For another example, the following node would cause a build error, because it has no `num-foos` property, and this property is marked required in the binding:

```yaml
bad-node {
    compatible = "foo-company,bar-device";
};
```

**Other ways nodes are matched to bindings** If a node has more than one string in its `compatible` property, the build system looks for compatible bindings in the listed order and uses the first match.

Take this node as an example:

```yaml
baz-device {
    compatible = "foo-company,baz-device", "generic-baz-device";
};
```

The `baz-device` node would get matched to a binding with a `compatible: "generic-baz-device"` line if the build system can't find a binding with a `compatible: "foo-company,baz-device"` line.

Nodes without compatible properties can be matched to bindings associated with their parent nodes. These are called "child bindings". If a node describes hardware on a bus, like I2C or SPI, then the bus type is also taken into account when matching nodes to bindings. (The [Bindings file syntax](#) section below describes how to write child bindings and bus-specific bindings.)

Some special nodes without `compatible` properties are matched to *Inferred bindings*. For these nodes, the build system generates macros based on the properties in the final devicetree.

**Where bindings are located** Binding file names usually match their `compatible:` lines. For example, the above example binding would be named `foo-company,bar-device.yaml` by convention.

The build system looks for bindings in `dts/bindings` subdirectories of the following places:

- the zephyr repository
- your application source directory
- your board directory
- any directories in the `DTS_ROOT` CMake variable
- any module that defines a `dts_root` in its Build settings

The build system will consider any YAML file in any of these, including in any subdirectories, when matching nodes to bindings. A file is considered YAML if its name ends with `.yaml` or `.yml`.

**Warning:** The binding files must be located somewhere inside the `dts/bindings` subdirectory of the above places.

For example, if `my-app` is your application directory, then you must place application-specific bindings inside `my-app/dts/bindings`. So `my-app/dts/bindings/serial/my-company,my-serial-port.yaml` would be found, but `my-app/my-company,my-serial-port.yaml` would be ignored.

**Bindings file syntax** Zephyr bindings files are YAML files. The top-level value in the file is a mapping. A *simple example* is given above.

The top-level keys in the mapping look like this:

```yaml
# A high level description of the device the binding applies to:
description: |
    This is the Vendomatic company's foo-device.
```

(continues on next page)
Descriptions which span multiple lines (like this) are OK, and are encouraged for complex bindings.

See https://yaml-multiline.info/ for formatting help.

# You can include definitions from other bindings using this syntax:
include: other.yaml

# Used to match nodes to this binding as discussed above:
compatible: "manufacturer,foo-device"

properties:
# Requirements for and descriptions of the properties that this binding's nodes need to satisfy go here.

child-binding:
# You can constrain the children of the nodes matching this binding using this key.

# If the node describes bus hardware, like an SPI bus controller
# on an SoC, use 'bus:' to say which one, like this:
bus: spi

# If the node instead appears as a device on a bus, like an external
# SPI memory chip, use 'on-bus:' to say what type of bus, like this.
# Like 'compatible', this key also influences the way nodes match bindings.
on-bus: spi

foo-cells:
# "Specifier" cell names for the 'foo' domain go here; example 'foo'
# values are 'gpio', 'pum', and 'dma'. See below for more information.

The following sections describe these keys in more detail:

- Description
- Compatible
- Properties
- Child-binding
- Bus
- On-bus
- Specifier cell names (*-cells)
- Include

The include: key usually appears early in the binding file, but it is documented last here because you need to know how the other keys work before understanding include:.

Description A free-form description of node hardware goes here. You can put links to datasheets or example nodes or properties as well.

Compatible This key is used to match nodes to this binding as described above. It should look like this in a binding file:
Note the comma-separated vendor prefix and device name
compatible: "manufacturer,device"

This devicetree node would match the above binding:

```c
device {
    compatible = "manufacturer,device";
};
```

Assuming no binding has compatible: "manufacturer,device-v2", it would also match this node:

```c
device-2 {
    compatible = "manufacturer,device-v2", "manufacturer,device";
};
```

Each node's compatible property is tried in order. The first matching binding is used. The on-bus: key can be used to refine the search.

If more than one binding for a compatible is found, an error is raised.

The manufacturer prefix identifies the device vendor. See dts/bindings/vendor-prefixes.txt for a list of accepted vendor prefixes. The device part is usually from the datasheet.

Some bindings apply to a generic class of devices which do not have a specific vendor. In these cases, there is no vendor prefix. One example is the gpio-leds compatible which is commonly used to describe board LEDs connected to GPIOs.

If more than one binding for a compatible is found, an error is raised.

Properties

The properties: key describes the properties that nodes which match the binding can contain.

For example, a binding for a UART peripheral might look something like this:

```c
compatible: "manufacturer,serial"
properties:
    reg:
        type: array
description: UART peripheral MMIO register space
required: true
current-speed:
    type: int
description: current baud rate
required: true
```

The properties in the following node would be validated by the above binding:

```c
my-serial@deadbeef {
    compatible = "manufacturer,serial";
    reg = <0xdeadbeef 0x1000>;
    current-speed = <115200>;
};
```

This is used to check that required properties appear, and to control the format of output generated for them.

Except for some special properties, like reg, whose meaning is defined by the devicetree specification itself, only properties listed in the properties: key will have generated macros.

5.2. Devicetree
**Example property definitions**  Here are some more examples.

```properties
[72x760]# Describes a property like 'current-speed = <115200>;'. We pretend that
# it's obligatory for the example node and set 'required: true'.
current-speed:
  type: int
  required: true
  description: Initial baud rate for bar-device

# Describes an optional property like 'keys = "foo", "bar";'
keys:
  type: string-array
  description: Keys for bar-device

# Describes an optional property like 'maximum-speed = "full-speed";'
# the enum specifies known values that the string property may take
maximum-speed:
  type: string
  description: Configures USB controllers to work up to a specific speed.
  enum:
    - "low-speed"
    - "full-speed"
    - "high-speed"
    - "super-speed"

# Describes an optional property like 'resolution = <16>;'
# the enum specifies known values that the int property may take
resolution:
  type: int
  enum:
    - 8
    - 16
    - 24
    - 32

# Describes a required property '#address-cells = <1>'; the const
# specifies that the value for the property is expected to be the value 1
"#address-cells":
  type: int
  required: true
  const: 1

int-with-default:
  type: int
  default: 123
  description: Value for int register, default is power-up configuration.

array-with-default:
  type: array
  default: [1, 2, 3] # Same as 'array-with-default = <1 2 3>

string-with-default:
  type: string
  default: "foo"

string-array-with-default:
  type: string-array
```

(continues on next page)
default: ["foo", "bar"] # Same as 'string-array-with-default = "foo", "bar"

uint8-array-with-default:
type: uint8-array
default: [0x12, 0x34] # Same as 'uint8-array-with-default = [12 34]'

Property entry syntax  As shown by the above examples, each property entry in a binding looks like this:

<property name>:
  required: <true | false>
  type: <string | int | boolean | array | uint8-array | string-array |
        phandle | phandles | phandle-array | path | compound>
  deprecated: <true | false>
  default: <default>
  description: <description of the property>
  enum:
    - <item1>
    - <item2>
    ...
    - <itemN>
  const: <string | int | array | uint8-array | string-array>

Required properties  If a node matches a binding but is missing any property which the binding defines with required: true, the build fails.

Note: A property is implicitly optional unless required: true is specified. Using required: false is therefore redundant and strongly discouraged.

Property types  The type of a property constrains its values. The following types are available. See Writing property values for more details about writing values of each type in a DTS file.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Example in DTS</th>

</table>

5.2. Devicetree
Deprecation properties A property with deprecated: true indicates to both the user and the tooling that the property is meant to be phased out. The tooling will report a warning if the devicetree includes the property that is flagged as deprecated. (This warning is upgraded to an error in the Test Runner (Twister) for upstream pull requests.)

Default values for properties The optional default: setting gives a value that will be used if the property is missing from the devicetree node.

For example, with this binding fragment:

```yaml
properties:
  foo:
    type: int
    default: 3
```

If property foo is missing in a matching node, then the output will be as if foo = <3>; had appeared in the DTS (except YAML data types are used for the default value).

Note that combining default: with required: true will raise an error.

For rules related to default in upstream Zephyr bindings, see Rules for default values.

See Example property definitions for examples. Putting default: on any property type besides those used in the examples will raise an error.

Enum values The enum: line is followed by a list of values the property may contain. If a property value in DTS is not in the enum: list in the binding, an error is raised. See Example property definitions for examples.

Const This specifies a constant value the property must take. It is mainly useful for constraining the values of common properties for a particular piece of hardware.

Child-binding child-binding can be used when a node has children that all share the same properties. Each child gets the contents of child-binding as its binding, though an explicit compatible = ... on the child node takes precedence, if a binding is found for it.

Consider a binding for a PWM LED node like this one, where the child nodes are required to have a pwms property:

```yaml
pwmleds {
  compatible = "pwm-leds";

  red_pwm_led {
    pwms = <&pwm3 4 15625000>;
  }

  green_pwm_led {
    pwms = <&pwm3 0 15625000>;
  }

  /* ... */
}
```

The binding would look like this:

```yaml
compatible: "pwm-leds"

child-binding:
  description: LED that uses PWM
```

(continues on next page)
child-binding also works recursively. For example, this binding:

```plaintext
compatible: foo

child-binding:
child-binding:
  properties:
    my-property:
      type: int
      required: true
```

will apply to the grandchild node in this DTS:

```plaintext
parent {
    compatible = "foo";
    child {
      grandchild {
        my-property = <123>;
      }
    }
};
```

**Bus**  If the node is a bus controller, use `bus:` in the binding to say what type of bus. For example, a binding for a SPI peripheral on an SoC would look like this:

```plaintext
compatible: "manufacturer,spi-peripheral"
bis: spi
# ...
```

The presence of this key in the binding informs the build system that the children of any node matching this binding appear on this type of bus.

This in turn influences the way `on-bus:` is used to match bindings for the child nodes.

For a single bus supporting multiple protocols, e.g. I2C and I2C, the `bus:` in the binding can have a list as value:

```plaintext
compatible: "manufacturer,i2c-controller"
bis: [i2c, i2c]
# ...
```

**On-bus**  If the node appears as a device on a bus, use `on-bus:` in the binding to say what type of bus.

For example, a binding for an external SPI memory chip should include this line:

```plaintext
on-bus: spi
```

And a binding for an I2C based temperature sensor should include this line:

```plaintext
on-bus: i2c
```
When looking for a binding for a node, the build system checks if the binding for the parent node contains `bus: <bus type>`. If it does, then only bindings with a matching `on-bus: <bus type>` and bindings without an explicit `on-bus` are considered. Bindings with an explicit `on-bus: <bus type>` are searched for first, before bindings without an explicit `on-bus`. The search repeats for each item in the node's `compatible` property, in order.

This feature allows the same device to have different bindings depending on what bus it appears on. For example, consider a sensor device with `compatible manu facer,sensor` which can be used via either I2C or SPI.

The sensor node may therefore appear in the devicetree as a child node of either an SPI or an I2C controller, like this:

```plaintext
spi-bus@0 {
    /* ... some compatible with 'bus: spi', etc. ... */
    sensor@0 {
        compatible = "manufacturer,sensor";
        reg = <0>;
        /* ... */
    };
};

i2c-bus@0 {
    /* ... some compatible with 'bus: i2c', etc. ... */
    sensor@79 {
        compatible = "manufacturer,sensor";
        reg = <79>;
        /* ... */
    };
};
```

You can write two separate binding files which match these individual sensor nodes, even though they have the same `compatible`:

```plaintext
# manufacturer,sensor-spi.yaml, which matches sensor@0 on the SPI bus:
compatible: "manufacturer,sensor"
on-bus: spi

# manufacturer,sensor-i2c.yaml, which matches sensor@79 on the I2C bus:
compatible: "manufacturer,sensor"
properties:
    uses-clock-stretching:
        type: boolean
on-bus: i2c
```

Only sensor@79 can have a `use-clock-stretching` property. The bus-sensitive logic ignores `manufacturer,sensor-i2c.yaml` when searching for a binding for sensor@0.

**Specifier cell names (**-cells**)** Specifier cells are usually used with `phandle-array` type properties briefly introduced above.

To understand the purpose of **-cells**, assume that some node has the following `pwms` property with type `phandle-array`:

```plaintext
my-device {
    pwms = <&pwm0 1 2>, <&pwm3 4>;
};
```
The tooling strips the final $s$ from the property name of such properties, resulting in $pwm$. Then the value of the $\texttt{#pwm-cells}$ property is looked up in each of the PWM controller nodes $pwm\{0\}$ and $pwm\{3\}$, like so:

```
pwm0: pwm\{0\} {
    compatible = "foo,pwm";
    $\texttt{#pwm-cells} = <2>;
};

pwm3: pwm\{3\} {
    compatible = "bar,pwm";
    $\texttt{#pwm-cells} = <1>;
};
```

The $\&pwm0$ 1 2 part of the property value has two cells, 1 and 2, which matches $\texttt{#pwm-cells} = <2>$; so these cells are considered the specifier associated with $pwm\{0\}$ in the phandle array.

Similarly, the cell 4 is the specifier associated with $pwm\{3\}$.

The number of PWM cells in the specifiers in $\texttt{pwms}$ must match the $\texttt{#pwm-cells}$ values, as shown above. If there is a mismatch, an error is raised. For example, this node would result in an error:

```
my-bad-device {
    /* wrong: 2 cells given in the specifier, but #pwm-cells is 1 in pwm\{3\}. */
    pwms = <&pwm\{3\} 5 6>;
};
```

The binding for each PWM controller must also have a $\texttt{*-cells}$ key, in this case $\texttt{pwm-cells}$, giving names to the cells in each specifier:

```
# foo,pwm.yaml
compatible: "foo,pwm"
...
$pwm\texttt{-cells}$:
- channel
- period

# bar,pwm.yaml
compatible: "bar,pwm"
...
$pwm\texttt{-cells}$:
- period
```

A $\texttt{*-names}$ (e.g. $\texttt{pwm\texttt{-names}}$) property can appear on the node as well, giving a name to each entry.

This allows the cells in the specifiers to be accessed by name, e.g. using APIs like $\texttt{DT\_PWMS\_CHANNEL\_BY\_NAME}$.

Because other property names are derived from the name of the property by removing the final $s$, the property name must end in $s$. An error is raised if it doesn’t.

An alternative is using a $\texttt{specifier\texttt{-space}}$ property to indicate the base property name for $\texttt{*-names}$ and $\texttt{*-cells}$.

$\texttt{*-gpios}$ properties are special-cased so that e.g. $\texttt{foo\texttt{-gpios}}$ resolves to $\texttt{#gpio\texttt{-cells}}$ rather than $\texttt{#foo\texttt{-gpio\texttt{-cells}}}$.

If the specifier is empty (e.g. $\texttt{#clock\texttt{-cells}} = <0>$), then $\texttt{*-cells}$ can either be omitted (recommended) or set to an empty array. Note that an empty array is specified as e.g. $\texttt{clock\texttt{-cells}: }\texttt{[]}$ in YAML.

All $\texttt{phandle\texttt{-array}}$ type properties support mapping through $\texttt{*-map}$ properties, e.g. $\texttt{gpio\texttt{-map}}$, as defined by the Devicetree specification.

5.2. Devicetree
Include  Bindings can include other files, which can be used to share common property definitions between bindings. Use the include: key for this. Its value is either a string or a list.

In the simplest case, you can include another file by giving its name as a string, like this:

```
include: foo.yaml
```

If any file named foo.yaml is found (see Where bindings are located for the search process), it will be included into this binding.

Included files are merged into bindings with a simple recursive dictionary merge. The build system will check that the resulting merged binding is well-formed. It is allowed to include at any level, including child-binding, like this:

```
# foo.yaml will be merged with content at this level
include: foo.yaml

child-binding:
  # bar.yaml will be merged with content at this level
  include: bar.yaml
```

It is an error if a key appears with a different value in a binding and in a file it includes, with one exception: a binding can have required: true for a property definition for which the included file has required: false. The required: true takes precedence, allowing bindings to strengthen requirements from included files.

Note that weakening requirements by having required: false where the included file has required: true is an error. This is meant to keep the organization clean.

The file base.yaml contains definitions for many common properties. When writing a new binding, it is a good idea to check if base.yaml already defines some of the needed properties, and include it if it does.

Note that you can make a property defined in base.yaml obligatory like this, taking reg as an example:

```
reg:
  required: true
```

This relies on the dictionary merge to fill in the other keys for reg, like type.

To include multiple files, you can use a list of strings:

```
include:
  - foo.yaml
  - bar.yaml
```

This includes the files foo.yaml and bar.yaml. (You can write this list in a single line of YAML as include: [foo.yaml, bar.yaml].)

When including multiple files, any overlapping required keys on properties in the included files are ORed together. This makes sure that a required: true is always respected.

In some cases, you may want to include some property definitions from a file, but not all of them. In this case, include: should be a list, and you can filter out just the definitions you want by putting a mapping in the list, like this:

```
include:
  - name: foo.yaml
    property-allowlist:
      - i-want-this-one
      - and-this-one
  - name: bar.yaml
    property-blocklist:
```

(continues on next page)
Each map element must have a name key which is the filename to include, and may have property-allowlist and property-blocklist keys that filter which properties are included.

You cannot have a single map element with both property-allowlist and property-blocklist keys. A map element with neither property-allowlist nor property-blocklist is valid; no additional filtering is done.

You can freely intermix strings and mappings in a single include:

```yaml
- foo.yaml
- name: bar.yaml
  property-blocklist:
  - do-not-include-this-one
  - or-this-one
```

Finally, you can filter from a child binding like this:

```yaml
include:
  - name: bar.yaml
    child-binding:
      property-allowlist:
      - child-prop-to-allow
```

### Rules for mainline bindings

This section includes general rules for writing bindings that you want to submit to the mainline Zephyr Project. (You don't need to follow these rules for bindings you don't intend to contribute to the Zephyr Project, but it's a good idea.)

Decisions made by the Zephyr devicetree maintainer override the contents of this section. If that happens, though, please let them know so they can update this page, or you can send a patch yourself.

#### Always check for existing bindings

Zephyr aims for devicetree *source compatibility with other operating systems*. Therefore, if there is an existing binding for your device in an authoritative location, you should try to replicate its properties when writing a Zephyr binding, and you must justify any Zephyr-specific divergences.

In particular, this rule applies if:

- There is an existing binding in the mainline Linux kernel. See [Documentation/devicetree/bindings in Linus's tree](https://git.kernel.org/pub/scm/linux/kernel/git/stable/linux.git/?p=stable.git;a=blob;f=Documentation/devicetree/bindings;h=...;o=diff) for existing bindings and the [Linux devicetree documentation](https://www.linuxfoundation.org/en/education/training/linux-devicetree) for more information.

- Your hardware vendor provides an official binding outside of the Linux kernel.

#### General rules

- Bindings which match a compatible must have file names based on the compatible.
  - For example, a binding for compatible `vnd,foo` must be named `vnd,foo.yaml`.
  - If the binding is bus-specific, you can append the bus to the file name; for example, if the binding YAML has `on-bus: bar`, you may name the file `vnd,foo-bar.yaml`.

- All recommendations in *Default values for properties* are requirements when submitting the binding.

In particular, if you use the `default:` feature, you must justify the value in the property's description.
There are two ways to write property `description`: strings that are always OK.

If your description is short, it's fine to use this style:

```yaml
description: my short string
```

If your description is long or spans multiple lines, you must use this style:

```yaml
description: |
  My very long string
  goes here.
  Look at all these lines!
```

This `|` style prevents YAML parsers from removing the newlines in multi-line descriptions. This in turn makes these long strings display properly in the **Bindings index**.

Do not use any other style for long or multi-line strings.

- Do not use uppercase letters (A through Z) or underscores (_) in property names. Use lowercase letters (a through z) instead of uppercase. Use dashes (-) instead of underscores. (The one exception to this rule is if you are replicating a well-established binding from somewhere like Linux.)

### Rules for vendor prefixes

The following general rules apply to vendor prefixes in `compatible` properties.

- If your device is manufactured by a specific vendor, then its compatible should have a vendor prefix.
  
  If your binding describes hardware with a well known vendor from the list in `dts/bindings/vendor-prefixes.txt`, you must use that vendor prefix.

- If your device is not manufactured by a specific hardware vendor, do not invent a vendor prefix.
  
  Vendor prefixes are not mandatory parts of compatible properties, and compatibles should not include them unless they refer to an actual vendor. There are some exceptions to this rule, but the practice is strongly discouraged.

- Do not submit additions to Zephyr's `dts/bindings/vendor-prefixes.txt` file unless you also include users of the new prefix. This means at least a binding and a devicetree using the vendor prefix, and should ideally include a device driver handling that compatible.

  For custom bindings, you can add a custom `dts/bindings/vendor-prefixes.txt` file to any directory in your `DTS_ROOT`. The devicetree tooling will respect these prefixes, and will not generate warnings or errors if you use them in your own bindings or devicetrees.

- We sometimes synchronize Zephyr's vendor-prefixes.txt file with the Linux kernel's equivalent file; this process is exempt from the previous rule.

- If your binding is describing an abstract class of hardware with Zephyr specific drivers handling the nodes, it's usually best to use `zephyr` as the vendor prefix. See **Zephyr-specific binding (zephyr)** for examples.

### Rules for default values

In any case where `default:` is used in a devicetree binding, the `description:` for that property **must** explain why the value was selected and any conditions that would make it necessary to provide a different value. Additionally, if changing one property would require changing another to create a consistent configuration, then those properties should be made required.

There is no need to document the default value itself; this is already present in the **Bindings index** output.

There is a risk in using `default:` when the value in the binding may be incorrect for a particular board or hardware configuration. For example, defaulting the capacity of the connected power cell in a charging IC binding is likely to be incorrect. For such properties it's better to make the property `required: true`, forcing the user to make an explicit choice.
Driver developers should use their best judgment as to whether a value can be safely defaulted. Candidates for default values include:

- delays that would be different only under unusual conditions (such as intervening hardware)
- configuration for devices that have a standard initial configuration (such as a USB audio headset)
- defaults which match the vendor-specified power-on reset value (as long as they are independent from other properties)

Examples of how to write descriptions according to these rules:

```yaml
properties:
cs-interval:
  type: int
  default: 0
  description: | Minimum interval between chip select deassertion and assertion. The default corresponds to the reset value of the register field.
hold-time-ms:
  type: int
  default: 20
  description: | Amount of time to hold the power enable GPIO asserted before initiating communication. The default was recommended in the manufacturer datasheet, and would only change under very cold temperatures.
```

Some examples of what not to do, and why:

```yaml
properties:
  # Description doesn't mention anything about the default
  foo:
    type: int
    default: 1
    description: number of foos

  # Description mentions the default value instead of why it was chosen
  bar:
    type: int
    default: 2
    description: bar size; default is 2

  # Explanation of the default value is in a comment instead of the description. This won't be shown in the bindings index.
  baz:
    type: int
    # This is the recommended value chosen by the manufacturer.
    default: 2
    description: baz time in milliseconds
```

**Inferred bindings** Zephyr's devicetree scripts can “infer” a binding for the special `/zephyr/user` node based on the values observed in its properties.

This node matches a binding which is dynamically created by the build system based on the values of its properties in the final devicetree. It does not have a `compatible` property.

This node is meant for sample code and applications. The devicetree API provides it as a convenient container when only a few simple properties are needed, such as storing a hardware-dependent value.
phandle(s), or GPIO pin.

For example, with this DTS fragment:

```c
#include <zephyr/dt-bindings/gpio/gpio.h>

/*
 * zephyr, user {
 *    boolean;
 *    bytes = [81 82 83];
 *    number = <23>;
 *    numbers = <1>, <2>, <3>;
 *    string = "text";
 *    strings = "a", "b", "c";
 *
 *    handle = <&gpio0>;
 *    handles = <&gpio0>, <&gpio1>;
 *    signal-gpios = <&gpio0 1 GPIO_ACTIVE_HIGH>;
 * }
 */

You can get the simple values like this:

```c
#define ZEPHYR_USER_NODE DT_PATH(zephyr_user)

DT_PROP(ZEPHYR_USER_NODE, boolean) // 1
DT_PROP(ZEPHYR_USER_NODE, bytes) // {0x81, 0x82, 0x83}
DT_PROP(ZEPHYR_USER_NODE, number) // 23
DT_PROP(ZEPHYR_USER_NODE, numbers) // {1, 2, 3}
DT_PROP(ZEPHYR_USER_NODE, string) // "text"
DT_PROP(ZEPHYR_USER_NODE, strings) // {"a", "b", "c"}
```

You can convert the phandles in the handle and handles properties to device pointers like this:

```c
/*
 * Same thing as:
 *
 * ... my_dev = DEVICE_DT_GET(DT_NODELABEL(gpio0));
 */
const struct device *my_device =
    DEVICE_DT_GET(DT_PROP(ZEPHYR_USER_NODE, handle));

#define PHANDLE_TO_DEVICE(node_id, prop, idx) \
    DEVICE_DT_GET(DT_PHANDLE_BY_IDX(node_id, prop, idx))

/*
 * Same thing as:
 *
 * ... *my_devices[] = {
 *     DEVICE_DT_GET(DT_NODELABEL(gpio0)),
 *     DEVICE_DT_GET(DT_NODELABEL(gpio1)),
 * };
 */
const struct device *my_devices[] = {
    DT_FOREACH_PROP_ELEM(ZEPHYR_USER_NODE, handles, PHANDLE_TO_DEVICE)
};
```

And you can convert the pin defined in signal-gpios to a struct gpio_dt_spec, then use it like this:
```c
#include <zephyr/drivers/gpio.h>

#define ZEPHYR_USER_NODE DT_PATH(zephyr_user)

const struct gpio_dt_spec signal =
    GPIO_DT_SPEC_GET(ZEPHYR_USER_NODE, signal_gpios);

/* Configure the pin */
gpio_pin_configure_dt(&signal, GPIO_OUTPUT_INACTIVE);

/* Set the pin to its active level */
gpio_pin_set_dt(&signal, 1);
```

(See `gpio_dt_spec`, `GPIO_DT_SPEC_GET`, and `gpio_pin_configure_dt()` for details on these APIs.)

### Devicetree access from C/C++

This guide describes Zephyr's `<devicetree.h>` API for reading the devicetree from C source files. It assumes you're familiar with the concepts in Introduction to devicetree and Devicetree bindings. See Devicetree Reference for reference material.

### A note for Linux developers

Linux developers familiar with devicetree should be warned that the API described here differs significantly from how devicetree is used on Linux.

Instead of generating a C header with all the devicetree data which is then abstracted behind a macro API, the Linux kernel would instead read the devicetree data structure in its binary form. The binary representation is parsed at runtime, for example to load and initialize device drivers.

Zephyr does not work this way because the size of the devicetree binary and associated handling code would be too large to fit comfortably on the relatively constrained devices Zephyr supports.

### Node identifiers

To get information about a particular devicetree node, you need a node identifier for it. This is a just a C macro that refers to the node.

These are the main ways to get a node identifier:

**By path**

Use `DT_PATH()` along with the node's full path in the devicetree, starting from the root node. This is mostly useful if you happen to know the exact node you're looking for.

**By node label**

Use `DT_NODELABEL()` to get a node identifier from a node label. Node labels are often provided by SoC .dtsi to give nodes names that match the SoC datasheet, like `i2c1`, `spi2`, etc.

**By alias**

Use `DT_ALIAS()` to get a node identifier for a property of the special `/aliases` node. This is sometimes done by applications (like blinky, which uses the `led0` alias) that need to refer to some device of a particular type ("the board's user LED") but don't care which one is used.

**By instance number**

This is done primarily by device drivers, as instance numbers are a way to refer to individual nodes based on a matching compatible. Get these with `DT_INST()`, but be careful doing so. See below.

**By chosen node**

Use `DT_CHOSEN()` to get a node identifier for /chosen node properties.

**By parent/child**

Use `DT_PARENT()` and `DT_CHILD()` to get a node identifier for a parent or child node, starting from a node identifier you already have.

5.2. Devicetree
Two node identifiers which refer to the same node are identical and can be used interchangeably.

Here's a DTS fragment for some imaginary hardware we'll return to throughout this file for examples:

```dts-v1
/dts-v1/;
/
  
    aliases {
      sensor-controller = &i2c1;
    };

  soc {
    i2c1: i2c@40002000 {
      compatible = "vnd,soc-i2c";
      label = "I2C_1";
      reg = <0x40002000 0x1000>;
      status = "okay";
      clock-frequency = < 100000 >;
    }
  };
/
```

Here are a few ways to get node identifiers for the `i2c@40002000` node:

- `DT_PATH(soc, i2c_40002000)`
- `DT_NODELABEL(i2c1)`
- `DT_ALIAS(sensor_controller)`
- `DT_INST(x, vnd_soc_i2c)` for some unknown number `x`. See the `DT_INST()` documentation for details.

**Important:** Non-alphanumeric characters like dash (`-`) and the at sign (`@`) in devicetree names are converted to underscores (`_`). The names in a DTS are also converted to lowercase.

**Node identifiers are not values** There is no way to store one in a variable. You cannot write:

```c
/* These will give you compiler errors: */

void *i2c_0 = DT_INST(0, vnd_soc_i2c);
unsigned int i2c_1 = DT_INST(1, vnd_soc_i2c);
long my_i2c = DT_NODELABEL(i2c1);
```

If you want something short to save typing, use C macros:

```c
/* Use something like this instead: */

#define MY_I2C DT_NODELABEL(i2c1)
#define INST(i) DT_INST(i, vnd_soc_i2c)
#define I2C_0 INST(0)
#define I2C_1 INST(1)
```

**Property access** The right API to use to read property values depends on the node and property.
• Simple properties
• reg properties
• interrupts properties
• phandle properties

Checking properties and values
You can use `DT_NODE_HAS_PROP()` to check if a node has a property. For the example devicetree above:

```
DT_NODE_HAS_PROP(DT_NODELABEL(i2c1), clock_frequency) /* expands to 1 */
DT_NODE_HAS_PROP(DT_NODELABEL(i2c1), not_a_property) /* expands to 0 */
```

Simple properties
Use `DT_PROP(node_id, property)` to read basic integer, boolean, string, numeric array, and string array properties.

For example, to read the clock-frequency property's value in the above example:

```
DT_PROP(DT_PATH(soc, i2c_40002000), clock_frequency) /* This is 100000, */
DT_PROP(DT_NODELABEL(i2c1), clock_frequency) /* and so is this, */
DT_PROP(DT_ALIAS(sensor_controller), clock_frequency) /* and this. */
```

Important: The DTS property clock-frequency is spelled clock_frequency in C. That is, properties also need special characters converted to underscores. Their names are also forced to lowercase.

Properties with string and boolean types work the exact same way. The `DT_PROP()` macro expands to a string literal in the case of strings, and the number 0 or 1 in the case of booleans. For example:

```
#define I2C1 DT_NODELABEL(i2c1)

DT_PROP(I2C1, status) /* expands to the string literal "okay" */
```

Note: Don’t use `DT_NODE_HAS_PROP()` for boolean properties. Use `DT_PROP()` instead as shown above. It will expand to either 0 or 1 depending on if the property is present or absent.

Properties with type array, uint8-array, and string-array work similarly, except `DT_PROP()` expands to an array initializer in these cases. Here is an example devicetree fragment:

```
foo: foo@1234 {
    a = <1000 2000 3000>; /* array */
    b = [aa bb cc dd]; /* uint8-array */
    c = "bar", "baz"; /* string-array */
};
```

Its properties can be accessed like this:

```
#define FOO DT_NODELABEL(foo)

int a[] = DT_PROP(FOO, a); /* {1000, 2000, 3000} */
unsigned char b[] = DT_PROP(FOO, b); /* {0x9a, 0xbb, 0xcc, 0xdd} */
char* c[] = DT_PROP(FOO, c); /* {"foo", "bar"} */
```

You can use `DT_PROP_LEN()` to get logical array lengths in number of elements.

5.2. Devicetree
size_t a_len = DT_PROP_LEN(FOO, a); // 3 */
size_t b_len = DT_PROP_LEN(FOO, b); // 4 */
size_t c_len = DT_PROP_LEN(FOO, c); // 2 */

DT_PROP_LEN() cannot be used with the special reg or interrupts properties. These have alternative macros which are described next.

reg properties  See Important properties for an introduction to reg.

Given a node identifier node_id, DT_NUM_REGS(node_id) is the total number of register blocks in the node’s reg property.

You cannot read register block addresses and lengths with DT_PROP(node, reg). Instead, if a node only has one register block, use DT_REG_ADDR() or DT_REG_SIZE():

- DT_REG_ADDR(node_id): the given node’s register block address
- DT_REG_SIZE(node_id): its size

Use DT_REG_ADDR_BY_IDX() or DT_REG_SIZE_BY_IDX() instead if the node has multiple register blocks:

- DT_REG_ADDR_BY_IDX(node_id, idx): address of register block at index idx
- DT_REG_SIZE_BY_IDX(node_id, idx): size of block at index idx

The idx argument to these must be an integer literal or a macro that expands to one without requiring any arithmetic. In particular, idx cannot be a variable. This won’t work:

/* This will cause a compiler error. */

for (size_t i = 0; i < DT_NUM_REGS(node_id); i++) {
  size_t addr = DT_REG_ADDR_BY_IDX(node_id, i);
}

interrupts properties  See Important properties for a brief introduction to interrupts.

Given a node identifier node_id, DT_NUM_IRQS(node_id) is the total number of interrupt specifiers in the node’s interrupts property.

The most general purpose API macro for accessing these is DT_IRQ_BY_IDX():

DT_IRQ_BY_IDX(node_id, idx, val)

Here, idx is the logical index into the interrupts array, i.e. it is the index of an individual interrupt specifier in the property. The val argument is the name of a cell within the interrupt specifier. To use this macro, check the bindings file for the node you are interested in to find the val names.

Most Zephyr devicetree bindings have a cell named irq, which is the interrupt number. You can use DT_IRQN() as a convenient way to get a processed view of this value.

Warning:  Here, “processed” reflects Zephyr’s devicetree Scripts and tools, which change the irq number in zephyr.dts to handle hardware constraints on some SoCs and in accordance with Zephyr’s multilevel interrupt numbering.

This is currently not very well documented, and you’ll need to read the scripts’ source code and existing drivers for more details if you are writing a device driver.
phandle properties  Property values can refer to other nodes using the &another-node phandle syntax introduced in Writing property values. Properties which contain phandles have type phandle, phandles, or phandle-array in their bindings. We'll call these "phandle properties" for short.

You can convert a phandle to a node identifier using DT_PHANDLE(), DT_PHANDLE_BY_IDX(), or DT_PHANDLE_BY_NAME(), depending on the type of property you are working with.

One common use case for phandle properties is referring to other hardware in the tree. In this case, you usually want to convert the devicetree-level phandle to a Zephyr driver-level struct device. See Get a struct device from a devicetree node for ways to do that.

Another common use case is accessing specifier values in a phandle array. The general purpose APIs for this are DT_PHA_BY_IDX() and DT_PHA(). There are also hardware-specific short-hands like DT_GPIO_CTLR_BY_IDX(), DT_GPIO_CTLR(), DT_GPIO_LABEL_BY_IDX(), DT_GPIO_LABEL(), DT_GPIO_PIN_BY_IDX(), DT_GPIO_PIN(), DT_GPIO_FLAGS_BY_IDX(), and DT_GPIO_FLAGS().

See DT_PHA_HAS_CELL_AT_IDX() and DT_PROP_HAS_IDX() for ways to check if a specifier value is present in a phandle property.

Other APIs  Here are pointers to some other available APIs.

- DT_CHOSEN(), DT_HAS_CHOSEN(): for properties of the special /chosen node
- DT_HAS_COMPAT_STATUS_OKAY(), DT_NODE_HAS_COMPAT(): global- and node-specific tests related to the compatible property
- DT_BUS(): get a node’s bus controller, if there is one
- DT_ENUM_IDX(): for properties whose values are among a fixed list of choices
- Fixed flash partitions: APIs for managing fixed flash partitions. Also see Flash map, which wraps this in a more user-friendly API.

Device driver conveniences  Special purpose macros are available for writing device drivers, which usually rely on instance identifiers.

To use these, you must define DT_DRV_COMPAT to the compat value your driver implements support for. This compat value is what you would pass to DT_INST().

If you do that, you can access the properties of individual instances of your compatible with less typing, like this:

```c
#include <zephyr/devicetree.h>

#define DT_DRVCompat my_driver_compat

/* This is same thing as DT_INST(0, my_driver_compat): */
DT_DRV_INST(0)

/*
 * This is the same thing as
 * DT_PROP(DT_INST(0, my_driver_compat), clock_frequency)
 */
DT_INST_PROP(0, clock_frequency)
```

See Instance-based APIs for a generic API reference.

Hardware specific APIs  Convenience macros built on top of the above APIs are also defined to help readability for hardware specific code. See Hardware specific APIs for details.
Generated macros While the devicetree.h API is not generated, it does rely on a generated C header which is put into every application build directory: devicetree_generated.h. This file contains macros with devicetree data.

These macros have tricky naming conventions which the Devicetree API abstracts away. They should be considered an implementation detail, but it’s useful to understand them since they will frequently be seen in compiler error messages.

This section contains an Augmented Backus-Naur Form grammar for these generated macros, with examples and more details in comments. See RFC 7405 (which extends RFC 5234) for a syntax specification.

; An RFC 7405 ABNF grammar for devicetree macros.
; This does not cover macros pulled out of DT via Kconfig,
; like CONFIG_SRAM_BASE_ADDRESS, etc. It only describes the
; ones that start with DT_ and are directly generated.

; dt-macro: the top level nonterminal for a devicetree macro
; A dt-macro starts with uppercase "DT_", and is one of:
; - a <node-macro>, generated for a particular node
; - some <other-macro>, a catch-all for other types of macros
dt-macro = node-macro / other-macro

; node-macro: a macro related to a node
; A macro about a property value
node-macro = property-macro
; A macro about the pinctrl properties in a node.
node-macro =/ pinctrl-macro
; EXISTS macro: node exists in the devicetree
node-macro =/ %s"DT_N" path-id %s"_EXISTS"
; Bus macros: the plain BUS is a way to access a node's bus controller.
; The additional dt-name suffix is added to match that node's bus type;
; the dt-name in this case is something like "spi" or "i2c".
node-macro =/ %s"DT_N" path-id %s"BUS" ["_" dt-name]
; The reg property is special and has its own macros.

node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD"
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD_SEP"
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD_VARS"
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD_SEP_VARS"

; These are used internally by DT_FOREACH_CHILD_STATUS_OKAY, which iterates
; over each child node with status "okay".
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD_STATUS_OKAY"
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD_STATUS_OKAY_SEP"
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD_STATUS_OKAY_VARS"

; The node's zero-based index in the list of its parent's child nodes.
node-macro =/ %s"DT_N" path-id %s"_CHILD_IDX"
; The node's status macro; dt-name in this case is something like "okay"
; or "disabled".
node-macro =/ %s"DT_N" path-id %s"_STATUS_
    %s"_ORD"
; The node's path, as a string literal
node-macro =/ %s"DT_N" path-id %s"_FULL_NAME"
; The dependency ordinals of a node's requirements (direct dependencies).
node-macro =/ %s"DT_N" path-id %s"_REQUIRES_ORDS"
; The dependency ordinals of a node supports (reverse direct dependencies).
node-macro =/ %s"DT_N" path-id %s"_Supports_ORDS"

; pinctrl-macro: a macro related to the pinctrl properties in a node
; These are a bit of a special case because they kind of form an array,
; but the array indexes correspond to pinctrl-DIGIT properties in a node.

(continues on next page)
So they're related to a node, but not just one property within the node.

The following examples assume something like this:

```c
foo {
    pinctrl-0 = <&bar>;
    pinctrl-1 = <&baz>;
    pinctrl-names = "default", "sleep";
};
```

Total number of pinctrl-DIGIT properties in the node. May be zero.

```c
#define DT_N_<node path>_PINCTRL_NUM 2
```

A given pinctrl-DIGIT property exists.

```c
#define DT_N_<node path>_PINCTRL_IDX_0_EXISTS 1
#define DT_N_<node path>_PINCTRL_IDX_1_EXISTS 1
```

A given pinctrl property name exists.

```c
#define DT_N_<node path>_PINCTRL_NAME_default_EXISTS 1
#define DT_N_<node path>_PINCTRL_NAME_sleep_EXISTS 1
```

The corresponding index number of a named pinctrl property.

```c
#define DT_N_<node path>_PINCTRL_NAME_default_IDX 0
#define DT_N_<node path>_PINCTRL_NAME_sleep_IDX 1
```

The node identifier for the phandle in a named pinctrl property.

```c
#define DT_N_<node path>_PINCTRL_NAME_default_IDX_0_PH <node id for 'bar'>
```

There's no need for a separate macro for access by index: that's covered by property-macro. We only need this because the map from names to properties is implicit in the structure of the DT.

```c
#define DT_N_<node path>_PINCTRL_NAME_default_IDX_0_PH <node id for 'bar'>
```

The plain vanilla macro for a property's value, with no prop-suf, looks like this:

```c
DT_N_<node path>_P_<property name>
```

Components:
property-macro = `%s"DT_N" path-id `%s"_P_" prop-id [prop-suf]

;----
; path-id: a node's path-based macro identifier
; This in "lowercase-and-underscores" form. I.e. it is
; the node's devicetree path converted to a C token by changing:
; - each slash (/) to _S_
; - all letters to lowercase
; - non-alphanumerics characters to underscores
; For example, the leaf node "bar-BAZ" in this devicetree:
; / {
;   foo@123 {
;     bar-BAZ {};
;   }
; }
; has path-id "_S_foo_123_S_bar_baz".
path-id = 1*( %s"_S_" dt-name )

;----
; prop-id: a property identifier
; A property name converted to a C token by changing:
; - all letters to lowercase
; - non-alphanumeric characters to underscores
; Example node:
; chosen {
;   zephyr,console = &uart1;
;   WHY,AM_I_SHOUTING = "unclear";
; }
; The 'zephyr,console' property has prop-id 'zephyr_console'.
; 'WHY,AM_I_SHOUTING' has prop-id 'why_am_i_shouting'.
prop-id = dt-name

;----
; prop-suf: a property-specific macro suffix
; Extra macros are generated for properties:
; - that are special to the specification ("reg", "interrupts", etc.)
; - with array types (uint8-array, phandle-array, etc.)
; - with "enum:" in their bindings
; - that have zephyr device API specific macros for phandle-arrays
; - related to phandle specifier names ("foo-names")
Here are some examples:

- _EXISTS: property, index or name existence flag
- _SIZE: logical property length
- _IDX_<i>: values of individual array elements
- _IDX_<DIGIT>_VAL_<dt-name>: values of individual specifier
cells within a phandle array
- _ADDR_<i>: for reg properties, the i-th register block address
- _LEN_<i>: for reg properties, the i-th register block length

The different cases are not exhaustively documented here to avoid
this file going stale. Please see devicetree.h if you need to know
the details.

prop-suf = 1*( "_" gen-name ["_" dt-name] )

; other-macro: grab bag for everything that isn’t a node-macro.

; See examples below.
other-macro =  %s"DT_N_" alternate-id  
; Total count of enabled instances of a compatible.
other-macro =/ %s"DT_N_INST_" dt-name %s"NUM_OKAY"
; These are used internally by DT_FOREACH_NODE and
; DT_FOREACH_STATUS_OKAY_NODE respectively.
other-macro =/ %s"DT_FOREACH_HELPER"
other-macro =/ %s"DT_FOREACH_OKAY_HELPER"
; These are used internally by DT_FOREACH_STATUS_OKAY,
; which iterates over each enabled node of a compatible.
other-macro =/ %s"DT_FOREACH_OKAY_" dt-name
other-macro =/ %s"DT_FOREACH_OKAY_VARGS_" dt-name
; These are used internally by DT_INST_FOREACH_STATUS_OKAY,
; which iterates over each enabled instance of a compatible.
other-macro =/ %s"DT_FOREACH_OKAY_INST_" dt-name
other-macro =/ %s"DT_FOREACH_OKAY_INST_VARGS_" dt-name
; E.g.: #define DT_CHOSEN_zephyr_flash
other-macro =/ %s"DT_CHOSEN_" dt-name
; Declares that a compatible has at least one node on a bus.
; Example:

; #define DT_COMPAT_vnd_dev_BUS_spi 1
other-macro =/ %s"DT_COMPAT_" dt-name %s"BUS_" dt-name
; Declares that a compatible has at least one status "okay" node.
; Example:

; #define DT_COMPAT_HAS_OKAY_vnd_dev 1
other-macro =/ %s"DT_COMPAT_HAS_OKAY_" dt-name
; Currently used to allow mapping a lowercase-and-underscores "label"
; property to a fixed-partitions node. See the flash map API docs
; for an example.
other-macro =/ %s"DT_COMPAT_" dt-name %s"LABEL_" dt-name

alternate-id: another way to specify a node besides a path-id

; Example devicetree:
Node device@123 has these alternate-id values:

- ALIAS_dev
- NODELABEL_dev_1
- INST_0_vnd_device

The full alternate-id macros are:

```
#define DT_N_INST_0_vnd_device DT_N_S_soc_S_device_123
#define DT_N_ALIAS_dev DT_N_S_soc_S_device_123
#define DT_N_NODELABEL_dev_1 DT_N_S_soc_S_device_123
```

These mainly exist to allow pasting an alternate-id macro onto a
"_P_<prop-id>" to access node properties given a node's alias, etc.

Notice that "inst"-type IDs have a leading instance identifier,
which is generated by the devicetree scripts. The other types of
alternate-id begin immediately with names taken from the devicetree.

```
alternate-id = ( %s"ALIAS" / %s"NODELABEL" ) dt-name
alternate-id =/ %s"INST_" 1*DIGIT "_" dt-name
```

miscellaneous helper definitions

- A dt-name is one or more:
  - lowercase ASCII letters (a-z)
  - numbers (0-9)
  - underscores ("_")

- They are the result of converting names or combinations of names
  from devicetree to a valid component of a C identifier by
  lowercasing letters (in practice, this is a no-op) and converting
  non-alphanumeric characters to underscores.

- You'll see these referred to as "lowercase-and-underscores" forms of
  various devicetree identifiers throughout the documentation.

```
dt-name = 1*( lower / DIGIT / "_" )
gen-name is used as a stand-in for a component of a generated macro
name which does not come from devicetree (dt-name covers that case).
```

5.2. Devicetree
Zephyr Project Documentation, Release 3.2.99

(continued from previous page)

```c
; - underscores ("_"
gen-name = upper 1*( upper / DIGIT / "_" )

; "lowercase ASCII letter" turns out to be pretty annoying to specify
; in RFC-7405 syntax.
;
; This is just ASCII letters \(0x61\) through \(0x7a\).
lower = %x61-7A

; "uppercase ASCII letter" in RFC-7405 syntax
upper = %x41-5A
```

Devicetree HOWTOs

This page has step-by-step advice for getting things done with devicetree.

**Tip:** See *Troubleshooting devicetree* for troubleshooting advice.

Get your devicetree and generated header  A board's devicetree (*BOARD.dts*) pulls in common node definitions via `#include` preprocessor directives. This at least includes the SoC's `.dtsi`. One way to figure out the devicetree's contents is by opening these files, e.g. by looking in `dts/<ARCH>/<vendor>/<soc>.dtsi`, but this can be time consuming.

If you just want to see the “final” devicetree for your board, build an application and open the `zephyr.dts` file in the build directory.

**Tip:** You can build hello_world to see the “base” devicetree for your board without any additional changes from overlay files.

For example, using the qemu_cortex_m3 board to build hello_world:

```
# --cmake-only here just forces CMake to run, skipping the
# build process to save time.
west build -b qemu_cortex_m3 samples/hello_world --cmake-only
```

You can change `qemu_cortex_m3` to match your board.

CMake prints the input and output file locations like this:

```
-- Found BOARD.dts: .../zephyr/boards/arm/qemu_cortex_m3/qemu_cortex_m3.dts
-- Generated zephyr.dts: .../zephyr/build/zephyr/zephyr.dts
-- Generated devicetree_generated.h: .../zephyr/build/zephyr/include/generated/
  → devicetree_generated.h
```

The `zephyr.dts` file is the final devicetree in DTS format.
The `devicetree_generated.h` file is the corresponding generated header.
See *Input and output files* for details about these files.

Get a struct device from a devicetree node  When writing Zephyr applications, you'll often want to get a driver-level `struct device` corresponding to a devicetree node.

For example, with this devicetree fragment, you might want the struct device for `serial@40002000`:
Start by making a **node identifier** for the device you are interested in. There are different ways to do this; pick whichever one works best for your requirements. Here are some examples:

```c
/* Option 1: by node label */
#define MY_SERIAL DT_NODELABEL(serial0)

/* Option 2: by alias */
#define MY_SERIAL DT_ALIAS(my_serial)

/* Option 3: by chosen node */
#define MY_SERIAL DT_CHOSEN(zephyr_console)

/* Option 4: by path */
#define MY_SERIAL DT_PATH(soc, serial_40002000)
```

Once you have a node identifier there are two ways to proceed. One way to get a device is to use

```c
const struct device *const uart_dev = DEVICE_DT_GET(MY_SERIAL);
```

```c
if (!device_is_ready(uart_dev)) {
    /* Not ready, do not use */
    return -ENODEV;
}
```

There are variants of `DEVICE_DT_GET()` such as `DEVICE_DT_GET_OR_NULL()`, `DEVICE_DT_GET_ONE()` or `DEVICE_DT_GET_ANY()`. This idiom fetches the device pointer at build-time, which means there is no runtime penalty. This method is useful if you want to store the device pointer as configuration data. But because the device may not be initialized, or may have failed to initialize, you must verify that the device is ready to be used before passing it to any API functions. (This check is done for you by `device_get_binding()`.)

In some situations the device cannot be known at build-time, e.g., if it depends on user input like in a shell application. In this case you can get the `struct device` by combining `device_get_binding()` with the device name:

```c
const char *dev_name = /* TODO: insert device name from user */;
const struct device *uart_dev = device_get_binding(dev_name);
```

You can then use `uart_dev` with `UART` API functions like `uartConfigure()`. Similar code will work for other device types; just make sure you use the correct API for the device.

5.2. Devicetree
If you're having trouble, see Troubleshooting devicetree. The first thing to check is that the node has status = "okay", like this:

```c
#define MY_SERIAL DT_NODELABEL(my_serial)

#if DT_NODE_HAS_STATUS(MY_SERIAL, okay)
    const struct device *const uart_dev = DEVICE_DT_GET(MY_SERIAL);
#else
    #error "Node is disabled"
#endif
```

If you see the `#error` output, make sure to enable the node in your devicetree. In some situations your code will compile but it will fail to link with a message similar to:

```bash
...undefined reference to `__device_dts_ord_N' collect2: error: ld returned 1 exit status
```

This likely means there's a Kconfig issue preventing the device driver from being built, resulting in a reference that does not exist. If your code compiles successfully, the last thing to check is if the device is ready, like this:

```c
if (!device_is_ready(uart_dev)) {
    printk("Device not ready\n");
}
```

If you find that the device is not ready, it likely means that the device's initialization function failed. Enabling logging or debugging driver code may help in such situations. Note that you can also use `device_get_binding()` to obtain a reference at runtime. If it returns `NULL` it can either mean that device's driver failed to initialize or that it does not exist.

### Find a devicetree binding

Devicetree bindings are YAML files which declare what you can do with the nodes they describe, so it's critical to be able to find them for the nodes you are using.

If you don't have them already, Get your devicetree and generated header. To find a node's binding, open the generated header file, which starts with a list of nodes in a block comment:

```c
/*
 * [...]
 * Nodes in dependency order (ordinal and path):
 * 0 /
 * 1 /aliases
 * 2 /chosen
 * 3 /flash@0
 * 4 /memory@20000000
 * (etc.)
 * [...]
*/
```

Make note of the path to the node you want to find, like `/flash@0`. Search for the node's output in the file, which starts with something like this if the node has a matching binding:

```c
/*
 * Devicetree node:
 * /flash@0
 * *
 * Binding (compatible = soc-nv-flash):
 * $ZEPHYR_BASE/dts/bindings/mtd/soc-nv-flash.yaml
 * [...]
*/
```
See [Check for missing bindings](#) for troubleshooting.

**Set devicetree overlays**  Devicetree overlays are explained in *Introduction to devicetree*. The CMake variable `DTC_OVERLAY_FILE` contains a space- or semicolon-separated list of overlay files to use. If `DTC_OVERLAY_FILE` specifies multiple files, they are included in that order by the C preprocessor. A file in a Zephyr module can be referred to by escaping the Zephyr module dir variable like `\${ZEPHYR_<module>_MODULE_DIR}/<path-to>/dts.overlay` when setting the `DTC_OVERLAY_FILE` variable.

You can set `DTC_OVERLAY_FILE` to contain exactly the files you want to use. Here is an example using `west build`.

If you don't set `DTC_OVERLAY_FILE`, the build system will follow these steps, looking for files in your application configuration directory to use as devicetree overlays:

1. If the file `boards/<BOARD>.overlay` exists, it will be used.
2. If the current board has multiple revisions and `boards/<BOARD>_<revision>.overlay` exists, it will be used. This file will be included in addition to `boards/<BOARD>.overlay` if both exist.
3. If one or more files have been found in the previous steps, the build system stops looking and just uses those files.
4. Otherwise, if `<BOARD>.overlay` exists, it will be used, and the build system will stop looking for more files.
5. Otherwise, if `app.overlay` exists, it will be used.

All configuration files will be taken from the application’s configuration directory except for files with an absolute path that are given with the `DTC_OVERLAY_FILE` argument.

See [Application Configuration Directory](#) on how the application configuration directory is defined.

Using Shields will also add devicetree overlay files.

The `DTC_OVERLAY_FILE` value is stored in the CMake cache and used in successive builds.

The `build system` prints all the devicetree overlays it finds in the configuration phase, like this:

```bash
-- Found devicetree overlay: .../some/file.overlay
```

**Use devicetree overlays**  See *Set devicetree overlays* for how to add an overlay to the build.

Overlays can override node property values in multiple ways. For example, if your BOARD.dts contains this node:

```dts
/ {
    soc {
        serial0: serial@4002000 {
            status = "okay";
            current-speed = <115200>;
            /* ... */
        }
    }
};
```

These are equivalent ways to override the current-speed value in an overlay:

```dts
/* Option 1 */
&serial0 {
    current-speed = <9600>;
};
```

(continues on next page)
We’ll use the &serial0 style for the rest of these examples.

You can add aliases to your devicetree using overlays: an alias is just a property of the /aliases node. For example:

```dts
/ {
    aliases {
        my-serial = &serial0;
    }
};
```

Chosen nodes work the same way. For example:

```dts
/ {
    chosen {
        zephyr,console = &serial0;
    }
};
```

To delete a property (in addition to deleting properties in general, this is how to set a boolean property to false if it’s true in BOARD.dts):

```dts
&serial0 {
    /delete-property/ some-unwanted-property;
};
```

You can add subnodes using overlays. For example, to configure a SPI or I2C child device on an existing bus node, do something like this:

```dts
/* SPI device example */
&spi1 {
    my_spi_device: temp-sensor@0 {
        compatible = "...";
        label = "TEMP_SENSOR_0";
        /* reg is the chip select number, if needed;
        * If present, it must match the node’s unit address. */
        reg = <0>;
        /* Configure other SPI device properties as needed.
        * Find your device’s DT binding for details. */
        spi-max-frequency = <4000000>;
    }
};

/* I2C device example */
&i2c2 {
    my_i2c_device: touchscreen@76 {
        compatible = "...";
        label = "TOUCHSCREEN";
        /* reg is the I2C device address.
        * It must match the node’s unit address. */
        reg = <76>;
    }
};
```

(continues on next page)
/* Configure other I2C device properties as needed.
 * Find your device's DT binding for details. */

Other bus devices can be configured similarly:

- create the device as a subnode of the parent bus
- set its properties according to its binding

Assuming you have a suitable device driver associated with the `my_spi_device` and `my_i2c_device` compatibles, you should now be able to enable the driver via Kconfig and get the `struct device` for your newly added bus node, then use it with that driver API.

**Write device drivers using devicetree APIs**  
“Devicetree-aware” device drivers should create a `struct device` for each `status = "okay"` devicetree node with a particular `compatible` (or related set of compatibles) supported by the driver.

Writing a devicetree-aware driver begins by defining a devicetree binding for the devices supported by the driver. Use existing bindings from similar drivers as a starting point. A skeletal binding to get started needs nothing more than this:

```yaml
description: <Human-readable description of your binding>
compatible: "foo-company,bar-device"
include: base.yaml
```

See [Find a devicetree binding](#) for more advice on locating existing bindings.

After writing your binding, your driver C file can then use the devicetree API to find `status = "okay"` nodes with the desired compatible, and instantiate a `struct device` for each one. There are two options for instantiating each `struct device`: using instance numbers, and using node labels. In either case:

- Each `struct device`'s name should be set to its devicetree node's `label` property. This allows the driver's users to *Get a struct device from a devicetree node* in the usual way.
- Each device's initial configuration should use values from devicetree properties whenever practical. This allows users to configure the driver using devicetree overlays.

Examples for how to do this follow. They assume you've already implemented the device-specific configuration and data structures and API functions, like this:

```c
/* my_driver.c */
#include <zephyr/drivers/some_api.h>

/* Define data (RAM) and configuration (ROM) structures: */
struct my_dev_data {
    /* per-device values to store in RAM */
};
struct my_dev_cfg {
    uint32_t freq; /* Just an example: initial clock frequency in Hz */
    /* other configuration to store in ROM */
};

/* Implement driver API functions (drivers/some_api.h callbacks): */
static int my_driver_api_func1(const struct device *dev, uint32_t *foo) { /* ... */ }
static int my_driver_api_func2(const struct device *dev, uint64_t bar) { /* ... */ }
```

(continues on next page)
Option 1: create devices using instance numbers  Use this option, which uses Instance-based APIs, if possible. However, they only work when devicetree nodes for your driver's compatible are all equivalent, and you do not need to be able to distinguish between them.

To use instance-based APIs, begin by defining DT_DRV_COMPAT to the lowercase-and-underscores version of the compatible that the device driver supports. For example, if your driver's compatible is "vnd, my-device" in devicetree, you would define DT_DRV_COMPAT to vnd_my_device in your driver C file:

```c
/*
* Put this near the top of the file. After the includes is a good place.
* (Note that you can therefore run "git grep DT_DRV_COMPAT drivers" in
* the zephyr Git repository to look for example drivers using this style).
*/
#define DT_DRV_COMPAT vnd_my_device
```

**Important:** As shown, the DT_DRV_COMPAT macro should have neither quotes nor special characters. Remove quotes and convert special characters to underscores when creating DT_DRV_COMPAT from the compatible property.

Finally, define an instantiation macro, which creates each struct device using instance numbers. Do this after defining my_api_funcs.

```c
/*
* This instantiation macro is named "CREATE_MY_DEVICE".
* Its "inst" argument is an arbitrary instance number.
* 
* Put this near the end of the file, e.g. after defining "my_api_funcs".
*/
#define CREATE_MY_DEVICE(inst) 
  static struct my_dev_data my_data_##inst = { 
    /* initialize RAM values as needed, e.g.: */
    .freq = DT_INST_PROP(inst, clock_frequency), 
  }; 
  static const struct my_dev_cfg my_cfg_##inst = { 
    /* initialize ROM values as needed. */
  }; 
  DEVICE_DT_INST_DEFINE(inst, 
    my_dev_init_function, 
    NULL, 
    &my_data_##inst, 
    &my_cfg_##inst, 
    MY_DEV_INIT_LEVEL, MY_DEV_INIT_PRIORITY, 
    &my_api_funcs);
```

Notice the use of APIs like DT_INST_PROP() and DEVICE_DT_INST_DEFINE() to access devicetree node data. These APIs retrieve data from the devicetree for instance number inst of the node with compatible determined by DT_DRV_COMPAT.

Finally, pass the instantiation macro to DT_INST_FOREACH_STATUS_OKAY():
DT_INST_FOREACH_STATUS_OKAY(CREATE_MY_DEVICE)

DT_INST_FOREACH_STATUS_OKAY expands to code which calls CREATE_MY_DEVICE once for each enabled node with the compatible determined by DT_DRV_COMPAT. It does not append a semicolon to the end of the expansion of CREATE_MY_DEVICE, so the macro's expansion must end in a semicolon or function definition to support multiple devices.

Option 2: create devices using node labels Some device drivers cannot use instance numbers. One example is a SoC peripheral driver which relies on vendor HAL APIs specialized for individual IP blocks to implement Zephyr driver callbacks. Cases like this should use DT_NODELABEL() to refer to individual nodes in the devicetree representing the supported peripherals on the SoC. The devicetree.h Generic APIs can then be used to access node data.

For this to work, your SoC's dtsi file must define node labels like mydevice0, mydevice1, etc. appropriately for the IP blocks your driver supports. The resulting devicetree usually looks something like this:

```c
/ {
    soc {
        mydevice0: dev@0 {
            compatible = "vnd,my-device";
        };
        mydevice1: dev@1 {
            compatible = "vnd,my-device";
        };
    };
}
```

The driver can use the mydevice0 and mydevice1 node labels in the devicetree to operate on specific device nodes:

```c
/*
 * This is a convenience macro for creating a node identifier for
 * the relevant devices. An example use is MYDEV(0) to refer to
 * the node with label "mydevice0".
 */
#define MYDEV(idx) DT_NODELABEL(mydevice ## idx)

/*
 * Define your instantiation macro; "idx" is a number like 0 for mydevice0
 * or 1 for mydevice1. It uses MYDEV() to create the node label from the
 * index.
 */
#define CREATE_MYDEVICE(idx) 
static struct my_dev_data my_data_##idx = {
    /* initialize RAM values as needed, e.g.: */
    .freq = DT_PROP(MYDEV(idx), clock_frequency),
};
static const struct my_dev_cfg my_cfg_##idx = { /* ... */ }; 
DEVICE_DT_DEFINE(MYDEV(idx),
    my_dev_init_function,
    NULL,
    &my_data_##idx,
    &my_cfg_##idx,
    MY_DEV_INIT_LEVEL, MY_DEV_INIT_PRIORITY,
    &my_api_funcs)
```
Notice the use of APIs like `DT_PROP()` and `DEVICE_DT_DEFINE()` to access devicetree node data.

Finally, manually detect each enabled devicetree node and use `CREATE_MY_DEVICE` to instantiate each `struct device`:

```c
#if DT_NODE_HAS_STATUS(DT_NODELABEL(mydevice0), okay)
CREATE_MY_DEVICE(0)
#endif

#if DT_NODE_HAS_STATUS(DT_NODELABEL(mydevice1), okay)
CREATE_MY_DEVICE(1)
#endif
```

Since this style does not use `DT_INST_FOREACH_STATUS_OKAY()`, the driver author is responsible for calling `CREATE_MY_DEVICE()` for every possible node, e.g. using knowledge about the peripherals available on supported SoCs.

**Device drivers that depend on other devices** At times, one `struct device` depends on another `struct device` and requires a pointer to it. For example, a sensor device might need a pointer to its SPI bus controller device. Some advice:

- Write your devicetree binding in a way that permits use of *Hardware specific APIs* from `devicetree.h` if possible.
- In particular, for bus devices, your driver’s binding should include a file like `dts/bindings/spi/spi-device.yaml` which provides common definitions for devices addressable via a specific bus. This enables use of APIs like `DT_BUS()` to obtain a node identifier for the bus node. You can then *Get a struct device from a devicetree node* for the bus in the usual way.

Search existing bindings and device drivers for examples.

**Applications that depend on board-specific devices** One way to allow application code to run unmodified on multiple boards is by supporting a devicetree alias to specify the hardware specific portions, as is done in the blinky-sample. The application can then be configured in `BOARD.dts` files or via device-tree overlays.

**Troubleshooting devicetree**

Here are some tips for fixing misbehaving devicetree related code.

See *Devicetree HOWTOs* for other “HOWTO” style information.

**Try again with a pristine build directory**

**Important:** Try this first, before doing anything else.

See *Pristine Builds* for examples, or just delete the build directory completely and retry.

This is general advice which is especially applicable to debugging devicetree issues, because the outputs are created during the CMake configuration phase, and are not always regenerated when one of their inputs changes.

**Make sure `<devicetree.h>` is included** Unlike Kconfig symbols, the `devicetree.h` header must be included explicitly.

Many Zephyr header files rely on information from devicetree, so including some other API may transiently include `devicetree.h`, but that's not guaranteed.
Make sure you're using the right names  Remember that:

- In C/C++, devicetree names must be lowercased and special characters must be converted to underscores. Zephyr's generated devicetree header has DTS names converted in this way into the C tokens used by the preprocessor-based `<devicetree.h>` API.

- In overlays, use devicetree node and property names the same way they would appear in any DTS file. Zephyr overlays are just DTS fragments.

For example, if you're trying to get the `clock-frequency` property of a node with path `/soc/i2c@12340000` in a C/C++ file:

```c
/*
 * foo.c: lowercase-and-underscores names
 */

/* Don't do this: */
#define MY_CLOCK_FREQ DT_PROP(DT_PATH(soc, i2c@1234000), clock-frequency)
/*
 * @ should be _ - should be _ */

/* Do this instead: */
#define MY_CLOCK_FREQ DT_PROP(DT_PATH(soc, i2c_1234000), clock_frequency)
/* ^ ^ */
```

And if you're trying to set that property in a devicetree overlay:

```c
/*
 * foo.overlay: DTS names with special characters, etc.
 */

/* Don't do this; you'll get devicetree errors. */
{k{/soc/i2c_12340000/}} {
    clock_frequency = <115200>;
}
/*
 * Do this instead. Overlays are just DTS fragments. */
{k{/soc/i2c@12340000/}} {
    clock-frequency = <115200>;
}
```

Look at the preprocessor output To save preprocessor output when using GCC-based toolchains, add `-save-temps=obj` to the `EXTRA_CFLAGS` CMake variable. For example, to build `hello_world` with `west` with this option set, use:

```
west build -b BOARD samples/hello_world -- -DEXTRA_CFLAGS=-save-temps=obj
```

This will create a preprocessor output file named `foo.c.i` in the build directory for each source file `foo.c`.

You can then search for the file in the build directory to see what your devicetree macros expanded to. For example, on macOS and Linux, using `find` to find `main.c.i`:

```
$ find build -name main.c.i
build/CMakeFiles/app.dir/src/main.c.i
```

It's usually easiest to run a style formatter on the results before opening them. For example, to use `clang-format` to reformat the file in place:

```
5.2. Devicetree
1033
```
Validate properties

If you're getting a compile error reading a node property, check your node identifier and property. For example, if you get a build error on a line that looks like this:

```c
int baud_rate = DT_PROP(DT_NODELABEL(my_serial), current_speed);
```

Try checking the node by adding this to the file and recompiling:

```c
#if !DT_NODE_EXISTS(DT_NODELABEL(my_serial))
#error "whoops"
#endif
```

If you see the “whoops” error message when you rebuild, the node identifier isn't referring to a valid node. Get your devicetree and generated header and debug from there.

Some hints for what to check next if you don’t see the “whoops” error message:

- did you Make sure you’re using the right names?
- does the property exist?
- does the node have a matching binding?
- does the binding define the property?

Check for missing bindings

See Devicetree bindings for information about bindings, and Bindings index for information on bindings built into Zephyr.

If the build fails to Find a devicetree binding for a node, then either the node's compatible property is not defined, or its value has no matching binding. If the property is set, check for typos in its name. In a devicetree source file, compatible should look like “vnd,some-device” – Make sure you’re using the right names.

If your binding file is not under zephyr/dts, you may need to set DTS_ROOT; see Where bindings are located.

Errors with DT_INST_() APIs

If you're using an API like DT_INST_PROP(), you must define DT_DRV_COMPAT to the lowercase-and-underscores version of the compatible you are interested in. See Option 1: create devices using instance numbers.

Devicetree versus Kconfig

Along with devicetree, Zephyr also uses the Kconfig language to configure the source code. Whether to use devicetree or Kconfig for a particular purpose can sometimes be confusing. This section should help you decide which one to use.

In short:

- Use devicetree to describe hardware and its boot-time configuration. Examples include peripherals on a board, boot-time clock frequencies, interrupt lines, etc.
- Use Kconfig to configure software support to build into the final image. Examples include whether to add networking support, which drivers are needed by the application, etc.

In other words, devicetree mainly deals with hardware, and Kconfig with software.

For example, consider a board containing a SoC with 2 UART, or serial port, instances.
- The fact that the board has this UART hardware is described with two UART nodes in the device-tree. These provide the UART type (via the compatible property) and certain settings such as the address range of the hardware peripheral registers in memory (via the reg property).

- Additionally, the UART boot-time configuration is also described with devicetree. This could include configuration such as the RX IRQ line's priority and the UART baud rate. These may be modifiable at runtime, but their boot-time configuration is described in devicetree.

- Whether or not to include software support for UART in the build is controlled via Kconfig. Applications which do not need to use the UARTs can remove the driver source code from the build using Kconfig, even though the board’s devicetree still includes UART nodes.

As another example, consider a device with a 2.4GHz, multi-protocol radio supporting both the Bluetooth Low Energy and 802.15.4 wireless technologies.

- Devicetree should be used to describe the presence of the radio hardware, what driver or drivers it's compatible with, etc.

- Boot-time configuration for the radio, such as TX power in dBm, should also be specified using devicetree.

- Kconfig should determine which software features should be built for the radio, such as selecting a BLE or 802.15.4 protocol stack.

As another example, Kconfig options that formerly enabled a particular instance of a driver (that is itself enabled by Kconfig) have been removed. The devices are selected individually using devicetree's status keyword on the corresponding hardware instance.

There are exceptions to these rules:

- Because Kconfig is unable to flexibly control some instance-specific driver configuration parameters, such as the size of an internal buffer, these options may be defined in devicetree. However, to make clear that they are specific to Zephyr drivers and not hardware description or configuration these properties should be prefixed with zephyr, e.g. zephyr,random-mac-address in the common Ethernet devicetree properties.

- Devicetree's chosen keyword, which allows the user to select a specific instance of a hardware device to be used for a particular purpose. An example of this is selecting a particular UART for use as the system's console.

### 5.2.2 Devicetree Reference

These pages contain reference material for Zephyr's devicetree APIs and built-in bindings. For the platform-independent details, see the Devicetree specification.

#### Devicetree API

This is a reference page for the `<devicetree.h>` API. The API is macro based. Use of these macros has no impact on scheduling. They can be used from any calling context and at file scope.

Some of these require a special macro named `DT_DRV_COMPAT` to be defined before they can be used; these are discussed individually below. These macros are generally meant for use within device drivers, though they can be used outside of drivers with appropriate care.

Generic APIs  The APIs in this section can be used anywhere and do not require `DT_DRV_COMPAT` to be defined.

Node identifiers and helpers  A node identifier is a way to refer to a devicetree node at C preprocessor time. While node identifiers are not C values, you can use them to access devicetree data in C rvalue form using, for example, the Property access API.

The root node / has node identifier `DT_ROOT`. You can create node identifiers for other devicetree nodes using `DT_PATH()`, `DT_NODELABEL()`, `DT_ALIAS()`, and `DT_INST()`.

There are also `DT_PARENT()` and `DT_CHILD()` macros which can be used to create node identifiers for a given node's parent node or a particular child node, respectively.

The following macros create or operate on node identifiers.

\[ group devicetree-generic-id \]

Defines

\[ DT_INVALID_NODE \]

Name for an invalid node identifier.
This supports cases where factored macros can be invoked from paths where devicetree data may or may not be available. It is a preprocessor identifier that does not match any valid devicetree node identifier.

**DT_ROOT**

Node identifier for the root node in the devicetree.

**DT_PATH(...)**

Get a node identifier for a devicetree path.

The arguments to this macro are the names of non-root nodes in the tree required to reach the desired node, starting from the root. Non-alphanumeric characters in each name must be converted to underscores to form valid C tokens, and letters must be lowercased.

Example devicetree fragment:

```
/ {
  soc {
    serial1: serial@40001000 {
      status = "okay";
      current-speed = <115200>;
      ...
    }
  }
};
```

You can use `DT_PATH(soc, serial_40001000)` to get a node identifier for the `serial@40001000` node. Node labels like `serial1` cannot be used as `DT_PATH()` arguments; use `DT_NODENAME()` for those instead.

Example usage with `DT_PROP()` to get the `current-speed` property:

```
DT_PROP(DT_PATH(soc, serial_40001000), current_speed) // 115200
```

(The `current-speed` property is also in lowercase-and-underscores form when used with this API.)

When determining arguments to `DT_PATH()`:

- the first argument corresponds to a child node of the root (`soc` above)
- a second argument corresponds to a child of the first argument (`serial_40001000` above, from the node name `serial@40001000` after lowercasing and changing @ to `_`)
- and so on for deeper nodes in the desired node's path

**Note:** This macro returns a node identifier from path components. To get a path string from a node identifier, use `DT_NODE_PATH()` instead.

**Parameters**

- `...` – lowercase-and-underscores node names along the node's path, with each name given as a separate argument
**Returns**

node identifier for the node with that path

`DT_NODELABEL(label)`

Get a node identifier for a node label. Convert non-alphanumeric characters in the node label to underscores to form valid C tokens, and lowercase all letters. Note that node labels are not the same thing as label properties.

Example devicetree fragment:

```c
serial1: serial@40001000 {
    label = "UART_0";
    status = "okay";
    current-speed = <115200>;
    ...
};
```

The only node label in this example is `serial1`.

The string `UART_0` is *not* a node label; it's the value of a property named label.

You can use `DT_NODELABEL(serial1)` to get a node identifier for the `serial@40001000` node.

Example usage with `DT_PROP()` to get the current-speed property:

```c
DT_PROP(DT_NODELABEL(serial1), current_speed) // 115200
```

Another example devicetree fragment:

```c
cpu@0 {
    L2_0: l2-cache {
        cache-level = <2>;
        ...
    };
};
```

Example usage to get the cache-level property:

```c
DT_PROP(DT_NODELABEL(L2_0), cache_level) // 2
```

Notice how `L2_0` in the devicetree is lowercased to `12_0` in the `DT_NODELABEL()` argument.

**Parameters**

- label – lowercase-and-underscores node label name

**Returns**

node identifier for the node with that label

`DT_ALIAS(alias)`

Get a node identifier from `/aliases`.

This macro's argument is a property of the `/aliases` node. It returns a node identifier for the node which is aliased. Convert non-alphanumeric characters in the alias property to underscores to form valid C tokens, and lowercase all letters.

Example devicetree fragment:
You can use `DT_ALIAS(my_serial)` to get a node identifier for the `serial@40001000` node. Notice how `my-serial` in the devicetree becomes `my_serial` in the `DT_ALIAS()` argument. Example usage with `DT_PROP()` to get the current-speed property:

```
DT_PROP(DT_ALIAS(my_serial), current_speed) // 115200
```

**Parameters**

- `alias` – lowercase-and-underscores alias name.

**Returns**

node identifier for the node with that alias

```c
DT_INST(inst, compat)
```

Get a node identifier for an instance of a compatible.

All nodes with a particular compatible property value are assigned instance numbers, which are zero-based indexes specific to that compatible. You can get a node identifier for these nodes by passing `DT_INST()` an instance number, `inst`, along with the lowercase-and-underscores version of the compatible, `compat`.

Instance numbers have the following properties:

- for each compatible, instance numbers start at 0 and are contiguous
- exactly one instance number is assigned for each node with a compatible, **including disabled nodes**
- enabled nodes (status property is `okay` or missing) are assigned the instance numbers starting from 0, and disabled nodes have instance numbers which are greater than those of any enabled node

No other guarantees are made. In particular:

- instance numbers **in no way reflect** any numbering scheme that might exist in SoC documentation, node labels or unit addresses, or properties of the `/aliases` node (use `DT_NODELABEL()` or `DT_ALIAS()` for those)
- there is **no general guarantee** that the same node will have the same instance number between builds, even if you are building the same application again in the same build directory
Example devicetree fragment:

```c
serial1: serial@40001000 {
  compatible = "vnd,soc-serial";
  status = "disabled";
  current-speed = <9600>;
  ...
};

serial2: serial@40002000 {
  compatible = "vnd,soc-serial";
  status = "okay";
  current-speed = <57600>;
  ...
};

serial3: serial@40003000 {
  compatible = "vnd,soc-serial";
  current-speed = <115200>;
  ...
};
```

Assuming no other nodes in the devicetree have compatible "vnd,soc-serial", that compatible has nodes with instance numbers 0, 1, and 2.

The nodes serial@40002000 and serial@40003000 are both enabled, so their instance numbers are 0 and 1, but no guarantees are made regarding which node has which instance number.

Since serial@40001000 is the only disabled node, it has instance number 2, since disabled nodes are assigned the largest instance numbers. Therefore:

```c
// Could be 57600 or 115200. There is no way to be sure:
// either serial@40002000 or serial@40003000 could
// have instance number 0, so this could be the current-speed
// property of either of those nodes.
DT_PROP(DT_INST(0, vnd_soc_serial), current_speed)

// Could be 57600 or 115200, for the same reason.
// If the above expression expands to 57600, then
// this expands to 115200, and vice-versa.
DT_PROP(DT_INST(1, vnd_soc_serial), current_speed)

// 9600, because there is only one disabled node, and
// disabled nodes are "at the end" of the instance
// number "list".
DT_PROP(DT_INST(2, vnd_soc_serial), current_speed)
```

Notice how "vnd,soc-serial" in the devicetree becomes vnd_soc_serial (without quotes) in the `DT_INST()` arguments. (As usual, current-speed in the devicetree becomes current_speed as well.)

Nodes whose compatible property has multiple values are assigned independent instance numbers for each compatible.

**Parameters**

- `inst` – instance number for compatible `compat`
Returns
node identifier for the node with that instance number and compatible

DT_PARENT(node_id)
Get a node identifier for a parent node.

Example devicetree fragment:

```plaintext
parent: parent-node {
    child: child-node {
        ...
    };
}
```

The following are equivalent ways to get the same node identifier:

```plaintext
DT_NODELABEL(parent)
DT_PARENT(DT_NODELABEL(child))
```

Parameters
• node_id – node identifier

Returns
a node identifier for the node's parent

DT_GPARENT(node_id)
Get a node identifier for a grandparent node.

Example devicetree fragment:

```plaintext
gparent: grandparent-node {
    parent: parent-node {
        child: child-node { ... }
    };
}
```

The following are equivalent ways to get the same node identifier:

```plaintext
DT_GPARENT(DT_NODELABEL(child))
DT_PARENT(DT_PARENT(DT_NODELABEL(child)))
```

Parameters
• node_id – node identifier

Returns
a node identifier for the node's parent's parent

DT_CHILD(node_id, child)
Get a node identifier for a child node.

Example devicetree fragment:
Example usage with `DT_PROP()` to get the status of the serial@40001000 node:

```c
#define SOC_NODE DT_NODELABEL(soc_label)
DT_PROP(DT_CHILD(SOC_NODE, serial_40001000), status) // "okay"
```

Node labels like serial1 cannot be used as the child argument to this macro. Use `DT_NODELABEL()` for that instead.

You can also use `DT_FOREACH_CHILD()` to iterate over node identifiers for all of a node's children.

### Parameters
- `node_id` – node identifier
- `child` – lowercase-and-underscores child node name

### Returns
node identifier for the node with the name referred to by 'child'

`DT_COMPAT_GET_ANY_STATUS_OKAY(compat)`

Get a node identifier for a status okay node with a compatible.

Use this if you want to get an arbitrary enabled node with a given compatible, and you do not care which one you get. If any enabled nodes with the given compatible exist, a node identifier for one of them is returned. Otherwise, `DT_INVALID_NODE` is returned.

Example devicetree fragment:

```c
node-a {
    compatible = "vnd,device";
    status = "okay";
};

node-b {
    compatible = "vnd,device";
    status = "okay";
};

node-c {
    compatible = "vnd,device";
    status = "disabled";
};
```

Example usage:

```c
DT_COMPAT_GET_ANY_STATUS_OKAY(vnd_device)
```
This expands to a node identifier for either node-a or node-b. It will not expand to a node identifier for node-c, because that node does not have status okay.

**Parameters**
- compat – lowercase-and-underscores compatible, without quotes

**Returns**
- node identifier for a node with that compatible, or DT_INVALID_NODE

**DT_NODE_PATH(node_id)**

Get a devicetree node's full path as a string literal.

This returns the path to a node from a node identifier. To get a node identifier from path components instead, use DT_PATH().

Example devicetree fragment:

```plaintext
/ {
    soc {
        node: my-node@12345678 { ... };
    };
};
```

Example usage:

```plaintext
DT_NODE_PATH(DT_NODELABEL(node))  // "/soc/my-node@12345678"
DT_NODE_PATH(DT_PATH(soc))        // "/soc"
DT_NODE_PATH(DT_ROOT)             // "/
```

**Parameters**
- node_id – node identifier

**Returns**
- the node's full path in the devicetree

**DT_NODE_FULL_NAME(node_id)**

Get a devicetree node's name with unit-address as a string literal.

This returns the node name and unit-address from a node identifier.

Example devicetree fragment:

```plaintext
/ {
    soc {
        node: my-node@12345678 { ... };
    };
};
```

Example usage:

```plaintext
DT_NODE_FULL_NAME(DT_NODELABEL(node)) // "my-node@12345678"
```

**Parameters**
- node_id – node identifier
Returns
the node’s name with unit-address as a string in the devicetree

DT_NODE_CHILD_IDX(node_id)
Get a devicetree node’s index into its parent’s list of children.
Indexes are zero-based.
It is an error to use this macro with the root node.
Example devicetree fragment:

```c
parent {
  c1: child-1 {};
  c2: child-2 {};
};
```

Example usage:

```c
DT_NODE_CHILD_IDX(DT_NODELABEL(c1)) // 0
DT_NODE_CHILD_IDX(DT_NODELABEL(c2)) // 1
```

Parameters
- node_id – node identifier

Returns
the node’s index in its parent node’s list of children

DT_SAME_NODE(node_id1, node_id2)
Do node_id1 and node_id2 refer to the same node?
Both node_id1 and node_id2 must be node identifiers for nodes that exist in the devicetree (if unsure, you can check with DT_NODE_EXISTS()).
The expansion evaluates to 0 or 1, but may not be a literal integer 0 or 1.

Parameters
- node_id1 – first node identifier
- node_id2 – second node identifier

Returns
an expression that evaluates to 1 if the node identifiers refer to the same node, and evaluates to 0 otherwise

Property access
The following general-purpose macros can be used to access node properties. There are special-purpose APIs for accessing the ranges property, reg property and interrupts property.

Property values can be read using these macros even if the node is disabled, as long as it has a matching binding.
Defines

DT_PROP(node_id, prop)
Get a devicetree property value.

For properties whose bindings have the following types, this macro expands to:

- string: a string literal
- boolean: 0 if the property is false, or 1 if it is true
- int: the property's value as an integer literal
- array, uint8-array, string-array: an initializer expression in braces, whose elements are integer or string literals (like {0, 1, 2}, {"hello", "world"}, etc.)
- phandle: a node identifier for the node with that phandle

A property's type is usually defined by its binding. In some special cases, it has an assumed type defined by the devicetree specification even when no binding is available: compatible has type string-array, status has type string, and interrupt-controller has type boolean.

For other properties or properties with unknown type due to a missing binding, behavior is undefined.

For usage examples, see DT_PATH(), DT_ALIAS(), DT_NODENAME(), and DT_INST() above.

Parameters
- node_id – node identifier
- prop – lowercase-and-underscores property name

Returns
a representation of the property's value

DT_PROP_LEN(node_id, prop)
Get a property's logical length.

Here, "length" is a number of elements, which may differ from the property's size in bytes.

The return value depends on the property's type:

- for types array, string-array, and uint8-array, this expands to the number of elements in the array
- for type phandles, this expands to the number of phandles
- for type phandle-array, this expands to the number of phandle and specifier blocks in the property

These properties are handled as special cases:

- reg property: use DT_NUM_REGS(node_id) instead
- interrupts property: use DT_NUM_IRQS(node_id) instead

It is an error to use this macro with the ranges, dma-ranges, reg or interrupts properties. For other properties, behavior is undefined.

Parameters
- node_id – node identifier
- prop – a lowercase-and-underscores property with a logical length

**Returns**
the property's length

\[
\text{DT_PROP_LEN**(OR**(node\_id, prop, default\_value)}
\]

Like \(\text{DT_PROP_LEN()}\), but with a fallback to default\_value.

If the property is defined (as determined by \(\text{DT_NODE_HAS_PROP()}\)), this expands to \(\text{DT_PROP_LEN(node\_id, prop)}\). The default\_value parameter is not expanded in this case.

Otherwise, this expands to default\_value.

**Parameters**

- node\_id – node identifier
- prop – a lowercase-and-underscores property with a logical length
- default\_value – a fallback value to expand to

**Returns**
the property's length or the given default value

\[
\text{DT_PROP_HAS_IDX**(node\_id, prop, idx)}
\]

Is index idx valid for an array type property?

If this returns 1, then \(\text{DT_PROP_BY_IDX(node\_id, prop, idx)}\) or \(\text{DT_PHA_BY_IDX(node\_id, prop, idx, ...)}\) are valid at index idx. If it returns 0, it is an error to use those macros with that index.

These properties are handled as special cases:

- \text{reg} property: use \(\text{DT_REG_HAS_IDX(node\_id, idx)}\) instead
- \text{interrupts} property: use \(\text{DT_IRQ_HAS_IDX(node\_id, idx)}\) instead

It is an error to use this macro with the \text{reg} or \text{interrupts} properties.

**Parameters**

- node\_id – node identifier
- prop – a lowercase-and-underscores property with a logical length
- idx – index to check

**Returns**
An expression which evaluates to 1 if idx is a valid index into the given property, and 0 otherwise.

\[
\text{DT_PROP_HAS_NAME**(node\_id, prop, name)}
\]

Is name name available in a foo-names property?

This property is handled as special case:

- \text{interrupts} property: use \(\text{DT_IRQ_HAS_NAME(node\_id, idx)}\) instead

It is an error to use this macro with the \text{interrupts} property.

Example devicetree fragment:

```c
nx: node-x {
  foos = <&bar xx yy>, <&baz xx zz>;
  foo-names = "event", "error";
  status = "okay";
};
```
Example usage:

```
DT_PROP_HAS_NAME(nx, foos, event)  // 1
DT_PROP_HAS_NAME(nx, foos, failure) // 0
```

**Parameters**
- `node_id` – node identifier
- `prop` – a lowercase-and-underscores property name
- `name` – a lowercase-and-underscores name to check

**Returns**
An expression which evaluates to 1 if “name” is an available name into the given property, and 0 otherwise.

**DT_PROP_BY_IDX(node_id, prop, idx)**

Get the value at index `idx` in an array type property.

It might help to read the argument order as being similar to `node->property[index]`.

When the property's binding has type array, string-array, uint8-array, or phandles, this expands to the `idx`-th array element as an integer, string literal, or node identifier respectively.

These properties are handled as special cases:

- **reg property**: use `DT_REG_ADDR_BY_IDX()` or `DT_REG_SIZE_BY_IDX()` instead
- **interrupts property**: use `DT_IRQ_BY_IDX()` instead

For non-array properties, behavior is undefined.

**Parameters**
- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

**Returns**
a representation of the `idx`-th element of the property

**DT_PROP_OR(node_id, prop, default_value)**

Like `DT_PROP()`, but with a fallback to `default_value`.

If the value exists, this expands to `DT_PROP(node_id, prop)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

**Parameters**
- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

**Returns**
the property's value or `default_value`
DT_LABEL(node_id)
   Equivalent to DT_PROP(node_id, label)

_DEPRECATED:
   Use DT_PROP(node_id, label)

This is a convenience for the Zephyr device API, which uses label properties as device_get_binding() arguments.

**Parameters**
- node_id – node identifier

**Returns**
node's label property value

DT_ENUM_IDX(node_id, prop)
Get a property value's index into its enumeration values.
The return values start at zero.

Example devicetree fragment:

```plaintext
usb1: usb@12340000 {
    maximum-speed = "full-speed";
};
usb2: usb@12341000 {
    maximum-speed = "super-speed";
};
```

Example bindings fragment:

```plaintext
properties:
    maximum-speed:
        type: string
        enum:
            - "low-speed"
            - "full-speed"
            - "high-speed"
            - "super-speed"
```

Example usage:

```plaintext
DT_ENUM_IDX(DT_NODELABEL(usb1), maximum_speed) // 1
DT_ENUM_IDX(DT_NODELABEL(usb2), maximum_speed) // 3
```

**Parameters**
- node_id – node identifier
- prop – lowercase-and-underscores property name

**Returns**
zero-based index of the property's value in its enum: list
DT_ENUM_IDX_OR(node_id, prop, default_idx_value)

Like DT_ENUM_IDX(), but with a fallback to a default enum index.

If the value exists, this expands to its zero based index value thanks to DT_ENUM_IDX(node_id, prop).

Otherwise, this expands to provided default index enum value.

Parameters

• node_id – node identifier
• prop – lowercase-and-underscores property name
• default_idx_value – a fallback index value to expand to

Returns

zero-based index of the property's value in its enum if present, default_idx_value otherwise

DT_STRING_TOKEN(node_id, prop)

Get a string property's value as a token.

This removes "the quotes" from a string property's value, converting any non-alphanumeric characters to underscores. This can be useful, for example, when programmatically using the value to form a C variable or code.

DT_STRING_TOKEN() can only be used for properties with string type.

It is an error to use DT_STRING_TOKEN() in other circumstances.

Example devicetree fragment:

```plaintext
n1: node-1 {
    prop = "foo";
};
n2: node-2 {
    prop = "FOO";
}
n3: node-3 {
    prop = "123 foo";
};
```

Example bindings fragment:

```plaintext
properties:
    prop:
        type: string
```

Example usage:

```plaintext
DT_STRING_TOKEN(DT_NODELABEL(n1), prop) // foo
DT_STRING_TOKEN(DT_NODELABEL(n2), prop) // FOO
DT_STRING_TOKEN(DT_NODELABEL(n3), prop) // 123_foo
```

Notice how:

• Unlike C identifiers, the property values may begin with a number. It's the user's responsibility not to use such values as the name of a C identifier.
The uppercased "F00" in the DTS remains F00 as a token. It is not converted to foo.

The whitespace in the DTS "123 foo" string is converted to 123_foo as a token.

Parameters

- node_id – node identifier
- prop – lowercase-and-underscores property name

Returns

the value of prop as a token, i.e. without any quotes and with special characters converted to underscores

DT_STRING_TOKEN_OR(node_id, prop, default_value)

Like DT_STRING_TOKEN(), but with a fallback to default_value.

If the value exists, this expands to DT_STRING_TOKEN(node_id, prop). The default_value parameter is not expanded in this case.

Otherwise, this expands to default_value.

Parameters

- node_id – node identifier
- prop – lowercase-and-underscores property name
- default_value – a fallback value to expand to

Returns

the property's value as a token, or default_value

DT_STRING_UPPER_TOKEN(node_id, prop)

Like DT_STRING_TOKEN(), but uppercased.

This removes "the quotes" from a string property's value, converting any non-alphanumeric characters to underscores, and capitalizing the result. This can be useful, for example, when programmatically using the value to form a C variable or code.

DT_STRING_UPPER_TOKEN() can only be used for properties with string type.

It is an error to use DT_STRING_UPPER_TOKEN() in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
  prop = "foo";
};
n2: node-2 {
  prop = "123 foo";
};
```

Example bindings fragment:

```
properties:
  prop:
    type: string
```

Example usage:
Notice how:

- Unlike C identifiers, the property values may begin with a number. It’s the user’s responsibility not to use such values as the name of a C identifier.
- The lowercased "foo" in the DTS becomes FOO as a token, i.e. it is uppercased.
- The whitespace in the DTS "123 foo" string is converted to 123_FOO as a token, i.e. it is uppercased and whitespace becomes an underscore.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name

**Returns**

the value of `prop` as an uppercased token, i.e. without any quotes and with special characters converted to underscores

**DT_STRING_UPPER_TOKEN_OR(node_id, prop, default_value)**

Like `DT_STRING_UPPER_TOKEN()`, but with a fallback to `default_value`. If the value exists, this expands to `DT_STRING_UPPER_TOKEN(node_id, prop)`. The `default_value` parameter is not expanded in this case. Otherwise, this expands to `default_value`.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

**Returns**

the property's value as an uppercased token, or `default_value`

**DT_STRING_TOKEN_BY_IDX(node_id, prop, idx)**

Get an element out of a string-array property as a token.

This removes “the quotes” from an element in the array, and converts non-alphanumeric characters to underscores. That can be useful, for example, when programmatically using the value to form a C variable or code.

`DT_STRING_TOKEN_BY_IDX()` can only be used for properties with string-array type. It is an error to use `DT_STRING_TOKEN_BY_IDX()` in other circumstances.

Example devicetree fragment:

```plaintext
n1: node-1 {
    prop = "f1", "F2";
};
n2: node-2 {
    prop = "123 foo", "456 FOO";
};
```
Example bindings fragment:

```plaintext
properties:
    prop:
        type: string-array
```

Example usage:

```plaintext
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n1), prop, 0)  // f1
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n1), prop, 1)  // F2
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n2), prop, 0)  // 123_foo
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n2), prop, 1)  // 456_FOO
```

For more information, see `DT_STRING_TOKEN`.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

**Returns**

the element in `prop` at index `idx` as a token

```plaintext
DT_STRING_UPPER_TOKEN_BY_IDX(node_id, prop, idx)
```

Like `DT_STRING_TOKEN_BY_IDX()`, but uppercased.

This removes “the quotes” and capitalizes an element in the array, and converts non-alphanumeric characters to underscores. That can be useful, for example, when programmatically using the value to form a C variable or code.

`DT_STRING_UPPER_TOKEN_BY_IDX()` can only be used for properties with string-array type.

It is an error to use `DT_STRING_UPPER_TOKEN_BY_IDX()` in other circumstances.

Example devicetree fragment:

```plaintext
n1: node-1 {
    prop = "f1", "F2";
};
n2: node-2 {
    prop = "123 foo", "456 FOO";
};
```

Example bindings fragment:

```plaintext
properties:
    prop:
        type: string-array
```

Example usage:

```plaintext
1052 Chapter 5. Build and Configuration Systems
```
For more information, see `DT_STRING_UPPER_TOKEN`.

**Parameters**
- node_id – node identifier
- prop – lowercase-and-underscores property name
- idx – the index to get

**Returns**
the element in prop at index idx as an uppercased token

`DT_PROP_BY_PHANDLE_IDX(node_id, phs, idx, prop)`
Get a property value from a phandle in a property.
This is a shorthand for:

`DT_PROP(DT_PHANDLE_BY_IDX(node_id, phs, idx), prop)`
That is, prop is a property of the phandle’s node, not a property of node_id.

Example devicetree fragment:

```plaintext
n1: node-1 {
    foo = <&n2 &n3>;
};

n2: node-2 {
    bar = <42>;
};

n3: node-3 {
    baz = <43>;
};
```

Example usage:

```plaintext
#define N1 DT_NODELABEL(n1)

DT_PROP_BY_PHANDLE_IDX(N1, foo, 0, bar) // 42
DT_PROP_BY_PHANDLE_IDX(N1, foo, 1, baz) // 43
```

**Parameters**
- node_id – node identifier
- phs – lowercase-and-underscores property with type phandle, phandles, or phandle-array
- idx – logical index into phs, which must be zero if phs has type phandle
- prop – lowercase-and-underscores property of the phandle's node
Outlet of the property's value

DT_PROP_BY_PHANDLE_IDX_OR(node_id, phs, idx, prop, default_value)

Like DT_PROP_BY_PHANDLE_IDX(), but with a fallback to default_value.

If the value exists, this expands to DT_PROP_BY_PHANDLE_IDX(node_id, phs, idx, prop). The default_value parameter is not expanded in this case.

Otherwise, this expands to default_value.

Parameters

• node_id – node identifier
• phs – lowercase-and-underscores property with type phandle, phandles, or phandle-array
• idx – logical index into phs, which must be zero if phs has type phandle
• prop – lowercase-and-underscores property of the phandle's node
• default_value – a fallback value to expand to

Returns

the property's value

DT_PROP_BY_PHANDLE(node_id, ph, prop)

Get a property value from a phandle's node.

This is equivalent to DT_PROP_BY_PHANDLE_IDX(node_id, ph, 0, prop).

Parameters

• node_id – node identifier
• ph – lowercase-and-underscores property of node_id with type phandle
• prop – lowercase-and-underscores property of the phandle's node

Returns

the property's value

DT_PHA_BY_IDX(node_id, pha, idx, cell)

Get a phandle-array specifier cell value at an index.

It might help to read the argument order as being similar to node->phandle_array[index].cell. That is, the cell value is in the pha property of node_id, inside the specifier at index idx.

Example devicetree fragment:

```
gpio0: gpio@abcd1234 {
    #gpio-cells = <2>;
};
gpio1: gpio@1234abcd {
    #gpio-cells = <2>;
};
led: led_0 {
    gpios = <&gpio0 17 0x1>, <&gpio1 5 0x3>;
};
```
Bindings fragment for the gpio0 and gpio1 nodes:

```markdown
**gpio-cells:**
- pin
- flags
```

Above, gpios has two elements:

- index 0 has specifier `<17 0x1>`, so its pin cell is 17, and its flags cell is 0x1
- index 1 has specifier `<5 0x3>`, so pin is 5 and flags is 0x3

Example usage:

```c
#define LED DT_NODELABEL(led)

DT_PHA_BY_IDX(LED, gpios, 0, pin)    // 17
DT_PHA_BY_IDX(LED, gpios, 1, flags)  // 0x3
```

**Parameters**

- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type phandle-array
- `idx` – logical index into pha
- `cell` – lowercase-and-underscores cell name within the specifier at pha index `idx`

**Returns**

the cell's value

`DT_PHA_BY_IDX_OR(node_id, pha, idx, cell, default_value)`

Like `DT_PHA_BY_IDX()`, but with a fallback to `default_value`.

If the value exists, this expands to `DT_PHA_BY_IDX(node_id, pha, idx, cell)`.

Otherwise, this expands to `default_value`.

**Parameters**

- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type phandle-array
- `idx` – logical index into pha
- `cell` – lowercase-and-underscores cell name within the specifier at pha index `idx`
- `default_value` – a fallback value to expand to

**Returns**

the cell's value or `default_value`

`DT_PHA(node_id, pha, cell)`

Equivalent to `DT_PHA_BY_IDX(node_id, pha, 0, cell)`

**Parameters**

- `node_id` – node identifier
DT_PHA_OR(node_id, pha, cell, default_value)
Like DT_PHA(), but with a fallback to default_value.
If the value exists, this expands to DT_PHA(node_id, pha, cell). The default_value parameter is not expanded in this case.
Otherwise, this expands to default_value.

Parameters
• node_id – node identifier
• pha – lowercase-and-underscores property with type phandle-array
• cell – lowercase-and-underscores cell name
• default_value – a fallback value to expand to

Returns
the cell's value or default_value

DT_PHA_BY_NAME(node_id, pha, name, cell)
Get a value within a phandle-array specifier by name.
This is like DT_PHA_BY_IDX(), except it treats pha as a structure where each array element has a name.
It might help to read the argument order as being similar to node->phandle_struct.name. cell. That is, the cell value is in the pha property of node_id, treated as a data structure where each array element has a name.

Example devicetree fragment:

```
n: node {
  io-channels = &adc1, &adc2;
  io-channel-names = "SENSOR", "BANDGAP";
};
```

Bindings fragment for the “adc1” and “adc2” nodes:

```
io-channel-cells:
  - input
```

Example usage:

```
DT_PHA_BY_NAME(DT_NODELABEL(n), io_channels, sensor, input) // 10
DT_PHA_BY_NAME(DT_NODELABEL(n), io_channels, bandgap, input) // 20
```

Parameters
• node_id – node identifier
• pha – lowercase-and-underscores property with type phandle-array
• name – lowercase-and-underscores name of a specifier in pha
DT_PHA_BY_NAME_OR(node_id, pha, name, cell, default_value)

Like \textit{DT_PHA_BY_NAME()}, but with a fallback to default_value.

If the value exists, this expands to \textit{DT_PHA_BY_NAME(node_id, pha, name, cell)}. The default_value parameter is not expanded in this case.

Otherwise, this expands to default_value.

\textbf{Parameters}

- \texttt{node_id} – node identifier
- \texttt{pha} – lowercase-and-underscores property with type phandle-array
- \texttt{name} – lowercase-and-underscores name of a specifier in \texttt{pha}
- \texttt{cell} – lowercase-and-underscores cell name in the named specifier
- \texttt{default_value} – a fallback value to expand to

\textbf{Returns}

the cell's value or default_value

DT_PHANDLE_BY_NAME(node_id, pha, name)

Get a phandle's node identifier from a phandle array by name.

It might help to read the argument order as being similar to \texttt{node->phandle_struct.name}. phandle. That is, the phandle array is treated as a structure with named elements. The return value is the node identifier for a phandle inside the structure.

Example devicetree fragment:

\begin{verbatim}
adc1: adc@abcd1234 {
    foobar = "ADC_1";
};
adc2: adc@1234abcd {
    foobar = "ADC_2";
};
n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};
\end{verbatim}

Above, “io-channels” has two elements:

- the element named “SENSOR” has phandle &adc1
- the element named “BANDGAP” has phandle &adc2

Example usage:

\begin{verbatim}
#define NODE DT_NODELABEL(n)
\end{verbatim}

(continues on next page)
Notice how devicetree properties and names are lowercased, and non-alphanumeric characters are converted to underscores.

Parameters
- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type phandle-array
- `name` – lowercase-and-underscores name of an element in `pha`

Returns
- a node identifier for the node with that phandle

Get a node identifier for a phandle in a property.

When a node's value at a logical index contains a phandle, this macro returns a node identifier for the node with that phandle.

Therefore, if `prop` has type phandle, `idx` must be zero. (A phandle type is treated as a phandles with a fixed length of 1).

Example devicetree fragment:

```
n1: node-1 {
    foo = <&n2 &n3>;
};
n2: node-2 { ... };
n3: node-3 { ... };
```

Above, `foo` has type phandles and has two elements:

- index 0 has phandle `&n2`, which is `node-2`'s phandle
- index 1 has phandle `&n3`, which is `node-3`'s phandle

Example usage:

```
#define N1 DT_NODELABEL(n1)

DT_PHANDLE_BY_IDX(N1, foo, 0) // node identifier for node-2
DT_PHANDLE_BY_IDX(N1, foo, 1) // node identifier for node-3
```

Behavior is analogous for phandle-arrays.

Parameters
- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name in `node_id` with type phandle, phandles or phandle-array
- `idx` – index into `prop`

Returns
- node identifier for the node with the phandle at that index
DT_PHANDLE(node_id, prop)
   Get a node identifier for a phandle property's value.

   This is equivalent to DT_PHANDLE_BY_IDX(node_id, prop, 0). Its primary benefit is readability when prop has type phandle.

Parameters
   • node_id – node identifier
   • prop – lowercase-and-underscores property of node_id with type phandle

Returns
   a node identifier for the node pointed to by “ph"

ranges property   Use these APIs instead of Property access to access the ranges property. Because this property's semantics are defined by the devicetree specification, these macros can be used even for nodes without matching bindings. However, they take on special semantics when the node's binding indicates it is a PCIe bus node, as defined in the PCI Bus Binding to: IEEE Std 1275-1994 Standard for Boot (Initialization Configuration) Firmware

Example devicetree fragment:

```
pcie0: pcie@0 {
   compatible = "intel,pcie";
   reg = <0 1>;
   #address-cells = <3>;
   #size-cells = <2>;

   ranges = <0x1000000 0 0 0 0x3eff0000 0 0x1000>,
   <0x2000000 0x10000000 0x10000000 0x2eff0000>,
   <0x3000000 0x80 0x80 0x80 0x2eff0000>;
};
```

other: other@1 {
   reg = <1 1>;
   ranges = <0x0 0x0 0x0 0x3eff0000 0x1000>,
   <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};

Example usage:

```
DT_NUM_RANGES(DT_NODELABEL(pcie0)) // 3
DT_NUM_RANGES(DT_NODELABEL(other)) // 2
```

Parameters
node_id – node identifier

DT_RANGES_HAS_IDX(node_id, idx)

Is idx a valid range block index?

If this returns 1, then DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(node_id, idx),
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(node_id, idx) or
DT_RANGES_LENGTH_BY_IDX(node_id, idx) are valid. For
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx) the return value of
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(node_id, idx) will indicate validity. If it returns 0, it is an error to use those macros with index idx, including
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx).

Example devicetree fragment:

```
pcie0: pcie@0 {
    compatible = "intel,pcie";
    reg = <0 1>;
    #address-cells = <3>;
    #size-cells = <2>;
    ranges = <0x1000000 0 0 0x3eff0000 0 0x10000>,
             <0x2000000 0x10000000 0x10000000 0x2eff0000>,
             <0x3000000 0x80 0 0x80 0 0x80 0>;
};
other: other@1 {
    reg = <1 1>;
    ranges = <0x0 0x0 0x0x3eff0000 0x10000>,
             <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};
```

Example usage:

```
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 0) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 1) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 2) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 3) // 0
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 0) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 1) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 2) // 0
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 3) // 0
```

Parameters

• node_id – node identifier
• idx – index to check

Returns

1 if idx is a valid register block index, 0 otherwise.

DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(node_id, idx)

Does a ranges property have child bus flags at index?
If this returns 1, then `DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx)` is valid. If it returns 0, it is an error to use this macro with index `idx`. This macro only returns 1 for PCIe buses (i.e. nodes whose bindings specify they are “pcie” bus nodes.)

Example devicetree fragment:

```
parent {
    #address-cells = <2>;

    pcie0: pcie00 {
        compatible = "intel,pcie";
        reg = <0 0 1>;
        #address-cells = <3>;
        #size-cells = <2>;

        ranges = <0x1000000 0 0 0x3eff0000 0x10000>,
                 <0x2000000 0x10000000 0x10000000 0x2eff0000>,
                 <0x3000000 0x80 0x80 0x80 0x80>;
    };

    other: other@1 {
        reg = <0 1 1>;

        ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
                 <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
    };
};
```
parent {
    #address-cells = <2>;

    pcie0: pcie@0 {
        compatible = "intel,pcie";
        reg = <0 0 1>;
        #address-cells = <3>;
        #size-cells = <2>;

        ranges = <0x1000000 0 0 0 0x3eff0000 0 0x10000>,
                  <0x2000000 0x10000000 0 0x10000000 0 0x2eff0000>,
                  <0x3000000 0x80 0 0x80 0 0x80 0>;
    }
};

Example usage:

```
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x1000000
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x2000000
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x3000000
```

**Parameters**

- node_id – node identifier
- idx – logical index into the ranges array

**Returns**

range child bus flags field at idx

```
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(node_id, idx)
```

Get the ranges property child bus address at index.

When the node is a PCIe bus, the Child Bus Address has an extra cell used to store some flags, thus this cell is removed from the Child Bus Address.

Example devicetree fragments:

```
parent {
    #address-cells = <2>;

    pcie0: pcie@0 {
        compatible = "intel,pcie";
        reg = <0 0 1>;
        #address-cells = <3>;
        #size-cells = <2>;

        ranges = <0x1000000 0 0 0 0x3eff0000 0 0x10000>,
                  <0x2000000 0x10000000 0 0x10000000 0 0x2eff0000>,
                  <0x3000000 0x80 0 0x80 0 0x80 0>;
    }
};

other: other@1 {
    reg = <0 1 1>;

    ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
```
Example usage:

```c
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x10000000
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 0) // 0
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 1) // 0x10000000
```

**Parameters**

- node_id – node identifier
- idx – logical index into the ranges array

**Returns**

range child bus address field at idx

**Example usage:**

```c
5.2. Devicetree 1063
```
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x3eff0000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x10000000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 0) // 0x3eff0000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 1) // 0x10000000

Parameters

- node_id – node identifier
- idx – logical index into the ranges array

Returns

range parent bus address field at idx

DT_RANGES_LENGTH_BY_IDX(node_id, idx)
Get the ranges property length at index.

Similarly to DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(), this properly accounts for child bus flags cells when the node is a PCIe bus.

Example devicetree fragment:

```
parent {
    #address-cells = <2>;
    pcie0: pcie@0 {
        compatible = "intel,pcie";
        reg = <0 0 1>;
        #address-cells = <3>;
        #size-cells = <2>;

        ranges = <0x10000000 0 0 0x3eff0000 0x10000>,
                 <0x20000000 0x10000000 0x10000000 0x2eff0000>,
                 <0x30000000 0x80 0x80 0x80 0x80 0x80 0x80 0x80>;
    };

    other: other@1 {
        reg = <0 1 1>;

        ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
                 <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
    };
};
```

Example usage:

DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x10000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x2eff0000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(other), 0) // 0x10000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(other), 1) // 0x2eff0000

Parameters

- node_id – node identifier
• idx – logical index into the ranges array

**Returns**

range length field at idx

```
DT_FOREACH_RANGE(node_id, fn)
```

Invokes fn for each entry of node_id ranges property.

The macro fn must take two parameters, node_id which will be the node identifier of the node with the ranges property and idx the index of the ranges block.

**Example devicetree fragment:**

```c
n: node0 {
    reg = <0 01>;
    ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
        <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};
```

**Example usage:**

```c
#define RANGE_LENGTH(node_id, idx) DT_RANGES_LENGTH_BY_IDX(node_id, idx),
const uint64_t *ranges_length[] = {
    DT_FOREACH_RANGE(DT_NODELABEL(n), RANGE_LENGTH)
};
```

This expands to:

```
const char *ranges_length[] = {
    0x10000, 0x2eff0000,
};
```

**Parameters**

• node_id – node identifier

• fn – macro to invoke

**reg property** Use these APIs instead of Property access to access the reg property. Because this property's semantics are defined by the devicetree specification, these macros can be used even for nodes without matching bindings.

**group devicetree-reg-prop**

**Defines**

```
DT_NUM_REGS(node_id)
```

Get the number of register blocks in the reg property.

Use this instead of **DT_PROP_LEN(node_id, reg)**.

**Parameters**

5.2. Devicetree
• node_id – node identifier

Returns
Number of register blocks in the node’s “reg” property.

DT_REG_HAS_IDX(node_id, idx)
Is idx a valid register block index?
If this returns 1, then DT_REG_ADDR_BY_IDX(node_id, idx) or DT_REG_SIZE_BY_IDX(node_id, idx) are valid. If it returns 0, it is an error to use those macros with index idx.

Parameters
• node_id – node identifier
• idx – index to check

Returns
1 if idx is a valid register block index, 0 otherwise.

DT_REG_ADDR_BY_IDX(node_id, idx)
Get the base address of the register block at index idx.

Parameters
• node_id – node identifier
• idx – index of the register whose address to return

Returns
address of the idx-th register block

DT_REG_SIZE_BY_IDX(node_id, idx)
Get the size of the register block at index idx.
This is the size of an individual register block, not the total number of register blocks in the property; use DT_NUM_REGS() for that.

Parameters
• node_id – node identifier
• idx – index of the register whose size to return

Returns
size of the idx-th register block

DT_REG_ADDR(node_id)
Get a node’s (only) register block address.
Equivalent to DT_REG_ADDR_BY_IDX(node_id, 0).

Parameters
• node_id – node identifier

Returns
node’s register block address

DT_REG_SIZE(node_id)
Get a node’s (only) register block size.
Equivalent to DT_REG_SIZE_BY_IDX(node_id, 0).

Parameters
• node_id – node identifier

Returns
node’s only register block’s size
**DT_REG_ADDR_BY_NAME(node_id, name)**

Get a register block’s base address by name.

**Parameters**
- `node_id` – node identifier
- `name` – lowercase-and-underscores register specifier name

**Returns**
address of the register block specified by name

**DT_REG_SIZE_BY_NAME(node_id, name)**

Get a register block’s size by name.

**Parameters**
- `node_id` – node identifier
- `name` – lowercase-and-underscores register specifier name

**Returns**
size of the register block specified by name

**interrupts property**

Use these APIs instead of `Property access` to access the `interrupts` property.

Because this property’s semantics are defined by the devicetree specification, some of these macros can be used even for nodes without matching bindings. This does not apply to macros which take cell names as arguments.

**group devicetree-interrupts-prop**

**Defines**

**DT_NUM_IRQS(node_id)**

Get the number of interrupt sources for the node.

Use this instead of `DT_PROP_LEN(node_id, interrupts)`.

**Parameters**
- `node_id` – node identifier

**Returns**
Number of interrupt specifiers in the node’s “interrupts” property.

**DT_IRQ_HAS_IDX(node_id, idx)**

Is `idx` a valid interrupt index?

If this returns 1, then `DT_IRQ_BY_IDX(node_id, idx)` is valid. If it returns 0, it is an error to use that macro with this index.

**Parameters**
- `node_id` – node identifier
- `idx` – index to check

**Returns**
1 if the `idx` is valid for the interrupt property 0 otherwise.

**DT_IRQ_HAS_CELL_AT_IDX(node_id, idx, cell)**

Does an interrupts property have a named cell specifier at an index? If this returns 1, then `DT_IRQ_BY_IDX(node_id, idx, cell)` is valid. If it returns 0, it is an error to use that macro.

**Parameters**
• node_id – node identifier
• idx – index to check
• cell – named cell value whose existence to check

**Returns**
1 if the named cell exists in the interrupt specifier at index idx 0 otherwise.

`DT_IRQ_HAS_CELL(node_id, cell)`

Equivalent to `DT_IRQ_HAS_CELL_AT_IDX(node_id, 0, cell)`

**Parameters**
• node_id – node identifier
• cell – named cell value whose existence to check

**Returns**
1 if the named cell exists in the interrupt specifier at index 0 0 otherwise.

`DT_IRQ_HAS_NAME(node_id, name)`

Does an interrupts property have a named specifier value at an index? If this returns 1, then `DT_IRQ_BY_NAME(node_id, name, cell)` is valid. If it returns 0, it is an error to use that macro.

**Parameters**
• node_id – node identifier
• name – lowercase-and-underscores interrupt specifier name

**Returns**
1 if “name” is a valid named specifier 0 otherwise.

`DT_IRQ_BY_IDX(node_id, idx, cell)`

Get a value within an interrupt specifier at an index.

It might help to read the argument order as being similar to “node->interrupts[index].cell”.

This can be used to get information about an individual interrupt when a device generates more than one.

Example devicetree fragment:

```plaintext
my-serial: serial@abcd1234 {
    interrupts = < 33 0 >, < 34 1 >;
};
```

Assuming the node’s interrupt domain has “#interrupt-cells = <2>;” and the individual cells in each interrupt specifier are named “irq” and “priority” by the node’s binding, here are some examples:

```plaintext
#define SERIAL DT_NODELABEL(my_serial)
```

<table>
<thead>
<tr>
<th>Example usage</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DT_IRQ_BY_IDX(SERIAL, 0, irq)</td>
<td>33</td>
</tr>
<tr>
<td>DT_IRQ_BY_IDX(SERIAL, 0, priority)</td>
<td>0</td>
</tr>
<tr>
<td>DT_IRQ_BY_IDX(SERIAL, 1, irq)</td>
<td>34</td>
</tr>
<tr>
<td>DT_IRQ_BY_IDX(SERIAL, 1, priority)</td>
<td>1</td>
</tr>
</tbody>
</table>

**Parameters**
• node_id – node identifier
• idx – logical index into the interrupt specifier array
• cell – cell name specifier

Returns
the named value at the specifier given by the index

DT_IRQ_BY_NAME(node_id, name, cell)
Get a value within an interrupt specifier by name.
It might help to read the argument order as being similar to node->interrupts.name.cell.
This can be used to get information about an individual interrupt when a device generates
more than one, if the bindings give each interrupt specifier a name.

Parameters
• node_id – node identifier
• name – lowercase-and-underscores interrupt specifier name
• cell – cell name specifier

Returns
the named value at the specifier given by the index

DT_IRQ(node_id, cell)
Get an interrupt specifier's value Equivalent to DT_IRQ_BY_IDX(node_id, 0, cell).

Parameters
• node_id – node identifier
• cell – cell name specifier

Returns
the named value at that index

DT_IRQN(node_id)
Get a node's (only) irq number.
Equivalent to DT_IRQ(node_id, irq). This is provided as a convenience for the common case
where a node generates exactly one interrupt, and the IRQ number is in a cell named irq.

Parameters
• node_id – node identifier

Returns
the interrupt number for the node's only interrupt

For-each macros
There is currently only one “generic” for-each macro, DT_FOREACH_CHILD(), which
allows iterating over the children of a devicetree node.

There are special-purpose for-each macros, like DT_INST_FOREACH_STATUS_OKAY(), but these require
DT_DRV_COMPAT to be defined before use.

group devicetree-generic-foreach

Defines

DT_FOREACH_NODE(fn)
Invokes fn for every node in the tree.
The macro fn must take one parameter, which will be a node identifier. The macro is expanded
once for each node in the tree. The order that nodes are visited in is not specified.
Parameters
- fn – macro to invoke

DT_FOREACH_STATUS_OKAY_NODE(fn)
Invokes fn for every status okay node in the tree.
The macro fn must take one parameter, which will be a node identifier. The macro is expanded once for each node in the tree with status okay (as usual, a missing status property is treated as status okay). The order that nodes are visited in is not specified.

Parameters
- fn – macro to invoke

DT_FOREACH_CHILD(node_id, fn)
Invokes fn for each child of node_id.
The macro fn must take one parameter, which will be the node identifier of a child node of node_id.
The children will be iterated over in the same order as they appear in the final devicetree.
Example devicetree fragment:

```plaintext
n: node {
    child-1 {
        foobar = "foo";
    }
    child-2 {
        foobar = "bar";
    }
};
```

Example usage:

```c
#define FOOBAR_AND_COMMA(node_id) DT_PROP(node_id, foobar),
const char *child_foobars[] = {
    DT_FOREACH_CHILD(DT_NODELABEL(n), FOOBAR_AND_COMMA)
};
```

This expands to:

```c
const char *child_foobars[] = {
    "foo", "bar",
};
```

Parameters
- node_id – node identifier
- fn – macro to invoke

DT_FOREACH_CHILD_SEP(node_id, fn, sep)
Invokes fn for each child of node_id with a separator.
The macro fn must take one parameter, which will be the node identifier of a child node of node_id.
Example devicetree fragment:

```
node {
  child-1 {
    ...
  };
  child-2 {
    ...
  };
};
```

Example usage:

```c
const char *child_names[] = {
  DT_FOREACH_CHILD_SEP(DT_NODELABEL(n), DT_NODE_FULL_NAME, ()),
};
```

This expands to:

```c
const char *child_names[] = {
  "child-1", "child-2"
};
```

**Parameters**

- `node_id` – node identifier
- `fn` – macro to invoke
- `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

```
DT_FOREACH_CHILD_VARGS(node_id, fn, ...)
```

Invokes `fn` for each child of `node_id` with multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

The children will be iterated over in the same order as they appear in the final devicetree.

**See also:**

```
DT_FOREACH_CHILD
```

**Parameters**

- `node_id` – node identifier
- `fn` – macro to invoke
- `...` – variable number of arguments to pass to `fn`

```
DT_FOREACH_CHILD_SEP_VARGS(node_id, fn, sep, ...)
```

Invokes `fn` for each child of `node_id` with separator and multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.
See also:

\texttt{DT_FOREACH_CHILD_VARGS}

Parameters

\begin{itemize}
  \item \texttt{node\_id} – node identifier
  \item \texttt{fn} – macro to invoke
  \item \texttt{sep} – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
  \item \ldots – variable number of arguments to pass to \texttt{fn}
\end{itemize}

\texttt{DT_FOREACH_CHILD\_STATUS\_OKAY(node\_id, fn)}

Call \texttt{fn} on the child nodes with status \texttt{okay}

The macro \texttt{fn} should take one argument, which is the node identifier for the child node. As usual, both a missing status and an \texttt{ok} status are treated as \texttt{okay}.

The children will be iterated over in the same order as they appear in the final devicetree.

Parameters

\begin{itemize}
  \item \texttt{node\_id} – node identifier
  \item \texttt{fn} – macro to invoke
\end{itemize}

\texttt{DT_FOREACH_CHILD\_STATUS\_OKAY\_SEP(node\_id, fn, sep)}

Call \texttt{fn} on the child nodes with status \texttt{okay} with separator.

The macro \texttt{fn} should take one argument, which is the node identifier for the child node. As usual, both a missing status and an \texttt{ok} status are treated as \texttt{okay}.

See also:

\texttt{DT_FOREACH_CHILD\_STATUS\_OKAY}

Parameters

\begin{itemize}
  \item \texttt{node\_id} – node identifier
  \item \texttt{fn} – macro to invoke
  \item \texttt{sep} – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
\end{itemize}

\texttt{DT_FOREACH_CHILD\_STATUS\_OKAY\_VARGS(node\_id, fn, \ldots)}

Call \texttt{fn} on the child nodes with status \texttt{okay} with multiple arguments.

The macro \texttt{fn} takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller. As usual, both a missing status and an \texttt{ok} status are treated as \texttt{okay}.

The children will be iterated over in the same order as they appear in the final devicetree.

See also:

\texttt{DT_FOREACH_CHILD\_STATUS\_OKAY}
• node_id – node identifier
• fn – macro to invoke
• ... – variable number of arguments to pass to fn

DT_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS(node_id, fn, sep, ...)

Call fn on the child nodes with status okay with separator and multiple arguments.
The macro fn takes multiple arguments. The first should be the node identifier for the child
node. The remaining are passed-in by the caller.
As usual, both a missing status and an ok status are treated as okay.

See also:
DT_FOREACH_CHILD_SEP_STATUS_OKAY

Parameters
• node_id – node identifier
• fn – macro to invoke
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is
required to enable providing a comma as separator.
• ... – variable number of arguments to pass to fn

DT_FOREACH_PROP_ELEM(node_id, prop, fn)

Invokes fn for each element in the value of property prop.
The macro fn must take three parameters: fn(node_id, prop, idx). node_id and prop are the
same as what is passed to DT_FOREACH_PROP_ELEM(), and idx is the current index into the
array. The idx values are integer literals starting from 0.
Example devicetree fragment:

```
int array[] = {
    (2 * DT_PROP_BY_IDX(node_id, prop, idx)),
};
```

Example usage:

```c
#define TIMES_TWO(node_id, prop, idx) 
    (2 * DT_PROP_BY_IDX(node_id, prop, idx)),

int array[] = {
    DT_FOREACH_PROP_ELEM(DT_NODELABEL(n), my_ints, TIMES_TWO)
};
```

This expands to:

```c
int array[] = {
    (2 * 1), (2 * 2), (2 * 3),
};
```

In general, this macro expands to:

5.2. Devicetree
fn(node_id, prop, 0) fn(node_id, prop, 1) [...] fn(node_id, prop, n-1)

where \( n \) is the number of elements in \( prop \), as it would be returned by \( DT\_PROP\_LEN(node\_id, prop) \).

The \( prop \) argument must refer to a property with type string, array, uint8-array, string-array, phandles, or phandle-array. It is an error to use this macro with properties of other types.

**Parameters**
- node_id – node identifier
- prop – lowercase-and-underscores property name
- fn – macro to invoke

\( DT\_FOREACH\_PROP\_ELEM\_SEP(node\_id, prop, fn, sep) \)

Invokes \( fn \) for each element in the value of property \( prop \) with separator.

Example devicetree fragment:

```plaintext
n: node {
    my-gpios = <&gpioa 0 GPIO_ACTIVE_HIGH>,
              &gpiob 1 GPIO_ACTIVE_HIGH>;
};
```

Example usage:

```c
struct gpio_dt_spec specs[] = {
    DT_FOREACH_PROP_ELEM_SEP(DT_NODELABEL(n), my_gpios,
                              GPIO_DT_SPEC_BY_IDX, (,))
};
```

This expands as a first step to:

```c
struct gpio_dt_spec specs[] = {
    struct gpio_dt_spec specs[] = {
        GPIO_DT_SPEC_BY_IDX(DT_NODELABEL(n), my_gpios, 0),
        GPIO_DT_SPEC_BY_IDX(DT_NODELABEL(n), my_gpios, 1)
    }
};
```

The “prop” argument must refer to a property with type string, array, uint8-array, string-array, phandles, or phandle-array. It is an error to use this macro with properties of other types.

**See also:**

\( DT\_FOREACH\_PROP\_ELEM \)

**Parameters**
- node_id – node identifier
- prop – lowercase-and-underscores property name
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
DT_FOREACH_PROP_ELEM_VARGS(node_id, prop, fn, ...)
Invokes fn for each element in the value of property prop with multiple arguments.

The macro fn must take multiple parameters: fn(node_id, prop, idx, ...). node_id and prop are the same as what is passed to DT_FOREACH_PROP_ELEM(), and idx is the current index into the array. The idx values are integer literals starting from 0. The remaining arguments are passed-in by the caller.

See also:
DT_FOREACH_PROP_ELEM

Parameters
• node_id – node identifier
• prop – lowercase-and-underscores property name
• fn – macro to invoke
• ... – variable number of arguments to pass to fn

DT_FOREACH_PROP_ELEM_SEP_VARGS(node_id, prop, fn, sep, ...)
Invokes fn for each element in the value of property prop with multiple arguments and a separator.

See also:
DT_FOREACH_PROP_ELEM_VARGS

Parameters
• node_id – node identifier
• prop – lowercase-and-underscores property name
• fn – macro to invoke
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
• ... – variable number of arguments to pass to fn

DT_FOREACH_STATUS_OKAY(compat, fn)
Invokes fn for each status okay node of a compatible.

This macro expands to:
fn(node_id_1) fn(node_id_2) ... fn(node_id_n)

where each node_id_<i> is a node identifier for some node with compatible compat and status okay. Whitespace is added between expansions as shown above.

Example devicetree fragment:

```
/ {
  a {
    compatible = "foo";
    status = "okay";
  };
  b {
```

(continues on next page)
Example usage:

```c
DT_FOREACH_STATUS_OKAY(foo, DT_NODE_PATH)
```

This expands to one of the following:

```
"/a" "/c"
"/c" "/a"
```

“One of the following” is because no guarantees are made about the order that node identifiers are passed to fn in the expansion. (The /c string literal is present because a missing status property is always treated as if the status were set to okay.)

Note also that fn is responsible for adding commas, semicolons, or other terminators as needed.

**Parameters**

- **compat** – lowercase-and-underscores devicetree compatible
- **fn** – Macro to call for each enabled node. Must accept a node_id as its only parameter.

```c
DT_FOREACH_STATUS_OKAY_VARGS(compat, fn, ...)
```

Invokes fn for each status okay node of a compatible with multiple arguments.

This is like `DT_FOREACH_STATUS_OKAY()` except you can also pass additional arguments to fn.

Example devicetree fragment:

```c
/ {
    a {
        compatible = "foo";
        val = <3>;
    }
    b {
        compatible = "foo";
        val = <4>;
    }
}
```

Example usage:

```c
#define MY_FN(node_id, operator) DT_PROP(node_id, val) operator
x = DT_FOREACH_STATUS_OKAY_VARGS(foo, MY_FN, +) 0;
```
This expands to one of the following:

\[
x = 3 + 4 + 0;
\]
\[
x = 4 + 3 + 0;
\]

i.e. it sets \( x \) to 7. As with \( DT\_FOREACH\_STATUS\_OKAY() \), there are no guarantees about the order nodes appear in the expansion.

**Parameters**
- `compat` – lowercase-and-underscores devicetree compatible
- `fn` – Macro to call for each enabled node. Must accept a node_id as its only parameter.
- `...` – Additional arguments to pass to `fn`

### Existence checks
This section documents miscellaneous macros that can be used to test if a node exists, how many nodes of a certain type exist, whether a node has certain properties, etc. Some macros used for special purposes (such as \( DT\_IRQ\_HAS\_IDX() \) and all macros which require \( DT\_DRV\_COMPAT \)) are documented elsewhere on this page.

**group devicetree-generic-exist**

#### Defines

**DT\_NODE\_EXISTS(node_id)**

Does a node identifier refer to a node?

Tests whether a node identifier refers to a node which exists, i.e. is defined in the devicetree. It doesn’t matter whether or not the node has a matching binding, or what the node’s status value is. This is purely a check of whether the node exists at all.

**Parameters**
- `node_id` – a node identifier

**Returns**
- 1 if the node identifier refers to a node, 0 otherwise.

**DT\_NODE\_HAS\_STATUS(node_id, status)**

Does a node identifier refer to a node with a status?

Example uses:

```
DT\_NODE\_HAS\_STATUS(DT\_PATH(soc, i2c_12340000), okay)
DT\_NODE\_HAS\_STATUS(DT\_PATH(soc, i2c_12340000), disabled)
```

Tests whether a node identifier refers to a node which:

- exists in the devicetree, and
- has a status property matching the second argument (except that either a missing status or an ok status in the devicetree is treated as if it were okay instead)

**Parameters**

---

### 5.2. Devicetree
• node_id – a node identifier
• status – a status as one of the tokens okay or disabled, not a string

Returns
1 if the node has the given status, 0 otherwise.

DT_HAS_COMPAT_STATUS_OKAY(compat)
Does the devicetree have a status okay node with a compatible?
Test for whether the devicetree has any nodes with status okay and the given compatible. That
is, this returns 1 if and only if there is at least one node_id for which both of these expressions
return 1:

\[
\text{DT\_NODE\_HAS\_STATUS(node\_id, okay)}
\]
\[
\text{DT\_NODE\_HAS\_COMPAT(node\_id, compat)}
\]

As usual, both a missing status and an ok status are treated as okay.

Parameters
• compat – lowercase-and-underscores compatible, without quotes

Returns
1 if both of the above conditions are met, 0 otherwise

DT_NUM_INST_STATUS_OKAY(compat)
Get the number of instances of a given compatible with status okay

Parameters
• compat – lowercase-and-underscores compatible, without quotes

Returns
Number of instances with status okay

DT_NODE_HAS_COMPAT(node_id, compat)
Does a devicetree node match a compatible?
Example devicetree fragment:

```
n: node {
    compatible = "vnd,specific-device", "generic-device";
}
```

Example usages which evaluate to 1:

\[
\text{DT\_NODE\_HAS\_COMPAT(DT\_NODELABEL(n), vnd_specific_device)}
\]
\[
\text{DT\_NODE\_HAS\_COMPAT(DT\_NODELABEL(n), generic_device)}
\]

This macro only uses the value of the compatible property. Whether or not a particular com-
patible has a matching binding has no effect on its value, nor does the node’s status.

Parameters
• node_id – node identifier
• compat – lowercase-and-underscores compatible, without quotes

Returns
1 if the node’s compatible property contains compat, 0 otherwise.
DT_NODE_HAS_COMPAT_STATUS(node_id, compat, status)
Does a devicetree node have a compatible and status?
This is equivalent to:

\[(DT_{\text{NODE HAS COMPAT}}(node_id, compat) \&\& \not\! DT_{\text{NODE HAS STATUS}}(node_id, status))\]

Parameters
- node_id – node identifier
- compat – lowercase-and-underscores compatible, without quotes
- status – okay or disabled as a token, not a string

DT_NODE_HAS_PROP(node_id, prop)
Does a devicetree node have a property?
Tests whether a devicetree node has a property defined.
This tests whether the property is defined at all, not whether a boolean property is true or false. To get a boolean property's truth value, use DT_PROP(node_id, prop) instead.

Parameters
- node_id – node identifier
- prop – lowercase-and-underscores property name

Returns
1 if the node has the property, 0 otherwise.

DT_PHA_HAS_CELL_AT_IDX(node_id, pha, idx, cell)
Does a phandle array have a named cell specifier at an index?
If this returns 1, then the phandle-array property pha has a cell named cell at index idx, and therefore DT_PHA_BY_IDX(node_id,pha, idx, cell) is valid. If it returns 0, it's an error to use DT_PHA_BY_IDX() with the same arguments.

Parameters
- node_id – node identifier
- pha – lowercase-and-underscores property with type phandle-array
- idx – index to check within pha
- cell – lowercase-and-underscores cell name whose existence to check at index idx

Returns
1 if the named cell exists in the specifier at index idx, 0 otherwise.

DT_PHA.Has_CELL(node_id, pha, cell)
Equivalent to DT_PHA.Has_CELL_AT_IDX(node_id, pha, 0, cell)

Parameters
- node_id – node identifier
- pha – lowercase-and-underscores property with type phandle-array
- cell – lowercase-and-underscores cell name whose existence to check at index idx

Returns
1 if the named cell exists in the specifier at index 0, 0 otherwise.
Inter-node dependencies  The `devicetree.h` API has some support for tracking dependencies between nodes. Dependency tracking relies on a binary “depends on” relation between devicetree nodes, which is defined as the transitive closure of the following “directly depends on” relation:

- every non-root node directly depends on its parent node
- a node directly depends on any nodes its properties refer to by phandle
- a node directly depends on its `interrupt-parent` if it has an `interrupts` property

A dependency ordering of a devicetree is a list of its nodes, where each node \( n \) appears earlier in the list than any nodes that depend on \( n \). A node's dependency ordinal is then its zero-based index in that list. Thus, for two distinct devicetree nodes \( n_1 \) and \( n_2 \) with dependency ordinals \( d_1 \) and \( d_2 \), we have:

- \( d_1 \neq d_2 \)
- if \( n_1 \) depends on \( n_2 \), then \( d_1 > d_2 \)
- \( d_1 > d_2 \) does not necessarily imply that \( n_1 \) depends on \( n_2 \)

The Zephyr build system chooses a dependency ordering of the final devicetree and assigns a dependency ordinal to each node. Dependency related information can be accessed using the following macros. The exact dependency ordering chosen is an implementation detail, but cyclic dependencies are detected and cause errors, so it's safe to assume there are none when using these macros.

