. IBI event should only be enabled when enabling IBI of a device.

\textbf{In-Band Interrupt (IBI)}

If a target device can generate In-Band Interrupt (IBI), the controller needs to be made aware of it.

- \texttt{i3c\_ibi\_enable()} to enable IBI of a target device.
  - Some controller hardware have IBI slots which need to be programmed so that the controller can recognize incoming IBIs from a particular target device.
    - If the hardware has IBI slots, \texttt{i3c\_ibi\_enable()} needs to program those IBI slots.
    - Note that there are usually limited IBI slots on the controller so this operation may fail.
  - The implementation in driver should also send the \texttt{ENEC} command to enable interrupt of this target device.
• `i3c_ibi_disable()` to disable IBI of a target device.
  
  – If controller hardware makes use of IBI slots, this will remove description of the target device from the slots.
  
  – The implementation in driver should also send the DISEC command to disable interrupt of this target device.

**Device Tree**  
Here is an example for defining an I3C controller in device tree:

```plaintext
i3c0: i3c@10000 {
    compatible = "vendor,i3c";

    #address-cells = <0x3>;
    #size-cells = <0x0>;

    reg = <0x1000 0x1000>;
    interrupts = <0x1F 0x0>;

    pinctrl-0 = <&pinmux-i3c>;
    pinctrl-names = "default";

    i2c-scl-hz = <400000>;
    i3c-scl-hz = <1200000>;

    status = "okay";
}

i3c-dev0: i3c-dev0@420000ABCD12345678 {
    compatible = "vendor,i3c-dev";

    reg = <0x42 0xABCD 0x12345678>;

    status = "okay";
};

i2c-dev0: i2c-dev0@380000000000000050 {
    compatible = "vendor-i2c-dev";

    reg = <0x38 0x0 0x50>;

    status = "okay";
};

**I3C Devices**  
For I3C devices, the `reg` property has 3 elements:

• The first one is the static address of the device.
  
  – Can be zero if static address is not used. Address will be assigned during DAA (Dynamic Address Assignment).
  
  – If non-zero and property `assigned-address` is not set, this will be the address of the device after SETDASA (Set Dynamic Address from Static Address) is issued.

• Second element is the upper 16-bit of the Provisioned ID (PID) which contains the manufacturer ID left-shifted by 1. This is the bits 33-47 (zero-based) of the 48-bit Provisioned ID.

• Third element contains the lower 32-bit of the Provisioned ID which is a combination of the part ID (left-shifted by 16, bits 16-31 of the PID) and the instance ID (left-shifted by 12, bits 12-15 of the PID).
Note that the unit-address (the part after @) must match the reg property fully where each element is treated as 32-bit integer, combining to form a 96-bit integer. This is required for properly generating device tree macros.

**I2C Devices** For I2C devices where the device driver has support for working under I3C bus, the device node can be described as a child of the I3C controller. If the device driver is written to only work with I2C controllers, define the node under the I2C virtual controller as described below. Otherwise, the reg property, similar to I3C devices, has 3 elements:

- The first one is the static address of the device. This must be a valid address as I2C devices do not support dynamic address assignment.
- Second element is always zero.
  - This is used by various helper macros to determine whether the device tree entry corresponds to a I2C device.
- Third element is the LVR (Legacy Virtual Register):
  - bit[31:8] are unused.
  - bit[7:5] are the I2C device index:
    - Index 0
      - I3C device has a 50 ns spike filter where it is not affected by high frequency on SCL.
    - Index 1
      - I2C device does not have a 50 ns spike filter but can work with high frequency on SCL.
    - Index 2
      - I3C device does not have a 50 ns spike filter and cannot work with high frequency on SCL.
  - bit[4] is the I2C mode indicator:
    - 0 is FM+ mode.
    - 1 is FM mode.

Similar to I3C devices, the unit-address must match the reg property fully where each element is treated as 32-bit integer, combining to form a 96-bit integer.

**Device Drivers for I3C Devices** All of the transfer functions of I3C controller API require the use of device descriptors, `i3c_device_desc`. This struct contains runtime information about an I3C device, such as, its dynamic address, BCR, DCR, MRL and MWL. Therefore, the device driver of an I3C device should grab a pointer to this device descriptor from the controller using `i3c_device_find()`. This function takes an ID parameter of type `i3c_device_id` for matching. The returned pointer can then be used in subsequent API calls to the controller.

**I2C Devices under I3C Bus** Since I3C is backward compatible with I2C, the I3C controller API can accommodate I2C API calls without modifications if the controller device driver implements the I2C API. This has the advantage of using existing I2C devices without any modifications to their device drivers. However, since the I3C controller API works on device descriptors, any calls to I2C API will need to look up the corresponding device descriptor from the I2C device address. This adds a bit of processing cost to any I2C API calls.

On the other hand, a device driver can be extended to utilize native I2C device support via the I3C controller API. During device initialization, `i3c_i2c_device_find()` needs to be called to retrieve the pointer to the device descriptor. This pointer can be used in subsequent API calls.
Note that, with either methods mentioned above, the devicetree node of the I2C device must be declared according to I3C standard:

The I2C virtual controller device driver provides a way to interface I2C devices on the I3C bus where the associated device drivers can be used as-is without modifications. This requires adding an intermediate node in the device tree:

```c
i3c0: i3c@00000 {
    <!-- I3C controller related properties -->
    <!-- Nodes of I3C devices, if any -->
    i2c-dev0: i2c-dev0@420000000000000050 {
        compatible = "vendor-i2c-dev";
        reg = <0x42 0x0 0x50 >;
        status = "okay";
    }
};
```

### Configuration Options

Related configuration options:

- `CONFIG_I3C`
- `CONFIG_I3C_USE_GROUP_ADDR`
- `CONFIG_I3C_USE_IBI`
- `CONFIG_I3C_IBI_MAX_PAYLOAD_SIZE`
- `CONFIG_I3C_CONTROLLER_INIT_PRIORITY`

### API Reference

`group i3c_interface`

I3C Interface.

#### Bus Characteristic Register (BCR)

- BCR[7:6]: Device Role
  - 0: I3C Target
  - 1: I3C Controller capable
  - 2: Reserved
  - 3: Reserved
- BCR[5]: Advanced Capabilities
  - 0: Does not support optional advanced capabilities.
  - 1: Supports optional advanced capabilities which can be viewed via GETCAPS CCC.
- BCR[4]: Virtual Target Support
  - 0: Is not a virtual target.
– 1: Is a virtual target.

• BCR[3]: Offline Capable
  – 0: Will always response to I3C commands.
  – 1: Will not always response to I3C commands.

• BCR[2]: IBI Payload
  – 0: No data bytes following the accepted IBI.
  – 1: One data byte (MDB, Mandatory Data Byte) follows the accepted IBI. Additional data bytes may also follows.

• BCR[1]: IBI Request Capable
  – 0: Not capable
  – 1: Capable

• BCR[0]: Max Data Speed Limitation
  – 0: No Limitation
  – 1: Limitation obtained via GETMXDS CCC.

\texttt{I3C\_BCR\_MAX\_DATA\_SPEED\_LIMIT}

Max Data Speed Limitation bit.
0 - No Limitation. 1 - Limitation obtained via GETMXDS CCC.

\texttt{I3C\_BCR\_IBI\_REQUEST\_CAPABLE}

IBI Request Capable bit.

\texttt{I3C\_BCR\_IBI\_PAYLOAD\_HAS\_DATA\_BYTE}

IBI Payload bit.

0 - No data bytes following the accepted IBI. 1 - One data byte (MDB, Mandatory Data Byte) follows the accepted IBI. Additional data bytes may also follows.

\texttt{I3C\_BCR\_OFFLINE\_CAPABLE}

Offline Capable bit.

0 - Will always respond to I3C commands. 1 - Will not always respond to I3C commands.

\texttt{I3C\_BCR\_VIRTUAL\_TARGET}

Virtual Target Support bit.

0 - Is not a virtual target. 1 - Is a virtual target.

\texttt{I3C\_BCR\_ADV\_CAPABILITIES}

Advanced Capabilities bit.

0 - Does not support optional advanced capabilities. 1 - Supports optional advanced capabilities which can be viewed via GETCAPS CCC.

\texttt{I3C\_BCR\_DEVICE\_ROLE\_I3C\_TARGET}

Device Role - I3C Target.

\texttt{I3C\_BCR\_DEVICE\_ROLE\_I3C\_CONTROLLER\_CAPABLE}

Device Role - I3C Controller Capable.
I3C_BCR_DEVICE_ROLE_SHIFT
   Device Role bit shift value.

I3C_BCR_DEVICE_ROLE_MASK
   Device Role bit shift mask.

I3C_BCR_DEVICE_ROLE(bcr)
   Device Role.
   Obtain Device Role value from the BCR value obtained via GETBCR.

   Parameters
   • bcr – BCR value

Legacy Virtual Register (LVR)

Legacy Virtual Register (LVR)

   • LVR[7:5]: I2C device index:
     – 0: I2C device has a 50 ns spike filter where it is not affected by high frequency on SCL.
     – 1: I2C device does not have a 50 ns spike filter but can work with high frequency on SCL.
     – 2: I2C device does not have a 50 ns spike filter and cannot work with high frequency on SCL.
   • LVR[4]: I2C mode indicator:
     – 0: FM+ mode
     – 1: FM mode
   • LVR[3:0]: Reserved.

I3C_LVR_I2C_FM_PLUS_MODE
   I2C FM+ Mode.

I3C_LVR_I2C_FM_MODE
   I2C FM Mode.

I3C_LVR_I2C_MODE_SHIFT
   I2C Mode Indicator bit shift value.

I3C_LVR_I2C_MODE_MASK
   I2C Mode Indicator bitmask.

I3C_LVR_I2C_MODE(lvr)
   I2C Mode.
   Obtain I2C Mode value from the LVR value.

   Parameters
   • lvr – LVR value
I3C_LVR_I2C_DEV_IDX_0
I2C Device Index 0.
I2C device has a 50 ns spike filter where it is not affected by high frequency on SCL.

I3C_LVR_I2C_DEV_IDX_1
I2C Device Index 1.
I2C device does not have a 50 ns spike filter but can work with high frequency on SCL.

I3C_LVR_I2C_DEV_IDX_2
I2C Device Index 2.
I2C device does not have a 50 ns spike filter and cannot work with high frequency on SCL.

I3C_LVR_I2C_DEV_IDX_SHIFT
I2C Device Index bit shift value.

I3C_LVR_I2C_DEV_IDX_MASK
I2C Device Index bitmask.

I3C_LVR_I2C_DEV_IDX(lvr)
I2C Device Index.
Obtain I2C Device Index value from the LVR value.

Parameters
• lvr – LVR value

Defines

I3C_DEVICE_ID(pid)
Structure initializer for i3c_device_id from PID.
This helper macro expands to a static initializer for a struct i3c_device_id by populating the PID (Provisioned ID) field.

Parameters
• pid – Provisioned ID.

Enums

enum i3c_bus_mode
I3C bus mode.
Values:

enumerator I3C_BUS_MODE_PUR
Only I3C devices are on the bus.
enumerator I3C_BUS_MODE_MIXED_FAST
    Both I3C and legacy I2C devices are on the bus.
    The I2C devices have 50ns spike filter on SCL.

enumerator I3C_BUS_MODE_MIXED_LIMITED
    Both I3C and legacy I2C devices are on the bus.
    The I2C devices do not have 50ns spike filter on SCL and can tolerate maximum SDR SCL clock frequency.

enumerator I3C_BUS_MODE_MIXED_SLOW
    Both I3C and legacy I2C devices are on the bus.
    The I2C devices do not have 50ns spike filter on SCL but cannot tolerate maximum SDR SCL clock frequency.

enumerator I3C_BUS_MODE_MAX = I3C_BUS_MODE_MIXED_SLOW

enumerator I3C_BUS_MODE_INVALID

eenum i3c_i2c_speed_type
    I2C bus speed under I3C bus.
    Only FM and FM+ modes are supported for I2C devices under I3C bus.
    Values:

    enumerator I3C_I2C_SPEED_FM
        I2C FM mode.

    enumerator I3C_I2C_SPEED_FMPLUS
        I2C FM+ mode.

    enumerator I3C_I2C_SPEED_MAX = I3C_I2C_SPEED_FMPLUS

    enumerator I3C_I2C_SPEED_INVALID

eenum i3c_data_rate
    I3C data rate.
    I3C data transfer rate defined by the I3C specification.
    Values:

    enumerator I3C_DATA_RATE_SDR
        Single Data Rate messaging.

    enumerator I3C_DATA_RATE_HDR_DDR
        High Data Rate - Double Data Rate messaging.

    enumerator I3C_DATA_RATE_HDR_TSL
        High Data Rate - Ternary Symbol Legacy-inclusive-Bus.

7.6. Peripherals
enumerator I3C_DATA_RATE_HDR_TSP
   High Data Rate - Ternary Symbol for Pure Bus.

enumerator I3C_DATA_RATE_HDR_BT
   High Data Rate - Bulk Transport.

enumerator I3C_DATA_RATE_MAX = I3C_DATA_RATE_HDR_BT

enumerator I3C_DATA_RATE_INVALID

enum i3c_sdr_controller_error_codes
I3C SDR Controller Error Codes.
These are error codes defined by the I3C specification.
I3C_ERROR_CE_UNKNOWN and I3C_ERROR_CE_NONE are not official error codes according to the specification. These are there simply to aid in error handling during interactions with the I3C drivers and subsystem.
Values:

enumerator I3C_ERROR_CE0
   Transaction after sending CCC.

enumerator I3C_ERROR_CE1
   Monitoring Error.

enumerator I3C_ERROR_CE2
   No response to broadcast address (0x7E)

enumerator I3C_ERROR_CE3
   Failed Controller Handoff.

enumerator I3C_ERROR_CE_UNKNOWN
   Unknown error (not official error code)

enumerator I3C_ERROR_CE_NONE
   No error (not official error code)

enumerator I3C_ERROR_CE_MAX = I3C_ERROR_CE_UNKNOWN

enumerator I3C_ERROR_CE_INVALID

enum i3c_sdr_target_error_codes
I3C SDR Target Error Codes.
These are error codes defined by the I3C specification.
I3C_ERROR_TE_UNKNOWN and I3C_ERROR_TE_NONE are not official error codes according to the specification. These are there simply to aid in error handling during interactions with the I3C drivers and subsystem.
Values:
enumerator I3C_ERROR_TE0
    Invalid Broadcast Address or Dynamic Address after DA assignment.

denumerator I3C_ERROR_TE1
    CCC Code.

denumerator I3C_ERROR_TE2
    Write Data.

denumerator I3C_ERROR_TE3
    Assigned Address during Dynamic Address Arbitration.

denumerator I3C_ERROR_TE4
    0x7E/R missing after RESTART during Dynamic Address Arbitration

denumerator I3C_ERROR_TE5
    Transaction after detecting CCC.

denumerator I3C_ERROR_TE6
    Monitoring Error.

denumerator I3C_ERROR_DBR
    Dead Bus Recovery.

denumerator I3C_ERROR_TE_UNKNOWN
    Unknown error (not official error code)

denumerator I3C_ERROR_TE_NONE
    No error (not official error code)

denumerator I3C_ERROR_TE_MAX = I3C_ERROR_TE_UNKNOWN

denumerator I3C_ERROR_TE_INVALID

denum i3c_config_type
    Type of configuration being passed to configure function. 
    Values:

    enumerator I3C_CONFIG_CONTROLLER

    enumerator I3C_CONFIG_TARGET

    enumerator I3C_CONFIG_CUSTOM

**Functions**
Find a I3C target device descriptor by ID.
This finds the I3C target device descriptor in the device list matching the provided ID.

Parameters
• dev_list – Pointer to the device list struct.
• id – Pointer to I3C device ID struct.

Returns
Pointer the the I3C target device descriptor, or NULL if none is found.

Find a I3C target device descriptor by dynamic address.
This finds the I3C target device descriptor in the attached device list matching the dynamic address (addr)

Parameters
• dev_list – Pointer to the device list struct.
• addr – Dynamic address to be matched.

Returns
Pointer the the I3C target device descriptor, or NULL if none is found.

Find a I2C target device descriptor by address.
This finds the I2C target device descriptor in the attached device list matching the address (addr)

Parameters
• dev_list – Pointer to the device list struct.
• addr – Address to be matched.

Returns
Pointer the the I2C target device descriptor, or NULL if none is found.

Helper function to find the default address an i3c device is attached with.
This is a helper function to find the default address the device will be loaded with. This could be either it’s static address, a requested dynamic address, or just a dynamic address that is available

Parameters
• target – [in] The pointer of the device descriptor
• addr – [out] Address to be assigned to target device.

Return values
• 0 – if successful.
• -EINVAL – if the expected default address is already in use
int i3c_dev_list_daa_addr_helper(struct i3c_addr_slots *addr_slots, const struct i3c_dev_list *dev_list, uint64_t pid, bool must_match, bool assigned_okay, struct i3c_device_desc **target, uint8_t *addr)

Helper function to find a usable address during ENTDAA.

This is a helper function to find a usable address during Dynamic Address Assignment. Given the PID (pid), it will search through the device list for the matching device descriptor. If the device descriptor indicates that there is a preferred address (i.e. assigned-address in device tree),

If must_match is true, the PID (pid) must match one of the device in the device list.

See also:

i3c_device_desc::init_dynamic_addr), this preferred address will be returned if this address is still available. If it is not available, another free address will be returned.

If must_match is false, this will return an arbitrary address. This is useful when not all devices are described in device tree. Or else, the DAA process cannot proceed since there is no address to be assigned.

If assigned_okay is true, it will return the same address already assigned to the device (that

If assigned_okay is false, the device cannot have an address assigned already (that

See also:

i3c_device_desc::dynamic_addr). If no address has been assigned, it behaves as if assigned_okay is false. This is useful for assigning the same address to the same device (for example, hot-join after device coming back from suspend).

See also:

i3c_device_desc::dynamic_addr is not zero). This is mainly used during the initial DAA.

Parameters

- addr_slots – [in] Pointer to address slots struct.
- dev_list – [in] Pointer to the device list struct.
- pid – [in] Provisioned ID of device to be assigned address.
- assigned_okay – [in] True if it is okay to return the address already assigned to the target matching the PID (pid).
- target – [out] Store the pointer of the device descriptor if it matches the incoming PID (pid).
- addr – [out] Address to be assigned to target device.

Return values

- 0 – if successful.
- -ENODEV – if no device matches the PID (pid) in the device list and must_match is true.
- -EINVAL – if the device matching PID (pid) already has an address assigned or invalid function arguments.
static inline int i3c_configure(const struct device *dev, enum i3c_config_type type, void *config)

Configure the I3C hardware.

Parameters

- dev – Pointer to controller device driver instance.
- type – Type of configuration parameters being passed in config.
- config – Pointer to the configuration parameters.

Return values

- 0 – If successful.
- EINVAL – If invalid configure parameters.
- EIO – General Input/Output errors.
- ENOSYS – If not implemented.

static inline int i3c_config_get(const struct device *dev, enum i3c_config_type type, void *config)

Get configuration of the I3C hardware.

This provides a way to get the current configuration of the I3C hardware.

This can return cached config or probed hardware parameters, but it has to be up to date with current configuration.

Note that if type is I3C_CONFIG_CUSTOM, config must contain the ID of the parameter to be retrieved.

Parameters

- dev – [in] Pointer to controller device driver instance.
- type – [in] Type of configuration parameters being passed in config.
- config – [inout] Pointer to the configuration parameters.

Return values

- 0 – If successful.
- EIO – General Input/Output errors.
- ENOSYS – If not implemented.

static inline int i3c_recover_bus(const struct device *dev)

Attempt bus recovery on the I3C bus.

This routine asks the controller to attempt bus recovery.

Return values

- 0 – If successful.
- EBUSY – If bus recovery fails.
- EIO – General input / output error.
- ENOSYS – Bus recovery is not supported by the controller driver.

int i3c_attach_i3c_device(struct i3c_device_desc *target)

Attach an I3C device.

Called to attach a I3C device to the addresses. This is typically called before a SETDASA or ENTDAA to reserve the addresses. This will also call the optional api to update any registers within the driver if implemented.
**Warning:** Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the i3c/i2c devices.

**Parameters**
- `target` – Pointer to the target device descriptor

**Return values**
- `0` – If successful.
- `-EINVAL` – If address is not available or if the device has already been attached before

```c
int i3c_reattach_i3c_device(struct i3c_device_desc *target, uint8_t old_dyn_addr)
```

Reattach I3C device. called after every time an I3C device has its address changed. It can be because the device has been powered down and has lost its address, or it can happen when a device had a static address and has been assigned a dynamic address with SETDASA or a dynamic address has been updated with SETNEWDA. This will also call the optional api to update any registers within the driver if implemented.

**Warning:** Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the i3c/i2c devices.

**Parameters**
- `target` – Pointer to the target device descriptor
- `old_dyn_addr` – The old dynamic address of target device, 0 if there was no old dynamic address

**Return values**
- `0` – If successful.
- `-EINVAL` – If address is not available

```c
int i3c_detach_i3c_device(struct i3c_device_desc *target)
```

Detach I3C Device. called to remove an I3C device and to free up the address that it used. If it's dynamic address was not set, then it assumed that SETDASA failed and will free it's static addr. This will also call the optional api to update any registers within the driver if implemented.

**Warning:** Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the i3c/i2c devices.

**Parameters**
- `target` – Pointer to the target device descriptor

**Return values**
- `0` – If successful.
- EINVAL – If device is already detached

int i3c_attach_i2c_device(struct i3c_i2c_device_desc *target)
Attach an I2C device.
Called to attach an I2C device to the addresses. This will also call the optional api to update any registers within the driver if implemented.

**Warning:** Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the i3c/i2c devices.

**Parameters**
- target – Pointer to the target device descriptor

**Return values**
- 0 – If successful.
- -EINVAL – If address is not available or if the device has already been attached before

int i3c_detach_i2c_device(struct i3c_i2c_device_desc *target)
Detach I2C Device.
called to remove an I2C device and to free up the address that it used. This will also call the optional api to update any registers within the driver if implemented.

**Warning:** Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the i3c/i2c devices.

**Parameters**
- target – Pointer to the target device descriptor

**Return values**
- 0 – If successful.
- -EINVAL – If device is already detached

static inline int i3c_do_daa(const struct device *dev)
Perform Dynamic Address Assignment on the I3C bus.
This routine asks the controller to perform dynamic address assignment where the controller belongs. Only the active controller of the bus should do this.

**Note:** For controller driver implementation, the controller should perform SETDASA to allow static addresses to be the dynamic addresses before actually doing ENTDAA.

**Parameters**
- dev – Pointer to the device structure for the controller driver instance.

**Return values**
- 0 – If successful.
• -EBUSY – Bus is busy.
• -EIO – General input / output error.
• -ENODEV – If a provisioned ID does not match to any target devices in the registered device list.
• -ENOSPC – No more free addresses can be assigned to target.
• -ENOSYS – Dynamic address assignment is not supported by the controller driver.

`int i3c_do_ccc(const struct device *dev, struct i3c_ccc_payload *payload)`
Send CCC to the bus.

**Parameters**
- `dev` – Pointer to the device structure for the controller driver instance.
- `payload` – Pointer to the structure describing the CCC payload.

**Return values**
- 0 – If successful.
- -EBUSY – Bus is busy.
- -EIO – General Input / output error.
- -EINVAL – Invalid valid set in the payload structure.
- -ENOSYS – Not implemented.

`static inline struct i3c_device_desc *i3c_device_find(const struct device *dev, const struct i3c_device_id *id)`
Find a registered I3C target device.
Controller only API.
This returns the I3C device descriptor of the I3C device matching the incoming `id`.

**Parameters**
- `dev` – Pointer to controller device driver instance.
- `id` – Pointer to I3C device ID.

**Returns**
Pointer to I3C device descriptor, or NULL if no I3C device found matching incoming `id`.

`int i3c_bus_init(const struct device *dev, const struct i3c_dev_list *i3c_dev_list)`
Generic helper function to perform bus initialization.

**Parameters**
- `dev` – Pointer to controller device driver instance.
- `i3c_dev_list` – Pointer to I3C device list.

**Return values**
- 0 – If successful.
- -EBUSY – Bus is busy.
- -EIO – General input / output error.
- -ENODEV – If a provisioned ID does not match to any target devices in the registered device list.
- -ENOSPC – No more free addresses can be assigned to target.
• -ENOSYS – Dynamic address assignment is not supported by the controller driver.

```c
int i3c_device_basic_info_get(struct i3c_device_desc *target)
```

Get basic information from device and update device descriptor.

This retrieves some basic information:

- Bus Characteristics Register (GETBCR)
- Device Characteristics Register (GETDCR)
- Max Read Length (GETMRL)
- Max Write Length (GETMWL) from the device and update the corresponding fields of the device descriptor.

This only updates the field(s) in device descriptor only if CCC operations succeed.

**Parameters**

- `target` – [inout] I3C target device descriptor.

**Return values**

- 0 – if successful.
- -EIO – General Input/Output error.

```c
struct i3c_config_controller
```

```c
#include <i3c.h>
```

Configuration parameters for I3C hardware to act as controller.

**Public Members**

```c
bool is_secondary
```

True if the controller is to be the secondary controller of the bus.

False to be the primary controller.

```c
uint32_t i3c
```

SCL frequency (in Hz) for I3C transfers.

```c
uint32_t i2c
```

SCL frequency (in Hz) for I2C transfers.

```c
uint8_t supported_hdr
```

Bit mask of supported HDR modes (0 - 7).

This can be used to enable or disable HDR mode supported by the hardware at runtime.

```c
struct i3c_config_custom
```

```c
#include <i3c.h>
```

Custom I3C configuration parameters.

This can be used to configure the I3C hardware on parameters not covered by

See also:

- `i3c_config_controller` or
See also:
i3c_config_target. Mostly used to configure vendor specific parameters of the I3C hardware.

Public Members

```c
uint32_t id
    ID of the configuration parameter.
```

```c
uintptr_t val
    Value of configuration parameter.
```

```c
void *ptr
    Pointer to configuration parameter.
    Mainly used to pointer to a struct that the device driver understands.
```

```c
struct i3c_device_id
    #include <i3c.h> Structure used for matching I3C devices.
```

Public Members

```c
const uint64_t pid
    Device Provisioned ID.
```

```c
struct i3c_device_desc
    #include <i3c.h> Structure describing a I3C target device.
```

Instances of this are passed to the I3C controller device APIs, for example:

- i3c_device_register() to tell the controller of a target device.
- i3c_transfers() to initiate data transfers between controller and target device.

Fields bus, pid and static_addr must be initialized by the module that implements the target device behavior prior to passing the object reference to I3C controller device APIs. static_addr can be zero if target device does not have static address.

Field node should not be initialized or modified manually.

Public Members

```c
const struct device *const bus
    Used to attach this node onto a linked list.
    I3C bus to which this target device is attached
```

```c
const struct device *const dev
    Device driver instance of the I3C device.
```
const uint64_t pid
    Device Provisioned ID.

const uint8_t static_addr
    Static address for this target device.

    0 if static address is not being used, and only dynamic address is used. This means that the target device must go through ENTDAA (Dynamic Address Assignment) to get a dynamic address before it can communicate with the controller. This means SETAASA and SETDASA CCC cannot be used to set dynamic address on the target device (as both are to tell target device to use static address as dynamic address).

const uint8_t init_dynamic_addr
    Initial dynamic address.

    This is specified in the device tree property “assigned-address” to indicate the desired dynamic address during address assignment (SETDASA and ENTDAA).

    0 if there is no preference.

uint8_t dynamic_addr
    Dynamic Address for this target device used for communication.

    This is to be set by the controller driver in one of the following situations:
    • During Dynamic Address Assignment (during ENTDAA)
    • Reset Dynamic Address Assignment (RSTDAA)
    • Set All Addresses to Static Addresses (SETAASA)
    • Set New Dynamic Address (SETNEWDA)
    • Set Dynamic Address from Static Address (SETDASA)

    0 if address has not been assigned.

uint8_t group_addr
    Group address for this target device.

    Set during:
    • Reset Group Address(es) (RSTGRPA)
    • Set Group Address (SETGRPA)

    0 if group address has not been assigned.

uint8_t bcr
    Bus Characteristic Register (BCR)

    • BCR[7:6]: Device Role
        – 0: I3C Target
        – 1: I3C Controller capable
        – 2: Reserved
        – 3: Reserved

    • BCR[5]: Advanced Capabilities
        – 0: Does not support optional advanced capabilities.
        – 1: Supports optional advanced capabilities which can be viewed via GETCAPS CCC.

    • BCR[4]: Virtual Target Support
        – 0: Is not a virtual target.
        – 1: Is a virtual target.

    • BCR[3]: Offline Capable
        – 0: Will always response to I3C commands.
        – 1: Will not always response to I3C commands.
• BCR[2]: IBI Payload
  – 0: No data bytes following the accepted IBI.
  – 1: One data byte (MDB, Mandatory Data Byte) follows the accepted IBI. Additional data bytes may also follow.
• BCR[1]: IBI Request Capable
  – 0: Not capable
  – 1: Capable
• BCR[0]: Max Data Speed Limitation
  – 0: No Limitation
  – 1: Limitation obtained via GETMXDS CCC.

```c
uint8_t dcr

Device Characteristic Register (DCR)

Describes the type of device. Refer to official documentation on what this number means.
```

```c
uint8_t maxrd

Maximum Read Speed.
```

```c
uint8_t maxwr

Maximum Write Speed.
```

```c
uint16_t max_read_turnaround

Maximum Read turnaround time in microseconds.
```

```c
uint16_t mrl

Maximum Read Length.
```

```c
uint16_t mwl

Maximum Write Length.
```

```c
uint8_t max_ibi

Maximum IBI Payload Size.

Valid only if BCR[2] is 1.
```

```c
i3c_target_ibi_cb_t ibi_cb

Private data by the controller to aid in transactions.

Do not modify. In-Band Interrupt (IBI) callback.
```

```c

```

```c
struct i3c_i2c_device_desc

#include <i3c.h> Structure describing a I2C device on I3C bus.

Instances of this are passed to the I3C controller device APIs, for example: () i3c_i2c_device_register() to tell the controller of an I2C device. () i3c_i2c_transfers() to initiate data transfers between controller and I2C device.

Fields other than node must be initialized by the module that implements the device behavior prior to passing the object reference to I3C controller device APIs.

Public Members

7.6. Peripherals
const struct device *bus
    Used to attach this node onto a linked list.
    I3C bus to which this I2C device is attached

const uint16_t addr
    Static address for this I2C device.

const uint8_t lvr
    Legacy Virtual Register (LVR)
    • LVR[7:5]: I2C device index:
        – 0: I2C device has a 50 ns spike filter where it is not affected by high frequency on SCL.
        – 1: I2C device does not have a 50 ns spike filter but can work with high frequency on SCL.
        – 2: I2C device does not have a 50 ns spike filter and cannot work with high frequency on SCL.
    • LVR[4]: I2C mode indicator:
        – 0: FM+ mode
        – 1: FM mode
    • LVR[3:0]: Reserved.

struct i3c_dev_attached_list
    #include <i3c.h> Structure for describing attached devices for a controller.
    This contains slists of attached I3C and I2C devices.
    This is a helper struct that can be used by controller device driver to aid in device management.

Public Members

struct i3c_addr_slots addr_slots
    Address slots:
    • Aid in dynamic address assignment.
    • Quick way to find out if a target address is a I3C or I2C device.

sys_slist_t i3c
    Linked list of attached I3C devices.

sys_slist_t i2c
    Linked list of attached I2C devices.

struct i3c_dev_list
    #include <i3c.h> Structure for describing known devices for a controller.
    This contains arrays of known I3C and I2C devices.
    This is a helper struct that can be used by controller device driver to aid in device management.
Public Members

struct i3c_device_desc *const i3c
    Pointer to array of known I3C devices.

struct i3c_i2c_device_desc *const i2c
    Pointer to array of known I2C devices.

const uint8_t num_i3c
    Number of I3C devices in array.

const uint8_t num_i2c
    Number of I2C devices in array.

struct i3c_driver_config
    #include <i3c.h> This structure is common to all I3C drivers and is expected to be the first element in the object pointed to by the config field in the device structure.

Public Members

struct i3c_dev_list dev_list
    I3C/I2C device list struct.

struct i3c_driver_data
    #include <i3c.h> This structure is common to all I3C drivers and is expected to be the first element in the driver's struct driver_data declaration.

Public Members

struct i3c_config_controller ctrl_config
    Controller Configuration.

struct i3c_dev_attached_list attached_dev
    Attached I3C/I2C devices and addresses.

group i3c_ccc
    I3C Common Command Codes.

Defines

I3C_CCC_BROADCAST_MAX_ID
    Maximum CCC ID for broadcast.

I3C_CCC_ENEC(broadcast)
    Enable Events Command.

Parameters
• broadcast – True if broadcast, false if direct.

I3C_CCC_DISEC(broadcast)
Disable Events Command.

Parameters
• broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS(as, broadcast)
Enter Activity State.

Parameters
• as – Desired activity state
• broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS0(broadcast)
Enter Activity State 0.

Parameters
• broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS1(broadcast)
Enter Activity State 1.

Parameters
• broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS2(broadcast)
Enter Activity State 2.

Parameters
• broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS3(broadcast)
Enter Activity State 3.

Parameters
• broadcast – True if broadcast, false if direct.

I3C_CCC_RSTDAA
Reset Dynamic Address Assignment (Broadcast)

I3C_CCC_ENTDA
Enter Dynamic Address Assignment (Broadcast)

I3C_CCC_DEFMTGS
Define List of Targets (Broadcast)

I3C_CCC_SETML_WL(broadcast)
Set Max Write Length (Broadcast or Direct)

Parameters
• broadcast – True if broadcast, false if direct.

I3C_CCC_SETML_RL(broadcast)
Set Max Read Length (Broadcast or Direct)

Parameters
- **broadcast** – True if broadcast, false if direct.

**I3C_CCC_ENTTM**
Enter Test Mode (Broadcast)

**I3C_CCC_SETBUSCON**
Set Bus Context (Broadcast)

**I3C_CCC_ENDXFER(broadcast)**
Data Transfer Ending Procedure Control.

**Parameters**
- **broadcast** – True if broadcast, false if direct.

**I3C_CCC_ENTHDR(x)**
Enter HDR Mode (HDR-DDR) (Broadcast)

**I3C_CCC_ENTHDR0**
Enter HDR Mode 0 (HDR-DDR) (Broadcast)

**I3C_CCC_ENTHDR1**
Enter HDR Mode 1 (HDR-TSP) (Broadcast)

**I3C_CCC_ENTHDR2**
Enter HDR Mode 2 (HDR-TSL) (Broadcast)

**I3C_CCC_ENTHDR3**
Enter HDR Mode 3 (HDR-BT) (Broadcast)

**I3C_CCC_ENTHDR4**
Enter HDR Mode 4 (Broadcast)

**I3C_CCC_ENTHDR5**
Enter HDR Mode 5 (Broadcast)

**I3C_CCC_ENTHDR6**
Enter HDR Mode 6 (Broadcast)

**I3C_CCC_ENTHDR7**
Enter HDR Mode 7 (Broadcast)

**I3C_CCC_SETXTIME(broadcast)**
Exchange Timing Information (Broadcast or Direct)

**Parameters**
- **broadcast** – True if broadcast, false if direct.

**I3C_CCC_SETAASA**
Set All Addresses to Static Addresses (Broadcast)

**I3C_CCC_RSTACT(broadcast)**
Target Reset Action.

**Parameters**

7.6. Peripherals
• broadcast – True if broadcast, false if direct.

I3C_CCC_DEFGRPA
   Define List of Group Address (Broadcast)

I3C_CCC_RSTGRPA(broadcast)
   Reset Group Address.

   Parameters
   • broadcast – True if broadcast, false if direct.

I3C_CCC_MLANE(broadcast)
   Multi-Lane Data Transfer Control (Broadcast)

I3C_CCC_VENDOR(broadcast, id)
   Vendor/Standard Extension.

   Parameters
   • broadcast – True if broadcast, false if direct.
   • id – Extension ID.

I3C_CCC_SETDASA
   Set Dynamic Address from Static Address (Direct)

I3C_CCC_SETNEWDA
   Set New Dynamic Address (Direct)

I3C_CCC_GETMWL
   Get Max Write Length (Direct)

I3C_CCC_GETMRL
   Get Max Read Length (Direct)

I3C_CCC_GETPID
   Get Provisioned ID (Direct)

I3C_CCC_GETBCR
   Get Bus Characteristics Register (Direct)

I3C_CCC_GETDCR
   Get Device Characteristics Register (Direct)

I3C_CCC_GETSTATUS
   Get Device Status (Direct)

I3C_CCC_GETACCCR
   Get Accept Controller Role (Direct)

I3C_CCC_SETBRGTGT
   Set Bridge Targets (Direct)
I3C_CCC_GETMXDS
   Get Max Data Speed (Direct)

I3C_CCC_GETCAPS
   Get Optional Feature Capabilities (Direct)

I3C_CCC_SETROUTE
   Set Route (Direct)

I3C_CCC_D2DXFER
   Device to Device(s) Tunneling Control (Direct)

I3C_CCC_GETXTIME
   Get Exchange Timing Information (Direct)

I3C_CCC_SETGRPDA
   Set Group Address (Direct)

I3C_CCC_ENEC.EVT_ENINTR
   Enable Events (ENEC) - Target Interrupt Requests.

I3C_CCC_ENEC.EVT_ENCR
   Enable Events (ENEC) - Controller Role Requests.

I3C_CCC_ENEC.EVT_ENHJ
   Enable Events (ENEC) - Hot-Join Event.

I3C_CCC_ENEC.EVT_ALL

I3C_CCC_DISEC.EVT_DISINTR
   Disable Events (DISEC) - Target Interrupt Requests.

I3C_CCC_DISEC.EVT_DISCR
   Disable Events (DISEC) - Controller Role Requests.

I3C_CCC_DISEC.EVT_DISHJ
   Disable Events (DISEC) - Hot-Join Event.

I3C_CCC_DISEC.EVT_ALL

I3C_CCC_EVT_INTR
   Events - Target Interrupt Requests.

I3C_CCC_EVT_CR
   Events - Controller Role Requests.

I3C_CCC_EVT_HJ
   Events - Hot-Join Event.
Zephyr Project Documentation, Release 3.6.0-rc3

I3C_CCC_EVT_ALL
   Bitmask for all events.

I3C_CCC_GETSTATUS_PROTOCOL_ERR
   GETSTATUS Format 1 - Protocol Error bit.

I3C_CCC_GETSTATUS_ACTIVITY_MODE_SHIFT
   GETSTATUS Format 1 - Activity Mode bit shift value.

I3C_CCC_GETSTATUS_ACTIVITY_MODE_MASK
   GETSTATUS Format 1 - Activity Mode bitmask.

I3C_CCC_GETSTATUS_ACTIVITY_MODE(status)
   GETSTATUS Format 1 - Activity Mode.
   Obtain Activity Mode from GETSTATUS Format 1 value obtained via GETSTATUS.

   Parameters
   • status – GETSTATUS Format 1 value

I3C_CCC_GETSTATUS_NUM_INT_SHIFT
   GETSTATUS Format 1 - Number of Pending Interrupts bit shift value.

I3C_CCC_GETSTATUS_NUM_INT_MASK
   GETSTATUS Format 1 - Number of Pending Interrupts bitmask.

I3C_CCC_GETSTATUS_NUM_INT(status)
   GETSTATUS Format 1 - Number of Pending Interrupts.
   Obtain Number of Pending Interrupts from GETSTATUS Format 1 value obtained via GETSTATUS.

   Parameters
   • status – GETSTATUS Format 1 value

I3C_CCC_GETSTATUS_PRECR_DEEP_SLEEP_DETECTED
   GETSTATUS Format 2 - PERCR - Deep Sleep Detected bit.

I3C_CCC_GETSTATUS_PRECR_HANDOFF_DELAY_NACK
   GETSTATUS Format 2 - PERCR - Handoff Delay NACK.

I3C_CCC_GETMXDS_MAX_SDR_FSCL_MAX
   Get Max Data Speed (GETMXDS) - Default Max Sustained Data Rate.

I3C_CCC_GETMXDS_MAX_SDR_FSCL_8MHZ
   Get Max Data Speed (GETMXDS) - 8MHz Max Sustained Data Rate.

I3C_CCC_GETMXDS_MAX_SDR_FSCL_6MHZ
   Get Max Data Speed (GETMXDS) - 6MHz Max Sustained Data Rate.

I3C_CCC_GETMXDS_MAX_SDR_FSCL_4MHZ
   Get Max Data Speed (GETMXDS) - 4MHz Max Sustained Data Rate.
I3C_CCC_GETMXDS_MAX_SDR_FSCL_2MHZ
Get Max Data Speed (GETMXDS) - 2MHz Max Sustained Data Rate.

I3C_CCC_GETMXDS_TSCO_8NS
Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 8ns.

I3C_CCC_GETMXDS_TSCO_9NS
Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 9ns.

I3C_CCC_GETMXDS_TSCO_10NS
Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 10ns.

I3C_CCC_GETMXDS_TSCO_11NS
Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 11ns.

I3C_CCC_GETMXDS_TSCO_12NS
Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 12ns.

I3C_CCC_GETMXDS_TSCO_GT_12NS
Get Max Data Speed (GETMXDS) - Clock to Data Turnaround > 12ns.

I3C_CCC_GETMXDS_MAXWR_DEFINING_BYTE_SUPPORT
Get Max Data Speed (GETMXDS) - maxWr - Optional Defining Byte Support.

I3C_CCC_GETMXDS_MAXWR_MAX_SDR_FSCL_SHIFT
Get Max Data Speed (GETMXDS) - Max Sustained Data Rate bit shift value.

I3C_CCC_GETMXDS_MAXWR_MAX_SDR_FSCL_MASK
Get Max Data Speed (GETMXDS) - Max Sustained Data Rate bitmask.

I3C_CCC_GETMXDS_MAXRD_W2R_PERMITS_STOP_BETWEEN
Get Max Data Speed (GETMXDS) - maxRd - Write-to-Read Permits Stop Between.

I3C_CCC_GETMXDS_MAXRD_TSCO_SHIFT
Get Max Data Speed (GETMXDS) - maxRd - Clock to Data Turnaround bit shift value.

I3C_CCC_GETMXDS_MAXRD_TSCO_MASK
Get Max Data Speed (GETMXDS) - maxRd - Clock to Data Turnaround bitmask.

Parameters
- maxwr – GETMXDS maxWr value.

I3C_CCC_GETMXDS_MAXRD_W2R_PERMITS_STOP_BETWEEN
Get Max Data Speed (GETMXDS) - maxRd - Write-to-Read Permits Stop Between.

I3C_CCC_GETMXDS_MAXRD_TSCO_SHIFT
Get Max Data Speed (GETMXDS) - maxRd - Clock to Data Turnaround bit shift value.

I3C_CCC_GETMXDS_MAXRD_TSCO_MASK
Get Max Data Speed (GETMXDS) - maxRd - Clock to Data Turnaround bitmask.

Obtain Clock to Data Turnaround value from GETMXDS maxRd value obtained via GETMXDS.

7.6. Peripherals
Parameters

• `maxrd` – `GETMXDS` maxRd value.

**I3C_CCC_GETMXDS_MAXRD_MAX_SDR_FSCL_SHIFT**
Get Max Data Speed (`GETMXDS`) - maxRd - Max Sustained Data Rate bit shift value.

**I3C_CCC_GETMXDS_MAXRD_MAX_SDR_FSCL_MASK**
Get Max Data Speed (`GETMXDS`) - maxRd - Max Sustained Data Rate bitmask.

**I3C_CCC_GETMXDS_MAXRD_MAX_SDR_FSCL(maxrd)**
Get Max Data Speed (`GETMXDS`) - maxRd - Max Sustained Data Rate.

Obtain Max Sustained Data Rate value from `GETMXDS` maxRd value obtained via `GETMXDS`.

Parameters

• `maxrd` – `GETMXDS` maxRd value.

**I3C_CCC_GETMXDS_CRDHLY1_SET_BUS_ACT_STATE**
Get Max Data Speed (`GETMXDS`) - CRDHLY1 - Set Bus Activity State bit shift value.

**I3C_CCC_GETMXDS_CRDHLY1_CTRL_HANDOFF_ACT_STATE_SHIFT**
Get Max Data Speed (`GETMXDS`) - CRDHLY1 - Controller Handoff Activity State bit shift value.

**I3C_CCC_GETMXDS_CRDHLY1_CTRL_HANDOFF_ACT_STATE_MASK**
Get Max Data Speed (`GETMXDS`) - CRDHLY1 - Controller Handoff Activity State bitmask.

**I3C_CCC_GETMXDS_CRDHLY1_CTRL_HANDOFF_ACT_STATE(crhdly1)**
Get Max Data Speed (`GETMXDS`) - CRDHLY1 - Controller Handoff Activity State.

Obtain Controller Handoff Activity State value from `GETMXDS` value obtained via `GETMXDS`.

Parameters

• `crhdly1` – `GETMXDS` value.

**I3C_CCC_GETCAPS1_HDR_DDR**
Get Optional Feature Capabilities (`GETCAPS`) Format 1 - HDR-DDR mode bit.

**I3C_CCC_GETCAPS1_HDR_BT**
Get Optional Feature Capabilities (`GETCAPS`) Format 1 - HDR-BT mode bit.

**I3C_CCC_GETCAPS1_HDR_MODE(x)**
Get Optional Feature Capabilities (`GETCAPS`) - HDR Mode.

Get the bit corresponding to HDR mode.

Parameters

• `x` – HDR mode

**I3C_CCC_GETCAPS1_HDR_MODE0**
Get Optional Feature Capabilities (`GETCAPS`) Format 1 - HDR Mode 0.
I3C_CCC_GETCAPS1_HDR_MODE1
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 1.

I3C_CCC_GETCAPS1_HDR_MODE2
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 2.

I3C_CCC_GETCAPS1_HDR_MODE3
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 3.

I3C_CCC_GETCAPS1_HDR_MODE4
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 4.

I3C_CCC_GETCAPS1_HDR_MODE5
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 5.

I3C_CCC_GETCAPS1_HDR_MODE6
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 6.

I3C_CCC_GETCAPS1_HDR_MODE7
Get Optional Feature Capabilities (GETCAPS) Format 1 - HDR Mode 7.

I3C_CCC_GETCAPS2_HDRDDR_WRITE_ABORT
Get Optional Feature Capabilities (GETCAPS) Format 2 - HDR-DDR Write Abort bit.

I3C_CCC_GETCAPS2_HDRDDR_ABORT_CRC
Get Optional Feature Capabilities (GETCAPS) Format 2 - HDR-DDR Abort CRC bit.

I3C_CCC_GETCAPS2_GRPADDR_CAP_SHIFT
Get Optional Feature Capabilities (GETCAPS) Format 2 - Group Address Capabilities bit shift value.

I3C_CCC_GETCAPS2_GRPADDR_CAP_MASK
Get Optional Feature Capabilities (GETCAPS) Format 2 - Group Address Capabilities bitmask.

I3C_CCC_GETCAPS2_GRPADDR_CAP(getcaps2)
Get Optional Feature Capabilities (GETCAPS) Format 2 - Group Address Capabilities.
Obtain Group Address Capabilities value from GETCAPS Format 2 value obtained via GETCAPS.

Parameters
  • getcaps2 – GETCAPS2 value.

I3C_CCC_GETCAPS2_SPEC_VER_SHIFT
Get Optional Feature Capabilities (GETCAPS) Format 2 - I3C 1.x Specification Version bit shift value.

I3C_CCC_GETCAPS2_SPEC_VER_MASK
Get Optional Feature Capabilities (GETCAPS) Format 2 - I3C 1.x Specification Version bitmask.
I3C_CCC_GETCAPS2_SPEC_VER(getcaps2)
Get Optional Feature Capabilities (GETCAPS) Format 2 - I3C 1.x Specification Version.
Obtain I3C 1.x Specification Version value from GETCAPS Format 2 value obtained via
GETCAPS.

Parameters
- getcaps2 – GETCAPS2 value.

I3C_CCC_GETCAPS3_MLANE_SUPPORT
Get Optional Feature Capabilities (GETCAPS) Format 3 - Multi-Lane Data Transfer Support bit.

I3C_CCC_GETCAPS3_D2DXFER_SUPPORT
Get Optional Feature Capabilities (GETCAPS) Format 3 - Device to Device Transfer (D2DXFER) Support bit.

I3C_CCC_GETCAPS3_D2DXFER_IBI_CAPABLE
Get Optional Feature Capabilities (GETCAPS) Format 3 - Device to Device Transfer (D2DXFER) IBI Capable bit.

I3C_CCC_GETCAPS3_GETCAPS_DEFINING_BYTE_SUPPORT
Get Optional Feature Capabilities (GETCAPS) Format 3 - Defining Byte Support in GETCAPS bit.

I3C_CCC_GETCAPS3_GETSTATUS_DEFINING_BYTE_SUPPORT
Get Optional Feature Capabilities (GETCAPS) Format 3 - Defining Byte Support in GETSTATUS bit.

I3C_CCC_GETCAPS3_HDRBT_CRC32_SUPPORT

I3C_CCC_GETCAPS3_IBI_MDR_PENDING_READ_NOTIFICATION
Get Optional Feature Capabilities (GETCAPS) Format 3 - IBI MDB Support for Pending Read Notification bit.

Enums

enum i3c_ccc_getstatus_fmt
Indicate which format of GETSTATUS to use.

Values:

- enumerator GETSTATUS_FORMAT_1
  GETSTATUS Format 1.

- enumerator GETSTATUS_FORMAT_2
  GETSTATUS Format 2.

enum i3c_ccc_getstatus_defbyte
Defining byte values for GETSTATUS Format 2.

Values:
enumerator **GETSTATUS_FORMAT_2_TGTSTAT** = 0x00U
   Target status.

enumerator **GETSTATUS_FORMAT_2_PRECR** = 0x91U
   PRECR - Alternate status format describing Controller-capable device.

enumerator **GETSTATUS_FORMAT_2_INVALID** = 0x100U
   Invalid defining byte.

enum **i3c_ccc_rstact_defining_byte**
   Enum for I3C Reset Action (RSTACT) Defining Byte Values.
   
   **Values:**

   enumerator **I3C_CCC_RSTACT_NO_RESET** = 0x00U
      No Reset on Target Reset Pattern.

   enumerator **I3C_CCC_RSTACT_PERIPHERAL_ONLY** = 0x01U
      Reset the I3C Peripheral Only.

   enumerator **I3C_CCC_RSTACT_RESET_WHOLE_TARGET** = 0x02U
      Reset the Whole Target.

   enumerator **I3C_CCC_RSTACT_DEBUG_NETWORK_ADAPTER** = 0x03U
      Debug Network Adapter Reset.

   enumerator **I3C_CCC_RSTACT_VIRTUAL_TARGET_DETECT** = 0x04U
      Virtual Target Detect.

**Functions**

static inline bool **i3c_ccc_is_payload_broadcast**(const struct **i3c_ccc_payload** *payload)
   Test if I3C CCC payload is for broadcast.
   This tests if the CCC payload is for broadcast.

   **Parameters**
   
   • payload – [in] Pointer to the CCC payload.

   **Return values**
   
   • true – if payload target is broadcast
   • false – if payload target is direct

int **i3c_ccc_do_getbcr**(struct **i3c_device_desc** *target, struct **i3c_ccc_getbcr** *bcr)
   Get BCR from a target.
   Helper function to get BCR (Bus Characteristic Register) from target device.

   **See also:**

   **i3c_do_ccc**
Parameters

- **target** – [in] Pointer to the target device descriptor.
- **bcr** – [out] Pointer to the BCR payload structure.

Returns

```c
int i3c_ccc_do_getdcr(struct i3c_device_desc *target, struct i3c_ccc_getdcr *dcr)
```

Get DCR from a target.

Helper function to get DCR (Device Characteristic Register) from target device.

See also:

- `i3c_do_ccc`

Parameters

- **target** – [in] Pointer to the target device descriptor.
- **dcr** – [out] Pointer to the DCR payload structure.

Returns

```c
int i3c_ccc_do_getpid(struct i3c_device_desc *target, struct i3c_ccc_getpid *pid)
```

Get PID from a target.

Helper function to get PID (Provisioned ID) from target device.

See also:

- `i3c_do_ccc`

Parameters

- **target** – [in] Pointer to the target device descriptor.
- **pid** – [out] Pointer to the PID payload structure.

Returns

```c
int i3c_ccc_do_rstact_all(const struct device *controller, enum i3c_ccc_rstact_defining_byte action)
```

Broadcast RSTACT to reset I3C Peripheral.

Helper function to broadcast Target Reset Action (RSTACT) to all connected targets to Reset the I3C Peripheral Only (0x01).

See also:

- `i3c_do_ccc`

Parameters

- **controller** – [in] Pointer to the controller device driver instance.

Returns
int i3c_ccc_do_rstdaa all(const struct device *controller)
  Broadcast RSTDAA to reset dynamic addresses for all targets.
  Helper function to reset dynamic addresses of all connected targets.

See also:
i3c_do_ccc

Parameters
  • controller – [in] Pointer to the controller device driver instance.

Returns

int i3c_ccc_do_setdasa(const struct i3c_device_desc *target)
  Set Dynamic Address from Static Address for a target.
  Helper function to do SETDASA (Set Dynamic Address from Static Address) for a particular target.
  Note this does not update target with the new dynamic address.

See also:
i3c_do_ccc

Parameters
  • target – [in] Pointer to the target device descriptor where the device is configured with a static address.

Returns

int i3c_ccc_do_setnewda(const struct i3c_device_desc *target, struct i3c_ccc_address new_da)
  Set New Dynamic Address for a target.
  Helper function to do SETNEWDA(Set New Dynamic Address) for a particular target.
  Note this does not update target with the new dynamic address.

See also:
i3c_do_ccc

Parameters
  • target – [in] Pointer to the target device descriptor where the device is configured with a static address.

Returns

int i3c_ccc_do_events_all_set(const struct device *controller, bool enable, struct i3c_ccc_events *events)
  Broadcast ENEC/DISEC to enable/disable target events.
  Helper function to broadcast Target Events Command to enable or disable target events (ENEC/DISEC).
See also:

\texttt{i3c\_do\_ccc}

\textbf{Parameters}

- \texttt{controller} – \texttt{[in]} Pointer to the controller device driver instance.
- \texttt{enable} – \texttt{[in]} ENEC if true, DISEC if false.
- \texttt{events} – \texttt{[in]} Pointer to the event struct.

\textbf{Returns}

\texttt{int i3c\_ccc\_do\_events\_set(struct i3c\_device\_desc \*target, bool enable, struct i3c\_ccc\_events \*events)}

Direct CCC ENEC/DISEC to enable/disable target events.

Helper function to send Target Events Command to enable or disable target events (ENEC/DISEC) on a single target.

See also:

\texttt{i3c\_do\_ccc}

\textbf{Parameters}

- \texttt{target} – \texttt{[in]} Pointer to the target device descriptor.
- \texttt{enable} – \texttt{[in]} ENEC if true, DISEC if false.
- \texttt{events} – \texttt{[in]} Pointer to the event struct.

\textbf{Returns}

\texttt{int i3c\_ccc\_do\_setmwl\_all(const struct device \*controller, const struct i3c\_ccc\_mwl \*mwl)}

Broadcast SETMWL to Set Maximum Write Length.

Helper function to do SETMWL (Set Maximum Write Length) to all connected targets.

See also:

\texttt{i3c\_do\_ccc}

\textbf{Parameters}

- \texttt{controller} – \texttt{[in]} Pointer to the controller device driver instance.
- \texttt{mwl} – \texttt{[in]} Pointer to SETMWL payload.

\textbf{Returns}

\texttt{int i3c\_ccc\_do\_setmwl(const struct i3c\_device\_desc \*target, const struct i3c\_ccc\_mwl \*mwl)}

Single target SETMWL to Set Maximum Write Length.

Helper function to do SETMWL (Set Maximum Write Length) to one target.

See also:

\texttt{i3c\_do\_ccc}
Parameters
• target – [in] Pointer to the target device descriptor.
• mwl – [in] Pointer to SETMWL payload.

Returns
int i3c_ccc_do_getmwl(const struct i3c_device_desc *target, struct i3c_ccc_mwl *mwl)
Single target GETMWL to Get Maximum Write Length.
Helper function to do GETMWL (Get Maximum Write Length) of one target.

See also:
i3c_do_ccc

Parameters
• target – [in] Pointer to the target device descriptor.
• mwl – [out] Pointer to GETMWL payload.

Returns
int i3c_ccc_do_setmrl_all(const struct device *controller, const struct i3c_ccc_mrl *mrl, bool has_ibi_size)
Broadcast SETMRL to Set Maximum Read Length.
Helper function to do SETMRL (Set Maximum Read Length) to all connected targets.

See also:
i3c_do_ccc

Parameters
• controller – [in] Pointer to the controller device driver instance.
• mrl – [in] Pointer to SETMRL payload.
• has_ibi_size – [in] True if also sending the optional IBI payload size.
  False if not sending.

Returns
int i3c_ccc_do_setmrl(const struct i3c_device_desc *target, const struct i3c_ccc_mrl *mrl)
Single target SETMRL to Set Maximum Read Length.
Helper function to do SETMRL (Set Maximum Read Length) to one target.
Note this uses the BCR of the target to determine whether to send the optional IBI payload size.

See also:
i3c_do_ccc

Parameters
• target – [in] Pointer to the target device descriptor.
• mrl – [in] Pointer to SETMRL payload.
Returns

int i3c_ccc_do_getmrl(const struct i3c_device_desc *target, struct i3c_ccc_mrl *mrl)

Single target GETMRL to Get Maximum Read Length.
Helper function to do GETMRL (Get Maximum Read Length) of one target.
Note this uses the BCR of the target to determine whether to send the optional IBI payload size.

See also:

i3c_do_ccc

Parameters

• target – [in] Pointer to the target device descriptor.
• mrl – [out] Pointer to GETMRL payload.

Returns

int i3c_ccc_do_getstatus(const struct i3c_device_desc *target, union i3c_ccc_getstatus *status, enum i3c_ccc_getstatus_fmt fmt, enum i3c_ccc_getstatus_defbyte defbyte)

Single target GETSTATUS to Get Target Status.
Helper function to do GETSTATUS (Get Target Status) of one target.
Note this uses the BCR of the target to determine whether to send the optional IBI payload size.

See also:

i3c_do_ccc

Parameters

• target – [in] Pointer to the target device descriptor.
• status – [out] Pointer to GETSTATUS payload.

Returns

static inline int i3c_ccc_do_getstatus_fmt1(const struct i3c_device_desc *target, union i3c_ccc_getstatus *status)

Single target GETSTATUS to Get Target Status (Format 1).
Helper function to do GETSTATUS (Get Target Status, format 1) of one target.

See also:

i3c_do_ccc

Parameters

• target – [in] Pointer to the target device descriptor.
• status – [out] Pointer to GETSTATUS payload.
Zephyr Project Documentation, Release 3.6.0-rc3

Returns

static inline int i3c_ccc_do_getstatus_fmt2(const struct i3c_device_desc *target, union i3c_ccc_getstatus *status, enum i3c_ccc_getstatus_defbyte defbyte)

Single target GETSTATUS to Get Target Status (Format 2).
Helper function to do GETSTATUS (Get Target Status, format 2) of one target.

See also:
i3c_do_ccc

Parameters

- **target** – [in] Pointer to the target device descriptor.
- **status** – [out] Pointer to GETSTATUS payload.

Returns

struct i3c_ccc_target_payload
#include <ccc.h> Payload structure for Direct CCC to one target.

Public Members

uint8_t addr
Target address.

uint8_t rnw
0 for Write, 1 for Read

uint8_t *data
- For Write CCC, pointer to the byte array of data to be sent, which may contain the Sub-Command Byte and additional data.
- For Read CCC, pointer to the byte buffer for data to be read into.

size_t data_len
Length in bytes for data.

size_t num_xfer
Total number of bytes transferred.
A Target can issue an EoD or the Controller can abort a transfer before the length of the buffer. It is expected for the driver to write to this after the transfer.

struct i3c_ccc_payload
#include <ccc.h> Payload structure for one CCC transaction.
Public Members

```c
uint8_t id
    The CCC ID (I3C_CCC_*)
```

```c
uint8_t *data
    Pointer to byte array of data for this CCC.
    This is the bytes following the CCC command in CCC frame. Set to NULL if no associated data.
```

```c
size_t data_len
    Length in bytes for optional data array.
```

```c
size_t num_xfer
    Total number of bytes transferred.
    A Controller can abort a transfer before the length of the buffer. It is expected for the driver to write to this after the transfer.
```

```c
struct i3c_ccc_target_payload *payloads
    Array of struct i3c_ccc_target_payload.
    Each element describes the target and associated payloads for this CCC.
    Use with Direct CCC.
```

```c
size_t num_targets
    Number of targets.
```

```c
struct i3c_ccc_events
    #include <ccc.h> Payload for ENEC/DISEC CCC (Target Events Command).
```

Public Members

```c
uint8_t events
    Event byte:
    - Bit[0]: ENINT/DISINT: Target Interrupt Requests
    - Bit[1]: ENCR/DISCR: Controller Role Requests
    - Bit[3]: ENHJ/DISHJ: Hot-Join Event
```

```c
struct i3c_ccc_mwl
    #include <ccc.h> Payload for SETMWL/GETMWL CCC (Set/Get Maximum Write Length).
```

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.
Public Members

uint16_t len
Maximum Write Length.

struct i3c_ccc_mrl
#include <ccc.h> Payload for SETMRL/GETMRL CCC (Set/Get Maximum Read Length).

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

Public Members

uint16_t len
Maximum Read Length.

uint8_t ibi_len
Optional IBI Payload Size.

struct i3c_ccc_deftgts_active_controller
#include <ccc.h> The active controller part of payload for DEFTGTS CCC.
This is used by DEFTGTS (Define List of Targets) CCC to describe the active controller on the I3C bus.

Public Members

uint8_t addr
Dynamic Address of Active Controller.

uint8_t dcr
Device Characteristic Register of Active Controller.

uint8_t bcr
Bus Characteristic Register of Active Controller.

uint8_t static_addr
Static Address of Active Controller.

struct i3c_ccc_deftgts_target
#include <ccc.h> The target device part of payload for DEFTGTS CCC.
This is used by DEFTGTS (Define List of Targets) CCC to describe the existing target devices on the I3C bus.
Public Members

uint8_t addr
  Dynamic Address of a target device, or a group address.

uint8_t dcr
  Device Characteristic Register of a I3C target device or a group.

uint8_t lvr
  Legacy Virtual Register for legacy I2C device.

uint8_t bcr
  Bus Characteristic Register of a target device or a group.

uint8_t static_addr
  Static Address of a target device or a group.

struct i3c_ccc_deftgts
  #include <ccc.h> Payload for DEFTGTS CCC (Define List of Targets).

Note: i3c_ccc_deftgts_target is an array of targets, where the number of elements is dependent on the number of I3C targets on the bus. Please have enough space for both read and write of this CCC.

Public Members

struct i3c_ccc_deftgts_active_controller active_controller
  Data describing the active controller.

struct i3c_ccc_deftgts_target targets[
  Data describing the target(s) on the bus.

struct i3c_ccc_address
  #include <ccc.h> Payload for a single device address.

This is used for:
  • SETDASA (Set Dynamic Address from Static Address)
  • SETNEWDA (Set New Dynamic Address)
  • SETGRPA (Set Group Address)
  • GETACCCR (Get Accept Controller Role)

Note that the target address is encoded within struct i3c_ccc_target_payload instead of being encoded in this payload.

Public Members
uint8_t addr

• For SETDASA, Static Address to be assigned as Dynamic Address.
• For SETNEWDA, new Dynamic Address to be assigned.
• For SETGRPA, new Group Address to be set.
• For GETACCCR, the correct address of Secondary Controller.

Note: For SETDATA, SETNEWDA and SETGRPA, the address is left-shift by 1, and bit[0] is always 0.

Note: For SET GETACCCR, the address is left-shift by 1, and bit[0] is the calculated odd parity bit.

struct i3c_ccc_getpid
#include <ccc.h> Payload for GETPID CCC (Get Provisioned ID).

Public Members

uint8_t pid[6]
48-bit Provisioned ID.

Note: Data is big-endian where first byte is MSB.

struct i3c_ccc_getbcr
#include <ccc.h> Payload for GETBCR CCC (Get Bus Characteristics Register).

Public Members

uint8_t bcr
Bus Characteristics Register.

struct i3c_ccc_getdcr
#include <ccc.h> Payload for GETDCR CCC (Get Device Characteristics Register).

Public Members

uint8_t dcr
Device Characteristics Register.

union i3c_ccc_getstatus
#include <ccc.h> Payload for GETSTATUS CCC (Get Device Status).

7.6. Peripherals 3189
Public Members

uint16_t status
   Device Status.
   
   • Bit[15:8]: Reserved.
   • Bit[7:6]: Activity Mode.
   • Bit[5]: Protocol Error.
   • Bit[4]: Reserved.
   • Bit[3:0]: Number of Pending Interrupts.

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

struct i3c_ccc_getstatus fmt1

uint16_t tgtstat
   Defining Byte 0x00: TGTSTAT.

See also:
   i3c_ccc_getstatus::fmt1::status

uint16_t precr
   Defining Byte 0x91: PRECR.
   
   • Bit[15:8]: Vendor Reserved
   • Bit[7:2]: Reserved
   • Bit[1]: Handoff Delay NACK
   • Bit[0]: Deep Sleep Detected

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

uint16_t raw_u16

union i3c_ccc_getstatus fmt2

struct i3c_ccc_setbrgtgt_tgt
   #include <ccc.h> One Bridged Target for SETBRGTGT payload.

Public Members

uint8_t addr
   Dynamic address of the bridged target.
**Note:** The address is left-shift by 1, and bit[0] is always 0.

`uint16_t id`
16-bit ID for the bridged target.

**Note:** For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

```c
struct i3c_ccc_setbrgtgt
#include <ccc.h>
Payload for SETBRGTGT CCC (Set Bridge Targets).
Note that the bridge target address is encoded within struct `i3c_ccc_target_payload` instead of being encoded in this payload.

**Public Members**

`uint8_t count`
Number of bridged targets.

`struct i3c_ccc_setbrgtgt_tgt targets[]`
Array of bridged targets.

```c
union i3c_ccc_getmxds
#include <ccc.h>
Payload for GETMXDS CCC (Get Max Data Speed).

**Note:** This is only for GETMXDS Format 1 and Format 2.

**Public Members**

`uint8_t maxwr`
maxWr

`uint8_t maxrd`
maxRd

`struct i3c_ccc_getmxds fmt1`

`uint8_t maxrdturn[3]`
Maximum Read Turnaround Time in microsecond.
This is in little-endian where first byte is LSB.

`struct i3c_ccc_getmxds fmt2`
uint8_t wrrdtturn

Defining Byte 0x00: WRRDTURN.

See also:

i3c_ccc_getmxds::fmt2

uint8_t crhdly1

Defining Byte 0x91: CRHDLY.

• Bit[2]: Set Bus Activity State
• Bit[1:0]: Controller Handoff Activity State

struct i3c_ccc_getmxds fmt3

struct i3c_ccc_getcaps

#include <ccc.h> Payload for GETCAPS CCC (Get Optional Feature Capabilities).

Note: Only support GETCAPS Format 1.

Public Members

uint8_t getcaps[4]

group i3c_addresses

I3C Address-related Helper Code.

Defines

I3C_BROADCAST_ADDR

Broadcast Address on I3C bus.

I3C_MAX_ADDR

Maximum value of device addresses.

Enums

enum i3c_addr_slot_status

Enum to indicate whether an address is reserved, has I2C/I3C device attached, or no device attached.

Values:
enumerator I3C_ADDR_SLOT_STATUS_FREE = 0U
Address has not device attached.

enumerator I3C_ADDR_SLOT_STATUS_RSVD
Address is reserved.

enumerator I3C_ADDR_SLOT_STATUS_I3C_DEV
Address is associated with an I3C device.

enumerator I3C_ADDR_SLOT_STATUS_I2C_DEV
Address is associated with an I2C device.

enumerator I3C_ADDR_SLOT_STATUS_MASK = 0x03U
Bit masks used to filter status bits.

Functions

int i3c_addr_slots_init(const struct device *dev)
Initialize the I3C address slots struct.
This clears out the assigned address bits, and set the reserved address bits according
to the I3C specification.

Parameters
  • dev – Pointer to controller device driver instance.

Return values
  • 0 – if successful.
  • -EINVAL – if duplicate addresses.

void i3c_addr_slots_set(struct i3c_addr_slots *slots, uint8_t dev_addr, enum
i3c_addr_slot_status status)
Set the address status of a device.

Parameters
  • slots – Pointer to the address slots structure.
  • dev_addr – Device address.
  • status – New status for the address dev_addr.

enum i3c_addr_slot_status i3c_addr_slots_status(struct i3c_addr_slots *slots, uint8_t
dev_addr)
Get the address status of a device.

Parameters
  • slots – Pointer to the address slots structure.
  • dev_addr – Device address.

Returns
  Address status for the address dev_addr.
bool i3c_addr_slots_is_free(struct i3c_addr_slots *slots, uint8_t dev_addr)

Check if the address is free.

**Parameters**

• slots – Pointer to the address slots structure.
• dev_addr – Device address.

**Return values**

• true – if address is free.
• false – if address is not free.

uint8_t i3c_addr_slots_next_free_find(struct i3c_addr_slots *slots, uint8_t start_addr)

This can be used to find the next free address that can be assigned to a new device.

**Parameters**

• slots – Pointer to the address slots structure.
• start_addr – Where to start searching

**Returns**

The next free address, or 0 if none found.

static inline void i3c_addr_slots_mark_free(struct i3c_addr_slots *addr_slots, uint8_t addr)

Mark the address as free (not used) in device list.

**Parameters**

• addr_slots – Pointer to the address slots struct.
• addr – Device address.

static inline void i3c_addr_slots_mark_rsvd(struct i3c_addr_slots *addr_slots, uint8_t addr)

Mark the address as reserved in device list.

**Parameters**

• addr_slots – Pointer to the address slots struct.
• addr – Device address.

static inline void i3c_addr_slots_mark_i3c(struct i3c_addr_slots *addr_slots, uint8_t addr)

Mark the address as I3C device in device list.

**Parameters**

• addr_slots – Pointer to the address slots struct.
• addr – Device address.

static inline void i3c_addr_slots_mark_i2c(struct i3c_addr_slots *addr_slots, uint8_t addr)

Mark the address as I2C device in device list.

**Parameters**

• addr_slots – Pointer to the address slots struct.
• addr – Device address.
struct i3c_addr_slots
#include <addresses.h> Structure to keep track of addresses on I3C bus.

group i3c_target_device
I3C Target Device API.

Functions

static inline int i3c_target_tx_write(const struct device *dev, uint8_t *buf, uint16_t len)
Writes to the target's TX FIFO.
Write to the TX FIFO dev I3C bus driver using the provided buffer and length. Some
I3C targets will NACK read requests until data is written to the TX FIFO. This function
will write as much as it can to the FIFO return the total number of bytes written. It is
then up to the application to utilize the target callbacks to write the remaining data.
Negative returns indicate error.
Most of the existing hardware allows simultaneous support for master and target
mode. This is however not guaranteed.

Parameters
• dev – Pointer to the device structure for an I3C controller driver config-
ured in target mode.
• buf – Pointer to the buffer
• len – Length of the buffer

Return values
• Total – number of bytes written
• -ENOTSUP – Not in Target Mode
• -ENOSPC – No space in Tx FIFO
• -ENOSYS – If target mode is not implemented

static inline int i3c_target_register(const struct device *dev, struct i3c_target_config *cfg)
Registers the provided config as target device of a controller.
Enable I3C target mode for the dev I3C bus driver using the provided config struct
(cfg) containing the functions and parameters to send bus events. The I3C target will
be registered at the address provided as i3c_target_config::address struct member. Any
I3C bus events related to the target mode will be passed onto I3C target device driver
via a set of callback functions provided in the 'callbacks' struct member.
Most of the existing hardware allows simultaneous support for master and target
mode. This is however not guaranteed.

Parameters
• dev – Pointer to the device structure for an I3C controller driver config-
ured in target mode.
• cfg – Config struct with functions and parameters used by the I3C target
driver to send bus events

Return values
• 0 – Is successful
• -EINVAL – If parameters are invalid
• -EIO – General input / output error.
• -ENOSYS – If target mode is not implemented

static inline int i3c_target_unregister(const struct device *dev, struct i3c_target_config *cfg)

Unregisters the provided config as target device.

This routine disables I3C target mode for the dev I3C bus driver using the provided config struct (cfg) containing the functions and parameters to send bus events.

Parameters

• dev – Pointer to the device structure for an I3C controller driver configured in target mode.
• cfg – Config struct with functions and parameters used by the I3C target driver to send bus events

Return values

• 0 – Is successful
• -EINVAL – If parameters are invalid
• -ENOSYS – If target mode is not implemented

struct i3c_config_target

#include <target_device.h> Configuration parameters for I3C hardware to act as target device.

This can also be used to configure the controller if it is to act as a secondary controller on the bus.

Public Members

bool enable

If the hardware is to act as a target device on the bus.

uint8_t static_addr

I3C target address.

Used used when operates as secondary controller or as a target device.

uint64_t pid

Provisioned ID.

bool pid_random

True if lower 32-bit of Provisioned ID is random.

This sets the bit 32 of Provisioned ID which means the lower 32-bit is random value.

uint8_t bcr

Bus Characteristics Register (BCR).

uint8_t dcr

Device Characteristics Register (DCR).
uint16_t max_read_len
    Maximum Read Length (MRL).

uint16_t max_write_len
    Maximum Write Length (MWL).

uint8_t supported_hdr
    Bit mask of supported HDR modes (0 - 7).
    This can be used to enable or disable HDR mode supported by the hardware at runtime.

struct i3c_target_config
    #include <target_device.h> Structure describing a device that supports the I3C target API.
    Instances of this are passed to the i3c_target_register() and i3c_target_unregister() functions to indicate addition and removal of a target device, respective.
    Fields other than node must be initialized by the module that implements the device behavior prior to passing the object reference to i3c_target_register().

Public Members

sys_snipe_t node
    Private, do not modify.

uint8_t flags
    Flags for the target device defined by I3C_TARGET_FLAGS_* constants.

uint8_t address
    Address for this target device.

const struct i3c_target_callbacks *callbacks
    Callback functions.

struct i3c_target_callbacks
    #include <target_device.h>

Public Members

int (*write_requested_cb)(struct i3c_target_config *config)
    Function called when a write to the device is initiated.
    This function is invoked by the controller when the bus completes a start condition for a write operation to the address associated with a particular device.
    A success return shall cause the controller to ACK the next byte received. An error return shall cause the controller to NACK the next byte received.

    Param config
        Configuration structure associated with the device to which the operation is addressed.
Return
0 if the write is accepted, or a negative error code.

```c
int (*write_received_cb)(struct i3c_target_config *config, uint8_t val)
```

Function called when a write to the device is continued.

This function is invoked by the controller when it completes reception of a byte of data in an ongoing write operation to the device.

A success return shall cause the controller to ACK the next byte received. An error return shall cause the controller to NACK the next byte received.

**Param config**
Configuration structure associated with the device to which the operation is addressed.

**Param val**
the byte received by the controller.

**Return**
0 if more data can be accepted, or a negative error code.

```c
int (*read_requested_cb)(struct i3c_target_config *config, uint8_t *val)
```

Function called when a read from the device is initiated.

This function is invoked by the controller when the bus completes a start condition for a read operation from the address associated with a particular device.

The value returned in val will be transmitted. A success return shall cause the controller to react to additional read operations. An error return shall cause the controller to ignore bus operations until a new start condition is received.

**Param config**
Configuration structure associated with the device to which the operation is addressed.

**Param val**
Pointer to storage for the first byte of data to return for the read request.

**Return**
0 if more data can be requested, or a negative error code.

```c
int (*read_processed_cb)(struct i3c_target_config *config, uint8_t *val)
```

Function called when a read from the device is continued.

This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device.

The value returned in val will be transmitted. A success return shall cause the controller to react to additional read operations. An error return shall cause the controller to ignore bus operations until a new start condition is received.

**Param config**
Configuration structure associated with the device to which the operation is addressed.

**Param val**
Pointer to storage for the next byte of data to return for the read request.

**Return**
0 if data has been provided, or a negative error code.

```c
int (*stop_cb)(struct i3c_target_config *config)
```

Function called when a stop condition is observed after a start condition addressed to a particular device.

This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device.
After the function returns the controller shall enter a state where it is ready to react to new start conditions.

**Param config**
Configuration structure associated with the device to which the operation is addressed.

**Return**
Ignored.

```c
struct i3c_target_driver_api
#include <target_device.h>
```

## 7.6.26 Inter-Integrated Circuit (I2C) Bus

### Overview

**Note:** The terminology used in Zephyr I2C APIs follows that of the *NXP I2C Bus Specification Rev 7.0*. These changed from previous revisions as of its release October 1, 2021.

I2C (Inter-Integrated Circuit, pronounced “eye squared see”) is a commonly-used two-signal shared peripheral interface bus. Many system-on-chip solutions provide controllers that communicate on an I2C bus. Devices on the bus can operate in two roles: as a “controller” that initiates transactions and controls the clock, or as a “target” that responds to transaction commands. A I2C controller on a given SoC will generally support the controller role, and some will also support the target mode. Zephyr has API for both roles.

**I2C Controller API**  Zephyr’s I2C controller API is used when an I2C peripheral controls the bus, in particularly the start and stop conditions and the clock. This is the most common mode, used to interact with I2C devices like sensors and serial memory.

This API is supported in all in-tree I2C peripheral drivers and is considered stable.

**I2C Target API**  Zephyr’s I2C target API is used when an I2C peripheral responds to transactions initiated by a different controller on the bus. It might be used for a Zephyr application with transducer roles that are controlled by another device such as a host processor.

This API is supported in very few in-tree I2C peripheral drivers. The API is considered experimental, as it is not compatible with the capabilities of all I2C peripherals supported in controller mode.

### Configuration Options

Related configuration options:

- `CONFIG_I2C`

### API Reference

*group* `i2c_interface`

I2C Interface.

Defines

I2C_SPEED_STANDARD
I2C Standard Speed: 100 kHz.

I2C_SPEED_FAST
I2C Fast Speed: 400 kHz.

I2C_SPEED_FAST_PLUS
I2C Fast Plus Speed: 1 MHz.

I2C_SPEED_HIGH
I2C High Speed: 3.4 MHz.

I2C_SPEED_ULTRA
I2C Ultra Fast Speed: 5 MHz.

I2C_SPEED_DT
Device Tree specified speed.

I2C_SPEED_SHIFT
I2C_SPEED_SET(speed)

I2C_SPEED_MASK
I2C_SPEED_GET(cfg)

I2C_ADDR_10_BITS
Use 10-bit addressing.
DEPRECATED - Use I2C_MSG_ADDR_10_BITS instead.

I2C_MODE_CONTROLLER
Peripheral to act as Controller.

I2C_DT_SPEC_GET_ON_I3C(node_id)
Structure initializer for i2c_dt_spec from devicetree (on I3C bus)
This helper macro expands to a static initializer for a struct i2c_dt_spec by reading the relevant bus and address data from the devicetree.

Parameters
  • node_id – Devicetree node identifier for the I2C device whose struct i2c_dt_spec to create an initializer for

I2C_DT_SPEC_GET_ON_I2C(node_id)
Structure initializer for i2c_dt_spec from devicetree (on I2C bus)
This helper macro expands to a static initializer for a struct i2c_dt_spec by reading the relevant bus and address data from the devicetree.

Parameters
  • node_id – Devicetree node identifier for the I2C device whose struct i2c_dt_spec to create an initializer for
I2C_DT_SPEC_GET(node_id)
Structure initializer for \texttt{i2c\_dt\_spec} from devicetree.
This helper macro expands to a static initializer for a struct \texttt{i2c\_dt\_spec} by reading the relevant bus and address data from the devicetree.

**Parameters**
- \texttt{node\_id} – Devicetree node identifier for the I2C device whose struct \texttt{i2c\_dt\_spec} to create an initializer for

I2C_DT_SPEC_INST_GET(inst)
Structure initializer for \texttt{i2c\_dt\_spec} from devicetree instance.
This is equivalent to \texttt{I2C\_DT\_SPEC\_GET(DT\_DRV\_INST(inst))}.

**Parameters**
- \texttt{inst} – Devicetree instance number

I2C_MSG_WRITE
Write message to I2C bus.

I2C_MSG_READ
Read message from I2C bus.

I2C_MSG_STOP
Send STOP after this message.

I2C_MSG_RESTART
RESTART I2C transaction for this message.

**Note:** Not all I2C drivers have or require explicit support for this feature. Some drivers require this be present on a read message that follows a write, or vice-versa. Some drivers will merge adjacent fragments into a single transaction using this flag; some will not.

I2C_MSG_ADDR_10_BITS
Use 10-bit addressing for this message.

**Note:** Not all SoC I2C implementations support this feature.

I2C_TARGET_FLAGS_ADDR_10_BITS
Target device responds to 10-bit addressing.

I2C_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, level, prio, api, ...)
Like \texttt{DEVICE\_DT\_DEFINE()} with I2C specifics.
Defines a device which implements the I2C API. May generate a custom \texttt{device\_state} container struct and \texttt{init\_fn} wrapper when needed depending on \texttt{I2C\_CONFIG\_I2C\_STATS}.

**Parameters**
- \texttt{node\_id} – The devicetree node identifier.
- \texttt{init\_fn} – Name of the init function of the driver. Can be \texttt{NULL}.
• pm – PM device resources reference (NULL if device does not use PM).
• data – Pointer to the device's private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• level – The initialization level. See SYS_INIT() for details.
• prio – Priority within the selected initialization level. See SYS_INIT() for details.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

I2C_DEVICE_DT_INST_DEFINE(inst, ...)
Like I2C_DEVICE_DT_DEFINE() for an instance of a DT_DRV_COMPAT compatible.

Parameters
• inst – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to I2C_DEVICE_DT_DEFINE().
• ... – other parameters as expected by I2C_DEVICE_DT_DEFINE().

I2C_DT_IODEV_DEFINE(name, node_id)
Define an iodev for a given dt node on the bus.
These do not need to be shared globally but doing so will save a small amount of memory.

Parameters
• name – Symbolic name of the iodev to define
• node_id – Devicetree node identifier

Typedefs
typedef void (*i2c_callback_t)(const struct device *dev, int result, void *data)
I2C callback for asynchronous transfer requests.

Param dev
I2C device which is notifying of transfer completion or error

Param result
Result code of the transfer request. 0 is success, -errno for failure.

Param data
Transfer requester supplied data which is passed along to the callback.

typedef int (*i2c_target_write_requested_cb_t)(struct i2c_target_config *config)
Function called when a write to the device is initiated.
This function is invoked by the controller when the bus completes a start condition for a write operation to the address associated with a particular device.
A success return shall cause the controller to ACK the next byte received. An error return shall cause the controller to NACK the next byte received.

Param config
the configuration structure associated with the device to which the operation is addressed.

Return
0 if the write is accepted, or a negative error code.
typedef int (*i2c_target_write_received_cb_t)(struct i2c_target_config *config, uint8_t val)

Function called when a write to the device is continued.
This function is invoked by the controller when it completes reception of a byte of data in an ongoing write operation to the device.

A success return shall cause the controller to ACK the next byte received. An error return shall cause the controller to NACK the next byte received.

**Param config**
the configuration structure associated with the device to which the operation is addressed.

**Param val**
the byte received by the controller.

**Return**
0 if more data can be accepted, or a negative error code.

typedef int (*i2c_target_read_requested_cb_t)(struct i2c_target_config *config, uint8_t *val)

Function called when a read from the device is initiated.
This function is invoked by the controller when the bus completes a start condition for a read operation from the address associated with a particular device.

The value returned in `*val` will be transmitted. A success return shall cause the controller to react to additional read operations. An error return shall cause the controller to ignore bus operations until a new start condition is received.

**Param config**
the configuration structure associated with the device to which the operation is addressed.

**Param val**
pointer to storage for the first byte of data to return for the read request.

**Return**
0 if more data can be requested, or a negative error code.

typedef int (*i2c_target_read_processed_cb_t)(struct i2c_target_config *config, uint8_t *val)

Function called when a read from the device is continued.
This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device.

The value returned in `*val` will be transmitted. A success return shall cause the controller to react to additional read operations. An error return shall cause the controller to ignore bus operations until a new start condition is received.

**Param config**
the configuration structure associated with the device to which the operation is addressed.

**Param val**
pointer to storage for the next byte of data to return for the read request.

**Return**
0 if data has been provided, or a negative error code.
typedef int (*i2c_target_stop_cb_t)(struct i2c_target_config *config)

Function called when a stop condition is observed after a start condition addressed to a particular device.

This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device. After the function returns the controller shall enter a state where it is ready to react to new start conditions.

**Param config**
the configuration structure associated with the device to which the operation is addressed.

**Return**
Ignored.

**Functions**

static inline bool i2c_is_ready_dt(const struct i2c_dt_spec *spec)
Validate that I2C bus is ready.

**Parameters**
- **spec** – I2C specification from devicetree

**Return values**
- **true** – if the I2C bus is ready for use.
- **false** – if the I2C bus is not ready for use.

static inline bool i2c_is_read_op(struct i2c_msg *msg)
Check if the current message is a read operation.

**Parameters**
- **msg** – The message to check

**Returns**
true if the I2C message is a read operation

**Returns**
false if the I2C message is a write operation

void i2c_dump_msgs_rw(const struct device *dev, const struct i2c_msg *msgs, uint8_t num_msgs, uint16_t addr, bool dump_read)
Dump out an I2C message.

Dumps out a list of I2C messages. For any that are writes (W), the data is displayed in hex. Setting dump_read will dump the data for read messages too, which only makes sense when called after the messages have been processed.

It looks something like this (with name “testing”):

| D: | I2C msg: testing, addr=56 |
| D: | W len=01: 06 |
| D: | W len=0e: |
| D: | contents: |
| D: | 00 01 02 03 04 05 06 07 | ........ |
| D: | 08 09 0a 0b 0c 0d | ...... |
| D: | W len=01: 0f |
| D: | R len=01: 6c |

**Parameters**
• dev – Target for the messages being sent. Its name will be printed in the log.
• msgs – Array of messages to dump.
• num_msgs – Number of messages to dump.
• addr – Address of the I2C target device.
• dump_read – Dump data from I2C reads, otherwise only writes have data dumped.

static inline void i2c_dump_msgs(const struct device *dev, const struct i2c_msg *msgs, uint8_t num_msgs, uint16_t addr)

Dump out an I2C message, before it is executed.
This is equivalent to:

i2c_dump_msgs_rw(dev, msgs, num_msgs, addr, false);

The read messages' data isn't dumped.

Parameters
• dev – Target for the messages being sent. Its name will be printed in the log.
• msgs – Array of messages to dump.
• num_msgs – Number of messages to dump.
• addr – Address of the I2C target device.

static inline void i2c_xfer_stats(const struct device *dev, struct i2c_msg *msgs, uint8_t num_msgs)

Updates the i2c stats for i2c transfers.

Parameters
• dev – I2C device to update stats for
• msgs – Array of struct i2c_msg
• num_msgs – Number of i2c_msgs

int i2c_configure(const struct device *dev, uint32_t dev_config)

Configure operation of a host controller.

Parameters
• dev – Pointer to the device structure for the driver instance.
• dev_config – Bit-packed 32-bit value to the device runtime configuration for the I2C controller.

Return values
• 0 – If successful.
• -EIO – General input / output error, failed to configure device.

int i2c_get_config(const struct device *dev, uint32_t *dev_config)

Get configuration of a host controller.

This routine provides a way to get current configuration. It is allowed to call the function before i2c_configure, because some I2C ports can be configured during init process. However, if the I2C port is not configured, i2c_get_config returns an error.
i2c_get_config can return cached config or probe hardware, but it has to be up to date with current configuration.
Parameters

- dev – Pointer to the device structure for the driver instance.
- dev_config – Pointer to return bit-packed 32-bit value of the I2C controller configuration.

Return values

- 0 – If successful.
- -EIO – General input / output error.
- -ERANGE – Configured I2C frequency is invalid.
- -ENOSYS – If get config is not implemented

```c
int i2c_transfer(const struct device *dev, struct i2c_msg *msgs, uint8_t num_msgs, uint16_t addr);
```

Perform data transfer to another I2C device in controller mode.

This routine provides a generic interface to perform data transfer to another I2C device synchronously. Use `i2c_read()`/`i2c_write()` for simple read or write.

The array of message `msgs` must not be NULL. The number of message `num_msgs` may be zero, in which case no transfer occurs.

**Note:** Not all scatter/gather transactions can be supported by all drivers. As an example, a gather write (multiple consecutive `i2c_msg` buffers all configured for `I2C_MSG_WRITE`) may be packed into a single transaction by some drivers, but others may emit each fragment as a distinct write transaction, which will not produce the same behavior. See the documentation of `struct i2c_msg` for limitations on support for multi-message bus transactions.

Parameters

- dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
- msgs – Array of messages to transfer.
- num_msgs – Number of messages to transfer.
- addr – Address of the I2C target device.

Return values

- 0 – If successful.
- -EIO – General input / output error.

```c
static inline int i2c_transfer_cb(const struct device *dev, struct i2c_msg *msgs, uint8_t num_msgs, uint16_t addr, i2c_callback_t cb, void *userdata);
```

Perform data transfer to another I2C device in controller mode.

This routine provides a generic interface to perform data transfer to another I2C device asynchronously with a callback completion.

**See also:**

`i2c_transfer()`
Function properties (list may not be complete)

*isr-ok*

**Parameters**

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `msgs` – Array of messages to transfer, must live until callback completes.
- `num_msgs` – Number of messages to transfer.
- `addr` – Address of the I2C target device.
- `cb` – Function pointer for completion callback.
- `userdata` – Userdata passed to callback.

**Return values**

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If transfer async is not implemented
- `-EWOULDBLOCK` – If the device is temporarily busy doing another transfer

```c
static inline int i2c_transfer_cb_dt(const struct i2c_dt_spec *spec, struct i2c_msg *msgs, uint8_t num_msgs, i2c_callback_t cb, void *userdata)
```
Perform data transfer to another I2C device in master mode asynchronously.
This is equivalent to:

```
i2c_transfer_cb(spec->bus, msgs, num_msgs, spec->addr, cb, userdata);
```

**Parameters**

- `spec` – I2C specification from devicetree.
- `msgs` – Array of messages to transfer.
- `num_msgs` – Number of messages to transfer.
- `cb` – Function pointer for completion callback.
- `userdata` – Userdata passed to callback.

**Returns**

a value from `i2c_transfer_cb()`

```c
static inline int i2c_write_read_cb(const struct device *dev, struct i2c_msg *msgs, uint8_t num_msgs, uint16_t addr, const void *write_buf, size_t num_write, void *read_buf, size_t num_read, i2c_callback_t cb, void *userdata)
```
Write then read data from an I2C device asynchronously.

This supports the common operation “this is what I want”, “now give it to me” transaction pair through a combined write-then-read bus transaction but using `i2c_transfer_cb`. This helper function expects caller to pass a message pointer with 2 and only 2 size.

**Parameters**
• **dev** – Pointer to the device structure for an I2C controller driver configured in master mode.

• **msgs** – Array of messages to transfer.

• **num_msgs** – Number of messages to transfer.

• **addr** – Address of the I2C device

• **write_buf** – Pointer to the data to be written

• **num_write** – Number of bytes to write

• **read_buf** – Pointer to storage for read data

• **num_read** – Number of bytes to read

• **cb** – Function pointer for completion callback.

• **userdata** – Userdata passed to callback.

**Return values**

• **0** – if successful

• **negative** – on error.

```c
static inline int i2c_write_read_cb_dt(const struct i2c_dt_spec *spec, struct i2c_msg *msgs, uint8_t num_msgs, const void *write_buf, size_t num_write, void *read_buf, size_t num_read, i2c_callback_t cb, void *userdata)
```

Write then read data from an I2C device asynchronously.

This is equivalent to:

```c
i2c_write_read_cb(spec->bus, msgs, num_msgs, spec->addr, write_buf, num_write, read_buf, num_read, i2c_callback_t cb, void *userdata);
```

**Parameters**

• **spec** – I2C specification from devicetree.

• **msgs** – Array of messages to transfer.

• **num_msgs** – Number of messages to transfer.

• **write_buf** – Pointer to the data to be written

• **num_write** – Number of bytes to write

• **read_buf** – Pointer to storage for read data

• **num_read** – Number of bytes to read

• **cb** – Function pointer for completion callback.

• **userdata** – Userdata passed to callback.

**Returns**

a value from **i2c_write_read_cb()**

```c
static inline int i2c_transfer_signal(const struct device *dev, struct i2c_msg *msgs, uint8_t num_msgs, uint16_t addr, struct k_poll_signal *sig)
```

Perform data transfer to another I2C device in controller mode.

This routine provides a generic interface to perform data transfer to another I2C device asynchronously with a **k_poll_signal** completion.
See also:
i2c_transfer_cb()

Function properties (list may not be complete)
isr-ok

Parameters
- **dev** – Pointer to the device structure for an I2C controller driver configured in controller mode.
- **msgs** – Array of messages to transfer, must live until callback completes.
- **num_msgs** – Number of messages to transfer.
- **addr** – Address of the I2C target device.
- **sig** – Signal to notify of transfer completion.

Return values
- **0** – If successful.
- **-EIO** – General input / output error.
- **-ENOSYS** – If transfer async is not implemented
- **-EWOULD BLOCK** – If the device is temporarily busy doing another transfer

static inline void i2c_iodev_submit(struct rtio_iodev_sqe *iodev_sqe)
Submit request(s) to an I2C device with RTIO.

Parameters
- **iodev_sqe** – Prepared submissions queue entry connected to an iodev defined by I2C_DT_IODEV_DEFINE.

struct rtio_sqe *i2c_rtio_copy(struct rtio *r, struct rtio_iodev *iodev, const struct i2c_msg *msgs, uint8_t num_msgs)
Copy the i2c_msgs into a set of RTIO requests.

Parameters
- **r** – RTIO context
- **iodev** – RTIO IODev to target for the submissions
- **msgs** – Array of messages
- **num_msgs** – Number of i2c msgs in array

Return values
- **sqe** – Last submission in the queue added
- **NULL** – Not enough memory in the context to copy the requests

static inline int i2c_transfer_dt(const struct i2c_dt_spec *spec, struct i2c_msg *msgs, uint8_t num_msgs)
Perform data transfer to another I2C device in controller mode.
This is equivalent to:

```c
i2c_transfer(spec->bus, msgs, num_msgs, spec->addr);
```

Parameters
• `spec` – I2C specification from devicetree.
• `msgs` – Array of messages to transfer.
• `num_msgs` – Number of messages to transfer.

**Returns**
a value from `i2c_transfer()`

```c
int i2c_recover_bus(const struct device *dev)
```
Recover the I2C bus.

**Parameters**
• `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.

**Return values**
• 0 – If successful
• -EBUSY – If bus is not clear after recovery attempt.
• -EIO – General input / output error.
• -ENOSYS – If bus recovery is not implemented

```c
static inline int i2c_target_register(const struct device *dev, struct i2c_target_config *cfg)
```
Registers the provided config as Target device of a controller.

Enable I2C target mode for the ‘dev’ I2C bus driver using the provided ‘config’ struct containing the functions and parameters to send bus events. The I2C target will be registered at the address provided as ‘address’ struct member. Addressing mode - 7 or 10 bit - depends on the ‘flags’ struct member. Any I2C bus events related to the target mode will be passed onto I2C target device driver via a set of callback functions provided in the ‘callbacks’ struct member.

Most of the existing hardware allows simultaneous support for controller and target mode. This is however not guaranteed.

**Parameters**
• `dev` – Pointer to the device structure for an I2C controller driver configured in target mode.
• `cfg` – Config struct with functions and parameters used by the I2C driver to send bus events

**Return values**
• 0 – Is successful
• -EINVAL – If parameters are invalid
• -EIO – General input / output error.
• -ENOSYS – If target mode is not implemented

```c
static inline int i2c_target_unregister(const struct device *dev, struct i2c_target_config *cfg)
```
Unregisters the provided config as Target device.

This routine disables I2C target mode for the ‘dev’ I2C bus driver using the provided ‘config’ struct containing the functions and parameters to send bus events.

**Parameters**
dev – Pointer to the device structure for an I2C controller driver configured in target mode.

cfg – Config struct with functions and parameters used by the I2C driver to send bus events

Return values

• 0 – Is successful
• -EINVAL – If parameters are invalid
• -ENOSYS – If target mode is not implemented

int i2c_target_driver_register(const struct device *dev)

Instructs the I2C Target device to register itself to the I2C Controller.

This routine instructs the I2C Target device to register itself to the I2C Controller via its parent controller's i2c_target_register() API.

Parameters

• dev – Pointer to the device structure for the I2C target device (not itself an I2C controller).

Return values

• 0 – Is successful
• -EINVAL – If parameters are invalid
• -EIO – General input / output error.

int i2c_target_driver_unregister(const struct device *dev)

Instructs the I2C Target device to unregister itself from the I2C Controller.

This routine instructs the I2C Target device to unregister itself from the I2C Controller via its parent controller's i2c_target_register() API.

Parameters

• dev – Pointer to the device structure for the I2C target device (not itself an I2C controller).

Return values

• 0 – Is successful
• -EINVAL – If parameters are invalid

static inline int i2c_write(const struct device *dev, const uint8_t *buf, uint32_t num_bytes, uint16_t addr)

Write a set amount of data to an I2C device.

This routine writes a set amount of data synchronously.

Parameters

• dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
• buf – Memory pool from which the data is transferred.
• num_bytes – Number of bytes to write.
• addr – Address to the target I2C device for writing.

Return values

• 0 – If successful.
• -EIO – General input / output error.
static inline int i2c_write_dt(const struct i2c_dt_spec *spec, const uint8_t *buf, uint32_t num_bytes)

Write a set amount of data to an I2C device.
This is equivalent to:

    i2c_write(spec->bus, buf, num_bytes, spec->addr);

**Parameters**
- *spec* – I2C specification from devicetree.
- *buf* – Memory pool from which the data is transferred.
- *num_bytes* – Number of bytes to write.

**Returns**
a value from `i2c_write()`

static inline int i2c_read(const struct device *dev, uint8_t *buf, uint32_t num_bytes, uint16_t addr)

Read a set amount of data from an I2C device.
This routine reads a set amount of data synchronously.

**Parameters**
- *dev* – Pointer to the device structure for an I2C controller driver configured in controller mode.
- *buf* – Memory pool that stores the retrieved data.
- *num_bytes* – Number of bytes to read.
- *addr* – Address of the I2C device being read.

**Return values**
- **0** – If successful.
- **-EIO** – General input / output error.

static inline int i2c_read_dt(const struct i2c_dt_spec *spec, uint8_t *buf, uint32_t num_bytes)

Read a set amount of data from an I2C device.
This is equivalent to:

    i2c_read(spec->bus, buf, num_bytes, spec->addr);

**Parameters**
- *spec* – I2C specification from devicetree.
- *buf* – Memory pool that stores the retrieved data.
- *num_bytes* – Number of bytes to read.

**Returns**
a value from `i2c_read()`

static inline int i2c_write_read(const struct device *dev, uint16_t addr, const void *write_buf, size_t num_write, void *read_buf, size_t num_read)
Write then read data from an I2C device.

This supports the common operation “this is what I want”, “now give it to me” transaction pair through a combined write-then-read bus transaction.

**Parameters**

- **dev** – Pointer to the device structure for an I2C controller driver configured in controller mode.
- **addr** – Address of the I2C device
- **write_buf** – Pointer to the data to be written
- **num_write** – Number of bytes to write
- **read_buf** – Pointer to storage for read data
- **num_read** – Number of bytes to read

**Return values**

- **0** – if successful
- **negative** – on error.

```c
static inline int i2c_write_read_dt(const struct i2c_dt_spec *spec, const void *write_buf, size_t num_write, void *read_buf, size_t num_read)
```

Write then read data from an I2C device.

This is equivalent to:

```c
i2c_write_read(spec->bus, spec->addr, write_buf, num_write, read_buf, num_read);
```

**Parameters**

- **spec** – I2C specification from devicetree.
- **write_buf** – Pointer to the data to be written
- **num_write** – Number of bytes to write
- **read_buf** – Pointer to storage for read data
- **num_read** – Number of bytes to read

**Returns**

A value from `i2c_write_read()`

```c
static inline int i2c_burst_read(const struct device *dev, uint16_t dev_addr, uint8_t start_addr, uint8_t *buf, uint32_t num_bytes)
```

Read multiple bytes from an internal address of an I2C device.