There are instance number-based conveniences as well; see `DT_INST_DEP_ORD()` and subsequent documentation.

```
group devicetree-dep-ord

Defines

DT_DEP_ORD(node_id)
Get a node's dependency ordinal.

Parameters
- node_id – Node identifier

Returns
the node’s dependency ordinal as an integer literal

DT_REQUIRES_DEP_ORDS(node_id)
Get a list of dependency ordinals of a node's direct dependencies.

There is a comma after each ordinal in the expansion, including the last one:

```
DT_REQUIRES_DEP_ORDS(my_node) // required_ord_1, ..., required_ord_n,
```

The one case `DT_REQUIRES_DEP_ORDS()` expands to nothing is when given the root node identifier `DT_ROOT` as argument. The root has no direct dependencies; every other node at least depends on its parent.

Parameters
- node_id – Node identifier

Returns
a list of dependency ordinals, with each ordinal followed by a comma (,), or an empty expansion

DT_SUPPORTS_DEP_ORDS(node_id)
Get a list of dependency ordinals of what depends directly on a node.

There is a comma after each ordinal in the expansion, including the last one:
DT_SUPPORTS_DEP_ORDS() may expand to nothing. This happens when node_id refers to a leaf node that nothing else depends on.

**Parameters**

- node_id – Node identifier

**Returns**

A list of dependency ordinals, with each ordinal followed by a comma (,), or an empty expansion.

DT_INST_DEP_ORD(inst)

Get a DT_DRV_COMPAT instance’s dependency ordinal.

Equivalent to DT_DEP_ORD(DT_DRV_INST(inst)).

**Parameters**

- inst – instance number

**Returns**

The instance's dependency ordinal.

DT_INSTQUIRES_DEP_ORDS(inst)

Get a list of dependency ordinals of a DT_DRV_COMPAT instance’s direct dependencies.

Equivalent to DT_REQUIRES_DEP_ORDS(DT_DRV_INST(inst)).

**Parameters**

- inst – instance number

**Returns**

A list of dependency ordinals for the nodes the instance depends on directly.

DT_INST_SUPPORTS_DEP_ORDS(inst)

Get a list of dependency ordinals of what depends directly on a DT_DRV_COMPAT instance.

Equivalent to DT_SUPPORTS_DEP_ORDS(DT_DRV_INST(inst)).

**Parameters**

- inst – instance number

**Returns**

A list of node identifiers for the nodes that depend directly on the instance.

**Bus helpers**

Zephyr's devicetree bindings language supports a bus: key which allows bindings to declare that nodes with a given compatible describe system buses. In this case, child nodes are considered to be on a bus of the given type, and the following APIs may be used.

**group devicetree-generic-bus**

**Defines**

DT_BUS(node_id)

Node's bus controller.

Get the node identifier of the node's bus controller. This can be used with DT_PROP() to get properties of the bus controller.

It is an error to use this with nodes which do not have bus controllers.
Example devicetree fragment:

```plaintext
devicetree

i2c@deadbeef {
    status = "okay";
    clock-frequency = <100000>;
    i2c_device: accelerometer@12 {
        ...
    };
};
```

Example usage:

```plaintext
DT_PROP(DT_BUS(DT_NODELABEL(i2c_device)), clock_frequency) // 100000
```

**Parameters**

- node_id – node identifier

**Returns**

a node identifier for the node's bus controller

**DT_BUS_LABEL(node_id)**

Node's bus controller's label property.

*Deprecated:*

If used to obtain a device instance with device_get_binding, consider using `DEVICE_DT_GET(DT_BUS(node))`.

**Parameters**

- node_id – node identifier

**Returns**

the label property of the node's bus controller `DT_BUS(node)`

**DT_ON_BUS(node_id, bus)**

Is a node on a bus of a given type?

Example devicetree overlay:

```plaintext
&i2c0 {
    temp: temperature-sensor@76 {
        compatible = "vnd,some-sensor";
        reg = <0x76>;
    };
};
```

Example usage, assuming i2c0 is an I2C bus controller node, and therefore temp is on an I2C bus:

```plaintext
DT_ON_BUS(DT_NODELABEL(temp), i2c) // 1
DT_ON_BUS(DT_NODELABEL(temp), spi) // 0
```
Parameters

- node_id – node identifier
- bus – lowercase-and-underscores bus type as a C token (i.e. without quotes)

Returns

1 if the node is on a bus of the given type, 0 otherwise

Instance-based APIs

These are recommended for use within device drivers. To use them, define DT_DRV_COMPAT to the lowercase-and-underscores compatible the device driver implements support for. Here is an example devicetree fragment:

```c
serial@40001000 {
    compatible = "vnd,serial";
    status = "okay";
    current-speed = <115200>;
};
```

Example usage, assuming serial@40001000 is the only enabled node with compatible vnd,serial:

```c
#define DT_DRV_COMPAT vnd_serial
DT_DRV_INST(0) // node identifier for serial@40001000
DT_INST_PROP(0, current_speed) // 115200
```

Warning: Be careful making assumptions about instance numbers. See DT_INST() for the API guarantees.

As shown above, the DT_INST_* APIs are conveniences for addressing nodes by instance number. They are almost all defined in terms of one of the Generic APIs. The equivalent generic API can be found by removing INST_ from the macro name. For example, DT_INST_PROP(inst, prop) is equivalent to DT_PROP(DT_DRV_INST(inst), prop). Similarly, DT_INST_REG_ADDR(inst) is equivalent to DT_REG_ADDR(DT_DRV_INST(inst)), and so on. There are some exceptions: DT_ANY_INST_ON_BUS_STATUS_OKAY() and DT_INST_FOREACH_STATUS_OKAY() are special-purpose helpers without straightforward generic equivalents.

Since DT_DRV_INST() requires DT_DRV_COMPAT to be defined, it's an error to use any of these without that macro defined.

Note that there are also helpers available for specific hardware; these are documented in Hardware specific APIs.

group devicetree-inst

Defines

DT_DRV_INST(inst)

Node identifier for an instance of a DT_DRV_COMPAT compatible.

Parameters

- inst – instance number

Returns

a node identifier for the node with DT_DRV_COMPAT compatible and instance number inst

5.2. Devicetree 1083
DT_INST_PARENT(inst)
Get a DT_DRV_COMPAT parent's node identifier.

See also:
DT_PARENT

Parameters
- inst – instance number

Returns
a node identifier for the instance's parent

DT_INST_GPARENT(inst)
Get a DT_DRV_COMPAT grandparent's node identifier.

See also:
DT_GPARENT

Parameters
- inst – instance number

Returns
a node identifier for the instance's grandparent

DT_INST_CHILD(inst, child)
Get a node identifier for a child node of DT_DRV_INST(inst)

See also:
DT_CHILD

Parameters
- inst – instance number
- child – lowercase-and-underscores child node name

Returns
node identifier for the node with the name referred to by ‘child’

DT_INST_FOREACH_CHILD(inst, fn)
Call fn on all child nodes of DT_DRV_INST(inst).
The macro fn should take one argument, which is the node identifier for the child node. The children will be iterated over in the same order as they appear in the final devicetree.

See also:
DT_FOREACH_CHILD

Parameters
- inst – instance number
- fn – macro to invoke on each child node identifier
DT_INST_FOREACH_CHILD_SEP (inst, fn, sep)

Call fn on all child nodes of DT_DRV_INST(inst) with a separator.

The macro fn should take one argument, which is the node identifier for the child node.

See also:

DT_FOREACH_CHILD_SEP

Parameters

- inst – instance number
- fn – macro to invoke on each child node identifier
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_INST_FOREACH_CHILD_VARGS (inst, fn, ...)

Call fn on all child nodes of DT_DRV_INST(inst).

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

The children will be iterated over in the same order as they appear in the final devicetree.

See also:

DT_FOREACH_CHILD

Parameters

- inst – instance number
- fn – macro to invoke on each child node identifier
- ... – variable number of arguments to pass to fn

DT_INST_FOREACH_CHILD_SEP_VARGS (inst, fn, sep, ...)

Call fn on all child nodes of DT_DRV_INST(inst) with separator.

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also:

DT_FOREACH_CHILD_SEP_VARGS

Parameters

- inst – instance number
- fn – macro to invoke on each child node identifier
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- ... – variable number of arguments to pass to fn
DT_INST_FOREACH_CHILD_STATUS_OKAY(inst, fn)
Call fn on all child nodes of DT_DRV_INST(inst) with status okay.
The macro fn should take one argument, which is the node identifier for the child node.

See also:
DT_FOREACH_CHILD_STATUS_OKAY

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier

DT_INST_FOREACH_CHILD_STATUS_OKAY_SEP(inst, fn, sep)
Call fn on all child nodes of DT_DRV_INST(inst) with status okay and with separator.
The macro fn should take one argument, which is the node identifier for the child node.

See also:
DT_FOREACH_CHILD_STATUS_OKAY_SEP

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_INST_FOREACH_CHILD_STATUS_OKAY_VARGS(inst, fn, ...)
Call fn on all child nodes of DT_DRV_INST(inst) with status okay and multiple arguments.
The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also:
DT_FOREACH_CHILD_STATUS_OKAY_VARGS

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier
• ... – variable number of arguments to pass to fn

DT_INST_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS(inst, fn, sep, ...)
Call fn on all child nodes of DT_DRV_INST(inst) with status okay and with separator and multiple arguments.
The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also:
DT_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS
Parameters
- inst – instance number
- fn – macro to invoke on each child node identifier
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- ... – variable number of arguments to pass to fn

DT_INST_ENUM_IDX(inst, prop)
Get a DT_DRV_COMPAT value's index into its enumeration values.

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name

Returns
zero-based index of the property's value in its enum: list

DT_INST_ENUM_IDX_OR(inst, prop, default_idx_value)
Like DT_INST_ENUM_IDX(), but with a fallback to a default enum index.

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name
- default_idx_value – a fallback index value to expand to

Returns
zero-based index of the property's value in its enum if present, default_idx_value otherwise

DT_INST_PROP(inst, prop)
Get a DT_DRV_COMPAT instance property.

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name

Returns
a representation of the property's value

DT_INST_PROP_LEN(inst, prop)
Get a DT_DRV_COMPAT property length.

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name

Returns
logical length of the property

DT_INST_PROP_HAS_IDX(inst, prop, idx)
Is index idx valid for an array type property on a DT_DRV_COMPAT instance?

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name
• idx – index to check

**Returns**
1 if idx is a valid index into the given property, 0 otherwise.

\[ \text{DT_INST_PROP_HAS_NAME}(\text{inst}, \text{prop}, \text{name}) \]

Is name \text{name} available in a foo-names property?

**Parameters**
- inst – instance number
- prop – a lowercase-and-underscores prop-names type property
- name – a lowercase-and-underscores name to check

**Returns**
An expression which evaluates to 1 if \text{name} is an available name into the given property, and 0 otherwise.

\[ \text{DT_INST_PROP_BY_IDX}(\text{inst}, \text{prop}, \text{idx}) \]

Get a DT_DRV_COMPAT element value in an array property.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name
- idx – the index to get

**Returns**
a representation of the idx-th element of the property

\[ \text{DT_INST_PROP_OR}(\text{inst}, \text{prop}, \text{default_value}) \]

Like \text{DT_INST_PROP()}, but with a fallback to default_value.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property name
- default_value – a fallback value to expand to

**Returns**
\text{DT_INST_PROP}(\text{inst}, \text{prop}) or \text{default_value}

\[ \text{DT_INST_LABEL}(\text{inst}) \]

Get a DT_DRV_COMPAT instance’s label property.

**Deprecated:**
Use \text{DT_INST_PROP}(\text{inst}, \text{label})

**Parameters**
- inst – instance number

**Returns**
instance’s label property value

\[ \text{DT_INST_STRING_TOKEN}(\text{inst}, \text{prop}) \]

Get a DT_DRV_COMPAT instance’s string property’s value as a token.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property string name

**Returns**

the value of prop as a token, i.e. without any quotes and with special characters converted to underscores

`DT_INST_STRING_UPPER_TOKEN(inst, prop)`

Like `DT_INST_STRING_TOKEN()`, but uppercased.

**Parameters**

- inst – instance number
- prop – lowercase-and-underscores property string name

**Returns**

the value of prop as an uppercased token, i.e. without any quotes and with special characters converted to underscores

`DT_INST_STRING_TOKEN_BY_IDX(inst, prop, idx)`

Get an element out of string-array property as a token.

**Parameters**

- inst – instance number
- prop – lowercase-and-underscores property string name
- idx – the index to get

**Returns**

the element in prop at index idx as a token

`DT_INST_STRING_UPPER_TOKEN_BY_IDX(inst, prop, idx)`

Like `DT_INST_STRING_TOKEN_BY_IDX()`, but uppercased.

**Parameters**

- inst – instance number
- prop – lowercase-and-underscores property string name
- idx – the index to get

**Returns**

the element in prop at index idx as an uppercased token

`DT_INST_PROP_BY_PHANDLE(inst, ph, prop)`

Get a DT_DRV_COMPAT instance's property value from a phandle's node.

**Parameters**

- inst – instance number
- ph – lowercase-and-underscores property of inst with type phandle
- prop – lowercase-and-underscores property of the phandle's node

**Returns**

the value of prop as described in the `DT_PROP()` documentation

`DT_INST_PROP_BY_PHANDLE_IDX(inst, phs, idx, prop)`

Get a DT_DRV_COMPAT instance's property value from a phandle in a property.

**Parameters**

- inst – instance number
- phs – lowercase-and-underscores property with type phandle, phandles, or phandle-array
• \( idx \) – logical index into “phs”, which must be zero if “phs” has type phandle
• \( prop \) – lowercase-and-underscores property of the phandle’s node

Returns
the value of \( prop \) as described in the \textit{DT_PROP()} documentation

\texttt{DT_INST_PHA_BY_IDX(inst, pha, idx, cell)}
Get a \texttt{DT_DRV_COMPAT} instance’s phandle-array specifier value at an index.

Parameters
• \( inst \) – instance number
• \( pha \) – lowercase-and-underscores property with type phandle-array
• \( idx \) – logical index into the property \( pha \)
• \( cell \) – binding’s cell name within the specifier at index \( idx \)

Returns
the value of the cell inside the specifier at index \( idx \)

\texttt{DT_INST_PHA_BY_IDX_OR(inst, pha, idx, cell, default_value)}
Like \texttt{DT_INST_PHA_BY_IDX()}, but with a fallback to \texttt{default_value}.

Parameters
• \( inst \) – instance number
• \( pha \) – lowercase-and-underscores property with type phandle-array
• \( idx \) – logical index into the property \( pha \)
• \( cell \) – binding’s cell name within the specifier at index \( idx \)
• \( default\_value \) – a fallback value to expand to

Returns
\( \texttt{DT_INST_PHA_BY_IDX(inst, pha, idx, cell)} \) or \texttt{default\_value}

\texttt{DT_INST_PHA(inst, pha, cell)}
Get a \texttt{DT_DRV_COMPAT} instance’s phandle-array specifier value Equivalent to
\texttt{DT_INST_PHA_BY_IDX(inst, pha, 0, cell)}

Parameters
• \( inst \) – instance number
• \( pha \) – lowercase-and-underscores property with type phandle-array
• \( cell \) – binding’s cell name for the specifier at pha index 0

Returns
the cell value

\texttt{DT_INST_PHA_OR(inst, pha, cell, default_value)}
Like \texttt{DT_INST_PHA()}, but with a fallback to \texttt{default\_value}.

Parameters
• \( inst \) – instance number
• \( pha \) – lowercase-and-underscores property with type phandle-array
• \( cell \) – binding’s cell name for the specifier at pha index 0
• \( default\_value \) – a fallback value to expand to

Returns
\( \texttt{DT_INST_PHA(inst, pha, cell)} \) or \texttt{default\_value}
DT_INST_PHA_BY_NAME(inst, pha, name, cell)
Get a DT_DRV_COMPAT instance's value within a phandle-array specifier by name.

Parameters
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- name – lowercase-and-underscores name of a specifier in pha
- cell – binding's cell name for the named specifier

Returns
the cell value

DT_INST_PHA_BY_NAME_OR(inst, pha, name, cell, default_value)
Like DT_INST_PHA_BY_NAME(), but with a fallback to default_value.

Parameters
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- name – lowercase-and-underscores name of a specifier in pha
- cell – binding's cell name for the named specifier
- default_value – a fallback value to expand to

Returns
DT_INST_PHA_BY_NAME(inst, pha, name, cell) or default_value

DT_INST_PHANDLE_BY_NAME(inst, pha, name)
Get a DT_DRV_COMPAT instance's phandle node identifier from a phandle array by name.

Parameters
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- name – lowercase-and-underscores name of an element in pha

Returns
node identifier for the phandle at the element named “name”

DT_INST_PHANDLE_BY_IDX(inst, prop, idx)
Get a DT_DRV_COMPAT instance's node identifier for a phandle in a property.

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name in inst with type phandle, phandles or phandle-array
- idx – index into prop

Returns
a node identifier for the phandle at index idx in prop

DT_INST_PHANDLE(inst, prop)
Get a DT_DRV_COMPAT instance's node identifier for a phandle property's value.

Parameters
- inst – instance number
- prop – lowercase-and-underscores property of inst with type phandle
Returns
a node identifier for the node pointed to by “ph”

\texttt{DT\_INST\_REG\_HAS\_IDX}(\texttt{inst}, \texttt{idx})
is \texttt{idx} a valid register block index on a \texttt{DT\_DRV\_COMPAT} instance?

\textbf{Parameters}
- \texttt{inst} – instance number
- \texttt{idx} – index to check

\textbf{Returns}
1 if \texttt{idx} is a valid register block index, 0 otherwise.

\texttt{DT\_INST\_REG\_ADDR\_BY\_IDX}(\texttt{inst}, \texttt{idx})
Get a \texttt{DT\_DRV\_COMPAT} instance’s \texttt{idx}-th register block’s address.

\textbf{Parameters}
- \texttt{inst} – instance number
- \texttt{idx} – index of the register whose address to return

\textbf{Returns}
address of the instance’s \texttt{idx}-th register block

\texttt{DT\_INST\_REG\_SIZE\_BY\_IDX}(\texttt{inst}, \texttt{idx})
Get a \texttt{DT\_DRV\_COMPAT} instance’s \texttt{idx}-th register block’s size.

\textbf{Parameters}
- \texttt{inst} – instance number
- \texttt{idx} – index of the register whose size to return

\textbf{Returns}
size of the instance’s \texttt{idx}-th register block

\texttt{DT\_INST\_REG\_ADDR\_BY\_NAME}(\texttt{inst}, \texttt{name})
Get a \texttt{DT\_DRV\_COMPAT}’s register block address by name.

\textbf{Parameters}
- \texttt{inst} – instance number
- \texttt{name} – lowercase-and-underscores register specifier name

\textbf{Returns}
address of the register block with the given \texttt{name}

\texttt{DT\_INST\_REG\_SIZE\_BY\_NAME}(\texttt{inst}, \texttt{name})
Get a \texttt{DT\_DRV\_COMPAT}’s register block size by name.

\textbf{Parameters}
- \texttt{inst} – instance number
- \texttt{name} – lowercase-and-underscores register specifier name

\textbf{Returns}
size of the register block with the given \texttt{name}

\texttt{DT\_INST\_REG\_ADDR}(\texttt{inst})
Get a \texttt{DT\_DRV\_COMPAT}’s (only) register block address.

\textbf{Parameters}
- \texttt{inst} – instance number
Returns
instance's register block address

DT_INST_REG_SIZE(inst)
Get a DT_DRV_COMPAT's (only) register block size.

Parameters
• inst – instance number

Returns
instance's register block size

DT_INST_IRQ_BY_IDX(inst, idx, cell)
Get a DT_DRV_COMPAT interrupt specifier value at an index.

Parameters
• inst – instance number
• idx – logical index into the interrupt specifier array
• cell – cell name specifier

Returns
the named value at the specifier given by the index

DT_INST_IRQ_BY_NAME(inst, name, cell)
Get a DT_DRV_COMPAT interrupt specifier value by name.

Parameters
• inst – instance number
• name – lowercase-and-underscores interrupt specifier name
• cell – cell name specifier

Returns
the named value at the specifier given by the index

DT_INST_IRQ(inst, cell)
Get a DT_DRV_COMPAT interrupt specifier's value.

Parameters
• inst – instance number
• cell – cell name specifier

Returns
the named value at that index

DT_INST_IRQN(inst)
Get a DT_DRV_COMPAT's (only) irq number.

Parameters
• inst – instance number

Returns
the interrupt number for the node's only interrupt

DT_INST_BUS(inst)
Get a DT_DRV_COMPAT's bus node identifier.

Parameters
• inst – instance number
Returns
node identifier for the instance's bus node

DT_INST_BUS_LABEL(inst)
Get a DT_DRV_COMPAT's bus node's label property.

Deprecated:
If used to obtain a device instance with device_get_binding, consider using DEVICE_DT_GET(DT_INST_BUS(inst)).

Parameters
• inst – instance number

Returns
the label property of the instance's bus controller

DT_INST_ON_BUS(inst, bus)
Test if a DT_DRV_COMPAT's bus type is a given type.

Parameters
• inst – instance number
• bus – a binding’s bus type as a C token, lowercased and without quotes

Returns
1 if the given instance is on a bus of the given type, 0 otherwise

DT_INST_STRING_TOKEN_OR(inst, name, default_value)
Like DT_INST_STRING_TOKEN(), but with a fallback to default_value.

Parameters
• inst – instance number
• name – lowercase-and-underscores property name
• default_value – a fallback value to expand to

Returns
if prop exists, its value as a token, i.e. without any quotes and with special characters converted to underscores. Otherwise default_value

DT_INST_STRING_UPPER_TOKEN_OR(inst, name, default_value)
Like DT_INST_STRING_UPPER_TOKEN(), but with a fallback to default_value.

Parameters
• inst – instance number
• name – lowercase-and-underscores property name
• default_value – a fallback value to expand to

Returns
the property's value as an uppercased token, or default_value

DT_ANY_INST_ON_BUS_STATUS_OKAY(bus)
Test if any DT_DRV_COMPAT node is on a bus of a given type and has status okay.

This is a special-purpose macro which can be useful when writing drivers for devices which can appear on multiple buses. One example is a sensor device which may be wired on an I2C or SPI bus.

Example devicetree overlay:
Example usage, assuming \texttt{i2c0} is an I2C bus controller node, and therefore \texttt{temp} is on an I2C bus:

```c
#define DT_DRV_COMPAT vnd_some_sensor
DT_ANY_INST_ON_BUS_STATUS_OKAY(i2c) // 1
```

**Parameters**
- \texttt{bus} – a binding’s bus type as a C token, lowercased and without quotes

**Returns**
1 if any enabled node with that compatible is on that bus type, 0 otherwise

```
DT_INST_FOREACH_STATUS_OKAY(fn)
```

Call \texttt{fn} on all nodes with compatible \texttt{DT_DRV_COMPAT} and status \texttt{okay}

This macro calls \texttt{fn(inst)} on each \texttt{inst} number that refers to a node with status \texttt{okay}. Whitespace is added between invocations.

Example devicetree fragment:

```c
a {
    compatible = "vnd,device";
    status = "okay";
    foobar = "DEV_A";
};

b {
    compatible = "vnd,device";
    status = "okay";
    foobar = "DEV_B";
};

c {
    compatible = "vnd,device";
    status = "disabled";
    foobar = "DEV_C";
};
```

Example usage:

```c
#define DT_DRV_COMPAT vnd_device
#define MY_FN(inst) DT_INST_PROP(inst, foobar),
DT_INST_FOREACH_STATUS_OKAY(MY_FN)
```
This expands to:

```
MY_FN(0) MY_FN(1)
```

and from there, to either this:

```
"DEV_A", "DEV_B",
```

or this:

```
"DEV_B", "DEV_A",
```

No guarantees are made about the order that a and b appear in the expansion.

Note that \texttt{fn} is responsible for adding commas, semicolons, or other separators or terminators.

Device drivers should use this macro whenever possible to instantiate a struct device for each enabled node in the devicetree of the driver's compatible \texttt{DT_DRV_COMPAT}.

**Parameters**

- \texttt{fn} – Macro to call for each enabled node. Must accept an instance number as its only parameter.

\texttt{DT_INST_FOREACH_STATUS_OKAY_VARGS(fn, ...)}

Call \texttt{fn} on all nodes with compatible \texttt{DT_DRV_COMPAT} and status \texttt{okay} with multiple arguments.

**See also:**

\texttt{DT_INST_FOREACH_STATUS_OKAY}

**Parameters**

- \texttt{fn} – Macro to call for each enabled node. Must accept an instance number as its only parameter.

\texttt{DT_INST_FOREACH_PROP_ELEM(inst, prop, fn)}

Invokes \texttt{fn} for each element of property \texttt{prop} for a \texttt{DT_DRV_COMPAT} instance.

Equivalent to \texttt{DT_FOREACH_PROP_ELEM(DT_DRV_INST(inst), prop, fn)}.

**Parameters**

- \texttt{inst} – instance number
- \texttt{prop} – lowercase-and-underscores property name
- \texttt{fn} – macro to invoke

\texttt{DT_INST_FOREACH_PROP_ELEM_SEP(inst, prop, fn, sep)}

Invokes \texttt{fn} for each element of property \texttt{prop} for a \texttt{DT_DRV_COMPAT} instance with a separator.

Equivalent to \texttt{DT_FOREACH_PROP_ELEM_SEP(DT_DRV_INST(inst), prop, fn, sep)}.

**Parameters**

- \texttt{inst} – instance number
- \texttt{prop} – lowercase-and-underscores property name
- \texttt{fn} – macro to invoke
- \texttt{sep} – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
DT_INST_FOREACH_PROP_ELEM_VARGS (inst, prop, fn, ...)  
Invokes fn for each element of property prop for a DT_DRV_COMPAT instance with multiple arguments.

Equivalent to DT_FOREACH_PROP_ELEM_VARGS(DT_DRV_INST (inst), prop, fn, VA_ARGS)

See also:
DT_INST_FOREACH_PROP_ELEM

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name
- fn – macro to invoke
- ... – variable number of arguments to pass to fn

DT_INST_FOREACH_PROP_ELEM_SEP_VARGS (inst, prop, fn, sep, ...)  
Invokes fn for each element of property prop for a DT_DRV_COMPAT instance with multiple arguments and a separator.

Equivalent to DT_FOREACH_PROP_ELEM_SEP_VARGS(DT_DRV_INST (inst), prop, fn, sep, VA_ARGS)

See also:
DT_INST_FOREACH_PROP_ELEM

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- ... – variable number of arguments to pass to fn

DT_INST_NODE_HAS_PROP (inst, prop)  
Does a DT_DRV_COMPAT instance have a property?

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name

Returns
1 if the instance has the property, 0 otherwise.

DT_INST_PHA_HAS_CELL_AT_IDX (inst, pha, idx, cell)  
Does a phandle array have a named cell specifier at an index for a DT_DRV_COMPAT instance?

Parameters
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- idx – index to check
• cell – named cell value whose existence to check

**Returns**
1 if the named cell exists in the specifier at index idx, 0 otherwise.

**DT_INST_PHA_HAS_CELL**(inst, pha, cell)

Does a phandle array have a named cell specifier at index 0 for a **DT_DRV_COMPAT** instance?

**Parameters**
• inst – instance number
• pha – lowercase-and-underscores property with type phandle-array
• cell – named cell value whose existence to check

**Returns**
1 if the named cell exists in the specifier at index 0, 0 otherwise.

**DT_INST_IRQ_HAS_IDX**(inst, idx)

is index valid for interrupt property on a **DT_DRV_COMPAT** instance?

**Parameters**
• inst – instance number
• idx – logical index into the interrupt specifier array

**Returns**
1 if the idx is valid for the interrupt property 0 otherwise.

**DT_INST_IRQ_HAS_CELL_AT_IDX**(inst, idx, cell)

Does a **DT_DRV_COMPAT** instance have an interrupt named cell specifier?

**Parameters**
• inst – instance number
• idx – index to check
• cell – named cell value whose existence to check

**Returns**
1 if the named cell exists in the interrupt specifier at index idx 0 otherwise.

**DT_INST_IRQ_HAS_CELL**(inst, cell)

Does a **DT_DRV_COMPAT** instance have an interrupt value?

**Parameters**
• inst – instance number
• cell – named cell value whose existence to check

**Returns**
1 if the named cell exists in the interrupt specifier at index 0 0 otherwise.

**DT_INST_IRQ_HAS_NAME**(inst, name)

Does a **DT_DRV_COMPAT** instance have an interrupt value?

**Parameters**
• inst – instance number
• name – lowercase-and-underscores interrupt specifier name

**Returns**
1 if name is a valid named specifier
Hardware specific APIs  The following APIs can also be used by including `<devicetree.h>`; no additional include is needed.

**CAN**  These conveniences may be used for nodes which describe CAN controllers/transceivers, and properties related to them.

```c

group devicetree-can

Defines

DT_CAN_TRANSCEIVER_MAX_BITRATE(node_id, max)

Get the maximum transceiver bitrate for a CAN controller.

The bitrate will be limited to the maximum bitrate supported by the CAN controller. If no CAN transceiver is present in the devicetree, the maximum bitrate will be that of the CAN controller.

Example devicetree fragment:

```c
transceiver0: can-phy0 {
    compatible = "vnd,can-transceiver";
    max-bitrate = <1000000>;
    #phy-cells = <0>;
};
can0: can@... {
    compatible = "vnd,can-controller";
    phys = <&transceiver0>;
};
can1: can@... {
    compatible = "vnd,can-controller";

    can-transceiver {
        max-bitrate = <2000000>;
    }
};
```

Example usage:

```c
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can0), 5000000) // 1000000
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can1), 5000000) // 2000000
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can1), 1000000) // 1000000
```

Parameters

- `node_id` – node identifier
- `max` – maximum bitrate supported by the CAN controller

Returns

the maximum bitrate supported by the CAN controller/transceiver combination

```c

DT_INST_CAN_TRANSCEIVER_MAX_BITRATE(inst, max)

Get the maximum transceiver bitrate for a DT_DRV_COMPAT CAN controller.
```
See also:

DT_CAN_TRANSCEIVER_MAX_BITRATE()

Parameters

- \texttt{inst} – DT_DRV_COMPAT instance number
- \texttt{max} – maximum bitrate supported by the CAN controller

Returns

the maximum bitrate supported by the CAN controller/transceiver combination

Clocks

These conveniences may be used for nodes which describe clock sources, and properties related to them.

group devicetree-clocks

Defines

\texttt{DT_CLOCKS_HAS_IDX(node\_id, idx)}

Test if a node has a clocks phandle-array property at a given index.

This expands to 1 if the given index is valid clocks property phandle-array index. Otherwise, it expands to 0.

Example devicetree fragment:

```c
n1: node-1 {
    clocks = <...>, <...>;
};
n2: node-2 {
    clocks = <...>;
};
```

Example usage:

\texttt{DT_CLOCKS_HAS_IDX(DT_NODELABEL(n1), 0) // 1}
\texttt{DT_CLOCKS_HAS_IDX(DT_NODELABEL(n1), 1) // 1}
\texttt{DT_CLOCKS_HAS_IDX(DT_NODELABEL(n1), 2) // 0}
\texttt{DT_CLOCKS_HAS_IDX(DT_NODELABEL(n2), 1) // 0}

Parameters

- \texttt{node\_id} – node identifier; may or may not have any clocks property
- \texttt{idx} – index of a clocks property phandle-array whose existence to check

Returns

1 if the index exists, 0 otherwise

\texttt{DT_CLOCKS_HAS_NAME(node\_id, name)}

Test if a node has a clock-names array property holds a given name.

This expands to 1 if the name is available as clocks-name array property cell. Otherwise, it expands to 0.

Example devicetree fragment:
n1: node-1 {
  clocks = <...>, <...>;
  clock-names = "alpha", "beta";
};

n2: node-2 {
  clocks = <...>;
  clock-names = "alpha";
};

Example usage:

DT_CLOCKS_HAS_NAME(DT_NODELABEL(n1), alpha) // 1
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n1), beta) // 1
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n2), beta) // 0

Parameters

• node_id – node identifier; may or may not have any clock-names property.

• name – lowercase-and-underscores clock-names cell value name to check

Returns

1 if the clock name exists, 0 otherwise

DT_NUM_CLOCKS(node_id)

Get the number of elements in a clocks property.

Example devicetree fragment:

n1: node-1 {
  clocks = <&foo>, <&bar>;
};

n2: node-2 {
  clocks = <&foo>;
};

Example usage:

DT_NUM_CLOCKS(DT_NODELABEL(n1)) // 2
DT_NUM_CLOCKS(DT_NODELABEL(n2)) // 1

Parameters

• node_id – node identifier with a clocks property

Returns

number of elements in the property

DT_CLOCKS_CTLR_BY_IDX(node_id, idx)

Get the node identifier for the controller phandle from a “clocks” phandle-array property at an index.

Example devicetree fragment:

clk1: clock-controller@... { ... };

clk2: clock-controller@... { ... };

(continues on next page)
Example usage:

```c
DT_CLOCKS_CTLR_BY_IDX(DT_NODELABEL(n), 0)) // DT_NODELABEL(clk1)
DT_CLOCKS_CTLR_BY_IDX(DT_NODELABEL(n), 1)) // DT_NODELABEL(clk2)
```

See also:

`DT_PHANDLE_BY_IDX()`

**Parameters**

- `node_id` – node identifier
- `idx` – logical index into “clocks”

**Returns**

the node identifier for the clock controller referenced at index “idx”

\[DT_CLOCKS_CTLR(node_id)\]

Equivalent to `DT_CLOCKS_CTLR_BY_IDX(node_id, 0)`

See also:

`DT_CLOCKS_CTLR_BY_IDX()`

**Parameters**

- `node_id` – node identifier

**Returns**

a node identifier for the clocks controller at index 0 in “clocks”

\[DT_CLOCKS_CTLR_BY_NAME(node_id, name)\]

Get the node identifier for the controller phandle from a clocks phandle-array property by name.

Example devicetree fragment:

```c
clk1: clock-controller@... {
};

clock2: clock-controller@... {
};

n: node {
    clocks = <&clk1 10 20>, <&clk2 30 40>;
    clock-names = "alpha", "beta";
};
```

Example usage:

```c
DT_CLOCKS_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(clk2)
```

See also:

`DT_PHANDLE_BY_NAME()`

**Parameters**
• node_id – node identifier
• name – lowercase-and-underscores name of a clocks element as defined by the
  node’s clock-names property

**Returns**
the node identifier for the clock controller referenced by name

\[\text{DT\_CLOCKS\_CELL\_BY\_IDX}(\text{node\_id}, \text{idx}, \text{cell})\]
Get a clock specifier’s cell value at an index.

Example devicetree fragment:

```plaintext
clk1: clock-controller@... {
    compatible = "vnd,clock";
    #clock-cells = < 2 >;
};

n: node {
    clocks = < &clk1 10 20 >, < &clk1 30 40 >;
};
```

Bindings fragment for the vnd,clock compatible:

```plaintext
clock-cells:
- bus
- bits
```

Example usage:

```
DT\_CLOCKS\_CELL\_BY\_IDX(DT\_NODELABEL(n), 0, bus) // 10
DT\_CLOCKS\_CELL\_BY\_IDX(DT\_NODELABEL(n), 1, bits) // 40
```

**See also:**

`DT\_PHA\_BY\_IDX()`

**Parameters**

• node_id – node identifier for a node with a clocks property
• idx – logical index into clocks property
• cell – lowercase-and-underscores cell name

**Returns**
the cell value at index “idx”

\[\text{DT\_CLOCKS\_CELL\_BY\_NAME}(\text{node\_id}, \text{name}, \text{cell})\]
Get a clock specifier’s cell value by name.

Example devicetree fragment:

```plaintext
clk1: clock-controller@... {
    compatible = "vnd,clock";
    #clock-cells = < 2 >;
};

n: node {
    clocks = < &clk1 10 20 >, < &clk1 30 40 >;
    clock-names = "alpha", "beta";
};
```
Bindings fragment for the vnd,clock compatible:

```yaml
clock-cells:
  - bus
  - bits
```

Example usage:

```c
DT_CLOCKS_CELL_BY_NAME(DT_NODELABEL(n), alpha, bus) // 10
DT_CLOCKS_CELL_BY_NAME(DT_NODELABEL(n), beta, bits) // 40
```

See also:

`DT_PHA_BY_NAME()`

**Parameters**

- `node_id` – node identifier for a node with a clocks property
- `name` – lowercase-and-underscores name of a clocks element as defined by the node's clock-names property
- `cell` – lowercase-and-underscores cell name

**Returns**

the cell value in the specifier at the named element

`DT_CLOCKS_CELL(node_id, cell)`
Equivalent to `DT_CLOCKS_CELL_BY_IDX(node_id, 0, cell)`

See also:

`DT_CLOCKS_CELL_BY_IDX()`

**Parameters**

- `node_id` – node identifier for a node with a clocks property
- `cell` – lowercase-and-underscores cell name

**Returns**

the cell value at index 0

`DT_INST_CLOCKS_HAS_IDX(inst, idx)`
Equivalent to `DT_CLOCKS_HAS_IDX(DT_DRV_INST(inst), idx)`

**Parameters**

- `inst` – DT_DRV_COMPAT instance number; may or may not have any clocks property
- `idx` – index of a clocks property phandle-array whose existence to check

**Returns**

1 if the index exists, 0 otherwise

`DT_INST_CLOCKS_HAS_NAME(inst, name)`
Equivalent to `DT_CLOCK_HAS_NAME(DT_DRV_INST(inst), name)`

**Parameters**

- `inst` – DT_DRV_COMPAT instance number; may or may not have any clock-names property.
- `name` – lowercase-and-underscores clock-names cell value name to check
Returns
1 if the clock name exists, 0 otherwise

\texttt{DT\_INST\_NUM\_CLOCKS} (\texttt{inst})
Equivalent to \texttt{DT\_NUM\_CLOCKS(DT\_DRV\_INST(\texttt{inst}))}

Parameters
\begin{itemize}
\item \texttt{inst} – instance number
\end{itemize}

Returns
number of elements in the clocks property

\texttt{DT\_INST\_CLOCKS\_CTLR\_BY\_IDX} (\texttt{inst, idx})
Get the node identifier for the controller phandle from a “clocks” phandle-array property at an index.

See also:

\texttt{DT\_CLOCKS\_CTLR\_BY\_IDX()}

Parameters
\begin{itemize}
\item \texttt{inst} – instance number
\item \texttt{idx} – logical index into “clocks”
\end{itemize}

Returns
the node identifier for the clock controller referenced at index “idx”

\texttt{DT\_INST\_CLOCKS\_CTLR} (\texttt{inst})
Equivalent to \texttt{DT\_INST\_CLOCKS\_CTLR\_BY\_IDX(\texttt{inst, 0})}

See also:

\texttt{DT\_CLOCKS\_CTLR()}

Parameters
\begin{itemize}
\item \texttt{inst} – instance number
\end{itemize}

Returns
a node identifier for the clocks controller at index 0 in “clocks”

\texttt{DT\_INST\_CLOCKS\_CTLR\_BY\_NAME} (\texttt{inst, name})
Get the node identifier for the controller phandle from a clocks phandle-array property by name.

See also:

\texttt{DT\_CLOCKS\_CTLR\_BY\_NAME()}

Parameters
\begin{itemize}
\item \texttt{inst} – instance number
\item \texttt{name} – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property
\end{itemize}

Returns
the node identifier for the clock controller referenced by the named element
DT_INST_CLOCKS_CELL_BY_IDX(inst, idx, cell)
Get a DT_DRV_COMPAT instance's clock specifier's cell value at an index.

See also:
DT_CLOCKS_CELL_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into clocks property
• cell – lowercase-and-underscores cell name

Returns
the cell value at index “idx”

DT_INST_CLOCKS_CELL_BY_NAME(inst, name, cell)
Get a DT_DRV_COMPAT instance's clock specifier's cell value by name.

See also:
DT_CLOCKS_CELL_BY_NAME()

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a clocks element as defined by the node's clock-names property
• cell – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_INST_CLOCKS_CELL(inst, cell)
Equivalent to DT_INST_CLOCKS_CELL_BY_IDX(inst, 0, cell)

Parameters
• inst – DT_DRV_COMPAT instance number
• cell – lowercase-and-underscores cell name

Returns
the value of the cell inside the specifier at index 0

DMA These conveniences may be used for nodes which describe direct memory access controllers or channels, and properties related to them.

group devicetree-dmas

Defines
DT_DMAS_CTLR_BY_IDX(node_id, idx)

Get the node identifier for the DMA controller from a dmas property at an index.

Example devicetree fragment:

```plaintext
dma1: dma@... { ... };
dma2: dma@... { ... };

n: node {
    dmas = <&dma1 1 2 0x400 0x3>,
         <&dma2 6 3 0x404 0x5>;
};
```

Example usage:

```plaintext
DT_DMAS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(dma1)
DT_DMAS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(dma2)
```

See also:

DT_PROP_BY_PHANDLE_IDX()

Parameters

- node_id – node identifier for a node with a dmas property
- idx – logical index into dmas property

Returns

the node identifier for the DMA controller referenced at index “idx”

DT_DMAS_CTLR_BY_NAME(node_id, name)

Get the node identifier for the DMA controller from a dmas property by name.

Example devicetree fragment:

```plaintext
dma1: dma@... { ... };
dma2: dma@... { ... };

n: node {
    dmas = <&dma1 1 2 0x400 0x3>,
         <&dma2 6 3 0x404 0x5>;
    dma-names = "tx", "rx";
};
```

Example usage:

```plaintext
DT_DMAS_CTLR_BY_NAME(DT_NODELABEL(n), tx) // DT_NODELABEL(dma1)
DT_DMAS_CTLR_BY_NAME(DT_NODELABEL(n), rx) // DT_NODELABEL(dma2)
```

See also:

DT_PHANDLE_BY_NAME()

Parameters

- node_id – node identifier for a node with a dmas property
- name – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property
**Returns**
the node identifier for the DMA controller in the named element

\texttt{DT_DMAS_CTLR(node\_id)}
Equivalent to \texttt{DT_DMAS_CTLR\_BY\_IDX(node\_id, 0)}

**See also:**
\texttt{DT_DMAS_CTLR\_BY\_IDX()}

**Parameters**
- \texttt{node\_id} – node identifier for a node with a dmas property

**Returns**
the node identifier for the DMA controller at index 0 in the node's "dmas" property

\texttt{DT\_INST\_DAMS\_CTLR\_BY\_IDX(inst, idx)}
Get the node identifier for the DMA controller from a DT_DRV_COMPAT instance's dmas property at an index.

**See also:**
\texttt{DT\_DAMS\_CTLR\_BY\_IDX()}

**Parameters**
- \texttt{inst} – DT_DRV_COMPAT instance number
- \texttt{idx} – logical index into dmas property

**Returns**
the node identifier for the DMA controller referenced at index "idx"

\texttt{DT\_INST\_DAMS\_CTLR\_BY\_NAME(inst, name)}
Get the node identifier for the DMA controller from a DT_DRV_COMPAT instance's dmas property by name.

**See also:**
\texttt{DT\_DAMS\_CTLR\_BY\_NAME()}

**Parameters**
- \texttt{inst} – DT_DRV_COMPAT instance number
- \texttt{name} – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property

**Returns**
the node identifier for the DMA controller in the named element

\texttt{DT\_INST\_DAMS\_CTLR(inst)}
Equivalent to \texttt{DT\_INST\_DAMS\_CTLR\_BY\_IDX(inst, 0)}

**See also:**
\texttt{DT\_DAMS\_CTLR\_BY\_IDX()}
Parameters

- `inst` – DT_DRV_COMPAT instance number

Returns

the node identifier for the DMA controller at index 0 in the instance’s “dmas” property

\[ \text{DT\_DMAS\_CELL\_BY\_IDX}(\text{node\_id}, \text{idx}, \text{cell}) \]

Get a DMA specifier’s cell value at an index.

Example devicetree fragment:

```plaintext
dma1: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};

dma2: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};

n: node {
    dmas = <&dma1 1 0x400>,
            <&dma2 6 0x404>;
};
```

Bindings fragment for the vnd,dma compatible:

```plaintext
dma-cells:
- channel
- config
```

Example usage:

```plaintext
\text{DT\_DMAS\_CELL\_BY\_IDX}(\text{DT\_NODELABEL}(n), \text{0}, \text{channel}) \text{ // 1}
\text{DT\_DMAS\_CELL\_BY\_IDX}(\text{DT\_NODELABEL}(n), \text{1}, \text{channel}) \text{ // 6}
\text{DT\_DMAS\_CELL\_BY\_IDX}(\text{DT\_NODELABEL}(n), \text{0}, \text{config}) \text{ // 0x400}
\text{DT\_DMAS\_CELL\_BY\_IDX}(\text{DT\_NODELABEL}(n), \text{1}, \text{config}) \text{ // 0x404}
```

See also:

`DT\_PHA\_BY\_IDX()`

Parameters

- `node\_id` – node identifier for a node with a dmas property
- `idx` – logical index into dmas property
- `cell` – lowercase-and-underscores cell name

Returns

the cell value at index “idx”

\[ \text{DT\_INST\_DMAS\_CELL\_BY\_IDX}(\text{inst}, \text{idx}, \text{cell}) \]

Get a DT_DRV_COMPAT instance’s DMA specifier’s cell value at an index.

See also:

`DT\_DMAS\_CELL\_BY\_IDX()`
Parameters

- inst – DT_DRV_COMPAT instance number
- idx – logical index into dmas property
- cell – lowercase-and-underscores cell name

Returns
the cell value at index “idx”

`DT_DMAS_CELL_BY_NAME(node_id, name, cell)`
Get a DMA specifier’s cell value by name.

Example devicetree fragment:

```plaintext
dma1: dma... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};
dma2: dma... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
};
n: node {
    dmas = <&dma1 1 0x400>,
         <&dma2 6 0x404>;
    dma-names = "tx", "rx";
};
```

Bindings fragment for the vnd,dma compatible:

```plaintext
dma-cells:
- channel
- config
```

Example usage:

```plaintext
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), tx, channel) // 1
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), rx, channel) // 6
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), tx, config) // 0x400
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), rx, config) // 0x404
```

See also:
`DT_PHA_BY_NAME()`

Parameters

- node_id – node identifier for a node with a dmas property
- name – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property
- cell – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element
DT_INST_DMAS_CELL_BY_NAME(inst, name, cell)
Get a DT_DRV_COMPAT instance's DMA specifier's cell value by name.

See also:
DT_DMAS_CELL_BY_NAME()

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property
• cell – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_DMAS_HAS_IDX(node_id, idx)
Is index “idx” valid for a dmas property?

Parameters
• node_id – node identifier for a node with a dmas property
• idx – logical index into dmas property

Returns
1 if the “dmas” property has index “idx”, 0 otherwise

DT_INST_DMAS_HAS_IDX(inst, idx)
Is index “idx” valid for a DT_DRV_COMPAT instance’s dmas property?

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into dmas property

Returns
1 if the “dmas” property has a specifier at index “idx”, 0 otherwise

DT_DMAS_HAS_NAME(node_id, name)
Does a dmas property have a named element?

Parameters
• node_id – node identifier for a node with a dmas property
• name – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property

Returns
1 if the dmas property has the named element, 0 otherwise

DT_INST_DMAS_HAS_NAME(inst, name)
Does a DT_DRV_COMPAT instance's dmas property have a named element?

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property

Returns
1 if the dmas property has the named element, 0 otherwise
Fixed flash partitions  These conveniences may be used for the special-purpose fixed-partitions compatible used to encode information about flash memory partitions in the device tree. See See fixed-partition for more details.

group devicetree-fixed-partition

Defines

DT_NODE_BY_FIXED_PARTITION_LABEL(label)
Get a node identifier for a fixed partition with a given label property.
Example devicetree fragment:

```plaintext
flash@... {
  partitions {
    compatible = "fixed-partitions";
    boot_partition: partition@0 {
      label = "mcuboot";
    }; 
    slot0_partition: partition@c000 {
      label = "image-0";
    }; 
  ... 
  }
};
```

Example usage:

```
DT_NODE_BY_FIXED_PARTITION_LABEL(mcuboot) // node identifier for boot_partition
DT_NODE_BY_FIXED_PARTITION_LABEL(image_0) // node identifier for slot0_partition
```

Parameters

- label – lowercase-and-underscores label property value

Returns

a node identifier for the partition with that label property

DT_HAS_FIXED_PARTITION_LABEL(label)
Test if a fixed partition with a given label property exists.

Parameters

- label – lowercase-and-underscores label property value

Returns

1 if any “fixed-partitions” child node has the given label, 0 otherwise.

DT_FIXED_PARTITION_EXISTS(node_id)
Test if fixed-partition compatible node exists.

Parameters

- node_id – DTS node to test

Returns

1 if node exists and is fixed-partition compatible, 0 otherwise.
DT_FIXED_PARTITION_ID(node_id)
Get a numeric identifier for a fixed partition.

Parameters
- node_id – node identifier for a fixed-partitions child node

Returns
the partition's ID, a unique zero-based index number

DT_MTD_FROM_FIXED_PARTITION(node_id)
Get the node identifier of the flash device for a partition.

Parameters
- node_id – node identifier for a fixed-partitions child node

Returns
the node identifier of the memory technology device that contains the fixed-partitions node.

GPIO These conveniences may be used for nodes which describe GPIO controllers/pins, and properties related to them.

group devicetree-gpio

Defines

DT_GPIO_CTLR_BY_IDX(node_id, gpio_pha, idx)
Get the node identifier for the controller phandle from a gpio phandle-array property at an index.

Example devicetree fragment:

```
gpio1: gpio@... { };  
gpio2: gpio@... { };  
n: node {  
    gpios = &gpio1 10 GPIO_ACTIVE_LOW,  
             &gpio2 30 GPIO_ACTIVE_HIGH;  
};
```

Example usage:

```
DT_GPIO_CTLR_BY_IDX(DT_NODELABEL(n), gpios, 1) // DT_NODELABEL(gpio2)
```

See also:

DT_PHANDLE_BY_IDX()

Parameters
- node_id – node identifier
- gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
- idx – logical index into “gpio_pha”

Returns
the node identifier for the gpio controller referenced at index “idx”
DT_GPIO_CTLR(node_id, gpio_pha)

Equivalent to DT_GPIO_CTLR_BY_IDX(node_id, gpio_pha, 0)

See also:
DT_GPIO_CTLR_BY_IDX()

Parameters
• node_id – node identifier
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
a node identifier for the gpio controller at index 0 in “gpio_pha”

DT_GPIO_LABEL_BY_IDX(node_id, gpio_pha, idx)

Get a label property from a gpio phandle-array property at an index.

Deprecated:
If used to obtain a device instance with device_get_binding, consider using DEVICE_DT_GET(DT_GPIO_CTLR_BY_IDX(node, gpio_pha, idx)).

It's an error if the GPIO controller node referenced by the phandle in node_id's “gpio_pha” property at index “idx” has no label property.

Example devicetree fragment:

```plaintext
gpio1: gpio@... {
    label = "GPIO_1";
};

gpio2: gpio@... {
    label = "GPIO_2";
};

n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
            <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Example usage:

```plaintext
DT_GPIO_LABEL_BY_IDX(DT_NODELABEL(n), gpios, 1) // "GPIO_2"
```

See also:
DT_PHANDLE_BY_IDX()

Parameters
• node_id – node identifier
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
• idx – logical index into “gpio_pha”

Returns
the label property of the node referenced at index “idx”
**DT_GPIO_LABEL(node_id, gpio_pha)**

Equivalent to **DT_GPIO_LABEL_BY_IDX(node_id, gpio_pha, 0)**

*Deprecated:*
If used to obtain a device instance with device_get_binding, consider using

```
DEVICE_DT_GET(DT_GPIO_CTLR(node, gpio_pha)).
```

*See also:*

**DT_GPIO_LABEL_BY_IDX()**

**Parameters**

- `node_id` – node identifier
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns**

the label property of the node referenced at index 0

**DT_GPIO_PIN_BY_IDX(node_id, gpio_pha, idx)**

Get a GPIO specifier’s pin cell at an index.

This macro only works for GPIO specifiers with cells named “pin”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```
gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};

gpio2: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};

n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
          <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Bindings fragment for the vnd,gpio compatible:

```
gpio-cells:
- pin
- flags
```

Example usage:

```
DT_GPIO_PIN_BY_IDX(DT_NODELABEL(n), gpios, 0) // 10
DT_GPIO_PIN_BY_IDX(DT_NODELABEL(n), gpios, 1) // 30
```

*See also:*

**DT_PHA_BY_IDX()**

*Parameters*
• node_id – node identifier
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
• idx – logical index into “gpio_pha”

Returns
the pin cell value at index “idx”

DT_GPIO_PIN(node_id, gpio_pha)
Equivalent to DT_GPIO_PIN_BY_IDX(node_id, gpio_pha, 0)

See also:
DT_GPIO_PIN_BY_IDX()

Parameters
• node_id – node identifier
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
the pin cell value at index 0

DT_GPIO_FLAGS_BY_IDX(node_id, gpio_pha, idx)
Get a GPIO specifier's flags cell at an index.

This macro expects GPIO specifiers with cells named “flags”. If there is no “flags” cell in the
GPIO specifier, zero is returned. Refer to the node’s binding to check specifier cell names if
necessary.

Example devicetree fragment:

gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};

gpio2: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};

n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
            <&gpio2 30 GPIO_ACTIVE_HIGH>;
};

Bindings fragment for the vnd,gpio compatible:

gpio-cells:
- pin
- flags

Example usage:

DT_GPIO_FLAGS_BY_IDX(DT_NODELABEL(n), gpios, 0) // GPIO_ACTIVE_LOW
DT_GPIO_FLAGS_BY_IDX(DT_NODELABEL(n), gpios, 1) // GPIO_ACTIVE_HIGH
See also:

\textit{DT\_PHA\_BY\_IDX()}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{node\_id} – node identifier
  \item \texttt{gpio\_pha} – lowercase-and-underscores GPIO property with type “phandle-array”
  \item \texttt{idx} – logical index into “gpio\_pha”
\end{itemize}

\textbf{Returns}

the flags cell value at index “idx”, or zero if there is none

\texttt{DT\_GPIO\_FLAGS(node\_id, gpio\_pha)}

Equivalent to \texttt{DT\_GPIO\_FLAGS\_BY\_IDX(node\_id, gpio\_pha, 0)}

See also:

\textit{DT\_GPIO\_FLAGS\_BY\_IDX()}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{node\_id} – node identifier
  \item \texttt{gpio\_pha} – lowercase-and-underscores GPIO property with type “phandle-array”
\end{itemize}

\textbf{Returns}

the flags cell value at index 0, or zero if there is none

\texttt{DT\_INST\_GPIO\_LABEL\_BY\_IDX(inst, gpio\_pha, idx)}

Get a label property from a DT\_DRV\_COMPAT instance's GPIO property at an index.

\textit{Deprecated:}

If used to obtain a device instance with device_get_binding, consider using \texttt{DEVICE\_DT\_GET(DT\_INST\_GPIO\_CTRL\_BY\_IDX(node, gpio\_pha, idx))}.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{inst} – DT\_DRV\_COMPAT instance number
  \item \texttt{gpio\_pha} – lowercase-and-underscores GPIO property with type “phandle-array”
  \item \texttt{idx} – logical index into “gpio\_pha”
\end{itemize}

\textbf{Returns}

the label property of the node referenced at index “idx”

\texttt{DT\_INST\_GPIO\_LABEL(inst, gpio\_pha)}

Equivalent to \texttt{DT\_INST\_GPIO\_LABEL\_BY\_IDX(inst, gpio\_pha, 0)}

\textit{Deprecated:}

If used to obtain a device instance with device_get Binding, consider using \texttt{DEVICE\_DT\_GET(DT\_INST\_GPIO\_CTRL(node, gpio\_pha))}.

\textbf{Parameters}
• inst – DT_DRV_COMPAT instance number
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
the label property of the node referenced at index 0

DT_INST_GPIO_PIN_BY_IDX(inst, gpio_pha, idx)
Get a DT_DRV_COMPAT instance’s GPIO specifier’s pin cell value at an index.

See also:

DT_GPIO_PIN_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
• idx – logical index into “gpio_pha”

Returns
the pin cell value at index “idx”

DT_INST_GPIO_PIN(inst, gpio_pha)
Equivalent to DT_INST_GPIO_PIN_BY_IDX(inst, gpio_pha, 0)

See also:

DT_INST_GPIO_PIN_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
the pin cell value at index 0

DT_INST_GPIO_FLAGS_BY_IDX(inst, gpio_pha, idx)
Get a DT_DRV_COMPAT instance’s GPIO specifier’s flags cell at an index.

See also:

DT_GPIO_FLAGS_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
• idx – logical index into “gpio_pha”

Returns
the flags cell value at index “idx”, or zero if there is none
DT_INST_GPIO_FLAGS(inst, gpio_pha)
   Equivalent to DT_INST_GPIO_FLAGS_BY_IDX(inst, gpio_pha, 0)

See also:
   DT_INST_GPIO_FLAGS_BY_IDX()

Parameters
   • inst – DT_DRV_COMPAT instance number
   • gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
   the flags cell value at index 0, or zero if there is none

IO channels  These are commonly used by device drivers which need to use IO channels (e.g. ADC or DAC channels) for conversion.

group devicetree-io-channels

Defines

DT_IO_CHANNELS_CTLR_BY_IDX(node_id, idx)
   Get the node identifier for the node referenced by an io-channels property at an index.

Example devicetree fragment:

```plaintext
adc1: adc@... { ... ;
adc2: adc@... { ... ;

n: node {
   io-channels = <&adc1 10>, <&adc2 20>;
};
```

Example usage:

```plaintext
DT_IO_CHANNELS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(adc1)
DT_IO_CHANNELS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(adc2)
```

See also:
   DT_PROP_BY_PHANDLE_IDX()

Parameters
   • node_id – node identifier for a node with an io-channels property
   • idx – logical index into io-channels property

Returns
   the node identifier for the node referenced at index “idx”

DT_IO_CHANNELS_CTLR_BY_NAME(node_id, name)
   Get the node identifier for the node referenced by an io-channels property by name.

Example devicetree fragment:
adc1: adc@
  ...
  {};  
adc2: adc@
  ...
  {};  
n: node {
  io-channels = `<&adc1 10>, `<&adc2 20>;`
  io-channel-names = "SENSOR", "BANDGAP";
};

Example usage:

DT_IO_CHANNELS_CTRL_BY_NAME(DT_NODELABEL(n), sensor) // DT_NODELABEL(adc1)  
DT_IO_CHANNELS_CTRL_BY_NAME(DT_NODELABEL(n), bandgap) // DT_NODELABEL(adc2)  

See also:

DT_PHANDLE_BY_NAME()  

Parameters

• node_id – node identifier for a node with an io-channels property  
• name – lowercase-and-underscores name of an io-channels element as defined  
  by the node's io-channel-names property  

Returns

 the node identifier for the node referenced at the named element  

DT_IO_CHANNELS_CTRL(node_id)

Equivalent to DT_IO_CHANNELS_CTRL_BY_IDX(node_id, 0)  

See also:

DT_IO_CHANNELS_CTRL_BY_IDX()  

Parameters

• node_id – node identifier for a node with an io-channels property  

Returns

 the node identifier for the node referenced at index 0 in the node's “io-channels”  
  property  

DT_INST_IO_CHANNELS_CTRL_BY_IDX(inst, idx)  

Get the node identifier from a DT_DRV_COMPAT instance's io-channels property at an index.  

See also:

DT_IO_CHANNELS_CTRL_BY_IDX()  

Parameters

• inst – DT_DRV_COMPAT instance number  
• idx – logical index into io-channels property  

Returns

 the node identifier for the node referenced at index “idx”
DT_INST_IO_CHANNELS_CTLR_BY_NAME(inst, name)

Get the node identifier from a DT_DRV_COMPAT instance's io-channels property by name.

See also:

DT_IO_CHANNELS_CTLR_BY_NAME()

Parameters

• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of an io-channels element as defined by the node’s io-channel-names property

Returns

the node identifier for the node referenced at the named element

DT_INST_IO_CHANNELS_CTLR(inst)

Equivalent to DT_INST_IO_CHANNELS_CTLR_BY_IDX(inst, 0)

See also:

DT_IO_CHANNELS_CTLR_BY_IDX()

Parameters

• inst – DT_DRV_COMPAT instance number

Returns

the node identifier for the node referenced at index 0 in the node’s “io-channels” property

DT_IO_CHANNELS_INPUT_BY_IDX(node_id, idx)

Get an io-channels specifier input cell at an index.

This macro only works for io-channels specifiers with cells named “input”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```plaintext
adc1: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};
adc2: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};
n: node {
    io-channels = <adc1 10>, <adc2 20>;
};
```

Bindings fragment for the vnd,adc compatible:

io-channel-cells:

• input

Example usage:
See also:

**DT_PHA_BY_IDX()**

**Parameters**

- node_id – node identifier for a node with an io-channels property
- idx – logical index into io-channels property

**Returns**

the input cell in the specifier at index “idx”

**DT_IO_CHANNELS_INPUT_BY_NAME(node_id, name)**

Get an io-channels specifier input cell by name.

This macro only works for io-channels specifiers with cells named “input”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```markdown
adc1: adc@... {
  compatible = "vnd,adc";
  #io-channel-cells = <1>;
};

adc2: adc@... {
  compatible = "vnd,adc";
  #io-channel-cells = <1>;
};

n: node {
  io-channels = <&adc1 10>, <&adc2 20>;
  io-channel-names = "SENSOR", "BANDGAP";
};
```

Bindings fragment for the vnd,adc compatible:

io-channel-cells:

- input

Example usage:

```markdown
DT_IO_CHANNELS_INPUT_BY_NAME(DT_NODELABEL(n), sensor) // 10
DT_IO_CHANNELS_INPUT_BY_NAME(DT_NODELABEL(n), bandgap) // 20
```

See also:

**DT_PHA_BY_NAME()**

**Parameters**

- node_id – node identifier for a node with an io-channels property
- name – lowercase-and-underscores name of an io-channels element as defined by the node's io-channel-names property

**Returns**

the input cell in the specifier at the named element
DT_IO_CHANNELS_INPUT(node_id)
Equivalent to DT_IO_CHANNELS_INPUT_BY_IDX(node_id, 0)

See also:
DT_IO_CHANNELS_INPUT_BY_IDX()

Parameters
- node_id – node identifier for a node with an io-channels property

Returns
the input cell in the specifier at index 0

DT_INST_IO_CHANNELS_INPUT_BY_IDX(inst, idx)
Get an input cell from the “DT_DRV_INST(inst)” io-channels property at an index.

See also:
DT_IO_CHANNELS_INPUT_BY_IDX()

Parameters
- inst – DT_DRV_COMPAT instance number
- idx – logical index into io-channels property

Returns
the input cell in the specifier at index “idx”

DT_INST_IO_CHANNELS_INPUT_BY_NAME(inst, name)
Get an input cell from the “DT_DRV_INST(inst)” io-channels property by name.

See also:
DT_IO_CHANNELS_INPUT_BY_NAME()

Parameters
- inst – DT_DRV_COMPAT instance number
- name – lowercase-and-underscores name of an io-channels element as defined by the instance’s io-channel-names property

Returns
the input cell in the specifier at the named element

DT_INST_IO_CHANNELS_INPUT(inst)
Equivalent to DT_INST_IO_CHANNELS_INPUT_BY_IDX(inst, 0)

Parameters
- inst – DT_DRV_COMPAT instance number

Returns
the input cell in the specifier at index 0
MBOX These conveniences may be used for nodes which describe MBOX controllers/users, and properties related to them.

group devicetree-mbox

Defines

DT_MBOX_CTLR_BY_NAME(node_id, name)
Get the node identifier for the MBOX controller from a mboxes property by name.

Example devicetree fragment:

```plaintext
mbox1: mbox-controller@... { ... }; 

n: node {
    mboxes = <&mbox1 8>,
            <&mbox1 9>;
    mbox-names = "tx", "rx";
};
```

Example usage:

```plaintext
DT_MBOX_CTLR_BY_NAME(DT_NODELABEL(n), tx) // DT_NODELABEL(mbox1)
DT_MBOX_CTLR_BY_NAME(DT_NODELABEL(n), rx) // DT_NODELABEL(mbox1)
```

See also:

DT_PHANDLE_BY_NAME()

Parameters

- node_id – node identifier for a node with a mboxes property
- name – lowercase-and-underscores name of a mboxes element as defined by the node's mbox-names property

Returns

the node identifier for the MBOX controller in the named element

DT_MBOX_CHANNEL_BY_NAME(node_id, name)
Get a MBOX channel value by name.

Example devicetree fragment:

```plaintext
mbox1: mbox@... {
    #mbox-cells = <1>;
};

n: node {
    mboxes = <&mbox1 1>,
            <&mbox1 6>;
    mbox-names = "tx", "rx";
};
```

Bindings fragment for the mbox compatible:

```plaintext
mbox-cells:
  - channel
```
DT_MBOX_CHANNEL_BY_NAME(DT_NODELABEL(n), tx) // 1
DT_MBOX_CHANNEL_BY_NAME(DT_NODELABEL(n), rx) // 6

See also:

*DT_PHA_BY_NAME_OR()

**Parameters**

- **node_id** – node identifier for a node with a mboxes property
- **name** – lowercase-and-underscores name of a mboxes element as defined by the node's mbox-names property

**Returns**

the channel value in the specifier at the named element or 0 if no channels are supported

---

**Pinctrl (pin control)**

These are used to access pin control properties by name or index.

Devicetree nodes may have properties which specify pin control (sometimes known as pin mux) settings. These are expressed using `pinctrl-<index>` properties within the node, where the `<index>` values are contiguous integers starting from 0. These may also be named using the `pinctrl-names` property.

Here is an example:

```
node {
  ...
  pinctrl-0 = &foo &bar ...);
  pinctrl-1 = <&baz ...);
  pinctrl-names = "default", "sleep";
};
```

Above, `pinctrl-0` has name "default", and `pinctrl-1` has name "sleep". The `pinctrl-<index>` property values contain phandles. The `&foo`, `&bar`, etc. phandles within the properties point to nodes whose contents vary by platform, and which describe a pin configuration for the node.

**group devicetree-pinctrl**

**Defines**

*DT_PINCTRL_BY_IDX(node_id, pc_idx, idx)*

Get a node identifier for a phandle in a pinctrl property by index.

Example devicetree fragment:

```
n: node {
  pinctrl-0 = <&foo &bar >;
  pinctrl-1 = <&baz &blub >;
}
```

Example usage:

```
DT_PINCTRL_BY_IDX(DT_NODELABEL(n), 0, 1) // DT_NODELABEL(bar)
DT_PINCTRL_BY_IDX(DT_NODELABEL(n), 1, 0) // DT_NODELABEL(baz)
```

**Parameters**

- **node_id** – node with a pinctrl-'pc_idx' property

---

5.2. Devicetree 1125
- pc_idx – index of the pinctrl property itself
- idx – index into the value of the pinctrl property

**Returns**
node identifier for the phandle at index ‘idx’ in ‘pinctrl-‘pc_idx”

```
DT_PINCTRL_0(node_id, idx)
```

Get a node identifier from a pinctrl-0 property.

This is equivalent to:
```
DT_PINCTRL_BY_IDX(node_id, 0, idx)
```

It is provided for convenience since pinctrl-0 is commonly used.

**Parameters**
- node_id – node with a pinctrl-0 property
- idx – index into the pinctrl-0 property

**Returns**
node identifier for the phandle at index idx in the pinctrl-0 property of that node

```
DT_PINCTRL_BY_NAME(node_id, name, idx)
```

Get a node identifier for a phandle inside a pinctrl node by name.

Example devicetree fragment:
```
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz &blub>;
    pinctrl-names = "default", "sleep";
};
```

Example usage:
```
DT_PINCTRL_BY_NAME(DT_NODELABEL(n), default, 1) // DT_NODELABEL(bar)
DT_PINCTRL_BY_NAME(DT_NODELABEL(n), sleep, 0) // DT_NODELABEL(baz)
```

**Parameters**
- node_id – node with a named pinctrl property
- name – lowercase-and-underscores pinctrl property name
- idx – index into the value of the named pinctrl property

**Returns**
node identifier for the phandle at that index in the pinctrl property

```
DT_PINCTRL_NAME_TO_IDX(node_id, name)
```

Convert a pinctrl name to its corresponding index.

Example devicetree fragment:
```
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz &blub>;
    pinctrl-names = "default", "sleep";
};
```

Example usage:
DT_PINCTRL_NAME_TO_IDX(DT_NODELABEL(n), default) // 0
DT_PINCTRL_NAME_TO_IDX(DT_NODELABEL(n), sleep) // 1

Parameters

• node_id – node identifier with a named pinctrl property
• name – lowercase-and-underscores name name of the pinctrl whose index to get

Returns

integer literal for the index of the pinctrl property with that name

DT_PINCTRL_IDX_TO_NAME_TOKEN(node_id, pc_idx)

Convert a pinctrl property index to its name as a token.

This allows you to get a pinctrl property's name, and “remove the quotes” from it.

DT_PINCTRL_IDX_TO_NAME_TOKEN(node_id, pc_idx)
can only be used if the node has a pinctrl-'pc_idx' property and a pinctrl-names property element for that index. It is an error to use it in other circumstances.

Example devicetree fragment:

n: node {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
    pinctrl-names = "default", "f.o.o2";
};

Example usage:

DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 0) // default
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 1) // f_o_o2

The same caveats and restrictions that apply to DT_STRING_TOKEN()’s return value also apply here.

Parameters

• node_id – node identifier
• pc_idx – index of a pinctrl property in that node

Returns

name of the pinctrl property, as a token, without any quotes and with non-alphanumeric characters converted to underscores

DT_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(node_id, pc_idx)

Like DT_PINCTRL_IDX_TO_NAME_TOKEN(), but with an uppercased result.

This does the a similar conversion as DT_PINCTRL_IDX_TO_NAME_TOKEN(node_id, pc_idx).
The only difference is that alphabetical characters in the result are uppercased.

Example devicetree fragment:

n: node {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
    pinctrl-names = "default", "f.o.o2";
};
Example usage:

```
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 0) // DEFAULT
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 1) // F_O_O2
```

The same caveats and restrictions that apply to `DT_STRING_UPPER_TOKEN()`’s return value also apply here.

**DT_NUM_PINCTRLS_BY_IDX(node_id, pc_idx)**

Get the number of phandles in a pinctrl property.

Example devicetree fragment:

```plaintext
n1: node-1 {
    pinctrl-0 = <&foo &bar>;
};
n2: node-2 {
    pinctrl-0 = <&baz>;
};
```

Example usage:

```
DT_NUM_PINCTRLS_BY_IDX(DT_NODELABEL(n1), 0) // 2
DT_NUM_PINCTRLS_BY_IDX(DT_NODELABEL(n2), 0) // 1
```

**Parameters**

- `node_id` – node identifier with a pinctrl property
- `pc_idx` – index of the pinctrl property itself

**Returns**

number of phandles in the property with that index

**DT_NUM_PINCTRLS_BY_NAME(node_id, name)**

Like `DT_NUM_PINCTRLS_BY_IDX()` but by name instead.

Example devicetree fragment:

```plaintext
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz>
    pinctrl-names = "default", "sleep";
};
```

Example usage:

```
DT_NUM_PINCTRLS_BY_NAME(DT_NODELABEL(n), default) // 2
DT_NUM_PINCTRLS_BY_NAME(DT_NODELABEL(n), sleep) // 1
```

**Parameters**

- `node_id` – node identifier with a pinctrl property
- `name` – lowercase-and-underscores name name of the pinctrl property

**Returns**

number of phandles in the property with that name
DT_NUM_PINCTRL_STATES(node_id)

Get the number of pinctrl properties in a node.

This expands to 0 if there are no pinctrl-i properties. Otherwise, it expands to the number of such properties.

Example devicetree fragment:

```plaintext
n1: node-1 {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
};
n2: node-2 {
};
```

Example usage:

```plaintext
DT_NUM_PINCTRL_STATES(DT_NODELABEL(n1)) // 2
DT_NUM_PINCTRL STATES(DT_NODELABEL(n2)) // 0
```

**Parameters**
- node_id – node identifier; may or may not have any pinctrl properties

**Returns**
- number of pinctrl properties in the node

DT_PINCTRL_HAS_IDX(node_id, pc_idx)

Test if a node has a pinctrl property with an index.

This expands to 1 if the pinctrl-'idx' property exists. Otherwise, it expands to 0.

Example devicetree fragment:

```plaintext
n1: node-1 {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
};
n2: node-2 {
};
```

Example usage:

```plaintext
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 0) // 1
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 1) // 1
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 2) // 0
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n2), 0) // 0
```

**Parameters**
- node_id – node identifier; may or may not have any pinctrl properties
- pc_idx – index of a pinctrl property whose existence to check

**Returns**
- 1 if the property exists, 0 otherwise
DT_PINCTRL_HAS_NAME(node_id, name)
Test if a node has a pinctrl property with a name.
This expands to 1 if the named pinctrl property exists. Otherwise, it expands to 0.

Example devicetree fragment:

```
n1: node-1 {
    pinctrl-0 = <...>;
    pinctrl-names = "default";
};
n2: node-2 {
};
```

Example usage:

```
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n1), default) // 1
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n1), sleep) // 0
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n2), default) // 0
```

**Parameters**

- node_id – node identifier; may or may not have any pinctrl properties
- name – lowercase-and-underscores pinctrl property name to check

**Returns**

1 if the property exists, 0 otherwise

DT_INST_PINCTRL_BY_IDX(inst, pc_idx, idx)
Get a node identifier for a phandle in a pinctrl property by index for a DT_DRV_COMPAT instance.
This is equivalent to `DT_PINCTRL_BY_IDX(DT_DRV_INST(inst), pc_idx, idx)`.

**Parameters**

- inst – instance number
- pc_idx – index of the pinctrl property itself
- idx – index into the value of the pinctrl property

**Returns**

node identifier for the phandle at index ‘idx’ in ‘pinctrl-‘pc_idx”

DT_INST_PINCTRL_0(inst, idx)
Get a node identifier from a pinctrl-0 property for a DT_DRV_COMPAT instance.
This is equivalent to:

```
DT_PINCTRL_BY_IDX(DT_DRV_INST(inst), 0, idx)
```

It is provided for convenience since pinctrl-0 is commonly used.

**Parameters**

- inst – instance number
- idx – index into the pinctrl-0 property

**Returns**

node identifier for the phandle at index idx in the pinctrl-0 property of that instance
DT_INST_PINCTRL_BY_NAME(inst, name, idx)
Get a node identifier for a phandle inside a pinctrl node for a DT_DRV_COMPAT instance.
This is equivalent to DT_PINCTRL_BY_NAME(DT_DRV_INST(inst), name, idx).

Parameters
- `inst` – instance number
- `name` – lowercase-and-underscores pinctrl property name
- `idx` – index into the value of the named pinctrl property

Returns
node identifier for the phandle at that index in the pinctrl property

DT_INST_PINCTRL_NAME_TO_IDX(inst, name)
Convert a pinctrl name to its corresponding index for a DT_DRV_COMPAT instance.
This is equivalent to DT_PINCTRL_NAME_TO_IDX(DT_DRV_INST(inst), name).

Parameters
- `inst` – instance number
- `name` – lowercase-and-underscores name of the pinctrl whose index to get

Returns
integer literal for the index of the pinctrl property with that name

DT_INST_PINCTRL_IDX_TO_NAME_TOKEN(inst, pc_idx)
Convert a pinctrl index to its name as an uppercased token.
This is equivalent to DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_DRV_INST(inst), pc_idx).

Parameters
- `inst` – instance number
- `pc_idx` – index of the pinctrl property itself

Returns
name of the pin control property as a token

DT_INST_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(inst, pc_idx)
Convert a pinctrl index to its name as an uppercase token.
This is equivalent to DT_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(DT_DRV_INST(inst), pc_idx).

Parameters
- `inst` – instance number
- `pc_idx` – index of the pinctrl property itself

Returns
name of the pin control property as an uppercase token

DT_INST_NUM_PINCTRLS_BY_IDX(inst, pc_idx)
Get the number of phandles in a pinctrl property for a DT_DRV_COMPAT instance.
This is equivalent to DT_NUM_PINCTRLS_BY_IDX(DT_DRV_INST(inst), pc_idx).

Parameters
- `inst` – instance number
- `pc_idx` – index of the pinctrl property itself

Returns
number of phandles in the property with that index
DT_INST_NUM_PINCTRLS_BY_NAME(inst, name)

Like DT_INST_NUM_PINCTRLS_BYIDX(), but by name instead.

This is equivalent to DT_NUM_PINCTRLS_BY_NAME(DT_DRV_INST(inst), name).

Parameters

- inst – instance number
- name – lowercase-and-underscores name of the pinctrl property

Returns

number of phandles in the property with that name

DT_INST_NUM_PINCTRL_STATES(inst)

Get the number of pinctrl properties in a DT_DRV_COMPAT instance.

This is equivalent to DT_NUM_PINCTRL_STATES(DT_DRV_INST(inst)).

Parameters

- inst – instance number

Returns

number of pinctrl properties in the instance

DT_INST_PINCTRL_HAS_IDX(inst, pc_idx)

Test if a DT_DRV_COMPAT instance has a pinctrl property with an index.

This is equivalent to DT_PINCTRL_HAS_IDX(DT_DRV_INST(inst), pc_idx).

Parameters

- inst – instance number
- pc_idx – index of a pinctrl property whose existence to check

Returns

1 if the property exists, 0 otherwise

DT_INST_PINCTRL_HAS_NAME(inst, name)

Test if a DT_DRV_COMPAT instance has a pinctrl property with a name.

This is equivalent to DT_PINCTRL_HAS_NAME(DT_DRV_INST(inst), name).

Parameters

- inst – instance number
- name – lowercase-and-underscores pinctrl property name to check

Returns

1 if the property exists, 0 otherwise

PWM These conveniences may be used for nodes which describe PWM controllers and properties related to them.

group devicetree-pwms

Defines

DT_PWMS_CTLR_BY_IDX(node_id, idx)

Get the node identifier for the PWM controller from a pwms property at an index.

Example devicetree fragment:
Zephyr Project Documentation, Release 3.2.99

Example usage:

```c
DT_PWMS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(pwm1)
DT_PWMS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(pwm2)
```

**See also:**

*DT_PROP_BY_PHANDLE_IDX()*

**Parameters**

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property

**Returns**

the node identifier for the PWM controller referenced at index “idx”

```c
DT_PWMS_CTLR_BY_NAME(node_id, name)
```

Get the node identifier for the PWM controller from a pwms property by name.

Example devicetree fragment:

```c
pwm1: pwm-controller@... { ... };
pwm2: pwm-controller@... { ... };

n: node {
    pwms = <&pwm1 1 PWM_POLARITY_NORMAL>,
         <&pwm2 3 PWM_POLARITY_INVERTED>;
};
```

Example usage:

```c
DT_PWMS_CTLR_BY_NAME(DT_NODELABEL(n), alpha) // DT_NODELABEL(pwm1)
DT_PWMS_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(pwm2)
```

**See also:**

*DT_PHANDLE_BY_NAME()*

**Parameters**

- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property

**Returns**

the node identifier for the PWM controller in the named element

```c
DT_PWMS_CTLR(node_id)
```

Equivalent to `DT_PWMS_CTLR_BY_IDX(node_id, 0)`

5.2. Devicetree

1133
See also:

```
DT_PWMS_CTLR_BY_IDX()
```

**Parameters**

- `node_id` – node identifier for a node with a pwms property

**Returns**

the node identifier for the PWM controller at index 0 in the node's "pwms" property

```
DT_PWMS_CELL_BY_IDX(node_id, idx, cell)
```

Get PWM specifier's cell value at an index.

Example devicetree fragment:

```device_tree
pwm1: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
}

pwm2: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
}

n: node {
    pwms = <&pwm1 1 200000 PWM_POLARITY_NORMAL>,
           <&pwm2 3 100000 PWM_POLARITY_INVERTED>;
}
```

**Bindings fragment for the “vnd,pwm” compatible:**

```device_tree
pwm-cells:
    - channel
    - period
    - flags
```

**Example usage:**

```
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, channel) // 1
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, channel) // 3
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, period) // 200000
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, period) // 100000
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, flags) // PWM_POLARITY_NORMAL
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, flags) // PWM_POLARITY_INVERTED
```

See also:

```
DT_PHA_BY_IDX()
```

**Parameters**

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property
- `cell` – lowercase-and-underscores cell name

**Returns**

the cell value at index “idx”
DT_PWMS_CELL_BY_NAME(node_id, name, cell)
Get a PWM specifier's cell value by name.

Example devicetree fragment:

pwm1: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
};

pwm2: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
};

n: node {
    pwms = <&pwm1 1 200000 PWM_POLARITY_NORMAL>,
    <&pwm2 3 100000 PWM_POLARITY_INVERTED>;
    pwm-names = "alpha", "beta";
};

Bindings fragment for the “vnd,pwm” compatible:

pwm-cells:
- channel
- period
- flags

Example usage:

DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, channel) // 1
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, channel) // 3
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, period) // 200000
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, period) // 100000
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, flags) // PWM_POLARITY_NORMAL
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, flags) // PWM_POLARITY_INVERTED

See also:

DT_PHA_BY_NAME()

Parameters

- node_id – node identifier for a node with a pwms property
- name – lowercase-and-underscores name of a pwms element as defined by the
  node's pwm-names property
- cell – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_PWMS_CELL(node_id, cell)
Equivalent to DT_PWMS_CELL_BY_IDX(node_id, 0, cell)

See also:

DT_PWMS_CELL_BY_IDX()
Parameters

- node_id – node identifier for a node with a pwms property
- cell – lowercase-and-underscores cell name

Returns

the cell value at index 0

DT_PWMS_CHANNEL_BY_IDX(node_id, idx)

Get a PWM specifier’s channel cell value at an index.

This macro only works for PWM specifiers with cells named “channel”. Refer to the node’s binding to check if necessary.

This is equivalent to DT_PWMS_CELL_BY_IDX(node_id, idx, channel).

See also:

DT_PWMS_CELL_BY_IDX()

Parameters

- node_id – node identifier for a node with a pwms property
- idx – logical index into pwms property

Returns

the channel cell value at index “idx”

DT_PWMS_CHANNEL_BY_NAME(node_id, name)

Get a PWM specifier’s channel cell value by name.

This macro only works for PWM specifiers with cells named “channel”. Refer to the node’s binding to check if necessary.

This is equivalent to DT_PWMS_CELL_BY_NAME(node_id, name, channel).

See also:

DT_PWMS_CELL_BY_NAME()

Parameters

- node_id – node identifier for a node with a pwms property
- name – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property

Returns

the channel cell value in the specifier at the named element

DT_PWMS_CHANNEL(node_id)

Equivalent to DT_PWMS_CHANNEL_BY_IDX(node_id, 0)

See also:

DT_PWMS_CHANNEL_BY_IDX()

Parameters

- node_id – node identifier for a node with a pwms property
Returns
the channel cell value at index 0

DT_PWMS_PERIOD_BY_IDX(node_id, idx)
Get PWM specifier's period cell value at an index.
This macro only works for PWM specifiers with cells named “period”. Refer to the node's binding to check if necessary.
This is equivalent to DT_PWMS_CELL_BY_IDX(node_id, idx, period).

See also:
DT_PWMS_CELL_BY_IDX()

Parameters
- node_id – node identifier for a node with a pwms property
- idx – logical index into pwms property

Returns
the period cell value at index “idx”

DT_PWMS_PERIOD_BY_NAME(node_id, name)
Get a PWM specifier's period cell value by name.
This macro only works for PWM specifiers with cells named “period”. Refer to the node's binding to check if necessary.
This is equivalent to DT_PWMS_CELL_BY_NAME(node_id, name, period).

See also:
DT_PWMS_CELL_BY_NAME()

Parameters
- node_id – node identifier for a node with a pwms property
- name – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property

Returns
the period cell value in the specifier at the named element

DT_PWMS_PERIOD(node_id)
Equivalent to DT_PWMS_PERIOD_BY_IDX(node_id, 0)

See also:
DT_PWMS_PERIOD_BY_IDX()
DT_PWMS_FLAGS_BY_IDX(node_id, idx)

Get a PWM specifier's flags cell value at an index.

This macro expects PWM specifiers with cells named “flags”. If there is no “flags” cell in the
PWM specifier, zero is returned. Refer to the node's binding to check specifier cell names if
necessary.

This is equivalent to DT_PWMS_CELL_BY_IDX(node_id, idx, flags).

See also:

DT_PWMS_CELL_BY_IDX()

Parameters

• node_id – node identifier for a node with a pwms property
• idx – logical index into pwms property

Returns

the flags cell value at index “idx”, or zero if there is none

DT_PWMS_FLAGS_BY_NAME(node_id, name)

Get a PWM specifier's flags cell value by name.

This macro expects PWM specifiers with cells named “flags”. If there is no “flags” cell in the
PWM specifier, zero is returned. Refer to the node's binding to check specifier cell names if
necessary.

This is equivalent to DT_PWMS_CELL_BY_NAME(node_id, name, flags) if there is a flags cell,
but expands to zero if there is none.

See also:

DT_PWMS_CELL_BY_NAME()

Parameters

• node_id – node identifier for a node with a pwms property
• name – lowercase-and-underscores name of a pwms element as defined by the
  node's pwm-names property

Returns

the flags cell value in the specifier at the named element, or zero if there is none

DT_PWMS_FLAGS(node_id)

Equivalent to DT_PWMS_FLAGS_BY_IDX(node_id, 0)

See also:

DT_PWMS_FLAGS_BY_IDX()

Parameters

• node_id – node identifier for a node with a pwms property

Returns

the flags cell value at index 0, or zero if there is none
DT_INST_PWMS_CTLR_BY_IDX(inst, idx)

Get the node identifier for the PWM controller from a DT_DRV_COMPAT instance's pwms property at an index.

See also:

DT_PWMS_CTLR_BY_IDX()

Parameters

• inst – DT_DRV_COMPAT instance number
• idx – logical index into pwms property

Returns

the node identifier for the PWM controller referenced at index “idx”

DT_INST_PWMS_CTLR_BY_NAME(inst, name)

Get the node identifier for the PWM controller from a DT_DRV_COMPAT instance’s pwms property by name.

See also:

DT_PWMS_CTLR_BY_NAME()

Parameters

• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property

Returns

the node identifier for the PWM controller in the named element

DT_INST_PWMS_CTLR(inst)

Equivalent to DT_INST_PWMS_CTLR_BY_IDX(inst, 0)

See also:

DT_PWMS_CTLR_BY_IDX()

Parameters

• inst – DT_DRV_COMPAT instance number

Returns

the node identifier for the PWM controller at index 0 in the instance’s “pwms” property

DT_INST_PWMS_CELL_BY_IDX(inst, idx, cell)

Get a DT_DRV_COMPAT instance’s PWM specifier's cell value at an index.

Parameters

• inst – DT_DRV_COMPAT instance number
• idx – logical index into pwms property
• cell – lowercase-and-underscores cell name
Returns
the cell value at index “idx”

\texttt{DT\_INST\_PWMS\_CELL\_BY\_NAME}(\texttt{inst, name, cell})

Get a DT\_DRV\_COMPAT instance’s PWM specifier’s cell value by name.

See also:
\texttt{DT\_PWMS\_CELL\_BY\_NAME()}

Parameters

\begin{itemize}
\item \texttt{inst} – DT\_DRV\_COMPAT instance number
\item \texttt{name} – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property
\item \texttt{cell} – lowercase-and-underscores cell name
\end{itemize}

Returns
the cell value in the specifier at the named element

\texttt{DT\_INST\_PWMS\_CELL} (\texttt{inst, cell})

Equivalent to \texttt{DT\_INST\_PWMS\_CELL\_BY\_IDX}(\texttt{inst, 0, cell})

Parameters

\begin{itemize}
\item \texttt{inst} – DT\_DRV\_COMPAT instance number
\item \texttt{cell} – lowercase-and-underscores cell name
\end{itemize}

Returns
the cell value at index 0

\texttt{DT\_INST\_PWMS\_CHANNEL\_BY\_IDX}(\texttt{inst, idx})

Equivalent to \texttt{DT\_INST\_PWMS\_CELL\_BY\_IDX}(\texttt{inst, idx, channel})

See also:
\texttt{DT\_INST\_PWMS\_CELL\_BY\_IDX()}

Parameters

\begin{itemize}
\item \texttt{inst} – DT\_DRV\_COMPAT instance number
\item \texttt{idx} – logical index into pwms property
\end{itemize}

Returns
the channel cell value at index “idx”

\texttt{DT\_INST\_PWMS\_CHANNEL\_BY\_NAME}(\texttt{inst, name})

Equivalent to \texttt{DT\_INST\_PWMS\_CELL\_BY\_NAME}(\texttt{inst, name, channel})

See also:
\texttt{DT\_INST\_PWMS\_CELL\_BY\_NAME()}
**Returns**
the channel cell value in the specifier at the named element

`DT_INST_PWMS_CHANNEL(inst)`
Equivalent to `DT_INST_PWMS_CHANNEL_BY_IDX(inst, 0)`

**See also:**
`DT_INST_PWMS_CHANNEL_BY_IDX()`

**Parameters**
- `inst` – DT_DRV_COMPAT instance number

**Returns**
the channel cell value at index 0

`DT_INST_PWMS_PERIOD_BY_IDX(inst, idx)`
Equivalent to `DT_INST_PWMS_CELL_BY_IDX(inst, idx, period)`

**See also:**
`DT_INST_PWMS_CELL_BY_IDX()`

**Parameters**
- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into pwms property

**Returns**
the period cell value at index “idx”

`DT_INST_PWMS_PERIOD_BY_NAME(inst, name)`
Equivalent to `DT_INST_PWMS_CELL_BY_NAME(inst, name, period)`

**See also:**
`DT_INST_PWMS_CELL_BY_NAME()`

**Parameters**
- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

**Returns**
the period cell value in the specifier at the named element

`DT_INST_PWMS_PERIOD(inst)`
Equivalent to `DT_INST_PWMS_PERIOD_BY_IDX(inst, 0)`

**See also:**
`DT_INST_PWMS_PERIOD_BY_IDX()`

**Parameters**
- `inst` – DT_DRV_COMPAT instance number
Returns
the period cell value at index 0

DT_INST_PWMS_FLAGS_BY_IDX(inst, idx)
Equivalent to DT_INST_PWMS_CELL_BY_IDX(inst, idx, flags)

See also:
DT_INST_PWMS_CELL_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into pwms property

Returns
the flags cell value at index “idx”, or zero if there is none

DT_INST_PWMS_FLAGS_BY_NAME(inst, name)
Equivalent to DT_INST_PWMS_CELL_BY_NAME(inst, name, flags)

See also:
DT_INST_PWMS_CELL_BY_NAME()

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a pwms element as defined by the
  node’s pwm-names property

Returns
the flags cell value in the specifier at the named element, or zero if there is none

DT_INST_PWMS_FLAGS(inst)
Equivalent to DT_INST_PWMS_FLAGS_BY_IDX(inst, 0)

See also:
DT_INST_PWMS_FLAGS_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
the flags cell value at index 0, or zero if there is none

Reset Controller  These conveniences may be used for nodes which describe reset controllers and properties related to them.

group devicetree-reset-controller
Defines

\texttt{DT\_RESET\_CTRLR\_BY\_IDX(node, idx)}

Get the node identifier for the controller phandle from a “resets” phandle-array property at an index.

Example devicetree fragment:

\begin{verbatim}
reset1: reset-controller@... { ... };
reset2: reset-controller@... { ... };

n: node {
    resets = <&reset1 10>, <&reset2 20>;
}
\end{verbatim}

Example usage:

\begin{verbatim}
DT\_RESET\_CTRLR\_BY\_IDX(DT\_NODELABEL(n), 0)) // DT\_NODELABEL(reset1)
DT\_RESET\_CTRLR\_BY\_IDX(DT\_NODELABEL(n), 1)) // DT\_NODELABEL(reset2)
\end{verbatim}

See also:
\texttt{DT\_PHANDLE\_BY\_IDX()}

Parameters
- node, \text{identifier}
- idx, \text{logical index into “resets”}

Returns
the node identifier for the reset controller referenced at index “idx”

\texttt{DT\_RESET\_CTRLR(node)}

Equivalent to \texttt{DT\_RESET\_CTRLR\_BY\_IDX(node, 0)}

See also:
\texttt{DT\_RESET\_CTRLR\_BY\_IDX()}

Parameters
- node, \text{identifier}

Returns
a node identifier for the reset controller at index 0 in “resets”

\texttt{DT\_RESET\_CTRLR\_BY\_NAME(node, name)}

Get the node identifier for the controller phandle from a resets phandle-array property by name.

Example devicetree fragment:

\begin{verbatim}
reset1: reset-controller@... { ... };
reset2: reset-controller@... { ... };

n: node {
    resets = <&reset1 10>, <&reset2 20>;
}
\end{verbatim}
reset-names = "alpha", "beta";
};

Example usage:

DT_RESET_CTLR_BY_NAME(DT_NODELABEL(n), alpha) // DT_NODELABEL(reset1)
DT_RESET_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(reset2)

See also:

`DT_PHANDLE_BY_NAME()`

Parameters

- node_id – node identifier
- name – lowercase-and-underscores name of a resets element as defined by the node's reset-names property

Returns

the node identifier for the reset controller referenced by name

`DT_RESET_CELL_BY_IDX(node_id, idx, cell)`

Get a reset specifier's cell value at an index.

Example devicetree fragment:

```devicetreex
reset: reset-controller@... {
   compatible = "vnd,reset";
   #reset-cells = <1>;
};

n: node {
   resets = <&reset 10>;
};
```

Bindings fragment for the vnd,reset compatible:

```devicetreex
reset-cells:
   - id
```

Example usage:

DT_RESET_CELL_BY_IDX(DT_NODELABEL(n), 0, id) // 10

See also:

`DT_PHA_BY_IDX()`

Parameters

- node_id – node identifier for a node with a resets property
- idx – logical index into resets property
- cell – lowercase-and-underscores cell name

Returns

the cell value at index “idx”
DT_RESET_CELL_BY_NAME(node_id, name, cell)
Get a reset specifier's cell value by name.

Example devicetree fragment:

```plaintext
reset: reset-controller@... {
    compatible = "vnd.reset";
    #reset-cells = <1>;
};

n: node {
    resets = <&reset 10>;
    reset-names = "alpha";
};
```

Bindings fragment for the vnd,reset compatible:

```plaintext
reset-cells:
- id
```

Example usage:

```
DT_RESET_CELL_BY_NAME(DT_NODELABEL(n), alpha, id) // 10
```

See also:

`DT_PHA_BY_NAME()`

Parameters
- node_id – node identifier for a node with a resets property
- name – lowercase-and-underscores name of a resets element as defined by the node's reset-names property
- cell – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_RESET_CELL(node_id, cell)
Equivalent to `DT_RESET_CELL_BY_IDX(node_id, 0, cell)`

See also:

`DT_RESET_CELL_BY_IDX()`

Parameters
- node_id – node identifier for a node with a resets property
- cell – lowercase-and-underscores cell name

Returns
the cell value at index 0

DT_INST_RESET_CTLR_BY_IDX(inst, idx)
Get the node identifier for the controller phandle from a "resets" phandle-array property at an index.
See also:

**DT_RESET_CTLR_BY_IDX()**

**Parameters**

- `inst` – instance number
- `idx` – logical index into “resets”

**Returns**

the node identifier for the reset controller referenced at index “idx”

**DT_INST_RESET_CTLR(inst)**

Equivalent to **DT_INST_RESET_CTLR_BY_IDX(inst, 0)**

See also:

**DT_RESET_CTLR()**

**Parameters**

- `inst` – instance number

**Returns**

a node identifier for the reset controller at index 0 in “resets”

**DT_INST_RESET_CTLR_BY_NAME(inst, name)**

Get the node identifier for the controller phandle from a resets phandle-array property by name.

See also:

**DT_RESET_CTLR_NAME()**

**Parameters**

- `inst` – instance number
- `name` – lowercase-and-underscores name of a resets element as defined by the node’s reset-names property

**Returns**

the node identifier for the reset controller referenced by the named element

**DT_INST_RESET_CELL_BY_IDX(inst, idx, cell)**

Get a DT_DRV_COMPAT instance’s reset specifier’s cell value at an index.

See also:

**DT_RESET_CELL_BY_IDX()**

**Parameters**

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into resets property
- `cell` – lowercase-and-underscores cell name

**Returns**

the cell value at index “idx”
DT_INST_RESET_CELL_BY_NAME(inst, name, cell)
Get a DT_DRV_COMPAT instance's reset specifier's cell value by name.

See also:

    DT_RESET_CELL_BY_NAME()

Parameters

- inst – DT_DRV_COMPAT instance number
- name – lowercase-and-underscores name of a resets element as defined by the
  node's reset-names property
- cell – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_INST_RESET_CELL(inst, cell)
Equivalent to DT_INST_RESET_CELL_BY_IDX(inst, 0, cell)

Parameters

- inst – DT_DRV_COMPAT instance number
- cell – lowercase-and-underscores cell name

Returns
the value of the cell inside the specifier at index 0

DT_RESET_ID_BY_IDX(node_id, idx)
Get a Reset Controller specifier's id cell at an index.
This macro only works for Reset Controller specifiers with cells named "id". Refer to the node's
binding to check if necessary.

Example devicetree fragment:

```plaintext
reset: reset-controller@... {
    compatible = "vnd,reset";
    #reset-cells = <1>;
};

n: node {
    resets = <&reset 10>;
};
```

Bindings fragment for the vnd,reset compatible:

```plaintext
reset-cells:
    - id
```

Example usage:

```plaintext
DT_RESET_ID_BY_IDX(DT_NODELABEL(n), 0) // 10
```

See also:

    DT_PHA_BY_IDX()

Parameters

- node_id – node identifier
• \text{idx} – logical index into “resets”

**Returns**
the id cell value at index “idx”

\text{DT\_RESET\_ID} (\text{node\_id})
Equivalent to \text{DT\_RESET\_ID\_BY\_IDX} (\text{node\_id}, 0)

**See also:**
\text{DT\_RESET\_ID\_BY\_IDX}()

**Parameters**
• \text{node\_id} – node identifier

**Returns**
the id cell value at index 0

\text{DT\_INST\_RESET\_ID\_BY\_IDX} (\text{inst}, \text{idx})
Get a DT\_DRV\_COMPAT instance’s Reset Controller specifier’s id cell value at an index.

**See also:**
\text{DT\_RESET\_ID\_BY\_IDX}()

**Parameters**
• \text{inst} – DT\_DRV\_COMPAT instance number
  • \text{idx} – logical index into “resets”

**Returns**
the id cell value at index “idx”

\text{DT\_INST\_RESET\_ID} (\text{inst})
Equivalent to \text{DT\_INST\_RESET\_ID\_BY\_IDX} (\text{inst}, 0)

**See also:**
\text{DT\_INST\_RESET\_ID\_BY\_IDX}()

**Parameters**
• \text{inst} – DT\_DRV\_COMPAT instance number

**Returns**
the id cell value at index 0

**SPI** These conveniences may be used for nodes which describe either SPI controllers or devices, depending on the case.

\textit{group devicetree-spi}
Defines

DT_SPI_HAS_CS_GPIOS(spi)

Does a SPI controller node have chip select GPIOs configured?

SPI bus controllers use the “cs-gpios” property for configuring chip select GPIOs. Its value is a phandle-array which specifies the chip select lines.

Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;
};
spi2: spi@... {
    compatible = "vnd.spi";
};
```

Example usage:

```
DT_SPI_HAS_CS_GPIOS(DT_NODELABEL(spi1)) // 1
DT_SPI_HAS_CS_GPIOS(DT_NODELABEL(spi2)) // 0
```

Parameters

• spi – a SPI bus controller node identifier

Returns

1 if “spi” has a cs-gpios property, 0 otherwise

DT_SPI_NUM_CS_GPIOS(spi)

Number of chip select GPIOs in a SPI controller’s cs-gpios property.

Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;
};
spi2: spi@... {
    compatible = "vnd.spi";
};
```

Example usage:

```
DT_SPI_NUM_CS_GPIOS(DT_NODELABEL(spi1)) // 2
DT_SPI_NUM_CS_GPIOS(DT_NODELABEL(spi2)) // 0
```

Parameters

• spi – a SPI bus controller node identifier

Returns

Logical length of spi’s cs-gpios property, or 0 if “spi” doesn’t have a cs-gpios property
DT_SPI_DEV_HAS_CS_GPIOS(spi_dev)

Does a SPI device have a chip select line configured? Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
};

spi2: spi@... {
    compatible = "vnd.spi";
    c: spi-dev-c@0 {
        reg = <0>;
    };
};
```

Example usage:

```
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(a)) // 1
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(b)) // 1
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(c)) // 0
```

**Parameters**

- `spi_dev` – a SPI device node identifier

**Returns**

1 if `spi_dev`'s bus node `DT_BUS(spi_dev)` has a chip select pin at index `DT_REG_ADDR(spi_dev)`, 0 otherwise

DT_SPI_DEV_CS_GPIOS_CTLR(spi_dev)
Get a SPI device's chip select GPIO controller's node identifier.

Example devicetree fragment:

```
gpio1: gpio@... { ... };
gpio2: gpio@... { ... };
spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        ... (continues on next page)
reg = <1>;
};
};

Example usage:

DT_SPI_DEV_CS_GPIOS_CTLR(DT_NODELABEL(a)) // DT_NODELABEL(gpio1)
DT_SPI_DEV_CS_GPIOS_CTLR(DT_NODELABEL(b)) // DT_NODELABEL(gpio2)

Parameters
• spi_dev – a SPI device node identifier

Returns
node identifier for spi_dev's chip select GPIO controller

DT_SPI_DEV_CS_GPIOS_LABEL(spi_dev)
Get a SPI device's chip select GPIO controller's label property.

Deprecated:
If used to obtain a device instance with device_get_binding, consider using
DEVICE_DT_GET(DT_SPI_DEV_CS_GPIOS_CTLR(node)).

Example devicetree fragment:

gpio1: gpio@... {
  label = "GPIO_1";
};

gpio2: gpio@... {
  label = "GPIO_2";
};

spi1: spi@... {
  compatible = "vnd.spi";
  cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
             <&gpio2 20 GPIO_ACTIVE_LOW>;

  a: spi-dev-a@0 {
    reg = <0>;
  };

  b: spi-dev-b@1 {
    reg = <1>;
  };
};

Example usage:

DT_SPI_DEV_CS_GPIOS_LABEL(DT_NODELABEL(a)) // "GPIO_1"
DT_SPI_DEV_CS_GPIOS_LABEL(DT_NODELABEL(b)) // "GPIO_2"

Parameters
• spi_dev – a SPI device node identifier

Returns
label property of spi_dev's chip select GPIO controller
DT_SPI_DEV_CS_GPIOS_PIN(spi_dev)
Get a SPI device's chip select GPIO pin number.
It's an error if the GPIO specifier for spi_dev's entry in its bus node's cs-gpios property has no pin cell.
Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
}
```

Example usage:

```
DT_SPI_DEV_CS_GPIOS_PIN(DT_NODELABEL(a)) // 10
DT_SPI_DEV_CS_GPIOS_PIN(DT_NODELABEL(b)) // 20
```

**Parameters**

- `spi_dev` – a SPI device node identifier

**Returns**

pin number of spi_dev's chip select GPIO

DT_SPI_DEV_CS_GPIOS_FLAGS(spi_dev)
Get a SPI device's chip select GPIO flags.
Example devicetree fragment:

```
spi1: spi@... {
    compatible = "vnd,spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };
}
```

Example usage:

```
DT_SPI_DEV_CS_GPIOS_FLAGS(DT_NODELABEL(a)) // GPIO_ACTIVE_LOW
```

If the GPIO specifier for spi_dev's entry in its bus node's cs-gpios property has no flags cell, this expands to zero.

**Parameters**

- `spi_dev` – a SPI device node identifier

**Returns**

flags value of spi_dev's chip select GPIO specifier, or zero if there is none
DT_INST_SPI_DEV_HAS_CS_GPIOS(inst)
   Equivalent to DT_SPI_DEV_HAS_CS_GPIOS(DT_DRV_INST(inst)).

See also:
DT_SPI_DEV_HAS_CS_GPIOS()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
   1 if the instance's bus has a CS pin at index DT_INST_REG_ADDR(inst), 0 otherwise

DT_INST_SPI_DEV_CS_GPIOS_CTLR(inst)
   Get GPIO controller node identifier for a SPI device instance This is equivalent to
   DT_SPI_DEV_CS_GPIOS_CTLR(DT_DRV_INST(inst)).

See also:
DT_SPI_DEV_CS_GPIOS_CTLR()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
   node identifier for instance's chip select GPIO controller

DT_INST_SPI_DEV_CS_GPIOS_LABEL(inst)
   Get GPIO controller name for a SPI device instance This is equivalent to
   DT_SPI_DEV_CS_GPIOS_LABEL(DT_DRV_INST(inst)).

Deprecated:
   If used to obtain a device instance with device_get_binding, consider using
   DEVICE_DT_GET(DT_INST_SPI_DEV_CS_GPIOS_CTLR(node)).

See also:
DT_SPI_DEV_CS_GPIOS_LABEL()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
   label property of the instance's chip select GPIO controller

DT_INST_SPI_DEV_CS_GPIOS_PIN(inst)
   Equivalent to DT_SPI_DEV_CS_GPIOS_PIN(DT_DRV_INST(inst)).

See also:
DT_SPI_DEV_CS_GPIOS_PIN()
• inst – DT_DRV_COMPAT instance number

Returns
pin number of the instance's chip select GPIO

DT_INST_SPI_DEV_CS_GPIOS_FLAGS(inst)

DT_SPI_DEV_CS_GPIOS_FLAGS(DT_DRV_INST(inst)).

See also:

DT_SPI_DEV_CS_GPIOS_FLAGS()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
flags value of the instance's chip select GPIO specifier, or zero if there is none

Chosen nodes
The special /chosen node contains properties whose values describe system-wide settings. The DT_CHOSEN() macro can be used to get a node identifier for a chosen node.

group devicetree-generic-chosen

Defines

DT_CHOSEN(prop)

Get a node identifier for a /chosen node property.

This is only valid to call if DT_HAS_CHOSEN(prop) is 1.

Parameters
• prop – lowercase-and-underscores property name for the /chosen node

Returns
a node identifier for the chosen node property

DT_HAS_CHOSEN(prop)

Test if the devicetree has a /chosen node.

Parameters
• prop – lowercase-and-underscores devicetree property

Returns
1 if the chosen property exists and refers to a node, 0 otherwise

Zephyr-specific chosen nodes
The following table documents some commonly used Zephyr-specific chosen nodes.

Sometimes, a chosen node's label property will be used to set the default value of a Kconfig option which in turn configures a hardware-specific device. This is usually for backwards compatibility in cases when the Kconfig option predates devicetree support in Zephyr. In other cases, there is no Kconfig option, and the devicetree node is used directly in the source code to select a device.
Table 5.1: Zephyr-specific chosen properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>zephyr,bt-c2h-uart</code></td>
<td>Selects the UART used for host communication in the <code>bluetooth-hci-uart-sample</code></td>
</tr>
<tr>
<td><code>zephyr,bt-mon-uart</code></td>
<td>Sets UART device used for the Bluetooth monitor logging</td>
</tr>
<tr>
<td><code>zephyr,bt-uart</code></td>
<td>Sets UART device used by Bluetooth</td>
</tr>
<tr>
<td><code>zephyr,canbus</code></td>
<td>Sets the default CAN controller</td>
</tr>
<tr>
<td><code>zephyr,ccm</code></td>
<td>Core-Coupled Memory node on some STM32 SoCs</td>
</tr>
<tr>
<td><code>zephyr,code-partition</code></td>
<td>Flash partition that the Zephyr image's text section should be linked into</td>
</tr>
<tr>
<td><code>zephyr,console</code></td>
<td>Sets UART device used by console driver</td>
</tr>
<tr>
<td><code>zephyr,display</code></td>
<td>Sets the default display controller</td>
</tr>
<tr>
<td><code>zephyr,keyboard-scan</code></td>
<td>Sets the default keyboard scan controller</td>
</tr>
<tr>
<td><code>zephyr,dtcm</code></td>
<td>Data Tightly Coupled Memory node on some Arm SoCs</td>
</tr>
<tr>
<td><code>zephyr,entropy</code></td>
<td>A device which can be used as a system-wide entropy source</td>
</tr>
<tr>
<td><code>zephyr,flash</code></td>
<td>A node whose <code>reg</code> is sometimes used to set the defaults for <code>CONFIG_FLASH_BASE_ADDRESS</code> and <code>CONFIG_FLASH_SIZE</code></td>
</tr>
<tr>
<td><code>zephyr,flash-controller</code></td>
<td>The node corresponding to the flash controller device for the <code>zephyr,flash</code> node</td>
</tr>
<tr>
<td><code>zephyr,gdbstub-uart</code></td>
<td>Sets UART device used by the <code>GDB stub</code> subsystem</td>
</tr>
<tr>
<td><code>zephyr,ieee802154</code></td>
<td>Used by the networking subsystem to set the IEEE 802.15.4 device</td>
</tr>
<tr>
<td><code>zephyr,ipc</code></td>
<td>Used by the OpenAMP subsystem to specify the inter-process communication (IPC) device</td>
</tr>
<tr>
<td><code>zephyr,ipc_shm</code></td>
<td>A node whose <code>reg</code> is used by the OpenAMP subsystem to determine the base address and size of the shared memory (SHM) usable for interprocess-communication (IPC)</td>
</tr>
<tr>
<td><code>zephyr,itmcm</code></td>
<td>Instruction Tightly Coupled Memory node on some Arm SoCs</td>
</tr>
<tr>
<td><code>zephyr,ocm</code></td>
<td>On-chip memory node on Xilinx Zynq-7000 and ZynqMP SoCs</td>
</tr>
<tr>
<td><code>zephyr,osdp-uart</code></td>
<td>Sets UART device used by OSDP subsystem</td>
</tr>
<tr>
<td><code>zephyr,ot-uart</code></td>
<td>Used by the OpenThread to specify UART device for Spinel protocol</td>
</tr>
<tr>
<td><code>zephyr,piee-controller</code></td>
<td>The node corresponding to the PCIe Controller</td>
</tr>
<tr>
<td><code>zephyr,ppp-uart</code></td>
<td>Sets UART device used by PPP</td>
</tr>
<tr>
<td><code>zephyr,settings-partition</code></td>
<td>Fixed partition node. If defined this selects the partition used by the NVS and FCB settings backends.</td>
</tr>
<tr>
<td><code>zephyr,shell-uart</code></td>
<td>Sets UART device used by serial shell backend</td>
</tr>
<tr>
<td><code>zephyr,sram</code></td>
<td>A node whose <code>reg</code> sets the base address and size of SRAM memory available to the Zephyr image, used during linking</td>
</tr>
<tr>
<td><code>zephyr,tracing-uart</code></td>
<td>Sets UART device used by tracing subsystem</td>
</tr>
<tr>
<td><code>zephyr,uart-mcumgr</code></td>
<td>UART used for Device Management</td>
</tr>
<tr>
<td><code>zephyr,uart-pipe</code></td>
<td>Sets UART device used by serial pipe driver</td>
</tr>
<tr>
<td><code>zephyr,usb-device</code></td>
<td>USB device node. If defined and has a <code>vbus-gpios</code> property, these will be used by the USB subsystem to enable/disable VBUS</td>
</tr>
</tbody>
</table>

**Bindings index**

This page documents the available devicetree bindings. See Devicetree bindings for an introduction to the Zephyr bindings file format.

**Vendor index** This section contains an index of hardware vendors. Click on a vendor's name to go to the list of bindings for that vendor.

- Generic or vendor-independent

Bindings by vendor This section contains available bindings, grouped by vendor. Within each group, bindings are listed by the “compatible” property they apply to, like this:

Vendor name (vendor prefix)
• <compatible-A>
• <compatible-B> (on <bus-name> bus)
• <compatible-C>
• ...
The text “(on <bus-name> bus)” appears when bindings may behave differently depending on the bus the node appears on. For example, this applies to some sensor device nodes, which may appear as children of either I2C or SPI bus nodes.

5.3 Configuration System (Kconfig)

The Zephyr kernel and subsystems can be configured at build time to adapt them for specific application and platform needs. Configuration is handled through Kconfig, which is the same configuration system used by the Linux kernel. The goal is to support configuration without having to change any source code.

Configuration options (often called symbols) are defined in Kconfig files, which also specify dependencies between symbols that determine what configurations are valid. Symbols can be grouped into menus and sub-menus to keep the interactive configuration interfaces organized.

The output from Kconfig is a header file autoconf.h with macros that can be tested at build time. Code for unused features can be compiled out to save space.

The following sections explain how to set Kconfig configuration options, go into detail on how Kconfig is used within the Zephyr project, and have some tips and best practices for writing Kconfig files.

5.3.1 Interactive Kconfig interfaces

There are two interactive configuration interfaces available for exploring the available Kconfig options and making temporary changes: menuconfig and guiconfig. menuconfig is a curses-based interface that runs in the terminal, while guiconfig is a graphical configuration interface.

Note: The configuration can also be changed by editing zephyr/.config in the application build directory by hand. Using one of the configuration interfaces is often handier, as they correctly handle dependencies between configuration symbols.

If you try to enable a symbol with unsatisfied dependencies in zephyr/.config, the assignment will be ignored and overwritten when re-configuring.

To make a setting permanent, you should set it in a *.conf file, as described in Setting Kconfig configuration values.

Tip: Saving a minimal configuration file (with e.g. D in menuconfig) and inspecting it can be handy when making settings permanent. The minimal configuration file only lists symbols that differ from their default value.

To run one of the configuration interfaces, do this:

1. Build your application as usual using either west or cmake:

   Using west:
   
   ```
   west build -b <board>
   ```

   Using CMake and ninja:
   
   ```
   mkdir build && cd build
   cmake -GNinja -DBOARD=<board> ..
   ninja
   ```

2. To run the terminal-based menuconfig interface, use either of these commands:
west build -t menuconfig

ninja menuconfig

To run the graphical `guiconfig`, use either of these commands:

west build -t guiconfig

ninja guiconfig

**Note:** If you get an import error for `tkinter` when trying to run `guiconfig`, you are missing required packages. See *Install Linux Host Dependencies*. The package you need is usually called something like `python3-tk`/`python3-tkinter`.

`tkinter` is not included by default in many Python installations, despite being part of the standard library.

The two interfaces are shown below:

![Zephyr Kernel Configuration](image)

`guiconfig` always shows the help text and other information related to the currently selected item in the bottom window pane. In the terminal interface, press `?` to view the same information.

**Note:** If you prefer to work in the `guiconfig` interface, then it’s a good idea to check any changes to Kconfig files you make in `single-menu mode`, which is toggled via a checkbox at the top. Unlike full-tree mode, single-menu mode will distinguish between symbols defined with `config` and symbols defined with `menuconfig`, showing you what things would look like in the `menuconfig` interface.

3. Change configuration values in the `menuconfig` interface as follows:

   • Navigate the menu with the arrow keys. Common Vim key bindings are supported as well.
   • Use `Space` and `Enter` to enter menus and toggle values. Menus appear with `--->` next to them. Press `ESC` to return to the parent menu.
Boolean configuration options are shown with \[ \] brackets, while numeric and string-valued configuration symbols are shown with ( ) brackets. Symbol values that can’t be changed are shown as \(- -\) or \(-*-\).

**Note:** You can also press Y or N to set a boolean configuration symbol to the corresponding value.

- Press ? to display information about the currently selected symbol, including its help text. Press ESC or Q to return from the information display to the menu.

In the guiconfig interface, either click on the image next to the symbol to change its value, or double-click on the row with the symbol (this only works if the symbol has no children, as double-clicking a symbol with children open/closes its menu instead).

guiconfig also supports keyboard controls, which are similar to menuconfig.

4. Pressing Q in the menuconfig interface will bring up the save-and-quit dialog (if there are changes to save):

    Press Y to save the kernel configuration options to the default filename (zephyr/.config). You will typically save to the default filename unless you are experimenting with different configurations.

The guiconfig interface will also prompt for saving the configuration on exit if it has been modified.

**Note:** The configuration file used during the build is always zephyr/.config. If you have another saved configuration that you want to build with, copy it to zephyr/.config. Make sure to back up your original configuration file.
Also note that filenames starting with . are not listed by `ls` by default on Linux and macOS. Use the `-a` flag to see them.

Finding a symbol in the menu tree and navigating to it can be tedious. To jump directly to a symbol, press the `/` key (this also works in `guiconfig`). This brings up the following dialog, where you can search for symbols by name and jump to them. In `guiconfig`, you can also change symbol values directly within the dialog.

If you jump to a symbol that isn’t currently visible (e.g., due to having unsatisfied dependencies), then show-all mode will be enabled. In show-all mode, all symbols are displayed, including currently invisible symbols. To turn off show-all mode, press `A` in `menuconfig` or `Ctrl-A` in `guiconfig`.

**Note:** Show-all mode can’t be turned off if there are no visible items in the current menu.
To figure out why a symbol you jumped to isn’t visible, inspect its dependencies, either by pressing `?` in menuconfig or in the information pane at the bottom in guiconfig. If you discover that the symbol depends on another symbol that isn’t enabled, you can jump to that symbol in turn to see if it can be enabled.

**Note:** In menuconfig, you can press Ctrl-F to view the help of the currently selected item in the jump-to dialog without leaving the dialog.

For more information on menuconfig and guiconfig, see the Python docstrings at the top of menuconfig.py and guiconfig.py.

### 5.3.2 Setting Kconfig configuration values

The menuconfig and guiconfig interfaces can be used to test out configurations during application development. This page explains how to make settings permanent.

All Kconfig options can be searched in the Kconfig search page.

**Note:** Before making changes to Kconfig files, it’s a good idea to also go through the Kconfig - Tips and Best Practices page.

#### Visible and invisible Kconfig symbols

When making Kconfig changes, it’s important to understand the difference between visible and invisible symbols.

- A visible symbol is a symbol defined with a prompt. Visible symbols show up in the interactive configuration interfaces (hence visible), and can be set in configuration files.

Here’s an example of a visible symbol:

```c
config FPU
  bool "Support floating point operations"
  depends on HAS_FPU
```

The symbol is shown like this in menuconfig, where it can be toggled:

```
[ ] Support floating point operations
```
An invisible symbol is a symbol without a prompt. Invisible symbols are not shown in the interactive configuration interfaces, and users have no direct control over their value. They instead get their value from defaults or from other symbols.

Here’s an example of an invisible symbol:

```plaintext
config CPU_HAS_FPU
  bool
  help
  This symbol is y if the CPU has a hardware floating point unit.
```

In this case, CPU_HAS_FPU is enabled through other symbols having `select CPU_HAS_FPU`.

### Setting symbols in configuration files

Visible symbols can be configured by setting them in configuration files. The initial configuration is produced by merging a `*_defconfig` file for the board with application settings, usually from `prj.conf`. See [The Initial Configuration](#) below for more details.

Assignments in configuration files use this syntax:

```plaintext
CONFIG_<symbol name>=<value>
```

There should be no spaces around the equals sign.

bool symbols can be enabled or disabled by setting them to `y` or `n`, respectively. The FPU symbol from the example above could be enabled like this:

```plaintext
CONFIG_FPU=y
```

**Note:** A boolean symbol can also be set to `n` with a comment formatted like this:

```plaintext
# CONFIG_SOME_OTHER_BOOL is not set
```

This is the format you will see in the merged configuration in `zephyr/.config`.

This style is accepted for historical reasons: Kconfig configuration files can be parsed as makefiles (though Zephyr doesn’t use this). Having `n`-valued symbols correspond to unset variables simplifies tests in Make.

Other symbol types are assigned like this:

```plaintext
CONFIG_SOME_STRING="cool value"
CONFIG_SOME_INT=123
```

Comments use a `#`:

```plaintext
# This is a comment
```

Assignments in configuration files are only respected if the dependencies for the symbol are satisfied. A warning is printed otherwise. To figure out what the dependencies of a symbol are, use one of the [interactive configuration interfaces](#) (you can jump directly to a symbol with `/`), or look up the symbol in the Kconfig search page.

### The Initial Configuration

The initial configuration for an application comes from merging configuration settings from three sources:
1. A BOARD-specific configuration file stored in boards/<architecture>/<BOARD>/
   <BOARD>_defconfig

2. Any CMake cache entries prefix with CONFIG_

3. The application configuration

The application configuration can come from the sources below. By default, prj.conf is used.

1. If CONF_FILE is set, the configuration file(s) specified in it are merged and used as the application
   configuration. CONF_FILE can be set in various ways:
   
   1. In CMakeLists.txt, before calling find_package(Zephyr)
   2. By passing -DCONF_FILE=<conf file(s)>, either directly or via west
   3. From the CMake variable cache

2. Otherwise if CONF_FILE is set, and a single configuration file of the form prj_<build>.conf is
   used, then if file boards/<BOARD>_<build>.conf exists in same folder as file prj_<build>.conf,
   the result of merging prj_<build>.conf and boards/<BOARD>_<build>.conf is used.

3. Otherwise, prj_<BOARD>.conf is used if it exists in the application configuration directory.

4. Otherwise, if boards/<BOARD>.conf exists in the application configuration directory, the result of
   merging it with prj.conf is used.

5. Otherwise, if board revisions are used and boards/<BOARD>_<revision>.conf exists in the appli-
   cation configuration directory, the result of merging it with prj.conf and boards/<BOARD>.conf
   is used.

6. Otherwise, prj.conf is used if it exists in the application configuration directory

All configuration files will be taken from the application's configuration directory except for files with an
absolute path that are given with the CONF_FILE, OVERLAY_CONFIG, and DTC_OVERLAY_FILE arguments.
For these, a file in a Zephyr module can be referred by escaping the Zephyr module dir variable like
this \${ZEPHYR_<module>_MODULE_DIR}/<path-to>/<file> when setting any of said variables in the
application's CMakeLists.txt.

See Application Configuration Directory on how the application configuration directory is defined.

If a symbol is assigned both in <BOARD>_defconfig and in the application configuration, the value set in
the application configuration takes precedence.

The merged configuration is saved to zephyr/.config in the build directory.

As long as zephyr/.config exists and is up-to-date (is newer than any BOARD and application configu-
ration files), it will be used in preference to producing a new merged configuration. zephyr/.config is
also the configuration that gets modified when making changes in the interactive configuration interfaces.

Configuring invisible Kconfig symbols

When making changes to the default configuration for a board, you might have to configure invisible
symbols. This is done in boards/<architecture>/<BOARD>/Kconfig.defconfig, which is a regular
Kconfig file.

Note: Assignments in .config files have no effect on invisible symbols, so this scheme is not just an
organizational issue.

Assigning values in Kconfig.defconfig relies on defining a Kconfig symbol in multiple locations. As an
example, say we want to set FOO_WIDTH below to 32:

```
config FOO_WIDTH
int
```
To do this, we extend the definition of FOO_WIDTH as follows, in `Kconfig.defconfig`:

```plaintext
if BOARD_MY_BOARD
    config FOO_WIDTH
default 32
endif
```

**Note:** Since the type of the symbol (int) has already been given at the first definition location, it does not need to be repeated here. Only giving the type once at the “base” definition of the symbol is a good idea for reasons explained in *Common Kconfig shorthands*.

Default values in `Kconfig.defconfig` files have priority over default values given on the “base” definition of a symbol. Internally, this is implemented by including the `Kconfig.defconfig` files first. `Kconfig` uses the first default with a satisfied condition, where an empty condition corresponds to `if y` (is always satisfied).

Note that conditions from surrounding top-level `if`s are propagated to symbol properties, so the above default is equivalent to `default 32 if BOARD_MY_BOARD`.

**Warning:** When defining a symbol in multiple locations, dependencies are ORed together rather than ANDed together. It is not possible to make the dependencies of a symbol more restrictive by defining it in multiple locations.

For example, the direct dependencies of the symbol below becomes `DEP1 || DEP2`:

```plaintext
config FOO
... 
depends on DEP1
config FOO
... 
depends on DEP2
```

When making changes to `Kconfig.defconfig` files, always check the symbol’s direct dependencies in one of the interactive configuration interfaces afterwards. It is often necessary to repeat dependencies from the base definition of the symbol to avoid weakening a symbol’s dependencies.

**Motivation for Kconfig.defconfig files**  One motivation for this configuration scheme is to avoid making fixed BOARD-specific settings configurable in the interactive configuration interfaces. If all board configuration were done via `<BOARD>_defconfig`, all symbols would have to be visible, as values given in `<BOARD>_defconfig` have no effect on invisible symbols.

Having fixed settings be user-configurable would clutter up the configuration interfaces and make them harder to understand, and would make it easier to accidentally create broken configurations.

When dealing with fixed board-specific settings, also consider whether they should be handled via `devicetree` instead.

**Configuring choices**  There are two ways to configure a Kconfig choice:

1. By setting one of the choice symbols to `y` in a configuration file.

   Setting one choice symbol to `y` automatically gives all other choice symbols the value `n`.

   If multiple choice symbols are set to `y`, only the last one set to `y` will be honored (the rest will get the value `n`). This allows a choice selection from a board `defconfig` file to be overridden from an
1. By changing the default symbol of the choice in `Kconfig.defconfig`

As with symbols, changing the default for a choice is done by defining the choice in multiple locations. For this to work, the choice must have a name.

As an example, assume that a choice has the following base definition (here, the name of the choice is `FOO`):

```c
choice FOO
  bool "Foo choice"
  default B
config A
  bool "A"
config B
  bool "B"
endchoice
```

To change the default symbol of `FOO` to `A`, you would add the following definition to `Kconfig.defconfig`:

```c
defconfig:
  choice FOO
    default A
  endchoice
```

The `Kconfig.defconfig` method should be used when the dependencies of the choice might not be satisfied. In that case, you're setting the default selection whenever the user makes the choice visible.

More Kconfig resources

The `Kconfig - Tips and Best Practices` page has some tips for writing Kconfig files.

The `kconfiglib.py` docstring (at the top of the file) goes over how symbol values are calculated in detail.

5.3.3 Kconfig - Tips and Best Practices

This page covers some Kconfig best practices and explains some Kconfig behaviors and features that might be cryptic or that are easily overlooked.

**Note:** The official Kconfig documentation is `kconfig-language.rst` and `kconfig-macro-language.rst`.

- What to turn into Kconfig options
- What not to turn into Kconfig options
  - Options that specify a device in the system by name
  - Options that specify fixed hardware configuration
- `select` statements
  - `select` pitfalls
  - Alternatives to `select`
What to turn into Kconfig options

When deciding whether something belongs in Kconfig, it helps to distinguish between symbols that have prompts and symbols that don't.

If a symbol has a prompt (e.g. bool "Enable foo"), then the user can change the symbol's value in the menuconfig or guiconfig interface (see Interactive Kconfig interfaces), or by manually editing configuration files. Conversely, a symbol without a prompt can never be changed directly by the user, not even by manually editing configuration files.

Only put a prompt on a symbol if it makes sense for the user to change its value.

Symbols without prompts are called hidden or invisible symbols, because they don't show up in menuconfig and guiconfig. Symbols that have prompts can also be invisible, when their dependencies are not satisfied.

Symbols without prompts can't be configured directly by the user (they derive their value from other symbols), so less restrictions apply to them. If some derived setting is easier to calculate in Kconfig than e.g. during the build, then do it in Kconfig, but keep the distinction between symbols with and without prompts in mind.

See the optional prompts section for a way to deal with settings that are fixed on some machines and configurable on other machines.
What not to turn into Kconfig options

In Zephyr, Kconfig configuration is done after selecting a target board. In general, it does not make sense to use Kconfig for a value that corresponds to a fixed machine-specific setting. Usually, such settings should be handled via devicetree instead.

In particular, avoid adding new Kconfig options of the following types:

Options that specify a device in the system by name  For example, if you are writing an I2C device driver, avoid creating an option named MY_DEVICE_I2C_BUS_NAME for specifying the bus node your device is controlled by. See Device drivers that depend on other devices for alternatives.

Similarly, if your application depends on a hardware-specific PWM device to control an RGB LED, avoid creating an option like MY_PWM_DEVICE_NAME. See Applications that depend on board-specific devices for alternatives.

Options that specify fixed hardware configuration  For example, avoid Kconfig options specifying a GPIO pin.

An alternative applicable to device drivers is to define a GPIO specifier with type phandle-array in the device binding, and using the GPIO devicetree API from C. Similar advice applies to other cases where devicetree.h provides Hardware specific APIs for referring to other nodes in the system. Search the source code for drivers using these APIs for examples.

An application-specific devicetree binding to identify board specific properties may be appropriate. See tests/drivers/gpio/gpio_basic_api for an example.

For applications, see blinky-sample for a devicetree-based alternative.

select statements

The select statement is used to force one symbol to y whenever another symbol is y. For example, the following code forces CONSOLE to y whenever USB_CONSOLE is y:

```c
config CONSOLE
  bool "Console support"
...
config USB_CONSOLE
  bool "USB console support"
  select CONSOLE
```

This section covers some pitfalls and good uses for select.

select pitfalls  select might seem like a generally useful feature at first, but can cause configuration issues if overused.

For example, say that a new dependency is added to the CONSOLE symbol above, by a developer who is unaware of the USB_CONSOLE symbol (or simply forgot about it):

```c
config CONSOLE
  bool "Console support"
  depends on STRING_ROUTINES
```

Enabling USB_CONSOLE now forces CONSOLE to y, even if STRING_ROUTINES is n.

To fix the problem, the STRING_ROUTINES dependency needs to be added to USB_CONSOLE as well:
config USB_CONSOLE
  bool "USB console support"
  select CONSOLE
  depends on STRING_ROUTINES

...

config STRING_ROUTINES
  bool "Include string routines"

More insidious cases with dependencies inherited from if and menu statements are common.
An alternative attempt to solve the issue might be to turn the depends on into another select:

config CONSOLE
  bool "Console support"
  select STRING_ROUTINES

...

config USB_CONSOLE
  bool "USB console support"
  select CONSOLE

In practice, this often amplifies the problem, because any dependencies added to STRING_ROUTINES now need to be copied to both CONSOLE and USB_CONSOLE.

In general, whenever the dependencies of a symbol are updated, the dependencies of all symbols that (directly or indirectly) select it have to be updated as well. This is very often overlooked in practice, even for the simplest case above.

Chains of symbols selecting each other should be avoided in particular, except for simple helper symbols, as covered below in Using select for helper symbols.

Liberal use of select also tends to make Kconfig files harder to read, both due to the extra dependencies and due to the non-local nature of select, which hides ways in which a symbol might get enabled.

Alternatives to select For the example in the previous section, a better solution is usually to turn the select into a depends on:

config CONSOLE
  bool "Console support"

...

config USB.Console
  bool "USB console support"
  depends on CONSOLE

This makes it impossible to generate an invalid configuration, and means that dependencies only ever have to be updated in a single spot.

An objection to using depends on here might be that configuration files that enable USB_CONSOLE now also need to enable CONSOLE:

CONFIG_CONSOLE=y
CONFIG_USB_CONSOLE=y

This comes down to a trade-off, but if enabling CONSOLE is the norm, then a mitigation is to make CONSOLE default to y:
config CONSOLE
    bool "Console support"
    default y

This gives just a single assignment in configuration files:

CONFIG_USB_CONSOLE=y

Note that configuration files that do not want CONSOLE enabled now have to explicitly disable it:

CONFIG_CONSOLE=n

Using select for helper symbols  A good and safe use of select is for setting “helper” symbols that capture some condition. Such helper symbols should preferably have no prompt or dependencies.

For example, a helper symbol for indicating that a particular CPU/SoC has an FPU could be defined as follows:

config CPU_HAS_FPU
    bool
    help
        If y, the CPU has an FPU
...

config SOC_FOO
    bool "FOO SoC"
    select CPU_HAS_FPU
...

config SOC_BAR
    bool "BAR SoC"
    select CPU_HAS_FPU
This makes it possible for other symbols to check for FPU support in a generic way, without having to look for particular architectures:

config FPU
    bool "Support floating point operations"
    depends on CPU_HAS_FPU

The alternative would be to have dependencies like the following, possibly duplicated in several spots:

config FPU
    bool "Support floating point operations"
    depends on SOC_FOO || SOC_BAR || ...

Invisible helper symbols can also be useful without select. For example, the following code defines a helper symbol that has the value y if the machine has some arbitrarily-defined “large” amount of memory:

config LARGE_MEM
    def_bool MEM_SIZE >= 64

Note: This is short for the following:
select recommendations  In summary, here are some recommended practices for select:

- Avoid selecting symbols with prompts or dependencies. Prefer depends on. If depends on causes annoying bloat in configuration files, consider adding a Kconfig default for the most common value.

  Rare exceptions might include cases where you’re sure that the dependencies of the selecting and selected symbol will never drift out of sync, e.g. when dealing with two simple symbols defined close to one another within the same if.

  Common sense applies, but be aware that select often causes issues in practice. depends on is usually a cleaner and safer solution.

- Select simple helper symbols without prompts and dependencies however much you like. They’re a great tool for simplifying Kconfig files.

(Lack of) conditional includes

if blocks add dependencies to each item within the if, as if depends on was used.

A common misunderstanding related to if is to think that the following code conditionally includes the file Kconfig.other:

```c
if DEP
  source "Kconfig.other"
endif
```

In reality, there are no conditional includes in Kconfig. if has no special meaning around a source.

**Note:** Conditional includes would be impossible to implement, because if conditions may contain (either directly or indirectly) forward references to symbols that haven’t been defined yet.

Say that Kconfig.other above contains this definition:

```c
config FOO
  bool "Support foo"
```

In this case, FOO will end up with this definition:

```c
config FOO
  bool "Support foo"
  depends on DEP
```

Note that it is redundant to add depends on DEP to the definition of FOO in Kconfig.other, because the DEP dependency has already been added by if DEP.

In general, try to avoid adding redundant dependencies. They can make the structure of the Kconfig files harder to understand, and also make changes more error-prone, since it can be hard to spot that the same dependency is added twice.

“Stuck” symbols in menuconfig and guiconfig

There is a common subtle gotcha related to interdependent configuration symbols with prompts. Consider these symbols:
Assume that the intention here is to use a larger stack whenever FOO is enabled, and that the configuration initially has FOO disabled. Also, remember that Zephyr creates an initial configuration in `zephyr/.config` in the build directory by merging configuration files (including e.g. `prj.conf`). This configuration file exists before `menuconfig` or `guiconfig` is run.

When first entering the configuration interface, the value of STACK_SIZE is 0x100, as expected. After enabling FOO, you might reasonably expect the value of STACK_SIZE to change to 0x200, but it stays as 0x100.

To understand what's going on, remember that STACK_SIZE has a prompt, meaning it is user-configurable, and consider that all Kconfig has to go on from the initial configuration is this:

```plaintext
CONFIG_STACK_SIZE=0x100
```

Since Kconfig can’t know if the 0x100 value came from a default or was typed in by the user, it has to assume that it came from the user. Since STACK_SIZE is user-configurable, the value from the configuration file is respected, and any symbol defaults are ignored. This is why the value of STACK_SIZE appears to be “frozen” at 0x100 when toggling FOO.

The right fix depends on what the intention is. Here’s some different scenarios with suggestions:

- **If STACK_SIZE can always be derived automatically and does not need to be user-configurable, then just remove the prompt:**

  ```plaintext
  config STACK_SIZE
  hex
  default 0x200 if FOO
  default 0x100
  ```

  Symbols without prompts ignore any value from the saved configuration.

- **If STACK_SIZE should usually be user-configurable, but needs to be set to 0x200 when FOO is enabled, then disable its prompt when FOO is enabled, as described in optional prompts:**

  ```plaintext
  config STACK_SIZE
  hex "Stack size" if !FOO
  default 0x200 if FOO
  default 0x100
  ```

- **If STACK_SIZE should usually be derived automatically, but needs to be set to a custom value in rare circumstances, then add another option for making STACK_SIZE user-configurable:**

  ```plaintext
  config CUSTOM_STACK_SIZE
  bool "Use a custom stack size"
  help
      Enable this if you need to use a custom stack size. When disabled, a suitable stack size is calculated automatically.
  ```

  ```plaintext
  config STACK_SIZE
  hex "Stack size" if CUSTOM_STACK_SIZE
  default 0x200 if FOO
  default 0x100
  ```
As long as CUSTOM_STACK_SIZE is disabled, STACK_SIZE will ignore the value from the saved configuration.

It is a good idea to try out changes in the menuconfig or guiconfig interface, to make sure that things behave the way you expect. This is especially true when making moderately complex changes like these.

Assignments to promptless symbols in configuration files

Assignments to hidden (promptless, also called invisible) symbols in configuration files are always ignored. Hidden symbols get their value indirectly from other symbols, via e.g. default and select.

A common source of confusion is opening the output configuration file (zephyr/.config), seeing a bunch of assignments to hidden symbols, and assuming that those assignments must be respected when the configuration is read back in by Kconfig. In reality, all assignments to hidden symbols in zephyr/.config are ignored by Kconfig, like for other configuration files.

To understand why zephyr/.config still includes assignments to hidden symbols, it helps to realize that zephyr/.config serves two separate purposes:

1. It holds the saved configuration, and
2. it holds configuration output. zephyr/.config is parsed by the CMake files to let them query configuration settings, for example.

The assignments to hidden symbols in zephyr/.config are just configuration output. Kconfig itself ignores assignments to hidden symbols when calculating symbol values.

**Note:** A minimal configuration, which can be generated from within the menuconfig and guiconfig interfaces, could be considered closer to just a saved configuration, without the full configuration output.

depends on and string/int/hex symbols

depends on works not just for bool symbols, but also for string, int, and hex symbols (and for choices).

The Kconfig definitions below will hide the FOO_DEVICE_FREQUENCY symbol and disable any configuration output for it when FOO_DEVICE is disabled.

```c
config FOO_DEVICE
    bool "Foo device"

config FOO_DEVICE_FREQUENCY
    int "Foo device frequency"
    depends on FOO_DEVICE
```

In general, it's a good idea to check that only relevant symbols are ever shown in the menuconfig/guiconfig interface. Having FOO_DEVICE_FREQUENCY show up when FOO_DEVICE is disabled (and possibly hidden) makes the relationship between the symbols harder to understand, even if code never looks at FOO_DEVICE_FREQUENCY when FOO_DEVICE is disabled.

menuconfig symbols

If the definition of a symbol F00 is immediately followed by other symbols that depend on F00, then those symbols become children of F00. If F00 is defined with config F00, then the children are shown indented relative to F00. Defining F00 with menuconfig F00 instead puts the children in a separate menu root at F00.

menuconfig has no effect on evaluation. It's just a display option.
menuconfig can cut down on the number of menus and make the menu structure easier to navigate. For example, say you have the following definitions:

```c
menu "Foo subsystem"

config FOO_SUBSYSTEM
    bool "Foo subsystem"

if FOO_SUBSYSTEM

config FOO_FEATURE_1
    bool "Foo feature 1"

config FOO_FEATURE_2
    bool "Foo feature 2"

config FOO_FREQUENCY
    int "Foo frequency"

... lots of other FOO-related symbols

endif # FOO_SUBSYSTEM

demenu
```

In this case, it's probably better to get rid of the `menu` and turn `FOO_SUBSYSTEM` into a `menuconfig` symbol:

```c
menuconfig FOO_SUBSYSTEM
    bool "Foo subsystem"

if FOO_SUBSYSTEM

config FOO_FEATURE_1
    bool "Foo feature 1"

config FOO_FEATURE_2
    bool "Foo feature 2"

config FOO_FREQUENCY
    int "Foo frequency"

... lots of other FOO-related symbols

endif # FOO_SUBSYSTEM

endmenu
```

In the `menuconfig` interface, this will be displayed as follows:

```
[*] Foo subsystem  --->
```

Note that making a symbol without children a `menuconfig` is meaningless. It should be avoided, because it looks identical to a symbol with all children invisible:

```
[*] I have no children  ----
[++] All my children are invisible  ----
```

**Commas in macro arguments**

Kconfig uses commas to separate macro arguments. This means a construct like this will fail:
config FOO
  bool
  default y if $(dt_chosen_enabled,"zephyr,bar")

To solve this problem, create a variable with the text and use this variable as argument, as follows:

DT_CHOSEN_ZEPHYR_BAR := zephyr,bar

config FOO
  bool
  default y if $(dt_chosen_enabled,$(DT_CHOSEN_ZEPHYR_BAR))

Checking changes in menuconfig/guiconfig

When adding new symbols or making other changes to Kconfig files, it is a good idea to look up the symbols in menuconfig or guiconfig afterwards. To get to a symbol quickly, use the jump-to feature (press /).

Here are some things to check:

- Are the symbols placed in a good spot? Check that they appear in a menu where they make sense, close to related symbols.

  If one symbol depends on another, then it's often a good idea to place it right after the symbol it depends on. It will then be shown indented relative to the symbol it depends on in the menuconfig interface, and in a separate menu rooted at the symbol in guiconfig. This also works if several symbols are placed after the symbol they depend on.

- Is it easy to guess what the symbols do from their prompts?

- If many symbols are added, do all combinations of values they can be set to make sense?

  For example, if two symbols FOO_SUPPORT and NO_FOO_SUPPORT are added, and both can be enabled at the same time, then that makes a nonsensical configuration. In this case, it's probably better to have a single FOO_SUPPORT symbol.

- Are there any duplicated dependencies?

  This can be checked by selecting a symbol and pressing ? to view the symbol information. If there are duplicated dependencies, then use the Included via ... path shown in the symbol information to figure out where they come from.

Checking changes with scripts/kconfig/lint.py

After you make Kconfig changes, you can use the scripts/kconfig/lint.py script to check for some potential issues, like unused symbols and symbols that are impossible to enable. Use --help to see available options.

Some checks are necessarily a bit heuristic, so a symbol being flagged by a check does not necessarily mean there's a problem. If a check returns a false positive e.g. due to token pasting in C (CONFIG_FOO_##index##_BAR), just ignore it.

When investigating an unknown symbol FOO_BAR, it is a good idea to run git grep FOO_BAR to look for references. It is also a good idea to search for some components of the symbol name with e.g. git grep FOO and git grep BAR, as it can help uncover token pasting.

Style recommendations and shorthands

This section gives some style recommendations and explains some common Kconfig shorthands.
Factoring out common dependencies  If a sequence of symbols/choices share a common dependency, the dependency can be factored out with an if.

As an example, consider the following code:

```plaintext
config FOO
  bool "Foo"
  depends on DEP

config BAR
  bool "Bar"
  depends on DEP

choice
  prompt "Choice"
  depends on DEP

config BAZ
  bool "Baz"

config QAZ
  bool "Qaz"
endchoice

Here, the DEP dependency can be factored out like this:

if DEP

config FOO
  bool "Foo"

config BAR
  bool "Bar"

choice
  prompt "Choice"
config BAZ
  bool "Baz"
config QAZ
  bool "Qaz"
endchoice
endif # DEP
```

Note: Internally, the second version of the code is transformed into the first.

If a sequence of symbols/choices with shared dependencies are all in the same menu, the dependency can be put on the menu itself:

```plaintext
menu "Foo features"
  depends on FOO_SUPPORT

config FOO_FEATURE_1
```

(continues on next page)
If FOO_SUPPORT is n, the entire menu disappears.

**Redundant defaults**  bool symbols implicitly default to n, and string symbols implicitly default to the empty string. Therefore, default n and default "" are (almost) always redundant.

The recommended style in Zephyr is to skip redundant defaults for bool and string symbols. That also generates clearer documentation: *(Implicitly defaults to n instead of n if <dependencies, possibly inherited>).*

Defaults *should* always be given for int and hex symbols, however, as they implicitly default to the empty string. This is partly for compatibility with the C Kconfig tools, though an implicit 0 default might be less likely to be what was intended compared to other symbol types as well.

The one case where default n/default "" is not redundant is when defining a symbol in multiple locations and wanting to override e.g. a default y on a later definition. Note that a default n does not override a previously defined default y.

That is, FOO will be set to n in the example below. If the default n was omitted in the first definition, FOO would have been set to y.

```
config FOO
  bool "foo"
  default n

config FOO
  bool "foo"
  default y
```

In the following example FOO will get the value y.

```
config FOO
  bool "foo"
  default y

config FOO
  bool "foo"
  default n
```

**Common Kconfig shorthands**  Kconfig has two shorthands that deal with prompts and defaults.

- `<type> "prompt"` is a shorthand for giving a symbol/choice a type and a prompt at the same time. These two definitions are equal:

```
config FOO
  bool "foo"

config FOO
  bool
  prompt "foo"
```

The first style, with the shorthand, is preferred in Zephyr.
• `def_<type> <value>` is a shorthand for giving a type and a value at the same time. These two definitions are equal:

```markdown
config FOO
  def_bool BAR && BAZ
```

```markdown
config FOO
  bool
  default BAR && BAZ
```

Using both the `<type>` "prompt" and the `def_<type> <value>` shorthand in the same definition is redundant, since it gives the type twice.

The `def_<type> <value>` shorthand is generally only useful for symbols without prompts, and somewhat obscure.

**Note:** For a symbol defined in multiple locations (e.g., in a Kconfig.defconfig file in Zephyr), it is best to only give the symbol type for the “base” definition of the symbol, and to use default (instead of `def_<type> value`) for the remaining definitions. That way, if the base definition of the symbol is removed, the symbol ends up without a type, which generates a warning that points to the other definitions. That makes the extra definitions easier to discover and remove.

---

**Prompt strings** For a Kconfig symbol that enables a driver/subsystem FOO, consider having just “Foo” as the prompt, instead of “Enable Foo support” or the like. It will usually be clear in the context of an option that can be toggled on/off, and makes things consistent.

**Header comments and other nits** A few formatting nits, to help keep things consistent:

- Use this format for any header comments at the top of Kconfig files:

  ```markdown
  # <Overview of symbols defined in the file, preferably in plain English>
  (Blank line)
  # Copyright (c) 2019 ...
  # SPDX-License-Identifier: <License>
  (Blank line)
  (Kconfig definitions)
  ```

  ```markdown
  • Format comments as # Comment rather than #Comment
  • Put a blank line before/after each top-level if and endif
  • Use a single tab for each indentation
  • Indent help text with two extra spaces
  ```

**Lesser-known/used Kconfig features**

This section lists some more obscure Kconfig behaviors and features that might still come in handy.

**The imply statement** The `imply` statement is similar to `select`, but respects dependencies and doesn’t force a value. For example, the following code could be used to enable USB keyboard support by default on the FOO SoC, while still allowing the user to turn it off:
config SOC_FOO
    bool "FOO SoC"
    imply USB_KEYBOARD

...

config USB_KEYBOARD
    bool "USB keyboard support"

imply acts like a suggestion, whereas select forces a value.

Optional prompts A condition can be put on a symbol's prompt to make it optionally configurable by the user. For example, a value MASK that's hardcoded to 0xFF on some boards and configurable on others could be expressed as follows:

```
config MASK
    hex "Bitmask" if HAS_CONFIGURABLE_MASK
    default 0xFF
```

**Note:** This is short for the following:

```
config MASK
    hex
    prompt "Bitmask" if HAS_CONFIGURABLE_MASK
    default 0xFF
```

The HAS_CONFIGURABLE_MASK helper symbol would get selected by boards to indicate that MASK is configurable. When MASK is configurable, it will also default to 0xFF.

Optional choices Defining a choice with the optional keyword allows the whole choice to be toggled off to select none of the symbols:

```
choice
    prompt "Use legacy protocol"
    optional

config LEGACY_PROTOCOL_1
    bool "Legacy protocol 1"

config LEGACY_PROTOCOL_2
    bool "Legacy protocol 2"
endchoice
```

In the menuconfig interface, this will be displayed e.g. as [*] Use legacy protocol (Legacy protocol 1) --->, where the choice can be toggled off to enable neither of the symbols.

visible if conditions Putting a visible if condition on a menu hides the menu and all the symbols within it, while still allowing symbol default values to kick in.

As a motivating example, consider the following code:

```
menu "Foo subsystem"
    depends on HAS_CONFIGURABLE_FOO
```

(continues on next page)
config FOO_SETTING_1
    int "Foo setting 1"
    default 1
config FOO_SETTING_2
    int "Foo setting 2"
    default 2
endmenu

When HAS_CONFIGURABLE_FOO is n, no configuration output is generated for FOO_SETTING_1 and FOO_SETTING_2, as the code above is logically equivalent to the following code:

config FOO_SETTING_1
    int "Foo setting 1"
    default 1
    depends on HAS_CONFIGURABLE_FOO
config FOO_SETTING_2
    int "Foo setting 2"
    default 2
    depends on HAS_CONFIGURABLE_FOO

If we want the symbols to still get their default values even when HAS_CONFIGURABLE_FOO is n, but not be configurable by the user, then we can use visible if instead:

menu "Foo subsystem"
    visible if HAS_CONFIGURABLE_FOO
config FOO_SETTING_1
    int "Foo setting 1"
    default 1
config FOO_SETTING_2
    int "Foo setting 2"
    default 2
endmenu

This is logically equivalent to the following:

config FOO_SETTING_1
    int "Foo setting 1" if HAS_CONFIGURABLE_FOO
    default 1
config FOO_SETTING_2
    int "Foo setting 2" if HAS_CONFIGURABLE_FOO
    default 2

**Note:** See the optional prompts section for the meaning of the conditions on the prompts.

When HAS_CONFIGURABLE is n, we now get the following configuration output for the symbols, instead of no output:
Other resources

The *Intro to symbol values* section in the Kconfiglib docstring goes over how symbols values are calculated in more detail.

### 5.3.4 Custom Kconfig Preprocessor Functions

Kconfiglib supports custom Kconfig preprocessor functions written in Python. These functions are defined in scripts/kconfig/kconfigfunctions.py.

**Note:** The official Kconfig preprocessor documentation can be found [here](#).

Most of the custom preprocessor functions are used to get devicetree information into Kconfig. For example, the default value of a Kconfig symbol can be fetched from a devicetree `reg` property.

#### Devicetree-related Functions

The functions listed below are used to get devicetree information into Kconfig. See the Python docstrings in scripts/kconfig/kconfigfunctions.py for detailed documentation.

The `*_int` version of each function returns the value as a decimal integer, while the `*_hex` version returns a hexadecimal value starting with `0x`.

```
$(dt_has_compat,<compatible string>)
$(dt_compat_enabled,<compatible string>)
$(dt_compat_on_bus,<compatible string>,<bus>)
$(dt_chosen_label,<property in /chosen>)
$(dt_chosen_enabled,<property in /chosen>)
$(dt_chosen_path,<property in /chosen>)
$(dt_chosen_has_compat,<property in /chosen>)
$(dt_path_enabled,<node path>)
$(dt_alias_enabled,<node alias>)
$(dt_nodelabel_enabled,<node label>)
$(dt_nodelabel_enabled_with_compat,<node label>,<compatible string>)
$(dt_chosen_reg_addr_int,<property in /chosen>[<index>,<unit>])
$(dt_chosen_reg_addr_hex,<property in /chosen>[<index>,<unit>])
$(dt_chosen_reg_size_int,<property in /chosen>[<index>,<unit>])
$(dt_chosen_reg_size_hex,<property in /chosen>[<index>,<unit>])
$(dt_node_reg_addr_int,<node path>[<index>,<unit>])
$(dt_node_reg_addr_hex,<node path>[<index>,<unit>])
$(dt_node_reg_size_int,<node path>[<index>,<unit>])
$(dt_node_reg_size_hex,<node path>[<index>,<unit>])
$(dt_compat_enabled,<compatible string>)
$(dt_chosen_enabled,<property in /chosen>)
$(dt_node_bool_prop,<node path>,<prop>)
$(dt_nodelabel_bool_prop,<node label>,<prop>)
$(dt_node_has_prop,<node path>,<prop>)
$(dt_nodelabel_has_prop,<node label>,<prop>)
```

(continues on next page)
$(dt_node_int_prop_int,<node path>,<prop>,[<unit>])
$(dt_node_int_prop_hex,<node path>,<prop>,[<unit>])
$(dt_node_str_prop_equals,<node path>,<prop>,<value>)
$(dt_nodelabel_has_compat,<node label>,<compatible string>)
$(dt_node_has_compat,<node path>,<compatible string>)
$(dt_nodelabel_path,<node label>)
$(dt_node_parent,<node path>)
$(shields_list_contains,<shield name>)

**Example Usage**  Assume that the devicetree for some board looks like this:

```plaintext
{  
  soc {  
    #address-cells = <1>;  
    #size-cells = <1>;  
    spi0: spi@10014000 {  
      compatible = "sifive,spi0";  
      reg = <0x10014000 0x1000 0x20010000 0x3c0900>;  
      reg-names = "control", "mem";  
      ...  
    }  
  }  
}
```

The second entry in `reg` in `spi0@10014000 (<0x20010000 0x3c0900>)` corresponds to `mem`, and has the address `0x20010000`. This address can be inserted into Kconfig as follows:

```plaintext
cfg FLASH_BASE_ADDRESS  
  default $(dt_node_reg_addr_hex,/soc/spi0@10014000,1)
```

After preprocessor expansion, this turns into the definition below:

```plaintext
cfg FLASH_BASE_ADDRESS  
  default 0x20010000
```

### 5.3.5 Kconfig extensions

Zephyr uses the Kconfiglib implementation of Kconfig, which includes some Kconfig extensions:

- Environment variables in `source` statements are expanded directly, meaning no “bounce” symbols with `option env="ENV_VAR"` need to be defined.

**Note:** `option env` has been removed from the C tools as of Linux 4.18 as well.

The recommended syntax for referencing environment variables is `$(F00)` rather than `$F00`. This uses the new Kconfig preprocessor. The `$F00` syntax for expanding environment variables is only supported for backwards compatibility.

- The `source` statement supports glob patterns and includes each matching file. A pattern is required to match at least one file.

Consider the following example:

```plaintext
source "foo/bar/*/Kconfig"
```
If the pattern `foo/bar/*/Kconfig` matches the files `foo/bar/baz/Kconfig` and `foo/bar/qaz/Kconfig`, the statement above is equivalent to the following two `source` statements:

```plaintext
source "foo/bar/baz/Kconfig"
source "foo/bar/qaz/Kconfig"
```

If no files match the pattern, an error is generated.

The wildcard patterns accepted are the same as for the Python `glob` module.

For cases where it's okay for a pattern to match no files (or for a plain filename to not exist), a separate `osource` (optional source) statement is available. `osource` is a no-op if no file matches.

**Note:** `source` and `osource` are analogous to `include` and `-include` in Make.

- An `rsource` statement is available for including files specified with a relative path. The path is relative to the directory of the `Kconfig` file that contains the `rsource` statement.

As an example, assume that `foo/Kconfig` is the top-level `Kconfig` file, and that `foo/bar/Kconfig` has the following statements:

```plaintext
source "qaz/Kconfig1"
rsource "qaz/Kconfig2"
```

This will include the two files `foo/qaz/Kconfig1` and `foo/bar/qaz/Kconfig2`.

`rsource` can be used to create `Kconfig` “subtrees” that can be moved around freely.

`rsource` also supports glob patterns.

A drawback of `rsource` is that it can make it harder to figure out where a file gets included, so only use it if you need it.

- An `orsource` statement is available that combines `osource` and `rsource`.

For example, the following statement will include `Kconfig1` and `Kconfig2` from the current directory (if they exist):

```plaintext
orsource "Kconfig[12]"
```

- `def_int`, `def_hex`, and `def_string` keywords are available, analogous to `def_bool`. These set the type and add a `default` at the same time.

Users interested in optimizing their configuration for security should refer to the Zephyr Security Guide's section on the *Hardening Tool*.

### 5.4 Zephyr CMake Package

The Zephyr CMake package is a convenient way to create a Zephyr-based application.

**Note:** The *Application types* section introduces the application types used in this page.

The Zephyr CMake package ensures that CMake can automatically select a Zephyr installation to use for building the application, whether it is a *Zephyr repository application*, a *Zephyr workspace application*, or a *Zephyr freestanding application*.

When developing a Zephyr-based application, then a developer simply needs to write `find_package(Zephyr)` in the beginning of the application `CMakeLists.txt` file.

To use the Zephyr CMake package it must first be exported to the CMake user package registry. This is means creating a reference to the current Zephyr installation inside the CMake user package registry.
In Linux, the CMake user package registry is found in:

```
~/.cmake/packages/Zephyr
```

In macOS, the CMake user package registry is found in:

```
~/.cmake/packages/Zephyr
```

In Windows, the CMake user package registry is found in:

```
HKEY_CURRENT_USER\Software\Kitware\CMake\Packages\Zephyr
```

The Zephyr CMake package allows CMake to automatically find a Zephyr base. One or more Zephyr installations must be exported. Exporting multiple Zephyr installations may be useful when developing or testing Zephyr freestanding applications, Zephyr workspace application with vendor forks, etc.

### 5.4.1 Zephyr CMake package export (west)

When installing Zephyr using `west` then it is recommended to export Zephyr using `west zephyr-export`.

### 5.4.2 Zephyr CMake package export (without west)

Zephyr CMake package is exported to the CMake user package registry using the following commands:

```cmake
cmake -P <PATH-TO-ZEPHYR>/share/zephyr-package/cmake/zephyr_export.cmake
```

This will export the current Zephyr to the CMake user package registry.

To also export the Zephyr Unittest CMake package, run the following command in addition:

```cmake
cmake -P <PATH-TO-ZEPHYR>/share/zephyrunittest-package/cmake/zephyr_export.cmake
```

### 5.4.3 Zephyr Base Environment Setting

The Zephyr CMake package search functionality allows for explicitly specifying a Zephyr base using an environment variable.

To do this, use the following `find_package()` syntax:

```cmake
find_package(Zephyr REQUIRED HINTS $ENV{ZEPHYR_BASE})
```

This syntax instructs CMake to first search for Zephyr using the Zephyr base environment setting `ZEPHYR_BASE` and then use the normal search paths.

### 5.4.4 Zephyr CMake Package Search Order

When Zephyr base environment setting is not used for searching, the Zephyr installation matching the following criteria will be used:

- A Zephyr repository application will use the Zephyr in which it is located. For example:

```bash
<projects>/zephyr-workspace/zephyr
  └── samples
      └── hello_world
```
in this example, hello_world will use `<projects>/zephyr-workspace/zephyr`.

- Zephyr workspace application will use the Zephyr that share the same workspace. For example:

  ```
  <projects>/zephyr-workspace
  ├── zephyr
  │   └── my_applications
  │         └── my_first_app
  ```

  in this example, my_first_app will use `<projects>/zephyr-workspace/zephyr` as this Zephyr is located in the same workspace as the Zephyr workspace application.

**Note:** The root of a Zephyr workspace is identical to `west topdir` if the workspace was installed using `west`.

- Zephyr freestanding application will use the Zephyr registered in the CMake user package registry. For example:

  ```
  <projects>/zephyr-workspace-1
  └── zephyr (Not exported to CMake)

  <projects>/zephyr-workspace-2
  └── zephyr (Exported to CMake)

  <home>/app
  └── CMakeLists.txt
  └── prj.conf
  └── src
      └── main.c
  ```

  in this example, only `<projects>/zephyr-workspace-2/zephyr` is exported to the CMake package registry and therefore this Zephyr will be used by the Zephyr freestanding application `<home>/app`.

  If user wants to test the application with `<projects>/zephyr-workspace-1/zephyr`, this can be done by using the Zephyr Base environment setting, meaning set ZEPHYR_BASE=`<projects>/zephyr-workspace-1/zephyr`, before running CMake.

**Note:** The Zephyr package selected on the first CMake invocation will be used for all subsequent builds. To change the Zephyr package, for example to test the application using Zephyr base environment setting, then it is necessary to do a pristine build first (See Rebuilding an Application).

### 5.4.5 Zephyr CMake Package Version

When writing an application then it is possible to specify a Zephyr version number `x.y.z` that must be used in order to build the application.

Specifying a version is especially useful for a Zephyr freestanding application as it ensures the application is built with a minimal Zephyr version.

It also helps CMake to select the correct Zephyr to use for building, when there are multiple Zephyr installations in the system.

For example:

```
find_package(Zephyr 2.2.0)
project(app)
```
will require app to be built with Zephyr 2.2.0 as minimum. CMake will search all exported candidates to find a Zephyr installation which matches this version criteria. Thus it is possible to have multiple Zephyr installations and have CMake automatically select between them based on the version number provided, see CMake package version for details.

For example:

```
<projects>/zephyr-workspace-2.a
   └── zephyr (Exported to CMake)

<projects>/zephyr-workspace-2.b
   └── zephyr (Exported to CMake)

<home>/app
   ├── CMakeLists.txt
   ├── prj.conf
   └── src
       └── main.c
```

in this case, there are two released versions of Zephyr installed at their own workspaces. Workspace 2.a and 2.b, corresponding to the Zephyr version.

To ensure app is built with minimum version 2.a the following find_package syntax may be used:

```cmake
find_package(Zephyr 2.a)
project(app)
```

Note that both 2.a and 2.b fulfill this requirement.

CMake also supports the keyword EXACT, to ensure an exact version is used, if that is required. In this case, the application CMakeLists.txt could be written as:

```cmake
find_package(Zephyr 2.a EXACT)
project(app)
```

In case no Zephyr is found which satisfies the version required, as example, the application specifies

```cmake
find_package(Zephyr 2.z)
project(app)
```

then an error similar to below will be printed:

```
Could not find a configuration file for package "Zephyr" that is compatible with requested version "2.z".
```

The following configuration files were considered but not accepted:

```
<projects>/zephyr-workspace-2.a/zephyr/share/zephyr-package/cmake/ZephyrConfig.cmake, version: 2.a.0
<projects>/zephyr-workspace-2.b/zephyr/share/zephyr-package/cmake/ZephyrConfig.cmake, version: 2.b.0
```

**Note:** It can also be beneficial to specify a version number for Zephyr repository applications and Zephyr workspace applications. Specifying a version in those cases ensures the application will only build if the Zephyr repository or workspace is matching. This can be useful to avoid accidental builds when only part of a workspace has been updated.
5.4.6 Multiple Zephyr Installations (Zephyr workspace)

Testing out a new Zephyr version, while at the same time keeping the existing Zephyr in the workspace untouched is sometimes beneficial.

Or having both an upstream Zephyr, Vendor specific, and a custom Zephyr in same workspace.

For example:

```
<projects>/zephyr-workspace
    ├── zephyr
    │    └── zephyr-vendor
    │    └── zephyr-custom
    │              ...
    └── my_applications
        └── my_first_app
```

In this setup, `find_package(Zephyr)` has the following order of precedence for selecting which Zephyr to use:

- Project name: `zephyr`
- First project, when Zephyr projects are ordered lexicographical, in this case.
  - `zephyr-custom`
  - `zephyr-vendor`

This means that `my_first_app` will use `<projects>/zephyr-workspace/zephyr`.

It is possible to specify a Zephyr preference list in the application.

A Zephyr preference list can be specified as:

```cmake
set(ZEPHYR_PREFER "zephyr-custom" "zephyr-vendor")
find_package(Zephyr)
project(my_first_app)
```

The `ZEPHYR_PREFER` is a list, allowing for multiple Zephyrs. If a Zephyr is specified in the list, but not found in the system, it is simply ignored and `find_package(Zephyr)` will continue to the next candidate.

This allows for temporary creation of a new Zephyr release to be tested, without touching current Zephyr. When testing is done, the `zephyr-test` folder can simply be removed. Such a CMakeLists.txt could look as:

```cmake
set(ZEPHYR_PREFER "zephyr-test")
find_package(Zephyr)
project(my_first_app)
```

5.4.7 Zephyr Build Configuration CMake package

The Zephyr Build Configuration CMake package provides a possibility for a Zephyr based project to control Zephyr build settings in a generic way.

It is similar to the per-user `.zephyrrc` file that can be used to set Environment Variables, but it sets CMake variables instead. It also allows you to automatically share the build configuration among all users through the project repository. It also allows more advanced use cases, such as loading of additional CMake boilerplate code.

The Zephyr Build Configuration CMake package will be loaded in the Zephyr boilerplate code after initial properties and `ZEPHYR_BASE` has been defined, but before CMake code execution. This allows the Zephyr
Build Configuration CMake package to setup or extend properties such as: DTS_ROOT, BOARD_ROOT, TOOLCHAIN_ROOT / other toolchain setup, fixed overlays, and any other property that can be controlled. It also allows inclusion of additional toolchain code.

To provide a Zephyr Build Configuration CMake package, create ZephyrBuildConfig.cmake and place it in a Zephyr workspace top-level folder as:

```
<projects>/zephyr-workspace
    ├── zephyr
    │   ├── ...
    │   └── zephyr application (can be named anything)
    │       └── share/zephyrbuild-package/cmake/ZephyrBuildConfig.cmake
```

The Zephyr Build Configuration CMake package will not search in any CMake default search paths, and thus cannot be installed in the CMake package registry. There will be no version checking on the Zephyr Build Configuration package.

Note: share/zephyrbuild-package/cmake/ZephyrBuildConfig.cmake follows the same folder structure as the Zephyr CMake package.

It is possible to place ZephyrBuildConfig.cmake directly in a <zephyr application>/cmake folder or another folder, as long as that folder is honoring the CMake package search algorithm.

A sample ZephyrBuildConfig.cmake can be seen below.

```
# ZephyrBuildConfig.cmake sample code

# To ensure final path is absolute and does not contain ../../../ in variable.
get_filename_component(APPLICATION_PROJECT_DIR
    ${CMAKE_CURRENT_LIST_DIR}/../../..
    ABSOLUTE)

# Add this project to list of board roots
list(APPEND BOARD_ROOT ${APPLICATION_PROJECT_DIR})

# Default to GNU Arm Embedded toolchain if no toolchain is set
if(NOT ENV{ZEPHYR_TOOLCHAIN_VARIANT})
    set(ZEPHYR_TOOLCHAIN_VARIANT gnuarmemb)
    find_program(GNU_ARM_GCC arm-none-eabi-gcc)
    if(NOT ${GNU_ARM_GCC} STREQUAL GNU_ARM_GCC-NOTFOUND)
        # The toolchain root is located above the path to the compiler.
        get_filename_component(GNUARMEMB_TOOLCHAIN_PATH ${GNU_ARM_GCC}/../..
            ABSOLUTE)
    endif()
endif()
```

5.4.8 Zephyr Build Configuration CMake package (Freestanding application)

The Zephyr Build Configuration CMake package can be located outside a Zephyr workspace, for example located with a Zephyr freestanding application.

Create the build configuration as described in the previous section, and then refer to the location of your Zephyr Build Configuration CMake package using the CMake variable ZephyrBuildConfiguration_ROOT.

1. At the CMake command line, like this:
2. At the top of your application's top level CMakeLists.txt, like this:

```cmake
set(ZephyrBuildConfiguration_ROOT <path-to-build-config>)
find_package(Zephyr REQUIRED HINTS $ENV{ZEPHYR_BASE})
```

If you choose this option, make sure to set the variable **before** calling `find_package(Zephyr ... )`, as shown above.

3. In a separate CMake script which is pre-loaded to populate the CMake cache, like this:

```cmake
# Put this in a file with a name like "zephyr-settings.cmake"
set(ZephyrBuildConfiguration_ROOT <path-to-build-config>
       CACHE STRING "pre-cached build config"
)
```

You can tell the build system to use this file by adding `-C zephyr-settings.cmake` to your CMake command line. This principle is useful when not using west as both this setting and Zephyr modules can be specified using the same file. See Zephyr module *Without West*.

### 5.4.9 Zephyr CMake package source code

The Zephyr CMake package source code in `share/zephyr-package/cmake` and `share/zephyrunittest-package/cmake` contains the CMake config package which is used by the CMake `find_package` function. It also contains code for exporting Zephyr as a CMake config package.

The following is an overview of the files in these directories:

- **ZephyrConfigVersion.cmake**
  
  The Zephyr package version file. This file is called by CMake to determine if this installation fulfills the requirements specified by user when calling `find_package(Zephyr ... )`. It is also responsible for detection of Zephyr repository or workspace only installations.

- **ZephyrUnittestConfigVersion.cmake**
  
  Same responsibility as `ZephyrConfigVersion.cmake`, but for unit tests. Includes `ZephyrConfigVersion.cmake`.

- **ZephyrConfig.cmake**
  
  The Zephyr package file. This file is called by CMake to for the package meeting which fulfills the requirements specified by user when calling `find_package(Zephyr ... )`. This file is responsible for sourcing of boilerplate code.

- **ZephyrUnittestConfig.cmake**
  
  Same responsibility as `ZephyrConfig.cmake`, but for unit tests. Includes `ZephyrConfig.cmake`.

- **zephyr_package_search.cmake**
  
  Common file used for detection of Zephyr repository and workspace candidates. Used by `ZephyrConfigVersion.cmake` and `ZephyrConfig.cmake` for common code.

- **zephyr_export.cmake**
  
  See *Zephyr CMake package export (without west)*.

### 5.5 Sysbuild (System build)

Sysbuild is a higher-level build system that can be used to combine multiple other build systems together. It is a higher-level layer that combines one or more Zephyr build systems and optional additional build systems into a hierarchical build system.
For example, you can use sysbuild to build a Zephyr application together with the MCUboot bootloader, flash them both onto your device, and debug the results.

Sysbuild works by configuring and building at least a Zephyr application and, optionally, as many additional projects as you want. The additional projects can be either Zephyr applications or other types of builds you want to run.

Like Zephyr’s build system, sysbuild is written in CMake and uses Kconfig.

5.5.1 Definitions

The following are some key concepts used in this document:

**Single-image build**
When sysbuild is used to create and manage just one Zephyr application’s build system.

**Multi-image build**
When sysbuild is used to manage multiple build systems. The word “image” is used because your main goal is usually to generate the binaries of the firmware application images from each build system.

**Domain**
Every Zephyr CMake build system managed by sysbuild.

**Multi-domain**
When more than one Zephyr CMake build system (domain) is managed by sysbuild.

5.5.2 Architectural Overview

This figure is an overview of sysbuild’s inputs, outputs, and user interfaces:

The following are some key sysbuild features indicated in this figure:
• You can run sysbuild either with `west build` or directly via `cmake`.

• You can use sysbuild to generate application images from each build system, shown above as ELF, BIN, and HEX files.

• You can configure sysbuild or any of the build systems it manages using various configuration variables. These variables are namespaced so that sysbuild can direct them to the right build system. In some cases, such as the `BOARD` variable, these are shared among multiple build systems.

• Sysbuild itself is also configured using Kconfig. For example, you can instruct sysbuild to build the MCUboot bootloader, as well as to build and link your main Zephyr application as an MCUboot child image, using sysbuild's Kconfig files.

• Sysbuild integrates with west's `Building, Flashing and Debugging` commands. It does this by managing the `Flash and debug runners`, and specifically the runners.yaml files that each Zephyr build system will contain. These are packaged into a global view of how to flash and debug each build system in a domains.yaml file generated and managed by sysbuild.

5.5.3 Building with sysbuild

As mentioned above, you can run sysbuild via `west build` or `cmake`.

`west build`

Here is an example. For details, see `Sysbuild (multi-domain builds)` in the west build documentation.

```
west build -b reel_board --sysbuild samples/hello_world
```

Tip: To configure `west build` to use `--sysbuild` by default from now on, run:

```
west config build.sysbuild True
```

Since sysbuild supports both single- and multi-image builds, this lets you use sysbuild all the time, without worrying about what type of build you are running.

To turn this off, run this before generating your build system:

```
west config build.sysbuild False
```

To turn this off for just one `west build` command, run:

```
w west build --no-sysbuild ...
```

`cmake`

Here is an example using CMake and Ninja.

```
cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world share/sysbuild
ninja -Cbuild
```

To use sysbuild directly with CMake, you must specify the sysbuild project as the source folder, and give `-DAPP_DIR=<path-to-sample>` as an extra CMake argument. `APP_DIR` is the path to the main Zephyr application managed by sysbuild.

5.5.4 Configuration namespaces

When building a single Zephyr application without sysbuild, all CMake cache settings and Kconfig build options given on the command line as `-D<var>=<value>` or `-DCONFIG_<var>=<value>` are handled by the Zephyr build system.
However, when sysbuild combines multiple Zephyr build systems, there could be Kconfig settings exclusive to sysbuild (and not used by any of the applications). To handle this, sysbuild has namespaces for configuration variables. You can use these namespaces to direct settings either to sysbuild itself or to a specific Zephyr application managed by sysbuild using the information in these sections.

The following example shows how to build hello_world with MCUboot enabled, applying to both images debug optimizations:

```
w west build
west build -b reel_board --sysbuild samples/hello_world -- -DSB_CONFIG_BOOTLOADER_MCUBOOT=y -DCONFIG_DEBUG_OPTIMIZATIONS=y -Dmcuboot_DEBUG_OPTIMIZATIONS=y

c make

c make -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONFIG_BOOTLOADER_MCUBOOT=y -DCONFIG_DEBUG_OPTIMIZATIONS=y -Dmcuboot_DEBUG_OPTIMIZATIONS=y

ninja -Cbuild
```

See the following subsections for more information.

**CMake variable namespaces**

CMake variable settings can be passed to CMake using `-D<var>=<value>` on the command line. You can also set Kconfig options via CMake as `-DCONFIG_<var>=<value>` or `-D<namespace>_CONFIG_<var>=<value>`.

Since sysbuild is the entry point for the build system, and sysbuild is written in CMake, all CMake variables are first processed by sysbuild.

Sysbuild creates a namespace for each domain. The namespace prefix is the domain's application name. See [Adding Zephyr applications to sysbuild](#) for more information.

To set the variable `<var>` in the namespace `<namespace>`, use this syntax:

```
-D<namespace>_<var>=<value>
```

For example, to set the CMake variable `FOO` in the `my_sample` application build system to the value `BAR`, run the following commands:

```
w west build
west build --sysbuild ... -- -Dmy_sample_FOO=BAR

c make

c make -Dmy_sample_FOO=BAR ...
```

**Kconfig namespaces**

To set the sysbuild Kconfig option `<var>` to the value `<value>`, use this syntax:

```
-DSB_CONFIG_<var>=<value>
```

In the previous example, `SB_CONFIG` is the namespace prefix for sysbuild's Kconfig options.

To set a Zephyr application's Kconfig option instead, use this syntax:

```
-D<namespace>_CONFIG_<var>=<value>
```
In the previous example, `<namespace>` is the application name discussed above in CMake variable naming.

For example, to set the Kconfig option `FOO` in the `my_sample` application build system to the value `BAR`, run the following commands:

```bash
west build
west build --sysbuild ... --Dmy_sample_CONFIG_FOO=BAR

cmake

cmake -Dmy_sample_CONFIG_FOO=BAR ...
```

Tip: When no `<namespace>` is used, the Kconfig setting is passed to the main Zephyr application `my_sample`. This means that passing `-DCONFIG_<var>=<value>` and `-Dmy_sample_CONFIG_<var>=<value>` are equivalent.

This allows you to build the same application with or without sysbuild using the same syntax for setting Kconfig values at CMake time. For example, the following commands will work in the same way:

```bash
west build -b <board> my_sample -- -DCONFIG_FOO=BAR
west build -b <board> --sysbuild my_sample -- -DCONFIG_FOO=BAR
```

### 5.5.5 Sysbuild flashing using `west flash`

You can use `west flash` to flash applications with sysbuild.

When invoking `west flash` on a build consisting of multiple images, each image is flashed in sequence. Extra arguments such as `--runner jlink` are passed to each invocation.

For more details, see [Multi-domain flashing](#).

### 5.5.6 Sysbuild debugging using `west debug`

You can use `west debug` to debug the main application, whether you are using sysbuild or not. Just follow the existing `west debug` guide to debug the main sample.

To debug a different domain (Zephyr application), such as `mcuboot`, use the `--domain` argument, as follows:

```bash
west debug --domain mcuboot
```

For more details, see [Multi-domain debugging](#).

### 5.5.7 Building a sample with MCUboot

Sysbuild supports MCUboot natively.

To build a sample like `hello_world` with MCUboot, enable MCUboot and build and flash the sample as follows:

```bash
west build
```
west build -b reel_board --sysbuild samples/hello_world -- -DSB_CONFIG_BOOTLOADER_MCUBOOT=y

cmake

cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONFIG_BOOTLOADER_MCUBOOT=y share/sysbuild

ninja -Cbuild

This builds hello_world and mcuboot for the reel_board, and then flashes both the mcuboot and hello_world application images to the board.

More detailed information regarding the use of MCUboot with Zephyr can be found in the MCUboot with Zephyr documentation page on the MCUboot website.

Note: MCUBoot default configuration will perform a full chip erase when flashed. This can be controlled through the MCUBoot Kconfig option CONFIG_ZEPHYR_TRY_MASS_ERASE. If this option is enabled, then flashing only MCUBoot, for example using west flash --domain mcuboot, may erase the entire flash, including the main application image.

5.5.8 Sysbuild Kconfig file

You can set sysbuild’s Kconfig options for a single application using configuration files. By default, sysbuild looks for a configuration file named sysbuild.conf in the application top-level directory.

In the following example, there is a sysbuild.conf file that enables building and flashing with MCUboot whenever sysbuild is used:

```
<home>/application
    └── CMakeLists.txt
        └── prj.conf
        └── sysbuild.conf
```

```
SB_CONFIG_BOOTLOADER_MCUBOOT=y
```

You can set a configuration file to use with the -DSB_CONF_FILE=<sysbuild-conf-file> CMake build setting.

For example, you can create sysbuild-mcuboot.conf and then specify this file when building with sysbuild, as follows:

```
wst build
```

```
wst build -b reel_board --sysbuild samples/hello_world -- -DSB_CONF_FILE=sysbuild-mcuboot.conf
```

cmake

cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONF_FILE=sysbuild-mcuboot.conf share/sysbuild

ninja -Cbuild

5.5.9 Adding Zephyr applications to sysbuild

You can use the ExternalZephyrProject_Add() function to add Zephyr applications as sysbuild domains. Call this CMake function from your application’s sysbuild.cmake file, or any other CMake file you know will run as part sysbuild CMake invocation.
Targeting the same board

To include `my_sample` as another sysbuild domain, targeting the same board as the main image, use this example:

```cmake
ExternalZephyrProject_Add(
    APPLICATION my_sample
    SOURCE_DIR <path-to>/my_sample
)
```

This could be useful, for example, if your board requires you to build and flash an SoC-specific bootloader along with your main application.

Targeting a different board

In sysbuild and Zephyr CMake build system a board may refer to:

- A physical board with a single core SoC.
- A specific core on a physical board with a multi-core SoC, such as nrf5340dk_nrf5340.
- A specific SoC on a physical board with multiple SoCs, such as nrf9160dk_nrf9160 and nrf9160dk_nrf52840.

If your main application, for example, is built for `mps2_an521`, and your helper application must target the `mps2_an521_remote` board (cpu1), add a CMake function call that is structured as follows:

```cmake
ExternalZephyrProject_Add(
    APPLICATION my_sample
    SOURCE_DIR <path-to>/my_sample
    BOARD mps2_an521_remote
)
```

This could be useful, for example, if your main application requires another helper Zephyr application to be built and flashed alongside it, but the helper runs on another core in your SoC.

Targeting conditionally using Kconfig

You can control whether extra applications are included as sysbuild domains using Kconfig.

If the extra application image is specific to the board or an application, you can create two additional files: `sysbuild.cmake` and `Kconfig.sysbuild`.

For an application, this would look like this:

```cmake
<home>/application
    CMakeLists.txt
    prj.conf
    Kconfig.sysbuild
    sysbuild.cmake
```

In the previous example, `sysbuild.cmake` would be structured as follows:

```cmake
if(SB_CONFIG_SECOND_SAMPLE)
    ExternalZephyrProject_Add(
        APPLICATION second_sample
        SOURCE_DIR <path-to>/second_sample
    )
endif()
```

5.5. Sysbuild (System build)
Kconfig.sysbuild would be structured as follows:

```c
source "sysbuild/Kconfig"

config SECOND_SAMPLE
    bool "Second sample"
    default y
```

This will include `second_sample` by default, while still allowing you to disable it using the Kconfig option `SECOND_SAMPLE`.

For more information on setting sysbuild Kconfig options, see *Kconfig namespacing*.

**Zephyr application configuration**

When adding a Zephyr application to sysbuild, such as MCUboot, then the configuration files from the application (MCUboot) itself will be used.

When integrating multiple applications with each other, then it is often necessary to make adjustments to the configuration of extra images.

Sysbuild gives users the ability of creating Kconfig fragments or devicetree overlays that will be used together with the application’s default configuration. Sysbuild also allows users to change Application Configuration Directory in order to give users full control of an image’s configuration.

**Zephyr application Kconfig fragment and devicetree overlay** In the folder of the main application, create a Kconfig fragment or a devicetree overlay under a sysbuild folder, where the name of the file is `<image>.conf` or `<image>.overlay`, for example if your main application includes `my_sample` then create a sysbuild/my_sample.conf file or a devicetree overlay sysbuild/my_sample.overlay.

A Kconfig fragment could look as:

```c
# sysbuild/my_sample.conf
CONFIG_FOO=n
```

**Zephyr application configuration directory** In the folder of the main application, create a new folder under sysbuild/<image>//. This folder will then be used as `APPLICATION_CONFIG_DIR` when building <image>. As an example, if your main application includes `my_sample` then create a sysbuild/my_sample/ folder and place any configuration files in there as you would normally do:

```
<home>/application
    ├── CMakeLists.txt
    │   └── prj.conf
    └── sysbuild
        └── my_sample
            ├── prj.conf
            └── app.overlay
                └── boards
                    ├── <board_A>.conf
                    ├── <board_A>.overlay
                    ├── <board_B>.conf
                    └── <board_B>.overlay
```

All configuration files under the `sysbuild/my_sample/` folder will now be used when `my_sample` is included in the build, and the default configuration files for `my_sample` will be ignored.

This give you full control on how images are configured when integrating those with application.
5.5.10 Adding non-Zephyr applications to sysbuild

You can include non-Zephyr applications in a multi-image build using the standard CMake module ExternalProject. Please refer to the CMake documentation for usage details.

When using ExternalProject, the non-Zephyr application will be built as part of the sysbuild build invocation, but west flash or west debug will not be aware of the application. Instead, you must manually flash and debug the application.
Chapter 6

Connectivity

6.1 Bluetooth

This section contains information regarding the Bluetooth stack of the Zephyr OS. You can use this information to understand the principles behind the operation of the layers and how they were implemented. Zephyr includes a complete Bluetooth Low Energy stack from application to radio hardware, as well as portions of a Classical Bluetooth (BR/EDR) Host layer.

6.1.1 Overview

- **Supported Features**

Since its inception, Zephyr has had a strong focus on Bluetooth and, in particular, on Bluetooth Low Energy (BLE). Through the contributions of several companies and individuals involved in existing open source implementations of the Bluetooth specification (Linux’s BlueZ) as well as the design and development of BLE radio hardware, the protocol stack in Zephyr has grown to be mature and feature-rich, as can be seen in the section below.

**Supported Features**

Zephyr comes integrated with a feature-rich and highly configurable Bluetooth stack.

- Bluetooth 5.0 compliant (ESR10)
  - Highly configurable
    - Features, buffer sizes/counts, stack sizes, etc.
  - Portable to all architectures supported by Zephyr (including big and little endian, alignment flavors and more)
  - Support for all combinations of Host and Controller builds:
    - Controller-only (HCI) over UART, SPI, and USB physical transports
    - Host-only over UART, SPI, and IPM (shared memory)
    - Combined (Host + Controller)

- Bluetooth-SIG qualified
  - Controller on Nordic Semiconductor hardware
Conformance tests run regularly on all layers

**Bluetooth Low Energy Controller support (LE Link Layer)**
- Unlimited role and connection count, all roles supported
- Concurrent multi-protocol support ready
- Intelligent scheduling of roles to minimize overlap
- Portable design to any open BLE radio, currently supports Nordic Semiconductor nRF51 and nRF52, as well as proprietary radios
- Supports little and big endian architectures, and abstracts the hard real-time specifics so that they can be encapsulated in a hardware-specific module
- Support for Controller (HCI) builds over different physical transports

**Bluetooth Host support**
- Generic Access Profile (GAP) with all possible LE roles
  - Peripheral & Central
  - Observer & Broadcaster
- GATT (Generic Attribute Profile)
  - Server (to be a sensor)
  - Client (to connect to sensors)
- Pairing support, including the Secure Connections feature from Bluetooth 4.2
- Non-volatile storage support for permanent storage of Bluetooth-specific settings and data
- Bluetooth mesh support
  - Relay, Friend Node, Low-Power Node (LPN) and GATT Proxy features
  - Both Provisioning bearers supported (PB-ADV & PB-GATT)
  - Highly configurable, fits as small as 16k RAM devices
- IPSP/6LoWPAN for IPv6 connectivity over Bluetooth LE
  - IPSP node sample application
- Basic Bluetooth BR/EDR (Classic) support
  - Generic Access Profile (GAP)
  - Logical Link Control and Adaptation Protocol (L2CAP)
  - Serial Port emulation (RFCOMM protocol)
  - Service Discovery Protocol (SDP)
- Clean HCI driver abstraction
  - 3-Wire (H:5) & 5-Wire (H:4) UART
  - SPI
  - Local controller support as a virtual HCI driver
- Verified with multiple popular controllers
6.1.2 Bluetooth Stack Architecture

Overview

This page describes the software architecture of Zephyr’s Bluetooth protocol stack.

Note: Zephyr supports mainly Bluetooth Low Energy (BLE), the low-power version of the Bluetooth specification. Zephyr also has limited support for portions of the BR/EDR Host. Throughout this architecture document we use BLE interchangeably for Bluetooth except when noted.

BLE Layers

There are 3 main layers that together constitute a full Bluetooth Low Energy protocol stack:

- **Host**: This layer sits right below the application, and is comprised of multiple (non real-time) network and transport protocols enabling applications to communicate with peer devices in a standard and interoperable way.

- **Controller**: The Controller implements the Link Layer (LE LL), the low-level, real-time protocol which provides, in conjunction with the Radio Hardware, standard-interoperable over-the-air communication. The LL schedules packet reception and transmission, guarantees the delivery of data, and handles all the LL control procedures.

- **Radio Hardware**: Hardware implements the required analog and digital baseband functional blocks that permit the Link Layer firmware to send and receive in the 2.4GHz band of the spectrum.

Host Controller Interface

The Bluetooth Specification describes the format in which a Host must communicate with a Controller. This is called the Host Controller Interface (HCI) protocol. HCI can be implemented over a range of different physical transports like UART, SPI, or USB. This protocol defines the commands that a Host can send to a Controller and the events that it can expect in return, and also the format for user and protocol data that needs to go over the air. The HCI ensures that different Host and Controller implementations can communicate in a standard way making it possible to combine Hosts and Controllers from different vendors.

Configurations

The three separate layers of the protocol and the standardized interface make it possible to implement the Host and Controller on different platforms. The two following configurations are commonly used:

- **Single-chip configuration**: In this configuration, a single microcontroller implements all three layers and the application itself. This can also be called a system-on-chip (SoC) implementation. In this case the BLE Host and the BLE Controller communicate directly through function calls and queues in RAM. The Bluetooth specification does not specify how HCI is implemented in this single-chip configuration and so how HCI commands, events, and data flows between the two can be implementation-specific. This configuration is well suited for those applications and designs that require a small footprint and the lowest possible power consumption, since everything runs on a single IC.

- **Dual-chip configuration**: This configuration uses two separate ICs, one running the Application and the Host, and a second one with the Controller and the Radio Hardware. This is sometimes also called a connectivity-chip configuration. This configuration allows for a wider variety of combinations of Hosts when using the Zephyr OS as a Controller. Since HCI ensures interoperability among Host and Controller implementations, including of course Zephyr’s very own BLE Host and Controller, users of the Zephyr Controller can choose to use whatever Host running on any platform they prefer. For example, the host can be the Linux BLE Host stack (BlueZ) running on any processor capable of supporting Linux. The Host processor may of course also run Zephyr and the Zephyr OS BLE Host. Conversely, combining an IC running the Zephyr Host with an external Controller that does not run Zephyr is also supported.
**Build Types**  The Zephyr software stack as an RTOS is highly configurable, and in particular, the BLE subsystem can be configured in multiple ways during the build process to include only the features and layers that are required to reduce RAM and ROM footprint as well as power consumption. Here’s a short list of the different BLE-enabled builds that can be produced from the Zephyr project codebase:

- **Controller-only build**: When built as a BLE Controller, Zephyr includes the Link Layer and a special application. This application is different depending on the physical transport chosen for HCI:
  - hci_uart
  - hci_usb
  - hci_spi
  This application acts as a bridge between the UART, SPI or USB peripherals and the Controller subsystem, listening for HCI commands, sending application data and responding with events and received data. A build of this type sets the following Kconfig option values:
  - CONFIG_BT =y
  - CONFIG_BT_HCI =y
  - CONFIG_BT_HCI_RAW =y
  - CONFIG_BT_CTLR =y
  - CONFIG_BT_LL_SW_SPLIT =y (if using the open source Link Layer)

- **Host-only build**: A Zephyr OS Host build will contain the Application and the BLE Host, along with an HCI driver (UART or SPI) to interface with an external Controller chip. A build of this type sets the following Kconfig option values:
  - CONFIG_BT =y
  - CONFIG_BT_HCI =y
  - CONFIG_BT_CTLR =n

  All of the samples located in `samples/bluetooth` except for the ones used for Controller-only builds can be built as Host-only

- **Combined build**: This includes the Application, the Host and the Controller, and it is used exclusively for single-chip (SoC) configurations. A build of this type sets the following Kconfig option values:
  - CONFIG_BT =y
  - CONFIG_BT_HCI =y
  - CONFIG_BT_CTLR =y
  - CONFIG_BT_LL_SW_SPLIT =y (if using the open source Link Layer)

  All of the samples located in `samples/bluetooth` except for the ones used for Controller-only builds can be built as Combined

The picture below shows the SoC or single-chip configuration when using a Zephyr combined build (a build that includes both a BLE Host and a Controller in the same firmware image that is programmed onto the chip):

When using connectivity or dual-chip configurations, several Host and Controller combinations are possible, some of which are depicted below:

When using a Zephyr Host (left side of image), two instances of Zephyr OS must be built with different configurations, yielding two separate images that must be programmed into each of the chips respectively. The Host build image contains the application, the BLE Host and the selected HCI driver (UART or SPI), while the Controller build runs either the hci_uart, or the hci_spi app to provide an interface to the BLE Controller.
6.1. Bluetooth

---

**Single-chip configuration**

**Zephyr combined build**

- Application
- BLE Host
  - HCI (RAM)
  - BLE Controller
- BLE Radio Hardware

**BLE Controller**

**BLE Radio Hardware**

**Zephyr Controller-only build**

**Dual-chip configuration, GNU/Linux Host**

**GNU/Linux**

- Application
- Userspace BlueZ BLE Host
  - Kernel BlueZ modules
  - Kernel HCI UART or USB driver

![hci_uart or hci_usb application]

**BLE Controller**

**BLE Radio Hardware**

**Zephyr Controller-only build**

![Fig. 6.2: Host-only and Controller-only builds on dual-chip configurations](image)

---

1239
This configuration is not limited to using a Zephyr OS Host, as the right side of the image shows. One can indeed take one of the many existing GNU/Linux distributions, most of which include Linux’s own BLE Host (BlueZ), to connect it via UART or USB to one or more instances of the Zephyr OS Controller build. BlueZ as a Host supports multiple Controllers simultaneously for applications that require more than one BLE radio operating at the same time but sharing the same Host stack.

**Source tree layout**

The stack is split up as follows in the source tree:

- `subsys/bluetooth/host`
  - The host stack. This is where the HCI command and event handling as well as connection tracking happens. The implementation of the core protocols such as L2CAP, ATT, and SMP is also here.

- `subsys/bluetooth/controller`
  - Bluetooth Controller implementation. Implements the controller-side of HCI, the Link Layer as well as access to the radio transceiver.

- `include/bluetooth/`
  - Public API header files. These are the header files applications need to include in order to use Bluetooth functionality.

- `drivers/bluetooth/`
  - HCI transport drivers. Every HCI transport needs its own driver. For example, the two common types of UART transport protocols (3-Wire and 5-Wire) have their own drivers.

- `samples/bluetooth/`
  - Sample Bluetooth code. This is a good reference to get started with Bluetooth application development.

- `tests/bluetooth/`
  - Test applications. These applications are used to verify the functionality of the Bluetooth stack, but are not necessary the best source for sample code (see `samples/bluetooth` instead).

- `doc/guides/bluetooth/`
  - Extra documentation, such as PICS documents.

**Host**

The Bluetooth Host implements all the higher-level protocols and profiles, and most importantly, provides a high-level API for applications. The following diagram depicts the main protocol & profile layers of the host.

![Diagram of Bluetooth Host protocol & profile layers](image)

Fig. 6.3: Bluetooth Host protocol & profile layers.
Lowest down in the host stack sits a so-called HCI driver, which is responsible for abstracting away the details of the HCI transport. It provides a basic API for delivering data from the controller to the host, and vice-versa.

Perhaps the most important block above the HCI handling is the Generic Access Profile (GAP). GAP simplifies Bluetooth LE access by defining four distinct roles of BLE usage:

- **Connection-oriented roles**
  - Peripheral (e.g. a smart sensor, often with a limited user interface)
  - Central (typically a mobile phone or a PC)

- **Connection-less roles**
  - Broadcaster (sending out BLE advertisements, e.g. a smart beacon)
  - Observer (scanning for BLE advertisements)

Each role comes with its own build-time configuration option: `CONFIG_BT_PERIPHERAL`, `CONFIG_BT_CENTRAL`, `CONFIG_BT_BROADCASTER` & `CONFIG_BT_OBSERVER`. Of the connection-oriented roles central implicitly enables observer role, and peripheral implicitly enables broadcaster role. Usually the first step when creating an application is to decide which roles are needed and go from there. Bluetooth mesh is a slightly special case, requiring at least the observer and broadcaster roles, and possibly also the Peripheral role. This will be described in more detail in a later section.

**Peripheral role**   Most Zephyr-based BLE devices will most likely be peripheral-role devices. This means that they perform connectable advertising and expose one or more GATT services. After registering services using the `bt_gatt_service_register()` API the application will typically start connectable advertising using the `bt_le_adv_start()` API.

There are several peripheral sample applications available in the tree, such as `samples/bluetooth/peripheral_hr`.

**Central role**   Central role may not be as common for Zephyr-based devices as peripheral role, but it is still a plausible one and equally well supported in Zephyr. Rather than accepting connections from other devices a central role device will scan for available peripheral device and choose one to connect to. Once connected, a central will typically act as a GATT client, first performing discovery of available services and then accessing one or more supported services.

To initially discover a device to connect to the application will likely use the `bt_le_scan_start()` API, wait for an appropriate device to be found (using the scan callback), stop scanning using `bt_le_scan_stop()` and then connect to the device using `bt_conn_create_le()`. If the central wants to keep automatically reconnecting to the peripheral it should use the `bt_le_set_auto_conn()` API.

There are some sample applications for the central role available in the tree, such as `samples/bluetooth/central_hr`.

**Observer role**   An observer role device will use the `bt_le_scan_start()` API to scan for device, but it will not connect to any of them. Instead it will simply utilize the advertising data of found devices, combining it optionally with the received signal strength (RSSI).

**Broadcaster role**   A broadcaster role device will use the `bt_le_adv_start()` API to advertise specific advertising data, but the type of advertising will be non-connectable, i.e. other device will not be able to connect to it.

**Connections**   Connection handling and the related APIs can be found in the *Connection Management* section.
Security  To achieve a secure relationship between two Bluetooth devices a process called pairing is used. This process can either be triggered implicitly through the security properties of GATT services, or explicitly using the `bt_conn_security()` API on a connection object.

To achieve a higher security level, and protect against Man-In-The-Middle (MITM) attacks, it is recommended to use some out-of-band channel during the pairing. If the devices have a sufficient user interface this “channel” is the user itself. The capabilities of the device are registered using the `bt_conn_auth_cb_register()` API. The `bt_conn_auth_cb` struct that's passed to this API has a set of optional callbacks that can be used during the pairing - if the device lacks some feature the corresponding callback may be set to NULL. For example, if the device does not have an input method but does have a display, the `passkey_entry` and `passkey_confirm` callbacks would be set to NULL, but the `passkey_display` would be set to a callback capable of displaying a passkey to the user.

Depending on the local and remote security requirements & capabilities, there are four possible security levels that can be reached:

- **BT_SECURITY_L1**
  - No encryption and no authentication.

- **BT_SECURITY_L2**
  - Encryption but no authentication (no MITM protection).

- **BT_SECURITY_L3**
  - Encryption and authentication using the legacy pairing method from Bluetooth 4.0 and 4.1.

- **BT_SECURITY_L4**
  - Encryption and authentication using the LE Secure Connections feature available since Bluetooth 4.2.

**Note:** Mesh has its own security solution through a process called provisioning. It follows a similar procedure as pairing, but is done using separate mesh-specific APIs.

**L2CAP**  L2CAP stands for the Logical Link Control and Adaptation Protocol. It is a common layer for all communication over Bluetooth connections, however an application comes in direct contact with it only when using it in the so-called Connection-oriented Channels (CoC) mode. More information on this can be found in the [L2CAP API section](#).

**GATT**  The Generic Attribute Profile is the most common means of communication over LE connections. A more detailed description of this layer and the API reference can be found in the [GATT API reference section](#).

**Mesh**  Mesh is a little bit special when it comes to the needed GAP roles. By default, mesh requires both observer and broadcaster role to be enabled. If the optional GATT Proxy feature is desired, then peripheral role should also be enabled.

The API reference for mesh can be found in the [Mesh API reference section](#).

**LE Audio**  The LE audio is a set of profiles and services that utilizes GATT and Isochronous Channel to provide audio over Bluetooth Low Energy. The architecture and API references can be found in [Bluetooth Audio Architecture](#).

**Persistent storage**  The Bluetooth host stack uses the settings subsystem to implement persistent storage to flash. This requires the presence of a flash driver and a designated “storage” partition on flash. A typical set of configuration options needed will look something like the following:
Once enabled, it is the responsibility of the application to call settings_load() after having initialized Bluetooth (using the bt_enable() API).

Bluetooth Low Energy Controller

Hardware Requirements

Nordic Semiconductor  The Nordic Semiconductor Bluetooth Low Energy Controller implementation requires the following hardware peripherals.

1. Clock
   • A Low Frequency Clock (LFCLOCK) or sleep clock, for low power consumption between Bluetooth radio events
   • A High Frequency Clock (HFCLOCK) or active clock, for high precision packet timing and software based transceiver state switching with inter-frame space (tIFS) timing inside Bluetooth radio events

2. Real Time Counter (RTC)
   • 1 instance
   • 2 capture/compare registers

3. Timer
   • 2 instances, one each for packet timing and tIFS software switching, respectively
   • 7 capture/compare registers (3 mandatory, 1 optional for ISR profiling, 4 for single timer tIFS switching) on first instance
   • 4 capture/compare registers for second instance, if single tIFS timer is not used.

4. Programmable Peripheral Interconnect (PPI)
   • 21 channels (20 channels when not using pre-defined channels)
   • 2 channel groups for software-based tIFS switching

5. Distributed Programmable Peripheral Interconnect (DPPI)
   • 20 channels
   • 2 channel groups for s/w tIFS switching

6. Software Interrupt (SWI)
   • 3 instances, for Lower Link Layer, Upper Link Layer High priority, and Upper Link Layer Low priority execution

7. Radio
   • 2.4 GHz radio transceiver with multiple radio standards such as 1 Mbps, 2 Mbps and Long Range Bluetooth Low Energy technology

8. Random Number Generator (RNG)
   • 1 instance
9. AES electronic codebook mode encryption (ECB)  
   • 1 instance

10. Cipher Block Chaining - Message Authentication Code with Counter Mode encryption (CCM)  
    • 1 instance

11. Accelerated address resolver (AAR)  
    • 1 instance

12. GPIO  
    • 2 GPIO pins for PA and LNA, 1 each.  
    • 10 Debug GPIO pins (optional)

13. GPIO tasks and events (GPIOTE)  
    • 1 instance  
    • 1 channel for PA/LNA

14. Temperature sensor (TEMP)  
    • For RC calibration

15. Interprocess Communication peripheral (IPC)  
    • For HCI interface

16. UART  
    • For HCI interface

Standard

Split

6.1.3 Bluetooth Audio Architecture

Fig. 6.4: Bluetooth Audio Architecture
Generic Audio Framework (GAF)

The Generic Audio Framework (GAF) is considered the middleware of the Bluetooth LE Audio architecture. The GAF contains the profiles and services that allows higher layer applications and profiles to set up streams, change volume, control media and telephony and more. The GAF builds on GATT, GAP and isochronous channels (ISO).

GAF uses GAP to connect, advertise and synchronize to other devices. GAF uses GATT to configure streams, associate streams with content (e.g. media or telephony), control volume and more. GAF uses ISO for the audio streams themselves, both as unicast (connected) audio streams or broadcast (unconnected) audio streams.

GAF mandates the use of the LC3 codec, but also supports other codecs.

Fig. 6.5: Generic Audio Framework

The top-level profiles TMAP and HAP are not part of the GAF, but rather provide top-level requirements for how to use the GAF.

GAF has been implemented in Zephyr with the following structure.

Fig. 6.6: Zephyr Generic Audio Framework

Currently CAP (and CAS) as well as CCP (and TBS) are not yet implemented in Zephyr. Similarly the top-level profiles TMAP and HAP are also not yet implemented.
Using the Bluetooth Audio Stack  To use any of the profiles in the Bluetooth Audio Stack, including the top-level profiles outside of GAF, CONFIG_BT_AUDIO shall be enabled. This Kconfig option allows the enabling of the individual profiles inside of the Bluetooth Audio Stack. Each profile can generally be enabled on its own, but enabling higher-layer profiles (such as CAP, TMAP and HAP) will typically require enabling some of the lower layer profiles.

It is, however, possible to create a device that uses e.g. only Stream Control (with just the BAP), without using any of the content control or rendering/capture control profiles, or vice versa. Using the higher layer profiles will however typically provide a better user experience and better interoperability with other devices.

Stream Control (BAP)  Stream control is implemented by the Basic Audio Profile. This profile defines multiple roles:

- Unicast Client
- Unicast Server
- Broadcast Source
- Broadcast Sink
- Scan Delegator (not yet implemented)
- Broadcast assistant (not yet implemented)

Each role can be enabled individually, and it is possible to support more than one role.

The API reference for stream control can be found in Bluetooth Audio.

Rendering and Capture Control  Rendering and capture control is implemented by the Volume Control Profile (VCP) and Microphone Input Control Profile (MICP).

The VCP implementation supports the following roles

- Volume Control Service (VCS) Server
- Volume Control Service (VCS) Client

The MICP implementation supports the following roles

- Microphone Input Control Profile (MICP) Microphone Device (server)
- Microphone Input Control Profile (MICP) Microphone Controller (client)

The API reference for volume control can be found in Bluetooth Volume Control.
The API reference for microphone input control can be found in Bluetooth Microphone Input Control.

Content Control  Content control is implemented by the Call Control Profile (CCP) and Media Control Profile (MCP).

The CCP implementation is not yet implemented in Zephyr.

The MCP implementation supports the following roles

- Media Control Service (MCS) Server via the Media Proxy module
- Media Control Client (MCC)

The API reference for media control can be found in Bluetooth Media Control.
Coordinated Sets  Coordinated Sets is implemented by the Coordinated Sets Identification Profile (CSIP).

The CSIP implementation supports the following roles

- Coordinated Set Identification Service (CSIP) Set Member
- Coordinated Set Identification Service (CSIP) Set Coordinator

The API reference for media control can be found in Bluetooth Coordinated Sets.

6.1.4 Bluetooth Qualification

Qualification Listings

The Zephyr BLE stack has obtained qualification listings for both the Host and the Controller. See the tables below for a list of qualification listings

### Host qualifications

<table>
<thead>
<tr>
<th>Zephyr version</th>
<th>Link</th>
<th>Qualifying Company</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.2.x</td>
<td>QDID 151074</td>
<td>Demant A/S</td>
</tr>
<tr>
<td>1.14.x</td>
<td>QDID 139258</td>
<td>The Linux Foundation</td>
</tr>
<tr>
<td>1.13</td>
<td>QDID 119517</td>
<td>Nordic Semiconductor</td>
</tr>
</tbody>
</table>

### Mesh qualifications

<table>
<thead>
<tr>
<th>Zephyr version</th>
<th>Link</th>
<th>Qualifying Company</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.14.x</td>
<td>QDID 139259</td>
<td>The Linux Foundation</td>
</tr>
</tbody>
</table>

### Controller qualifications

<table>
<thead>
<tr>
<th>Zephyr version</th>
<th>Link</th>
<th>Qualifying Company</th>
<th>Compatible Hardware</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.2.x</td>
<td>QDID 150092</td>
<td>Nordic Semiconductor</td>
<td>nRF52x</td>

### Peripheral Link Layer Advertising Event Types
### Parameter Name | Selected | Description
--- | --- | ---
TSPC_GAP_20_1 | True | Connectable and Scannable Undirected Event (M)
TSPC_GAP_20_2 | True | Connectable Directed Event (O)
TSPC_GAP_20_3 | True | Non-Connectable and Non-Scannable Undirected Event (O)
TSPC_GAP_20_4 | True | Scannable Undirected Event (O)
TSPC_GAP_20_5 | True | Connectable Undirected Event (C.1)
TSPC_GAP_20_6 | True | Non-Connectable and Non-Scannable Directed Event (C.1)
TSPC_GAP_20_7 | True | Scannable Directed Event (C.1)

### Peripheral Link Layer Advertising Data Types

| Parameter Name | Selected | Description |
--- | --- | ---
TSPC_GAP_20A_1 | True | AD Type – Service UUID (C.1) |
TSPC_GAP_20A_2 | True | AD Type – Local Name (C.1) |
TSPC_GAP_20A_3 | True | AD Type – Flags (C.2) |
TSPC_GAP_20A_4 | True | AD Type – Manufacturer Specific Data (C.1) |
TSPC_GAP_20A_5 | True | AD Type – TX Power Level (C.1) |
TSPC_GAP_20A_6 | True | AD Type – Security Manager Out of Band (OOB) (C.3) |
TSPC_GAP_20A_7 | True | AD Type – Security Manager TK Value (C.1) |
TSPC_GAP_20A_8 | True | AD Type – Peripheral Connection Interval Range (C.1) |
TSPC_GAP_20A_9 | True | AD Type – Service Solicitation (C.1) |
TSPC_GAP_20A_10 | True | AD Type – Service Data (C.1) |
TSPC_GAP_20A_11 | True | AD Type – Appearance (C.1) |
TSPC_GAP_20A_12 | True | AD Type – Public Target Address (C.1) |
TSPC_GAP_20A_13 | True | AD Type – Random Target Address (C.1) |
TSPC_GAP_20A_14 | True | AD Type – Advertising Interval (C.1) |
TSPC_GAP_20A_15 | True | AD Type – LE Bluetooth Device Address (C.1) |
TSPC_GAP_20A_16 | True | AD Type – LE Role (C.1) |
TSPC_GAP_20A_17 | True | AD Type – URI (O) |

### Peripheral Link Layer Control Procedures

| Parameter Name | Selected | Description |
--- | --- | ---
TSPC_GAP_21_1 | True | Connection Update Procedure (M) |
TSPC_GAP_21_2 | True | Channel Map Update Procedure (M) |
TSPC_GAP_21_3 | True | Encryption Procedure (O) |
TSPC_GAP_21_4 | True | Central Initiated Feature Exchange Procedure (M) |
TSPC_GAP_21_5 | True | Version Exchange Procedure (M) |
TSPC_GAP_21_6 | True | Termination Procedure (M) |
TSPC_GAP_21_7 | True | LE Ping Procedure (O) |
TSPC_GAP_21_8 | True | Peripheral Initiated Feature Exchange Procedure (C.1) |
TSPC_GAP_21_9 | True | Connection Parameter Request Procedure (O) |
TSPC_GAP_21_10 | True | Data Length Update Procedure (O) |
TSPC_GAP_21_11 | True | PHY Update Procedure (C.2) |
TSPC_GAP_21_12 | False | Minimum Number Of Used Channels Procedure (C.2) |

### Peripheral Discovery Modes and Procedures

| Parameter Name | Selected | Description |
--- | --- | ---
TSPC_GAP_22_1 | True | Non-Discoverable Mode (M) |
TSPC_GAP_22_2 | True | Limited Discoverable Mode (O) |
TSPC_GAP_22_3 | True | General Discoverable Mode (C.1) |
TSPC_GAP_22_4 | True | Name Discovery Procedure (O) |

TSPC_GAP_45_1 | False | Simultaneous BR/EDR and LE Transports – BR/EDR Peripheral to the same device (O)
TSPC_GAP_45_2 | False | Simultaneous BR/EDR and LE Transports – BR/EDR Central to the same device (O)

**GATT ICS**  
PTS version: 8.0.3

M - mandatory  
O - optional

### Generic Attribute Profile Support

| Parameter Name | Selected | Description |
--- | --- | ---
TSPC_GATT_1_1 | True | Generic Attribute Profile (GATT) Client (C.1)
TSPC_GATT_1_2 | True | Generic Attribute Profile (GATT) Server (C.2)

### GATT role configuration

| Parameter Name | Selected | Description |
--- | --- | ---
TSPC_GATT_1a_1 | True | GATT Client over LE (C.1)
TSPC_GATT_1a_2 | False | GATT Client over BR/EDR (C.2)
TSPC_GATT_1a_3 | True | GATT Server over LE (C.3)
TSPC_GATT_1a_4 | False | GATT Server over BR/EDR (C.4)

### Attribute Protocol Transport

| Parameter Name | Selected | Description |
--- | --- | ---
TSPC_GATT_2_1 | False | Attribute Protocol Supported over BR/EDR (L2CAP fixed channel support) (C.1)
TSPC_GATT_2_2 | True | Attribute Protocol Supported over LE (C.2)
TSPC_GATT_2_3 | True | Enhanced ATT bearer Attribute Protocol Supported (L2CAP fixed EATT PSM supported) (C.3)
TSPC_GATT_2_3a | True | Enhanced ATT bearer supported over LE (C.4)
TSPC_GATT_2_3b | False | Enhanced ATT bearer supported over BR/EDR (C.5)

### Generic Attribute Profile Feature Support, by Client

| Parameter Name | Selected | Description |
--- | --- | ---
TSPC_GATT_3_1 | True | Exchange MTU (C.11)
TSPC_GATT_3_2 | True | Discover All Primary Services (O)
TSPC_GATT_3_3 | True | Discover Primary Services by Service UUID (O)
TSPC_GATT_3_4 | True | Find Included Services (O)
TSPC_GATT_3_5 | True | Discover All characteristics of a Service (O)
TSPC_GATT_3_6 | True | Discover Characteristics by UUID (O)
TSPC_GATT_3_7 | True | Discover All Characteristic Descriptors (O)
TSPC_GATT_3_8 | True | Read Characteristic Value (O)
TSPC_GATT_3_9 | True | Read Using Characteristic UUID (O)
TSPC_GATT_3_10 | True | Read Long Characteristic Values (O)
TSPC_GATT_3_11 | True | Read Multiple Characteristic Values (O)

### 6.1.5 Bluetooth tools

This page lists and describes tools that can be used to assist during Bluetooth stack or application development in order to help, simplify and speed up the development process.

#### Mobile applications

It is often useful to make use of existing mobile applications to interact with hardware running Zephyr, to test functionality without having to write any additional code or requiring extra hardware.

The recommended mobile applications for interacting with Zephyr are:

- **Android**:
  - nRF Connect for Android
  - nRF Mesh for Android
  - LightBlue for Android
- **iOS**:
  - nRF Connect for iOS
  - nRF Mesh for iOS
  - LightBlue for iOS
Using BlueZ with Zephyr

The Linux Bluetooth Protocol Stack, BlueZ, comes with a very useful set of tools that can be used to debug and interact with Zephyr's BLE Host and Controller. In order to benefit from these tools you will need to make sure that you are running a recent version of the Linux Kernel and BlueZ:

- Linux Kernel 4.10+
- BlueZ 4.45+

Additionally, some of the BlueZ tools might not be bundled by default by your Linux distribution. If you need to build BlueZ from scratch to update to a recent version or to obtain all of its tools you can follow the steps below:

```bash
git clone git://git.kernel.org/pub/scm/bluetooth/bluez.git
cd bluez
./bootstrap-configure --disable-android --disable-midi
make
```

You can then find `btattach`, `btmgt` and `btproxy` in the `tools/` folder and `btmon` in the `monitor/` folder.

You'll need to enable BlueZ's experimental features so you can access its most recent BLE functionality. Do this by editing the file `/lib/systemd/system/bluetooth.service` and making sure to include the `-E` option in the daemon's execution start line:

```bash
ExecStart=/usr/libexec/bluetooth/bluetoothd -E
```

Finally, reload and restart the daemon:

```bash
sudo systemctl daemon-reload
sudo systemctl restart bluetooth
```

Running on QEMU and Native POSIX

It's possible to run Bluetooth applications using either the **QEMU emulator** or Native POSIX. In either case, a Bluetooth controller needs to be exported from the host OS (Linux) to the emulator. For this purpose you will need some tools described in the *Using BlueZ with Zephyr* section.

Using the Host System Bluetooth Controller

The host OS's Bluetooth controller is connected in the following manner:

- To the second QEMU serial line using a UNIX socket. This socket gets used with the help of the QEMU option `--serial unix:/tmp/bt-server-bredr`. This option gets passed to QEMU through `QEMU_EXTRA_FLAGS` automatically whenever an application has enabled Bluetooth support.

On the host side, BlueZ allows you to export its Bluetooth controller through a so-called user channel for QEMU and Native POSIX to use.

**Note:** You only need to run `btproxy` when using QEMU. Native POSIX handles the UNIX socket proxying automatically.

If you are using QEMU, in order to make the Controller available you will need one additional step using `btproxy`:

1. Make sure that the Bluetooth controller is down
2. Use the `btproxy` tool to open the listening UNIX socket, type:
You might need to replace `-i 0` with the index of the Controller you wish to proxy.

If you see `Received unknown host packet type 0x00` when running QEMU, then add `-z` to the `btproxy` command line to ignore any null bytes transmitted at startup.

Once the hardware is connected and ready to use, you can then proceed to building and running a sample:

- Choose one of the Bluetooth sample applications located in `samples/bluetooth`.
- To run a Bluetooth application in QEMU, type:

  ```shell
  west build -b qemu_x86 samples/bluetooth/<sample>
  west build -t run
  ```

  Running QEMU now results in a connection with the second serial line to the `bt-server-bredr` UNIX socket, letting the application access the Bluetooth controller.

- To run a Bluetooth application in Native POSIX, first build it:

  ```shell
  west build -b native_posix samples/bluetooth/<sample>
  ```

  And then run it with:

  ```shell
  $ sudo ./build/zephyr/zephyr.exe --bt-dev=hci0
  ```

### Using a Zephyr-based BLE Controller

Depending on which hardware you have available, you can choose between two transports when building a single-mode, Zephyr-based BLE Controller:

- UART: Use the `hci_uart` sample and follow the instructions in `bluetooth-hci-uart-qemu-posix`.
- USB: Use the `hci_usb` sample and then treat it as a Host System Bluetooth Controller (see previous section)

### HCI Tracing

When running the Host on a computer connected to an external Controller, it is very useful to be able to see the full log of exchanges between the two, in the format of a Host Controller Interface log. In order to see those logs, you can use the built-in `btmon` tool from BlueZ:

```shell
$ btmon
```

### Using Zephyr-based Controllers with BlueZ

If you want to test a Zephyr-powered BLE Controller using BlueZ's Bluetooth Host, you will need a few tools described in the `Using BlueZ with Zephyr` section. Once you have installed the tools you can then use them to interact with your Zephyr-based controller:

```shell
sudo tools/btmgmt --index 0
[hci0]# auto-power
[hci0]# find -1
```

You might need to replace `--index 0` with the index of the Controller you wish to manage. Additional information about `btmgmt` can be found in its manual pages.
6.1.6 Developing Bluetooth Applications

Bluetooth applications are developed using the common infrastructure and approach that is described in the Application Development section of the documentation.

Additional information that is only relevant to Bluetooth applications can be found in this page.

Thread safety

Calling into the Bluetooth API is intended to be thread safe, unless otherwise noted in the documentation of the API function. The effort to ensure that this is the case for all API calls is an ongoing one, but the overall goal is formally stated in this paragraph. Bug reports and Pull Requests that move the subsystem in the direction of such goal are welcome.

Hardware setup

This section describes the options you have when building and debugging Bluetooth applications with Zephyr. Depending on the hardware that is available to you, the requirements you have and the type of development you prefer you may pick one or another setup to match your needs.

There are 4 possible hardware setups to use with Zephyr and Bluetooth:

1. Embedded
2. QEMU with an external Controller
3. Native POSIX with an external Controller
4. Simulated nRF52 with BabbleSim

**Embedded** This setup relies on all software running directly on the embedded platform(s) that the application is targeting. All the Configurations and Build Types are supported but you might need to build Zephyr more than once if you are using a dual-chip configuration or if you have multiple cores in your SoC each running a different build type (e.g., one running the Host, the other the Controller).

To start developing using this setup follow the Getting Started Guide, choose one (or more if you are using a dual-chip solution) boards that support Bluetooth and then run the application.

**Embedded HCI tracing** When running both Host and Controller in actual Integrated Circuits, you will only see normal log messages on the console by default, without any way of accessing the HCI traffic between the Host and the Controller. However, there is a special Bluetooth logging mode that converts the console to use a binary protocol that interleaves both normal log messages as well as the HCI traffic.

Set the following Kconfig options to enable this protocol before building your application:

```
CONFIG_BT_DEBUG_MONITOR_UART=y
CONFIG_UART_CONSOLE=n
```

Setting `CONFIG_BT_DEBUG_MONITOR_UART` to `y` replaces the `CONFIG_BT_DEBUG_LOG` option, and setting `CONFIG_UART_CONSOLE` to `n` disables the default printk/printf hooks.

To decode the binary protocol that will now be sent to the console UART you need to use the btmon tool from BlueZ:

```
$ btmon --tty <console TTY> --tty-speed 115200
```
This setup relies on a “dual-chip” configuration which is comprised of the following devices:

1. A **Host-only** application running in the QEMU emulator or the native_posix native port of Zephyr
2. A Controller, which can be one of two types:
   - A commercially available Controller
   - A **Controller-only** build of Zephyr

**Warning:** Certain external Controllers are either unable to accept the Host to Controller flow control parameters that Zephyr sets by default (Qualcomm), or do not transmit any data from the Controller to the Host (Realtek). If you see a message similar to:

```
<wrn> bt_hci_core: opcode 0x0c33 status 0x12
```

when booting your sample of choice (make sure you have enabled `CONFIG_BT_DEBUG_LOG` in your `prj.conf` before running the sample), or if there is no data flowing from the Controller to the Host, then you need to disable Host to Controller flow control. To do so, set `CONFIG_BT_HCI_ACL_FLOW_CONTROL=n` in your `prj.conf`.

**QEMU** You can run the Zephyr Host on the QEMU emulator and have it interact with a physical external Bluetooth Controller. Refer to Running on QEMU and Native POSIX for full instructions on how to build and run an application in this setup.

**Native POSIX**

This is currently only available on GNU/Linux

The Native POSIX target builds your Zephyr application with the Zephyr kernel, and some minimal HW emulation as a native Linux executable. This executable is a normal Linux program, which can be debugged and instrumented like any other, and it communicates with a physical external Controller. Refer to Running on QEMU and Native POSIX for full instructions on how to build and run an application in this setup.

**Simulated nRF52 with BabbleSim**

This is currently only available on GNU/Linux

The nrf52_bsim board, is a simulated target board which emulates the necessary peripherals of a nrf52 SOC to be able to develop and test BLE applications. This board, uses:

- BabbleSim to simulate the nrf52 modem and the radio environment.
- The POSIX arch to emulate the processor.
- Models of the nrf52 HW

Just like with the native_posix target, the build result is a normal Linux executable. You can find more information on how to run simulations with one or several devices in this board’s documentation. Currently, only Combined builds are possible, as this board does not yet have any models of a UART, or USB which could be used for an HCI interface towards another real or simulated device.
Initialization

The Bluetooth subsystem is initialized using the `bt_enable()` function. The caller should ensure that
function succeeds by checking the return code for errors. If a function pointer is passed to `bt_enable()`,
the initialization happens asynchronously, and the completion is notified through the given function.

Bluetooth Application Example

A simple Bluetooth beacon application is shown below. The application initializes the Bluetooth Subsys-
tem and enables non-connectable advertising, effectively acting as a Bluetooth Low Energy broadcaster.

```c
/*
 * Set Advertisement data. Based on the Eddystone specification:
 * https://github.com/google/eddystone/blob/master/protocol-specification.md
 * https://github.com/google/eddystone/tree/master/eddystone-url
 */
static const struct bt_data ad[] = {
    BT_DATA_BYTES(BT_DATA_FLAGS, BT_LE_AD_NO_BREDR),
    BT_DATA_BYTES(BT_DATA_UUID16_ALL, Oxaa, Oxfe),
    BT_DATA_BYTES(BT_DATA_SVC_DATA16,
        Oxaa, Oxfe, /* Eddystone UUID */
        0x10, /* Eddystone-URL frame type */
        0x00, /* Calibrated Tx power at 0m */
        0x00, /* URL Scheme Prefix http://www. */
        'z', 'e', 'p', 'r', 'o', 'j', 'e', 'c', 't',
        0x08) /* .org */
};

/* Set Scan Response data */
static const struct bt_data sd[] = {
    BT_DATA(BT_DATA_NAME_COMPLETE, DEVICE_NAME, DEVICE_NAME_LEN),
};

static void bt_ready(int err)
{
    char addr_s[BT_ADDR_LE_STR_LEN];
    bt_addr_le_t addr = {0};
    size_t count = 1;
    if (err) {
        printk("Bluetooth init failed (err %d)\n", err);
        return;
    }

    printk("Bluetooth initialized\n");

    /* Start advertising */
    err = bt_le_adv_start(BT_LE_ADV_NCONN, ad, ARRAY_SIZE(ad),
        sd, ARRAY_SIZE(sd));
    if (err) {
        printk("Advertising failed to start (err %d)\n", err);
        return;
    }
}
```

(continues on next page)
47  /* For connectable advertising you would use
48   * bt_le_oob_get_local(). For non-connectable non-identity
49   * advertising an non-resolvable private address is used;
50   * there is no API to retrieve that.
51   */
52
53   bt_id_get(&addr, &count);
54   bt_addr_le_to_str(&addr, addr_s, sizeof(addr_s));
55
56   printk("Beacon started, advertising as %s\n", addr_s);
57 }
58
59 void main(void)
60 {
61   int err;
62
63   printk("Starting Beacon Demo\n");
64
65   /* Initialize the Bluetooth Subsystem */
66   err = bt_enable(bt_ready);
67   if (err) {
68     printk("Bluetooth init failed (err %d)\n", err);
69   }
70 }

The key APIs employed by the beacon sample are bt_enable() that's used to initialize Bluetooth and then bt_le_adv_start() that's used to start advertising a specific combination of advertising and scan response data.

### 6.1.7 AutoPTS on Windows 10 with nRF52 board

#### Overview

This tutorial shows how to setup AutoPTS client and server to run both on Windows 10. We use WSL1 with Ubuntu only to build a Zephyr project to an elf file, because Zephyr SDK is not available on Windows yet. Tutorial covers only nrf52840dk.

#### Update Windows and drivers

Update Windows in:
Start -> Settings -> Update & Security -> Windows Update
Update drivers, following the instructions from your hardware vendor.

#### Install Python 3

Download and install Python 3. Setup was tested with versions >=3.8. Let the installer add the Python installation directory to the PATH and disable the path length limitation.
Install Git

Download and install Git. During installation enable option: Enable experimental support for pseudo consoles. We will use Git Bash as Windows terminal.
Install PTS 8

Install latest PTS from https://www.bluetooth.org. Remember to install drivers from installation directory “C:/Program Files (x86)/Bluetooth SIG/Bluetooth PTS/PTS Driver/win64/CSRBlueCoreUSB.inf”

**Note:** Starting with PTS 8.0.1 the Bluetooth Protocol Viewer is no longer included. So to capture Bluetooth events, you have to download it separately.

Setup Zephyr project for Windows

Perform Windows setup from Getting Started Guide.

Install nrftools

Connect devices
Flash board

In Device Manager find COM port of your nrf board. In my case it is COM3.
In Git Bash, go to zephyrproject

```
cd ~/zephyrproject
```

Build the auto-pts tester app

```
west build -p auto -b nrf52840dk_nrf52840 zephyr/tests/bluetooth/tester/
```

You can display flashing options with:

```
west flash --help
```

and flash board with built earlier elf file:

```
west flash --skip-rebuild --board-dir /dev/ttyS2 --elf-file ~/zephyrproject/build/...zephyr/zephyr.elf
```

Note that west does not accept COMs, so use /dev/ttyS2 as the COM3 equivalent, /dev/ttyS2 as the COM3 equivalent, etc. (/dev/ttyS + decremented COM number).

**Setup auto-pts project**

In Git Bash, clone project repo:

```
git clone https://github.com/intel/auto-pts.git
```

Go into the project folder:

```
cd auto-pts
```

Install required python modules:
pip3 install --user wheel
pip3 install --user -r autoptsserver_requirements.txt
pip3 install --user -r autoptsclient_requirements.txt

Install socat.exe

Download and extract socat.exe from https://sourceforge.net/projects/unix-utils/files/socat/1.7.3.2/ into folder ~/socat-1.7.3.2-1-x86_64/.

Add path to directory of socat.exe to PATH:

6.1. Bluetooth
Running AutoPTS

Server and client by default will run on localhost address. Run server:

```
python ./autoptsserver.py -S 65000
```

Note: If the error “ImportError: No module named pywintypes” appeared after the fresh setup, uninstall and install the pywin32 module:

```
pip install --upgrade --force-reinstall pywin32
```

Run client:

```
python ./autoptsclient-zephyr.py zephyr-master ~/zephyrproject/build/zephyr/zephyr.elf -t COM3 -b nrf52 -S 65000 -C 65001
```
At the first run, when Windows asks, enable connection through firewall:

![Windows Security Alert]

Troubleshooting

- “When running actual hardware test mode, I have only BTP TIMEOUTs.”

This is a problem with connection between auto-pts client and board. There are many possible causes. Try:

- Clean your auto-pts and zephyr repos with

```
Warning: This command will force the irreversible removal of all uncommitted files in the repo.
```

```
git clean -fdx
```

then build and flash tester elf again.
• If you have set up Windows on virtual machine, check if guest extensions are installed properly or change USB compatibility mode in VM settings to USB 2.0.
• Check, if firewall is not blocking python.exe or socat.exe.
• Check if board sends ready event after restart (hex 00 00 80 ff 00 00). Open serial connection to board with e.g. PuTTY with proper COM and baud rate. After board reset you should see some strings in console.
• Check if socat.exe creates tunnel to board. Run in console

```
 socat.exe -x -v tcp-listen:65123 /dev/ttyS2,raw,b115200
```

where /dev/ttyS2 is the COM3 equivalent. Open PuTTY, set connection type to Raw, IP to 127.0.0.1, port to 65123. After board reset you should see some strings in console.

### 6.1.8 AutoPTS on Linux

**Overview**

This tutorial shows how to setup AutoPTS client on Linux with AutoPTS server running on Windows 10 virtual machine. Tested with Ubuntu 20.4 and Linux Mint 20.4.

You must have a Zephyr development environment set up. See [*Getting Started Guide*](#) for details.

Supported methods to test zephyr bluetooth host:

- Testing Zephyr Host Stack on QEMU
- Testing Zephyr Host Stack on native posix
- Testing Zephyr combined (controller + host) build on Real hardware (such as nRF52)

For running with QEMU or native posix, see [*Running on QEMU and Native POSIX*](#).

**Setup Linux**

**Install nrftools (only required in the actual hardware test mode)**

After you extract archive, you will see 2 .deb files, e.g.:

- JLink_Linux_V688a_x86_64.deb
- nRF-Command-Line-Tools_10_12_1_Linux-amd64.deb

and README.md. To install the tools, double click on each .deb file or follow instructions from README.md.

**Setup Windows 10 virtual machine**

Choose and install your hypervisor like VMWare Workstation (preferred) or VirtualBox. On VirtualBox there could be some issues, if your host has fewer than 6 CPU.

Create Windows virtual machine instance. Make sure it has at least 2 cores and installed guest extensions. Setup tested with VirtualBox 6.1.18 and VMWare Workstation 16.1.1 Pro.

**Update Windows**  Update Windows in:
Start -> Settings -> Update & Security -> Windows Update

**Setup static IP**

**WMWare Works**  On Linux, open Virtual Network Editor app and create network:
Open virtual machine network settings. Add custom adapter:

If you type ‘ifconfig’ in terminal, you should be able to find your host IP:
VirtualBox  Go to:

File -> Host Network Manager

and create network:

Open virtual machine network settings. On adapter 1 you will have created by default NAT. Add adapter 2:
**Windows**  Setup static IP on Windows virtual machine. Go to Settings -> Network & Internet -> Ethernet -> Unidentified network -> Edit and set:
**Install Python 3** Download and install latest Python on Windows. Let the installer add the Python installation directory to the PATH and disable the path length limitation.

![Python 3.9.2 (64-bit) Setup](image)

**Install Git** Download and install Git. During installation enable option: Enable experimental support for pseudo consoles. We will use Git Bash as Windows terminal.

![Python 3.9.2 (64-bit) Setup](image)
Install PTS 8  On Windows virtual machine, install latest PTS from https://www.bluetooth.org. Remember to install drivers from installation directory “C:/Program Files (x86)/Bluetooth SIG/Bluetooth PTS/PTS Driver/win64/CSRBlueCoreUSB.inf”

Note: Starting with PTS 8.0.1 the Bluetooth Protocol Viewer is no longer included. So to capture Bluetooth events, you have to download it separately.

Connect PTS dongle  With VirtualBox there should be no problem. Just find dongle in Devices -> USB and connect.

With VMWare you might need to use some trick, if you cannot find dongle in VM -> Removable Devices. Type in Linux terminal:

```
usb-devices
```

and find in output your PTS Bluetooth USB dongle
Note Vendor and ProdID number. Close VMWare Workstation and open .vmx of your virtual machine (path similar to /home/codecoup/vmware/Windows 10/Windows 10.vmx) in text editor. Write anywhere in the file following line:

```plaintext
usb.autoConnect.device0 = "0x0a12:0x0001"
```

just replace 0x0a12 with Vendor number and 0x0001 with ProdID number you found earlier.

**Connect devices (only required in the actual hardware test mode)**
Flash board (only required in the actual hardware test mode)

On Linux, go to ~/zephyrproject. There should be already ~/zephyrproject/build directory. Flash board:

```
west flash
```

Setup auto-pts project

AutoPTS client on Linux  
Clone auto-pts project:
git clone https://github.com/intel/auto-pts.git

Install socat, that is used to transfer BTP data stream from UART’s try file:

sudo apt-get install python-setuptools socat

Install required python modules:

cd auto-pts
pip3 install --user wheel
pip3 install --user -r autoptsclient_requirements.txt

**Autopts server on Windows virtual machine**  In Git Bash, clone auto-pts project repo:

git clone https://github.com/intel/auto-pts.git

Install required python modules:

cd auto-pts
pip3 install --user wheel
pip3 install --user -r autoptsserver_requirements.txt

Restart virtual machine.

**Running AutoPTS**

Server and client by default will run on localhost address. Run server:

python ./autoptsserver.py

Testing Zephyr Host Stack on QEMU:

```
# A Bluetooth controller needs to be mounted.
# For running with HCI UART, please visit: https://docs.zephyrproject.org/latest/
~samples/bluetooth/hci_uart/README.html#bluetooth-hci-uart
```

```
python ./autoptsclient-zephyr.py "C:\Users\USER_NAME\Documents\Profile Tuning Suite\PTS_PROJECT\PTS_PROJECT.pqw6" /zephyrproject/build/zephyr/zephyr.elf -i SERVER_IP -l LOCAL_IP
```

Testing Zephyr Host Stack on native posix:

```
# A Bluetooth controller needs to be mounted.
# For running with HCI UART, please visit: https://docs.zephyrproject.org/latest/
~samples/bluetooth/hci_uart/README.html#bluetooth-hci-uart
```

```
west build -b native_posix zephyr/tests/bluetooth/tester/ -DOVERLAY_CONFIG=overlay-native.conf
```

(continues on next page)
Testing Zephyr combined (controller + host) build on nRF52:

**Note:** If the error “ImportError: No module named pywintypes” appeared after the fresh setup, uninstall and install the pywin32 module:

```
pip install --upgrade --force-reinstall pywin32
```

Run client:
```
python ./autoptsclient-zephyr.py zephyr-master ~/zephyrproject/build/zephyr/zephyr.elf -t /dev/ACM0 -b nrf52 -l 192.168.2.1 -i 192.168.2.2
```

At the first run, when Windows asks, enable connection through firewall:
Troubleshooting

- “After running one test, I need to restart my Windows virtual machine to run another, because of fail verdict from APICOM in PTS logs.”

It means your virtual machine has not enough processor cores or memory. Try to add more in settings. Note that a host with 4 CPUs could be not enough with VirtualBox as hypervisor. In this case, choose rather VMWare Workstation.

- “I cannot start autoptsserver-zephyr.py. I always got error:”

One or more of the following steps should help:

- Close all PTS Windows.
- Replug PTS bluetooth dongle.
- Delete temporary workspace. You will find it in auto-pts-code/workspaces/zephyr/zephyr-master/ as temp_zephyr-master. Be careful, do not remove the original one zephyr-master.pqw6.
- Restart Windows virtual machine.

6.1.9 Bluetooth APIs

Attribute Protocol (ATT)

API Reference

`group bt_att`

Attribute Protocol (ATT)

`Defines`

- `BT_ATT_ERR_SUCCESS`
- `BT_ATT_ERR_INVALID_HANDLE`
- `BT_ATT_ERR_READ_NOT_PERMITTED`
BT_ATT_ERR_WRITE_NOT_PERMITTED

BT_ATT_ERR_INVALID_PDU

BT_ATT_ERR_AUTHENTICATION

BT_ATT_ERR_NOT_SUPPORTED

BT_ATT_ERR_INVALID_OFFSET

BT_ATT_ERR_AUTHORIZATION

BT_ATT_ERR_PREPARE_QUEUE_FULL

BT_ATT_ERR_ATTRIBUTE_NOT_FOUND

BT_ATT_ERR_ATTRIBUTE_NOT_LONG

BT_ATT_ERR_ENCRYPTION_KEY_SIZE

BT_ATT_LAST_ATTRIBUTE_HANDLE

BT_ATT_LAST_ATTRIBUTE_HANDLE

 Enums

```c
enum bt_att_chan_opt
{
    AT&T channel option bit field values.

    // Note: BT_ATT_CHAN_OPT_UNENHANCED_ONLY and BT_ATT_CHAN_OPT_ENHANCED_ONLY
    // are mutually exclusive and both bits may not be set.

    BT_ATT_CHAN_OPT_NONE = 0x0,
        // Both Enhanced and Unenhanced channels can be used
    BT_ATT_CHAN_OPT_UNENHANCED_ONLY = BIT(0),
        // Only Unenhanced channels will be used
    BT_ATT_CHAN_OPT_ENHANCED_ONLY = BIT(1),
        // Only Enhanced channels will be used
```

 Functions

```c
int bt_eatt_connect(struct bt_conn *conn, size_t num_channels)
{
    Connect Enhanced ATT channels.

    Sends a series of Credit Based Connection Requests to connect num_channels Enhanced ATT
    channels. The peer may have limited resources and fewer channels may be created.

    Parameters
    • conn – The connection to send the request on
    • num_channels – The number of Enhanced ATT beares to request. Must be in
      the range 1 - CONFIG_BT_EATT_MAX , inclusive.

    Return values
    • -EINVAL – if num_channels is not in the allowed range or conn is NULL.
    • -ENOMEM – if less than num_channels are allocated.
    • 0 – in case of success

    Returns
    0 in case of success or negative value in case of error.
```

```c
size_t bt_eatt_count(struct bt_conn *conn)
{
    Get number of EATT channels connected.

    Parameters
```
• conn – The connection to get the number of EATT channels for.

Returns
The number of EATT channels connected. Returns 0 if conn is NULL or not connected.

Bluetooth Audio

API Reference

group bt_audio
Bluetooth Audio.

Defines

BT_AUDIO_BROADCAST_ID_SIZE

BT_AUDIO_CONTEXT_TYPE_ANY
Any known context.

BT_AUDIO_UNICAST_ANNOUNCEMENT_GENERAL

BT_AUDIO_UNICAST_ANNOUNCEMENT_TARGETED

BROADCAST_SNK_STREAM_CNT

BROADCAST_SNK_SUBGROUP_CNT

BT_CODEC_DATA(_type, _bytes...)
Helper to declare elements of bt_codec_data arrays.
This macro is mainly for creating an array of struct bt_codec_data elements inside bt_codec which is then passed to the likes of bt_audio_stream_config or bt_audio_stream_reconfig.

Parameters
• _type – Type of advertising data field
• _bytes – Variable number of single-byte parameters

BT_CODEC(_id, _cid, _vid, _data, _meta)
Helper to declare bt_codec structure.

Parameters
• _id – Codec ID
• _cid – Company ID
• _vid – Vendor ID
• _data – Codec Specific Data in LVT format
• _meta – Codec Specific Metadata in LVT format
BT_CODEC_QOS(_interval, _framing, _phy, _sdu, _rtn, _latency, _pd)
Helper to declare elements of bt_codec_qos.

Parameters
- _interval – SDU interval (usec)
- _framing – Framing
- _phy – Target PHY
- _sdu – Maximum SDU Size
- _rtn – Retransmission number
- _latency – Maximum Transport Latency (msec)
- _pd – Presentation Delay (usec)

BT_CODEC_QOS_UNFRAMED(_interval, _sdu, _rtn, _latency, _pd)
Helper to declare Unframed bt_codec_qos.

Parameters
- _interval – SDU interval (usec)
- _sdu – Maximum SDU Size
- _rtn – Retransmission number
- _latency – Maximum Transport Latency (msec)
- _pd – Presentation Delay (usec)

BT_CODEC_QOS_FRAMED(_interval, _sdu, _rtn, _latency, _pd)
Helper to declare Framed bt_codec_qos.

Parameters
- _interval – SDU interval (usec)
- _sdu – Maximum SDU Size
- _rtn – Retransmission number
- _latency – Maximum Transport Latency (msec)
- _pd – Presentation Delay (usec)

BT_CODEC_QOS_PREF(_unframed_supported, _phy, _rtn, _latency, _pd_min, _pd_max, _pref_pd_min, _pref_pd_max)
Helper to declare elements of bt_codec_qos_pref.

Parameters
- _unframed_supported – Unframed PDUs supported
- _phy – Preferred Target PHY
- _rtn – Preferred Retransmission number
- _latency – Preferred Maximum Transport Latency (msec)
- _pd_min – Minimum Presentation Delay (usec)
- _pd_max – Maximum Presentation Delay (usec)
- _pref_pd_min – Preferred Minimum Presentation Delay (usec)
- _pref_pd_max – Preferred Maximum Presentation Delay (usec)

BT_AUDIO_LC3_PRESET(_codec, _qos)
Helper to declare an LC3 preset structure
BT_AUDIO_LC3_UNICAST_PRESET_8_1_1(_loc, _stream_context)
Helper to declare LC3 Unicast 8_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_8_2_1(_loc, _stream_context)
Helper to declare LC3 Unicast 8_2_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_16_1_1(_loc, _stream_context)
Helper to declare LC3 Unicast 16_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

Mandatory to support as both unicast client and server

BT_AUDIO_LC3_UNICAST_PRESET_16_2_1(_loc, _stream_context)
Helper to declare LC3 Unicast 16_2_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_24_1_1(_loc, _stream_context)
Helper to declare LC3 Unicast 24_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

Mandatory to support as unicast server

BT_AUDIO_LC3_UNICAST_PRESET_24_2_1(_loc, _stream_context)
Helper to declare LC3 Unicast 24_2_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_32_1_1(_loc, _stream_context)
Helper to declare LC3 Unicast 32_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_32_2_1(_loc, _stream_context)
Helper to declare LC3 Unicast 32_2_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_441_1_1(_loc, _stream_context)
Helper to declare LC3 Unicast 441_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_441_2_1(_loc, _stream_context)
Helper to declare LC3 Unicast 441_2_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_1_1(_loc, _stream_context)
Helper to declare LC3 Unicast 48_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_2_1(_loc, _stream_context)
Helper to declare LC3 Unicast 48_2_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_3_1(_loc, _stream_context)
Helper to declare LC3 Unicast 48_3_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_4_1(_loc, _stream_context)
Helper to declare LC3 Unicast 48_4_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_5_1(_loc, _stream_context)
Helper to declare LC3 Unicast 48_5_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_6_1(_loc, _stream_context)
Helper to declare LC3 Unicast 48_6_1 codec configuration.
• _loc – Audio channel location bitfield (_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_8_1_2(_loc, _stream_context)
Helper to declare LC3 Unicast 8_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_8_2_2(_loc, _stream_context)
Helper to declare LC3 Unicast 8_2_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_16_1_2(_loc, _stream_context)
Helper to declare LC3 Unicast 16_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_16_2_2(_loc, _stream_context)
Helper to declare LC3 Unicast 16_2_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_24_1_2(_loc, _stream_context)
Helper to declare LC3 Unicast 24_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_24_2_2(_loc, _stream_context)
Helper to declare LC3 Unicast 24_2_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_32_1_2(_loc, _stream_context)
Helper to declare LC3 Unicast 32_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_32_2_2(_loc, _stream_context)
Helper to declare LC3 Unicast 32_2_2 codec configuration.
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_441_1_2(_loc, _stream_context)
Helper to declare LC3 Unicast 441_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_441_2_2(_loc, _stream_context)
Helper to declare LC3 Unicast 441_2_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_1_2(_loc, _stream_context)
Helper to declare LC3 Unicast 48_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_2_2(_loc, _stream_context)
Helper to declare LC3 Unicast 48_2_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_3_2(_loc, _stream_context)
Helper to declare LC3 Unicast 48_3_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_4_2(_loc, _stream_context)
Helper to declare LC3 Unicast 48_4_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIOCONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_5_2(_loc, _stream_context)
Helper to declare LC3 Unicast 48_5_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_6_2(_loc, _stream_context)
Helper to declare LC3 Unicast 48_6_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_8_1_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 8_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_8_2_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 8_2_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT AUDIO LC3 BROADCAST PRESET 16 1_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 16_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT AUDIO LC3 BROADCAST PRESET 16 2_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 16_2_1 codec configuration.
Mandatory to support as both broadcast source and sink

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT AUDIO LC3 BROADCAST PRESET 24 1_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 24_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT AUDIO LC3 BROADCAST PRESET 24 2_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 24_2_1 codec configuration.
Mandatory to support as broadcast sink

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT AUDIO LC3 BROADCAST PRESET 32 1_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 32_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)
BT_AUDIO_LC3_BROADCAST_PRESET_32_2_1(loc, stream_context)
Helper to declare LC3 Broadcast 32_2_1 codec configuration.

Parameters

- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_441_1_1(loc, stream_context)
Helper to declare LC3 Broadcast 441_1_1 codec configuration.

Parameters

- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_441_2_1(loc, stream_context)
Helper to declare LC3 Broadcast 441_2_1 codec configuration.

Parameters

- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_48_1_1(loc, stream_context)
Helper to declare LC3 Broadcast 48_1_1 codec configuration.

Parameters

- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_48_2_1(loc, stream_context)
Helper to declare LC3 Broadcast 48_2_1 codec configuration.

Parameters

- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIOCONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_48_3_1(loc, stream_context)
Helper to declare LC3 Broadcast 48_3_1 codec configuration.

Parameters

- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIOCONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_48_4_1(loc, stream_context)
Helper to declare LC3 Broadcast 48_4_1 codec configuration.

Parameters

- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIOCONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_48_5_1(loc, stream_context)
Helper to declare LC3 Broadcast 48_5_1 codec configuration.

Parameters

- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIOCONTEXT_*)
BT_AUDIO_LC3_BROADCAST_PRESET_48_6_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 48_6_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_8_1_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 8_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_8_2_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 8_2_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_16_1_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 16_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_16_2_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 16_2_2 codec configuration.

Mandatory to support as both broadcast source and sink

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_24_1_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 24_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_24_2_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 24_2_2 codec configuration.

Mandatory to support as broadcast sink

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_32_1_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 32_1_2 codec configuration.
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

`BT_AUDIO_LC3_BROADCAST_PRESET_32_2_2(_loc, _stream_context)`
Helper to declare LC3 Broadcast 32_2_2 codec configuration.

**Parameters**

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

`BT_AUDIO_LC3_BROADCAST_PRESET_441_1_2(_loc, _stream_context)`
Helper to declare LC3 Broadcast 441_1_2 codec configuration.

**Parameters**

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

`BT_AUDIO_LC3_BROADCAST_PRESET_441_2_2(_loc, _stream_context)`
Helper to declare LC3 Broadcast 441_2_2 codec configuration.

**Parameters**

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

`BT_AUDIO_LC3_BROADCAST_PRESET_48_1_2(_loc, _stream_context)`
Helper to declare LC3 Broadcast 48_1_2 codec configuration.

**Parameters**

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

`BT_AUDIO_LC3_BROADCAST_PRESET_48_2_2(_loc, _stream_context)`
Helper to declare LC3 Broadcast 48_2_2 codec configuration.

**Parameters**

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

`BT_AUDIO_LC3_BROADCAST_PRESET_48_3_2(_loc, _stream_context)`
Helper to declare LC3 Broadcast 48_3_2 codec configuration.

**Parameters**

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

`BT_AUDIO_LC3_BROADCAST_PRESET_48_4_2(_loc, _stream_context)`
Helper to declare LC3 Broadcast 48_4_2 codec configuration.

**Parameters**

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

`BT_AUDIO_LC3_BROADCAST_PRESET_48_5_2(_loc, _stream_context)`
Helper to declare LC3 Broadcast 48_5_2 codec configuration.

**Parameters**

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)
• _loc – Audio channel location bitfield (`bt_audio_location`)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

`BT_AUDIO_LC3_BROADCAST_PRESET_48_6_2(_loc, _stream_context)`

Helper to declare LC3 Broadcast 48_6_2 codec configuration.

**Parameters**

- _loc – Audio channel location bitfield (`bt_audio_location`)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

** Enums **

```c
enum bt_audio_context
{
    Audio Context Type for Generic Audio.
    These values are defined by the Generic Audio Assigned Numbers, bluetooth.com

    Values:

    enumerator BT_AUDIO_CONTEXT_TYPE_PROHIBITED = 0
    enumerator BT_AUDIO_CONTEXT_TYPE_UNSPECIFIED = BIT(0)
    enumerator BT_AUDIO_CONTEXT_TYPE_CONVERSATIONAL = BIT(1)
    enumerator BT_AUDIO_CONTEXT_TYPE_MEDIA = BIT(2)
    enumerator BT_AUDIO_CONTEXT_TYPE_GAME = BIT(3)
    enumerator BT_AUDIO_CONTEXT_TYPE_INSTRUCTIONAL = BIT(4)
    enumerator BT_AUDIO_CONTEXT_TYPE_VOICE_ASSISTANTS = BIT(5)
    enumerator BT_AUDIO_CONTEXT_TYPE_LIVE = BIT(6)
    enumerator BT_AUDIO_CONTEXT_TYPE_SOUND_EFFECTS = BIT(7)
    enumerator BT_AUDIO_CONTEXT_TYPE_NOTIFICATIONS = BIT(8)
    enumerator BT_AUDIO_CONTEXT_TYPE_RINGTONE = BIT(9)
    enumerator BT_AUDIO_CONTEXT_TYPE_ALERTS = BIT(10)
    enumerator BT_AUDIO_CONTEXT_TYPE_EMERGENCY_ALARM = BIT(11)
}
```

1306 Chapter 6. Connectivity
enum bt_audio_parental_rating
    Parental rating defined by the Generic Audio assigned numbers (bluetooth.com).
The numbering scheme is aligned with Annex F of EN 300 707 v1.2.1 which defined parental rating for viewing.
Values:
    enumerator BT_AUDIO_PARENTAL_RATING_NO_RATING = 0x00
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_ANY = 0x01
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_5_OR_ABOVE = 0x02
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_6_OR_ABOVE = 0x03
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_7_OR_ABOVE = 0x04
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_8_OR_ABOVE = 0x05
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_9_OR_ABOVE = 0x06
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_10_OR_ABOVE = 0x07
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_11_OR_ABOVE = 0x08
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_12_OR_ABOVE = 0x09
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_13_OR_ABOVE = 0x0A
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_14_OR_ABOVE = 0x0B
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_15_OR_ABOVE = 0x0C
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_16_OR_ABOVE = 0x0D
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_17_OR_ABOVE = 0x0E
    enumerator BT_AUDIO_PARENTAL_RATING_AGE_18_OR_ABOVE = 0x0F

enum bt_audio_metadata_type
    Codec metadata type IDs.
    Metadata types defined by the Generic Audio assigned numbers (bluetooth.com).
    Values:
Enumerator `BT_AUDIO_METADATA_TYPE_PREF_CONTEXT` = 0x01
Preferred audio context.

Bitfield of preferred audio contexts.
If 0, the context type is not a preferred use case for this codec configuration.
See the `BT_AUDIO_CONTEXT_*` for valid values.

Enumerator `BT_AUDIO_METADATA_TYPE_STREAM_CONTEXT` = 0x02
Streaming audio context.

Bitfield of streaming audio contexts.
If 0, the context type is not a preferred use case for this codec configuration.
See the `BT_AUDIO_CONTEXT_*` for valid values.

Enumerator `BT_AUDIO_METADATA_TYPE_PROGRAM_INFO` = 0x03
UTF-8 encoded title or summary of stream content.

Enumerator `BT_AUDIO_METADATA_TYPE_STREAM_LANG` = 0x04
Stream language.

3 octet lower case language code defined by ISO 639-3

Enumerator `BT_AUDIO_METADATA_TYPE_CCID_LIST` = 0x05
Array of 8-bit CCID values.

Enumerator `BT_AUDIO_METADATA_TYPE_PARENTAL_RATING` = 0x06
Parental rating.

See `@ref bt_audio_parental_rating` for valid values.

Enumerator `BT_AUDIO_METADATA_TYPE_PROGRAM_INFO_URI` = 0x07
UTF-8 encoded URI for additional Program information.

Enumerator `BT_AUDIO_METADATA_TYPE_EXTENDED` = 0xFE
Extended metadata.

Enumerator `BT_AUDIO_METADATA_TYPE_VENDOR` = 0xFF
Vendor specific metadata.
enum bt_audio_location

Location values for BT Audio.
These values are defined by the Generic Audio Assigned Numbers, bluetooth.com

Values:

enumerator BT_AUDIO_LOCATION_FRONT_LEFT = BIT(0)
enumerator BT_AUDIO_LOCATION_FRONT_RIGHT = BIT(1)
enumerator BT_AUDIO_LOCATION_FRONT_CENTER = BIT(2)
enumerator BT_AUDIO_LOCATION_LOW_FREQ_EFFECTS_1 = BIT(3)
enumerator BT_AUDIO_LOCATION_BACK_LEFT = BIT(4)
enumerator BT_AUDIO_LOCATION_BACK_RIGHT = BIT(5)
enumerator BT_AUDIO_LOCATION_FRONT_LEFT_OF_CENTER = BIT(6)
enumerator BT_AUDIO_LOCATION_FRONT_RIGHT_OF_CENTER = BIT(7)
enumerator BT_AUDIO_LOCATION_BACK_CENTER = BIT(8)
enumerator BT_AUDIO_LOCATION_LOW_FREQ_EFFECTS_2 = BIT(9)
enumerator BT_AUDIO_LOCATION_SIDE_LEFT = BIT(10)
enumerator BT_AUDIO_LOCATION_SIDE_RIGHT = BIT(11)
enumerator BT_AUDIO_LOCATION_TOP_FRONT_LEFT = BIT(12)
enumerator BT_AUDIO_LOCATION_TOP_FRONT_RIGHT = BIT(13)
enumerator BT_AUDIO_LOCATION_TOP_FRONT_CENTER = BIT(14)
enumerator BT_AUDIO_LOCATION_TOP_CENTER = BIT(15)
enumerator BT_AUDIO_LOCATION_TOP_BACK_LEFT = BIT(16)
enumerator BT_AUDIO_LOCATION_TOP_BACK_RIGHT = BIT(17)
enumerator BT_AUDIO_LOCATION_TOP_SIDE_LEFT = BIT(18)
enumerator BT_AUDIO_LOCATION_TOP_SIDE_RIGHT = BIT(19)
enumerator BT_AUDIO_LOCATION_TOP_BACK_CENTER = \texttt{BIT}(20)

enumerator BT_AUDIO_LOCATION_BOTTOM_FRONT_CENTER = \texttt{BIT}(21)

enumerator BT_AUDIO_LOCATION_BOTTOM_FRONT_LEFT = \texttt{BIT}(22)

enumerator BT_AUDIO_LOCATION_BOTTOM_FRONT_RIGHT = \texttt{BIT}(23)

enumerator BT_AUDIO_LOCATION_FRONT_LEFT_WIDE = \texttt{BIT}(24)

enumerator BT_AUDIO_LOCATION_FRONT_RIGHT_WIDE = \texttt{BIT}(25)

enumerator BT_AUDIO_LOCATION_LEFT_SURROUND = \texttt{BIT}(26)

enumerator BT_AUDIO_LOCATION_RIGHT_SURROUND = \texttt{BIT}(27)

\begin{verbatim}
enum bt_audio_dir
    Audio Capability type.
    Values:
    
    enumerator BT_AUDIO_DIR_SINK = 0x01

    enumerator BT_AUDIO_DIR_SOURCE = 0x02
\end{verbatim}

\begin{verbatim}
enum [anonymous]
    Codec QoS Framing.
    Values:
    
    enumerator BT_CODEC_QOS_UNFRAMED = 0x00

    enumerator BT_CODEC_QOS_FRAMED = 0x01
\end{verbatim}

\begin{verbatim}
enum [anonymous]
    Codec QoS Preferred PHY.
    Values:
    
    enumerator BT_CODEC_QOS_1M = \texttt{BIT}(0)

    enumerator BT_CODEC_QOS_2M = \texttt{BIT}(1)

    enumerator BT_CODEC_QOS_CODED = \texttt{BIT}(2)
\end{verbatim}
Functions

`int bt_audio_unicast_client_register_cb(const struct bt_audio_unicast_client_cb *cb)`

Register unicast client callbacks.

Only one callback structure can be registered, and attempting to registering more than one will result in an error.

**Parameters**
- `cb` – Unicast client callback structure.

**Returns**
- 0 in case of success or negative value in case of error.

`void bt_audio_stream_cb_register(struct bt_audio_stream *stream, struct bt_audio_stream_ops *ops)`

Register Audio callbacks for a stream.

**Parameters**
- `stream` – Stream object.
- `ops` – Stream operations structure.

```c
struct bt_codec_data
#include <audio.h> Codec configuration structure.
```

```c
struct bt_codec
#include <audio.h> Codec structure.
```

**Public Members**

```c
uint8_t path_id
Data path ID
BT_ISO_DATA_PATH_HCI for HCI path, or any other value for vendor specific ID.
```

```c
uint8_t id
Codec ID
```

```c
uint16_t cid
Codec Company ID
```

```c
uint16_t vid
Codec Company Vendor ID
```

```c
struct bt_audio_base_bis_data
#include <audio.h>
```

```c
struct bt_audio_base_subgroup
#include <audio.h>
```
Public Members

struct bt_codec codec
   Codec information for the subgroup
   If the data_count of the codec is 0, then codec specific data may be found for each BIS in
   the bis_data.

struct bt_audio_base
   #include <audio.h>

struct bt_codec_qos
   #include <audio.h> Codec QoS structure.

Public Members

uint8_t phy
   QoS PHY

uint8_t framing
   QoS Framing

uint8_t rtn
   QoS Retransmission Number

uint16_t sdu
   QoS SDU

uint16_t latency
   QoS Transport Latency

uint32_t interval
   QoS Frame Interval

uint32_t pd
   QoS Presentation Delay

struct bt_codec_qos_pref
   #include <audio.h> Audio Stream Quality of Service Preference structure.

Public Members

bool unframed_supported
   Unframed PDUs supported.
   Unlike the other fields, this is not a preference but whether the codec supports unframed
   ISOAL PDUs.
uint8_t phy
    Preferred PHY

uint8_t rtn
    Preferred Retransmission Number

uint16_t latency
    Preferred Transport Latency

uint32_t pd_min
    Minimum Presentation Delay.
    Unlike the other fields, this is not a preference but a minimum requirement.

uint32_t pd_max
    Maximum Presentation Delay.
    Unlike the other fields, this is not a preference but a maximum requirement.

uint32_t pref_pd_min
    Preferred minimum Presentation Delay.

uint32_t pref_pd_max
    Preferred maximum Presentation Delay

struct bt_audio_lc3_preset
    \#include <audio.h> Struct to hold a BAP defined LC3 preset

Public Members

struct bt_codec codec
    The LC3 Codec

struct bt_codec_qos qos
    The BAP spec defined QoS values

struct bt_audio_stream
    \#include <audio.h> Audio stream structure.
    Audio Streams represents a stream configuration of a Remote Endpoint and a Local Capability.

    **Note:** Audio streams are unidirectional although its QoS can be configured to be bidirectional if stream are linked, in which case the QoS must be symmetric in both directions.

Public Members

struct bt_conn *conn
    Connection reference

6.1. Bluetooth
struct bt_audio_ep *ep
    Endpoint reference

const struct bt_codec *codec
    Codec Configuration

struct bt_codec_qos *qos
    QoS Configuration

struct bt_audio_stream_ops *ops
    Audio stream operations

void *user_data
    Stream user data

struct bt_audio_unicast_client_cb
    #include <audio.h> Unicast Client callback structure

Public Members

void (*location)(struct bt_conn *conn, enum bt_audio_dir dir, enum bt_audio_location loc)
    Remote Unicast Server Audio Locations.
    This callback is called whenever the audio locations is read from the server or otherwise notified to the client.
    
    Param conn
    Connection to the remote unicast server.
    
    Param dir
    Direction of the location.
    
    Param loc
    The location bitfield value.
    
    Return
    0 in case of success or negative value in case of error.

void (*available_contexts)(struct bt_conn *conn, enum bt_audio_context snk_ctx, enum bt_audio_context src_ctx)
    Remote Unicast Server Available Contexts.
    This callback is called whenever the available contexts are read from the server or otherwise notified to the client.
    
    Param conn
    Connection to the remote unicast server.
    
    Param snk_ctx
    The sink context bitfield value.
    
    Param src_ctx
    The source context bitfield value.
    
    Return
    0 in case of success or negative value in case of error.

#include <audio.h> Unicast Server callback structure
Public Members

int (*config)(struct bt_conn *conn, const struct bt_audio_ep *ep, enum bt_audio_dir dir, const struct bt_codec *codec, struct bt_audio_stream **stream, struct bt_codec_qos_pref *const pref)

Endpoint config request callback.
Config callback is called whenever an endpoint is requested to be configured

Param conn
[in] Connection object.
Param ep
[in] Local Audio Endpoint being configured.
Param dir
[in] Direction of the endpoint.
Param codec
[in] Codec configuration.
Param stream
[out] Pointer to stream that will be configured for the endpoint.
Param pref
[out] Pointer to a QoS preference object that shall be populated with values.
Invalid values will reject the codec configuration request.

Return
0 in case of success or negative value in case of error.

int (*reconfig)(struct bt_audio_stream *stream, enum bt_audio_dir dir, const struct bt_codec *codec, struct bt_codec_qos_pref *const pref)

Stream reconfig request callback.
Reconfig callback is called whenever an Audio Stream needs to be reconfigured with different codec configuration.

Param stream
[in] Stream object being reconfigured.
Param dir
[in] Direction of the endpoint.
Param codec
[in] Codec configuration.
Param pref
[out] Pointer to a QoS preference object that shall be populated with values.
Invalid values will reject the codec configuration request.

Return
0 in case of success or negative value in case of error.

int (*qos)(struct bt_audio_stream *stream, const struct bt_codec_qos *qos)

Stream QoS request callback.
QoS callback is called whenever an Audio Stream Quality of Service needs to be configured.

Param stream
Stream object being reconfigured.

Param qos
Quality of Service configuration.

Return
0 in case of success or negative value in case of error.

int (*enable)(struct bt_audio_stream *stream, const struct bt_codec_data *meta, size_t meta_count)

Stream Enable request callback.
Enable callback is called whenever an Audio Stream is requested to be enabled to stream.

**Param stream**
Stream object being enabled.

**Param meta**
Metadata entries

**Param meta_count**
Number of metadata entries

**Return**
0 in case of success or negative value in case of error.

```c
int (*start)(struct bt_audio_stream *stream)
```

Stream Start request callback.

Start callback is called whenever an Audio Stream is requested to start streaming.

**Param stream**
Stream object.

**Return**
0 in case of success or negative value in case of error.

```c
int (*metadata)(struct bt_audio_stream *stream, const struct bt_codec_data *meta, size_t meta_count)
```

Stream Metadata update request callback.

Metadata callback is called whenever an Audio Stream is requested to update its metadata.

**Param stream**
Stream object.

**Param meta**
Metadata entries

**Param meta_count**
Number of metadata entries

**Return**
0 in case of success or negative value in case of error.

```c
int (*disable)(struct bt_audio_stream *stream)
```

Stream Disable request callback.

Disable callback is called whenever an Audio Stream is requested to disable the stream.

**Param stream**
Stream object being disabled.

**Return**
0 in case of success or negative value in case of error.

```c
int (*stop)(struct bt_audio_stream *stream)
```

Stream Stop callback.

Stop callback is called whenever an Audio Stream is requested to stop streaming.

**Param stream**
Stream object.

**Return**
0 in case of success or negative value in case of error.

```c
int (*release)(struct bt_audio_stream *stream)
```

Stream release callback.

Release callback is called whenever a new Audio Stream needs to be released and thus deallocated.
Param stream
   Stream object.
Return
   0 in case of success or negative value in case of error.

struct bt_audio_broadcast_sink_cb
#include <audio.h> Broadcast Audio Sink callback structure

Public Members

bool (*scan_recv)(const struct bt_le_scan_recv_info *info, struct net_buf_simple *ad,
                  uint32_t broadcast_id)
   Scan receive callback.
   Scan receive callback is called whenever a broadcast source has been found.
   Param info
      Advertiser packet information.
   Param ad
      Buffer containing advertiser data.
   Param broadcast_id
      24-bit broadcast ID
   Return
      true to sync to the broadcaster, else false. Syncing to the broadcaster will stop
      the current scan.

void (*pa_synced)(struct bt_audio_broadcast_sink *sink, struct bt_le_per_adv_sync *sync,
                  uint32_t broadcast_id)
   Periodic advertising sync callback.
   Called when synchronized to a periodic advertising. When synchronized a
   bt_audio_broadcast_sink structure is allocated for future use.
   Param sink
      Pointer to the allocated sink structure.
   Param sync
      Pointer to the periodic advertising sync.
   Param broadcast_id
      24-bit broadcast ID previously reported by scan_recv.

void (*base_recv)(struct bt_audio_broadcast_sink *sink, const struct bt_audio_base *base)
   Broadcast Audio Source Endpoint (BASE) received.
   Callback for when we receive a BASE from a broadcaster after syncing to the broadcaster’s
   periodic advertising.
   Param sink
      Pointer to the sink structure.
   Param base
      Broadcast Audio Source Endpoint (BASE).

void (*syncable)(struct bt_audio_broadcast_sink *sink, bool encrypted)
   Broadcast sink is syncable.
   Called whenever a broadcast sink is not synchronized to audio, but the audio is synchro-
   nizable. This is inferred when a BIGInfo report is received.
   Once this callback has been called, it is possible to call bt_audio_broadcast_sink_sync() to
   synchronize to the audio stream(s).

6.1. Bluetooth
Param sink
   Pointer to the sink structure.

Param encrypted
   Whether or not the broadcast is encrypted

void (*scan_term)(int err)
Scan terminated callback.
Scan terminated callback is called whenever a scan started
by \texttt{bt\_audio\_broadcast\_sink\_scan\_start()} is terminated before
\texttt{bt\_audio\_broadcast\_sink\_scan\_stop()}.
Typical reasons for this are that the periodic advertising has synchronized (success cri-
teria) or the scan timed out. It may also be called if the periodic advertising failed to
synchronize.

Param err
   0 in case of success or negative value in case of error.

void (*pa_sync_lost)(struct bt_audio_broadcast_sink *sink)
Periodic advertising synchronization lost callback.
The periodic advertising synchronization lost callback is called if the periodic advertising
sync is lost. If this happens, the sink object is deleted. To synchronize to the broadcaster
again, \texttt{bt\_audio\_broadcast\_sink\_scan\_start()} must be called.

Param sink
   Pointer to the sink structure.

\begin{verbatim}
struct bt_audio_stream_ops
   #include <audio.h> Stream operation.
\end{verbatim}

Public Members

void (*started)(struct \texttt{bt\_audio\_stream} *stream)
Stream started callback.
Started callback is called whenever an Audio Stream has been started and will be usable
for streaming.

Param stream
   Stream object that has been started.

void (*stopped)(struct \texttt{bt\_audio\_stream} *stream)
Stream stopped callback.
Stopped callback is called whenever an Audio Stream has been stopped.

Param stream
   Stream object that has been stopped.

\begin{verbatim}
group bt_audio_client
\end{verbatim}

Typedefs

typedef void (*bt_audio_discover_func_t)(struct bt_conn *conn, struct \texttt{bt\_codec} *codec, struct
\texttt{bt\_audio\_ep} *ep, struct \texttt{bt\_audio\_discover\_params} *params)
Discover Audio capabilities and endpoints callback function.

If discovery procedure has complete both cap and ep are set to NULL.

**Functions**

```c
int bt_audio_discover(struct bt_conn *conn, struct bt_audio_discover_params *params)
```

Discover remote capabilities and endpoints.

This procedure is used by a client to discover remote capabilities and endpoints and notifies via params callback.

---

**Note:** This procedure is asynchronous therefore the parameters need to remains valid while it is active.

---

**Parameters**

- `conn` – Connection object
- `params` – Discover parameters

---

```c
int bt_audio_stream_config(struct bt_conn *conn, struct bt_audio_stream *stream, struct bt_audio_ep *ep, struct bt_codec *codec)
```

Configure Audio Stream.

This procedure is used by a client to configure a new stream using the remote endpoint, local capability and codec configuration.

**Parameters**

- `conn` – Connection object
- `stream` – Stream object being configured
- `ep` – Remote Audio Endpoint being configured
- `codec` – Codec configuration

**Returns**

Allocated Audio Stream object or NULL in case of error.

---

```c
int bt_audio_stream_reconfig(struct bt_audio_stream *stream, const struct bt_codec *codec)
```

Reconfigure Audio Stream.

This procedure is used by a unicast client or unicast server to reconfigure a stream to use a different local codec configuration.

This can only be done for unicast streams.

**Parameters**

- `stream` – Stream object being reconfigured
- `codec` – Codec configuration

**Returns**

0 in case of success or negative value in case of error.

---

```c
int bt_audio_stream_qos(struct bt_conn *conn, struct bt_audio_unicast_group *group)
```

Configure Audio Stream QoS.

This procedure is used by a client to configure the Quality of Service of streams in a unicast group. All streams in the group for the specified `conn` will have the Quality of Service configured. This shall only be used to configure unicast streams.
Parameters

- conn – Connection object
- group – Unicast group object

Returns

0 in case of success or negative value in case of error.

```c
int bt_audio_stream_enable(struct bt_audio_stream *stream, struct bt_codec_data *meta, size_t meta_count)
```

Enable Audio Stream.

This procedure is used by a client to enable a stream.

This shall only be called for unicast streams, as broadcast streams will always be enabled once created.

Parameters

- stream – Stream object
- meta_count – Number of metadata entries
- meta – Metadata entries

Returns

0 in case of success or negative value in case of error.

```c
int bt_audio_stream_metadata(struct bt_audio_stream *stream, struct bt_codec_data *meta, size_t meta_count)
```

Change Audio Stream Metadata.

This procedure is used by a unicast client or unicast server to change the metadata of a stream.

Parameters

- stream – Stream object
- meta_count – Number of metadata entries
- meta – Metadata entries

Returns

0 in case of success or negative value in case of error.

```c
int bt_audio_stream_disable(struct bt_audio_stream *stream)
```

Disable Audio Stream.

This procedure is used by a unicast client or unicast server to disable a stream.

This shall only be called for unicast streams, as broadcast streams will always be enabled once created.

Parameters

- stream – Stream object

Returns

0 in case of success or negative value in case of error.

```c
int bt_audio_stream_start(struct bt_audio_stream *stream)
```

Start Audio Stream.

This procedure is used by a unicast client or unicast server to make a stream start streaming.

This shall only be called for unicast streams. Broadcast sinks will always be started once synchronized, and broadcast source streams shall be started with `bt_audio_broadcast_source_start()`.

Parameters
int bt_audio_stream_stop(struct bt_audio_stream *stream)

Stop Audio Stream.
This procedure is used by a client to make a stream stop streaming.
This shall only be called for unicast streams. Broadcast sinks cannot be stopped. Broadcast sources shall be stopped with bt_audio_broadcast_source_stop().

Parameters
• stream – Stream object

Returns
0 in case of success or negative value in case of error.

int bt_audio_stream_release(struct bt_audio_stream *stream)

Release Audio Stream.
This procedure is used by a unicast client or unicast server to release a unicast stream. Broadcast sink streams cannot be released, but can be deleted by bt_audio_broadcast_sink_delete(). Broadcast source streams cannot be released, but can be deleted by bt_audio_broadcast_source_delete().

Parameters
• stream – Stream object

Returns
0 in case of success or negative value in case of error.

int bt_audio_stream_send(struct bt_audio_stream *stream, struct net_buf *buf, uint16_t seq_num, uint32_t ts)

Send data to Audio stream.
Send data from buffer to the stream.

Note: Data will not be sent to linked streams since linking is only consider for procedures affecting the state machine.