This routine reads multiple bytes from an internal address of an I2C device synchronously.

Instances of this may be replaced by `i2c_write_read()`.

**Parameters**

- **dev** – Pointer to the device structure for an I2C controller driver configured in controller mode.
• **dev_addr** – Address of the I2C device for reading.
• **start_addr** – Internal address from which the data is being read.
• **buf** – Memory pool that stores the retrieved data.
• **num_bytes** – Number of bytes being read.

**Return values**
• 0 – If successful.
• -EIO – General input / output error.

```c
static inline int i2c_burst_read_dt(const struct i2c_dt_spec *spec, uint8_t start_addr, uint8_t *buf, uint32_t num_bytes)
```

Read multiple bytes from an internal address of an I2C device.

This is equivalent to:

```c
i2c_burst_read(spec->bus, spec->addr, start_addr, buf, num_bytes);
```

**Parameters**
• **spec** – I2C specification from devicetree.
• **start_addr** – Internal address from which the data is being read.
• **buf** – Memory pool that stores the retrieved data.
• **num_bytes** – Number of bytes to read.

**Returns**

a value from `i2c_burst_read()`

```c
static inline int i2c_burst_write(const struct device *dev, uint16_t dev_addr, uint8_t start_addr, const uint8_t *buf, uint32_t num_bytes)
```

Write multiple bytes to an internal address of an I2C device.

This routine writes multiple bytes to an internal address of an I2C device synchronously.

**Warning:** The combined write synthesized by this API may not be supported on all I2C devices. Uses of this API may be made more portable by replacing them with calls to `i2c_write()` passing a buffer containing the combined address and data.

**Parameters**
• **dev** – Pointer to the device structure for an I2C controller driver configured in controller mode.
• **dev_addr** – Address of the I2C device for writing.
• **start_addr** – Internal address to which the data is being written.
• **buf** – Memory pool from which the data is transferred.
• **num_bytes** – Number of bytes being written.

**Return values**
• 0 – If successful.
• -EIO – General input / output error.
static inline int i2c_burst_write_dt(const struct i2c_dt_spec *spec, uint8_t start_addr, const uint8_t *buf, uint32_t num_bytes)

Write multiple bytes to an internal address of an I2C device. This is equivalent to:

```
    i2c_burst_write(spec->bus, spec->addr, start_addr, buf, num_bytes);
```

**Parameters**

- `spec` – I2C specification from devicetree.
- `start_addr` – Internal address to which the data is being written.
- `buf` – Memory pool from which the data is transferred.
- `num_bytes` – Number of bytes being written.

**Returns**
a value from `i2c_burst_write()`

static inline int i2c_reg_read_byte(const struct device *dev, uint16_t dev_addr, uint8_t reg_addr, uint8_t *value)

Read internal register of an I2C device. This routine reads the value of an 8-bit internal register of an I2C device synchronously.

**Parameters**

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `dev_addr` – Address of the I2C device for reading.
- `reg_addr` – Address of the internal register being read.
- `value` – Memory pool that stores the retrieved register value.

**Return values**

- `0` – If successful.
- `-EIO` – General input / output error.

static inline int i2c_reg_read_byte_dt(const struct i2c_dt_spec *spec, uint8_t reg_addr, uint8_t *value)

Read internal register of an I2C device. This is equivalent to:

```
    i2c_reg_read_byte(spec->bus, spec->addr, reg_addr, value);
```

**Parameters**

- `spec` – I2C specification from devicetree.
- `reg_addr` – Address of the internal register being read.
- `value` – Memory pool that stores the retrieved register value.

**Returns**
a value from `i2c_reg_read_byte()`
static inline int i2c_reg_write_byte(const struct device *dev, uint16_t dev_addr, uint8_t reg_addr, uint8_t value)

Write internal register of an I2C device.

This routine writes a value to an 8-bit internal register of an I2C device synchronously.

Note: This function internally combines the register and value into a single bus transaction.

Parameters
- dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
- dev_addr – Address of the I2C device for writing.
- reg_addr – Address of the internal register being written.
- value – Value to be written to internal register.

Return values
- 0 – If successful.
- -EIO – General input / output error.

static inline int i2c_reg_write_byte_dt(const struct i2c_dt_spec *spec, uint8_t reg_addr, uint8_t value)

Write internal register of an I2C device.

This is equivalent to:

i2c_reg_write_byte(spec->bus, spec->addr, reg_addr, value);

Parameters
- spec – I2C specification from devicetree.
- reg_addr – Address of the internal register being written.
- value – Value to be written to internal register.

Returns
a value from i2c_reg_write_byte()

static inline int i2c_reg_update_byte(const struct device *dev, uint16_t dev_addr, uint8_t reg_addr, uint8_t mask, uint8_t value)

Update internal register of an I2C device.

This routine updates the value of a set of bits from an 8-bit internal register of an I2C device synchronously.

Note: If the calculated new register value matches the value that was read this function will not generate a write operation.

Parameters
- dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
- dev_addr – Address of the I2C device for updating.
• **reg_addr** – Address of the internal register being updated.
• **mask** – Bitmask for updating internal register.
• **value** – Value for updating internal register.

**Return values**
• **0** – If successful.
• **-EIO** – General input / output error.

```c
static inline int i2c_reg_update_byte_dt(const struct i2c_dt_spec *spec, uint8_t reg_addr, uint8_t mask, uint8_t value)
```

Update internal register of an I2C device.
This is equivalent to:

```
i2c_reg_update_byte(spec->bus, spec->addr, reg_addr, mask, value);
```

**Parameters**
• **spec** – I2C specification from devicetree.
• **reg_addr** – Address of the internal register being updated.
• **mask** – Bitmask for updating internal register.
• **value** – Value for updating internal register.

**Returns**
a value from `i2c_reg_update_byte()

**Variables**

```c
const struct rtio_iodev_api i2c_iodev_api
```

```c
struct i2c_dt_spec
#include <i2c.h> Complete I2C DT information.
```

**Param bus**
is the I2C bus

**Param addr**
is the target address

```c
struct i2c_msg
#include <i2c.h> One I2C Message.
```

This defines one I2C message to transact on the I2C bus.

**Note:** Some of the configurations supported by this API may not be supported by specific SoC I2C hardware implementations, in particular features related to bus transactions intended to read or write data from different buffers within a single transaction. Invocations of `i2c_transfer()` may not indicate an error when an unsupported configuration is encountered. In some cases drivers will generate separate transactions for each message fragment, with or without presence of `I2C_MSG_RESTART` in `flags`.  

7.6. Peripherals
Public Members

`uint8_t *buf`
Data buffer in bytes.

`uint32_t len`
Length of buffer in bytes.

`uint8_t flags`
Flags for this message.

```
struct i2c_target_callbacks
#include <i2c.h>
Structure providing callbacks to be implemented for devices that supports the I2C target API.
This structure may be shared by multiple devices that implement the same API at different addresses on the bus.
```

```
struct i2c_target_config
#include <i2c.h>
Structure describing a device that supports the I2C target API.
Instances of this are passed to the `i2c_target_register()` and `i2c_target_unregister()` functions to indicate addition and removal of a target device, respective.
Fields other than `node` must be initialized by the module that implements the device behavior prior to passing the object reference to `i2c_target_register()`.
```

Public Members

```
sys_snode_t node
Private, do not modify.
```

```
uint8_t flags
Flags for the target device defined by I2C_TARGET_FLAGS_* constants.
```

```
uint16_t address
Address for this target device.
```

```
const struct i2c_target_callbacks *callbacks
Callback functions.
```

```
struct i2c_device_state
#include <i2c.h>
I2C specific device state which allows for i2c device class specific additions.
```

7.6.27 Inter-Processor Mailbox (IPM)

Overview
API Reference

Related code samples

**IPM on ESP32**
Implement inter-processor mailbox (IPM) between ESP32 APP and PRO CPUs.

**IPM on NXP LPC**
Implement inter-processor mailbox (IPM) on NXP LPC family.

**IPM on NXP i.MX**
Implement inter-processor mailbox (IPM) on i.MX SoCs containing a Messaging Unit peripheral.

**IPM over IVSHMEM**
Implement inter-processor mailbox (IPM) over IVSHMEM (Inter-VM shared memory)

**IPM with ARM MHU**
Implement inter-processor mailbox (IPM) using an MHU (Message Handling Unit)

**OpenAMP**
Send messages between two cores using OpenAMP.

**OpenAMP using resource table**
Send messages between two cores using OpenAMP and a resource table.

```c
typedef void (*ipm_callback_t)(const struct device *ipmdev, void *user_data, uint32_t id, volatile void *data)
```
Callback API for incoming IPM messages. These callbacks execute in interrupt context. Therefore, use only interrupt-safe APIs. Registration of callbacks is done via `ipm_register_callback`

**Param ipmdev**
Driver instance

**Param user_data**
Pointer to some private data provided at registration time.

**Param id**
Message type identifier.

**Param data**
Message data pointer. The correct amount of data to read out must be inferred using the message id/upper level protocol.

```c
typedef int (*ipm_send_t)(const struct device *ipmdev, int wait, uint32_t id, const void *data, int size)
```
Callback API to send IPM messages.
See `ipm_send()` for argument definitions.
typedef int (*ipm_max_data_size_get_t)(const struct device *ipmdev)
    Callback API to get maximum data size.
    See ipm_max_data_size_get() for argument definitions.

typedef uint32_t (*ipm_max_id_val_get_t)(const struct device *ipmdev)
    Callback API to get the ID’s maximum value.
    See ipm_max_id_val_get() for argument definitions.

typedef void (*ipm_register_callback_t)(const struct device *port,
                        ipm_callback_t cb, void *user_data)
    Callback API upon registration.
    See ipm_register_callback() for argument definitions.

typedef int (*ipm_set_enabled_t)(const struct device *ipmdev, int enable)
    Callback API upon enablement of interrupts.
    See ipm_set_enabled() for argument definitions.

typedef void (*ipm_complete_t)(const struct device *ipmdev)
    Callback API upon command completion.
    See ipm_complete() for argument definitions.

Functions

int ipm_send(const struct device *ipmdev, int wait, uint32_t id, const void *data, int size)
    Try to send a message over the IPM device.
    A message is considered consumed once the remote interrupt handler finishes. If there is deferred processing on the remote side, or if outgoing messages must be queued and wait on an event/semaphore, a high-level driver can implement that.
    There are constraints on how much data can be sent or the maximum value of id. Use the ipm_max_data_size_get and ipm_max_id_val_get routines to determine them.
    The size parameter is used only on the sending side to determine the amount of data to put in the message registers. It is not passed along to the receiving side. The upper-level protocol dictates the amount of data read back.

Parameters

- ipmdev – Driver instance
- wait – If nonzero, busy-wait for remote to consume the message. The message is considered consumed once the remote interrupt handler finishes. If there is deferred processing on the remote side, or you would like to queue outgoing messages and wait on an event/semaphore, you can implement that in a high-level driver
- id – Message identifier. Values are constrained by ipm_max_data_size_get since many boards only allow for a subset of bits in a 32-bit register to store the ID.
- data – Pointer to the data sent in the message.
- size – Size of the data.

Return values
• -EBUSY – If the remote hasn’t yet read the last data sent.
• -EMSGSIZE – If the supplied data size is unsupported by the driver.
• -EINVAL – If there was a bad parameter, such as: too-large id value. or the device isn’t an outbound IPM channel.
• 0 – On success.

static inline void ipm_register_callback(const struct device *ipmdev, ipm_callback_t cb, void *user_data)

Register a callback function for incoming messages.

Parameters
• ipmdev – Driver instance pointer.
• cb – Callback function to execute on incoming message interrupts.
• user_data – Application-specific data pointer which will be passed to the callback function when executed.

int ipm_max_data_size_get(const struct device *ipmdev)

Return the maximum number of bytes possible in an outbound message.
IPM implementations vary on the amount of data that can be sent in a single message since the data payload is typically stored in registers.

Parameters
• ipmdev – Driver instance pointer.

Returns
Maximum possible size of a message in bytes.

uint32_t ipm_max_id_val_get(const struct device *ipmdev)

Return the maximum id value possible in an outbound message.
Many IPM implementations store the message's ID in a register with some bits reserved for other uses.

Parameters
• ipmdev – Driver instance pointer.

Returns
Maximum possible value of a message ID.

int ipm_set_enabled(const struct device *ipmdev, int enable)
Enable interrupts and callbacks for inbound channels.

Parameters
• ipmdev – Driver instance pointer.
• enable – Set to 0 to disable and to nonzero to enable.

Return values
• 0 – On success.
• -EINVAL – If it isn’t an inbound channel.

void ipm_complete(const struct device *ipmdev)

Signal asynchronous command completion.

Some IPM backends have an ability to deliver a command asynchronously. The callback will be invoked in interrupt context, but the message (including the provided data pointer) will stay “active” and unacknowledged until later code (presumably in thread mode) calls ipm_complete().
This function is, obviously, a noop on drivers without async support.

**Parameters**

- `ipmdev` – Driver instance pointer.

```c
struct ipm_driver_api
#include <ipm.h>
```

## 7.6.28 Keyboard Scan

### Overview

The `kscan` driver (keyboard scan matrix) is used for detecting a key press in a connected matrix keyboard or any device with buttons such as joysticks. Typically, matrix keyboards are implemented using a two-dimensional configuration in order to sense several keys. This allows interfacing to many keys through fewer physical pins. Keyboard matrix drivers read the rows while applying power through the columns one at a time with the purpose of detecting key events. There is no correlation between the physical and electrical layout of keys. For example, the physical layout may be one array of 16 or fewer keys, which may be electrically connected to a 4 x 4 array. In addition, key values are defined by a keymap provided by the keyboard manufacturer.

### Configuration Options

Related configuration options:

- `CONFIG_KSCAN`

### API Reference

**Related code samples**

**HT16K33 LED driver with keyscan**

Control up to 128 LEDs connected to an HT16K33 LED driver and log keyscan events.

**KSCAN**

Use the KSCAN API to read key presses and releases on a keyboard matrix.

### Typedefs

```c
typedef void (*kscan_callback_t)(const struct device *dev, uint32_t row, uint32_t column, bool pressed)
```

Keyboard scan callback called when user press/release a key on a matrix keyboard.

**Param dev**

Pointer to the device structure for the driver instance.

**Param row**

Describes row change.
**Param column**
Describes column change.

**Param pressed**
Describes the kind of key event.

**Functions**

```c
int kscan_config(const struct device *dev, kscan_callback_t callback)
Configure a Keyboard scan instance.
```

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `callback` – called when keyboard devices reply to to a keyboard event such as key pressed/released.

**Return values**
- `0` – If successful.
- `Negative` – errno code if failure.

```c
int kscan_enable_callback(const struct device *dev)
Enables callback.
```

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.

**Return values**
- `0` – If successful.
- `Negative` – errno code if failure.

```c
int kscan_disable_callback(const struct device *dev)
Disables callback.
```

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.

**Return values**
- `0` – If successful.
- `Negative` – errno code if failure.

### 7.6.29 Light-Emitting Diode (LED)

**Overview**

The LED API provides access to Light Emitting Diodes, both in individual and strip form.

**Configuration Options**

Related configuration options:

---

group led_interface
LED Interface.

**Typedefs**

typedef int (*led_api_blink)(const struct device *dev, uint32_t led, uint32_t delay_on, uint32_t delay_off)

Callback API for blinking an LED.

**See also:**

*led_blink()* for argument descriptions.

typedef int (*led_api_get_info)(const struct device *dev, uint32_t led, const struct led_info **info)

Optional API callback to get LED information.

**See also:**

*led_get_info()* for argument descriptions.
typedef int (*led_api_set_brightness)(const struct device *dev, uint32_t led, uint8_t value)

Callback API for setting brightness of an LED.

**See also:**

*led_set_brightness()* for argument descriptions.

typedef int (*led_api_set_color)(const struct device *dev, uint32_t led, uint8_t num_colors, const uint8_t *color)

Optional API callback to set the colors of a LED.

**See also:**

*led_set_color()* for argument descriptions.

typedef int (*led_api_on)(const struct device *dev, uint32_t led)

Callback API for turning on an LED.

**See also:**

*led_on()* for argument descriptions.

typedef int (*led_api_off)(const struct device *dev, uint32_t led)

Callback API for turning off an LED.

**See also:**

*led_off()* for argument descriptions.

typedef int (*led_api_write_channels)(const struct device *dev, uint32_t start_channel, uint32_t num_channels, const uint8_t *buf)

Callback API for writing a strip of LED channels.

**See also:**

*led_api_write_channels()* for arguments descriptions.

**Functions**

```c
int led_blink(const struct device *dev, uint32_t led, uint32_t delay_on, uint32_t delay_off)
```

Blink an LED.

This optional routine starts blinking a LED forever with the given time period.

**Parameters**

- **dev** – LED device
- **led** – LED number
- **delay_on** – Time period (in milliseconds) an LED should be ON
- **delay_off** – Time period (in milliseconds) an LED should be OFF
Returns
0 on success, negative on error

int led_get_info(const struct device *dev, uint32_t led, const struct led_info **info)
Get LED information.
This optional routine provides information about a LED.

Parameters
• dev – LED device
• led – LED number
• info – Pointer to a pointer filled with LED information

Returns
0 on success, negative on error

int led_set_brightness(const struct device *dev, uint32_t led, uint8_t value)
Set LED brightness.
This optional routine sets the brightness of a LED to the given value. Calling this function after led_blink() won’t affect blinking.
LEDs which can only be turned on or off may provide this function. These should simply turn the LED on if value is nonzero, and off if value is zero.

Parameters
• dev – LED device
• led – LED number
• value – Brightness value to set in percent

Returns
0 on success, negative on error

int led_write_channels(const struct device *dev, uint32_t start_channel, uint32_t num_channels, const uint8_t *buf)
Write/update a strip of LED channels.
This optional routine writes a strip of LED channels to the given array of levels. Therefore it can be used to configure several LEDs at the same time.
Calling this function after led_blink() won’t affect blinking.

Parameters
• dev – LED device
• start_channel – Absolute number (i.e. not relative to a LED) of the first channel to update.
• num_channels – The number of channels to write/update.
• buf – array of values to configure the channels with. num_channels entries must be provided.

Returns
0 on success, negative on error

int led_set_channel(const struct device *dev, uint32_t channel, uint8_t value)
Set a single LED channel.
This optional routine sets a single LED channel to the given value.
Calling this function after led_blink() won’t affect blinking.

Parameters
- dev – LED device
- channel – Absolute channel number (i.e. not relative to a LED)
- value – Value to configure the channel with

**Returns**
0 on success, negative on error

```c
int led_set_color(const struct device *dev, uint32_t led, uint8_t num_colors, const uint8_t *color)
```

Set LED color.
This routine configures all the color channels of a LED with the given color array.
Calling this function after `led_blink()` won’t affect blinking.

**Parameters**
- dev – LED device
- led – LED number
- num_colors – Number of colors in the array.
- color – Array of colors. It must be ordered following the color mapping of the LED controller. See the the color_mapping member in struct `led_info`.

**Returns**
0 on success, negative on error

```c
int led_on(const struct device *dev, uint32_t led)
```

Turn on an LED.
This routine turns on an LED

**Parameters**
- dev – LED device
- led – LED number

**Returns**
0 on success, negative on error

```c
int led_off(const struct device *dev, uint32_t led)
```

Turn off an LED.
This routine turns off an LED

**Parameters**
- dev – LED device
- led – LED number

**Returns**
0 on success, negative on error

```c
struct led_info
```

#include `<led.h>` LED information structure.
This structure gathers useful information about LED controller.

**Public Members**
const char *label
        LED label.

uint32_t index
        Number of colors per LED.

uint8_t num_colors
        Index of the LED on the controller.

color_mapping
        Mapping of the LED colors.

struct led_driver_api
        #include <led.h> LED driver API.

LED Strip
Related code samples

APA102 LED strip
        Control an LED strip using an APA102, Adafruit DotStar, or compatible driver chip.

LPD880x LED strip
        Control an LED strip using an LPD880x-compatible driver chip.

WS2812 LED strip
        Control an LED strip using a WS2812 (or compatible) driver chip.

group led_strip_interface
        LED Strip Interface.

Typedefs

typedef int (*led_api_update_rgb)(const struct device *dev, struct led_rgb *pixels, size_t num_pixels)
        Callback API for updating an RGB LED strip.

        See also:
        led_strip_update_rgb() for argument descriptions.

typedef int (*led_api_update_channels)(const struct device *dev, uint8_t *channels, size_t num_channels)
        Callback API for updating channels without an RGB interpretation.

        See also:
        led_strip_update_channels() for argument descriptions.
Functions

static inline int led_strip_update_rgb(const struct device *dev, struct led_rgb *pixels, size_t num_pixels)

Update an LED strip made of RGB pixels.
Important: This routine may overwrite pixels.
This routine immediately updates the strip display according to the given pixels array.

Warning: May overwrite pixels

Parameters

• dev – LED strip device
• pixels – Array of pixel data
• num_pixels – Length of pixels array

Returns
0 on success, negative on error

static inline int led_strip_update_channels(const struct device *dev, uint8_t *channels, size_t num_channels)

Update an LED strip on a per-channel basis.
Important: This routine may overwrite channels.
This routine immediately updates the strip display according to the given channels array. Each channel byte corresponds to an individually addressable color channel or LED. Channels are updated linearly in strip order.

Warning: May overwrite channels

Parameters

• dev – LED strip device
• channels – Array of per-channel data
• num_channels – Length of channels array

Returns
0 on success, negative on error

struct led_rgb

#include <led_strip.h> Color value for a single RGB LED.

Individual strip drivers may ignore lower-order bits if their resolution in any channel is less than a full byte.

Public Members

uint8_t r

Red channel.

7.6. Peripherals
uint8_t g
    Green channel.

uint8_t b
    Blue channel.

struct led_strip_driver_api
#include <led_strip.h> LED strip driver API.
    This is the mandatory API any LED strip driver needs to expose.

7.6.30 Management Data Input/Output (MDIO)

Overview

MDIO is a bus that is commonly used to communicate with ethernet PHY devices. Many ethernet MAC controllers also provide hardware to communicate over MDIO bus with a peripheral device. This API is intended to be used primarily by PHY drivers but can also be used by user firmware.

API Reference

group mdio_interface
    MDIO Interface.

Functions

void mdio_bus_enable(const struct device *dev)
    Enable MDIO bus.

    Parameters
        • dev – [in] Pointer to the device structure for the controller

void mdio_bus_disable(const struct device *dev)
    Disable MDIO bus and tri-state drivers.

    Parameters
        • dev – [in] Pointer to the device structure for the controller

int mdio_read(const struct device *dev, uint8_t prtad, uint8_t regad, uint16_t *data)
    Read from MDIO Bus.

    This routine provides a generic interface to perform a read on the MDIO bus.

    Parameters
        • dev – [in] Pointer to the device structure for the controller
        • prtad – [in] Port address
        • regad – [in] Register address
        • data – Pointer to receive read data

    Return values
        • 0 – If successful.
• -EIO – General input / output error.
• -ETIMEDOUT – If transaction timed out on the bus
• -ENOSYS – if read is not supported

```
int mdio_write(const struct device *dev, uint8_t prtad, uint8_t regad, uint16_t data)
```

Write to MDIO bus.

This routine provides a generic interface to perform a write on the MDIO bus.

**Parameters**

- `dev` – [in] Pointer to the device structure for the controller
- `prtad` – [in] Port address
- `regad` – [in] Register address
- `data` – [in] Data to write

**Return values**

- 0 – If successful.
- -EIO – General input / output error.
- -ETIMEDOUT – If transaction timed out on the bus
- -ENOSYS – if write is not supported

```
int mdio_read_c45(const struct device *dev, uint8_t prtad, uint8_t devad, uint16_t regad,
                  uint16_t *data)
```

Read from MDIO Bus using Clause 45 access.

This routine provides an interface to perform a read on the MDIO bus using IEEE 802.3 Clause 45 access.

**Parameters**

- `dev` – [in] Pointer to the device structure for the controller
- `prtad` – [in] Port address
- `devad` – [in] Device address
- `regad` – [in] Register address
- `data` – Pointer to receive read data

**Return values**

- 0 – If successful.
- -EIO – General input / output error.
- -ETIMEDOUT – If transaction timed out on the bus
- -ENOSYS – if write using Clause 45 access is not supported

```
int mdio_write_c45(const struct device *dev, uint8_t prtad, uint8_t devad, uint16_t regad,
                    uint16_t data)
```

Write to MDIO bus using Clause 45 access.

This routine provides an interface to perform a write on the MDIO bus using IEEE 802.3 Clause 45 access.

**Parameters**

- `dev` – [in] Pointer to the device structure for the controller
- `prtad` – [in] Port address
- `devad` – [in] Device address
7.6.31 MIPI Display Bus Interface (DBI)

The MIPI DBI driver class implements support for MIPI DBI compliant display controllers. MIPI DBI defines 3 interface types:

- Type A: Motorola 6800 parallel bus
- Type B: Intel 8080 parallel bus
- Type C: SPI Type serial bit bus with 3 options:
  1. 9 write clocks per byte, final bit is command/data selection bit
  2. Same as above, but 16 write clocks per byte
  3. 8 write clocks per byte. Command/data selected via GPIO pin

Currently, the API only supports Type C controllers, options 1 and 3.

API Reference

group mipi_dbi_interface
MIPI-DBI driver APIs.

Defines

MIPI_DBI_MODE_SPI_3WIRE
SPI 3 wire (Type C1).
Uses 9 write clocks to send a byte of data. The bit sent on the 9th clock indicates whether the byte is a command or data byte.

```
SCK : ---'---'---'---'---'---'---'---'---'---'---'---'---'---'---'---'

CS

CD

MIPI_DBI_SPI_CONFIG_DT(node_id, operation_, delay_)
initialize a MIPI DBI SPI configuration struct from devicetree

This helper allows drivers to initialize a MIPI DBI SPI configuration structure using
devicetree.

Parameters

- **node_id** – Devicetree node identifier for the MIPI DBI device whose struct
  *spi_config* to create an initializer for
- **operation_** – the desired operation field in the struct *spi_config*
- **delay_** – the desired delay field in the struct *spi_config*’s
  *spi_cs_control*, if there is one

Functions

static inline int miapi_dbi_command_write(const struct device *dev, const struct
  miapi_dbi_config *config, uint8_t cmd, const
  uint8_t *data, size_t len)

Write a command to the display controller.

Writes a command, along with an optional data buffer to the display. If data buffer
and buffer length are NULL and 0 respectively, then only a command will be sent.

Parameters

- **dev** – miapi dbi controller
- **config** – MIPI DBI configuration
- **cmd** – command to write to display controller
- **data** – optional data buffer to write after command
- **len** – size of data buffer in bytes. Set to 0 to skip sending data.

Return values

- 0 – command write succeeded
- -EIO – I/O error
• -ETIMEDOUT – transfer timed out
• -EBUSY – controller is busy
• -ENOSYS – not implemented

static inline int miipi_dbi_command_read(const struct device *dev, const struct miipi_dbi_config *config, uint8_t *cmds, size_t num_cmd, uint8_t *response, size_t len)

Read a command response from the display controller.

Parameters
• dev – miipi dbi controller
• config – MIPI DBI configuration
• cmds – array of one byte commands to send to display controller
• num_cmd – number of commands to write to display controller
• response – response buffer, filled with display controller response
• len – size of response buffer in bytes.

Return values
• 0 – command read succeeded
• -EIO – I/O error
• -ETIMEDOUT – transfer timed out
• -EBUSY – controller is busy
• -ENOSYS – not implemented

static inline int miipi_dbi_write_display(const struct device *dev, const struct miipi_dbi_config *config, const uint8_t *framebuf, struct display_bufferDescriptor *desc, enum display_pixel_format pixfmt)

Write a display buffer to the display controller.

Parameters
• dev – miipi dbi controller
• config – MIPI DBI configuration
• framebuffer – framebuffer to write to display
• desc – descriptor of framebuffer to write. Note that the pitch must be equal to width. “buf_size” field determines how many bytes will be written.
• pixfmt – pixel format of framebuffer data

Return values
• 0 – buffer write succeeded.
• -EIO – I/O error
• -ETIMEDOUT – transfer timed out
• -EBUSY – controller is busy
static inline int mipi_dbi_reset(const struct device *dev, uint32_t delay)
Resets the attached display controller.

Parameters

- `dev` – mipi dbi controller
- `delay` – duration to set reset signal for, in milliseconds

Return values

- `0` – reset succeeded
- `-EIO` – I/O error
- `-ENOSYS` – not implemented
- `-ENOTSUP` – not supported

struct `mipi_dbi_config`

```c
#include <mipi_dbi.h>
```
MIPI DBI controller configuration.

Configuration for MIPI DBI controller write

Public Members

```c
uint8_t mode
```
MIPI DBI mode (SPI 3 wire or 4 wire)

```c
struct spi_config config
```
SPI configuration.

```c
struct `mipi_dbi_driver_api`
#include <mipi_dbi.h> MIPI-DBI host driver API.
```

7.6.32 MIPI Display Serial Interface (DSI)

API Reference

`group mipi_dsi_interface`
MIPI-DSI driver APIs.

MIPI-DSI Device mode flags.

```c
MIPI_DSI_MODE_VIDEO
```
Video mode.

```c
MIPI_DSI_MODE_VIDEO_BURST
```
Video burst mode.
MIPI_DSI_MODE_VIDEO_SYNC_PULSE
Video pulse mode.

MIPI_DSI_MODE_VIDEO_AUTO_VERT
Enable auto vertical count mode.

MIPI_DSI_MODE_VIDEO_HSE
Enable hsync-end packets in vsync-pulse and v-porch area.

MIPI_DSI_MODE_VIDEO_HFP
Disable hfront-porch area.

MIPI_DSI_MODE_VIDEO_HBP
Disable hback-porch area.

MIPI_DSI_MODE_VIDEO_HSA
Disable hsync-active area.

MIPI_DSI_MODE_VSYNC_FLUSH
Flush display FIFO on vsync pulse.

MIPI_DSI_MODE_EOT_PACKET
Disable EoT packets in HS mode.

MIPI_DSI_CLOCK_NON_CONTINUOUS
Device supports non-continuous clock behavior (DSI spec 5.6.1)

MIPI_DSI_MODE_LPM
Transmit data in low power.

MIPI-DSI Pixel formats.

MIPI_DSI_PIXFMT_RGB888
RGB888 (24bpp).

MIPI_DSI_PIXFMT_RGB666
RGB666 (24bpp).

MIPI_DSI_PIXFMT_RGB666_PACKED
Packed RGB666 (18bpp).

MIPI_DSI_PIXFMT_RGB565
RGB565 (16bpp).

Defines

MIPI_DSI_MSG_USE_LPM
Functions

static inline int mipi_dsi_attach(const struct device *dev, uint8_t channel, const struct mipi_dsi_device *mdev)

Attach a new device to the MIPI-DSI bus.

Parameters

- dev – MIPI-DSI host device.
- channel – Device channel (VID).
- mdev – MIPI-DSI device description.

Returns

0 on success, negative on error

static inline ssize_t mipi_dsi_transfer(const struct device *dev, uint8_t channel, struct mipi_dsi_msg *msg)

Transfer data to/from a device attached to the MIPI-DSI bus.

Parameters

- dev – MIPI-DSI device.
- channel – Device channel (VID).
- msg – Message.

Returns

Size of the transferred data on success, negative on error.

ssize_t mipi_dsi_generic_read(const struct device *dev, uint8_t channel, const void *params, size_t nparams, void *buf, size_t len)

MIPI-DSI generic read.

Parameters

- dev – MIPI-DSI host device.
- channel – Device channel (VID).
- params – Buffer containing request parameters.
- nparams – Number of parameters.
- buf – Buffer where read data will be stored.
- len – Length of the reception buffer.

Returns

Size of the read data on success, negative on error.

ssize_t mipi_dsi_generic_write(const struct device *dev, uint8_t channel, const void *buf, size_t len)

MIPI-DSI generic write.

Parameters

- dev – MIPI-DSI host device.
- channel – Device channel (VID).
- buf – Transmission buffer.
- len – Length of the transmission buffer.

Returns

Size of the written data on success, negative on error.
ssize_t mihi_dsi_dcs_read(const struct device *dev, uint8_t channel, uint8_t cmd, void *buf, size_t len)

MIPI-DSI DCS read.

**Parameters**
- **dev** – MIPI-DSI host device.
- **channel** – Device channel (VID).
- **cmd** – DCS command.
- **buf** – Buffer where read data will be stored.
- **len** – Length of the reception buffer.

**Returns**
Size of the read data on success, negative on error.

ssize_t mihi_dsi_dcs_write(const struct device *dev, uint8_t channel, uint8_t cmd, const void *buf, size_t len)

MIPI-DSI DCS write.

**Parameters**
- **dev** – MIPI-DSI host device.
- **channel** – Device channel (VID).
- **cmd** – DCS command.
- **buf** – Transmission buffer.
- **len** – Length of the transmission buffer

**Returns**
Size of the written data on success, negative on error.

static inline int mihi_dsi_detach(const struct device *dev, uint8_t channel, const struct mihi_dsi_device *mdev)

Detach a device from the MIPI-DSI bus.

**Parameters**
- **dev** – MIPI-DSI host device.
- **channel** – Device channel (VID).
- **mdev** – MIPI-DSI device description.

**Returns**
0 on success, negative on error

struct mihi_dsi_timings
#include <mihi_dsi.h> MIPI-DSI display timings.

**Public Members**

**uint32_t hactive**
Horizontal active video.

**uint32_t hfp**
Horizontal front porch.
uint32_t hbp
    Horizontal back porch.

uint32_t hsync
    Horizontal sync length.

uint32_t vactive
    Vertical active video.

uint32_t vfp
    Vertical front porch.

uint32_t vbp
    Vertical back porch.

uint32_t vsync
    Vertical sync length.

struct mipi_dsi_device
    #include <mipi_dsi.h> MIPI-DSI device.

Public Members

uint8_t data_lanes
    Number of data lanes.

struct mipi_dsi_timings timings
    Display timings.

uint32_t pixfmt
    Pixel format.

uint32_t mode_flags
    Mode flags.

struct mipi_dsi_msg
    #include <mipi_dsi.h> MIPI-DSI read/write message.

Public Members

uint8_t type
    Payload data type.

uint16_t flags
    Flags controlling message transmission.
```c
uint8_t cmd
    Command (only for DCS)

size_t tx_len
    Transmission buffer length.

const void *tx_buf
    Transmission buffer.

size_t rx_len
    Reception buffer length.

void *rx_buf
    Reception buffer.
```

```c
struct mipi_dsi_driver_api
    #include <mipi_dsi.h> MIPI-DSI host driver API.
```

### 7.6.33 Multi-Channel Inter-Processor Mailbox (MBOX)

#### Overview

An MBOX device is a peripheral capable of passing signals (and data depending on the peripheral) between CPUs and clusters in the system. Each MBOX instance is providing one or more channels, each one targeting one other CPU cluster (multiple channels can target the same cluster).

#### API Reference

**Related code samples**

**MBOX**

Perform inter-processor mailbox communication using the MBOX API.

**MBOX Data**

Perform inter-processor mailbox communication using the MBOX API with data.

**group mbox_interface**

MBOX Interface.
An MBOX device is a peripheral capable of passing signals (and data depending on the peripheral) between CPUs and clusters in the system. Each MBOX instance is providing one or more channels, each one targeting one other CPU cluster (multiple channels can target the same cluster).

For example in the plot the device ‘dev A’ is using the TX channel 9 to signal (or send data to) the CPU #2 and it’s expecting data or signals on the RX channel 8. Thus it can send the message through the channel 9, and it can register a callback on the channel 8 of the MBOX device.

This API supports two modes: signalling mode and data transfer mode.

In signalling mode:
- \texttt{mbox_mtu_get()} must return 0
- \texttt{mbox_send()} must have (msg == NULL)
- the callback must be called with (data == NULL)

In data transfer mode:
- \texttt{mbox_mtu_get()} must return a (value != 0)
- \texttt{mbox_send()} must have (msg != NULL)
- the callback must be called with (data != NULL)
- The msg content must be the same between sender and receiver

\textbf{Defines}

\texttt{MBOX_DT_CHANNEL_GET(node_id, name)}

Structure initializer for \texttt{mbox\_channel} from devicetree.

This helper macro expands to a static initializer for a \texttt{mbox\_channel} by reading the relevant device controller and channel number from the devicetree.

Example devicetree fragment:

```c
mbox1: mbox-controller@... { ... };

n: node {
    mboxes = <&mbox1 8>,
     <&mbox1 9>;
    mbox-names = "tx", "rx";
};
```

Example usage:

```c
const struct mbox\_channel channel = MBOX\_DT\_CHANNEL\_GET(DT\_NODELABEL(n), tx);
```

\textbf{Parameters}

- \texttt{node\_id} – Devicetree node identifier for the MBOX device
- \texttt{name} – lowercase-and-underscores name of the mboxes element
**Typedefs**

typedef void (*mbox_callback_t)(const struct device *dev, uint32_t channel, void *user_data, struct mbox_msg *data)

Callback API for incoming MBOX messages.

These callbacks execute in interrupt context. Therefore, use only interrupt-safe APIS. Registration of callbacks is done via **mbox_register_callback()**

The data parameter must be NULL in signalling mode.

**Param dev**
Driver instance

**Param channel**
Channel ID

**Param user_data**
Pointer to some private data provided at registration time

**Param data**
Message struct

typedef int (*mbox_send_t)(const struct device *dev, uint32_t channel, const struct mbox_msg *msg)

Callback API to send MBOX messages.

See **mbox_send()** for function description

**Param dev**
Driver instance

**Param channel**
Channel ID

**Param msg**
Message struct

**Return**
See return values for **mbox_send()**

typedef int (*mbox_mtu_get_t)(const struct device *dev)

Callback API to get maximum data size.

See **mbox_mtu_get()** for argument definitions.

typedef int (*mbox_register_callback_t)(const struct device *dev, uint32_t channel, mbox_callback_t cb, void *user_data)

Callback API upon registration.

See **mbox_register_callback()** for function description

**Param dev**
Driver instance

**Param channel**
Channel ID

**Param cb**
Callback function to execute on incoming message interrupts.

**Param user_data**
Application-specific data pointer which will be passed to the callback function when executed.
Return
See return values for `mbox_register_callback()`

typedef int (*mbox_set_enabled_t)(const struct device *dev, uint32_t channel, bool enable)
Callback API upon enablement of interrupts.
See `mbox_set_enabled()` for function description

Param dev
Driver instance

Param channel
Channel ID

Param enable
Set to 0 to disable and to nonzero to enable.

Return
See return values for `mbox_set_enabled()`

typedef uint32_t (*mbox_max_channels_get_t)(const struct device *dev)
Callback API to get maximum number of channels.
See `mbox_max_channels_get()` for argument definitions.

Functions

static inline void mbox_init_channel(struct mbox_channel *channel, const struct device *dev, uint32_t ch_id)
Initialize a channel struct.

Initialize an `mbox_channel` passed by the user with a provided MBOX device and channel ID. This function is needed when the information about the device and the channel ID is not in the DT. In the DT case `MBOX_DT_CHANNEL_GET()` must be used instead.

Parameters
• channel – Pointer to the channel struct
• dev – Driver instance
• ch_id – Channel ID

int mbox_send(const struct mbox_channel *channel, const struct mbox_msg *msg)
Try to send a message over the MBOX device.

Send a message over an `mbox_channel`. The msg parameter must be NULL when the driver is used for signalling.

If the msg parameter is not NULL, this data is expected to be delivered on the receiving side using the data parameter of the receiving callback.

Parameters
• channel – Channel instance pointer
• msg – Pointer to the message struct

Return values
• -EBUSY – If the remote hasn’t yet read the last data sent.
• -EMSGSIZE – If the supplied data size is unsupported by the driver.
• -EINVAL – If there was a bad parameter, such as: too-large channel descriptor or the device isn’t an outbound MBOX channel.
• 0 – On success, negative value on error.

static inline int mbox_register_callback(const struct mbox_channel *channel,
                                           mbox_callback_t cb, void *user_data)

Register a callback function on a channel for incoming messages.

This function doesn't assume anything concerning the status of the interrupts. Use mbox_set_enabled() to enable or to disable the interrupts if needed.

Parameters
• channel – Channel instance pointer.
• cb – Callback function to execute on incoming message interrupts.
• user_data – Application-specific data pointer which will be passed to the callback function when executed.

Return values
0 – On success, negative value on error.

int mbox_mtu_get(const struct device *dev)

Return the maximum number of bytes possible in an outbound message.

Returns the actual number of bytes that it is possible to send through an outgoing channel.

This number can be 0 when the driver only supports signalling or when on the receiving side the content and size of the message must be retrieved in an indirect way (i.e. probing some other peripheral, reading memory regions, etc...).

If this function returns 0, the msg parameter in mbox_send() is expected to be NULL.

Parameters
• dev – Driver instance pointer.

Returns
Maximum possible size of a message in bytes, 0 for signalling, negative value on error.

int mbox_set_enabled(const struct mbox_channel *channel, bool enable)

Enable (disable) interrupts and callbacks for inbound channels.

Enable interrupt for the channel when the parameter ‘enable’ is set to true. Disable it otherwise.

Immediately after calling this function with ‘enable’ set to true, the channel is considered enabled and ready to receive signal and messages (even already pending), so the user must take care of installing a proper callback (if needed) using mbox_register_callback() on the channel before enabling it. For this reason it is recommended that all the channels are disabled at probe time.

Enabling a channel for which there is no installed callback is considered undefined behavior (in general the driver must take care of gracefully handling spurious interrupts with no installed callback).

Parameters
• channel – Channel instance pointer.
• enable – Set to 0 to disable and to nonzero to enable.

Return values
• 0 – On success.
• -EINVAL – If it isn’t an inbound channel.
uint32_t mbox_max_channels_get(const struct device *dev)

Return the maximum number of channels.

Return the maximum number of channels supported by the hardware.

Parameters

• dev – Driver instance pointer.

Returns

Maximum possible number of supported channels on success, negative value on error.

struct mbox_msg

#include <mbox.h> Message struct (to hold data and its size).

Public Members

const void *data  
Pointer to the data sent in the message.

size_t size  
Size of the data.

struct mbox_channel

#include <mbox.h> Provides a type to hold an MBOX channel.
Struct type to hold an MBOX device pointer and the channel ID.

Public Members

const struct device *dev  
MBOX device pointer.

uint32_t id  
Channel ID.

struct mbox_driver_api

#include <mbox.h>

7.6.34 Peripheral Component Interconnect express Bus (PCIe)

Overview

API Reference

group pcie_host_interface

PCle Host Interface.
Defines

PCIE_ID_IS_VALID(id)

PCIE_DT_ID(node_id)
Get the PCIe Vendor and Device ID for a node.

Parameters
  • node_id – DTS node identifier

Returns
  The VID/DID combination as pcie_id_t

PCIE_DT_INST_ID(inst)
Get the PCIe Vendor and Device ID for a node.
This is equivalent to PCIE_DT_ID(DT_DRV_INST(inst))

Parameters
  • inst – Devicetree instance number

Returns
  The VID/DID combination as pcie_id_t

DEVICE_PCIE_DECLARE(node_id)
Declare a PCIe context variable for a DTS node.
Declares a PCIe context for a DTS node. This must be done before using the DEVICE_PCIE_INIT() macro for the same node.

Parameters
  • node_id – DTS node identifier

DEVICE_PCIE_INST_DECLARE(inst)
Declare a PCIe context variable for a DTS node.
This is equivalent to DEVICE_PCIE_DECLARE(DT_DRV_INST(inst))

Parameters
  • inst – Devicetree instance number

DEVICE_PCIE_INIT(node_id, name)
Initialize a named struct member to point at a PCIe context.
Initialize PCIe-related information within a specific instance of a device config struct, using information from DTS. Using the macro requires having first created PCIe context struct using the DEVICE_PCIE_DECLARE() macro.

Example for an instance of a driver belonging to the “foo” subsystem
struct foo_config { struct pcie_dev *pcie; ... };
DEVICE_PCIE_ID_DECLARE(DT_DRV_INST(...)); struct foo_config my_config = { DEVICE_PCIE_INIT(pcie, DT_DRV_INST(...)), ... };

Parameters
  • node_id – DTS node identifier
  • name – Member name within config for the MMIO region

DEVICE_PCIE_INST_INIT(inst, name)
Initialize a named struct member to point at a PCIe context.
This is equivalent to DEVICE_PCIE_INIT(DT_DRV_INST(inst), name)
Parameters
- \textit{inst} – Devicetree instance number
- \textit{name} – Name of the struct member (of type struct \textit{pcie_dev} *)

\textbf{PCIE\_HOST\_CONTROLLER}(\textit{n})
Get the BDF for a given PCI host controller.
This macro is useful when the PCI host controller behind PCIE\_BDF(0, 0, 0) indicates a multifunction device. In such a case each function of this endpoint is a potential host controller itself.

Parameters
- \textit{n} – Bus number

Returns
BDF value of the given host controller

PCIE\_CONF\_CAPPTR
PCIE\_CONF\_CAPPTR\_FIRST(\textit{w})
PCIE\_CONF\_CAP\_ID(\textit{w})
PCIE\_CONF\_CAP\_NEXT(\textit{w})

PCIE\_CONF\_EXT\_CAPPTR
PCIE\_CONF\_EXT\_CAP\_ID(\textit{w})
PCIE\_CONF\_EXT\_CAP\_VER(\textit{w})
PCIE\_CONF\_EXT\_CAP\_NEXT(\textit{w})

PCIE\_CONF\_ID
PCIE\_CONF\_CMDSTAT
PCIE\_CONF\_CMDSTAT\_IO
PCIE\_CONF\_CMDSTAT\_MEM
PCIE\_CONF\_CMDSTAT\_MASTER
PCIE\_CONF\_CMDSTAT\_INTERRUPT
PCIE\_CONF\_CMDSTAT\_CAPS
PCIE\_CONF\_CLASSREV
PCIE\_CONF\_CLASSREV\_CLASS(\textit{w})
PCIE\_CONF\_CLASSREV\_SUBCLASS(\textit{w})
PCIE\_CONF\_CLASSREV\_PROGIF(\textit{w})
PCIE_CONF_CLASSREV_REV(w)

PCIE_CONF_TYPE

PCIE_CONF_MULTIFUNCTION(w)

PCIE_PREFETCH_BASE_UPPER
PCIE_PREFETCH_LIMIT_UPPER
PCIE_IO_BASE_LIMIT_UPPER
PCIE_IO_BASE_UPPER (w)
PCIE_IO_LIMIT_UPPER (w)
PCIE_IO_BASE_LIMIT_UPPER_VAL (iobu, iolu)

PCIE_CONF_INTR
PCIE_CONF_INTR_IRQ (w)
PCIE_CONF_INTR_IRQ_NONE

PCIE_MAX_BUS
PCIE_MAX_DEV
PCIE_MAX_FUNC
PCIE_IRQ_CONNECT(bdf_p, irq_p, priority_p, isr_p, isr_param_p, flags_p)
Initialize an interrupt handler for a PCIe endpoint IRQ.

This routine is only meant to be used by drivers using PCIe bus and having fixed or MSI based IRQ (so no runtime detection of the IRQ). In case of runtime detection see pcie_connect_dynamic_irq()

Parameters
- bdf_p – PCIe endpoint BDF
- irq_p – IRQ line number.
- priority_p – Interrupt priority.
- isr_p – Address of interrupt service routine.
- isr_param_p – Parameter passed to interrupt service routine.
- flags_p – Architecture-specific IRQ configuration flags.

Typedefs

typedef uint32_t pcie_bdf_t
A unique PCI(e) endpoint (bus, device, function).
A PCI(e) endpoint is uniquely identified topologically using a (bus, device, function) tuple. The internal structure is documented in include/dt-bindings/pcie/pcie.h: see PCIE_BDF() and friends, since these tuples are referenced from devicetree.

typedef uint32_t pcie_id_t
A unique PCI(e) identifier (vendor ID, device ID).
The PCIE_CONF_ID register for each endpoint is a (vendor ID, device ID) pair, which is meant to tell the system what the PCI(e) endpoint is. Again, look to PCIE_ID_* macros in include/dt-bindings/pcie/pcie.h for more.

typedef bool (*pcie_scan_cb_t)(pcie_bdf_t bdf, pcie_id_t id, void *cb_data)
Callback type used for scanning for PCI endpoints.

Param bdf
BDF value for a found endpoint.

Param id
Vendor & Device ID for the found endpoint.

Param cb_data
Custom, use case specific data.

Return
true to continue scanning, false to stop scanning.

Enums

Values:

enumerator PCIE_SCAN_RECURSIVE = BIT(0)
Scan all available PCI host controllers and sub-busses.
enumerator PCIE_SCAN_CB_ALL = BIT(1)
    Do the callback for all endpoint types, including bridges.

Functions

pcie_bdf_t pcie_bdf_lookup(pcie_id_t id)
    Look up the BDF based on PCI(e) vendor & device ID.
    This function is used to look up the BDF for a device given its vendor and device ID.

    Deprecated:
    See also:
    DEVICE_PCIE_DECLARE

    Parameters
    • id – PCI(e) vendor & device ID encoded using PCIE_ID()

    Returns
    The BDF for the device, or PCIE_BDF_NONE if it was not found

uint32_t pcie_conf_read(pcie_bdf_t bdf, unsigned int reg)
    Read a 32-bit word from an endpoint's configuration space.
    This function is exported by the arch/SoC/board code.

    Parameters
    • bdf – PCI(e) endpoint
    • reg – the configuration word index (not address)

    Returns
    the word read (0xFFFFFFFFU if nonexistent endpoint or word)

void pcie_conf_write(pcie_bdf_t bdf, unsigned int reg, uint32_t data)
    Write a 32-bit word to an endpoint's configuration space.
    This function is exported by the arch/SoC/board code.

    Parameters
    • bdf – PCI(e) endpoint
    • reg – the configuration word index (not address)
    • data – the value to write

int pcie_scan(const struct pcie_scan_opt *opt)
    Scan for PCIe devices.
    Scan the PCI bus (or busses) for available endpoints.

    Parameters
    • opt – Options determining how to perform the scan.

    Returns
    0 on success, negative POSIX error number on failure.
bool pcie_probe(pcie_bdf_t bdf, pcie_id_t id)
    Probe for the presence of a PCI(e) endpoint.

    Deprecated:
    See also:
    DEVICE_PCIE_DECLARE

    Parameters
    • bdf – the endpoint to probe
    • id – the endpoint ID to expect, or PCIE_ID_NONE for “any device”

    Returns
    true if the device is present, false otherwise

bool pcie_get_mbar(pcie_bdf_t bdf, unsigned int bar_index, struct pcie_bar *mbar)
    Get the MBAR at a specific BAR index.

    Parameters
    • bdf – the PCI(e) endpoint
    • bar_index – 0-based BAR index
    • mbar – Pointer to struct pcie_bar

    Returns
    true if the mbar was found and is valid, false otherwise

bool pcie_probe_mbar(pcie_bdf_t bdf, unsigned int index, struct pcie_bar *mbar)
    Probe the nth MMIO address assigned to an endpoint.

    A PCI(e) endpoint has 0 or more memory-mapped regions. This function allows the
caller to enumerate them by calling with index=0..n. Value of n has to be below 6,
as there is a maximum of 6 BARs. The indices are order-preserving with respect to
the endpoint BARs: e.g., index 0 will return the lowest-numbered memory BAR on the
endpoint.

    Parameters
    • bdf – the PCI(e) endpoint
    • index – (0-based) index
    • mbar – Pointer to struct pcie_bar

    Returns
    true if the mbar was found and is valid, false otherwise

bool pcie_get_iobar(pcie_bdf_t bdf, unsigned int bar_index, struct pcie_bar *iobar)
    Get the I/O BAR at a specific BAR index.

    Parameters
    • bdf – the PCI(e) endpoint
    • bar_index – 0-based BAR index
    • iobar – Pointer to struct pcie_bar

    Returns
    true if the I/O BAR was found and is valid, false otherwise
bool `pcie_probe_iobar` *(pcie_bdf_t bdf, unsigned int index, struct pcie_bar *iobar)*
Probes the nth I/O BAR address assigned to an endpoint.

A PCI(e) endpoint has 0 or more I/O regions. This function allows the caller to enumerate them by calling with index=0..n. Value of n has to be below 6, as there is a maximum of 6 BARs. The indices are order-preserving with respect to the endpoint BARs: e.g., index 0 will return the lowest-numbered I/O BAR on the endpoint.

**Parameters**
- `bdf` – the PCI(e) endpoint
- `index` – (0-based) index
- `iobar` – Pointer to struct `pcie_bar`

**Returns**
true if the I/O BAR was found and is valid, false otherwise

void `pcie_set_cmd` *(pcie_bdf_t bdf, uint32_t bits, bool on)*
Set or reset bits in the endpoint command/status register.

**Parameters**
- `bdf` – the PCI(e) endpoint
- `bits` – the powerset of bits of interest
- `on` – use true to set bits, false to reset them

unsigned int `pcie_alloc_irq` *(pcie_bdf_t bdf)*
Allocate an IRQ for an endpoint.
This function first checks the IRQ register and if it contains a valid value this is returned. If the register does not contain a valid value allocation of a new one is attempted. Such function is only exposed if CONFIG_PCIE_CONTROLLER is unset. It is thus available where architecture tied dynamic IRQ allocation for PCIe device makes sense.

**Parameters**
- `bdf` – the PCI(e) endpoint

**Returns**
the IRQ number, or PCIE_CONF_INTR_IRQ_NONE if allocation failed.

unsigned int `pcie_get_irq` *(pcie_bdf_t bdf)*
Return the IRQ assigned by the firmware/board to an endpoint.

**Parameters**
- `bdf` – the PCI(e) endpoint

**Returns**
the IRQ number, or PCIE_CONF_INTR_IRQ_NONE if unknown.

void `pcie_irq_enable` *(pcie_bdf_t bdf, unsigned int irq)*
Enable the PCI(e) endpoint to generate the specified IRQ.

If MSI is enabled and the endpoint supports it, the endpoint will be configured to generate the specified IRQ via MSI. Otherwise, it is assumed that the IRQ has been routed by the boot firmware to the specified IRQ, and the IRQ is enabled (at the I/O APIC, or wherever appropriate).

**Parameters**
uint32_t pcie_get_cap(pcie_bdf_t bdf, uint32_t cap_id)
Find a PCI(e) capability in an endpoint's configuration space.

Parameters
• bdf – the PCI endpoint to examine
• cap_id – the capability ID of interest

Returns
the index of the configuration word, or 0 if no capability.

uint32_t pcie_get_ext_cap(pcie_bdf_t bdf, uint32_t cap_id)
Find an Extended PCI(e) capability in an endpoint's configuration space.

Parameters
• bdf – the PCI endpoint to examine
• cap_id – the capability ID of interest

Returns
the index of the configuration word, or 0 if no capability.

bool pcie_connect_dynamic_irq(pcie_bdf_t bdf, unsigned int irq, unsigned int priority,
void (*routine)(const void *parameter), const void *parameter,
uint32_t flags)
Dynamically connect a PCIe endpoint IRQ to an ISR handler.

Parameters
• bdf – the PCI endpoint to examine
• irq – the IRQ to connect (see pcie_alloc_irq())
• priority – priority of the IRQ
• routine – the ISR handler to connect to the IRQ
• parameter – the parameter to provide to the handler
• flags – IRQ connection flags

Returns
true if connected, false otherwise

struct pcie_dev
#include <pcie.h>

struct pcie_bar
#include <pcie.h>

struct pcie_scan_opt
#include <pcie.h> Options for performing a scan for PCI devices.

Public Members

uint8_t bus
Initial bus number to scan.
7.6.35 Platform Environment Control Interface (PECI)

Overview

The Platform Environment Control Interface, abbreviated as PECI, is a thermal management standard introduced in 2006 with the Intel Core 2 Duo Microprocessors. The PECI interface allows external devices to read processor temperature, perform processor manageability functions, and manage processor interface tuning and diagnostics. The PECI bus driver APIs enable the interaction between Embedded Microcontrollers and CPUs.

Functions

int peci_config(const struct device *dev, uint32_t bitrate)
Configures the PECI interface.

Parameters
• dev – Pointer to the device structure for the driver instance.
• bitrate – the selected bitrate expressed in Kbps.

Return values
• 0 – If successful.
• Negative – errno code if failure.

int peci_enable(const struct device *dev)
Enable PECI interface.

Parameters
• dev – Pointer to the device structure for the driver instance.
Return values

- 0 – If successful.
- Negative – errno code if failure.

int peci_disable(const struct device *dev)

Disable PECI interface.

Parameters

- dev – Pointer to the device structure for the driver instance.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int peci_transfer(const struct device *dev, struct peci_msg *msg)

Performs a PECI transaction.

Parameters

- dev – Pointer to the device structure for the driver instance.
- msg – Structure representing a PECI transaction.

Return values

- 0 – If successful.
- Negative – errno code if failure.

struct peci_buf

#include <peci.h> PECI buffer structure.

Public Members

uint8_t *buf

Valid pointer on a data buffer, or NULL otherwise.

size_t len

Length of the data buffer expected to be received without considering the frame check sequence byte.

Note: Frame check sequence byte is added into rx buffer: need to allocate an additional byte for this in rx buffer.

struct peci_msg

#include <peci.h> PECI transaction packet format.

Public Members

uint8_t addr

Client address.
enum peci_command_code cmd_code
    Command code.

struct peci_buf tx_buffer
    Pointer to buffer of write data.

struct peci_buf rx_buffer
    Pointer to buffer of read data.

uint8_t flags
    PECI msg flags.

7.6.36 PS/2

Overview

The PS/2 connector first hit the market in 1987 on IBM’s desktop PC line of the same name before becoming an industry-wide standard for mouse and keyboard connections. Starting around 2007, USB superseded PS/2 and is the modern peripheral device connection standard. For legacy support on boards with a PS/2 connector, Zephyr provides these PS/2 driver APIs.

Configuration Options

Related configuration options:

- CONFIG_PS2

API Reference

Related code samples

PS/2 interface
    Communicate with a PS/2 mouse.

group ps2_interface
    PS/2 Driver APIs.

Typedefs

typedef void (*ps2_callback_t)(const struct device *dev, uint8_t data)
    PS/2 callback called when user types or click a mouse.

    Param dev
        Pointer to the device structure for the driver instance.

    Param data
        Data byte passed pack to the user.
Functions

int ps2_config(const struct device *dev, ps2_callback_t callback_isr)
Configure a ps2 instance.

Parameters
• dev – Pointer to the device structure for the driver instance.
• callback_isr – called when PS/2 devices reply to a configuration command or when a mouse/keyboard send data to the client application.

Return values
• 0 – If successful.
• Negative – errno code if failure.

int ps2_write(const struct device *dev, uint8_t value)
Write to PS/2 device.

Parameters
• dev – Pointer to the device structure for the driver instance.
• value – Data for the PS2 device.

Return values
• 0 – If successful.
• Negative – errno code if failure.

int ps2_read(const struct device *dev, uint8_t *value)
Read slave-to-host values from PS/2 device.

Parameters
• dev – Pointer to the device structure for the driver instance.
• value – Pointer used for reading the PS/2 device.

Return values
• 0 – If successful.
• Negative – errno code if failure.

int ps2_enable_callback(const struct device *dev)
Enables callback.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• Negative – errno code if failure.

int ps2_disable_callback(const struct device *dev)
Disables callback.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• Negative – errno code if failure.
7.6.37 Pulse Width Modulation (PWM)

Overview

API Reference

Related code samples

Fade LED
Fade an LED using the PWM API.

PWM Blinky
Blink an LED using the PWM API.

PWM RGB LED
Drive an RGB LED using the PWM API.

Servomotor
Drive a servomotor using the PWM API.

group pwm_interface
PWM Interface.

PWM capture configuration flags

PWM_CAPTURE_TYPE_PERIOD
PWM pin capture captures period.

PWM_CAPTURE_TYPE_PULSE
PWM pin capture captures pulse width.

PWM_CAPTURE_TYPE_BOTH
PWM pin capture captures both period and pulse width.

PWM_CAPTURE_MODE_SINGLE
PWM pin capture captures a single period/pulse width.

PWM_CAPTURE_MODE_CONTINUOUS
PWM pin capture captures period/pulse width continuously.

PWM period set helpers

The period cell in the PWM specifier needs to be provided in nanoseconds. However, in some applications it is more convenient to use another scale.

PWM_NSEC(x)
Specify PWM period in nanoseconds.

PWM_USEC(x)
Specify PWM period in microseconds.
PWM_MSEC(x)
Specify PWM period in milliseconds.

PWM_SEC(x)
Specify PWM period in seconds.

PWM_HZ(x)
Specify PWM frequency in hertz.

PWM_KHZ(x)
Specify PWM frequency in kilohertz.

**PWM polarity flags**

The `PWM_POLARITY_*` flags are used with `pwm_set_cycles()`, `pwm_set()` or `pwm_configure_capture()` to specify the polarity of a PWM channel.

The flags are on the lower 8 bits of the `pwm_flags_t` union.

**PWM_POLARITY_NORMAL**
PWM pin normal polarity (active-high pulse).

**PWM_POLARITY_INVERTED**
PWM pin inverted polarity (active-low pulse).

**Defines**

`PWM_DT_SPEC_GET_BY_NAME(node_id, name)`
Static initializer for a struct `pwm_dt_spec`.

This returns a static initializer for a struct `pwm_dt_spec` given a devicetree node identifier and an index.

Example devicetree fragment:
```
{n: node {
    pwns = <&pwm1 1 1000 PWM_POLARITY_NORMAL>,
          <&pwm2 3 2000 PWM_POLARITY_INVERTED>;
    pwm-names = "alpha", "beta";
};
```

Example usage:
```
const struct pwm_dt_spec spec =
    PWM_DT_SPEC_GET_BY_NAME(DT_NODELABEL(n), alpha);