Parameters
• stream – Stream object.
• buf – Buffer containing data to be sent.
• seq_num – Packet Sequence number. This value shall be incremented for each call to this function and at least once per SDU interval for a specific channel.
• ts – Timestamp of the SDU in microseconds (us). This value can be used to transmit multiple SDUs in the same SDU interval in a CIG or BIG. Can be omitted by using BT_ISO_TIMESTAMP_NONE which will simply enqueue the ISO SDU in a FIFO manner.

Returns
Bytes sent in case of success or negative value in case of error.

int bt_audio_unicast_group_create(struct bt_audio_unicast_group_param params[], size_t num_param, struct bt_audio_unicast_group **unicast_group)
Create audio unicast group.

Create a new audio unicast group with one or more audio streams as a unicast client. Streams in a unicast group shall share the same interval, framing and latency (see \texttt{bt\_codec\_qos}).

**Parameters**

- \texttt{params} – [in] Array of stream parameters being used for the group.
- \texttt{num\_param} – [in] Number of parameters in \texttt{params}.
- \texttt{unicast\_group} – [out] Pointer to the unicast group created

**Returns**

Zero on success or (negative) error code otherwise.

\begin{verbatim}
int bt_audio_unicast_group_add_streams(struct bt_audio_unicast_group *unicast_group, 
struct bt_audio_unicast_group_param params[], 
size_t num_param)
\end{verbatim}

Add streams to a unicast group as a unicast client.

This function can be used to add additional streams to a \texttt{bt\_audio\_unicast\_group}.

This can be called at any time before any of the streams in the group has been started (see \texttt{bt\_audio\_stream\_ops\_started()}). This can also be called after the streams have been stopped (see \texttt{bt\_audio\_stream\_ops\_stopped()}).

Once a stream has been added to a unicast group, it cannot be removed. To remove a stream from a group, the group must be deleted with \texttt{bt\_audio\_unicast\_group\_delete()}, but this will require all streams in the group to be released first.

**Parameters**

- \texttt{unicast\_group} – Pointer to the unicast group
- \texttt{params} – Array of stream parameters with streams being added to the group.
- \texttt{num\_param} – Number of parameters in \texttt{params}.

**Returns**

0 in case of success or negative value in case of error.

\begin{verbatim}
int bt_audio_unicast_group_delete(struct bt_audio_unicast_group *unicast_group)
\end{verbatim}

Delete audio unicast group.

Delete a audio unicast group as a client. All streams in the group shall be in the idle or configured state.

**Parameters**

- \texttt{unicast\_group} – Pointer to the unicast group to delete

**Returns**

Zero on success or (negative) error code otherwise.
bt_audio_discover_func_t func
    Callback function

uint8_t num_caps
    Number of capabilities found

uint8_t num_eps
    Number of endpoints found

uint8_t err
    Error code.

struct bt_audio_unicast_group_param
    #include <audio.h> Parameter struct for the unicast group functions.
    Parameter struct for the bt_audio_unicast_group_create() and bt_audio_unicast_group_add_streams() functions.

Public Members

struct bt_audio_stream *stream
    Pointer to a stream object.

struct bt_codec_qos *qos
    The QoS settings for the bt_audio_unicast_group_param::stream.

tomer bt_audio_dir dir
    The direction of the bt_audio_unicast_group_param::stream.
    If two streams are being used for the same ACL connection but in different directions, they may use the same CIS.

Group bt_audio_server

Functions

int bt_audio_unicast_server_register_cb(const struct bt_audio_unicast_server_cb *cb)
    Register unicast server callbacks.
    Only one callback structure can be registered, and attempting to registering more than one will result in an error.

    Parameters
    • cb – Unicast server callback structure.

    Returns
    0 in case of success or negative value in case of error.

int bt_audio_unicast_server_unregister_cb(const struct bt_audio_unicast_server_cb *cb)
    Unregister unicast server callbacks.
    May only unregister a callback structure that has previously been registered by bt_audio_unicast_server_register_cb().
Parameters

- cb – Unicast server callback structure.

Returns

0 in case of success or negative value in case of error.

### Functions

#### int bt_audio_broadcast_source_create(struct bt_audio_broadcast_source_create_param *param, struct bt_audio_broadcast_source **source)

Create audio broadcast source.

Create a new audio broadcast source with one or more audio streams.

The broadcast source will be visible for scanners once this has been called, and the device will advertise audio announcements.

No audio data can be sent until `bt_audio_broadcast_source_start()` has been called and no audio information (BIGInfo) will be visible to scanners (see `bt_le_per_adv_sync_cb`).

**Parameters**

- **param** – [in] Pointer to parameters used to create the broadcast source.
- **source** – [out] Pointer to the broadcast source created

**Returns**

Zero on success or (negative) error code otherwise.

#### int bt_audio_broadcast_source_reconfig(struct bt_audio_broadcast_source *source, struct bt_codec *codec, struct bt_codec_qos *qos)

Reconfigure audio broadcast source.

Reconfigure an audio broadcast source with a new codec and codec quality of service parameters.

**Parameters**

- **source** – Pointer to the broadcast source
- **codec** – Codec configuration.
- **qos** – Quality of Service configuration

**Returns**

Zero on success or (negative) error code otherwise.

#### int bt_audio_broadcast_source_start(struct bt_audio_broadcast_source *source, struct bt_le_ext_adv *adv)

Start audio broadcast source.

Start an audio broadcast source with one or more audio streams. The broadcast source will start advertising BIGInfo, and audio data can be streamed.

**Parameters**

- **source** – Pointer to the broadcast source
- **adv** – Pointer to an extended advertising set with periodic advertising configured.

**Returns**

Zero on success or (negative) error code otherwise.
int bt_audio_broadcast_source_stop(struct bt_audio_broadcast_source *source)
Stop audio broadcast source.

Stop an audio broadcast source. The broadcast source will stop advertising BIGInfo, and audio
data can no longer be streamed.

Parameters
• source – Pointer to the broadcast source

Returns
Zero on success or (negative) error code otherwise.

int bt_audio_broadcast_source_delete(struct bt_audio_broadcast_source *source)
Delete audio broadcast source.

Delete an audio broadcast source. The broadcast source will stop advertising entirely, and the
source can no longer be used.

Parameters
• source – Pointer to the broadcast source

Returns
Zero on success or (negative) error code otherwise.

int bt_audio_broadcast_source_get_id(const struct bt_audio_broadcast_source *source,
uint32_t *const broadcast_id)
Get the broadcast ID of a broadcast source.

This will return the 3-octet broadcast ID that should be advertised in the extended advertising
data with BT_UUID_BROADCAST_AUDIO_VAL as BT_DATA_SVC_DATA16.

See table 3.14 in the Basic Audio Profile v1.0.1 for the structure.

Parameters
• source – [in] Pointer to the broadcast source.
• broadcast_id – [out] Pointer to the 3-octet broadcast ID.

Returns
int 0 if on success, errno on error.

int bt_audio_broadcast_source_get_base(struct bt_audio_broadcast_source *source,
struct net_buf_simple *base_buf)
Get the Broadcast Audio Stream Endpoint of a broadcast source.

This will encode the BASE of a broadcast source into a buffer, that can be used for advertise-
ment. The encoded BASE will thus be encoded as little-endian. The BASE shall be put into
the periodic advertising data (see bt_le_per_adv_set_data()).

See table 3.15 in the Basic Audio Profile v1.0.1 for the structure.

Parameters
• source – Pointer to the broadcast source.
• base_buf – Pointer to a buffer where the BASE will be inserted.

Returns
int 0 if on success, errno on error.

void bt_audio_broadcast_sink_register_cb(struct bt_audio_broadcast_sink_cb *cb)
Register Broadcast sink callbacks *.

Parameters
• cb – Broadcast sink callback structure.
int bt_audio_broadcast_sink_scan_start(const struct bt_le_scan_param *param)
Start scan for broadcast sources.

Starts a scan for broadcast sources. Scan results will be received by the scan_recv callback. Only reports from devices advertising broadcast audio support will be sent. Note that a broadcast source may advertise broadcast audio capabilities, but may not be streaming.

**Parameters**

- param – Scan parameters.

**Returns**
Zero on success or (negative) error code otherwise.

int bt_audio_broadcast_sink_scan_stop(void)
Stop scan for broadcast sources.

Stops ongoing scanning for broadcast sources.

**Returns**
Zero on success or (negative) error code otherwise.

int bt_audio_broadcast_sink_sync(struct bt_audio_broadcast_sink *sink, uint32_t indexes_bitfield, struct bt_audio_stream *streams[], const uint8_t broadcast_code[16])
Sync to a broadcaster's audio.

**Parameters**

- sink – Pointer to the sink object from the base_recv callback.
- indexes_bitfield – Bitfield of the BIS index to sync to. To sync to e.g. BIS index 1 and 2, this should have the value of BIT(1) | BIT(2).
- streams – Stream object pointers to be used for the receiver. If multiple BIS indexes shall be synchronized, multiple streams shall be provided.
- broadcast_code – The 16-octet broadcast code. Shall be supplied if the broadcast is encrypted (see the syncable callback).

**Returns**
0 in case of success or negative value in case of error.

int bt_audio_broadcast_sink_stop(struct bt_audio_broadcast_sink *sink)
Stop audio broadcast sink.

Stop an audio broadcast sink. The broadcast sink will stop receiving BIGInfo, and audio data can no longer be streamed.

**Parameters**

- sink – Pointer to the broadcast sink

**Returns**
Zero on success or (negative) error code otherwise.

int bt_audio_broadcast_sink_delete(struct bt_audio_broadcast_sink *sink)
Release a broadcast sink.

Once a broadcast sink has been allocated after the pa_synced callback, it can be deleted using this function. If the sink has synchronized to any broadcast audio streams, these must first be stopped using bt_audio_stream_stop.

**Parameters**

- sink – Pointer to the sink object to delete.

**Returns**
0 in case of success or negative value in case of error.
```c
struct bt_audio_broadcast_source_stream_param
#include <audio.h>

Public Members

struct bt_audio_stream *stream
  Audio stream

size_t data_count
  The number of elements in the data array.
  The BIS specific data may be omitted and this set to 0.

struct bt_codec_data *data
  BIS Codec Specific Configuration

struct bt_audio_broadcast_source_subgroup_param
#include <audio.h>

Public Members

size_t params_count
  The number of parameters in stream_params

struct bt_audio_broadcast_source_stream_param *params
  Array of stream parameters

struct bt_codec *codec
  Subgroup Codec configuration.

struct bt_audio_broadcast_source_create_param
#include <audio.h>

Public Members

size_t params_count
  The number of parameters in subgroup_params

struct bt_audio_broadcast_source_subgroup_param *params
  Array of stream parameters

struct bt_codec_qos *qos
  Quality of Service configuration.

group bt_audio_codec_cfg
  Audio codec Config APIs.
  Functions to parse codec config data when formatted as LTV wrapped into bt_codec.
```

6.1. Bluetooth
Enums

enum bt_audio_codec_parse_err
    Codec parser error codes for Codec config parsing APIs.
    Values:
    
    enumerator BT_AUDIO_CODEC_PARSE_ERR_SUCCESS = 0
        The requested type is not present in the data set.
    
    enumerator BT_AUDIO_CODEC_PARSE_ERR_TYPE_NOT_FOUND = -1
        The requested type is not present in the data set.
    
    enumerator BT_AUDIO_CODEC_PARSE_ERR_INVALID_VALUE_FOUND = -2
        The value found is invalid.
    
    enumerator BT_AUDIO_CODEC_PARSE_ERR_INVALID_PARAM = -3
        The parameters specified to the function call are not valid.

Functions

int bt_codec_cfg_get_freq(const struct bt_codec *codec)
    Extract the frequency from a codec configuration.
    Parameters
    • codec – The codec configuration to extract data from.
    
    Returns
    The frequency in Hz if found else a negative value of type
    bt_audio_codec_parse_err.

int bt_codec_cfg_get_frame_duration_us(const struct bt_codec *codec)
    Extract frame duration from BT codec config.
    Parameters
    • codec – The codec configuration to extract data from.
    
    Returns
    Frame duration in microseconds if value is found else a negative value of type
    bt_audio_codec_parse_err.

int bt_codec_cfg_get_chan_allocation_val(const struct bt_codec *codec, uint32_t *chan_allocation)
    Extract channel allocation from BT codec config.

    The value returned is a bit field representing one or more audio locations
    as specified by bt_audio_location Shall match one or more of the bits set in
    BT_PAC_SNK_LOC/BT_PAC_SRC_LOC.

    Up to the configured BT_CODEC_LC3_CHAN_COUNT number of channels can be present.

    Parameters
    • codec – The codec configuration to extract data from.
    • chan_allocation – Pointer to the variable to store the extracted value in.
Returns
BT_AUDIO_CODEC_PARSE_SUCCESS if value is found and stored in the pointer
provided else a negative value of type bt_audio_codec_parse_err.

int bt_codec_cfg_get_octets_per_frame(const struct bt_codec *codec)
Extract frame size in octets from BT codec config.

The overall SDU size will be octets_per_frame * blocks_per_sdu.
The Bluetooth specifications are not clear about this value - it does not state that the codec
shall use this SDU size only. A codec like LC3 supports variable bit-rate (per SDU) hence
it might be allowed for an encoder to reduce the frame size below this value. Hence it is
recommended to use the received SDU size and divide by blocks_per_sdu rather than relying
on this octets_per_sdu value to be fixed.

Parameters
• codec – The codec configuration to extract data from.

Returns
Frame length in octets if value is found else a negative value of type
bt_audio_codec_parse_err.

int bt_codec_cfg_get_frame_blocks_per_sdu(const struct bt_codec *codec, bool fallback_to_default)
Extract number of audio frame blocks in each SDU from BT codec config.

The overall SDU size will be octets_per_frame * frame_blocks_per_sdu * number-of-channels.
If this value is not present a default value of 1 shall be used.

A frame block is one or more frames that represents data for the same period of time but for
different channels. If the stream have two audio channels and this value is two there will be
four frames in the SDU.

Parameters
• codec – The codec configuration to extract data from.
• fallback_to_default – If true this function will return the default value of 1
  if the type is not found. In this case the function will only fail if a NULL pointer
  is provided.

Returns
The count of codec frames in each SDU if value is found else a negative value of type
bt_audio_codec_parse_err - unless when fallback_to_default is true then
the value 1 is returned if frames per sdu is not found.

bool bt_codec_get_val(const struct bt_codec *codec, uint8_t type, const struct bt_codec_data **data)
Lookup a specific value based on type.

Depending on context bt_codec will be either codec capabilities, codec configuration or meta
data.

Typically types used are: bt_codec_capability_type bt_codec_config_type
bt_audio_metadata_type

Parameters
• codec – The codec data to search in.
• type – The type id to look for
• data – Pointer to the data-pointer to update when item is found

Returns
True if the type is found, false otherwise.
Connection Management

The Zephyr Bluetooth stack uses an abstraction called `bt_conn` to represent connections to other devices. The internals of this struct are not exposed to the application, but a limited amount of information (such as the remote address) can be acquired using the `bt_conn_get_info()` API. Connection objects are reference counted, and the application is expected to use the `bt_conn_ref()` API whenever storing a connection pointer for a longer period of time, since this ensures that the object remains valid (even if the connection would get disconnected). Similarly the `bt_conn_unref()` API is to be used when releasing a reference to a connection.

An application may track connections by registering a `bt_conn_cb` struct using the `bt_conn_cb_register()` or `BT_CONN_CB_DEFINE` APIs. This struct lets the application define callbacks for connection & disconnection events, as well as other events related to a connection such as a change in the security level or the connection parameters. When acting as a central the application will also get hold of the connection object through the return value of the `bt_conn_create_le()` API.

API Reference

**group bt_conn**

Connection management.

**Defines**

`BT_LE_CONN_PARAM_INIT(int_min, int_max, lat, to)`

Initialize connection parameters.

**Parameters**

- `int_min` – Minimum Connection Interval (N * 1.25 ms)
- `int_max` – Maximum Connection Interval (N * 1.25 ms)
- `lat` – Connection Latency
- `to` – Supervision Timeout (N * 10 ms)

`BT_LE_CONN_PARAM(int_min, int_max, lat, to)`

Helper to declare connection parameters inline

**Parameters**

- `int_min` – Minimum Connection Interval (N * 1.25 ms)
- `int_max` – Maximum Connection Interval (N * 1.25 ms)
- `lat` – Connection Latency
- `to` – Supervision Timeout (N * 10 ms)

`BT_LE_CONN_PARAM_DEFAULT`

Default LE connection parameters: Connection Interval: 30-50 ms Latency: 0 Timeout: 4 s

`BT_CONN_LE_PHY_PARAM_INIT(_pref_tx_phy, _pref_rx_phy)`

Initialize PHY parameters

**Parameters**

- `_pref_tx_phy` – Bitmask of preferred transmit PHYs.
- `_pref_rx_phy` – Bitmask of preferred receive PHYs.
BT_CONN_LE_PHY_PARAM(_pref_tx_phy, _pref_rx_phy)
Helper to declare PHY parameters inline

Parameters
- _pref_tx_phy – Bitmask of preferred transmit PHYs.
- _pref_rx_phy – Bitmask of preferred receive PHYs.

BT_CONN_LE_PHY_PARAM_1M
Only LE 1M PHY

BT_CONN_LE_PHY_PARAM_2M
Only LE 2M PHY

BT_CONN_LE_PHY_PARAM_CODED
Only LE Coded PHY.

BT_CONN_LE_PHY_PARAM_ALL
All LE PHYs.

BT_CONN_LE_DATA_LEN_PARAM_INIT(_tx_max_len, _tx_max_time)
Initialize transmit data length parameters

Parameters
- _tx_max_len – Maximum Link Layer transmission payload size in bytes.
- _tx_max_time – Maximum Link Layer transmission payload time in us.

BT_CONN_LE_DATA_LEN_PARAM(_tx_max_len, _tx_max_time)
Helper to declare transmit data length parameters inline

Parameters
- _tx_max_len – Maximum Link Layer transmission payload size in bytes.
- _tx_max_time – Maximum Link Layer transmission payload time in us.

BT_LE_DATA_LEN_PARAM_DEFAULT
Default LE data length parameters.

BT_LE_DATA_LEN_PARAM_MAX
Maximum LE data length parameters.

BT_CONN_INTERVAL_TO_MS(interval)

BT_CONN_ROLE_MASTER
Connection role (central or peripheral)

BT_CONN_ROLE_SLAVE

BT_CONN_LE_CREATE_PARAM_INIT(_options, _interval, _window)
Initialize create connection parameters.

Parameters
- _options – Create connection options.
- _interval – Create connection scan interval (N * 0.625 ms).
• _window – Create connection scan window (N * 0.625 ms).

`BT_CONN_LE_CREATE_PARAM(_options, _interval, _window)`

Helper to declare create connection parameters inline

**Parameters**

• _options – Create connection options.
• _interval – Create connection scan interval (N * 0.625 ms).
• _window – Create connection scan window (N * 0.625 ms).

`BT_CONN_LE_CREATE_CONN`

Default LE create connection parameters. Scan continuously by setting scan interval equal to scan window.

`BT_CONN_LE_CREATE_CONN_AUTO`

Default LE create connection using filter accept list parameters. Scan window: 30 ms. Scan interval: 60 ms.

`BT_CONN_CB_DEFINE(_name)`

Register a callback structure for connection events.

**Parameters**

• _name – Name of callback structure.

`BT_PASSKEY_INVALID`

Special passkey value that can be used to disable a previously set fixed passkey.

`BT_BR_CONN_PARAM_INIT(role_switch)`

Initialize BR/EDR connection parameters.

**Parameters**

• role_switch – True if role switch is allowed

`BT_BR_CONN_PARAM(role_switch)`

Helper to declare BR/EDR connection parameters inline

**Parameters**

• role_switch – True if role switch is allowed

`BT_BR_CONN_PARAM_DEFAULT`

Default BR/EDR connection parameters: Role switch allowed

**Enums**

enum [anonymous]

Connection PHY options

**Values:**

enumerator `BT_CONN_LE_PHY_OPT_NONE` = 0

Convenience value when no options are specified.
enumerator BT_CONN_LE_PHY_OPT_CODED_S2 = BIT(0)
LE Coded using S=2 coding preferred when transmitting.

enumerator BT_CONN_LE_PHY_OPT_CODED_S8 = BIT(1)
LE Coded using S=8 coding preferred when transmitting.

enum [anonymous]
Connection Type
Values:

enumerator BT_CONN_TYPE_LE = BIT(0)
LE Connection Type

enumerator BT_CONN_TYPE_BR = BIT(1)
BR/EDR Connection Type

enumerator BT_CONN_TYPE_SCO = BIT(2)
SCO Connection Type

enumerator BT_CONN_TYPE_ISO = BIT(3)
ISO Connection Type

enumerator BT_CONN_TYPE_ALL = BT_CONN_TYPE_LE | BT_CONN_TYPE_BR |
BT_CONN_TYPE_SCO | BT_CONN_TYPE_ISO
All Connection Type

enum [anonymous]
Values:

enumerator BT_CONN_ROLE_CENTRAL = 0

enumerator BT_CONN_ROLE_PERIPHERAL = 1

enum bt_conn_state
Values:

enumerator BT_CONN_STATE_DISCONNECTED
Channel disconnected

enumerator BT_CONN_STATE_CONNECTING
Channel in connecting state

enumerator BT_CONN_STATE_CONNECTED
Channel connected and ready for upper layer traffic on it

enumerator BT_CONN_STATE_DISCONNECTING
Channel in disconnecting state

6.1. Bluetooth
enum bt_security_t
  Security level.

  Values:

  enumerator BT_SECURITY_L0
    Level 0: Only for BR/EDR special cases, like SDP

  enumerator BT_SECURITY_L1
    Level 1: No encryption and no authentication.

  enumerator BT_SECURITY_L2
    Level 2: Encryption and no authentication (no MITM).

  enumerator BT_SECURITY_L3
    Level 3: Encryption and authentication (MITM).

  enumerator BT_SECURITY_L4
    Level 4: Authenticated Secure Connections and 128-bit key.

enumerator BT_SECURITY_FORCE_PAIR = BIT(7)
  Bit to force new pairing procedure, bit-wise OR with requested security level.

enum bt_security_flag
  Security Info Flags.

  Values:

  enumerator BT_SECURITY_FLAG_SC = BIT(0)
    Paired with Secure Connections.

  enumerator BT_SECURITY_FLAG_OOB = BIT(1)
    Paired with Out of Band method.

enum bt_conn_le_tx_power_phy
  Values:

  enumerator BT_CONN_LE_TX_POWER_PHY_NONE
    Convenience macro for when no PHY is set.

  enumerator BT_CONN_LE_TX_POWER_PHY_1M
    LE 1M PHY

  enumerator BT_CONN_LE_TX_POWER_PHY_2M
    LE 2M PHY

  enumerator BT_CONN_LE_TX_POWER_PHY_CODED_S8
    LE Coded PHY using S=8 coding.
enumerator BT_CONN_LE_TX_POWER_PHY_CODED_S2
    LE Coded PHY using $S=2$ coding.

enum [anonymous]

Values:

enumerator BT_CONN_LE_OPT_NONE = 0
    Convenience value when no options are specified.

enumerator BT_CONN_LE_OPT_CODED = BIT(0)
    Enable LE Coded PHY.

    Enable scanning on the LE Coded PHY.

enumerator BT_CONN_LE_OPT_NO_1M = BIT(1)
    Disable LE 1M PHY.

    Disable scanning on the LE 1M PHY.

    @note Requires @ref BT_CONN_LE_OPT_CODED.

enum bt_security_err

Values:

enumerator BT_SECURITY_ERR_SUCCESS
    Security procedure successful.

enumerator BT_SECURITY_ERR_AUTH_FAIL
    Authentication failed.

enumerator BT_SECURITY_ERR_PIN_OR_KEY_MISSING
    PIN or encryption key is missing.

enumerator BT_SECURITY_ERR_OOB_NOT_AVAILABLE
    OOB data is not available.

enumerator BT_SECURITY_ERR_AUTH_REQUIREMENT
    The requested security level could not be reached.

enumerator BT_SECURITY_ERR_PAIR_NOT_SUPPORTED
    Pairing is not supported

enumerator BT_SECURITY_ERR_PAIR_NOT_ALLOWED
    Pairing is not allowed.

enumerator BT_SECURITY_ERR_INVALID_PARAM
    Invalid parameters.
enumerator BT_SECURITY_ERR_KEY_REJECTED
  Distributed Key Rejected

enumerator BT_SECURITY_ERR_UNSPECIFIED
  Pairing failed but the exact reason could not be specified.

Functions

struct bt_conn *bt_conn_ref(struct bt_conn *conn)
  Increment a connection's reference count.
  Increment the reference count of a connection object.

  **Note:** Will return NULL if the reference count is zero.

Parameters

  • conn – Connection object.

Returns

  Connection object with incremented reference count, or NULL if the reference
count is zero.

void bt_conn_unref(struct bt_conn *conn)
  Decrement a connection's reference count.
  Decrement the reference count of a connection object.

Parameters

  • conn – Connection object.

void bt_conn_foreach(int type, void (*func)(struct bt_conn *conn, void *data), void *data)
  Iterate through all existing connections.

Parameters

  • type – Connection Type
  • func – Function to call for each connection.
  • data – Data to pass to the callback function.

struct bt_conn *bt_conn_lookup_addr_le(uint8_t id, const bt_addr_le_t *peer)
  Look up an existing connection by address.
  Look up an existing connection based on the remote address.
  The caller gets a new reference to the connection object which must be released with
  bt_conn_unref() once done using the object.

Parameters

  • id – Local identity (in most cases BT_ID_DEFAULT).
  • peer – Remote address.

Returns

  Connection object or NULL if not found.
const bt_addr_le_t *bt_conn_get_dst(const struct bt_conn *conn)
Get destination (peer) address of a connection.

**Parameters**

- conn – Connection object.

**Returns**

Destination address.

uint8_t bt_conn_index(const struct bt_conn *conn)
Get array index of a connection.

This function is used to map bt_conn to index of an array of connections. The array has
CONFIG_BT_MAX_CONN elements.

**Parameters**

- conn – Connection object.

**Returns**

Index of the connection object. The range of the returned value is
0..CONFIG_BT_MAX_CONN-1

int bt_conn_get_info(const struct bt_conn *conn, struct bt_conn_info *info)
Get connection info.

**Parameters**

- conn – Connection object.
- info – Connection info object.

**Returns**

Zero on success or (negative) error code on failure.

int bt_conn_get_remote_info(struct bt_conn *conn, struct bt_conn_remote_info *remote_info)
Get connection info for the remote device.

**Note:** In order to retrieve the remote version (version, manufacturer and subversion)
CONFIG_BT_REMOTE_VERSION must be enabled

**Note:** The remote information is exchanged directly after the connection has been estab-
lished. The application can be notified about when the remote information is available
through the remote_info_available callback.

**Parameters**

- conn – Connection object.
- remote_info – Connection remote info object.

**Returns**

Zero on success or (negative) error code on failure.

**Returns**

-EBUSY The remote information is not yet available.

int bt_conn_le_get_tx_power_level(struct bt_conn *conn, struct bt_conn_le_tx_power
*tx_power_level)
Get connection transmit power level.

**Parameters**
• conn – Connection object.
• tx_power_level – Transmit power level descriptor.

Returns
Zero on success or (negative) error code on failure.

Returns
-ENOBUSFS HCI command buffer is not available.

int bt_conn_le_param_update(struct bt_conn *conn, const struct bt_le_conn_param *param)
Update the connection parameters.
If the local device is in the peripheral role then updating the connection parameters will be delayed. This delay can be configured by through the CONFIG_BT_CONN_PARAM_UPDATE_TIMEOUT option.

Parameters
• conn – Connection object.
• param – Updated connection parameters.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_le_data_len_update(struct bt_conn *conn, const struct bt_conn_le_data_len_param *param)
Update the connection transmit data length parameters.

Parameters
• conn – Connection object.
• param – Updated data length parameters.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_le_phy_update(struct bt_conn *conn, const struct bt_conn_le_phy_param *param)
Update the connection PHY parameters.
Update the preferred transmit and receive PHYs of the connection. Use BT_GAP_LE_PHY_NONE to indicate no preference.

Parameters
• conn – Connection object.
• param – Updated connection parameters.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_disconnect(struct bt_conn *conn, uint8_t reason)
Disconnect from a remote device or cancel pending connection.
Disconnect an active connection with the specified reason code or cancel pending outgoing connection.
The disconnect reason for a normal disconnect should be: BT_HCI_ERR_REMOTE_USER_TERM_CONN.
The following disconnect reasons are accepted:
• BT_HCI_ERR_AUTH_FAIL
• BT_HCI_ERR_REMOTE_USER_TERM_CONN
• BT_HCI_ERR_REMOTE_LOW_RESOURCES
• BT_HCI_ERR_REMOTE_POWER_OFF
• BT_HCI_ERR_UNSUPP_REMOTE_FEATURE
• BT_HCI_ERR_PAIRING_NOT_SUPPORTED
• BT_HCI_ERR_UNACCEPT_CONN_PARAM

Parameters
  • conn – Connection to disconnect.
  • reason – Reason code for the disconnection.

Returns
  Zero on success or (negative) error code on failure.

```c
int bt_conn_le_create(const bt_addr_le_t *peer, const struct bt_conn_le_create_param *create_param, const struct bt_le_conn_param *conn_param, struct bt_conn **conn)
```
Initiate an LE connection to a remote device.

Allows initiate new LE link to remote peer using its address.

The caller gets a new reference to the connection object which must be released with `bt_conn_unref()` once done using the object.

This uses the General Connection Establishment procedure.

The application must disable explicit scanning before initiating a new LE connection.

When `CONFIG_BT_PRIVACY` enabled and `peer` is an identity address from a local bond, this API will connect to an advertisement with either:

  • the address being an RPA resolved from the IRK obtained during bonding.
  • the passed identity address, if the local identity is not in Network Privacy Mode.

Parameters
  • peer – [in] Remote address.
  • create_param – [in] Create connection parameters.
  • conn_param – [in] Initial connection parameters.
  • conn – [out] Valid connection object on success.

Returns
  Zero on success or (negative) error code on failure.

```c
int bt_conn_le_create_auto(const struct bt_conn_le_create_param *create_param, const struct bt_le_conn_param *conn_param)
```
Automatically connect to remote devices in the filter accept list..

This uses the Auto Connection Establishment procedure. The procedure will continue until a single connection is established or the procedure is stopped through `bt_conn_create_auto_stop`.

To establish connections to all devices in the the filter accept list the procedure should be started again in the connected callback after a new connection has been established.

Parameters
  • create_param – Create connection parameters
  • conn_param – Initial connection parameters.

Returns
  Zero on success or (negative) error code on failure.
int bt_conn_create_auto_stop(void)
Stop automatic connect creation.

Returns
Zero on success or (negative) error code on failure.

int bt_le_set_auto_conn(const bt_addr_le_t *addr, const struct bt_le_conn_param *param)
Automatically connect to remote device if it’s in range.

This function enables/disables automatic connection initiation. Every time the device loses
the connection with peer, this connection will be re-established if connectable advertisement
from peer is received.

Note: Auto connect is disabled during explicit scanning.

Parameters
• addr – Remote Bluetooth address.
• param – If non-NULL, auto connect is enabled with the given parameters. If
  NULL, auto connect is disabled.

Returns
Zero on success or error code otherwise.

int bt_conn_set_security(struct bt_conn *conn, bt_security_t sec)
Set security level for a connection.

This function enable security (encryption) for a connection. If the device has bond information
for the peer with sufficiently strong key encryption will be enabled. If the connection is already
encrypted with sufficiently strong key this function does nothing.

If the device has no bond information for the peer and is not already paired then the pairing
procedure will be initiated. If the device has bond information or is already paired and the
keys are too weak then the pairing procedure will be initiated.

This function may return error if required level of security is not possible to achieve due to
local or remote device limitation (e.g., input output capabilities), or if the maximum number
of paired devices has been reached.

This function may return error if the pairing procedure has already been initiated by the local
device or the peer device.

Note: When CONFIG_BT_SMP_SC_ONLY is enabled then the security level will always be level 4.

Note: When CONFIG_BT_SMP_OOB_LEGACY_PAIR_ONLY is enabled then the security level will
always be level 3.

Parameters
• conn – Connection object.
• sec – Requested security level.

Returns
0 on success or negative error
bt_security_t bt_conn_get_security(const struct bt_conn *conn)
Get security level for a connection.

Returns
Connection security level

uint8_t bt_conn_enc_key_size(const struct bt_conn *conn)
Get encryption key size.
This function gets encryption key size. If there is no security (encryption) enabled 0 will be returned.

Parameters
• conn – Existing connection object.

Returns
Encryption key size.

void bt_conn_cb_register(struct bt_conn_cb *cb)
Register connection callbacks.
Register callbacks to monitor the state of connections.

Parameters
• cb – Callback struct. Must point to memory that remains valid.

void bt_set_bondable(bool enable)
Enable/disable bonding.
Set/clear the Bonding flag in the Authentication Requirements of SMP Pairing Request/Response data. The initial value of this flag depends on BT_BONDABLE Kconfig setting. For the vast majority of applications calling this function shouldn’t be needed.

Parameters
• enable – Value allowing/disallowing to be bondable.

void bt_set_oob_data_flag(bool enable)
Allow/disallow remote OOB data to be used for pairing.
Set/clear the OOB data flag for SMP Pairing Request/Response data. The initial value of this flag depends on BT_OOB_DATA_PRESENT Kconfig setting.

Parameters
• enable – Value allowing/disallowing remote OOB data.

int bt_le_oob_set_legacy_tk(struct bt_conn *conn, const uint8_t *tk)
Set OOB Temporary Key to be used for pairing.
This function allows to set OOB data for the LE legacy pairing procedure. The function should only be called in response to the oob_data_request() callback provided that the legacy method is user pairing.

Parameters
• conn – Connection object
• tk – Pointer to 16 byte long TK array

Returns
Zero on success or -EINVAL if NULL

int bt_le_oob_set_sc_data(struct bt_conn *conn, const struct bt_le_oob_sc_data *oobd_local, const struct bt_le_oob_sc_data *oobd_remote)
Set OOB data during LE Secure Connections (SC) pairing procedure.

This function allows to set OOB data during the LE SC pairing procedure. The function should only be called in response to the oob_data_request() callback provided that LE SC method is used for pairing.

The user should submit OOB data according to the information received in the callback. This may yield three different configurations: with only local OOB data present, with only remote OOB data present or with both local and remote OOB data present.

**Parameters**
- `conn` – Connection object
- `oobd_local` – Local OOB data or NULL if not present
- `oobd_remote` – Remote OOB data or NULL if not present

**Returns**
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
int bt_le_oob_get_sc_data(struct bt_conn *conn, const struct bt_le_oob_sc_data **oobd_local, const struct bt_le_oob_sc_data **oobd_remote)
```

Get OOB data used for LE Secure Connections (SC) pairing procedure.

This function allows to get OOB data during the LE SC pairing procedure that were set by the `bt_le_oob_set_sc_data()` API.

**Note:** The OOB data will only be available as long as the connection object associated with it is valid.

**Parameters**
- `conn` – Connection object
- `oobd_local` – Local OOB data or NULL if not set
- `oobd_remote` – Remote OOB data or NULL if not set

**Returns**
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
int bt_passkey_set(unsigned int passkey)
```

Set a fixed passkey to be used for pairing.

This API is only available when the CONFIG_BT_FIXED_PASSKEY configuration option has been enabled.

Sets a fixed passkey to be used for pairing. If set, the pairing_confirm() callback will be called for all incoming pairings.

**Parameters**
- `passkey` – A valid passkey (0 - 999999) or BT_PASSKEY_INVALID to disable a previously set fixed passkey.

**Returns**
0 on success or a negative error code on failure.
int bt_conn_auth_cb_register(const struct bt_conn_auth_cb *cb)

Register authentication callbacks.

Register callbacks to handle authenticated pairing. Passing NULL unregisters a previous callbacks structure.

**Parameters**
- *cb* – Callback struct.

**Returns**
Zero on success or negative error code otherwise

int bt_conn_auth_cb_overlay(struct bt_conn *conn, const struct bt_conn_auth_cb *cb)

Overlay authentication callbacks used for a given connection.

This function can be used only for Bluetooth LE connections. The CONFIG_BT_SMP must be enabled for this function.

The authentication callbacks for a given connection cannot be overlaid if security procedures in the SMP module have already started. This function can be called only once per connection.

**Parameters**
- *conn* – Connection object.
- *cb* – Callback struct.

**Returns**
Zero on success or negative error code otherwise

int bt_conn_auth_info_cb_register(struct bt_conn_auth_info_cb *cb)

Register authentication information callbacks.

Register callbacks to get authenticated pairing information. Multiple registrations can be done.

**Parameters**
- *cb* – Callback struct.

**Returns**
Zero on success or negative error code otherwise

int bt_conn_auth_info_cb_unregister(struct bt_conn_auth_info_cb *cb)

Unregister authentication information callbacks.

Unregister callbacks to stop getting authenticated pairing information.

**Parameters**
- *cb* – Callback struct.

**Returns**
Zero on success or negative error code otherwise

int bt_conn_auth_passkey_entry(struct bt_conn *conn, unsigned int passkey)

Reply with entered passkey.

This function should be called only after passkey_entry callback from *bt_conn_auth_cb* structure was called.

**Parameters**
- *conn* – Connection object.
- *passkey* – Entered passkey.

**Returns**
Zero on success or negative error code otherwise

```c
int bt_conn_auth_cancel(struct bt_conn *conn)
```

Cancel ongoing authenticated pairing.

This function allows to cancel ongoing authenticated pairing.

**Parameters**

- conn – Connection object.

**Returns**

Zero on success or negative error code otherwise.

```c
int bt_conn_auth_passkey_confirm(struct bt_conn *conn)
```

Reply if passkey was confirmed to match by user.

This function should be called only after passkey_confirm callback from `bt_conn_auth_cb` structure was called.

**Parameters**

- conn – Connection object.

**Returns**

Zero on success or negative error code otherwise.

```c
int bt_conn_auth_pairing_confirm(struct bt_conn *conn)
```

Reply if incoming pairing was confirmed by user.

This function should be called only after pairing_confirm callback from `bt_conn_auth_cb` structure was called if user confirmed incoming pairing.

**Parameters**

- conn – Connection object.

**Returns**

Zero on success or negative error code otherwise.

```c
int bt_conn_auth_pincode_entry(struct bt_conn *conn, const char *pin)
```

Reply with entered PIN code.

This function should be called only after PIN code callback from `bt_conn_auth_cb` structure was called. It’s for legacy 2.0 devices.

**Parameters**

- conn – Connection object.
- pin – Entered PIN code.

**Returns**

Zero on success or negative error code otherwise.

```c
struct bt_conn *bt_conn_create_br(const bt_addr_t *peer, const struct bt_br_conn_param *param)
```

Initiate an BR/EDR connection to a remote device.

Allows initiate new BR/EDR link to remote peer using its address.

The caller gets a new reference to the connection object which must be released with `bt_conn_unref()` once done using the object.

**Parameters**

- peer – Remote address.
- param – Initial connection parameters.

**Returns**

Valid connection object on success or NULL otherwise.
struct bt_conn *bt_conn_create_sco(const bt_addr_t *peer)
   Initiate an SCO connection to a remote device.
   Allows initiate new SCO link to remote peer using its address.
   The caller gets a new reference to the connection object which must be released with
   bt_conn_unref() once done using the object.

   Parameters
   • peer – Remote address.

   Returns
   Valid connection object on success or NULL otherwise.

struct bt_le_conn_param
   #include <conn.h> Connection parameters for LE connections

struct bt_conn_le_phy_info
   #include <conn.h> Connection PHY information for LE connections

   Public Members

   uint8_t rx_phy
      Connection transmit PHY

      Maximum Link Layer transmission payload size in bytes.

   uint16_t tx_max_time
      Maximum Link Layer transmission payload time in us.

   uint16_t rx_max_len
      Maximum Link Layer reception payload size in bytes.
uint16_t rx_max_time
    Maximum Link Layer reception payload time in us.

struct bt_conn_le_data_len_param
    #include <conn.h> Connection data length parameters for LE connections

Public Members

uint16_t tx_max_len
    Maximum Link Layer transmission payload size in bytes.

uint16_t tx_max_time
    Maximum Link Layer transmission payload time in us.

struct bt_conn_le_info
    #include <conn.h> LE Connection Info Structure

Public Members

const bt_addr_le_t *src
    Source (Local) Identity Address

cst bt_addr_le_t *dst
    Destination (Remote) Identity Address or remote Resolvable Private Address (RPA) before identity has been resolved.

cst bt_addr_le_t *local
    Local device address used during connection setup.

cst bt_addr_le_t *remote
    Remote device address used during connection setup.

uint16_t latency
    Connection interval

uint16_t timeout
    Connection peripheral latency

const struct bt_conn_le_phy_info *phy
    Connection supervision timeout

struct bt_conn_br_info
    #include <conn.h> BR/EDR Connection Info Structure

struct bt_security_info
    #include <conn.h> Security Info Structure.

   #include <conn.h> LE Connection Remote Info Structure

Public Members

const uint8_t *features
   Remote LE feature set (bitmask).
struct bt_conn_br_remote_info

#include <conn.h>  BR/EDR Connection Remote Info structure

Public Members

const uint8_t *features
   Remote feature set (pages of bitmasks).

uint8_t num_pages
   Number of pages in the remote feature set.

struct bt_conn_remote_info

#include <conn.h>  Connection Remote Info Structure.

Note: The version, manufacturer and subversion fields will only contain valid data if CONFIG_BT_REMOTE_VERSION is enabled.

Public Members

uint8_t type
   Connection Type

uint8_t version
   Remote Link Layer version

uint16_t manufacturer
   Remote manufacturer identifier

uint16_t subversion
   Per-manufacturer unique revision

struct bt_conn_le_remote_info le
   LE connection remote info

struct bt_conn_br_remote_info br
   BR/EDR connection remote info

struct bt_conn_le_tx_power

#include <conn.h>  LE Transmit Power Level Structure

Public Members

uint8_t phy
   Input: 1M, 2M, Coded S2 or Coded S8
int8_t current_level
   Output: current transmit power level

int8_t max_level
   Output: maximum transmit power level

struct bt_conn_le_create_param
   #include <conn.h>

Public Members

dt32_t options
   Bit-field of create connection options.

dt16_t interval
   Scan interval (N * 0.625 ms)

dt16_t window
   Scan window (N * 0.625 ms)

dt16_t interval_coded
   Scan interval LE Coded PHY (N * 0.625 MS)
   Set zero to use same as LE 1M PHY scan interval

uint16_t window_coded
   Scan window LE Coded PHY (N * 0.625 MS)
   Set zero to use same as LE 1M PHY scan window.

dt16_t timeout
   Connection initiation timeout (N * 10 MS)
   Set zero to use the default CONFIG_BT_CREATE_CONN_TIMEOUT timeout.

Note: Unused in bt_conn_le_create_auto

struct bt_conn_cb
   #include <conn.h> Connection callback structure.

This structure is used for tracking the state of a connection. It is registered with the help of the bt_conn_cb_register() API. It's permissible to register multiple instances of this bt_conn_cb type, in case different modules of an application are interested in tracking the connection state. If a callback is not of interest for an instance, it may be set to NULL and will as a consequence not be used for that instance.

Public Members

6.1. Bluetooth
void (*connected)(struct bt_conn *conn, uint8_t err)

A new connection has been established.

This callback notifies the application of a new connection. In case the err parameter is non-zero it means that the connection establishment failed.

err can mean either of the following:
• BT_HCI_ERR_UNKNOWN_CONN_ID Creating the connection started by \texttt{bt_conn_le_create} was canceled either by the user through \texttt{bt_conn_disconnect} or by the timeout in the host through \texttt{bt_conn_le_create_param} timeout parameter, which defaults to \texttt{CONFIG_BT_CREATE_CONN_TIMEOUT} seconds.
• BT_HCI_ERR_ADV_TIMEOUT High duty cycle directed connectable advertiser started by \texttt{bt_le_adv_start} failed to be connected within the timeout.

\textbf{Note:} If the connection was established from an advertising set then the advertising set cannot be restarted directly from this callback. Instead use the connected callback of the advertising set.

**Param conn**
New connection object.

**Param err**
HCI error. Zero for success, non-zero otherwise.

void (*disconnected)(struct bt_conn *conn, uint8_t reason)

A connection has been disconnected.

This callback notifies the application that a connection has been disconnected.

When this callback is called the stack still has one reference to the connection object. If the application in this callback tries to start either a connectable advertiser or create a new connection this might fail because there are no free connection objects available. To avoid this issue it is recommended to either start connectable advertise or create a new connection using \texttt{k_work_submit} or increase \texttt{CONFIG_BT_MAX_CONN}.

**Param conn**
Connection object.

**Param reason**
BT_HCI_ERR_* reason for the disconnection.

bool (*le_param_req)(struct bt_conn *conn, struct \texttt{bt_le_conn_param} *param)

LE connection parameter update request.

This callback notifies the application that a remote device is requesting to update the connection parameters. The application accepts the parameters by returning true, or rejects them by returning false. Before accepting, the application may also adjust the parameters to better suit its needs.

It is recommended for an application to have just one of these callbacks for simplicity. However, if an application registers multiple it needs to manage the potentially different requirements for each callback. Each callback gets the parameters as returned by previous callbacks, i.e. they are not necessarily the same ones as the remote originally sent.

If the application does not have this callback then the default is to accept the parameters.

**Param conn**
Connection object.

**Param param**
Proposed connection parameters.

**Return**
true to accept the parameters, or false to reject them.
void (*le_param_updated)(struct bt_conn *conn, uint16_t interval, uint16_t latency, uint16_t timeout)

The parameters for an LE connection have been updated.

This callback notifies the application that the connection parameters for an LE connection have been updated.

- **Param conn**
  Connection object.
- **Param interval**
  Connection interval.
- **Param latency**
  Connection latency.
- **Param timeout**
  Connection supervision timeout.

void (*identity_resolved)(struct bt_conn *conn, const bt_addr_le_t *rpa, const bt_addr_le_t *identity)

Remote Identity Address has been resolved.

This callback notifies the application that a remote Identity Address has been resolved.

- **Param conn**
  Connection object.
- **Param rpa**
  Resolvable Private Address.
- **Param identity**
  Identity Address.

void (*security_changed)(struct bt_conn *conn, bt_security_t level, enum bt_security_err err)

The security level of a connection has changed.

This callback notifies the application that the security of a connection has changed.

The security level of the connection can either have been increased or remain unchanged. An increased security level means that the pairing procedure has been performed or the bond information from a previous connection has been applied. If the security level remains unchanged this means that the encryption key has been refreshed for the connection.

- **Param conn**
  Connection object.
- **Param level**
  New security level of the connection.
- **Param err**

void (*remote_info_available)(struct bt_conn *conn, struct bt_conn_remote_info *remote_info)

Remote information procedures has completed.

This callback notifies the application that the remote information has been retrieved from the remote peer.

- **Param conn**
  Connection object.
- **Param remote_info**
  Connection information of remote device.

void (*le_phy_updated)(struct bt_conn *conn, struct bt_conn_le_phy_info *param)

The PHY of the connection has changed.
This callback notifies the application that the PHY of the connection has changed.

**Param conn**
Connection object.

**Param info**
Connection LE PHY information.

```c
void (*le_data_len_updated)(struct bt_conn *conn, struct bt_conn_le_data_len_info *info)
```

The data length parameters of the connection has changed.

This callback notifies the application that the maximum Link Layer payload length or transmission time has changed.

**Param conn**
Connection object.

**Param info**
Connection data length information.

```c
#include <conn.h>
```

Info Structure for OOB pairing

**Public Types**

```c
enum [anonymous]
  Type of OOB pairing method

Values:

enumerator BT_CONN_OOB_LE_LEGACY
  LE legacy pairing

enumerator BT_CONN_OOB_LE_SC
  LE SC pairing
```

**Public Members**

```c
enum bt_conn_oob_info.[anonymous].type
  Type of OOB pairing method

enum bt_conn_oob_info.[anonymous].[anonymous].[anonymous] oob_config
  OOB data configuration

struct bt_conn_oob_info.[anonymous].[anonymous] lesc
  LE Secure Connections OOB pairing parameters
```

```c
#include <conn.h>
```

Pairing request and pairing response info structure.

This structure is the same for both smp_pairing_req and smp_pairing_rsp and a subset of the packet data, except for the initial Code octet. It is documented in Core Spec. Vol. 3, Part H, 3.5.1 and 3.5.2.
Public Members

struct bt_conn_auth_cb
#include <conn.h> Authenticated pairing callback structure

Public Members

enum bt_security_err (*pairing_accept)(struct bt_conn *conn, const struct bt_conn_pairing_feat *const feat)
Query to proceed incoming pairing or not.
On any incoming pairing req/rsp this callback will be called for the application to decide whether to allow for the pairing to continue.
The pairing info received from the peer is passed to assist making the decision.
As this callback is synchronous the application should return a response value immediately. Otherwise it may affect the timing during pairing. Hence, this information should not be conveyed to the user to take action.
The remaining callbacks are not affected by this, but do notice that other callbacks can be called during the pairing. Eg. if pairing_confirm is registered both will be called for Just-Works pairings.
This callback may be unregistered in which case pairing continues as if the Kconfig flag was not set.
This callback is not called for BR/EDR Secure Simple Pairing (SSP).

Param conn
Connection where pairing is initiated.

Param feat
Pairing req/resp info.

void (*passkey_display)(struct bt_conn *conn, unsigned int passkey)
Display a passkey to the user.

6.1. Bluetooth
When called the application is expected to display the given passkey to the user, with the expectation that the passkey will then be entered on the peer device. The passkey will be in the range of 0 - 999999, and is expected to be padded with zeroes so that six digits are always shown. E.g. the value 37 should be shown as 000037.

This callback may be set to NULL, which means that the local device lacks the ability do display a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop displaying the passkey.

**Param conn**
- Connection where pairing is currently active.

**Param passkey**
- Passkey to show to the user.

```c
void (*passkey_entry)(struct bt_conn *conn)
```
Request the user to enter a passkey.

When called the user is expected to enter a passkey. The passkey must be in the range of 0 - 999999, and should be expected to be zero-padded, as that's how the peer device will typically be showing it (e.g. 37 would be shown as 000037).

Once the user has entered the passkey its value should be given to the stack using the `bt_conn_auth_passkey_entry()` API.

This callback may be set to NULL, which means that the local device lacks the ability to enter a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to enter a passkey.

**Param conn**
- Connection where pairing is currently active.

```c
void (*passkey_confirm)(struct bt_conn *conn, unsigned int passkey)
```
Request the user to confirm a passkey.

When called the user is expected to confirm that the given passkey is also shown on the peer device. The passkey will be in the range of 0 - 999999, and should be zero-padded to always be six digits (e.g. 37 would be shown as 000037).

Once the user has confirmed the passkey to match, the `bt_conn_auth_passkey_confirm()` API should be called. If the user concluded that the passkey doesn't match the `bt_conn_auth_cancel()` API should be called.

This callback may be set to NULL, which means that the local device lacks the ability to confirm a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to confirm a passkey.

**Param conn**
- Connection where pairing is currently active.

**Param passkey**
- Passkey to be confirmed.

```c
void (*oob_data_request)(struct bt_conn *conn, struct bt_conn_oob_info *info)
```
Request the user to provide Out of Band (OOB) data.

When called the user is expected to provide OOB data. The required data are indicated by the information structure.

For LE Secure Connections OOB pairing, the user should provide local OOB data, remote OOB data or both depending on their availability. Their value should be given to the stack using the `bt_le_oob_set_sc_data()` API.

This callback must be set to non-NULL in order to support OOB pairing.
**Param conn**  
Connection where pairing is currently active.

**Param info**  
OOB pairing information.

```c
void (*cancel)(struct bt_conn *conn)
```

Cancel the ongoing user request.

This callback will be called to notify the application that it should cancel any previous user request (passkey display, entry or confirmation).

This may be set to NULL, but must always be provided whenever the passkey_display, passkey_entry passkey_confirm or pairing_confirm callback has been provided.

**Param conn**  
Connection where pairing is currently active.

```c
void (*pairing_confirm)(struct bt_conn *conn)
```

Request confirmation for an incoming pairing.

This callback will be called to confirm an incoming pairing request where none of the other user callbacks is applicable.

If the user decides to accept the pairing the `bt_conn_auth_pairing_confirm()` API should be called. If the user decides to reject the pairing the `bt_conn_auth_cancel()` API should be called.

This callback may be set to NULL, which means that the local device lacks the ability to confirm a pairing request. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to confirm a pairing request.

**Param conn**  
Connection where pairing is currently active.

```c
void (*pincode_entry)(struct bt_conn *conn, bool highsec)
```

Request the user to enter a passkey.

This callback will be called for a BR/EDR (Bluetooth Classic) connection where pairing is being performed. Once called the user is expected to enter a PIN code with a length between 1 and 16 digits. If the `highsec` parameter is set to true the PIN code must be 16 digits long.

Once entered, the PIN code should be given to the stack using the `bt_conn_auth_pincode_entry()` API.

This callback may be set to NULL, however in that case pairing over BR/EDR will not be possible. If provided, the cancel callback must be provided as well.

**Param conn**  
Connection where pairing is currently active.

**Param highsec**  
true if 16 digit PIN is required.

```c
struct bt_conn_auth_info_cb
   #include <conn.h> Authenticated pairing information callback structure
```

**Public Members**

```c
void (*pairing_complete)(struct bt_conn *conn, bool bonded)
```

6.1. Bluetooth
notify that pairing procedure was complete.
This callback notifies the application that the pairing procedure has been completed.

\textbf{Param conn}  
Connection object.

\textbf{Param bonded}  
Bond information has been distributed during the pairing procedure.

\begin{verbatim}
void (*pairing_failed)(struct bt_conn *conn, enum bt_security_err reason)

notify that pairing process has failed.

\textbf{Param conn}  
Connection object.

\textbf{Param reason}  
Pairing failed reason
\end{verbatim}

\begin{verbatim}
void (*bond_deleted)(uint8_t id, const bt_addr_le_t *peer)

Notify that bond has been deleted.

This callback notifies the application that the bond information for the remote peer has been deleted.

\textbf{Param id}  
Which local identity had the bond.

\textbf{Param peer}  
Remote address.
\end{verbatim}

\texttt{sys_snode_t node}  
Internally used field for list handling

\texttt{struct bt_br_conn_param}  
\texttt{#include <conn.h> Connection parameters for BR/EDR connections}

\textbf{Bluetooth Controller}

\textbf{API Reference}

\texttt{group bt_ctrl}  
Bluetooth Controller.

\textbf{Functions}

\begin{verbatim}
void bt_ctlr_set_public_addr(const uint8_t *addr)

Set public address for controller.

Should be called before \texttt{bt_enable()}.  
\end{verbatim}

\textbf{Parameters}

- \texttt{addr} – Public address

\textbf{Bluetooth Coordinated Sets}

\textbf{API Reference}
group bt_gatt_csip

Defines

BT_CSIP_SET_COORDINATOR_DISCOVER_TIMER_VALUE
  Recommended timer for member discovery

BT_CSIP_SET_COORDINATOR_MAX_CSIS_INSTANCES

BT_CSIP_READ_SIRK_REQ_RSP_ACCEPT
  Accept the request to read the SIRK as plaintext

BT_CSIP_READ_SIRK_REQ_RSP_ACCEPT_ENC
  Accept the request to read the SIRK, but return encrypted SIRK

BT_CSIP_READ_SIRK_REQ_RSP_REJECT
  Reject the request to read the SIRK

BT_CSIP_READ_SIRK_REQ_RSP_OOB_ONLY
  SIRK is available only via an OOB procedure

BT_CSIP_SET_SIRK_SIZE
  Size of the Set Identification Resolving Key (SIRK)

BT_CSIP_RSI_SIZE
  Size of the Resolvable Set Identifier (RSI)

BT_CSIP_ERROR_LOCK_DENIED
  Service is already locked

BT_CSIP_ERROR_LOCK_RELEASE_DENIED
  Service is not locked

BT_CSIP_ERROR_LOCK_INVAL_VALUE
  Invalid lock value

BT_CSIP_ERROR_SIRK_OOB_ONLY
  SIRK only available out-of-band

BT_CSIP_ERROR_LOCK_ALREADY_GRANTED
  Client is already owner of the lock

6.1. Bluetooth
BT_CSIP_DATA_RSI(_rsi)
Helper to declare bt_data array including RSI.
This macro is mainly for creating an array of struct bt_data elements which is then passed to
  e.g. bt_le_ext_adv_start().

Parameters
  • _rsi – Pointer to the RSI value

typedefs

typedef void (*bt_csip_set_coordinator_discover_cb)(struct bt_conn *conn, const struct
  bt_csip_set_coordinator_set_member *member, int err, size_t set_count)
Callback for discovering Coordinated Set Identification Services.

  Param conn
      Pointer to the remote device.

  Param member
      Pointer to the set member.

  Param err
      0 on success, or an errno value on error.

  Param set_count
      Number of sets on the member.

typedef void (*bt_csip_set_coordinator_lock_set_cb)(int err)
Callback for locking a set across one or more devices.

  Param err
      0 on success, or an errno value on error.

typedef void (*bt_csip_set_coordinator_lock_changed_cb)(struct
  bt_csip_set_coordinator_csis_inst *inst, bool locked)
Callback when the lock value on a set of a connected device changes.

  Param inst
      The Coordinated Set Identification Service instance that was changed.

  Param locked
      Whether the lock is locked or release.

  Return
      int Return 0 on success, or an errno value on error.

typedef void (*bt_csip_set_coordinator_ordered_access_cb_t)(const struct
  bt_csip_set_coordinator_set_info *set_info, int err, bool locked, struct
  bt_csip_set_coordinator_set_member *member)
Callback for bt_csip_set_coordinator_ordered_access()
If any of the set members supplied to bt_csip_set_coordinator_ordered_access() is in the locked
state, this will be called with locked true and member will be the locked member, and the
ordered access procedure is cancelled. Likewise, if any error occurs, the procedure will also
be aborted.

  Param set_info
      Pointer to the a specific set_info struct.

  Param err
      Error value. 0 on success, GATT error or errno on fail.
### Param locked
Whether the lock is locked or release.

### Param member
The locked member if locked is true, otherwise NULL.

```c
typedef bool (*bt_csip_set_coordinator_ordered_access_t)(const struct bt_csip_set_coordinator_set_info *set_info, struct bt_csip_set_coordinator_set_member *members[], size_t count);
```

Callback function definition for `bt_csip_set_coordinator_ordered_access()`

- **Param set_info**
  Pointer to the a specific set_info struct.

- **Param members**
  Array of members ordered by rank. The procedure shall be done on the members in ascending order.

- **Param count**
  Number of members in members.

- **Return**
  true if the procedures can be successfully done, or false to stop the procedure.

### Functions

`void *bt_csip_set_member_svc_decl_get(const struct bt_csip_set_member_svc_inst *svc_inst)`

Get the service declaration attribute.

The first service attribute can be included in any other GATT service.

- **Parameters**
  - `svc_inst` – Pointer to the Coordinated Set Identification Service.

- **Returns**
  The first CSIS attribute instance.

`int bt_csip_set_member_register(const struct bt_csip_set_member_register_param *param, struct bt_csip_set_member_svc_inst **svc_inst)`

Register a Coordinated Set Identification Service instance.

This will register and enable the service and make it discoverable by clients.

This shall only be done as a server.

- **Parameters**
  - `param` – Coordinated Set Identification Service register parameters.
  - `svc_inst` – [out] Pointer to the registered Coordinated Set Identification Service.

- **Returns**
  0 if success, errno on failure.

`void bt_csip_set_member_print_sirk(const struct bt_csip_set_member_svc_inst *svc_inst)`

Print the SIRK to the debug output.

- **Parameters**
  - `svc_inst` – Pointer to the Coordinated Set Identification Service.

---

**6.1. Bluetooth**
int bt_csip_set_member_generate_rsi(const struct bt_csip_set_member_svc_inst *svc_inst, uint8_t rsi[6])

Generate the Resolvable Set Identifier (RSI) value. This will generate RSI for given svc_inst instance.

Parameters
- svc_inst – Pointer to the Coordinated Set Identification Service.
- rsi – Pointer to the 6-octet newly generated RSI data.

Returns
int 0 if on success, errno on error.

int bt_csip_set_member_lock(struct bt_csip_set_member_svc_inst *svc_inst, bool lock, bool force)

Locks a specific Coordinated Set Identification Service instance on the server.

Parameters
- svc_inst – Pointer to the Coordinated Set Identification Service.
- lock – If true lock the set, if false release the set.
- force – This argument only have meaning when lock is false (release) and will force release the lock, regardless of who took the lock.

Returns
0 on success, GATT error on error.

int bt_csip_set_coordinator_discover(struct bt_conn *conn)

Initialise the csip_set_coordinator instance for a connection. This will do a discovery on the device and prepare the instance for following commands.

Parameters
- conn – Pointer to remote device to perform discovery on.

Returns
int Return 0 on success, or an errno value on error.

bool bt_csip_set_coordinator_is_set_member(const uint8_t set_sirk[16], struct bt_data *data)

Check if advertising data indicates a set member.

Parameters
- set_sirk – The SIRK of the set to check against
- data – The advertising data

Returns
true if the advertising data indicates a set member, false otherwise

int bt_csip_set_coordinator_register_cb(struct bt_csip_set_coordinator_cb *cb)

Registers callbacks for csip_set_coordinator.

Parameters
- cb – Pointer to the callback structure.

Returns
Return 0 on success, or an errno value on error.

int bt_csip_set_coordinator_ordered_access(const struct bt_csip_set_coordinator_set_member *members[], uint8_t count, const struct bt_csip_set_coordinator_set_info *set_info, bt_csip_set_coordinator_ordered_access_t cb)
Access Coordinated Set devices in an ordered manner as a client. This function will read the lock state of all devices and if all devices are in the unlocked state, then \texttt{cb} will be called with the same members as provided by \texttt{members}, but where the members are ordered by rank (if present). Once this procedure is finished or an error occurs, \texttt{bt_csip_set_coordinator_cb::ordered_access} will be called.

This procedure only works if all the members have the lock characteristic, and all either has rank = 0 or unique ranks.

If any of the members are in the locked state, the procedure will be cancelled.

This can only be done on members that are bonded.

**Parameters**

- **members** – Array of set members to access.
- **count** – Number of set members in \texttt{members}.
- **set_info** – Pointer to the a specific set_info struct, as a member may be part of multiple sets.
- **cb** – The callback function to be called for each member.

```c
int bt_csip_set_coordinator_lock(const struct bt_csip_set_coordinator_set_member **members, uint8_t count, const struct bt_csip_set_coordinator_set_info *set_info)
```

Lock an array of set members.

The members will be locked starting from lowest rank going up.

**TODO:** If locking fails, the already locked members will not be unlocked.

**Parameters**

- **members** – Array of set members to lock.
- **count** – Number of set members in \texttt{members}.
- **set_info** – Pointer to the a specific set_info struct, as a member may be part of multiple sets.

**Returns**

Return 0 on success, or an errno value on error.

```c
int bt_csip_set_coordinator_release(const struct bt_csip_set_coordinator_set_member **members, uint8_t count, const struct bt_csip_set_coordinator_set_info *set_info)
```

Release an array of set members.

The members will be released starting from highest rank going down.

**Parameters**

- **members** – Array of set members to lock.
- **count** – Number of set members in \texttt{members}.
- **set_info** – Pointer to the a specific set_info struct, as a member may be part of multiple sets.

**Returns**

Return 0 on success, or an errno value on error.

```c
struct bt_csip_set_member_cb
```

#include <csip.h> Callback structure for the Coordinated Set Identification Service

6.1. Bluetooth
Public Members

```c
void (*lock_changed)(struct bt_conn *conn, struct bt_csip_set_member_svc_inst *svc_inst, bool locked)
```

Callback whenever the lock changes on the server.

**Param conn**
- The connection to the client that changed the lock. NULL if server changed it, either by calling `bt_csip_set_member_lock()` or by timeout.

**Param svc_inst**
- Pointer to the Coordinated Set Identification Service.

**Param locked**
- Whether the lock was locked or released.

```c
uint8_t (*sirk_read_req)(struct bt_conn *conn, struct bt_csip_set_member_svc_inst *svc_inst)
```

Request from a peer device to read the sirk.

If this callback is not set, all clients will be allowed to read the SIRK unencrypted.

**Param conn**
- The connection to the client that requested to read the SIRK.

**Param svc_inst**
- Pointer to the Coordinated Set Identification Service.

**Return**
- A `BT_CSIP_READ_SIRK_REQ_RSP_*` response code.

```c
#include <csip.h>
```

Register structure for Coordinated Set Identification Service

Public Members

```c
uint8_t set_size
```

Size of the set.

If set to 0, the set size characteristic won’t be initialized.

```c
uint8_t set_sirk[16]
```

The unique Set Identity Resolving Key (SIRK)

This shall be unique between different sets, and shall be the same for each set member for each set.

```c
bool lockable
```

Boolean to set whether the set is lockable by clients.

Setting this to false will disable the lock characteristic.

```c
uint8_t rank
```

Rank of this device in this set.

If the lockable parameter is set to true, this shall be > 0 and <= to the set_size. If the lockable parameter is set to false, this may be set to 0 to disable the rank characteristic.

```c
struct bt_csip_set_member_register_param *cb
```

Pointer to the callback structure.
struct bt_csip_set_coordinator_set_info
#include <csip.h> Information about a specific set

Public Members

uint8_t set_sirk[16]
The 16 octet set Set Identity Resolving Key (SIRK)
The Set SIRK may not be exposed by the server over Bluetooth, and may require an out-of-band solution.

uint8_t set_size
The size of the set.
Will be 0 if not exposed by the server.

uint8_t rank
The rank of the set on on the remote device.
Will be 0 if not exposed by the server.

struct bt_csip_set_coordinator_csis_inst
#include <csip.h> Struct representing a coordinated set instance on a remote device.
The values in this struct will be populated during discovery of sets (bt_csip_set_coordinator_discover()).

Public Members

void *svc_inst
Internally used pointer value

struct bt_csip_set_coordinator_set_member
#include <csip.h> Struct representing a remote device as a set member

Public Members

struct bt_csip_set_coordinator_csis_inst insts[0]
Array of Coordinated Set Identification Service instances for the remote device

Cryptography

API Reference

group bt_crypto
Cryptography.

6.1. Bluetooth
### Functions

**int bt_rand(void *buf, size_t len)**

Generate random data.

A random number generation helper which utilizes the Bluetooth controller's own RNG.

**Parameters**
- **buf** – Buffer to insert the random data
- **len** – Length of random data to generate

**Returns**
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error

**int bt_encrypt_le(const uint8_t key[16], const uint8_t plaintext[16], uint8_t enc_data[16])**

AES encrypt little-endian data.

An AES encrypt helper is used to request the Bluetooth controller's own hardware to encrypt the plaintext using the key and returns the encrypted data.

**Parameters**
- **key** – 128 bit LS byte first key for the encryption of the plaintext
- **plaintext** – 128 bit LS byte first plaintext data block to be encrypted
- **enc_data** – 128 bit LS byte first encrypted data block

**Returns**
Zero on success or error code otherwise.

**int bt_encrypt_be(const uint8_t key[16], const uint8_t plaintext[16], uint8_t enc_data[16])**

AES encrypt big-endian data.

An AES encrypt helper is used to request the Bluetooth controller's own hardware to encrypt the plaintext using the key and returns the encrypted data.

**Parameters**
- **key** – 128 bit MS byte first key for the encryption of the plaintext
- **plaintext** – 128 bit MS byte first plaintext data block to be encrypted
- **enc_data** – 128 bit MS byte first encrypted data block

**Returns**
Zero on success or error code otherwise.

**int bt_ccm_decrypt(const uint8_t key[16], uint8_t nonce[13], const uint8_t *enc_data, size_t len, const uint8_t *aad, size_t aad_len, uint8_t *plaintext, size_t mic_size)**

Decrypt big-endian data with AES-CCM.

Decrypts and authorizes **enc_data** with AES-CCM, as described in [https://tools.ietf.org/html/rfc3610](https://tools.ietf.org/html/rfc3610).

Assumes that the MIC follows directly after the encrypted data.

**Parameters**
- **key** – 128 bit MS byte first key
- **nonce** – 13 byte MS byte first nonce
- **enc_data** – Encrypted data
- **len** – Length of the encrypted data
- **aad** – Additional input data
• aad_len – Additional input data length
• plaintext – Plaintext buffer to place result in
• mic_size – Size of the trailing MIC (in bytes)

Return values
• 0 – Successfully decrypted the data.
• -EINVAL – Invalid parameters.
• -EBADMSG – Authentication failed.

int bt_ccm_encrypt(const uint8_t key[16], uint8_t nonce[13], const uint8_t *plaintext, size_t len, const uint8_t *aad, size_t aad_len, uint8_t *enc_data, size_t mic_size)

Encrypt big-endian data with AES-CCM.
Encrypts and generates a MIC from plaintext with AES-CCM, as described in https://tools.ietf.org/html/rfc3610.
Places the MIC directly after the encrypted data.

Parameters
• key – 128 bit MS byte first key
• nonce – 13 byte MS byte first nonce
• plaintext – Plaintext buffer to encrypt
• len – Length of the encrypted data
• aad – Additional input data
• aad_len – Additional input data length
• enc_data – Buffer to place encrypted data in
• mic_size – Size of the trailing MIC (in bytes)

Return values
• 0 – Successfully encrypted the data.
• -EINVAL – Invalid parameters.

Data Buffers

API Reference

group bt_buf

Data buffers.

Defines

BT_BUF_RESERVE

BT_BUF_SIZE(size)
Helper to include reserved HCI data in buffer calculations

BT_BUF_ACL_SIZE(size)
Helper to calculate needed buffer size for HCI ACL packets

BT_BUF_EVT_SIZE(size)
Helper to calculate needed buffer size for HCI Event packets.
BT_BUF_CMD_SIZE(size)
    Helper to calculate needed buffer size for HCI Command packets.

BT_BUF_ISO_SIZE(size)
    Helper to calculate needed buffer size for HCI ISO packets.

BT_BUF_ACL_RX_SIZE
    Data size needed for HCI ACL RX buffers

BT_BUF_EVT_RX_SIZE
    Data size needed for HCI Event RX buffers

BT_BUF_ISO_RX_SIZE

BT_BUF_ISO_RX_COUNT

BT_BUF_RX_SIZE
    Data size needed for HCI ACL, HCI ISO or Event RX buffers

BT_BUF_RX_COUNT
    Buffer count needed for HCI ACL, HCI ISO or Event RX buffers

BT_BUF_CMD_TX_SIZE
    Data size needed for HCI Command buffers.

Enums

def bt_buf_type
    Possible types of buffers passed around the Bluetooth stack
    Values:

    enumerator BT_BUF_CMD
        HCI command

    enumerator BT_BUF_EVT
        HCI event

    enumerator BT_BUF_ACL_OUT
        Outgoing ACL data

    enumerator BT_BUF_ACL_IN
        Incoming ACL data

    enumerator BT_BUF_ISO_OUT
        Outgoing ISO data

    enumerator BT_BUF_ISO_IN
        Incoming ISO data
Functions

struct net_buf *bt_buf_get_rx(enum bt_buf_type type, k_timeout_t timeout)
Allocate a buffer for incoming data
This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_recv_prio().

Parameters
- type – Type of buffer. Only BT_BUF_EVT, BT_BUF_ACL_IN and BT_BUF_ISO_IN are allowed.
- timeout – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.

Returns
A new buffer.

struct net_buf *bt_buf_get_tx(enum bt_buf_type type, k_timeout_t timeout, const void *data, size_t size)
Allocate a buffer for outgoing data
This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_send().

Parameters
- type – Type of buffer. Only BT_BUF_CMD, BT_BUF_ACL_OUT or BT_BUF_H4, when operating on H:4 mode, are allowed.
- timeout – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.
- data – Initial data to append to buffer.
- size – Initial data size.

Returns
A new buffer.

struct net_buf *bt_buf_get_cmd_complete(k_timeout_t timeout)
Allocate a buffer for an HCI Command Complete/Status Event
This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_recv_prio().

Parameters
- timeout – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.

Returns
A new buffer.

struct net_buf *bt_buf_get_evt(uint8_t evt, bool discardable, k_timeout_t timeout)
Allocate a buffer for an HCI Event
This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_recv_prio() or bt_recv().

Parameters
• **evt** – HCI event code
• **discardable** – Whether the driver considers the event discardable.
• **timeout** – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.

**Returns**
A new buffer.

```c
static inline void bt_buf_set_type(struct net_buf *buf, enum bt_buf_type type)
    Set the buffer type

Parameters
• **buf** – Bluetooth buffer
• **type** – The BT_* type to set the buffer to
```

```c
static inline enum bt_buf_type bt_buf_get_type(struct net_buf *buf)
    Get the buffer type

Parameters
• **buf** – Bluetooth buffer

Returns
The BT_* type to of the buffer
```

```c
struct bt_buf_data
    #include <buf.h> This is a base type for bt_buf user data.
```

**Generic Access Profile (GAP)**

**API Reference**

**group bt_gap**
Generic Access Profile.

**Defines**

```c
BT_ID_DEFAULT
    Convenience macro for specifying the default identity. This helps make the code more readable, especially when only one identity is supported.
```

```c
BT_DATA(_type, _data, _data_len)
    Helper to declare elements of bt_data arrays.
    This macro is mainly for creating an array of struct bt_data elements which is then passed to e.g. bt_le_adv_start().

Parameters
• **_type** – Type of advertising data field
• **_data** – Pointer to the data field payload
• **_data_len** – Number of bytes behind the _data pointer
```
BT_DATA_BYTES(_type, _bytes...)  
Helper to declare elements of bt_data arrays. 
This macro is mainly for creating an array of struct bt_data elements which is then passed to e.g. bt_le_adv_start().

**Parameters**
- _type – Type of advertising data field
- _bytes – Variable number of single-byte parameters

BT_LE_ADV_PARAM_INIT(_options, _int_min, _int_max, _peer)  
Initialize advertising parameters.

**Parameters**
- _options – Advertising Options
- _int_min – Minimum advertising interval
- _int_max – Maximum advertising interval
- _peer – Peer address, set to NULL for undirected advertising or address of peer for directed advertising.

BT_LE_ADV_PARAM(_options, _int_min, _int_max, _peer)  
Helper to declare advertising parameters inline.

**Parameters**
- _options – Advertising Options
- _int_min – Minimum advertising interval
- _int_max – Maximum advertising interval
- _peer – Peer address, set to NULL for undirected advertising or address of peer for directed advertising.

BT_LE_ADV_CONN_DIR(_peer)  

**6.1. Bluetooth**
BT_LE_EXT_ADV_SCAN_NAME
Scannable extended advertising with \texttt{BT\_LE\_ADV\_OPT\_USE\_NAME}

BT_LE_EXT_ADV_NCONN
Non-connectable extended advertising with private address

BT_LE_EXT_ADV_NCONN_NAME
Non-connectable extended advertising with \texttt{BT\_LE\_ADV\_OPT\_USE\_NAME}

BT_LE_EXT_ADV_NCONN_IDENTITY
Non-connectable extended advertising with \texttt{BT\_LE\_ADV\_OPT\_USE\_IDENTITY}

BT_LE_EXT_ADV_CODEC_NCONN
Non-connectable extended advertising on coded PHY with private address

BT_LE_EXT_ADV_CODEC_NCONN_NAME
Non-connectable extended advertising on coded PHY with \texttt{BT\_LE\_ADV\_OPT\_USE\_NAME}

BT_LE_EXT_ADV_CODEC_NCONN_IDENTITY
Non-connectable extended advertising on coded PHY with \texttt{BT\_LE\_ADV\_OPT\_USE\_IDENTITY}

BT_LE_EXT_ADV_START_PARAM_INIT(_timeout, _n_evts)
Helper to initialize extended advertising start parameters inline

\textbf{Parameters}
\begin{itemize}
  \item \texttt{_timeout} – Advertiser timeout
  \item \texttt{_n_evts} – Number of advertising events
\end{itemize}

BT_LE_EXT_ADV_START_PARAM(_timeout, _n_evts)
Helper to declare extended advertising start parameters inline

\textbf{Parameters}
\begin{itemize}
  \item \texttt{_timeout} – Advertiser timeout
  \item \texttt{_n_evts} – Number of advertising events
\end{itemize}

BT_LE_EXT_ADV_START_DEFAULT

BT_LE_PER_ADV_PARAM_INIT(_int_min, _int_max, _options)
Helper to declare periodic advertising parameters inline

\textbf{Parameters}
\begin{itemize}
  \item \texttt{_int_min} – Minimum periodic advertising interval
  \item \texttt{_int_max} – Maximum periodic advertising interval
  \item \texttt{_options} – Periodic advertising properties bitfield.
\end{itemize}

BT_LE_PER_ADV_PARAM(_int_min, _int_max, _options)
Helper to declare periodic advertising parameters inline

\textbf{Parameters}
\begin{itemize}
  \item \texttt{_int_min} – Minimum periodic advertising interval
  \item \texttt{_int_max} – Maximum periodic advertising interval
  \item \texttt{_options} – Periodic advertising properties bitfield.
\end{itemize}
BT_LE_PER_ADV_DEFAULT

BT_LE_SCAN_OPT_FILTER_WHITELIST

BT_LE_SCAN_PARAM_INIT(_type, _options, _interval, _window)
  Initialize scan parameters.

  **Parameters**
  
  - `_type` – Scan Type, `BT_LE_SCAN_TYPE_ACTIVE` or `BT_LE_SCAN_TYPE_PASSIVE`.
  - `_options` – Scan options
  - `_interval` – Scan Interval \((N \times 0.625 \text{ ms})\)
  - `_window` – Scan Window \((N \times 0.625 \text{ ms})\)

BT_LE_SCAN_PARAM(_type, _options, _interval, _window)
  Helper to declare scan parameters inline.

  **Parameters**
  
  - `_type` – Scan Type, `BT_LE_SCAN_TYPE_ACTIVE` or `BT_LE_SCAN_TYPE_PASSIVE`.
  - `_options` – Scan options
  - `_interval` – Scan Interval \((N \times 0.625 \text{ ms})\)
  - `_window` – Scan Window \((N \times 0.625 \text{ ms})\)

BT_LE_SCAN_ACTIVE
  Helper macro to enable active scanning to discover new devices.

BT_LE_SCAN_PASSIVE
  Helper macro to enable passive scanning to discover new devices.

  This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

BT_LE_SCAN_CODED_ACTIVE
  Helper macro to enable active scanning to discover new devices. Include scanning on Coded PHY in addition to 1M PHY.

BT_LE_SCAN_CODED_PASSIVE
  Helper macro to enable passive scanning to discover new devices. Include scanning on Coded PHY in addition to 1M PHY.

  This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

**Typedefs**

typedef void (*bt_ready_cb_t)(int err)
  Callback for notifying that Bluetooth has been enabled.

  **Param err**
  zero on success or (negative) error code otherwise.
typedef void bt_le_scan_cb_t(const bt_addr_le_t *addr, int8_t rssi, uint8_t adv_type, struct net_buf_simple *buf)

Callback type for reporting LE scan results.

A function of this type is given to the bt_le_scan_start() function and will be called for any discovered LE device.

- **Param addr**:Advertiser LE address and type.
- **Param rssi**:Strength of advertiser signal.
- **Param adv_type**:Type of advertising response from advertiser. Uses the BT_GAP_ADV_TYPE_* values.
- **Param buf**:Buffer containing advertiser data.

typedef void bt_br_discovery_cb_t(struct bt_br_discovery_result *results, size_t count)

Callback type for reporting BR/EDR discovery (inquiry) results.

A callback of this type is given to the bt_br_discovery_start() function and will be called at the end of the discovery with information about found devices populated in the results array.

- **Param results**:Storage used for discovery results
- **Param count**:Number of valid discovery results.

** Enums **

**enum [anonymous]**

Advertising options

*Values:*

- **enumerator BT_LE_ADV_OPT_NONE = 0**:Convenience value when no options are specified.

- **enumerator BT_LE_ADV_OPT_CONNECTABLE = BIT(0)**:Advertise as connectable.

  Advertise as connectable. If not connectable then the type of advertising is determined by providing scan response data. The advertiser address is determined by the type of advertising and/or enabling privacy CONFIG_BT_PRIVACY.

- **enumerator BT_LE_ADV_OPT_ONE_TIME = BIT(1)**:Advertise one time.

  Don’t try to resume connectable advertising after a connection. This option is only meaningful when used together with BT_LE_ADV_OPT_CONNECTABLE. If set the advertising will be stopped when bt_le_adv_stop() is called or when an incoming (peripheral) connection happens. If this option is not set the stack will take care of keeping advertising enabled even as connections occur. If Advertising directed or the advertiser was started with bt_le_ext_adv_start then this behavior is the default behavior and this flag has no effect.
enumerator BT_LE_ADV_OPT_USE_IDENTITY = \textit{BIT}(2)

Advertise using identity address.
Advertise using the identity address as the advertiser address.

\textbf{Note:} The address used for advertising will not be the same as returned by \textit{bt_le_oob_get_local}, instead \textit{bt_id_get} should be used to get the LE address.

\textbf{Warning:} This will compromise the privacy of the device, so care must be taken when using this option.

enumerator BT_LE_ADV_OPT_USE_NAME = \textit{BIT}(3)

Advertise using GAP device name.

\textsf{Include the GAP device name automatically when advertising. By default the GAP device name is put at the end of the scan response data.}
When advertising using @ref BT_LE_ADV_OPT_EXT_ADV and not @ref BT_LE_ADV_OPT_SCANNABLE then it will be put at the end of the advertising data.
If the GAP device name does not fit into advertising data it will be converted to a shortened name if possible.
@ref BT_LE_ADV_OPT_FORCE_NAME_IN_AD can be used to force the device name to appear in the advertising data of an advert with scan response data.
The application can set the device name itself by including the following in the advertising data.
\begin{verbatim}
@code
BT_DATA(BT_DATA_NAME_COMPLETE, name, sizeof(name) - 1)
@endcode
\end{verbatim}

enumerator BT_LE_ADV_OPT_DIR_MODE_LOW_DUTY = \textit{BIT}(4)

Low duty cycle directed advertising.
Use low duty directed advertising mode, otherwise high duty mode will be used.

enumerator BT_LE_ADV_OPT_DIR_ADDR_RPA = \textit{BIT}(5)

Directed advertising to privacy-enabled peer.
Enable use of Resolvable Private Address (RPA) as the target address in directed advertisements. This is required if the remote device is privacy-enabled and supports address resolution of the target address in directed advertisement. It is the responsibility of the application to check that the remote device supports address resolution of directed advertisements by reading its Central Address Resolution characteristic.

enumerator BT_LE_ADV_OPT_FILTER_SCAN_REQ = \textit{BIT}(6)

Use filter accept list to filter devices that can request scan response data.

enumerator BT_LE_ADV_OPT_FILTER_CONN = \textit{BIT}(7)

Use filter accept list to filter devices that can connect.
enumerator BT_LE_ADV_OPT_NOTIFY_SCAN_REQ = BIT(8)

Notify the application when a scan response data has been sent to an active scanner.

enumerator BT_LE_ADV_OPT_SCANNABLE = BIT(9)

Support scan response data.

When used together with BT_LE_ADV_OPT_EXT_ADV then this option cannot be used together with the BT_LE_ADV_OPT_CONNECTABLE option. When used together with BT_LE_ADV_OPT_EXT_ADV then scan response data must be set.

enumerator BT_LE_ADV_OPT_EXT_ADV = BIT(10)

Advertise with extended advertising.

This option enables extended advertising in the advertising set. In extended advertising the advertising set will send a small header packet on the three primary advertising channels. This small header points to the advertising data packet that will be sent on one of the 37 secondary advertising channels. The advertiser will send primary advertising on LE 1M PHY, and secondary advertising on LE 2M PHY. Connections will be established on LE 2M PHY.

Without this option the advertiser will send advertising data on the three primary advertising channels.

Note: Enabling this option requires extended advertising support in the peer devices scanning for advertisement packets.

enumerator BT_LE_ADV_OPT_NO_2M = BIT(11)

Disable use of LE 2M PHY on the secondary advertising channel.

Disabling the use of LE 2M PHY could be necessary if scanners don't support the LE 2M PHY. The advertiser will send primary advertising on LE 1M PHY, and secondary advertising on LE 1M PHY. Connections will be established on LE 1M PHY.

Note: Cannot be set if BT_LE_ADV_OPT_CODED is set.

Note: Requires BT_LE_ADV_OPT_EXT_ADV.

enumerator BT_LE_ADV_OPT_CODED = BIT(12)

Advertise on the LE Coded PHY (Long Range).

The advertiser will send both primary and secondary advertising on the LE Coded PHY. This gives the advertiser increased range with the trade-off of lower data rate and higher power consumption. Connections will be established on LE Coded PHY.

Note: Requires BT_LE_ADV_OPT_EXT_ADV

enumerator BT_LE_ADV_OPT_ANONYMOUS = BIT(13)

Advertise without a device address (identity or RPA).

Note: Requires BT_LE_ADV_OPT_EXT_ADV
enumerator BT_LE_ADV_OPT_USE_TX_POWER = \texttt{BIT}(14)
Advertise with transmit power.

\textbf{Note:} Requires \texttt{BT\_LE\_ADV\_OPT\_EXT\_ADV}

enumerator BT_LE_ADV_OPT_DISABLE_CHAN_37 = \texttt{BIT}(15)
Disable advertising on channel index 37.

enumerator BT_LE_ADV_OPT_DISABLE_CHAN_38 = \texttt{BIT}(16)
Disable advertising on channel index 38.

enumerator BT_LE_ADV_OPT_DISABLE_CHAN_39 = \texttt{BIT}(17)
Disable advertising on channel index 39.

enumerator BT_LE_ADV_OPT_FORCE_NAME_IN_AD = \texttt{BIT}(18)
Put GAP device name into advert data.
Will place the GAP device name into the advertising data rather than the scan response data.

\textbf{Note:} Requires \texttt{BT\_LE\_ADV\_OPT\_USE\_NAME}

\begin{verbatim}
enum [anonymous]
    Periodic Advertising options
    \textbf{Values:}
    
    enumerator BT_LE_PER_ADV_OPT_NONE = 0
    Convenience value when no options are specified.
    
    enumerator BT_LE_PER_ADV_OPT_USE_TX_POWER = \texttt{BIT}(1)
    Advertise with transmit power.

    \textbf{Note:} Requires \texttt{BT\_LE\_ADV\_OPT\_EXT\_ADV}

    enumerator BT_LE_PER_ADV_OPT_INCLUDE_ADI = \texttt{BIT}(2)
    Advertise with included AdvDataInfo (ADI).

    \textbf{Note:} Requires \texttt{BT\_LE\_ADV\_OPT\_EXT\_ADV}

\end{verbatim}

\begin{verbatim}
enum [anonymous]
    Periodic advertising sync options
    \textbf{Values:}
    
    enumerator BT_LE_PER_ADV_SYNC_OPT_NONE = 0
    Convenience value when no options are specified.
\end{verbatim}
enumerator BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST = BIT(0)
Use the periodic advertising list to sync with advertiser.
When this option is set, the address and SID of the parameters are ignored.

enumerator BT_LE_PER_ADV_SYNC_OPT_REPORTINGINITIALLYDISABLED = BIT(1)
Disables periodic advertising reports.
No advertisement reports will be handled until enabled.

enumerator BT_LE_PER_ADV_SYNC_OPT_FILTERDUPLICATE = BIT(2)
Filter duplicate Periodic Advertising reports

enumerator BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOA = BIT(3)
Sync with Angle of Arrival (AoA) constant tone extension

enumerator BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOD_1US = BIT(4)
Sync with Angle of Departure (AoD) 1 us constant tone extension

enumerator BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOD_2US = BIT(5)
Sync with Angle of Departure (AoD) 2 us constant tone extension

enumerator BT_LE_PER_ADV_SYNC_OPT_SYNC_ONLY_CONST_TONE_EXT = BIT(6)
Do not sync to packets without a constant tone extension

enum [anonymous]
Periodic Advertising Sync Transfer options

Values:

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_NONE = 0
Convenience value when no options are specified.

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOA = BIT(0)
No Angle of Arrival (AoA)
Do not sync with Angle of Arrival (AoA) constant tone extension

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOD_1US = BIT(1)
No Angle of Departure (AoD) 1 us.
Do not sync with Angle of Departure (AoD) 1 us constant tone extension

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOD_2US = BIT(2)
No Angle of Departure (AoD) 2.
Do not sync with Angle of Departure (AoD) 2 us constant tone extension

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_ONLY_CTE = BIT(3)
Only sync to packets with constant tone extension

enum [anonymous]
Values:
enumerator BT_LE_SCAN_OPT_NONE = 0
    Convenience value when no options are specified.

enumerator BT_LE_SCAN_OPT_FILTER_DUPLICATE = BIT(0)
    Filter duplicates.

enumerator BT_LE_SCAN_OPT_FILTER_ACCEPT_LIST = BIT(1)
    Filter using filter accept list.

enumerator BT_LE_SCAN_OPT_CODED = BIT(2)
    Enable scan on coded PHY (Long Range).

enumerator BT_LE_SCAN_OPT_NO_1M = BIT(3)
    Disable scan on 1M phy.

**Note:** Requires BT_LE_SCAN_OPT_CODED.

e_num [anonymous]

*Values:*

enumerator BT_LE_SCAN_TYPE_PASSIVE = 0x00
    Scan without requesting additional information from advertisers.

enumerator BT_LE_SCAN_TYPE_ACTIVE = 0x01
    Scan and request additional information from advertisers.
    Using this scan type will automatically send scan requests to all devices. Scan responses
    are received in the same manner and using the same callbacks as advertising reports.

**Functions**

```c
int bt_enable(bt_ready_cb_t cb)
```

Enable Bluetooth.

Enable Bluetooth. Must be the called before any calls that require communication with the
local Bluetooth hardware.

When CONFIG_BT_SETTINGS is enabled, the application must load the Bluetooth settings after
this API call successfully completes before Bluetooth APIs can be used. Loading the settings be-
fore calling this function is insufficient. Bluetooth settings can be loaded with settings_load()
or settings_load_subtree() with argument “bt”. The latter selectively loads only Bluetooth set-
tings and is recommended if settings_load() has been called earlier.

**Parameters**

- cb – Callback to notify completion or NULL to perform the enabling syn-
chronously.

**Returns**

Zero on success or (negative) error code otherwise.
int bt_disable(void)
Disable Bluetooth.
Disable Bluetooth. Can't be called before bt_enable has completed.
Close and release HCI resources. Result is architecture dependent.

Returns
Zero on success or (negative) error code otherwise.

bool bt_is_ready(void)
Check if Bluetooth is ready.

Returns
true when Bluetooth is ready, false otherwise

int bt_set_name(const char *name)
Set Bluetooth Device Name.
Set Bluetooth GAP Device Name.
When advertising with device name in the advertising data the name should be updated by calling bt_le_adv_update_data or bt_le_ext_adv_set_data.

Parameters
• name – New name

Returns
Zero on success or (negative) error code otherwise.

const char *bt_get_name(void)
Get Bluetooth Device Name.
Get Bluetooth GAP Device Name.

Returns
Bluetooth Device Name

uint16_t bt_get_appearance(void)
Get local Bluetooth appearance.
Bluetooth Appearance is a description of the external appearance of a device in terms of an Appearance Value.

See also:
https://specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf

Returns
Appearance Value of local Bluetooth host.

int bt_set_appearance(uint16_t new_appearance)
Set local Bluetooth appearance.
Automatically preserves the new appearance across reboots if CONFIG_BT_SETTINGS is enabled.
This symbol is linkable if CONFIG_BT_DEVICE_APPEARANCE_DYNAMIC is enabled.

Parameters
• new_appearance – Appearance Value

Return values
• 0 – Success.
• other – Persistent storage failed. Appearance was not updated.

```c
void bt_id_get(bt_addr_le_t* addrs, size_t* count)
```

Get the currently configured identities.

Returns an array of the currently configured identity addresses. To make sure all available identities can be retrieved, the number of elements in the `addrs` array should be `CONFIG_BT_ID_MAX`. The identity identifier that some APIs expect (such as advertising parameters) is simply the index of the identity in the `addrs` array.

If `addrs` is passed as NULL, then returned `count` contains the count of all available identities that can be retrieved with a subsequent call to this function with non-NULL `addrs` parameter.

**Note:** Deleted identities may show up as `BT_ADDR_LE_ANY` in the returned array.

### Parameters

- `addrs` – Array where to store the configured identities.
- `count` – Should be initialized to the array size. Once the function returns it will contain the number of returned identities.

```c
int bt_id_create(bt_addr_le_t* addr, uint8_t* irk)
```

Create a new identity.

Create a new identity using the given address and IRK. This function can be called before calling `bt_enable()`, in which case it can be used to override the controller’s public address (in case it has one). However, the new identity will only be stored persistently in flash when this API is used after `bt_enable()`. The reason is that the persistent settings are loaded after `bt_enable()` and would therefore cause potential conflicts with the stack blindly overwriting what’s stored in flash. The identity will also not be written to flash in case a pre-defined address is provided, since in such a situation the app clearly has some place it got the address from and will be able to repeat the procedure on every power cycle, i.e. it would be redundant to also store the information in flash.

Generating random static address or random IRK is not supported when calling this function before `bt_enable()`.

If the application wants to have the stack randomly generate identities and store them in flash for later recovery, the way to do it would be to first initialize the stack (using `bt_enable`), then call `settings_load()`, and after that check with `bt_id_get()` how many identities were recovered. If an insufficient amount of identities were recovered the app may then call `bt_id_create()` to create new ones.

### Parameters

- `addr` – Address to use for the new identity. If NULL or initialized to `BT_ADDR_LE_ANY` the stack will generate a new random static address for the identity and copy it to the given parameter upon return from this function (in case the parameter was non-NULL).
- `irk` – Identity Resolving Key (16 bytes) to be used with this identity. If set to all zeroes or NULL, the stack will generate a random IRK for the identity and copy it back to the parameter upon return from this function (in case the parameter was non-NULL). If privacy `CONFIG_BT_PRIVACY` is not enabled this parameter must be NULL.

### Returns

Identity identifier (>= 0) in case of success, or a negative error code on failure.
int bt_id_reset(uint8_t id, bt_addr_le_t *addr, uint8_t *irk)

Reset/reclaim an identity for reuse.

The semantics of the \textit{addr} and \textit{irk} parameters of this function are the same as with \textit{bt_id_create()}. The difference is the first \textit{id} parameter that needs to be an existing identity (if it doesn't exist this function will return an error). When given an existing identity this function will disconnect any connections created using it, remove any pairing keys or other data associated with it, and then create a new identity in the same slot, based on the \textit{addr} and \textit{irk} parameters.

\textbf{Note:} the default identity (BT_ID_DEFAULT) cannot be reset, i.e. this API will return an error if asked to do that.

\textbf{Parameters}

- \textit{id} – Existing identity identifier.
- \textit{addr} – Address to use for the new identity. If NULL or initialized to BT_ADDR_LE_ANY the stack will generate a new static random address for the identity and copy it to the given parameter upon return from this function (in case the parameter was non-NULL).
- \textit{irk} – Identity Resolving Key (16 bytes) to be used with this identity. If set to all zeroes or NULL, the stack will generate a random IRK for the identity and copy it back to the parameter upon return from this function (in case the parameter was non-NULL). If privacy \texttt{CONFIG_BT_PRIVACY} is not enabled this parameter must be NULL.

\textbf{Returns}

Identification identifier (\(>= 0\)) in case of success, or a negative error code on failure.

int bt_id_delete(uint8_t id)

Delete an identity.

When given a valid identity this function will disconnect any connections created using it, remove any pairing keys or other data associated with it, and then flag it as deleted, so that it can not be used for any operations. To take back into use the slot the identity was occupying the \textit{bt_id_reset()} API needs to be used.

\textbf{Note:} the default identity (BT_ID_DEFAULT) cannot be deleted, i.e. this API will return an error if asked to do that.

\textbf{Parameters}

- \textit{id} – Existing identity identifier.

\textbf{Returns}

0 in case of success, or a negative error code on failure.

int bt_le_adv_start(const struct bt_le_adv_param *param, const struct bt_data *ad, size_t ad_len, const struct bt_data *sd, size_t sd_len)

Start advertising.

Set advertisement data, scan response data, advertisement parameters and start advertising.

When the advertisement parameter peer address has been set the advertising will be directed to the peer. In this case advertisement data and scan response data parameters are ignored. If the mode is high duty cycle the timeout will be \texttt{BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT}.
Parameters
- param – Advertising parameters.
- ad – Data to be used in advertisement packets.
- ad_len – Number of elements in ad
- sd – Data to be used in scan response packets.
- sd_len – Number of elements in sd

Returns
Zero on success or (negative) error code otherwise.

Returns
-ENOMEM No free connection objects available for connectable advertiser.

Returns
- ECONNREFUSED When connectable advertising is requested and there is already maximum number of connections established in the controller. This error code is only guaranteed when using Zephyr controller, for other controllers code returned in this case may be -EIO.

int bt_le_adv_update_data(const struct bt_data *ad, size_t ad_len, const struct bt_data *sd, size_t sd_len)
Update advertising.
Update advertisement and scan response data.

Parameters
- ad – Data to be used in advertisement packets.
- ad_len – Number of elements in ad
- sd – Data to be used in scan response packets.
- sd_len – Number of elements in sd

Returns
Zero on success or (negative) error code otherwise.

int bt_le_adv_stop(void)
Stop advertising.
Stops ongoing advertising.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_ext_adv_create(const struct bt_le_adv_param *param, const struct bt_le_ext_adv_cb *cb, struct bt_le_ext_adv **adv)
Create advertising set.
Create a new advertising set and set advertising parameters. Advertising parameters can be updated with bt_le_ext_adv_update_param.

Parameters
- cb – [in] Callback struct to notify about advertiser activity. Can be NULL. Must point to valid memory during the lifetime of the advertising set.
- adv – [out] Valid advertising set object on success.

Returns
Zero on success or (negative) error code otherwise.
int bt_le_ext_adv_start(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_start_param *param)
Start advertising with the given advertising set.

If the advertiser is limited by either the timeout or number of advertising events the application will be notified by the advertiser sent callback once the limit is reached. If the advertiser is limited by both the timeout and the number of advertising events then the limit that is reached first will stop the advertiser.

Parameters
• adv – Advertising set object.
• param – Advertise start parameters.

int bt_le_ext_adv_stop(struct bt_le_ext_adv *adv)
Stop advertising with the given advertising set.

Stop advertising with a specific advertising set. When using this function the advertising sent callback will not be called.

Parameters
• adv – Advertising set object.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_ext_adv_set_data(struct bt_le_ext_adv *adv, const struct bt_data *ad, size_t ad_len, const struct bt_data *sd, size_t sd_len)
Set an advertising set's advertising or scan response data.

Set advertisement data or scan response data. If the advertising set is currently advertising then the advertising data will be updated in subsequent advertising events.

When both BT_LE_ADV_OPT_EXT_ADV and BT_LE_ADV_OPT_SCANNABLE are enabled then advertising data is ignored. When BT_LE_ADV_OPT_SCANNABLE is not enabled then scan response data is ignored.

If the advertising set has been configured to send advertising data on the primary advertising channels then the maximum data length is BT_GAP_ADV_MAX_ADV_DATA_LEN bytes. If the advertising set has been configured for extended advertising, then the maximum data length is defined by the controller with the maximum possible of BT_GAP_ADV_MAX_EXT_ADV_DATA_LEN bytes.

Note: Not all scanners support extended data length advertising data.

Note: When updating the advertising data while advertising the advertising data and scan response data length must be smaller or equal to what can be fit in a single advertising packet. Otherwise the advertiser must be stopped.

Parameters
• adv – Advertising set object.
• ad – Data to be used in advertisement packets.
• ad_len – Number of elements in ad
• sd – Data to be used in scan response packets.
• sd_len – Number of elements in sd

Returns
Zero on success or (negative) error code otherwise.
int bt_le_ext_adv_update_param(struct bt_le_ext_adv *adv, const struct bt_le_adv_param *param)

Update advertising parameters.

Update the advertising parameters. The function will return an error if the advertiser set is currently advertising. Stop the advertising set before calling this function.

Note: When changing the option BT_LE_ADV_OPT_USE_NAME then bt_le_ext_adv_set_data needs to be called in order to update the advertising data and scan response data.

Parameters
- adv – Advertising set object.
- param – Advertising parameters.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_ext_adv_delete(struct bt_le_ext_adv *adv)

Delete advertising set.

Delete advertising set. This will free up the advertising set and make it possible to create a new advertising set.

Returns
Zero on success or (negative) error code otherwise.

uint8_t bt_le_ext_adv_get_index(struct bt_le_ext_adv *adv)

Get array index of an advertising set.

This function is used to map bt_adv to index of an array of advertising sets. The array has CONFIG_BT_EXT_ADV_MAX_ADV_SET elements.

Parameters
- adv – Advertising set.

Returns
Index of the advertising set object. The range of the returned value is 0..CONFIG_BT_EXT_ADV_MAX_ADV_SET-1

int bt_le_ext_adv_get_info(const struct bt_le_ext_adv *adv, struct bt_le_ext_adv_info *info)

Get advertising set info.

Parameters
- adv – Advertising set object
- info – Advertising set info object

Returns
Zero on success or (negative) error code on failure.

int bt_le_per_adv_set_param(struct bt_le_ext_adv *adv, const struct bt_le_per_adv_param *param)

Set or update the periodic advertising parameters.

The periodic advertising parameters can only be set or updated on an extended advertisement set which is neither scannable, connectable nor anonymous.

Parameters
- adv – Advertising set object.
- param – Advertising parameters.
**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_le_per_adv_set_data(const struct bt_le_ext_adv *adv, const struct bt_data *ad, size_t ad_len)
```
Set or update the periodic advertising data.

The periodic advertisement data can only be set or updated on an extended advertisement set which is neither scannable, connectable nor anonymous.

**Parameters**
- `adv` – Advertising set object.
- `ad` – Advertising data.
- `ad_len` – Advertising data length.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_le_per_adv_start(struct bt_le_ext_adv *adv)
```
Starts periodic advertising.

Enabling the periodic advertising can be done independently of extended advertising, but both periodic advertising and extended advertising shall be enabled before any periodic advertising data is sent. The periodic advertising and extended advertising can be enabled in any order.

Once periodic advertising has been enabled, it will continue advertising until `bt_le_per_adv_stop()` has been called, or if the advertising set is deleted by `bt_le_ext_adv_delete()`. Calling `bt_le_ext_adv_stop()` will not stop the periodic advertising.

**Parameters**
- `adv` – Advertising set object.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_le_per_adv_stop(struct bt_le_ext_adv *adv)
```
Stops periodic advertising.

Disabling the periodic advertising can be done independently of extended advertising. Disabling periodic advertising will not disable extended advertising.

**Parameters**
- `adv` – Advertising set object.

**Returns**
Zero on success or (negative) error code otherwise.

```c
uint8_t bt_le_per_adv_sync_get_index(struct bt_le_per_adv_sync *per_adv_sync)
```
Get array index of an periodic advertising sync object.

This function is get the index of an array of periodic advertising sync objects. The array has `CONFIG_BT_PER_ADV_SYNC_MAX` elements.

**Parameters**
- `per_adv_sync` – The periodic advertising sync object.

**Returns**
Index of the periodic advertising sync object. The range of the returned value is `0..CONFIG_BT_PER_ADV_SYNC_MAX-1`
struct bt_le_per_adv_sync *bt_le_per_adv_sync_lookup_index(uint8_t index)
Get a periodic advertising sync object from the array index.

This function is to get the periodic advertising sync object from the array index. The array has CONFIG_BT_PER_ADV_SYNC_MAX elements.

Parameters
• index – The index of the periodic advertising sync object. The range of the index value is 0..CONFIG_BT_PER_ADV_SYNC_MAX-1

Returns
The periodic advertising sync object of the array index or NULL if invalid index.

int bt_le_per_adv_sync_get_info(struct bt_le_per_adv_sync *per_adv_sync, struct bt_le_per_adv_sync_info *info)
Get periodic adv sync information.

Parameters
• per_adv_sync – Periodic advertising sync object.
• info – Periodic advertising sync info object

Returns
Zero on success or (negative) error code on failure.

struct bt_le_per_adv_sync *bt_le_per_adv_sync_lookup_addr(const bt_addr_le_t *adv_addr, uint8_t sid)
Look up an existing periodic advertising sync object by advertiser address.

Parameters
• adv_addr – Advertiser address.
• sid – The advertising set ID.

Returns
Periodic advertising sync object or NULL if not found.

int bt_le_per_adv_sync_create(const struct bt_le_per_adv_sync_param *param, struct bt_le_per_adv_sync **out_sync)
Create a periodic advertising sync object.

Create a periodic advertising sync object that can try to synchronize to periodic advertising reports from an advertiser. Scan shall either be disabled or extended scan shall be enabled.

Parameters
• param – [in] Periodic advertising sync parameters.
• out_sync – [out] Periodic advertising sync object on.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_delete(struct bt_le_per_adv_sync *per_adv_sync)
Delete periodic advertising sync.

Delete the periodic advertising sync object. Can be called regardless of the state of the sync. If the syncing is currently syncing, the syncing is cancelled. If the sync has been established, it is terminated. The periodic advertising sync object will be invalidated afterwards.

If the state of the sync object is syncing, then a new periodic advertising sync object may not be created until the controller has finished canceling this object.

Parameters
• per_adv_sync – The periodic advertising sync object.
**Returns**
Zero on success or (negative) error code otherwise.

`void bt_le_per_adv_sync_cb_register(struct bt_le_per_adv_sync_cb *cb)`
Register periodic advertising sync callbacks.
- Adds the callback structure to the list of callback structures for periodic advertising syncs.
- This callback will be called for all periodic advertising sync activity, such as synced, terminated and when data is received.

**Parameters**
- `cb` – Callback struct. Must point to memory that remains valid.

`int bt_le_per_adv_sync_recv_enable(struct bt_le_per_adv_sync *per_adv_sync)`
Enables receiving periodic advertising reports for a sync.
- If the sync is already receiving the reports, -EALREADY is returned.

**Parameters**
- `per_adv_sync` – The periodic advertising sync object.

**Returns**
Zero on success or (negative) error code otherwise.

`int bt_le_per_adv_sync_recv_disable(struct bt_le_per_adv_sync *per_adv_sync)`
Disables receiving periodic advertising reports for a sync.
- If the sync report receiving is already disabled, -EALREADY is returned.

**Parameters**
- `per_adv_sync` – The periodic advertising sync object.

**Returns**
Zero on success or (negative) error code otherwise.

`int bt_le_per_adv_sync_transfer(const struct bt_le_per_adv_sync *per_adv_sync, const struct bt_conn *conn, uint16_t service_data)`
Transfer the periodic advertising sync information to a peer device.
- This will allow another device to quickly synchronize to the same periodic advertising train that this device is currently synced to.

**Parameters**
- `per_adv_sync` – The periodic advertising sync to transfer.
- `conn` – The peer device that will receive the sync information.
- `service_data` – Application service data provided to the remote host.

**Returns**
Zero on success or (negative) error code otherwise.

`int bt_le_per_adv_set_info_transfer(const struct bt_le_ext_adv *adv, const struct bt_conn *conn, uint16_t service_data)`
Transfer the information about a periodic advertising set.
- This will allow another device to quickly synchronize to periodic advertising set from this device.

**Parameters**
- `adv` – The periodic advertising set to transfer info of.
- `conn` – The peer device that will receive the information.
- `service_data` – Application service data provided to the remote host.
Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_transfer_subscribe(const struct bt_conn *conn, const struct bt_le_per_adv_sync_transfer_param *param)
Subscribe to periodic advertising sync transfers (PASTs).
Sets the parameters and allow other devices to transfer periodic advertising syncs.

Parameters
• conn – The connection to set the parameters for. If NULL default parameters for all connections will be set. Parameters set for specific connection will always have precedence.
• param – The periodic advertising sync transfer parameters.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_transfer_unsubscribe(const struct bt_conn *conn)
Unsubscribe from periodic advertising sync transfers (PASTs).
Remove the parameters that allow other devices to transfer periodic advertising syncs.

Parameters
• conn – The connection to remove the parameters for. If NULL default parameters for all connections will be removed. Unsubscribing for a specific device, will still allow other devices to transfer periodic advertising syncs.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_list_add(const bt_addr_le_t *addr, uint8_t sid)
Add a device to the periodic advertising list.
Add peer device LE address to the periodic advertising list. This will make it possibly to automatically create a periodic advertising sync to this device.

Parameters
• addr – Bluetooth LE identity address.
• sid – The advertising set ID. This value is obtained from the bt_le_scan_recv_info in the scan callback.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_list_remove(const bt_addr_le_t *addr, uint8_t sid)
Remove a device from the periodic advertising list.
Removes peer device LE address from the periodic advertising list.

Parameters
• addr – Bluetooth LE identity address.
• sid – The advertising set ID. This value is obtained from the bt_le_scan_recv_info in the scan callback.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_list_clear(void)
Clear the periodic advertising list.
Clears the entire periodic advertising list.
Returns
Zero on success or (negative) error code otherwise.

int bt_le_scan_start(const struct bt_le_scan_param *param, bt_le_scan_cb_t cb)
Start (LE) scanning.
Start LE scanning with given parameters and provide results through the specified callback.

Note: The LE scanner by default does not use the Identity Address of the local device when CONFIG_BT_PRIVACY is disabled. This is to prevent the active scanner from disclosing the identity information when requesting additional information from advertisers. In order to enable directed advertiser reports then CONFIG_BT_SCAN_WITH.IDENTITY must be enabled.

Parameters
• param – Scan parameters.
• cb – Callback to notify scan results. May be NULL if callback registration through bt_le_scan_cb_register is preferred.

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_le_scan_stop(void)
Stop (LE) scanning.
Stops ongoing LE scanning.

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

void bt_le_scan_cb_register(struct bt_le_scan_cb *cb)
Register scanner packet callbacks.
Adds the callback structure to the list of callback structures that monitors scanner activity. This callback will be called for all scanner activity, regardless of what API was used to start the scanner.

Parameters
• cb – Callback struct. Must point to memory that remains valid.

void bt_le_scan_cb_unregister(struct bt_le_scan_cb *cb)
Unregister scanner packet callbacks.
Remove the callback structure from the list of scanner callbacks.

Parameters
• cb – Callback struct. Must point to memory that remains valid.

int bt_le_filter_accept_list_add(const bt_addr_le_t *addr)
Add device (LE) to filter accept list.
Add peer device LE address to the filter accept list.

Note: The filter accept list cannot be modified when an LE role is using the filter accept list, i.e advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.
Parameters

- addr – Bluetooth LE identity address.

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

static inline int bt_le_whitelist_add(const bt_addr_le_t *addr)

int bt_le_filter_accept_list_remove(const bt_addr_le_t *addr)
Remove device (LE) from filter accept list.

Remove peer device LE address from the filter accept list.

Note: The filter accept list cannot be modified when an LE role is using the filter accept list, i.e. advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

Parameters

- addr – Bluetooth LE identity address.

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

static inline int bt_le_whitelist_rem(const bt_addr_le_t *addr)

int bt_le_filter_accept_list_clear(void)
Clear filter accept list.

Clear all devices from the filter accept list.

Note: The filter accept list cannot be modified when an LE role is using the filter accept list, i.e. advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

static inline int bt_le_whitelist_clear(void)

int bt_le_set_chan_map(uint8_t chan_map[5])
Set (LE) channel map.

Parameters

- chan_map – Channel map.

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_le_set_rpa_timeout(uint16_t new_rpa_timeout)
Set the Resolvable Private Address timeout in runtime.

The new RPA timeout value will be used for the next RPA rotation and all subsequent rotations until another override is scheduled with this API.

6.1. Bluetooth
Initially, the if CONFIG_BT_RPA_TIMEOUT is used as the RPA timeout. This symbol is linkable if CONFIG_BT_RPA_TIMEOUT_DYNAMIC is enabled.

**Parameters**

- **new_rpa_timeout** – Resolvable Private Address timeout in seconds

**Return values**

- **0** – Success.
- **-EINVAL** – RPA timeout value is invalid. Valid range is 1s - 3600s.

```c
void bt_data_parse(struct net_buf_simple *ad, bool (*func)(struct bt_data *data, void *user_data), void *user_data)
```

Helper for parsing advertising (or EIR or OOB) data.

A helper for parsing the basic data types used for Extended Inquiry Response (EIR), Advertising Data (AD), and OOB data blocks. The most common scenario is to call this helper on the advertising data received in the callback that was given to `bt_le_scan_start()`.

**Warning:** This helper function will consume `ad` when parsing. The user should make a copy if the original data is to be used afterwards.

```c
int bt_le_oob_get_local(uint8_t id, struct bt_le_oob *oob)
```

Get local LE Out of Band (OOB) information.

This function allows to get local information that are useful for Out of Band pairing or connection creation.

If privacy CONFIG_BT_PRIVACY is enabled this will result in generating new Resolvable Private Address (RPA) that is valid for CONFIG_BT_RPA_TIMEOUT seconds. This address will be used for advertising started by `bt_le_adv_start()`, active scanning and connection creation.

**Note:** If privacy is enabled the RPA cannot be refreshed in the following cases:

- Creating a connection in progress, wait for the connected callback. In addition when extended advertising CONFIG_BT_EXT_ADV is not enabled or not supported by the controller:
- Advertiser is enabled using a Random Static Identity Address for a different local identity.
- The local identity conflicts with the local identity used by other roles.

**Parameters**

- **id** – [in] Local identity, in most cases BT_ID_DEFAULT.
- **oob** – [out] LE OOB information

**Returns**

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.
int bt_le_ext_adv_oob_get_local(struct bt_le_ext_adv *adv, struct bt_le_oob *oob)
Get local LE Out of Band (OOB) information.

This function allows to get local information that are useful for Out of Band pairing or connection creation.

If privacy CONFIG_BT_PRIVACY is enabled this will result in generating new Resolvable Private Address (RPA) that is valid for CONFIG_BT_RPA_TIMEOUT seconds. This address will be used by the advertising set.

**Note:** When generating OOB information for multiple advertising set all OOB information needs to be generated at the same time.

**Note:** If privacy is enabled the RPA cannot be refreshed in the following cases:
- Creating a connection in progress, wait for the connected callback.

**Parameters**
- **adv** – [in] The advertising set object
- **oob** – [out] LE OOB information

**Returns**
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_br_discovery_start(const struct bt_br_discovery_param *param, struct bt_br_discovery_result *results, size_t count, bt_br_discovery_cb_t cb)
Start BR/EDR discovery.

Start BR/EDR discovery (inquiry) and provide results through the specified callback. When bt_br_discovery_cb_t is called it indicates that discovery has completed. If more inquiry results were received during session than fits in provided result storage, only ones with highest RSSI will be reported.

**Parameters**
- **param** – Discovery parameters.
- **results** – Storage for discovery results.
- **count** – Number of results in storage. Valid range: 1-255.
- **cb** – Callback to notify discovery results.

**Returns**
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error

int bt_br_discovery_stop(void)
Stop BR/EDR discovery.

Stops ongoing BR/EDR discovery. If discovery was stopped by this call results won't be reported.

**Returns**
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.
int bt_br_oob_get_local(struct bt_br_oob *oob)
Get BR/EDR local Out Of Band information.

This function allows to get local controller information that are useful for Out Of Band pairing or connection creation process.

Parameters
• oob – Out Of Band information

int bt_br_set_discoverable(bool enable)
Enable/disable set controller in discoverable state.

Allows make local controller to listen on INQUIRY SCAN channel and responds to devices making general inquiry. To enable this state it’s mandatory to first be in connectable state.

Parameters
• enable – Value allowing/disallowing controller to become discoverable.

Returns
Negative if fail set to requested state or requested state has been already set. Zero if done successfully.

int bt_br_set_connectable(bool enable)
Enable/disable set controller in connectable state.

Allows make local controller to be connectable. It means the controller start listen to devices requests on PAGE SCAN channel. If disabled also resets discoverability if was set.

Parameters
• enable – Value allowing/disallowing controller to be connectable.

Returns
Negative if fail set to requested state or requested state has been already set. Zero if done successfully.

int bt_unpair(uint8_t id, const bt_addr_le_t *addr)
Clear pairing information.

Parameters
• id – Local identity (mostly just BT_ID_DEFAULT).
• addr – Remote address, NULL or BT_ADDR_LE_ANY to clear all remote devices.

Returns
0 on success or negative error value on failure.

void bt_foreach_bond(uint8_t id, void (*func)(const struct bt_bond_info *info, void *user_data), void *user_data)
Iterate through all existing bonds.

Parameters
• id – Local identity (mostly just BT_ID_DEFAULT).
• func – Function to call for each bond.
• user_data – Data to pass to the callback function.

int bt_configure_data_path(uint8_t dir, uint8_t id, uint8_t vs_config_len, const uint8_t *vs_config)
Configure vendor data path.

Request the Controller to configure the data transport path in a given direction between the Controller and the Host.
Parameters

- **dir** – Direction to be configured, `BT_HCI_DATAPATH_DIR_HOST_TO_CTLR` or `BT_HCI_DATAPATH_DIR_CTLR_TO_HOST`
- **id** – Vendor specific logical transport channel ID, range `[BT_HCI_DATAPATH_ID_VS..BT_HCI_DATAPATH_ID_VS_END]`
- **vs_config_len** – Length of additional vendor specific configuration data
- **vs_config** – Pointer to additional vendor specific configuration data

Returns

0 in case of success or negative value in case of error.

```c
struct bt_le_ext_adv_sent_info
#include <bluetooth.h>
```

**Public Members**

```c
tuint8_t num_sent
```

The number of advertising events completed.

```c
struct bt_le_ext_adv_connected_info
#include <bluetooth.h>
```

**Public Members**

```c
struct bt_conn *conn
```

Connection object of the new connection

```c
struct bt_le_ext_adv_scanned_info
#include <bluetooth.h>
```

**Public Members**

```c
bt_addr_le_t *addr
```

Active scanner LE address and type

```c
struct bt_le_ext_adv_cb
#include <bluetooth.h>
```

**Public Members**

```c
void (*sent)(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_sent_info *info)
```

The advertising set has finished sending adv data.

This callback notifies the application that the advertising set has finished sending advertising data. The advertising set can either have been stopped by a timeout or because the specified number of advertising events has been reached.

6.1. Bluetooth
void (*connected)(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_connected_info *info)
The advertising set has accepted a new connection.

Param adv
The advertising set object.

Param info
Information about the connected event.

void (*scanned)(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_scanned_info *info)
The advertising set has sent scan response data.

Param adv
The advertising set object.

Param info
Information about the scanned event.

struct bt_data
#include <bluetooth.h> Bluetooth data.
Description of different data types that can be encoded into advertising data. Used to form
arrays that are passed to the bt_le_adv_start() function.

struct bt_le_adv_param
#include <bluetooth.h> LE Advertising Parameters.

Public Members

uint8_t id
Local identity.

Note: When extended advertising CONFIG_BT_EXT_ADV is not enabled or not supported
by the controller it is not possible to scan and advertise simultaneously using two different
random addresses.

uint8_t sid
Advertising Set Identifier, valid range 0x00 - 0x0f.

Note: Requires BT_LE_ADV_OPT_EXT_ADV

uint8_t secondary_max_skip
Secondary channel maximum skip count.
Maximum advertising events the advertiser can skip before it must send advertising data on the secondary advertising channel.

**Note:** Requires `BT_LE_ADV_OPT_EXT_ADV`

```c
uint32_t options
    Bit-field of advertising options
```

```c
uint32_t interval_min
    Minimum Advertising Interval (N * 0.625 milliseconds) Minimum Advertising Interval shall be less than or equal to the Maximum Advertising Interval. The Minimum Advertising Interval and Maximum Advertising Interval should not be the same value (as stated in Bluetooth Core Spec 5.2, section 7.8.5) Range: 0x0020 to 0x4000
```

```c
uint32_t interval_max
    Maximum Advertising Interval (N * 0.625 milliseconds) Minimum Advertising Interval shall be less than or equal to the Maximum Advertising Interval. The Minimum Advertising Interval and Maximum Advertising Interval should not be the same value (as stated in Bluetooth Core Spec 5.2, section 7.8.5) Range: 0x0020 to 0x4000
```

```c
const bt_addr_le_t *peer
    Directed advertising to peer.
    When this parameter is set the advertiser will send directed advertising to the remote device.
    The advertising type will either be high duty cycle, or low duty cycle if the `BT_LE_ADV_OPT_DIR_MODE_LOW_DUTY` option is enabled. When using `BT_LE_ADV_OPT_EXT_ADV` then only low duty cycle is allowed.
    In case of connectable high duty cycle if the connection could not be established within the timeout the connected() callback will be called with the status set to `BT_HCI_ERR_ADV_TIMEOUT`.

struct bt_le_per_adv_param
    #include <bluetooth.h>
```

**Public Members**

```c
uint16_t interval_min
    Minimum Periodic Advertising Interval (N * 1.25 ms)
    Shall be greater or equal to `BT_GAP_PER_ADV_MIN_INTERVAL` and less or equal to interval_max.
```

```c
uint16_t interval_max
    Maximum Periodic Advertising Interval (N * 1.25 ms)
    Shall be less or equal to `BT_GAP_PER_ADV_MAX_INTERVAL` and greater or equal to interval_min.
```

```c
uint32_t options
    Bit-field of periodic advertising options
```
struct bt_le_ext_adv_start_param
#include <bluetooth.h>

Public Members

uint16_t timeout
Advertiser timeout (N * 10 ms).
Application will be notified by the advertiser sent callback. Set to zero for no timeout.
When using high duty cycle directed connectable advertising then this parameters must be set to a non-zero value less than or equal to the maximum of BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT.
If privacy CONFIG_BT_PRIVACY is enabled then the timeout must be less than CONFIG_BT_RPA_TIMEOUT.

uint8_t num_events
Number of advertising events.
Application will be notified by the advertiser sent callback. Set to zero for no limit.

struct bt_le_ext_adv_info
#include <bluetooth.h> Advertising set info structure.

Public Members

int8_t tx_power
Currently selected Transmit Power (dBm).

const bt_addr_le_t *addr
Current local advertising address used.

struct bt_le_per_adv_sync_synced_info
#include <bluetooth.h>

Public Members

const bt_addr_le_t *addr
Advertiser LE address and type.

uint8_t sid
Advertiser SID

uint16_t interval
Periodic advertising interval (N * 1.25 ms)

uint8_t phy
Advertiser PHY
bool recv_enabled
    True if receiving periodic advertisements, false otherwise.

uint16_t service_data
    Service Data provided by the peer when sync is transferred.
    Will always be 0 when the sync is locally created.

struct bt_conn *conn
    Peer that transferred the periodic advertising sync.
    Will always be 0 when the sync is locally created.

struct bt_le_per_adv_sync_term_info
    #include <bluetooth.h>

Public Members

const bt_addr_le_t *addr
    Advertiser LE address and type.

uint8_t sid
    Advertiser SID

uint8_t reason
    Cause of periodic advertising termination

struct bt_le_per_adv_sync_recv_info
    #include <bluetooth.h>

Public Members

const bt_addr_le_t *addr
    Advertiser LE address and type.

uint8_t sid
    Advertiser SID

int8_t tx_power
    The TX power of the advertisement.

int8_t rssi
    The RSSI of the advertisement excluding any CTE.

uint8_t cte_type
    The Constant Tone Extension (CTE) of the advertisement (bt_df_cte_type)

struct bt_le_per_adv_sync_state_info
    #include <bluetooth.h>
bool recv_enabled
    True if receiving periodic advertisements, false otherwise.

struct bt_le_per_adv_sync_cb

#include <bluetooth.h>

Public Members

void (*synced)(struct bt_le_per_adv_sync *sync, struct bt_le_per_adv_sync_synced_info *info)
    The periodic advertising has been successfully synced.
    This callback notifies the application that the periodic advertising set has been successfully
    synced, and will now start to receive periodic advertising reports.
    Param sync
        The periodic advertising sync object.
    Param info
        Information about the sync event.

void (*term)(struct bt_le_per_adv_sync *sync, const struct bt_le_per_adv_sync_term_info *info)
    The periodic advertising sync has been terminated.
    This callback notifies the application that the periodic advertising sync has been terminated,
    either by local request, remote request or because due to missing data, e.g. by
    being out of range or sync.
    Param sync
        The periodic advertising sync object.

void (*recv)(struct bt_le_per_adv_sync *sync, const struct bt_le_per_adv_sync_recv_info *info, struct net_buf_simple *buf)
    Periodic advertising data received.
    This callback notifies the application of an periodic advertising report.
    Param sync
        The advertising set object.
    Param info
        Information about the periodic advertising event.
    Param buf
        Buffer containing the periodic advertising data.

void (*state_changed)(struct bt_le_per_adv_sync *sync, const struct bt_le_per_adv_sync_state_info *info)
    The periodic advertising sync state has changed.
    This callback notifies the application about changes to the sync state. Initialize sync and
    termination is handled by their individual callbacks, and won't be notified here.
    Param sync
        The periodic advertising sync object.
    Param info
        Information about the state change.
void (*biginfo)(struct bt_le_per_adv_sync *sync, const struct bt_iso_biginfo *biginfo)
BIGInfo advertising report received.

This callback notifies the application of a BIGInfo advertising report. This is received if the advertiser is broadcasting isochronous streams in a BIG. See iso.h for more information.

**Param** sync
The advertising set object.

**Param** biginfo
The BIGInfo report.

void (*)(cte_report_cb)(struct bt_le_per_adv_sync *sync, struct bt_df_per_adv_sync_iq_samples_report const *info)
Callback for IQ samples report collected when sampling CTE received with periodic advertising PDU.

**Param** sync
The periodic advertising sync object.

**Param** info
Information about the sync event.

```c
#include <bluetooth.h>
```

**Public Members**

```c
struct bt_le_per_adv_sync_param
```

```c
#include <bluetooth.h>
```

**bt_addr_le_t** addr
Periodic Advertiser Address.

Only valid if not using the periodic advertising list (BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST)

```c
uint8_t sid
```
Advertiser SID.

Only valid if not using the periodic advertising list (BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST)

```c
uint32_t options
```
Bit-field of periodic advertising sync options.

```c
uint16_t skip
```
Maximum event skip.

Maximum number of periodic advertising events that can be skipped after a successful receive. Range: 0x0000 to 0x01F3

```c
uint16_t timeout
```
Synchronization timeout (N * 10 ms)

Synchronization timeout for the periodic advertising sync. Range 0x000A to 0x4000 (100 ms to 163840 ms)

```c
struct bt_le_per_adv_sync_info
```

```c
#include <bluetooth.h> Advertising set info structure.
```
Public Members

bt_addr_le_t addr
  Periodic Advertiser Address

uint8_t sid
  Advertiser SID

uint16_t interval
  Periodic advertising interval (N * 1.25 ms)

uint8_t phy
  Advertiser PHY

struct bt_le_per_adv_sync_transfer_param
#include <bluetooth.h>

Public Members

uint16_t skip
  Maximum event skip.
  The number of periodic advertising packets that can be skipped after a successful receive.

uint16_t timeout
  Synchronization timeout (N * 10 ms)
  Synchronization timeout for the periodic advertising sync. Range 0x000A to 0x4000 (100 ms to 163840 ms)

uint32_t options
  Periodic Advertising Sync Transfer options

struct bt_le_scan_param
#include <bluetooth.h> LE scan parameters

Public Members

uint8_t type
  Scan type (BT_LE_SCAN_TYPE_ACTIVE or BT_LE_SCAN_TYPE_PASSIVE)

uint32_t options
  Bit-field of scanning options.

uint16_t interval
  Scan interval (N * 0.625 ms)

uint16_t window
  Scan window (N * 0.625 ms)
### Public Members

#### const bt_addr_le_t *addr
Advertiser LE address and type.
If advertiser is anonymous then this address will be `BT_ADDR_LE_ANY`.

#### uint8_t sid
Advertising Set Identifier.

#### int8_t rssi
Strength of advertiser signal.

#### int8_t tx_power
Transmit power of the advertiser.

#### uint8_t adv_type
Advertising packet type.
Uses the `BT_GAP_ADV_TYPE_` value.
May indicate that this is a scan response if the type is `BT_GAP_ADV_TYPE_SCAN_RSP`.

#### uint16_t adv_props
Advertising packet properties bitfield.
Uses the `BT_GAP_ADV_PROP_` values. May indicate that this is a scan response if the value contains the `BT_GAP_ADV_PROP_SCAN_RESPONSE` bit.

#### uint16_t interval
Periodic advertising interval.
If 0 there is no periodic advertising.

#### uint8_t primary_phy
Primary advertising channel PHY.
### Public Members

- **uint8_t secondary_phy**
  
  Secondary advertising channel PHY.

- **struct bt_le_scan_cb**
  
  Listener context for (LE) scanning.

- **void (recv)(const struct bt_le_scan_recv_info *info, struct net_buf_simple *buf)**
  
  Advertisement packet and scan response received callback.

  - **Param info**
    
    Advertiser packet and scan response information.

  - **Param buf**
    
    Buffer containing advertiser data.

- **void (timeout)(void)**
  
  The scanner has stopped scanning after scan timeout.

- **struct bt_le_oob_sc_data**
  
  LE Secure Connections pairing Out of Band data.

- **bt_addr_le_t addr**
  
  LE address. If privacy is enabled this is a Resolvable Private Address.

- **struct bt_le_oob sc_data le_sc_data**
  
  LE Secure Connections pairing Out of Band data.

- **struct bt_br_discovery_result**
  
  BR/EDR discovery result structure.
bt_addr_t  addr
    Remote device address

int8_t  rssi
    RSSI from inquiry

uint8_t cod[3]
    Class of Device

uint8_t eir[240]
    Extended Inquiry Response

struct bt_br_discovery_param
    #include <bluetooth.h> BR/EDR discovery parameters

Public Members

uint8_t length
    Maximum length of the discovery in units of 1.28 seconds. Valid range is 0x01 - 0x30.

bool limited
    True if limited discovery procedure is to be used.

struct bt_br_oob
    #include <bluetooth.h>

Public Members

bt_addr_t  addr
    BR/EDR address.

struct bt_bond_info
    #include <bluetooth.h> Information about a bond with a remote device.

Public Members

bt_addr_le_t  addr
    Address of the remote device.

group bt_addr
    Bluetooth device address definitions and utilities.

Defines

BT_ADDR_LE_PUBLIC
BT_ADDR_LE_RANDOM

BT_ADDR_LE_PUBLIC_ID

BT_ADDR_LE_RANDOM_ID

BT_ADDR_LE_UNRESOLVED

BT_ADDR_LE_ANONYMOUS

BT_ADDR_SIZE
    Length in bytes of a standard Bluetooth address

BT_ADDR_LE_SIZE
    Length in bytes of an LE Bluetooth address. Not packed, so no sizeof()

BT_ADDR_ANY
    Bluetooth device “any” address, not a valid address

BT_ADDR_NONE
    Bluetooth device “none” address, not a valid address

BT_ADDR_LE_ANY
    Bluetooth LE device “any” address, not a valid address

BT_ADDR_LE_NONE
    Bluetooth LE device “none” address, not a valid address

BT_ADDR_IS_RPA(a)
    Check if a Bluetooth LE random address is resolvable private address.

BT_ADDR_IS_NRPA(a)
    Check if a Bluetooth LE random address is a non-resolvable private address.

BT_ADDR_IS_STATIC(a)
    Check if a Bluetooth LE random address is a static address.

BT_ADDR_SET_RPA(a)
    Set a Bluetooth LE random address as a resolvable private address.

BT_ADDR_SET_NRPA(a)
    Set a Bluetooth LE random address as a non-resolvable private address.

BT_ADDR_SET_STATIC(a)
    Set a Bluetooth LE random address as a static address.

BT_ADDR_STR_LEN
    Recommended length of user string buffer for Bluetooth address.
    The recommended length guarantee the output of address conversion will not lose valuable
    information about address being processed.
**BT_ADDR_LE_STR_LEN**

Recommended length of user string buffer for Bluetooth LE address.

The recommended length guarantee the output of address conversion will not lose valuable information about address being processed.

**Functions**

```c
static inline int bt_addr_cmp(const bt_addr_t *a, const bt_addr_t *b)
```

Compare Bluetooth device addresses.

**Parameters**

- `a` – First Bluetooth device address to compare
- `b` – Second Bluetooth device address to compare

**Returns**

- negative value if `a < b`, 0 if `a == b`, else positive

```c
static inline int bt_addr_le_cmp(const bt_addr_le_t *a, const bt_addr_le_t *b)
```

Compare Bluetooth LE device addresses.

**See also:**

*bt_addr_le_eq*

**Parameters**

- `a` – First Bluetooth LE device address to compare
- `b` – Second Bluetooth LE device address to compare

**Returns**

- negative value if `a < b`, 0 if `a == b`, else positive

```c
static inline bool bt_addr_le_eq(const bt_addr_le_t *a, const bt_addr_le_t *b)
```

Determine equality of two Bluetooth LE device addresses.

The Bluetooth LE addresses are equal iff both the types and the 48-bit addresses are numerically equal.

**Return values**

- `true` – if the two addresses are equal
- `false` – otherwise

```c
static inline void bt_addr_copy(bt_addr_t *dst, const bt_addr_t *src)
```

Copy Bluetooth device address.

**Parameters**

- `dst` – Bluetooth device address destination buffer.
- `src` – Bluetooth device address source buffer.

```c
static inline void bt_addr_le_copy(bt_addr_le_t *dst, const bt_addr_le_t *src)
```

Copy Bluetooth LE device address.

**Parameters**

- `dst` – Bluetooth LE device address destination buffer.
- `src` – Bluetooth LE device address source buffer.
int bt_addr_le_create_nrpa(bt_addr_le_t *addr)
Create a Bluetooth LE random non-resolvable private address.

int bt_addr_le_create_static(bt_addr_le_t *addr)
Create a Bluetooth LE random static address.

static inline bool bt_addr_le_is_rpa(const bt_addr_le_t *addr)
Check if a Bluetooth LE address is a random private resolvable address.

Parameters
- addr – Bluetooth LE device address.

Returns
true if address is a random private resolvable address.

static inline bool bt_addr_le_is_identity(const bt_addr_le_t *addr)
Check if a Bluetooth LE address is a valid identity address.

Valid Bluetooth LE identity addresses are either public address or random static address.

Parameters
- addr – Bluetooth LE device address.

Returns
true if address is a valid identity address.

static inline int bt_addr_to_str(const bt_addr_t *addr, char *str, size_t len)
Converts binary Bluetooth address to string.

Parameters
- addr – Address of buffer containing binary Bluetooth address.
- str – Address of user buffer with enough room to store formatted string containing binary address.
- len – Length of data to be copied to user string buffer. Refer to BT_ADDR_STR_LEN about recommended value.

Returns
Number of successfully formatted bytes from binary address.

static inline int bt_addr_le_to_str(const bt_addr_le_t *addr, char *str, size_t len)
Converts binary LE Bluetooth address to string.

Parameters
- addr – Address of buffer containing binary LE Bluetooth address.
- str – Address of user buffer with enough room to store formatted string containing binary LE address.
- len – Length of data to be copied to user string buffer. Refer to BT_ADDR_LE_STR_LEN about recommended value.

Returns
Number of successfully formatted bytes from binary address.

int bt_addr_from_str(const char *str, bt_addr_t *addr)
Convert Bluetooth address from string to binary.

Parameters
- addr – [out] Address of buffer to store the Bluetooth address.
Returns
Zero on success or (negative) error code otherwise.

int bt_addr_le_from_str(const char *str, const char *type, bt_addr_le_t *addr)
Convert LE Bluetooth address from string to binary.

Parameters
• str – [in] The string representation of an LE Bluetooth address.
• type – [in] The string representation of the LE Bluetooth address type.
• addr – [out] Address of buffer to store the LE Bluetooth address

Returns
Zero on success or (negative) error code otherwise.

Minimum Periodic Advertising Interval (N * 1.25 ms)

BT_GAP_PER_ADV_MIN_INTERVAL

Maximum Periodic Advertising Interval (N * 1.25 ms)

BT_GAP_PER_ADV_INTERVAL_TO_MS(interval)

Convert periodic advertising interval (N * 1.25 ms) to milliseconds.

5 / 4 represents 1.25 ms unit.

BT_LE_SUPP_FEAT_40_ENCODE(w64)

Encode 40 least significant bits of 64-bit LE Supported Features into array values in little-endian format.

Helper macro to encode 40 least significant bits of 64-bit LE Supported Features value into advertising data. The number of bits that are encoded is a number of LE Supported Features defined by BT 5.3 Core specification.

Example of how to encode the 0x000000DFF00DF00D into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_40_ENCODE(0x000000DFF00DF00D))
```

**Parameters**

- w64 – LE Supported Features value (64-bits)

**Returns**

The comma separated values for LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.
BT_LE_SUPP_FEAT_32_ENCODE(w64)

Encode 4 least significant bytes of 64-bit LE Supported Features into 4 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 4 least significant bytes into advertising data. Other 4 bytes are not encoded.

Example of how to encode the 0x000000DFF00DF00D into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_32_ENCODE(0x000000DFF00DF00D))
```

Parameters

- w64 – LE Supported Features value (64-bits)

Returns

The comma separated values for LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.

BT_LE_SUPP_FEAT_24_ENCODE(w64)

Encode 3 least significant bytes of 64-bit LE Supported Features into 3 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 3 least significant bytes into advertising data. Other 5 bytes are not encoded.

Example of how to encode the 0x000000DFF00DF00D into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_24_ENCODE(0x000000DFF00DF00D))
```

Parameters

- w64 – LE Supported Features value (64-bits)

Returns

The comma separated values for LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.

BT_LE_SUPP_FEAT_16_ENCODE(w64)

Encode 2 least significant bytes of 64-bit LE Supported Features into 2 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 3 least significant bytes into advertising data. Other 6 bytes are not encoded.

Example of how to encode the 0x000000DFF00DF00D into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_16_ENCODE(0x000000DFF00DF00D))
```

Parameters

- w64 – LE Supported Features value (64-bits)
Returns
The comma separated values for LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.

`BT_LE_SUPP_FEAT_8_ENCODE(w64)`

Encode the least significant byte of 64-bit LE Supported Features into single byte long array.
Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes the least significant byte into advertising data. Other 7 bytes are not encoded.
Example of how to encode the 0x000000DFF00DF00D into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_8_ENCODE(0x000000DFF00DF00D))
```

Parameters
- `w64` – LE Supported Features value (64-bits)

Returns
The value of least significant byte of LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.

`BT_LE_SUPP_FEAT_VALIDATE(w64)`

Validate whether LE Supported Features value does not use bits that are reserved for future use.
Helper macro to check if `w64` has zeros as bits 40-63. The macro is compliant with BT 5.3 Core Specification where bits 0-40 has assigned values. In case of invalid value, build time error is reported.

Enums

```
enum [anonymous]

LE PHY types
Values:

enumerator BT_GAP_LE_PHY_NONE = 0
  Convenience macro for when no PHY is set.

enumerator BT_GAP_LE_PHY_1M = BIT(0)
  LE 1M PHY

enumerator BT_GAP_LE_PHY_2M = BIT(1)
  LE 2M PHY

enumerator BT_GAP_LE_PHY_CODED = BIT(2)
  LE Coded PHY
```

```
enum [anonymous]

Advertising PDU types
Values:
```

6.1. Bluetooth
enumerator BT_GAP_ADV_TYPE_ADV_IND = 0x00
    Scannable and connectable advertising.

enumerator BT_GAP_ADV_TYPE_ADV_DIRECT_IND = 0x01
    Directed connectable advertising.

enumerator BT_GAP_ADV_TYPE_ADV_SCAN_IND = 0x02
    Non-connectable and scannable advertising.

enumerator BT_GAP_ADV_TYPE_ADV_NONCONN_IND = 0x03
    Non-connectable and non-scannable advertising.

enumerator BT_GAP_ADV_TYPE_SCAN_RSP = 0x04
    Additional advertising data requested by an active scanner.

enumerator BT_GAP_ADV_TYPE_EXT_ADV = 0x05
    Extended advertising, see advertising properties.

enum [anonymous]
    Advertising PDU properties
    Values:

    enumerator BT_GAP_ADV_PROP_CONNECTABLE = BIT(0)
        Connectable advertising.

    enumerator BT_GAP_ADV_PROP_SCANNABLE = BIT(1)
        Scannable advertising.

    enumerator BT_GAP_ADV_PROP_DIRECTED = BIT(2)
        Directed advertising.

    enumerator BT_GAP_ADV_PROP_SCAN_RESPONSE = BIT(3)
        Additional advertising data requested by an active scanner.

    enumerator BT_GAP_ADV_PROP_EXT_ADV = BIT(4)
        Extended advertising.

enum [anonymous]
    Constant Tone Extension (CTE) types
    Values:

    enumerator BT_GAP_CTE_AOA = 0x00
        Angle of Arrival

    enumerator BT_GAP_CTE_AOD_1US = 0x01
        Angle of Departure with 1 us slots
enumerator BT_GAP_CTE_AOD_2US = 0x02
    Angle of Departure with 2 us slots

enumerator BT_GAP_CTE_NONE = 0xFF
    No extensions

enum [anonymous]
    Peripheral sleep clock accuracy (SCA) in ppm (parts per million)
    Values:
        enumerator BT_GAP_SCA_UNKNOWN = 0
        enumerator BT_GAP_SCA_251_500 = 0
        enumerator BT_GAP_SCA_151_250 = 1
        enumerator BT_GAP_SCA_101_150 = 2
        enumerator BT_GAP_SCA_76_100 = 3
        enumerator BT_GAP_SCA_51_75 = 4
        enumerator BT_GAP_SCA_31_50 = 5
        enumerator BT_GAP_SCA_21_30 = 6
        enumerator BT_GAP_SCA_0_20 = 7

**Generic Attribute Profile (GATT)**

GATT layer manages the service database providing APIs for service registration and attribute declaration.

Services can be registered using `bt_gatt_service_register()` API which takes the `bt_gatt_service` struct that provides the list of attributes the service contains. The helper macro `BT_GATT_SERVICE()` can be used to declare a service.

Attributes can be declared using the `bt_gatt_attr` struct or using one of the helper macros:

- `BT_GATT_PRIMARY_SERVICE`
  Declares a Primary Service.
- `BT_GATT_SECONDARY_SERVICE`
  Declares a Secondary Service.
- `BT_GATT_INCLUDE_SERVICE`
  Declares a Include Service.
- `BT_GATT_CHARACTERISTIC`
  Declares a Characteristic.
- `BT_GATT_DESCRIPTOR`
  Declares a Descriptor.
BT_GATT_ATTRIBUTE
Declares an Attribute.

BT_GATT_CCC
Declares a Client Characteristic Configuration.

BT_GATT_CEP
Declares a Characteristic Extended Properties.

BT_GATT_CUD
Declares a Characteristic User Format.

Each attribute contains a uuid, which describes their type, a read callback, a write callback and a set of permission. Both read and write callbacks can be set to NULL if the attribute permission don’t allow their respective operations.

Note: 32-bit UUIDs are not supported in GATT. All 32-bit UUIDs shall be converted to 128-bit UUIDs when the UUID is contained in an ATT PDU.

Note: Attribute read and write callbacks are called directly from RX Thread thus it is not recommended to block for long periods of time in them.

Attribute value changes can be notified using bt_gatt_notify() API, alternatively there is bt_gatt_notify_cb() where is is possible to pass a callback to be called when it is necessary to know the exact instant when the data has been transmitted over the air. Indications are supported by bt_gatt_indicate() API.

Client procedures can be enabled with the configuration option: CONFIG_BT_GATT_CLIENT

Discover procedures can be initiated with the use of bt_gatt_discover() API which takes the bt_gatt_discover_params struct which describes the type of discovery. The parameters also serve as a filter when setting the uuid field only attributes which matches will be discovered, in contrast setting it to NULL allows all attributes to be discovered.

Note: Caching discovered attributes is not supported.

Read procedures are supported by bt_gatt_read() API which takes the bt_gatt_read_params struct as parameters. In the parameters one or more attributes can be set, though setting multiple handles requires the option: CONFIG_BT_GATT_READ_MULTIPLE

Write procedures are supported by bt_gatt_write() API and takes bt_gatt_write_params struct as parameters. In case the write operation don’t require a response bt_gatt_write_without_response() or bt_gatt_write_without_response_cb() APIs can be used, with the later working similarly to bt_gatt_notify_cb().

Subscriptions to notification and indication can be initiated with use of bt_gatt_subscribe() API which takes bt_gatt_subscribe_params as parameters. Multiple subscriptions to the same attribute are supported so there could be multiple notify callback being triggered for the same attribute. Subscriptions can be removed with use of bt_gatt_unsubscribe() API.

Note: When subscriptions are removed notify callback is called with the data set to NULL.

API Reference

group bt_gatt
Generic Attribute Profile (GATT)
Defines

\texttt{BT\_GATT\_ERR(_\texttt{att\_err})}

Construct error return value for attribute read and write callbacks.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{_\texttt{att\_err}} – ATT error code
\end{itemize}

\textbf{Returns}

Appropriate error code for the attribute callbacks.

\texttt{BT\_GATT\_CHRC\_BROADCAST}

Characteristic broadcast property.

Characteristic Properties Bit field values

If set, permits broadcasts of the Characteristic Value using Server Characteristic Configuration Descriptor.

\texttt{BT\_GATT\_CHRC\_READ}

Characteristic read property.

If set, permits reads of the Characteristic Value.

\texttt{BT\_GATT\_CHRC\_WRITE\_WITHOUT\_RESP}

Characteristic write without response property.

If set, permits write of the Characteristic Value without response.

\texttt{BT\_GATT\_CHRC\_WRITE}

Characteristic write with response property.

If set, permits write of the Characteristic Value with response.

\texttt{BT\_GATT\_CHRC\_NOTIFY}

Characteristic notify property.

If set, permits notifications of a Characteristic Value without acknowledgment.

\texttt{BT\_GATT\_CHRC\_INDICATE}

Characteristic indicate property.

If set, permits indications of a Characteristic Value with acknowledgment.

\texttt{BT\_GATT\_CHRC\_AUTH}

Characteristic Authenticated Signed Writes property.

If set, permits signed writes to the Characteristic Value.

\texttt{BT\_GATT\_CHRC\_EXT\_PROP}

Characteristic Extended Properties property.

If set, additional characteristic properties are defined in the Characteristic Extended Properties Descriptor.

\texttt{BT\_GATT\_CEP\_RELIABLE\_WRITE}

Characteristic Extended Properties Bit field values
BT_GATT_CEP_WRITABLE_AUX

BT_GATT_CCC_NOTIFY
  Client Characteristic Configuration Notification.
  Client Characteristic Configuration Values
  If set, changes to Characteristic Value shall be notified.

BT_GATT_CCC_INDICATE
  Client Characteristic Configuration Indication.
  If set, changes to Characteristic Value shall be indicated.

BT_GATT_SCC_BROADCAST
  Server Characteristic Configuration Broadcast.
  Server Characteristic Configuration Values
  If set, the characteristic value shall be broadcast in the advertising data when the server is
  advertising.

Typedefs

typedef ssize_t (*bt_gatt_attr_read_func_t)(struct bt_conn *conn, const struct bt_gatt_attr
  *attr, void *buf, uint16_t len, uint16_t offset)
  Attribute read callback.
  The callback can also be used locally to read the contents of the attribute in which case no
  connection will be set.

  Param conn
  The connection that is requesting to read

  Param attr
  The attribute that's being read

  Param buf
  Buffer to place the read result in

  Param len
  Length of data to read

  Param offset
  Offset to start reading from

  Return
  Number of bytes read, or in case of an error BT_GATT_ERR() with a specific
  BT_ATT_ERR_* error code.

typedef ssize_t (*bt_gatt_attr_write_func_t)(struct bt_conn *conn, const struct bt_gatt_attr
  *attr, const void *buf, uint16_t len, uint16_t offset, uint8_t flags)
  Attribute write callback.

  Param conn
  The connection that is requesting to write

  Param attr
  The attribute that's being written
**Param buf**
Buffer with the data to write

**Param len**
Number of bytes in the buffer

**Param offset**
Offset to start writing from

**Param flags**
Flags (BT_GATT_WRITE_FLAG_*)

**Return**
Number of bytes written, or in case of an error `BT_GATT_ERR()` with a specific BT_ATT_ERR_* error code.

### Enums

**enum bt_gatt_perm**
GATT attribute permission bit field values

**Values:**

- enumerator `BT_GATT_PERM_NONE = 0`
  No operations supported, e.g. for notify-only

- enumerator `BT_GATT_PERM_READ = BIT(0)`
  Attribute read permission.

- enumerator `BT_GATT_PERM_WRITE = BIT(1)`
  Attribute write permission.

- enumerator `BT_GATT_PERM_READ_ENCRYPT = BIT(2)`
  Attribute read permission with encryption.

  If set, requires encryption for read access.

- enumerator `BT_GATT_PERM_WRITE_ENCRYPT = BIT(3)`
  Attribute write permission with encryption.

  If set, requires encryption for write access.

- enumerator `BT_GATT_PERM_READ_AUTHEN = BIT(4)`
  Attribute read permission with authentication.

  If set, requires encryption using authenticated link-key for read access.

---

6.1. Bluetooth
enumerator BT_GATT_PERM_WRITE_AUTHEN = \textit{BIT}(5)
Attribute write permission with authentication.

\textbf{If set, requires encryption using authenticated link-key for write access.}

enumerator BT_GATT_PERM_PREPARE_WRITE = \textit{BIT}(6)
Attribute prepare write permission.

\textbf{If set, allows prepare writes with use of BT_GATT_WRITE_FLAG_PREPARE passed to write callback.}

enumerator BT_GATT_PERM_READ_LESC = \textit{BIT}(7)
Attribute read permission with LE Secure Connection encryption.

\textbf{If set, requires that LE Secure Connections is used for read access.}

enumerator BT_GATT_PERM_WRITE_LESC = \textit{BIT}(8)
Attribute write permission with LE Secure Connection encryption.

\textbf{If set, requires that LE Secure Connections is used for write access.}

def \texttt{enum [anonymous]}
GATT attribute write flags
\textit{Values:}

enumerator BT_GATT_WRITE_FLAG_PREPARE = \textit{BIT}(0)
Attribute prepare write flag.

\textbf{If set, write callback should only check if the device is authorized but no data shall be written.}

enumerator BT_GATT_WRITE_FLAG_CMD = \textit{BIT}(1)
Attribute write command flag.

\textbf{If set, indicates that write operation is a command (Write without response) which doesn't generate any response.}

enumerator BT_GATT_WRITE_FLAG_EXECUTE = \textit{BIT}(2)
Attribute write execute flag.
If set, indicates that write operation is a execute, which indicates the end of a long write, and will come after 1 or more @ref BT_GATT_WRITE_FLAG_PREPARE.

```c
struct bt_gatt_attr
  #include <gatt.h> GATT Attribute structure.

Public Members

const struct bt_uuid *uuid
  Attribute UUID

bt_gatt_attr_write_func_t write
  Attribute write callback

void *user_data
  Attribute user data

uint16_t handle
  Attribute handle

uint16_t perm
  Attribute permissions.
  Will be 0 if returned from bt_gatt_discover().
```

```c
struct bt_gatt_service_static
  #include <gatt.h> GATT Service structure.

Public Members

const struct bt_gatt_attr *attrs
  Service Attributes

size_t attr_count
  Service Attribute count
```

```c
struct bt_gatt_service
  #include <gatt.h> GATT Service structure.

Public Members

struct bt_gatt_attr *attrs
  Service Attributes

size_t attr_count
  Service Attribute count
```

6.1. Bluetooth
struct bt_gatt_service_val
   #include <gatt.h> Service Attribute Value.

   Public Members

   const struct bt_uuid *uuid
       Service UUID.

   uint16_t end_handle
       Service end handle.

struct bt_gatt_include
   #include <gatt.h> Include Attribute Value.

   Public Members

   const struct bt_uuid *uuid
       Service UUID.

   uint16_t start_handle
       Service start handle.

   uint16_t end_handle
       Service end handle.

struct bt_gatt_cb
   #include <gatt.h> GATT callback structure.

   Public Members

   void (*att_mtu_updated)(struct bt_conn *conn, uint16_t tx, uint16_t rx)
       The maximum ATT MTU on a connection has changed.
       This callback notifies the application that the maximum TX or RX ATT MTU has increased.
       Param conn
           Connection object.
       Param tx
           Updated TX ATT MTU.
       Param rx
           Updated RX ATT MTU.

struct bt_gatt_chrc
   #include <gatt.h> Characteristic Attribute Value.

   Public Members
const struct bt_uuid *uuid
    Characteristic UUID.

uint16_t value_handle
    Characteristic Value handle.

uint8_t properties
    Characteristic properties.

struct bt_gatt_cep
    #include <gatt.h> Characteristic Extended Properties Attribute Value.

Public Members

uint16_t properties
    Characteristic Extended properties

struct bt_gatt_ccc
    #include <gatt.h> Client Characteristic Configuration Attribute Value

Public Members

uint16_t flags
    Client Characteristic Configuration flags

struct bt_gatt_scc
    #include <gatt.h> Server Characteristic Configuration Attribute Value

Public Members

uint16_t flags
    Server Characteristic Configuration flags

struct bt_gatt_cpf
    #include <gatt.h> GATT Characteristic Presentation Format Attribute Value.

Public Members

uint8_t format
    Format of the value of the characteristic

int8_t exponent
    Exponent field to determine how the value of this characteristic is further formatted
uint16_t unit
   Unit of the characteristic

uint8_t name_space
   Name space of the description

uint16_t description
   Description of the characteristic as defined in a higher layer profile

**GATT Server**

group bt_gatt_server

**Defines**

BT_GATT_SERVICE_DEFINE(_name, ...)
   Statically define and register a service.
   Helper macro to statically define and register a service.

   **Parameters**
   
   • _name – Service name.

BT_GATT_SERVICE_INSTANCE_DEFINE(_name, _instances, _instance_num, _attrs_def)
   Statically define service structure array.
   Helper macro to statically define service structure array. Each element of the array is linked to the service attribute array which is also defined in this scope using _attrs_def macro.

   **Parameters**
   
   • _name – Name of service structure array.
   
   • _instances – Array of instances to pass as user context to the attribute callbacks.
   
   • _instance_num – Number of elements in instance array.
   
   • _attrs_def – Macro provided by the user that defines attribute array for the service. This macro should accept single parameter which is the instance context.

BT_GATT_SERVICE(_attrs)
   Service Structure Declaration Macro.
   Helper macro to declare a service structure.

   **Parameters**
   
   • _attrs – Service attributes.

BT_GATT_PRIMARY_SERVICE(_service)
   Primary Service Declaration Macro.
   Helper macro to declare a primary service attribute.

   **Parameters**
   
   • _service – Service attribute value.
**BT_GATT_SECONDARY_SERVICE(_service)**

Secondary Service Declaration Macro.

Helper macro to declare a secondary service attribute.

**Note:** A secondary service is only intended to be included from a primary service or another secondary service or other higher layer specification.

**Parameters**

- _service – Service attribute value.

**BT_GATT_INCLUDE_SERVICE(_service_incl)**

Include Service Declaration Macro.

Helper macro to declare database internal include service attribute.

**Parameters**

- _service_incl – the first service attribute of service to include

**BT_GATT_CHRC_INIT(_uuid, _handle, _props)**

**BT_GATT_CHARACTERISTIC(_uuid, _props, _perm, _read, _write, _user_data)**

Characteristic and Value Declaration Macro.

Helper macro to declare a characteristic attribute along with its attribute value.

**Parameters**

- _uuid – Characteristic attribute uuid.
- _props – Characteristic attribute properties, a bitmap of BT_GATT_CHRC_* macros.
- _perm – Characteristic Attribute access permissions, a bitmap of bt_gatt_perm values.
- _read – Characteristic Attribute read callback (bt_gatt_attr_read_func_t).
- _write – Characteristic Attribute write callback (bt_gatt_attr_write_func_t).
- _user_data – Characteristic Attribute user data.

**BT_GATT_CCC_MAX**

**BT_GATT_CCC_INITIALIZER(_changed, _write, _match)**

Initialize Client Characteristic Configuration Declaration Macro.

Helper macro to initialize a Managed CCC attribute value.

**Parameters**

- _changed – Configuration changed callback.
- _write – Configuration write callback.
- _match – Configuration match callback.

**BT_GATT_CCC_MANAGED(_ccc, _perm)**

Managed Client Characteristic Configuration Declaration Macro.

Helper macro to declare a Managed CCC attribute.

**Parameters**

- _ccc – CCC attribute user data, shall point to a _bt_gatt_ccc.
• _perm – CCC access permissions, a bitmap of bt_gatt_perm values.

BT_GATT_CCC(_changed, _perm)
Client Characteristic Configuration Declaration Macro.
Helper macro to declare a CCC attribute.

Parameters
• _changed – Configuration changed callback.
• _perm – CCC access permissions, a bitmap of bt_gatt_perm values.

BT_GATT_CEP(_value)
Characteristic Extended Properties Declaration Macro.
Helper macro to declare a CEP attribute.

Parameters
• _value – Pointer to a struct bt_gatt_cep.

BT_GATT_CUD(_value, _perm)
Characteristic User Format Descriptor Declaration Macro.
Helper macro to declare a CUD attribute.

Parameters
• _value – User description NULL-terminated C string.
• _perm – Descriptor attribute access permissions, a bitmap of bt_gatt_perm values.

BT_GATT_CPF(_value)
Characteristic Presentation Format Descriptor Declaration Macro.
Helper macro to declare a CPF attribute.

Parameters
• _value – Pointer to a struct bt_gatt_cpf.

BT_GATT_DESCRIPTOR(_uuid, _perm, _read, _write, _user_data)
Descriptor Declaration Macro.
Helper macro to declare a descriptor attribute.

Parameters
• _uuid – Descriptor attribute uuid.
• _perm – Descriptor attribute access permissions, a bitmap of bt_gatt_perm values.
• _read – Descriptor attribute read callback (bt_gatt_attr_read_func_t).
• _write – Descriptor attribute write callback (bt_gatt_attr_write_func_t).
• _user_data – Descriptor attribute user data.

BT_GATT_ATTRIBUTE(_uuid, _perm, _read, _write, _user_data)
Attribute Declaration Macro.
Helper macro to declare an attribute.

Parameters
• _uuid – Attribute uuid.
• _perm – Attribute access permissions, a bitmap of bt_gatt_perm values.
• _read – Attribute read callback (bt_gatt_attr_read_func_t).
• `write` – Attribute write callback (`bt_gatt_attr_write_func_t`).
• `user_data` – Attribute user data.

### Typedefs

typedef uint8_t (*bt_gatt_attr_func_t)(const struct bt_gatt_attr *attr, uint16_t handle, void *user_data)

Attribute iterator callback.

**Param attr**
Attribute found.

**Param handle**
Attribute handle found.

**Param user_data**
Data given.

**Return**
`BT_GATT_ITER_CONTINUE` if should continue to the next attribute.

**Return**
`BT_GATT_ITER_STOP` to stop.

typedef void (*bt_gatt_complete_func_t)(struct bt_conn *conn, void *user_data)

Notification complete result callback.

**Param conn**
Connection object.

**Param user_data**
Data passed in by the user.

typedef void (*bt_gatt_indicate_func_t)(struct bt_conn *conn, struct bt_gatt_indicate_params *params, uint8_t err)

Indication complete result callback.

**Param conn**
Connection object.

**Param params**
Indication params object.

**Param err**
ATT error code

typedef void (*bt_gatt_indicate_params_destroy_t)(struct bt_gatt_indicate_params *params)

### Enums

enum [anonymous]

**Values:**

enumerator `BT_GATT_ITER_STOP` = 0

enumerator `BT_GATT_ITER_CONTINUE`
Functions

void bt_gatt_cb_register(struct bt_gatt_cb *cb)
Register GATT callbacks.
Register callbacks to monitor the state of GATT.

Parameters
• cb – Callback struct.

int bt_gatt_service_register(struct bt_gatt_service *svc)
Register GATT service.
Register GATT service. Applications can make use of macros such as
BT_GATT_PRIMARY_SERVICE, BT_GATT_CHARACTERISTIC, BT_GATT_DESCRIPTOR, etc.
When using CONFIG_BT_SETTINGS then all services that should have bond configuration
loaded, i.e. CCC values, must be registered before calling settings_load.
When using CONFIG_BT_GATT_CACHING and CONFIG_BT_SETTINGS then all services that should
be included in the GATT Database Hash calculation should be added before calling settings_load. All services registered after settings_load will trigger a new database hash calculation and a new hash stored.

Parameters
• svc – Service containing the available attributes

Returns
0 in case of success or negative value in case of error.

int bt_gatt_service_unregister(struct bt_gatt_service *svc)
Unregister GATT service.

Parameters
• svc – Service to be unregistered.

Returns
0 in case of success or negative value in case of error.

bool bt_gatt_service_is_registered(const struct bt_gatt_service *svc)
Check if GATT service is registered.

Parameters
• svc – Service to be checked.

Returns
ture if registered or false if not register.

void bt_gatt_foreach_attr_type(uint16_t start_handle, uint16_t end_handle, const struct bt_uuid *uuid, const void *attr_data, uint16_t num_matches, bt_gatt_attr_func_t func, void *user_data)
Attribute iterator by type.
 Iterate attributes in the given range matching given UUID and/or data.

Parameters
• start_handle – Start handle.
• end_handle – End handle.
• uuid – UUID to match, passing NULL skips UUID matching.
• attr_data – Attribute data to match, passing NULL skips data matching.
• num_matches – Number matches, passing 0 makes it unlimited.
• func – Callback function.
• user_data – Data to pass to the callback.

static inline void bt_gatt_foreach_attr(uint16_t start_handle, uint16_t end_handle,
                                        bt_gatt_attr_func_t func, void *user_data)

Attribute iterator.
Iterate attributes in the given range.

Parameters
• start_handle – Start handle.
• end_handle – End handle.
• func – Callback function.
• user_data – Data to pass to the callback.

struct bt_gatt_attr *bt_gatt_attr_next(const struct bt_gatt_attr *attr)
Iterate to the next attribute.
Iterate to the next attribute following a given attribute.

Parameters
• attr – Current Attribute.

Returns
The next attribute or NULL if it cannot be found.

struct bt_gatt_attr *bt_gatt_find_by_uuid(const struct bt_gatt_attr *attr, uint16_t attr_count,
                                         const struct bt_uuid *uuid)

Find Attribute by UUID.
Find the attribute with the matching UUID. To limit the search to a service set the attr to the
service attributes and the attr_count to the service attribute count.

Parameters
• attr – Pointer to an attribute that serves as the starting point for the search of
  a match for the UUID. Passing NULL will search the entire range.
• attr_count – The number of attributes from the starting point to search for a
  match for the UUID. Set to 0 to search until the end.
• uuid – UUID to match.

uint16_t bt_gatt_attr_get_handle(const struct bt_gatt_attr *attr)
Get Attribute handle.

Parameters
• attr – Attribute object.

Returns
Handle of the corresponding attribute or zero if the attribute could not be found.

uint16_t bt_gatt_attr_value_handle(const struct bt_gatt_attr *attr)
Get the handle of the characteristic value descriptor.

Note: The user_data of the attribute must of type bt_gatt_chrc.

Parameters
attr – A Characteristic Attribute.

**Returns**
the handle of the corresponding Characteristic Value. The value will be zero (the invalid handle) if attr was not a characteristic attribute.

```c
ssize_t bt_gatt_attr_read(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf,
                           uint16_t buf_len, uint16_t offset, const void *value, uint16_t value_len)
```

Generic Read Attribute value helper.
Read attribute value from local database storing the result into buffer.

**Parameters**
- conn – Connection object.
- attr – Attribute to read.
- buf – Buffer to store the value.
- buf_len – Buffer length.
- offset – Start offset.
- value – Attribute value.
- value_len – Length of the attribute value.

**Returns**
number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_service(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *
                                   buf, uint16_t len, uint16_t offset)
```

Read Service Attribute helper.
Read service attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a `bt_uuid`.

**Parameters**
- conn – Connection object.
- attr – Attribute to read.
- buf – Buffer to store the value read.
- len – Buffer length.
- offset – Start offset.

**Returns**
number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_included(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *
                                    buf, uint16_t len, uint16_t offset)
```

Read Include Attribute helper.
Read include service attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a `bt_gatt_include`. 
Parameters

- conn – Connection object.
- attr – Attribute to read.
- buf – Buffer to store the value read.
- len – Buffer length.
- offset – Start offset.

Returns

number of bytes read in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_chrc(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic Attribute helper.
Read characteristic attribute value from local database storing the result into buffer after encoding it.

Note: Only use this with attributes which user_data is a bt_gatt_chrc.

Parameters

- conn – Connection object.
- attr – Attribute to read.
- buf – Buffer to store the value read.
- len – Buffer length.
- offset – Start offset.

Returns

number of bytes read in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_ccc(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Client Characteristic Configuration Attribute helper.
Read CCC attribute value from local database storing the result into buffer after encoding it.

Note: Only use this with attributes which user_data is a bt_gatt_ccc.
ssize_t bt_gatt_attr_write_ccc(struct bt_conn *conn, const struct bt_gatt_attr *attr, const void *buf, uint16_t len, uint16_t offset, uint8_t flags)

Write Client Characteristic Configuration Attribute helper.
Write value in the buffer into CCC attribute.

**Note:** Only use this with attributes which user_data is a _bt_gatt_ccc.

**Parameters**
- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
- `offset` – Start offset.
- `flags` – Write flags.

**Returns**
number of bytes written in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_cep(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic Extended Properties Attribute helper.
Read CEP attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a `bt_gatt_cep`.

**Parameters**
- `conn` – Connection object
- `attr` – Attribute to read
- `buf` – Buffer to store the value read
- `len` – Buffer length
- `offset` – Start offset

**Returns**
number of bytes read in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_cud(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic User Description Descriptor Attribute helper.
Read CUD attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a NULL-terminated C string.

**Parameters**
- `conn` – Connection object
- `attr` – Attribute to read
buf – Buffer to store the value read
len – Buffer length
offset – Start offset

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_cpf(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic Presentation format Descriptor Attribute helper.
Read CPF attribute value from local database storing the result into buffer after encoding it.

Note: Only use this with attributes which user_data is a bt_gatt_pf.

Parameters
• conn – Connection object
• attr – Attribute to read
• buf – Buffer to store the value read
• len – Buffer length
• offset – Start offset

Returns
number of bytes read in case of success or negative values in case of error.

int bt_gatt_notify_cb(struct bt_conn *conn, struct bt_gatt_notify_params *params)

Notify attribute value change.
This function works in the same way as bt_gatt_notify. With the addition that after sending the notification the callback function will be called.
The callback is run from System Workqueue context. When called from the System Workqueue context this API will not wait for resources for the callback but instead return an error. The number of pending callbacks can be increased with the CONFIG_BT_CONN_TX_MAX option.
Alternatively it is possible to notify by UUID by setting it on the parameters, when using this method the attribute if provided is used as the start range when looking up for possible matches.

Parameters
• conn – Connection object.
• params – Notification parameters.

Returns
0 in case of success or negative value in case of error.

int bt_gatt_notify_multiple(struct bt_conn *conn, uint16_t num_params, struct bt_gatt_notify_params params[])

Send multiple notifications in a single PDU.
The GATT Server will send a single ATT_MULTIPLE_HANDLE_VALUE_NTF PDU containing all the notifications passed to this API.
All params must have the same func and user_data (due to implementation limitation). But func(user_data) will be invoked for each parameter.

6.1. Bluetooth
As this API may block to wait for Bluetooth Host resources, it is not recommended to call it from a cooperative thread or a Bluetooth callback.

The peer's GATT Client must write to this device's Client Supported Features attribute and set the bit for Multiple Handle Value Notifications before this API can be used.

Only use this API to force the use of the ATT_MULTIPLE_HANDLE_VALUE_NTF PDU. For standard applications, bt_gatt_notify_cb is preferred, as it will use this PDU if supported and automatically fallback to ATT_HANDLE_VALUE_NTF when not supported by the peer.

This API has an additional limitation: it only accepts valid attribute references and not UUIDs like bt_gatt_notify and bt_gatt_notify_cb.

**Parameters**

- `conn` – Target client. Notifying all connected clients by passing NULL is not yet supported, please use bt_gatt_notify instead.
- `num_params` – Element count of `params` array. Has to be greater than 1.
- `params` – Array of notification parameters. It is okay to free this after calling this function.

**Return values**

- 0 – Success. The PDU is queued for sending.
- -EINVAL – One of the attribute handles is invalid.
- Only one parameter was passed. This API expects 2 or more.
- Not all `func` were equal or not all `user_data` were equal.
- One of the characteristics is not notifiable.
- An UUID was passed in one of the parameters.
- -ERANGE –
  - The notifications cannot all fit in a single ATT_MULTIPLE_HANDLE_VALUE_NTF.
  - They exceed the MTU of all open ATT bearers.
- -EPERM – The connection has a lower security level than required by one of the attributes.
- -EOPNOTSUPP – The peer hasn't yet communicated that it supports this PDU type.

```c
static inline int bt_gatt_notify(struct bt_conn *conn, const struct bt_gatt_attr *attr, const void *data, uint16_t len)
```

Notify attribute value change.

Send notification of attribute value change, if connection is NULL notify all peer that have notification enabled via CCC otherwise do a direct notification only the given connection.

The attribute object on the parameters can be the so called Characteristic Declaration, which is usually declared with BT_GATT_CHARACTERISTIC followed by BT_GATT_CCC, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using BT_GATT_CHARACTERISTIC.

**Parameters**

- `conn` – Connection object.
- `attr` – Characteristic or Characteristic Value attribute.
- `data` – Pointer to Attribute data.
• **len** – Attribute value length.

**Returns**
0 in case of success or negative value in case of error.

```c
static inline int bt_gatt_notify_uuid(struct bt_conn *conn, const struct bt_uuid *uuid, const struct bt_gatt_attr *attr, const void *data, uint16_t len)
```

Notify attribute value change by UUID.

Send notification of attribute value change, if connection is NULL notify all peer that have notification enabled via CCC otherwise do a direct notification only on the given connection. The attribute object is the starting point for the search of the UUID.

**Parameters**
- **conn** – Connection object.
- **uuid** – The UUID. If the server contains multiple services with the same UUID, then the first occurrence, starting from the attr given, is used.
- **attr** – Pointer to an attribute that serves as the starting point for the search of a match for the UUID.
- **data** – Pointer to Attribute data.
- **len** – Attribute value length.

**Returns**
0 in case of success or negative value in case of error.

```c
int bt_gatt_indicate(struct bt_conn *conn, struct bt_gatt_indicate_params *params)
```

Indicate attribute value change.

Send an indication of attribute value change. if connection is NULL indicate all peer that have notification enabled via CCC otherwise do a direct indication only the given connection.

The attribute object on the parameters can be the so called Characteristic Declaration, which is usually declared with BT_GATT_CHARACTERISTIC followed by BT_GATT_CCC, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using BT_GATT_CHARACTERISTIC.

Alternatively it is possible to indicate by UUID by setting it on the parameters, when using this method the attribute if provided is used as the start range when looking up for possible matches.

**Note:** This procedure is asynchronous therefore the parameters need to remains valid while it is active. The procedure is active until the destroy callback is run.

**Parameters**
- **conn** – Connection object.
- **params** – Indicate parameters.

**Returns**
0 in case of success or negative value in case of error.

```c
bool bt_gatt_is_subscribed(struct bt_conn *conn, const struct bt_gatt_attr *attr, uint16_t ccc_type)
```

Check if connection have subscribed to attribute.

Check if connection has subscribed to attribute value change.

The attribute object can be the so called Characteristic Declaration, which is usually declared with BT_GATT_CHARACTERISTIC followed by BT_GATT_CCC, or the Characteristic Value Declaration which is usually declared with BT_GATT_CHARACTERISTIC followed by BT_GATT_CCC.
Declaration which is automatically created after the Characteristic Declaration when using BT_GATT_CHARACTERISTIC, or the Client Characteristic Configuration Descriptor (CCCD) which is created by BT_GATT_CCC.

**Parameters**
- conn – Connection object.
- attr – Attribute object.
- ccc_type – The subscription type, **BT_GATT_CCC_NOTIFY** and/or **BT_GATT_CCC_INDICATE**.

**Returns**
true if the attribute object has been subscribed.

```c
uint16_t bt_gatt_get_mtu(struct bt_conn *conn)
```

Get ATT MTU for a connection.

Get negotiated ATT connection MTU, note that this does not equal the largest amount of attribute data that can be transferred within a single packet.

**Parameters**
- conn – Connection object.

**Returns**
MTU in bytes

```c
struct bt_gatt_ccc_cfg
```

#include <gatt.h> GATT CCC configuration entry.

**Public Members**

```c
uint8_t id
```

Local identity, BT_ID_DEFAULT in most cases.

```c
bt_addr_le_t peer
```
Remote peer address.

```c
uint16_t value
```
Configuration value.

```c
struct bt_gatt_notify_params
```

#include <gatt.h>

**Public Members**

```c
const struct bt_uuid *uuid
```
Notification Attribute UUID type.

Optional, use to search for an attribute with matching UUID when the attribute object pointer is not known.
const struct bt_gatt_attr *attr
    Notification Attribute object.
    Optional if uuid is provided, in this case it will be used as start range to search for the attribute with the given UUID.

const void *data
    Notification Value data

uint16_t len
    Notification Value length

bt_gatt_complete_func_t func
    Notification Value callback

void *user_data
    Notification Value callback user data

struct bt_gatt_indicate_params
    #include <gatt.h> GATT Indicate Value parameters.

Public Members

const struct bt_uuid *uuid
    Indicate Attribute UUID type.
    Optional, use to search for an attribute with matching UUID when the attribute object pointer is not known.

const struct bt_gatt_attr *attr
    Indicate Attribute object.
    Optional if uuid is provided, in this case it will be used as start range to search for the attribute with the given UUID.

bt_gatt_indicate_func_t func
    Indicate Value callback

bt_gatt_indicate_params_destroy_t destroy
    Indicate operation complete callback

const void *data
    Indicate Value data

uint16_t len
    Indicate Value length

GATT Client

group bt_gatt_client
typedef uint8_t (*bt_gatt_discover_func_t)(struct bt_conn *conn, const struct bt_gatt_attr *attr, struct bt_gatt_discover_params *params)

Discover attribute callback function.

If discovery procedure has completed this callback will be called with attr set to NULL. This will not happen if procedure was stopped by returning BT_GATT_ITER_STOP.

The attribute object as well as its UUID and value objects are temporary and must be copied to in order to cache its information. Only the following fields of the attribute contains valid information:

- uuid UUID representing the type of attribute.
- handle Handle in the remote database.
- user_data The value of the attribute, if the discovery type maps to an ATT operation that provides this information. NULL otherwise. See below.

The effective type of attr->user_data is determined by params. Note that the fields params->type and params->uuid are left unchanged by the discovery procedure.

<table>
<thead>
<tr>
<th>params-&gt;type</th>
<th>params-&gt;uuid</th>
<th>Type of attr-&gt;user_data</th>
</tr>

</tbody>
</table>

Also consider if using read-by-type instead of discovery is more convenient. See bt_gatt_read with bt_gatt_read_params::handle_count set to 0.

**Param conn**
Connection object.

**Param attr**
Attribute found, or NULL if not found.

**Param params**
Discovery parameters given.

**Return**
BT_GATT_ITER_CONTINUE to continue discovery procedure.

**Return**
BT_GATT_ITER_STOP to stop discovery procedure.

typedef uint8_t (*bt_gatt_read_func_t)(struct bt_conn *conn, uint8_t err, struct bt_gatt_read_params *params, const void *data, uint16_t length)

Read callback function.
Param conn
Connection object.

Param err
ATT error code.

Param params
Read parameters used.

Param data
Attribute value data. NULL means read has completed.

Param length
Attribute value length.

Return
BT_GATT_ITER_CONTINUE if should continue to the next attribute.

Return
BT_GATT_ITER_STOP to stop.

typedef void (*bt_gatt_write_func_t)(struct bt_conn *conn, uint8_t err, struct bt_gatt_write_params *params)
Write callback function.

Param conn
Connection object.

Param err
ATT error code.

Param params
Write parameters used.

typedef uint8_t (*bt_gatt_notify_func_t)(struct bt_conn *conn, struct bt_gatt_subscribe_params *params, const void *data, uint16_t length)
Notification callback function.

In the case of an empty notification, the data pointer will be non-NULL while the length will be 0, which is due to the special case where a data NULL pointer means unsubscribed.

Param conn
Connection object. May be NULL, indicating that the peer is being unpaired

Param params
Subscription parameters.

Param data
Attribute value data. If NULL then subscription was removed.

Param length
Attribute value length.

Return
BT_GATT_ITER_CONTINUE to continue receiving value notifications.
BT_GATT_ITER_STOP to unsubscribe from value notifications.

typedef void (*bt_gatt_subscribe_func_t)(struct bt_conn *conn, uint8_t err, struct bt_gatt_subscribe_params *params)
Subscription callback function.

Param conn
Connection object.
**Param err**
ATT error code.

**Param params**
Subscription parameters used.

**Enums**

```
enum [anonymous]
    GATT Discover types
    Values:

    enumerator BT_GATT_DISCOVER_PRIMARY
        Discover Primary Services.

    enumerator BT_GATT_DISCOVER_SECONDARY
        Discover Secondary Services.

    enumerator BT_GATT_DISCOVER_INCLUDE
        Discover Included Services.

    enumerator BT_GATT_DISCOVER_CHARACTERISTIC
        Discover Characteristic Values.

    Discover Characteristic Value and its properties.

    enumerator BT_GATT_DISCOVER_DESCRIPTOR
        Discover Descriptors.

    Discover Attributes which are not services or characteristics.

    @note The use of this type of discover is not recommended for
          discovering in ranges across multiple services/characteristics
          as it may incur in extra round trips.

    enumerator BT_GATT_DISCOVER_ATTRIBUTE
        Discover Attributes.

    Discover Attributes of any type.

    @note The use of this type of discover is not recommended for
          discovering in ranges across multiple services/characteristics
          as it may incur in more round trips.

    enumerator BT_GATT_DISCOVER_STD_CHAR_DESC
        Discover standard characteristic descriptor values.
```
Discover standard characteristic descriptor values and their properties.
Supported descriptors:
- Characteristic Extended Properties
- Client Characteristic Configuration
- Server Characteristic Configuration
- Characteristic Presentation Format

enum [anonymous]
Subscription flags

Values:

enumerator BT_GATT_SUBSCRIBE_FLAG_VOLATILE
Persistence flag.

If set, indicates that the subscription is not saved on the GATT server side. Therefore, upon disconnection, the subscription will be automatically removed from the client's subscriptions list and when the client reconnects, it will have to issue a new subscription.

enumerator BT_GATT_SUBSCRIBE_FLAG_NO_RESUB
No resubscribe flag.

By default when BT_GATT_SUBSCRIBE_FLAG_VOLATILE is unset, the subscription will be automatically renewed when the client reconnects, as a workaround for GATT servers that do not persist subscriptions.

This flag will disable the automatic resubscription. It is useful if the application layer knows that the GATT server remembers subscriptions from previous connections and wants to avoid renewing the subscriptions.

enumerator BT_GATT_SUBSCRIBE_FLAG_WRITE_PENDING
Write pending flag.

If set, indicates write operation is pending waiting remote end to respond.

enumerator BT_GATT_SUBSCRIBE_NUM_FLAGS

Functions

int bt_gatt_exchange_mtu(struct bt_conn *conn, struct bt_gatt_exchange_params *params)
Exchange MTU.

6.1. Bluetooth
This client procedure can be used to set the MTU to the maximum possible size the buffers can hold.

The Response comes in callback `params->func`. The callback is run from the context specified by `config BT_RECV_CONTEXT`. `params` must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Note:** Shall only be used once per connection.

### Parameters
- `conn` – Connection object.
- `params` – Exchange MTU parameters.

### Return values
- 0 – Successfully queued request. Will call `params->func` on resolution.
- -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_L2CAP_TX_BUF_COUNT`.
- -EALREADY – The MTU exchange procedure has been already performed.

```c
int bt_gatt_discover(struct bt_conn *conn, struct bt_gatt_discover_params *params)
```

GATT Discover function.

This procedure is used by a client to discover attributes on a server.

Primary Service Discovery: Procedure allows to discover primary services either by Discover All Primary Services or Discover Primary Services by Service UUID. Include Service Discovery: Procedure allows to discover all Include Services within specified range. Characteristic Discovery: Procedure allows to discover all characteristics within specified handle range as well as discover characteristics with specified UUID. Descriptors Discovery: Procedure allows to discover all characteristic descriptors within specified range.

For each attribute found the callback is called which can then decide whether to continue discovering or stop.

The Response comes in callback `params->func`. The callback is run from the BT RX thread. `params` must remain valid until start of callback where `iter.attr` is NULL or callback will return `BT_GATT_ITER_STOP`.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

### Parameters
- `conn` – Connection object.
- `params` – Discover parameters.

### Return values
- 0 – Successfully queued request. Will call `params->func` on resolution.
- -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_L2CAP_TX_BUF_COUNT`.
int bt_gatt_read(struct bt_conn *conn, struct bt_gatt_read_params *params)
Read Attribute Value by handle.

This procedure read the attribute value and return it to the callback.

When reading attributes by UUID the callback can be called multiple times depending on how many instances of given the UUID exists with the start_handle being updated for each instance.

If an instance does contain a long value which cannot be read entirely the caller will need to read the remaining data separately using the handle and offset.

The Response comes in callback params->func. The callback is run from the context specified by ‘config BT_RECV_CONTEXT’. params must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Parameters
• conn – Connection object.
• params – Read parameters.

Return values
• 0 – Successfully queued request. Will call params->func on resolution.
• -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.

int bt_gatt_write(struct bt_conn *conn, struct bt_gatt_write_params *params)
Write Attribute Value by handle.

The Response comes in callback params->func. The callback is run from the context specified by ‘config BT_RECV_CONTEXT’. params must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from Bluetooth event context. When called from Bluetooth context, this function will instead return -ENOMEM if it would block to avoid a deadlock.

Parameters
• conn – Connection object.
• params – Write parameters.

Return values
• 0 – Successfully queued request. Will call params->func on resolution.
• -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside Bluetooth event context to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.

int bt_gatt_write_without_response_cb(struct bt_conn *conn, uint16_t handle, const void *data, uint16_t length, bool sign, 
bt_gatt_complete_func_t func, void *user_data)
Write Attribute Value by handle without response with callback.

This function works in the same way as bt_gatt_write_without_response. With the addition that after sending the write the callback function will be called.

The callback is run from System Workqueue context. When called from the System Workqueue context this API will not wait for resources for the callback but instead return an error. The number of pending callbacks can be increased with the CONFIG_BT_CONN_TX_MAX option.

6.1. Bluetooth
This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Note:** By using a callback it also disable the internal flow control which would prevent sending multiple commands without waiting for their transmissions to complete, so if that is required the caller shall not submit more data until the callback is called.

**Parameters**

- `conn` – Connection object.
- `handle` – Attribute handle.
- `data` – Data to be written.
- `length` – Data length.
- `sign` – Whether to sign data.
- `func` – Transmission complete callback.
- `user_data` – User data to be passed back to callback.

**Return values**

- `0` – Successfully queued request.
- `-ENOMEM` – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_L2CAP_TX_BUF_COUNT`.

```c
static inline int bt_gatt_write_without_response(struct bt_conn *conn, uint16_t handle, const void *data, uint16_t length, bool sign)
```

Write Attribute Value by handle without response.

This procedure write the attribute value without requiring an acknowledgment that the write was successfully performed.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Parameters**

- `conn` – Connection object.
- `handle` – Attribute handle.
- `data` – Data to be written.
- `length` – Data length.
- `sign` – Whether to sign data.

**Return values**

- `0` – Successfully queued request.
- `-ENOMEM` – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_L2CAP_TX_BUF_COUNT`.
int bt_gatt_subscribe(struct bt_conn *conn, struct bt_gatt_subscribe_params *params)

Subscribe Attribute Value Notification.

This procedure subscribe to value notification using the Client Characteristic Configuration handle. If notification received subscribe value callback is called to return notified value. One may then decide whether to unsubscribe directly from this callback. Notification callback with NULL data will not be called if subscription was removed by this method.

The Response comes in callback params->subscribe. The callback is run from the context specified by 'config BT_RECV_CONTEXT'. params must remain valid until start of callback. The Notification callback params->notify is also called from the BT RX thread.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Note: Notifications are asynchronous therefore the parameters need to remain valid while subscribed.

Parameters

• conn – Connection object.
• params – Subscribe parameters.

Return values

• 0 – Successfully queued request. Will call params->write on resolution.
• -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.

int bt_gatt_resubscribe(uint8_t id, const bt_addr_le_t *peer, struct bt_gatt_subscribe_params *params)

Resubscribe Attribute Value Notification subscription.

Resubscribe to Attribute Value Notification when already subscribed from a previous connection. The GATT server will remember subscription from previous connections when bonded, so resubscribing can be done without performing a new subscribe procedure after a power cycle.

Note: Notifications are asynchronous therefore the parameters need to remain valid while subscribed.

Parameters

• id – Local identity (in most cases BT_ID_DEFAULT).
• peer – Remote address.
• params – Subscribe parameters.

Returns

0 in case of success or negative value in case of error.
int bt_gatt_unsubscribe(struct bt_conn *conn, struct bt_gatt_subscribe_params *params)
Unsubscribe Attribute Value Notification.
This procedure unsubscribe to value notification using the Client Characteristic Configuration handle. Notification callback with NULL data will be called if subscription was removed by this call, until then the parameters cannot be reused.
The Response comes in callback params->func. The callback is run from the BT RX thread.
This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Parameters
• conn – Connection object.
• params – Subscribe parameters.

Return values
• 0 – Successfully queued request. Will call params->write on resolution.
• -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.

void bt_gatt_cancel(struct bt_conn *conn, void *params)
Try to cancel the first pending request identified by params.
This function does not release params for reuse. The usual callbacks for the request still apply. A successful cancel simulates a BT_ATT_ERR_UNLIKELY response from the server.
This function can cancel the following request functions:
• bt_gatt_exchange_mtu
• bt_gatt_discover
• bt_gatt_read
• bt_gatt_write
• bt_gatt_subscribe
• bt_gatt_unsubscribe

Parameters
• conn – The connection the request was issued on.
• params – The address params used in the request function call.

struct bt_gatt_exchange_params
#include "gatt.h" GATT Exchange MTU parameters.

Public Members

void (*func)(struct bt_conn *conn, uint8_t err, struct bt_gatt_exchange_params *params)
Response callback

struct bt_gatt_discover_params
#include "gatt.h" GATT Discover Attributes parameters.
Public Members

const struct bt_uuid *uuid
  Discover UUID type

bt_gatt_discover_func_t func
  Discover attribute callback

uint16_t attr_handle
  Include service attribute declaration handle

uint16_t start_handle
  Included service start handle
  Discover start handle

uint16_t end_handle
  Included service end handle
  Discover end handle

uint8_t type
  Discover type

Public Members

bt_gatt_read_func_t func
  Read attribute callback.

size_t handle_count
  If equals to 1 single.handle and single.offset are used. If greater than 1 multiple.handles
  are used. If equals to 0 by_uuid is used for Read Using Characteristic UUID.

uint16_t handle
  Attribute handle.

uint16_t offset
  Attribute data offset.

uint16_t *handles
  Attribute handles to read with Read Multiple Characteristic Values.

bool variable
  If true use Read Multiple Variable Length Characteristic Values procedure. The values of
  the set of attributes may be of variable or unknown length. If false use Read Multiple
  Characteristic Values procedure. The values of the set of attributes must be of a known
  fixed length, with the exception of the last value that can have a variable length.
uint16_t start_handle
   First requested handle number.

uint16_t end_handle
   Last requested handle number.

const struct bt_uuid *uuid
   2 or 16 octet UUID.

struct bt_gatt_write_params
   #include <gatt.h> GATT Write parameters.

Public Members

bt_gatt_write_func_t func
   Response callback

uint16_t handle
   Attribute handle

uint16_t offset
   Attribute data offset

const void *data
   Data to be written

uint16_t length
   Length of the data

struct bt_gatt_subscribe_params
   #include <gatt.h> GATT Subscribe parameters.

Public Members

bt_gatt_notify_func_t notify
   Notification value callback

bt_gatt_subscribe_func_t subscribe
   Subscribe CCC write request response callback If given, called with the subscription pa-
   rameters given when subscribing

bt_gatt_write_func_t write
   Deprecated:

uint16_t value_handle
   Subscribe value handle
uint16_t ccc_handle
    Subscribe CCC handle

uint16_t value
    Subscribe value

bt_security_t min_security
    Minimum required security for received notification. Notifications and indications received over a connection with a lower security level are silently discarded.

atomic_t flags[ATOMIC_BITMAP_SIZE(BT_GATT_SUBSCRIBE_NUM_FLAGS)]
    Subscription flags

**HCI Drivers**

**API Reference**

**group bt HCI driver**
    HCI drivers.

    **Defines**

    IS_BT_QUIRK_NO_AUTO_DLE(bt_dev)

    BT HCI_EVT_FLAG_RECV_PRIO

    BT HCI_EVT_FLAG_RECV

    **Enums**

    enum [anonymous]
        Values:

        enumerator BT_QUIRK_NO_RESET = BIT(0)

        enumerator BT_QUIRK_NO_AUTO_DLE = BIT(1)

    enum bt HCI driver bus
        Possible values for the 'bus' member of the bt HCI driver struct
        Values:

enumerator BT_HCI_DRIVER_BUS_I2C = 8
enumerator BT_HCI_DRIVER_BUS_IPM = 9

Functions

static inline uint8_t bt_hci_evt_get_flags(uint8_t evt)
Get HCI event flags.
Helper for the HCI driver to get HCI event flags that describes rules that must be followed.
When CONFIG_BT_RECV_BLOCKING is enabled the flags BT_HCI_EVT_FLAG_RECV and
BT_HCI_EVT_FLAG_RECV_PRIO indicates if the event should be given to bt_recv or
bt_recv_prio.

Parameters
  • evt – HCI event code.

Returns
  HCI event flags for the specified event.

int bt_recv(struct net_buf *buf)
Receive data from the controller/HCI driver.
This is the main function through which the HCI driver provides the host with data from the
controller. The buffer needs to have its type set with the help of bt_buf_set_type() before
calling this API.
When CONFIG_BT_RECV_BLOCKING is defined then this API should not be used for so-called
high priority HCI events, which should instead be delivered to the host stack through
bt_recv_prio().

Parameters
  • buf – Network buffer containing data from the controller.

Returns
  0 on success or negative error number on failure.

int bt_recv_prio(struct net_buf *buf)
Receive high priority data from the controller/HCI driver.
This is the same as bt_recv(), except that it should be used for so-called high priority HCI events. There’s a separate bt_hci_evt_get_flags() helper that can be used to identify which
events have the BT_HCI_EVT_FLAG_RECV_PRIO flag set.
As with bt_recv(), the buffer needs to have its type set with the help of bt_buf_set_type()
before calling this API. The only exception is so called high priority HCI events which should be
delivered to the host stack through bt_recv_prio() instead.
Parameters
- `buf` – Network buffer containing data from the controller.

Returns
0 on success or negative error number on failure.

```c
uint8_t bt_read_static_addr(struct bt_hci_vs_static_addr addrs[], uint8_t size)
```
Read static addresses from the controller.

Parameters
- `addrs` – Random static address and Identity Root (IR) array.
- `size` – Size of array.

Returns
Number of addresses read.

```c
int bt_hci_driver_register(const struct bt_hci_driver *drv)
```
Register a new HCI driver to the Bluetooth stack.

This needs to be called before any application code runs. The `bt_enable()` API will fail if there is no driver registered.

Parameters
- `drv` – A `bt_hci_driver` struct representing the driver.

Returns
0 on success or negative error number on failure.

```c
int bt_hci_transport_setup(const struct device *dev)
```
Set up the HCI transport, which usually means to reset the Bluetooth IC.

**Note:** A weak version of this function is included in the H4 driver, so defining it is optional per board.

Parameters
- `dev` – The device structure for the bus connecting to the IC

Returns
0 on success, negative error value on failure

```c
struct net_buf *bt_hci_evt_create(uint8_t evt, uint8_t len)
```
Allocate an HCI event buffer.

This function allocates a new buffer for an HCI event. It is given the OpCode and the total length of the parameters. Upon successful return the buffer is ready to have the parameters encoded into it.

Parameters
- `len` – Length of event parameters.

Returns
Newly allocated buffer.

```c
struct net_buf *bt_hci_cmd_complete_create(uint16_t op, uint8_t plen)
```
Allocate an HCI Command Complete event buffer.

This function allocates a new buffer for HCI Command Complete event. It is given the OpCode (encoded e.g. using the `BT_OP` macro) and the total length of the parameters. Upon successful return the buffer is ready to have the parameters encoded into it.
Allocate an HCI Command Status event buffer.

This function allocates a new buffer for HCI Command Status event. It is given the OpCode (encoded e.g. using the BT_OP macro) and the status code. Upon successful return the buffer is ready to have the parameters encoded into it.

**Parameters**

- status – Status code.

**Returns**

Newly allocated buffer.

```c
struct net_buf *bt_hci_cmd_status_create(uint16_t op, uint8_t status)
```

# Zephyr Project Documentation, Release 3.2.99

## Parameters

- **op** – Command OpCode.
- **plen** – Length of command parameters.

## Returns

Newly allocated buffer.

```c
struct net_buf *bt_hci_cmd_status_create(uint16_t op, uint8_t status)
```

Abstraction which represents the HCI transport to the controller.

This struct is used to represent the HCI transport to the Bluetooth controller.

### Public Members

- **name**
  
  Name of the driver

- **bus**
  
  Bus of the transport (BT_HCI_DRIVER_BUS_*)

- **quirks**
  
  Specific controller quirks. These are set by the HCI driver and acted upon by the host. They can either be statically set at buildtime, or set at runtime before the HCI driver's `open()` callback returns.

- **open**(void)
  
  Open the HCI transport.

  Opens the HCI transport for operation. This function must not return until the transport is ready for operation, meaning it is safe to start calling the `send()` handler.

  If the driver uses its own RX thread, i.e. CONFIG_BT_RECV_BLOCKING is set, then this function is expected to start that thread.

  **Return**

  0 on success or negative error number on failure.

- **close**(void)
  
  Close the HCI transport.

  Closes the HCI transport. This function must not return until the transport is closed.

  If the driver uses its own RX thread, i.e. CONFIG_BT_RECV_BLOCKING is set, then this function is expected to abort that thread.
Return
0 on success or negative error number on failure.

int (*send)(struct net_buf *buf)
Send HCI buffer to controller.
Send an HCI command or ACL data to the controller. The exact type of the data can be checked with the help of `bt_buf_get_type()`.

Note: This function must only be called from a cooperative thread.

Param buf
Buffer containing data to be sent to the controller.

Return
0 on success or negative error number on failure.

int (*setup)(void)
HCI vendor-specific setup.
Executes vendor-specific commands sequence to initialize BT Controller before BT Host executes Reset sequence.

Note: `CONFIG_BT_HCI_SETUP` must be selected for this field to be available.

Return
0 on success or negative error number on failure.

HCI RAW channel

Overview
HCI RAW channel API is intended to expose HCI interface to the remote entity. The local Bluetooth controller gets owned by the remote entity and host Bluetooth stack is not used. RAW API provides direct access to packets which are sent and received by the Bluetooth HCI driver.

API Reference

group hci_raw
HCI RAW channel.

Defines

BT_HCI_ERR_EXT_HANDLED

BT_HCI_RAW_CMD_EXT(_op, _min_len, _func)
Helper macro to define a command extension

Parameters

• _op – Opcode of the command.
• _min_len – Minimal length of the command.
• _func – Handler function to be called.
### Enums

enum [anonymous]

Values:

enumerator BT_HCI_RAW_MODE_PASSTHROUGH = 0x00

Passthrough mode

While in this mode the buffers are passed as is between the stack and the driver.

enumerator BT_HCI_RAW_MODE_H4 = 0x01

H:4 mode

While in this mode H:4 headers will added into the buffers according to the buffer type when coming from the stack and will be removed and used to set the buffer type.

### Functions

int bt_send(struct net_buf *buf)

Send packet to the Bluetooth controller.

Send packet to the Bluetooth controller. Caller needs to implement netbuf pool.

**Parameters**

- buf – netbuf packet to be send

**Returns**

Zero on success or (negative) error code otherwise.

int bt_hci_raw_set_mode(uint8_t mode)

Set Bluetooth RAW channel mode.

Set access mode of Bluetooth RAW channel.

**Parameters**

- mode – Access mode.

**Returns**

Zero on success or (negative) error code otherwise.

uint8_t bt_hci_raw_get_mode(void)

Get Bluetooth RAW channel mode.

Get access mode of Bluetooth RAW channel.

**Returns**

Access mode.

void bt_hci_raw_cmd_ext_register(struct bt_hci_raw_cmd_ext *cmds, size_t size)

Register Bluetooth RAW command extension table.

Register Bluetooth RAW channel command extension table, opcodes in this table are intercepted to sent to the handler function.

**Parameters**

- cmds – Pointer to the command extension table.
int bt_enable_raw(struct k_fifo *rx_queue)

Enable Bluetooth RAW channel:
Enable Bluetooth RAW HCI channel.

Parameters
- `rx_queue` - netbuf queue where HCI packets received from the Bluetooth controller are to be queued. The queue is defined in the caller while the available buffers pools are handled in the stack.

Returns
Zero on success or (negative) error code otherwise.

```c
#include <hci_raw.h>

struct bt_hci_raw_cmd_ext
```

Public Members

- `uint16_t op`
  Opcode of the command

- `size_t min_len`
  Minimal length of the command

- `uint8_t (*func)(struct net_buf *buf)`
  Handler function.

  Handler function to be called when a command is intercepted.

  **Param buf**
  Buffer containing the command.

  **Return**
  HCI Status code or BT_HCI_ERR_EXT_HANDLED if command has been handled already and a response has been sent as oppose to BT_HCI_ERR_SUCCESS which just indicates that the command can be sent to the controller to be processed.

Hands Free Profile (HFP)

API Reference

group bt_hfp

Hands Free Profile (HFP)

Defines

- `HFP_HF_CMD_OK`

- `HFP_HF_CMD_ERROR`

- `HFP_HF_CMD_CME_ERROR`
HFP_HF_CMD_UNKNOWN_ERROR

Enums

define bt_hfp_hf_at_cmd

Values:

enumerator BT_HFP_HF_ATA
enumerator BT_HFP_HF_AT_CHUP

Functions

int bt_hfp_hf_register(struct bt_hfp_hf_cb *cb)

Register HFP HF profile.

Register Handsfree profile callbacks to monitor the state and get the required HFP details to display.

Parameters

• cb – callback structure.

Returns

0 in case of success or negative value in case of error.

int bt_hfp_hf_send_cmd(struct bt_conn *conn, enum bt_hfp_hf_at_cmd cmd)

Handsfree client Send AT.

Send specific AT commands to handsfree client profile.

Parameters

• conn – Connection object.
• cmd – AT command to be sent.

Returns

0 in case of success or negative value in case of error.

struct bt_hfp_hf_cmd_complete

#include <hfp_hf.h> HFP HF Command completion field.

struct bt_hfp_hf_cb

#include <hfp_hf.h> HFP profile application callback.

Public Members

void (*connected)(struct bt_conn *conn)

HF connected callback to application

If this callback is provided it will be called whenever the connection completes.

Param conn
Connection object.
void (*disconnected)(struct bt_conn *conn)

    HF disconnected callback to application

    If this callback is provided it will be called whenever the connection gets disconnected,
    including when a connection gets rejected or cancelled or any error in SLC establishment.

    **Param conn**
    Connection object.

void (*service)(struct bt_conn *conn, uint32_t value)

    HF indicator Callback

    This callback provides service indicator value to the application

    **Param conn**
    Connection object.

    **Param value**
    service indicator value received from the AG.

void (*call)(struct bt_conn *conn, uint32_t value)

    HF indicator Callback

    This callback provides call indicator value to the application

    **Param conn**
    Connection object.

    **Param value**
    call indicator value received from the AG.

void (*call_setup)(struct bt_conn *conn, uint32_t value)

    HF indicator Callback

    This callback provides call setup indicator value to the application

    **Param conn**
    Connection object.

    **Param value**
    call setup indicator value received from the AG.

void (*call_held)(struct bt_conn *conn, uint32_t value)

    HF indicator Callback

    This callback provides call held indicator value to the application

    **Param conn**
    Connection object.

    **Param value**
    call held indicator value received from the AG.

void (*signal)(struct bt_conn *conn, uint32_t value)

    HF indicator Callback

    This callback provides signal indicator value to the application

    **Param conn**
    Connection object.

    **Param value**
    signal indicator value received from the AG.

void (*roam)(struct bt_conn *conn, uint32_t value)

    HF indicator Callback

    This callback provides roaming indicator value to the application
**Param conn**
Connection object.

**Param value**
roaming indicator value received from the AG.

```c
void (*battery)(struct bt_conn *conn, uint32_t value)
```

HF indicator Callback
This callback battery service indicator value to the application

**Param conn**
Connection object.

**Param value**
battery indicator value received from the AG.

```c
void (*ring_indication)(struct bt_conn *conn)
```

HF incoming call Ring indication callback to application
If this callback is provided it will be called whenever there is an incoming call.

**Param conn**
Connection object.

```c
void (*cmd_complete_cb)(struct bt_conn *conn, struct bt_hfp_hf_cmd_complete *cmd)
```

HF notify command completed callback to application
The command sent from the application is notified about its status

**Param conn**
Connection object.

**Param cmd**
structure contains status of the command including cme.

---

**Logical Link Control and Adaptation Protocol (L2CAP)**

L2CAP layer enables connection-oriented channels which can be enabled with the configuration option: `CONFIG_BT_L2CAP_DYNAMIC_CHANNEL`. This channels support segmentation and reassembly transparently, they also support credit based flow control making it suitable for data streams.

Channels instances are represented by the `bt_l2cap_chan` struct which contains the callbacks in the `bt_l2cap_chan_ops` struct to inform when the channel has been connected, disconnected or when the encryption has changed. In addition to that it also contains the `recv` callback which is called whenever an incoming data has been received. Data received this way can be marked as processed by returning 0 or using `bt_l2cap_chan_recv_complete()` API if processing is asynchronous.

---

**Note:** The `recv` callback is called directly from RX Thread thus it is not recommended to block for long periods of time.

For sending data the `bt_l2cap_chan_send()` API can be used noting that it may block if no credits are available, and resuming as soon as more credits are available.

Servers can be registered using `bt_l2cap_server_register()` API passing the `bt_l2cap_server` struct which informs what `psm` it should listen to, the required security level `sec_level`, and the callback `accept` which is called to authorize incoming connection requests and allocate channel instances.

Client channels can be initiated with use of `bt_l2cap_chan_connect()` API and can be disconnected with the `bt_l2cap_chan_disconnect()` API. Note that the later can also disconnect channel instances created by servers.
API Reference

**group** bt_l2cap

L2CAP.

**Defines**

**BT_L2CAP_HDR_SIZE**

L2CAP PDU header size, used for buffer size calculations

**BT_L2CAP_TX_MTU**

Maximum Transmission Unit (MTU) for an outgoing L2CAP PDU.

**BT_L2CAP_RX_MTU**

Maximum Transmission Unit (MTU) for an incoming L2CAP PDU.

**BT_L2CAP_BUF_SIZE(mtu)**

Helper to calculate needed buffer size for L2CAP PDUs. Useful for creating buffer pools.

**Parameters**

- `mtu` – Needed L2CAP PDU MTU.

**Returns**

Needed buffer size to match the requested L2CAP PDU MTU.

**BT_L2CAP_SDU_HDR_SIZE**

L2CAP SDU header size, used for buffer size calculations

**BT_L2CAP_SDU_TX_MTU**

Maximum Transmission Unit for an unsegmented outgoing L2CAP SDU.

The Maximum Transmission Unit for an outgoing L2CAP SDU when sent without segmentation, i.e. a single L2CAP SDU will fit inside a single L2CAP PDU.

The MTU for outgoing L2CAP SDUs with segmentation is defined by the size of the application buffer pool.

**BT_L2CAP_SDU_RX_MTU**

Maximum Transmission Unit for an unsegmented incoming L2CAP SDU.

The Maximum Transmission Unit for an incoming L2CAP SDU when sent without segmentation, i.e. a single L2CAP SDU will fit inside a single L2CAP PDU.

The MTU for incoming L2CAP SDUs with segmentation is defined by the size of the application buffer pool. The application will have to define an alloc_buf callback for the channel in order to support receiving segmented L2CAP SDUs.

**BT_L2CAP_SDU_BUF_SIZE(mtu)**

Helper to calculate needed buffer size for L2CAP SDUs. Useful for creating buffer pools.

**Parameters**

- `mtu` – Required BT_L2CAP_*_SDU.

**Returns**

Needed buffer size to match the requested L2CAP SDU MTU.
BT_L2CAP_LE_CHAN(_ch)
    Helper macro getting container object of type `bt_l2cap_le_chan` address having the same container chan member address as object in question.

**Parameters**
- `_ch` – Address of object of `bt_l2cap_chan` type

**Returns**
Address of in memory `bt_l2cap_le_chan` object type containing the address of in question object.

BT_L2CAP_CHAN_SEND_RESERVE
    Headroom needed for outgoing L2CAP PDUs.

BT_L2CAP_SDU_CHAN_SEND_RESERVE
    Headroom needed for outgoing L2CAP SDUs.

**Typedefs**

typedef void (*bt_l2cap_chan_destroy_t)(struct `bt_l2cap_chan` *chan)
    Channel destroy callback.

    **Param chan**
    Channel object.

typedef enum `bt_l2cap_chan_state` bt_l2cap_chan_state_t
    Life-span states of L2CAP CoC channel.
    Used only by internal APIs dealing with setting channel to proper state depending on operational context.

typedef enum `bt_l2cap_chan_status` bt_l2cap_chan_status_t
    Status of L2CAP channel.

** Enums**

enum `bt_l2cap_chan_state`
    Life-span states of L2CAP CoC channel.
    Used only by internal APIs dealing with setting channel to proper state depending on operational context.
    
    **Values:**

    enumerator `BT_L2CAP_DISCONNECTED`
        Channel disconnected

    enumerator `BT_L2CAP_CONNECTING`
        Channel in connecting state

    enumerator `BT_L2CAP_CONFIG`
        Channel in config state, BR/EDR specific
enumerator BT_L2CAP_CONNECTED
   Channel ready for upper layer traffic on it

enumerator BT_L2CAP_DISCONNECTING
   Channel in disconnecting state

enum bt_l2cap_chan_status
   Status of L2CAP channel.
Values:

enumerator BT_L2CAP_STATUS_OUT
   Channel output status

enumerator BT_L2CAP_STATUS_SHUTDOWN
   Channel shutdown status.
Once this status is notified it means the channel will no longer be able to transmit or receive data.

enumerator BT_L2CAP_STATUS_ENCRYPT_PENDING
   Channel encryption pending status.

enumerator BT_L2CAP_NUM_STATUS

Functions

int bt_l2cap_server_register(struct bt_l2cap_server *server)
   Register L2CAP server.
   Register L2CAP server for a PSM, each new connection is authorized using the accept() callback which in case of success shall allocate the channel structure to be used by the new connection.

   For fixed, SIG-assigned PSMs (in the range 0x0001-0x007f) the PSM should be assigned to server->psm before calling this API. For dynamic PSMs (in the range 0x0080-0x00ff) server->psm may be pre-set to a given value (this is however not recommended) or be left as 0, in which case upon return a newly allocated value will have been assigned to it. For dynamically allocated values the expectation is that it's exposed through a GATT service, and that's how L2CAP clients discover how to connect to the server.

   Parameters
   • server – Server structure.

   Returns
   0 in case of success or negative value in case of error.

int bt_l2cap_br_server_register(struct bt_l2cap_server *server)
   Register L2CAP server on BR/EDR oriented connection.
   Register L2CAP server for a PSM, each new connection is authorized using the accept() callback which in case of success shall allocate the channel structure to be used by the new connection.
Parameters

- server – Server structure.

Returns

0 in case of success or negative value in case of error.

int bt_l2cap_ecred_chan_connect (struct bt_conn *conn, struct bt_l2cap_chan **chans, uint16_t psm)

Connect Enhanced Credit Based L2CAP channels.

Connect up to 5 L2CAP channels by PSM, once the connection is completed each channel connected() callback will be called. If the connection is rejected disconnected() callback is called instead.

Parameters

- conn – Connection object.
- chans – Array of channel objects.
- psm – Channel PSM to connect to.

Returns

0 in case of success or negative value in case of error.

int bt_l2cap_ecred_chan_reconfigure (struct bt_l2cap_chan **chans, uint16_t mtu)

Reconfigure Enhanced Credit Based L2CAP channels.

Reconfigure up to 5 L2CAP channels. Channels must be from the same bt_conn. Once reconfiguration is completed each channel reconfigured() callback will be called. MTU cannot be decreased on any of provided channels.

Parameters

- chans – Array of channel objects. Null-terminated. Elements after the first 5 are silently ignored.
- mtu – Channel MTU to reconfigure to.

Returns

0 in case of success or negative value in case of error.

int bt_l2cap_chan_connect (struct bt_conn *conn, struct bt_l2cap_chan *chan, uint16_t psm)

Connect L2CAP channel.

Connect L2CAP channel by PSM, once the connection is completed channel connected() callback will be called. If the connection is rejected disconnected() callback is called instead. Channel object passed (over an address of it) as second parameter shouldn’t be instantiated in application as standalone. Instead of, application should create transport dedicated L2CAP objects, i.e. type of bt_l2cap_le_chan for LE and/or type of bt_l2cap_br_chan for BR/EDR. Then pass to this API the location (address) of bt_l2cap_chan type object which is a member of both transport dedicated objects.

Parameters

- conn – Connection object.
- chan – Channel object.
- psm – Channel PSM to connect to.

Returns

0 in case of success or negative value in case of error.
int bt_l2cap_chan_disconnect(struct bt_l2cap_chan *chan)
Disconnect L2CAP channel.

Disconnect L2CAP channel, if the connection is pending it will be canceled and as a result
the channel disconnected() callback is called. Regarding to input parameter, to get details see
reference description to bt_l2cap_chan_connect() API above.

Parameters
• chan – Channel object.

Returns
0 in case of success or negative value in case of error.

int bt_l2cap_chan_send(struct bt_l2cap_chan *chan, struct net_buf *buf)
Send data to L2CAP channel.

Send data from buffer to the channel. If credits are not available, buf will be queued and sent
as and when credits are received from peer. Regarding to first input parameter, to get details
see reference description to bt_l2cap_chan_connect() API above.

When sending L2CAP data over an BR/EDR connection the application is sending L2CAP
PDUs. The application is required to have reserved BT_L2CAP_CHAN_SEND_RESERVE bytes
in the buffer before sending. The application should use the BT_L2CAP_BUF_SIZE() helper to
correctly size the buffers for the for the outgoing buffer pool.

When sending L2CAP data over an LE connection the application is sending L2CAP SDUs.
The application can optionally reserve BT_L2CAP_SDU_CHAN_SEND_RESERVE bytes in the
buffer before sending. By reserving bytes in the buffer the stack can use this buffer as a
segment directly, otherwise it will have to allocate a new segment for the first segment. If the
application is reserving the bytes it should use the BT_L2CAP_BUF_SIZE() helper to correctly
size the buffers for the for the outgoing buffer pool. When segmenting an L2CAP SDU into
L2CAP PDUs the stack will first attempt to allocate buffers from the original buffer pool of the
L2CAP SDU before using the stacks own buffer pool.

Note: Buffer ownership is transferred to the stack in case of success, in case of an error the
caller retains the ownership of the buffer.

Returns
Bytes sent in case of success or negative value in case of error.

int bt_l2cap_chan_recv_complete(struct bt_l2cap_chan *chan, struct net_buf *buf)
Complete receiving L2CAP channel data.

Complete the reception of incoming data. This shall only be called if the channel recv callback
has returned -EINPROGRESS to process some incoming data. The buffer shall contain the
original user_data as that is used for storing the credits/segments used by the packet.

Parameters
• chan – Channel object.
• buf – Buffer containing the data.

Returns
0 in case of success or negative value in case of error.

struct bt_l2cap_chan
#include <l2cap.h> L2CAP Channel structure.
Public Members

    Helps match request context during CoC

struct bt_l2cap_chan_ops
    #include <l2cap.h> L2CAP Channel operations structure.
Public Members

void (*connected)(struct bt_l2cap_chan *chan)
Channel connected callback.
If this callback is provided it will be called whenever the connection completes.
  Param chan
    The channel that has been connected

void (*disconnected)(struct bt_l2cap_chan *chan)
Channel disconnected callback.
If this callback is provided it will be called whenever the channel is disconnected, including when a connection gets rejected.
  Param chan
    The channel that has been Disconnected

void (*encrypt_change)(struct bt_l2cap_chan *chan, uint8_t hci_status)
Channel encrypt_change callback.
If this callback is provided it will be called whenever the security level changed (indirectly link encryption done) or authentication procedure fails. In both cases security initiator and responder got the final status (HCI status) passed by related to encryption and authentication events from local host's controller.
  Param chan
    The channel which has made encryption status changed.
  Param status
    HCI status of performed security procedure caused by channel security requirements. The value is populated by HCI layer and set to 0 when success and to non-zero (reference to HCI Error Codes) when security/authentication failed.

struct net_buf *(*alloc_seg)(struct bt_l2cap_chan *chan)
Channel alloc_seg callback.
If this callback is provided the channel will use it to allocate buffers to store segments. This avoids wasting big SDU buffers with potentially much smaller PDUs. If this callback is supplied, it must return a valid buffer.
  Param chan
    The channel requesting a buffer.
  Return
    Allocated buffer.

struct net_buf *(*alloc_buf)(struct bt_l2cap_chan *chan)
Channel alloc_buf callback.
If this callback is provided the channel will use it to allocate buffers to store incoming data. Channels that requires segmentation must set this callback. If the application has not set a callback the L2CAP SDU MTU will be truncated to BT_L2CAP_SDU_RX_MTU.
  Param chan
    The channel requesting a buffer.
  Return
    Allocated buffer.

int (*recv)(struct bt_l2cap_chan *chan, struct net_buf *buf)
Channel recv callback.
  Param chan
    The channel receiving data.
**Param buf**
- Buffer containing incoming data.

**Return**
- 0 in case of success or negative value in case of error.
- `-EINPROGRESS` in case where user has to confirm once the data has been processed by calling `bt_l2cap_chan_recv_complete` passing back the buffer received with its original user data which contains the number of segments/credits used by the packet.

```c
void (*sent)(struct bt_l2cap_chan *chan)
```
- Channel sent callback.
- If this callback is provided it will be called whenever a SDU has been completely sent.
  - **Param chan**
  - The channel which has sent data.

```c
void (*status)(struct bt_l2cap_chan *chan, atomic_t *status)
```
- Channel status callback.
- If this callback is provided it will be called whenever the channel status changes.
  - **Param chan**
  - The channel which status changed
  - **Param status**
  - The channel status

```c
void (*reconfigured)(struct bt_l2cap_chan *chan)
```
- Channel reconfigured callback.
- If this callback is provided it will be called whenever peer or local device requested reconfiguration. Application may check updated MTU and MPS values by inspecting `chan->le` endpoints.
  - **Param chan**
  - The channel which was reconfigured

```c
struct bt_l2cap_server

#include <l2cap.h> L2CAP Server structure.
```

**Public Members**

```c
uint16_t psm
```
- Server PSM.
- Possible values: 0 A dynamic value will be auto-allocated when `bt_l2cap_server_register()` is called.
  - 0x0001-0x007f Standard, Bluetooth SIG-assigned fixed values.
  - 0x0080-0x00ff Dynamically allocated. May be pre-set by the application before server registration (not recommended however), or auto-allocated by the stack if the app gave 0 as the value.

```c
bt_security_t sec_level
```
- Required minimum security level
int (*accept)(struct bt_conn *conn, struct bt_l2cap_chan **chan)

Server accept callback.

This callback is called whenever a new incoming connection requires authorization.

**Param conn**
- The connection that is requesting authorization

**Param chan**
- Pointer to received the allocated channel

**Return**
- 0 in case of success or negative value in case of error.
- -ENOMEM if no available space for new channel.
- -EACCES if application did not authorize the connection.
- -EPERM if encryption key size is too short.

Media Proxy

group bt_media_proxy
Media proxy module.

The media proxy module is the connection point between media players and media controllers. A media player has (access to) media content and knows how to navigate and play this content. A media controller reads or gets information from a player and controls the player by setting player parameters and giving the player commands.

The media proxy module allows media player implementations to make themselves available to media controllers. And it allows controllers to access, and get updates from, any player.

The media proxy module allows both local and remote control of local player instances: A media controller may be a local application, or it may be a Media Control Service relaying requests from a remote Media Control Client. There may be either local or remote control, or both, or even multiple instances of each.

[Experimental] Users should note that the APIs can change as a part of ongoing development.

Defines

MEDIA_PROXY_PLAYBACK_SPEED_MIN
Playback speed parameters.

All values from -128 to 127 allowed, only some defined

MEDIA_PROXY_PLAYBACK_SPEED_QUARTER

MEDIA_PROXY_PLAYBACK_SPEED_HALF

MEDIA_PROXY_PLAYBACK_SPEED_UNITY

MEDIA_PROXY_PLAYBACK_SPEED_DOUBLE

MEDIA_PROXY_PLAYBACK_SPEED_MAX

MEDIA_PROXY_SEEKING_SPEED_FACTOR_MAX
Seeking speed factors.

The allowed values for seeking speed are the range -64 to -4 (endpoints included), the value 0, and the range 4 to 64 (endpoints included).
MEDIA_PROXY_SEEKING_SPEED_FACTOR_MIN

MEDIA_PROXY_SEEKING_SPEED_FACTOR_ZERO

MEDIA_PROXY_GROUP_OBJECT_GROUP_TYPE

6.1. Bluetooth
Functions

int media_proxy_ctrl_register(struct media_proxy_ctrl_cbs *ctrl_cbs)

Register a controller with the media_proxy.

Parameters
• ctrl_cbs – Callbacks to the controller

Returns
0 if success, errno on failure

int media_proxy_ctrl_discover_player(struct bt_conn *conn)

Discover a remote media player.

Discover a remote media player instance. The remote player instance will be discovered, and
accessed, using Bluetooth, via the media control client and a remote media control service.
This call will start a GATT discovery of the Media Control Service on the peer, and setup
handles and subscriptions.

This shall be called once before any other actions can be executed for the remote player. The
remote player instance will be returned in the discover_player() callback.

Parameters
• conn – The connection to do discovery for

Returns
0 if success, errno on failure

int media_proxy_ctrl_get_player_name(struct media_player *player)

Read Media Player Name.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_icon_id(struct media_player *player)

Read Icon Object ID.

Get an ID (48 bit) that can be used to retrieve the Icon Object from an Object Transfer Service
See the Media Control Service spec v1.0 sections 3.2 and 4.1 for a description of the Icon
Object.

Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_icon_url(struct media_player *player)

Read Icon URL.

Get a URL to the media player’s icon.

Parameters
• player – Media player instance pointer
int media_proxy_ctrl_get_track_title(struct media_player *player)
Read Track Title.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_track_duration(struct media_player *player)
Read Track Duration.
The duration of a track is measured in hundredths of a second.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_track_position(struct media_player *player)
Read Track Position.
The position of the player (the playing position) is measured in hundredths of a second from
the beginning of the track

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_set_track_position(struct media_player *player, int32_t position)
Set Track Position.
Set the playing position of the media player in the current track. The position is given in in
hundredths of a second, from the beginning of the track for positive values, and
(backwards) from the end of the track for negative values.

Parameters
• player – Media player instance pointer
• position – The track position to set

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_playback_speed(struct media_player *player)
Get Playback Speed.
The playback speed parameter is related to the actual playback speed as follows: actual play-
back speed = $2^{\text{speed parameter}/64}$$^\text{speed parameter}/64$
A speed parameter of 0 corresponds to unity speed playback (i.e. playback at “normal” speed).
A speed parameter of -128 corresponds to playback at one fourth of normal speed, 127 corre-
sponds to playback at almost four times the normal speed.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.
int media_proxy_ctrl_set_playback_speed(struct media_player *player, int8_t speed)
Set Playback Speed.

See the get_playback_speed() function for an explanation of the playback speed parameter.

Note that the media player may not support all possible values of the playback speed parameter. If the value given is not supported, and is higher than the current value, the player should set the playback speed to the next higher supported value. (And correspondingly to the next lower supported value for given values lower than the current value.)

Parameters

• player – Media player instance pointer
• speed – The playback speed parameter to set

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_seeking_speed(struct media_player *player)
Get Seeking Speed.

The seeking speed gives the speed with which the player is seeking. It is a factor, relative to real-time playback speed - a factor four means seeking happens at four times the real-time playback speed. Positive values are for forward seeking, negative values for backwards seeking.

The seeking speed is not settable - a non-zero seeking speed is the result of “fast rewind” of “fast forward” commands.

Parameters

• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_track_segments_id(struct media_player *player)
Read Current Track Segments Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Segments Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.10 and 4.2 for a description of the Track Segments Object.

Requires Object Transfer Service

Parameters

• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_current_track_id(struct media_player *player)
Read Current Track Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.11 and 4.3 for a description of the Current Track Object.

Requires Object Transfer Service

Parameters

• player – Media player instance pointer
Returns
0 if success, errno on failure.

int media_proxy_ctrl_set_current_track_id(struct media_player *player, uint64_t id)
Set Current Track Object ID.
Change the player's current track to the track given by the ID. (Behaves similarly to the goto
track command.)
Requires Object Transfer Service

Parameters
• player – Media player instance pointer
• id – The ID of a track object

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_next_track_id(struct media_player *player)
Read Next Track Object ID.
Get an ID (48 bit) that can be used to retrieve the Next Track Object from an Object Transfer
Service
Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_set_next_track_id(struct media_player *player, uint64_t id)
Set Next Track Object ID.
Change the player's next track to the track given by the ID.
Requires Object Transfer Service

Parameters
• player – Media player instance pointer
• id – The ID of a track object

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_parent_group_id(struct media_player *player)
Read Parent Group Object ID.
Get an ID (48 bit) that can be used to retrieve the Parent Track Object from an Object Transfer
Service
The parent group is the parent of the current group.
See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current
Track Object.
Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.
int media_proxy_ctrl_get_current_group_id(struct media_player *player)
Read Current Group Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Group Object.

Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_set_current_group_id(struct media_player *player, uint64_t id)
Set Current Group Object ID.

Change the player's current group to the group given by the ID, and the current track to the first track in that group.

Requires Object Transfer Service

Parameters
• player – Media player instance pointer
• id – The ID of a group object

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_playing_order(struct media_player *player)
Read Playing Order.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_set_playing_order(struct media_player *player, uint8_t order)
Set Playing Order.

Set the media player's playing order

Parameters
• player – Media player instance pointer
• order – The playing order to set

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_playing_orders_supported(struct media_player *player)
Read Playing Orders Supported.

Read a bitmap containing the media player's supported playing orders.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.
int media_proxy_ctrl_get_media_state(struct media_player *player)
Read the media player's state

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_send_command(struct media_player *player, const struct mpl_cmd *command)
Send Command.
Send a command to the media player. Commands may cause the media player to change its state. May result in two callbacks - one for the actual sending of the command to the player, one for the result of the command from the player.

Parameters
• player – Media player instance pointer
• command – The command to send

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_commands_supported(struct media_player *player)
Read Commands Supported.
Read a bitmap containing the media player's supported command opcodes.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_send_search(struct media_player *player, const struct mpl_search *search)
Set Search.
Write a search to the media player. If the search is successful, the search results will be available as a group object in the Object Transfer Service (OTS).
May result in up to three callbacks
• one for the actual sending of the search to the player
• one for the result code for the search from the player
• if the search is successful, one for the search results object ID in the OTs
Requires Object Transfer Service

Parameters
• player – Media player instance pointer
• search – The search to write

Returns
0 if success, errno on failure.
int media_proxy_ctrl_get_search_results_id(struct media_player *player)
Read Search Results Object ID.
Get an ID (48 bit) that can be used to retrieve the Search Results Object from an Object Transfer Service.
The search results object is a group object. The search results object only exists if a successful search operation has been done.
Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

uint8_t media_proxy_ctrl_get_content_ctrl_id(struct media_player *player)
Read Content Control ID.
The content control ID identifies a content control service on a device, and links it to the corresponding audio stream.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_pl_register(struct media_proxy_pl_calls *pl_calls)
Register a player with the media proxy.
Register a player with the media proxy module, for use by media controllers.
The media proxy may call any non-NULL function pointers in the supplied media_proxy_pl_calls structure.

Parameters
• pl_calls – Function pointers to the media player's calls

Returns
0 if success, errno on failure

int media_proxy_pl_init(void)
struct bt_ots *bt_mcs_get_ots(void)
void media_proxy_pl_track_changed_cb(void)
Track changed callback.
To be called when the player's current track is changed
void media_proxy_pl_track_title_cb(char *title)
Track title callback.
To be called when the player's current track is changed

Parameters
• title – The title of the track

void media_proxy_pl_track_duration_cb(int32_t duration)
Track duration callback.
To be called when the current track's duration is changed (e.g. due to a track change)
The track duration is given in hundredths of a second.
Parameters

• duration – The track duration

```c
void media_proxy_pl_track_position_cb(int32_t position)
```
Track position callback.
To be called when the media player’s position in the track is changed, or when the player is paused or similar.
Exception: This callback should not be called when the position changes during regular playback, i.e. while the player is playing and playback happens at a constant speed.
The track position is given in hundredths of a second from the start of the track.

Parameters

• position – The media player’s position in the track

```c
void media_proxy_pl_playback_speed_cb(int8_t speed)
```
Playback speed callback.
To be called when the playback speed is changed.

Parameters

• speed – The playback speed parameter

```c
void media_proxy_pl_seeking_speed_cb(int8_t speed)
```
Seeking speed callback.
To be called when the seeking speed is changed.

Parameters

• speed – The seeking speed factor

```c
void media_proxy_pl_current_track_id_cb(uint64_t id)
```
Current track object ID callback.
To be called when the ID of the current track is changed (e.g. due to a track change).

Parameters

• id – The ID of the current track object in the OTS

```c
void media_proxy_pl_next_track_id_cb(uint64_t id)
```
Next track object ID callback.
To be called when the ID of the current track changes

Parameters

• id – The ID of the next track object in the OTS

```c
void media_proxy_pl_parent_group_id_cb(uint64_t id)
```
Parent group object ID callback.
To be called when the ID of the parent group is changed

Parameters

• id – The ID of the parent group object in the OTS

```c
void media_proxy_pl_current_group_id_cb(uint64_t id)
```
Current group object ID callback.
To be called when the ID of the current group is changed

Parameters

• id – The ID of the current group object in the OTS
void media_proxy_pl_playing_order_cb(uint8_t order)
    Playing order callback.
    To be called when the playing order is changed

    **Parameters**
    
    • order – The playing order

void media_proxy_pl_media_state_cb(uint8_t state)
    Media state callback.
    To be called when the media state is changed

    **Parameters**
    
    • state – The media player's state

void media_proxy_pl_command_cb(const struct mpl_cmd_ntf *cmd_ntf)
    Command callback.
    To be called when a command has been sent, to notify whether the command was successfully
    performed or not. See the MEDIA_PROXY_CMD_* result code defines.

    **Parameters**
    
    • cmd_ntf – The result of the command

void media_proxy_pl_commands_supported_cb(uint32_t opcodes)
    Commands supported callback.
    To be called when the set of commands supported is changed

    **Parameters**
    
    • opcodes – The supported commands opcodes

void media_proxy_pl_search_cb(uint8_t result_code)
    Search callback.
    To be called when a search has been set to notify whether the search was successfully per-
    formed or not. See the MEDIA_PROXY_SEARCH_* result code defines.
    The actual results of the search, if successful, can be found in the search results object.

    **Parameters**
    
    • result_code – The result (success or failure) of the search

void media_proxy_pl_search_results_id_cb(uint64_t id)
    Search Results object ID callback.
    To be called when the ID of the search results is changed (typically as the result of a new
    successful search).

    **Parameters**
    
    • id – The ID of the search results object in the OTS

#include <media_proxy.h> Media player command.

#include <media_proxy.h> Media command notification.

#include <media_proxy.h> Search control item.
Public Members

uint8_t len
    Length of type and parameter

uint8_t type
    MEDIA_PROXY_SEARCH_TYPE_<...>

cchar param[62]
    Search parameter

struct mpl_search
    #include <media_proxy.h> Search.

struct media_proxy_ctrl_cbs
    #include <media_proxy.h> Callbacks to a controller, from the media proxy.
    Given by a controller when registering

Public Members

void (*local_player_instance)(struct media_player *player, int err)
    Media Player Instance callback.
    Called when the local Media Player instance is registered or read (TODO). Also called if
    the local player instance is already registered when the controller is registered. Provides
    the controller with the pointer to the local player instance.
    Param player
        Media player instance pointer
    Param err
        Error value. 0 on success, or errno on negative value.

void (*player_name_recv)(struct media_player *player, int err, const char *name)
    Media Player Name receive callback.
    Called when the Media Player Name is read or changed See also media_proxy_ctrl_name_get()
    Param player
        Media player instance pointer
    Param err
        Error value. 0 on success, GATT error on positive value or errno on negative value.
    Param name
        The name of the media player

void (*icon_id_recv)(struct media_player *player, int err, uint64_t id)
    Media Player Icon Object ID receive callback.
    Called when the Media Player Icon Object ID is read See also media_proxy_ctrl_get_icon_id()
    Param player
        Media player instance pointer

6.1. Bluetooth
**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param id**
The ID of the Icon object in the Object Transfer Service (48 bits)

```c
void (*icon_url_recv)(struct media_player *player, int err, const char *url)
```
Media Player Icon URL receive callback.

Called when the Media Player Icon URL is read See also `media_proxy_ctrl_get_icon_url()`

- **Param player**
  Media player instance pointer

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

- **Param url**
  The URL of the icon

```c
void (*track_changed_recv)(struct media_player *player, int err)
```
Track changed receive callback.

Called when the Current Track is changed

- **Param player**
  Media player instance pointer

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*track_title_recv)(struct media_player *player, int err, const char *title)
```
Track Title receive callback.

Called when the Track Title is read or changed See also `media_proxy_ctrl_get_track_title()`

- **Param player**
  Media player instance pointer

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

- **Param title**
  The title of the current track

```c
void (*track_duration_recv)(struct media_player *player, int err, int32_t duration)
```
Track Duration receive callback.

Called when the Track Duration is read or changed See also `media_proxy_ctrl_get_track_duration()`

- **Param player**
  Media player instance pointer

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

- **Param duration**
  The duration of the current track

```c
void (*track_position_recv)(struct media_player *player, int err, int32_t position)
```
Track Position receive callback.

Called when the Track Position is read or changed See also `media_proxy_ctrl_get_track_position()` and `media_proxy_ctrl_set_track_position()`
**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param position**
The player's position in the track

```c
void (*track_position_write)(struct media_player *player, int err, int32_t position)
```
Track Position write callback.
Called when the Track Position is written See also `media_proxy_ctrl_set_track_position()`.

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param position**
The position given attempted to write

```c
void (*playback_speed_recv)(struct media_player *player, int err, int8_t speed)
```
Playback Speed receive callback.
Called when the Playback Speed is read or changed See also `media_proxy_ctrl_get_playback_speed()` and `media_proxy_ctrl_set_playback_speed()`.

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param speed**
The playback speed parameter

```c
void (*playback_speed_write)(struct media_player *player, int err, int8_t speed)
```
Playback Speed write callback.
Called when the Playback Speed is written See also `media_proxy_ctrl_set_playback_speed()`.

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param speed**
The playback speed parameter attempted to write

```c
void (*seeking_speed_recv)(struct media_player *player, int err, int8_t speed)
```
Seeking Speed receive callback.
Called when the Seeking Speed is read or changed See also `media_proxy_ctrl_get_seeking_speed()`.

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param speed**
The seeking speed factor
void (*track_segments_id_recv)(struct media_player *player, int err, uint64_t id)

Track Segments Object ID receive callback.
Called when the Track Segments Object ID is read. See also media_proxy_ctrl_get_track_segments_id()

- **Param player**: Media player instance pointer
- **Param err**: Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param id**: The ID of the track segments object in Object Transfer Service (48 bits)

void (*current_track_id_recv)(struct media_player *player, int err, uint64_t id)

Current Track Object ID receive callback.
Called when the Current Track Object ID is read or changed. See also media_proxy_ctrl_get_current_track_id() and media_proxy_ctrl_set_current_track_id()

- **Param player**: Media player instance pointer
- **Param err**: Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param id**: The ID of the current track object in Object Transfer Service (48 bits)

void (*current_track_id_write)(struct media_player *player, int err, uint64_t id)

Current Track Object ID write callback.
Called when the Current Track Object ID is written. See also media_proxy_ctrl_set_current_track_id()

- **Param player**: Media player instance pointer
- **Param err**: Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param id**: The ID (48 bits) attempted to write

void (*next_track_id_recv)(struct media_player *player, int err, uint64_t id)

Next Track Object ID receive callback.
Called when the Next Track Object ID is read or changed. See also media_proxy_ctrl_get_next_track_id() and media_proxy_ctrl_set_next_track_id()

- **Param player**: Media player instance pointer
- **Param err**: Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param id**: The ID of the next track object in Object Transfer Service (48 bits)

void (*next_track_id_write)(struct media_player *player, int err, uint64_t id)

Next Track Object ID write callback.
Called when the Next Track Object ID is written. See also media_proxy_ctrl_set_next_track_id()
void (*parent_group_id_recv)(struct media_player *player, int err, uint64_t id)

Parent Group Object ID receive callback.

Called when the Parent Group Object ID is read or changed See also media_proxy_ctrl_get_parent_group_id()

Param player
    Media player instance pointer

Param err
    Error value. 0 on success, GATT error on positive value or errno on negative value.

Param id
    The ID (48 bits) attempted to write

void (*current_group_id_recv)(struct media_player *player, int err, uint64_t id)

Current Group Object ID receive callback.

Called when the Current Group Object ID is read or changed See also media_proxy_ctrl_get_current_group_id() and media_proxy_ctrl_set_current_group_id()

Param player
    Media player instance pointer

Param err
    Error value. 0 on success, GATT error on positive value or errno on negative value.

Param id
    The ID of the current group object in Object Transfer Service (48 bits)

void (*current_group_id_write)(struct media_player *player, int err, uint64_t id)

Current Group Object ID write callback.

Called when the Current Group Object ID is written See also media_proxy_ctrl_set_current_group_id()

Param player
    Media player instance pointer

Param err
    Error value. 0 on success, GATT error on positive value or errno on negative value.

Param id
    The ID (48 bits) attempted to write

void (*playing_order_recv)(struct media_player *player, int err, uint8_t order)

Playing Order receive callback.

Called when the Playing Order is read or changed See also media_proxy_ctrl_get_playing_order() and media_proxy_ctrl_set_playing_order()

Param player
    Media player instance pointer

Param err
    Error value. 0 on success, GATT error on positive value or errno on negative value.
Param order
   The playing order

void (*playing_order_write)(struct media_player *player, int err, uint8_t order)
Playing Order write callback.
Called when the Playing Order is written See also media_proxy_ctrl_set_playing_order()
   Param player
       Media player instance pointer
   Param err
       Error value. 0 on success, GATT error on positive value or errno on negative value.
   Param order
       The playing order attempted to write

void (*playing_orders_supported_recv)(struct media_player *player, int err, uint16_t orders)
Playing Orders Supported receive callback.
Called when the Playing Orders Supported is read See also media_proxy_ctrl_get_playing_orders_supported()
   Param player
       Media player instance pointer
   Param err
       Error value. 0 on success, GATT error on positive value or errno on negative value.
   Param orders
       The playing orders supported

void (*media_state_recv)(struct media_player *player, int err, uint8_t state)
Media State receive callback.
Called when the Media State is read or changed See also media_proxy_ctrl_get_media_state() and media_proxy_ctrl_send_command()
   Param player
       Media player instance pointer
   Param err
       Error value. 0 on success, GATT error on positive value or errno on negative value.
   Param state
       The media player state

void (*command_send)(struct media_player *player, int err, const struct mpl_cmd *cmd)
Command send callback.
Called when a command has been sent See also media_proxy_ctrl_send_command()
   Param player
       Media player instance pointer
   Param err
       Error value. 0 on success, GATT error on positive value or errno on negative value.
   Param cmd
       The command sent

void (*command_recv)(struct media_player *player, int err, const struct mpl_cmd_ntf *result)
Command result receive callback.
Called when a command result has been received. See also \texttt{media_proxy_ctrl_send_command()}.

\begin{description}
  \item[Param player] Media player instance pointer
  \item[Param err] Error value. 0 on success, GATT error on positive value or \texttt{errno} on negative value.
  \item[Param result] The result received
\end{description}

\begin{verbatim}
void (*commands_supported_recv)(struct media_player *player, int err, uint32_t opcodes)
\end{verbatim}

Commands supported receive callback.

Called when the Commands Supported is read or changed. See also \texttt{media_proxy_ctrl_get_commands_supported()}

\begin{description}
  \item[Param player] Media player instance pointer
  \item[Param err] Error value. 0 on success, GATT error on positive value or \texttt{errno} on negative value.
  \item[Param opcodes] The supported command opcodes (bitmap)
\end{description}

\begin{verbatim}
void (*search_send)(struct media_player *player, int err, const struct mpl_search *search)
\end{verbatim}

Search send callback.

Called when a search has been sent. See also \texttt{media_proxy_ctrl_send_search()}

\begin{description}
  \item[Param player] Media player instance pointer
  \item[Param err] Error value. 0 on success, GATT error on positive value or \texttt{errno} on negative value.
  \item[Param search] The search sent
\end{description}

\begin{verbatim}
void (*search_recv)(struct media_player *player, int err, uint8_t result_code)
\end{verbatim}

Search result code receive callback.

Called when a search result code has been received. See also \texttt{media_proxy_ctrl_send_search()}

The search result code tells whether the search was successful or not. For a successful search, the actual results of the search (i.e. what was found as a result of the search) can be accessed using the Search Results Object ID. The Search Results Object ID has a separate callback - \texttt{search_results_id_recv()}.

\begin{description}
  \item[Param player] Media player instance pointer
  \item[Param err] Error value. 0 on success, GATT error on positive value or \texttt{errno} on negative value.
  \item[Param result_code] Search result code
\end{description}

\begin{verbatim}
void (*search_results_id_recv)(struct media_player *player, int err, uint64_t id)
\end{verbatim}

Search Results Object ID receive callback. See also \texttt{media_proxy_ctrl_get_search_results_id()}

Called when the Search Results Object ID is read or changed.

6.1. Bluetooth
void (*content_ctrl_id_recv)(struct media_player *player, int err, uint8_t ccid)

Content Control ID receive callback. Called when the Content Control ID is read. See also `media_proxy_ctrl_get_content_ctrl_id()`.

- **Param player**: Media player instance pointer
- **Param err**: Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param ccid**: The content control ID

__Public Members__

- `const char *(*get_player_name)(void)`: Read Media Player Name.
  - **Return**: The name of the media player

- `uint64_t *(*get_icon_id)(void)`: Read Icon Object ID.
  - **Return**: The Icon Object ID

- `const char *(*get_icon_url)(void)`: Read Icon URL.
  - **Return**: The URL of the Icon

- `const char *(*get_track_title)(void)`: Read Track Title.
  - **Return**: The title of the current track
int32_t (*get_track_duration)(void)
Read Track Duration.

The duration of a track is measured in hundredths of a second.

Return
The duration of the current track

int32_t (*get_track_position)(void)
Read Track Position.

The position of the player (the playing position) is measured in hundredths of a second from the beginning of the track

Return
The position of the player in the current track

void (*set_track_position)(int32_t position)
Set Track Position.

Set the playing position of the media player in the current track. The position is given in hundredths of a second, from the beginning of the track for positive values, and (backwards) from the end of the track for negative values.

Param position
The player position to set

int8_t (*get_playback_speed)(void)
Get Playback Speed.

The playback speed parameter is related to the actual playback speed as follows: actual playback speed = 2 ^ (speed_parameter/64)

A speed parameter of 0 corresponds to unity speed playback (i.e. playback at “normal” speed). A speed parameter of -128 corresponds to playback at one fourth of normal speed, 127 corresponds to playback at almost four times the normal speed.

Return
The playback speed parameter

void (*set_playback_speed)(int8_t speed)
Set Playback Speed.

See the get_playback_speed() function for an explanation of the playback speed parameter.

Note that the media player may not support all possible values of the playback speed parameter. If the value given is not supported, and is higher than the current value, the player should set the playback speed to the next higher supported value. (And correspondingly to the next lower supported value for given values lower than the current value.)

Param speed
The playback speed parameter to set

int8_t (*get_seeking_speed)(void)
Get Seeking Speed.

The seeking speed gives the speed with which the player is seeking. It is a factor, relative to real-time playback speed - a factor four means seeking happens at four times the real-time playback speed. Positive values are for forward seeking, negative values for backwards seeking.

The seeking speed is not settable - a non-zero seeking speed is the result of “fast rewind” of “fast forward” commands.
The seeking speed factor

uint64_t (*get_track_segments_id)(void)
Read Current Track Segments Object ID.
Get an ID (48 bit) that can be used to retrieve the Current Track Segments Object from an Object Transfer Service
See the Media Control Service spec v1.0 sections 3.10 and 4.2 for a description of the Track Segments Object.

Return
Current The Track Segments Object ID

uint64_t (*get_current_track_id)(void)
Read Current Track Object ID.
Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service
See the Media Control Service spec v1.0 sections 3.11 and 4.3 for a description of the Current Track Object.

Return
The Current Track Object ID

void (*set_current_track_id)(uint64_t id)
Set Current Track Object ID.
Change the player's current track to the track given by the ID. (Behaves similarly to the goto track command.)

Param id
The ID of a track object

uint64_t (*get_next_track_id)(void)
Read Next Track Object ID.
Get an ID (48 bit) that can be used to retrieve the Next Track Object from an Object Transfer Service

Return
The Next Track Object ID

void (*set_next_track_id)(uint64_t id)
Set Next Track Object ID.
Change the player's next track to the track given by the ID.

Param id
The ID of a track object

uint64_t (*get_parent_group_id)(void)
Read Parent Group Object ID.
Get an ID (48 bit) that can be used to retrieve the Parent Track Object from an Object Transfer Service
The parent group is the parent of the current group.
See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Track Object.

Return
The Current Group Object ID
uint64_t (*get_current_group_id)(void)

Read Current Group Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service.

See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Group Object.

**Return**

The Current Group Object ID

void (*set_current_group_id)(uint64_t id)

Set Current Group Object ID.

Change the player's current group to the group given by the ID, and the current track to the first track in that group.

**Param id**

The ID of a group object

uint8_t (*get_playing_order)(void)

Read Playing Order.

return The media player's current playing order

void (*set_playing_order)(uint8_t order)

Set Playing Order.

Set the media player's playing order. See the MEDIA_PROXY_PLAYING_ORDER_* defines.

**Param order**

The playing order to set

uint16_t (*get_playing_orders_supported)(void)

Read Playing Orders Supported.

Read a bitmap containing the media player's supported playing orders. See the MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_* defines.

**Return**

The media player's supported playing orders

uint8_t (*get_media_state)(void)

Read Media State.

Read the media player's state. See the MEDIA_PROXY_MEDIA_STATE_* defines.

**Return**

The media player's state

void (*send_command)(const struct mpl_cmd *command)

Send Command.

Send a command to the media player. For command opcodes (play, pause, ...) - see the MEDIA_PROXY_OP_* defines.

**Param command**

The command to send

uint32_t (*get_commands_supported)(void)

Read Commands Supported.
Read a bitmap containing the media player's supported command opcodes. See the MEDIA_PROXY_OP_SUP_* defines.

**Return**
The media player's supported command opcodes

```c
void (*send_search)(const struct mpl_search *search)
```

Set Search.

Write a search to the media player. (For the formatting of a search, see the Media Control Service spec and the mcs.h file.)

**Param search**
The search to write

```c
uint64_t (*get_search_results_id)(void)
```

Read Search Results Object ID.

Get an ID (48 bit) that can be used to retrieve the Search Results Object from an Object Transfer Service.

The search results object is a group object. The search results object only exists if a successful search operation has been done.

**Return**
The Search Results Object ID

```c
uint8_t (*get_content_ctrl_id)(void)
```

Read Content Control ID.

The content control ID identifies a content control service on a device, and links it to the corresponding audio stream.

**Return**
The content control ID for the media player

**Media Control Client**

*group bt_gatt_mcc*

Bluetooth Media Control Client (MCC) interface.

Updated to the Media Control Profile specification revision 1.0

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Typedefs**

typedef void (*bt_mcc_discover_mcs_cb)(struct bt_conn *conn, int err)

Callback function for `bt_mcc_discover_mcs()`

Called when a media control server is discovered

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

typedef void (*bt_mcc_read_player_name_cb)(struct bt_conn *conn, int err, const char *name)

Callback function for `bt_mcc_read_player_name()`

Called when the player name is read or notified
Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param name
Player name

typedef void (*bt_mcc_read_icon_url_cb)(struct bt_conn *conn, int err, const char *icon_url)
Callback function for bt_mcc_read_icon_url()
Called when the icon URL is read

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param icon_url
The URL of the Icon

typedef void (*bt_mcc_track_changed_ntf_cb)(struct bt_conn *conn, int err)
Callback function for track changed notifications.
Called when a track change is notified.
The track changed characteristic is a special case. It can not be read or set, it can only be notified.

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

typedef void (*bt_mcc_read_track_title_cb)(struct bt_conn *conn, int err, const char *title)
Callback function for bt_mcc_read_track_title()
Called when the track title is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param title
The title of the track

typedef void (*bt_mcc_read_track_duration_cb)(struct bt_conn *conn, int err, int32_t dur)
Callback function for bt_mcc_read_track_duration()
Called when the track duration is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param dur
The duration of the track

6.1. Bluetooth
typedef void (*bt_mcc_read_track_position_cb)(struct bt_conn *conn, int err, int32_t pos)
Callback function for bt_mcc_read_track_position()
Called when the track position is read or notified
  
  **Param conn**
  The connection that was used to initialise the media control client
  
  **Param err**
  Error value. 0 on success, GATT error or errno on fail
  
  **Param pos**
  The Track Position

typedef void (*bt_mcc_set_track_position_cb)(struct bt_conn *conn, int err, int32_t pos)
Callback function for bt_mcc_set_track_position()
Called when the track position is set
  
  **Param conn**
  The connection that was used to initialise the media control client
  
  **Param err**
  Error value. 0 on success, GATT error or errno on fail
  
  **Param pos**
  The Track Position set (or attempted to set)

typedef void (*bt_mcc_read_playback_speed_cb)(struct bt_conn *conn, int err, int8_t speed)
Callback function for bt_mcc_read_playback_speed()
Called when the playback speed is read or notified
  
  **Param conn**
  The connection that was used to initialise the media control client
  
  **Param err**
  Error value. 0 on success, GATT error or errno on fail
  
  **Param speed**
  The Playback Speed

typedef void (*bt_mcc_set_playback_speed_cb)(struct bt_conn *conn, int err, int8_t speed)
Callback function for bt_mcc_set_playback_speed()
Called when the playback speed is set
  
  **Param conn**
  The connection that was used to initialise the media control client
  
  **Param err**
  Error value. 0 on success, GATT error or errno on fail
  
  **Param speed**
  The Playback Speed set (or attempted to set)

typedef void (*bt_mcc_read_seeking_speed_cb)(struct bt_conn *conn, int err, int8_t speed)
Callback function for bt_mcc_read_seeking_speed()
Called when the seeking speed is read or notified
  
  **Param conn**
  The connection that was used to initialise the media control client
**Param err**  
Error value. 0 on success, GATT error or errno on fail

**Param speed**  
The Seeking Speed

typedef void (*bt_mcc_read_playing_order_cb)(struct bt_conn *conn, int err, uint8_t order)  
Callback function for **bt_mcc_read_playing_order()**  
Called when the playing order is read or notified

**Param conn**  
The connection that was used to initialise the media control client

**Param err**  
Error value. 0 on success, GATT error or errno on fail

**Param order**  
The playback order

typedef void (*bt_mcc_set_playing_order_cb)(struct bt_conn *conn, int err, uint8_t order)  
Callback function for **bt_mcc_set_playing_order()**  
Called when the playing order is set

**Param conn**  
The connection that was used to initialise the media control client

**Param err**  
Error value. 0 on success, GATT error or errno on fail

**Param order**  
The Playing Order set (or attempted to set)

typedef void (*bt_mcc_read_playing_orders_supported_cb)(struct bt_conn *conn, int err, uint16_t orders)  
Callback function for **bt_mcc_read_playing_orders_supported()**  
Called when the supported playing orders are read or notified

**Param conn**  
The connection that was used to initialise the media control client

**Param err**  
Error value. 0 on success, GATT error or errno on fail

**Param orders**  
The playing orders supported (bitmap)

typedef void (*bt_mcc_read_media_state_cb)(struct bt_conn *conn, int err, uint8_t state)  
Callback function for **bt_mcc_read_media_state()**  
Called when the media state is read or notified

**Param conn**  
The connection that was used to initialise the media control client

**Param err**  
Error value. 0 on success, GATT error or errno on fail

**Param state**  
The Media State
typedef void (*bt_mcc_send_cmd_cb)(struct bt_conn *conn, int err, const struct mpl_cmd *cmd)
Callback function for `bt_mcc_send_cmd()`
Called when a command is sent, i.e. when the media control point is set

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param cmd**
The command sent

typedef void (*bt_mcc_cmd_ntf_cb)(struct bt_conn *conn, int err, const struct mpl_cmd_ntf *ntf)
Callback function for command notifications.
Called when the media control point is notified
Notifications for commands (i.e. for writes to the media control point) use a different parameter structure than what is used for sending commands (writing to the media control point)

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param ntf**
The command notification

typedef void (*bt_mcc_read_opcodes_supported_cb)(struct bt_conn *conn, int err, uint32_t opcodes)
Callback function for `bt_mcc_read_opcodes_supported()`
Called when the supported opcodes (commands) are read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param opcodes**
The supported opcodes

typedef void (*bt_mcc_read_content_control_id_cb)(struct bt_conn *conn, int err, uint8_t ccid)
Callback function for `bt_mcc_read_content_control_id()`
Called when the content control ID is read

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param ccid**
The Content Control ID
Functions

int bt_mcc_init(struct bt_mcc_cb *cb)
Initialize Media Control Client.

Parameters
• cb – Callbacks to be used

Returns
0 if success, errno on failure.

int bt_mcc_discover_mcs(struct bt_conn *conn, bool subscribe)
Discover Media Control Service.
Discover Media Control Service (MCS) on the server given by the connection Optionally sub-
scribe to notifications.
Shall be called once, after media control client initialization and before using other media
control client functionality.

Parameters
• conn – Connection to the peer device
• subscribe – Whether to subscribe to notifications

Returns
0 if success, errno on failure.

int bt_mcc_read_player_name(struct bt_conn *conn)
Read Media Player Name.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_icon_url(struct bt_conn *conn)
Read Icon Object URL.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_track_title(struct bt_conn *conn)
Read Track Title.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_track_duration(struct bt_conn *conn)
Read Track Duration.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.
**int bt_mcc_read_track_position(struct bt_conn *conn)**

Read Track Position.

**Parameters**
- conn – Connection to the peer device

**Returns**
- 0 if success, errno on failure.

**int bt_mcc_set_track_position(struct bt_conn *conn, int32_t pos)**

Set Track position.

**Parameters**
- conn – Connection to the peer device
- pos – Track position

**Returns**
- 0 if success, errno on failure.

**int bt_mcc_read_playback_speed(struct bt_conn *conn)**

Read Playback speed.

**Parameters**
- conn – Connection to the peer device

**Returns**
- 0 if success, errno on failure.

**int bt_mcc_set_playback_speed(struct bt_conn *conn, int8_t speed)**

Set Playback Speed.

**Parameters**
- conn – Connection to the peer device
- speed – Playback speed

**Returns**
- 0 if success, errno on failure.

**int bt_mcc_read_seeking_speed(struct bt_conn *conn)**

Read Seeking speed.

**Parameters**
- conn – Connection to the peer device

**Returns**
- 0 if success, errno on failure.

**int bt_mcc_read_playing_order(struct bt_conn *conn)**

Read Playing Order.

**Parameters**
- conn – Connection to the peer device

**Returns**
- 0 if success, errno on failure.

**int bt_mcc_set_playing_order(struct bt_conn *conn, uint8_t order)**

Set Playing Order.

**Parameters**
- conn – Connection to the peer device
• order – Playing order

Returns
0 if success, errno on failure.

int bt_mcc_read_playing_orders_supported(struct bt_conn *conn)
Read Playing Orders Supported.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_media_state(struct bt_conn *conn)
Read Media State.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_send_cmd(struct bt_conn *conn, const struct mpl_cmd *cmd)
Send a command.

Write a command (e.g. “play”, “pause”) to the server's media control point.

Parameters
• conn – Connection to the peer device
• cmd – The command to send

Returns
0 if success, errno on failure.

int bt_mcc_read_opcodes_supported(struct bt_conn *conn)
Read Opcodes Supported.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_content_control_id(struct bt_conn *conn)
Read Content Control ID.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

struct bt_mcc_cb
#include <mcc.h> Media control client callbacks.

Bluetooth Mesh Profile

The Bluetooth mesh profile adds secure wireless multi-hop communication for Bluetooth Low Energy. This module implements the Bluetooth Mesh Profile Specification v1.0.1.

Read more about Bluetooth mesh on the Bluetooth SIG Website.
Core  The core provides functionality for managing the general Bluetooth mesh state.

Low Power Node  The Low Power Node (LPN) role allows battery powered devices to participate in a mesh network as a leaf node. An LPN interacts with the mesh network through a Friend node, which is responsible for relaying any messages directed to the LPN. The LPN saves power by keeping its radio turned off, and only wakes up to either send messages or poll the Friend node for any incoming messages. The radio control and polling is managed automatically by the mesh stack, but the LPN API allows the application to trigger the polling at any time through `bt_mesh_lpn_poll()`. The LPN operation parameters, including poll interval, poll event timing and Friend requirements is controlled through the `CONFIG_BT_MESH_LOW_POWER` option and related configuration options.

Replay Protection List  The Replay Protection List (RPL) is used to hold recently received sequence numbers from elements within the mesh network to perform protection against replay attacks.

To keep a node protected against replay attacks after reboot, it needs to store the entire RPL in the persistent storage before it is powered off. Depending on the amount of traffic in a mesh network, storing recently seen sequence numbers can make flash wear out sooner or later. To mitigate this, `CONFIG_BT_MESH_RPL_STORE_TIMEOUT` can be used. This option postpones storing of RPL entries in the persistent storage.

This option, however, doesn’t completely solve the issue as the node may get powered off before the timer to store the RPL is fired. To ensure that messages can not be replayed, the node can initiate storage of the pending RPL entry (or entries) at any time (or sufficiently before power loss) by calling `bt_mesh_rpl_pending_store()`. This is up to the node to decide, which RPL entries are to be stored in this case.

Setting `CONFIG_BT_MESH_RPL_STORE_TIMEOUT` to -1 allows to completely switch off the timer, which can help to significantly reduce flash wear out. This moves the responsibility of storing RPL to the user application and requires that sufficient power backup is available from the time this API is called until all RPL entries are written to the flash.

Finding the right balance between `CONFIG_BT_MESH_RPL_STORE_TIMEOUT` and calling `bt_mesh_rpl_pending_store()` may reduce a risk of security vulnerability and flash wear out.

API reference

group bt_mesh
  Bluetooth mesh.

  Defines

  `BT_MESH_NET_PRIMARY`
  Relay feature

  `BT_MESH_FEAT_PROXY`
  GATT Proxy feature

  `BT_MESH_FEAT_FRIEND`
  Friend feature
BT_MESH_FEAT_LOW_POWER

Low Power Node feature

BT_MESH_FEAT_SUPPORTED

BT_MESH_LPN_CB_DEFINE(_name)

Register a callback structure for Friendship events.

Parameters
- _name – Name of callback structure.

BT_MESH_FRIEND_CB_DEFINE(_name)

Register a callback structure for Friendship events.

Registers a callback structure that will be called whenever Friendship gets established or terminated.

Parameters
- _name – Name of callback structure.

Functions

int bt_mesh_init(const struct bt_mesh_prov *prov, const struct bt_mesh_comp *comp)

Initialize Mesh support.

After calling this API, the node will not automatically advertise as unprovisioned, rather the bt_mesh_prov_enable() API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

Parameters
- prov – Node provisioning information.
- comp – Node Composition.

Returns
0 on success, or (negative) error code otherwise.

void bt_mesh_reset(void)

Reset the state of the local Mesh node.

Resets the state of the node, which means that it needs to be reprovisioned to become an active node in a Mesh network again.

After calling this API, the node will not automatically advertise as unprovisioned, rather the bt_mesh_prov_enable() API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

int bt_mesh_suspend(void)

Suspend the Mesh network temporarily.

This API can be used for power saving purposes, but the user should be aware that leaving the local node suspended for a long period of time may cause it to become permanently disconnected from the Mesh network. If at all possible, the Friendship feature should be used instead, to make the node into a Low Power Node.

Returns
0 on success, or (negative) error code on failure.
int bt_mesh_resume(void)
Resume a suspended Mesh network.

This API resumes the local node, after it has been suspended using the \texttt{bt\_mesh\_suspend()} API.

\textbf{Returns}
0 on success, or (negative) error code on failure.

\textbf{void bt\_mesh\_iv\_update\_test(bool enable)}
Toggle the IV Update test mode.

This API is only available if the IV Update test mode has been enabled in Kconfig. It is needed for passing most of the IV Update qualification test cases.

\textbf{Parameters}
- \texttt{enable} – true to enable IV Update test mode, false to disable it.

\textbf{bool bt\_mesh\_iv\_update(void)}
Toggle the IV Update state.

This API is only available if the IV Update test mode has been enabled in Kconfig. It is needed for passing most of the IV Update qualification test cases.

\textbf{Returns}
true if IV Update In Progress state was entered, false otherwise.

\textbf{int bt\_mesh\_lpn\_set(bool enable)}
Toggle the Low Power feature of the local device.

Enables or disables the Low Power feature of the local device. This is exposed as a run-time feature, since the device might want to change this e.g. based on being plugged into a stable power source or running from a battery power source.

\textbf{Parameters}
- \texttt{enable} – true to enable LPN functionality, false to disable it.

\textbf{Returns}
Zero on success or (negative) error code otherwise.

\textbf{int bt\_mesh\_lpn\_poll(void)}
Send out a Friend Poll message.

Send a Friend Poll message to the Friend of this node. If there is no established Friendship the function will return an error.

\textbf{Returns}
Zero on success or (negative) error code otherwise.

\textbf{int bt\_mesh\_friend\_terminate(uint16\_t lpn\_addr)}
Terminate Friendship.

Terminated Friendship for given LPN.

\textbf{Parameters}
- \texttt{lpn\_addr} – Low Power Node address.

\textbf{Returns}
Zero on success or (negative) error code otherwise.

\textbf{void bt\_mesh\_rpl\_pending\_store(uint16\_t addr)}
Store pending RPL entry(ies) in the persistent storage.

This API allows the user to store pending RPL entry(ies) in the persistent storage without waiting for the timeout.
**Note:** When flash is used as the persistent storage, calling this API too frequently may wear it out.

### Parameters

- **addr** – Address of the node which RPL entry needs to be stored or `BT_MESH_ADDR_ALL_NODES` to store all pending RPL entries.

```c
struct bt_mesh_lpn_cb
#include <main.h> // Low Power Node callback functions.
```

### Public Members

```c
void (*established)(uint16_t net_idx, uint16_t friend_addr, uint8_t queue_size, uint8_t recv_window)
Friendship established.
This callback notifies the application that friendship has been successfully established.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.

- **Param friend_addr**
  Friend address.

- **Param queue_size**
  Friend queue size.

- **Param recv_window**
  Low Power Node’s listens duration for Friend response.

void (*terminated)(uint16_t net_idx, uint16_t friend_addr)
Friendship terminated.
This callback notifies the application that friendship has been terminated.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.

- **Param friend_addr**
  Friend address.

void (*polled)(uint16_t net_idx, uint16_t friend_addr, bool retry)
Local Poll Request.
This callback notifies the application that the local node has polled the friend node.
This callback will be called before `bt_mesh_lpn_cb::established` when attempting to establish a friendship.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.

- **Param friend_addr**
  Friend address.

- **Param retry**
  Retry or first poll request for each transaction.

```c
struct bt_mesh_friend_cb
#include <main.h> // Friend Node callback functions.
```
Public Members

void (*established)(uint16_t net_idx, uint16_t lpn_addr, uint8_t recv_delay, uint32_t polltimeout)

Friendship established.
This callback notifies the application that friendship has been successfully established.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.

- **Param lpn_addr**
  Low Power Node address.

- **Param recv_delay**
  Receive Delay in units of 1 millisecond.

- **Param polltimeout**
  PollTimeout in units of 1 millisecond.

void (*terminated)(uint16_t net_idx, uint16_t lpn_addr)

Friendship terminated.
This callback notifies the application that friendship has been terminated.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.

- **Param lpn_addr**
  Low Power Node address.

void (*polled)(uint16_t net_idx, uint16_t lpn_addr)

Friend Poll Request.
This callback notifies the application that the low power node has polled the friend node.
This callback will be called before `bt_mesh_friend_cb::established` when attempting to establish a friendship.

- **Param net_idx**
  NetKeyIndex used during friendship establishment.

- **Param lpn_addr**
  LPN address.

Access layer  The access layer is the application's interface to the Bluetooth mesh network. The access layer provides mechanisms for compartmentalizing the node behavior into elements and models, which are implemented by the application.

Mesh models  The functionality of a mesh node is represented by models. A model implements a single behavior the node supports, like being a light, a sensor or a thermostat. The mesh models are grouped into elements. Each element is assigned its own unicast address, and may only contain one of each type of model. Conventionally, each element represents a single aspect of the mesh node behavior. For instance, a node that contains a sensor, two lights and a power outlet would spread this functionality across four elements, with each element instantiating all the models required for a single aspect of the supported behavior.

The node's element and model structure is specified in the node composition data, which is passed to `bt_mesh_init()` during initialization. The Bluetooth SIG have defined a set of foundation models (see **Foundation models**) and a set of models for implementing common behavior in the Bluetooth Mesh Model Specification. All models not specified by the Bluetooth SIG are vendor models, and must be tied to a Company ID.

Mesh models have several parameters that can be configured either through initialization of the mesh stack or with the **Configuration Server:**
Opcode list  The opcode list contains all message opcodes the model can receive, as well as the minimum acceptable payload length and the callback to pass them to. Models can support any number of opcodes, but each opcode can only be listed by one model in each element.

The full opcode list must be passed to the model structure in the composition data, and cannot be changed at runtime. The end of the opcode list is determined by the special \texttt{BT_MESH_MODEL_OP\_END} entry. This entry must always be present in the opcode list, unless the list is empty. In that case, \texttt{BT_MESH_MODEL\_NO\_OPS} should be used in place of a proper opcode list definition.

AppKey list  The AppKey list contains all the application keys the model can receive messages on. Only messages encrypted with application keys in the AppKey list will be passed to the model.

The maximum number of supported application keys each model can hold is configured with the \texttt{CONFIG\_BT\_MESH\_MODEL\_KEY\_COUNT} configuration option. The contents of the AppKey list is managed by the Configuration Server.

Subscription list  A model will process all messages addressed to the unicast address of their element (given that the utilized application key is present in the AppKey list). Additionally, the model will process packets addressed to any group or virtual address in its subscription list. This allows nodes to address multiple nodes throughout the mesh network with a single message.

The maximum number of supported addresses in the Subscription list each model can hold is configured with the \texttt{CONFIG\_BT\_MESH\_MODEL\_GROUP\_COUNT} configuration option. The contents of the subscription list is managed by the Configuration Server.

Model publication  The models may send messages in two ways:

- By specifying a set of message parameters in a \texttt{bt\_mesh\_msg\_ctx}, and calling \texttt{bt\_mesh\_model\_send()}.
- By setting up a \texttt{bt\_mesh\_model\_pub} structure and calling \texttt{bt\_mesh\_model\_publish()}.

When publishing messages with \texttt{bt\_mesh\_model\_publish()}, the model will use the publication parameters configured by the Configuration Server. This is the recommended way to send unprompted model messages, as it passes the responsibility of selecting message parameters to the network administrator, which likely knows more about the mesh network than the individual nodes will.

To support publishing with the publication parameters, the model must allocate a packet buffer for publishing, and pass it to \texttt{bt\_mesh\_model\_pub\_msg}. The Config Server may also set up period publication for the publication message. To support this, the model must populate the \texttt{bt\_mesh\_model\_pub\_update} callback. The \texttt{bt\_mesh\_model\_pub\_update} callback will be called right before the message is published, allowing the model to change the payload to reflect its current state.

By setting \texttt{bt\_mesh\_model\_pub\_retr\_update} to 1, the model can configure the \texttt{bt\_mesh\_model\_pub\_update} callback to be triggered on every retransmission. This can, for example, be used by models that make use of a Delay parameter, which can be adjusted for every retransmission. The \texttt{bt\_mesh\_model\_pub\_is\_retransmission()} function can be used to differentiate a first publication and a retransmission. The \texttt{BT\_MESH\_PUB\_MSG\_TOTAL} and \texttt{BT\_MESH\_PUB\_MSG\_NUM} macros can be used to return total number of transmissions and the retransmission number within one publication interval.

Extended models  The Bluetooth mesh specification allows the mesh models to extend each other. When a model extends another, it inherits that model's functionality, and extension can be used to construct complex models out of simple ones, leveraging the existing model functionality to avoid defining new opcodes. Models may extend any number of models, from any element. When one model extends another in the same element, the two models will share subscription lists. The mesh stack implements this by merging the subscription lists of the two models into one, combining the number of subscriptions the models can have in total. Models may extend models that extend others, creating an "extension tree". All models in an extension tree share a single subscription list per element it spans.
Model extensions are done by calling `bt_mesh_model_extend()` during initialization. A model can only be extended by one other model, and extensions cannot be circular. Note that binding of node states and other relationships between the models must be defined by the model implementations.

The model extension concept adds some overhead in the access layer packet processing, and must be explicitly enabled with `CONFIG_BT_MESH_MODEL_EXTENSIONS` to have any effect.

**Model data storage**  
Mesh models may have data associated with each model instance that needs to be stored persistently. The access API provides a mechanism for storing this data, leveraging the internal model instance encoding scheme. Models can store one user defined data entry per instance by calling `bt_mesh_model_data_store()`. To be able to read out the data the next time the device reboots, the model’s `bt_mesh_model_cb.settings_set` callback must be populated. This callback gets called when model specific data is found in the persistent storage. The model can retrieve the data by calling the `read_cb` passed as a parameter to the callback. See the *Settings* module documentation for details.

BT_MESH_APP_SEG_SDU_MAX
    Maximum size of an access message segment (in octets).

BT_MESH_APP_UNSEG_SDU_MAX
    Maximum payload size of an unsegmented access message (in octets).

BT_MESH_RX_SEG_MAX
    Maximum number of segments supported for incoming messages.

BT_MESH_TX_SEG_MAX
    Maximum number of segments supported for outgoing messages.

BT_MESH_TX_SDU_MAX
    Maximum possible payload size of an outgoing access message (in octets).

BT_MESH_RX_SDU_MAX
    Maximum possible payload size of an incoming access message (in octets).

BT_MESH_ELEM(_loc, _mods, _vnd_mods)
    Helper to define a mesh element within an array.
    In case the element has no SIG or Vendor models the helper macro BT_MESH_MODEL_NONE can be given instead.

    Parameters
    • _loc – Location Descriptor.
    • _mods – Array of models.
    • _vnd_mods – Array of vendor models.

    Macro for encoding minimum message length for variable-length messages.

BT_MESH_MODEL_OP_END
    End of the opcode list. Must always be present.

BT_MESH_MODEL_NO_OPS
    Helper to define an empty opcode list.

BT_MESH_MODEL_NONE
    Helper to define an empty model array

BT_MESH_MODEL_CNT_CB(_id, _op, _pub, _user_data, _keys, _grps, _cb)
    Composition data SIG model entry with callback functions with specific number of keys &
groups.

    Parameters
    • _id – Model ID.
    • _op – Array of model opcode handlers.
    • _pub – Model publish parameters.
    • _user_data – User data for the model.
    • _keys – Number of keys that can be bound to the model. Shall not exceed
      CONFIG_BT_MESH_MODEL_KEY_COUNT.
    • _grps – Number of addresses that the model can be subscribed to. Shall not
      exceed CONFIG_BT_MESH_MODEL_GROUP_COUNT.
    • _cb – Callback structure, or NULL to keep no callbacks.

BT_MESH_MODEL_CNT_VND_CB(_company, _id, _op, _pub, _user_data, _keys, _grps, _cb)
    Composition data vendor model entry with callback functions with specific number of keys &
groups.