// Initializes 'spec' to:
// { 
//    .dev = DEVICE_DT_GET(DT_NODELABEL(pwm1)),
//    .channel = 1,
//    .period = 1000,
//    .flags = PWM_POLARITY_NORMAL,
// }
```

The device (dev) must still be checked for readiness, e.g. using `device_is_ready()`. It is an error to use this macro unless the node exists, has the 'pwms' property, and that 'pwms' property specifies a PWM controller, a channel, a period in nanoseconds and optionally flags.
See also:

**PWM_DT_SPEC_INST_GET_BY_NAME**

**Parameters**

- `node_id` – Devicetree node identifier.
- `name` – Lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property.

**Returns**

Static initializer for a struct `pwm_dt_spec` for the property.

`PWM_DT_SPEC_INST_GET_BY_NAME(inst, name)`  
Static initializer for a struct `pwm_dt_spec` from a DT_DRV_COMPAT instance.

See also:

**PWM_DT_SPEC_GET_BY_NAME**

**Parameters**

- `inst` – DT_DRV_COMPAT instance number
- `name` – Lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property

**Returns**

Static initializer for a struct `pwm_dt_spec` for the property.

`PWM_DT_SPEC_GET_BY_NAME_OR(node_id, name, default_value)`  
Like `PWM_DT_SPEC_GET_BY_NAME()`, with a fallback to a default value.

If the devicetree node identifier ‘node_id’ refers to a node with a property ‘pwms’, this expands to `PWM_DT_SPEC_GET_BY_NAME(node_id, name)`. The default_value parameter is not expanded in this case. Otherwise, this expands to `default_value`.

See also:

**PWM_DT_SPEC_INST_GET_BY_NAME_OR**

**Parameters**

- `node_id` – Devicetree node identifier.
- `name` – Lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property
- `default_value` – Fallback value to expand to.

**Returns**

Static initializer for a struct `pwm_dt_spec` for the property, or `default_value` if the node or property do not exist.

`PWM_DT_SPEC_INST_GET_BY_NAME_OR(inst, name, default_value)`  
Like `PWM_DT_SPEC_INST_GET_BY_NAME_OR()` , with a fallback to a default value.

See also:

**PWM_DT_SPEC_GET_BY_NAME_OR**
Parameters

- `inst` – DT_DRV_COMPAT instance number
- `name` – Lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property.
- `default_value` – Fallback value to expand to.

Returns

Static initializer for a struct `pwm_dt_spec` for the property, or `default_value` if the node or property do not exist.

`PWM_DT_SPEC_GET_BY_IDX(node_id, idx)`

Static initializer for a struct `pwm_dt_spec`.

This returns a static initializer for a struct `pwm_dt_spec` given a devicetree node identifier and an index.

Example devicetree fragment:

```plaintext
n: node {
  pwms = <&pwm1 1 1000 PWM_POLARITY_NORMAL>,
         <&pwm2 3 2000 PWM_POLARITY_INVERTED>;
}
```

Example usage:

```c
const struct pwm_dt_spec spec = 
  PWM_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), 1);
// Initializes 'spec' to:
// { 
//   .dev = DEVICE_DT_GET(DT_NODELABEL(pwm2)),
//   .channel = 3,
//   .period = 2000,
//   .flags = PWM_POLARITY_INVERTED,
// }
```

The device (dev) must still be checked for readiness, e.g. using `device_is_ready()`. It is an error to use this macro unless the node exists, has the ‘pwms’ property, and that ‘pwms’ property specifies a PWM controller, a channel, a period in nanoseconds and optionally flags.

See also:

`PWM_DT_SPEC_INST_GET_BY_IDX`

Parameters

- `node_id` – Devicetree node identifier.
- `idx` – Logical index into ‘pwms’ property.

Returns

Static initializer for a struct `pwm_dt_spec` for the property.

`PWM_DT_SPEC_INST_GET_BY_IDX(inst, idx)`

Static initializer for a struct `pwm_dt_spec` from a DT_DRV_COMPAT instance.

See also:

`PWM_DT_SPEC_GET_BY_IDX`
Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – Logical index into ‘pwms’ property.

Returns
Static initializer for a struct `pwm_dt_spec` for the property.

`PWM_DT_SPEC_GET_BY_IDX_OR(node_id, idx, default_value)`

Like `PWM_DT_SPEC_GET_BY_IDX()`, with a fallback to a default value.

If the devicetree node identifier `node_id` refers to a node with a property ‘pwms’, this expands to `PWM_DT_SPEC_GET_BY_IDX(node_id, idx)`. The `default_value` parameter is not expanded in this case. Otherwise, this expands to `default_value`.

See also:
`PWM_DT_SPEC_INST_GET_BY_IDX_OR`

Parameters

- `node_id` – Devicetree node identifier.
- `idx` – Logical index into ‘pwms’ property.
- `default_value` – Fallback value to expand to.

Returns
Static initializer for a struct `pwm_dt_spec` for the property, or `default_value` if the node or property do not exist.

`PWM_DT_SPEC_INST_GET_BY_IDX_OR(inst, idx, default_value)`

Like `PWM_DT_SPEC_INST_GET_BY_IDX_OR()`, with a fallback to a default value.

See also:
`PWM_DT_SPEC_INST_GET_BY_IDX_OR`

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – Logical index into ‘pwms’ property.
- `default_value` – Fallback value to expand to.

Returns
Static initializer for a struct `pwm_dt_spec` for the property, or `default_value` if the node or property do not exist.

`PWM_DT_SPEC_GET(node_id)`

Equivalent to `PWM_DT_SPEC_GET_BY_IDX(node_id, 0)`.

See also:

`PWM_DT_SPEC_GET_BY_IDX`

See also:

`PWM_DT_SPEC_INST_GET`
• node_id – Devicetree node identifier.

**Returns**
Static initializer for a struct `pwm_dt_spec` for the property.

```c
PWM_DT_SPEC_INST_GET(inst)
```
Equivalent to `PWM_DT_SPEC_INST_GET_BY_IDX(inst, 0)`.

**See also:**
`PWM_DT_SPEC_INST_GET_BY_IDX`

**See also:**
`PWM_DT_SPEC_GET`

**Parameters**

• inst – DT_DRV_COMPAT instance number

**Returns**
Static initializer for a struct `pwm_dt_spec` for the property.

```c
PWM_DT_SPEC_GET_OR(node_id, default_value)
```
Equivalent to `PWM_DT_SPEC_GET_BY_IDX_OR(node_id, 0, default_value)`.

**See also:**
`PWM_DT_SPEC_GET_BY_IDX_OR`

**See also:**
`PWM_DT_SPEC_INST_GET_OR`

**Parameters**

• node_id – Devicetree node identifier.

• default_value – Fallback value to expand to.

**Returns**
Static initializer for a struct `pwm_dt_spec` for the property.

```c
PWM_DT_SPEC_INST_GET_OR(inst, default_value)
```
Equivalent to `PWM_DT_SPEC_INST_GET_BY_IDX_OR(inst, 0, default_value)`.

**See also:**
`PWM_DT_SPEC_INST_GET_BY_IDX_OR`

**See also:**
`PWM_DT_SPEC_GET_OR`

**Parameters**

• inst – DT_DRV_COMPAT instance number

• default_value – Fallback value to expand to.

**Returns**
Static initializer for a struct `pwm_dt_spec` for the property.
**Typedefs**

typedef uint16_t pwm_flags_t

Provides a type to hold PWM configuration flags.

The lower 8 bits are used for standard flags. The upper 8 bits are reserved for SoC specific flags.

**See also:**

PWM_CAPTURE_FLAGS.

typedef void (*pwm_capture_callback_handler_t)(const struct device *dev, uint32_t channel, uint32_t period_cycles, uint32_t pulse_cycles, int status, void *user_data)

PWM capture callback handler function signature.

**Note:** The callback handler will be called in interrupt context.

**Note:** CONFIG_PWM_CAPTURE must be selected to enable PWM capture support.

**Param dev**

[in] PWM device instance.

**Param channel**

PWM channel.

**Param period_cycles**

Captured PWM period width (in clock cycles). HW specific.

**Param pulse_cycles**

Captured PWM pulse width (in clock cycles). HW specific.

**Param status**

Status for the PWM capture (0 if no error, negative errno otherwise. See pwm_capture_cycles() return value descriptions for details).

**Param user_data**

User data passed to pwm_configure_capture()

**Functions**

int pwm_set_cycles(const struct device *dev, uint32_t channel, uint32_t period, uint32_t pulse, pwm_flags_t flags)

Set the period and pulse width for a single PWM output.

The PWM period and pulse width will synchronously be set to the new values without glitches in the PWM signal, but the call will not block for the change to take effect.

Passing 0 as pulse will cause the pin to be driven to a constant inactive level. Passing a non-zero pulse equal to period will cause the pin to be driven to a constant active level.
Note: Not all PWM controllers support synchronous, glitch-free updates of the PWM period and pulse width. Depending on the hardware, changing the PWM period and/or pulse width may cause a glitch in the generated PWM signal.

Note: Some multi-channel PWM controllers share the PWM period across all channels. Depending on the hardware, changing the PWM period for one channel may affect the PWM period for the other channels of the same PWM controller.

**Parameters**

- **dev** – [in] PWM device instance.
- **channel** – PWM channel.
- **period** – Period (in clock cycles) set to the PWM. HW specific.
- **pulse** – Pulse width (in clock cycles) set to the PWM. HW specific.
- **flags** – Flags for pin configuration.

**Return values**

- **0** – If successful.
- **-EINVAL** – If pulse > period.
- **-errno** – Negative errno code on failure.

```
int pwm_get_cycles_per_sec(const struct device *dev, uint32_t channel, uint64_t *cycles)
```

Get the clock rate (cycles per second) for a single PWM output.

**Parameters**

- **dev** – [in] PWM device instance.
- **channel** – PWM channel.
- **cycles** – [out] Pointer to the memory to store clock rate (cycles per sec). HW specific.

**Return values**

- **0** – If successful.
- **-errno** – Negative errno code on failure.

```
static inline int pwm_set(const struct device *dev, uint32_t channel, uint32_t period,
                          uint32_t pulse, pwm_flags_t flags)
```

Set the period and pulse width in nanoseconds for a single PWM output.

**Note:** Utility macros such as `PWM_MSEC` can be used to convert from other scales or units to nanoseconds, the units used by this function.

**Parameters**

- **dev** – [in] PWM device instance.
- **channel** – PWM channel.
- **period** – Period (in nanoseconds) set to the PWM.
- **pulse** – Pulse width (in nanoseconds) set to the PWM.
- **flags** – Flags for pin configuration (polarity).
Return values

- 0 – If successful.
- -ENOTSUP – If requested period or pulse cycles are not supported.
- -errno – Other negative errno code on failure.

static inline int pwm_set_dt(const struct pwm_dt_spec *spec, uint32_t period, uint32_t pulse)

Set the period and pulse width in nanoseconds from a struct pwm_dt_spec (with custom period).

This is equivalent to:
```
pwm_set(spec->dev, spec->channel, period, pulse, spec->flags)
```

The period specified in spec is ignored. This API call can be used when the period specified in Devicetree needs to be changed at runtime.

See also:
```
pwm_set_pulse_dt()
```

Parameters

- period – Period (in nanoseconds) set to the PWM.
- pulse – Pulse width (in nanoseconds) set to the PWM.

Returns

A value from pwm_set().

static inline int pwm_set_pulse_dt(const struct pwm_dt_spec *spec, uint32_t pulse)

Set the period and pulse width in nanoseconds from a struct pwm_dt_spec.

This is equivalent to:
```
pwm_set(spec->dev, spec->channel, spec->period, pulse, spec->flags)
```

See also:
```
pwm_set_pulse_dt()
```

Parameters

- pulse – Pulse width (in nanoseconds) set to the PWM.

Returns

A value from pwm_set().

static inline int pwm_cycles_to_usec(const struct device *dev, uint32_t channel, uint32_t cycles, uint64_t *usec)

Convert from PWM cycles to microseconds.

Parameters

- channel – PWM channel.
- cycles – Cycles to be converted.
• **usec** – **[out]** Pointer to the memory to store calculated usec.

**Return values**

- **0** – If successful.
- **-ERANGE** – If result is too large.
- **-errno** – Other negative errno code on failure.

static inline int pwm_cycles_to_nsec(const struct device *dev, uint32_t channel, uint32_t cycles, uint64_t *nsec)

Convert from PWM cycles to nanoseconds.

**Parameters**

- **dev** – **[in]** PWM device instance.
- **channel** – PWM channel.
- **cycles** – Cycles to be converted.
- **nsec** – **[out]** Pointer to the memory to store the calculated nsec.

**Return values**

- **0** – If successful.
- **-ERANGE** – If result is too large.
- **-errno** – Other negative errno code on failure.

static inline int pwm_configure_capture(const struct device *dev, uint32_t channel, pwm_flags_t flags, pwm_capture_callback_handler_t cb, void *user_data)

Configure PWM period/pulse width capture for a single PWM input.

After configuring PWM capture using this function, the capture can be enabled/disabled using **pwm_enable_capture()** and **pwm_disable_capture()**.

**Note:** This API function cannot be invoked from user space due to the use of a function callback. In user space, one of the simpler API functions (**pwm_capture_cycles()**, **pwm_capture_usec()**, or **pwm_capture_nsec()**) can be used instead.

**Note:** **CONFIG_PWM_CAPTURE** must be selected for this function to be available.

**Parameters**

- **dev** – **[in]** PWM device instance.
- **channel** – PWM channel.
- **flags** – PWM capture flags
- **cb** – **[in]** Application callback handler function to be called upon capture
- **user_data** – **[in]** User data to pass to the application callback handler function

**Return values**

- **-EINVAL** – if invalid function parameters were given
- **-ENOSYS** – if PWM capture is not supported or the given flags are not supported
• -EIO – if IO error occurred while configuring
• -EBUSY – if PWM capture is already in progress

int pwm_enable_capture(const struct device *dev, uint32_t channel)
Enable PWM period/pulse width capture for a single PWM input.
The PWM pin must be configured using pwm_configure_capture() prior to calling this function.

Note: CONFIG_PWM_CAPTURE must be selected for this function to be available.

Parameters
• dev – [in] PWM device instance.
• channel – PWM channel.

Return values
• 0 – If successful.
• -EINVAL – if invalid function parameters were given
• -ENOSYS – if PWM capture is not supported
• -EIO – if IO error occurred while enabling PWM capture
• -EBUSY – if PWM capture is already in progress

int pwm_disable_capture(const struct device *dev, uint32_t channel)
Disable PWM period/pulse width capture for a single PWM input.

Note: CONFIG_PWM_CAPTURE must be selected for this function to be available.

Parameters
• dev – [in] PWM device instance.
• channel – PWM channel.

Return values
• 0 – If successful.
• -EINVAL – if invalid function parameters were given
• -ENOSYS – if PWM capture is not supported
• -EIO – if IO error occurred while disabling PWM capture

int pwm_capture_cycles(const struct device *dev, uint32_t channel, pwm_flags_t flags, uint32_t *period, uint32_t *pulse, k_timeout_t timeout)
Capture a single PWM period/pulse width in clock cycles for a single PWM input.
This API function wraps calls to pwm_configure_capture(), pwm_enable_capture(), and pwm_disable_capture() and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.

Note: CONFIG_PWM_CAPTURE must be selected for this function to be available.

Parameters
Capture a single PWM period/pulse width in microseconds for a single PWM input. This API function wraps calls to `pwm_capture_cycles()` and `pwm_cycles_to_usec()` and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.

**Parameters**

- **dev** – [in] PWM device instance.
- **channel** – PWM channel.
- **flags** – PWM capture flags.
- **period** – [out] Pointer to the memory to store the captured PWM period width (in clock cycles). HW specific.
- **pulse** – [out] Pointer to the memory to store the captured PWM pulse width (in clock cycles). HW specific.
- **timeout** – Waiting period for the capture to complete.

**Return values**

- **0** – If successful.
- **-EBUSY** – PWM capture already in progress.
- **-EAGAIN** – Waiting period timed out.
- **-EIO** – IO error while capturing.
- **-ERANGE** – If result is too large.

```c
static inline int pwm_capture_usec(const struct device *dev, uint32_t channel, pwm_flags_t flags, uint64_t *period, uint64_t *pulse, k_timeout_t timeout)
```

Capture a single PWM period/pulse width in microseconds for a single PWM input. This API function wraps calls to `pwm_capture_cycles()` and `pwm_cycles_to_usec()` and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.

**Note:** `CONFIG_PWM_CAPTURE` must be selected for this function to be available.
static inline int pwm_capture_nsec(const struct device *dev, uint32_t channel, pwm_flags_t flags, uint64_t *period, uint64_t *pulse, k_timeout_t timeout)

Capture a single PWM period/pulse width in nanoseconds for a single PWM input.
This API function wraps calls to pwm_capture_cycles() and pwm_cycles_to_nsec() and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.

Note: CONFIG_PWM_CAPTURE must be selected for this function to be available.

Parameters
- channel – PWM channel.
- flags – PWM capture flags.
- period – [out] Pointer to the memory to store the captured PWM period width (in nsec).
- pulse – [out] Pointer to the memory to store the captured PWM pulse width (in nsec).
- timeout – Waiting period for the capture to complete.

Return values
- 0 – If successful.
- -EBUSY – PWM capture already in progress.
- -EAGAIN – Waiting period timed out.
- -EIO – IO error while capturing.
- -ERANGE – If result is too large.
- -errno – Other negative errno code on failure.

static inline bool pwm_is_ready_dt(const struct pwm_dt_spec *spec)
Validate that the PWM device is ready.

Parameters
- spec – PWM specification from devicetree

Return values
- true – If the PWM device is ready for use
- false – If the PWM device is not ready for use

struct pwm_dt_spec
#include <pwm.h> Container for PWM information specified in devicetree.
This type contains a pointer to a PWM device, channel number (controlled by the PWM device), the PWM signal period in nanoseconds and the flags applicable to the channel. Note that not all PWM drivers support flags. In such case, flags will be set to 0.

```
Channel number.

```c
uint32_t period
```
Period in nanoseconds.

```c
pwm_flags_t flags
```
Flags.

### 7.6.38 Real-Time Clock (RTC)

#### Overview

<table>
<thead>
<tr>
<th>Word</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Real-time clock</td>
<td>Low power device tracking time using broken-down time</td>
</tr>
<tr>
<td>Real-time counter</td>
<td>Low power counter which can be used to track time</td>
</tr>
<tr>
<td>RTC</td>
<td>Acronym for real-time clock</td>
</tr>
</tbody>
</table>

An RTC is a low power device which tracks time using broken-down time. It should not be confused with low-power counters which sometimes share the same name, acronym, or both.

RTCs are usually optimized for low energy consumption and are usually kept running even when the system is in a low power state.

RTCs usually contain one or more alarms which can be configured to trigger at a given time. These alarms are commonly used to wake up the system from a low power state.
History of RTCs in Zephyr

RTCs have been supported before this API was created, using the Counter API. The unix timestamp was used to convert between broken-down time and the unix timestamp within the RTC drivers, which internally used the broken-down time representation.

The disadvantages of this approach were that hardware counters could not be set to a specific count, requiring all RTCs to use device specific APIs to set the time, converting from unix time to broken-down time, unnecessarily in some cases, and some common features missing, like input clock calibration and the update callback.

Configuration Options

Related configuration options:

- CONFIG_RTC
- CONFIG_RTC_ALARM
- CONFIG_RTC_UPDATE
- CONFIG_RTC_CALIBRATION

API Reference

*group rtc_interface*

RTC Interface.

**RTC Interface Alarm**

**int rtc_alarm_get_supported_fields**(*const struct device* dev, uint16_t id, uint16_t mask)*

API for getting the supported fields of the RTC alarm time.

**Note:** Bits in the mask param are defined here `RTC_ALARM_TIME_MASK`.

**Parameters**

- *dev* – Device instance
- *id* – Id of the alarm
- *mask* – Mask of fields in the alarm time which are supported

**Returns**

- 0 if successful
- -EINVAL if id is out of range or time is invalid

**Returns**

- -ENOTSUP if API is not supported by hardware

**Returns**

- errno code if failure
int rtc_alarm_set_time(const struct device *dev, uint16_t id, uint16_t mask, const struct rtc_time *timeptr)

API for setting RTC alarm time.

To enable an RTC alarm, one or more fields of the RTC alarm time must be enabled. The mask designates which fields of the RTC alarm time to enable. If the mask parameter is 0, the alarm will be disabled. The RTC alarm will trigger when all enabled fields of the alarm time match the RTC time.

**Note:** The timeptr param may be NULL if the mask param is 0

**Note:** Only the enabled fields in the timeptr param need to be configured

**Note:** Bits in the mask param are defined here `RTC_ALARM_TIME_MASK`

**Parameters**
- dev – Device instance
- id – Id of the alarm
- mask – Mask of fields in the alarm time to enable
- timeptr – The alarm time to set

**Returns**
- 0 if successful

**Returns**
- EINVAL if id is out of range or time is invalid

**Returns**
- ENOTSUP if API is not supported by hardware

**Returns**
- errno code if failure

int rtc_alarm_get_time(const struct device *dev, uint16_t id, uint16_t *mask, struct rtc_time *timeptr)

API for getting RTC alarm time.

**Note:** Bits in the mask param are defined here `RTC_ALARM_TIME_MASK`

**Parameters**
- dev – Device instance
- id – Id of the alarm
- mask – Destination for mask of fields which are enabled in the alarm time
- timeptr – Destination for the alarm time

**Returns**
- 0 if successful

**Returns**
- EINVAL if id is out of range
Returns
- ENOTSUP if API is not supported by hardware

Returns
-_errno code if failure

int rtc_alarm_is_pending(const struct device *dev, uint16_t id)
API for testing if RTC alarm is pending.
Test whether or not the alarm with id is pending. If the alarm is pending, the pending
status is cleared.

Parameters
  • dev – Device instance
  • id – Id of the alarm to test

Returns
  1 if alarm was pending

Returns
  0 if alarm was not pending

Returns
  -EINVAL if id is out of range

Returns
  -ENOTSUP if API is not supported by hardware

Returns
-_errno code if failure

int rtc_alarm_set_callback(const struct device *dev, uint16_t id, rtc_alarm_callback callback, void *user_data)
API for setting alarm callback.
Setting the alarm callback for an alarm, will enable the alarm callback. When the
callback for an alarm is enabled, the alarm triggered event will invoke the callback,
after which the alarm pending status will be cleared automatically. The alarm will
remain enabled until manually disabled using rtc_alarm_set_time().
To disable the alarm callback for an alarm, the callback and user_data parameters
must be set to NULL. When the alarm callback for an alarm is disabled, the alarm
triggered event will set the alarm status to “pending”. To check if the alarm status is
“pending”, use rtc_alarm_is_pending().

Parameters
  • dev – Device instance
  • id – Id of the alarm for which the callback shall be set
  • callback – Callback called when alarm occurs
  • user_data – Optional user data passed to callback

Returns
  0 if successful

Returns
  -EINVAL if id is out of range

Returns
  -ENOTSUP if API is not supported by hardware

Returns
-_errno code if failure
RTC Interface Update

int rtc_update_set_callback(const struct device *dev, rtc_update_callback callback, void *user_data)

API for setting update callback.

Setting the update callback will enable the update callback. The update callback will be invoked every time the RTC clock is updated by 1 second. It can be used to synchronize the RTC clock with other clock sources.

To disable the update callback for the RTC clock, the callback and user_data parameters must be set to NULL.

Parameters

- dev – Device instance
- callback – Callback called when update occurs
- user_data – Optional user data passed to callback

Returns

- 0 if successful
- -ENOTSUP if API is not supported by hardware
- -errno code if failure

RTC Interface Calibration

int rtc_set_calibration(const struct device *dev, int32_t calibration)

API for setting RTC calibration.

Calibration is applied to the RTC clock input. A positive calibration value will increase the frequency of the RTC clock, a negative value will decrease the frequency of the RTC clock.

Parameters

- dev – Device instance
- calibration – Calibration to set in parts per billion

Returns

- 0 if successful
- -EINVAL if calibration is out of range
- -ENOTSUP if API is not supported by hardware
- -errno code if failure

int rtc_get_calibration(const struct device *dev, int32_t *calibration)

API for getting RTC calibration.

Parameters

- dev – Device instance
- calibration – Destination for calibration in parts per billion
Returns
0 if successful

Returns
-ENOTSUP if API is not supported by hardware

Returns
-errno code if failure

RTC Interface Helpers

static inline struct tm *rtc_time_to_tm(struct rtc_time *timeptr)
   Convenience function for safely casting a rtc_time pointer to a tm pointer.

RTC Alarm Time Mask

Mask for alarm time fields to enable when setting alarm time

RTC_ALARM_TIME_MASK_SECOND
RTC_ALARM_TIME_MASK_MINUTE
RTC_ALARM_TIME_MASK_HOUR
RTC_ALARM_TIME_MASK_MONTHDAY
RTC_ALARM_TIME_MASK_MONTH
RTC_ALARM_TIME_MASK_YEAR
RTC_ALARM_TIME_MASK_WEEKDAY
RTC_ALARM_TIME_MASK_YEARDAY
RTC_ALARM_TIME_MASK_NSEC

Typedefs

typedef void (*rtc_update_callback)(const struct device *dev, void *user_data)
RTC update event callback.

Param dev
   Device instance invoking the handler

Param user_data
   Optional user data provided when update irq callback is set
typedef void (*rtc_alarm_callback)(const struct device *dev, uint16_t id, void *user_data)
RTC alarm triggered callback.

**Param dev**
Device instance invoking the handler

**Param id**
Alarm id

**Param user_data**
Optional user data passed with the alarm configuration

**Functions**

```c
int rtc_set_time(const struct device *dev, const struct rtc_time *timeptr)
```
API for setting RTC time.

**Parameters**
- `dev` – Device instance
- `timeptr` – The time to set

**Returns**
- 0 if successful
- -EINVAL if RTC time is invalid or exceeds hardware capabilities
- -errno code if failure

```c
int rtc_get_time(const struct device *dev, struct rtc_time *timeptr)
```
API for getting RTC time.

**Parameters**
- `dev` – Device instance
- `timeptr` – Destination for the time

**Returns**
- 0 if successful
- -ENODATA if RTC time has not been set
- -errno code if failure

```c
struct rtc_time
#include <rtc.h> Structure for storing date and time values with sub-second precision.
The structure is 1-1 mapped to the struct tm for the members tm_sec to tm_isdst making it compatible with the standard time library.
```

**Note:** Use `rtc_time_to_tm()` to safely cast from a `rtc_time` pointer to a tm pointer.
Public Members

```c
int tm_sec
    Seconds [0, 59].

int tm_min
    Minutes [0, 59].

int tm_hour
    Hours [0, 23].

int tm_mday
    Day of the month [1, 31].

int tm_mon
    Month [0, 11].

int tm_year
    Year - 1900.

int tm_wday
    Day of the week [0, 6] (Sunday = 0) (Unknown = -1)

int tm_yday
    Day of the year [0, 365] (Unknown = -1)

int tm_isdst
    Daylight saving time flag [-1] (Unknown = -1)

int tm_nsec
    Nanoseconds [0, 999999999] (Unknown = 0)
```

RTC device driver test suite

The test suite validates the behavior of the RTC device driver. It is designed to be portable between boards. It uses the device tree alias `rtc` to designate the RTC device to test.

This test suite tests the following:

- Setting and getting the time.
- RTC Time incrementing correctly.
- Alarms if supported by hardware, with and without callback enabled
- Calibration if supported by hardware.

The calibration test tests a range of values which are printed to the console to be manually compared. The user must review the set and gotten values to ensure they are valid.

By default, only the mandatory setting and getting of time is enabled for testing. To test the optional alarms, update event callback and clock calibration, these must be enabled by selecting `CONFIG_RTC_ALARM`, `CONFIG_RTC_UPDATE` and `CONFIG_RTC_CALIBRATION`.

3284 Chapter 7. Hardware Support
The following examples build the test suite for the native_sim board. To build the test suite for a different board, replace the native_sim board with your board.

To build the test application with the default configuration, testing only the mandatory features, the following command can be used for reference:

```
# From the root of the zephyr repository
west build -b native_sim tests/drivers/rtc/rtc_api
```

To build the test with additional RTC features enabled, use menuconfig to enable the additional features by updating the configuration. The following command can be used for reference:

```
# From the root of the zephyr repository
west build -b native_sim tests/drivers/rtc/rtc_api
west build -t menuconfig
```

Then build the test application using the following command:

```
# From the root of the zephyr repository
west build -b native_sim tests/drivers/rtc/rtc_api
```

To run the test suite, flash and run the application on your board, the output will be printed to the console.

**Note:** The tests take up to 30 seconds each if they are testing real hardware.

**RTC emulated device**

The emulated RTC device fully implements the RTC API, and will behave like a real RTC device, with the following limitations:

- RTC time is not persistent across application initialization.
- RTC alarms are not persistent across application initialization.
- RTC time will drift over time.

Every time an application is initialized, the RTC's time and alarms are reset. Reading the time using `rtc_get_time()` will return -ENODATA, until the time is set using `rtc_set_time()`. The RTC will then behave as a real RTC, until the application is reset.

The emulated RTC device driver is built for the compatible zephyr,rtc-emul and will be included if CONFIG_RTC is selected.

**7.6.39 Regulators**

This subsystem provides control of voltage and current regulators. A common example is a GPIO that controls a transistor that supplies current to a device that is not always needed. Another example is a PMIC, typically a much more complex device.

The *-supply devicetree properties are used to identify the regulator(s) that a devicetree node directly depends on. Within the driver for the node the regulator API is used to issue requests for power when the device is to be active, and release the power request when the device shuts down.

The simplest case where a regulator is needed is one where there is only one client. For those situations the cost of using the regulator device infrastructure is not justified, and *-gpios devicetree properties should be used. There is no device interface to these regulators as they are entirely controlled within the driver for the corresponding node, e.g. a sensor.
API Reference

*group regulator_interface*

Regulator Interface.

**Regulator error flags.**

- **REGULATOR_ERROR_OVER_VOLTAGE**
  Voltage is too high.

- **REGULATOR_ERROR_OVER_CURRENT**
  Current is too high.

- **REGULATOR_ERROR_OVER_TEMP**
  Temperature is too high.

**Typedefs**

- **typedef uint8_t regulator_dvs_state_t**
  Opaque type to store regulator DVS states.

- **typedef uint8_t regulator_mode_t**
  Opaque type to store regulator modes.

- **typedef uint8_t regulator_error_flags_t**
  Opaque bit map for regulator error flags (see *REGULATOR_ERRORS*)

**Functions**

- **int regulator_enable(const struct device *dev)**
  Enable a regulator.

  Reference-counted request that a regulator be turned on. A regulator is considered “on” when it has reached a stable/usable state. Regulators that are always on, or configured in devicetree with *regulator-always-on* will always stay enabled, and so this function will always succeed.

  **Parameters**
  - *dev* – Regulator device instance

  **Return values**
  - 0 – If regulator has been successfully enabled.
  - -errno – Negative errno in case of failure.
  - -ENOTSUP – If regulator enablement can not be controlled.
bool regulator_is_enabled(const struct device *dev)

Check if a regulator is enabled.

**Parameters**

- dev – Regulator device instance.

**Return values**

- true – If regulator is enabled.
- false – If regulator is disabled.

int regulator_disable(const struct device *dev)

Disable a regulator.

Release a regulator after a previous regulator_enable() completed successfully. Regulators that are always on, or configured in devicetree with regulator-always-on will always stay enabled, and so this function will always succeed.

This must be invoked at most once for each successful regulator_enable().

**Parameters**

- dev – Regulator device instance.

**Return values**

- 0 – If regulator has been successfully disabled.
- -errno – Negative errno in case of failure.
- -ENOTSUP – If regulator disablement can not be controlled.

static inline unsigned int regulator_count_voltages(const struct device *dev)

Obtain the number of supported voltage levels.

Each voltage level supported by a regulator gets an index, starting from zero. The total number of supported voltage levels can be used together with regulator_list_voltage() to list all supported voltage levels.

**Parameters**

- dev – Regulator device instance.

**Returns**

Number of supported voltages.

static inline int regulator_list_voltage(const struct device *dev, unsigned int idx, int32_t *volt_uv)

Obtain the value of a voltage given an index.

Each voltage level supported by a regulator gets an index, starting from zero. Together with regulator_count_voltages(), this function can be used to iterate over all supported voltages.

**Parameters**

- dev – Regulator device instance.
- idx – Voltage index.
- volt_uv – [out] Where voltage for the given index will be stored, in microvolts.

**Return values**

- 0 – If index corresponds to a supported voltage.
- -EINVAL – If index does not correspond to a supported voltage.

7.6. Peripherals
bool regulator_is_supported_voltage(const struct device *dev, int32_t min_uv, int32_t max_uv)

Check if a voltage within a window is supported.

Parameters

- `dev` – Regulator device instance.
- `min_uv` – Minimum voltage in microvolts.
- `max_uv` – maximum voltage in microvolts.

Return values

- `true` – If voltage is supported.
- `false` – If voltage is not supported.

int regulator_set_voltage(const struct device *dev, int32_t min_uv, int32_t max_uv)

Set the output voltage.

The output voltage will be configured to the closest supported output voltage. `regulator_get_voltage()` can be used to obtain the actual configured voltage. The voltage will be applied to the active or selected mode. Output voltage may be limited using `regulator-min-microvolt` and/or `regulator-max-microvolt` in devicetree.

Parameters

- `dev` – Regulator device instance.
- `min_uv` – Minimum acceptable voltage in microvolts.
- `max_uv` – Maximum acceptable voltage in microvolts.

Return values

- `0` – If successful.
- `-EINVAL` – If the given voltage window is not valid.
- `-ENOSYS` – If function is not implemented.
- `-errno` – In case of any other error.

static inline int regulator_get_voltage(const struct device *dev, int32_t *volt_uv)

Obtain output voltage.

Parameters

- `dev` – Regulator device instance.
- `volt_uv` – [out] Where configured output voltage will be stored.

Return values

- `0` – If successful
- `-ENOSYS` – If function is not implemented.
- `-errno` – In case of any other error.

static inline unsigned int regulator_count_current_limits(const struct device *dev)

Obtain the number of supported current limit levels.

Each current limit level supported by a regulator gets an index, starting from zero. The total number of supported current limit levels can be used together with `regulator_list_current_limit()` to list all supported current limit levels.

Parameters

- `dev` – Regulator device instance.
Returns
Number of supported current limits.

static inline int regulator_list_current_limit(const struct device *dev, unsigned int idx, int32_t *current_ua)

Obtain the value of a current limit given an index.

Each current limit level supported by a regulator gets an index, starting from zero. Together with regulator_count_current_limits(), this function can be used to iterate over all supported current limits.

Parameters
• dev – Regulator device instance.
• idx – Current index.
• current_ua – [out] Where current for the given index will be stored, in microamps.

Return values
• 0 – If index corresponds to a supported current limit.
• -EINVAL – If index does not correspond to a supported current limit.

int regulator_set_current_limit(const struct device *dev, int32_t min_ua, int32_t max_ua)

Set output current limit.

The output current limit will be configured to the closest supported output current limit. regulator_get_current_limit() can be used to obtain the actual configured current limit. Current may be limited using current-min-microamp and/or current-max-microamp in Devicetree.

Parameters
• dev – Regulator device instance.
• min_ua – Minimum acceptable current limit in microamps.
• max_ua – Maximum acceptable current limit in microamps.

Return values
• 0 – If successful.
• -EINVAL – If the given current limit window is not valid.
• -ENOSYS – If function is not implemented.
• -errno – In case of any other error.

static inline int regulator_get_current_limit(const struct device *dev, int32_t *curr_ua)

Get output current limit.

Parameters
• dev – Regulator device instance.
• curr_ua – [out] Where output current limit will be stored.

Return values
• 0 – If successful.
• -ENOSYS – If function is not implemented.
• -errno – In case of any other error.
int regulator_set_mode(const struct device *dev, regulator_mode_t mode)
    Set mode.

Regulators can support multiple modes in order to permit different voltage configuration or better power savings. This API will apply a mode for the regulator. Allowed modes may be limited using regulator-allowed-modes devicetree property.

Parameters
• dev – Regulator device instance.
• mode – Mode to select for this regulator.

Return values
• 0 – If successful.
• -ENOTSUP – If mode is not supported.
• -ENOSYS – If function is not implemented.
• -errno – In case of any other error.

static inline int regulator_get_mode(const struct device *dev, regulator_mode_t *mode)
Get mode.

Parameters
• dev – Regulator device instance.
• mode – [out] Where mode will be stored.

Return values
• 0 – If successful.
• -ENOSYS – If function is not implemented.
• -errno – In case of any other error.

static inline int regulator_set_active_discharge(const struct device *dev, bool active_discharge)
Set active discharge setting.

Parameters
• dev – Regulator device instance.
• active_discharge – Active discharge enable or disable.

Return values
• 0 – If successful.
• -ENOSYS – If function is not implemented.
• -errno – In case of any other error.

static inline int regulator_get_active_discharge(const struct device *dev, bool *active_discharge)
Get active discharge setting.

Parameters
• dev – Regulator device instance.
• active_discharge – [out] Where active discharge will be stored.

Return values
• 0 – If successful.
• -ENOSYS – If function is not implemented.
Parameters

- dev – Regulator device instance.
- flags – [out] Where error flags will be stored.

Return values

- 0 – If successful.
- -ENOSYS – If function is not implemented.
- -errno – In case of any other error.

### 7.6.40 Reset Controller

**Overview**

Reset controllers are units that control the reset signals to multiple peripherals. The reset controller API allows peripheral drivers to request control over their reset input signals, including the ability to assert, deassert and toggle those signals. Also, the reset status of the reset input signal can be checked.

Mainly, the line_assert and line_deassert API functions are optional because in most cases we want to toggle the reset signals.

**Configuration Options**

Related configuration options:

- CONFIG_RESET

**API Reference**

group reset_controller_interface

Reset Controller Interface.

**Defines**

RESET_DT_SPEC_GET_BY_IDX(node_id, idx)

Static initializer for a reset_dt_spec.

This returns a static initializer for a reset_dt_spec structure given a devicetree node identifier, a property specifying a Reset Controller and an index.

Example devicetree fragment:

```bash
n: node {
    resets = &reset 10;
}
```

Example usage:
const struct reset_dt_spec spec = RESET_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), 0);
// Initializes 'spec' to:
// {
//   .dev = DEVICE_DT_GET(DT_NODELABEL(reset)),
//   .id = 10
// }

The `reset` field must still be checked for readiness, e.g. using `device_is_ready()`. It is an error to use this macro unless the node exists, has the given property, and that property specifies a reset controller reset line id as shown above.

Parameters

- `node_id` – devicetree node identifier
- `idx` – logical index into “resets”

Returns

static initializer for a struct `reset_dt_spec` for the property

RESET_DT_SPEC_GET(node_id)
Equivalent to `RESET_DT_SPEC_GET_BY_IDX(node_id, 0)`.