    Parameters
    • _company – Company ID.
    • _id – Model ID.
    • _op – Array of model opcode handlers.
    • _pub – Model publish parameters.
    • _user_data – User data for the model.
    • _keys – Number of keys that can be bound to the model. Shall not exceed
      CONFIG_BT_MESH_MODEL_KEY_COUNT.
• _grps – Number of addresses that the model can be subscribed to. Shall not exceed `CONFIG_BT_MESH_MODEL_GROUP_COUNT`.

• _cb – Callback structure, or NULL to keep no callbacks.

`BT_MESH_MODEL_CB(_id, _op, _pub, _user_data, _cb)`
Composition data SIG model entry with callback functions.

**Parameters**

• _id – Model ID.
• _op – Array of model opcode handlers.
• _pub – Model publish parameters.
• _user_data – User data for the model.
• _cb – Callback structure, or NULL to keep no callbacks.

`BT_MESH_MODEL_VND_CB(_company, _id, _op, _pub, _user_data, _cb)`
Composition data vendor model entry with callback functions.

**Parameters**

• _company – Company ID.
• _id – Model ID.
• _op – Array of model opcode handlers.
• _pub – Model publish parameters.
• _user_data – User data for the model.
• _cb – Callback structure, or NULL to keep no callbacks.

`BT_MESH_MODEL(_id, _op, _pub, _user_data)`
Composition data SIG model entry.

**Parameters**

• _id – Model ID.
• _op – Array of model opcode handlers.
• _pub – Model publish parameters.
• _user_data – User data for the model.

`BT_MESH_MODEL_VND(_company, _id, _op, _pub, _user_data)`
Composition data vendor model entry.

**Parameters**

• _company – Company ID.
• _id – Model ID.
• _op – Array of model opcode handlers.
• _pub – Model publish parameters.
• _user_data – User data for the model.

`BT_MESH_TRANSMIT(count, int_ms)`
Encode transmission count & interval steps.

**Parameters**

• count – Number of retransmissions (first transmission is excluded).
• int_ms – Interval steps in milliseconds. Must be greater than 0, less than or equal to 320, and a multiple of 10.

Returns
Mesh transmit value that can be used e.g. for the default values of the configuration model data.

BT_MESH_TRANSMIT_COUNT(transmit)
Decode transmit count from a transmit value.

Parameters
• transmit – Encoded transmit count & interval value.

Returns
Transmission count (actual transmissions is N + 1).

BT_MESH_TRANSMIT_INT(transmit)
Decode transmit interval from a transmit value.

Parameters
• transmit – Encoded transmit count & interval value.

Returns
Transmission interval in milliseconds.

BT_MESH_PUB_TRANSMIT(count, int_ms)
Encode Publish Retransmit count & interval steps.

Parameters
• count – Number of retransmissions (first transmission is excluded).
• int_ms – Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

Returns
Mesh transmit value that can be used e.g. for the default values of the configuration model data.

BT_MESH_PUB_TRANSMIT_COUNT(transmit)
Decode Publish Retransmit count from a given value.

Parameters
• transmit – Encoded Publish Retransmit count & interval value.

Returns
Retransmission count (actual transmissions is N + 1).

BT_MESH_PUB_TRANSMIT_INT(transmit)
Decode Publish Retransmit interval from a given value.

Parameters
• transmit – Encoded Publish Retransmit count & interval value.

Returns
Transmission interval in milliseconds.

BT_MESH_PUB_MSG_TOTAL(pub)
Get total number of messages within one publication interval including initial publication.

Parameters
• pub – Model publication context.

Returns
total number of messages.
BT_MESH_PUB_MSG_NUM(pub)
   Get message number within one publication interval.
   Meant to be used inside bt_mesh_model_pub::update.

   Parameters
   • pub – Model publication context.

   Returns
   message number starting from 1.

BT_MESH_MODEL_PUB_DEFINE(_name, _update, _msg_len)
Define a model publication context.

   Parameters
   • _name – Variable name given to the context.
   • _update – Optional message update callback (may be NULL).
   • _msg_len – Length of the publication message.

BT_MESH_TTL_DEFAULT
   Special TTL value to request using configured default TTL

BT_MESH_TTL_MAX
   Maximum allowed TTL value

Functions

int bt_mesh_model_send(struct bt_mesh_model *model, struct bt_mesh_msg_ctx *ctx, struct net_buf_simple *msg, const struct bt_mesh_send_cb *cb, void *cb_data)
Send an Access Layer message.

   Parameters
   • model – Mesh (client) Model that the message belongs to.
   • ctx – Message context, includes keys, TTL, etc.
   • msg – Access Layer payload (the actual message to be sent).
   • cb – Optional “message sent” callback.
   • cb_data – User data to be passed to the callback.

   Returns
   0 on success, or (negative) error code on failure.

int bt_mesh_model_publish(struct bt_mesh_model *model)
Send a model publication message.

   Before calling this function, the user needs to ensure that the model publication message
   (bt_mesh_model_pub::msg) contains a valid message to be sent. Note that this API is only to be
   used for non-period publishing. For periodic publishing the app only needs to make sure that
   bt_mesh_model_pub::msg contains a valid message whenever the bt_mesh_model_pub::update
   callback is called.

   Parameters
   • model – Mesh (client) Model that’s publishing the message.

   Returns
   0 on success, or (negative) error code on failure.
static inline bool bt_mesh_model_pub_is_retransmission(const struct bt_mesh_model *model)
    Check if a message is being retransmitted.
    Meant to be used inside the bt_mesh_model_pub::update callback.

    Parameters
    • model – Mesh Model that supports publication.

    Returns
    true if this is a retransmission, false if this is a first publication.

struct bt_mesh_elem *bt_mesh_model_elem(struct bt_mesh_model *mod)
    Get the element that a model belongs to.

    Parameters
    • mod – Mesh model.

    Returns
    Pointer to the element that the given model belongs to.

struct bt_mesh_model *bt_mesh_model_find(const struct bt_mesh_elem *elem, uint16_t id)
    Find a SIG model.

    Parameters
    • elem – Element to search for the model in.
    • id – Model ID of the model.

    Returns
    A pointer to the Mesh model matching the given parameters, or NULL if no SIG model with the given ID exists in the given element.

struct bt_mesh_model *bt_mesh_model_find_vnd(const struct bt_mesh_elem *elem, uint16_t company, uint16_t id)
    Find a vendor model.

    Parameters
    • elem – Element to search for the model in.
    • company – Company ID of the model.
    • id – Model ID of the model.

    Returns
    A pointer to the Mesh model matching the given parameters, or NULL if no vendor model with the given ID exists in the given element.

static inline bool bt_mesh_model_in_primary(const struct bt_mesh_model *mod)
    Get whether the model is in the primary element of the device.

    Parameters
    • mod – Mesh model.

    Returns
    true if the model is on the primary element, false otherwise.

int bt_mesh_model_data_store(struct bt_mesh_model *mod, bool vnd, const char *name, const void *data, size_t data_len)
    Immediately store the model’s user data in persistent storage.

    Parameters
    • mod – Mesh model.
    • vnd – This is a vendor model.
• \texttt{name} – Name/key of the settings item. Only \texttt{SETTINGS_MAX_DIR_DEPTH} bytes will be used at most.
• \texttt{data} – Model data to store, or NULL to delete any model data.
• \texttt{data\_len} – Length of the model data.

\textbf{Returns}

0 on success, or (negative) error code on failure.

\begin{verbatim}
int bt_mesh_model_extend(struct bt_mesh_model *extending_mod, struct bt_mesh_model *base_mod)
\end{verbatim}

Let a model extend another.

Mesh models may be extended to reuse their functionality, forming a more complex model. A Mesh model may extend any number of models, in any element. The extensions may also be nested, i.e., a model that extends another may itself be extended.

A set of models that extend each other form a model extension list.

All models in an extension list share one subscription list per element. The access layer will utilize the combined subscription list of all models in an extension list and element, giving the models extended subscription list capacity.

\textbf{Parameters}

• \texttt{extending\_mod} – Mesh model that is extending the base model.
• \texttt{base\_mod} – The model being extended.

\textbf{Return values}

0 – Successfully extended the base\_mod model.

\begin{verbatim}
bool bt_mesh_model_is_extended(struct bt_mesh_model *model)
\end{verbatim}

Check if model is extended by another model.

\textbf{Parameters}

• \texttt{model} – The model to check.

\textbf{Return values}

\texttt{true} – If model is extended by another model, otherwise false

\begin{verbatim}
struct bt_mesh_elem
#include <access.h> Abstraction that describes a Mesh Element
\end{verbatim}

\textbf{Public Members}

\begin{verbatim}
uint16_t addr
Unicast Address. Set at runtime during provisioning.
\end{verbatim}

\begin{verbatim}
const uint16_t loc
Location Descriptor (GATT Bluetooth Namespace Descriptors)
\end{verbatim}

\begin{verbatim}
const uint8_t model\_count
The number of SIG models in this element
\end{verbatim}

\begin{verbatim}
const uint8_t vnd_model\_count
The number of vendor models in this element
\end{verbatim}
struct bt_mesh_model *const models
    The list of SIG models in this element

struct bt_mesh_model *const vnd_models
    The list of vendor models in this element

struct bt_mesh_model_op
#include <access.h> Model opcode handler.

Public Members

const uint32_t opcode
    OpCode encoded using the BT_MESH_MODEL_OP_* macros

const ssize_t len
    Message length. If the message has variable length then this value indicates minimum
    message length and should be positive. Handler function should verify precise length
    based on the contents of the message. If the message has fixed length then this value
    should be negative. Use BT_MESH_LEN_* macros when defining this value.

int (*const func)(struct bt_mesh_model *model, struct bt_mesh_msg_ctx *ctx, struct
    net_buf_simple *buf)
    Handler function for this opcode.
    
    Param model
        Model instance receiving the message.
    Param ctx
        Message context for the message.
    Param buf
        Message buffer containing the message payload, not including the opcode.
    Return
        Zero on success or (negative) error code otherwise.

struct bt_mesh_model_pub
#include <access.h> Model publication context.
    The context should primarily be created using the BT_MESH_MODEL_PUB_DEFINE macro.

Public Members

struct bt_mesh_model *mod
    The model the context belongs to. Initialized by the stack.

uint16_t addr
    Publish Address.

uint16_t key
    Publish AppKey Index.

uint16_t cred
    Friendship Credentials Flag.
uint16_t send_rel
    Force reliable sending (segment acks)

uint16_t fast_period
    Use FastPeriodDivisor

uint16_t retr_update
    Call update callback on every retransmission.

uint8_t ttl
    Publish Time to Liv.

uint8_t retransmit
    Retransmit Count & Interval Steps.

uint8_t period
    Publish Period.

uint8_t period_div
    Divisor for the Period.

uint8_t count
    Transmissions left.

uint32_t period_start
    Start of the current period.

struct net_buf_simple *msg
    Publication buffer, containing the publication message.
    This will get correctly created when the publication context has been defined using the
    BT_MESH_MODEL_PUB_DEFINE macro.

    BT_MESH_MODEL_PUB_DEFINE(name, update, size);

int (*update)(struct bt_mesh_model *mod)
    Callback for updating the publication buffer.
    When set to NULL, the model is assumed not to support periodic publishing. When
    set to non-NULL the callback will be called periodically and is expected to update
    bt_mesh_model_pub::msg with a valid publication message.
    If the callback returns non-zero, the publication is skipped and will resume on the next
    periodic publishing interval.
    When bt_mesh_model_pub::retr_update is set to 1, the callback will be called on every
    retransmission.

    Param mod
    The Model the Publication Context belongs to.

    Return
    Zero on success or (negative) error code otherwise.
struct k_work_delayable timer

Publish Period Timer. Only for stack-internal use.

struct bt_mesh_model_cb

#include <access.h> Model callback functions.

Public Members

int (*const settings_set)(struct bt_mesh_model *model, const char *name, size_t len_rd, settings_read_cb read_cb, void *cb_arg)

Set value handler of user data tied to the model.

See also:

settings_handler::h_set

  Param model
    Model to set the persistent data of.

  Param name
    Name/key of the settings item.

  Param len_rd
    The size of the data found in the backend.

  Param read_cb
    Function provided to read the data from the backend.

  Param cb_arg
    Arguments for the read function provided by the backend.

  Return
    0 on success, error otherwise.

int (*const start)(struct bt_mesh_model *model)

Callback called when the mesh is started.

This handler gets called after the node has been provisioned, or after all mesh data has been loaded from persistent storage.

When this callback fires, the mesh model may start its behavior, and all Access APIs are ready for use.

  Param model
    Model this callback belongs to.

  Return
    0 on success, error otherwise.

int (*const init)(struct bt_mesh_model *model)

Model init callback.

Called on every model instance during mesh initialization.

If any of the model init callbacks return an error, the Mesh subsystem initialization will be aborted, and the error will be returned to the caller of bt_mesh_init.

  Param model
    Model to be initialized.

  Return
    0 on success, error otherwise.
void (*const reset)(struct bt_mesh_model *model)
    Model reset callback.
    Called when the mesh node is reset. All model data is deleted on reset, and the model
    should clear its state.

    **Note:** If the model stores any persistent data, this needs to be erased manually.

**Param model**
    Model this callback belongs to.

struct bt_mesh_mod_id_vnd
    #include <access.h> Vendor model ID

**Public Members**

uint16_t company
    Vendor's company ID

uint16_t id
    Model ID

struct bt_mesh_model
    #include <access.h> Abstraction that describes a Mesh Model instance

**Public Members**

const uint16_t id
    SIG model ID

const struct bt_mesh_mod_id_vnd vnd
    Vendor model ID

struct bt_mesh_model_pub *const pub
    Model Publication

uint16_t *const keys
    AppKey List

uint16_t *const groups
    Subscription List (group or virtual addresses)

const struct bt_mesh_model_op *const op
    Opcode handler list

const struct bt_mesh_model_cb *const cb
    Model callback structure.

6.1. Bluetooth
void *user_data
    Model-specific user data

struct bt_mesh_send_cb
    #include <access.h> Callback structure for monitoring model message sending

Public Members

void (*start)(uint16_t duration, int err, void *cb_data)
    Handler called at the start of the transmission.
    
    **Param duration**
    The duration of the full transmission.
    
    **Param err**
    Error occurring during sending.
    
    **Param cb_data**
    Callback data, as passed to the send API.

void (*end)(int err, void *cb_data)
    Handler called at the end of the transmission.
    
    **Param err**
    Error occurring during sending.
    
    **Param cb_data**
    Callback data, as passed to the send API.

struct bt_mesh_comp
    #include <access.h> Node Composition

Public Members

uint16_t cid
    Company ID

uint16_t pid
    Product ID

uint16_t vid
    Version ID

size_t elem_count
    The number of elements in this device.

struct bt_mesh_elem *elem
    List of elements.

Foundation models  The Bluetooth mesh specification defines four foundation models that can be used by network administrators to configure and diagnose mesh nodes.
**Configuration Server**  The Configuration Server model is a foundation model defined by the Bluetooth mesh specification. The Configuration Server model controls most parameters of the mesh node. It does not have an API of its own, but relies on a *Configuration Client* to control it.

..note::
The `bt_mesh_cfg_srv` structure has been deprecated. The initial values of the Relay, Beacon, Friend, Network transmit and Relay retransmit should be set through Kconfig, and the Heartbeat feature should be controlled through the *Heartbeat* API.

The Configuration Server model is mandatory on all Bluetooth mesh nodes, and should be instantiated in the first element.

**API reference**

`group bt_mesh_cfg_srv`

Configuration Server Model.

**Defines**

`BT_MESH_MODEL_CFG_SRV`

Generic Configuration Server model composition data entry.

**Configuration Client**  The Configuration Client model is a foundation model defined by the Bluetooth mesh specification. It provides functionality for configuring most parameters of a mesh node, including encryption keys, model configuration and feature enabling.

The Configuration Client model communicates with a *Configuration Server* model using the device key of the target node. The Configuration Client model may communicate with servers on other nodes or self-configure through the local Configuration Server model.

All configuration functions in the Configuration Client API have `net_idx` and `addr` as their first parameters. These should be set to the network index and primary unicast address that the target node was provisioned with.

The Configuration Client model is optional, but should be instantiated on the first element if it is present in the composition data.

**API reference**

`group bt_mesh_cfg_cli`

Configuration Client Model.

**Defines**

`BT_MESH_MODEL_CFG_CLI(cli_data)`

Generic Configuration Client model composition data entry.

**Parameters**

- `cli_data` – Pointer to a *Configuration Client Model* instance.

`BT_MESH_PUB_PERIOD_100MS(steps)`

Helper macro to encode model publication period in units of 100ms.

**Parameters**

- `steps` – Number of 100ms steps.
Returns

Encoded value that can be assigned to `bt_mesh_cfg_cli_mod_pub.period`

`BT_MESH_PUB_PERIOD_SEC(steps)`

Helper macro to encode model publication period in units of 1 second.

Parameters

- `steps` – Number of 1 second steps.

Returns

Encoded value that can be assigned to `bt_mesh_cfg_cli_mod_pub.period`

`BT_MESH_PUB_PERIOD_10SEC(steps)`

Helper macro to encode model publication period in units of 10 seconds.

Parameters

- `steps` – Number of 10 second steps.

Returns

Encoded value that can be assigned to `bt_mesh_cfg_cli_mod_pub.period`

`BT_MESH_PUB_PERIOD_10MIN(steps)`

Helper macro to encode model publication period in units of 10 minutes.

Parameters

- `steps` – Number of 10 minute steps.

Returns

Encoded value that can be assigned to `bt_mesh_cfg_cli_mod_pub.period`

Functions

```c
int bt_mesh_cfg_node_reset(uint16_t net_idx, uint16_t addr, bool *status)

Reset the target node and remove it from the network.
```

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `status` – Status response parameter

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_comp_data_get(uint16_t net_idx, uint16_t addr, uint8_t page, uint8_t *rsp,
                                      struct net_buf_simple *comp)

Get the target node's composition data.
```

If the other device does not have the given composition data page, it will return the largest page number it supports that is less than the requested page index. The actual page the device responds with is returned in `rsp`.

This method can be used asynchronously by setting `rsp` and `comp` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `page` – Composition data page, or `0xff` to request the first available page.
• *rsp* – Return parameter for the returned page number, or NULL.
• *comp* – Composition data buffer to fill.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_beacon_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```
Get the target node's network beacon state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- *net_idx* – Network index to encrypt with.
- *addr* – Target node address.
- *status* – Status response parameter, returns one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED` on success.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_krp_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint8_t *phase)
```
Get the target node's network key refresh phase state.

This method can be used asynchronously by setting `status` and `phase` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- *net_idx* – Network index to encrypt with.
- *addr* – Target node address.
- *key_net_idx* – Network key index.
- *status* – Status response parameter.
- *phase* – Pointer to the Key Refresh variable to fill.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_krp_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t transition, uint8_t *status, uint8_t *phase)
```
Set the target node’s network key refresh phase parameters.

This method can be used asynchronously by setting `status` and `phase` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- *net_idx* – Network index to encrypt with.
- *addr* – Target node address.
- *key_net_idx* – Network key index.
- *transition* – Transition parameter.
- *status* – Status response parameter.
- *phase* – Pointer to the new Key Refresh phase. Will return the actual Key Refresh phase after updating.
Returns 0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_beacon_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node's network beacon state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New network beacon state, should be one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED`.
- `status` – Status response parameter. Returns one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED` on success.

Returns 0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_ttl_get(uint16_t net_idx, uint16_t addr, uint8_t *ttl)
```

Get the target node's Time To Live value.

This method can be used asynchronously by setting `ttl` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `ttl` – TTL response buffer.

Returns 0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_ttl_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *ttl)
```

Set the target node's Time To Live value.

This method can be used asynchronously by setting `ttl` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New Time To Live value.
- `ttl` – TTL response buffer.

Returns 0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_friend_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```

Get the target node's Friend feature status.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
• **addr** – Target node address.
• **status** – Status response parameter. Returns one of `BT_MESH_FRIEND_DISABLED`, `BT_MESH_FRIEND_ENABLED` or `BT_MESH_FRIEND_NOT_SUPPORTED` on success.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_friend_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node's Friend feature state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **val** – New Friend feature state. Should be one of `BT_MESH_FRIEND_DISABLED` or `BT_MESH_FRIEND_ENABLED`.
• **status** – Status response parameter. Returns one of `BT_MESH_FRIEND_DISABLED`, `BT_MESH_FRIEND_ENABLED` or `BT_MESH_FRIEND_NOT_SUPPORTED` on success.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_gatt_proxy_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```

Get the target node's Proxy feature state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **status** – Status response parameter. Returns one of `BT_MESH_GATT_PROXY_DISABLED`, `BT_MESH_GATT_PROXY_ENABLED` or `BT_MESH_GATT_PROXY_NOT_SUPPORTED` on success.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_gatt_proxy_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node's Proxy feature state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **val** – New Proxy feature state. Must be one of `BT_MESH_GATT_PROXY_DISABLED` or `BT_MESH_GATT_PROXY_ENABLED`.
• **status** – Status response parameter. Returns one of `BT_MESH_GATT_PROXY_DISABLED`, `BT_MESH_GATT_PROXY_ENABLED` or `BT_MESH_GATT_PROXY_NOT_SUPPORTED` on success.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_net_transmit_get(uint16_t net_idx, uint16_t addr, uint8_t *transmit)
Get the target node’s network_transmit state.
This method can be used asynchronously by setting transmit as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- transmit – Network transmit response parameter. Returns the encoded network transmission parameters on success. Decoded with BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_net_transmit_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *transmit)
Set the target node’s network transmit parameters.
This method can be used asynchronously by setting transmit as NULL. This way the method
will not wait for response and will return immediately after sending the command.

See also:
BT_MESH_TRANSMIT.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- val – New encoded network transmit parameters.
- transmit – Network transmit response parameter. Returns the encoded network transmission parameters on success. Decoded with BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_relay_get(uint16_t net_idx, uint16_t addr, uint8_t *status, uint8_t *transmit)
Get the target node’s Relay feature state.
This method can be used asynchronously by setting status and transmit as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- status – Status response parameter. Returns one of BT_MESH_RELAY_DISABLED, BT_MESH_RELAY_ENABLED or BT_MESH_RELAY_NOT_SUPPORTED on success.
- transmit – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT.
Returns
0 on success, or (negative) error code on failure.

\[
\text{int bt_mesh_cfg_relay_set} (\text{uint16_t net_idx, uint16_t addr, uint8_t new_relay, uint8_t new_transmit, uint8_t *status, uint8_t *transmit})
\]

Set the target node's Relay parameters.
This method can be used asynchronously by setting \text{status} and \text{transmit} as NULL. This way the method will not wait for response and will return immediately after sending the command.

See also:
\textit{BT_MESH_TRANSMIT}.

Parameters
- \text{net_idx} – Network index to encrypt with.
- \text{addr} – Target node address.
- \text{new_relay} – New relay state. Must be one of \text{BT_MESH_RELAY_DISABLED} or \text{BT_MESH_RELAY_ENABLED}.
- \text{new_transmit} – New encoded relay transmit parameters.
- \text{status} – Status response parameter. Returns one of \text{BT_MESH_RELAY_DISABLED}, \text{BT_MESH_RELAY_ENABLED} or \text{BT_MESH_RELAY_NOT_SUPPORTED} on success.
- \text{transmit} – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with \text{BT_MESH_TRANSMIT_COUNT} and \text{BT_MESH_TRANSMIT_INT}.

Returns
0 on success, or (negative) error code on failure.

\[
\text{int bt_mesh_cfg_net_key_add} (\text{uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const uint8_t net_key[16], uint8_t *status})
\]

Add a network key to the target node.
This method can be used asynchronously by setting \text{status} as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- \text{net_idx} – Network index to encrypt with.
- \text{addr} – Target node address.
- \text{key_net_idx} – Network key index.
- \text{net_key} – Network key.
- \text{status} – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

\[
\text{int bt_mesh_cfg_net_key_get} (\text{uint16_t net_idx, uint16_t addr, uint16_t *keys, size_t *key_cnt})
\]

Get a list of the target node's network key indexes.
This method can be used asynchronously by setting \text{keys} or \text{key_cnt} as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- \text{net_idx} – Network index to encrypt with.
• **addr** – Target node address.
• **keys** – Net key index list response parameter. Will be filled with all the returned network key indexes it can fill.
• **key_cnt** – Net key index list length. Should be set to the capacity of the keys list when calling. Will return the number of returned network key indexes upon success.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_net_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status)
```

Delete a network key from the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **key_net_idx** – Network key index.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_app_key_add(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, const uint8_t app_key[16], uint8_t *status)
```

Add an application key to the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **key_net_idx** – Network key index the application key belongs to.
• **key_app_idx** – Application key index.
• **app_key** – Application key.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_app_key_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint16_t *keys, size_t *key_cnt)
```

Get a list of the target node's application key indexes for a specific network key.

This method can be used asynchronously by setting `status` and (`keys` or `key_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **key_net_idx** – Network key index to request the app key indexes of.
• **status** – Status response parameter.
• **keys** – App key index list response parameter. Will be filled with all the returned application key indexes it can fill.
• **key_cnt** – App key index list length. Should be set to the capacity of the `keys` list when calling. Will return the number of returned application key indexes upon success.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_app_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, uint8_t *status)
```

Delete an application key from the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **key_net_idx** – Network key index the application key belongs to.
• **key_app_idx** – Application key index.
• **status** – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_app_bind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)
```

Bind an application to a SIG model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **mod_app_idx** – Application index to bind.
• **mod_id** – Model ID.
• **status** – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_app_unbind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)
```

Unbind an application from a SIG model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_app_idx** – Application index to unbind.
- **mod_id** – Model ID.
- **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_app_bind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                 uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid,
                                 uint8_t *status)
```

Bind an application to a vendor model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_app_idx** – Application index to bind.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_app_unbind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                   uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid,
                                   uint8_t *status)
```

Unbind an application from a vendor model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_app_idx** – Application index to unbind.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_app_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id,
                            uint8_t *status, uint16_t *apps, size_t *app_cnt)
```

Get a list of all applications bound to a SIG model on the target node.
This method can be used asynchronously by setting `status` and `(apps or app_cnt)` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `status` – Status response parameter.
- `apps` – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
- `app_cnt` – App index list length. Should be set to the capacity of the `apps` list when calling. Will return the number of returned application key indexes upon success.

**Returns**

0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_app_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                 uint16_t mod_id, uint16_t cid, uint8_t *status,
                                 uint16_t *apps, size_t *app_cnt)
```

Get a list of all applications bound to a vendor model on the target node.

This method can be used asynchronously by setting `status` and `(apps or app_cnt)` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.
- `apps` – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
- `app_cnt` – App index list length. Should be set to the capacity of the `apps` list when calling. Will return the number of returned application key indexes upon success.

**Returns**

0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_mod_pub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id,
                            struct bt_mesh_cfg_mod_pub *pub, uint8_t *status)
```

Get publish parameters for a SIG model on the target node.

This method can be used asynchronously by setting `status` and `pub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• pub – Publication parameter return buffer.
• status – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_pub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, uint16_t cid,
                                struct bt_mesh_cfg_mod_pub *pub,
                                uint8_t *status)
```

Get publish parameters for a vendor model on the target node.

This method can be used asynchronously by setting `status` and `pub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• `net_idx` – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• cid – Company ID of the model.
• pub – Publication parameter return buffer.
• status – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_pub_set(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                            uint16_t mod_id, struct bt_mesh_cfg_mod_pub *
                            pub,
                            uint8_t *status)
```

Set publish parameters for a SIG model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

`pub` shall not be NULL.

**Parameters**
• `net_idx` – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• pub – Publication parameters.
• status – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_pub_set_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, uint16_t cid,
                                struct bt_mesh_cfg_mod_pub *
                                pub,
                                uint8_t *status)
```
Set publish parameters for a vendor model on the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

pub shall not be NULL.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `pub` – Publication parameters.
- `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_sub_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint8_t *status)
```

Add a group address to a SIG model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_sub_add_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)
```

Add a group address to a vendor model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_sub_del(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint8_t *status)

Delete a group address in a SIG model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• sub_addr – Group address to add to the subscription list.
• mod_id – Model ID.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_sub_del_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Delete a group address in a vendor model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• sub_addr – Group address to add to the subscription list.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_sub_overwrite(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint8_t *status)

Overwrite all addresses in a SIG model's subscription list with a group address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• **elem_addr** – Element address the model is in.
• **sub_addr** – Group address to add to the subscription list.
• **mod_id** – Model ID.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_sub_overwrite_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                      uint16_t sub_addr, uint16_t mod_id, uint16_t cid,
                                      uint8_t *status)
```

Overwrite all addresses in a vendor model's subscription list with a group address.
Deletes all subscriptions in the model's subscription list, and adds a single group address instead.
This method can be used asynchronously by setting **status** as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **sub_addr** – Group address to add to the subscription list.
• **mod_id** – Model ID.
• **cid** – Company ID of the model.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_sub_va_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const
                                uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr,
                                uint8_t *status)
```

Add a virtual address to a SIG model's subscription list.
This method can be used asynchronously by setting **status** and **virt_addr** as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **label** – Virtual address label to add to the subscription list.
• **mod_id** – Model ID.
• **virt_addr** – Virtual address response parameter.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.
Add a virtual address to a vendor model's subscription list.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **label** – Virtual address label to add to the subscription list.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **virt_addr** – Virtual address response parameter.
- **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

Delete a virtual address in a SIG model's subscription list.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **label** – Virtual address parameter to add to the subscription list.
- **mod_id** – Model ID.
- **virt_addr** – Virtual address response parameter.
- **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

Delete a virtual address in a vendor model's subscription list.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
*label – Virtual address label to add to the subscription list.
*mod_id – Model ID.
*cid – Company ID of the model.
*virt_addr – Virtual address response parameter.
*status – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_sub_va_overwrite(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
    const uint8_t label[16], uint16_t mod_id, uint16_t
    *virt_addr, uint8_t *status)
```

Overwrite all addresses in a SIG model’s subscription list with a virtual address.

Deletes all subscriptions in the model’s subscription list, and adds a single group address instead.

This method can be used asynchronously by setting *status and *virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **label** – Virtual address label to add to the subscription list.
- **mod_id** – Model ID.
- **virt_addr** – Virtual address response parameter.
- **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_sub_va_overwrite_vnd(uint16_t net_idx, uint16_t addr, uint16_t
    elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t
    cid, uint16_t *virt_addr, uint8_t *status)
```

Overwrite all addresses in a vendor model’s subscription list with a virtual address.

Deletes all subscriptions in the model’s subscription list, and adds a single group address instead.

This method can be used asynchronously by setting *status and *virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **label** – Virtual address label to add to the subscription list.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **virt_addr** – Virtual address response parameter.
- **status** – Status response parameter.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_sub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status, uint16_t *subs, size_t *sub_cnt)

Get the subscription list of a SIG model on the target node.
This method can be used asynchronously by setting status and (subs or sub_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• status – Status response parameter.
• subs – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
• sub_cnt – Subscription list element count. Should be set to the capacity of the subs list when calling. Will return the number of returned subscriptions upon success.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_sub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, uint8_t *status, uint16_t *subs, size_t *sub_cnt)

Get the subscription list of a vendor model on the target node.
This method can be used asynchronously by setting status and (subs or sub_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.
• subs – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
• sub_cnt – Subscription list element count. Should be set to the capacity of the subs list when calling. Will return the number of returned subscriptions upon success.

Returns
0 on success, or (negative) error code on failure.
int bt_mesh_cfg_hb_sub_set(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_hb_sub *sub, uint8_t *status)
Set the target node's Heartbeat subscription parameters.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.
sub shall not be null.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- sub – New Heartbeat subscription parameters.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_hb_sub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_hb_sub *sub, uint8_t *status)
Get the target node's Heartbeat subscription parameters.
This method can be used asynchronously by setting status and sub as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- sub – Heartbeat subscription parameter return buffer.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_hb_pub_set(uint16_t net_idx, uint16_t addr, const struct bt_mesh_cfg_hb_pub *pub, uint8_t *status)
Set the target node's Heartbeat publication parameters.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.
pub shall not be NULL;

Note: The target node must already have received the specified network key.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- pub – New Heartbeat publication parameters.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.
int bt_mesh_cfg_hb_pub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_hb_pub *pub, uint8_t *status)

Get the target node’s Heartbeat publication parameters.

This method can be used asynchronously by setting status and pub as NULL. This way the
method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• pub – Heartbeat publication parameter return buffer.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_sub_del_all(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status)

Delete all group addresses in a SIG model’s subscription list.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_sub_del_all_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Delete all group addresses in a vendor model’s subscription list.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_net_key_update(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const uint8_t net_key[16], uint8_t *status)

1546 Chapter 6. Connectivity
Update a network key to the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index.
- `net_key` – Network key.
- `status` – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_app_key_update(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                                uint16_t key_app_idx, const uint8_t app_key[16],
                                uint8_t *status)
```

Update an application key to the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `key_app_idx` – Application key index.
- `app_key` – Application key.
- `status` – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_node_identity_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                                  uint8_t new_identity, uint8_t *status, uint8_t *identity)
```

Set the Node Identity parameters.

This method can be used asynchronously by setting `status` and `identity` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `new_identity` – New identity state. Must be one of `BT_MESH_NODE_IDENTITY_STOPPED` or `BT_MESH_NODE_IDENTITY_RUNNING`.
- `key_net_idx` – Network key index the application key belongs to.
- `status` – Status response parameter.
- `identity` – Identity response parameter.

**Returns**

0 on success, or (negative) error code on failure.
int bt_mesh_cfg_node_identity_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint8_t *identity)

Get the Node Identity parameters.
This method can be used asynchronously by setting status and identity as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- key_net_idx – Network key index the application key belongs to.
- status – Status response parameter.
- identity – Identity response parameter. Must be one of BT_MESH_NODE_IDENTITY_STOPPED or BT_MESH_NODE_IDENTITY_RUNNING

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_lpn_timeout_get(uint16_t net_idx, uint16_t addr, uint16_t unicast_addr, int32_t *polltimeout)

Get the Low Power Node Polltimeout parameters.
This method can be used asynchronously by setting polltimeout as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- unicast_addr – LPN unicast address.
- polltimeout – Poll timeout response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_node_reset(uint16_t net_idx, uint16_t addr, bool *status)

Reset the target node and remove it from the network.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- status – Status response parameter

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_comp_data_get(uint16_t net_idx, uint16_t addr, uint8_t page, uint8_t *rsp, struct net_buf_simple *comp)

Get the target node's composition data.
If the other device does not have the given composition data page, it will return the largest page number it supports that is less than the requested page index. The actual page the device responds with is returned in rsp.

This method can be used asynchronously by setting rsp and comp as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• page – Composition data page, or 0xff to request the first available page.
• rsp – Return parameter for the returned page number, or NULL.
• comp – Composition data buffer to fill.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_beacon_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
Get the target node's network beacon state.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• status – Status response parameter, returns one of
  BT_MESH_BEACON_DISABLED or BT_MESH_BEACON_ENABLED on suc-
  cess.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_krp_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t
  *status, uint8_t *phase)
Get the target node's network key refresh phase state.

This method can be used asynchronously by setting status and phase as NULL. This way the
method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index.
• status – Status response parameter.
• phase – Pointer to the Key Refresh variable to fill.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_krp_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t
  transition, uint8_t *status, uint8_t *phase)
Set the target node's network key refresh phase parameters.

This method can be used asynchronously by setting status and phase as NULL. This way the
method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index.
• transition – Transition parameter.
• status – Status response parameter.
• phase – Pointer to the new Key Refresh phase. Will return the actual Key Refresh phase after updating.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_beacon_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node’s network beacon state.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• net_idx – Network index to encrypt with.

• addr – Target node address.

• val – New network beacon state, should be one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED`.

• status – Status response parameter. Returns one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED` on success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_ttl_get(uint16_t net_idx, uint16_t addr, uint8_t *ttl)
```

Get the target node’s Time To Live value.

This method can be used asynchronously by setting ttl as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• net_idx – Network index to encrypt with.

• addr – Target node address.

• ttl – TTL response buffer.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_ttl_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *ttl)
```

Set the target node’s Time To Live value.

This method can be used asynchronously by setting ttl as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• net_idx – Network index to encrypt with.

• addr – Target node address.

• val – New Time To Live value.

• ttl – TTL response buffer.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_friend_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```

Get the target node’s Friend feature status.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
net_idx – Network index to encrypt with.
addr – Target node address.
status – Status response parameter. Returns one of
  BT_MESH_FRIEND_DISABLED, BT_MESH_FRIEND_ENABLED or
  BT_MESH_FRIEND_NOT_SUPPORTED on success.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_friend_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
Set the target node’s Friend feature state.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• val – New Friend feature state. Should be one of
  BT_MESH_FRIEND_DISABLED or BT_MESH_FRIEND_ENABLED.
• status – Status response parameter. Returns one of
  BT_MESH_FRIEND_DISABLED, BT_MESH_FRIEND_ENABLED or
  BT_MESH_FRIEND_NOT_SUPPORTED on success.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_gatt_proxy_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
Get the target node’s Proxy feature state.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• status – Status response parameter. Returns one of
  BT_MESH_GATT_PROXY_DISABLED, BT_MESH_GATT_PROXY_ENABLED or
  BT_MESH_GATT_PROXY_NOT_SUPPORTED on success.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_gatt_proxy_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
Set the target node’s Proxy feature state.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• val – New Proxy feature state. Must be one of
  BT_MESH_GATT_PROXY_DISABLED or BT_MESH_GATT_PROXY_ENABLED.
status – Status response parameter. Returns one of BT_MESH_GATT_PROXY_DISABLED, BT_MESH_GATT_PROXY_ENABLED or BT_MESH_GATT_PROXY_NOT_SUPPORTED on success.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_net_transmit_get(uint16_t net_idx, uint16_t addr, uint8_t *transmit)
Get the target node’s network transmit state.

This method can be used asynchronously by setting transmit as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• transmit – Network transmit response parameter. Returns the encoded network transmission parameters on success. Decoded with BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_net_transmit_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *transmit)
Set the target node’s network transmit parameters.

This method can be used asynchronously by setting transmit as NULL. This way the method will not wait for response and will return immediately after sending the command.

See also:
BT_MESH_TRANSMIT.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• val – New encoded network transmit parameters.
• transmit – Network transmit response parameter. Returns the encoded network transmission parameters on success. Decoded with BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_relay_get(uint16_t net_idx, uint16_t addr, uint8_t *status, uint8_t *transmit)
Get the target node’s Relay feature state.

This method can be used asynchronously by setting status and transmit as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• **status** – Status response parameter. Returns one of **BT_MESH_RELAY_DISABLED**, **BT_MESH_RELAY_ENABLED** or **BT_MESH_RELAY_NOT_SUPPORTED** on success.

• **transmit** – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with **BT_MESH_TRANSMIT_COUNT** and **BT_MESH_TRANSMIT_INT**.

**Returns**
- 0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_relay_set(uint16_t net_idx, uint16_t addr, uint8_t new_relay, uint8_t new_transmit, uint8_t *status, uint8_t *transmit)
```

Set the target node's Relay parameters.

This method can be used asynchronously by setting `status` and `transmit` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**See also:**
**BT_MESH_TRANSMIT**.

**Parameters**
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **new_relay** – New relay state. Must be one of **BT_MESH_RELAY_DISABLED** or **BT_MESH_RELAY_ENABLED**.
- **new_transmit** – New encoded relay transmit parameters.
- **status** – Status response parameter. Returns one of **BT_MESH_RELAY_DISABLED**, **BT_MESH_RELAY_ENABLED** or **BT_MESH_RELAY_NOT_SUPPORTED** on success.
- **transmit** – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with **BT_MESH_TRANSMIT_COUNT** and **BT_MESH_TRANSMIT_INT**.

**Returns**
- 0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_net_key_add(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const uint8_t net_key[16], uint8_t *status)
```

Add a network key to the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index.
- **net_key** – Network key.
- **status** – Status response parameter.

**Returns**
- 0 on success, or (negative) error code on failure.
Get a list of the target node’s network key indexes.
This method can be used asynchronously by setting keys or key_cnt as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **keys** – Net key index list response parameter. Will be filled with all the returned network key indexes it can fill.
- **key_cnt** – Net key index list length. Should be set to the capacity of the keys list when calling. Will return the number of returned network key indexes upon success.

**Returns**
0 on success, or (negative) error code on failure.

Delete a network key from the target node.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index.
- **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

Add an application key to the target node.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index the application key belongs to.
- **key_app_idx** – Application key index.
- **app_key** – Application key.
- **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.
int bt_mesh_cfg_cli_app_key_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint16_t *keys, size_t *key_cnt)

Get a list of the target node’s application key indexes for a specific network key.

This method can be used asynchronously by setting status and (keys or key_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index to request the app key indexes of.
- **status** – Status response parameter.
- **keys** – App key index list response parameter. Will be filled with all the returned application key indexes it can fill.
- **key_cnt** – App key index list length. Should be set to the capacity of the keys list when calling. Will return the number of returned application key indexes upon success.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_app_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, uint8_t *status)

Delete an application key from the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index the application key belongs to.
- **key_app_idx** – Application key index.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_app_bind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)

Bind an application to a SIG model on the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_app_idx** – Application index to bind.
- **mod_id** – Model ID.
- **status** – Status response parameter.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_app_unbind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)

Unbind an application from a SIG model on the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_app_idx – Application index to unbind.
• mod_id – Model ID.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_app_bind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid, uint8_t *status)

Bind an application to a vendor model on the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_app_idx – Application index to bind.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_app_unbind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid, uint8_t *status)

Unbind an application from a vendor model on the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• **mod_app_idx** – Application index to unbind.
• **mod_id** – Model ID.
• **cid** – Company ID of the model.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_app_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, uint8_t *status, uint16_t *apps, size_t *app_cnt)
```

Get a list of all applications bound to a SIG model on the target node.

This method can be used asynchronously by setting `status` and (`apps` or `app_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **mod_id** – Model ID.
• **status** – Status response parameter.
• **apps** – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
• **app_cnt** – App index list length. Should be set to the capacity of the `apps` list when calling. Will return the number of returned application key indexes upon success.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_app_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                     uint16_t mod_id, uint16_t cid, uint8_t *status, uint16_t *apps, size_t *app_cnt)
```

Get a list of all applications bound to a vendor model on the target node.

This method can be used asynchronously by setting `status` and (`apps` or `app_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **mod_id** – Model ID.
• **cid** – Company ID of the model.
• **status** – Status response parameter.
• **apps** – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
• **app_cnt** – App index list length. Should be set to the capacity of the `apps` list when calling. Will return the number of returned application key indexes upon success.
Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_pub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, struct bt_mesh_cfg_cli_mod_pub *pub,
                                uint8_t *status)
```

Get publish parameters for a SIG model on the target node.

This method can be used asynchronously by setting `status` and `pub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `pub` – Publication parameter return buffer.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_pub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                    uint16_t mod_id, uint16_t cid, struct bt_mesh_cfg_cli_mod_pub *pub,
                                    uint8_t *status)
```

Get publish parameters for a vendor model on the target node.

This method can be used asynchronously by setting `status` and `pub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `pub` – Publication parameter return buffer.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_pub_set(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, struct bt_mesh_cfg_cli_mod_pub *pub,
                                uint8_t *status)
```

Set publish parameters for a SIG model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

`pub` shall not be NULL.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• pub – Publication parameters.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_pub_set_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
uint16_t mod_id, uint16_t cid, struct bt_mesh_cfg_cli_mod_pub *pub, uint8_t *status)

Set publish parameters for a vendor model on the target node.
This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

pub shall not be NULL.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• cid – Company ID of the model.
• pub – Publication parameters.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
uint16_t sub_addr, uint16_t mod_id, uint8_t *status)

Add a group address to a SIG model’s subscription list.
This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• sub_addr – Group address to add to the subscription list.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_add_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Add a group address to a vendor model’s subscription list.
This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

6.1. Bluetooth
Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_mod_sub_del(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t sub_addr, uint16_t mod_id, uint8_t *status)
```

Delete a group address in a SIG model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_mod_sub_del_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                    uint16_t sub_addr, uint16_t mod_id, uint16_t cid,
                                    uint8_t *status)
```

Delete a group address in a vendor model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.
int bt_mesh_cfg_cli_mod_sub_overwrite(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
uint16_t sub_addr, uint16_t mod_id, uint8_t *status)

Overwrite all addresses in a SIG model's subscription list with a group address.
Deletes all subscriptions in the model's subscription list, and adds a single group address instead.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- sub_addr – Group address to add to the subscription list.
- mod_id – Model ID.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_overwrite_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Overwrite all addresses in a vendor model's subscription list with a group address.
Deletes all subscriptions in the model's subscription list, and adds a single group address instead.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- sub_addr – Group address to add to the subscription list.
- mod_id – Model ID.
- cid – Company ID of the model.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_va_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
const uint8_t label[16], uint16_t mod_id, uint16_t virt_addr, uint8_t *status)

Add a virtual address to a SIG model's subscription list.
This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
• `elem_addr` – Element address the model is in.
• `label` – Virtual address label to add to the subscription list.
• `mod_id` – Model ID.
• `virt_addr` – Virtual address response parameter.
• `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_va_add_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t cid, uint16_t *virt_addr, uint8_t *status)
```

Add a virtual address to a vendor model's subscription list.

This method can be used asynchronously by setting `status` and `virt_addr` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• `net_idx` – Network index to encrypt with.
• `addr` – Target node address.
• `elem_addr` – Element address the model is in.
• `label` – Virtual address label to add to the subscription list.
• `mod_id` – Model ID.
• `cid` – Company ID of the model.
• `virt_addr` – Virtual address response parameter.
• `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_va_del(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t cid, uint16_t *virt_addr, uint8_t *status)
```

Delete a virtual address in a SIG model's subscription list.

This method can be used asynchronously by setting `status` and `virt_addr` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• `net_idx` – Network index to encrypt with.
• `addr` – Target node address.
• `elem_addr` – Element address the model is in.
• `label` – Virtual address parameter to add to the subscription list.
• `mod_id` – Model ID.
• `virt_addr` – Virtual address response parameter.
• `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.
int bt_mesh_cfg_cli_mod_sub_va_del_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
const uint8_t label[16], uint16_t mod_id, uint16_t cid, uint16_t *virt_addr, uint8_t *status)

Delete a virtual address in a vendor model's subscription list.
This method can be used asynchronously by setting status and virt_addr as NULL. This way
the method will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- label – Virtual address label to add to the subscription list.
- mod_id – Model ID.
- cid – Company ID of the model.
- virt_addr – Virtual address response parameter.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_va_overwrite(uint16_t net_idx, uint16_t addr, uint16_t
elem_addr, const uint8_t label[16], uint16_t
mod_id, uint16_t *virt_addr, uint8_t *status)

Overwrite all addresses in a SIG model's subscription list with a virtual address.
Deletes all subscriptions in the model's subscription list, and adds a single group address
instead.
This method can be used asynchronously by setting status and virt_addr as NULL. This way
the method will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- label – Virtual address label to add to the subscription list.
- mod_id – Model ID.
- virt_addr – Virtual address response parameter.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_va_overwrite_vnd(uint16_t net_idx, uint16_t addr, uint16_t
elem_addr, const uint8_t label[16], uint16_t
mod_id, uint16_t cid, uint16_t *virt_addr,
uint8_t *status)

Overwrite all addresses in a vendor model's subscription list with a virtual address.
Deletes all subscriptions in the model's subscription list, and adds a single group address
instead.
This method can be used asynchronously by setting status and virt_addr as NULL. This way
the method will not wait for response and will return immediately after sending the command.
Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address label to add to the subscription list.
• mod_id – Model ID.
• cid – Company ID of the model.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                 uint16_t mod_id, uint8_t *status, uint16_t *subs, size_t *sub_cnt)
```

Get the subscription list of a SIG model on the target node.

This method can be used asynchronously by setting `status` and (`subs` or `sub_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• status – Status response parameter.
• subs – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
• sub_cnt – Subscription list element count. Should be set to the capacity of the subs list when calling. Will return the number of returned subscriptions upon success.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                    uint16_t mod_id, uint8_t *status, uint16_t *subs, size_t *sub_cnt)
```

Get the subscription list of a vendor model on the target node.

This method can be used asynchronously by setting `status` and (`subs` or `sub_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• **cid** – Company ID of the model.
• **status** – Status response parameter.
• **subs** – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
• **sub_cnt** – Subscription list element count. Should be set to the capacity of the subs list when calling. Will return the number of returned subscriptions upon success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_sub_set(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_sub *sub, uint8_t *status)
```

Set the target node’s Heartbeat subscription parameters.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Sub shall not be null.

**Parameters**

• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **sub** – New Heartbeat subscription parameters.
• **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_sub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_sub *sub, uint8_t *status)
```

Get the target node’s Heartbeat subscription parameters.

This method can be used asynchronously by setting status and sub as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **sub** – Heartbeat subscription parameter return buffer.
• **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_pub_set(uint16_t net_idx, uint16_t addr, const struct bt_mesh_cfg_cli_hb_pub *pub, uint8_t *status)
```

Set the target node’s Heartbeat publication parameters.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Pub shall not be NULL;

**Note:** The target node must already have received the specified network key.
Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- pub – New Heartbeat publication parameters.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_hb_pub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_pub *pub, uint8_t *status)

Get the target node's Heartbeat publication parameters.
This method can be used asynchronously by setting status and pub as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- pub – Heartbeat publication parameter return buffer.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_del_all(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status)

Delete all group addresses in a SIG model's subscription list.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- mod_id – Model ID.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_del_all_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Delete all group addresses in a vendor model's subscription list.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_net_key_update(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                                   const uint8_t net_key[16], uint8_t *status)
```

Update a network key to the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index.
- `net_key` – Network key.
- `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_app_key_update(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                                   uint16_t key_app_idx, const uint8_t app_key[16],
                                   uint8_t *status)
```

Update an application key to the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `key_app_idx` – Application key index.
- `app_key` – Application key.
- `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_node_identity_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                                      uint8_t new_identity, uint8_t *status,
                                      uint8_t *identity)
```

Set the Node Identity parameters.

This method can be used asynchronously by setting `status` and `identity` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
new_identity – New identity state. Must be one of `BT_MESH_NODE_IDENTITY_STOPPED` or `BT_MESH_NODE_IDENTITY_RUNNING`

key_net_idx – Network key index the application key belongs to.

status – Status response parameter.

identity – Identity response parameter.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_node_identity_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint8_t *identity)
```

Get the Node Identity parameters.

This method can be used asynchronously by setting `status` and `identity` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `status` – Status response parameter.
- `identity` – Identity response parameter.

identity – Identity response parameter. Must be one of `BT_MESH_NODE_IDENTITY_STOPPED` or `BT_MESH_NODE_IDENTITY_RUNNING`

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_lpn_timeout_get(uint16_t net_idx, uint16_t addr, uint16_t unicast_addr, int32_t *polltimeout)
```

Get the Low Power Node Polltimeout parameters.

This method can be used asynchronously by setting `polltimeout` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `unicast_addr` – LPN unicast address.
- `polltimeout` – Poll timeout response parameter.

Returns
0 on success, or (negative) error code on failure.

```c
int32_t bt_mesh_cfg_cli_timeout_get(void)
```

Get the current transmission timeout value.

Returns
The configured transmission timeout in milliseconds.

```c
void bt_mesh_cfg_cli_timeout_set(int32_t timeout)
```

Set the transmission timeout value.

**Parameters**

- `timeout` – The new transmission timeout.
int bt_mesh_comp_p0_get(struct bt_mesh_comp_p0 *comp, struct net_buf_simple *buf)
Create a composition data page 0 representation from a buffer.
The composition data page object will take ownership over the buffer, which should not be
manipulated directly after this call.
This function can be used in combination with bt_mesh_cfg_cli_comp_data_get to read out
composition data page 0 from other devices:

```c
NET_BUF_SIMPLE_DEFINE(buf, BT_MESH_RX_SDU_MAX);
struct bt_mesh_comp_p0 comp;

err = bt_mesh_cfg_cli_comp_data_get(net_idx, addr, 0, &page, &buf);
if (!err) {
    bt_mesh_comp_p0_get(&comp, &buf);
}
```

**Parameters**
- `buf` – Network buffer containing composition data.
- `comp` – Composition data structure to fill.

**Returns**
0 on success, or (negative) error code on failure.

struct bt_mesh_comp_p0_elem *bt_mesh_comp_p0_elem_pull(const struct bt_mesh_comp_p0
*comp, struct bt_mesh_comp_p0_elem *elem)
Pull a composition data page 0 element from a composition data page 0 instance.
Each call to this function will pull out a new element from the composition data page, until
all elements have been pulled.

**Parameters**
- `comp` – Composition data page
- `elem` – Element to fill.

**Returns**
A pointer to `elem` on success, or NULL if no more elements could be pulled.

uint16_t bt_mesh_comp_p0_elem_mod(struct bt_mesh_comp_p0_elem *elem, int idx)
Get a SIG model from the given composition data page 0 element.

**Parameters**
- `elem` – Element to read the model from.
- `idx` – Index of the SIG model to read.

**Returns**
The Model ID of the SIG model at the given index, or 0xffff if the index is out of
bounds.

struct bt_mesh_mod_id_vnd bt_mesh_comp_p0_elem_mod_vnd(struct bt_mesh_comp_p0_elem
*elem, int idx)
Get a vendor model from the given composition data page 0 element.

**Parameters**
- `elem` – Element to read the model from.
- `idx` – Index of the vendor model to read.
Returns
The model ID of the vendor model at the given index, or {0xffff, 0xffff} if the index is out of bounds.

struct bt_mesh_cfg_cli_cb
#include <cfg_cli.h> Mesh Configuration Client Status messages callback

Public Members

void (*mod_sub_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t sub_addr, uint32_t mod_id)
Optional callback for Model Sub Status messages.
Handles received Model Sub Status messages from a server.
    Param cli
        Client that received the status message.
    Param addr
        Address of the sender.
    Param status
        Status Code for requesting message.
    Param elem_addr
        The unicast address of the element.
    Param sub_addr
        The sub address.
    Param mod_id
        The model ID within the element.

void (*node_reset_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr)
Optional callback for Node Reset Status messages.
Handles received Node Reset Status messages from a server.
    Param cli
        Client that received the status message.
    Param addr
        Address of the sender.

void (*beacon_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for Beacon Status messages.
Handles received Beacon Status messages from a server.
    Param cli
        Client that received the status message.
    Param addr
        Address of the sender.
    Param status
        Status Code for requesting message.

void (*ttl_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for Default TTL Status messages.
Handles received Default TTL Status messages from a server.
    Param cli
        Client that received the status message.
    Param addr
        Address of the sender.
 void (*friend_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for Friend Status messages.
Handles received Friend Status messages from a server.

  *Param cli*
  Client that received the status message.

  *Param addr*
  Address of the sender.

  *Param status*
  Status Code for requesting message.

 void (*gatt_proxy_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for GATT Proxy Status messages.
Handles received GATT Proxy Status messages from a server.

  *Param cli*
  Client that received the status message.

  *Param addr*
  Address of the sender.

  *Param status*
  Status Code for requesting message.

 void (*network_transmit_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for Network Transmit Status messages.
Handles received Network Transmit Status messages from a server.

  *Param cli*
  Client that received the status message.

  *Param addr*
  Address of the sender.

  *Param status*
  Status Code for requesting message.

 void (*relay_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint8_t transmit)
Optional callback for Relay Status messages.
Handles received Relay Status messages from a server.

  *Param cli*
  Client that received the status message.

  *Param addr*
  Address of the sender.

  *Param status*
  Status Code for requesting message.

  *Param transmit*
  The relay retransmit count and interval steps.

 void (*net_key_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx)
Optional callback for NetKey Status messages.
Handles received NetKey Status messages from a server.

  *Param cli*
  Client that received the status message.
void (*app_key_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint16_t app_idx)

Optional callback for AppKey Status messages.
Handles received AppKey Status messages from a server.

void (*mod_app_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t app_idx, uint32_t mod_id)

Optional callback for Model App Status messages.
Handles received Model App Status messages from a server.

void (*node_identity_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint8_t identity)

Optional callback for Node Identity Status messages.
Handles received Node Identity Status messages from a server.

void (*lpn_timeout_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint16_t elem_addr, uint32_t timeout)
Optional callback for LPN PollTimeout Status messages. Handles received LPN PollTimeout Status messages from a server.

- **Param cli**
  Client that received the status message.

- **Param addr**
  Address of the sender.

- **Param elem_addr**
  The unicast address of the LPN.

- **Param timeout**
  Current value of PollTimeout timer of the LPN.

struct bt_mesh_cfg_hb_sub
   #include <cfg_cli.h> Heartbeat subscription configuration parameters.

Public Members

uint16_t src
   Source address to receive Heartbeat messages from.
uint16_t dst
  Destination address to receive Heartbeat messages on.

uint8_t period
  Logarithmic subscription period to keep listening for. The decoded subscription period is
  \((1 << (period - 1))\) seconds, or 0 seconds if period is 0.

uint8_t count
  Logarithmic Heartbeat subscription receive count. The decoded Heartbeat count is
  \((1 << (\text{count - 1}))\) if count is between 1 and 0xfe, 0 if count is 0 and 0xffff if count is 0xff.
  Ignored in Heartbeat subscription set.

uint8_t min
  Minimum hops in received messages, i.e. the shortest registered path from the publishing
  node to the subscribing node. A Heartbeat received from an immediate neighbor has hop
  count = 1.
  Ignored in Heartbeat subscription set.

uint8_t max
  Maximum hops in received messages, i.e. the longest registered path from the publishing
  node to the subscribing node. A Heartbeat received from an immediate neighbor has hop
  count = 1.
  Ignored in Heartbeat subscription set.

\textbf{struct bt_mesh_cfg_cli_hb_sub}

\texttt{#include <cfg\_cli\_h\_sub>}

\texttt{Heartbeat subscription configuration parameters.}

\textbf{Public Members}

uint16_t src
  Source address to receive Heartbeat messages from.

uint16_t dst
  Destination address to receive Heartbeat messages on.

uint8_t period
  Logarithmic subscription period to keep listening for. The decoded subscription period is
  \((1 << (\text{period - 1}))\) seconds, or 0 seconds if period is 0.

uint8_t count
  Logarithmic Heartbeat subscription receive count. The decoded Heartbeat count is
  \((1 << (\text{count - 1}))\) if count is between 1 and 0xfe, 0 if count is 0 and 0xffff if count is 0xff.
  Ignored in Heartbeat subscription set.

  node to the subscribing node. A Heartbeat received from an immediate neighbor has hop
  count = 1.
  Ignored in Heartbeat subscription set.
uint8_t max
    Maximum hops in received messages, ie the longest registered path from the publishing node to the subscribing node. A Heartbeat received from an immediate neighbor has hop count = 1.
    Ignored in Heartbeat subscription set.

struct bt_mesh_cfg_hb_pub
    #include <cfg_cli.h> Heartbeat publication configuration parameters.

Public Members

uint16_t dst
    Heartbeat destination address.

uint8_t count
    Logarithmic Heartbeat count. Decoded as (1 << (count - 1)) if count is between 1 and 0x11, 0 if count is 0, or “indefinitely” if count is 0xff.
    When used in Heartbeat publication set, this parameter denotes the number of Heartbeat messages to send.
    When returned from Heartbeat publication get, this parameter denotes the number of Heartbeat messages remaining to be sent.

uint8_t period
    Logarithmic Heartbeat publication transmit interval in seconds. Decoded as (1 << (period - 1)) if period is between 1 and 0x11. If period is 0, Heartbeat publication is disabled.

uint8_t ttl
    Publication message Time To Live value.

uint16_t feat
    Bitmap of features that trigger Heartbeat publications. Legal values are BT_MESH_FEAT_RELAY, BT_MESH_FEAT_PROXY, BT_MESH_FEAT_FRIEND and BT_MESH_FEAT_LOW_POWER

uint16_t net_idx
    Network index to publish with.

struct bt_mesh_cfg_cli_hb_pub
    #include <cfg_cli.h> Heartbeat publication configuration parameters.

Public Members

uint16_t dst
    Heartbeat destination address.
uint8_t count
Logarithmic Heartbeat count. Decoded as \( 1 << (count - 1) \) if count is between 1 and 0x11, 0 if count is 0, or “indefinitely” if count is 0xff.

When used in Heartbeat publication set, this parameter denotes the number of Heartbeat messages to send.

When returned from Heartbeat publication get, this parameter denotes the number of Heartbeat messages remaining to be sent.

uint8_t period
Logarithmic Heartbeat publication transmit interval in seconds. Decoded as \( 1 << (period - 1) \) if period is between 1 and 0x11. If period is 0, Heartbeat publication is disabled.

uint8_t ttl
Publication message Time To Live value.

uint16_t feat
Bitmap of features that trigger Heartbeat publications. Legal values are `BT_MESH_FEAT_RELAY`, `BT_MESH_FEAT_PROXY`, `BT_MESH_FEAT_FRIEND` and `BT_MESH_FEAT_LOW_POWER`.

uint16_t net_idx
Network index to publish with.

Public Members

uint16_t loc
   Element location

size_t nsig
   The number of SIG models in this element

size_t nvnd
   The number of vendor models in this element

Health Server
   The Health Server model provides attention callbacks and node diagnostics for Health Client models. It is primarily used to report faults in the mesh node and map the mesh nodes to their physical location.

Faults
   The Health Server model may report a list of faults that have occurred in the device’s lifetime. Typically, the faults are events or conditions that may alter the behavior of the node, like power outages or faulty peripherals. Faults are split into warnings and errors. Warnings indicate conditions that are close to the limits of what the node is designed to withstand, but not necessarily damaging to the device. Errors indicate conditions that are outside of the node’s design limits, and may have caused invalid behavior or permanent damage to the device.

Fault values 0x01 to 0x7f are reserved for the Bluetooth mesh specification, and the full list of specification defined faults are available in Health faults. Fault values 0x80 to 0xff are vendor specific. The list of faults are always reported with a company ID to help interpreting the vendor specific faults.

Attention state
   The attention state is used to make the device call attention to itself through some physical behavior like blinking, playing a sound or vibrating. The attention state may be used during provisioning to let the user know which device they’re provisioning, as well as through the Health models at runtime.

The attention state is always assigned a timeout in the range of one to 255 seconds when enabled. The Health Server API provides two callbacks for the application to run their attention calling behavior: \texttt{bt\_mesh\_health\_srv\_cb\_attn\_on} is called at the beginning of the attention period, \texttt{bt\_mesh\_health\_srv\_cb\_attn\_off} is called at the end.

The remaining time for the attention period may be queried through \texttt{bt\_mesh\_health\_srv\_attn\_timer}.

API reference

\texttt{group bt\_mesh\_health\_srv}
   Health Server Model.

\texttt{Defines}

\texttt{BT\_MESH\_HEALTH\_PUB\_DEFINE(_name, _max\_faults)}
   A helper to define a health publication context

\texttt{Parameters}

\begin{itemize}
   \item \_name – Name given to the publication context variable.
   \item \_max\_faults – Maximum number of faults the element can have.
\end{itemize}
BT_MESH_MODEL_HEALTH_SRV(srv, pub)

Define a new health server model. Note that this API needs to be repeated for each element
that the application wants to have a health server model on. Each instance also needs a unique
bt_mesh_health_srv and bt_mesh_model_pub context.

Parameters

• srv – Pointer to a unique struct bt_mesh_health_srv.

• pub – Pointer to a unique struct bt_mesh_model_pub.

Returns

New mesh model instance.

Functions

int bt_mesh_fault_update(struct bt_mesh_elem *elem)

Notify the stack that the fault array state of the given element has changed.

This prompts the Health server on this element to publish the current fault array if periodic
publishing is disabled.

Parameters

• elem – Element to update the fault state of.

Returns

0 on success, or (negative) error code otherwise.

int bt_mesh_health_srv_fault_update(struct bt_mesh_elem *elem)

Notify the stack that the fault array state of the given element has changed.

This prompts the Health server on this element to publish the current fault array if periodic
publishing is disabled.

Parameters

• elem – Element to update the fault state of.

Returns

0 on success, or (negative) error code otherwise.

struct bt_mesh_health_srv_cb

#include <health_srv.h> Callback function for the Health Server model

Public Members

int (*fault_get_cur)(struct bt_mesh_model *model, uint8_t *test_id, uint16_t
*company_id, uint8_t *faults, uint8_t *fault_count)

Callback for fetching current faults.

Fault values may either be defined by the specification, or by a vendor. Vendor specific
faults should be interpreted in the context of the accompanying Company ID. Specification
defined faults may be reported for any Company ID, and the same fault may be presented
for multiple Company IDs.

All faults shall be associated with at least one Company ID, representing the device vendor
or some other vendor whose vendor specific fault values are used.

If there are multiple Company IDs that have active faults, return only the faults associated
with one of them at the time. To report faults for multiple Company IDs, interleave which
Company ID is reported for each call.
**Param model**
Health Server model instance to get faults of.

**Param test_id**
Test ID response buffer.

**Param company_id**
Company ID response buffer.

**Param faults**
Array to fill with current faults.

**Param fault_count**
The number of faults the fault array can fit. Should be updated to reflect the number of faults copied into the array.

**Return**
0 on success, or (negative) error code otherwise.

```c
int (*fault_get_reg)(struct bt_mesh_model *model, uint16_t company_id, uint8_t *test_id, uint8_t *faults, uint8_t *fault_count)
```
Callback for fetching all registered faults.
Registered faults are all past and current faults since the last call to `fault_clear`. Only faults associated with the given Company ID should be reported.

Fault values may either be defined by the specification, or by a vendor. Vendor specific faults should be interpreted in the context of the accompanying Company ID. Specification defined faults may be reported for any Company ID, and the same fault may be presented for multiple Company IDs.

**Param model**
Health Server model instance to get faults of.

**Param company_id**
Company ID to get faults for.

**Param test_id**
Test ID response buffer.

**Param faults**
Array to fill with registered faults.

**Param fault_count**
The number of faults the fault array can fit. Should be updated to reflect the number of faults copied into the array.

**Return**
0 on success, or (negative) error code otherwise.

```c
int (*fault_clear)(struct bt_mesh_model *model, uint16_t company_id)
```
Clear all registered faults associated with the given Company ID.

**Param model**
Health Server model instance to clear faults of.

**Param company_id**
Company ID to clear faults for.

**Return**
0 on success, or (negative) error code otherwise.

```c
int (*fault_test)(struct bt_mesh_model *model, uint8_t test_id, uint16_t company_id)
```
Run a self-test.
The Health server may support up to 256 self-tests for each Company ID. The behavior for all test IDs are vendor specific, and should be interpreted based on the accompanying Company ID. Test failures should result in changes to the fault array.

**Param model**
Health Server model instance to run test for.

**Param test_id**
Test ID to run.
**Param company_id**
Company ID to run test for.

**Return**
0 if the test execution was started successfully, or (negative) error code otherwise. Note that the fault array will not be reported back to the client if the test execution didn't start.

```c
void (*attn_on)(struct bt_mesh_model *model)
Start calling attention to the device.

The attention state is used to map an element address to a physical device. When this callback is called, the device should start some physical procedure meant to call attention to itself, like blinking, buzzing, vibrating or moving. If there are multiple Health server instances on the device, the attention state should also help identify the specific element the server is in.

The attention calling behavior should continue until the attn_off callback is called.

**Param model**
Health Server model to start the attention state of.

```c
void (*attn_off)(struct bt_mesh_model *model)
Stop the attention state.

Any physical activity started to call attention to the device should be stopped.

**Param model**
```

```c
struct bt_mesh_health_srv

#include <health_srv.h> Mesh Health Server Model Context

**Public Members**

```c
struct bt_mesh_model *model
Composition data model entry pointer.

const struct bt_mesh_health_srv_cb *cb
Optional callback struct

struct k_work_delayable attn_timer
Attention Timer state

**Health faults**
Fault values defined by the Bluetooth mesh specification.

```c
group bt_mesh_health_faults
List of specification defined Health fault values.

**Defines**

```c
BT_MESH_HEALTH_FAULT_NO_FAULT
No fault has occurred.

BT_MESH_HEALTH_FAULT_VENDOR_SPECIFIC_START

Start of the vendor specific fault values.

All values below this are reserved for the Bluetooth Specification.

**Health Client**  The Health Client model interacts with a Health Server model to read out diagnostics and control the node's attention state.

All message passing functions in the Health Client API have cli as their first parameter. This is a pointer to the client model instance to be used in this function call. The second parameter is the ctx or message context. Message context contains netkey index, appkey index and unicast address that the target node uses.

The Health Client model is optional, and may be instantiated in any element. However, if a Health Client model is instantiated in an element other than the first, an instance must also be present in the first element.

*See Health faults* for a list of specification defined fault values.

**API reference**

group bt_mesh_health_cli

Health Client Model.

**Defines**

BT_MESH_MODEL_HEALTH_CLI(cli_data)

Generic Health Client model composition data entry.

**Parameters**

• cli_data – Pointer to a Health Client Model instance.

**Functions**

int bt_mesh_health_cli_set(struct bt_mesh_model *model)

Set Health client model instance to use for communication.

**Parameters**

• model – Health Client model instance from the composition data.

**Returns**

0 on success, or (negative) error code on failure.

int bt_mesh_health_fault_get(uint16_t addr, uint16_t app_idx, uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)
Get the registered fault state for the given Company ID.
This method can be used asynchronously by setting test_id and (faults or fault_count) as NULL. This way the method will not wait for response and will return immediately after sending the command.
To process the response arguments of an async method, register the fault_status callback in `bt_mesh_health_cli` struct.

See also:
Health faults

**Parameters**
- addr – Target node element address.
- app_idx – Application index to encrypt with.
- cid – Company ID to get the registered faults of.
- test_id – Test ID response buffer.
- faults – Fault array response buffer.
- fault_count – Fault count response buffer.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_fault_clear(uint16_t addr, uint16_t app_idx, uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)
```

Clear the registered faults for the given Company ID.
This method can be used asynchronously by setting test_id and (faults or fault_count) as NULL. This way the method will not wait for response and will return immediately after sending the command.
To process the response arguments of an async method, register the fault_status callback in `bt_mesh_health_cli` struct.

See also:
Health faults

**Parameters**
- addr – Target node element address.
- app_idx – Application index to encrypt with.
- cid – Company ID to clear the registered faults for.
- test_id – Test ID response buffer.
- faults – Fault array response buffer.
- fault_count – Fault count response buffer.

**Returns**
0 on success, or (negative) error code on failure.
int bt_mesh_health_fault_clear_unack(uint16_t addr, uint16_t app_idx, uint16_t cid)
Clear the registered faults for the given Company ID (unacked).

See also:
Health faults

Parameters
• addr – Target node element address.
• app_idx – Application index to encrypt with.
• cid – Company ID to clear the registered faults for.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_fault_test(uint16_t addr, uint16_t app_idx, uint16_t cid, uint8_t test_id,
uint8_t *faults, size_t *fault_count)
Invoke a self-test procedure for the given Company ID.
This method can be used asynchronously by setting faults or fault_count as NULL This way the method will not wait for response and will return immediately after sending the command.
To process the response arguments of an async method, register the fault_status callback in bt_mesh_health_cli struct.

Parameters
• addr – Target node element address.
• app_idx – Application index to encrypt with.
• cid – Company ID to invoke the test for.
• test_id – Test ID response buffer.
• faults – Fault array response buffer.
• fault_count – Fault count response buffer.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_fault_test_unack(uint16_t addr, uint16_t app_idx, uint16_t cid, uint8_t test_id)
Invoke a self-test procedure for the given Company ID (unacked).

Parameters
• addr – Target node element address.
• app_idx – Application index to encrypt with.
• cid – Company ID to invoke the test for.
• test_id – Test ID response buffer.

Returns
0 on success, or (negative) error code on failure.
int bt_mesh_health_period_get(uint16_t addr, uint16_t app_idx, uint8_t *divisor)

Get the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by \((1 << \text{divisor})\). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

This method can be used asynchronously by setting \text{divisor} as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the \text{period_status} callback in \text{bt_mesh_health_cli} struct.

**Parameters**

- \text{addr} – Target node element address.
- \text{app_idx} – Application index to encrypt with.
- \text{divisor} – Health period divisor response buffer.

**Returns**

0 on success, or (negative) error code on failure.

int bt_mesh_health_period_set(uint16_t addr, uint16_t app_idx, uint8_t divisor, uint8_t *updated_divisor)

Set the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by \((1 << \text{divisor})\). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

This method can be used asynchronously by setting \text{updated_divisor} as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the \text{period_status} callback in \text{bt_mesh_health_cli} struct.

**Parameters**

- \text{addr} – Target node element address.
- \text{app_idx} – Application index to encrypt with.
- \text{divisor} – New Health period divisor.
- \text{updated_divisor} – Health period divisor response buffer.

**Returns**

0 on success, or (negative) error code on failure.

int bt_mesh_health_period_set_unack(uint16_t addr, uint16_t app_idx, uint8_t divisor)

Set the target node's Health fast period divisor (unacknowledged).

This is an unacknowledged version of this API.

**Parameters**

- \text{addr} – Target node element address.
- \text{app_idx} – Application index to encrypt with.
- \text{divisor} – New Health period divisor.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_attention_get(uint16_t addr, uint16_t app_idx, uint8_t *attention)
Get the current attention timer value.

This method can be used asynchronously by setting attention as NULL. This way the method
will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the attention_status call-
back in bt_mesh_health_cli struct.

Parameters
• addr – Target node element address.
• app_idx – Application index to encrypt with.
• attention – Attention timer response buffer, measured in seconds.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_attention_set(uint16_t addr, uint16_t app_idx, uint8_t attention, uint8_t *updated_attention)
Set the attention timer.

This method can be used asynchronously by setting updated_attention as NULL. This way
the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the attention_status call-
back in bt_mesh_health_cli struct.

Parameters
• addr – Target node element address.
• app_idx – Application index to encrypt with.
• attention – New attention timer time, in seconds.
• updated_attention – Attention timer response buffer, measured in seconds.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_attention_set_unack(uint16_t addr, uint16_t app_idx, uint8_t attention)
Set the attention timer (unacknowledged).

Parameters
• addr – Target node element address.
• app_idx – Application index to encrypt with.
• attention – New attention timer time, in seconds.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_cli_fault_get(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx,
uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)
Get the registered fault state for the given Company ID.

This method can be used asynchronously by setting test_id and ( faults or fault_count )
as NULL. This way the method will not wait for response and will return immediately after
sending the command.
To process the response arguments of an async method, register the fault_status callback in `bt_mesh_health_cli` struct.

See also:

- **Health faults**

**Parameters**

- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `cid` – Company ID to get the registered faults of.
- `test_id` – Test ID response buffer.
- `faults` – Fault array response buffer.
- `fault_count` – Fault count response buffer.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_clear(
    struct bt_mesh_health_cli *cli,
    struct bt_mesh_msg_ctx *ctx,
    uint16_t cid,
    uint8_t *test_id,
    uint8_t *faults,
    size_t *fault_count
)
```

Clear the registered faults for the given Company ID.

This method can be used asynchronously by setting `test_id` and (faults or fault_count) as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the fault_status callback in `bt_mesh_health_cli` struct.

See also:

- **Health faults**

**Parameters**

- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `cid` – Company ID to clear the registered faults for.
- `test_id` – Test ID response buffer.
- `faults` – Fault array response buffer.
- `fault_count` – Fault count response buffer.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_clear_unack(
    struct bt_mesh_health_cli *cli,
    struct bt_mesh_msg_ctx *ctx,
    uint16_t cid
)
```

Clear the registered faults for the given Company ID (unacked).

See also:

- **Health faults**
Parameters

- cli – Client model to send on.
- ctx – Message context, or NULL to use the configured publish parameters.
- cid – Company ID to clear the registered faults for.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_test(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid, uint8_t test_id, uint8_t *faults, size_t *fault_count)
```

Invoke a self-test procedure for the given Company ID.

This method can be used asynchronously by setting faults or fault_count as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the fault_status callback in `bt_mesh_health_cli` struct.

Parameters

- cli – Client model to send on.
- ctx – Message context, or NULL to use the configured publish parameters.
- cid – Company ID to invoke the test for.
- test_id – Test ID response buffer.
- faults – Fault array response buffer.
- fault_count – Fault count response buffer.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_test_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid, uint8_t test_id)
```

Invoke a self-test procedure for the given Company ID (unacked).

Parameters

- cli – Client model to send on.
- ctx – Message context, or NULL to use the configured publish parameters.
- cid – Company ID to invoke the test for.
- test_id – Test ID response buffer.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_period_get(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t *divisor)
```

Get the target node’s Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by \((1 << \text{divisor})\). For example, if the target node’s Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.
This method can be used asynchronously by setting \texttt{divisor} as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the \texttt{period\_status} callback in \texttt{bt\_mesh\_health\_cli} struct.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{cli} – Client model to send on.
  \item \texttt{ctx} – Message context, or NULL to use the configured publish parameters.
  \item \texttt{divisor} – Health period divisor response buffer.
\end{itemize}

\textbf{Returns}

0 on success, or (negative) error code on failure.

\begin{verbatim}
int bt_mesh_health_cli_period_set(struct bt_mesh_health_cli *cli, struct bt_mesh_ctx *ctx, uint8_t divisor, uint8_t *updated_divisor)
\end{verbatim}

Set the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by \((1 \ll divisor)\). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

This method can be used asynchronously by setting \texttt{updated\_divisor} as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the \texttt{period\_status} callback in \texttt{bt\_mesh\_health\_cli} struct.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{cli} – Client model to send on.
  \item \texttt{ctx} – Message context, or NULL to use the configured publish parameters.
  \item \texttt{divisor} – New Health period divisor.
  \item \texttt{updated\_divisor} – Health period divisor response buffer.
\end{itemize}

\textbf{Returns}

0 on success, or (negative) error code on failure.

\begin{verbatim}
int bt_mesh_health_cli_period_set_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_ctx *ctx, uint8_t divisor)
\end{verbatim}

Set the target node's Health fast period divisor (unacknowledged).

This is an unacknowledged version of this API.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{cli} – Client model to send on.
  \item \texttt{ctx} – Message context, or NULL to use the configured publish parameters.
  \item \texttt{divisor} – New Health period divisor.
\end{itemize}

\textbf{Returns}

0 on success, or (negative) error code on failure.

\begin{verbatim}
int bt_mesh_health_cli_attention_get(struct bt_mesh_health_cli *cli, struct bt_mesh_ctx *ctx, uint8_t *attention)
\end{verbatim}

Get the current attention timer value.

This method can be used asynchronously by setting \texttt{attention} as NULL. This way the method will not wait for response and will return immediately after sending the command.
To process the response arguments of an async method, register the `attention_status` callback in `bt_mesh_health_cli` struct.

**Parameters**
- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `attention` – Attention timer response buffer, measured in seconds.

**Returns**
- 0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_attention_set(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t attention, uint8_t *updated_attention)
```

Set the attention timer.

This method can be used asynchronously by setting `updated_attention` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `attention_status` callback in `bt_mesh_health_cli` struct.

**Parameters**
- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `attention` – New attention timer time, in seconds.
- `updated_attention` – Attention timer response buffer, measured in seconds.

**Returns**
- 0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_attention_set_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t attention)
```

Set the attention timer (unacknowledged).

**Parameters**
- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `attention` – New attention timer time, in seconds.

**Returns**
- 0 on success, or (negative) error code on failure.

```c
int32_t bt_mesh_health_cli_timeout_get(void)
```

Get the current transmission timeout value.

**Returns**
- The configured transmission timeout in milliseconds.

```c
void bt_mesh_health_cli_timeout_set(int32_t timeout)
```

Set the transmission timeout value.

**Parameters**
- `timeout` – The new transmission timeout.

```c
#include <health_cli.h> Health Client Model Context
```
Public Members

struct bt_mesh_model *model
Composition data model entry pointer.

struct bt_mesh_model_pub pub
Publication structure instance

struct net_buf_simple pub_buf
Publication buffer

uint8_t *pub_data[BT_MESH_MODEL_BUF_LEN(BT_MESH_MODEL_OP_2(0x80, 0x32), 3)]
Publication data

void (*period_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t divisor)
Optional callback for Health Period Status messages.
Handles received Health Period Status messages from a Health server. The divisor param
represents the period divisor value.

   Param cli
    Health client that received the status message.
   Param addr
    Address of the sender.
   Param divisor
    Health Period Divisor value.

void (*attention_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t attention)
Optional callback for Health Attention Status messages.
Handles received Health Attention Status messages from a Health server. The attention
param represents the current attention value.

   Param cli
    Health client that received the status message.
   Param addr
    Address of the sender.
   Param attention
    Current attention value.

void (*fault_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t test_id, uint16_t cid, uint8_t *faults, size_t fault_count)
Optional callback for Health Fault Status messages.
Handles received Health Fault Status messages from a Health server. The fault array
represents all faults that are currently present in the server's element.

See also:
Health faults

   Param cli
    Health client that received the status message.
   Param addr
    Address of the sender.
   Param test_id
    Identifier of a most recently performed test.
Param \textit{cid}  
Company Identifier of the node.

\textbf{Param faults}  
Array of faults.

\textbf{Param fault\_count}  
Number of faults in the fault array.

\begin{verbatim}
void (* \textit{current\_status})(struct \textit{bt\_mesh\_health\_cli} *\textit{cli}, uint16_t \textit{addr}, uint8_t \textit{test\_id},
uint16_t \textit{cid}, uint8_t *\textit{faults}, size_t \textit{fault\_count})

Optional callback for Health Current Status messages.
Handles received Health Current Status messages from a Health server. The \textit{fault} array
represents all faults that are currently present in the server's element.

\textbf{See also:}
\textit{Health faults}
\end{verbatim}

\textbf{Param \textit{cli}}  
Health client that received the status message.

\textbf{Param \textit{addr}}  
Address of the sender.

\textbf{Param \textit{test\_id}}  
Identifier of a most recently performed test.

\textbf{Param \textit{cid}}  
Company Identifier of the node.

\textbf{Param \textit{faults}}  
Array of faults.

\textbf{Param \textit{fault\_count}}  
Number of faults in the fault array.

\textbf{Message}  
The Bluetooth mesh message provides set of structures, macros and functions used for preparing
message buffers, managing message and acknowledged message contexts.

\textbf{API reference}
\begin{verbatim}
\textit{group bt\_mesh\_msg}

Message.

\textbf{Defines}
\end{verbatim}

\begin{verbatim}
\textbf{BT\_MESH\_MIC\_SHORT}
Length of a short Mesh MIC.

\textbf{BT\_MESH\_MIC\_LONG}
Length of a long Mesh MIC.

\textbf{BT\_MESH\_MODEL\_OP\_LEN(_op)}
Helper to determine the length of an opcode.

\textbf{Parameters}
\begin{itemize}
  \item {_op} – Opcode.
\end{itemize}
\end{verbatim}
BT_MESH_MODEL_BUF_LEN(_op, _payload_len)
Helper for model message buffer length.

Returns the length of a Mesh model message buffer, including the opcode length and a short MIC.

Parameters
• _op – Opcode of the message.
• _payload_len – Length of the model payload.

BT_MESH_MODEL_BUF_LEN_LONG_MIC(_op, _payload_len)
Helper for model message buffer length.

Returns the length of a Mesh model message buffer, including the opcode length and a long MIC.

Parameters
• _op – Opcode of the message.
• _payload_len – Length of the model payload.

BT_MESH_MODEL_BUF_DEFINE(_buf, _op, _payload_len)
Define a Mesh model message buffer using NET_BUF_SIMPLE_DEFINE.

Parameters
• _buf – Buffer name.
• _op – Opcode of the message.
• _payload_len – Length of the model message payload.

Functions

void bt_mesh_model_msg_init(struct net_buf_simple *msg, uint32_t opcode)
Initialize a model message.

Clears the message buffer contents, and encodes the given opcode. The message buffer will be ready for filling in payload data.

Parameters
• msg – Message buffer.
• opcode – Opcode to encode.

static inline void bt_mesh_msg_ack_ctx_init(struct bt_mesh_msg_ack_ctx *ack)
Initialize an acknowledged message context.

Initializes semaphore used for synchronization between bt_mesh_msg_ack_ctx_wait and bt_mesh_msg_ack_ctx_rx calls. Call this function before using bt_mesh_msg_ack_ctx.

Parameters
• ack – Acknowledged message context to initialize.

static inline void bt_mesh_msg_ack_ctx_reset(struct bt_mesh_msg_ack_ctx *ack)
Reset the synchronization semaphore in an acknowledged message context.

This function aborts call to bt_mesh_msg_ack_ctx_wait.

Parameters
• ack – Acknowledged message context to be reset.
void bt_mesh_msg_ack_ctx_clear(struct bt_mesh_msg_ack_ctx *ack)

Clear parameters of an acknowledged message context.

This function clears the opcode, remote address and user data set by
bt_mesh_msg_ack_ctx_prepare.

Parameters

• ack – Acknowledged message context to be cleared.

int bt_mesh_msg_ack_ctx_prepare(struct bt_mesh_msg_ack_ctx *ack, uint32_t op, uint16_t dst,
void *user_data)

Prepare an acknowledged message context for the incoming message to wait.

This function sets the opcode, remote address of the incoming message and stores the user
data. Use this function before calling bt_mesh_msg_ack_ctx_wait.

Parameters

• ack – Acknowledged message context to prepare.
• dst – Destination address of the message.
• user_data – User data for the acknowledged message context.

Returns

0 on success, or (negative) error code on failure.

static inline bool bt_mesh_msg_ack_ctx_busy(struct bt_mesh_msg_ack_ctx *ack)

Check if the acknowledged message context is initialized with an opcode.

Parameters

• ack – Acknowledged message context.

Returns

true if the acknowledged message context is initialized with an opcode, false
otherwise.

int bt_mesh_msg_ack_ctx_wait(struct bt_mesh_msg_ack_ctx *ack, k_timeout_t timeout)

Wait for a message acknowledge.

This function blocks execution until bt_mesh_msg_ack_ctx_rx is called or by timeout.

Parameters

• ack – Acknowledged message context of the message to wait for.
• timeout – Wait timeout.

Returns

0 on success, or (negative) error code on failure.

static inline void bt_mesh_msg_ack_ctx_rx(struct bt_mesh_msg_ack_ctx *ack)

Mark a message as acknowledged.

This function unblocks call to bt_mesh_msg_ack_ctx_wait.

Parameters

• ack – Context of a message to be acknowledged.

bool bt_mesh_msg_ack_ctx_match(const struct bt_mesh_msg_ack_ctx *ack, uint32_t op, uint16_t
addr, void **user_data)

Check if an opcode and address of a message matches the expected one.

Parameters

• ack – Acknowledged message context to be checked.
• **op** – OpCode of the incoming message.
• **addr** – Source address of the incoming message.
• **user_data** – If not NULL, returns a user data stored in the acknowledged message context by `bt_mesh_msg_ack_ctx_prepare`.

**Returns**
true if the incoming message matches the expected one, false otherwise.

```c
struct bt_mesh_msg_ctx
#include <msg.h> Message sending context.

Public Members
```

```c
uint16_t net_idx
 NetKey Index of the subnet to send the message on.
```

```c
uint16_t app_idx
 AppKey Index to encrypt the message with.
```

```c
uint16_t addr
 Remote address.
```

```c
uint16_t recv_dst
 Destination address of a received message. Not used for sending.
```

```c
int8_t recv_rssi
 RSSI of received packet. Not used for sending.
```

```c
uint8_t recv_ttl
 Received TTL value. Not used for sending.
```

```c
bool send_rel
 Force sending reliably by using segment acknowledgment
```

```c
uint8_t send_ttl
 TTL, or BT_MESH_TTL_DEFAULT for default TTL.
```

```c
struct bt_mesh_msg_ack_ctx
#include <msg.h> Acknowledged message context for tracking the status of model messages pending a response.

Public Members
```

```c
struct k_sem sem
 Sync semaphore.
```

```c
uint32_t op
 Opcode we're waiting for.
```
uint16_t dst
Address of the node that should respond.

void *user_data
User specific parameter.

Provisioning  Provisioning is the process of adding devices to a mesh network. It requires two devices operating in the following roles:

- The provisioner represents the network owner, and is responsible for adding new nodes to the mesh network.
- The provisionee is the device that gets added to the network through the Provisioning process. Before the provisioning process starts, the provisionee is an unprovisioned device.

The Provisioning module in the Zephyr Bluetooth mesh stack supports both the Advertising and GATT Provisioning bearers for the provisionee role, as well as the Advertising Provisioning bearer for the provisioner role.

The Provisioning process  All Bluetooth mesh nodes must be provisioned before they can participate in a Bluetooth mesh network. The Provisioning API provides all the functionality necessary for a device to become a provisioned mesh node. Provisioning is a five-step process, involving the following steps:

- Beaconing
- Invitation
- Public key exchange
- Authentication
- Provisioning data transfer

Beaconing  To start the provisioning process, the unprovisioned device must first start broadcasting the Unprovisioned Beacon. This makes it visible to nearby provisioners, which can initiate the provisioning. To indicate that the device needs to be provisioned, call `bt_mesh_prov_enable()`. The device starts broadcasting the Unprovisioned Beacon with the device UUID and the OOB information field, as specified in the prov parameter passed to `bt_mesh_init()`. Additionally, a Uniform Resource Identifier (URI) may be specified, which can point the provisioner to the location of some Out Of Band information, such as the device's public key or an authentication value database. The URI is advertised in a separate beacon, with a URI hash included in the unprovisioned beacon, to tie the two together.

Uniform Resource Identifier  The Uniform Resource Identifier shall follow the format specified in the Bluetooth Core Specification Supplement. The URI must start with a URI scheme, encoded as a single utf-8 data point, or the special `none` scheme, encoded as 0x01. The available schemes are listed on the Bluetooth website.

Examples of encoded URIs:

<table>
<thead>
<tr>
<th>URI</th>
<th>Encoded</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://example.com">http://example.com</a></td>
<td>\x16//example.com</td>
</tr>
<tr>
<td><a href="https://www.zephyrproject.org/">https://www.zephyrproject.org/</a></td>
<td>\x17//www.zephyrproject.org/</td>
</tr>
<tr>
<td>just a string</td>
<td>\x01just a string</td>
</tr>
</tbody>
</table>
Providing invitation The provisioner initiates the Provisioning process by sending a Provisioning invitation. The invitations prompts the provisionee to call attention to itself using the Health Server Attention state, if available.

The Unprovisioned device automatically responds to the invite by presenting a list of its capabilities, including the supported Out of Band Authentication methods.

Public key exchange Before the provisioning process can begin, the provisioner and the unprovisioned device exchange public keys, either in-band or Out of Band (OOB).

In-band public key exchange is a part of the provisioning process and always supported by the unprovisioned device and provisioner.

If the application wants to support public key exchange via OOB, it needs to provide public and private keys to the mesh stack. The unprovisioned device will reflect this in its capabilities. The provisioner obtains the public key via any available OOB mechanism (e.g. the device may advertise a packet containing the public key or it can be encoded in a QR code printed on the device packaging). Note that even if the unprovisioned device has specified the public key for the Out of Band exchange, the provisioner may choose to exchange the public key in-band if it can’t retrieve the public key via OOB mechanism. In this case, a new key pair will be generated by the mesh stack for each Provisioning process.

To enable support of OOB public key on the unprovisioned device side, CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY needs to be enabled. The application must provide public and private keys before the Provisioning process is started by initializing pointers to bt_mesh_prov.public_key_be and bt_mesh_prov.private_key_be. The keys needs to be provided in big-endian bytes order.

To provide the device’s public key obtained via OOB, call bt_mesh_prov_remote_pub_key_set() on the provisioner side.

Authentication After the initial exchange, the provisioner selects an Out of Band (OOB) Authentication method. This allows the user to confirm that the device the provisioner connected to is actually the device they intended, and not a malicious third party.

The Provisioning API supports the following authentication methods for the provisionee:

- **Static OOB**: An authentication value is assigned to the device in production, which the provisioner can query in some application specific way.
- **Input OOB**: The user inputs the authentication value. The available input actions are listed in bt_mesh_input_action_t.
- **Output OOB**: Show the user the authentication value. The available output actions are listed in bt_mesh_output_action_t.

The application must provide callbacks for the supported authentication methods in bt_mesh_prov, as well as enabling the supported actions in bt_mesh_prov.output_actions and bt_mesh_prov.input_actions.

When an Output OOB action is selected, the authentication value should be presented to the user when the output callback is called, and remain until the bt_mesh_prov.input_complete or bt_mesh_prov.complete callback is called. If the action is blink, beep or vibrate, the sequence should be repeated after a delay of three seconds or more.

When an Input OOB action is selected, the user should be prompted when the application receives the bt_mesh_prov.input callback. The user response should be fed back to the Provisioning API through bt_mesh_prov_input_string() or bt_mesh_prov_input_number(). If no user response is recorded within 60 seconds, the Provisioning process is aborted.

Data transfer After the device has been successfully authenticated, the provisioner transfers the Provisioning data:
• Unicast address
• A network key
• IV index
• Network flags
  – Key refresh
  – IV update

Additionally, a device key is generated for the node. All this data is stored by the mesh stack, and the provisioning `bt_mesh_prov.complete` callback gets called.

**Provisioning security**  Depending on the choice of public key exchange mechanism and authentication method, the provisioning process can be secure or insecure.

On May 24th 2021, ANSSI disclosed a set of vulnerabilities in the Bluetooth mesh provisioning protocol that showcased how the low entropy provided by the Blink, Vibrate, Push, Twist and Input/Output numeric OOB methods could be exploited in impersonation and MITM attacks. In response, the Bluetooth SIG has reclassified these OOB methods as insecure in the Mesh Profile specification erratum 16350, as AuthValue may be brute forced in real time. To ensure secure provisioning, applications should use a static OOB value and OOB public key transfer.

**API reference**

`group bt_mesh_prov`  
Provisioning.

** Enums**

```c
enum bt_mesh_output_action_t 
  Available Provisioning output authentication actions.

Values:

enumerator BT_MESH_NO_OUTPUT = 0
enumerator BT_MESH_BLINK = BIT(0)
enumerator BT_MESH_BEEP = BIT(1)
enumerator BT_MESH_VIBRATE = BIT(2)
enumerator BT_MESH_DISPLAY_NUMBER = BIT(3)
enumerator BT_MESH_DISPLAY_STRING = BIT(4)
```

```c
enum bt_mesh_input_action_t 
  Available Provisioning input authentication actions.

Values:
```
enumerator BT_MESH_NO_INPUT = 0
enumerator BT_MESH_PUSH = BIT(0)
enumerator BT_MESH_TWIST = BIT(1)
enumerator BT_MESH_ENTER_NUMBER = BIT(2)
enumerator BT_MESH_ENTER_STRING = BIT(3)

enum bt_mesh_prov_bearer_t
    Available Provisioning bearers.
    Values:
    enumerator BT_MESH_PROV_ADV = BIT(0)
    enumerator BT_MESH_PROV_GATT = BIT(1)

enum bt_mesh_prov_oob_info_t
    Out of Band information location.
    Values:
    enumerator BT_MESH_PROV_OOB_OTHER = BIT(0)
    enumerator BT_MESH_PROV_OOB_URI = BIT(1)
    enumerator BT_MESH_PROV_OOB_2D_CODE = BIT(2)
    enumerator BT_MESH_PROV_OOB_BAR_CODE = BIT(3)
    enumerator BT_MESH_PROV_OOB_NFC = BIT(4)
    enumerator BT_MESH_PROV_OOB_NUMBER = BIT(5)
    enumerator BT_MESH_PROV_OOB_STRING = BIT(6)
    enumerator BT_MESH_PROV_OOB_ON_BOX = BIT(11)
    enumerator BT_MESH_PROV_OOB_IN_BOX = BIT(12)
    enumerator BT_MESH_PROV_OOB_ON_PAPER = BIT(13)
    enumerator BT_MESH_PROV_OOB_IN_MANUAL = BIT(14)
    enumerator BT_MESH_PROV_OOB_ON_DEV = BIT(15)
Functions

int bt_mesh_input_string(const char *str)

Provide provisioning input OOB string.

This is intended to be called after the `bt_mesh_prov` input callback has been called with BT_MESH_ENTER_STRING as the action.

Parameters

• str – String.

Returns

Zero on success or (negative) error code otherwise.

int bt_mesh_input_number(uint32_t num)

Provide provisioning input OOB number.

This is intended to be called after the `bt_mesh_prov` input callback has been called with BT_MESH_ENTER_NUMBER as the action.

Parameters

• num – Number.

Returns

Zero on success or (negative) error code otherwise.

int bt_mesh_prov_remote_pub_key_set(const uint8_t public_key[64])

Provide Device public key.

Parameters

• public_key – Device public key in big-endian.

Returns

Zero on success or (negative) error code otherwise.

int bt_mesh_auth_method_set_input(bt_mesh_input_action_t action, uint8_t size)

Use Input OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use the specified Input OOB authentication action. When using `BT_MESH_PUSH`, `BT_MESH_TWIST` or `BT_MESH_ENTER_NUMBER`, the `bt_mesh_prov::output_number` callback is called with a random number that has to be entered on the unprovisioned device.

When using `BT_MESH_ENTER_STRING`, the `bt_mesh_prov::output_string` callback is called with a random string that has to be entered on the unprovisioned device.

Parameters

• action – Authentication action used by the unprovisioned device.

• size – Authentication size.

Returns

Zero on success or (negative) error code otherwise.

int bt_mesh_auth_method_set_output(bt_mesh_output_action_t action, uint8_t size)

Use Output OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use the specified Output OOB authentication action. The `bt_mesh_prov::input` callback will be called.
When using `BT_MESH_BLINK`, `BT_MESH_BEEP`, `BT_MESH_VIBRATE` or `BT_MESH_DISPLAY_NUMBER`, and the application has to call `bt_mesh_input_number` with the random number indicated by the unprovisioned device.

When using `BT_MESH_DISPLAY_STRING`, the application has to call `bt_mesh_input_string` with the random string displayed by the unprovisioned device.

**Parameters**

- `action` – Authentication action used by the unprovisioned device.
- `size` – Authentication size.

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_mesh_auth_method_set_static(const uint8_t *static_val, uint8_t size)
```

Use static OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use static OOB authentication, and use the given static authentication value when provisioning.

**Parameters**

- `static_val` – Static OOB value.
- `size` – Static OOB value size.

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_mesh_auth_method_set_none(void)
```

Don’t use OOB authentication.

Provisioner only.

Don’t use any authentication when provisioning new devices. This is the default behavior.

**Warning:** Not using any authentication exposes the mesh network to impersonation attacks, where attackers can pretend to be the unprovisioned device to gain access to the network. Authentication is strongly encouraged.

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_mesh_prov_enable(bt_mesh_prov_bearer_t bearers)
```

Enable specific provisioning bearers.

Enable one or more provisioning bearers.

**Parameters**

- `bearers` – Bit-wise or of provisioning bearers.

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_mesh_prov_disable(bt_mesh_prov_bearer_t bearers)
```

Disable specific provisioning bearers.

Disable one or more provisioning bearers.

**Parameters**

- `bearers` – Bit-wise or of provisioning bearers.
Returns
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_provision(const uint8_t net_key[16], uint16_t net_idx, uint8_t flags, uint32_t iv_index, uint16_t addr, const uint8_t dev_key[16])
```

Provision the local Mesh Node.

This API should normally not be used directly by the application. The only exception is for testing purposes where manual provisioning is desired without an actual external provisioner.

Parameters
- `net_key` – Network Key
- `net_idx` – Network Key Index
- `flags` – Provisioning Flags
- `iv_index` – IV Index
- `addr` – Primary element address
- `dev_key` – Device Key

Returns
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_provision_adv(const uint8_t uuid[16], uint16_t net_idx, uint16_t addr, uint8_t attention_duration)
```

Provision a Mesh Node using PB-ADV.

Parameters
- `uuid` – UUID
- `net_idx` – Network Key Index
- `addr` – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- `attention_duration` – The attention duration to be send to remote device

Returns
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_provision_gatt(const uint8_t uuid[16], uint16_t net_idx, uint16_t addr, uint8_t attention_duration)
```

Provision a Mesh Node using PB-GATT.

Parameters
- `uuid` – UUID
- `net_idx` – Network Key Index
- `addr` – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- `attention_duration` – The attention duration to be send to remote device

Returns
Zero on success or (negative) error code otherwise.

```c
bool bt_mesh_is_provisioned()
```

Check if the local node has been provisioned.

This API can be used to check if the local node has been provisioned or not. It can e.g. be helpful to determine if there was a stored network in flash, i.e. if the network was restored after calling `settings_load()`.
**Returns**

True if the node is provisioned. False otherwise.

```c
struct bt_mesh_dev_capabilities
#include <main.h> Device Capabilities.
```

**Public Members**

```c
uint8_t elem_count
   Number of elements supported by the device

uint16_t algorithms
   Supported algorithms and other capabilities

uint8_t pub_key_type
   Supported public key types

uint8_t static_oob
   Supported static OOB Types

bt_mesh_output_action_t output_actions
   Supported Output OOB Actions

bt_mesh_input_action_t input_actions
   Supported Input OOB Actions

uint8_t output_size
   Maximum size of Output OOB supported

uint8_t input_size
   Maximum size in octets of Input OOB supported
```

```c
struct bt_mesh_prov
#include <main.h> Provisioning properties & capabilities.
```

**Public Members**

```c
const uint8_t *uuid
   The UUID that's used when advertising as unprovisioned

const char *uri
   Optional URI. This will be advertised separately from the unprovisioned beacon, however
   the unprovisioned beacon will contain a hash of it so the two can be associated by the
   provisioner.

bt_mesh_prov_oob_info_t oob_info
   Out of Band information field.
```
const uint8_t *public_key_be
   Pointer to Public Key in big-endian for OOB public key type support.
   Remember to enable CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY when initializing this parameter.
   Must be used together with bt_mesh_prov::private_key_be.

const uint8_t *private_key_be
   Pointer to Private Key in big-endian for OOB public key type support.
   Remember to enable CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY when initializing this parameter.
   Must be used together with bt_mesh_prov::public_key_be.

const uint8_t *static_val
   Static OOB value

uint8_t static_val_len
   Static OOB value length

uint8_t output_size
   Maximum size of Output OOB supported

uint16_t output_actions
   Supported Output OOB Actions

uint8_t input_size
   Maximum size of Input OOB supported

uint16_t input_actions
   Supported Input OOB Actions

void (*capabilities)(const struct bt_mesh_dev_capabilities *cap)
   Provisioning Capabilities.
   This callback notifies the application that the provisioning capabilities of the unprovisioned device has been received.
   The application can consequently call bt_mesh_auth_method_set_<*> to select suitable provisioning oob authentication method.
   When this callback returns, the provisioner will start authentication with the chosen method.
   Param cap
      capabilities supported by device.

int (*output_number)(bt_mesh_output_action_t act, uint32_t num)
   Output of a number is requested.
   This callback notifies the application that it should output the given number using the given action.
   Param act
      Action for outputting the number.
   Param num
      Number to be outputted.
Return
Zero on success or negative error code otherwise

int (*output_string)(const char *str)
Output of a string is requested.
This callback notifies the application that it should display the given string to the user.
Param str
String to be displayed.
Return
Zero on success or negative error code otherwise

int (*input)(bt_mesh_input_action_t act, uint8_t size)
Input is requested.
This callback notifies the application that it should request input from the user using the
given action. The requested input will either be a string or a number, and the application needs to consequently call the bt_mesh_input_string() or bt_mesh_input_number() functions once the data has been acquired from the user.
Param act
Action for inputting data.
Param num
Maximum size of the inputted data.
Return
Zero on success or negative error code otherwise

void (*input_complete)(void)
The other device finished their OOB input.
This callback notifies the application that it should stop displaying its output OOB value,
as the other party finished their OOB input.

void (*unprovisioned_beacon)(uint8_t uuid[16], bt_mesh_prov_oob_info_t oob_info,
uint32_t *uri_hash)
Unprovisioned beacon has been received.
This callback notifies the application that an unprovisioned beacon has been received.
Param uuid
UUID
Param oob_info
OOB Information
Param uri_hash
Pointer to URI Hash value. NULL if no hash was present in the beacon.

void (*unprovisioned_beacon_gatt)(uint8_t uuid[16], bt_mesh_prov_oob_info_t oob_info)
PB-GATT Unprovisioned Advertising has been received.
This callback notifies the application that an PB-GATT unprovisioned Advertising has been
received.
Param uuid
UUID
Param oob_info
OOB Information

void (*link_open)(bt_mesh_prov_bearer_t bearer)
Provisioning link has been opened.
This callback notifies the application that a provisioning link has been opened on the given provisioning bearer.

**Param bearer**
- Provisioning bearer.

```c
void (*link_close)(bt_mesh_prov_bearer_t bearer)
```
- Provisioning link has been closed.

This callback notifies the application that a provisioning link has been closed on the given provisioning bearer.

**Param bearer**
- Provisioning bearer.

```c
void (*complete)(uint16_t net_idx, uint16_t addr)
```
- Provisioning is complete.

This callback notifies the application that provisioning has been successfully completed, and that the local node has been assigned the specified NetKeyIndex and primary element address.

**Param net_idx**
- NetKeyIndex given during provisioning.

**Param addr**
- Primary element address.

```c
void (*node_added)(uint16_t net_idx, uint8_t uuid[16], uint16_t addr, uint8_t num_elem)
```
- A new node has been added to the provisioning database.

This callback notifies the application that provisioning has been successfully completed, and that a node has been assigned the specified NetKeyIndex and primary element address.

**Param net_idx**
- NetKeyIndex given during provisioning.

**Param uuid**
- UUID of the added node

**Param addr**
- Primary element address.

**Param num_elem**
- Number of elements that this node has.

```c
void (*reset)(void)
```
- Node has been reset.

This callback notifies the application that the local node has been reset and needs to be reprovisioned. The node will not automatically advertise as unprovisioned, rather the `bt_mesh_prov_enable()` API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

**Proxy** The Proxy feature allows legacy devices like phones to access the Bluetooth mesh network through GATT. The Proxy feature is only compiled in if the `CONFIG_BT_MESH_GATT_PROXY` option is set. The Proxy feature state is controlled by the `Configuration Server`, and the initial value can be set with `bt_mesh_cfg_srv.gatt.proxy`.

**API reference**

```
group bt_mesh_proxy
  Proxy.
```

1608 Chapter 6. Connectivity
Defines

BT_MESH_PROXY_CB_DEFINE(_name)
   Register a callback structure for Proxy events.
   Registers a structure with callback functions that gets called on various Proxy events.
   
   **Parameters**
   - _name – Name of callback structure.

Functions

int bt_mesh_proxy_identity_enable(void)
   Enable advertising with Node Identity.
   This API requires that GATT Proxy support has been enabled. Once called each subnet will
   start advertising using Node Identity for the next 60 seconds.
   
   **Returns**
   - 0 on success, or (negative) error code on failure.

int bt_mesh_proxy_connect(uint16_t net_idx)
   Allow Proxy Client to auto connect to a network.
   This API allows a proxy client to auto-connect a given network.
   
   **Parameters**
   - net_idx – Network Key Index
   
   **Returns**
   - 0 on success, or (negative) error code on failure.

int bt_mesh_proxy_disconnect(uint16_t net_idx)
   Disallow Proxy Client to auto connect to a network.
   This API disallows a proxy client to connect a given network.
   
   **Parameters**
   - net_idx – Network Key Index
   
   **Returns**
   - 0 on success, or (negative) error code on failure.

struct bt_mesh_proxy_cb
   #include <proxy.h> Callbacks for the Proxy feature.
   Should be instantiated with BT_MESH_PROXY_CB_DEFINE.

Public Members

void (*identity_enabled)(uint16_t net_idx)
   Started sending Node Identity beacons on the given subnet.
   
   **Param net_idx**
   - Network index the Node Identity beacons are running on.

void (*identity_disabled)(uint16_t net_idx)
   Stopped sending Node Identity beacons on the given subnet.
   
   **Param net_idx**
   - Network index the Node Identity beacons were running on.
Heartbeat  The Heartbeat feature provides functionality for monitoring Bluetooth mesh nodes and determining the distance between nodes.

The Heartbeat feature is configured through the Configuration Server model.

Heartbeat messages  Heartbeat messages are sent as transport control packets through the network, and are only encrypted with a network key. Heartbeat messages contain the original Time To Live (TTL) value used to send the message and a bitfield of the active features on the node. Through this, a receiving node can determine how many relays the message had to go through to arrive at the receiver, and what features the node supports.

Available Heartbeat feature flags:

- BT_MESH_FEAT_RELAY
- BT_MESH_FEAT_PROXY
- BT_MESH_FEAT_FRIEND
- BT_MESH_FEAT_LOW_POWER

Heartbeat publication  Heartbeat publication is controlled through the Configuration models, and can be triggered in two ways:

Periodic publication
The node publishes a new Heartbeat message at regular intervals. The publication can be configured to stop after a certain number of messages, or continue indefinitely.

Triggered publication
The node publishes a new Heartbeat message every time a feature changes. The set of features that can trigger the publication is configurable.

The two publication types can be combined.

Heartbeat subscription  A node can be configured to subscribe to Heartbeat messages from one node at the time. To receive a Heartbeat message, both the source and destination must match the configured subscription parameters.

Heartbeat subscription is always time limited, and throughout the subscription period, the node keeps track of the number of received Heartbeats as well as the minimum and maximum received hop count.

All Heartbeats received with the configured subscription parameters are passed to the bt_mesh_hb_cb::recv event handler.

When the Heartbeat subscription period ends, the bt_mesh_hb_cb::sub_end callback gets called.

API reference

group bt_mesh_heartbeat
  
  Heartbeat.

  Defines

  BT_MESH_HB_CB_DEFINE(_name)
  
  Register a callback structure for Heartbeat events.

  Registers a callback structure that will be called whenever Heartbeat events occur

  Parameters

  _name – Name of callback structure.
Functions

void bt_mesh_hb_pub_get(struct bt_mesh_hb_pub *get)
Get the current Heartbeat publication parameters.

Parameters
• get – Heartbeat publication parameters return buffer.

void bt_mesh_hb_sub_get(struct bt_mesh_hb_sub *get)
Get the current Heartbeat subscription parameters.

Parameters
• get – Heartbeat subscription parameters return buffer.

struct bt_mesh_hb_pub
#include <heartbeat.h> Heartbeat Publication parameters

Public Members

uint16_t dst
Destination address.

uint16_t count
Remaining publish count.

uint8_t ttl
Time To Live value.

uint16_t feat
Bitmap of features that trigger a Heartbeat publication if they change. Legal values are BT_MESH_FEAT_RELAY, BT_MESH_FEAT_PROXY, BT_MESH_FEAT_FRIEND and BT_MESH_FEAT_LOW_POWER.

uint16_t net_idx
Network index used for publishing.

uint32_t period
Publication period in seconds.

struct bt_mesh_hb_sub
#include <heartbeat.h> Heartbeat Subscription parameters.

Public Members

uint32_t period
Subscription period in seconds.

uint32_t remaining
Remaining subscription time in seconds.
uint16_t src
    Source address to receive Heartbeats from.

uint16_t dst
    Destination address to received Heartbeats on.

uint16_t count
    The number of received Heartbeat messages so far.

uint8_t min_hops
    Minimum hops in received messages, ie the shortest registered path from the publishing
node to the subscribing node. A Heartbeat received from an immediate neighbor has hop
count = 1.

uint8_t max_hops
    Maximum hops in received messages, ie the longest registered path from the publishing
node to the subscribing node. A Heartbeat received from an immediate neighbor has hop
count = 1.

struct bt_mesh_hb_cb
    #include <heartbeat.h> Heartbeat callback structure

Public Members

void (*recv)(const struct bt_mesh_hb_sub *sub, uint8_t hops, uint16_t feat)
    Receive callback for heartbeats.
    Gets called on every received Heartbeat that matches the current Heartbeat subscription
parameters.
    Param sub
        Current Heartbeat subscription parameters.
    Param hops
        The number of hops the Heartbeat was received with.
    Param feat
        The feature set of the publishing node. The value is a bitmap
of BT_MESH_FEAT_RELAY, BT_MESH_FEAT_PROXY, BT_MESH_FEAT_FRIEND
and BT_MESH_FEAT_LOW_POWER.

void (*sub_end)(const struct bt_mesh_hb_sub *sub)
    Subscription end callback for heartbeats.
    Gets called when the subscription period ends, providing a summary of the received heart-
beat messages.
    Param sub
        Current Heartbeat subscription parameters.

void (*pub_sent)(const struct bt_mesh_hb_pub *pub)
    Publication sent callback for heartbeats.
    Gets called when the heartbeat is successfully published.
    Param pub
        Current Heartbeat publication parameters.
Runtime Configuration  The runtime configuration API allows applications to change their runtime configuration directly, without going through the Configuration models.

Bluetooth mesh nodes should generally be configured by a central network configurator device with a Configuration Client model. Each mesh node instantiates a Configuration Server model that the Configuration Client can communicate with to change the node configuration. In some cases, the mesh node can't rely on the Configuration Client to detect or determine local constraints, such as low battery power or changes in topology. For these scenarios, this API can be used to change the configuration locally.

API reference

group bt_meshCfg
  Runtime Configuration.

Enums

enum bt Mesh _ feat _ state

Bluetooth mesh feature states

Values:

enumerator BT_MESH_FEATURE_DISABLED
Feature is supported, but disabled.

enumerator BT_MESH_FEATURE_ENABLED
Feature is supported and enabled.

denumerator BT_MESH_FEATURE_NOT_SUPPORTED
Feature is not supported, and cannot be enabled.

Functions

void bt_mesh_beacon_set (bool beacon)
Enable or disable sending of the Secure Network Beacon.

Parameters

• beacon – New Secure Network Beacon state.

bool bt_mesh_beacon_enabled (void)
Get the current Secure Network Beacon state.

Returns

Whether the Secure Network Beacon feature is enabled.

int bt_mesh_default_ttl_set (uint8_t default_ttl)
Set the default TTL value.

The default TTL value is used when no explicit TTL value is set. Models will use the default TTL value when \texttt{bt\_mesh\_msg\_ctx::send\_ttl} is \texttt{BT\_MESH\_TTL\_DEFAULT}.

Parameters

• default_ttl – The new default TTL value. Valid values are 0x00 and 0x02 to \texttt{BT\_MESH\_TTL\_MAX}.

Return values

• 0 – Successfully set the default TTL value.
• -EINVAL – Invalid TTL value.

uint8_t bt_mesh_default_ttl_get (void)
Get the current default TTL value.

Returns

The current default TTL value.
void bt_mesh_net_transmit_set(uint8_t xmit)
    Set the Network Transmit parameters.
    The Network Transmit parameters determine the parameters local messages are transmitted
    with.

    See also:
    BT_MESH_TRANSMIT

    Parameters
    • xmit – New Network Transmit parameters. Use BT_MESH_TRANSMIT for encoding.

uint8_t bt_mesh_net_transmit_get(void)
    Get the current Network Transmit parameters.
    The BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT macros can be used to de-
    code the Network Transmit parameters.

    Returns
    The current Network Transmit parameters.

int bt_mesh_relay_set(enum bt_mesh_feat_state relay, uint8_t xmit)
    Configure the Relay feature.
    Enable or disable the Relay feature, and configure the parameters to transmit relayed mes-
    sages with.
    Support for the Relay feature must be enabled through the CONFIG_BT_MESH_RELAY con-
    figuration option.

    See also:
    BT_MESH_TRANSMIT

    Parameters
    • relay – New Relay feature state. Must be one of
    BT_MESH_FEATURE_ENABLED and BT_MESH_FEATURE_DISABLED.
    • xmit – New Relay retransmit parameters. Use BT_MESH_TRANSMIT for encod-
        ing.

    Return values
    • 0 – Successfully changed the Relay configuration.
    • -ENOTSUP – The Relay feature is not supported.
    • -EINVAL – Invalid parameter.
    • -EAGAIN – Already using the given parameters.

enum bt_mesh_feat_state bt_mesh_relay_get(void)
    Get the current Relay feature state.

    Returns
    The Relay feature state.
uint8_t bt_mesh_relay_retransmit_get(void)
Get the current Relay Retransmit parameters.

The `BT_MESH_TRANSMIT_COUNT` and `BT_MESH_TRANSMIT_INT` macros can be used to decode the Relay Retransmit parameters.

**Returns**
The current Relay Retransmit parameters, or 0 if relay is not supported.

int bt_mesh_gatt_proxy_set(enum bt_mesh_feat_state gatt_proxy)
Enable or disable the GATT Proxy feature.

Support for the GATT Proxy feature must be enabled through the `CONFIG_BT_MESH_GATT_PROXY` configuration option.

**Note:** The GATT Proxy feature only controls a Proxy node's ability to relay messages to the mesh network. A node that supports GATT Proxy will still advertise Connectable Proxy beacons, even if the feature is disabled. The Proxy feature can only be fully disabled through compile time configuration.

**Parameters**
- gatt_proxy – New GATT Proxy state. Must be one of `BT_MESH_FEATURE_ENABLED` and `BT_MESH_FEATURE_DISABLED`.

**Return values**
- 0 – Successfully changed the GATT Proxy feature state.
- -ENOTSUP – The GATT Proxy feature is not supported.
- -EINVAL – Invalid parameter.
- -EALREADY – Already in the given state.

enum bt_mesh_feat_state bt_mesh_gatt_proxy_get(void)
Get the current GATT Proxy state.

**Returns**
The GATT Proxy feature state.

int bt_mesh_friend_set(enum bt_mesh_feat_state friendship)
Enable or disable the Friend feature.

Any active friendships will be terminated immediately if the Friend feature is disabled.

Support for the Friend feature must be enabled through the `CONFIG_BT_MESH_FRIEND` configuration option.

**Parameters**
- friendship – New Friend feature state. Must be one of `BT_MESH_FEATURE_ENABLED` and `BT_MESH_FEATURE_DISABLED`.

**Return values**
- 0 – Successfully changed the Friend feature state.
- -ENOTSUP – The Friend feature is not supported.
- -EINVAL – Invalid parameter.
- -EALREADY – Already in the given state.
enum bt_mesh_feat_state bt_mesh_friend_get(void)
    Get the current Friend state.

Returns
    The Friend feature state.

Bluetooth Mesh Shell  The Bluetooth mesh shell subsystem provides a set of Bluetooth mesh shell commands for the Shell module. It allows for testing and exploring the Bluetooth mesh API through an interactive interface, without having to write an application.

The Bluetooth mesh shell interface provides access to most Bluetooth mesh features, including provisioning, configuration, and message sending.

Prerequisites  The Bluetooth mesh shell subsystem depends on the application to create the composition data and do the mesh initialization.

Application  The Bluetooth mesh shell subsystem is most easily used through the Bluetooth mesh shell application under tests/bluetooth/mesh_shell. See Shell for information on how to connect and interact with the Bluetooth mesh shell application.

Basic usage  The Bluetooth mesh shell subsystem adds a single mesh command, which holds a set of sub-commands. Every time the device boots up, make sure to call mesh init before any of the other Bluetooth mesh shell commands can be called:

uart:~$ mesh init

This is done to ensure that all available log will be printed to the shell output.

Provisioning  The mesh node must be provisioned to become part of the network. This is only necessary the first time the device boots up, as the device will remember its provisioning data between reboots.

The simplest way to provision the device is through self-provisioning. To do this the user must provision the device with the default network key and address 0x0001, execute:

uart:~$ mesh prov local 0 0x0001

Since all mesh nodes use the same values for the default network key, this can be done on multiple devices, as long as they're assigned non-overlapping unicast addresses. Alternatively, to provision the device into an existing network, the unprovisioned beacon can be enabled with mesh prov pb-adv on or mesh prov pb-gatt on. The beacons can be picked up by an external provisioner, which can provision the node into its network.

Once the mesh node is part of a network, its transmission parameters can be controlled by the general configuration commands:

- To set the destination address, call mesh target dst <addr>.
- To set the network key index, call mesh target net <NetIdx>.
- To set the application key index, call mesh target app <AppIdx>.

By default, the transmission parameters are set to send messages to the provisioned address and network key.

6.1. Bluetooth
**Configuration**  
By setting the destination address to the local unicast address (0x0001 in the `mesh local` command above), we can perform self-configuration through any of the `Models` commands.

A good first step is to read out the node's own composition data:

```
 uart:~$ mesh models cfg get-comp
```

This prints a list of the composition data of the node, including a list of its model IDs.

Next, since the device has no application keys by default, it's a good idea to add one:

```
 uart:~$ mesh models cfg appkey add 0 0
```

**Message sending**  
With an application key added (see above), the mesh node's transition parameters are all valid, and the Bluetooth mesh shell can send raw mesh messages through the network.

For example, to send a Generic OnOff Set message, call:

```
 uart:~$ mesh test net-send 82020100
```

*Note:* All multibyte fields model messages are in little endian, except the opcode.

The message will be sent to the current destination address, using the current network and application key indexes. As the destination address points to the local unicast address by default, the device will only send packets to itself. To change the destination address to the All Nodes broadcast address, call:

```
 uart:~$ mesh target dst 0xffff
```

With the destination address set to 0xffff, any other mesh nodes in the network with the configured network and application keys will receive and process the messages we send.

*Note:* To change the configuration of the device, the destination address must be set back to the local unicast address before issuing any configuration commands.

Sending raw mesh packets is a good way to test model message handler implementations during development, as it can be done without having to implement the sending model. By default, only the reception of the model messages can be tested this way, as the Bluetooth mesh shell only includes the foundation models. To receive a packet in the mesh node, you have to add a model with a valid opcode handler list to the composition data in `subsys/bluetooth/mesh/shell.c`, and print the incoming message to the shell in the handler callback.

**Parameter formats**  
The Bluetooth mesh shell commands are parsed with a variety of formats:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integers</td>
<td>The default format unless something else is specified. Can be either decimal or hexadecimal.</td>
<td>1234, 0xabcd01234</td>
</tr>
<tr>
<td>Hexstrings</td>
<td>For raw byte arrays, like UUIDs, key values and message payloads, the parameters should be formatted as an unbroken string of hexadecimal values without any prefix.</td>
<td>deadbeef01234</td>
</tr>
<tr>
<td>Booleans</td>
<td>Boolean values are denoted in the API documentation as <code>&lt;val: on, off&gt;</code>.</td>
<td>on, off, enabled, disabled, 1, 0</td>
</tr>
</tbody>
</table>
Commands  The Bluetooth mesh shell implements a large set of commands. Some of the commands accept parameters, which are mentioned in brackets after the command name. For example, `mesh lpn set <value: off, on>`. Mandatory parameters are marked with angle brackets (e.g. `<NetKeyIndex>`), and optional parameters are marked with square brackets (e.g. `[destination address]`).

The Bluetooth mesh shell commands are divided into the following groups:

- **General configuration**
- **Target**
- **Low Power Node**
- **Testing**
- **Provisioning**
- **Proxy**
- **Models**
- **Configuration database**

**Note:** Some commands depend on specific features being enabled in the compile time configuration of the application. Not all features are enabled by default. The list of available Bluetooth mesh shell commands can be shown in the shell by calling `mesh` without any arguments.

**General configuration**

`mesh init`

Initialize the mesh shell. This command must be run before any other mesh command.

`mesh reset-local`

Reset the local mesh node to its initial unprovisioned state. This command will also clear the Configuration Database (CDB) if present.

**Target**  The target commands enables the user to monitor and set the target destination address, network index and application index for the shell. These parameters are used by several commands, like provisioning, Configuration Client, etc.

`mesh target dst [destination address]`

Get or set the message destination address. The destination address determines where mesh packets are sent with the shell, but has no effect on modules outside the shell’s control.

- **destination address**: If present, sets the new 16-bit mesh destination address. If omitted, the current destination address is printed.

`mesh target net [NetIdx]`

Get or set the message network index. The network index determines which network key is used to encrypt mesh packets that are sent with the shell, but has no effect on modules outside the shell’s control. The network key must already be added to the device, either through provisioning or by a Configuration Client.
• NetIdx: If present, sets the new network index. If omitted, the current network index is printed.

mesh target app [AppIdx]

Get or set the message application index. The application index determines which application key is used to encrypt mesh packets that are sent with the shell, but has no effect on modules outside the shell’s control. The application key must already be added to the device by a Configuration Client, and must be bound to the current network index.

• AppIdx: If present, sets the new application index. If omitted, the current application index is printed.

Low Power Node

mesh lpn set <value: off, on>

Enable or disable Low Power operation. Once enabled, the device will turn off its radio and start polling for friend nodes.

• value: Sets whether Low Power operation is enabled.

mesh lpn poll

Perform a poll to the friend node, to receive any pending messages. Only available when LPN is enabled.

Testing

mesh test net-send <Hex string>

Send a raw mesh message with the current destination address, network and application index. The message opcode must be encoded manually.

• hex string Raw hexadecimal representation of the message to send.

mesh test iv-update

Force an IV update.

mesh test iv-update-test <value: off, on>

Set the IV update test mode. In test mode, the IV update timing requirements are bypassed.

• value: Enable or disable the IV update test mode.

mesh test rpl-clear

Clear the replay protection list, forcing the node to forget all received messages.

**Warning:** Clearing the replay protection list breaks the security mechanisms of the mesh node, making it susceptible to message replay attacks. This should never be performed in a real deployment.

Health Server Test
mesh test health-srv add-fault <Fault ID>

Register a new Health Server Fault for the Linux Foundation Company ID.

- Fault ID: ID of the fault to register (0x0001 to 0xFFFF)

mesh test health-srv del-fault [Fault ID]

Remove registered Health Server faults for the Linux Foundation Company ID.

- Fault ID: If present, the given fault ID will be deleted. If omitted, all registered faults will be cleared.

**Provisioning** To allow a device to broadcast connectable unprovisioned beacons, the CONFIG_BT_MESH_PROV_DEVICE configuration option must be enabled, along with the CONFIG_BT_MESH_PB_GATT option.

mesh prov pb-gatt <val: off, on>

Start or stop advertising a connectable unprovisioned beacon. The connectable unprovisioned beacon allows the mesh node to be discovered by nearby GATT based provisioners, and provisioned through the GATT bearer.

- val: Enable or disable provisioning with GATT

To allow a device to broadcast unprovisioned beacons, the CONFIG_BT_MESH_PROV_DEVICE configuration option must be enabled, along with the CONFIG_BT_MESH_PB_ADV option.

mesh prov pb-adv <val: off, on>

Start or stop advertising the unprovisioned beacon. The unprovisioned beacon allows the mesh node to be discovered by nearby advertising-based provisioners, and provisioned through the advertising bearer.

- val: Enable or disable provisioning with advertiser

To allow a device to provision devices, the CONFIG_BT_MESH_PROVISIONER and CONFIG_BT_MESH_PB_ADV configuration options must be enabled.

mesh prov remote-adv <UUID> <NetKeyIndex> <addr> <AttentionDuration>

Provision a nearby device into the mesh. The mesh node starts scanning for unprovisioned beacons with the given UUID. Once found, the unprovisioned device will be added to the mesh network with the given unicast address, and given the network key indicated by NetKeyIndex.

- UUID: UUID of the unprovisioned device.
- NetKeyIndex: Index of the network key to pass to the device.
- addr: First unicast address to assign to the unprovisioned device. The device will occupy as many addresses as it has elements, and all must be available.
- AttentionDuration: The duration in seconds the unprovisioned device will identify itself for, if supported. See Attention state for details.

To allow a device to provision devices over GATT, the CONFIG_BT_MESH_PROVISIONER and CONFIG_BT_MESH_PB_GATT_CLIENT configuration options must be enabled.

6.1. Bluetooth
Provision a nearby device into the mesh. The mesh node starts scanning for connectable advertising for PB-GATT with the given UUID. Once found, the unprovisioned device will be added to the mesh network with the given unicast address, and given the network key indicated by NetKeyIndex.

- UUID: UUID of the unprovisioned device.
- NetKeyIndex: Index of the network key to pass to the device.
- addr: First unicast address to assign to the unprovisioned device. The device will occupy as many addresses as it has elements, and all must be available.
- AttentionDuration: The duration in seconds the unprovisioned device will identify itself for, if supported. See Attention state for details.

Get or set the mesh node's UUID, used in the unprovisioned beacons.

- UUID: If present, new 128-bit UUID value. Any missing bytes will be zero. If omitted, the current UUID will be printed. To enable this command, the BT_MESH_SHELL_PROV_CTX_INSTANCE option must be enabled.

Input a numeric OOB authentication value. Only valid when prompted by the shell during provisioning. The input number must match the number presented by the other participant in the provisioning.

- number: Decimal authentication number.

Input an alphanumeric OOB authentication value. Only valid when prompted by the shell during provisioning. The input string must match the string presented by the other participant in the provisioning.

- string: Unquoted alphanumeric authentication string.

Set or clear the static OOB authentication value. The static OOB authentication value must be set before provisioning starts to have any effect. The static OOB value must be same on both participants in the provisioning. To enable this command, the BT_MESH_SHELL_PROV_CTX_INSTANCE option must be enabled.

- val: If present, indicates the new hexadecimal value of the static OOB. If omitted, the static OOB value is cleared.

Provision the mesh node itself. If the Configuration database is enabled, the network key must be created. Otherwise, the default key value is used.

- NetKeyIndex: Index of the network key to provision.
- addr: First unicast address to assign to the device. The device will occupy as many addresses as it has elements, and all must be available.
- IVIndex: Indicates the current network IV index. Defaults to 0 if omitted.
mesh prov beacon-listen <val: off, on>

Enable or disable printing of incoming unprovisioned beacons. Allows a provisioner device to detect nearby unprovisioned devices and provision them. To enable this command, the BT_MESH_SHELL_PROV_CTX_INSTANCE option must be enabled.

- val: Whether to enable the unprovisioned beacon printing.

mesh prov remote-pub-key <PubKey>

Provide Device public key.

- PubKey - Device public key in big-endian.

mesh prov auth-method input <Action> <Size>

From the provisioner device, instruct the unprovisioned device to use the specified Input OOB authentication action.

- Action - Input action. Allowed values:
  - 0 - No input action.
  - 1 - Push action set.
  - 2 - Twist action set.
  - 4 - Enter number action set.
  - 8 - Enter String action set.
- Size - Authentication size.

mesh prov auth-method output <Action> <Size>

From the provisioner device, instruct the unprovisioned device to use the specified Output OOB authentication action.

- Action - Output action. Allowed values:
  - 0 - No output action.
  - 1 - Blink action set.
  - 2 - Vibrate action set.
  - 4 - Display number action set.
  - 8 - Display String action set.
- Size - Authentication size.

mesh prov auth-method static <Value>

From the provisioner device, instruct the unprovisioned device to use static OOB authentication, and use the given static authentication value when provisioning.

- Value - Static OOB value.

mesh prov auth-method none <Value>

From the provisioner device, don’t use any authentication when provisioning new devices. This is the default behavior.
Proxy  The Proxy Server module is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_GATT_PROXY` configuration option.

```
mesh proxy identity-enable
```
Enable the Proxy Node Identity beacon, allowing Proxy devices to connect explicitly to this device. The beacon will run for 60 seconds before the node returns to normal Proxy beacons.

The Proxy Client module is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_PROXY_CLIENT` configuration option.

```
mesh proxy connect <NetKeyIndex>
```
Auto-Connect a nearby proxy server into the mesh.

- **NetKeyIndex**: Index of the network key to connect.

```
mesh proxy disconnect <NetKeyIndex>
```
Disconnect the existing proxy connection.

- **NetKeyIndex**: Index of the network key to disconnect.

Models

Configuration Client  The Configuration Client model is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_CFG_CLI` configuration option. This is implemented as a separate module (`mesh models cfg`) inside the `mesh models` subcommand list. This module will work on any instance of the Configuration Client model if the mentioned shell configuration options is enabled, and as long as the Configuration Client model is present in the model composition of the application. This shell module can be used for configuring itself and other nodes in the mesh network.

The Configuration Client uses general message parameters set by `mesh target dst` and `mesh target net` to target specific nodes. When the Bluetooth mesh shell node is provisioned, given that the `BT_MESH_SHELL_PROV_CTX_INSTANCE` option is enabled with the shell provisioning context initialized, the Configuration Client model targets itself by default. Similarly, when another node has been provisioned by the Bluetooth mesh shell, the Configuration Client model targets the new node. In most common use-cases, the Configuration Client is depending on the provisioning features and the Configuration database to be fully functional. The Configuration Client always sends messages using the Device key bound to the destination address, so it will only be able to configure itself and the mesh nodes it provisioned. The following steps are an example of how you can set up a device to start using the Configuration Client commands:

- Initialize the client node (`mesh init`).
- Create the CDB (`mesh cdb create`).
- Provision the local device (`mesh prov local`).
- The shell module should now target itself.
- Monitor the composition data of the local node (`mesh models cfg get-comp`).
- Configure the local node as desired with the Configuration Client commands.
- Provision other devices (`mesh prov beacon-listen`) (`mesh prov remote-adv`) (`mesh prov remote-gatt`).
- The shell module should now target the newly added node.
- Monitor the newly provisioned nodes and their addresses (`mesh cdb show`).
- Monitor the composition data of the target device (`mesh models cfg get-comp`).
• Configure the node as desired with the Configuration Client commands.

mesh models cfg target get
Get the target Configuration server for the Configuration Client model.

mesh models cfg help
Print information for the Configuration Client shell module.

mesh models cfg reset
Reset the target device.

mesh models cfg timeout [timeout in seconds]
Get and set the Config Client model timeout used during message sending.
• timeout in seconds: If present, set the Config Client model timeout in seconds. If omitted, the current timeout is printed.

mesh models cfg get-comp [page]
Read a composition data page. The full composition data page will be printed. If the target does not have the given page, it will return the last page before it.
• page: The composition data page to request. Defaults to 0 if omitted.

mesh models cfg beacon [val: off, on]
Get or set the network beacon transmission.
• val: If present, enables or disables sending of the network beacon. If omitted, the current network beacon state is printed.

mesh models cfg ttl [ttl: 0x00, 0x02-0x7f]
Get or set the default TTL value.
• ttl: If present, sets the new default TTL value. If omitted, the current default TTL value is printed.

mesh models cfg friend [val: off, on]
Get or set the Friend feature.
• val: If present, enables or disables the Friend feature. If omitted, the current Friend feature state is printed:
  - 0x00: The feature is supported, but disabled.
  - 0x01: The feature is enabled.
  - 0x02: The feature is not supported.
mesh models cfg gatt-proxy [val: off, on]
Get or set the GATT Proxy feature.
- **val**: If present, enables or disables the GATT Proxy feature. If omitted, the current GATT Proxy feature state is printed:
  - 0x00: The feature is supported, but disabled.
  - 0x01: The feature is enabled.
  - 0x02: The feature is not supported.

mesh models cfg relay [<val: off, on> [<count: 0-7> [interval: 10-320]]]
Get or set the Relay feature and its parameters.
- **val**: If present, enables or disables the Relay feature. If omitted, the current Relay feature state is printed:
  - 0x00: The feature is supported, but disabled.
  - 0x01: The feature is enabled.
  - 0x02: The feature is not supported.
- **count**: Sets the new relay retransmit count if **val** is on. Ignored if **val** is off. Defaults to 2 if omitted.
- **interval**: Sets the new relay retransmit interval in milliseconds if **val** is on. Ignored if **val** is off. Defaults to 20 if omitted.

mesh models cfg node-id <NetKeyIndex> [Identity]
Get or Set of current Node Identity state of a subnet.
- **NetKeyIndex**: The network key index to Get/Set.
- **Identity**: If present, sets the identity of Node Identity state.

mesh models cfg polltimeout-get <LPN Address>
Get current value of the PollTimeout timer of the LPN within a Friend node.
- **addr**: Address of Low Power node.

mesh models cfg net-transmit-param [<count: 0-7> <interval: 10-320>]
Get or set the network transmit parameters.
- **count**: Sets the number of additional network transmits for every sent message.
- **interval**: Sets the new network retransmit interval in milliseconds.

mesh models cfg netkey add <NetKeyIndex> [val]
Add a network key to the target node. Adds the key to the Configuration Database if enabled.
- **NetKeyIndex**: The network key index to add.
- **val**: If present, sets the key value as a 128-bit hexadecimal value. Any missing bytes will be zero. Only valid if the key does not already exist in the Configuration Database. If omitted, the default key value is used.
mesh models cfg netkey upd <NetKeyIndex> [val]
Update a network key to the target node.
  • NetKeyIndex: The network key index to updated.
  • val: If present, sets the key value as a 128-bit hexadecimal value. Any missing bytes will be zero. If omitted, the default key value is used.

mesh models cfg netkey get
Get a list of known network key indexes.

mesh models cfg netkey del <NetKeyIndex>
Delete a network key from the target node.
  • NetKeyIndex: The network key index to delete.

mesh models cfg appkey add <NetKeyIndex> <AppKeyIndex> [val]
Add an application key to the target node. Adds the key to the Configuration Database if enabled.
  • NetKeyIndex: The network key index the application key is bound to.
  • AppKeyIndex: The application key index to add.
  • val: If present, sets the key value as a 128-bit hexadecimal value. Any missing bytes will be zero. Only valid if the key does not already exist in the Configuration Database. If omitted, the default key value is used.

mesh models cfg appkey upd <NetKeyIndex> <AppKeyIndex> [val]
Update an application key to the target node.
  • NetKeyIndex: The network key index the application key is bound to.
  • AppKeyIndex: The application key index to update.
  • val: If present, sets the key value as a 128-bit hexadecimal value. Any missing bytes will be zero. If omitted, the default key value is used.

mesh models cfg appkey get <NetKeyIndex>
Get a list of known application key indexes bound to the given network key index.
  • NetKeyIndex: Network key indexes to get a list of application key indexes from.

mesh models cfg appkey del <NetKeyIndex> <AppKeyIndex>
Delete an application key from the target node.
  • NetKeyIndex: The network key index the application key is bound to.
  • AppKeyIndex: The application key index to delete.
mesh models cfg model app-bind <addr> <AppIndex> <Model ID> [Company ID]

Bind an application key to a model. Models can only encrypt and decrypt messages sent with application keys they are bound to.