See also:

`RESET_DT_SPEC_GET_BY_IDX()`

Parameters

- `node_id` – devicetree node identifier

Returns

static initializer for a struct `reset_dt_spec` for the property

RESET_DT_SPEC_INST_GET_BY_IDX(inst, idx)
Static initializer for a `reset_dt_spec` from a DT_DRV_COMPAT instance's Reset Controller property at an index.

See also:

`RESET_DT_SPEC_GET_BY_IDX()`

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into “resets”

Returns

static initializer for a struct `reset_dt_spec` for the property

RESET_DT_SPEC_INST_GET(inst)
Equivalent to `RESET_DT_SPEC_INST_GET_BY_IDX(inst, 0)`.

See also:

`RESET_DT_SPEC_INST_GET_BY_IDX()`

Parameters

- `inst` – DT_DRV_COMPAT instance number
Returns
static initializer for a struct reset_dt_spec for the property

Functions

int reset_status(const struct device *dev, uint32_t id, uint8_t *status)
Get the reset status.
This function returns the reset status of the device.

Parameters
• dev – Reset controller device.
• id – Reset line.
• status – Where to write the reset status.

Return values
• 0 – On success.
• -ENOSYS – If the functionality is not implemented by the driver.
• -errno – Other negative errno in case of failure.

static inline int reset_status_dt(const struct reset_dt_spec *spec, uint8_t *status)
Get the reset status from a reset_dt_spec.
This is equivalent to:
reset_status(spec->dev, spec->id, status);

Parameters
• spec – Reset controller specification from devicetree
• status – Where to write the reset status.

Returns
a value from reset_status()

int reset_line_assert(const struct device *dev, uint32_t id)
Put the device in reset state.
This function sets/clears the reset bits of the device, depending on the logic level
(active-high/active-low).

Parameters
• dev – Reset controller device.
• id – Reset line.

Return values
• 0 – On success.
• -ENOSYS – If the functionality is not implemented by the driver.
• -errno – Other negative errno in case of failure.

static inline int reset_line_assert_dt(const struct reset_dt_spec *spec)
Assert the reset state from a reset_dt_spec.
This is equivalent to:
reset_line_assert(spec->dev, spec->id);
Parameters
- `spec` – Reset controller specification from devicetree

Returns
a value from `reset_line_assert()`

```c
int reset_line_deassert(const struct device *dev, uint32_t id)
```

Take out the device from reset state.
This function sets/clears the reset bits of the device, depending on the logic level (active-low/active-high).

Parameters
- `dev` – Reset controller device.
- `id` – Reset line.

Return values
- `0` – On success.
- `-ENOSYS` – If the functionality is not implemented by the driver.
- `-errno` – Other negative errno in case of failure.

```c
static inline int reset_line_deassert_dt(const struct reset_dt_spec *spec)
```

Deassert the reset state from a `reset_dt_spec`.
This is equivalent to:

```c
reset_line_deassert(spec->dev, spec->id)
```

Parameters
- `spec` – Reset controller specification from devicetree

Returns
a value from `reset_line_deassert()

```c
int reset_line_toggle(const struct device *dev, uint32_t id)
```

Reset the device.
This function performs reset for a device (assert + deassert).

Parameters
- `dev` – Reset controller device.
- `id` – Reset line.

Return values
- `0` – On success.
- `-ENOSYS` – If the functionality is not implemented by the driver.
- `-errno` – Other negative errno in case of failure.

```c
static inline int reset_line_toggle_dt(const struct reset_dt_spec *spec)
```

Reset the device from a `reset_dt_spec`.
This is equivalent to:

```c
reset_line_toggle(spec->dev, spec->id)
```
• spec – Reset controller specification from devicetree

**Returns**

a value from `reset_line_toggle()`

```c
struct reset_dt_spec
    #include <reset.h> Reset controller device configuration.

Public Members

const struct device *dev
    Reset controller device.

uint32_t id
    Reset line.
```

### 7.6.41 Retained Memory

**Overview**

The retained memory driver API provides a way of reading from/writing to memory areas whereby the contents of the memory is retained whilst the device is powered (data may be lost in low power modes).

**Configuration Options**

Related configuration options:

- `CONFIG_RETAINED_MEM`
- `CONFIG_RETAINED_MEM_INIT_PRIORITY`
- `CONFIG_RETAINED_MEM_MUTEX_FORCE_DISABLE`

**Mutex protection**

Mutex protection of retained memory drivers is enabled by default when applications are compiled with multithreading support. This means that different threads can safely call the retained memory functions without clashing with other concurrent thread function usage, but means that retained memory functions cannot be used from ISRs. It is possible to disable mutex protection globally on all retained memory drivers by enabling `CONFIG_RETAINED_MEM_MUTEX_FORCE_DISABLE` - users are then responsible for ensuring that the function calls do not conflict with each other.

**API Reference**

```c
group retained_mem_interface
    Retained memory driver interface.
```
**Typedefs**

```c
typedef ssize_t (*retained_mem_size_api)(const struct device *dev)
    Callback API to get size of retained memory area.
    See retained_mem_size() for argument description.

typedef int (*retained_mem_read_api)(const struct device *dev, off_t offset, uint8_t *buffer, size_t size)
    Callback API to read from retained memory area.
    See retained_mem_read() for argument description.

typedef int (*retained_mem_write_api)(const struct device *dev, off_t offset, const uint8_t *buffer, size_t size)
    Callback API to write to retained memory area.
    See retained_mem_write() for argument description.

typedef int (*retained_mem_clear_api)(const struct device *dev)
    Callback API to clear retained memory area (reset all data to 0x00).
    See retained_mem_clear() for argument description.
```

**Functions**

```c
ssize_t retained_mem_size(const struct device *dev)
    Returns the size of the retained memory area.

Parameters
- dev – Retained memory device to use.

Return values
- Positive – value indicating size in bytes on success, else negative errno code.

int retained_mem_read(const struct device *dev, off_t offset, uint8_t *buffer, size_t size)
    Reads data from the Retained memory area.

Parameters
- dev – Retained memory device to use.
- offset – Offset to read data from.
- buffer – Buffer to store read data in.
- size – Size of data to read.

Return values
- 0 – on success else negative errno code.

int retained_mem_write(const struct device *dev, off_t offset, const uint8_t *buffer, size_t size)
    Writes data to the Retained memory area - underlying data does not need to be cleared prior to writing.

Parameters
- dev – Retained memory device to use.
- offset – Offset to write data to.
```
• **buffer** – Data to write.
• **size** – Size of data to be written.

**Return values**

0 – on success else negative errno code.

```c
int retained_mem_clear(const struct device *dev)
```

Clears data in the retained memory area by setting it to 0x00.

**Parameters**

• **dev** – Retained memory device to use.

**Return values**

0 – on success else negative errno code.

```c
struct retained_mem_driver_api
```

```
#include <retained_mem.h> Retained memory driver API API which can be used by a device to store data in a retained memory area.
```

Retained memory is memory that is retained while the device is powered but is lost when power to the device is lost (note that low power modes in some devices may clear the data also). This may be in a non-initialised RAM region, or in specific registers, but is not reset when a different application begins execution or the device is rebooted (without power loss). It must support byte-level reading and writing without a need to erase data before writing.

Note that drivers must implement all functions, none of the functions are optional.

### 7.6.42 Secure Digital High Capacity (SDHC)

The SDHC api offers a generic interface for interacting with an SD host controller device. It is used by the SD subsystem, and is not intended to be directly used by the application.

**Basic Operation**

**SD Host Controller** An SD host controller is a device capable of sending SD commands to an attached SD card. These commands can be sent using the native SD protocol, or over SPI. Some SD host controllers are also capable of communicating with MMC devices. The SDHC api is designed to provide a generic way to send commands to and interact with attached SD devices.

**Requests** The core of the SDHC api is the `sdhc_request()` api. Requests contain a `sdhc_command` command structure, and an optional `sdhc_data` data structure. The caller may check the return code, or the `response` field of the SD command structure to determine if the SDHC request succeeded. The data structure allows the caller to specify a number of blocks to transfer, and a buffer location to read or write them from. Whether the provided buffer is used for sending or reading data depends on the command opcode provided.

**Host Controller I/O** The `sdhc_set_io()` api allows the user to change I/O settings of the SD host controller, such as clock frequency, I/O voltage, and card power. Not all controllers will support applying all I/O settings. For example, SPI mode controllers typically cannot toggle power to the SD card.

Related configuration options:

- **CONFIG_SDHC**
API Reference

**group sdhc_interface**
SDHC interface.

**SD command timeouts**

SDHC_TIMEOUT_FOREVER

**Defines**

SDHC_NATIVE_RESPONSE_MASK

SDHC_SPI_RESPONSE_TYPE_MASK

**Typedefs**

typedef void (*sdhc_interrupt_cb_t)(const struct device *dev, int reason, const void *user_data)
SDHC card interrupt callback prototype.
Function prototype for SDHC card interrupt callback.

- **Param dev**
  SDHC device that produced interrupt

- **Param reason**
  one of sdhc_interrupt_source values.

- **Param user_data**
  User data, set via sdhc_enable_interrupt

**Enums**

enum sdhc_bus_mode
SD bus mode.
Most controllers will use push/pull, including spi, but SDHC controllers that implement SD host specification can support open drain mode

- **Values:**

  - enumerator SDHC_BUSMODE_OPENDRAIN = 1
  
  - enumerator SDHC_BUSMODE_PUSHPULL = 2
enum sdhc_power

SD host controller power.

Many host controllers can control power to attached SD cards. This enum allows applications to request the host controller power off the SD card.

Values:

enumerator SDHC_POWER_OFF = 1
enumerator SDHC_POWER_ON = 2

enum sdhc_bus_width

SD host controller bus width.

Only relevant in SD mode, SPI does not support bus width. UHS cards will use 4 bit data bus, all cards start in 1 bit mode

Values:

enumerator SDHC_BUS_WIDTH1BIT = 1U
enumerator SDHC_BUS_WIDTH4BIT = 4U
enumerator SDHC_BUS_WIDTH8BIT = 8U

enum sdhc_timing_mode

SD host controller timing mode.

Used by SD host controller to determine the timing of the cards attached to the bus. Cards start with legacy timing, but UHS-II cards can go up to SDR104.

Values:

enumerator SDHC_TIMING_LEGACY = 1U
    Legacy 3.3V Mode.
enumerator SDHC_TIMING_HS = 2U
    Legacy High speed mode (3.3V)
enumerator SDHC_TIMING_SDR12 = 3U
    Identification mode & SDR12.
enumerator SDHC_TIMING_SDR25 = 4U
    High speed mode & SDR25.
enumerator SDHC_TIMING_SDR50 = 5U
    SDR49 mode.
enumerator SDHC_TIMING_SDR104 = 6U
    SDR104 mode.
enumerator SDHC_TIMING_DDR50 = 7U
  DDR50 mode.

enumerator SDHC_TIMING_DDR52 = 8U
  DDR52 mode.

enumerator SDHC_TIMING_HS200 = 9U
  HS200 mode.

enumerator SDHC_TIMING_HS400 = 10U
  HS400 mode.

enum sd_voltage
  SD voltage.
  UHS cards can run with 1.8V signalling for improved power consumption. Legacy cards may support 3.0V signalling, and all cards start at 3.3V. Only relevant for SD controllers, not SPI ones.
  
  Values:

enumerator SD_VOL_3_3_V = 1U
  card operation voltage around 3.3v

enumerator SD_VOL_3_0_V = 2U
  card operation voltage around 3.0v

enumerator SD_VOL_1_8_V = 3U
  card operation voltage around 1.8v

enumerator SD_VOL_1_2_V = 4U
  card operation voltage around 1.2v

enum sdhc_interrupt_source
  SD host controller interrupt sources.
  Interrupt sources for SD host controller.
  Values:

enumerator SDHC_INT_SDIO = BIT(0)
  Card interrupt, used by SDIO cards.

enumerator SDHC_INT_INSERTED = BIT(1)
  Card was inserted into slot.

enumerator SDHC_INT_REMOVED = BIT(2)
  Card was removed from slot.

Functions
int sdhc_hw_reset(const struct device *dev)
reset SDHC controller state

Used when the SDHC has encountered an error. Resetting the SDHC controller should
clear all errors on the SDHC, but does not necessarily reset I/O settings to boot (this can
be done with sdhc_set_io)

Parameters
• dev – SD host controller device

Return values
• 0 – reset succeeded
• -ETIMEDOUT – controller reset timed out
• -EIO – reset failed

int sdhc_request(const struct device *dev, struct sdhc_command *cmd, struct sdhc_data *
data)
Send command to SDHC.
Sends a command to the SD host controller, which will send this command to attached
SD cards.

Parameters
• dev – SDHC device
• cmd – SDHC command
• data – SDHC data. Leave NULL to send SD command without data.

Return values
• 0 – command was sent successfully
• -ETIMEDOUT – command timed out while sending
• -ENOTSUP – host controller does not support command
• -EIO – I/O error

int sdhc_set_io(const struct device *dev, struct sdhc_io *io)
set I/O properties of SDHC

I/O properties should be reconfigured when the card has been sent a command to
change its own SD settings. This function can also be used to toggle power to the SD
card.

Parameters
• dev – SDHC device
• io – I/O properties

Returns
0 I/O was configured correctly

Returns
-ENOTSUP controller does not support these I/O settings

Returns
-EIO controller could not configure I/O settings

int sdhc_card_present(const struct device *dev)
check for SDHC card presence

Checks if card is present on the SD bus. Note that if a controller requires cards be
powered up to detect presence, it should do so in this function.
Parameters

- `dev` – SDHC device

Return values

- 1 – card is present
- 0 – card is not present
- -EIO – I/O error

`int sdhc_execute_tuning(const struct device *dev)`

run SDHC tuning

SD cards require signal tuning for UHS modes SDR104 and SDR50. This function allows an application to request the SD host controller to tune the card.

Parameters

- `dev` – SDHC device

Return values

- 0 – tuning succeeded, card is ready for commands
- -ETIMEDOUT – tuning failed after timeout
- -ENOTSUP – controller does not support tuning
- -EIO – I/O error while tuning

`int sdhc_card_busy(const struct device *dev)`

check if SD card is busy

This check should generally be implemented as checking the line level of the DAT[0:3] lines of the SD bus. No SD commands need to be sent, the controller simply needs to report the status of the SD bus.

Parameters

- `dev` – SDHC device

Return values

- 0 – card is not busy
- 1 – card is busy
- -EIO – I/O error

`int sdhc_get_host_props(const struct device *dev, struct sdhc_host_props *props)`

Get SD host controller properties.

Gets host properties from the host controller. Host controller should initialize all values in the `sdhc_host_props` structure provided.

Parameters

- `dev` – SDHC device
- `props` – property structure to be filled by sdhc driver

Return values

- 0 – function succeeded.
- -ENOTSUP – host controller does not support this call
int sdhc_enable_interrupt(const struct device *dev, sdhc_interrupt_cb_t callback, int sources, void *user_data)

Enable SDHC interrupt sources.

Enables SDHC interrupt sources. Each subsequent call of this function should replace the previous callback set, and leave only the interrupts specified in the “sources” argument enabled.

**Parameters**
- `dev` – SDHC device
- `callback` – Callback called when interrupt occurs
- `sources` – bitmask of `sdhc_interrupt_source` values indicating which interrupts should produce a callback
- `user_data` – parameter that will be passed to callback function

**Return values**
- `0` – interrupts were enabled, and callback was installed
- `-ENOTSUP` – controller does not support this function
- `-EIO` – I/O error

int sdhc_disable_interrupt(const struct device *dev, int sources)

Disable SDHC interrupt sources.

Disables SDHC interrupt sources. If multiple sources are enabled, only the ones specified in “sources” will be masked.

**Parameters**
- `dev` – SDHC device
- `sources` – bitmask of `sdhc_interrupt_source` values indicating which interrupts should be disabled.

**Return values**
- `0` – interrupts were disabled
- `-ENOTSUP` – controller does not support this function
- `-EIO` – I/O error

struct sdhc_command

`#include <sdhc.h>` SD host controller command structure.

This command structure is used to send command requests to an SD host controller, which will be sent to SD devices.

**Public Members**

`uint32_t opcode`

SD Host specification CMD index.

`uint32_t arg`

SD host specification argument.

uint32_t response[4]
SD card response field.

uint32_t response_type
Expected SD response type.

unsigned int retries
Max number of retries.

int timeout_ms
Command timeout in milliseconds.

struct sdhc_data
#include <sdhc.h> SD host controller data structure.
This command structure is used to send data transfer requests to an SD host controller, which will be sent to SD devices.

**Public Members**

unsigned int block_addr
Block to start read from.

unsigned int block_size
Block size.

unsigned int blocks
Number of blocks.

unsigned int bytes_xfered
populated with number of bytes sent by SDHC

void *data
Data to transfer or receive.

int timeout_ms
data timeout in milliseconds

struct sdhc_host_caps
#include <sdhc.h> SD host controller capabilities.
SD host controller capability flags. These flags should be set by the SDHC driver, using the sdhc_get_host_props api.

**Public Members**

unsigned int timeout_clk_freq
Timeout clock frequency.
unsigned int timeout_clk_unit
    Timeout clock unit.

unsigned int sd_base_clk
    SD base clock frequency.

unsigned int max_blk_len
    Max block length.

unsigned int bus_8_bit_support
    8-bit Support for embedded device

unsigned int bus_4_bit_support
    4 bit bus support

unsigned int adma_2_support
    ADMA2 support.

unsigned int high_spd_support
    High speed support.

unsigned int sdma_support
    SDMA support.

unsigned int suspend_res_support
    Suspend/Resume support.

unsigned int vol_330_support
    Voltage support 3.3V.

unsigned int vol_300_support
    Voltage support 3.0V.

unsigned int vol_180_support
    Voltage support 1.8V.

unsigned int address_64_bit_support_v4
    64-bit system address support for V4

unsigned int address_64_bit_support_v3
    64-bit system address support for V3

unsigned int sdio_async_interrupt_support
    Asynchronous interrupt support.

unsigned int slot_type
    Slot type.

7.6. Peripherals
unsigned int sdr50_support
    SDR50 support.

unsigned int sdr104_support
    SDR104 support.

unsigned int ddr50_support
    DDR50 support.

unsigned int uhs_2_support
    UHS-II support.

unsigned int drv_type_a_support
    Driver type A support.

unsigned int drv_type_c_support
    Driver type C support.

unsigned int drv_type_d_support
    Driver type D support.

unsigned int retune_timer_count
    Timer count for re-tuning.

unsigned int sdr50_needs_tuning
    Use tuning for SDR50.

unsigned int retuning_mode
    Re-tuning mode.

unsigned int clk_multiplier
    Clock multiplier.

unsigned int adma3_support
    ADMA3 support.

unsigned int vdd2_180_support
    1.8V VDD2 support

unsigned int hs200_support
    HS200 support.

unsigned int hs400_support
    HS400 support.

struct sdhc_io
    #include <sdhc.h> SD host controller I/O control structure.

    Controls I/O settings for the SDHC. Note that only a subset of these settings apply to host
    controllers in SPI mode. Populate this struct, then call sdhc_set_io to apply I/O settings
Public Members

typedef enum sdhc_clock_speed {clock} Clock rate.

typedef enum sdhc_bus_mode {bus_mode} command output mode

typedef enum sdhc_power {power_mode} SD power supply mode.

typedef enum sdhc_bus_width {bus_width} SD bus width.

typedef enum sdhc_timing_mode {timing} SD bus timing.

typedef enum sd_driver_type {driver_type} SD driver type.

typedef enum sd_voltage {signal_voltage} IO signalling voltage (usually 1.8 or 3.3V)

struct sdhc_host_props

#include <sdhc.h> SD host controller properties.

Populated by the host controller using sdhc_get_host_props api.

Public Members

unsigned int f_max
Max bus frequency.

unsigned int f_min
Min bus frequency.

unsigned int power_delay
Delay to allow SD to power up or down (in ms)

struct sdhc_host_caps {host_caps}
Host capability bitfield.

uint32_t max_current_330
Max current (in mA) at 3.3V.

uint32_t max_current_300
Max current (in mA) at 3.0V.
7.6.43 Sensors

The sensor subsystem exposes an API to uniformly access sensor devices. Common operations are: reading data and executing code when specific conditions are met.

Basic Operation

Channels  Fundamentally, a channel is a quantity that a sensor device can measure.

Sensors can have multiple channels, either to represent different axes of the same physical property (e.g. acceleration); or because they can measure different properties altogether (ambient temperature, pressure and humidity). Complex sensors cover both cases, so a single device can expose three acceleration channels and a temperature one.

It is imperative that all sensors that support a given channel express results in the same unit of measurement. Consult the API Reference for all supported channels, along with their description and units of measurement:

Values  Sensor stable APIs return results as sensor_value. This representation avoids use of floating point values as they may not be supported on certain setups.

A newer experimental (may change) API that can interpret raw sensor data is available in parallel. This new API exposes raw encoded sensor data to the application and provides a separate decoder to convert the data to a Q31 format which is compatible with the Zephyr Digital Signal Processing (DSP). The values represented are in the range of (-1.0, 1.0) and require a shift operation in order to scale them to their SI unit values. See Async Read for more information.

Fetching Values  Getting a reading from a sensor requires two operations. First, an application instructs the driver to fetch a sample of all its channels. Then, individual channels may be read. In the case of channels with multiple axes, they can be read in a single operation by supplying the corresponding _XYZ channel type and a buffer of 3 sensor_value objects. This approach ensures consistency of channels between reads and efficiency of communication by issuing a single transaction on the underlying bus.

Below is an example illustrating the usage of the BME280 sensor, which measures ambient temperature and atmospheric pressure. Note that sensor_sample_fetch() is only called once, as it reads and compensates data for both channels.
const struct device *const dev = DEVICE_DT_GET_ANY(bosch_bme280);

if (dev == NULL) {
    /* No such node, or the node does not have status "okay". */
    printk("Error: no device found.

return NULL;
}

if (!device_is_ready(dev)) {
    printk("Error: Device ""%s" is not ready; "
    "check the driver initialization logs for errors.
    dev->name);
    return NULL;
}

printk("Found device ""%s", getting sensor data

return dev;
}

int main(void)
{
    const struct device *dev = get_bme280_device();

    if (dev == NULL) {
        return 0;
    }

    while (1) {
        struct sensor_value temp, press, humidity;

        sensor_sample_fetch(dev);
        sensor_channel_get(dev, SENSOR_CHAN_AMBIENT_TEMP, &temp);
        sensor_channel_get(dev, SENSOR_CHAN_PRESS, &press);
        sensor_channel_get(dev, SENSOR_CHAN_HUMIDITY, &humidity);

        printk("temp: %d.%06d; press: %d.%06d; humidity: %d.%06d

44 temp.val1, temp.val2, press.val1, press.val2,
        humidity.val1, humidity.val2);

        k_sleep(K_MSEC(1000));
    }

    return 0;
}

Async Read  To enable the async APIs, use CONFIG_SENSOR_ASYNC_API.

Reading the sensors leverages the Real Time I/O (RTIO) subsystem. Applications gain control of
the data processing thread and even memory management. In order to get started with reading
the sensors, an IODev must be created via the SENSOR_DT_READ_IODEV. Next, an RTIO context
must be created. It is strongly suggested that this context is created with a memory pool via
RTIO_DEFINE_WITH_MEMPOOL.

#include <zephyr/device.h>
#include <zephyr/drivers/sensor.h>
#include <zephyr/rtio/rtio.h>

static const struct device *lid_accel = DEVICE_DT_GET(DT_ALIAS(lid_accel));
SENSOR_DT_READ_IODEV(lid_accel_iodev, DT_ALIAS(lid_accel), SENSOR_CHAN_ACCEL_XYZ);
RTIO_DEFINE_WITH_MEMPOOL(sensors_rtio,
To trigger a read, the application simply needs to call `sensor_read()` and pass the relevant IODEV and RTIO context. Getting the result is done like any other RTIO operation, by waiting on a completion queue event (CQE). In order to help reduce some boilerplate code, the helper function `sensor_processing_with_callback()` is provided. When called, the function will block until a CQE becomes available from the provided RTIO context. The appropriate buffers are extracted and the callback is called. Once the callback is done, the memory is reclaimed by the memory-pool. This looks like:

```c
static void sensor_processing_callback(int result, uint8_t *buf,
                                       uint32_t buf_len, void *userdata) {
    // Process the data...
}
static void sensor_processing_thread(void *, void *, void *) {
    while (true) {
        sensor_processing_with_callback(&sensors_rtio, sensor_processing_callback);
    }
}
K_THREAD_DEFINE(sensor_processing_tid, 1024, sensor_processing_thread,
                NULL, NULL, NULL, 0, 0, 0);
```

**Note:** Helper functions to create custom length IODEV nodes and ones that don’t have static bindings will be added soon.

**Processing the Data** Once data collection completes and the processing callback was called, processing the data is done via the `sensor_decoder_api`. The API provides a means for applications to control when to process the data and how many resources to dedicate to the processing. The API is entirely self contained and requires no system calls (even when `CONFIG_USERSPACE` is enabled).

```c
static struct sensor_decoder_api *lid_accel_decoder = SENSOR_DECODER_DT_GET(DT_ALIAS(lid_accel));

static void sensor_processing_callback(int result, uint8_t *buf,
                                        uint32_t buf_len, void *userdata) {

    uint64_t timestamp;
    sensor_frame_iterator_t fit = {0};
    sensor_channel_iterator_t cit = {0};
    enum sensor_channel channels[3];
    q31_t values[3];
    int8_t shift[3];
    lid_accel_decoder->get_timestamp(buf, &timestamp);
    lid_accel_decoder->decode(buf, &fit, &cit, channels, values, 3);

    /* Values are now in q31_t format, we're going to convert them to micro-units */

    /* First, we need to know by how much to shift the values */
    lid_accel_decoder->get_shift(buf, channels[0], &shift[0]);
    lid_accel_decoder->get_shift(buf, channels[1], &shift[1]);

    // Process the data...
}
```
Configuration and Attributes

Setting the communication bus and address is considered the most basic configuration for sensor devices. This setting is done at compile time, via the configuration menu. If the sensor supports interrupts, the interrupt lines and triggering parameters described below are also configured at compile time.

Alongside these communication parameters, sensor chips typically expose multiple parameters that control the accuracy and frequency of measurement. In compliance with Zephyr’s design goals, most of these values are statically configured at compile time.

However, certain parameters could require runtime configuration, for example, threshold values for interrupts. These values are configured via attributes. The example in the following section showcases a sensor with an interrupt line that is triggered when the temperature crosses a threshold. The threshold is configured at runtime using an attribute.

Triggers

Triggers in Zephyr refer to the interrupt lines of the sensor chips. Many sensor chips support one or more triggers. Some examples of triggers include: new data is ready for reading, a channel value has crossed a threshold, or the device has sensed motion.

To configure a trigger, an application needs to supply a `sensor_trigger` and a handler function. The structure contains the trigger type and the channel on which the trigger must be configured.

Because most sensors are connected via SPI or I2C buses, it is not possible to communicate with them from the interrupt execution context. The execution of the trigger handler is deferred to a thread, so that data fetching operations are possible. A driver can spawn its own thread to fetch data, thus ensuring minimum latency. Alternatively, multiple sensor drivers can share a system-wide thread. The shared thread approach increases the latency of handling interrupts but uses less memory. You can configure which approach to follow for each driver. Most drivers can entirely disable triggers resulting in a smaller footprint.

The following example contains a trigger fired whenever temperature crosses the 26 degree Celsius threshold. It also samples the temperature every second. A real application would ideally disable periodic sampling in the interest of saving power. Since the application has direct access to the kernel config symbols, no trigger is registered when triggering was disabled by the driver’s configuration.

group sensor_interface
    Sensor Interface.
Defines

`SENSOR_DECODER_CONTEXT_INIT(decoder_, buffer_, channel_, channel_index_)`

Initialize a `sensor_decode_context`.

`SENSOR_STREAM_TRIGGER_PREP(_trigger, _opt)`

`SENSOR_DT_READ_IODEV(name, dt_node, ...)`

Define a reading instance of a sensor.

Use this macro to generate a `rtio_iodev` for reading specific channels. Example:

```c
SENSOR_DT_READ_IODEV(icm42688_accelgyro, DT_NODELABEL(icm42688),
                      SENSOR_CHAN_ACCEL_XYZ, SENSOR_CHAN_GYRO_XYZ);
int main(void) {
    sensor_read(&icm42688_accelgyro, &rtio);
}
```

`SENSOR_DT_STREAM_IODEV(name, dt_node, ...)`

Define a stream instance of a sensor.

Use this macro to generate a `rtio_iodev` for starting a stream that's triggered by specific interrupts. Example:

```c
SENSOR_DT_STREAM_IODEV(imu_stream, DT_ALIAS(imu),
                        {SENSOR_TRIG_FIFO_WATERMARK, SENSOR_STREAM_DATA_INCLUDE},
                        {SENSOR_TRIG_FIFO_FULL, SENSOR_STREAM_DATA_NOP});
int main(void) {
    struct rtio_sqe *handle;
    sensor_stream(&imu_stream, &rtio, NULL, &handle);
    k_msleep(1000);
    rtio_sqe_cancel(handle);
}
```

`SENSOR_CHANNEL_3_AXIS(chan)`

checks if a given channel is a 3-axis channel

**Parameters**

- chan – **[in]** The channel to check

**Return values**

- true – if chan is any of `SENSOR_CHAN_ACCEL_XYZ`, `SENSOR_CHAN_GYRO_XYZ`, or `SENSOR_CHAN_MAGN_XYZ`
- false – otherwise

`SENSOR_G`

The value of gravitational constant in micro m/s^2.

`SENSOR_PI`

The value of constant PI in micros.

`SENSOR_INFO_DEFINE(name, ...)`

`SENSOR_INFO_DT_DEFINE(node_id)`
SENSOR_DEVICE_DT_DEFINE(node_id, init_fn, pm_device, data_ptr, cfg_ptr, level, prio, 
api_ptr, ...)

Like DEVICE_DT_DEFINE() with sensor specifics.

Defines a device which implements the sensor API. May define an element in the sensor
info iterable section used to enumerate all sensor devices.

**Parameters**

- **node_id** – The devicetree node identifier.
- **init_fn** – Name of the init function of the driver.
- **pm_device** – PM device resources reference (NULL if device does not use PM).
- **data_ptr** – Pointer to the device's private data.
- **cfg_ptr** – The address to the structure containing the configuration in-
information for this instance of the driver.
- **level** – The initialization level. See SYS_INIT() for details.
- **prio** – Priority within the selected initialization level. See SYS_INIT() for
details.
- **api_ptr** – Provides an initial pointer to the API function struct used by
the driver. Can be NULL.

SENSOR_DEVICE_DT_INST_DEFINE(inst, ...)

Like SENSOR_DEVICE_DT_DEFINE() for an instance of a DT_DRV_COMPAT compatible.

**Parameters**

- **inst** – instance number. This is replaced by DT_DRV_COMPAT(inst) in the
call to SENSOR_DEVICE_DT_DEFINE().
- **...** – other parameters as expected by SENSOR_DEVICE_DT_DEFINE().

**Typedefs**

typedef void (*sensor_trigger_handler_t)(const struct device *dev, const struct
sensor_trigger *trigger)

Callback API upon firing of a trigger.

**Param dev**
Pointer to the sensor device

**Param trigger**
The trigger

typedef int (*sensor_attr_set_t)(const struct device *dev, enum sensor_channel chan,
enum sensor_attribute attr, const struct sensor_value *val)

Callback API upon setting a sensor's attributes.

See sensor_attr_set() for argument description

typedef int (*sensor_attr_get_t)(const struct device *dev, enum sensor_channel chan,
enum sensor_attribute attr, struct sensor_value *val)

Callback API upon getting a sensor's attributes.

See sensor_attr_get() for argument description
typedef int (*sensor_trigger_set_t)(const struct device *dev, const struct sensor_trigger *trig, sensor_trigger_handler_t handler)

Callback API for setting a sensor's trigger and handler.
See sensor_trigger_set() for argument description

typedef int (*sensor_sample_fetch_t)(const struct device *dev, enum sensor_channel chan)

Callback API for fetching data from a sensor.
See sensor_sample_fetch() for argument description

typedef int (*sensor_channel_get_t)(const struct device *dev, enum sensor_channel chan, struct sensor_value *val)

Callback API for getting a reading from a sensor.
See sensor_channel_get() for argument description

typedef int (*sensor_get_decoder_t)(const struct device *dev, const struct sensor_decoder_api **api)

Get the decoder associate with the given device.

See also:
sensor_get_decoder for more details

typedef int (*sensor_submit_t)(const struct device *sensor, struct rtio_iodev_sqe *sqe)

typedef void (*sensor_processing_callback_t)(int result, uint8_t *buf, uint32_t buf_len, void *userdata)

Callback function used with the helper processing function.

See also:
sensor_processing_with_callback

**Param result**
  [in] The result code of the read (0 being success)

**Param buf**
  [in] The data buffer holding the sensor data

**Param buf_len**
  [in] The length (in bytes) of the buf

**Param userdata**
  [in] The optional userdata passed to sensor_read()

Enums

defined sensor_channel
  Sensor channels.

Values:

7.6. Peripherals
enumerator SENSOR_CHAN_ACCEL_X
    Acceleration on the X axis, in m/s^2.

enumerator SENSOR_CHAN_ACCEL_Y
    Acceleration on the Y axis, in m/s^2.

enumerator SENSOR_CHAN_ACCEL_Z
    Acceleration on the Z axis, in m/s^2.

enumerator SENSOR_CHAN_ACCEL_XYZ
    Acceleration on the X, Y and Z axes.

enumerator SENSOR_CHAN_GYRO_X
    Angular velocity around the X axis, in radians/s.

enumerator SENSOR_CHAN_GYRO_Y
    Angular velocity around the Y axis, in radians/s.

enumerator SENSOR_CHAN_GYRO_Z
    Angular velocity around the Z axis, in radians/s.

enumerator SENSOR_CHAN_GYRO_XYZ
    Angular velocity around the X, Y and Z axes.

enumerator SENSOR_CHAN_MAGN_X
    Magnetic field on the X axis, in Gauss.

enumerator SENSOR_CHAN_MAGN_Y
    Magnetic field on the Y axis, in Gauss.

enumerator SENSOR_CHAN_MAGN_Z
    Magnetic field on the Z axis, in Gauss.

enumerator SENSOR_CHAN_MAGN_XYZ
    Magnetic field on the X, Y and Z axes.

enumerator SENSOR_CHAN_DIE_TEMP
    Device die temperature in degrees Celsius.

enumerator SENSOR_CHAN_AMBIENT_TEMP
    Ambient temperature in degrees Celsius.

enumerator SENSOR_CHAN_PRESS
    Pressure in kilopascal.

enumerator SENSOR_CHAN_PROX
    Proximity.
    Adimensional. A value of 1 indicates that an object is close.
enumerator SENSOR_CHAN_HUMIDITY
   Humidity, in percent.

enumerator SENSOR_CHAN_LIGHT
   Illuminance in visible spectrum, in lux.

enumerator SENSOR_CHAN_IR
   Illuminance in infra-red spectrum, in lux.

enumerator SENSOR_CHAN_RED
   Illuminance in red spectrum, in lux.

enumerator SENSOR_CHAN_GREEN
   Illuminance in green spectrum, in lux.

enumerator SENSOR_CHAN_BLUE
   Illuminance in blue spectrum, in lux.

enumerator SENSOR_CHAN_ALTITUDE
   Altitude, in meters.

enumerator SENSOR_CHAN_PM_1_0
   1.0 micro-meters Particulate Matter, in ug/m^3

enumerator SENSOR_CHAN_PM_2_5
   2.5 micro-meters Particulate Matter, in ug/m^3

enumerator SENSOR_CHAN_PM_10
   10 micro-meters Particulate Matter, in ug/m^3

enumerator SENSOR_CHAN_DISTANCE
   Distance.
   From sensor to target, in meters

enumerator SENSOR_CHAN_CO2
   CO2 level, in parts per million (ppm)

enumerator SENSOR_CHAN_VOC
   VOC level, in parts per billion (ppb)

enumerator SENSOR_CHAN_GAS_RES
   Gas sensor resistance in ohms.

enumerator SENSOR_CHAN_VOLTAGE
   Voltage, in volts.

enumerator SENSOR_CHAN_VSHUNT
   Current Shunt Voltage in milli-volts.
enumerator SENSOR_CHAN_CURRENT
Current, in amps.

enumerator SENSOR_CHAN_POWER
Power in watts.

enumerator SENSOR_CHAN_RESISTANCE
Resistance, in Ohm.

enumerator SENSOR_CHAN_ROTATION
Angular rotation, in degrees.

enumerator SENSOR_CHAN_POS_DX
Position change on the X axis, in points.

enumerator SENSOR_CHAN_POS_DY
Position change on the Y axis, in points.

enumerator SENSOR_CHAN_POS_DZ
Position change on the Z axis, in points.

enumerator SENSOR_CHAN_RPM
Revolutions per minute, in RPM.

enumerator SENSOR_CHAN_GAUGE_VOLTAGE
Voltage, in volts.

enumerator SENSOR_CHAN_GAUGE_AVG_CURRENT
Average current, in amps.

enumerator SENSOR_CHAN_GAUGE_STDBY_CURRENT
Standby current, in amps.

enumerator SENSOR_CHAN_GAUGE_MAX_LOAD_CURRENT
Max load current, in amps.

enumerator SENSOR_CHAN_GAUGE_TEMP
Gauge temperature

enumerator SENSOR_CHAN_GAUGE_STATE_OF_CHARGE
State of charge measurement in %.

enumerator SENSOR_CHAN_GAUGE_FULL_CHARGE_CAPACITY
Full Charge Capacity in mAh.

enumerator SENSOR_CHAN_GAUGE_REMAINING_CHARGE_CAPACITY
Remaining Charge Capacity in mAh.
enumerator SENSOR_CHAN_GAUGE_NOM_AVAIL_CAPACITY
Nominal Available Capacity in mAh.

denumerator SENSOR_CHAN_GAUGE_FULL_AVAIL_CAPACITY
Full Available Capacity in mAh.

denumerator SENSOR_CHAN_GAUGE_AVG_POWER
Average power in mW.

denumerator SENSOR_CHAN_GAUGE_STATE_OF_HEALTH
State of health measurement in %.

denumerator SENSOR_CHAN_GAUGE_TIME_TO_EMPTY
Time to empty in minutes.

denumerator SENSOR_CHAN_GAUGE_TIME_TO_FULL
Time to full in minutes.

denumerator SENSOR_CHAN_GAUGE_CYCLE_COUNT
Cycle count (total number of charge/discharge cycles)

denumerator SENSOR_CHAN_GAUGE_DESIGN_VOLTAGE
Design voltage of cell in V (max voltage)

denumerator SENSOR_CHAN_GAUGE_DESIRED_VOLTAGE
Desired voltage of cell in V (nominal voltage)

denumerator SENSOR_CHAN_GAUGE_DESIRED_CHARGING_CURRENT
Desired charging current in mA.

denumerator SENSOR_CHAN_ALL
All channels.

denumerator SENSOR_CHAN_COMMON_COUNT
Number of all common sensor channels.

denumerator SENSOR_CHAN_PRIV_START = SENSOR_CHAN_COMMON_COUNT
This and higher values are sensor specific.
Refer to the sensor header file.

denumerator SENSOR_CHAN_MAX = INT16_MAX
Maximum value describing a sensor channel type.

e enum sensor_trigger_type
  Sensor trigger types.

  Values:
enumerator SENSOR_TRIG_TIMER
    Timer-based trigger, useful when the sensor does not have an interrupt line.

eenumerator SENSOR_TRIG_DATA_READY
    Trigger fires whenever new data is ready.

eenumerator SENSOR_TRIG_DELTA
    Trigger fires when the selected channel varies significantly.
    This includes any-motion detection when the channel is acceleration or gyro. If detection is based on slope between successive channel readings, the slope threshold is configured via the SENSOR_ATTR_SLOPE_TH and SENSOR_ATTR_SLOPE_DUR attributes.

eenumerator SENSOR_TRIG_NEAR_FAR
    Trigger fires when a near/far event is detected.

eenumerator SENSOR_TRIG_THRESHOLD
    Trigger fires when channel reading transitions configured thresholds.
    The thresholds are configured via the SENSOR_ATTR_LOWER_THRESH, SENSOR_ATTR_UPPER_THRESH, and SENSOR_ATTR_HYSTERESIS attributes.

eenumerator SENSOR_TRIG_TAP
    Trigger fires when a single tap is detected.

eenumerator SENSOR_TRIG_DOUBLE_TAP
    Trigger fires when a double tap is detected.

eenumerator SENSOR_TRIG_FREEFALL
    Trigger fires when a free fall is detected.

eenumerator SENSOR_TRIG_MOTION
    Trigger fires when motion is detected.

eenumerator SENSOR_TRIG_STATIONARY
    Trigger fires when no motion has been detected for a while.

eenumerator SENSOR_TRIG_FIFO_WATERMARK
    Trigger fires when the FIFO watermark has been reached.

eenumerator SENSOR_TRIG_FIFO_FULL
    Trigger fires when the FIFO becomes full.

eenumerator SENSOR_TRIG_COMMON_COUNT
    Number of all common sensor triggers.

eenumerator SENSOR_TRIG_PRIV_START = SENSOR_TRIG_COMMON_COUNT
    This and higher values are sensor specific.
    Refer to the sensor header file.
enumerator SENSOR_TRIG_MAX = INT16_MAX
   Maximum value describing a sensor trigger type.

defined sensor_attribute
   Sensor attribute types.
   Values:

   enumerator SENSOR_ATTR_SAMPLING_FREQUENCY
      Sensor sampling frequency, i.e.
      how many times a second the sensor takes a measurement.

   enumerator SENSOR_ATTR_LOWER_THRESH
      Lower threshold for trigger.

   enumerator SENSOR_ATTR_UPPER_THRESH
      Upper threshold for trigger.

   enumerator SENSOR_ATTR_SLOPE_TH
      Threshold for any-motion (slope) trigger.

   enumerator SENSOR_ATTR_SLOPE_DUR
      Duration for which the slope values needs to be outside the threshold for the trig-
      ger to fire.

   enumerator SENSOR_ATTR_HYSTERESIS

   enumerator SENSOR_ATTR_OVERSAMPLING
      Oversampling factor.

   enumerator SENSOR_ATTR_FULL_SCALE
      Sensor range, in SI units.

   enumerator SENSOR_ATTR_OFFSET
      The sensor value returned will be altered by the amount indicated by offset: fi-
      nal_value = sensor_value + offset.

   enumerator SENSOR_ATTR_CALIB_TARGET
      Calibration target.
      This will be used by the internal chip's algorithms to calibrate itself on a certain
      axis, or all of them.

   enumerator SENSOR_ATTR_CONFIGURATION
      Configure the operating modes of a sensor.

   enumerator SENSOR_ATTR_CALIBRATION
      Set a calibration value needed by a sensor.
enumerator SENSOR_ATTR_FEATURE_MASK
   Enable/disable sensor features.

enumerator SENSOR_ATTR_ALERT
   Alert threshold or alert enable/disable.

enumerator SENSOR_ATTR_FF_DUR
   Free-fall duration represented in milliseconds.
   If the sampling frequency is changed during runtime, this attribute should be set
to adjust freefall duration to the new sampling frequency.

enumerator SENSOR_ATTR_BATCH_DURATION
   Hardware batch duration in ticks.

enumerator SENSOR_ATTR_COMMON_COUNT
   Number of all common sensor attributes.

enumerator SENSOR_ATTR_PRIV_START = SENSOR_ATTR_COMMON_COUNT
   This and higher values are sensor specific.
   Refer to the sensor header file.

enumerator SENSOR_ATTR_MAX = INT16_MAX
   Maximum value describing a sensor attribute type.

enum sensor_stream_data_opt
   Options for what to do with the associated data when a trigger is consumed.
   Values:

enumerator SENSOR_STREAM_DATA_INCLUDE = 0
   Include whatever data is associated with the trigger.

enumerator SENSOR_STREAM_DATA_NOP = 1
   Do nothing with the associated trigger data, it may be consumed later.

enumerator SENSOR_STREAM_DATA_DROP = 2
   Flush/clear whatever data is associated with the trigger.

Functions

static inline int sensor_decode(struct sensor_decode_context *ctx, void *out, uint16_t max_count)
   Decode N frames using a sensor_decode_context.

Parameters

• ctx – [inout] The context to use for decoding
• out – [out] The output buffer
• max_count – [in] Maximum number of frames to decode
Returns
The decode result from `sensor_decoder_api`'s decode function

```c
int sensor_natively_supported_channel_size_info(enum sensor_channel channel,
    size_t *base_size, size_t *
    *frame_size)
```

Set an attribute for a sensor:

```c
int sensor_attr_set(const struct device *dev, enum sensor_channel chan, enum
    sensor_attribute attr, const struct sensor_value *val)
```

Parameters
- **dev** – Pointer to the sensor device
- **chan** – The channel the attribute belongs to, if any. Some attributes may only be set for all channels of a device, depending on device capabilities.
- **attr** – The attribute to set
- **val** – The value to set the attribute to

Returns
0 if successful, negative errno code if failure.

```c
int sensor_attr_get(const struct device *dev, enum sensor_channel chan, enum
    sensor_attribute attr, struct sensor_value *val)
```

Get an attribute for a sensor:

Parameters
- **dev** – Pointer to the sensor device
- **chan** – The channel the attribute belongs to, if any. Some attributes may only be set for all channels of a device, depending on device capabilities.
- **attr** – The attribute to get
- **val** – Pointer to where to store the attribute

Returns
0 if successful, negative errno code if failure.

```c
static inline int sensor_trigger_set(const struct device *dev, const struct
    sensor_trigger *trig, sensor_trigger_handler_t handler)
```

Activate a sensor's trigger and set the trigger handler.

The handler will be called from a thread, so I2C or SPI operations are safe. However, the thread's stack is limited and defined by the driver. It is currently up to the caller to ensure that the handler does not overflow the stack.

The user-allocated trigger will be stored by the driver as a pointer, rather than a copy, and passed back to the handler. This enables the handler to use CONTAINER_OF to retrieve a context pointer when the trigger is embedded in a larger struct and requires that the trigger is not allocated on the stack.

Function properties (list may not be complete)

**supervisor**

```c
Parameters
- **dev** – Pointer to the sensor device
- **trig** – The trigger to activate
- **handler** – The function that should be called when the trigger fires
```

7.6. Peripherals
Returns
0 if successful, negative errno code if failure.

int sensor_sample_fetch(const struct device *dev)
Fetch a sample from the sensor and store it in an internal driver buffer.
Read all of a sensor's active channels and, if necessary, perform any additional operations necessary to make the values useful. The user may then get individual channel values by calling sensor_channel_get.
The function blocks until the fetch operation is complete.
Since the function communicates with the sensor device, it is unsafe to call it in an ISR if the device is connected via I2C or SPI.

Parameters
• dev – Pointer to the sensor device

Returns
0 if successful, negative errno code if failure.

int sensor_sample_fetch_chan(const struct device *dev, enum sensor_channel type)
Fetch a sample from the sensor and store it in an internal driver buffer.
Read and compute compensation for one type of sensor data (magnetometer, accelerometer, etc). The user may then get individual channel values by calling sensor_channel_get.
This is mostly implemented by multi function devices enabling reading at different sampling rates.
The function blocks until the fetch operation is complete.
Since the function communicates with the sensor device, it is unsafe to call it in an ISR if the device is connected via I2C or SPI.

Parameters
• dev – Pointer to the sensor device
• type – The channel that needs updated

Returns
0 if successful, negative errno code if failure.

int sensor_channel_get(const struct device *dev, enum sensor_channel chan, struct sensor_value *val)
Get a reading from a sensor device.
Return a useful value for a particular channel, from the driver's internal data. Before calling this function, a sample must be obtained by calling sensor_sample_fetch or sensor_sample_fetch_chan. It is guaranteed that two subsequent calls of this function for the same channels will yield the same value, if sensor_sample_fetch or sensor_sample_fetch_chan has not been called in the meantime.
For vectorial data samples you can request all axes in just one call by passing the specific channel with _XYZ suffix. The sample will be returned at val[0], val[1] and val[2] (X, Y and Z in that order).

Parameters
• dev – Pointer to the sensor device
• chan – The channel to read
• val – Where to store the value
Returns
0 if successful, negative errno code if failure.

int sensor_get_decoder(const struct device *dev, const struct sensor_decoder_api **decoder)

Get the sensor's decoder API.

Parameters
• dev – [in] The sensor device
• decoder – [in] Pointer to the decoder which will be set upon success

Returns
0 on success

Returns
< 0 on error

int sensor_reconfigure_read_iodev(struct rtio_iodev *iodev, const struct device *sensor, const enum sensor_channel *channels, size_t num_channels)

Reconfigure a reading iodev.

Allows a reconfiguration of the iodev associated with reading a sample from a sensor.

Important: If the iodev is currently servicing a read operation, the data will likely be invalid. Please be sure the flush or wait for all pending operations to complete before using the data after a configuration change.

It is also important that the data field of the iodev is a sensor_read_config.

Parameters
• iodev – [in] The iodev to reconfigure
• sensor – [in] The sensor to read from
• channels – [in] One or more channels to read
• num_channels – [in] The number of channels in channels

Returns
0 on success

Returns
< 0 on error

static inline int sensor_stream(struct rtio_iodev *iodev, struct rtio *ctx, void *userdata, struct rtio_sqe **handle)

static inline int sensor_read(struct rtio_iodev *iodev, struct rtio *ctx, void *userdata)

Read data from a sensor.

Using cfg, read one snapshot of data from the device by using the provided RTIO context ctx. This call will generate a rtio_sqe that will leverage the RTIO's internal mem-pool when the time comes to service the read.

Parameters
• iodev – [in] The iodev created by SENSOR_DT_READ_IODEV
• ctx – [in] The RTIO context to service the read
• userdata – [in] Optional userdata that will be available when the read is complete

Returns
0 on success
Returns
< 0 on error

void sensor_processing_with_callback(struct rtio *ctx, sensor_processing_callback_t cb)
Helper function for common processing of sensor data.

This function can be called in a blocking manner after sensor_read() or in a standalone thread dedicated to processing. It will wait for a cqe from the RTIO context, once received, it will decode the userdata and call the cb. Once the cb returns, the buffer will be released back into ctx’s mempool if available.

Parameters
- ctx [in] The RTIO context to wait on
- cb [in] Callback to call when data is ready for processing

static inline int32_t sensor_ms2_to_g(const struct sensor_value *ms2)
Helper function to convert acceleration from m/s^2 to Gs.

Parameters
- ms2 [in] A pointer to a sensor_value struct holding the acceleration, in m/s^2.

Returns
The converted value, in Gs.

static inline void sensor_g_to_ms2(int32_t g, struct sensor_value *ms2)
Helper function to convert acceleration from Gs to m/s^2.

Parameters
- g [in] The G value to be converted.
- ms2 [out] A pointer to a sensor_value struct, where the result is stored.

static inline int32_t sensor_ms2_to_ug(const struct sensor_value *ms2)
Helper function to convert acceleration from m/s^2 to micro Gs.

Parameters
- ms2 [in] A pointer to a sensor_value struct holding the acceleration, in m/s^2.

Returns
The converted value, in micro Gs.

static inline void sensor_ug_to_ms2(int32_t ug, struct sensor_value *ms2)
Helper function to convert acceleration from micro Gs to m/s^2.

Parameters
- ug [in] The micro G value to be converted.
- ms2 [out] A pointer to a sensor_value struct, where the result is stored.

static inline int32_t sensor_rad_to_degrees(const struct sensor_value *rad)
Helper function for converting radians to degrees.

Parameters
- rad [in] A pointer to a sensor_value struct, holding the value in radians.

Returns
The converted value, in degrees.

static inline void sensor_degrees_to_rad(int32_t d, struct sensor_value *rad)
Helper function for converting degrees to radians.

Parameters
• d – The value (in degrees) to be converted.
• rad – A pointer to a sensor_value struct, where the result is stored.

static inline int32_t sensor_rad_to_10udegrees(const struct sensor_value *rad)
Helper function for converting radians to 10 micro degrees.
When the unit is 1 micro degree, the range that the int32_t can represent is +/-2147483 degrees. In order to increase this range, here we use 10 micro degrees as the unit.

Parameters
• rad – A pointer to a sensor_value struct, holding the value in radians.

Returns
The converted value, in 10 micro degrees.

static inline void sensor_10udegrees_to_rad(int32_t d, struct sensor_value *rad)
Helper function for converting 10 micro degrees to radians.

Parameters
• d – The value (in 10 micro degrees) to be converted.
• rad – A pointer to a sensor_value struct, where the result is stored.

static inline double sensor_value_to_double(const struct sensor_value *val)
Helper function for converting struct sensor_value to double.

Parameters
• val – A pointer to a sensor_value struct.

Returns
The converted value.

static inline float sensor_value_to_float(const struct sensor_value *val)
Helper function for converting struct sensor_value to float.

Parameters
• val – A pointer to a sensor_value struct.

Returns
The converted value.

static inline int sensor_value_from_double(struct sensor_value *val, double inp)
Helper function for converting double to struct sensor_value.

Parameters
• val – A pointer to a sensor_value struct.
• inp – The converted value.

Returns
0 if successful, negative errno code if failure.

static inline int sensor_value_from_float(struct sensor_value *val, float inp)
Helper function for converting float to struct sensor_value.

Parameters
• val – A pointer to a sensor_value struct.
• inp – The converted value.

Returns
0 if successful, negative errno code if failure.
static inline int64_t sensor_value_to_milli(const struct sensor_value *val)
  Helper function for converting struct sensor_value to integer milli units.

  Parameters
  • val – A pointer to a sensor_value struct.

  Returns
  The converted value.

static inline int64_t sensor_value_to_micro(const struct sensor_value *val)
  Helper function for converting struct sensor_value to integer micro units.

  Parameters
  • val – A pointer to a sensor_value struct.

  Returns
  The converted value.

static inline int sensor_value_from_milli(struct sensor_value *val, int64_t milli)
  Helper function for converting integer milli units to struct sensor_value.

  Parameters
  • val – A pointer to a sensor_value struct.
  • milli – The converted value.

  Returns
  0 if successful, negative errno code if failure.

static inline int sensor_value_from_micro(struct sensor_value *val, int64_t micro)
  Helper function for converting integer micro units to struct sensor_value.

  Parameters
  • val – A pointer to a sensor_value struct.
  • micro – The converted value.

  Returns
  0 if successful, negative errno code if failure.

struct sensor_value
  #include <sensor.h> Representation of a sensor readout value.

  The value is represented as having an integer and a fractional part, and can be ob-
  tained using the formula val1 + val2 * 10^-6. Negative values also adhere to the above
  formula, but may need special attention. Here are some examples of the value repre-
  sentation:

<table>
<thead>
<tr>
<th>Value</th>
<th>val1</th>
<th>val2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.5</td>
<td>0</td>
<td>500000</td>
</tr>
<tr>
<td>-0.5</td>
<td>0</td>
<td>-500000</td>
</tr>
<tr>
<td>-1.0</td>
<td>-1</td>
<td>0</td>
</tr>
<tr>
<td>-1.5</td>
<td>-1</td>
<td>-500000</td>
</tr>
</tbody>
</table>

  Public Members

  int32_t val1
    Integer part of the value.
int32_t val2
  Fractional part of the value (in one-millionth parts).

struct sensor_trigger
  #include <sensor.h> Sensor trigger spec.

Public Members

enum sensor_trigger_type type
  Trigger type.

enum sensor_channel chan
  Channel the trigger is set on.

struct sensor_decoder_api
  #include <sensor.h> Decodes a single raw data buffer.
  Data buffers are provided on the RTIO context that's supplied to sensor_read.

Public Members

int (*get_frame_count)(const uint8_t *buffer, enum sensor_channel channel, size_t channel_idx, uint16_t *frame_count)
  Get the number of frames in the current buffer.
  Param buffer  
    [in] The buffer provided on the RTIO context.
  Param channel  
    [in] The channel to get the count for
  Param channel_idx  
    [in] The index of the channel
  Param frame_count  
    [out] The number of frames on the buffer (at least 1)
  Return  
    0 on success
  Return  
    -ENOTSUP if the channel/channel_idx aren’t found

int (*get_size_info)(enum sensor_channel channel, size_t *base_size, size_t *frame_size)
  Get the size required to decode a given channel.
  When decoding a single frame, use base_size. For every additional frame, add another frame_size. As an example, to decode 3 frames use: ‘base_size + 2 * frame_size’.
  Param channel  
    [in] The channel to query
  Param base_size  
    [out] The size of decoding the first frame
  Param frame_size  
    [out] The additional size of every additional frame
  Return  
    0 on success
int (*decode)(const uint8_t *buffer, enum sensor_channel channel, size_t channel_idx, uint32_t *fit, uint16_t max_count, void *data_out)

Decode up to max_count samples from the buffer.

Decode samples of channel sensor_channel across multiple frames. If there exist multiple instances of the same channel, channel_index is used to differentiate them. As an example, assume a sensor provides 2 distance measurements:

```c
// Decode the first channel instance of 'distance'
decoder->decode(buffer, SENSOR_CHAN_DISTANCE, 0, &fit, 5, out);
...

// Decode the second channel instance of 'distance'
decoder->decode(buffer, SENSOR_CHAN_DISTANCE, 1, &fit, 5, out);
```

Param buffer
[in] The buffer provided on the RTIO context

Param channel
[in] The channel to decode

Param channel_idx
[in] The index of the channel

Param fit
[inout] The current frame iterator

Param max_count
[in] The maximum number of channels to decode.

Param data_out
[out] The decoded data

Return
0 no more samples to decode

Return
>0 the number of decoded frames

Return
<0 on error

bool (*has_trigger)(const uint8_t *buffer, enum sensor_trigger_type trigger)

Check if the given trigger type is present.

Param buffer
[in] The buffer provided on the RTIO context

Param trigger
[in] The trigger type in question

Return
Whether the trigger is present in the buffer

struct sensor_decode_context
```
#include <sensor.h> Used for iterating over the data frames via the sensor_decoder_api.
```

Example usage:
```
(c)
   struct sensor_decode_context ctx = SENSOR_DECODECONTEXT_INIT(
       decoder, buffer, SENSOR_CHAN_ACCEL_XYZ, 0);

   while (true) {
       struct sensor_three_axis_data accel_out_data;
       ```
num_decoded_channels = sensor_decode(ctx, &accel_out_data, 1);
if (num_decoded_channels <= 0) {
    printk("Done decoding buffer\n");
    break;
}
printk("Decoded (%" PRId32 ", %" PRId32 ", %" PRId32 ")\n", accel_out_data.readings[0].x, accel_out_data.readings[0].y, accel_out_data.readings[0].z);

structure sensor_stream_trigger
#include <sensor.h>

structure sensor_read_config
#include <sensor.h>

structure sensor_driver_api
#include <sensor.h>

structure sensor_data_generic_header
#include <sensor.h>

Group sensor_emulator_backend
Sensor emulator backend API.

Functions

static inline bool emul_sensor_backend_is_supported(const struct emul *target)
    Check if a given sensor emulator supports the backend API.

    Parameters
    • target – Pointer to emulator instance to query

    Returns
    True if supported, false if unsupported or if target is NULL.

static inline int emul_sensor_backend_set_channel(const struct emul *target, enum sensor_channel ch, const q31_t *value, int8_t shift)
    Set an expected value for a given channel on a given sensor emulator.

    Parameters
    • target – Pointer to emulator instance to operate on
    • ch – Sensor channel to set expected value for
    • value – Expected value in fixed-point format using standard SI unit for sensor type
    • shift – Shift value (scaling factor) applied to value

    Returns
    0 if successful
Returns
-ENOTSUP if no backend API or if channel not supported by emul

Returns
-ERANGE if provided value is not in the sensor's supported range

static inline int emul_sensor_backend_get_sample_range(const struct emul *target, enum sensor_channel ch, q31_t *lower, q31_t *upper, q31_t *epsilon, int8_t *shift)

Query an emulator for a channel's supported sample value range and tolerance.

Parameters
- target – Pointer to emulator instance to operate on
- ch – The channel to request info for. If ch is unsupported, return -ENOTSUP
- lower – [out] Minimum supported sample value in SI units, fixed-point format
- upper – [out] Maximum supported sample value in SI units, fixed-point format
- epsilon – [out] Tolerance to use comparing expected and actual values to account for rounding and sensor precision issues. This can usually be set to the minimum sample value step size. Uses SI units and fixed-point format.
- shift – [out] The shift value (scaling factor) associated with lower, upper, and epsilon.

Returns
0 if successful

Returns
-ENOTSUP if no backend API or if channel not supported by emul

static inline int emul_sensor_backend_set_attribute(const struct emul *target, enum sensor_channel ch, enum sensor_attribute attribute, const void *value)

Set the emulator's attribute values.

Parameters
- target – [in] Pointer to emulator instance to operate on
- ch – [in] The channel to request info for. If ch is unsupported, return -ENOTSUP
- attribute – [in] The attribute to set
- value – [in] the value to use (cast according to the channel/attribute pair)

Returns
0 is successful

Returns
< 0 on error

static inline int emul_sensor_backend_get_attribute_metadata(const struct emul *target, enum sensor_channel ch, enum sensor_attribute attribute, q31_t *min, q31_t *max, q31_t *increment, int8_t *shift)
Get metadata about an attribute.

Information provided by this function includes the minimum/maximum values of the attribute as well as the increment (value per LSB) which can be used as an epsilon when comparing results.

**Parameters**

- **target** – [in] Pointer to emulator instance to operate on
- **ch** – [in] The channel to request info for. If ch is unsupported, return ‘-ENOTSUP’
- **attribute** – [in] The attribute to request info for. If attribute is unsupported, return ‘-ENOTSUP’
- **min** – [out] The minimum value the attribute can be set to
- **max** – [out] The maximum value the attribute can be set to
- **increment** – [out] The value that the attribute increases by for every LSB
- **shift** – [out] The shift for min, max, and increment

**Returns**

0 on SUCCESS

< 0 on error

7.6.44 Serial Peripheral Interface (SPI) Bus

**Overview**

**API Reference**

**Related code samples**

**Enhanced Serial Peripheral Interface (eSPI)**

Use eSPI to connect to a slave device and exchange virtual wire packets.

**SPI bitbang**

Use the bitbang SPI driver for communicating with a slave.

```c
#include <spi.h>

int spi_open(int channel)
{
    // Open SPI using the channel
    return 0; // Success
}

int spi_setmode(int channel, int sopm)
{
    // Set SPI mode
    return 0; // Success
}

int spi_transfer(int channel, uint8_t *txdata, uint8_t *rxdata, int size)
{
    // Transfer data
    return 0; // Success
}
```

7.6. Peripherals
**SPI Polarity & Phase Modes**

**SPI_MODE_CPOL**
Clock Polarity: if set, clock idle state will be 1 and active state will be 0.
If untouched, the inverse will be true which is the default.

**SPI_MODE_CPHA**
Clock Phase: this dictates when is the data captured, and depends clock’s polarity.
When SPI_MODE_CPOL is set and this bit as well, capture will occur on low to high transition and high to low if this bit is not set (default). This is fully reversed if CPOL is not set.

**SPI_MODE_LOOP**
Whatever data is transmitted is looped-back to the receiving buffer of the controller.
This is fully controller dependent as some may not support this, and can be used for testing purposes only.

**SPI_MODE_GET(_mode_)**
Get SPI polarity and phase mode bits.

**SPI Transfer modes (host controller dependent)**

**SPI_TRANSFER_MSB**
Most significant bit first.

**SPI_TRANSFER_LSB**
Least significant bit first.

**SPI word size**

**SPI_Word_SIZE_GET(_operation_)**
Get SPI word size.

**SPI_Word_SET(_word_size_)**
Set SPI word size.

**Specific SPI devices control bits**

**SPI_HOLD_ON_CS**
Requests - if possible - to keep CS asserted after the transaction.

**SPI_LOCK_ON**
Keep the device locked after the transaction for the current config.
Use this with extreme caution (see *spi_release()* below) as it will prevent other callers to access the SPI device until *spi_release()* is properly called.
**SPI_CS_ACTIVE_HIGH**

Active high logic on CS.

Usually, and by default, CS logic is active low. However, some devices may require the reverse logic: active high. This bit will request the controller to use that logic. Note that not all controllers are able to handle that natively. In this case deferring the CS control to a gpio line through struct `spi_cs_control` would be the solution.

**SPI MISO lines**

Some controllers support dual, quad or octal MISO lines connected to slaves. Default is single, which is the case most of the time. Without `CONFIG_SPI_EXTENDED_MODES` being enabled, single is the only supported one.

- **SPI_LINES_SINGLE**
  Single line.

- **SPI_LINES_DUAL**
  Dual lines.

- **SPI_LINES QUAD**
  Quad lines.

- **SPI_LINES_OCTAL**
  Octal lines.

- **SPI_LINES_MASK**
  Mask for MISO lines in `spi_operation_t`.

**SPI duplex mode**

Some controllers support half duplex transfer, which results in 3-wire usage. By default, full duplex will prevail.

- **SPI_FULL_DUPLEX**

- **SPI_HALF_DUPLEX**

**SPI Frame Format**

2 frame formats are exposed: Motorola and TI.

The main difference is the behavior of the CS line. In Motorola it stays active the whole transfer. In TI, it's active only one serial clock period prior to actually make the transfer, it is thus inactive during the transfer, which ends when the clocks ends as well. By default, as it is the most commonly used, the Motorola frame format will prevail.

- **SPI_FRAME_FORMAT_MOTOROLA**

- **SPI_FRAME_FORMAT_TI**
Defines

SPI_CS_GPIOS_DT_SPEC_GET(spi_dev)
Get a struct gpio_dt_spec for a SPI device's chip select pin.

Example devicetree fragment:

```plaintext
gpio1: gpio@abcd0001 { ... };
gpio2: gpio@abcd0002 { ... };
spi@abcd0003 {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 \n        GPIO_ACTIVE_LOW>,
              <&gpio2 20 \n        GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
};
```

Example usage:

```c
SPI_CS_GPIOS_DT_SPEC_GET(DT_NODELABEL(a)) \n// { DEVICE_DT_GET(DT_NODELABEL(gpio1)), 10, GPIO_ACTIVE_LOW }
SPI_CS_GPIOS_DT_SPEC_GET(DT_NODELABEL(b)) \n// { DEVICE_DT_GET(DT_NODELABEL(gpio2)), 20, GPIO_ACTIVE_LOW }
```

Parameters
- spi_dev – a SPI device node identifier

Returns
- gpio_dt_spec struct corresponding with spi_dev's chip select

SPI_CS_GPIOS_DT_SPEC_INST_GET(inst)
Get a struct gpio_dt_spec for a SPI device's chip select pin.

This is equivalent to SPI_CS_GPIOS_DT_SPEC_GET(DT_DRV_INST(inst)).

Parameters
- inst – Devicetree instance number

Returns
- gpio_dt_spec struct corresponding with spi_dev's chip select

SPI_CS_CONTROL_INIT(node_id, delay_)
Initialize and get a pointer to a spi_cs_control from a devicetree node identifier.

This helper is useful for initializing a device on a SPI bus. It initializes a struct spi_cs_control and returns a pointer to it. Here, node_id is a node identifier for a SPI device, not a SPI controller.

Example devicetree fragment:

```plaintext
spi@abcd0001 {
    cs-gpios = <&gpio0 1 \n        GPIO_ACTIVE_LOW>;
    spidev: spi-device@0 { ... };
};
```
Example usage:

```c
struct spi_cs_control ctrl =
    SPI_CS_CONTROL_INIT(DT_NODELABEL(spidev), 2);
```

This example is equivalent to:

```c
struct spi_cs_control ctrl = {
    .gpio = SPI_CS_GPIOS_DT_SPEC_GET(DT_NODELABEL(spidev)),
    .delay = 2,
};
```

**Parameters**

- `node_id` – Devicetree node identifier for a device on a SPI bus
- `delay_` – The delay field to set in the `spi_cs_control`

**Returns**

a pointer to the `spi_cs_control` structure

`SPI_CS_CONTROL_INIT_INST(inst, delay_)`

Get a pointer to a `spi_cs_control` from a devicetree node.

This is equivalent to `SPI_CS_CONTROL_INIT(DT_DRV_INST(inst), delay)`.

Therefore, `DT_DRV_COMPAT` must already be defined before using this macro.

**Parameters**

- `inst` – Devicetree node instance number
- `delay_` – The delay field to set in the `spi_cs_control`

**Returns**

a pointer to the `spi_cs_control` structure

`SPI_CONFIG_DT(node_id, operation_, delay_)`

Structure initializer for `spi_config` from devicetree.

This helper macro expands to a static initializer for a struct `spi_config` by reading the relevant frequency, slave, and cs data from the devicetree.

**Parameters**

- `node_id` – Devicetree node identifier for the SPI device whose struct `spi_config` to create an initializer for
- `operation_` – the desired operation field in the struct `spi_config`
- `delay_` – the desired delay field in the struct `spi_config`’s `spi_cs_control`, if there is one

`SPI_CONFIG_DT_INST(inst, operation_, delay_)`

Structure initializer for `spi_config` from devicetree instance.

This is equivalent to `SPI_CONFIG_DT(DT_DRV_INST(inst), operation_, delay_)`.

**Parameters**

- `inst` – Devicetree instance number
- `operation_` – the desired operation field in the struct `spi_config`
- `delay_` – the desired delay field in the struct `spi_config`’s `spi_cs_control`, if there is one
SPI_DT_SPEC_GET(node_id, operation_, delay_)
Structure initializer for spi_dt_spec from devicetree.
This helper macro expands to a static initializer for a struct spi_dt_spec by reading the relevant bus, frequency, slave, and cs data from the devicetree.
Important: multiple fields are automatically constructed by this macro which must be checked before use. spi_is_ready performs the required device_is_ready checks.

Deprecated:
Use spi_is_ready_dt instead.

Parameters
- node_id – Devicetree node identifier for the SPI device whose struct spi_dt_spec to create an initializer for
- operation_ – the desired operation field in the struct spi_config
- delay_ – the desired delay field in the struct spi_config’s spi_cs_control, if there is one

SPI_DT_SPEC_INST_GET(inst, operation_, delay_)
Structure initializer for spi_dt_spec from devicetree instance.
This is equivalent to SPI_DT_SPEC_GET(DT_DRV_INST(inst), operation_, delay_).

Parameters
- inst – Devicetree instance number
- operation_ – the desired operation field in the struct spi_config
- delay_ – the desired delay field in the struct spi_config’s spi_cs_control, if there is one

SPI_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, level, prio, api, ...)

SPI_STATS_RX_BYTES_INC(dev_)
SPI_STATS_TX_BYTES_INC(dev_)
SPI_STATS_TRANSFER_ERROR_INC(dev_)
spi_transceive_stats(dev, error, tx_bufs, rx_bufs)

SPI_DT_IODEV_DEFINE(name, node_id, operation_, delay_)
Define an iodev for a given dt node on the bus.
These do not need to be shared globally but doing so will save a small amount of memory.

Parameters
- name – Symbolic name to use for defining the iodev
- node_id – Devicetree node identifier
- operation_ – SPI operational mode
- delay_ – Chip select delay in microseconds
Typedefs

typedef uint16_t spi_operation_t
    Opaque type to hold the SPI operation flags.

typedef int (*spi_api_io)(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs)
    Callback API for I/O See spi_transceive() for argument descriptions.
    Callback API for asynchronous I/O See spi_transceive_async() for argument descriptions.

typedef void (*spi_callback_t)(const struct device *dev, int result, void *data)
    SPI callback for asynchronous transfer requests.

    \textbf{Param dev}  
    SPI device which is notifying of transfer completion or error

    \textbf{Param result}  
    Result code of the transfer request. 0 is success, -errno for failure.

    \textbf{Param data}  
    Transfer requester supplied data which is passed along to the callback.

typedef int (*spi_api_io_async)(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs, spi_callback_t cb, void *userdata)

typedef int (*spi_api_release)(const struct device *dev, const struct spi_config *config)
    Callback API for unlocking SPI device.
    See spi_release() for argument descriptions

Functions

static inline bool spi_cs_is_gpio(const struct spi_config *config)
    Check if SPI CS is controlled using a GPIO.

    \textbf{Parameters}  
    \begin{itemize}
        \item config – SPI configuration.
    \end{itemize}

    \textbf{Returns}  
    true If CS is controlled using a GPIO.

    \textbf{Returns}  
    false If CS is controlled by hardware or any other means.

static inline bool spi_cs_is_gpio_dt(const struct spi_dt_spec *spec)
    Check if SPI CS in spi_dt_spec is controlled using a GPIO.

    \textbf{Parameters}  
    \begin{itemize}
        \item spec – SPI specification from devicetree.
    \end{itemize}

    \textbf{Returns}  
    true If CS is controlled using a GPIO.

    \textbf{Returns}  
    false If CS is controlled by hardware or any other means.
static inline bool spi_is_ready(const struct spi_dt_spec *spec)

Validate that SPI bus is ready.

**Parameters**

- **spec** – SPI specification from devicetree

**Return values**

- **true** – if the SPI bus is ready for use.
- **false** – if the SPI bus is not ready for use.

static inline bool spi_is_ready_dt(const struct spi_dt_spec *spec)

Validate that SPI bus (and CS gpio if defined) is ready.

**Parameters**

- **spec** – SPI specification from devicetree

**Return values**

- **true** – if the SPI bus is ready for use.
- **false** – if the SPI bus (or the CS gpio defined) is not ready for use.

int spi_transceive(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs)

Read/write the specified amount of data from the SPI driver.

**Note:** This function is synchronous.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance
- **config** – Pointer to a valid `spi_config` structure instance. Pointer-comparison may be used to detect changes from previous operations.
- **tx_bufs** – Buffer array where data to be sent originates from, or NULL if none.
- **rx_bufs** – Buffer array where data to be read will be written to, or NULL if none.

**Return values**

- **frames** – Positive number of frames received in slave mode.
- **0** – If successful in master mode.
- **-errno** – Negative errno code on failure.

static inline int spi_transceive_dt(const struct spi_dt_spec *spec, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs)

Read/write data from an SPI bus specified in `spi_dt_spec`.

This is equivalent to:

```c
spi_transceive(spec->bus, &spec->config, tx_bufs, rx_bufs);
```

**Parameters**

- **spec** – SPI specification from devicetree
- **tx_bufs** – Buffer array where data to be sent originates from, or NULL if none.
• **rx_bufs** – Buffer array where data to be read will be written to, or NULL if none.

**Returns**
a value from `spi_transceive()`.

```c
static inline int spi_read(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *rx_bufs)
```

Read the specified amount of data from the SPI driver.

**Note:** This function is synchronous.

**Note:** This function is a helper function calling `spi_transceive`.

**Parameters**
- **dev** – Pointer to the device structure for the driver instance
- **config** – Pointer to a valid `spi_config` structure instance. Pointer-comparison may be used to detect changes from previous operations.
- **rx_bufs** – Buffer array where data to be read will be written to.

**Return values**
- **frames** – Positive number of frames received in slave mode.
- **0** – If successful.
- **-errno** – Negative errno code on failure.

```c
static inline int spi_read_dt(const struct spi_dt_spec *spec, const struct spi_buf_set *rx_bufs)
```

Read data from a SPI bus specified in `spi_dt_spec`.

This is equivalent to:

```c
spi_read(spec->bus, &spec->config, rx_bufs);
```

**Parameters**
- **spec** – SPI specification from devicetree
- **rx_bufs** – Buffer array where data to be read will be written to.

**Returns**
a value from `spi_read()`.

```c
static inline int spi_write(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs)
```

Write the specified amount of data from the SPI driver.

**Note:** This function is synchronous.

**Note:** This function is a helper function calling `spi_transceive`.

**Parameters**
• **dev** – Pointer to the device structure for the driver instance

• **config** – Pointer to a valid `spi_config` structure instance. Pointer-comparison may be used to detect changes from previous operations.

• **tx_bufs** – Buffer array where data to be sent originates from.

**Return values**

• **0** – If successful.

• **-errno** – Negative errno code on failure.

```c
static inline int spi_write_dt(const struct spi_dt_spec *spec, const struct spi_buf_set *tx_bufs)
```

Write data to a SPI bus specified in `spi_dt_spec`.

This is equivalent to:

```c
spi_write(spec->bus, &spec->config, tx_bufs);
```

**Parameters**

• **spec** – SPI specification from devicetree

• **tx_bufs** – Buffer array where data to be sent originates from.

**Returns**

a value from `spi_write()`.

```c
static inline int spi_transceive_cb(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs, spi_callback_t callback, void *userdata)
```

Read/write the specified amount of data from the SPI driver.

**Note:** This function is asynchronous.

**Note:** This function is available only if `CONFIG_SPI_ASYNC` is selected.

**Parameters**

• **dev** – Pointer to the device structure for the driver instance

• **config** – Pointer to a valid `spi_config` structure instance. Pointer-comparison may be used to detect changes from previous operations.

• **tx_bufs** – Buffer array where data to be sent originates from, or NULL if none.

• **rx_bufs** – Buffer array where data to be read will be written to, or NULL if none.

• **callback** – Function pointer to completion callback. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

• **userdata** – Userdata passed to callback

**Return values**

• **frames** – Positive number of frames received in slave mode.
• 0 – If successful in master mode.
• -errno – Negative errno code on failure.

static inline int spi_transceive_signal(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs, struct k_poll_signal *sig)

Read/write the specified amount of data from the SPI driver.

**Note:** This function is asynchronous.

**Note:** This function is available only if CONFIG_SPI_ASYNC and CONFIG_POLL are selected.

### Parameters

- **dev** – Pointer to the device structure for the driver instance
- **config** – Pointer to a valid spi_config structure instance. Pointer-comparison may be used to detect changes from previous operations.
- **tx_bufs** – Buffer array where data to be sent originates from, or NULL if none.
- **rx_bufs** – Buffer array where data to be read will be written to, or NULL if none.
- **sig** – A pointer to a valid and ready to be signaled struct k_poll_signal. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

### Return values

- **frames** – Positive number of frames received in slave mode.
- 0 – If successful in master mode.
- -errno – Negative errno code on failure.

static inline int spi_transceive_async(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs, struct k_poll_signal *sig)

Alias for spi_transceive_signal for backwards compatibility.

**Deprecated:**
Use spi_transceive_signal instead.

static inline int spi_read_signal(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, struct k_poll_signal *sig)

Read the specified amount of data from the SPI driver.

**Note:** This function is asynchronous.
Note: This function is a helper function calling spi_transceive_signal.

Note: This function is available only if CONFIG_SPI_ASYNC and CONFIG_POLL are selected.

Parameters

- dev – Pointer to the device structure for the driver instance
- config – Pointer to a valid spi_config structure instance. Pointer-comparison may be used to detect changes from previous operations.
- rx_bufs – Buffer array where data to be read will be written to.
- sig – A pointer to a valid and ready to be signaled struct k_poll_signal. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

Return values

- frames – Positive number of frames received in slave mode.
- 0 – If successful
- -errno – Negative errno code on failure.

static inline int spi_read_async(const struct device *dev, const struct spi_config *config,
const struct spi_buf_set *rx_bufs, struct k_poll_signal *sig)

Alias for spi_read_signal for backwards compatibility.

Deprecated:
Use spi_read_signal instead.

static inline int spi_write_signal(const struct device *dev, const struct spi_config *config,
const struct spi_buf_set *tx_bufs, struct k_poll_signal *sig)

Write the specified amount of data from the SPI driver.

Note: This function is asynchronous.

Note: This function is a helper function calling spi_transceive_async.

Note: This function is available only if CONFIG_SPI_ASYNC and CONFIG_POLL are selected.

Parameters

- dev – Pointer to the device structure for the driver instance
- config – Pointer to a valid spi_config structure instance. Pointer-comparison may be used to detect changes from previous operations.
- tx_bufs – Buffer array where data to be sent originates from.
• sig – A pointer to a valid and ready to be signaled struct k_poll_signal. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

**Return values**
• \(0\) – If successful.
• \(-\text{errno}\) – Negative errno code on failure.

```c
static inline int spi_write_async(const struct device *dev, const struct spi_config *config,
                                  const struct spi_buf_set *tx_bufs, struct k_poll_signal *sig)
```

Alias for spi_write_signal for backwards compatibility.

**Deprecated:**
Use `spi_write_signal` instead.

```c
static inline void spi_iodev_submit(struct rtio_iodev_sqe *iodev_sqe)
```

Submit a SPI device with a request.

**Parameters**
• iodev_sqe – Prepared submissions queue entry connected to an iodev defined by SPI_IODEV_DEFINE. Must live as long as the request is in flight.

```c
static inline bool spi_is_ready_iodev(const struct rtio_iodev *spi_iodev)
```

Validate that SPI bus (and CS gpio if defined) is ready.

**Parameters**
• spi_iodev – SPI iodev defined with SPI_DT_IODEV_DEFINE

**Return values**
• true – if the SPI bus is ready for use.
• false – if the SPI bus (or the CS gpio defined) is not ready for use.

```c
static inline int spi_rtio_copy(struct rtio *r, struct rtio_iodev *iodev, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs,
                                struct rtio_sqe **last_sqe)
```

Copy the tx_bufs and rx_bufs into a set of RTIO requests.

**Parameters**
• r – [in] rtio context
• iodev – [in] iodev to transceive with
• tx_bufs – [in] transmit buffer set
• rx_bufs – [in] receive buffer set
• last_sqe – [out] last sqe submitted, NULL if not enough memory

**Return values**
• Number – of submission queue entries
• -ENOMEM – out of memory

```c
int spi_release(const struct device *dev, const struct spi_config *config)
```

Release the SPI device locked on and/or the CS by the current config.

**Note:** This synchronous function is used to release either the lock on the SPI device and/or the CS line that was kept if, and if only, given config parameter was the last
one to be used (in any of the above functions) and if it has the SPI\_LOCK\_ON bit set and/or the SPI\_HOLD\_ON\_CS bit set into its operation bits field. This can be used if the caller needs to keep its hand on the SPI device for consecutive transactions and/or if it needs the device to stay selected. Usually both bits will be used along each other, so the device is locked and stays on until another operation is necessary or until it gets released with the present function.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance
- **config** – Pointer to a valid `spi_config` structure instance.

**Return values**

- **0** – If successful.
- **-errno** – Negative errno code on failure.

static inline int _SPI\_release\_dt(const struct spi\_dt\_spec *spec)

Release the SPI device specified in `spi\_dt\_spec`.

This is equivalent to:

```
spi_release(spec->bus, &spec->config);
```

**Parameters**

- **spec** – SPI specification from devicetree

**Returns**

a value from `spi_release()`.

**Variables**

const struct rtio\_iodev\_api spi\_iodev\_api

struct spi\_cs\_control

```
#include <spi.h> SPI Chip Select control structure.
```

This can be used to control a CS line via a GPIO line, instead of using the controller inner CS logic.

**Public Members**

struct gpio\_dt\_spec gpio

GPIO devicetree specification of CS GPIO.

The device pointer can be set to NULL to fully inhibit CS control if necessary. The GPIO flags GPIO\_ACTIVE\_LOW/_GPIO\_ACTIVE\_HIGH should be equivalent to SPI\_CS\_ACTIVE\_HIGH/SPI\_CS\_ACTIVE\_LOW options in struct `spi\_config`.

```
#include <spi.h> SPI controller configuration structure.
```

```
uint32\_t delay
```

Delay in microseconds to wait before starting the transmission and before releasing the CS line.

struct spi\_config

```
Public Members

uint32_t frequency
   Bus frequency in Hertz.

spi_operation_t operation
   Operation flags.
   It is a bit field with the following parts:

   • 0: Master or slave.
   • 1..3: Polarity, phase and loop mode.
   • 4: LSB or MSB first.
   • 5..10: Size of a data frame in bits.
   • 11: Full/half duplex.
   • 12: Hold on the CS line if possible.
   • 13: Keep resource locked for the caller.
   • 14: Active high CS logic.
   • 15: Motorola or TI frame format (optional).
   If CONFIG_SPI_EXTENDED_MODES is enabled:

   • 16..17: MISO lines (Single/Dual/Quad/Octal).
   • 18..31: Reserved for future use.

uint16_t slave
   Slave number from 0 to host controller slave limit.

struct spi_cs_control cs
   GPIO chip-select line (optional, must be initialized to zero if not used).

struct spi_dt_spec
   #include <spi.h> Complete SPI DT information.

Public Members

const struct device *bus
   SPI bus.

struct spi_config config
   Slave specific configuration.

struct spi_buf
   #include <spi.h> SPI buffer structure.

Public Members

void *buf
   Valid pointer to a data buffer, or NULL otherwise.
size_t len
Length of the buffer buf.
If buf is NULL, length which as to be sent as dummy bytes (as TX buffer) or the
length of bytes that should be skipped (as RX buffer).

struct spi_buf_set
#include <spi.h> SPI buffer array structure.

Public Members

const struct spi_buf *buffers
Pointer to an array of spi_buf, or NULL.

size_t count
Length of the array pointed by buffers.

struct spi_driver_api
#include <spi.h> SPI driver API This is the mandatory API any SPI driver needs to ex-
pose.

7.6.45 System Management Bus (SMBus)

Overview
System Management Bus (SMBus) is derived from I2C for communication with devices on the
motherboard. A system may use SMBus to communicate with the peripherals on the mother-
board without using dedicated control lines. SMBus peripherals can provide various manufac-
turer information, report errors, accept control parameters, etc.

Devices on the bus can operate in three roles: as a Controller that initiates transactions and
controls the clock, a Peripheral that responds to transaction commands, or a Host, which is a
specialized Controller, that provides the main interface to the system's CPU. Zephyr has API for
the Controller role.

SMBus peripheral devices can initiate communication with Controller with two methods:

- **Host Notify protocol:** Peripheral device that supports the Host Notify protocol behaves as
  a Controller to perform the notification. It writes a three-bytes message to a special address
  “SMBus Host (0x08)” with own address and two bytes of relevant data.

- **SMBALERT# signal:** Peripheral device uses special signal SMBALERT# to request attention
  from the Controller. The Controller needs to read one byte from the special “SMBus Alert
  Response Address (ARA) (0x0c)”. The peripheral device responds with a data byte contain-
  ing its own address.
Currently, the API is based on SMBus Specification version 2.0

Note: See Rule A.2: Inclusive Language for information about the terminology used in this API.

SMBus Controller API

Zephyr's SMBus controller API is used when an SMBus device controls the bus, particularly the start and stop conditions and the clock. This is the most common mode used to interact with SMBus peripherals.

Configuration Options

Related configuration options:

- CONFIG_SMBUS

API Reference

Related code samples

SMBus shell

Interact with SMBus peripherals using shell commands.

```c
group smbus_interface

SMBus Interface.

SMBus read / write direction

enum smbus_direction
    SMBus read / write direction.
    Values:

   enumerator SMBUS_MSG_WRITE = 0
    Write a message to SMBus peripheral.

   enumerator SMBUS_MSG_READ = 1
    Read a message from SMBus peripheral.

SMBus Protocol commands

SMBus Specification defines the following SMBus protocols operations
```
SMBUS_CMD_QUICK

SMBus Quick protocol is a very simple command with no data sent or received. Peripheral may denote only R/W bit, which can still be used for the peripheral management, for example to switch peripheral On/Off. Quick protocol can also be used for peripheral devices scanning.

SMBUS_CMD_BYTE

SMBus Byte protocol can send or receive one byte of data.

SMBUS_CMD_BYTE_DATA

SMBus Byte Data protocol sends the first byte (command) followed by read or write one byte.

SMBUS_CMD_WORD_DATA

SMBus Word Data protocol sends the first byte (command) followed by read or write two bytes.
Word Data Write

+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+

**SMBUS_CMD_PROC_CALL**

SMBus Process Call protocol is Write Word followed by Read Word.

It is named so because the command sends data and waits for the peripheral to return a reply.

SMBus Block protocol reads or writes a block of data up to 32 bytes.

The Count byte specifies the amount of data.

**SMBUS_CMD_BLOCK**

SMBus Block Write

SMBus device functionality

The following parameters describe the functionality of the SMBus device

**SMBUS_MODE_CONTROLLER**

Peripheral to act as Controller.

**SMBUS_MODE_PEC**

**SMBUS_MODE_HOST_NOTIFY**

Support Host Notify functionality.

**SMBUS_MODE_SMBALERT**

Support SMBALERT signal functionality.

SMBus special reserved addresses

The following addresses are reserved by SMBus specification

**SMBUS_ADDRESS_ARA**

Alert Response Address (ARA)

A broadcast address used by the system host as part of the Alert Response Protocol.

Defines

**SMBUS_BLOCK_BYTES_MAX**

Maximum number of bytes in SMBus Block protocol.
Zephyr Project Documentation, Release 3.6.0-rc3

SMBUS_DT_SPEC_GET(node_id)
Structure initializer for `smbus_dt_spec` from devicetree.

This helper macro expands to a static initializer for a `struct smbus_dt_spec` by reading
the relevant bus and address data from the devicetree.

**Parameters**
- **node_id** – Devicetree node identifier for the SMBus device whose `smbus_dt_spec` to create an initializer for

SMBUS_DT_SPEC_INST_GET(inst)
Structure initializer for `smbus_dt_spec` from devicetree instance.

This is equivalent to `SMBUS_DT_SPEC_GET(DT_DRV_INST(inst))`.

**Parameters**
- **inst** – Devicetree instance number

SMBUS_DEVICE_DT_DEFINE(node_id, init_fn, pm_device, data_ptr, cfg_ptr, level, prio, api_ptr, ...
Like `DEVICE_DT_DEFINE()` with SMBus specifics.

Defines a device which implements the SMBus API. May generate a custom `device_state` container struct and init_fn wrapper when needed depending on SMBus `CONFIG_SMBUS_STATS`.

**Parameters**
- **node_id** – The devicetree node identifier.
- **init_fn** – Name of the init function of the driver.
- **pm_device** – PM device resources reference (NULL if device does not use PM).
- **data_ptr** – Pointer to the device’s private data.
- **cfg_ptr** – The address to the structure containing the configuration information for this instance of the driver.
- **level** – The initialization level. See SYS_INIT() for details.
- **prio** – Priority within the selected initialization level. See SYS_INIT() for details.
- **api_ptr** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

SMBUS_DEVICE_DT_INST_DEFINE(inst, ...
Like `SMBUS_DEVICE_DT_DEFINE()` for an instance of a DT_DRV_COMPAT compatible.

**Parameters**
- **inst** – instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to `SMBUS_DEVICE_DT_DEFINE()`.
- **...** – other parameters as expected by `SMBUS_DEVICE_DT_DEFINE()`.

**Typedefs**

typedef void (*smbus_callback_handler_t)(const struct `device *dev, struct smbus_callback *cb, uint8_t addr)
Define SMBus callback handler function signature.
**Param dev**  
Pointer to the device structure for the SMBus driver instance.

**Param cb**  
Structure `smbus_callback` owning this handler.

**Param addr**  
Address of the SMBus peripheral device.

### Functions

```c
static inline void smbus_xfer_stats(const struct device *dev, uint8_t sent, uint8_t recv)  
Updates the SMBus stats.
```

**Parameters**

- `dev` – Pointer to the device structure for the SMBus driver instance to update stats for.
- `sent` – Number of bytes sent
- `recv` – Number of bytes received

```c
int smbus_configure(const struct device *dev, uint32_t dev_config)  
Configure operation of a SMBus host controller.
```

**Parameters**

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `dev_config` – Bit-packed 32-bit value to the device runtime configuration for the SMBus controller.

**Return values**

- `0` – If successful.
- `-EIO` – General input / output error.

```c
int smbus_get_config(const struct device *dev, uint32_t *dev_config)  
Get configuration of a SMBus host controller.
```

This routine provides a way to get current configuration. It is allowed to call the function before `smbus_configure`, because some SMBus ports can be configured during init process. However, if the SMBus port is not configured, `smbus_get_config` returns an error.

`smbus_get_config` can return cached config or probe hardware, but it has to be up to date with current configuration.

**Parameters**

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `dev_config` – Pointer to return bit-packed 32-bit value of the SMBus controller configuration.

**Return values**

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function `smbus_get_config()` is not implemented by the driver.
static inline int smbus_smbalert_set_cb(const struct device *dev, struct smbus_callback *cb)

Add SMBUSALERT callback for a SMBus host controller.

**Parameters**

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `cb` – Pointer to a callback structure.

**Return values**

- `0` – If successful.
- `EIO` – General input / output error.
- `ENOSYS` – If function `smbus_smbalert_set_cb()` is not implemented by the driver.

int smbus_smbalert_remove_cb(const struct device *dev, struct smbus_callback *cb)

Remove SMBUSALERT callback from a SMBus host controller.

**Parameters**

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `cb` – Pointer to a callback structure.

**Return values**

- `0` – If successful.
- `EIO` – General input / output error.
- `ENOSYS` – If function `smbus_smbalert_remove_cb()` is not implemented by the driver.

static inline int smbus_host_notify_set_cb(const struct device *dev, struct smbus_callback *cb)

Add Host Notify callback for a SMBus host controller.

**Parameters**

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `cb` – Pointer to a callback structure.

**Return values**

- `0` – If successful.
- `EIO` – General input / output error.
- `ENOSYS` – If function `smbus_host_notify_set_cb()` is not implemented by the driver.

int smbus_host_notify_remove_cb(const struct device *dev, struct smbus_callback *cb)

Remove Host Notify callback from a SMBus host controller.

**Parameters**

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `cb` – Pointer to a callback structure.

**Return values**

- `0` – If successful.
- `EIO` – General input / output error.
- `ENOSYS` – If function `smbus_host_notify_remove_cb()` is not implemented by the driver.
int smbus_quick(const struct device *dev, uint16_t addr, enum smbus_direction direction)

Perform SMBus Quick operation.

This routine provides a generic interface to perform SMBus Quick operation.

**Parameters**

- **dev** – Pointer to the device structure for the SMBus driver instance. Driver configured in controller mode.
- **addr** – Address of the SMBus peripheral device.
- **direction** – Direction Read or Write.

**Return values**

- **0** – If successful.
- **-EIO** – General input / output error.
- **-ENOSYS** – If function `smbus_quick()` is not implemented by the driver.

int smbus_byte_write(const struct device *dev, uint16_t addr, uint8_t byte)

Perform SMBus Byte Write operation.

This routine provides a generic interface to perform SMBus Byte Write operation.

**Parameters**

- **dev** – Pointer to the device structure for the SMBus driver instance.
- **addr** – Address of the SMBus peripheral device.
- **byte** – Byte to be sent to the peripheral device.

**Return values**

- **0** – If successful.
- **-EIO** – General input / output error.
- **-ENOSYS** – If function `smbus_byte_write()` is not implemented by the driver.

int smbus_byte_read(const struct device *dev, uint16_t addr, uint8_t *byte)

Perform SMBus Byte Read operation.

This routine provides a generic interface to perform SMBus Byte Read operation.

**Parameters**

- **dev** – Pointer to the device structure for the SMBus driver instance.
- **addr** – Address of the SMBus peripheral device.
- **byte** – Byte received from the peripheral device.

**Return values**

- **0** – If successful.
- **-EIO** – General input / output error.
- **-ENOSYS** – If function `smbus_byte_read()` is not implemented by the driver.

int smbus_byte_data_write(const struct device *dev, uint16_t addr, uint8_t cmd, uint8_t byte)

Perform SMBus Byte Data Write operation.

This routine provides a generic interface to perform SMBus Byte Data Write operation.

**Parameters**

- **dev** – Pointer to the device structure for the SMBus driver instance.
• `addr` – Address of the SMBus peripheral device.
• `cmd` – Command byte which is sent to peripheral device first.
• `byte` – Byte to be sent to the peripheral device.

**Return values**
• `0` – If successful.
• `-EIO` – General input / output error.
• `-ENOSYS` – If function `smbus_byte_data_write()` is not implemented by the driver.

```c
int smbus_byte_data_read(const struct device *dev, uint16_t addr, uint8_t cmd, uint8_t *byte)
```

Perform SMBus Byte Data Read operation.

This routine provides a generic interface to perform SMBus Byte Data Read operation.

**Parameters**
• `dev` – Pointer to the device structure for the SMBus driver instance.
• `addr` – Address of the SMBus peripheral device.
• `cmd` – Command byte which is sent to peripheral device first.
• `byte` – Byte received from the peripheral device.

**Return values**
• `0` – If successful.
• `-EIO` – General input / output error.
• `-ENOSYS` – If function `smbus_byte_data_read()` is not implemented by the driver.

```c
int smbus_word_data_write(const struct device *dev, uint16_t addr, uint8_t cmd, uint16_t word)
```

Perform SMBus Word Data Write operation.

This routine provides a generic interface to perform SMBus Word Data Write operation.

**Parameters**
• `dev` – Pointer to the device structure for the SMBus driver instance.
• `addr` – Address of the SMBus peripheral device.
• `cmd` – Command byte which is sent to peripheral device first.
• `word` – Word (16-bit) to be sent to the peripheral device.

**Return values**
• `0` – If successful.
• `-EIO` – General input / output error.
• `-ENOSYS` – If function `smbus_word_data_write()` is not implemented by the driver.

```c
int smbus_word_data_read(const struct device *dev, uint16_t addr, uint8_t cmd, uint16_t *word)
```

Perform SMBus Word Data Read operation.

This routine provides a generic interface to perform SMBus Word Data Read operation.

**Parameters**
• dev – Pointer to the device structure for the SMBus driver instance.
• addr – Address of the SMBus peripheral device.
• cmd – Command byte which is sent to peripheral device first.
• word – Word (16-bit) received from the peripheral device.

Return values
• 0 – If successful.
• -EIO – General input / output error.
• -ENOSYS – If function smbus_word_data_read() is not implemented by the driver.

int smbus_pcall(const struct device *dev, uint16_t addr, uint8_t cmd, uint16_t send_word, uint16_t *recv_word)

Perform SMBus Process Call operation.

This routine provides a generic interface to perform SMBus Process Call operation, which means Write 2 bytes following by Read 2 bytes.

Parameters
• dev – Pointer to the device structure for the SMBus driver instance.
• addr – Address of the SMBus peripheral device.
• cmd – Command byte which is sent to peripheral device first.
• send_word – Word (16-bit) to be sent to the peripheral device.
• recv_word – Word (16-bit) received from the peripheral device.

Return values
• 0 – If successful.
• -EIO – General input / output error.
• -ENOSYS – If function smbus_pcall() is not implemented by the driver.

int smbus_block_write(const struct device *dev, uint16_t addr, uint8_t cmd, uint8_t count, uint8_t *buf)

Perform SMBus Block Write operation.

This routine provides a generic interface to perform SMBus Block Write operation.

Parameters
• dev – Pointer to the device structure for the SMBus driver instance.
• addr – Address of the SMBus peripheral device.
• cmd – Command byte which is sent to peripheral device first.
• count – Size of the data block buffer. Maximum 32 bytes.
• buf – Data block buffer to be sent to the peripheral device.

Return values
• 0 – If successful.
• -EIO – General input / output error.
• -ENOSYS – If function smbus_block_write() is not implemented by the driver.
int smbus_block_read(const struct device *dev, uint16_t addr, uint8_t cmd, uint8_t *count, uint8_t *buf)

Perform SMBus Block Read operation.

This routine provides a generic interface to perform SMBus Block Read operation.

**Parameters**

- **dev** – Pointer to the device structure for the SMBus driver instance.
- **addr** – Address of the SMBus peripheral device.
- **cmd** – Command byte which is sent to peripheral device first.
- **count** – Size of the data peripheral sent. Maximum 32 bytes.
- **buf** – Data block buffer received from the peripheral device.

**Return values**

- 0 – If successful.
- -EIO – General input / output error.
- -ENOSYS – If function `smbus_block_read()` is not implemented by the driver.

int smbus_block_pcall(const struct device *dev, uint16_t addr, uint8_t cmd, uint8_t snd_count, uint8_t *snd_buf, uint8_t *rcv_count, uint8_t *rcv_buf)

Perform SMBus Block Process Call operation.

This routine provides a generic interface to perform SMBus Block Process Call operation. This operation is basically Block Write followed by Block Read.

**Parameters**

- **dev** – Pointer to the device structure for the SMBus driver instance.
- **addr** – Address of the SMBus peripheral device.
- **cmd** – Command byte which is sent to peripheral device first.
- **snd_count** – Size of the data block buffer to send.
- **snd_buf** – Data block buffer send to the peripheral device.
- **rcv_count** – Size of the data peripheral sent.
- **rcv_buf** – Data block buffer received from the peripheral device.

**Return values**

- 0 – If successful.
- -EIO – General input / output error.
- -ENOSYS – If function `smbus_block_pcall()` is not implemented by the driver.

**Note:** Such struct should not be allocated on stack.
Public Members

sys_snodet node
This should be used in driver for a callback list management.

smbus_callback_handler_t handler
Actual callback function being called when relevant.

uint8_t addr
Peripheral device address.

struct smbus_dt_spec
#include <smbus.h> Complete SMBus DT information.