- **addr**: Address of the element the model is on.
- **AppIndex**: The application key to bind to the model.
- **Model ID**: The model ID of the model to bind the key to.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model app-unbind <addr> <AppIndex> <Model ID> [Company ID]

Unbind an application key from a model.

- **addr**: Address of the element the model is on.
- **AppIndex**: The application key to unbind from the model.
- **Model ID**: The model ID of the model to unbind the key from.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model app-get <elem addr> <Model ID> [Company ID]

Get a list of application keys bound to a model.

- **elem addr**: Address of the element the model is on.
- **Model ID**: The model ID of the model to get the bound keys of.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model pub <addr> <mod id> [cid] [<PubAddr> <AppKeyId> <cred: off, on> <ttl> <period> <count> <interval>]

Get or set the publication parameters of a model. If all publication parameters are included, they become the new publication parameters of the model. If all publication parameters are omitted, print the current publication parameters of the model.

- **addr**: Address of the element the model is on.
- **Model ID**: The model ID of the model to get the bound keys of.
- **cid**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

Publication parameters:

- **PubAddr**: The destination address to publish to.
- **AppKeyId**: The application key index to publish with.
- **cred**: Whether to publish with Friendship credentials when acting as a Low Power Node.
- **ttl**: TTL value to publish with (0x00 to 0x07f).
- **period**: Encoded publication period, or 0 to disable periodic publication.
- **count**: Number of retransmission for each published message (0 to 7).
- **interval**: The interval between each retransmission, in milliseconds. Must be a multiple of 50.
Set the publication parameters of a model.

- **addr**: Address of the element the model is on.
- **Model ID**: The model ID of the model to get the bound keys of.
- **cid**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

**Publication parameters:**

- **UUID**: The destination virtual address to publish to.
- **AppKeyIndex**: The application key index to publish with.
- **cred**: Whether to publish with Friendship credentials when acting as a Low Power Node.
- **ttl**: TTL value to publish with (0x00 to 0x07f).
- **period**: Encoded publication period, or 0 to disable periodic publication.
- **count**: Number of retransmission for each published message (0 to 7).
- **interval**: The interval between each retransmission, in milliseconds. Must be a multiple of 50.

Subscription the model to a group address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

- **elem addr**: Address of the element the model is on.
- **sub addr**: 16-bit group address the model should subscribe to (0xc000 to 0xFEFF).
- **Model ID**: The model ID of the model to add the subscription to.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

Unsubscribe a model from a group address.

- **elem addr**: Address of the element the model is on.
- **sub addr**: 16-bit group address the model should remove from its subscription list (0xc000 to 0xFEFF).
- **Model ID**: The model ID of the model to add the subscription to.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

Subscribe the model to a virtual address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

- **elem addr**: Address of the element the model is on.
- **Label UUID**: 128-bit label UUID of the virtual address to subscribe to. Any omitted bytes will be zero.
• **Model ID**: The model ID of the model to add the subscription to.
• **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

```
mesh models cfg model sub-del-va <elem addr> <Label UUID> <Model ID> [Company ID]
```

Unsubscribe a model from a virtual address.
• **elem addr**: Address of the element the model is on.
• **Label UUID**: 128-bit label UUID of the virtual address to remove the subscription of. Any omitted bytes will be zero.
• **Model ID**: The model ID of the model to add the subscription to.
• **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

```
mesh models cfg model sub-ow <elem addr> <sub addr> <Model ID> [Company ID]
```

Overwrite all model subscriptions with a single new group address.
• **elem addr**: Address of the element the model is on.
• **sub addr**: 16-bit group address the model should added to the subscription list (0xc000 to 0xFEFF).
• **Model ID**: The model ID of the model to add the subscription to.
• **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

```
mesh models cfg model sub-ow-va <elem addr> <Label UUID> <Model ID> [Company ID]
```

Overwrite all model subscriptions with a single new virtual address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.
• **elem addr**: Address of the element the model is on.
• **Label UUID**: 128-bit label UUID of the virtual address as the new Address to be added to the subscription list. Any omitted bytes will be zero.
• **Model ID**: The model ID of the model to add the subscription to.
• **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

```
mesh models cfg model sub-del-all <elem addr> <Model ID> [Company ID]
```

Remove all group and virtual address subscriptions from of a model.
• **elem addr**: Address of the element the model is on.
• **Model ID**: The model ID of the model to Unsubscribe all.
• **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.
mesh models cfg model sub-get <elem addr> <Model ID> [Company ID]

Get a list of addresses the model subscribes to.

- **elem addr**: Address of the element the model is on.
- **Model ID**: The model ID of the model to get the subscription list of.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg krp <NetKeyIdx> [Phase]

Get or set the key refresh phase of a subnet.

- **NetKeyIdx**: The identified network key used to Get/Set the current Key Refresh Phase state.
- **Phase**: New Key Refresh Phase. Valid phases are 0, 1 or 2.

mesh models cfg hb-sub [<src> <dst> <period>]

Get or set the Heartbeat subscription parameters. A node only receives Heartbeat messages matching the Heartbeat subscription parameters. Sets the Heartbeat subscription parameters if present, or prints the current Heartbeat subscription parameters if called with no parameters.

- **src**: Unicast source address to receive Heartbeat messages from.
- **dst**: Destination address to receive Heartbeat messages on.
- **period**: Logarithmic representation of the Heartbeat subscription period:
  - 0: Heartbeat subscription will be disabled.
  - 1 to 17: The node will subscribe to Heartbeat messages for \(2^{(\text{period} - 1)}\) seconds.

mesh models cfg hb-pub [<dst> <count> <period> <ttl> <features> <NetKeyIndex>]

Get or set the Heartbeat publication parameters. Sets the Heartbeat publication parameters if present, or prints the current Heartbeat publication parameters if called with no parameters.

- **dst**: Destination address to publish Heartbeat messages to.
- **count**: Logarithmic representation of the number of Heartbeat messages to publish periodically:
  - 0: Heartbeat messages are not published periodically.
  - 1 to 17: The node will periodically publish \(2^{(\text{count} - 1)}\) Heartbeat messages.
  - 255: Heartbeat messages will be published periodically indefinitely.
- **period**: Logarithmic representation of the Heartbeat publication period:
  - 0: Heartbeat messages are not published periodically.
  - 1 to 17: The node will publish Heartbeat messages every \(2^{(\text{period} - 1)}\) seconds.
- **ttl**: The TTL value to publish Heartbeat messages with (0x00 to 0xFF).
- **features**: Bitfield of features that should trigger a Heartbeat publication when changed:
  - Bit 0: Relay feature.
  - Bit 1: Proxy feature.
  - Bit 2: Friend feature.
Bit 3: Low Power feature.
  - NetKeyIndex: Index of the network key to publish Heartbeat messages with.

Health Client  The Health Client model is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_HEALTH_CLI configuration option. This is implemented as a separate module (mesh models health) inside the mesh models subcommand list. This module will work on any instance of the Health Client model if the mentioned shell configuration options is enabled, and as long as one or more Health Client model(s) is present in the model composition of the application. This shell module can be used to trigger interaction between Health Clients and Servers on devices in a Mesh network.

By default, the module will choose the first Health Client instance in the model composition when using the Health Client commands. To choose a specific Health Client instance the user can utilize the commands mesh models health instance set and mesh models health instance get-all.

The Health Client may use the general messages parameters set by mesh target dst, mesh target net and mesh target app to target specific nodes. If the shell target destination address is set to zero, the targeted Health Client will attempt to publish messages using its configured publication parameters.

```
mesh models health instance set <Elem_idx>
  Set the Health Client model instance to use.
  • Elem_idx: Element index of Health Client model.

mesh models health instance get-all
  Prints all available Health Client model instances on the device.

mesh models health fault-get <Company ID>
  Get a list of registered faults for a Company ID.
  • Company ID: Company ID to get faults for.

mesh models health fault-clear <Company ID>
  Clear the list of faults for a Company ID.
  • Company ID: Company ID to clear the faults for.

mesh models health fault-clear-unack <Company ID>
  Clear the list of faults for a Company ID without requesting a response.
  • Company ID: Company ID to clear the faults for.

mesh models health fault-test <Company ID> <Test ID>
  Invoke a self-test procedure, and show a list of triggered faults.
  • Company ID: Company ID to perform self-tests for.
  • Test ID: Test to perform.
```
mesh models health fault-test-unack <Company ID> <Test ID>

Invoke a self-test procedure without requesting a response.

- **Company ID**: Company ID to perform self-tests for.
- **Test ID**: Test to perform.

mesh models health period-get

Get the current Health Server publish period divisor.

mesh models health period-set <divisor>

Set the current Health Server publish period divisor. When a fault is detected, the Health Server will start publishing fault status with a reduced interval. The reduced interval is determined by the Health Server publish period divisor: Fault publish period = Publish period / $2^{\text{divisor}}$.

- **divisor**: The new Health Server publish period divisor.

mesh models health period-set-unack <divisor>

Set the current Health Server publish period divisor. When a fault is detected, the Health Server will start publishing fault status with a reduced interval. The reduced interval is determined by the Health Server publish period divisor: Fault publish period = Publish period / $2^{\text{divisor}}$.

- **divisor**: The new Health Server publish period divisor.

mesh models health attention-get

Get the current Health Server attention state.

mesh models health attention-set <timer>

Enable the Health Server attention state for some time.

- **timer**: Duration of the attention state, in seconds (0 to 255)

mesh models health attention-set-unack <timer>

Enable the Health Server attention state for some time without requesting a response.

- **timer**: Duration of the attention state, in seconds (0 to 255)

**Configuration database**

The Configuration database is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_CDB` configuration option. The Configuration database is only available on provisioner devices, and allows them to store all information about the mesh network. To avoid conflicts, there should only be one mesh node in the network with the Configuration database enabled. This node is the Configurator, and is responsible for adding new nodes to the network and configuring them.

mesh cdb create [NetKey]

Create a Configuration database.

- **NetKey**: Optional network key value of the primary network key (NetKeyIndex=0). Defaults to the default key value if omitted.

6.1. Bluetooth
mesh cdb clear

Clear all data from the Configuration database.

mesh cdb show

Show all data in the Configuration database.

mesh cdb node-add <UUID> <addr> <num-elem> <NetKeyIdx> [DevKey]

Manually add a mesh node to the configuration database. Note that devices provisioned with mesh provision and mesh provision-adv will be added automatically if the Configuration Database is enabled and created.

- **UUID**: 128-bit hexadecimal UUID of the node. Any omitted bytes will be zero.
- **addr**: Unicast address of the node, or 0 to automatically choose the lowest available address.
- **num-elem**: Number of elements on the node.
- **NetKeyIdx**: The network key the node was provisioned with.
- **DevKey**: Optional 128-bit device key value for the device. If omitted, a random value will be generated.

mesh cdb node-del <addr>

Delete a mesh node from the Configuration database. If possible, the node should be reset with mesh reset before it is deleted from the Configuration database, to avoid unexpected behavior and uncontrolled access to the network.

- **addr**: Address of the node to delete.

mesh cdb subnet-add <NetKeyIdx> [<NetKey>]

Add a network key to the Configuration database. The network key can later be passed to mesh nodes in the network. Note that adding a key to the Configuration database does not automatically add it to the local node’s list of known network keys.

- **NetKeyIdx**: Key index of the network key to add.
- **NetKey**: Optional 128-bit network key value. Any missing bytes will be zero. If omitted, a random value will be generated.

mesh cdb subnet-del <NetKeyIdx>

Delete a network key from the Configuration database.

- **NetKeyIdx**: Key index of the network key to delete.

mesh cdb app-key-add <NetKeyIdx> <AppKeyIdx> [<AppKey>]

Add an application key to the Configuration database. The application key can later be passed to mesh nodes in the network. Note that adding a key to the Configuration database does not automatically add it to the local node’s list of known application keys.

- **NetKeyIdx**: Network key index the application key is bound to.
- **AppKeyIdx**: Key index of the application key to add.
- **AppKey**: Optional 128-bit application key value. Any missing bytes will be zero. If omitted, a random value will be generated.
mesh cdb app-key-del <AppKeyIdx>

Delete an application key from the Configuration database.

- **AppKeyIdx**: Key index of the application key to delete.

**Bluetooth Microphone Control**

**API Reference**

**group bt_gatt_micp**

Microphone Input Control Profile (MICP)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Defines**

- **BT_MICP_MIC_DEV_AICS_CNT**
- **BT_MICP_ERR_MUTE_DISABLED**
  - Application error codes
- **BT_MICP_ERR_VAL_OUT_OF_RANGE**
- **BT_MICP_MUTE_MUTED**
  - Microphone Input Control Profile mute states
- **BT_MICP_MUTE_MUTED**
- **BT_MICP_MUTE_DISABLED**

**Functions**

```c
int bt_micp_mic_dev_register(struct bt_micp_mic_dev_register_param *param)
```

Initialize the Microphone Input Control Profile Microphone Device. This will enable the Microphone Input Control Service instance and make it discoverable by Microphone Controllers.

**Parameters**

- **param**: Pointer to an initialization structure.

**Returns**

- 0 if success, errno on failure.

```c
int bt_micp_mic_dev_included_get(struct bt_micp_included *included)
```

Get Microphone Device included services.

Returns a pointer to a struct that contains information about the Microphone Device included Audio Input Control Service instances.

Requires that CONFIG_BT_MICP_MIC_DEV_AICS is enabled.

**Parameters**

- **included**: Pointer to store the result in.
Returns
0 if success, errno on failure.

int bt_micp_mic_dev_unmute(void)
Unmute the Microphone Device.

Returns
0 on success, GATT error value on fail.

int bt_micp_mic_dev_mute(void)
Mute the Microphone Device.

Returns
0 on success, GATT error value on fail.

int bt_micp_mic_dev_mute_disable(void)
Disable the mute functionality on the Microphone Device.
Can be reenabled by called \texttt{bt_micp_mic_dev_mute} or \texttt{bt_micp_mic_dev_unmute}.

Returns
0 on success, GATT error value on fail.

int bt_micp_mic_dev_mute_get(void)
Read the mute state on the Microphone Device.

Returns
0 on success, GATT error value on fail.

int bt_micp_mic_ctlr_included_get(struct bt_micp_mic_ctlr *mic_ctlr, struct bt_micp_included *included)
Get Microphone Input Control Profile included services.
Returns a pointer to a struct that contains information about the Microphone Input Control Profile included services instances, such as pointers to the Audio Input Control Service instances.
Requires that \texttt{CONFIG_BT_MICP_MIC_CTLR_AICS} is enabled.

Parameters
\begin{itemize}
\item \texttt{mic_ctlr} – Microphone Controller instance pointer.
\item \texttt{included} – [\texttt{out}] Pointer to store the result in.
\end{itemize}

Returns
0 if success, errno on failure.

int bt_micp_mic_ctlr_conn_get(const struct bt_micp_mic_ctlr *mic_ctlr, struct bt_conn **conn)
Get the connection pointer of a Microphone Controller instance.
Get the Bluetooth connection pointer of a Microphone Controller instance.

Parameters
\begin{itemize}
\item \texttt{mic_ctlr} – Microphone Controller instance pointer.
\item \texttt{conn} – Connection pointer.
\end{itemize}

Returns
0 if success, errno on failure.

int bt_micp_mic_ctlr_discover(struct bt_conn *conn, struct bt_micp_mic_ctlr **mic_ctlr)
Discover Microphone Input Control Service.
This will start a GATT discovery and setup handles and subscriptions. This shall be called once before any other actions can be executed for the peer device, and the \texttt{bt_micp_mic_ctlr_cb::discover} callback will notify when it is possible to start remote operations.
Parameters

- conn – The connection to initialize the profile for.
- mic_ctlr – [out] Valid remote instance object on success.

Returns

0 on success, GATT error value on fail.

```c
int bt_micp_mic_ctlr_unmute(struct bt_micp_mic_ctlr *mic_ctlr)
```

Unmute a remote Microphone Device.

Parameters

- mic_ctlr – Microphone Controller instance pointer.

Returns

0 on success, GATT error value on fail.

```c
int bt_micp_mic_ctlr_mute(struct bt_micp_mic_ctlr *mic_ctlr)
```

Mute a remote Microphone Device.

Parameters

- mic_ctlr – Microphone Controller instance pointer.

Returns

0 on success, GATT error value on fail.

```c
int bt_micp_mic_ctlr_mute_get(struct bt_micp_mic_ctlr *mic_ctlr)
```

Read the mute state of a remote Microphone Device.

Parameters

- mic_ctlr – Microphone Controller instance pointer.

Returns

0 on success, GATT error value on fail.

```c
int bt_micp_mic_ctlr_cb_register(struct bt_micp_mic_ctlr_cb *cb)
```

Registers the callbacks used by Microphone Controller.

This can only be done as the client.

Parameters

- cb – The callback structure.

Returns

0 if success, errno on failure.

```c
struct bt_micp_mic_dev_register_param
```

#include <micp.h> Register parameters structure for Microphone Input Control Service.

Public Members

```c
struct bt_micp_mic_dev_cb *cb
```

Microphone Input Control Profile callback structure.
struct bt_micp_included

#include <micp.h> Microphone Input Control Profile included services.

Used for to represent the Microphone Input Control Profile included service instances, for ei-
ther a Microphone Controller or a Microphone Device. The instance pointers either represent
local service instances, or remote service instances.

Public Members

uint8_t aics_cnt
   Number of Audio Input Control Service instances

struct bt_aics **aics
   Array of pointers to Audio Input Control Service instances

struct bt_micp_mic_dev_cb
#include <micp.h>

Public Members

void (*mute)(uint8_t mute)
   Callback function for Microphone Device mute.
   Called when the value is read with bt_micp_mic_dev_mute_get(), or if the value is changed
   by either the Microphone Device or a Microphone Controller.
      Param mute
         The mute setting of the Microphone Input Control Service.

struct bt_micp_mic_ctlr_cb
#include <micp.h>

Public Members

void (*mute)(struct bt_micp_mic_ctlr *mic_ctlr, int err, uint8_t mute)
   Callback function for Microphone Input Control Profile mute.
   Called when the value is read, or if the value is changed by either the Microphone Device
   or a Microphone Controller.
      Param mic_ctlr
         Microphone Controller instance pointer.
      Param err
         Error value. 0 on success, GATT error or errno on fail. For notifications, this
         will always be 0.
      Param mute
         The mute setting of the Microphone Input Control Service.

void (*discover)(struct bt_micp_mic_ctlr *mic_ctlr, int err, uint8_t aics_count)
   Callback function for bt_micp_mic_ctlr_discover().
      Param mic_ctlr
         Microphone Controller instance pointer.
### Param err
Error value. 0 on success, GATT error or errno on fail.

**Param aics_count**
Number of Audio Input Control Service instances on peer device.

```c
void (*mute_written)(struct bt_micp_mic_ctlr *mic_ctlr, int err)
```
Callback function for Microphone Input Control Profile mute/unmute.

- **Param mic_ctlr**
  Microphone Controller instance pointer.
- **Param err**
  Error value. 0 on success, GATT error or errno on fail.

```c
void (*unmute_written)(struct bt_micp_mic_ctlr *mic_ctlr, int err)
```
Callback function for Microphone Input Control Profile mute/unmute.

- **Param mic_ctlr**
  Microphone Controller instance pointer.
- **Param err**
  Error value. 0 on success, GATT error or errno on fail.

---

### Serial Port Emulation (RFCOMM)

**API Reference**

**group bt_rfcomm**
RFCOMM.

**Typedefs**

```c
typedef enum bt_rfcomm_role bt_rfcomm_role_t
```
Role of RFCOMM session and dlc. Used only by internal APIs.

** Enums**

```c
enum [anonymous]
```
Values:

```c
enumerator BT_RFCOMM_CHAN_HFP_HF = 1
```

```c
enumerator BT_RFCOMM_CHAN_HFP_AG
```

```c
enumerator BT_RFCOMM_CHAN_HSP_AG
```

```c
enumerator BT_RFCOMM_CHAN_HSP_HS
```

```c
enumerator BT_RFCOMM_CHAN_SPP
```

** Enum bt_rfcomm_role **
Role of RFCOMM session and dlc. Used only by internal APIs.
Values:
enumerator BT_RFCOMM_ROLE_ACCEPTOR

enumerator BT_RFCOMM_ROLE_INITIATOR

Functions

int bt_rfcomm_server_register(struct bt_rfcomm_server *server)
Register RFCOMM server.

Register RFCOMM server for a channel, each new connection is authorized using the accept() callback which in case of success shall allocate the dlc structure to be used by the new connection.

Parameters
• server – Server structure.

Returns
0 in case of success or negative value in case of error.

int bt_rfcomm_dlc_connect(struct bt_conn *conn, struct bt_rfcomm_dlc *dlc, uint8_t channel)
Connect RFCOMM channel.

Connect RFCOMM dlc by channel, once the connection is completed dlc connected() callback will be called. If the connection is rejected disconnected() callback is called instead.

Parameters
• conn – Connection object.
• dlc – Dlc object.
• channel – Server channel to connect to.

Returns
0 in case of success or negative value in case of error.

int bt_rfcomm_dlc_send(struct bt_rfcomm_dlc *dlc, struct net_buf *buf)
Send data to RFCOMM.

Send data from buffer to the dlc. Length should be less than or equal to mtu.

Parameters
• dlc – Dlc object.
• buf – Data buffer.

Returns
Bytes sent in case of success or negative value in case of error.

int bt_rfcomm_dlc_disconnect(struct bt_rfcomm_dlc *dlc)
Disconnect RFCOMM dlc.

Disconnect RFCOMM dlc, if the connection is pending it will be canceled and as a result the dlc disconnected() callback is called.

Parameters
• dlc – Dlc object.

Returns
0 in case of success or negative value in case of error.
struct *bt_rfcomm_create_pdu(struct *pool)
  Allocate the buffer from pool after reserving head room for RFCOMM, L2CAP and ACL headers.

  Parameters
  • pool – Which pool to take the buffer from.

  Returns
  New buffer.

struct bt_rfcomm_dlc_ops
#include <rfcomm.h> RFCOMM DLC operations structure.

Public Members

void (*connected)(struct bt_rfcomm_dlc *dlc)
  DLC connected callback
  If this callback is provided it will be called whenever the connection completes.
    Param dlc
    The dlc that has been connected

void (*disconnected)(struct bt_rfcomm_dlc *dlc)
  DLC disconnected callback
  If this callback is provided it will be called whenever the dlc is disconnected, including
  when a connection gets rejected or cancelled (both incoming and outgoing)
    Param dlc
    The dlc that has been Disconnected

void (*recv)(struct bt_rfcomm_dlc *dlec, struct *buf)
  DLC recv callback
    Param dlc
    The dlc receiving data.
    Param buf
    Buffer containing incoming data.

struct bt_rfcomm_dlc
#include <rfcomm.h> RFCOMM DLC structure.

struct bt_rfcomm_server
#include <rfcomm.h>

Public Members

uint8_t channel
  Server Channel

int (*accept)(struct *conn, struct bt_rfcomm_dlc **dlec)
  Server accept callback
  This callback is called whenever a new incoming connection requires authorization.
**Param conn**
The connection that is requesting authorization

**Param dlc**
Pointer to received the allocated dlc

**Return**
0 in case of success or negative value in case of error.

**Bluetooth standard services**

**Battery Service**

*group* **bt_bas**

Battery Service (BAS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Functions**

```c
uint8_t bt_bas_get_battery_level(void)
```

Read battery level value.

Read the characteristic value of the battery level

**Returns**
The battery level in percent.

```c
int bt_bas_set_battery_level(uint8_t level)
```

Update battery level value.

Update the characteristic value of the battery level This will send a GATT notification to all current subscribers.

**Parameters**

- `level` – The battery level in percent.

**Returns**
Zero in case of success and error code in case of error.

**Heart Rate Service**

*group* **bt_hrs**

Heart Rate Service (HRS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Functions**

```c
int bt_hrs_notify(uint16_t heartrate)
```

Notify heart rate measurement.

This will send a GATT notification to all current subscribers.

**Parameters**

- `heartrate` – The heartrate measurement in beats per minute.

**Returns**
Zero in case of success and error code in case of error.
Immediate Alert Service

**group** bt_ias

Immediate Alert Service (IAS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Defines**

BT_IAS_CB_DEFINE(_name)

Register a callback structure for immediate alert events.

**Parameters**

- _name – Name of callback structure.

** Enums**

enum bt_ias_alert_lvl

**Values:**

- enumerator BT_IAS_ALERT_LVL_NO_ALERT
  No alerting should be done on device

- enumerator BT_IAS_ALERT_LVL_MILD_ALERT
  Device shall alert

- enumerator BT_IAS_ALERT_LVL_HIGH_ALERT
  Device should alert in strongest possible way

** Functions**

int bt_ias_local_alert_stop(void)

Method for stopping alert locally.

**Returns**

- Zero in case of success and error code in case of error.

int bt_ias_client_alert_write(struct bt_conn *conn, enum bt_ias_alert_lvl)

Set alert level.

**Parameters**

- conn – Bluetooth connection object
- bt_ias_alert_lvl – Level of alert to write

**Returns**

- Zero in case of success and error code in case of error.

int bt_ias_discover(struct bt_conn *conn)

Discover Immediate Alert Service.

**Parameters**

- conn – Bluetooth connection object

**Returns**

- Zero in case of success and error code in case of error.
int bt_iacs_client_cb_register(const struct bt_iacs_client_cb *cb)

Register Immediate Alert Client callbacks.

**Parameters**
- cb – The callback structure

**Returns**
Zero in case of success and error code in case of error.

```c
#include <ias.h>
```
Immediate Alert Service callback structure.

### Public Members

- void (*no_alert)(void)
  - Callback function to stop alert.
  - This callback is called when peer commands to disable alert.

- void (*mild_alert)(void)
  - Callback function for alert level value.
  - This callback is called when peer commands to alert.

- void (*high_alert)(void)
  - Callback function for alert level value.
  - This callback is called when peer commands to alert in the strongest possible way.

```c
#include <ias.h>
```

### Public Members

- void (*discover)(struct bt_conn *conn, int err)
  - Callback function for bt_iacs_discover.
  - This callback is called when discovery procedure is complete.

**Param conn**
- Bluetooth connection object.

**Param err**
- 0 on success, ATT error or negative errno otherwise

### Object Transfer Service

**group bt_ots**
Object Transfer Service (OTS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.
Defines

BT_OTS_OBJ_ID_SIZE
   Size of OTS object ID (in bytes).

BT_OTS_OBJ_ID_MIN
   Minimum allowed value for object ID (except ID for directory listing)

BT_OTS_OBJ_ID_MAX
   Maximum allowed value for object ID (except ID for directory listing)

OTS_OBJ_ID_DIR_LIST
   ID of the Directory Listing Object.

BT_OTS_OBJ_ID_MASK
   Mask for OTS object IDs, preserving the 48 bits.

BT_OTS_OBJ_ID_STR_LEN
   Length of OTS object ID string (in bytes).

BT_OTS_OBJ_SET_PROP_DELETE(prop)
   Set BT_OTS_OBJ_PROP_DELETE property.

Parameters
   • prop – Object properties.

BT_OTS_OBJ_SET_PROP_EXECUTE(prop)
   Set BT_OTS_OBJ_PROP_EXECUTE property.

Parameters
   • prop – Object properties.

BT_OTS_OBJ_SET_PROP_READ(prop)
   Set BT_OTS_OBJ_PROP_READ property.

Parameters
   • prop – Object properties.

BT_OTS_OBJ_SET_PROP_WRITE(prop)
   Set BT_OTS_OBJ_PROP_WRITE property.

Parameters
   • prop – Object properties.

BT_OTS_OBJ_SET_PROP_APPEND(prop)
   Set BT_OTS_OBJ_PROP_APPEND property.

Parameters
   • prop – Object properties.

BT_OTS_OBJ_SET_PROP_TRUNCATE(prop)
   Set BT_OTS_OBJ_PROP_TRUNCATE property.

Parameters
   • prop – Object properties.
BT_OTS_OBJ_SET_PROP_PATCH(prop)
Set \textit{BT\_OTS\_OBJ\_PROP\_PATCH} property.

\textbf{Parameters}
\begin{itemize}
\item prop – Object properties.
\end{itemize}

BT_OTS_OBJ_SET_PROP_MARKED(prop)
Set \textit{BT\_OTS\_OBJ\_SET\_PROP\_MARKED} property.

\textbf{Parameters}
\begin{itemize}
\item prop – Object properties.
\end{itemize}

BT_OTS_OBJ_GET_PROP_DELETE(prop)
Get \textit{BT\_OTS\_OBJ\_PROP\_DELETE} property.

\textbf{Parameters}
\begin{itemize}
\item prop – Object properties.
\end{itemize}

BT_OTS_OBJ_GET_PROP_EXECUTE(prop)
Get \textit{BT\_OTS\_OBJ\_PROP\_EXECUTE} property.

\textbf{Parameters}
\begin{itemize}
\item prop – Object properties.
\end{itemize}

BT_OTS_OBJ_GET_PROP_READ(prop)
Get \textit{BT\_OTS\_OBJ\_PROP\_READ} property.

\textbf{Parameters}
\begin{itemize}
\item prop – Object properties.
\end{itemize}

BT_OTS_OBJ_GET_PROP_WRITE(prop)
Get \textit{BT\_OTS\_OBJ\_PROP\_WRITE} property.

\textbf{Parameters}
\begin{itemize}
\item prop – Object properties.
\end{itemize}

BT_OTS_OBJ_GET_PROP_APPEND(prop)
Get \textit{BT\_OTS\_OBJ\_PROP\_APPEND} property.

\textbf{Parameters}
\begin{itemize}
\item prop – Object properties.
\end{itemize}

BT_OTS_OBJ_GET_PROP_TRUNCATE(prop)
Get \textit{BT\_OTS\_OBJ\_PROP\_TRUNCATE} property.

\textbf{Parameters}
\begin{itemize}
\item prop – Object properties.
\end{itemize}

BT_OTS_OBJ_GET_PROP_PATCH(prop)
Get \textit{BT\_OTS\_OBJ\_PROP\_PATCH} property.

\textbf{Parameters}
\begin{itemize}
\item prop – Object properties.
\end{itemize}

BT_OTS_OBJ_GET_PROP_MARKED(prop)
Get \textit{BT\_OTS\_OBJ\_PROP\_MARKED} property.

\textbf{Parameters}
\begin{itemize}
\item prop – Object properties.
\end{itemize}
BT_OTS_OACP_SET_FEAT_CREATE(\texttt{feat})

Set \texttt{BT_OTS_OACP_SET_FEAT_CREATE} feature.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_SET_FEAT_DELETE(\texttt{feat})

Set \texttt{BT_OTS_OACP_FEAT_DELETE} feature.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_SET_FEAT_CHECKSUM(\texttt{feat})

Set \texttt{BT_OTS_OACP_FEAT_CHECKSUM} feature.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_SET_FEAT_EXECUTE(\texttt{feat})

Set \texttt{BT_OTS_OACP_FEAT_EXECUTE} feature.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_SET_FEAT_READ(\texttt{feat})

Set \texttt{BT_OTS_OACP_FEAT_READ} feature.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_SET_FEAT_WRITE(\texttt{feat})

Set \texttt{BT_OTS_OACP_FEAT_WRITE} feature.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_SET_FEAT_APPEND(\texttt{feat})

Set \texttt{BT_OTS_OACP_FEAT_APPEND} feature.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_SET_FEAT_TRUNCATE(\texttt{feat})

Set \texttt{BT_OTS_OACP_FEAT_TRUNCATE} feature.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_SET_FEAT_PATCH(\texttt{feat})

Set \texttt{BT_OTS_OACP_FEAT_PATCH} feature.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{feat} – OTS features.
\end{itemize}

BT_OTS_OACP_SET_FEAT_ABORT(\texttt{feat})

Set \texttt{BT_OTS_OACP_FEAT_ABORT} feature.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{feat} – OTS features.
\end{itemize}
BT_OTS_OACP_GET_FEAT_CREATE(feat)
Get \texttt{BT\_OTS\_OACP\_FEAT\_CREATE} feature.

\textbf{Parameters}
+ feat – OTS features.

BT_OTS_OACP_GET_FEAT_DELETE(feat)
Get \texttt{BT\_OTS\_OACP\_FEAT\_DELETE} feature.

\textbf{Parameters}
+ feat – OTS features.

BT_OTS_OACP_GET_FEAT_CHECKSUM(feat)
Get \texttt{BT\_OTS\_OACP\_FEAT\_CHECKSUM} feature.

\textbf{Parameters}
+ feat – OTS features.

BT_OTS_OACP_GET_FEAT_EXECUTE(feat)
Get \texttt{BT\_OTS\_OACP\_FEAT\_EXECUTE} feature.

\textbf{Parameters}
+ feat – OTS features.

BT_OTS_OACP_GET_FEAT_READ(feat)
Get \texttt{BT\_OTS\_OACP\_FEAT\_READ} feature.

\textbf{Parameters}
+ feat – OTS features.

BT_OTS_OACP_GET_FEAT_WRITE(feat)
Get \texttt{BT\_OTS\_OACP\_FEAT\_WRITE} feature.

\textbf{Parameters}
+ feat – OTS features.

BT_OTS_OACP_GET_FEAT_APPEND(feat)
Get \texttt{BT\_OTS\_OACP\_FEAT\_APPEND} feature.

\textbf{Parameters}
+ feat – OTS features.

BT_OTS_OACP_GET_FEAT_TRUNCATE(feat)
Get \texttt{BT\_OTS\_OACP\_FEAT\_TRUNCATE} feature.

\textbf{Parameters}
+ feat – OTS features.

BT_OTS_OACP_GET_FEAT_PATCH(feat)
Get \texttt{BT\_OTS\_OACP\_FEAT\_PATCH} feature.

\textbf{Parameters}
+ feat – OTS features.

BT_OTS_OACP_GET_FEAT_ABORT(feat)
Get \texttt{BT\_OTS\_OACP\_FEAT\_ABORT} feature.

\textbf{Parameters}
+ feat – OTS features.
BT_OTS_OLCP_SET_FEAT_GO_TO(\texttt{feat})
Set \texttt{BT_OTS_OLCP_FEAT_GO_TO} feature.

\textbf{Parameters}

- \texttt{feat} – OTS features.

BT_OTS_OLCP_SET_FEAT_ORDER(\texttt{feat})
Set \texttt{BT_OTS_OLCP_FEAT_ORDER} feature.

\textbf{Parameters}

- \texttt{feat} – OTS features.

BT_OTS_OLCP_SET_FEAT_NUM_REQ(\texttt{feat})
Set \texttt{BT_OTS_OLCP_FEAT_NUM_REQ} feature.

\textbf{Parameters}

- \texttt{feat} – OTS features.

BT_OTS_OLCP_SET_FEAT_CLEAR(\texttt{feat})
Set \texttt{BT_OTS_OLCP_FEAT_CLEAR} feature.

\textbf{Parameters}

- \texttt{feat} – OTS features.

BT_OTS_OLCP_GET_FEAT_GO_TO(\texttt{feat})
Get \texttt{BT_OTS_OLCP_GET_FEAT_GO_TO} feature.

\textbf{Parameters}

- \texttt{feat} – OTS features.

BT_OTS_OLCP_GET_FEAT_ORDER(\texttt{feat})
Get \texttt{BT_OTS_OLCP_GET_FEAT_ORDER} feature.

\textbf{Parameters}

- \texttt{feat} – OTS features.

BT_OTS_OLCP_GET_FEAT_NUM_REQ(\texttt{feat})
Get \texttt{BT_OTS_OLCP_GET_FEAT_NUM_REQ} feature.

\textbf{Parameters}

- \texttt{feat} – OTS features.

BT_OTS_OLCP_GET_FEAT_CLEAR(\texttt{feat})
Get \texttt{BT_OTS_OLCP_GET_FEAT_CLEAR} feature.

\textbf{Parameters}

- \texttt{feat} – OTS features.

BT_OTS_DATE_TIME_FIELD_SIZE

BT_OTS_STOP

BT_OTS_CONTINUE
Typedefs

typedef int (*bt_ots_client_dirlisting_cb)(struct bt_ots_obj_metadata *meta)
Directory listing object metadata callback.
If a directory listing is decoded using bt_ots_client_decode_dirlisting(), this callback will be
called for each object in the directory listing.

**Param meta**
The metadata of the decoded object

**Return**
int BT_OTS_STOP or BT_OTS_CONTINUE. BT_OTS_STOP can be used to stop
the decoding.

Enums

eenum [anonymous]
Properties of an OTS object.

**Values:**

enumerator BT_OTS_OBJ_PROP_DELETE = 0
Bit 0 Deletion of this object is permitted

enumerator BT_OTS_OBJ_PROP_EXECUTE = 1
Bit 1 Execution of this object is permitted

enumerator BT_OTS_OBJ_PROP_READ = 2
Bit 2 Reading this object is permitted

enumerator BT_OTS_OBJ_PROP_WRITE = 3
Bit 3 Writing data to this object is permitted

enumerator BT_OTS_OBJ_PROP_APPEND = 4
Bit 4 Appending data to this object is permitted.

Appending data increases its Allocated Size.

enumerator BT_OTS_OBJ_PROP_TRUNCATE = 5
Bit 5 Truncation of this object is permitted

enumerator BT_OTS_OBJ_PROP_PATCH = 6
Bit 6 Patching this object is permitted.

Patching this object overwrites some of
the object's existing contents.
enumerator BT_OTS_OBJ_PROP_MARKED = 7
   Bit 7 This object is a marked object

enum [anonymous]
   Object Action Control Point Feature bits.
   
   Values:

enumerator BT_OTS_OACP_FEAT_CREATE = 0
   Bit 0 OACP Create Op Code Supported

enumerator BT_OTS_OACP_FEAT_DELETE = 1
   Bit 1 OACP Delete Op Code Supported

enumerator BT_OTS_OACP_FEAT_CHECKSUM = 2
   Bit 2 OACP Calculate Checksum Op Code Supported

enumerator BT_OTS_OACP_FEAT_EXECUTE = 3
   Bit 3 OACP Execute Op Code Supported

enumerator BT_OTS_OACP_FEAT_READ = 4
   Bit 4 OACP Read Op Code Supported

enumerator BT_OTS_OACP_FEAT_WRITE = 5
   Bit 5 OACP Write Op Code Supported

enumerator BT_OTS_OACP_FEAT_APPEND = 6
   Bit 6 Appending Additional Data to Objects Supported

enumerator BT_OTS_OACP_FEAT_TRUNCATE = 7
   Bit 7 Truncation of Objects Supported

enumerator BT_OTS_OACP_FEAT_PATCH = 8
   Bit 8 Patching of Objects Supported

enumerator BT_OTS_OACP_FEAT_ABORT = 9
   Bit 9 OACP Abort Op Code Supported

enum bt_ots_oacp_write_op_mode
   
   Values:

enumerator BT_OTS_OACP_WRITE_OP_MODE_NONE = 0

enumerator BT_OTS_OACP_WRITE_OP_MODE_TRUNCATE = BIT(1)

enum [anonymous]
   Object List Control Point Feature bits.
   
   Values:
enumerator BT_OTS_OLCP_FEAT_GO_TO = 0
    Bit 0 OLCP Go To Op Code Supported

enumerator BT_OTS_OLCP_FEAT_ORDER = 1
    Bit 1 OLCP Order Op Code Supported

enumerator BT_OTS_OLCP_FEAT_NUM_REQ = 2
    Bit 2 OLCP Request Number of Objects Op Code Supported

enumerator BT_OTS_OLCP_FEAT_CLEAR = 3
    Bit 3 OLCP Clear Marking Op Code Supported

enum [anonymous]
    Object metadata request bit field values.
    Values:

enumerator BT_OTS_METADATA_REQ_NAME = BIT(0)
    Request object name.

enumerator BT_OTS_METADATA_REQ_TYPE = BIT(1)
    Request object type.

enumerator BT_OTS_METADATA_REQ_SIZE = BIT(2)
    Request object size.

enumerator BT_OTS_METADATA_REQ_CREATED = BIT(3)
    Request object first created time.

enumerator BT_OTS_METADATA_REQ_MODIFIED = BIT(4)
    Request object last modified time.

enumerator BT_OTS_METADATA_REQ_ID = BIT(5)
    Request object ID.

enumerator BT_OTS_METADATA_REQ_PROPS = BIT(6)
    Request object properties.

enumerator BT_OTS_METADATA_REQ_ALL = 0x7F
    Request all object metadata.

Functions

int bt_ots_obj_add(struct bt_ots *ots, const struct bt_ots_obj_add_param *param)
    Add an object to the OTS instance.

    This function adds an object to the OTS database. When the object is being added, a callback
    obj_created() is called to notify the user about a new object ID.

    Parameters
    • ots – OTS instance.
param – Object addition parameters.

Returns
ID of created object in case of success.

Returns
negative value in case of error.

```c
int bt_ots_obj_delete(struct bt_ots *ots, uint64_t id)
```

Delete an object from the OTS instance.

This function deletes an object from the OTS database. When the object is deleted a callback
obj_deleted() is called to notify the user about this event. At this point, it is possible to free
allocated buffer for object data.

Parameters
- ots – OTS instance.
- id – ID of the object to be deleted (uint48).

Returns
0 in case of success or negative value in case of error.

```c
void *bt_ots_svc_decl_get(struct bt_ots *ots)
```

Get the service declaration attribute.

This function is enabled for CONFIG_BT_OTS_SECONDARY_SVC configuration. The first ser-
vice attribute can be included in any other GATT service.

Parameters
- ots – OTS instance.

Returns
The first OTS attribute instance.

```c
int bt_ots_init(struct bt_ots *ots, struct bt_ots_init *ots_init)
```

Initialize the OTS instance.

Parameters
- ots – OTS instance.
- ots_init – OTS initialization descriptor.

Returns
0 in case of success or negative value in case of error.

```c
struct bt_ots *bt_ots_free_instance_get(void)
```

Get a free instance of OTS from the pool.

Returns
OTS instance in case of success or NULL in case of error.

```c
int bt_ots_client_register(struct bt_ots_client *ots_inst)
```

Register an Object Transfer Service Instance.

Register an Object Transfer Service instance discovered on the peer. Call this function when
an OTS instance is discovered (discovery is to be handled by the higher layer).

Parameters

Returns
int 0 if success, ERRNO on failure.
uint8_t bt_ots_client_indicate_handler(struct bt_conn *conn, struct bt_gatt_subscribe_params *params, const void *data, uint16_t length)

OTS Indicate Handler function.
Set this function as callback for indicate handler when discovering OTS.

Parameters
- conn – Connection object. May be NULL, indicating that the peer is being unpaired.
- params – Subscription parameters.
- data – Attribute value data. If NULL then subscription was removed.
- length – Attribute value length.

int bt_ots_client_read_feature(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Read the OTS feature characteristic.

Parameters
- otc_inst – Pointer to the OTC instance.
- conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_id(struct bt_ots_client *otc_inst, struct bt_conn *conn, uint64_t obj_id)
Select an object by its Object ID.

Parameters
- otc_inst – Pointer to the OTC instance.
- conn – Pointer to the connection object.
- obj_id – Object’s ID.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_first(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Select the first object.

Parameters
- otc_inst – Pointer to the OTC instance.
- conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_last(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Select the last object.

Parameters
- otc_inst – Pointer to the OTC instance.
- conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.
int bt_ots_client_select_next(struct bt_ots_client *otc_inst, struct bt_conn *conn)

Select the next object.

Parameters

• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns

int 0 if success, ERRNO on failure.

int bt_ots_client_select_prev(struct bt_ots_client *otc_inst, struct bt_conn *conn)

Select the previous object.

Parameters

• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns

int 0 if success, ERRNO on failure.

int bt_ots_client_read_object_metadata(struct bt_ots_client *otc_inst, struct bt_conn *conn, uint8_t metadata)

Read the metadata of the current object.

The metadata are returned in the obj_metadata_read() callback.

Parameters

• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.
• metadata – Bitfield (BT_OTS_METADATA_REQ_*) of the metadata to read.

Returns

int 0 if success, ERRNO on failure.

int bt_ots_client_read_object_data(struct bt_ots_client *otc_inst, struct bt_conn *conn)

Read the data of the current selected object.

This will trigger an OACP read operation for the current size of the object with a 0 offset and then expect receiving the content via the L2CAP CoC.

The data of the object are returned in the obj_data_read() callback.

Parameters

• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns

int 0 if success, ERRNO on failure.

int bt_ots_client_write_object_data(struct bt_ots_client *otc_inst, struct bt_conn *conn, const void *buf, size_t len, off_t offset, enum bt_ots_oacp_write_op_mode mode)

Write the data of the current selected object.

This will trigger an OACP write operation for the current size of the object with a specified offset and then expect transferring the content via the L2CAP CoC.

The length of the data written to object is returned in the obj_data_written() callback.

Parameters

• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.
• buf – Pointer to the data buffer to be written.
• len – Size of data.
• offset – Offset to write, usually 0.
• mode – Mode Parameter for OACP Write Op Code. See bt_ots_oacp_write_op_mode.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_decode_dirlisting(uint8_t *data, uint16_t length,
                                bt_ots_client_dirlisting_cb cb)

Decode Directory Listing object into object metadata.
If the Directory Listing object contains multiple objects, then the callback will be called for each of them.

Parameters
• data – The data received for the directory listing object.
• length – Length of the data.
• cb – The callback that will be called for each object.

static inline int bt_ots_obj_id_to_str(uint64_t obj_id, char *str, size_t len)

Converts binary OTS Object ID to string.

Parameters
• obj_id – Object ID.
• str – Address of user buffer with enough room to store formatted string containing binary Object ID.
• len – Length of data to be copied to user string buffer. Refer to BT_OTS_OBJ_ID_STR_LEN about recommended value.

Returns
Number of successfully formatted bytes from binary ID.

void bt_ots_metadata_display(struct bt_ots_obj_metadata *metadata, uint16_t count)

Displays one or more object metadata as text with LOG_INF.

Parameters
• metadata – Pointer to the first (or only) metadata in an array.
• count – Number of metadata objects to display information of.

struct bt_ots_obj_type
#include <ots.h> Type of an OTS object.

struct bt_ots_obj_size
#include <ots.h> Descriptor for OTS Object Size parameter.

Public Members

uint32_t cur
Current Size.
uint32_t alloc
    Allocated Size.

struct bt_ots_feat
    #include <ots.h> Features of the OTS.

struct bt_ots_date_time
    #include <ots.h> Date and Time structure.

struct bt_ots_obj_metadata
    #include <ots.h> Metadata of an OTS object.
    Used by the server as a descriptor for OTS object initialization. Used by the client to present object metadata to the application.

Public Members

struct bt_ots_obj_type type
    Object Type.

struct bt_ots_obj_size size
    Object Size.

uint32_t props
    Object Properties.

struct bt_ots_obj_add_param
    #include <ots.h> Descriptor for OTS object addition.

Public Members

uint32_t size
    Object size to allocate.

struct bt_ots_obj_type type
    Object type.

struct bt_ots_obj_created_desc
    #include <ots.h> Descriptor for OTS created object.
    Descriptor for OTS object created by the application. This descriptor is returned by bt_ots_cb::obj_created callback which contains further documentation on distinguishing between server and client object creation.

Public Members
char *name

Object name.
The object name as a NULL terminated string.
When the server creates a new object the name shall be > 0 and <= BT_OTS_OBJ_MAX_NAME_LEN
When the client creates a new object the name shall be an empty string

struct bt_ots_obj_size size

Object size.

bt_ots_obj_size::alloc shall be >= bt_ots_obj_add_param::size
When the server creates a new object bt_ots_obj_size::cur shall be <= bt_ots_obj_add_param::size
When the client creates a new object bt_ots_obj_size::cur shall be 0

uint32_t props

Object properties.

struct bt_ots_cb

#include <ots.h> OTS callback structure.

Public Members

int (*obj_created)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const struct bt_ots_obj_add_param *add_param, struct bt_ots_obj_created_desc *created_desc)

Object created callback.
This callback is called whenever a new object is created. Application can reject this request by returning an error when it does not have necessary resources to hold this new object. This callback is also triggered when the server creates a new object with bt_ots_obj_add() API.

Param ots
OTS instance.

Param conn
The connection that is requesting object creation or NULL if object is created by bt_ots_obj_add().

Param id
Object ID.

Param add_param
Object creation requested parameters.

Param created_desc
Created object descriptor that shall be filled by the receiver of this callback.

Return
0 in case of success or negative value in case of error.

Return
-ENOTSUP if object type is not supported

Return
-ENOMEM if no available space for new object.

Return
-EINVAL if an invalid parameter is provided

Return
other negative values are treated as a generic operation failure
int (*obj_deleted)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id)

Object deleted callback.

This callback is called whenever an object is deleted. It is also triggered when the server deletes an object with `bt_ots_obj_delete()` API.

Param ots
OTS instance.

Param conn
The connection that deleted the object or NULL if this request came from the server.

Param id
Object ID.

Retval When
an error is indicated by using a negative value, the object delete procedure is aborted and a corresponding failed status is returned to the client.

Return
0 in case of success.

Return
-EBUSY if the object is locked. This is generally not expected to be returned by the application as the OTS layer tracks object accesses. An object locked status is returned to the client.

Return
Other negative values in case of error. A generic operation failed status is returned to the client.

void (*obj_selected)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id)

Object selected callback.

This callback is called on successful object selection.

Param ots
OTS instance.

Param conn
The connection that selected new object.

Param id
Object ID.

ssize_t (*obj_read)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, void **data, size_t len, off_t offset)

Object read callback.

This callback is called multiple times during the Object read operation. OTS module will keep requesting successive Object fragments from the application until the read operation is completed. The end of read operation is indicated by NULL data parameter.

Param ots
OTS instance.

Param conn
The connection that read object.

Param id
Object ID.

Param data
In: NULL once the read operations is completed. Out: Next chunk of data to be sent.

Param len
Remaining length requested by the client.

Param offset
Object data offset.

Return
Data length to be sent via data parameter. This value shall be smaller or equal
to the len parameter.

**Return**
Negative value in case of an error.

```c
ssize_t (*obj_write)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const void *data, size_t len, off_t offset, size_t rem)
```

Object write callback.

This callback is called multiple times during the Object write operation. OTS module will keep providing successive Object fragments to the application until the write operation is completed. The offset and length of each write fragment is validated by the OTS module to be within the allocated size of the object. The remaining length indicates data length remaining to be written and will decrease each write iteration until it reaches 0 in the last write fragment.

- **Param ots**
  OTS instance.
- **Param conn**
  The connection that wrote object.
- **Param id**
  Object ID.
- **Param data**
  Next chunk of data to be written.
- **Param len**
  Length of the current chunk of data in the buffer.
- **Param offset**
  Object data offset.
- **Param rem**
  Remaining length in the write operation.

**Return**
Number of bytes written in case of success, if the number of bytes written does not match len, -EIO is returned to the L2CAP layer.

**Return**
A negative value in case of an error.

**Return**
-EINPROGRESS has a special meaning and is unsupported at the moment. It should not be returned.

```c
void (*obj_name_written)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const char *cur_name, const char *new_name)
```

Object name written callback.

This callback is called when the object name is written. This is a notification to the application that the object name will be updated by the OTS service implementation.

- **Param ots**
  OTS instance.
- **Param conn**
  The connection that wrote object name.
- **Param id**
  Object ID.
- **Param cur_name**
  Current object name.
- **Param new_name**
  New object name.

```c
#include <ots.h> Descriptor for OTS initialization.
```

```c
struct bt_ots_init
```

```c
struct bt_ots_client
```

**Chapter 6. Connectivity**
#include <ots.h> OTS client instance.

struct bt_ots_client_cb
#include <ots.h> OTS client callback structure

Public Members

void (*obj_selected)(struct bt_ots_client *ots_inst, struct bt_conn *conn, int err)
Callback function when a new object is selected.
Called when the a new object is selected and the current object has changed. The
cur_object in ots_inst will have been reset, and metadata should be read again with
bt_ots_client_read_object_metadata().
   Param ots_inst
      Pointer to the OTC instance.
   Param conn
      The connection to the peer device.
   Param err
      Error code (bt_ots_oicp_res_code).

int (*obj_data_read)(struct bt_ots_client *ots_inst, struct bt_conn *conn, uint32_t offset,
uint32_t len, uint8_t *data_p, bool is_complete)
Callback function for the data of the selected object.
Called when the data of the selected object are read using
bt_ots_client_read_object_data().
   Param ots_inst
      Pointer to the OTC instance.
   Param conn
      The connection to the peer device.
   Param offset
      Offset of the received data.
   Param len
      Length of the received data.
   Param data_p
      Pointer to the received data.
   Param is_complete
      Indicate if the whole object has been received.
Return
   int BT_OTS_STOP or BT_OTS_CONTINUE. BT_OTS_STOP can be used to stop
reading.

void (*obj_metadata_read)(struct bt_ots_client *ots_inst, struct bt_conn *conn, int err,
uint8_t metadata_read)
Callback function for metadata of the selected object.
Called when metadata of the selected object are read using
bt_ots_client_read_object_metadata(). Not all of the metadata may have been initia-
ized.
   Param ots_inst
      Pointer to the OTC instance.
   Param conn
      The connection to the peer device.
   Param err
      Error value. 0 on success, GATT error or ERRNO on fail.
Param metadata_read
Bitfield of the metadata that was successfully read.

void (*obj_data_written)(struct bt_ots_client *ots_inst, struct bt_conn *conn, size_t len)
Callback function for the data of the write object.
Called when the data of the selected object is written using
bt_ots_client_write_object_data().

Param ots_inst
Pointer to the OTC instance.

Param conn
The connection to the peer device.

Param len
Length of the written data.

BT_SDP_ARRAY_8(\ldots)
    Declare an array of 8-bit elements in an attribute.

BT_SDP_ARRAY_16(\ldots)
    Declare an array of 16-bit elements in an attribute.

BT_SDP_ARRAY_32(\ldots)
    Declare an array of 32-bit elements in an attribute.

BT_SDP_TYPE_SIZE(_type)
    Declare a fixed-size data element header.

**Parameters**

- _type – Data element header containing type and size descriptors.
BT_SDP_TYPE_SIZE_VAR(_type, _size)
Declare a variable-size data element header.

Parameters
• _type – Data element header containing type and size descriptors.
• _size – The actual size of the data.

BT_SDP_DATA_ELEM_LIST(...)
Declare a list of data elements.

BT_SDP_NEW_SERVICE
SDP New Service Record Declaration Macro.
Helper macro to declare a new service record. Default attributes: Record Handle, Record State, Language Base, Root Browse Group

BT_SDP_LIST(_att_id, _type_size, _data_elem_seq)
Generic SDP List Attribute Declaration Macro.
Helper macro to declare a list attribute.

Parameters
• _att_id – List Attribute ID.
• _data_elem_seq – Data element sequence for the list.
• _type_size – SDP type and size descriptor.

BT_SDP_SERVICE_ID(_uuid)
SDP Service ID Attribute Declaration Macro.
Helper macro to declare a service ID attribute.

Parameters
• _uuid – Service ID 16bit UUID.

BT_SDP_SERVICE_NAME(_name)
SDP Name Attribute Declaration Macro.
Helper macro to declare a service name attribute.

Parameters
• _name – Service name as a string (up to 256 chars).

BT_SDP_SUPPORTED_FEATURES(_features)
SDP Supported Features Attribute Declaration Macro.
Helper macro to declare supported features of a profile/protocol.

Parameters
• _features – Feature mask as 16bit unsigned integer.

BT_SDP_RECORD(_attrs)
SDP Service Declaration Macro.
Helper macro to declare a service.

Parameters
• _attrs – List of attributes for the service record.
Enums

enum [anonymous]
Helper enum to be used as return value of bt_sdp_discover_func_t. The value informs the
caller to perform further pending actions or stop them.
Values:

enumerator BT_SDP_DISCOVER_UUID_STOP = 0
enumerator BT_SDP_DISCOVER_UUID_CONTINUE

enum bt_sdp_proto
Protocols to be asked about specific parameters.
Values:

enumerator BT_SDP_PROTO_RFCOMM = 0x0003
enumerator BT_SDP_PROTO_L2CAP = 0x0100

Functions
int bt_sdp_register_service(struct bt_sdp_record *service)

Register a Service Record. Applications can make use of macros such as BT_SDP_DECLARE_SERVICE, BT_SDP_LIST, BT_SDP_SERVICE_ID, BT_SDP_SERVICE_NAME, etc. A service declaration must start with BT_SDP_NEW_SERVICE.

Parameters

• service – Service record declared using BT_SDP_DECLARE_SERVICE.

Returns

0 in case of success or negative value in case of error.

int bt_sdp_discover(struct bt_conn *conn, const struct bt_sdp_discover_params *params)

Allows user to start SDP discovery session.

The function performs SDP service discovery on remote server driven by user delivered discovery parameters. Discovery session is made as soon as no SDP transaction is ongoing between peers and if any then this one is queued to be processed at discovery completion of previous one. On the service discovery completion the callback function will be called to get feedback to user about findings.

Parameters

• conn – Object identifying connection to remote.
• params – SDP discovery parameters.

Returns

0 in case of success or negative value in case of error.

int bt_sdp_discover_cancel(struct bt_conn *conn, const struct bt_sdp_discover_params *params)

Release waiting SDP discovery request.

It can cancel valid waiting SDP client request identified by SDP discovery parameters object.

Parameters

• conn – Object identifying connection to remote.
• params – SDP discovery parameters.

Returns

0 in case of success or negative value in case of error.

int bt_sdp_get_proto_param(const struct net_buf *buf, enum bt_sdp_proto proto, uint16_t *param)

Give to user parameter value related to given stacked protocol UUID.

API extracts specific parameter associated with given protocol UUID available in Protocol Descriptor List attribute.

Parameters

• buf – Original buffered raw record data.
• proto – Known protocol to be checked like RFCOMM or L2CAP.
• param – On success populated by found parameter value.

Returns

0 on success when specific parameter associated with given protocol value is found, or negative if error occurred during processing.
Get additional parameter value related to given stacked protocol UUID.

API extracts specific parameter associated with given protocol UUID available in Additional Protocol Descriptor List attribute.

**Parameters**

- `buf` – Original buffered raw record data.
- `proto` – Known protocol to be checked like RFCOMM or L2CAP.
- `param_index` – There may be more than one parameter related to the given protocol UUID. This function returns the result that is indexed by this parameter. It's value is from 0, 0 means the first matched result, 1 means the second matched result.
- `param` – [out] On success populated by found parameter value.

**Returns**

0 on success when a specific parameter associated with a given protocol value is found, or negative if error occurred during processing.

Get profile version.

Helper API extracting remote profile version number. To get it proper generic profile parameter needs to be selected usually listed in SDP Interoperability Requirements section for given profile specification.

**Parameters**

- `buf` – Original buffered raw record data.
- `profile` – Profile family identifier the profile belongs.
- `version` – On success populated by found version number.

**Returns**

0 on success, negative value if error occurred during processing.

Get SupportedFeatures attribute value.

Allows if exposed by remote retrieve SupportedFeature attribute.

**Parameters**

- `buf` – Buffer holding original raw record data from remote.
- `features` – On success object to be populated with SupportedFeature mask.

**Returns**

0 on success if feature found and valid, negative in case any error

BT_VCP_STATE_MUTED

Functions
int bt_vcp_vol_rend_included_get(struct bt_vcp_included *included)
Get Volume Control Service included services.

Returns a pointer to a struct that contains information about the Volume Control Service included service instances, such as pointers to the Volume Offset Control Service (Volume Offset Control Service) or Audio Input Control Service (AICS) instances.

Parameters
• included – [out] Pointer to store the result in.

Returns
0 if success, errno on failure.

int bt_vcp_vol_rend_register(struct bt_vcp_vol_rend_register_param *param)
Register the Volume Control Service.

This will register and enable the service and make it discoverable by clients.

Parameters
• param – Volume Control Service register parameters.

Returns
0 if success, errno on failure.

int bt_vcp_vol_rend_set_step(uint8_t volume_step)
Set the Volume Control Service volume step size.

Set the value that the volume changes, when changed relatively with e.g. bt_vcp_vol_rend_vol_down or bt_vcp_vol_rend_vol_up.

This can only be done as the server.

Parameters
• volume_step – The volume step size (1-255).

Returns
0 if success, errno on failure.

int bt_vcp_vol_rend_get_state(void)
Get the Volume Control Service volume state.

Returns
0 if success, errno on failure.

int bt_vcp_vol_rend_get_flags(void)
Get the Volume Control Service flags.

Returns
0 if success, errno on failure.

int bt_vcp_vol_rend_vol_down(void)
Turn the volume down by one step on the server.

Returns
0 if success, errno on failure.

int bt_vcp_vol_rend_vol_up(void)
Turn the volume up by one step on the server.

Returns
0 if success, errno on failure.
int bt_vcp_vol_rend_unmute_vol_down(void)
    Turn the volume down and unmute the server.

    **Returns**
    0 if success, errno on failure.

int bt_vcp_vol_rend_unmute_vol_up(void)
    Turn the volume up and unmute the server.

    **Returns**
    0 if success, errno on failure.

int bt_vcp_vol_rend_set_vol(uint8_t volume)
    Set the volume on the server.

    **Parameters**
    • volume – The absolute volume to set.

    **Returns**
    0 if success, errno on failure.

int bt_vcp_vol_rend_unmute(void)
    Unmute the server.

    **Returns**
    0 if success, errno on failure.

int bt_vcp_vol_rend_mute(void)
    Mute the server.

    **Returns**
    0 if success, errno on failure.

int bt_vcp_vol_ctlr_cb_register(struct bt_vcp_vol_ctlr_cb *cb)
    Registers the callbacks used by the Volume Controller.

    **Parameters**
    • cb – The callback structure.

    **Returns**
    0 if success, errno on failure.

int bt_vcp_vol_ctlr_discover(struct bt_conn *conn, struct bt_vcp_vol_ctlr **vol_ctlr)
    Discover Volume Control Service and included services.

    This will start a GATT discovery and setup handles and subscriptions. This shall be called once before any other actions can be executed for the peer device, and the bt_vcp_vol_ctlr_cb::discover callback will notify when it is possible to start remote operations.

    This shall only be done as the client,

    **Parameters**
    • conn – The connection to discover Volume Control Service for.
    • vol_ctlr – [out] Valid remote instance object on success.

    **Returns**
    0 if success, errno on failure.

int bt_vcp_vol_ctlr_conn_get(const struct bt_vcp_vol_ctlr *vol_ctlr, struct bt_conn **conn)
    Get the connection pointer of a client instance.

    Get the Bluetooth connection pointer of a Volume Control Service client instance.

    **Parameters**
• vol_ctlr – Volume Controller instance pointer.
• conn – [out] Connection pointer.

**Returns**
0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_included_get(struct bt_vcp_vol_ctlr *vol_ctlr, struct bt_vcp_included *included)
```

Get Volume Control Service included services.

Returns a pointer to a struct that contains information about the Volume Control Service included service instances, such as pointers to the Volume Offset Control Service (Volume Offset Control Service) or Audio Input Control Service (AICS) instances.

**Parameters**
• vol_ctlr – Volume Controller instance pointer.
• included – [out] Pointer to store the result in.

**Returns**
0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_read_state(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Read the volume state of a remote Volume Renderer.

**Parameters**
• vol_ctlr – Volume Controller instance pointer.

**Returns**
0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_read_flags(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Read the volume flags of a remote Volume Renderer.

**Parameters**
• vol_ctlr – Volume Controller instance pointer.

**Returns**
0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_vol_down(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Turn the volume down one step on a remote Volume Renderer.

**Parameters**
• vol_ctlr – Volume Controller instance pointer.

**Returns**
0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_vol_up(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Turn the volume up one step on a remote Volume Renderer.

**Parameters**
• vol_ctlr – Volume Controller instance pointer.

**Returns**
0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_unmute_vol_down(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Turn the volume down one step and unmute on a remote Volume Renderer.

**Parameters**
• vol_ctlr – Volume Controller instance pointer.
int bt_vcp_vol_ctlr_unmute_vol_up(struct bt_vcp_vol_ctlr *vol_ctlr)

Turn the volume up one step and unmute on a remote Volume Renderer.

Parameters
- vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_set_vol(struct bt_vcp_vol_ctlr *vol_ctlr, uint8_t volume)

Set the absolute volume on a remote Volume Renderer.

Parameters
- vol_ctlr – Volume Controller instance pointer.
- volume – The absolute volume to set.

Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_unmute(struct bt_vcp_vol_ctlr *vol_ctlr)

Unmute a remote Volume Renderer.

Parameters
- vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_mute(struct bt_vcp_vol_ctlr *vol_ctlr)

Mute a remote Volume Renderer.

Parameters
- vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

struct bt_vcp_vol_rend_register_param

#include <vcp.h> Register structure for Volume Control Service

Public Members

uint8_t step
Initial step size (1-255)

uint8_t mute
Initial mute state (0-1)

uint8_t volume
Initial volume level (0-255)

struct bt_vocs_register_param vocs_param[0]
Register parameters for Volume Offset Control Services
struct bt_aics_register_param aics_param[0]
  Register parameters for Audio Input Control Services

struct bt_vcp_vol_rend_cb *cb
  Volume Control Service callback structure.

struct bt_vcp_included
  #include <vcp.h> Volume Control Service included services.
  Used for to represent the Volume Control Service included service instances, for either a client or a server. The instance pointers either represent local server instances, or remote service instances.

Public Members

uint8_t vocs_cnt
  Number of Volume Offset Control Service instances

struct bt_vocs **vocs
  Array of pointers to Volume Offset Control Service instances

uint8_t aics_cnt
  Number of Audio Input Control Service instances

struct bt_aics **aics
  Array of pointers to Audio Input Control Service instances

struct bt_vcp_vol_rend_cb
  #include <vcp.h>

Public Members

void (*state)(int err, uint8_t volume, uint8_t mute)
  Callback function for Volume Control Service volume state.
  Called when the value is locally read with bt_vcp_vol_rend_get_state(), or if the state is changed by either the Volume Renderer or a remote Volume Controller.
  
  **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

  **Param volume**
  The volume of the Volume Control Service server.

  **Param mute**
  The mute setting of the Volume Control Service server.

void (*flags)(int err, uint8_t flags)
  Callback function for Volume Control Service flags.
  Called when the value is locally read as the server. Called when the value is remotely read as the client. Called if the value is changed by either the server or client.
**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param flags**
The flags of the Volume Control Service server.

```c
struct bt_vcp_vol_ctlr_cb
#include <vcp.h>
```

### Public Members

```c
void (*state)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t volume, uint8_t mute)
```
Callback function for Volume Control Profile volume state.

Called when the value is remotely read as the Volume Controller. Called if the value is changed by either the Volume Renderer or Volume Controller, and notified to the Volume Controller.

**Param vol_ctlr**
Volume Controller instance pointer.

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param volume**
The volume of the Volume Renderer.

**Param mute**
The mute setting of the Volume Renderer.

```c
void (*flags)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t flags)
```
Callback function for Volume Control Profile volume flags.

Called when the value is remotely read as the Volume Controller. Called if the value is changed by the Volume Renderer.

A non-zero value indicates the the volume has been changed on the Volume Renderer since it was booted.

**Param vol_ctlr**
Volume Controller instance pointer.

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param flags**
The flags of the Volume Renderer.

```c
void (*discover)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t vocs_count, uint8_t aics_count)
```
Callback function for `bt_vcp_vol_ctlr_discover()`.

This callback is called once the discovery procedure is completed.

**Param vol_ctlr**
Volume Controller instance pointer.

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param vocs_count**
Number of Volume Offset Control Service instances on the remote Volume Renderer.
**Param aics_count**

Number of Audio Input Control Service instances the remote Volume Renderer.

```c
void (*vol_down)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_vol_down()`.

Called when the volume down procedure is completed.

**Param vol_ctlr**

Volume Controller instance pointer.

**Param err**

Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*vol_up)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_vol_up()`.

Called when the volume up procedure is completed.

**Param vol_ctlr**

Volume Controller instance pointer.

**Param err**

Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*mute)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_mute()`.

Called when the mute procedure is completed.

**Param vol_ctlr**

Volume Controller instance pointer.

**Param err**

Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*unmute)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_unmute()`.

Called when the unmute procedure is completed.

**Param vol_ctlr**

Volume Controller instance pointer.

**Param err**

Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*vol_down_unmute)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_vol_down_unmute()`.

Called when the volume down and unmute procedure is completed.

**Param vol_ctlr**

Volume Controller instance pointer.

**Param err**

Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*vol_up_unmute)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_vol_up_unmute()`.

Called when the volume up and unmute procedure is completed.
**Param vol_ctlr**
Volume Controller instance pointer.

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*vol_set)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```
Callback function for `bt_vcp_vol_ctlr_vol_set()`.
Called when the set absolute volume procedure is completed.

**Param vol_ctlr**
Volume Controller instance pointer.

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

---

### Universal Unique Identifiers (UUIDs)

**API Reference**

**group bt_uuid**

**UUIDs.**

#### Defines

**BT_UUID_SIZE_16**
Size in octets of a 16-bit UUID

**BT_UUID_SIZE_32**
Size in octets of a 32-bit UUID

**BT_UUID_SIZE_128**
Size in octets of a 128-bit UUID

**BT_UUID_INIT_16(value)**
Initialize a 16-bit UUID.

**Parameters**

- `value` – 16-bit UUID value in host endianness.

**BT_UUID_INIT_32(value)**
Initialize a 32-bit UUID.

**Parameters**

- `value` – 32-bit UUID value in host endianness.

**BT_UUID_INIT_128(value...)**
Initialize a 128-bit UUID.

**Parameters**

- `value` – 128-bit UUID array values in little-endian format. Can be combined with `BT_UUID_128_ENCODE` to initialize a UUID from the readable form of UUIDs.
BT_UUID_DECLARE_16\(\text{value}\)

Helper to declare a 16-bit UUID inline.

**Parameters**
- value – 16-bit UUID value in host endianness.

**Returns**
Pointer to a generic UUID.

BT_UUID_DECLARE_32\(\text{value}\)

Helper to declare a 32-bit UUID inline.

**Parameters**
- value – 32-bit UUID value in host endianness.

**Returns**
Pointer to a generic UUID.

BT_UUID_DECLARE_128\(\text{value...}\)

Helper to declare a 128-bit UUID inline.

**Parameters**
- value – 128-bit UUID array values in little-endian format. Can be combined with `BT_UUID_128_ENCODE` to declare a UUID from the readable form of UUIDs.

**Returns**
Pointer to a generic UUID.

BT_UUID_16\(\_u\)

Helper macro to access the 16-bit UUID from a generic UUID.

BT_UUID_32\(\_u\)

Helper macro to access the 32-bit UUID from a generic UUID.

BT_UUID_128\(\_u\)

Helper macro to access the 128-bit UUID from a generic UUID.

BT_UUID_128_ENCODE\(w32, w1, w2, w3, w48\)

Encode 128 bit UUID into array values in little-endian format.

Helper macro to initialize a 128-bit UUID array value from the readable form of UUIDs, or encode 128-bit UUID values into advertising data. Can be combined with `BT_UUID_DECLARE_128` to declare a 128-bit UUID.

Example of how to declare the UUID 6E400001-B5A3-F393-E0A9-E50E24DCCA9E

```
BT_UUID_DECLARE_128(BT_UUID_128_ENCODE(0x6E400001, 0xB5A3, 0xF393, 0xE0A9, 0xE50E24DCCA9E))
```

Example of how to encode the UUID 6E400001-B5A3-F393-E0A9-E50E24DCCA9E into advertising data.

```
BT_DATA_BYTES(BT_DATA_UUID128_ALL,
               BT_UUID_128_ENCODE(0x6E400001, 0xB5A3, 0xF393, 0xE0A9, 0xE50E24DCCA9E))
```

Just replace the hyphen by the comma and add 0x prefixes.

**Parameters**
- w32 – First part of the UUID (32 bits)
• \( w_1 \) – Second part of the UUID (16 bits)
• \( w_2 \) – Third part of the UUID (16 bits)
• \( w_3 \) – Fourth part of the UUID (16 bits)
• \( w_48 \) – Fifth part of the UUID (48 bits)

**Returns**
The comma separated values for UUID 128 initializer that may be used directly as an argument for `BT_UUID_INIT_128` or `BT_UUID_DECLARE_128`.

`BT_UUID_16_ENCODE(w16)`

Encode 16-bit UUID into array values in little-endian format.
Helper macro to encode 16-bit UUID values into advertising data.
Example of how to encode the UUID 0x180a into advertising data.

```c
BT_DATA_BYTES(BT_DATA_UUID16_ALL, BT_UUID_16_ENCODE(0x180a))
```

**Parameters**
• \( w_{16} \) – UUID value (16-bits)

**Returns**
The comma separated values for UUID 16 value that may be used directly as an argument for `BT_DATA_BYTES`.

`BT_UUID_32_ENCODE(w32)`

Encode 32-bit UUID into array values in little-endian format.
Helper macro to encode 32-bit UUID values into advertising data.
Example of how to encode the UUID 0x180a01af into advertising data.

```c
BT_DATA_BYTES(BT_DATA_UUID32_ALL, BT_UUID_32_ENCODE(0x180a01af))
```

**Parameters**
• \( w_{32} \) – UUID value (32-bits)

**Returns**
The comma separated values for UUID 32 value that may be used directly as an argument for `BT_DATA_BYTES`.

`BT_UUID_STR_LEN`

Recommended length of user string buffer for Bluetooth UUID.
The recommended length guarantee the output of UUID conversion will not lose valuable information about the UUID being processed. If the length of the UUID is known the string can be shorter.

`BT_UUID_GAP_VAL`

Generic Access UUID value.

`BT_UUID_GAP`

Generic Access.
BT_UUID_GATT_VAL
Generic attribute UUID value.

BT_UUID_GATT
Generic Attribute.

BT_UUID_IAS_VAL
Immediate Alert Service UUID value.

BT_UUID_IAS
Immediate Alert Service.

BT_UUID_LLS_VAL
Link Loss Service UUID value.

BT_UUID_LLS
Link Loss Service.

BT_UUID_TPS_VAL
Tx Power Service UUID value.

BT_UUID_TPS
Tx Power Service.

BT_UUID_CTS_VAL
Current Time Service UUID value.

BT_UUID_CTS
Current Time Service.

BT_UUID_HTS_VAL
Health Thermometer Service UUID value.

BT_UUID_HTS
Health Thermometer Service.

BT_UUID_DIS_VAL
Device Information Service UUID value.

BT_UUID_DIS
Device Information Service.

BT_UUID_HRS_VAL
Heart Rate Service UUID value.

BT_UUID_HRS
Heart Rate Service.
BT_UUID_BAS_VAL
Battery Service UUID value.

BT_UUID_BAS
Battery Service.

BT_UUID_HIDS_VAL
HID Service UUID value.

BT_UUID_HIDS
HID Service.

BT_UUID_RSCS_VAL
Running Speed and Cadence Service UUID value.

BT_UUID_RSCS
Running Speed and Cadence Service.

BT_UUID_CSC_VAL
Cycling Speed and Cadence Service UUID value.

BT_UUID_CSC
Cycling Speed and Cadence Service.

BT_UUID_ESS_VAL
Environmental Sensing Service UUID value.

BT_UUID_ESS
Environmental Sensing Service.

BT_UUID_BMS_VAL
Bond Management Service UUID value.

BT_UUID_BMS
Bond Management Service.

BT_UUID_CGMS_VAL
Continuous Glucose Monitoring Service UUID value.

BT_UUID_CGMS
Continuous Glucose Monitoring Service.

BT_UUID_IPSS_VAL
IP Support Service UUID value.

BT_UUID_IPSS
IP Support Service.
BT_UUID_HPS_VAL
   HTTP Proxy Service UUID value.

BT_UUID_HPS
   HTTP Proxy Service.

BT_UUID_OTS_VAL
   Object Transfer Service UUID value.

BT_UUID_OTS
   Object Transfer Service.

BT_UUID_MESH_PROV_VAL
   Mesh Provisioning Service UUID value.

BT_UUID_MESH_PROV
   Mesh Provisioning Service.

BT_UUID_MESH_PROXY_VAL
   Mesh Proxy Service UUID value.

BT_UUID_MESH_PROXY
   Mesh Proxy Service.

BT_UUID_AICS_VAL
   Audio Input Control Service value.

BT_UUID_AICS
   Audio Input Control Service.

BT_UUID_VCS_VAL
   Volume Control Service value.

BT_UUID_VCS
   Volume Control Service.

BT_UUID_VOCS_VAL
   Volume Offset Control Service value.

BT_UUID_VOCS
   Volume Offset Control Service.

BT_UUID_CSIS_VAL
   Coordinated Set Identification Service value.

BT_UUID_CSIS
   Coordinated Set Identification Service.
BT_UUID_MCS_VAL
  Media Control Service value.

BT_UUID_MCS
  Media Control Service.

BT_UUID_GMCS_VAL
  Generic Media Control Service value.

BT_UUID_GMCS
  Generic Media Control Service.

BT_UUID_TBS_VAL
  Telephone Bearer Service value.

BT_UUID_TBS
  Telephone Bearer Service.

BT_UUID_GTBS_VAL
  Generic Telephone Bearer Service value.

BT_UUID_GTBS
  Generic Telephone Bearer Service.

BT_UUID_MICS_VAL
  Microphone Input Control Service value.

BT_UUID_MICS
  Microphone Input Control Service.

BT_UUID_ASCS_VAL
  Audio Stream Control Service value.

BT_UUID_ASCS
  Audio Stream Control Service.

BT_UUID_BASS_VAL
  Broadcast Audio Scan Service value.

BT_UUID_BASS
  Broadcast Audio Scan Service.

BT_UUID_PACS_VAL
  Published Audio Capabilities Service value.

BT_UUID_PACS
  Published Audio Capabilities Service.
BT_UUID_BASIC_AUDIO_VAL
    Basic Audio Announcement Service value.

BT_UUID_BASIC_AUDIO
    Basic Audio Announcement Service.

BT_UUID_BROADCAST_AUDIO_VAL
    Broadcast Audio Announcement Service value.

BT_UUID_BROADCAST_AUDIO
    Broadcast Audio Announcement Service.

BT_UUID_CAS_VAL
    Common Audio Service value.

BT_UUID_CAS
    Common Audio Service.

BT_UUID_HAS_VAL
    Hearing Access Service value.

BT_UUID_HAS
    Hearing Access Service.

BT_UUID_GATT_PRIMARY_VAL
    GATT Primary Service UUID value.

BT_UUID_GATT_PRIMARY
    GATT Primary Service.

BT_UUID_GATT_SECONDARY_VAL
    GATT Secondary Service UUID value.

BT_UUID_GATT_SECONDARY
    GATT Secondary Service.

BT_UUID_GATT_INCLUDE_VAL
    GATT Include Service UUID value.

BT_UUID_GATT_INCLUDE
    GATT Include Service.

BT_UUID_GATT_CHRC_VAL
    GATT Characteristic UUID value.

BT_UUID_GATT_CHRC
    GATT Characteristic.
BT_UUID_GATT_CEP_VAL
    GATT Characteristic Extended Properties UUID value.

BT_UUID_GATT_CEP
    GATT Characteristic Extended Properties.

BT_UUID_GATT_CUD_VAL
    GATT Characteristic User Description UUID value.

BT_UUID_GATT_CUD
    GATT Characteristic User Description.

BT_UUID_GATT_CCC_VAL
    GATT Client Characteristic Configuration UUID value.

BT_UUID_GATT_CCC
    GATT Client Characteristic Configuration.

BT_UUID_GATT_SCC_VAL
    GATT Server Characteristic Configuration UUID value.

BT_UUID_GATT_SCC
    GATT Server Characteristic Configuration.

BT_UUID_GATT_CPF_VAL
    GATT Characteristic Presentation Format UUID value.

BT_UUID_GATT_CPF
    GATT Characteristic Presentation Format.

BT_UUID_GATT_CAF_VAL
    GATT Characteristic Aggregated Format UUID value.

BT_UUID_GATT_CAF
    GATT Characteristic Aggregated Format.

BT_UUID_VALID_RANGE_VAL
    Valid Range Descriptor UUID value.

BT_UUID_VALID_RANGE
    Valid Range Descriptor.

BT_UUID_HIDS_EXT_REPORT_VAL
    HID External Report Descriptor UUID value.

BT_UUID_HIDS_EXT_REPORT
    HID External Report Descriptor.
BT_UUID_HIDS_REPORT_REF_VAL
   HID Report Reference Descriptor UUID value.

BT_UUID_HIDS_REPORT_REF
   HID Report Reference Descriptor.

BT_UUID_ES_CONFIGURATION_VAL
   Environmental Sensing Configuration Descriptor UUID value.

BT_UUID_ES_CONFIGURATION
   Environmental Sensing Configuration Descriptor.

BT_UUID_ES_MEASUREMENT_VAL
   Environmental Sensing Measurement Descriptor UUID value.

BT_UUID_ES_MEASUREMENT
   Environmental Sensing Measurement Descriptor.

BT_UUID_ES_TRIGGER_SETTING_VAL
   Environmental Sensing Trigger Setting Descriptor UUID value.

BT_UUID_ES_TRIGGER_SETTING
   Environmental Sensing Trigger Setting Descriptor.

BT_UUID_GAP_DEVICE_NAME_VAL
   GAP Characteristic Device Name UUID value.

BT_UUID_GAP_DEVICE_NAME
   GAP Characteristic Device Name.

BT_UUID_GAP_APPEARANCE_VAL
   GAP Characteristic Appearance UUID value.

BT_UUID_GAP_APPEARANCE
   GAP Characteristic Appearance.

BT_UUID_GAP_PPCP_VAL
   GAP Characteristic Peripheral Preferred Connection Parameters UUID value.

BT_UUID_GAP_PPCP
   GAP Characteristic Peripheral Preferred Connection Parameters.

BT_UUID_GATT_SC_VAL
   GATT Characteristic Service Changed UUID value.

BT_UUID_GATT_SC
   GATT Characteristic Service Changed.
BT_UUID_ALERT_LEVEL_VAL
Alert Level UUID value.

BT_UUID_ALERT_LEVEL
Alert Level.

BT_UUID_TPS_TX_POWER_LEVEL_VAL
TPS Characteristic Tx Power Level UUID value.

BT_UUID_TPS_TX_POWER_LEVEL
TPS Characteristic Tx Power Level.

BT_UUID_BAS_BATTERY_LEVEL_VAL
BAS Characteristic Battery Level UUID value.

BT_UUID_BAS_BATTERY_LEVEL
BAS Characteristic Battery Level.

BT_UUID_HTS_MEASUREMENT_VAL
HTS Characteristic Measurement Value UUID value.

BT_UUID_HTS_MEASUREMENT
HTS Characteristic Measurement Value.

BT_UUID_HIDS_BOOT_KB_IN_REPORT_VAL
HID Characteristic Boot Keyboard Input Report UUID value.

BT_UUID_HIDS_BOOT_KB_IN_REPORT
HID Characteristic Boot Keyboard Input Report.

BT_UUID_DIS_SYSTEM_ID_VAL
DIS Characteristic System ID UUID value.

BT_UUID_DIS_SYSTEM_ID
DIS Characteristic System ID.

BT_UUID_DIS_MODEL_NUMBER_VAL
DIS Characteristic Model Number String UUID value.

BT_UUID_DIS_MODEL_NUMBER
DIS Characteristic Model Number String.

BT_UUID_DIS_SERIAL_NUMBER_VAL
DIS Characteristic Serial Number String UUID value.

BT_UUID_DIS_SERIAL_NUMBER
DIS Characteristic Serial Number String.
BT_UUID_DIS_FIRMWARE_REVISION_VAL
DIS Characteristic Firmware Revision String UUID value.

BT_UUID_DIS_FIRMWARE_REVISION
DIS Characteristic Firmware Revision String.

BT_UUID_DIS_HARDWARE_REVISION_VAL
DIS Characteristic Hardware Revision String UUID value.

BT_UUID_DIS_HARDWARE_REVISION
DIS Characteristic Hardware Revision String.

BT_UUID_DIS_SOFTWARE_REVISION_VAL
DIS Characteristic Software Revision String UUID value.

BT_UUID_DIS_SOFTWARE_REVISION
DIS Characteristic Software Revision String.

BT_UUID_DIS_MANUFACTURER_NAME_VAL
DIS Characteristic Manufacturer Name String UUID Value.

BT_UUID_DIS_MANUFACTURER_NAME
DIS Characteristic Manufacturer Name String.

BT_UUID_DIS_PNP_ID_VAL
DIS Characteristic PnP ID UUID value.

BT_UUID_DIS_PNP_ID
DIS Characteristic PnP ID.

BT_UUID_CTS_CURRENT_TIME_VAL
CTS Characteristic Current Time UUID value.

BT_UUID_CTS_CURRENT_TIME
CTS Characteristic Current Time.

BT_UUID_MAGN_DECLINATION_VAL
Magnetic Declination Characteristic UUID value.

BT_UUID_MAGN_DECLINATION
Magnetic Declination Characteristic.

BT_UUID_HIDS_BOOT_KB_OUT_REPORT_VAL
HID Boot Keyboard Output Report Characteristic UUID value.

BT_UUID_HIDS_BOOT_KB_OUT_REPORT
HID Boot Keyboard Output Report Characteristic.
BT_UUID_HIDS_BOOT_MOUSE_IN_REPORT_VAL
HID Boot Mouse Input Report Characteristic UUID value.

BT_UUID_HIDS_BOOT_MOUSE_IN_REPORT
HID Boot Mouse Input Report Characteristic.

BT_UUID_HRS_MEASUREMENT_VAL
HRS Characteristic Measurement Interval UUID value.

BT_UUID_HRS_MEASUREMENT
HRS Characteristic Measurement Interval.

BT_UUID_HRS_BODY_SENSOR_VAL
HRS Characteristic Body Sensor Location.

BT_UUID_HRS_BODY_SENSOR
HRS Characteristic Control Point.

BT_UUID_HRS_CONTROL_POINT_VAL
HRS Characteristic Control Point UUID value.

BT_UUID_HRS_CONTROL_POINT
HRS Characteristic Control Point.

BT_UUID_HIDS_INFO_VAL
HID Information Characteristic UUID value.

BT_UUID_HIDS_INFO
HID Information Characteristic.

BT_UUID_HIDS_REPORT_MAP_VAL
HID Report Map Characteristic UUID value.

BT_UUID_HIDS_REPORT_MAP
HID Report Map Characteristic.

BT_UUID_HIDS_CTRL_POINT_VAL
HID Control Point Characteristic UUID value.

BT_UUID_HIDS_CTRL_POINT
HID Control Point Characteristic.

BT_UUID_HIDS_REPORT_VAL
HID Report Characteristic UUID value.

BT_UUID_HIDS_REPORT
HID Report Characteristic.
BT_UUID_HIDS_PROTOCOL_MODE_VAL
   HID Protocol Mode Characteristic UUID value.

BT_UUID_HIDS_PROTOCOL_MODE
   HID Protocol Mode Characteristic.

BT_UUID_RECORD_ACCESS_CONTROL_POINT_VAL
   Record Access Control Point Characteristic value.

BT_UUID_RECORD_ACCESS_CONTROL_POINT
   Record Access Control Point.

BT_UUID_RSC_MEASUREMENT_VAL
   RSC Measurement Characteristic UUID value.

BT_UUID_RSC_MEASUREMENT
   RSC Measurement Characteristic.

BT_UUID_RSC_FEATURE_VAL
   RSC Feature Characteristic UUID value.

BT_UUID_RSC_FEATURE
   RSC Feature Characteristic.

BT_UUID_CSC_MEASUREMENT_VAL
   CSC Measurement Characteristic UUID value.

BT_UUID_CSC_MEASUREMENT
   CSC Measurement Characteristic.

BT_UUID_CSC_FEATURE_VAL
   CSC Feature Characteristic UUID value.

BT_UUID_CSC_FEATURE
   CSC Feature Characteristic.

BT_UUID_SENSOR_LOCATION_VAL
   Sensor Location Characteristic UUID value.

BT_UUID_SENSOR_LOCATION
   Sensor Location Characteristic.

BT_UUID_SC_CONTROL_POINT_VAL
   SC Control Point Characteristic UUID value.

BT_UUID_SC_CONTROL_POINT
   SC Control Point Characteristic.
BT_UUID_ELEVATION_VAL
   Elevation Characteristic UUID value.

BT_UUID_ELEVATION
   Elevation Characteristic.

BT_UUID_PRESSURE_VAL
   Pressure Characteristic UUID value.

BT_UUID_PRESSURE
   Pressure Characteristic.

BT_UUID_TEMPERATURE_VAL
   Temperature Characteristic UUID value.

BT_UUID_TEMPERATURE
   Temperature Characteristic.

BT_UUID_HUMIDITY_VAL
   Humidity Characteristic UUID value.

BT_UUID_HUMIDITY
   Humidity Characteristic.

BT_UUID_TRUE_WIND_SPEED_VAL
   True Wind Speed Characteristic UUID value.

BT_UUID_TRUE_WIND_SPEED
   True Wind Speed Characteristic.

BT_UUID_TRUE_WIND_DIR_VAL
   True Wind Direction Characteristic UUID value.

BT_UUID_TRUE_WIND_DIR
   True Wind Direction Characteristic.

BT_UUID_APPARENT_WIND_SPEED_VAL
   Apparent Wind Speed Characteristic UUID value.

BT_UUID_APPARENT_WIND_SPEED
   Apparent Wind Speed Characteristic.

BT_UUID_APPARENT_WIND_DIR_VAL
   Apparent Wind Direction Characteristic UUID value.

BT_UUID_APPARENT_WIND_DIR
   Apparent Wind Direction Characteristic.

6.1. Bluetooth
BT_UUID_GUST_FACTOR_VAL
Gust Factor Characteristic UUID value.

BT_UUID_GUST_FACTOR
Gust Factor Characteristic.

BT_UUID_POLLEN_CONCENTRATION_VAL
Pollen Concentration Characteristic UUID value.

BT_UUID_POLLEN_CONCENTRATION
Pollen Concentration Characteristic.

BT_UUID_UV_INDEX_VAL
UV Index Characteristic UUID value.

BT_UUID_UV_INDEX
UV Index Characteristic.

BT_UUID_IRRADIANCE_VAL
Irradiance Characteristic UUID value.

BT_UUID_IRRADIANCE
Irradiance Characteristic.

BT_UUID_RAINFALL_VAL
Rainfall Characteristic UUID value.

BT_UUID_RAINFALL
Rainfall Characteristic.

BT_UUID_WIND_CHILL_VAL
Wind Chill Characteristic UUID value.

BT_UUID_WIND_CHILL
Wind Chill Characteristic.

BT_UUID_HEAT_INDEX_VAL
Heat Index Characteristic UUID value.

BT_UUID_HEAT_INDEX
Heat Index Characteristic.

BT_UUID_DEW_POINT_VAL
Dew Point Characteristic UUID value.

BT_UUID_DEW_POINT
Dew Point Characteristic.
BT_UUID_DESC_VALUE_CHANGED_VAL
Descriptor Value Changed Characteristic UUID value.

BT_UUID_DESC_VALUE_CHANGED
Descriptor Value Changed Characteristic.

BT_UUID_MAGN_FLUX_DENSITY_2D_VAL
Magnetic Flux Density - 2D Characteristic UUID value.

BT_UUID_MAGN_FLUX_DENSITY_2D
Magnetic Flux Density - 2D Characteristic.

BT_UUID_MAGN_FLUX_DENSITY_3D_VAL
Magnetic Flux Density - 3D Characteristic UUID value.

BT_UUID_MAGN_FLUX_DENSITY_3D
Magnetic Flux Density - 3D Characteristic.

BT_UUID_BAR_PRESSURE_TREND_VAL
Barometric Pressure Trend Characteristic UUID value.

BT_UUID_BAR_PRESSURE_TREND
Barometric Pressure Trend Characteristic.

BT_UUID_BMS_CONTROL_POINT_VAL
Bond Management Control Point UUID value.

BT_UUID_BMS_CONTROL_POINT
Bond Management Control Point.

BT_UUID_BMS_FEATURE_VAL
Bond Management Feature UUID value.

BT_UUID_BMS_FEATURE
Bond Management Feature.

BT_UUID_CENTRAL_ADDR_RES_VAL
Central Address Resolution Characteristic UUID value.

BT_UUID_CENTRAL_ADDR_RES
Central Address Resolution Characteristic.

BT_UUID_CGM_MEASUREMENT_VAL
CGM Measurement Characteristic value.

BT_UUID_CGM_MEASUREMENT
CGM Measurement Characteristic.
BT_UUID_CGM_FEATURE_VAL
CGM Feature Characteristic value.

BT_UUID_CGM_FEATURE
CGM Feature Characteristic.

BT_UUID_CGM_STATUS_VAL
CGM Status Characteristic value.

BT_UUID_CGM_STATUS
CGM Status Characteristic.

BT_UUID_CGM_SESSION_START_TIME_VAL
CGM Session Start Time Characteristic value.

BT_UUID_CGM_SESSION_START_TIME
CGM Session Start Time.

BT_UUID_CGM_SESSION_RUN_TIME_VAL
CGM Session Run Time Characteristic value.

BT_UUID_CGM_SESSION_RUN_TIME
CGM Session Run Time.

BT_UUID_CGM_SPECIFIC_OPS_CONTROL_POINT_VAL
CGM Specific Ops Control Point Characteristic value.

BT_UUID_CGM_SPECIFIC_OPS_CONTROL_POINT
CGM Specific Ops Control Point.

BT_UUID_URI_VAL
URI UUID value.

BT_UUID_URI
URI.

BT_UUID_HTTP_HEADERS_VAL
HTTP Headers UUID value.

BT_UUID_HTTP_HEADERS
HTTP Headers.

BT_UUID_HTTP_STATUS_CODE_VAL
HTTP Status Code UUID value.

BT_UUID_HTTP_STATUS_CODE
HTTP Status Code.
6.1. Bluetooth

BT_UUID_HTTP_ENTITY_BODY_VAL
HTTP Entity Body UUID value.

BT_UUID_HTTP_ENTITY_BODY
HTTP Entity Body.

BT_UUID_HTTP_CONTROL_POINT_VAL
HTTP Control Point UUID value.

BT_UUID_HTTP_CONTROL_POINT
HTTP Control Point.

BT_UUID_HTTPS_SECURITY_VAL
HTTPS Security UUID value.

BT_UUID_HTTPS_SECURITY
HTTPS Security.

BT_UUID_OTS_FEATURE_VAL
OTS Feature Characteristic UUID value.

BT_UUID_OTS_FEATURE
OTS Feature Characteristic.

BT_UUID_OTS_NAME_VAL
OTS Object Name Characteristic UUID value.

BT_UUID_OTS_NAME
OTS Object Name Characteristic.

BT_UUID_OTS_TYPE_VAL
OTS Object Type Characteristic UUID value.

BT_UUID_OTS_TYPE
OTS Object Type Characteristic.

BT_UUID_OTS_SIZE_VAL
OTS Object Size Characteristic UUID value.

BT_UUID_OTS_SIZE
OTS Object Size Characteristic.

BT_UUID_OTS_FIRST_CREATED_VAL
OTS Object First-Created Characteristic UUID value.

BT_UUID_OTS_FIRST_CREATED
OTS Object First-Created Characteristic.
BT_UUID_OTS_LAST_MODIFIED_VAL
OTS Object Last-Modified Characteristic UUID value.

BT_UUID_OTS_LAST_MODIFIED
OTS Object Last-Modified Characteristic.

BT_UUID_OTS_ID_VAL
OTS Object ID Characteristic UUID value.

BT_UUID_OTS_ID
OTS Object ID Characteristic.

BT_UUID_OTS_PROPERTIES_VAL
OTS Object Properties Characteristic UUID value.

BT_UUID_OTS_PROPERTIES
OTS Object Properties Characteristic.

BT_UUID_OTS_ACTION_CP_VAL
OTS Object Action Control Point Characteristic UUID value.

BT_UUID_OTS_ACTION_CP
OTS Object Action Control Point Characteristic.

BT_UUID_OTS_LIST_CP_VAL
OTS Object List Control Point Characteristic UUID value.

BT_UUID_OTS_LIST_CP
OTS Object List Control Point Characteristic.

BT_UUID_OTS_LIST_FILTER_VAL
OTS Object List Filter Characteristic UUID value.

BT_UUID_OTS_LIST_FILTER
OTS Object List Filter Characteristic.

BT_UUID_OTS_CHANGED_VAL
OTS Object Changed Characteristic UUID value.

BT_UUID_OTS_CHANGED
OTS Object Changed Characteristic.

BT_UUID_OTS_TYPE_UNSPECIFIED_VAL
OTS Unspecified Object Type UUID value.

BT_UUID_OTS_TYPE_UNSPECIFIED
OTS Unspecified Object Type.
BT_UUID_OTS_DIRECTORY_LISTING_VAL
OTS Directory Listing UUID value.

BT_UUID_OTS_DIRECTORY_LISTING
OTS Directory Listing.

BT_UUID_MESH_PROV_DATA_IN_VAL
Mesh Provisioning Data In UUID value.

BT_UUID_MESH_PROV_DATA_IN
Mesh Provisioning Data In.

BT_UUID_MESH_PROV_DATA_OUT_VAL
Mesh Provisioning Data Out UUID value.

BT_UUID_MESH_PROV_DATA_OUT
Mesh Provisioning Data Out.

BT_UUID_MESH_PROXY_DATA_IN_VAL
Mesh Proxy Data In UUID value.

BT_UUID_MESH_PROXY_DATA_IN
Mesh Proxy Data In.

BT_UUID_MESH_PROXY_DATA_OUT_VAL
Mesh Proxy Data Out UUID value.

BT_UUID_MESH_PROXY_DATA_OUT
Mesh Proxy Data Out.

BT_UUID_GATT_CLIENT_FEATURES_VAL
Client Supported Features UUID value.

BT_UUID_GATT_CLIENT_FEATURES
Client Supported Features.

BT_UUID_GATT_DB_HASH_VAL
Database Hash UUID value.

BT_UUID_GATT_DB_HASH
Database Hash.

BT_UUID_GATT_SERVER_FEATURES_VAL
Server Supported Features UUID value.

BT_UUID_GATT_SERVER_FEATURES
Server Supported Features.
BT_UUID_AICS_STATE_VAL
   Audio Input Control Service State value.

BT_UUID_AICS_STATE
   Audio Input Control Service State.

BT_UUID_AICS_GAIN_SETTINGS_VAL
   Audio Input Control Service Gain Settings Properties value.

BT_UUID_AICS_GAIN_SETTINGS
   Audio Input Control Service Gain Settings Properties.

BT_UUID_AICS_INPUT_TYPE_VAL
   Audio Input Control Service Input Type value.

BT_UUID_AICS_INPUT_TYPE
   Audio Input Control Service Input Type.

BT_UUID_AICS_INPUT_STATUS_VAL
   Audio Input Control Service Input Status value.

BT_UUID_AICS_INPUT_STATUS
   Audio Input Control Service Input Status.

BT_UUID_AICS_CONTROL_VAL
   Audio Input Control Service Control Point value.

BT_UUID_AICS_CONTROL
   Audio Input Control Service Control Point.

BT_UUID_AICS_DESCRIPTION_VAL
   Audio Input Control Service Input Description value.

BT_UUID_AICS_DESCRIPTION
   Audio Input Control Service Input Description.

BT_UUID_VCS_STATE_VAL
   Volume Control Setting value.

BT_UUID_VCS_STATE
   Volume Control Setting.

BT_UUID_VCS_CONTROL_VAL
   Volume Control Control point value.

BT_UUID_VCS_CONTROL
   Volume Control Control point.
BT_UUID_VCS_FLAGS_VAL
  Volume Control Flags value.

BT_UUID_VCS_FLAGS
  Volume Control Flags.

BT_UUID_VOCS_STATE_VAL
  Volume Offset State value.

BT_UUID_VOCS_STATE
  Volume Offset State.

BT_UUID_VOCS_LOCATION_VAL
  Audio Location value.

BT_UUID_VOCS_LOCATION
  Audio Location.

BT_UUID_VOCS_CONTROL_VAL
  Volume Offset Control Point value.

BT_UUID_VOCS_CONTROL
  Volume Offset Control Point.

BT_UUID_VOCS_DESCRIPTION_VAL
  Volume Offset Audio Output Description value.

BT_UUID_VOCS_DESCRIPTION
  Volume Offset Audio Output Description.

BT_UUID_CSIS_SET_SIRK_VAL
  Set Identity Resolving Key value.

BT_UUID_CSIS_SET_SIRK
  Set Identity Resolving Key.

BT_UUID_CSIS_SET_SIZE_VAL
  Set size value.

BT_UUID_CSIS_SET_SIZE
  Set size.

BT_UUID_CSIS_SET_LOCK_VAL
  Set lock value.

BT_UUID_CSIS_SET_LOCK
  Set lock.
BT_UUID_CSIS_RANK_VAL
   Rank value.

BT_UUID_CSIS_RANK
   Rank.

BT_UUID_MCS_PLAYER_NAME_VAL
   Media player name value.

BT_UUID_MCS_PLAYER_NAME
   Media player name.

BT_UUID_MCS_ICON_OBJ_ID_VAL
   Media Icon Object ID value.

BT_UUID_MCS_ICON_OBJ_ID
   Media Icon Object ID.

BT_UUID_MCS_ICON_URL_VAL
   Media Icon URL value.

BT_UUID_MCS_ICON_URL
   Media Icon URL.

BT_UUID_MCS_TRACK_CHANGED_VAL
   Track Changed value.

BT_UUID_MCS_TRACK_CHANGED
   Track Changed.

BT_UUID_MCS_TRACK_TITLE_VAL
   Track Title value.

BT_UUID_MCS_TRACK_TITLE
   Track Title.

BT_UUID_MCS_TRACK_DURATION_VAL
   Track Duration value.

BT_UUID_MCS_TRACK_DURATION
   Track Duration.

BT_UUID_MCS_TRACK_POSITION_VAL
   Track Position value.

BT_UUID_MCS_TRACK_POSITION
   Track Position.
BT_UUID_MCS_PLAYBACK_SPEED_VAL
Playback Speed value.

BT_UUID_MCS_PLAYBACK_SPEED
Playback Speed.

BT_UUID_MCS_SEEKING_SPEED_VAL
Seeking Speed value.

BT_UUID_MCS_SEEKING_SPEED
Seeking Speed.

BT_UUID_MCS_TRACK_SEGMENTS_OBJ_ID_VAL
Track Segments Object ID value.

BT_UUID_MCS_TRACK_SEGMENTS_OBJ_ID
Track Segments Object ID.

BT_UUID_MCS_CURRENT_TRACK_OBJ_ID_VAL
Current Track Object ID value.

BT_UUID_MCS_CURRENT_TRACK_OBJ_ID
Current Track Object ID.

BT_UUID_MCS_NEXT_TRACK_OBJ_ID_VAL
Next Track Object ID value.

BT_UUID_MCS_NEXT_TRACK_OBJ_ID
Next Track Object ID.

BT_UUID_MCS_PARENT_GROUP_OBJ_ID_VAL
Parent Group Object ID value.

BT_UUID_MCS_PARENT_GROUP_OBJ_ID
Parent Group Object ID.

BT_UUID_MCS_CURRENT_GROUP_OBJ_ID_VAL
Group Object ID value.

BT_UUID_MCS_CURRENT_GROUP_OBJ_ID
Group Object ID.

BT_UUID_MCS_PLAYING_ORDER_VAL
Playing Order value.

BT_UUID_MCS_PLAYING_ORDER
Playing Order.
BT_UUID_MCS_PLAYING_ORDERS_VAL
Playing Orders supported value.

BT_UUID_MCS_PLAYING_ORDERS
Playing Orders supported.

BT_UUID_MCS_MEDIA_STATE_VAL
Media State value.

BT_UUID_MCS_MEDIA_STATE
Media State.

BT_UUID_MCS_MEDIA_CONTROL_POINT_VAL
Media Control Point value.

BT_UUID_MCS_MEDIA_CONTROL_POINT
Media Control Point.

BT_UUID_MCS_MEDIA_CONTROL_OPCODES_VAL
Media control opcodes supported value.

BT_UUID_MCS_MEDIA_CONTROL_OPCODES
Media control opcodes supported.

BT_UUID_MCS_SEARCH_RESULTS_OBJ_ID_VAL
Search result object ID value.

BT_UUID_MCS_SEARCH_RESULTS_OBJ_ID
Search result object ID.

BT_UUID_MCS_SEARCH_CONTROL_POINT_VAL
Search control point value.

BT_UUID_MCS_SEARCH_CONTROL_POINT
Search control point.

BT_UUID_OTS_TYPE_MPL_ICON_VAL
Media Player Icon Object Type value.

BT_UUID_OTS_TYPE_MPL_ICON
Media Player Icon Object Type.

BT_UUID_OTS_TYPE_TRACK_SEGMENT_VAL
Track Segments Object Type value.

BT_UUID_OTS_TYPE_TRACK_SEGMENT
Track Segments Object Type.
BT_UUID_OTS_TYPETRACK_VAL
Track Object Type value.

BT_UUID_OTS_TYPE_TRACK
Track Object Type.

BT_UUID_OTS_TYPE_GROUP_VAL
Group Object Type value.

BT_UUID_OTS_TYPE_GROUP
Group Object Type.

BT_UUID_TBS_PROVIDER_NAME_VAL
Bearer Provider Name value.

BT_UUID_TBS_PROVIDER_NAME
Bearer Provider Name.

BT_UUID_TBS_UCI_VAL
Bearer UCI value.

BT_UUID_TBS_UCI
Bearer UCI.

BT_UUID_TBS_TECHNOLOGY_VAL
Bearer Technology value.

BT_UUID_TBS_TECHNOLOGY
Bearer Technology.

BT_UUID_TBS_URI_LIST_VAL
Bearer URI Prefixes Supported List value.

BT_UUID_TBS_URI_LIST
Bearer URI Prefixes Supported List.

BT_UUID_TBS_SIGNAL_STRENGTH_VAL
Bearer Signal Strength value.

BT_UUID_TBS_SIGNAL_STRENGTH
Bearer Signal Strength.

BT_UUID_TBS_SIGNAL_INTERVAL_VAL
Bearer Signal Strength Reporting Interval value.

BT_UUID_TBS_SIGNAL_INTERVAL
Bearer Signal Strength Reporting Interval.

6.1. Bluetooth
**BT_UUID_TBS_LIST_CURRENT_CALLS_VAL**
Bearer List Current Calls value.

**BT_UUID_TBS_LIST_CURRENT_CALLS**
Bearer List Current Calls.

**BT_UUID_CCID_VAL**
Content Control ID value.

**BT_UUID_CCID**
Content Control ID.

**BT_UUID_TBS_STATUS_FLAGS_VAL**
Status flags value.

**BT_UUID_TBS_STATUS_FLAGS**
Status flags.

**BT_UUID_TBS_INCOMING_URI_VAL**
Incoming Call Target Caller ID value.

**BT_UUID_TBS_INCOMING_URI**
Incoming Call Target Caller ID.

**BT_UUID_TBS_CALL_STATE_VAL**
Call State value.

**BT_UUID_TBS_CALL_STATE**
Call State.

**BT_UUID_TBS_CALL_CONTROL_POINT_VAL**
Call Control Point value.

**BT_UUID_TBS_CALL_CONTROL_POINT**
Call Control Point.

**BT_UUID_TBS_OPTIONAL_OPCODES_VAL**
Optional Opcodes value.

**BT_UUID_TBS_OPTIONAL_OPCODES**
Optional Opcodes.

**BT_UUID_TBS_TERMINATE_REASON_VAL**
Terminate reason value.

**BT_UUID_TBS_TERMINATE_REASON**
Terminate reason.

Enums

enum [anonymous]

Bluetooth UUID types.

Values:

enumerator BT_UUID_TYPE_16

UUID type 16-bit.

enumerator BT_UUID_TYPE_32

UUID type 32-bit.

enumerator BT_UUID_TYPE_128

UUID type 128-bit.

Functions

int bt_uuid_cmp(const struct bt_uuid *u1, const struct bt_uuid *u2)

Compare Bluetooth UUIDs.

Compares 2 Bluetooth UUIDs, if the types are different both UUIDs are first converted to 128 bits format before comparing.

Parameters

• u1 – First Bluetooth UUID to compare
• u2 – Second Bluetooth UUID to compare

Returns

negative value if u1 < u2, 0 if u1 == u2, else positive

bool bt_uuid_create(struct bt_uuid *uuid, const uint8_t *data, uint8_t data_len)

Create a bt_uuid from a little-endian data buffer.

Create a bt_uuid from a little-endian data buffer. The data_len parameter is used to determine whether the UUID is in 16, 32 or 128 bit format (length 2, 4 or 16). Note: 32 bit format is not allowed over the air.

Parameters

• uuid – Pointer to the bt_uuid variable
• data – pointer to UUID stored in little-endian data buffer

6.1. Bluetooth
• data_len – length of the UUID in the data buffer

**Returns**

true if the data was valid and the UUID was successfully created.

```c
void bt_uuid_to_str(const struct bt_uuid *uuid, char *str, size_t len)
```

Converts Bluetooth UUID to string. UUID can be in any format, 16-bit, 32-bit or 128-bit.

**Parameters**

- **uuid** – Bluetooth UUID
- **str** – pointer where to put converted string
- **len** – length of str

```c
struct bt_uuid

#include <uuid.h>  // This is a ‘tentative’ type and should be used as a pointer only.
```

```c
struct bt_uuid_16

#include <uuid.h>
```

**Public Members**

```c
struct bt_uuid uuid
```

UUID generic type.

```c
uint16_t val
```

UUID value, 16-bit in host endianness.

```c
struct bt_uuid_32

#include <uuid.h>
```

**Public Members**

```c
struct bt_uuid uuid
```

UUID generic type.

```c
uint32_t val
```

UUID value, 32-bit in host endianness.

```c
struct bt_uuid_128

#include <uuid.h>
```

**Public Members**

```c
struct bt_uuid uuid
```

UUID generic type.

```c
uint8_t val[16]
```

UUID value, 128-bit in little-endian format.
Bluetooth: Basic Audio Profile

This document describes how to run basic audio profile functionality which includes:

- Capabilities and Endpoint discovery
- Audio Stream Endpoint procedures

Commands

```
audio --help
Subcommands:
  init
  select_broadcast :<stream>
  create_broadcast :[codec] [preset]
  start_broadcast :
  stop_broadcast :
  delete_broadcast :
  broadcast_scan :<on, off>
  accept_broadcast :0x<broadcast_id>
  sync_broadcast :0x<bis_bitfield>
  stop_broadcast_sink :
  term_broadcast_sink :
  discover :[type: sink, source]
  preset :[preset]
  config :<direction: sink, source> <index> [codec] [preset]
  qos :[preset] [interval] [framing] [latency] [pd] [sdu] [phy]
       [rtn]
  enable
  metadata :[context]
  start
  disable
  stop
  release
  list
  connect :<direction: sink, source> <index> [codec] [preset]
  select_unicast :<stream>
  send :Send to Audio Stream [data]
```

Example Central  Connect and establish a stream:
uart:~$ bt init
uart:~$ audio init
uart:~$ bt connect <address>
uart:~$ gatt exchange-mtu
uart:~$ audio discover sink
uart:~$ audio config sink 0
uart:~$ audio qos
uart:~$ audio enable

Or using connect command:

uart:~$ bt init
uart:~$ audio init
uart:~$ bt connect <address>
uart:~$ gatt exchange-mtu
uart:~$ audio discover sink
uart:~$ audio connect sink 0

Disconnect and release:

uart:~$ audio disable
uart:~$ audio release

---

**Example Peripheral**  
**Listen:**

uart:~$ bt init
uart:~$ audio init
uart:~$ bt advertise on

**Server initiated disable and release:**

uart:~$ audio disable
uart:~$ audio release

---

**Example Broadcast Source**  
Create and establish a broadcast source stream:

uart:~$ audio init
uart:~$ audio create_broadcast
uart:~$ audio start_broadcast

**Stop and release a broadcast source stream:**

uart:~$ audio stop_broadcast
uart:~$ audio delete_broadcast

---

**Example Broadcast Sink**  
Scan for and establish a broadcast sink stream:

uart:~$ audio init
uart:~$ audio broadcast_scan on

Found broadcaster with ID 0xB91CD4
uart:~$ audio accept_broadcast 0xB91CD4
PA syncing to broadcaster
Broadcast scan was terminated: 0
PA synced to broadcaster with ID 0xB91CD4 as sink 0x2000d09c
Sink 0x2000d09c is set as default

(continues on next page)
Sink 0x2000d09c is ready to sync without encryption
Received BASE from sink 0x2000d09c:
Subgroup[0]:

[0]: 0x01
Possible indexes: 0x01
audio sync_broadcast 0x01

Stop and release a broadcast sink stream:

```sh
uart:~$ audio stop_broadcast_sink
uart:~$ audio term_broadcast_sink
```

**Init**  The `init` command register local PAC records which are necessary to be able to configure stream and properly manage capabilities in use.

<table>
<thead>
<tr>
<th>Depends</th>
<th>Allowed States</th>
<th>Next States</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>any</td>
<td>none</td>
</tr>
</tbody>
</table>

```sh
uart:~$ audio init
```

**Discover PAC(s) and ASE(s)**  Once connected the `discover` command discover PAC records and ASE characteristics representing remote endpoints.

<table>
<thead>
<tr>
<th>Depends</th>
<th>Allowed States</th>
<th>Next States</th>
</tr>
</thead>
<tbody>
<tr>
<td>init</td>
<td>any</td>

00000000: ff 03 |.. |

ep 0x81754e0
ep 0x81755d4
Discover complete: err 0

Select preset  The `preset` command can be used to either print the default preset configuration or set a different one, it is worth noting that it doesn't change any stream previously configured.

```
uart:~$ audio preset [preset]
uart:~$ audio preset
16_2_1
codec 0x06 cid 0x0000 vid 0x0000 count 3
data #0: type 0x01 len 1

```
uart:~$ audio enable
```

Start [sink only]  The `start` command is only necessary when acting as a sink as it indicates to the source the stack is ready to start receiving data.

<table>
<thead>
<tr>
<th>Depends</th>
<th>Allowed States</th>
<th>Next States</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enabling</td>
<td>streaming</td>
</tr>
</tbody>
</table>

```
uart:~$ audio start
```

Disable  The `disable` command attempts to disable the stream previously enabled, if the remote peer accepts then the ISO disconnection procedure is also initiated.

<table>
<thead>
<tr>
<th>Depends</th>
<th>Allowed States</th>
<th>Next States</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>enabling/streaming</td>
<td>disabling</td>
</tr>
</tbody>
</table>

```
uart:~$ audio disable
```

Stop [sink only]  The `stop` command is only necessary when acting as a sink as it indicates to the source the stack is ready to stop receiving data.

<table>
<thead>
<tr>
<th>Depends</th>
<th>Allowed States</th>
<th>Next States</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>disabling</td>
<td>qos-configure/idle</td>
</tr>
</tbody>
</table>

```
uart:~$ audio stop
```
Release  The `release` command releases the current stream and its configuration.

### Table 6.15: State Machine Transitions

Bluetooth: Broadcast Audio Profile Broadcast Assistant

This document describes how to run the BAP Broadcast Assistant functionality. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

The Broadcast Assistant is responsible for offloading scan for a resource restricted device, such that scanning does not drain the battery. The Broadcast Assistant shall support scanning for periodic advertisements and may optionally support the periodic advertisements synchronization transfer (PAST) protocol.

The Broadcast Assistant will typically be phones or laptops. The Broadcast Assistant scans for periodic advertisements and transfer information to the server.

It is necessary to have BT_DEBUG_BAP_BROADCAST_ASSISTANT enabled for using the Broadcast Assistant interactively.

When the Bluetooth stack has been initialized (bt init), and a device has been connected, the Broadcast Assistant can discover BASS on the connected device calling bap_broadcast_assistant discover, which will start a discovery for the BASS UUIDs and store the handles, and subscribe to all notifications.

bap_broadcast_assistant - Bluetooth BAP Broadcast Assistant shell commands
Subcommands:
  discover :Discover BASS on the server
  scan_start :Start scanning for broadcasters
  scan_stop :Stop scanning for BISs
  add_src :Add a source <address: XX:XX:XX:XX:XX:XX> <type: public/random> <adv_sid> <sync_pa> <broadcast_id>

(continues on next page)
mod_src : Set sync <src_id> <sync_pa> [<pa_interval>] [<sync_bis>] [metadata]

broadcast_code : Send a space separated broadcast code of up to 16 bytes
<src_id> [broadcast code]

rem_src : Remove a source <src_id>
read_state : Remove a source <index>

Example usage

Setup
uart:~$ bt init

When connected  Start scanning for periodic advertisements for a server:

Note: The Broadcast Assistant will not actually start scanning for periodic advertisements, as that feature is still, at the time of writing, not implemented.

uart:~$ bap_broadcast_assistant discover
<dbg> bt_bap_broadcast_assistant.char_discover_func: Found 1 BASS receive states
<dbg> bt_bap_broadcast_assistant.read_recv_state_cb: src_id 0, PA 0, BIS 0, encrypt 0,
→ addr 00:00:00:00:00:00 (public), sid 0, metadata_len 0
uart:~$ bap_broadcast_assistant scan_start
<dbg> bt_bap_broadcast_assistant.write_func: err: 0x00, handle 0x001e

Adding a source to the receive state:

uart:~$ bap_broadcast_assistant add_src 11:22:33:44:55:66 public 5 1 1
BASS recv state: src_id 0, addr 11:22:33:44:55:66 (public), sid 5, sync_state 1,
→ encrypt_state 000000000000000000000000000000000
[0]: BIS sync 0, metadata_len 0

Bluetooth: Broadcast Audio Profile Scan Delegator

This document describes how to run the Scan Delegator functionality. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

The Scan Delegator may optionally support the periodic advertisements synchronization transfer (PAST) protocol.

The Scan Delegator server typically resides on devices that have inputs or outputs.

It is necessary to have BT_DEBUG_BAP_SCAN_DELEGATOR enabled for using the Scan Delegator interactively.

The Scan Delegator can currently only set the sync state of a receive state, but does not actually support syncing with periodic advertisements yet.

bap_scan_delegator --help
bap_scan_delegator - Bluetooth BAP Scan Delegator shell commands
Subcommands:
Example Usage

Setup

```
init:~$ bt init
init:~$ bt advertise on
Advertising started
```

When connected Set sync state for a source:

```
init:~$ bap_scan_delegator synced 0 1 3 0
```

Bluetooth: Call Control Profile

This document describes how to run the call control functionality, both as a client and as a (telephone bearer service (TBS)) server. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

**Telephone Bearer Service Client** The telephone bearer service client will typically exist on a resource restricted device, such as headphones, but may also exist on e.g. phones or laptops. The call control client will also typically be the advertiser. The client can control the states of calls on a server using the call control point.

It is necessary to have `BT_DEBUG_TBS_CLIENT` enabled for using the client interactively.

**Using the telephone bearer service client** When the Bluetooth stack has been initialized (`bt init`), and a device has been connected, the telephone bearer service client can discover TBS on the connected device calling `tbs_client discover`, which will start a discovery for the TBS UUIDs and store the handles, and optionally subscribe to all notifications (default is to subscribe to all).

Since a server may have multiple TBS instances, most of the `tbs_client` commands will take an index (starting from 0) as input. Joining calls require at least 2 call IDs, and all call indexes shall be on the same TBS instance.

A server may also have a GTBS instance, which is an abstraction layer for all the telephone bearers on the server. If the server has both GTBS and TBS, the client may subscribe and use either when sending requests if `BT_TBS_CLIENT_GTBS` is enabled.
In the following examples, notifications from GTBS is ignored, unless otherwise specified.

**Example usage**

**Setup**

```
uart:~$ bt init
uart:~$ bt advertise on
Advertising started
```

**When connected**  Placing a call:

```
uart:~$ tbs_client discover
< dbg > bt_tbs_client.primary_discover_func: Discover complete, found 1 instances (GTBS
→ found)
< dbg > bt_tbs_client.discover_func: Setup complete for 1 / 1 TBS
< dbg > bt_tbs_client.discover_func: Setup complete GTBS
uart:~$ tbs_client originate 0 tel:123
< dbg > bt_tbs_client.notify_handler: Index 0
< dbg > bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the dialing state
→ with URI tel:123
< dbg > bt_tbs_client.call_cp_notify_handler: Status: success for the originate opcode
→ for call 0x00
< dbg > bt_tbs_client.notify_handler: Index 0
```

(continues on next page)
Placing a call on GTBS:

```bash
uart:~$ tbs_client originate 0 tel:123
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the dialing state
→ with URI tel:123
<dbg> bt_tbs_client.call_cp_notify_handler: Status: success for the originate opcode
→ for call 0x00
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the alerting state
→ with URI tel:123
<call answered by peer device, and status notified by TBS server>
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the active state
→ with URI tel:123
```

It is necessary to set an outgoing caller ID before placing a call.

Accepting incoming call from peer device:

```bash
<dbg> bt_tbs_client.incoming_uri_notify_handler: tel:123
<dbg> bt_tbs_client.in_call_notify_handler: tel:456
<dbg> bt_tbs_client.friendly_name_notify_handler: Peter
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x05 is in the incoming state
→ with URI tel:456
uart:~$ tbs_client accept 0 5
<dbg> bt_tbs_client.call_cp_callback_handler: Status: success for the accept opcode
→ for call 0x05
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x05 is in the active state
→ with URI tel
```

Terminate call:

```bash
uart:~$ tbs_client terminate 0 5
<dbg> bt_tbs_client.termination_reason_notify_handler: ID 0x05, reason 0x06
<dbg> bt_tbs_client.call_cp_notify_handler: Status: success for the terminate opcode
→ for call 0x05
<dbg> bt_tbs_client.current_calls_notify_handler:
```

**Telephone Bearer Service (TBS)** The telephone bearer service is a service that typically resides on devices that can make calls, including calls from apps such as Skype, e.g. (smart)phones and PCs.

It is necessary to have `BT_DEBUG_TBS` enabled for using the TBS server interactively.

**Using the telephone bearer service** TBS can be controlled locally, or by a remote device (when in a call). For example a remote device may initiate a call to the device with the TBS server, or the TBS server may initiate a call to remote device, without a TBS_CLIENT client. The TBS implementation is capable of fully controlling any call.
tbs --help

Subcommands:

init : Initialize TBS
authorize : Authorize the current connection
accept : Accept call <call_index>
terminate : Terminate call <call_index>
hold : Hold call <call_index>
retrieve : Retrieve call <call_index>
originate : Originate call [<instance_index>] <uri>
join : Join calls <id> [id] [id] [id] [id] [id]
incoming : Simulate incoming remote call [<instance_index, gtbs>] <local_uri> <remote_uri>
remote_answer : Simulate remote answer outgoing call <call_index>
remote_retrieve : Simulate remote retrieve <call_index>
remote_terminate : Simulate remote terminate <call_index>
remote_hold : Simulate remote hold <call_index>
s_set_bearer_provider_name : Set the bearer provider name [<instance_index, gtbs>] <name>
s_set_bearer_technology : Set the bearer technology [<instance_index, gtbs>] <technology>
s_set_bearer_signal_strength : Set the bearer signal strength [<instance_index, gtbs>] <strength>
s_set_status_flags : Set the bearer feature and status value [<instance_index, gtbs>] <feature_and_status>
s_set_uri_scheme : Set the URI prefix list <bearer_idx> <uri1 [uri2 [uri3 [...]]]>
print_calls : Output all calls in the debug log

Example Usage

Setup

_uart:~$ bt init

When connected  Answering a call for a peer device originated by a client:

<_dbg> bt_tbs.write_call_cp: Index 0: Processing the originate opcode
<_dbg> bt_tbs.originate_call: New call with call index 1
<_dbg> bt_tbs.write_call_cp: Index 0: Processed the originate opcode with status success for call index 1
_uart:~$ tbs remote_answer 1
TBS succeeded for call_id: 1

Incoming call from a peer device, accepted by client:

_uart:~$ tbs incoming 0 tel:123 tel:456 Peter
TBS succeeded for call_id: 4
<_dbg> bt_tbs.bt_tbs_remote_incoming: New call with call index 4
<_dbg> bt_tbs.write_call_cp: Index 0: Processed the accept opcode with status success for call index 4
Bluetooth: Coordinated Set Identification Profile

This document describes how to run the coordinated set identification functionality, both as a client and as a server. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

Set Coordinator (Client)  The client will typically be a resource-rich device, such as a smartphone or a laptop. The client is able to lock and release members of a coordinated set. While the coordinated set is locked, no other clients may lock the set.

To lock a set, the client must connect to each of the set members it wants to lock. This implementation will always try to connect to all the members of the set, and at the same time. Thus if the set size is 3, then \( BT\_MAX\_CONN \) shall be at least 3.

If the locks on set members shall persists through disconnects, it is necessary to bond with the set members. If you need to bond with multiple set members, make sure that \( BT\_MAX\_PAIRED \) is correctly configured.

Using the Set Coordinator  When the Bluetooth stack has been initialized (bt init), and a set member device has been connected, the call control client can be initialized by calling csip_set_coordinator init, which will start a discovery for the TBS uuids and store the handles, and optionally subscribe to all notifications (default is to subscribe to all).

Once the client has connected and discovered the handles, then it can read the set information, which is needed to identify other set members. The client can then scan for and connect to the remaining set members, and once all the members has been connected to, it can lock and release the set.

It is necessary to enable \( BT\_DEBUG\_CSIP\_SET\_COORDINATOR \) to properly use the set coordinator.

<dbg> bt_csip_set_coordinator.notify_func: Instance 0 lock was released
Set released
```
Coordinated Set Member (Server)  The server on devices that are part of a set, consisting of at least two devices, e.g. a pair of earbuds.

Using the Set Member

csip_set_member --help
csip_set_member - Bluetooth CSIP set member shell commands
Subcommands:
  register :Initialize the service and register callbacks [size <int>]
             [rank <int>] [not-lockable] [sirk <data>]
  update_psri :Update the advertised PSRI
  lock :Lock the set
  release :Release the set [force]
  print_sirk :Print the currently used SIRK
  set_sirk_rsp :Set the response used in SIRK requests <accept, accept_enc, reject, oob>

Example Usage

Setup

uart:~$ bt init
uart:~$ csip_set_member register

Bluetooth: Isochronous Channels

Commands

iso --help
iso - Bluetooth ISO shell commands
Subcommands:
  cig_create :[dir=tx,rx,txrx] [interval] [packing] [framing] [latency] [sdu]
              [phy] [rtn]
  cig_term :Terminate the CIG
  connect :Connect ISO Channel
  listen :<dir=tx,rx,txrx> [security level]
  send :Send to ISO Channel [count]
  disconnect :Disconnect ISO Channel
  create-big :Create a BIG as a broadcaster [enc <broadcast code>]
  broadcast :Broadcast on ISO channels
  sync-big :Synchronize to a BIG as a receiver <BIS bitfield> [mse] [timeout]
            [enc <broadcast code>]
  term-big :Terminate a BIG

1. [Central] Create CIG:

Requires to be connected:

uart:~$ iso cig_create
CIG created

2. [Peripheral] Listen to ISO connections

uart:~$ iso listen txrx

3. [Central] Connect ISO channel:
uart:~$ iso connect
ISO Connect pending...
ISO Channel 0x20000f88 connected

4. Send data:

uart:~$ iso send
send: 40 bytes of data
ISO sending...

5. Disconnect ISO channel:

uart:~$ iso disconnect
ISO Disconnect pending...
ISO Channel 0x20000f88 disconnected with reason 0x16

Media control for Generic Audio Content Control

This document describes how to run the media control functionality, using the shell, both as a client and as a server.

The media control server consists of two parts. There is a media player (mpl) that contains the logic to handle media, and there is a media control service (mcs) that serves as a GATT-based interface to the player. The media control client consists of one part, the GATT-based client (mcc).

The media control server may include an object transfer service (ots) and the media control client may include an object transfer client (otc). When these are included, a richer set of functionality is available.

The media control server and client both implement the Generic Media Control Service (only), and do not use any underlying Media Control Services.

Note that in the examples below, in many cases the debug output has been removed and long outputs may have been shortened to make the examples shorter and clearer.

Also note that this documentation does not list all shell commands, it just shows examples of some of them. The set of commands is explorable from the mcc shell and the mpl shell, by typing `mcc` or `mpl` and pressing TAB. A help text for each command can be found by doing `mcc <command> help` or `mpl <command> help`.

Overview

A media player has a name and an icon that allows identification of the player for the user.

The content of the media player is structured into tracks and groups. A media player has a number of groups. A group contains tracks and other groups. (In this implementation, a group only contains tracks, not other groups.) Tracks can be divided into segments.

An active player will have a current track. This is the track that is playing now (if the player is playing). The current track has a title, a duration (given in hundredths of a second) and a position - the current position of the player within the track.

There is also a current group (the group of the current track), a parent group (the parent group of the current group) and a next track.

The media player is in a state, which will be one of playing, paused, seeking or inactive. When playing, playback happens at a given playback speed, and the tracks are played according to the playing order, which is one of the playing orders supported. Track changes are signalled as notifications of the track changed characteristic. When seeking (fast forward or fast rewind), the track position is moved according to the seeking speed.

The opcodes supported tells which operations are supported by the player by writing to the media control point. There is also a search control point that allows to search for groups and tracks according to various criteria, with the result returned in the search results.
Finally, the content control ID is used to associate the media player with an audio stream.

Media Control Client (MCP) The media control client is used to control, and to get information from, a media control server. Control is done by writing to one of the two control points, or by writing to other writable characteristics. Getting information is done by reading characteristics, or by configuring the server to send notifications.

Using the media control client Before use, the media control client must be initialized by the command `mcc init`.

To achieve a connection to the peer, the `bt` commands must be used - `bt init` followed by `bt advertise on` (or `bt connect` if the server is advertising).

When the media control client is connected to a media control server, the client can discover the server's Generic Media Control Service, by giving the command `mcc discover_mcs`. This will store the handles of the service, and (optionally, but default) subscribe to all notifications.

After discovery, the media control client can read and write characteristics, including the media control point and the search control point.

Example usage

Setup

```bash
uart:~$ bt init
Bluetooth initialized

uart:~$ mcc init
MCC init complete

uart:~$ bt advertise on
Advertising started
```

When connected Service discovery (GMCS and included OTS):

```bash
uart:~$ mcc discover_mcs
<dbg> bt_mcc.bt_mcc_discover_mcs: start discovery of MCS primary service
<dbg> bt_mcc.discover_primary_func: [ATTRIBUTE] handle 0x00ae
<dbg> bt_mcc.discover_primary_func: Primary discovery complete
<dbg> bt_mcc.discover_primary_func: UUID: 2800
<dbg> bt_mcc.discover_primary_func: UUID: 8fd7
<dbg> bt_mcc.discover_primary_func: Start discovery of MCS characteristics
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00a0
<dbg> bt_mcc.discover_mcs_char_func: Player name, UUID: 8fa0
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b2
<dbg> bt_mcc.discover_mcs_char_func: Icon Object, UUID: 8fa1
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b4
<dbg> bt_mcc.discover_mcs_char_func: Icon URI, UUID: 8fa2
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b6
<dbg> bt_mcc.discover_mcs_char_func: Track Changed, UUID: 8fa3
<dbg> bt_mcc.discover_mcs_char_func: Subscribing - handle: 0x00b6
[
...
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00ea
<dbg> bt_mcc.discover_mcs_char_func: Content Control ID, UUID: 8fb5
```

(continues on next page)
Reading characteristics - the player name and the track duration as examples:

```
uart:~$ mcc read_player_name
Player name: My media player
4d 79 20 6d 65 64 69 61 20 70 6c 61 79 65 72 |My media player

uart:~$ mcc read_track_duration
Track duration: 6300
```

Note that the value of some characteristics may be truncated due to being too long to fit in the ATT packet. Increasing the ATT MTU may help:

```
uart:~$ gatt exchange-mtu
Exchange pending
Exchange successful
```

```
uart:~$ mcc read_track_title
Track title: Interlude #1 (Song for Alison)
```

Writing characteristics - track position as an example:
The track position is where the player “is” in the current track. Read the track position, change it by writing to it, confirm by reading it again.

```
uart:~$ mcc read_track_position
Track Position: 0
```

```
uart:~$ mcc set_track_position 500
Track Position: 500
```

```
uart:~$ mcc read_track_position
Track Position: 500
```

Controlling the player via the control point:
Writing to the control point allows the client to request the server to do operations like play, pause, fast forward, change track, change group and so on. Some operations (e.g. goto track) take an argument. Currently, raw opcode values are used as input to the control point shell command. These opcode values can be found in the mpl.h header file.
Send the play command (opcode “1”), the command to go to track (opcode “52”) number three, and the pause command (opcode “2”):

```
uart:~$ mcc set_cp 1
Media State: 1
Operation: 1, result: 1
Operation: 1, param: 0

uart:~$ mcc set_cp 52 3
Track changed
Track title: Interlude #3 (Levanto Seventy)
Track duration: 7800
Track Position: 0
Current Track Object ID: 0x000000000104
Next Track Object ID: 0x000000000105
Operation: 52, result: 1
Operation: 52, param: 3

uart:~$ mcc set_cp 2
Media State: 2
Operation: 2, result: 1
Operation: 2, param: 0
```

Using the included object transfer client When object transfer is supported by both the client and the server, a larger set of characteristics is available. These include object IDs for the various track and group objects. These IDs can be used to select and download the corresponding objects from the server's object transfer service.