Public Members

const struct device *bus
SMBus bus.

uint16_t addr
Address of the SMBus peripheral device.

7.6.46 Universal Asynchronous Receiver-Transmitter (UART)

Overview

Zephyr provides three different ways to access the UART peripheral. Depending on the method, different API functions are used according to below sections:

1. Polling API
2. Interrupt-driven API
3. Asynchronous API using Direct Memory Access (DMA)

Polling is the most basic method to access the UART peripheral. The reading function, uart_poll_in, is a non-blocking function and returns a character or -1 when no valid data is available. The writing function, uart_poll_out, is a blocking function and the thread waits until the given character is sent.

With the Interrupt-driven API, possibly slow communication can happen in the background while the thread continues with other tasks. The Kernel's Data Passing features can be used to communicate between the thread and the UART driver.

The Asynchronous API allows to read and write data in the background using DMA without interrupting the MCU at all. However, the setup is more complex than the other methods.

Warning: Interrupt-driven API and the Asynchronous API should NOT be used at the same time for the same hardware peripheral, since both APIs require hardware interrupts to function properly. Using the callbacks for both APIs would result in interference between each other. CONFIG_UART_EXCLUSIVE_API_CALLBACKS is enabled by default so that only the callbacks associated with one API is active at a time.
**Configuration Options**

Most importantly, the Kconfig options define whether the polling API (default), the interrupt-driven API or the asynchronous API can be used. Only enable the features you need in order to minimize memory footprint.

Related configuration options:

- `CONFIG_SERIAL`
- `CONFIG_UART_INTERRUPT_DRIVEN`
- `CONFIG_UART_ASYNC_API`
- `CONFIG_UART_WIDE_DATA`
- `CONFIG_UART_USE_RUNTIME_CONFIGURE`
- `CONFIG_UART_LINE_CTRL`
- `CONFIG_UART_DRV_CMD`

**API Reference**

**Related code samples**

**802.15.4 "serial-radio"**
Implement a slip-radio device for Contiki-based border routers.

**Console over USB CDC ACM**
Output "Hello World!" to the console over USB CDC ACM.

**Native TTY UART**
Use native TTY driver to send and receive data between two UART-to-USB bridge dongles.

**STM32 single-wire UART**
Use single-wire/half-duplex UART functionality of STM32 devices.

**UART Passthrough**
Pass data directly between the console and another UART interface.

**UART echo**
Read data from the console and echo it back.

---

**group uart_interface**
UART Interface.

**Enums**

enum uart_line_ctrl
    Line control signals.
    Values:
    
    enumerator UART_LINE_CTRL_BAUD_RATE = BIT(0)
    Baud rate.
enumerator UART_LINE_CTRL_RTS = BIT(1)
    Request To Send (RTS)

enumerator UART_LINE_CTRL_DTR = BIT(2)
    Data Terminal Ready (DTR)

enumerator UART_LINE_CTRL_DCD = BIT(3)
    Data Carrier Detect (DCD)

enumerator UART_LINE_CTRL_DSR = BIT(4)
    Data Set Ready (DSR)

enum uart_rx_stop_reason
    Reception stop reasons.
    Values that correspond to events or errors responsible for stopping receiving.
    Values:

enumerator UART_ERROR_OVERRUN = (1 « 0)
    Overrun error.

enumerator UART_ERROR_PARITY = (1 « 1)
    Parity error.

enumerator UART_ERROR_FRAMING = (1 « 2)
    Framing error.

enumerator UART_BREAK = (1 « 3)
    Break interrupt.
    A break interrupt was received. This happens when the serial input is held at a logic '0' state for longer than the sum of start time + data bits + parity + stop bits.

enumerator UART_ERROR_COLLISION = (1 « 4)
    Collision error.
    This error is raised when transmitted data does not match received data. Typically this is useful in scenarios where the TX and RX lines maybe connected together such as RS-485 half-duplex. This error is only valid on UARTs that support collision checking.

enumerator UART_ERROR_NOISE = (1 « 5)
    Noise error.

eenum uart_config_parity
    Parity modes.
    Values:

enumerator UART_CFG_PARITY_NONE
    No parity.
enumerator UART_CFG_PARITY_ODD
   Odd parity.

enumerator UART_CFG_PARITY_EVEN
   Even parity.

enumerator UART_CFG_PARITY_MARK
   Mark parity.

enumerator UART_CFG_PARITY_SPACE
   Space parity.

enum uart_config_stop_bits
   Number of stop bits.
   Values:

   enumerator UART_CFG_STOP_BITS_0_5
      0.5 stop bit

   enumerator UART_CFG_STOP_BITS_1
      1 stop bit

   enumerator UART_CFG_STOP_BITS_1_5
      1.5 stop bits

   enumerator UART_CFG_STOP_BITS_2
      2 stop bits

enum uart_config_data_bits
   Number of data bits.
   Values:

   enumerator UART_CFG_DATA_BITS_5
      5 data bits

   enumerator UART_CFG_DATA_BITS_6
      6 data bits

   enumerator UART_CFG_DATA_BITS_7
      7 data bits

   enumerator UART_CFG_DATA_BITS_8
      8 data bits

   enumerator UART_CFG_DATA_BITS_9
      9 data bits
enum uart_config_flow_control

Hardware flow control options.

With flow control set to none, any operations related to flow control signals can be managed by user with uart_line_ctrl functions. In other cases, flow control is managed by hardware/driver.

Values:

enumerator UART_CFG_FLOW_CTRL_NONE
    No flow control.

enumerator UART_CFG_FLOW_CTRL_RTS_CTS
    RTS/CTS flow control.

enumerator UART_CFG_FLOW_CTRL_DTR_DSR
    DTR/DSR flow control.

enumerator UART_CFG_FLOW_CTRL_RS485
    RS485 flow control.

Functions

int uart_err_check(const struct device *dev)

Check whether an error was detected.

Parameters

• dev – UART device instance.

Return values

• 0 – If no error was detected.
• err – Error flags as defined in uart_rx_stop_reason
• -ENOSYS – If not implemented.

int uart_configure(const struct device *dev, const struct uart_config *cfg)

Set UART configuration.

Sets UART configuration using data from *cfg.

Parameters

• dev – UART device instance.
• cfg – UART configuration structure.

Return values

• 0 – If successful.
• -errno – Negative errno code in case of failure.
• -ENOSYS – If configuration is not supported by device or driver does not support setting configuration in runtime.
• -ENOTSUP – If API is not enabled.
int uart_config_get(const struct device *dev, struct uart_config *cfg)
Get UART configuration.
Stores current UART configuration to *cfg, can be used to retrieve initial configuration after device was initialized using data from DTS.

Parameters
• dev – UART device instance.
• cfg – UART configuration structure.

Return values
• 0 – If successful.
• -errno – Negative errno code in case of failure.
• -ENOSYS – If driver does not support getting current configuration.
• -ENOTSUP – If API is not enabled.

int uart_line_ctrl_set(const struct device *dev, uint32_t ctrl, uint32_t val)
Manipulate line control for UART.

Parameters
• dev – UART device instance.
• ctrl – The line control to manipulate (see enum uart_line_ctrl).
• val – Value to set to the line control.

Return values
• 0 – If successful.
• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.
• -errno – Other negative errno value in case of failure.

int uart_line_ctrl_get(const struct device *dev, uint32_t ctrl, uint32_t *val)
Retrieve line control for UART.

Parameters
• dev – UART device instance.
• ctrl – The line control to retrieve (see enum uart_line_ctrl).
• val – Pointer to variable where to store the line control value.

Return values
• 0 – If successful.
• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.
• -errno – Other negative errno value in case of failure.

int uart_drv_cmd(const struct device *dev, uint32_t cmd, uint32_t p)
Send extra command to driver.
Implementation and accepted commands are driver specific. Refer to the drivers for more information.

Parameters
• dev – UART device instance.
- cmd – Command to driver.
- p – Parameter to the command.

**Return values**
- 0 – If successful.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.
- -errno – Other negative errno value in case of failure.

```c
#include <uart.h> UART controller configuration structure.

**Public Members**

```c
uint32_t baudrate
    Baudrate setting in bps.

uint8_t parity
    Parity bit, use uart_config_parity.

uint8_t stop_bits
    Stop bits, use uart_config_stop_bits.

uint8_t data_bits
    Data bits, use uart_config_data_bits.

uint8_t flow_ctrl
    Flow control setting, use uart_config_flow_control.
```

**Polling API**

```c
struct uart_config

group uart_polling
```

**Functions**

```c
int uart_poll_in(const struct device *dev, unsigned char *p_char)
    Read a character from the device for input.

This routine checks if the receiver has valid data. When the receiver has valid data, it reads a character from the device, stores to the location pointed to by p_char, and returns 0 to the calling thread. It returns -1, otherwise. This function is a non-blocking call.

**Parameters**
- dev – UART device instance.
- p_char – Pointer to character.

**Return values**
- 0 – If a character arrived.
• -1 – If no character was available to read (i.e. the UART input buffer was empty).
• -ENOSYS – If the operation is not implemented.
• -EBUSY – If async reception was enabled using `uart_rx_enable`

```c
int uart_poll_in_u16(const struct device *dev, uint16_t *p_u16)
```

Read a 16-bit datum from the device for input.

This routine checks if the receiver has valid data. When the receiver has valid data, it reads a 16-bit datum from the device, stores to the location pointed to by `p_u16`, and returns 0 to the calling thread. It returns -1, otherwise. This function is a non-blocking call.

**Parameters**

- `dev` – UART device instance.
- `p_u16` – Pointer to 16-bit data.

**Return values**

- 0 – If data arrived.
- -1 – If no data was available to read (i.e., the UART input buffer was empty).
- -ENOTSUP – If API is not enabled.
- -ENOSYS – If the function is not implemented.
- -EBUSY – If async reception was enabled using `uart_rx_enable`

```c
void uart_poll_out(const struct device *dev, unsigned char out_char)
```

Write a character to the device for output.

This routine checks if the transmitter is full. When the transmitter is not full, it writes a character to the data register. It waits and blocks the calling thread, otherwise. This function is a blocking call.

To send a character when hardware flow control is enabled, the handshake signal CTS must be asserted.

**Parameters**

- `dev` – UART device instance.
- `out_char` – Character to send.

```c
void uart_poll_out_u16(const struct device *dev, uint16_t out_u16)
```

Write a 16-bit datum to the device for output.

This routine checks if the transmitter is full. When the transmitter is not full, it writes a 16-bit datum to the data register. It waits and blocks the calling thread, otherwise. This function is a blocking call.

To send a datum when hardware flow control is enabled, the handshake signal CTS must be asserted.

**Parameters**

- `dev` – UART device instance.
- `out_u16` – Wide data to send.

**Interrupt-driven API**

**group uart_interrupt**
**Typedefs**

typedef void (*uart_irq_callback_user_data_t)(const struct device *dev, void *user_data)

Define the application callback function signature for `uart_irq_callback_user_data_set()` function.

**Param dev**
UART device instance.

**Param user_data**
Arbitrary user data.

typedef void (*uart_irq_config_func_t)(const struct device *dev)

For configuring IRQ on each individual UART device.

**Param dev**
UART device instance.

**Functions**

static inline int uart_fifo_fill(const struct device *dev, const uint8_t *tx_data, int size)

Fill FIFO with data.

This function is expected to be called from UART interrupt handler (ISR), if `uart_irq_tx_ready()` returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). Likewise, *not* calling this function from an ISR if `uart_irq_tx_ready()` returns true may lead to undefined behavior, e.g. infinite interrupt loops. It's mandatory to test return value of this function, as different hardware has different FIFO depth (oftentimes just 1).

**Parameters**

- `dev` – UART device instance.
- `tx_data` – Data to transmit.
- `size` – Number of bytes to send.

**Return values**

- `-ENOSYS` – if this function is not supported
- `-ENOTSUP` – If API is not enabled.

**Returns**
Number of bytes sent.

static inline int uart_fifo_fill_u16(const struct device *dev, const uint16_t *tx_data, int size)

Fill FIFO with wide data.

This function is expected to be called from UART interrupt handler (ISR), if `uart_irq_tx_ready()` returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). Likewise, *not* calling this function from an ISR if `uart_irq_tx_ready()` returns true may lead to undefined behavior, e.g. infinite interrupt loops. It's mandatory to test return value of this function, as different hardware has different FIFO depth (oftentimes just 1).

**Parameters**

- `dev` – UART device instance.
- `tx_data` – Wide data to transmit.
• size – Number of datum to send.

**Return values**

• -ENOSYS – If this function is not implemented
• -ENOTSUP – If API is not enabled.

**Returns**

Number of datum sent.

```c
static inline int uart_fifo_read(const struct device *dev, uint8_t *rx_data, const int size)
```

Read data from FIFO.

This function is expected to be called from UART interrupt handler (ISR), if `uart_irq_rx_ready()` returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). It’s unspecified whether “RX ready” condition as returned by `uart_irq_rx_ready()` is level- or edge- triggered. That means that once `uart_irq_rx_ready()` is detected, `uart_fifo_read()` must be called until it reads all available data in the FIFO (i.e. until it returns less data than was requested).

**Parameters**

• dev – UART device instance.
• rx_data – Data container.
• size – Container size.

**Return values**

• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.

**Returns**

Number of bytes read.

```c
static inline int uart_fifo_read_u16(const struct device *dev, uint16_t *rx_data, const int size)
```

Read wide data from FIFO.

This function is expected to be called from UART interrupt handler (ISR), if `uart_irq_rx_ready()` returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). It’s unspecified whether “RX ready” condition as returned by `uart_irq_rx_ready()` is level- or edge- triggered. That means that once `uart_irq_rx_ready()` is detected, `uart_fifo_read()` must be called until it reads all available data in the FIFO (i.e. until it returns less data than was requested).

**Parameters**

• dev – UART device instance.
• rx_data – Wide data container.
• size – Container size.

**Return values**

• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.

**Returns**

Number of datum read.

```c
void uart_irq_tx_enable(const struct device *dev)
```

Enable TX interrupt in IER.

**Parameters**
• dev – UART device instance.

void uart_irq_tx_disable(const struct device *dev)
Disable TX interrupt in IER.

Parameters
• dev – UART device instance.

static inline int uart_irq_tx_ready(const struct device *dev)
Check if UART TX buffer can accept a new char.
Check if UART TX buffer can accept at least one character for transmission (i.e. uart_fifo_fill() will succeed and return non-zero). This function must be called in a UART interrupt handler, or its result is undefined. Before calling this function in the interrupt handler, uart_irq_update() must be called once per the handler invocation.

Parameters
• dev – UART device instance.

Return values
• 1 – If TX interrupt is enabled and at least one char can be written to UART.
• 0 – If device is not ready to write a new byte.
• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.

void uart_irq_rx_enable(const struct device *dev)
Enable RX interrupt.

Parameters
• dev – UART device instance.

void uart_irq_rx_disable(const struct device *dev)
Disable RX interrupt.

Parameters
• dev – UART device instance.

static inline int uart_irq_tx_complete(const struct device *dev)
Check if UART TX block finished transmission.
Check if any outgoing data buffered in UART TX block was fully transmitted and TX block is idle. When this condition is true, UART device (or whole system) can be power off. Note that this function is not useful to check if UART TX can accept more data, use uart_irq_tx_ready() for that. This function must be called in a UART interrupt handler, or its result is undefined. Before calling this function in the interrupt handler, uart_irq_update() must be called once per the handler invocation.

Parameters
• dev – UART device instance.

Return values
• 1 – If nothing remains to be transmitted.
• 0 – If transmission is not completed.
• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.
static inline int uart_irq_rx_ready(const struct device *dev)
Check if UART RX buffer has a received char.

Check if UART RX buffer has at least one pending character (i.e. uart_fifo_read() will succeed and return non-zero). This function must be called in a UART interrupt handler, or its result is undefined. Before calling this function in the interrupt handler, uart_irq_update() must be called once per the handler invocation. It’s unspecified whether condition as returned by this function is level- or edge- triggered (i.e. if this function returns true when RX FIFO is non-empty, or when a new char was received since last call to it). See description of uart_fifo_read() for implication of this.

Parameters
- dev – UART device instance.

Return values
- 1 – If a received char is ready.
- 0 – If a received char is not ready.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.

void uart_irq_err_enable(const struct device *dev)
Enable error interrupt.

Parameters
- dev – UART device instance.

void uart_irq_err_disable(const struct device *dev)
Disable error interrupt.

Parameters
- dev – UART device instance.

int uart_irq_is_pending(const struct device *dev)
Check if any IRQs is pending.

Parameters
- dev – UART device instance.

Return values
- 1 – If an IRQ is pending.
- 0 – If an IRQ is not pending.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.

int uart_irq_update(const struct device *dev)
Start processing interrupts in ISR.

This function should be called the first thing in the ISR. Calling uart_irq_rx_ready(), uart_irq_tx_ready(), uart_irq_tx_complete() allowed only after this.

The purpose of this function is:

- For devices with auto-acknowledge of interrupt status on register read to cache the value of this register (rx_ready, etc. then use this case).
- For devices with explicit acknowledgment of interrupts, to ack any pending interrupts and likewise to cache the original value.

7.6. Peripherals 3373
• For devices with implicit acknowledgment, this function will be empty. But the ISR must perform the actions needed to ack the interrupts (usually, call `uart_fifo_read()` on `rx_ready`, and `uart_fifo_fill()` on `tx_ready`).

**Parameters**

• `dev` – UART device instance.

**Return values**

• 1 – On success.
• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.

```c
static inline int uart_irq_callback_user_data_set(const struct device *dev, uart_irq_callback_user_data_t cb, void *user_data)
```

Set the IRQ callback function pointer.

This sets up the callback for IRQ. When an IRQ is triggered, the specified function will be called with specified user data. See description of `uart_irq_update()` for the requirements on ISR.

**Parameters**

• `dev` – UART device instance.
• `cb` – Pointer to the callback function.
• `user_data` – Data to pass to callback function.

**Return values**

• 0 – On success.
• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.

```c
static inline int uart_irq_callback_set(const struct device *dev, uart_irq_callback_user_data_t cb)
```

Set the IRQ callback function pointer (legacy).

This sets up the callback for IRQ. When an IRQ is triggered, the specified function will be called with the device pointer.

**Parameters**

• `dev` – UART device instance.
• `cb` – Pointer to the callback function.

**Return values**

• 0 – On success.
• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.

```c
Asynchronous API
group uart_async
```
**Typedefs**

```c
typedef void (*uart_callback_t)(const struct device *dev, struct uart_event *evt, void *user_data)
```

Define the application callback function signature for `uart_callback_set()` function.

**Param dev**
UART device instance.

**Param evt**
Pointer to `uart_event` instance.

**Param user_data**
Pointer to data specified by user.

** Enums**

```c
enum uart_event_type
```

Types of events passed to callback in UART_ASYNC_API.

**Receiving:**

a. To start receiving, `uart_rx_enable` has to be called with first buffer

b. When receiving starts to current buffer, `UART_RX_BUF_REQUEST` will be generated, in response to that user can either:
   
   i. Provide second buffer using `uart_rx_buf_rsp`, when first buffer is filled, receiving will automatically start to second buffer.
   
   ii. Ignore the event, this way when current buffer is filled `UART_RX_RDY` event will be generated and receiving will be stopped.

c. If some data was received and timeout occurred `UART_RX_RDY` event will be generated. It can happen multiples times for the same buffer. RX timeout is counted from last byte received i.e. if no data was received, there won’t be any timeout event.

d. `UART_RX_BUF_RELEASED` event will be generated when the current buffer is no longer used by the driver. It will immediately follow `UART_RX_RDY` event. Depending on the implementation buffer may be released when it is completely or partially filled.

e. If there was second buffer provided, it will become current buffer and we start again at point 2. If no second buffer was specified receiving is stopped and `UART_RX_DISABLED` event is generated. After that whole process can be repeated.

Any time during reception `UART_RX_STOPPED` event can occur. if there is any data received, `UART_RX_RDY` event will be generated. It will be followed by `UART_RX_BUF_RELEASED` event for every buffer currently passed to driver and finally by `UART_RX_DISABLED` event.

Receiving can be disabled using `uart_rx_disable`, after calling that function, if there is any data received, `UART_RX_RDY` event will be generated. `UART_RX_BUF_RELEASED` event will be generated for every buffer currently passed to driver and finally `UART_RX_DISABLED` event will occur.

**Transmitting:**

a. Transmitting starts by `uart_tx` function.

b. If whole buffer was transmitted `UART_TX_DONE` is generated. If timeout occurred `UART_TX_ABORTED` will be generated.
Transmitting can be aborted using `uart_tx_abort`, after calling that function `UART_TX_ABORTED` event will be generated.

**Values:**

enum UART_TX_DONE
  Whole TX buffer was transmitted.

enum UART_TX_ABORTED
  Transmitting aborted due to timeout or `uart_tx_abort` call.

When flow control is enabled, there is a possibility that TX transfer won’t finish in the allotted time. Some data may have been transferred, information about it can be found in event data.

enum UART_RX_RDY
  Received data is ready for processing.

This event is generated in the following cases:
- When RX timeout occurred, and data was stored in provided buffer. This can happen multiple times in the same buffer.
- When provided buffer is full.
- After `uart_rx_disable()`.
- After stopping due to external event (`UART_RX_STOPPED`).

enum UART_RX_BUF_REQUEST
  Driver requests next buffer for continuous reception.

This event is triggered when receiving has started for a new buffer, i.e. it’s time to provide a next buffer for a seamless switchover to it. For continuous reliable receiving, user should provide another RX buffer in response to this event, using `uart_rx_buf_rsp` function.

If `uart_rx_buf_rsp` is not called before current buffer is filled up, receiving will stop.

enum UART_RX_BUF_RELEASED
  Buffer is no longer used by UART driver.

enum UART_RX_DISABLED
  RX has been disabled and can be reenabled.

This event is generated whenever receiver has been stopped, disabled or finished its operation and can be enabled again using `uart_rx_enable`

enum UART_RX_STOPPED
  RX has stopped due to external event.

Reason is one of `uart_rx_stop_reason`.

**Functions**

```c
static inline int uart_callback_set(const struct device *dev, uart_callback_t callback, void *user_data)
```

Set event handler function.

Since it is mandatory to set callback to use other asynchronous functions, it can be used to detect if the device supports asynchronous API. Remaining API does not have that detection.
Parameters

- `dev` – UART device instance.
- `callback` – Event handler.
- `user_data` – Data to pass to event handler function.

Return values

- `0` – If successful.
- `-ENOSYS` – If not supported by the device.
- `-ENOTSUP` – If API not enabled.

```c
int uart_tx(const struct device *dev, const uint8_t *buf, size_t len, int32_t timeout)
```

Send given number of bytes from buffer through UART.

Function returns immediately and event handler, set using `uart_callback_set`, is called after transfer is finished.

Parameters

- `dev` – UART device instance.
- `buf` – Pointer to transmit buffer.
- `len` – Length of transmit buffer.
- `timeout` – Timeout in microseconds. Valid only if flow control is enabled. `SYS_FOREVER_US` disables timeout.

Return values

- `0` – If successful.
- `-ENOTSUP` – If API is not enabled.
- `-EBUSY` – If there is already an ongoing transfer.
- `-errno` – Other negative `errno` value in case of failure.

```c
int uart_tx_u16(const struct device *dev, const uint16_t *buf, size_t len, int32_t timeout)
```

Send given number of datum from buffer through UART.

Function returns immediately and event handler, set using `uart_callback_set`, is called after transfer is finished.

Parameters

- `dev` – UART device instance.
- `buf` – Pointer to wide data transmit buffer.
- `len` – Length of wide data transmit buffer.
- `timeout` – Timeout in milliseconds. Valid only if flow control is enabled. `SYS_FOREVER_MS` disables timeout.

Return values

- `0` – If successful.
- `-ENOTSUP` – If API is not enabled.
- `-EBUSY` – If there is already an ongoing transfer.
- `-errno` – Other negative `errno` value in case of failure.
int uart_tx_abort(const struct device *dev)
Abort current TX transmission.

UART_TX_DONE event will be generated with amount of data sent.

Parameters
• dev – UART device instance.

Return values
• 0 – If successful.
• -ENOTSUP – If API is not enabled.
• -EFAULT – There is no active transmission.
• -errno – Other negative errno value in case of failure.

int uart_rx_enable(const struct device *dev, uint8_t *buf, size_t len, int32_t timeout)
Start receiving data through UART.

Function sets given buffer as first buffer for receiving and returns immediately. After that event handler, set using uart_callback_set, is called with UART_RX_RDY or UART_RX_BUF_REQUEST events.

Parameters
• dev – UART device instance.
• buf – Pointer to receive buffer.
• len – Buffer length.
• timeout – Inactivity period after receiving at least a byte which triggers UART_RX_RDY event. Given in microseconds. SYS_FOREVER_US disables timeout. See uart_event_type for details.

Return values
• 0 – If successful.
• -ENOTSUP – If API is not enabled.
• -EBUSY – RX already in progress.
• -errno – Other negative errno value in case of failure.

int uart_rx_enable_u16(const struct device *dev, uint16_t *buf, size_t len, int32_t timeout)
Start receiving wide data through UART.

Function sets given buffer as first buffer for receiving and returns immediately. After that event handler, set using uart_callback_set, is called with UART_RX_RDY or UART_RX_BUF_REQUEST events.

Parameters
• dev – UART device instance.
• buf – Pointer to wide data receive buffer.
• len – Buffer length.
• timeout – Inactivity period after receiving at least a byte which triggers UART_RX_RDY event. Given in milliseconds. SYS_FOREVER_MS disables timeout. See uart_event_type for details.

Return values
• 0 – If successful.
• -ENOTSUP – If API is not enabled.
-EBUSY – RX already in progress.
-errno – Other negative errno value in case of failure.

static inline int uart_rx_buf_rsp(const struct device *dev, uint8_t *buf, size_t len)
Provide receive buffer in response to UART_RX_BUF_REQUEST event.
Provide pointer to RX buffer, which will be used when current buffer is filled.

Note: Providing buffer that is already in usage by driver leads to undefined behavior. Buffer can be reused when it has been released by driver.

Parameters
- dev – UART device instance.
- buf – Pointer to receive buffer.
- len – Buffer length.

Return values
- 0 – If successful.
-ENOTSUP – If API is not enabled.
-EBUSY – Next buffer already set.
-EACCES – Receiver is already disabled (function called too late?).
-errno – Other negative errno value in case of failure.

static inline int uart_rx_buf_rsp_u16(const struct device *dev, uint16_t *buf, size_t len)
Provide wide data receive buffer in response to UART_RX_BUF_REQUEST event.
Provide pointer to RX buffer, which will be used when current buffer is filled.

Note: Providing buffer that is already in usage by driver leads to undefined behavior. Buffer can be reused when it has been released by driver.

Parameters
- dev – UART device instance.
- buf – Pointer to wide data receive buffer.
- len – Buffer length.

Return values
- 0 – If successful.
-ENOTSUP – If API is not enabled.
-EBUSY – Next buffer already set.
-EACCES – Receiver is already disabled (function called too late?).
-errno – Other negative errno value in case of failure.
int uart_rx_disable(const struct device *dev)
    Disable RX.

    UART_RX_BUFReleased event will be generated for every buffer scheduled, after that UART_RX_DISABLED event will be generated. Additionally, if there is any pending received data, the UART_RX_RDY event for that data will be generated before the UART_RX_BUFReleased events.

Parameters
- dev – UART device instance.

Return values
- 0 – If successful.
- -ENOTSUP – If API is not enabled.
- -EFAULT – There is no active reception.
- -errno – Other negative errno value in case of failure.

struct uart_event_tx

    #include <uart.h> UART TX event data.

    Public Members

    const uint8_t *buf
    Pointer to current buffer.

    size_t len
    Number of bytes sent.

struct uart_event_rx

    #include <uart.h> UART RX event data.

    The data represented by the event is stored in rx.buf[rx.offset] to rx.buf[rx.offset+rx.len]. That is, the length is relative to the offset.

    Public Members

    uint8_t *buf
    Pointer to current buffer.

    size_t offset
    Currently received data offset in bytes.

    size_t len
    Number of new bytes received.

struct uart_event_rx_buf

    #include <uart.h> UART RX buffer released event data.
Public Members

uint8_t *buf
    Pointer to buffer that is no longer in use.

struct uart_event_rx_stop
#include <uart.h> UART RX stopped data.

Public Members

elem uart_rx_stop_reason reason
    Reason why receiving stopped.

struct uart_event_rx data
    Last received data.

struct uart_event
#include <uart.h> Structure containing information about current event.

Public Members

elem uart_event_type type
    Type of event.

union uart_event_data
    #include <uart.h> Event data.

Public Members

struct uart_event_tx tx
    UART_TX_DONE and UART_TX_ABORTED events data.

struct uart_event_rx rx
    UART_RX_RDY event data.

struct uart_event_rx_buf rx_buf
    UART_RX_BUF_RELEASED event data.

struct uart_event_rx_stop rx_stop
    UART_RX_STOPPED event data.
7.6.47  USB-C VBUS

Overview

USB-C VBUS is the line in a USB Type-C connection that delivers power from a Source to a Sink device.

USB-C VBUS API  The USB-C VBUS device driver presents an API that's used to control and measure VBUS.

Configuration Options

Related configuration options:

• CONFIG_USBC_VBUS_DRIVER

API Reference

group usbc_vbus_api

USB-C VBUS API.

Functions

static inline bool usbc_vbus_check_level(const struct device *dev, enum tc_vbus_level level)

Checks if VBUS is at a particular level.

Parameters

• dev – Runtime device structure
• level – The level voltage to check against

Return values

• true – if VBUS is at the level voltage
• false – if VBUS is not at that level voltage

static inline int usbc_vbus_measure(const struct device *dev, int *meas)

Reads and returns VBUS measured in mV.

Parameters

• dev – Runtime device structure
• meas – pointer where the measured VBUS voltage is stored

Return values

• 0 – on success
• -EIO – on failure

static inline int usbc_vbus_discharge(const struct device *dev, bool enable)

Controls a pin that discharges VBUS.

Parameters

• dev – Runtime device structure
• **enable** – Discharge VBUS when true

### Return values

- 0 – on success
- -EIO – on failure
- -ENOENT – if discharge pin isn’t defined

```c
static inline int usbc_vbus_enable(const struct device *dev, bool enable)
```

Controls a pin that enables VBUS measurements.

### Parameters

- `dev` – Runtime device structure
- `enable` – enable VBUS measurements when true

### Return values

- 0 – on success
- -EIO – on failure
- -ENOENT – if enable pin isn’t defined

```c
struct usbc_vbus_driver_api
#include <usbc_vbus.h>
```

#### 7.6.48 USB Type-C Port Controller (TCPC)

### Overview

**TCPC (USB Type-C Port Controller)** The TCPC is a device used to simplify the implementation of a USB-C system by providing the following three function:

- VBUS and VCONN control **USB Type-C**: The TCPC may provide a Source device, the mechanism to control VBUS sourcing, and a Sink device, the mechanism to control VBUS sinking. A similar mechanism is provided for the control of VCONN.
- CC control and sensing: The TCPC implements logic for controlling the CC pin pull-up and pull-down resistors. It also provides a way to sense and report what resistors are present on the CC pin.
- Power Delivery message reception and transmission **USB Power Delivery**: The TCPC sends and receives messages constructed in the TCPM and places them on the CC lines.

**TCPC API** The TCPC device driver functions as the liaison between the TCPC device and the application software; this is accomplished by the Zephyr’s API provided by the device driver that’s used to communicate with and control the TCPC device.

### Configuration Options

Related configuration options:

- CONFIG_USBC_TCPC_DRIVER
API Reference

group usb_type_c

USB Type-C.

Defines

TC_V_SINK_DISCONNECT_MIN_MV
VBUS minimum for a sink disconnect detection.
See Table 4-3 VBUS Sink Characteristics

TC_V_SINK_DISCONNECT_MAX_MV
VBUS maximum for a sink disconnect detection.
See Table 4-3 VBUS Sink Characteristics

TC_T_VBUS_ON_MAX_MS
From entry to Attached.SRC until VBUS reaches the minimum vSafe5V threshold as measured at the source's receptacle See Table 4-29 VBUS and VCONN Timing Parameters.

TC_T_VBUS_OFF_MAX_MS
From the time the Sink is detached until the Source removes VBUS and reaches vSafe0V (See USB PD).
See Table 4-29 VBUS and VCONN Timing Parameters

TC_T_VCONN_ON_MAX_MS
From the time the Source supplied VBUS in the Attached.SRC state.
See Table 4-29 VBUS and VCONN Timing Parameters

TC_T_VCONN_ON_PA_MAX_MS
From the time a Sink with accessory support enters the PoweredAccessory state until the Sink sources minimum VCONN voltage (see Table 4-5) See Table 4-29 VBUS and VCONN Timing Parameters.

TC_T_VCONN_OFF_MAX_MS
From the time that a Sink is detached or as directed until the VCONN supply is disconnected.
See Table 4-29 VBUS and VCONN Timing Parameters

TC_T_SINK_ADJ_MAX_MS
Response time for a Sink to adjust its current consumption to be in the specified range due to a change in USB Type-C Current advertisement See Table 4-29 VBUS and VCONN Timing Parameters.

TC_T_DRP_MIN_MS
The minimum period a DRP shall complete a Source to Sink and back advertisement See Table 4-30 DRP Timing Parameters.
**TC_T_DRP_MAX_MS**

The maximum period a DRP shall complete a Source to Sink and back advertisement. See Table 4-30 DRP Timing Parameters.

**TC_T_DRP_TRANSITION_MIN_MS**

The minimum time a DRP shall complete transitions between Source and Sink roles during role resolution. See Table 4-30 DRP Timing Parameters.

**TC_T_DRP_TRANSITION_MAX_MS**

The maximum time a DRP shall complete transitions between Source and Sink roles during role resolution. See Table 4-30 DRP Timing Parameters.

**TC_T_DRP_TRY_MIN_MS**

Minimum wait time associated with the Try.SRC state. See Table 4-30 DRP Timing Parameters.

**TC_T_DRP_TRY_MAX_MS**

Maximum wait time associated with the Try.SRC state. See Table 4-30 DRP Timing Parameters.

**TC_T_DRP_TRY_WAIT_MIN_MS**

Minimum wait time associated with the Try.SNK state. See Table 4-30 DRP Timing Parameters.

**TC_T_DRP_TRY_WAIT_MAX_MS**

Maximum wait time associated with the Try.SNK state. See Table 4-30 DRP Timing Parameters.

**TC_T_TRY_TIMEOUT_MIN_MS**

Minimum timeout for transition from Try.SRC to TryWait.SNK. See Table 4-30 DRP Timing Parameters.

**TC_T_TRY_TIMEOUT_MAX_MS**

Maximum timeout for transition from Try.SRC to TryWait.SNK. See Table 4-30 DRP Timing Parameters.

**TC_T_VPD_DETACH_MIN_MS**

Minimum Time for a DRP to detect that the connected Charge-Through VCONNPowered USB Device has been detached, after VBUS has been removed. See Table 4-30 DRP Timing Parameters.

**TC_T_VPD_DETACH_MAX_MS**

Maximum Time for a DRP to detect that the connected Charge-Through VCONNPowered USB Device has been detached, after VBUS has been removed. See Table 4-30 DRP Timing Parameters.
TC_T_CC_DEBOUNCE_MIN_MS
Minimum time a port shall wait before it can determine it is attached. See Table 4-31 CC Timing.

TC_T_CC_DEBOUNCE_MAX_MS
Maximum time a port shall wait before it can determine it is attached. See Table 4-31 CC Timing.

TC_T_PD_DEBOUNCE_MIN_MS
Minimum time a sink port shall wait before it can determine it is detached due to the potential for USB PD signaling on CC as described in the state definitions. See Table 4-31 CC Timing.

TC_T_PD_DEBOUNCE_MAX_MS
Maximum time a sink port shall wait before it can determine it is detached due to the potential for USB PD signaling on CC as described in the state definitions. See Table 4-31 CC Timing.

TC_T_TRY_CC_DEBOUNCE_MIN_MS
Minimum Time a port shall wait before it can determine it is re-attached during the try-wait process. See Table 4-31 CC Timing.

TC_T_TRY_CC_DEBOUNCE_MAX_MS
Maximum Time a port shall wait before it can determine it is re-attached during the try-wait process. See Table 4-31 CC Timing.

TC_T_ERROR_RECOVERY_SELFPOWERED_MIN_MS
Minimum time a self-powered port shall remain in the ErrorRecovery state. See Table 4-31 CC Timing.

TC_T_ERROR_RECOVERY_SOURCE_MIN_MS
Minimum time a source shall remain in the ErrorRecovery state if it was sourcing VCONN in the previous state. See Table 4-31 CC Timing.

TC_T_RP_VALUE_CHANGE_MIN_MS
Minimum time a sink port shall wait before it can determine there has been a change in Rp where CC is not BMC Idle or the port is unable to detect BMC Idle. See Table 4-31 CC Timing.

TC_T_RP_VALUE_CHANGE_MAX_MS
Maximum time a sink port shall wait before it can determine there has been a change in Rp where CC is not BMC Idle or the port is unable to detect BMC Idle. See Table 4-31 CC Timing.
TC_T_SRC_DISCONNECT_MIN_MS
Minimum time a Source shall detect the SRC.Open state.
The Source should detect the SRC.Open state as quickly as practical. See Table 4-31 CC Timing

TC_T_SRC_DISCONNECT_MAX_MS
Maximum time a Source shall detect the SRC.Open state.
The Source should detect the SRC.Open state as quickly as practical. See Table 4-31 CC Timing

TC_T_NO_TOGGLE_CONNECT_MIN_MS
Minimum time to detect connection when neither Port Partner is toggling.
See Table 4-31 CC Timing

TC_T_NO_TOGGLE_CONNECT_MAX_MS
Maximum time to detect connection when neither Port Partner is toggling.
See Table 4-31 CC Timing

TC_T_ONE_PORT_TOGGLE_CONNECT_MIN_MS
Minimum time to detect connection when one Port Partner is toggling 0ms ... dc-SRC.DRP max * tDRP max + 2 * tNoToggleConnect).
See Table 4-31 CC Timing

TC_T_ONE_PORT_TOGGLE_CONNECT_MAX_MS
Maximum time to detect connection when one Port Partner is toggling 0ms ... dc-SRC.DRP max * tDRP max + 2 * tNoToggleConnect).
See Table 4-31 CC Timing

TC_T_TWO_PORT_TOGGLE_CONNECT_MIN_MS
Minimum time to detect connection when both Port Partners are toggling (0ms ... 5 * tDRP max + 2 * tNoToggleConnect).
See Table 4-31 CC Timing

TC_T_TWO_PORT_TOGGLE_CONNECT_MAX_MS
Maximum time to detect connection when both Port Partners are toggling (0ms ... 5 * tDRP max + 2 * tNoToggleConnect).
See Table 4-31 CC Timing

TC_T_VPDCTDD_MIN_US
Minimum time for a Charge-Through VCONN-Powered USB Device to detect that the Charge-Through source has disconnected from CC after VBUS has been removed, transition to CTUnattached.VPD, and re-apply its Rp termination advertising 3.0 A on the host port CC.
See Table 4-31 CC Timing

TC_T_VPDCTDD_MAX_MS
Maximum time for a Charge-Through VCONN-Powered USB Device to detect that the
Charge-Through source has disconnected from CC after VBUS has been removed, transition to CTUnattached.VPD, and re-apply its Rp termination advertising 3.0 A on the host port CC.

See Table 4-31 CC Timing

**TC_T_VPDDISABLE_MIN_MS**
Minimum time for a Charge-Through VCONN-Powered USB Device shall remain in CT-Disabled.VPD state.

See Table 4-31 CC Timing

**Enums**

**enum tc_cc_voltage_state**
CC Voltage status.

*Values:*

- **enumerator TC_CC_VOLT_OPEN = 0**
  No port partner connection.

- **enumerator TC_CC_VOLT_RA = 1**
  Port partner is applying Ra.

- **enumerator TC_CC_VOLT_RD = 2**
  Port partner is applying Rd.

- **enumerator TC_CC_VOLT_RP_DEF = 5**
  Port partner is applying Rp (0.5A)

- **enumerator TC_CC_VOLT_RP_1A5 = 6**

- **enumerator TC_CC_VOLT_RP_3A0 = 7**
  Port partner is applying Rp (3.0A)

**enum tc_vbus_level**
VBUS level voltages.

*Values:*

- **enumerator TC_VBUS_SAFE0V = 0**
  VBUS is less than vSafe0V max.

- **enumerator TC_VBUS_PRESENT = 1**
  VBUS is at least vSafe5V min.

- **enumerator TC_VBUS_REMOVED = 2**
  VBUS is less than vSinkDisconnect max.
enum tc_rp_value
    Pull-Up resistor values.
    Values:

    enumerator TC_RP_USB = 0
        Pull-Up resistor for a current of 900mA.

    enumerator TC_RP_1A5 = 1
        Pull-Up resistor for a current of 1.5A.

    enumerator TC_RP_3A0 = 2
        Pull-Up resistor for a current of 3.0A.

    enumerator TC_RP_RESERVED = 3
        No Pull-Up resistor is applied.

denum tc_cc_pull
    CC pull resistors.
    Values:

    enumerator TC_CC_RA = 0
        Ra Pull-Down resistor.

    enumerator TC_CC_RP = 1
        Rp Pull-Up resistor.

    enumerator TC_CC_RD = 2
        Rd Pull-Down resistor.

    enumerator TC_CC_OPEN = 3
        No CC resistor.

    enumerator TC_RA_RD = 4
        Ra and Rd Pull-Down resistor.

denum tc_cable_plug
    Cable plug.
    See 6.2.1.1.7 Cable Plug. Only applies to SOP’ and SOP”. Replaced by pd_power_role for
    SOP packets.
    Values:

    enumerator PD_PLUG_FROM_DFP_UFP = 0

    enumerator PD_PLUG_FROM_CABLE_VPD = 1

denum tc_power_role
    Power Delivery Power Role.
    Values:
enumerator TC_ROLE_SINK = 0
Power role is a sink.

enumerator TC_ROLE_SOURCE = 1
Power role is a source.

enum tc_data_role
Power Delivery Data Role.
Values:

enumerator TC_ROLE_UFP = 0
Data role is an Upstream Facing Port.

enumerator TC_ROLE_DFP = 1
Data role is a Downstream Facing Port.

enumerator TC_ROLE_DISCONNECTED = 2
Port is disconnected.

enum tc_cc_polarity
Polarity of the CC lines.
Values:

enumerator TC_POLARITY_CC1 = 0
Use CC1 IO for Power Delivery communication.

enumerator TC_POLARITY_CC2 = 1
Use CC2 IO for Power Delivery communication.

enum tc_cc_states
Possible port partner connections based on CC line states.
Values:

enumerator TC_CC_NONE = 0
No port partner attached.

enumerator TC_CC_UFP_NONE = 1
From DFP perspective.
No UFP accessory connected

enumerator TC_CC_UFP_AUDIO_ACC = 2
UFP Audio accessory connected.

enumerator TC_CC_UFP_DEBUG_ACC = 3
UFP Debug accessory connected.

enumerator TC_CC_UFP_ATTACHED = 4
Plain UFP attached.
enumerator TC_CC_DFP_ATTACHED = 5
    From UFP perspective.
    Plain DFP attached

enumerator TC_CC_DFP_DEBUG_ACC = 6
    DFP debug accessory connected.

**group** usb_type_c_port_controller_api
    USB Type-C Port Controller API.

**typedefs**

typedef int (*tcpc_vconn_control_cb_t)(const struct device *dev, enum tc_cc_polarity pol, bool enable)

typedef int (*tcpc_vconn_discharge_cb_t)(const struct device *dev, enum tc_cc_polarity pol, bool enable)

typedef void (*tcpc_alert_handler_cb_t)(const struct device *dev, void *data, enum tcpc_alert alert)

**enums**

enum tcpc_alert
    TCPC Alert bits.
    **Values:**

    enumerator TCPC_ALERT_CC_STATUS
        CC status changed.

    enumerator TCPC_ALERT_POWER_STATUS
        Power status changed.

    enumerator TCPC_ALERT_MSG_STATUS
        Receive Buffer register changed.

    enumerator TCPC_ALERT_HARD_RESET_RECEIVED
        Received Hard Reset message.

    enumerator TCPC_ALERT_TRANSMIT_MSG_FAILED
        SOP* message transmission not successful.

    enumerator TCPC_ALERT_TRANSMIT_MSG_DISCARDED
        Reset or SOP* message transmission not sent due to an incoming receive message.
enumerator TCPC_ALERT_TRANSMIT_MSG_SUCCESS
  Reset or SOP* message transmission successful.

enumerator TCPC_ALERT_VBUS_ALARM_HI
  A high-voltage alarm has occurred.

enumerator TCPC_ALERT_VBUS_ALARM_LO
  A low-voltage alarm has occurred.

enumerator TCPC_ALERT_FAULT_STATUS
  A fault has occurred.
  Read the FAULT_STATUS register

enumerator TCPC_ALERT_RX_BUFFER_OVERFLOW
  TCPC RX buffer has overflowed.

enumerator TCPC_ALERT_VBUS_SNK_DISCONNECT
  The TCPC in Attached.SNK state has detected a sink disconnect.

enumerator TCPC_ALERT_BEGINNING_MSG_STATUS
  Receive buffer register changed.

enumerator TCPC_ALERT_EXTENDED_STATUS
  Extended status changed.

enumerator TCPC_ALERT_EXTENDED
  An extended interrupt event has occurred.
  Read the alert_extended register

enumerator TCPC_ALERT_VENDOR_DEFINED
  A vendor defined alert has been detected.

enum tcpc_status_reg
  TCPC Status register.
  Values:

  enumerator TCPC_CC_STATUS
    The CC Status register.

  enumerator TCPC_POWER_STATUS
    The Power Status register.

  enumerator TCPC_FAULT_STATUS
    The Fault Status register.

  enumerator TCPC_EXTENDED_STATUS
    The Extended Status register.
enumerator TCPC_EXTENDED_ALERT_STATUS
The Extended Alert Status register.

enumerator TCPC_VENDOR_DEFINED_STATUS
The Vendor Defined Status register.

Functions

static inline int tcpc_is_cc_rp(enum tc_cc_voltage_state cc)
    Returns whether the sink has detected a Rp resistor on the other side.

static inline int tcpc_is_cc_open(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
    Returns true if both CC lines are completely open.

static inline int tcpc_is_cc_snk_dbg_acc(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
    Returns true if we detect the port partner is a snk debug accessory.

static inline int tcpc_is_cc_src_dbg_acc(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
    Returns true if we detect the port partner is a src debug accessory.

static inline int tcpc_is_cc_audio_acc(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
    Returns true if the port partner is an audio accessory.

static inline int tcpc_is_cc_at_least_one_rd(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
    Returns true if the port partner is presenting at least one Rd.

static inline int tcpc_is_cc_only_one_rd(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
    Returns true if the port partner is presenting Rd on only one CC line.

static inline int tcpc_init(const struct device *dev)
    Initializes the TCPC.

    Parameters
    • dev – Runtime device structure

    Return values
    • 0 – on success
    • -EIO – on failure
    • -EAGAIN – if initialization should be postponed

static inline int tcpc_get_cc(const struct device *dev, enum tc_cc_voltage_state *cc1, enum tc_cc_voltage_state *cc2)
    Reads the status of the CC lines.

    Parameters
    • dev – Runtime device structure
    • cc1 – A pointer where the CC1 status is written
    • cc2 – A pointer where the CC2 status is written
Return values

• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_select_rp_value(const struct device *dev, enum tc_rp_value rp)
Sets the value of CC pull up resistor used when operating as a Source.

Parameters

• dev – Runtime device structure
• rp – Value of the Pull-Up Resistor.

Return values

• 0 – on success
• -ENOSYS –
• -EIO – on failure

static inline int tcpc_get_rp_value(const struct device *dev, enum tc_rp_value *rp)
Gets the value of the CC pull up resistor used when operating as a Source.

Parameters

• dev – Runtime device structure
• rp – pointer where the value of the Pull-Up Resistor is stored

Return values

• 0 – on success
• -ENOSYS –
• -EIO – on failure

static inline int tcpc_set_cc(const struct device *dev, enum tc_cc_pull pull)
Sets the CC pull resistor and sets the role as either Source or Sink.

Parameters

• dev – Runtime device structure
• pull – The pull resistor to set

Return values

• 0 – on success
• -EIO – on failure

static inline void tcpc_set_vconn_cb(const struct device *dev, tcpc_vconn_control_cb_t vconn_cb)
Sets a callback that can enable or disable VCONN if the TCPC is unable to or the system is configured in a way that does not use the VCONN control capabilities of the TCPC.

The callback is called in the tcpc_set_vconn function if vconn_cb isn't NULL

Parameters

• dev – Runtime device structure
• vconn_cb – pointer to the callback function that controls vconn
static inline void tcpc_set_vconn_discharge_cb(const struct device *dev, tcpc_vconn_discharge_cb_t cb)

Sets a callback that can enable or discharge VCONN if the TCPC is unable to or the system is configured in a way that does not use the VCONN control capabilities of the TCPC.

The callback is called in the tcpc_vconn_discharge function if cb isn’t NULL.

**Parameters**

- `dev` – Runtime device structure
- `cb` – pointer to the callback function that discharges vconn

static inline int tcpc_vconn_discharge(const struct device *dev, bool enable)

Discharges VCONN.

This function uses the TCPC to discharge VCONN if possible or calls the callback function set by tcpc_set_vconn_cb.

**Parameters**

- `dev` – Runtime device structure
- `enable` – VCONN discharge is enabled when true, it's disabled

**Return values**

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int tcpc_set_vconn(const struct device *dev, bool enable)

Enables or disables VCONN.

This function uses the TCPC to measure VCONN if possible or calls the callback function set by tcpc_set_vconn_cb.

**Parameters**

- `dev` – Runtime device structure
- `enable` – VCONN is enabled when true, it's disabled

**Return values**

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int tcpc_set_roles(const struct device *dev, enum tc_power_role power_role, enum tc_data_role data_role)

Sets the Power and Data Role of the PD message header.

This function only needs to be called once per data / power role change.

**Parameters**

- `dev` – Runtime device structure
- `power_role` – current power role
- `data_role` – current data role

**Return values**

- `0` – on success
static inline int tcpc_get_rx_pending_msg(const struct device *dev, struct pd_msg *buf)

Retrieves the Power Delivery message from the TCPC.

If buf is NULL, then only the status is returned, where 0 means there is a message pending and -ENODATA means there is no pending message.

Parameters
• dev – Runtime device structure
• buf – pointer where the pd_buf pointer is written, NULL if only checking the status

Return values
• Greater – or equal to 0 is the number of bytes received if buf parameter is provided
• 0 – if there is a message pending and buf parameter is NULL
• -EIO – on failure
• -ENODATA – if no message is pending

static inline int tcpc_set_rx_enable(const struct device *dev, bool enable)

Enables the reception of SOP* message types.

Parameters
• dev – Runtime device structure
• enable – Enable Power Delivery when true, else it’s disabled

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_set_cc_polarity(const struct device *dev, enum tc_cc_polarity polarity)

Sets the polarity of the CC lines.

Parameters
• dev – Runtime device structure
• polarity – Polarity of the cc line

Return values
• 0 – on success
• -EIO – on failure

static inline int tcpc_transmit_data(const struct device *dev, struct pd_msg *msg)

Transmits a Power Delivery message.

Parameters
• dev – Runtime device structure
• msg – Power Delivery message to transmit

Return values
• 0 – on success
static inline int tcpc_dump_std_reg(const struct device *dev)
    Dump a set of TCPC registers.

Parameters

• dev – Runtime device structure

Return values

• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_set_alert_handler_cb(const struct device *dev,
                                          tcpc_alert_handler_cb_t handler, void *data)

Sets the alert function that’s called when an interrupt is triggered due to an alert bit.
Calling this function enables the particular alert bit

Parameters

• dev – Runtime device structure
• handler – The callback function called when the bit is set
• data – user data passed to the callback

Return values

• 0 – on success
• -EINVAL – on failure

static inline int tcpc_get_status_register(const struct device *dev, enum tcpc_status_reg reg, int32_t *status)

Gets a status register.

Parameters

• dev – Runtime device structure
• reg – The status register to read
• status – Pointer where the status is stored

Return values

• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_clear_status_register(const struct device *dev, enum tcpc_status_reg reg, uint32_t mask)

Clears a TCPC status register.

Parameters

• dev – Runtime device structure
• reg – The status register to read
• mask – A bit mask of the status register to clear. A status bit is cleared when it’s set to 1.

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_mask_status_register(const struct device *dev, enum tcpc_status_reg reg, uint32_t mask)

Sets the mask of a TCPC status register.

Parameters
• dev – Runtime device structure
• reg – The status register to read
• mask – A bit mask of the status register to mask. The status bit is masked if it's 0, else it's unmasked.

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_set_debug_accessory(const struct device *dev, bool enable)

Manual control of TCPC DebugAccessory control.

Parameters
• dev – Runtime device structure
• enable – Enable Debug Accessory when true, else it's disabled

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_set_debug_detach(const struct device *dev)

Detach from a debug connection.

Parameters
• dev – Runtime device structure

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_set_drp_toggle(const struct device *dev, bool enable)

Enable TCPC auto dual role toggle.

Parameters
• dev – Runtime device structure
• enable – Auto dual role toggle is active when true, else it's disabled

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_get_snk_ctrl(const struct device *dev)
Queries the current sinking state of the TCPC.

Parameters
• dev – Runtime device structure

Return values
• true – if sinking power
• false – if not sinking power
• -ENOSYS – if not implemented

static inline int tcpc_get_src_ctrl(const struct device *dev)
Queries the current sourcing state of the TCPC.

Parameters
• dev – Runtime device structure

Return values
• true – if sourcing power
• false – if not sourcing power
• -ENOSYS – if not implemented

static inline int tcpc_set_bist_test_mode(const struct device *dev, bool enable)
Controls the BIST Mode of the TCPC.
It disables RX alerts while the mode is active.

Parameters
• dev – Runtime device structure
• enable – The TCPC enters BIST TEST Mode when true

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_get_chip_info(const struct device *dev, struct tcpc_chip_info *chip_info)
Gets the TCPC firmware version.

Parameters
• dev – Runtime device structure
• chip_info – Pointer to TCPC chip info where the version is stored

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented
static inline int tcpc_set_low_power_mode(const struct device *dev, bool enable)
Instructs the TCPC to enter or exit low power mode.

Parameters
• dev – Runtime device structure
• enable – The TCPC enters low power mode when true, else it exits it

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_sop_prime_enable(const struct device *dev, bool enable)
Enables the reception of SOP Prime messages.

Parameters
• dev – Runtime device structure
• enable – Can receive SOP Prime messages when true, else it can not

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

struct tcpc_chip_info
#include <usbc_tcpc.h> TCPC Chip Information.

Public Members

uint16_t vendor_id
Vendor Id.

  USB Power Delivery.

**USB PD 3.1 Rev 1.6, Table 6-70 Counter Parameters**

**PD\_N\_CAPS\_COUNT**
  The CapsCounter is used to count the number of Source Capabilities Messages which
  have been sent by a Source at power up or after a Hard Reset.
  Parameter Name: nCapsCounter

**PD\_N\_HARD\_RESET\_COUNT**
  The HardResetCounter is used to retry the Hard Reset whenever there is no response
  from the remote device (see Section 6.6.6) Parameter Name: nHardResetCounter.

**USB PD 3.1 Rev 1.6, Table 6-68 Time Values**

**PD\_T\_NO\_RESPONSE\_MIN\_MS**
  The NoResponseTimer is used by the Policy Engine in a Source to determine that its
  Port Partner is not responding after a Hard Reset.
  Parameter Name: tNoResponseTimer

**PD\_T\_NO\_RESPONSE\_MAX\_MS**
  The NoResponseTimer is used by the Policy Engine in a Source to determine that its
  Port Partner is not responding after a Hard Reset.
  Parameter Name: tNoResponseTimer

**PD\_T\_PS\_HARD\_RESET\_MIN\_MS**
  Min time the Source waits to ensure that the Sink has had sufficient time to process
  Hard Reset Signaling before turning off its power supply to VBUS Parameter Name:
  tPSHardReset.

**PD\_T\_PS\_HARD\_RESET\_MAX\_MS**
  Max time the Source waits to ensure that the Sink has had sufficient time to process
  Hard Reset Signaling before turning off its power supply to VBUS Parameter Name:
  tPSHardReset.

**PD\_T\_SINK\_TX\_MIN\_MS**
  Minimum time a Source waits after changing Rp from SinkTxOk to SinkTxNG before
  initiating an AMS by sending a Message.
  Parameter Name: tSinkTx

**PD\_T\_SINK\_TX\_MAX\_MS**
  Maximum time a Source waits after changing Rp from SinkTxOk to SinkTxNG before
  initiating an AMS by sending a Message.
  Parameter Name: tSinkTx
**PD_T_TYPEC_SEND_SOURCE_CAP_MIN_MS**
Minimum time a source shall wait before sending a Source_Capabilities message while the following is true: 1) The Port is Attached.
2) The Source is not in an active connection with a PD Sink Port. Parameter Name: tTypeCSendSourceCap

**PD_T_TYPEC_SEND_SOURCE_CAP_MAX_MS**
Maximum time a source shall wait before sending a Source_Capabilities message while the following is true: 1) The Port is Attached.
2) The Source is not in an active connection with a PD Sink Port. Parameter Name: tTypeCSendSourceCap

**Defines**

**PD_MAX_EXTENDED_MSG_LEGACY_LEN**
Maximum length of a non-Extended Message in bytes.
See Table 6-75 Value Parameters Parameter Name: MaxExtendedMsgLegacyLen

**PD_MAX_EXTENDED_MSG_LEN**
Maximum length of an Extended Message in bytes.
See Table 6-75 Value Parameters Parameter Name: MaxExtendedMsgLen

**PD_MAX_EXTENDED_MSG_CHUNK_LEN**
Maximum length of a Chunked Message in bytes.
When one of both Port Partners do not support Extended Messages of Data Size greater than PD_MAX_EXTENDED_MSG_LEGACY_LEN then the Protocol Layer supports a Chunking mechanism to break larger Messages into smaller Chunks of size PD_MAX_EXTENDED_MSG_CHUNK_LEN. See Table 6-75 Value Parameters Parameter Name: MaxExtendedMsgChunkLen

**PD_T_TYPEC_SINK_WAIT_CAP_MIN_MS**
Minimum time a sink shall wait for a Source_Capabilities message before sending a Hard Reset See Table 6-61 Time Values Parameter Name: tTypeCSinkWaitCap.

**PD_T_TYPEC_SINK_WAIT_CAP_MAX_MS**
Minimum time a sink shall wait for a Source_Capabilities message before sending a Hard Reset See Table 6-61 Time Values Parameter Name: tTypeCSinkWaitCap.

**PD_V_SAFE_0V_MAX_MV**
VBUS maximum safe operating voltage at “zero volts”.
See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: vSafe0V

**PD_V_SAFE_5V_MIN_MV**
VBUS minimum safe operating voltage at 5V.
See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: vSafe5V
PD_T_SAFE_0V_MAX_MS
Time to reach PD_V_SAFE_0V_MV max in milliseconds.
See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: tSafe0V

PD_T_SAFE_5V_MAX_MS
Time to reach PD_V_SAFE_5V_MV max in milliseconds.
See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: tSafe5V

PD_T_TX_TIMEOUT_MS
Time to wait for TCPC to complete transmit.

PD_T_HARD_RESET_COMPLETE_MIN_MS
Minimum time a Hard Reset must complete.
See Table 6-68 Time Values

PD_T_HARD_RESET_COMPLETE_MAX_MS
Maximum time a Hard Reset must complete.
See Table 6-68 Time Values

PD_T_SENDER_RESPONSE_MIN_MS
Minimum time a response must be sent from a Port Partner See Table 6-68 Time Values.

PD_T_SENDER_RESPONSE_NOM_MS
Nominal time a response must be sent from a Port Partner See Table 6-68 Time Values.

PD_T_SENDER_RESPONSE_MAX_MS
Maximum time a response must be sent from a Port Partner See Table 6-68 Time Values.

PD_T_SPR_PS_TRANSITION_MIN_MS
Minimum SPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

PD_T_SPR_PS_TRANSITION_NOM_MS
Nominal SPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

PD_T_SPR_PS_TRANSITION_MAX_MS
Maximum SPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

PD_T_EPR_PS_TRANSITION_MIN_MS
Minimum EPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

PD_T_EPR_PS_TRANSITION_NOM_MS
Nominal EPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.
PD_T_EPR_PS_TRANSITION_MAX_MS
Maximum EPR Mode time for a power supply to transition to a new level. See Table 6-68 Time Values.

PD_T_SINK_REQUEST_MIN_MS
Minimum time to wait before sending another request after receiving a Wait message. See Table 6-68 Time Values.

PD_T_CHUNKING_NOT_SUPPORTED_MIN_MS
Minimum time to wait before sending a Not_Supported message after receiving a Chunked message. See Table 6-68 Time Values.

PD_T_CHUNKING_NOT_SUPPORTED_NOM_MS
Nominal time to wait before sending a Not_Supported message after receiving a Chunked message. See Table 6-68 Time Values.

PD_T_CHUNKING_NOT_SUPPORTED_MAX_MS
Maximum time to wait before sending a Not_Supported message after receiving a Chunked message. See Table 6-68 Time Values.

PD_CONVERT_BYTES_TO_PD_HEADER_COUNT(c)
Convert bytes to PD Header data object count, where a data object is 4-bytes.

Parameters
• c – number of bytes to convert

PD_CONVERT_PD_HEADER_COUNT_TO_BYTES(c)
Convert PD Header data object count to bytes.

Parameters
• c – number of PD Header data objects

SINK_TX_OK
Collision avoidance Rp values in REV 3.0 Sink Transmit “OK”.

SINK_TX_NG
Collision avoidance Rp values in REV 3.0 Sink Transmit “NO GO”.

PD_GET_EXT_HEADER(c)
Used to get extended header from the first 32-bit word of the message.

Parameters
• c – first 32-bit word of the message

PDO_MAX_DATA_OBJECTS
PDO - Power Data Object RDO - Request Data Object.
Maximum number of 32-bit data objects sent in a single request.

PD_CONVERT_MA_TO_FIXED_PDO_CURRENT(c)
Convert milliamps to Fixed PDO Current in 10mA units.

Parameters
• c – Current in milliamps
PD_CONVERT_MV_TO_FIXED_PDO_VOLTAGE(v)
Convert millivolts to Fixed PDO Voltage in 50mV units.

Parameters
• v – Voltage in millivolts

PD_CONVERT_FIXED_PDO_CURRENT_TO_MA(c)
Convert a Fixed PDO Current from 10mA units to milliamps.

Parameters
• c – Fixed PDO current in 10mA units.

PD_CONVERT_FIXED_PDO_VOLTAGE_TO_MV(v)
Convert a Fixed PDO Voltage from 50mV units to millivolts.
Used for converting `pd_fixed_supply pdo_source.voltage` and `pd_fixed_supply pdo_sink.voltage`

Parameters
• v – Fixed PDO voltage in 50mV units.

PD_CONVERT_MA_TO_VARIABLE_PDO_CURRENT(c)
Convert milliamps to Variable PDO Current in 10ma units.

Parameters
• c – Current in milliamps

PD_CONVERT_MV_TO_VARIABLE_PDO_VOLTAGE(v)
Convert millivolts to Variable PDO Voltage in 50mV units.

Parameters
• v – Voltage in millivolts

PD_CONVERT_VARIABLE_PDO_CURRENT_TO_MA(c)
Convert a Variable PDO Current from 10mA units to milliamps.

Parameters
• c – Variable PDO current in 10mA units.

PD_CONVERT_VARIABLE_PDO_VOLTAGE_TO_MV(v)
Convert a Variable PDO Voltage from 50mV units to millivolts.

Parameters
• v – Variable PDO voltage in 50mV units.

PD_CONVERT_MW_TO_BATTERY_PDO_POWER(c)
Convert milliwatts to Battery PDO Power in 250mW units.

Parameters
• c – Power in milliwatts

PD_CONVERT_MV_TO_BATTERY_PDO_VOLTAGE(v)
Convert milliwatts to Battery PDO Voltage in 50mV units.

Parameters
• v – Voltage in millivolts
PD_CONVERT_BATTERY(PDO_POWER_TO_MW(c))
Convert a Battery PDO Power from 250mW units to milliwatts.

**Parameters**
- c – Power in 250mW units.

PD_CONVERT_BATTERY(PDO_VOLTAGE_TO_MV(v))
Convert a Battery PDO Voltage from 50mV units to millivolts.

**Parameters**
- v – Voltage in 50mV units.

PD_CONVERT_MA_TO_AUGMENTED_PDO_CURRENT(c)
Convert milliamps to Augmented PDO Current in 50mA units.

**Parameters**
- c – Current in milliamps

PD_CONVERT_MV_TO_AUGMENTED_PDO_VOLTAGE(v)
Convert millivolts to Augmented PDO Voltage in 100mV units.

**Parameters**
- v – Voltage in millivolts

PD_CONVERT_AUGMENTED_PDO_CURRENT_TO_MA(c)
Convert an Augmented PDO Current from 50mA units to milliamps.

**Parameters**
- c – Augmented PDO current in 50mA units.

PD_CONVERT_AUGMENTED_PDO_VOLTAGE_TO_MV(v)
Convert an Augmented PDO Voltage from 100mV units to millivolts.

**Parameters**
- v – Augmented PDO voltage in 100mV units.

**NUM_SOP_STAR_TYPES**
Number of valid Transmit Types.

** Enums **

enum pdo_type
Power Data Object Type Table 6-7 Power Data Object.

**Values:**

enumerator PDO_FIXED = 0
Fixed supply (Vmin = Vmax)

enumerator PDO_BATTERY = 1
Battery.

enumerator PDO_VARIABLE = 2
Variable Supply (non-Battery)
enumerator PDO_AUGMENTED = 3
    Augmented Power Data Object (APDO)

denum pd_frs_type
    Fast Role Swap Required for USB Type-C current.
    Values:

    enumerator FRS_NOT_SUPPORTED
        Fast Swap not supported.

    enumerator FRS_DEFAULT_USB_POWER
        Default USB Power.

    enumerator FRS_1P5A_5V
        1.5A @ 5V

    enumerator FRS_3P0A_5V
        3.0A @ 5V

denum pd_rev_type
    Protocol revision.
    Values:

    enumerator PD_REV10 = 0
        PD revision 1.0.

    enumerator PD_REV20 = 1
        PD revision 2.0.

    enumerator PD_REV30 = 2
        PD revision 3.0.

denum pd_packet_type
    Power Delivery packet type See USB Type-C Port Controller Interface Specification, Revision 2.0, Version 1.2, Table 4-38 TRANSMIT Register Definition.
    Values:

    enumerator PD_PACKET_SOP = 0
        Port Partner message.

    enumerator PD_PACKET_SOP_PRIME = 1
        Cable Plug message.

    enumerator PD_PACKET_PRIME_PRIME = 2
        Cable Plug message far end.

    enumerator PD_PACKET_DEBUG_PRIME = 3
        Currently undefined in the PD specification.
enumerator PD_PACKET_DEBUG_PRIME_PRIME = 4
Currently undefined in the PD specification.

enumerator PD_PACKET_TX_HARD_RESET = 5
Hard Reset message to the Port Partner.

enumerator PD_PACKET_CABLE_RESET = 6
Cable Reset message to the Cable.

enumerator PD_PACKET_TX_BIST_MODE_2 = 7
BIST_MODE_2 message to the Port Partner.

enumerator PD_PACKET_MSG_INVALID = 0xf
USED ONLY FOR RECEPTION OF UNKNOWN MSG TYPES.

enum pd_ctrl_msg_type
Control Message type See Table 6-5 Control Message Types.

Values:

enumerator PD_CTRL_GOOD_CRC = 1
  0 Reserved
  GoodCRC Message

enumerator PD_CTRL_GOTO_MIN = 2
  GotoMin Message.

enumerator PD_CTRL_ACCEPT = 3
  Accept Message.

enumerator PD_CTRL_REJECT = 4
  Reject Message.

enumerator PD_CTRL_PING = 5
  Ping Message.

enumerator PD_CTRL_PS_RDY = 6
  PS_RDY Message.

enumerator PD_CTRL_GET_SOURCE_CAP = 7
  Get_Source_Cap Message.

enumerator PD_CTRL_GET_SINK_CAP = 8
  Get_Sink_Cap Message.

enumerator PD_CTRL_DR_SWAP = 9
  DR_Swap Message.
enumerator PD_CTRL_PR_SWAP = 10
    PR_Swap Message.

descriptor PD_CTRL_VCONN_SWAP = 11
    VCONN_Swap Message.

descriptor PD_CTRL_WAIT = 12
    Wait Message.

descriptor PD_CTRL_SOFT_RESET = 13
    Soft Reset Message.

descriptor PD_CTRL_DATA_RESET = 14
    Used for REV 3.0.
    Data_Reset Message.

descriptor PD_CTRL_DATA_RESET_COMPLETE = 15
    Data_Reset_Complete Message.

descriptor PD_CTRL_NOT_SUPPORTED = 16
    Not_Supported Message.

descriptor PD_CTRL_GET_SOURCE_CAP_EXT = 17
    Get_Source_Cap_Extended Message.

descriptor PD_CTRL_GET_STATUS = 18
    Get_Status Message.

descriptor PD_CTRL_FR_SWAP = 19
    FR_Swap Message.

descriptor PD_CTRL_GET_PPS_STATUS = 20
    Get_PPS_Status Message.

descriptor PD_CTRL_GET_COUNTRY_CODES = 21
    Get_Country_Codes Message.

descriptor PD_CTRL_GET_SINK_CAP_EXT = 22
    Get_Sink_Cap_Extended Message.

enum pd_data_msg_type
    Data message type See Table 6-6 Data Message Types.
    Values:
        enumerator PD_DATA_SOURCE_CAP = 1
            0 Reserved
            SourceCapabilities Message
enumerator PD_DATA_REQUEST = 2
    Request Message.

enumerator PD_DATA_BIST = 3
    BIST Message.

enumerator PD_DATA_SINK_CAP = 4
    Sink Capabilities Message.

enumerator PD_DATA_BATTERY_STATUS = 5
    5-14 Reserved for REV 2.0

enumerator PD_DATA_ALERT = 6
    Alert Message.

enumerator PD_DATA_GET_COUNTRY_INFO = 7
    Get Country Info Message.

enumerator PD_DATA_ENTER_USB = 8
    8-14 Reserved for REV 3.0
    Enter USB message

enumerator PD_DATA_VENDOR_DEF = 15
    Vendor Defined Message.

enum pd_ext_msg_type
    Extended message type for REV 3.0 See Table 6-48 Extended Message Types.

    Values:

enumerator PD_EXT_SOURCE_CAP = 1
    0 Reserved
    Source_Capabilities_Extended Message

enumerator PD_EXT_STATUS = 2
    Status Message.

enumerator PD_EXT_GET_BATTERY_CAP = 3
    Get_Battery_Cap Message.

enumerator PD_EXT_GET_BATTERY_STATUS = 4
    Get_Battery_Status Message.

enumerator PD_EXT_BATTERY_CAP = 5
    Battery_Capabilities Message.

enumerator PD_EXT_GET_MANUFACTURER_INFO = 6
    Get.Manufacturer_Info Message.
enumerator PD_EXT_MANUFACTURER_INFO = 7
  Manufacturer_Info Message.

enumerator PD_EXT_SECURITY_REQUEST = 8
  Security_Request Message.

enumerator PD_EXT_SECURITY_RESPONSE = 9
  Security_Response Message.

enumerator PD_EXT_FIRMWARE_UPDATE_REQUEST = 10
  Firmware_Update_Request Message.

enumerator PD_EXT_FIRMWARE_UPDATE_RESPONSE = 11
  Firmware_Update_Response Message.

enumerator PD_EXT_PPS_STATUS = 12
  PPS_Status Message.

enumerator PD_EXT_COUNTRY_INFO = 13
  Country_Codes Message.

enumerator PD_EXT_COUNTRY_CODES = 14
  Country_Info Message.

enum usbpd_cc_pin
  Active PD CC pin.

  Values:

  enumerator USBPD_CC_PIN_1 = 0
    PD is active on CC1.

  enumerator USBPD_CC_PIN_2 = 1
    PD is active on CC2.

union pd_header
  #include <usbc_pd.h> Build a PD message header See Table 6-1 Message Header.

Public Members

uint16_t message_type
  Type of message.

uint16_t port_data_role
  Port Data role.

uint16_t specification_revision
  Specification Revision.
uint16_t port_power_role
    Port Power Role.

uint16_t message_id
    Message ID.

uint16_t number_of_data_objects
    Number of Data Objects.

uint16_t extended
    Extended Message.

struct pd_header

uint16_t raw_value

union pd_ext_header
    #include <usbc_pd.h> Build an extended message header See Table 6-3 Extended Message Header.

Public Members

uint16_t data_size
    Number of total bytes in data block.

uint16_t reserved0
    Reserved.

uint16_t request_chunk
    1 for a chunked message, else 0

uint16_t chunk_number
    Chunk number when chkd = 1, else 0.

uint16_t chunked
    1 for chunked messages

struct pd_ext_header

uint16_t raw_value
    Raw PD Ext Header value.

union pd_fixed_supply_pdo_source
    #include <usbc_pd.h> Create a Fixed Supply PDO Source value See Table 6-9 Fixed Supply PDO - Source.
Public Members

```c
uint32_t max_current
   Maximum Current in 10mA units.

uint32_t voltage
   Voltage in 50mV units.

uint32_t peak_current
   Peak Current.

uint32_t reserved0
   Reserved – Shall be set to zero.

uint32_t unchunked_ext_msg_supported
   Unchunked Extended Messages Supported.

uint32_t dual_role_data
   Dual-Role Data.

uint32_t usb_comms_capable
   USB Communications Capable.

uint32_t unconstrained_power
   Unconstrained Power.

uint32_t usb_suspend_supported
   USB Suspend Supported.

uint32_t dual_role_power
   Dual-Role Power.
```

```c
enum pdo_type
   Fixed supply.
   SET TO PDO_FIXED

struct pd_fixed_supply_pdo_source

  uint32_t raw_value
     Raw PDO value.

union pd_fixed_supply_pdo_sink
   #include <usbc_pd.h> Create a Fixed Supply PDO Sink value See Table 6-14 Fixed Supply PDO - Sink.
```

Public Members
uint32_t operational_current
Operational Current in 10mA units.

uint32_t voltage
Voltage in 50mV units.

uint32_t reserved0
Reserved – Shall be set to zero.

enum pd_frs_type frs_required
Fast Role Swap required USB Type-C Current.

uint32_t dual_role_data
Dual-Role Data.

uint32_t usb_comms_capable
USB Communications Capable.

uint32_t unconstrained_power
Unconstrained Power.

uint32_t higher_capability
Higher Capability.

uint32_t dual_role_power
Dual-Role Power.

enum pdo_type type
Fixed supply.
SET TO PDO_FIXED

struct pd_fixed_supply_pdo_sink

uint32_t raw_value
Raw PDO value.

union pd_variable_supply_pdo_source
#include <usbc_pd.h> Create a Variable Supply PDO Source value See Table 6-11 Variable Supply (non-Battery) PDO - Source.

Public Members

uint32_t max_current
Maximum Current in 10mA units.

uint32_t min_voltage
Minimum Voltage in 50mV units.
```c
#include <usbc_pd.h>

uint32_t max_voltage
    Maximum Voltage in 50mV units.

enum pdo_type type
    Variable supply.
    SET TO PDO_VARIABLE

struct pd_variable_supply_pdo_source

uint32_t raw_value
    Raw PDO value.

union pd_variable_supply_pdo_sink
    #include <usbc_pd.h> Create a Variable Supply PDO Sink value See Table 6-15 Variable Supply (non-Battery) PDO - Sink.

Public Members

uint32_t operational_current
    operational Current in 10mA units

uint32_t min_voltage
    Minimum Voltage in 50mV units.

uint32_t max_voltage
    Maximum Voltage in 50mV units.

enum pdo_type type
    Variable supply.
    SET TO PDO_VARIABLE

struct pd_variable_supply_pdo_sink

uint32_t raw_value
    Raw PDO value.

union pd_battery_supply_pdo_source
    #include <usbc_pd.h> Create a Battery Supply PDO Source value See Table 6-12 Battery Supply PDO - Source.

Public Members

uint32_t max_power
    Maximum Allowable Power in 250mW units.
```

7.6. Peripherals
uint32_t min_voltage
    Minimum Voltage in 50mV units.

uint32_t max_voltage
    Maximum Voltage in 50mV units.

definition pdo_type
type
    Battery supply.
    SET TO PDO_BATTERY

struct pd_battery_supply_pdo_source

    uint32_t raw_value
        Raw PDO value.

union pd_battery_supply_pdo_sink
    #include <usbc_pd.h> Create a Battery Supply PDO Sink value See Table 6-16 Battery Supply PDO - Sink.

Public Members

uint32_t operational_power
    Operational Power in 250mW units.

uint32_t min_voltage
    Minimum Voltage in 50mV units.

uint32_t max_voltage
    Maximum Voltage in 50mV units.

definition pdo_type type
    Battery supply.
    SET TO PDO_BATTERY

struct pd_battery_supply_pdo_sink

uint32_t raw_value
    Raw PDO value.

union pd_augmented_supply_pdo_source
    #include <usbc_pd.h> Create Augmented Supply PDO Source value See Table 6-13 Programmable Power Supply APDO - Source.

Public Members
uint32_t max_current
    Maximum Current in 50mA increments.

uint32_t reserved0
    Reserved – Shall be set to zero.

uint32_t min_voltage
    Minimum Voltage in 100mV increments.

uint32_t reserved1
    Reserved – Shall be set to zero.

uint32_t max_voltage
    Maximum Voltage in 100mV increments.

uint32_t reserved2
    Reserved – Shall be set to zero.

uint32_t pps_power_limited
    PPS Power Limited.

uint32_t reserved3
    00b – Programmable Power Supply 01b...11b - Reserved, Shall Not be used Setting as reserved because it defaults to 0 when not set.

enum pdo_type type
    Augmented Power Data Object (APDO).
    SET TO PDO_AUGMENTED

struct pd_augmented_supply_pdo_source

uint32_t raw_value
    Raw PDO value.

union pd_augmented_supply_pdo_sink
    #include <usbc_pd.h> Create Augmented Supply PDO Sink value See Table 6-17 Programmable Power Supply APDO - Sink.

Public Members

uint32_t max_current
    Maximum Current in 50mA increments.

uint32_t reserved0
    Reserved – Shall be set to zero.

uint32_t min_voltage
    Minimum Voltage in 100mV increments.
uint32_t reserved1
   Reserved – Shall be set to zero.

uint32_t max_voltage
   Maximum Voltage in 100mV increments.

uint32_t reserved2
   Reserved – Shall be set to zero.

uint32_t reserved3
   00b – Programmable Power Supply 01b...11b - Reserved, Shall Not be used Setting as reserved because it defaults to 0 when not set.

enum pdo_type type
   Augmented Power Data Object (APDO).
   SET TO PDO_AUGMENTED

struct pd_augmented_supply_pdo_sink

uint32_t raw_value
   Raw PDO value.

union pd_rdo
   #include <usbc_pd.h> The Request Data Object (RDO) Shall be returned by the Sink making a request for power.
   See Section 6.4.2 Request Message

Public Members

uint32_t min_or_max_operating_current
   Operating Current 10mA units NOTE: If Give Back Flag is zero, this field is the Maximum Operating Current.
   If Give Back Flag is one, this field is the Minimum Operating Current.

uint32_t operating_current
   Operating current in 10mA units.
   Operating Current 50mA units.

uint32_t reserved0
   Reserved - Shall be set to zero.

uint32_t unchuncked_ext_msg_supported
   Unchuncked Extended Messages Supported.

uint32_t no_usb_suspend
   No USB Suspend.
uint32_t usb_comm_capable
   USB Communications Capable.

uint32_t cap_mismatch
   Capability Mismatch.

uint32_t giveback
   Give Back Flag.

uint32_t object_pos
   Object Position (000b is Reserved and Shall Not be used)

uint32_t reserved1
   Reserved - Shall be set to zero.

struct pd_rdo fixed
   Create a Fixed RDO value See Table 6-19 Fixed and Variable Request Data Object.

struct pd_rdo variable
   Create a Variable RDO value See Table 6-19 Fixed and Variable Request Data Object.

uint32_t min_operating_power
   Minimum Operating Power in 250mW units.

uint32_t operating_power
   Operating power in 250mW units.

struct pd_rdo battery
   Create a Battery RDO value See Table 6-20 Battery Request Data Object.

uint32_t output_voltage
   Output Voltage in 20mV units.

uint32_t reserved2
   Reserved - Shall be set to zero.

uint32_t reserved3
   Reserved - Shall be set to zero.

struct pd_rdo augmented
   Create an Augmented RDO value See Table 6-22 Programmable Request Data Object.

uint32_t raw_value
   Raw RDO value.

struct pd_msg
   #include <usbc_pd.h> Power Delivery message.
Public Members

  \item \textbf{TGPIO\_RISING\_EDGE} = 0
  \item \textbf{TGPIO\_FALLING\_EDGE}
  \item \textbf{TGPIO\_TOGGLE\_EDGE}
\end{itemize}
Functions

int tgpio_port_get_time(const struct device *dev, uint64_t *current_time)
Get time from ART timer.

Parameters
• dev – TGPIO device
• current_time – Pointer to store timer value in cycles

Returns
0 if successful

int tgpio_port_get_cycles_per_second(const struct device *dev, uint32_t *cycles)
Get current running rate.

Parameters
• dev – TGPIO device
• cycles – pointer to store current running requency

Returns
0 if successful, negative errno code on failure.

int tgpio_pin_disable(const struct device *dev, uint32_t pin)
Disable operation on pin.

Parameters
• dev – TGPIO device
• pin – TGPIO pin

Returns
0 if successful, negative errno code on failure.

int tgpio_pin_config_ext_timestamp(const struct device *dev, uint32_t pin, uint32_t event_polarity)
Enable/Continue operation on pin.

Parameters
• dev – TGPIO device
• pin – TGPIO pin
• event_polarity – TGPIO pin event polarity

Returns
0 if successful, negative errno code on failure.

int tgpio_pin_periodic_output(const struct device *dev, uint32_t pin, uint64_t start_time,
uint64_t repeat_interval, bool periodic_enable)
Enable periodic pulse generation on a pin.

Parameters
• dev – TGPIO device
• pin – TGPIO pin
• start_time – start_time of first pulse in hw cycles
• repeat_interval – repeat interval between two pulses in hw cycles
• periodic_enable – enables periodic mode if ‘true’ is passed.

7.6. Peripherals

3421
Returns
0 if successful, negative errno code on failure.

int tgpio_pin_read_ts_ec(const struct device *dev, uint32_t pin, uint64_t *timestamp,
    uint64_t *event_count)

Read timestamp and event counter from TGPIO.

Parameters
• dev – TGPIO device
• pin – TGPIO pin
• timestamp – timestamp of the last pulse received
• event_count – number of pulses received since the pin is enabled

Returns
0 if successful, negative errno code on failure.

7.6.50 Video

The video driver API offers a generic interface to video devices.

Basic Operation

Video Device A video device is the abstraction of a hardware or software video function, which can produce, process, consume or transform video data. The video API is designed to offer flexible way to create, handle and combine various video devices.

Endpoint Each video device can have one or more endpoints. Output endpoints configure video output function and generate data. Input endpoints configure video input function and consume data.

Video Buffer A video buffer provides the transport mechanism for the data. There is no particular requirement on the content. The requirement for the content is defined by the endpoint format. A video buffer can be queued to a device endpoint for filling (input ep) or consuming (output ep) operation, once the operation is achieved, buffer can be dequeued for post-processing, release or reuse.

Controls A video control is accessed and identified by a CID (control identifier). It represents a video control property. Different devices will have different controls available which can be generic, related to a device class or vendor specific. The set/get control functions provide a generic scalable interface to handle and create controls.

Typedefs

typedef int (*video_api_set_format_t)(const struct device *dev, enum video_endpoint_id ep, struct video_format *fmt)
Set video format.
See video_set_format() for argument descriptions.

typedef int (*video_api_get_format_t)(const struct device *dev, enum video_endpoint_id ep, struct video_format *fmt)
Get current video format.
See video_get_format() for argument descriptions.

typedef int (*video_api_enqueue_t)(const struct device *dev, enum video_endpoint_id ep, struct video_buffer *buf)
Enqueue a buffer in the driver's incoming queue.
See video_enqueue() for argument descriptions.

typedef int (*video_api_dequeue_t)(const struct device *dev, enum video_endpoint_id ep, struct video_buffer **buf, k_timeout_t timeout)
Dequeue a buffer from the driver's outgoing queue.
See video_dequeue() for argument descriptions.

typedef int (*video_api_flush_t)(const struct device *dev, enum video_endpoint_id ep, bool cancel)
Flush endpoint buffers, buffer are moved from incoming queue to outgoing queue.
See video_flush() for argument descriptions.

typedef int (*video_api_stream_start_t)(const struct device *dev)
Start the capture or output process.
See video_stream_start() for argument descriptions.
typedef int (*video_api_stream_stop_t)(const struct device *dev)
    Stop the capture or output process.
    See video_stream_stop() for argument descriptions.

typedef int (*video_api_set_ctrl_t)(const struct device *dev, unsigned int cid, void *value)
    Set a video control value.
    See video_set_ctrl() for argument descriptions.

typedef int (*video_api_get_ctrl_t)(const struct device *dev, unsigned int cid, void *value)
    Get a video control value.
    See video_get_ctrl() for argument descriptions.

typedef int (*video_api_get_caps_t)(const struct device *dev, enum video_endpoint_id ep, struct video_caps *caps)
    Get capabilities of a video endpoint.
    See video_get_caps() for argument descriptions.

typedef int (*video_api_set_signal_t)(const struct device *dev, enum video_endpoint_id ep, struct k_poll_signal *signal)
    Register/Unregister poll signal for buffer events.
    See video_set_signal() for argument descriptions.

Enums

typedef enum video_endpoint_id
    video_endpoint_id enum
    Identify the video device endpoint.
    Values:

        enumerator VIDEO_EP_NONE

        enumerator VIDEO_EP_ANY

        enumerator VIDEO_EP_IN

        enumerator VIDEO_EP_OUT

enum video_signal_result
    video_event enum
    Identify video event.
    Values:

        enumerator VIDEO_BUF_DONE
Functions

static inline int video_set_format(const struct device *dev, enum video_endpoint_id ep, struct video_format *fmt)

Set video format.
Configure video device with a specific format.

Parameters
• dev – Pointer to the device structure for the driver instance.
• ep – Endpoint ID.
• fmt – Pointer to a video format struct.

Return values
• 0 – Is successful.
• -EINVAL – If parameters are invalid.
• -ENOTSUP – If format is not supported.
• -EIO – General input / output error.

static inline int video_get_format(const struct device *dev, enum video_endpoint_id ep, struct video_format *fmt)

Get video format.
Get video device current video format.

Parameters
• dev – Pointer to the device structure for the driver instance.
• ep – Endpoint ID.
• fmt – Pointer to video format struct.

Return values
pointer – to video format

static inline int video_enqueue(const struct device *dev, enum video_endpoint_id ep, struct video_buffer *buf)

Enqueue a video buffer.
Enqueue an empty (capturing) or filled (output) video buffer in the driver’s endpoint incoming queue.

Parameters
• dev – Pointer to the device structure for the driver instance.
• ep – Endpoint ID.
• buf – Pointer to the video buffer.

Return values
• 0 – Is successful.
• -EINVAL – If parameters are invalid.
Dequeue a video buffer.
Dequeue a filled (capturing) or displayed (output) buffer from the driver’s endpoint outgoing queue.

**Parameters**
- **dev** – Pointer to the device structure for the driver instance.
- **ep** – Endpoint ID.
- **buf** – Pointer a video buffer pointer.
- **timeout** – Timeout

**Return values**
- 0 – Is successful.
- -EINVAL – If parameters are invalid.
- -EIO – General input / output error.

Flush endpoint buffers.
A call to flush finishes when all endpoint buffers have been moved from incoming queue to outgoing queue. Either because canceled or fully processed through the video function.

**Parameters**
- **dev** – Pointer to the device structure for the driver instance.
- **ep** – Endpoint ID.
- **cancel** – If true, cancel buffer processing instead of waiting for completion.

**Return values**
0 – Is successful, -ERRNO code otherwise.

Start the video device function.
video_stream_start is called to enter ‘streaming’ state (capture, output...). The driver may receive buffers with video_enqueue() before video_stream_start is called. If driver/device needs a minimum number of buffers before being able to start streaming, then driver set the min_vbuf_count to the related endpoint capabilities.

**Return values**
- 0 – Is successful.
- -EIO – General input / output error.

Stop the video device function.
On video_stream_stop, driver must stop any transactions or wait until they finish.

**Return values**
- 0 – Is successful.
- -EIO – General input / output error.
static inline int video_get_caps(const struct device *dev, enum video_endpoint_id ep, struct video_caps *caps)

Get the capabilities of a video endpoint.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `ep` – Endpoint ID.
- `caps` – Pointer to the `video_caps` struct to fill.

**Return values**

- 0 – Is successful, -ERRNO code otherwise.

static inline int video_set_ctrl(const struct device *dev, unsigned int cid, void *value)

Set the value of a control.

This set the value of a video control, value type depends on control ID, and must be interpreted accordingly.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `cid` – Control ID.
- `value` – Pointer to the control value.

**Return values**

- 0 – Is successful.
- -EINVAL – If parameters are invalid.
- -ENOTSUP – If format is not supported.
- -EIO – General input / output error.

static inline int video_get_ctrl(const struct device *dev, unsigned int cid, void *value)

Get the current value of a control.

This retrieve the value of a video control, value type depends on control ID, and must be interpreted accordingly.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `cid` – Control ID.
- `value` – Pointer to the control value.

**Return values**

- 0 – Is successful.
- -EINVAL – If parameters are invalid.
- -ENOTSUP – If format is not supported.
- -EIO – General input / output error.

static inline int video_set_signal(const struct device *dev, enum video_endpoint_id ep, struct k_poll_signal *signal)

Register/Unregister k_poll signal for a video endpoint.

Register a poll signal to the endpoint, which will be signaled on frame completion (done, aborted, error). Registering a NULL poll signal unregisters any previously registered signal.

**Parameters**
• **dev** – Pointer to the device structure for the driver instance.
• **ep** – Endpoint ID.
• **signal** – Pointer to `k_poll_signal`

**Return values**

0 – Is successful, -ERRNO code otherwise.

```c
struct video_buffer *video_buffer_alloc(size_t size)
```
Allocate video buffer.

**Parameters**

• **size** – Size of the video buffer.

**Return values**

pointer – to allocated video buffer

```c
void video_buffer_release(struct video_buffer *buf)
```
Release a video buffer.

**Parameters**

• **buf** – Pointer to the video buffer to release.

```c
struct video_format

#include <video.h> Video format structure.
Used to configure frame format.

**Public Members**

```c
tUint32_t pixelformat

FourCC pixel format value (Video pixel formats)
```

```c
tUint32_t width

frame width in pixels.
```

```c
tUint32_t height

frame height in pixels.
```

```c
tUint32_t pitch

line stride.
This is the number of bytes that needs to be added to the address in the first pixel of a row in order to go to the address of the first pixel of the next row (>=width).
```

```c
struct video_format_cap

#include <video.h> Video format capability.
Used to describe a video endpoint format capability.

**Public Members**

```c
tUint32_t pixelformat

FourCC pixel format value (Video pixel formats).
```
`uint32_t` width_min
minimum supported frame width in pixels.

`uint32_t` width_max
maximum supported frame width in pixels.

`uint32_t` height_min
minimum supported frame height in pixels.

`uint32_t` height_max
maximum supported frame height in pixels.

`uint16_t` width_step
width step size in pixels.

`uint16_t` height_step
height step size in pixels.

`struct` video_caps
```
#include <video.h> Video format capabilities.
```
Used to describe video endpoint capabilities.

**Public Members**

const `struct` video_format_cap *format_caps
list of video format capabilities (zero terminated).

`uint8_t` min_vbuf_count
minimal count of video buffers to enqueue before being able to start the stream.

`struct` video_buffer
```
#include <video.h> Video buffer structure.
```
Represent a video frame.

**Public Members**

void *driver_data
pointer to driver specific data.

`uint8_t` *buffer
pointer to the start of the buffer.

`uint32_t` size
size of the buffer in bytes.
\begin{verbatim}

uint32_t bytesused
    number of bytes occupied by the valid data in the buffer.

uint32_t timestamp
    time reference in milliseconds at which the last data byte was actually received for
    input endpoints or to be consumed for output endpoints.

struct video_driver_api
    #include <video.h>

group video_controls
    Video controls.

Control classes

VIDEO_CTRL_CLASS_GENERIC
    Generic class controls.

VIDEO_CTRL_CLASS_CAMERA
    Camera class controls.

VIDEO_CTRL_CLASS_MPEG
    MPEG-compression controls.

VIDEO_CTRL_CLASS_JPEG
    JPEG-compression controls.

VIDEO_CTRL_CLASS_VENDOR
    Vendor-specific class controls.

Generic class control IDs

VIDEO_CID_HFLIP
    Mirror the picture horizontally.

VIDEO_CID_VFLIP
    Mirror the picture vertically.

Camera class control IDs

VIDEO_CID_CAMERA_EXPOSURE

VIDEO_CID_CAMERA_GAIN

VIDEO_CID_CAMERA_ZOOM
\end{verbatim}
7.6.51 Watchdog

Overview

API Reference

Related code samples

Watchdog

Use the watchdog driver API to reset the board when it gets stuck in an infinite loop.

group watchdog_interface

Watchdog Interface.

Watchdog options

WDT_OPT_PAUSE_IN_SLEEP
Pause watchdog timer when CPU is in sleep state.

WDT_OPT_PAUSE_HALTED_BY_DBG
Pause watchdog timer when CPU is halted by the debugger.

Watchdog behavior flags

WDT_FLAG_RESET_NONE
Reset: none.

WDT_FLAG_RESET_CPU_CORE
Reset: CPU core.
WDT_FLAG_RESET_SoC
Reset: SoC.

**Typedefs**

typedef void (*wdt_callback_t)(const struct device *dev, int channel_id)
Watchdog callback.

**Param dev**
Watchdog device instance.

**Param channel_id**
Channel identifier.

**Functions**

int wdt_setup(const struct device *dev, uint8_t options)
Set up watchdog instance.
This function is used for configuring global watchdog settings that affect all timeouts. It should be called after installing timeouts. After successful return, all installed timeouts are valid and must be serviced periodically by calling `wdt_feed()`.

**Parameters**
• dev – Watchdog device instance.
• options – Configuration options (see `WDT_OPT`).

**Return values**
• 0 – If successful.
• -ENOTSUP – If any of the set options is not supported.
• -EBUSY – If watchdog instance has been already setup.
• -errno – In case of any other failure.

int wdt_disable(const struct device *dev)
Disable watchdog instance.
This function disables the watchdog instance and automatically uninstalls all timeouts. To set up a new watchdog, install timeouts and call `wdt_setup()` again. Not all watchdogs can be restarted after they are disabled.

**Parameters**
• dev – Watchdog device instance.

**Return values**
• 0 – If successful.
• -EFAULT – If watchdog instance is not enabled.
• -EPERM – If watchdog can not be disabled directly by application code.
• -errno – In case of any other failure.
static inline int wdt_install_timeout(const struct device *dev, const struct wdt_timeout_cfg *cfg)

Install a new timeout.

**Note:** This function must be used before *wdt_setup()*.
Changes applied here have no effects until *wdt_setup()* is called.

**Parameters**
- *dev* – Watchdog device instance.

**Return values**
- *channel_id* – If successful, a non-negative value indicating the index of the channel to which the timeout was assigned. This value is supposed to be used as the parameter in calls to *wdt_feed()*.
- -EBUSY – If timeout can not be installed while watchdog has already been setup.
- -ENOMEM – If no more timeouts can be installed.
- -ENOTSUP – If any of the set flags is not supported.
- -EINVAL – If any of the window timeout value is out of possible range. This value is also returned if watchdog supports only one timeout value for all timeouts and the supplied timeout window differs from windows for alarms installed so far.
- -errno – In case of any other failure.

```
int wdt_feed(const struct device *dev, int channel_id)
```

Feed specified watchdog timeout.

**Parameters**
- *dev* – Watchdog device instance.
- *channel_id* – Channel index.

**Return values**
- 0 – If successful.
- -EAGAIN – If completing the feed operation would stall the caller, for example due to an in-progress watchdog operation such as a previous *wdt_feed()* call.
- -EINVAL – If there is no installed timeout for supplied channel.
- -errno – In case of any other failure.

```
struct wdt_window
```

#include <watchdog.h> Watchdog timeout window.

Each installed timeout needs feeding within the specified time window, otherwise the watchdog will trigger. If the watchdog instance does not support window timeouts then min value must be equal to 0.

**Note:** If specified values can not be precisely set they are always rounded up.
**Public Members**

- `uint32_t min`  
  Lower limit of watchdog feed timeout in milliseconds.

- `uint32_t max`  
  Upper limit of watchdog feed timeout in milliseconds.

```c
struct wdt_timeout_cfg
#include <watchdog.h>  
Watchdog timeout configuration.
```

**Public Members**

- `struct wdt_window window`  
  Timing parameters of watchdog timeout.

- `wdt_callback_t callback`  
  Timeout callback (can be `NULL`).

- `struct wdt_timeout_cfg *next`  
  Pointer to the next timeout configuration.
  
  This field is only available if `CONFIG_WDT_MULTISTAGE` is enabled (watchdogs with staged timeouts functionality). Value must be `NULL` for single stage timeout.

- `uint8_t flags`  
  Flags (see `WDT_FLAGS`).

## 7.7 Pin Control

This is a high-level guide to pin control. See *Pin Control API* for API reference material.

### 7.7.1 Introduction

The hardware blocks that control pin multiplexing and pin configuration parameters such as pin direction, pull-up/down resistors, etc. are named **pin controllers**. The pin controller's main users are SoC hardware peripherals, since the controller enables exposing peripheral signals, like for example, map `I2C0 SDA` signal to pin `PX0`. Not only that, but it usually allows configuring certain pin settings that are necessary for the correct functioning of a peripheral, for example, the slew-rate depending on the operating frequency. The available configuration options are vendor/SoC dependent and can range from simple pull-up/down options to more advanced settings such as debouncing, low-power modes, etc.

The way pin control is implemented in hardware is vendor/SoC specific. It is common to find a **centralized** approach, that is, all pin configuration parameters are controlled by a single hardware block (typically named pinmux), including signal mapping. The figure below illustrates this approach. `PX0` can be mapped to `UART0_TX`, `I2C0_SCK` or `SPI0_MOSI` depending on the `AF` control bits. Other configuration parameters such as pull-up/down are controlled in the same block via `CONFIG` bits. This model is used by several SoC families, such as many from NXP and STM32.
Other vendors/SoCs use a *distributed* approach. In such case, the pin mapping and configuration are controlled by multiple hardware blocks. The figure below illustrates a distributed approach where pin mapping is controlled by peripherals, such as in Nordic nRF SoCs.

From a user perspective, there is no difference in pin controller usage regardless of the hardware implementation: a user will always apply a state. The only difference lies in the driver implementation. In general, implementing a pin controller driver for a hardware that uses a distributed approach requires more effort, since the driver needs to gather knowledge of peripheral dependent registers.

**Pin control vs. GPIO**

Some functionality covered by a pin controller driver overlaps with GPIO drivers. For example, pull-up/down resistors can usually be enabled by both the pin control driver and the GPIO driver.
In Zephyr context, the pin control driver purpose is to perform peripheral signal multiplexing and configuration of other pin parameters required for the correct operation of that peripheral. Therefore, the main users of the pin control driver are SoC peripherals. In contrast, GPIO drivers are for general purpose control of a pin, that is, when its logic level is read or controlled manually.

### 7.7.2 State model

For a device driver to operate correctly, a certain pin configuration needs to be applied. Some device drivers require a static configuration, usually set up at initialization time. Others need to change the configuration at runtime depending on the operating conditions, for example, to enable a low-power mode when suspending the device. Such requirements are modeled using states, a concept that has been adapted from the one in the Linux kernel. Each device driver owns a set of states. Each state has a unique name and contains a full pin configuration set (see the figure below). This effectively means that states are independent of each other, so they do not need to be applied in any specific order. Another advantage of the state model is that it isolates device drivers from pin configuration.

#### Table 2: Example pin configuration encoded using the states model

<table>