Read the object ID of the current group object:

```
uart:~$ mcc read_current_group_obj_id
Current Group Object ID: 0x000000000107
```

Select the object with that ID:

```
uart:~$ mcc ots_select 0x107
Selecting object succeeded
```

Read the object's metadata:

```
uart:~$ mcc ots_read_metadata
Reading object metadata succeeded
<inf> bt_mcc: Object's meta data:
<inf> bt_mcc:  Current size :35
<inf> bt_ots:  --- Displaying 1 metadata records ---
<inf> bt_ots:  Object ID: 0x000000000107
<inf> bt_ots:  Object name: Joe Pass - Guitar Inte
<inf> bt_ots:  Object Current Size: 35
<inf> bt_ots:  Object Allocate Size: 35
<inf> bt_ots:  Type: Group Obj Type
<inf> bt_ots:  Properties:0x4
<inf> bt_ots:   - read permitted
```

Read the object itself:

The object received is a group object. It consists of a series of records consisting of a type (track or group) and an object ID.
uart:~$ mcc ots_read_current_group_object
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000102
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000103
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000104
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000105
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x000000000106

Search  The search control point takes as its input a sequence of search control items, each consisting of length, type (e.g. track name or artist name) and parameter (the track name or artist name to search for). If the result is successful, the search results are stored in an object in the object transfer service. The ID of the search results ID object can be read from the search results object ID characteristic. The search result object can then be downloaded as for the current group object above. (Note that the search results object ID is empty until a search has been done.)

This implementation has a working implementation of the search functionality interface and the server-side search control point parameter parsing. But the actual searching is faked, the same results are returned no matter what is searched for.

There are two commands for search, one (mcc set_scp_raw) allows to input the search control point parameter (the sequence of search control items) as a string. The other (mcc set_scp_iop) does preset IOP test searches and takes the round number of the IOP search control point test as a parameter.

Before the search, the search results object ID is empty

uart:~$ mcc read_search_results_obj_id
Search Results Object ID: 0x000000000000
<dbg> bt_mcc.mcc_read_search_results_obj_id_cb: Zero-length Search Results Object ID

Run the search corresponding to the fourth round of the IOP test:

The search control point parameter generated by this command and parameter has one search control item. The length field (first octet) is 16 (0x10). (The length of the length field itself is not included.) The type field (second octet) is 0x04 (search for a group name). The parameter (the group name to search for) is “TSPX_Group_Name”.

uart:~$ mcc set_scp_iop 4
Search string:
00000000: 10 04 54 53 50 4f 75 70 5f 4e 61 6d |...TSPX_G roup_Nam|
00000010: 65 |e |
Search control point notification result code: 1
Search Results Object ID: 0x000000000107
Search Control Point set

After the successful search, the search results object ID has a value:

uart:~$ mcc read_search_results_obj_id
Search Results Object ID: 0x000000000107

Media Control Service (MCS)  The media control service (mcs) and the associated media player (mpl) typically reside on devices that can provide access to, and serve, media content, like PCs and smartphones.

As mentioned above, the media player (mpl) has the player logic, while the media control service (mcs) has the GATT-based interface. This separation is done so that the media player can also be used without the GATT-based interface.
Using the media control service and the media player  
The media control service and the media player are in general controlled remotely, from the media control client.

Before use, the media control client must be initialized by the command mpl init.

As for the client, the bt commands are used for connecting - bt init followed by bt connect <address> <address type> (or bt advertise on if the server is advertising).

Example Usage

Setup

uart:~$ bt init
Bluetooth initialized

uart:~$ mpl init
[Large amounts of debug output]

uart:~$ bt connect F9:33:3B:67:D2:A7 (random)
Connection pending
Connected: F9:33:3B:67:D2:A7 (random)

When connected  
Control is done from the client.

The server will give debug output related to the various operations performed by the client.

Example: Debug output by the server when the client gives the “next track” command:

```
[00:13:29.932,373] <dbg> bt_mcs.control_point_write: Opcode: 49
[00:13:29.932,403] <dbg> bt_mpl.paused_state_operation_handler: Operation opcode: 49
[00:13:29.932,495] <dbg> bt_mpl.do_next_track: Track ID before: 0x000000000104
[00:13:29.932,586] <dbg> bt_mpl.do_next_track: Track ID after: 0x000000000105
[00:13:29.932,617] <dbg> bt_mcs.mpl_track_changed_cb: Notifying track change
[00:13:29.932,800] <dbg> bt_mcs.mpl_track_duration_cb: Notifying track duration: 13500
[00:13:29.932,861] <dbg> bt_mcs.mpl_track_position_cb: Notifying track position: 0
[00:13:29.933,044] <dbg> bt_mcs.mpl_current_track_id_cb: Notifying current track ID: → 0x000000000105
[00:13:29.933,258] <dbg> bt_mcs.mpl_next_track_id_cb: Notifying next track ID: → 0x000000000106
[00:13:29.933,380] <dbg> bt_mcs.mpl_operation_cb: Notifying control point - opcode: → 49, result: 1
```

Some server commands are available. These commands force notifications of the various characteristics, for testing that the client receives notifications. The values sent in the notifications caused by these testing commands are independent of the media player, so they do not correspond the actual values of the characteristics nor to the actual state of the media player.

Example: Force (fake value) notification of the track duration:

```
uart:~$ mpl duration_changed_cb
[00:15:17.491,058] <dbg> bt_mcs.mpl_track_duration_cb: Notifying track duration: 12000
```
6.2 Networking

The networking section contains information regarding the network stack of the Zephyr kernel. Use the information to understand the principles behind the operation of the stacks and how they were implemented.

6.2.1 Overview

- **Supported Features**
- **Source Tree Layout**

Supported Features

The networking IP stack is modular and highly configurable via build-time configuration options. You can minimize system memory consumption by enabling only those network features required by your application. Almost all features can be disabled if not needed.

- **IPv6** The support for IPv6 is enabled by default. Various IPv6 sub-options can be enabled or disabled depending on networking needs.
  - The IPv6 address for the device can be set either statically or dynamically using SLAAC (Stateless Address Auto Configuration) (RFC 4862).
  - DHCP (Dynamic Host Configuration Protocol) client is supported (RFC 2131).
  - The IPv4 address can also be configured manually. Static IPv4 addresses are supported by default.

- **IPv4** The legacy IPv4 is supported by the networking stack. It cannot be used by IEEE 802.15.4 or Bluetooth IPSP as those network technologies support only IPv6. IPv4 can be used in Ethernet based networks. By default IPv4 support is disabled.
  - The IPv4 address can also be configured manually. Static IPv4 addresses are supported by default.

- **Dual stack support.** The networking stack allows a developer to configure the system to use both IPv6 and IPv4 at the same time.

- **UDP** User Datagram Protocol (RFC 768) is supported. The developer can send UDP datagrams (client side support) or create a listener to receive UDP packets destined to certain port (server side support).

- **TCP** Transmission Control Protocol (RFC 793) is supported. Both server and client roles can be used the the application. The amount of TCP sockets that are available to applications can be configured at build time.

- **BSD Sockets API** Support for a subset of a BSD sockets compatible API is implemented. Both blocking and non-blocking datagram (UDP) and stream (TCP) sockets are supported.
• **Secure Sockets API** Experimental support for TLS/DTLS secure protocols and configuration options for sockets API. Secure functions for the implementation are provided by mbedTLS library.

• **MQTT** Message Queue Telemetry Transport (ISO/IEC PRF 20922) is supported. A sample mqtt-publisher-sample client application for MQTT v3.1.1 is implemented.

• **CoAP** Constrained Application Protocol (RFC 7252) is supported. Both coap-client-sample and coap-server-sample sample applications are implemented.

• **LWM2M** OMA Lightweight Machine-to-Machine Protocol (LwM2M specification 1.0.2) is supported via the “Bootstrap”, “Client Registration”, “Device Management & Service Enablement” and “Information Reporting” interfaces. The required core LwM2M objects are implemented as well as several IPSO Smart Objects. (LwM2M specification 1.1.1) is supported in similar manner when enabled with a Kconfig option. lwm2m-client-sample implements the library as an example.

• **DNS** Domain Name Service (RFC 1035) client functionality is supported. Applications can use the DNS API to query domain name information or IP addresses from the DNS server. Both IPv4 (A) and IPv6 (AAAA) records can be queried. Both multicast DNS (mDNS) (RFC 6762) and link-local multicast name resolution (LLMNR) (RFC 4795) are supported.

• **Network Management API**. Applications can use network management API to listen management events generated by core stack when for example IP address is added to the device, or network interface is coming up etc.

• **Multiple Network Technologies**. The Zephyr OS can be configured to support multiple network technologies at the same time simply by enabling them in Kconfig: for example, Ethernet and 802.15.4 support. Note that no automatic IP routing functionality is provided between these technologies. Applications can send data according to their needs to desired network interface.

• **Minimal Copy Network Buffer Management**. It is possible to have minimal copy network data path. This means that the system tries to avoid copying application data when it is sent to the network.

• **Virtual LAN support**. Virtual LANs (VLANs) allow partitioning of physical ethernet networks into logical networks. See [VLAN support](#) for more details.

• **Network traffic classification**. The sent and received network packets can be prioritized depending on application needs. See [traffic classification](#) for more details.

• **Time Sensitive Networking**. The gPTP (generalized Precision Time Protocol) is supported. See [gPTP support](#) for more details.

• **Network shell**. The network shell provides helpers for figuring out network status, enabling/disabling features, and issuing commands like ping or DNS resolving. The net-shell is useful when developing network software. See [network shell](#) for more details.

Additionally these network technologies (link layers) are supported in Zephyr OS v1.7 and later:

- IEEE 802.15.4
- Bluetooth
- Ethernet
- SLIP (IP over serial line). Used for testing with QEMU. It provides ethernet interface to host system (like Linux) and test applications can be run in Linux host and send network data to Zephyr OS device.

### Source Tree Layout

The networking stack source code tree is organized as follows:

```
subsys/net/ip/
```

This is where the IP stack code is located.
Zephyr Project Documentation, Release 3.2.99

subsys/net/12/

This is where the IP stack layer 2 code is located. This includes generic support for Bluetooth IPSP adaptation, Ethernet, IEEE 802.15.4 and Wi-Fi.

subsys/net/lib/

Application-level protocols (DNS, MQTT, etc.) and additional stack components (BSD Sockets, etc.).

include/net/

Public API header files. These are the header files applications need to include to use IP networking functionality.

samples/net/

Sample networking code. This is a good reference to get started with network application development.

tests/net/

Test applications. These applications are used to verify the functionality of the IP stack, but are not the best source for sample code (see samples/net instead).

6.2.2 Network Stack Architecture

Network Packet Processing Statistics

This page describes how to get information about network packet processing statistics inside network stack.

Network stack contains infrastructure to figure out how long the network packet processing takes either in sending or receiving path. There are two Kconfig options that control this. For transmit (TX) path the option is called `CONFIG_NET_PKT_TXTIME_STATS` and for receive (RX) path the options is called `CONFIG_NET_PKT_RXTIME_STATS`. Note that for TX, all kind of network packet statistics is collected. For RX, only UDP, TCP or raw packet type network packet statistics is collected.

After enabling these options, the `net stats` network shell command will show this information:

```
Avg TX net_pkt (11484) time 67 us
Avg RX net_pkt (11474) time 43 us
```

**Note:** The values above and below are from emulated qemu_x86 board and UDP traffic

The TX time tells how long it took for network packet from its creation to when it was sent to the network. The RX time tells the time from its creation to when it was passed to the application. The values are in microseconds. The statistics will be collected per traffic class if there are more than one transmit or receive queues defined in the system. These are controlled by `CONFIG_NET_TC_TX_COUNT` and `CONFIG_NET_TC_RX_COUNT` options.

If you enable `CONFIG_NET_PKT_TXTIME_STATS_DETAIL` or `CONFIG_NET_PKT_RXTIME_STATS_DETAIL` options, then additional information for TX or RX network packets are collected when the network packet traverses the IP stack.

After enabling these options, the `net stats` will show this information:

```
Avg TX net_pkt (18902) time 63 us [0->22->15->23=60 us]
Avg RX net_pkt (18892) time 42 us [0->9->6->11->13=39 us]
```

The numbers inside the brackets contain information how many microseconds it took for a network packet to go from previous state to next.

In the TX example above, the values are averages over 18902 packets and contain this information:

- Packet was created by application so the time is 0.
• Packet is about to be placed to transmit queue. The time it took from network packet creation to this state, is 22 microseconds in this example.

• The correct TX thread is invoked, and the packet is read from the transmit queue. It took 15 microseconds from previous state.

• The network packet was just sent and the network stack is about to free the network packet. It took 23 microseconds from previous state.

• In total it took on average 60 microseconds to get the network packet sent. The value 63 tells also the same information, but is calculated differently so there is slight difference because of rounding errors.

In the RX example above, the values are averages over 18892 packets and contain this information:

• Packet was created network device driver so the time is 0.

• Packet is about to be placed to receive queue. The time it took from network packet creation to this state, is 9 microseconds in this example.

• The correct RX thread is invoked, and the packet is read from the receive queue. It took 6 microseconds from previous state.

• The network packet is then processed and placed to correct socket queue. It took 11 microseconds from previous state.

• The last value tells how long it took from there to the application. Here the value is 13 microseconds.

• In total it took on average 39 microseconds to get the network packet sent. The value 42 tells also the same information, but is calculated differently so there is slight difference because of rounding errors.

The Zephyr network stack is a native network stack specifically designed for Zephyr OS. It consists of layers, each meant to provide certain services to other layers. Network stack functionality is highly configurable via Kconfig options.

- High level overview of the network stack
- Network data flow
  - Data receiving (RX)
  - Data sending (TX)
- Network packet processing statistics

High level overview of the network stack

The network stack is layered and consists of the following parts:

- **Network Application.** The network application can either use the provided application-level protocol libraries or access the **BSD socket API** directly to create a network connection, send or receive data, and close a connection. The application can also use the **network management API** to configure the network and set related parameters such as network link options, starting a scan (when applicable), listen network configuration events, etc. The **network interface API** can be used to set IP address to a network interface, taking the network interface down, etc.

- **Network Protocols.** This provides implementations for various protocols such as
  - Application-level network protocols like CoAP, LWM2M, and MQTT. See application protocols chapter for information about them.
  - Core network protocols like IPv6, IPv4, UDP, TCP, ICMPv4, and ICMPv6. You access these protocols by using the **BSD socket API**.
Network Application

Application Protocols
- CoAP
- LWM2M
- MQTT
- ...

Socket API

Network Protocols

- TCP
- IPv6
- IPv4
- ICMPv6
- ICMPv4

Network Interface Abstraction

L2 Network Technologies
- IPv6 Header Compression
- Ethernet
- 802.15.4
- Bluetooth
- CAN

Network Device Drivers
- Ethernet drivers
- 802.15.4 drivers
- Other drivers

Fig. 6.7: Network stack overview
• **Network Interface Abstraction.** This provides functionality that is common in all the network interfaces, such as setting network interface down, etc. There can be multiple network interfaces in the system. See [network interface overview](#) for more details.

• **L2 Network Technologies.** This provides a common API for sending and receiving data to and from an actual network device. See [L2 overview](#) for more details. These network technologies include Ethernet, IEEE 802.15.4, Bluetooth, CANBUS, etc. Some of these technologies support IPv6 header compression (6Lo), see RFC 6282 for details. For example ARP for IPv4 is done by the Ethernet component.

• **Network Device Drivers.** The actual low-level device drivers handle the physical sending or receiving of network packets.

**Network data flow**

An application typically consists of one or more *threads* that execute the application logic. When using the BSD socket API, the following things will happen.

**Data receiving (RX)**

1. A network data packet is received by a device driver.
2. The device driver allocates enough network buffers to store the received data. The network packet is placed in the proper RX queue (implemented by k_fifo). By default there is only one receive queue in the system, but it is possible to have up to 8 receive queues. These queues will process incoming packets with different priority. See Traffic Classification for more details. The receive queues also act as a way to separate the data processing pipeline (bottom-half) as the device driver is running in an interrupt context and it must do its processing as fast as possible.
3. The network packet is then passed to the correct L2 driver. The L2 driver can check if the packet is proper and modify it if needed, e.g. strip L2 header and frame check sequence, etc.
4. The packet is processed by a network interface. The network statistics are collected if enabled by CONFIG_NET_STATISTICS.
5. The packet is then passed to L3 processing. If the packet is IP based, then the L3 layer checks if the packet is a proper IPv6 or IPv4 packet.
6. A socket handler then finds an active socket to which the network packet belongs and puts it in a queue for that socket, in order to separate the networking code from the application. Typically the application is run in userspace context and the network stack is run in kernel context.
7. The application will then receive the data and can process it as needed. The application should have used the BSD socket API to create a socket that will receive the data.

**Data sending (TX)**

1. The application should use the BSD socket API when sending the data.
2. The application data is prepared for sending to kernel space and then copied to internal net_buf structures.
3. Depending on the socket type, a protocol header is added in front of the data. For example, if the socket is a UDP socket, then a UDP header is constructed and placed in front of the data.
4. An IP header is added to the network packet for a UDP or TCP packet.
5. The network stack will check that the network interface is properly set for the network packet, and also will make sure that the network interface is enabled before the data is queued to be sent.
6. The network packet is then classified and placed to the proper transmit queue (implemented by k_fifo). By default there is only one transmit queue in the system, but it is possible to have up to 8 transmit queues. These queues will process the sent packets with different priority. See Traffic
Packet received from the network

Allocate buffers and put packet to RX queue

Network packet passed to correct L2 driver, Ethernet headers stripped and packet checked

IPv4 headers parsed and stripped

UDP headers parsed and stripped. Packet added to socket queue

UDP packet retrieved from socket queue. Data copied into application buffers.

Recv returns

Fig. 6.8: Network RX data flow
Sending UDP packet

1. Application calls send() from socket API

2. Net_packet structure created, user data copied to it. Packet marshalled to kernel space

3. UDP protocol header is added in front of the data

4. IPv4 headers added in front

5. The network stack checks if interface is set up and enabled and sends the data

6. The network packet is classified and placed to proper transmit queue. Packet checked and L2 headers for the network packet are added.

7. Device driver retrieves packet from the FIFO and sends it to the network.

8. Data physically sent

Fig. 6.9: Network TX data flow
For more details. After the transmit packet classification, the packet is checked by the correct L2 layer module. The L2 module will do additional checks for the data and it will also create any L2 headers for the network packet. If everything is ok, the data is given to the network device driver to be sent out.

7. The device driver will send the packet to the network.

Note that in both the TX and RX data paths, the queues (kfifo’s) form separation points where data is passed from one thread to another. These threads might run in different contexts (kernel vs. userspace) and with different priorities.

Network packet processing statistics

See information about network processing statistics here.

6.2.3 Network Connectivity API

Applications should use the BSD socket API defined in include/zephyr/net/socket.h to create a connection, send or receive data, and close a connection. The same API can be used when working with UDP or TCP data. See BSD socket API for more details.

See sockets-echo-server-sample and sockets-echo-client-sample applications how to create a simple server or client BSD socket based application.

The legacy connectivity API in include/zephyr/net/net_context.h should not be used by applications.

6.2.4 Networking with the host system

Networking with native_posix board

- Prerequisites
- Basic Setup
  - Step 1 - Create Ethernet interface
  - Step 2 - Start app in native_posix board
  - Step 3 - Connect to console (optional)

This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in a native_posix board.

In this example, the sockets-echo-server-sample sample application from the Zephyr source distribution is run in native_posix board. The Zephyr native_posix board instance is connected to a Linux host using a tuntap device which is modeled in Linux as an Ethernet network interface.

Prerequisites  On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

  git clone https://github.com/zephyrproject-rtos/net-tools

Basic Setup  For the steps below, you will need three terminal windows:

  - Terminal #1 is terminal window with net-tools being the current directory (cd net-tools)
  - Terminal #2 is your usual Zephyr development terminal, with the Zephyr environment initialized.
• Terminal #3 is the console to the running Zephyr native_posix instance (optional).

**Step 1 - Create Ethernet interface**  Before starting native_posix with network emulation, a network interface should be created.
In terminal #1, type:

```
./net-setup.sh
```

You can tweak the behavior of the net-setup.sh script. See various options by running `net-setup.sh` like this:

```
./net-setup.sh --help
```

**Step 2 - Start app in native_posix board**  Build and start the echo_server sample application.
In terminal #2, type:

```
west build -b native_posix samples/net/sockets/echo_server
west build -t run
```

**Step 3 - Connect to console (optional)**  The console window should be launched automatically when the Zephyr instance is started but if it does not show up, you can manually connect to the console. The native_posix board will print a string like this when it starts:

```
UART connected to pseudotty: /dev/pts/5
```

You can manually connect to it like this:

```
screen /dev/pts/5
```

**Networking with QEMU Ethernet**

- **Prerequisites**
- **Basic Setup**
  - Step 1 - Create Ethernet interface
  - Step 2 - Start app in QEMU board

This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in QEMU.

In this example, the sockets-echo-server-sample sample application from the Zephyr source distribution is run in QEMU. The Zephyr instance is connected to a Linux host using a tuntap device which is modeled in Linux as an Ethernet network interface.

**Prerequisites**  On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```
Basic Setup  For the steps below, you will need two terminal windows:

- Terminal #1 is terminal window with net-tools being the current directory (cd net-tools)
- Terminal #2 is your usual Zephyr development terminal, with the Zephyr environment initialized.

When configuring the Zephyr instance, you must select the correct Ethernet driver for QEMU connectivity:

- For qemu_x86, select Intel(R) PRO/1000 Gigabit Ethernet driver Ethernet driver. Driver is called e1000 in Zephyr source tree.
- For qemu_cortex_m3, select TI Stellaris MCU family ethernet driver Ethernet driver. Driver is called stellaris in Zephyr source tree.
- For mps2_an385, select SMSC911x/9220 Ethernet driver Ethernet driver. Driver is called smsc911x in Zephyr source tree.

Step 1 - Create Ethernet interface  Before starting QEMU with network connectivity, a network interface should be created in the host system.

In terminal #1, type:

```bash
./net-setup.sh
```

You can tweak the behavior of the net-setup.sh script. See various options by running net-setup.sh like this:

```bash
./net-setup.sh --help
```

Step 2 - Start app in QEMU board  Build and start the sockets-echo-server-sample sample application. In this example, the qemu_x86 board is used.

In terminal #2, type:

```bash
west build -b qemu_x86 samples/net/sockets/echo_server -- -DOVERLAY_CONFIG=overlay-e1000.conf
west build -t run
```

Exit QEMU by pressing CTRL+A x.

Networking with QEMU

- Prerequisites
- Basic Setup
  - Step 1 - Create helper socket
  - Step 2 - Start TAP device routing daemon
  - Step 3 - Start app in QEMU
  - Step 4 - Run apps on host
  - Step 5 - Stop supporting daemons
- Setting up Zephyr and NAT/masquerading on host to access Internet
- Network connection between two QEMU VMs
  - Terminal #1:
This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in a QEMU virtual machine (built for Zephyr targets such as qemu_x86 and qemu_cortex_m3).

In this example, the sockets-echo-server-sample sample application from the Zephyr source distribution is run in QEMU. The QEMU instance is connected to a Linux host using a serial port, and SLIP is used to transfer data between the Zephyr application and Linux (over a chain of virtual connections).

Prerequisites
On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```bash
git clone https://github.com/zephyrproject-rtos/net-tools
cd net-tools
make
```

Note: If you get an error about AX_CHECK_COMPILE_FLAG, install package autoconf-archive package on Debian/Ubuntu.

Basic Setup
For the steps below, you will need at least 4 terminal windows:

- Terminal #1 is your usual Zephyr development terminal, with the Zephyr environment initialized.
- Terminals #2, #3, and #4 are terminal windows with net-tools being the current directory (cd net-tools)

Step 1 - Create helper socket
Before starting QEMU with network emulation, a Unix socket for the emulation should be created.

In terminal #2, type:

```
./loop-socat.sh
```

Step 2 - Start TAP device routing daemon
In terminal #3, type:

```
sudo ./loop-slip-tap.sh
```

For applications requiring DNS, you may need to restart the host's DNS server at this point, as described in Setting up Zephyr and NAT/masquerading on host to access Internet.

Step 3 - Start app in QEMU
Build and start the echo_server sample application.

In terminal #1, type:

```
w west build -b qemu_x86 samples/net/sockets/echo_server
west build -t run
```

If you see an error from QEMU about unix:/tmp/slip.sock, it means you missed Step 1 above.
Step 4 - Run apps on host  Now in terminal #4, you can run various tools to communicate with the application running in QEMU.

You can start with pings:

```
ping 192.0.2.1
ping6 2001:db8::1
```

You can use the netcat ("nc") utility, connecting using UDP:

```
echo foobar | nc -6 -u 2001:db8::1 4242
foobar
```

```
echo foobar | nc -u 192.0.2.1 4242
foobar
```

If echo_server is compiled with TCP support (now enabled by default for the echo_server sample, CONFIG_NET_TCP=y):

```
echo foobar | nc -6 -q2 2001:db8::1 4242
foobar
```

Note: Use Ctrl+C to exit.

You can also use the telnet command to achieve the above.

Step 5 - Stop supporting daemons  When you are finished with network testing using QEMU, you should stop any daemons or helpers started in the initial steps, to avoid possible networking or routing problems such as address conflicts in local network interfaces. For example, stop them if you switch from testing networking with QEMU to using real hardware, or to return your host laptop to normal Wi-Fi use.

To stop the daemons, press Ctrl+C in the corresponding terminal windows (you need to stop both loop-slip-tap.sh and loop-soeacat.sh).

Exit QEMU by pressing CTRL+A x.

Setting up Zephyr and NAT/masquerading on host to access Internet  To access the internet from a Zephyr application, some additional setup on the host may be required. This setup is common for both application running in QEMU and on real hardware, assuming that a development board is connected to the development host. If a board is connected to a dedicated router, it should not be needed.

To access the internet from a Zephyr application using IPv4, a gateway should be set via DHCP or configured manually. For applications using the “Settings” facility (with the config option CONFIG_NET_CONFIG_SETTINGS enabled), set the CONFIG_NET_CONFIG_MY_IPV4_GW option to the IP address of the gateway. For apps not using the “Settings” facility, set up the gateway by calling the net_if_ipv4_set_gw() at runtime.

To access the internet from a custom application running in QEMU, NAT (masquerading) should be set up for QEMU's source address. Assuming 192.0.2.1 is used, the following command should be run as root:

```
iptables -t nat -A POSTROUTING -j MASQUERADE -s 192.0.2.1
```

Additionally, IPv4 forwarding should be enabled on the host, and you may need to check that other firewall (iptables) rules don’t interfere with masquerading. To enable IPv4 forwarding the following command should be run as root:
sysctl -w net.ipv4.ip_forward=1

Some applications may also require a DNS server. A number of Zephyr-provided samples assume by default that the DNS server is available on the host (IP 192.0.2.2), which, in modern Linux distributions, usually runs at least a DNS proxy. When running with QEMU, it may be required to restart the host's DNS, so it can serve requests on the newly created TAP interface. For example, on Debian-based systems:

```
service dnsmasq restart
```

An alternative to relying on the host's DNS server is to use one in the network. For example, 8.8.8.8 is a publicly available DNS server. You can configure it using `CONFIG_DNS_SERVER1` option.

**Network connection between two QEMU VMs**  Unlike the VM-to-Host setup described above, VM-to-VM setup is automatic. For sample applications that support this mode (such as the `echo_server` and `echo_client` samples), you will need two terminal windows, set up for Zephyr development.

**Terminal #1:**
```
west build -b qemu_x86 samples/net/sockets/echo_server
```
This will start QEMU, waiting for a connection from a client QEMU.

**Terminal #2:**
```
west build -b qemu_x86 samples/net/sockets/echo_client
```
This will start a second QEMU instance, where you should see logging of data sent and received in both.

**Running multiple QEMU VMs of the same sample**  If you find yourself wanting to run multiple instances of the same Zephyr sample application, which do not need to talk to each other, use the `QEMU_INSTANCE` argument.

Start `socat` and `tunslip6` manually (instead of using the `loop-xxx.sh` scripts) for as many instances as you want. Use the following as a guide, replacing MAIN or OTHER.

**Terminal #1:**
```
socat PTY,link=/tmp/slip.devMAIN UNIX-LISTEN:/tmp/slip.sockMAIN
$ZEPHYR_BASE/../net-tools/tunslip6 -t tapMAIN -T -s /tmp/slip.devMAIN \ 2001:db8::1/64
# Now run Zephyr
make -Cbuild run QEMU_INSTANCE=MAIN
```

**Terminal #2:**
```
socat PTY,link=/tmp/slip.devOTHER UNIX-LISTEN:/tmp/slip.sockOTHER
$ZEPHYR_BASE/../net-tools/tunslip6 -t tapOTHER -T -s /tmp/slip.devOTHER \ 2001:db8::1/64
make -Cbuild run QEMU_INSTANCE=OTHER
```

**USB Device Networking**

6.2. Networking
This page describes how to set up networking between a Linux host and a Zephyr application running on USB supported devices.

The board is connected to Linux host using USB cable and provides an Ethernet interface to the host. The sockets-echo-server-sample application from the Zephyr source distribution is run on supported board. The board is connected to a Linux host using a USB cable providing an Ethernet interface to the host.

**Basic Setup**

To communicate with the Zephyr application over a newly created Ethernet interface, we need to assign IP addresses and set up a routing table for the Linux host. After plugging a USB cable from the board to the Linux host, the `cdc_ether` driver registers a new Ethernet device with a provided MAC address.

You can check that network device is created and MAC address assigned by running `dmesg` from the Linux host.

```
cdc_ether 1-2.7:1.0 eth0: register 'cdc_ether' at usb-0000:00:01.2-2.7, CDC Ethernet
Device, 00:00:5e:00:53:01
```

We need to set it up and assign IP addresses as explained in the following section.

**Choosing IP addresses**

To establish network connection to the board we need to choose IP address for the interface on the Linux host.

It make sense to choose addresses in the same subnet we have in Zephyr application. IP addresses usually set in the project configuration files and may be checked also from the shell with following commands. Connect a serial console program (such as puTTY) to the board, and enter this command to the Zephyr shell:

```
shell> net iface
```

```
Interface 0xa800e580 (Ethernet)
===============================
Link addr : 00:00:5E:00:53:00
MTU : 1500
IPv6 unicast addresses (max 2):
    fe80::200:5eff:fe00:5300 autoconf preferred infinite
    2001:db8::1 manual preferred infinite
...
IPv4 unicast addresses (max 1):
    192.0.2.1 manual preferred infinite
```

This command shows that one IPv4 address and two IPv6 addresses have been assigned to the board. We can use either IPv4 or IPv6 for network connection depending on the board network configuration.

Next step is to assign IP addresses to the new Linux host interface, in the following steps `enx000005e005301` is the name of the interface on my Linux system.

**Setting IPv4 address and routing**
Networking with QEMU User

- **Introduction**  SLIRP is a network backend which provides the complete TCP/IP stack within QEMU and uses that stack to implement a virtual NAT’d network. As there are no dependencies on the host, SLIRP is simple to setup.

By default, QEMU uses the 10.0.2.X/24 network and runs a gateway at 10.0.2.2. All traffic intended for the host network has to travel through this gateway, which will filter out packets based on the QEMU command line parameters. This gateway also functions as a DHCP server for all GOS, allowing them to be automatically assigned with an IP address starting from 10.0.2.15.

More details about User Networking can be obtained from here: [https://wiki.qemu.org/Documentation/Networking#User_Networking._28SLIRP.29](https://wiki.qemu.org/Documentation/Networking#User_Networking._28SLIRP.29)

- **Using SLIRP with Zephyr**  In order to use SLIRP with Zephyr, the user has to set the Kconfig option to enable User Networking.

  `CONFIG_NET_QEMU_USER=y`

Once this configuration option is enabled, all QEMU launches will use SLIRP. In the default configuration, Zephyr only enables User Networking, and does not pass any arguments to it. This means that the Guest will only be able to communicate to the QEMU gateway, and any data intended for the host machine will be dropped by QEMU.

In general, QEMU User Networking can take in a lot of arguments including,
• Information about host/guest port forwarding. This must be provided to create a communication channel between the guest and host.

• Information about network to use. This may be valuable if the user does not want to use the default 10.0.2.X network.

• Tell QEMU to start DHCP server at user-defined IP address.

• ID and other information.

As this information varies with every use case, it is difficult to come up with good defaults that work for all. Therefore, Zephyr Implementation offloads this to the user, and expects that they will provide arguments based on requirements. For this, there is a Kconfig string which can be populated by the user.

```
CONFIG_NET_QEMU_USER_EXTRA_ARGS="net=192.168.0.0/24,hostfwd=tcp::8080-:8080"
```

This option is appended as-is to the QEMU command line. Therefore, any problems with this command line will be reported by QEMU only. Here's what this particular example will do,

• Make QEMU use the 192.168.0.0/24 network instead of the default.

• Enable forwarding of any TCP data received from port 8080 of host to port 8080 of guest, and vice versa.

Limitations

If the user does not have any specific networking requirements other than the ability to access a web page from the guest, user networking (slirp) is a good choice. However, it has several limitations

• There is a lot of overhead so the performance is poor.

• The guest is not directly accessible from the host or the external network.

• In general, ICMP traffic does not work (so you cannot use ping within a guest).

• As port mappings need to be defined before launching qemu, clients which use dynamically generated ports cannot communicate with external network.

• There is a bug in the SLIRP implementation which filters out all IPv6 packets from the guest. See https://bugs.launchpad.net/qemu/+bug/1724590 for details. Therefore, IPv6 will not work with User Networking.

Networking with multiple Zephyr instances

This page describes how to set up a virtual network between multiple Zephyr instances. The Zephyr instances could be running inside QEMU or could be native_posix board processes. The Linux host can be used to route network traffic between these systems.

Prerequisites

On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:
Basic Setup

For the steps below, you will need five terminal windows:

- Terminal #1 and #2 are terminal windows with net-tools being the current directory (cd net-tools)
- Terminal #3, where you setup bridging in Linux host
- Terminal #4 and #5 are your usual Zephyr development terminal, with the Zephyr environment initialized.

As there are multiple ways to setup the Zephyr network, the example below uses qemu_x86 board with e1000 Ethernet controller and native_posix board to simplify the setup instructions. You can use other QEMU boards and drivers if needed, see Networking with QEMU Ethernet for details. You can also use two or more native_posix board Zephyr instances and connect them together.

Step 1 - Create configuration files

Before starting QEMU with network connectivity, a network interfaces for each Zephyr instance should be created in the host system. The default setup for creating network interface cannot be used here as that is for connecting one Zephyr instance to Linux host.

For Zephyr instance #1, create file called zephyr1.conf to net-tools project, or to some other suitable directory.

```bash
# Configuration file for setting IP addresses for a network interface.
INTERFACE="$1"
HWADDR="00:00:5e:00:53:11"
IPV6_ADDR_1="2001:db8:100::2"
IPV6_ROUTE_1="2001:db8:100::/64"
IPV4_ADDR_1="198.51.100.2/24"
IPV4_ROUTE_1="198.51.100.0/24"

ip link set dev $INTERFACE up
ip link set dev $INTERFACE address $HWADDR
ip -6 address add $IPV6_ADDR_1 dev $INTERFACE nodad
ip -6 route add $IPV6_ROUTE_1 dev $INTERFACE
ip address add $IPV4_ADDR_1 dev $INTERFACE
ip route add $IPV4_ROUTE_1 dev $INTERFACE > /dev/null 2>&1
```

For Zephyr instance #2, create file called zephyr2.conf to net-tools project, or to some other suitable directory.

```bash
# Configuration file for setting IP addresses for a network interface.
INTERFACE="$1"
HWADDR="00:00:5e:00:53:22"
IPV6_ADDR_1="2001:db8:200::2"
IPV6_ROUTE_1="2001:db8:200::/64"
IPV4_ADDR_1="203.0.113.2/24"
IPV4_ROUTE_1="203.0.113.0/24"

ip link set dev $INTERFACE up
ip link set dev $INTERFACE address $HWADDR
ip -6 address add $IPV6_ADDR_1 dev $INTERFACE nodad
ip -6 route add $IPV6_ROUTE_1 dev $INTERFACE
ip address add $IPV4_ADDR_1 dev $INTERFACE
ip route add $IPV4_ROUTE_1 dev $INTERFACE > /dev/null 2>&1
```

Step 2 - Create Ethernet interfaces

The following net-setup.sh commands should be typed in net-tools directory (cd net-tools).
In terminal #1, type:

```
./net-setup.sh -c zephyr1.conf -i zeth.1
```

In terminal #2, type:

```
./net-setup.sh -c zephyr2.conf -i zeth.2
```

**Step 3 - Setup network bridging** In terminal #3, type:

```
sudo brctl addbr zeth-br
sudo brctl addif zeth-br zeth.1
sudo brctl addif zeth-br zeth.2
sudo ifconfig zeth-br up
```

**Step 4 - Start Zephyr instances** In this example we start sockets-echo-server-sample and sockets-echo-client-sample applications. You can use other applications too as needed.

In terminal #4, if you are using QEMU, type this:

```
west build -d build/server -b qemu_x86 -t run \
samples/net/sockets/echo_server -- \
-DOVERLAY_CONFIG=overlay-e1000.conf \
-DCONFIG_NET_CONFIG_MY_IPV4_ADDR="198.51.100.1" \
-DCONFIG_NET_CONFIG_PEER_IPV4_ADDR="203.0.113.1" \
-DCONFIG_NET_CONFIG_MY_IPV6_ADDR="2001:db8:100::1" \
-DCONFIG_NET_CONFIG_PEER_IPV6_ADDR="2001:db8:200::1" \
-DCONFIG_NET_CONFIG_MY_IPV4_GW="203.0.113.1" \
-DCONFIG_ETH_QEMU_IFACE_NAME="zeth.1" \
-DCONFIG_ETH_QEMU_EXTRA_ARGS="mac=00:00:5e:00:53:01"
```

or if you want to use native_posix board, type this:

```
west build -d build/server -b native_posix -t run \
samples/net/sockets/echo_server -- \
-DCONFIG_NET_CONFIG_MY_IPV4_ADDR="198.51.100.1" \
-DCONFIG_NET_CONFIG_PEER_IPV4_ADDR="203.0.113.1" \
-DCONFIG_NET_CONFIG_MY_IPV6_ADDR="2001:db8:100::1" \
-DCONFIG_NET_CONFIG_PEER_IPV6_ADDR="2001:db8:200::1" \
-DCONFIG_NET_CONFIG_MY_IPV4_GW="203.0.113.1" \
-DCONFIG_ETH_NATIVE_POSIX_DRV_NAME="zeth.1" \
-DCONFIG_ETH_NATIVE_POSIX_MAC_ADDR="00:00:5e:00:53:01" \
-DCONFIG_ETH_NATIVE_POSIX_RANDOM_MAC=n
```

In terminal #5, if you are using QEMU, type this:

```
west build -d build/client -b qemu_x86 -t run \
samples/net/sockets/echo_client -- \
-DOVERLAY_CONFIG=overlay-e1000.conf \
-DCONFIG_NET_CONFIG_MY_IPV4_ADDR="203.0.113.1" \
-DCONFIG_NET_CONFIG_PEER_IPV4_ADDR="198.51.100.1" \
-DCONFIG_NET_CONFIG_MY_IPV6_ADDR="2001:db8:200::1" \
-DCONFIG_NET_CONFIG_PEER_IPV6_ADDR="2001:db8:100::1" \
-DCONFIG_NET_CONFIG_MY_IPV4_GW="198.51.100.1" \
-DCONFIG_ETH_QEMU_IFACE_NAME="zeth.2" \
-DCONFIG_ETH_QEMU_EXTRA_ARGS="mac=00:00:5e:00:53:02"
```

or if you want to use native_posix board, type this:
Also if you have firewall enabled in your host, you need to allow traffic between zeth.1, zeth.2 and zeth-br interfaces.

Networking with QEMU and IEEE 802.15.4

Basic Setup

- Step 1 - Compile and start echo-server
- Step 2 - Compile and start echo-client

This page describes how to set up a virtual network between two QEMUs that are connected together via UART and are running IEEE 802.15.4 link layer between them. Note that this only works in Linux host.

Basic Setup

For the steps below, you will need two terminal windows:

- Terminal #1 is terminal window with echo-server Zephyr sample application.
- Terminal #2 is terminal window with echo-client Zephyr sample application.

If you want to capture the transferred network data, you must compile the monitor_15_4 program in net-tools directory.

Open a terminal window and type:

```bash
cd $ZEPHYR_BASE/../net-tools
make monitor_15_4
```

Step 1 - Compile and start echo-server

In terminal #1, type:

```bash
west build -b qemu_x86 -d build/server samples/net/sockets/echo_server -- -DOVERLAY_CONFIG=overlay-qemu_802154.conf
west build -t server -d build/server
```

If you want to capture the network traffic between the two QEMUs, type:

```bash
west build -b qemu_x86 -d build/server samples/net/sockets/echo_server -- -G'Unix Makefiles' -DOVERLAY_CONFIG=overlay-qemu_802154.conf -DPCAP=capture.pcap
west build -t server -d build/server
```

Note that the make must be used for server target if packet capture option is set in command line. The build/server/capture.pcap file will contain the transferred data.
Step 2 - Compile and start echo-client  

In terminal #2, type:

```
west build -b qemu_x86 -d build/client samples/net/sockets/echo_client -- -DOVERLAY_CONFIG=overlay-qemu_802154.conf
west build -t client -d build/client
```

You should see data passed between the two QEMUs. Exit QEMU by pressing CTRL+A x.

While developing networking software, it is usually necessary to connect and exchange data with the host system like a Linux desktop computer. Depending on what board is used for development, the following options are possible:

- **QEMU using SLIP (Serial Line Internet Protocol).**
  - Here IP packets are exchanged between Zephyr and the host system via serial port. This is the legacy way of transferring data. It is also quite slow so use it only when necessary. See [Networking with QEMU](#) for details.

- **QEMU using built-in Ethernet driver.**
  - Here IP packets are exchanged between Zephyr and the host system via QEMU’s built-in Ethernet driver. Not all QEMU boards support built-in Ethernet so in some cases, you might need to use the SLIP method for host connectivity. See [Networking with QEMU Ethernet](#) for details.

- **QEMU using SLIRP (Qemu User Networking).**
  - QEMU User Networking is implemented using “slirp”, which provides a full TCP/IP stack within QEMU and uses that stack to implement a virtual NAT’d network. As this support is built into QEMU, it can be used with any model and requires no admin privileges on the host machine, unlike TAP. However, it has several limitations including performance which makes it less valuable for practical purposes. See [Networking with QEMU User](#) for details.

- **native_posix board.**
  - The Zephyr instance can be executed as a user space process in the host system. This is the most convenient way to debug the Zephyr system as one can attach host debugger directly to the running Zephyr instance. This requires that there is an adaptation driver in Zephyr for interfacing with the host system. An Ethernet driver exists in Zephyr for this purpose. See [Networking with native_posix board](#) for details.

- **USB device networking.**
  - Here, the Zephyr instance is run on a real board and the connectivity to the host system is done via USB. See [USB Device Networking](#) for details.

- **Connecting multiple Zephyr instances together.**
  - If you have multiple Zephyr instances, either QEMU or native_posix ones, and want to create a connection between them, see [Networking with multiple Zephyr instances](#) for details.

- **Simulating IEEE 802.15.4 network between two QEMUs.**
  - Here, two Zephyr instances are running and there is IEEE 802.15.4 link layer run over an UART between them. See [Networking with QEMU and IEEE 802.15.4](#) for details.

### 6.2.5 Monitor Network Traffic

- **Host Configuration**
- **Zephyr Configuration**
- **Wireshark Configuration**
It is useful to be able to monitor the network traffic especially when debugging a connectivity issues or when developing new protocol support in Zephyr. This page describes how to set up a way to capture network traffic so that user is able to use Wireshark or similar tool in remote host to see the network packets sent or received by a Zephyr device.

See also the net-capture-sample sample application from the Zephyr source distribution for configuration options that need to be enabled.

**Host Configuration**

The instructions here describe how to setup a Linux host to capture Zephyr network RX and TX traffic. Similar instructions should work also in other operating systems. On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

The net-tools project provides a configure file to setup IP-to-IP tunnel interface so that we can transfer monitoring data from Zephyr to host.

In terminal #1, type:

```
./net-setup.sh -c zeth-tunnel.conf
```

This script will create following IPIP tunnel interfaces:

<table>
<thead>
<tr>
<th>Interface name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>zeth-ip6ip</td>
<td>IPv6-over-IPv4 tunnel</td>
</tr>
<tr>
<td>zeth-ipip</td>
<td>IPv4-over-IPv4 tunnel</td>
</tr>
<tr>
<td>zeth-ipip6</td>
<td>IPv4-over-IPv6 tunnel</td>
</tr>
<tr>
<td>zeth-ip6ip6</td>
<td>IPv6-over-IPv6 tunnel</td>
</tr>
</tbody>
</table>

Zephyr will send captured network packets to one of these interfaces. The actual interface will depend on how the capturing is configured. You can then use Wireshark to monitor the proper network interface.

After the tunneling interfaces have been created, you can use for example net-capture.py script from net-tools project to print or save the captured network packets. The net-capture.py provides an UDP listener, it can print the captured data to screen and optionally can also save the data to a pcap file.

```
$ ./net-capture.py -i zeth-ip6ip -w capture.pcap
```

The net-capture.py has following command line options:

```
Listen captured network data from Zephyr and save it optionally to pcap file.
./net-capture.py
   -i | --interface <network interface>
```

(continues on next page)
Listen this interface for the data

[-p | --port <UDP port>]
  UDP port (default is 4242) where the capture data is received
[-q | --quiet]
  Do not print packet information
[-t | --type <L2 type of the data>]
  Scapy L2 type name of the UDP payload, default is Ether
[-w | --write <pcap file name>]
  Write the received data to file in PCAP format

Instead of the net-capture.py script, you can for example use netcat to provide an UDP listener so that the host will not send port unreachable message to Zephyr:

nc -l -u 2001:db8:200::2 4242 > /dev/null

The IP address above is the inner tunnel endpoint, and can be changed and it depends on how the Zephyr is configured. Zephyr will send UDP packets containing the captured network packets to the configured IP tunnel, so we need to terminate the network connection like this.

Zephyr Configuration

In this example, we use native_posix board. You can also use any other board that supports networking. In terminal #3, type:

west build -b native_posix samples/net/capture -- -DCONFIG_NATIVE_UART_AUTOATTACH_DEFAULT_CMD="\"gnome-terminal -- screen %s\""

To see the Zephyr console and shell, start Zephyr instance like this:

build/zephyr/zephyr.exe -attach_uart

Any other application can be used too, just make sure that suitable configuration options are enabled (see samples/net/capture/prj.conf file for examples).

The network capture can be configured automatically if needed, but currently the capture sample application does not do that. User has to use net-shell to setup and enable the monitoring.

The network packet monitoring needs to be setup first. The net-shell has net capture setup command for doing that. The command syntax is

net capture setup <remote-ip-addr> <local-ip-addr> <peer-ip-addr>
  <remote> is the (outer) endpoint IP address
  <local> is the (inner) local IP address
  <peer> is the (inner) peer IP address
Local and Peer IP addresses can have UDP port number in them (optional) like 198.0.51.2:9000 or [2001:db8:100::2]:4242

In Zephyr console, type:

net capture setup 192.0.2.2 2001:db8:200::1 2001:db8:200::2

This command will create the tunneling interface. The 192.0.2.2 is the remote host where the tunnel is terminated. The address is used to select the local network interface where the tunneling interface is attached to. The 2001:db8:200::1 tells the local IP address for the tunnel, the 2001:db8:200::2 is the peer IP address where the captured network packets are sent. The port numbers for UDP packet can be given in the setup command like this for IPv6-over-IPv4 tunnel
net capture setup 192.0.2.2 [2001:db8:200::1]:9999 [2001:db8:200::2]:9998

and like this for IPv4-over-IPv4 tunnel

net capture setup 192.0.2.2 198.51.100.1:9999 198.51.100.2:9998

If the port number is omitted, then 4242 UDP port is used as a default.

The current monitoring configuration can be checked like this:

```
uart:~$ net capture
Network packet capture disabled
```

```
Device | Capture | Tunnel | Local | Peer
-------|---------|--------|-------|--------
NET_CAPTURE0 | 1 | 1 | [2001:db8:200::1]:4242 | [2001:db8:200::2]:4242
```

which will print the current configuration. As we have not yet enabled monitoring, the Capture iface is not set.

Then we need to enable the network packet monitoring like this:

```
net capture enable 2
```

The 2 tells the network interface which traffic we want to capture. In this example, the 2 is the native_posix board Ethernet interface. Note that we send the network traffic to the same interface that we are monitoring in this example. The monitoring system avoids to capture already captured network traffic as that would lead to recursion. You can use net iface command to see what network interfaces are available. Note that you cannot capture traffic from the tunnel interface as that would cause recursion loop. The captured network traffic can be sent to some other network interface if configured so. Just set the <remote-ip-addr> option properly in net capture setup so that the IP tunnel is attached to desired network interface. The capture status can be checked again like this:

```
uart:~$ net capture
Network packet capture enabled
```

```
Device | Capture | Tunnel | Local | Peer
-------|---------|--------|-------|--------
NET_CAPTURE0 | 2 | 1 | [2001:db8:200::1]:4242 | [2001:db8:200::2]:4242
```

After enabling the monitoring, the system will send captured (either received or sent) network packets to the tunnel interface for further processing.

The monitoring can be disabled like this:

```
net capture disable
```

which will turn currently running monitoring off. The monitoring setup can be cleared like this:

```
net capture cleanup
```

It is not necessary to use net-shell for configuring the monitoring. The network capture API functions can be called by the application if needed.

**Wireshark Configuration**

The Wireshark tool can be used to monitor the captured network traffic in a useful way.

You can monitor either the tunnel interfaces or the zeth interface. In order to see the actual captured data inside an UDP packet, see Wireshark decapsulate UDP document for instructions.
6.2.6 Networking APIs

Network APIs

BSD Sockets

- **Overview**
- **Secure Sockets**
  - TLS credentials subsystem
  - Secure Socket Creation
  - Secure Sockets options
- **Socket offloading**
  - Offloaded socket creation
  - Dealing with multiple offloaded interfaces
- **API Reference**
  - BSD Sockets
  - TLS Credentials

**Overview**

Zephyr offers an implementation of a subset of the BSD Sockets API (a part of the POSIX standard). This API allows to reuse existing programming experience and port existing simple networking applications to Zephyr.

Here are the key requirements and concepts which governed BSD Sockets compatible API implementation for Zephyr:

- Has minimal overhead, similar to the requirement for other Zephyr subsystems.
- Is namespaced by default, to avoid name conflicts with well-known names like `close()`, which may be part of libc or other POSIX compatibility libraries. If enabled by `CONFIG_NET_SOCKETS_POSIX_NAMES`, it will also expose native POSIX names.

BSD Sockets compatible API is enabled using `CONFIG_NET_SOCKETS` config option and implements the following operations: `socket()`, `close()`, `recv()`, `recvfrom()`, `send()`, `sendto()`, `connect()`, `bind()`, `listen()`, `accept()`, `fcntl()` (to set non-blocking mode), `getsockopt()`, `setsockopt()`, `poll()`, `select()`, `getaddrinfo()`, `getnameinfo()`.

Based on the namespacing requirements above, these operations are by default exposed as functions with `zsock_` prefix, e.g. `zsock_socket()` and `zsock_close()`. If the config option `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined, all the functions will be also exposed as aliases without the prefix. This includes the functions like `close()` and `fcntl()` (which may conflict with functions in libc or other libraries, for example, with the filesystem libraries).

Another entailment of the design requirements above is that the Zephyr API aggressively employs the short-read/short-write property of the POSIX API whenever possible (to minimize complexity and overheads). POSIX allows for calls like `recv()` and `send()` to actually process (receive or send) less data than requested by the user (on `SOCK_STREAM` type sockets). For example, a call `recv(sock, 1000, 0)` may return 100, meaning that only 100 bytes were read (short read), and the application needs to retry call(s) to receive the remaining 900 bytes.

The BSD Sockets API uses file descriptors to represent sockets. File descriptors are small integers, consecutively assigned from zero, shared among sockets, files, special devices (like stdin/stdout), etc. Internally, there is a table mapping file descriptors to internal object pointers. The file descriptor table is used by the BSD Sockets API even if the rest of the POSIX subsystem (filesystem, stdin/stdout) is not enabled.
Secure Sockets  Zephyr provides an extension of standard POSIX socket API, allowing to create and configure sockets with TLS protocol types, facilitating secure communication. Secure functions for the implementation are provided by mbedTLS library. Secure sockets implementation allows use of both TLS and DTLS protocols with standard socket calls. See net_ip_protocol_secure type for supported secure protocol versions.

To enable secure sockets, set the CONFIG_NET_SOCKETS_SOCKOPT_TLS option. To enable DTLS support, use CONFIG_NET_SOCKETS_ENABLE_DTLS option.

TLS credentials subsystem  TLS credentials must be registered in the system before they can be used with secure sockets. See tls_credential_add() for more information.

When a specific TLS credential is registered in the system, it is assigned with numeric value of type sec_tag_t, called a tag. This value can be used later on to reference the credential during secure socket configuration with socket options.

The following TLS credential types can be registered in the system:

- TLS_CREDENTIAL_CA_CERTIFICATE
- TLS_CREDENTIAL_SERVER_CERTIFICATE
- TLS_CREDENTIAL_PRIVATE_KEY
- TLS_CREDENTIAL_PSK
- TLS_CREDENTIAL_PSK_ID

An example registration of CA certificate (provided in ca_certificate array) looks like this:

```c
ret = tls_credential_add(CA_CERTIFICATE_TAG, TLS_CREDENTIAL_CA_CERTIFICATE, ca_certificate, sizeof(ca_certificate));
```

By default certificates in DER format are supported. PEM support can be enabled in mbedTLS settings.

Secure Socket Creation  A secure socket can be created by specifying secure protocol type, for instance:

```c
sock = socket(AF_INET, SOCK_STREAM, IPPROTO_TLS_1_2);
```

Once created, it can be configured with socket options. For instance, the CA certificate and hostname can be set:

```c
sec_tag_t sec_tag_opt[] = {
    CA_CERTIFICATE_TAG,
};
ret = setsockopt(sock, SOL_TLS, TLS_SEC_TAG_LIST, sec_tag_opt, sizeof(sec_tag_opt));
char host[] = "google.com";
ret = setsockopt(sock, SOL_TLS, TLS_HOSTNAME, host, sizeof(host) - 1);
```

Once configured, socket can be used just like a regular TCP socket.

Several samples in Zephyr use secure sockets for communication. For a sample use see e.g. echo-server sample application or HTTP GET sample application.

Secure Sockets options  Secure sockets offer the following options for socket management:

```c
6.2. Networking 1763
```
Defines

**TLS_SEC_TAG_LIST**
Socket option to select TLS credentials to use. It accepts and returns an array of sec_tag_t that indicate which TLS credentials should be used with specific socket.

**TLS_HOSTNAME**
Write-only socket option to set hostname. It accepts a string containing the hostname (may be NULL to disable hostname verification). By default, hostname check is enforced for TLS clients.

**TLS_CIPHERSUITE_LIST**
Socket option to select ciphersuites to use. It accepts and returns an array of integers with IANA assigned ciphersuite identifiers. If not set, socket will allow all ciphersuites available in the system (mbedTLS default behavior).

**TLS_CIPHERSUITE_USED**
Read-only socket option to read a ciphersuite chosen during TLS handshake. It returns an integer containing an IANA assigned ciphersuite identifier of chosen ciphersuite.

**TLS_PEER_VERIFY**
Write-only socket option to set peer verification level for TLS connection. This option accepts an integer with a peer verification level, compatible with mbedTLS values:

- 0 - none
- 1 - optional
- 2 - required

If not set, socket will use mbedTLS defaults (none for servers, required for clients).

**TLS_DTLS_ROLE**
Write-only socket option to set role for DTLS connection. This option is irrelevant for TLS connections, as for them role is selected based on `connect()/listen()` usage. By default, DTLS will assume client role. This option accepts an integer with a TLS role, compatible with mbedTLS values:

- 0 - client
- 1 - server

**TLS_ALPN_LIST**
Socket option for setting the supported Application Layer Protocols. It accepts and returns a const char array of NULL terminated strings representing the supported application layer protocols listed during the TLS handshake.

**TLS_DTLS_HANDSHAKE_TIMEOUT_MIN**
Socket option to set DTLS handshake timeout. The timeout starts at min, and upon retransmission the timeout is doubled until max is reached. Min and max arguments are separate options. The time unit is ms.

**TLS_DTLS_HANDSHAKE_TIMEOUT_MAX**
**TLS_CERT_NOCOPY**

Socket option for preventing certificates from being copied to the mbedTLS heap if possible. The option is only effective for DER certificates and is ignored for PEM certificates.

**TLS_NATIVE**

TLS socket option to use with offloading. The option instructs the network stack only to offload underlying TCP/UDP communication. The TLS/DTLS operation is handled by a native TLS/DTLS socket implementation from Zephyr.

Note, that this option is only applicable if socket dispatcher is used (CONFIG_NET_SOCKETS_OFFLOAD_DISPATCHER is enabled). In such case, it should be the first socket option set on a newly created socket. After that, the application may use SO_BINDTODEVICE to choose the dedicated network interface for the underlying TCP/UDP socket.

**TLS_SESSION_CACHE**

Socket option to control TLS session caching on a socket. Accepted values:

- 0 - Disabled.
- 1 - Enabled.

**TLS_SESSION_CACHE_PURGE**

Write-only socket option to purge session cache immediately. This option accepts any value.

**Socket offloading**

Zephyr allows to register custom socket implementations (called offloaded sockets). This allows for seamless integration for devices which provide an external IP stack and expose socket-like API.

Socket offloading can be enabled with CONFIG_NET_SOCKETS_OFFLOAD option. A network driver that wants to register a new socket implementation should use NET_SOCKET_OFFLOAD_REGISTER macro. The macro accepts the following parameters:

- **socket_name** - an arbitrary name for the socket implementation.
- **prio** - socket implementation priority, the higher priority is, the earlier particular implementation is processed when creating a new socket. Lower numeric value indicate higher priority.
- **_family** - socket family implemented by the offloaded socket. AF_UNSPEC indicate any family.
- **_is_supported** - a filtering function, used to verify whether particular socket family, type and protocol are supported by the offloaded socket implementation.
- **_handler** - a function compatible with socket() API, used to create an offloaded socket.

Every offloaded socket implementation should also implement a set of socket APIs, specified in socket_op_vtable struct.

The function registered for socket creation should allocate a new file descriptor using z_reserve_fd() function. Any additional actions, specific to the creation of a particular offloaded socket implementation should take place after the file descriptor is allocated. As a final step, if the offloaded socket was created successfully, the file descriptor should be finalized with z_finalize_fd() function. The finalize function allows to register a socket_op_vtable structure implementing socket APIs for an offloaded socket along with an optional socket context data pointer.

Finally, when an offloaded network interface is initialized, it should indicate that the interface is offloaded with net_if_socket_offload_set() function. The function registers the function used to
create an offloaded socket (the same as the one provided in NET_SOCKET_OFFLOAD_REGISTER) at the network interface.

Offloaded socket creation When application creates a new socket with socket() function, the network stack iterates over all registered socket implementations (native and offloaded). Higher priority socket implementations are processed first. For each registered socket implementation, an address family is verified, and if it matches (or the socket was registered as AF_UNSPEC), the corresponding _is_supported function is called to verify the remaining socket parameters. The first implementation that fulfills the socket requirements (i.e. _is_supported returns true) will create a new socket with its _handler function.

The above indicates the importance of the socket priority. If multiple socket implementations support the same set of socket family/type/protocol, the first implementation processed by the system will create a socket. Therefore it’s important to give the highest priority to the implementation that should be the system default.

The socket priority for native socket implementation is configured with Kconfig. Use CONFIG_NET_SOCKETS_TLS_PRIORITY to set the priority for the native TLS sockets. Use CONFIG_NET_SOCKETS_PRIORITY_DEFAULT to set the priority for the remaining native sockets.

Dealing with multiple offloaded interfaces As the socket() function does not allow to specify which network interface should be used by a socket, it’s not possible to choose a specific implementation in case multiple offloaded socket implementations, supporting the same type of sockets, are available. The same problem arises when both native and offloaded sockets are available in the system.

To address this problem, a special socket implementation (called socket dispatcher) was introduced. The sole reason for this module is to postpone the socket creation for until the first operation on a socket is performed. This leaves an opening to use SO_BINDTODEVICE socket option, to bind a socket to a particular network interface (and thus offloaded socket implementation). The socket dispatcher can be enabled with CONFIG_NET_SOCKETS_OFFLOAD_DISPATCHER Kconfig option.

When enabled, the application can specify the network interface to use with setsockopt() function:

```c
/* A "dispatcher" socket is created */
sock = socket(AF_INET, SOCK_DGRAM, IPPROTO_UDP);

struct ifreq ifreq = {
    .ifr_name = "SimpleLink"
};

/* The socket is "dispatched" to a particular network interface */
/* (offloaded or not). */
setsockopt(sock, SOL_SOCKET, SO_BINDTODEVICE, &ifreq, sizeof(ifreq));
```

Similarly, if TLS is supported by both native and offloaded sockets, TLS_NATIVE socket option can be used to indicate that a native TLS socket should be created. The underlying socket can then be bound to a particular network interface:

```c
/* A "dispatcher" socket is created */
sock = socket(AF_INET, SOCK_STREAM, IPPROTO_TLS_1_2);

int tls_native = 1;

/* The socket is "dispatched" to a native TLS socket implementation. */
/* The underlying socket is a "dispatcher" socket now. */
setsockopt(sock, SOL_TLS, TLS_NATIVE, &tls_native, sizeof(tls_native));
```
(continues on next page)
struct ifreq ifreq = {
    .ifr_name = "SimpleLink"
};

/* The underlying socket is "dispatched" to a particular network interface
 * (offloaded or not).
 */
setsockopt(sock, SOL_SOCKET, SO_BINDTODEVICE, &ifreq, sizeof(ifreq));

In case no SO_BINDTODEVICE socket option is used on a socket, the socket will be dispatched according to the default priority and filtering rules on a first socket API call.

API Reference

BSD Sockets

group bsd_sockets
    BSD Sockets compatible API.

Defines

ZSOCK_POLLIN
    zsock_poll: Poll for readability

ZSOCK_POLLPRI
    zsock_poll: Compatibility value, ignored

ZSOCK_POLLOUT
    zsock_poll: Poll for writability

ZSOCK_POLLErr
    zsock_poll: Poll results in error condition (output value only)

ZSOCK_POLLHUP
    zsock_poll: Poll detected closed connection (output value only)

ZSOCK_POLLNVAL
    zsock_poll: Invalid socket (output value only)

ZSOCK_MSG_PEEK
    zsock_recv: Read data without removing it from socket input queue

ZSOCK_MSG_TRUNC
    zsock_recv: return the real length of the datagram, even when it was longer than the passed buffer

ZSOCK_MSG_DONTWAIT
    zsock_recv/zsock_send: Override operation to non-blocking

6.2. Networking
ZSOCK_MSG_WAITALL
    zsock_recv: block until the full amount of data can be returned

ZSOCK_SHUT_RD
    zsock_shutdown: Shut down for reading

ZSOCK_SHUT_WR
    zsock_shutdown: Shut down for writing

ZSOCK_SHUT_RDWR
    zsock_shutdown: Shut down for both reading and writing

SOL_TLS
    Protocol level for TLS. Here, the same socket protocol level for TLS as in Linux was used.

TLS_PIEER_VERIFY_NONE
    Peer verification disabled.

TLS_PIEER_VERIFY_OPTIONAL
    Peer verification optional.

TLS_PIEER_VERIFY_REQUIRED
    Peer verification required.

TLS_DTLS_ROLE_CLIENT
    Client role in a DTLS session.

TLS_DTLS_ROLE_SERVER
    Server role in a DTLS session.

TLS_CERT_NOCOPY_NONE
    Cert duplicated in heap

TLS_CERT_NOCOPY_OPTIONAL
    Cert not copied in heap if DER

TLS_SESSION_CACHE_DISABLED
    Disable TLS session caching.

TLS_SESSION_CACHE_ENABLED
    Enable TLS session caching.

AI_PASSIVE
    Address for bind() (vs for connect())

AI_CANONNAME
    Fill in ai_canonname
AI_NUMERICHOST
Assume host address is in numeric notation, don’t DNS lookup

AI_V4MAPPED
May return IPv4 mapped address for IPv6

AI_ALL
May return both native IPv6 and mapped IPv4 address for IPv6

AI_ADDRCONFIG
IPv4/IPv6 support depends on local system config

AI_NUMERICSERV
Assume service (port) is numeric

NI_NUMERICHOST
zsock_getnameinfo(): Resolve to numeric address.

NI_NUMERICSERV
zsock_getnameinfo(): Resolve to numeric port number.

NI_NOFQDN
zsock_getnameinfo(): Return only hostname instead of FQDN

NI_NAMEREQD
zsock_getnameinfo(): Dummy option for compatibility

NI_DGRAM
zsock_getnameinfo(): Dummy option for compatibility

NI_MAXHOST
zsock_getnameinfo(): Max supported hostname length

pollfd

cntl

addrinfo

POLLIN
POSIX wrapper for ZSOCK_POLLIN

POLLOUT
POSIX wrapper for ZSOCK_POLLOUT

POLLERR
POSIX wrapper for ZSOCK_POLLERR
POLLHUP
    POSIX wrapper for ZSOCK_POLLHUP

POLLNVAL
    POSIX wrapper for ZSOCK_POLLNVAL

MSG_PEEK
    POSIX wrapper for ZSOCK_MSG_PEEK

MSG_TRUNC
    POSIX wrapper for ZSOCK_MSG_TRUNC

MSG_DONTWAIT
    POSIX wrapper for ZSOCK_MSG_DONTWAIT

MSG_WAITALL
    POSIX wrapper for ZSOCK_MSG_WAITALL

SHUT_RD
    POSIX wrapper for ZSOCK_SHUT_RD

SHUT_WR
    POSIX wrapper for ZSOCK_SHUT_WR

SHUT_RDWR
    POSIX wrapper for ZSOCK_SHUT_RDWR

EAI_BADFLAGS
    POSIX wrapper for DNS_EAI_BADFLAGS

EAI_NONAME
    POSIX wrapper for DNS_EAI_NONAME

EAI_AGAIN
    POSIX wrapper for DNS_EAI_AGAIN

EAI_FAIL
    POSIX wrapper for DNS_EAI_FAIL

EAI_NODATA
    POSIX wrapper for DNS_EAI_NODATA

EAI_MEMORY
    POSIX wrapper for DNS_EAI_MEMORY

EAI_SYSTEM
    POSIX wrapper for DNS_EAI_SYSTEM
EAI_SERVICE
  POSIX wrapper for DNS_EAI_SERVICE

EAI_SOCKTYPE
  POSIX wrapper for DNS_EAI_SOCKTYPE

EAI_FAMILY
  POSIX wrapper for DNS_EAI_FAMILY

IFNAMSIZ

SOCKET
  sockopt: Socket-level option

SO_DEBUG
  sockopt: Recording debugging information (ignored, for compatibility)

SO_REUSEADDR
  sockopt: address reuse (ignored, for compatibility)

SO_TYPE
  sockopt: Type of the socket

SO_ERROR
  sockopt: Async error (ignored, for compatibility)

SO_DONTROUTE
  sockopt: Bypass normal routing and send directly to host (ignored, for compatibility)

SO.Broadcast
  sockopt: Transmission of broadcast messages is supported (ignored, for compatibility)

SO_SNDBUF
  sockopt: Size of socket socket send buffer (ignored, for compatibility)

SO_RCVBUF
  sockopt: Size of socket recv buffer

SO_KEEPALIVE
  sockopt: Enable sending keep-alive messages on connections (ignored, for compatibility)

SO_OOBINLINE
  sockopt: Place out-of-band data into receive stream (ignored, for compatibility)

SO_REUSEPORT
  sockopt: Allow multiple sockets to reuse a single port (ignored, for compatibility)

SO_RCVTIMEO
  sockopt: Receive timeout Applies to receive functions like recv(), but not to connect()
SO_SNDBUFFER
  sockopt: Send timeout

SO_BINDTODEVICE
  sockopt: Bind a socket to an interface

SO_ACCEPTCONN
  sockopt: Socket accepts incoming connections (ignored, for compatibility)

SO_TIMESTAMPING
  sockopt: Timestamp TX packets

SO_PROTOCOL
  sockopt: Protocol used with the socket

SO_DOMAIN
  sockopt: Domain used with SOCKET (ignored, for compatibility)

TCP_NODELAY
   End Socket options for SOL_SOCKET level sockopt: Disable TCP buffering (ignored, for compatibility)

IP_TOS
   sockopt: Set or receive the Type-Of-Service value for an outgoing packet.

IPV6_V6ONLY
   sockopt: Don't support IPv4 access (ignored, for compatibility)

IPV6_TCLASS
   sockopt: Set or receive the traffic class value for an outgoing packet.

SO_PRIORITY
   sockopt: Socket priority

SO_TXTIME
   sockopt: Socket TX time (when the data should be sent)

SCM_TXTIME

SO_SOCKS5
   sockopt: Enable SOCKS5 for Socket

ZSOCK_FD_SETSIZE
   Number of file descriptors which can be added to zsock_fd_set

fd_set

FD_SETSIZE
zsock_gettimeval

**Typedefs**

typedef struct _zsock_fd_set zsock_fd_set

**Functions**

void *zsock_get_context_object(int sock)

Obtain a file descriptor’s associated net context.

With CONFIG_USERSPACE enabled, the kernel’s object permission system must apply to socket file descriptors. When a socket is opened, by default only the caller has permission, access by other threads will fail unless they have been specifically granted permission.

This is achieved by tagging data structure definitions that implement the underlying object associated with a network socket file descriptor with ‘__net_socket’. All pointers to instances of these will be known to the kernel as kernel objects with type K_OBJ_NET_SOCKET.

This API is intended for threads that need to grant access to the object associated with a particular file descriptor to another thread. The returned pointer represents the underlying K_OBJ_NET_SOCKET and may be passed to APIs like k_object_access_grant().

In a system like Linux which has the notion of threads running in processes in a shared virtual address space, this sort of management is unnecessary as the scope of file descriptors is implemented at the process level.

However in Zephyr the file descriptor scope is global, and MPU-based systems are not able to implement a process-like model due to the lack of memory virtualization hardware. They use discrete object permissions and memory domains instead to define thread access scope.

User threads will have no direct access to the returned object and will fault if they try to access its memory; the pointer can only be used to make permission assignment calls, which follow exactly the rules for other kernel objects like device drivers and IPC.

**Parameters**

- *sock* – file descriptor

**Returns**

pointer to associated network socket object, or NULL if the file descriptor wasn’t valid or the caller had no access permission

int zsock_socket(int family, int type, int proto)

Create a network socket.

See POSIX.1-2017 article for normative description. This function is also exposed as socket() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

If CONFIG_USERSPACE is enabled, the caller will be granted access to the context object associated with the returned file descriptor.

**See also:**

zsock_get_context_object()

int zsock_socketpair(int family, int type, int proto, int *sv)

Create an unnamed pair of connected sockets.
See **POSIX.1-2017 article** for normative description. This function is also exposed as `socketpair()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
int zsock_close(int sock)
```

Close a network socket.

Close a network socket. This function is also exposed as `close()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined (in which case it may conflict with generic POSIX `close()` function).

```c
int zsock_shutdown(int sock, int how)
```

Shutdown socket send/receive operations.

See **POSIX.1-2017 article** for normative description, but currently this function has no effect in Zephyr and provided solely for compatibility with existing code. This function is also exposed as `shutdown()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
int zsock_bind(int sock, const struct sockaddr *addr, socklen_t addrlen)
```

Bind a socket to a local network address.

See **POSIX.1-2017 article** for normative description. This function is also exposed as `bind()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
int zsock_connect(int sock, const struct sockaddr *addr, socklen_t addrlen)
```

Connect a socket to a peer network address.

See **POSIX.1-2017 article** for normative description. This function is also exposed as `connect()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
int zsock_listen(int sock, int backlog)
```

Set up a STREAM socket to accept peer connections.

See **POSIX.1-2017 article** for normative description. This function is also exposed as `listen()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
int zsock_accept(int sock, struct sockaddr *addr, socklen_t *addrlen)
```

Accept a connection on listening socket.

See **POSIX.1-2017 article** for normative description. This function is also exposed as `accept()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
ssize_t zsock_sendto(int sock, const void *buf, size_t len, int flags, const struct sockaddr *dest_addr, socklen_t addrlen)
```

Send data to an arbitrary network address.

See **POSIX.1-2017 article** for normative description. This function is also exposed as `sendto()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
static inline ssize_t zsock_send(int sock, const void *buf, size_t len, int flags)
```

Send data to a connected peer.

See **POSIX.1-2017 article** for normative description. This function is also exposed as `send()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.
ssize_t zsock_sendmsg(int sock, const struct msghdr *msg, int flags)
Send data to an arbitrary network address.

See POSIX.1-2017 article for normative description. This function is also exposed as sendmsg() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

ssize_t zsock_recvfrom(int sock, void *buf, size_t max_len, int flags, struct sockaddr *src_addr, socklen_t *addrlen)
Receive data from an arbitrary network address.

See POSIX.1-2017 article for normative description. This function is also exposed as recvfrom() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline ssize_t zsock_recv(int sock, void *buf, size_t max_len, int flags)
Receive data from a connected peer.

See POSIX.1-2017 article for normative description. This function is also exposed as recv() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_fcntl(int sock, int cmd, int flags)
Control blocking/non-blocking mode of a socket.

This functions allow to (only) configure a socket for blocking or non-blocking operation (O_NONBLOCK). This function is also exposed as fcntl() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX fcntl() function).

int zsock_poll(struct zsock_pollfd *fds, int nfds, int timeout)
Efficiently poll multiple sockets for events.

See POSIX.1-2017 article for normative description. (In Zephyr this function works only with sockets, not arbitrary file descriptors.) This function is also exposed as poll() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX poll() function).

int zsock_getsockopt(int sock, int level, int optname, void *optval, socklen_t *optlen)
Get various socket options.

See POSIX.1-2017 article for normative description. In Zephyr this function supports a subset of socket options described by POSIX, but also some additional options available in Linux (some options are dummy and provided to ease porting of existing code). This function is also exposed as getsockopt() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_setsockopt(int sock, int level, int optname, const void *optval, socklen_t optlen)
Set various socket options.

See POSIX.1-2017 article for normative description. In Zephyr this function supports a subset of socket options described by POSIX, but also some additional options available in Linux (some options are dummy and provided to ease porting of existing code). This function is also exposed as setsockopt() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.
int zsock_getpeername(int sock, struct sockaddr *addr, socklen_t *addrlen)
    Get peer name.

See POSIX.1-2017 article for normative description. This function is also exposed as
getpeername() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getsockname(int sock, struct sockaddr *addr, socklen_t *addrlen)
    Get socket name.

See POSIX.1-2017 article for normative description. This function is also exposed as
getsockname() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_gethostname(char *buf, size_t len)
    Get local host name.

See POSIX.1-2017 article for normative description. This function is also exposed as
gethostname() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline char *zsock_inet_ntop(sa_family_t family, const void *src, char *dst, size_t size)
    Convert network address from internal to numeric ASCII form.

See POSIX.1-2017 article for normative description. This function is also exposed as
inet_ntop() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_inet_pton(sa_family_t family, const char *src, void *dst)
    Convert network address from numeric ASCII form to internal representation.

See POSIX.1-2017 article for normative description. This function is also exposed as
inet_pton() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getaddrinfo(const char *host, const char *service, const struct zsock_addrinfo *hints, struct zsock_addrinfo **res)
    Resolve a domain name to one or more network addresses.

See POSIX.1-2017 article for normative description. This function is also exposed as
getaddrinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

void zsock_freeaddrinfo(struct zsock_addrinfo *ai)
    Free results returned by zsock_getaddrinfo()}

See POSIX.1-2017 article for normative description. This function is also exposed as
freeaddrinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

const char *zsock_gai_strerror(int errcode)
    Convert zsock_getaddrinfo() error code to textual message.

See POSIX.1-2017 article for normative description. This function is also exposed as
gai_strerror() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.
int zsock_getnameinfo(const struct sockaddr *addr, socklen_t addrlen, char *host, socklen_t hostlen, char *serv, socklen_t servlen, int flags)

Resolve a network address to a domain name or ASCII address.

See POSIX.1-2017 article for normative description. This function is also exposed as getnameinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline int socket(int family, int type, int proto)
POSIX wrapper for zsock_socket

static inline int socketpair(int family, int type, int proto, int sv[2])
POSIX wrapper for zsock_socketpair

static inline int close(int sock)
POSIX wrapper for zsock_close

static inline int shutdown(int sock, int how)
POSIX wrapper for zsock_shutdown

static inline int bind(int sock, const struct sockaddr *addr, socklen_t addrlen)
POSIX wrapper for zsock_bind

static inline int connect(int sock, const struct sockaddr *addr, socklen_t addrlen)
POSIX wrapper for zsock_connect

static inline int listen(int sock, int backlog)
POSIX wrapper for zsock_listen

static inline int accept(int sock, struct sockaddr *addr, socklen_t *addrlen)
POSIX wrapper for zsock_accept

static inline ssize_t send(int sock, const void *buf, size_t len, int flags)
POSIX wrapper for zsock_send

static inline ssize_t recv(int sock, void *buf, size_t max_len, int flags)
POSIX wrapper for zsock_recv

static inline int zsock_fcntl_wrapper(int sock, int cmd, ...)
static inline int getsockname(int sock, struct sockaddr *addr, socklen_t *addrlen)
  POSIX wrapper for zsock_getsockname
static inline int getaddrinfo(const char *host, const char *service, const struct zsock_addrinfo *hints, struct zsock_addrinfo **res)
  POSIX wrapper for zsock_getaddrinfo
static inline void freeaddrinfo(struct zsock_addrinfo *ai)
  POSIX wrapper for zsock_freeaddrinfo
static inline const char *gai_strerror(int errcode)
  POSIX wrapper for zsock_gai_strerror
static inline int getnameinfo(const struct sockaddr *addr, socklen_t addrlen, char *host, socklen_t hostlen, char *serv, socklen_t servlen, int flags)
  POSIX wrapper for zsock_getnameinfo
static inline int gethostname(char *buf, size_t len)
  POSIX wrapper for zsock_gethostname
static inline int inet_pton(sa_family_t family, const char *src, void *dst)
  POSIX wrapper for zsock_inet_pton
static inline char *inet_ntop(sa_family_t family, const void *src, char *dst, size_t size)
  POSIX wrapper for zsock_inet_ntop
int zsock_select(int nfds, zsock_fd_set *readfds, zsock_fd_set *writefds, zsock_fd_set *exceptfds, struct zsock_timeval *timeout)
  Legacy function to poll multiple sockets for events.

See POSIX.1-2017 article for normative description. This function is provided to ease porting of existing code and not recommended for usage due to its inefficiency, use zsock_poll() instead. In Zephyr this function works only with sockets, not arbitrary file descriptors. This function is also exposed as select() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX select() function).

void ZSOCK_FD_ZERO(zsock_fd_set *set)
  Initialize (clear) fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as FD_ZERO() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int ZSOCK_FD_ISSET(int fd, zsock_fd_set *set)
  Check whether socket is a member of fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as FD_ISSET() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

void ZSOCK_FD_CLR(int fd, zsock_fd_set *set)
  Remove socket from fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as FD_CLR() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.
void ZSOCK_FD_SET(int fd, zsock_fd_set *set)
    Add socket to fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as FD_SET() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline int select(int nfds, zsock_fd_set *readfds, zsock_fd_set *writefds, zsock_fd_set *exceptfds, struct timeval *timeout)

static inline int FD_ZERO(zsock_fd_set *set)
static inline int FD_ISSET(int fd, zsock_fd_set *set)
static inline void FD_CLR(int fd, zsock_fd_set *set)
static inline void FD_SET(int fd, zsock_fd_set *set)

struct zsock_pollfd
    #include <socket.h>

struct zsock_addrinfo
    #include <socket.h>

struct ifreq
    #include <socket.h> Interface description structure

struct zsock_fd_set
    #include <socket_select.h>

TLS Credentials

group tls_credentials
    TLS credentials management.

Typedefs

typedef int sec_tag_t
    Secure tag, a reference to TLS credential
    Secure tag can be used to reference credential after it was registered in the system.

Note: Some TLS credentials come in pairs:
    • TLS_CREDENTIAL_SERVER_CERTIFICATE with TLS_CREDENTIAL_PRIVATE_KEY,
    • TLS_CREDENTIAL_PSK with TLS_CREDENTIAL_PSK_ID. Such pairs of credentials must be assigned the same secure tag to be correctly handled in the system.

Enums

6.2. Networking 1779
enum tls_credential_type
    TLS credential types

Values:

enumerator TLS_CREDENTIAL_NONE
    Unspecified credential.

enumerator TLS_CREDENTIAL_CA_CERTIFICATE
    A trusted CA certificate. Use this to authenticate remote servers. Used with certificate-based ciphersuites.

enumerator TLS_CREDENTIAL_SERVER_CERTIFICATE
    A public server certificate. Use this to register your own server certificate. Should be registered together with a corresponding private key. Used with certificate-based ciphersuites.

enumerator TLS_CREDENTIAL_PRIVATE_KEY
    Private key. Should be registered together with a corresponding public certificate. Used with certificate-based ciphersuites.

enumerator TLS_CREDENTIAL_PSK
    Pre-shared key. Should be registered together with a corresponding PSK identity. Used with PSK-based ciphersuites.

enumerator TLS_CREDENTIAL_PSK_ID
    Pre-shared key identity. Should be registered together with a corresponding PSK. Used with PSK-based ciphersuites.

Functions

int tls_credential_add(sec_tag_t tag, enum tls_credential_type type, const void *cred, size_t credlen)

Add a TLS credential.

This function adds a TLS credential, that can be used by TLS/DTLS for authentication.

Parameters

- tag – A security tag that credential will be referenced with.
- type – A TLS/DTLS credential type.
- cred – A TLS/DTLS credential.
- credlen – A TLS/DTLS credential length.

Return values

- 0 – TLS credential successfully added.
- -EACCES – Access to the TLS credential subsystem was denied.
- -ENOMEM – Not enough memory to add new TLS credential.
- -EEXIST – TLS credential of specific tag and type already exists.
int tls_credential_get (sec_tag_t tag, enum tls_credential_type type, void *cred, size_t *credlen)

Get a TLS credential.

This function gets an already registered TLS credential, referenced by tag secure tag of type.

Parameters
• tag – A security tag of requested credential.
• type – A TLS/DTLS credential type of requested credential.
• cred – A buffer for TLS/DTLS credential.
• credlen – A buffer size on input. TLS/DTLS credential length on output.

Return values
• 0 – TLS credential successfully obtained.
• -EACCES – Access to the TLS credential subsystem was denied.
• -ENOENT – Requested TLS credential was not found.
• -EFBIG – Requested TLS credential does not fit in the buffer provided.

int tls_credential_delete (sec_tag_t tag, enum tls_credential_type type)

Delete a TLS credential.

This function removes a TLS credential, referenced by tag secure tag of type.

Parameters
• tag – A security tag corresponding to removed credential.
• type – A TLS/DTLS credential type of removed credential.

Return values
• 0 – TLS credential successfully deleted.
• -EACCES – Access to the TLS credential subsystem was denied.
• -ENOENT – Requested TLS credential was not found.

IPv4/IPv6 Primitives and Helpers

- Overview
- API Reference

Overview  Miscellaneous defines and helper functions for IP addresses and IP protocols.

API Reference

group ip_4_6
IPv4/IPv6 primitives and helpers.

Defines

PF_UNSPEC
Unspecified protocol family.
PF_INET
   IP protocol family version 4.

PF_INET6
   IP protocol family version 6.

PF_PACKET
   Packet family.

PF_CAN
   Controller Area Network.

PF_NET_MGMT
   Network management info.

PF_LOCAL
   Inter-process communication

PF_UNIX
   Inter-process communication

AF_UNSPEC
   Unspecified address family.

AF_INET
   IP protocol family version 4.

AF_INET6
   IP protocol family version 6.

AF_PACKET
   Packet family.

AF_CAN
   Controller Area Network.

AF_NET_MGMT
   Network management info.

AF_LOCAL
   Inter-process communication

AF_UNIX
   Inter-process communication

ntohs(x)
   Convert 16-bit value from network to host byte order.

Parameters
   • x – The network byte order value to convert.
Returns
   Host byte order value.

\texttt{ntohl(x)}
   Convert 32-bit value from network to host byte order.

\textbf{Parameters}
   \begin{itemize}
   \item \texttt{x} – The network byte order value to convert.
   \end{itemize}

\textbf{Returns}
   Host byte order value.

\texttt{ntohl1(x)}
   Convert 64-bit value from network to host byte order.

\textbf{Parameters}
   \begin{itemize}
   \item \texttt{x} – The network byte order value to convert.
   \end{itemize}

\textbf{Returns}
   Host byte order value.

\texttt{htons(x)}
   Convert 16-bit value from host to network byte order.

\textbf{Parameters}
   \begin{itemize}
   \item \texttt{x} – The host byte order value to convert.
   \end{itemize}

\textbf{Returns}
   Network byte order value.

\texttt{htonl(x)}
   Convert 32-bit value from host to network byte order.

\textbf{Parameters}
   \begin{itemize}
   \item \texttt{x} – The host byte order value to convert.
   \end{itemize}

\textbf{Returns}
   Network byte order value.

\texttt{htonll(x)}
   Convert 64-bit value from host to network byte order.

\textbf{Parameters}
   \begin{itemize}
   \item \texttt{x} – The host byte order value to convert.
   \end{itemize}

\textbf{Returns}
   Network byte order value.

\texttt{NET_IPV6_ADDR_SIZE}

\texttt{NET_IPV4_ADDR_SIZE}

\texttt{ALIGN_H(x)}

\texttt{ALIGN_D(x)}

\texttt{CMSG_FIRSTHDR(msghdr)}

\texttt{CMSG_NXTHDR(msghdr, cmsg)}

\texttt{CMSG_DATA(cmsg)}
CMSG_SPACE(length)
CMSG_LEN(length)

INET_ADDRSTRLEN
Max length of the IPv4 address as a string. Defined by POSIX.

INET6_ADDRSTRLEN
Max length of the IPv6 address as a string. Takes into account possible mapped IPv4 addresses.

NET_MAX_PRIORITIES

net_ipaddr_copy(dest, src)
Copy an IPv4 or IPv6 address.

Parameters
• dest – Destination IP address.
• src – Source IP address.

Returns
Destination address.

Typedefs

typedef unsigned short int sa_family_t
Socket address family type

typedef size_t socklen_t
Length of a socket address

Enums
enum net_ip_protocol
Protocol numbers from IANA/BSD

Values:

enumerator IPPROTO_IP = 0
IP protocol (pseudo-val for setsockopt())

enumerator IPPROTO_ICMP = 1
ICMP protocol

enumerator IPPROTO_IGMP = 2
IGMP protocol

enumerator IPPROTO_IPIP = 4
IPIP tunnels
enumerator IPPROTO_TCP = 6
TCP protocol

enumerator IPPROTO_UDP = 17
UDP protocol

enumerator IPPROTO_IPV6 = 41
IPv6 protocol

enumerator IPPROTO_ICMPV6 = 58
ICMPv6 protocol

enumerator IPPROTO_RAW = 255
RAW IP packets

enum net_ip_protocol_secure
Protocol numbers for TLS protocols
Values:

enumerator IPPROTO_TLS_1_0 = 256
TLS 1.0 protocol

enumerator IPPROTO_TLS_1_1 = 257
TLS 1.1 protocol

enumerator IPPROTO_TLS_1_2 = 258
TLS 1.2 protocol

enumerator IPPROTO_DTLS_1_0 = 272
DTLS 1.0 protocol

enumerator IPPROTO_DTLS_1_2 = 273
DTLS 1.2 protocol

enum net_sock_type
Socket type
Values:

enumerator SOCK_STREAM = 1
Stream socket type

enumerator SOCK_DGRAM
Datagram socket type

enumerator SOCK_RAW
RAW socket type
enum net_ip_mtu
{
    Values:

    enumerator NET_IPV6_MTU = 1280
    IPv6 MTU length. We must be able to receive this size IPv6 packet without fragmentation.

    enumerator NET_IPV4_MTU = 576
    IPv4 MTU length. We must be able to receive this size IPv4 packet without fragmentation.
}

enum net_priority

Network packet priority settings described in IEEE 802.1Q Annex I.1

Values:

enumerator NET_PRIORITY_BK = 1
    Background (lowest)

enumerator NET_PRIORITY_BE = 0
    Best effort (default)

enumerator NET_PRIORITY_EE = 2
    Excellent effort

enumerator NET_PRIORITY_CA = 3
    Critical applications (highest)

enumerator NET_PRIORITY_VI = 4
    Video, < 100 ms latency and jitter

enumerator NET_PRIORITY_VO = 5
    Voice, < 10 ms latency and jitter

enumerator NET_PRIORITY_IC = 6
    Internetwork control

enumerator NET_PRIORITY_NC = 7
    Network control

enum net_addr_state

What is the current state of the network address

Values:

enumerator NET_ADDR_ANY_STATE = -1
    Default (invalid) address type

enumerator NET_ADDR_TENTATIVE = 0
    Tentative address
enumerator NET_ADDR_PREFERRED
   Preferred address

enumerator NET_ADDR_DEPRECATED
   Deprecated address

enum net_addr_type
   How the network address is assigned to network interface
   Values:

   enumerator NET_ADDR_ANY = 0
      Default value. This is not a valid value.

   enumerator NET_ADDR_AUTOCONF
      Auto configured address

   enumerator NET_ADDR_DHCP
      Address is from DHCP

   enumerator NET_ADDR_MANUAL
      Manually set address

   enumerator NET_ADDR_OVERRIDABLE
      Manually set address which is overridable by DHCP

Functions

static inline bool net_ipv6_is_addr_loopback(struct in6_addr *addr)
   Check if the IPv6 address is a loopback address (::1).
   Parameters
   • addr – IPv6 address
   Returns
   True if address is a loopback address, False otherwise.

static inline bool net_ipv6_is_addr_mcast(const struct in6_addr *addr)
   Check if the IPv6 address is a multicast address.
   Parameters
   • addr – IPv6 address
   Returns
   True if address is a multicast address, False otherwise.

struct net_if_addr *net_if_ipv6_addr_lookup(const struct in6_addr *addr, struct net_if **iface)

static inline bool net_ipv6_is_my_addr(struct in6_addr *addr)
   Check if IPv6 address is found in one of the network interfaces.
   Parameters
   • addr – IPv6 address
Returns
True if address was found, False otherwise.

```c
struct net_if_mcast_addr *net_if_ipv6_maddr_lookup(const struct in6_addr *addr, struct net_if **iface)
```

static inline bool net_ipv6_is_my_maddr(struct in6_addr *maddr)
Check if IPv6 multicast address is found in one of the network interfaces.

Parameters
• maddr – Multicast IPv6 address

Returns
True if address was found, False otherwise.

```c
static inline bool net_ipv6_is_prefix(const uint8_t *addr1, const uint8_t *addr2, uint8_t length)
```

Check if two IPv6 addresses are same when compared after prefix mask.

Parameters
• addr1 – First IPv6 address.
• addr2 – Second IPv6 address.
• length – Prefix length (max length is 128).

Returns
True if IPv6 prefixes are the same, False otherwise.

```c
static inline bool net_ipv4_is_addr_loopback(struct in_addr *addr)
```
Check if the IPv4 address is a loopback address (127.0.0.0/8).

Parameters
• addr – IPv4 address

Returns
True if address is a loopback address, False otherwise.

```c
static inline bool net_ipv4_is_addr_unspecified(const struct in_addr *addr)
```
Check if the IPv4 address is unspecified (all bits zero)

Parameters
• addr – IPv4 address

Returns
True if the address is unspecified, false otherwise.

```c
static inline bool net_ipv4_is_addr_mcast(const struct in_addr *addr)
```
Check if the IPv4 address is a multicast address.

Parameters
• addr – IPv4 address

Returns
True if address is multicast address, False otherwise.

```c
static inline bool net_ipv4_is_ll_addr(const struct in_addr *addr)
```
Check if the given IPv4 address is a link local address.

Parameters
• addr – A valid pointer on an IPv4 address

Returns
True if it is, false otherwise.
static inline void net_ipv4_addr_copy_raw(uint8_t *dest, const uint8_t *src)
Copy an IPv4 address raw buffer.

Parameters
• dest – Destination IP address.
• src – Source IP address.

static inline void net_ipv6_addr_copy_raw(uint8_t *dest, const uint8_t *src)
Copy an IPv6 address raw buffer.

Parameters
• dest – Destination IP address.
• src – Source IP address.

static inline bool net_ipv4_addr_cmp(const struct in_addr *addr1, const struct in_addr *addr2)
Compare two IPv4 addresses.

Parameters
• addr1 – Pointer to IPv4 address.
• addr2 – Pointer to IPv4 address.

Returns
True if the addresses are the same, false otherwise.

static inline bool net_ipv4_addr_cmp_raw(const uint8_t *addr1, const uint8_t *addr2)
Compare two raw IPv4 address buffers.

Parameters
• addr1 – Pointer to IPv4 address buffer.
• addr2 – Pointer to IPv4 address buffer.

Returns
True if the addresses are the same, false otherwise.

static inline bool net_ipv6_addr_cmp(const struct in6_addr *addr1, const struct in6_addr *addr2)
Compare two IPv6 addresses.

Parameters
• addr1 – Pointer to IPv6 address.
• addr2 – Pointer to IPv6 address.

Returns
True if the addresses are the same, false otherwise.

static inline bool net_ipv6_addr_cmp_raw(const uint8_t *addr1, const uint8_t *addr2)
Compare two raw IPv6 address buffers.

Parameters
• addr1 – Pointer to IPv6 address buffer.
• addr2 – Pointer to IPv6 address buffer.

Returns
True if the addresses are the same, false otherwise.
static inline bool net_ipv6_is_ll_addr(const struct in6_addr *addr)
Check if the given IPv6 address is a link local address.

Parameters
  • addr – A valid pointer on an IPv6 address

Returns
  True if it is, false otherwise.

static inline bool net_ipv6_is_ula_addr(const struct in6_addr *addr)
Check if the given IPv6 address is a unique local address.

Parameters
  • addr – A valid pointer on an IPv6 address

Returns
  True if it is, false otherwise.

const struct in6_addr *net_ipv6_unspecified_address(void)
Return pointer to any (all bits zeros) IPv6 address.

Returns
  Any IPv6 address.

const struct in_addr *net_ipv4_unspecified_address(void)
Return pointer to any (all bits zeros) IPv4 address.

Returns
  Any IPv4 address.

const struct in_addr *net_ipv4_broadcast_address(void)
Return pointer to broadcast (all bits ones) IPv4 address.

Returns
  Broadcast IPv4 address.

bool net_if_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
static inline bool net_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
Check if the given address belongs to same subnet that has been configured for the interface.

Parameters
  • iface – A valid pointer on an interface
  • addr – IPv4 address

Returns
  True if address is in same subnet, false otherwise.

bool net_if_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
static inline bool net_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
Check if the given IPv4 address is a broadcast address.

Parameters
  • iface – Interface to use. Must be a valid pointer to an interface.
  • addr – IPv4 address

Returns
  True if address is a broadcast address, false otherwise.

struct net_if_addr *net_if_ipv4_addr_lookup(const struct in_addr *addr, struct net_if **iface)
static inline bool net_ipv4_is_my_addr(const struct in_addr *addr)
  Check if the IPv4 address is assigned to any network interface in the system.

Parameters
  • addr – A valid pointer on an IPv4 address

Returns
  True if IPv4 address is found in one of the network interfaces, False otherwise.

static inline bool net_ipv6_is_addr_unspecified(const struct in6_addr *addr)
  Check if the IPv6 address is unspecified (all bits zero)

Parameters
  • addr – IPv6 address.

Returns
  True if the address is unspecified, false otherwise.

static inline bool net_ipv6_is_addr_solicited_node(const struct in6_addr *addr)
  Check if the IPv6 address is solicited node multicast address FF02:0:0:0:0:1:FFXX:XXXX defined in RFC 3513.

Parameters
  • addr – IPv6 address.

Returns
  True if the address is solicited node address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_scope(const struct in6_addr *addr, int scope)
  Check if the IPv6 address is a given scope multicast address (FFyx::).

Parameters
  • addr – IPv6 address
  • scope – Scope to check

Returns
  True if the address is in given scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_global(const struct in6_addr *addr)
  Check if the IPv6 address is a global multicast address (FFxE::/16).

Parameters
  • addr – IPv6 address.

Returns
  True if the address is global multicast address, false otherwise.
static inline bool net_ipv6_is_addr_mcast_iface(const struct in6_addr *addr)
Check if the IPv6 address is a interface scope multicast address (FFx1::).

Parameters
- addr – IPv6 address.

Returns
True if the address is a interface scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_link(const struct in6_addr *addr)
Check if the IPv6 address is a link local scope multicast address (FFx2::).

Parameters
- addr – IPv6 address.

Returns
True if the address is a link local scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_mesh(const struct in6_addr *addr)
Check if the IPv6 address is a mesh-local scope multicast address (FFx3::).

Parameters
- addr – IPv6 address.

Returns
True if the address is a mesh-local scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_site(const struct in6_addr *addr)
Check if the IPv6 address is a site scope multicast address (FFx5::).

Parameters
- addr – IPv6 address.

Returns
True if the address is a site scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_org(const struct in6_addr *addr)
Check if the IPv6 address is an organization scope multicast address (FFx8::).

Parameters
- addr – IPv6 address.

Returns
True if the address is an organization scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_group(const struct in6_addr *addr, const struct in6_addr *group)
Check if the IPv6 address belongs to certain multicast group.

Parameters
- addr – IPv6 address.
- group – Group id IPv6 address, the values must be in network byte order

Returns
True if the IPv6 multicast address belongs to given multicast group, false otherwise.

static inline bool net_ipv6_is_addr_mcast_all_nodes_group(const struct in6_addr *addr)
Check if the IPv6 address belongs to the all nodes multicast group.

Parameters
- addr – IPv6 address

Chapter 6. Connectivity
Returns
True if the IPv6 multicast address belongs to the all nodes multicast group, false otherwise.

static inline bool net_ipv6_is_addr_mcast_iface_all_nodes(const struct in6_addr *addr)
Check if the IPv6 address is a interface scope all nodes multicast address (FF01::1).

Parameters
• addr – IPv6 address.

Returns
True if the address is a interface scope all nodes multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_link_all_nodes(const struct in6_addr *addr)
Check if the IPv6 address is a link local scope all nodes multicast address (FF02::1).

Parameters
• addr – IPv6 address.

Returns
True if the address is a link local scope all nodes multicast address, false otherwise.

static inline void net_ipv6_addr_create_solicited_node(const struct in6_addr *src, struct in6_addr *dst)
Create solicited node IPv6 multicast address FF02:0:0:0:1:FFXX:XXXX defined in RFC 3513.

Parameters
• src – IPv6 address.
• dst – IPv6 address.

static inline void net_ipv6_addr_create(struct in6_addr *addr, uint16_t addr0, uint16_t addr1,
                           uint16_t addr2, uint16_t addr3, uint16_t addr4,
                           uint16_t addr5, uint16_t addr6, uint16_t addr7)
Construct an IPv6 address from eight 16-bit words.

Parameters
• addr – IPv6 address
• addr0 – 16-bit word which is part of the address
• addr1 – 16-bit word which is part of the address
• addr2 – 16-bit word which is part of the address
• addr3 – 16-bit word which is part of the address
• addr4 – 16-bit word which is part of the address
• addr5 – 16-bit word which is part of the address
• addr6 – 16-bit word which is part of the address
• addr7 – 16-bit word which is part of the address

static inline void net_ipv6_addr_create_ll_allnodes_mcast(struct in6_addr *addr)
Create link local allnodes multicast IPv6 address.

Parameters
• addr – IPv6 address
static inline void net_ipv6_addr_create_ll_allrouters_mcast(struct in6_addr *addr)
Create link local allrouters multicast IPv6 address.

Parameters
• addr – IPv6 address

static inline void net_ipv6_addr_create_iid(struct in6_addr *addr, struct net_linkaddr *lladdr)
Create IPv6 address interface identifier.

Parameters
• addr – IPv6 address
• lladdr – Link local address

static inline bool net_ipv6_addr_based_on_ll(const struct in6_addr *addr, const struct net_linkaddr *lladdr)
Check if given address is based on link layer address.

Returns
True if it is, False otherwise

static inline struct sockaddr_in6 *net_sin6(const struct sockaddr *addr)
Get sockaddr_in6 from sockaddr. This is a helper so that the code calling this function can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to IPv6 socket address

static inline struct sockaddr_in *net_sin(const struct sockaddr *addr)
Get sockaddr_in from sockaddr. This is a helper so that the code calling this function can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to IPv4 socket address

static inline struct sockaddr_in6_ptr *net_sin6_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_in6_ptr from sockaddr_ptr. This is a helper so that the code calling this function can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to IPv6 socket address

static inline struct sockaddr_in_ptr *net_sin_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_in_ptr from sockaddr_ptr. This is a helper so that the code calling this function can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to IPv4 socket address
static inline struct sockaddr_ll_ptr *net_sll_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_ll_ptr from sockaddr_ptr. This is a helper so that the code calling this function can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to link layer socket address

static inline struct sockaddr_can_ptr *net_can_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_can_ptr from sockaddr_ptr. This is a helper so that the code needing this functionality can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to CAN socket address

int net_addr_pton(sa_family_t family, const char *src, void *dst)
Convert a string to IP address.

Parameters
• family – IP address family (AF_INET or AF_INET6)
• src – IP address in a null terminated string
• dst – Pointer to struct in_addr if family is AF_INET or pointer to struct in6_addr if family is AF_INET6

Returns
0 if ok, < 0 if error

char *net_addr_ntop(sa_family_t family, const void *src, char *dst, size_t size)
Convert IP address to string form.

Parameters
• family – IP address family (AF_INET or AF_INET6)
• src – Pointer to struct in_addr if family is AF_INET or pointer to struct in6_addr if family is AF_INET6
• dst – Buffer for IP address as a null terminated string
• size – Number of bytes available in the buffer

Returns
dst pointer if ok, NULL if error

bool net_ipaddr_parse(const char *str, size_t str_len, struct sockaddr *addr)
Parse a string that contains either IPv4 or IPv6 address and optional port, and store the information in user supplied sockaddr struct.

Syntax of the IP address string: 192.0.2.1:80 192.0.2.42 [2001:db8::2] 2001:db::42 Note that the str_len parameter is used to restrict the amount of characters that are checked. If the string does not contain port number, then the port number in sockaddr is not modified.
Parameters

- `str` – String that contains the IP address.
- `str_len` – Length of the string to be parsed.
- `addr` – Pointer to user supplied struct sockaddr.

Returns

True if parsing could be done, false otherwise.

static inline int32_t net_tcp_seq_cmp(uint32_t seq1, uint32_t seq2)

Compare TCP sequence numbers.

This function compares TCP sequence numbers, accounting for wraparound effects.

Parameters

- `seq1` – First sequence number
- `seq2` – Seconds sequence number

Returns

< 0 if seq1 < seq2, 0 if seq1 == seq2, > 0 if seq > seq2

static inline bool net_tcp_seq_greater(uint32_t seq1, uint32_t seq2)

Check that one TCP sequence number is greater.

This is convenience function on top of `net_tcp_seq_cmp()`.

Parameters

- `seq1` – First sequence number
- `seq2` – Seconds sequence number

Returns

True if seq > seq2

int net_bytes_from_str(uint8_t *buf, int buf_len, const char *src)

Convert a string of hex values to array of bytes.

The syntax of the string is “ab:02:98:fa:42:01”

Parameters

- `buf` – Pointer to memory where the bytes are written.
- `buf_len` – Length of the memory area.
- `src` – String of bytes.

Returns

0 if ok, <0 if error

int net_tx_priority2tc(enum net_priority prio)

Convert Tx network packet priority to traffic class so we can place the packet into correct Tx queue.

Parameters

- `prio` – Network priority

Returns

Tx traffic class that handles that priority network traffic.

int net_rx_priority2tc(enum net_priority prio)

Convert Rx network packet priority to traffic class so we can place the packet into correct Rx queue.

Parameters
• prio – Network priority

**Returns**
Rx traffic class that handles that priority network traffic.

static inline enum *net_priority* net_vlan2priority(uint8_t priority)
Convert network packet VLAN priority to network packet priority so we can place the packet into correct queue.

**Parameters**
• priority – VLAN priority

**Returns**
Network priority

static inline uint8_t net_priority2vlan(enum *net_priority* priority)
Convert network packet priority to network packet VLAN priority.

**Parameters**
• priority – Packet priority

**Returns**
VLAN priority (PCP)

const char *net_family2str(sa_family_t family)
Return network address family value as a string. This is only usable for debugging.

**Parameters**
• family – Network address family code

**Returns**
Network address family as a string, or NULL if family is unknown.

struct in6_addr

#include <net_ip.h> IPv6 address struct

struct in_addr

#include <net_ip.h> IPv4 address struct

struct sockaddr_in6

#include <net_ip.h> Socket address struct for IPv6.

struct sockaddr_in6_ptr

#include <net_ip.h>

struct sockaddr_in

#include <net_ip.h> Socket address struct for IPv4.

struct sockaddr_in_ptr

#include <net_ip.h>

struct sockaddr_ll

#include <net_ip.h> Socket address struct for packet socket.

struct sockaddr_ll_ptr

#include <net_ip.h>
struct sockaddr_can_ptr
    #include <net_ip.h>

struct iovec
    #include <net_ip.h>

struct msghdr
    #include <net_ip.h>

struct cmsghdr
    #include <net_ip.h>

struct sockaddr
    #include <net_ip.h> Generic sockaddr struct. Must be cast to proper type.

struct net_tuple
    #include <net_ip.h> IPv6/IPv4 network connection tuple

Public Members

struct net_addr *remote_addr
    IPv6/IPv4 remote address

struct net_addr *local_addr
    IPv6/IPv4 local address

uint16_t remote_port
    UDP/TCP remote port

uint16_t local_port
    UDP/TCP local port

enum net_ip_protocol ip_proto
    IP protocol

DNS Resolve

Overview The DNS resolver implements a basic DNS resolver according to IETF RFC1035 on Domain Implementation and Specification. Supported DNS answers are IPv4/IPv6 addresses and CNAME. If a CNAME is received, the DNS resolver will create another DNS query. The number of additional queries is controlled by the CONFIG_DNS_RESOLVER_ADDITIONAL_QUERIES Kconfig variable.
The multicast DNS (mDNS) client resolver support can be enabled by setting `CONFIG_MDNS_RESOLVER` Kconfig option. See IETF RFC6762 for more details about mDNS.

The link-local multicast name resolution (LLMNR) client resolver support can be enabled by setting the `CONFIG_LLMNR_RESOLVER` Kconfig variable. See IETF RFC4795 for more details about LLMNR.

For more information about DNS configuration variables, see: `subsys/net/lib/dns/Kconfig`. The DNS resolver API can be found at `include/zephyr/net/dns_resolve.h`.

**Sample usage**  See DNS resolve sample application for details.

**API Reference**

```
group dns_resolve
  DNS resolving library.

  Defines

  DNS_MAX_NAME_SIZE
      Max size of the resolved name.

  Typedefs

  typedef void (*dns_resolve_cb_t)(enum dns_resolve_status status, struct dns_addrinfo *info, void *user_data)
      DNS resolve callback.

      The DNS resolve callback is called after a successful DNS resolving. The resolver can call this
      callback multiple times, one for each resolved address.

      **Param status**
      The status of the query: DNS_EAI_INPROGRESS returned for each resolved address
      DNS_EAI_ALLDONE mark end of the resolving, info is set to NULL in this case
      DNS_EAI_CANCELED if the query was canceled manually or time-out
      happened DNS_EAI_FAIL if the name cannot be resolved by the server
      DNS_EAI_NODATA if there is no such name other values means that an error
      happened.

      **Param info**
      Query results are stored here.

      **Param user_data**
      The user data given in `dns_resolve_name()` call.

  Enums

  enum dns_query_type
      DNS query type enum

      **Values:**

      enumerator DNS_QUERY_TYPE_A = 1
      IPv4 query
```
enumerator DNS_QUERY_TYPE_AAAA = 28
IPv6 query

eenum dns_resolve_status
    Status values for the callback.
    Values:
        enumerator DNS_EAI_BADFLAGS = -1
            Invalid value for ai_flags field
        enumerator DNS_EAI_NONAME = -2
            NAME or SERVICE is unknown
        enumerator DNS_EAI_AGAIN = -3
            Temporary failure in name resolution
        enumerator DNS_EAI_FAIL = -4
            Non-recoverable failure in name resolution
        enumerator DNS_EAI_NODATA = -5
            No address associated with NAME
        enumerator DNS_EAI_FAMILY = -6
            ai_family not supported
        enumerator DNS_EAI_SOCKTYPE = -7

   enumerator DNS_RESOLVE_CONTEXT_DEACTIVATING
   
   enumerator DNS_RESOLVE_CONTEXT_INACTIVE

Functions

int dns_resolve_init(struct dns_resolve_context *ctx, const char *dns_servers_str[], const struct sockaddr *dns_servers_sa[])
   Init DNS resolving context.
   
   This function sets the DNS server address and initializes the DNS context that is used by the actual resolver. DNS server addresses can be specified either in textual form, or as struct sockaddr (or both). Note that the recommended way to resolve DNS names is to use the dns_get_addr_info() API. In that case user does not need to call dns_resolve_init() as the DNS servers are already setup by the system.

   Parameters

   • ctx – DNS context. If the context variable is allocated from the stack, then the variable needs to be valid for the whole duration of the resolving. Caller does not need to fill the variable beforehand or edit the context afterwards.

   • dns_servers_str – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4 : 10.0.9.1 IPv4 + port : 10.0.9.1:53 IPv6 : 2001:db8::22:42 IPv6 + port : [2001:db8::22:42]:53 IPv6

   • dns_servers_sa – DNS server addresses as struct sockaddr. The array is NULL terminated. Port numbers are optional in struct sockaddr, the default will be used if set to 0.

   Returns

   0 if ok, <0 if error.

int dns_resolve_close(struct dns_resolve_context *ctx)
   Close DNS resolving context.
   
   This releases DNS resolving context and marks the context unusable. Caller must call the dns_resolve_init() again to make context usable.

   Parameters

   • ctx – DNS context
Returns
0 if ok, <0 if error.

int dns_resolve_reconfigure(struct dns_resolve_context *ctx, const char *servers_str[], const struct sockaddr *servers_sa[])

Reconfigure DNS resolving context.
Reconfigures DNS context with new server list.

Parameters
• ctx – DNS context
• servers_str – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4 : 10.0.9.1 IPv4 + port : 10.0.9.1:5353 IPv6 : 2001:db8::22:42 IPv6 + port : [2001:db8::22:42]:5353
• servers_sa – DNS server addresses as struct sockaddr. The array is NULL terminated. Port numbers are optional in struct sockaddr, the default will be used if set to 0.

Returns
0 if ok, <0 if error.

int dns_resolve_cancel(struct dns_resolve_context *ctx, uint16_t dns_id)

Cancel a pending DNS query.
This releases DNS resources used by a pending query.

Parameters
• ctx – DNS context
• dns_id – DNS id of the pending query

Returns
0 if ok, <0 if error.

int dns_resolve_cancel_with_name(struct dns_resolve_context *ctx, uint16_t dns_id, const char *query_name, enum dns_query_type query_type)

Cancel a pending DNS query using id, name and type.
This releases DNS query using id, name and type.

Parameters
• ctx – DNS context
• dns_id – DNS id of the pending query
• query_name – Name of the resource we are trying to query (hostname)
• query_type – Type of the query (A or AAAA)

Returns
0 if ok, <0 if error.

int dns_resolve_name(struct dns_resolve_context *ctx, const char *query, enum dns_query_type type, uint16_t *dns_id, dns_resolve_cb_t cb, void *user_data, int32_t timeout)

Resolve DNS name.
This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response.

Parameters
• ctx – DNS context
• query – What the caller wants to resolve.
• type – What kind of data the caller wants to get.
• dns_id – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
• cb – Callback to call after the resolving has finished or timeout has happened.
• user_data – The user data.
• timeout – The timeout value for the query. Possible values: SYS_FOREVER_MS: the query is tried forever, user needs to cancel it manually if it takes too long time to finish >0: start the query and let the system timeout it after specified ms

Returns
0 if resolving was started ok, < 0 otherwise

Get default DNS context.

struct dns_resolve_context *dns_resolve_get_default(void)

The system level DNS context uses DNS servers that are defined in project config file. If no DNS servers are defined by the user, then resolving DNS names using default DNS context will do nothing. The configuration options are described in subsys/net/lib/dns/Kconfig file.

Returns
Default DNS context.

Get IP address info from DNS.

static inline int dns_get_addr_info(const char *query, enum dns_query_type type, uint16_t *dns_id, dns_resolve_cb_t cb, void *user_data, int32_t timeout)

Parameters
• query – What the caller wants to resolve.
• type – What kind of data the caller wants to get.
• dns_id – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
• cb – Callback to call after the resolving has finished or timeout has happened.
• user_data – The user data.
• timeout – The timeout value for the connection. Possible values: SYS_FOREVER_MS: the query is tried forever, user needs to cancel it manually if it takes too long time to finish >0: start the query and let the system timeout it after specified ms

Returns
0 if resolving was started ok, < 0 otherwise

Cancel a pending DNS query.

static inline int dns_cancel_addr_info(uint16_t dns_id)

Cancel a pending DNS query.

This releases DNS resources used by a pending query.
• dns_id – DNS id of the pending query

Returns
0 if ok, <0 if error.

struct dns_addrinfo
#include <dns_resolve.h> Address info struct is passed to callback that gets all the results.

struct dns_resolve_context
#include <dns_resolve.h> DNS resolve context structure.

Public Members

struct sockaddr dns_server
DNS server information

struct net_context *net_ctx
Connection to the DNS server

uint8_t is_mdns
Is this server mDNS one

uint8_t is_llmnr
Is this server LLMNR one

struct k_mutex lock
Prevent concurrent access

k_timeout_t buf_timeout
This timeout is also used when a buffer is required from the buffer pools.

enum dns_resolve_context_state state
Is this context in use

struct dns_pending_query
#include <dns_resolve.h> Result callbacks. We have multiple callbacks here so that it is possible to do multiple queries at the same time.
Contents of this structure can be inspected and changed only when the lock is held.

Public Members

struct k_work_delayable timer
Timeout timer

struct dns_resolve_context *ctx
Back pointer to ctx, needed in timeout handler
dnsResolveCb_t cb
   Result callback.
   A null value indicates the slot is not in use.

void *user_data
   User data

k_timeout_t timeout
   TX timeout

const char *query
   String containing the thing to resolve like www.example.com
   This is set to a non-null value when the query is started, and is not used thereafter.
   If the query completed at a point where the work item was still pending the pointer
   is cleared to indicate that the query is complete, but release of the query slot will be
   deferred until a request for a slot determines that the work item has been released.

dns_query_type query_type
   Query type

uint16_t id
   DNS id of this query

uint16_t query_hash
   Hash of the DNS name + query type we are querying. This hash is calculated so we
   can match the response that we are receiving. This is needed mainly for mDNS which
   is setting the DNS id to 0, which means that the id alone cannot be used to find correct
   pending query.

Network Management

- Overview
- Requesting a defined procedure
- Listening to network events
- Defining a network management procedure
- Signaling a network event
- API Reference

Overview  The Network Management APIs allow applications, as well as network layer code itself, to
call defined network routines at any level in the IP stack, or receive notifications on relevant network
events. For example, by using these APIs, application code can request a scan be done on a Wi-Fi- or
Bluetooth-based network interface, or request notification if a network interface IP address changes.

The Network Management API implementation is designed to save memory by eliminating code at
build time for management routines that are not used. Distinct and statically defined APIs for net-
work management procedures are not used. Instead, defined procedure handlers are registered by
using a `NET_MGMT_REGISTER_REQUEST_HANDLER` macro. Procedure requests are done through a single
`net_mgmt()` API that invokes the registered handler for the corresponding request.
The current implementation is experimental and may change and improve in future releases.

**Requesting a defined procedure** All network management requests are of the form `net_mgmt(mgmt_request, ...)`. The `mgmt_request` parameter is a bit mask that tells which stack layer is targeted, if a `net_if` object is implied, and the specific management procedure being requested. The available procedure requests depend on what has been implemented in the stack.

To avoid extra cost, all `net_mgmt()` calls are direct. Though this may change in a future release, it will not affect the users of this function.

**Listening to network events** You can receive notifications on network events by registering a callback function and specifying a set of events used to filter when your callback is invoked. The callback will have to be unique for a pair of layer and code, whereas on the command part it will be a mask of events.

Two functions are available, `net_mgmt_add_event_callback()` for registering the callback function, and `net_mgmt_del_event_callback()` for unregistering a callback. A helper function, `net_mgmt_init_event_callback()`, can be used to ease the initialization of the callback structure.

When an event occurs that matches a callback's event set, the associated callback function is invoked with the actual event code. This makes it possible for different events to be handled by the same callback function, if desired.

**Warning:** Event set filtering allows false positives for events that have the same layer and layer code. A callback handler function must check the event code (passed as an argument) against the specific network events it will handle, regardless of how many events were in the set passed to `net_mgmt_init_event_callback()`.

Note that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened. The callback handler function can be shared between different layer events.

(Warning: False positives can occur for events which have the same layer and layer code.)

An example follows.

```c
/*
 * Set of events to handle.
 * See e.g. include/net/net_event.h for some NET_EVENT_xxx values.
 */
#define EVENT_IFACE_SET  (NET_EVENT_IF_xxx | NET_EVENT_IF_yyy)
#define EVENT_IPV4_SET   (NET_EVENT_IPV4_xxx | NET_EVENT_IPV4_yyy)

struct net_mgmt_event_callback iface_callback;
struct net_mgmt_event_callback ipv4_callback;

void callback_handler(struct net_mgmt_event_callback *cb,
                      uint32_t mgmt_event,
                      struct net_if *iface)
{
    if (mgmt_event == NET_EVENT_IF_xxx) {
        /* Handle NET_EVENT_IF_xxx */
    } else if (mgmt_event == NET_EVENT_IF_yyy) {
        /* Handle NET_EVENT_IF_yyy */
    } else if (mgmt_event == NET_EVENT_IPV4_xxx) {
        /* Handle NET_EVENT_IPV4_xxx */
    } else if (mgmt_event == NET_EVENT_IPV4_yyy) {
        /* Handle NET_EVENT_IPV4_yyy */
    }
}
```

(continues on next page)
See include/zephyr/net/net_event.h for available generic core events that can be listened to.

### Defining a network management procedure

You can provide additional management procedures specific to your stack implementation by defining a handler and registering it with an associated mgmt_request code.

Management request code are defined in relevant places depending on the targeted layer or eventually, if L2 is the layer, on the technology as well. For instance, all IP layer management request code will be found in the include/zephyr/net/net_event.h header file. But in case of an L2 technology, let’s say Ethernet, these would be found in include/zephyr/net/ethernet.h.

You define your handler modeled with this signature:

```c
static int your_handler(uint32_t mgmt_event, struct net_if *iface, void *data, size_t len);
```

and then register it with an associated mgmt_request code:

```c
NET_MGMT_REGISTER_REQUEST_HANDLER(<mgmt_request code>, your_handler);
```

This new management procedure could then be called by using:

```c
net_mgmt(<mgmt_request code>, ...);
```

### Signaling a network event

You can signal a specific network event using the `net_mgmt_event_notify()` function and provide the network event code. See include/zephyr/net/net_mgmt.h for details. As for the management request code, event code can be also found on specific L2 technology mgmt headers, for example include/zephyr/net/ieee802154_mgmt.h would be the right place if 802.15.4 L2 is the technology one wants to listen to events.

### API Reference

**group net_mgmt**

Network Management.

**Defines**

```c
net_mgmt(_mgmt_request, _iface, _data, _len)
```
NET_MGMT_DEFINE_REQUEST_HANDLER(_mgmt_request)

NET_MGMT_REGISTER_REQUEST_HANDLER(_mgmt_request, _func)

**Typedefs**

typedef int (*net_mgmt_request_handler_t)(uint32_t mgmt_request, struct net_if *iface, void *data, size_t len)

Signature which all Net MGMT request handler need to follow.

**Param mgmt_request**
The exact request value the handler is being called through

**Param iface**
A valid pointer on struct net_if if the request is meant to be tight to a network interface. NULL otherwise.

**Param data**
A valid pointer on a data understood by the handler. NULL otherwise.

**Param len**
Length in byte of the memory pointed by data.

typedef void (*net_mgmt_event_handler_t)(struct net_mgmt_event_callback *cb, uint32_t mgmt_event, struct net_if *iface)

Define the user's callback handler function signature.

**Param cb**
Original struct net_mgmt_event_callback owning this handler.

**Param mgmt_event**
The network event being notified.

**Param iface**
A pointer on a struct net_if to which the the event belongs to, if it's an event on an iface. NULL otherwise.

**Functions**

static inline void net_mgmt_init_event_callback(struct net_mgmt_event_callback *cb, net_mgmt_event_handler_t handler, uint32_t mgmt_event_mask)

Helper to initialize a struct net_mgmt_event_callback properly.

**Parameters**
- cb – A valid application's callback structure pointer.
- handler – A valid handler function pointer.
- mgmt_event_mask – A mask of relevant events for the handler

void net_mgmt_add_event_callback(struct net_mgmt_event_callback *cb)

Add a user callback.

**Parameters**
- cb – A valid pointer on user's callback to add.
void net_mgmt_del_event_callback(struct net_mgmt_event_callback *cb)

Delete a user callback.

Parameters
• cb – A valid pointer on user’s callback to delete.

void net_mgmt_event_notify_with_info(uint32_t mgmt_event, struct net_if *iface, const void *info, size_t length)

Used by the system to notify an event.

Note: info and length are disabled if CONFIG_NET_MGMT_EVENT_INFO is not defined.

Parameters
• mgmt_event – The actual network event code to notify
• iface – A valid pointer on a struct net_if if only the event is based on an iface. NULL otherwise.
• info – A valid pointer on the information you want to pass along with the event. NULL otherwise. Note the data pointed there is normalized by the related event.
• length – size of the data pointed by info pointer.

static inline void net_mgmt_event_notify(uint32_t mgmt_event, struct net_if *iface)

int net_mgmt_event_wait(uint32_t mgmt_event_mask, uint32_t *raised_event, struct net_if **iface, const void **info, size_t *info_length, k_timeout_t timeout)

Used to wait synchronously on an event mask.

Parameters
• mgmt_event_mask – A mask of relevant events to wait on.
• raised_event – a pointer on a uint32_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.
• iface – a pointer on a place holder for the iface on which the event has originated from. This is valid if only the event mask has bit NET_MGMT_IFACE_BIT set relevantly, depending on events the caller wants to listen to.
• info – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.
• info_length – tells how long the info memory area is. Only valid if the info is not NULL.
• timeout – A timeout delay. K_FOREVER can be used to wait indefinitely.

Returns
0 on success, a negative error code otherwise. -ETIMEDOUT will be specifically returned if the timeout kick-in instead of an actual event.

int net_mgmt_event_wait_on_iface(struct net_if *iface, uint32_t mgmt_event_mask, uint32_t *raised_event, struct net_if **iface, const void **info, size_t *info_length, k_timeout_t timeout)

Used to wait synchronously on an event mask for a specific iface.

Parameters
• iface – a pointer on a valid network interface to listen event to
• mgmt_event_mask – A mask of relevant events to wait on. Listened to events should be relevant to iface events and thus have the bit NET_MGMT_IFACE_BIT set.

6.2. Networking 1809
• **raised_event** – a pointer on a `uint32_t` to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.

• **info** – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.

• **info_length** – tells how long the info memory area is. Only valid if the info is not NULL.

• **timeout** – A timeout delay. `K_FOREVER` can be used to wait indefinitely.

**Returns**

0 on success, a negative error code otherwise. `-ETIMEDOUT` will be specifically returned if the timeout kick-in instead of an actual event.

```c
void net_mgmt_event_init(void)
```

Used by the core of the network stack to initialize the network event processing.

```c
struct net_mgmt_event_callback
```

#include `<net_mgmt.h>` Network Management event callback structure. Used to register a callback into the network management event part, in order to let the owner of this struct to get network event notification based on given event mask.

**Public Members**

```c
sys_snode_t node
```

Meant to be used internally, to insert the callback into a list. So nobody should mess with it.

```c
net_mgmt_event_handler_t handler
```

Actual callback function being used to notify the owner

```c
struct k_sem *sync_call
```

Semaphore meant to be used internally for the synchronous `net_mgmt_event_wait()` function.

```c
uint32_t event_mask
```

A mask of network events on which the above handler should be called in case those events come. Note that only the command part is treated as a mask, matching one to several commands. Layer and layer code will be made of an exact match. This means that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened.

```c
uint32_t raised_event
```

Internal place holder when a synchronous event wait is successfully unlocked on a event.

```c
union net_mgmt_event_callback.[anonymous] [anonymous]
```

A mask of network events on which the above handler should be called in case those events come. Such mask can be modified whenever necessary by the owner, and thus will affect the handler being called or not.

**Network Statistics**
Overview

Network statistics are collected if CONFIG_NET_STATISTICS is set. Individual component statistics for IPv4 or IPv6 can be turned off if those statistics are not needed. See various options in subsys/net/ip/Kconfig.stats file for details.

By default, the system collects network statistics per network interface. This can be controlled by CONFIG_NET_STATISTICS_PER_INTERFACE option.

The CONFIG_NET_STATISTICS_USER_API option can be set if the application wants to collect statistics for further processing. The network management interface API is used for that. See Network Management for details.

The CONFIG_NET_STATISTICS_Ethernet option can be set to collect generic Ethernet statistics. If the CONFIG_NET_STATISTICS_Ethernet_VENDOR option is set, then Ethernet device driver can collect Ethernet device specific statistics. These statistics can then be transferred to application for processing.

If the CONFIG_NET_SHELL option is set, then network shell can show statistics information with net stats command.

- API Reference
Overview

Zephyr's network infrastructure mostly uses the millisecond-resolution uptime clock to track timeouts, with both deadlines and durations measured with 32-bit unsigned values. The 32-bit value rolls over at 49 days 17 hours 2 minutes 47.296 seconds.

Timeout processing is often affected by latency, so that the time at which the timeout is checked may be some time after it should have expired. Handling this correctly without arbitrary expectations of maximum latency requires that the maximum delay that can be directly represented be a 31-bit non-negative number (INT32_MAX), which overflows at 24 days 20 hours 31 minutes 23.648 seconds.

Most network timeouts are shorter than the delay rollover, but a few protocols allow for delays that are represented as unsigned 32-bit values counting seconds, which corresponds to a 42-bit millisecond count.

The net_timeout API provides a generic timeout mechanism to correctly track the remaining time for these extended-duration timeouts.

Use

The simplest use of this API is:

1. Configure a network timeout using net_timeout_set().
2. Use net_timeout_evaluate() to determine how long it is until the timeout occurs. Schedule a timeout to occur after this delay.
3. When the timeout callback is invoked, use net_timeout_evaluate() again to determine whether the timeout has completed, or whether there is additional time remaining. If the latter, reschedule the callback.
4. While the timeout is running, use net_timeout_remaining() to get the number of seconds until the timeout expires. This may be used to explicitly update the timeout, which should be done by canceling any pending callback and restarting from step 1 with the new timeout.

The net_timeout contains a sys_snode_t that allows multiple timeout instances to be aggregated to share a single kernel timer element. The application must use net_timeout_evaluate() on all instances to determine the next timeout event to occur.

net_timeout_deadline() may be used to reconstruct the full-precision deadline of the timeout. This exists primarily for testing but may have use in some applications, as it does allow a millisecond-resolution calculation of remaining time.

API Reference

group net_timeout

Network long timeout primitives and helpers.

Defines

NET_TIMEOUT_MAX_VALUE

Divisor used to support ms resolution timeouts.

Because delays are processed in work queues which are not invoked synchronously with clock changes we need to be able to detect timeouts after they occur, which requires comparing "deadline" to "now" with enough "slop" to handle any observable latency due to "now" advancing past "deadline".

The simplest solution is to use the native conversion of the well-defined 32-bit unsigned difference to a 32-bit signed difference, which caps the maximum delay at INT32_MAX. This is compatible with the standard mechanism for detecting completion of deadlines that do not overflow their representation.
Functions

void net_timeout_set(struct net_timeout *timeout, uint32_t lifetime, uint32_t now)
Configure a network timeout structure.

Parameters
• timeout – a pointer to the timeout state.
• lifetime – the duration of the timeout in seconds.
• now – the time at which the timeout started counting down, in milliseconds.
  This is generally a captured value of k_uptime_get_32().

int64_t net_timeout_deadline(const struct net_timeout *timeout, int64_t now)
Return the 64-bit system time at which the timeout will complete.

Note: Correct behavior requires invocation of net_timeout_evaluate() at its specified intervals.

Parameters
• timeout – state a pointer to the timeout state, initialized by net_timeout_set()
  and maintained by net_timeout_evaluate().
• now – the full-precision value of k_uptime_get() relative to which the deadline
  will be calculated.

Returns
the value of k_uptime_get() at which the timeout will expire.

uint32_t net_timeout_remaining(const struct net_timeout *timeout, uint32_t now)
Calculate the remaining time to the timeout in whole seconds.

Note: This function rounds the remaining time down, i.e. if the timeout will occur in 3500
milliseconds the value 3 will be returned.

Note: Correct behavior requires invocation of net_timeout_evaluate() at its specified intervals.

Parameters
• timeout – a pointer to the timeout state
• now – the time relative to which the estimate of remaining time should be
  calculated. This should be recently captured value from k_uptime_get_32().

Return values
• 0 – if the timeout has completed.
• positive – the remaining duration of the timeout, in seconds.

uint32_t net_timeout_evaluate(struct net_timeout *timeout, uint32_t now)
Update state to reflect elapsed time and get new delay.

This function must be invoked periodically to (1) apply the effect of elapsed time on what
remains of a total delay that exceeded the maximum representable delay, and (2) determine
that either the timeout has completed or that the infrastructure must wait a certain period
before checking again for completion.

Parameters
• timeout – a pointer to the timeout state
• now – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from k_uptime_get_32().

**Return values**
• 0 – if the timeout has completed
• positive – the maximum delay until the state of this timeout should be re-evaluated, in milliseconds.

```c
struct net_timeout
#include <net_timeout.h> Generic struct for handling network timeouts.

Except for the linking node, all access to state from these objects must go through the defined API.

**Public Members**

```c
sys_snode_t node
```
Used to link multiple timeouts that share a common timer infrastructure.
For examples a set of related timers may use a single delayed work structure, which is always scheduled at the shortest time to a timeout event.

**Networking Context** The net_context API is not meant for application use. Application should use BSD Sockets API instead.

**Promiscuous Mode**

**Overview** Promiscuous mode is a mode for a network interface controller that causes it to pass all traffic it receives to the application rather than passing only the frames that the controller is specifically programmed to receive. This mode is normally used for packet sniffing as used to diagnose network connectivity issues by showing an application all the data being transferred over the network. (See the Wikipedia article on promiscuous mode for more information.)

The network promiscuous APIs are used to enable and disable this mode, and to wait for and receive a network data to arrive. Not all network technologies or network device drivers support promiscuous mode.

**Sample usage** First the promiscuous mode needs to be turned ON by the application like this:

```c
ret = net_promisc_mode_on(iface);
if (ret < 0) {
    if (ret == -EALREADY) {
        printf("Promiscuous mode already enabled\n");
    } else {
        printf("Cannot enable promiscuous mode for ");
```
If there is no error, then the application can start to wait for network data:

```c
while (true) {
    pkt = net_promisc_mode_wait_data(K_FOREVER);
    if (pkt) {
        print_info(pkt);
    }
    net_pkt_unref(pkt);
}
```

Finally the promiscuous mode can be turned OFF by the application like this:

```c
ret = net_promisc_mode_off(iface);
if (ret < 0) {
    if (ret == -EAGAIN) {
        printf("Promiscuous mode already disabled\n");
    } else {
        printf("Cannot disable promiscuous mode for "
               "interface %p (%d)\n", iface, ret);
    }
}
```

See net-promiscuous-mode-sample for a more comprehensive example.

**API Reference**

*group* promiscuous

Promiscuous mode support.

**Functions**

static inline struct net_pkt *net_promisc_mode_wait_data(k_timeout_t timeout)

Start to wait received network packets.

**Parameters**

- timeout – How long to wait before returning.

**Returns**

Received `net_pkt`, NULL if not received any packet.

static inline int net_promisc_mode_on(struct net_if *iface)

Enable promiscuous mode for a given network interface.

**Parameters**

- iface – Network interface

**Returns**

0 if ok, <0 if error

static inline int net_promisc_mode_off(struct net_if *iface)

Disable promiscuous mode for a given network interface.

**Parameters**
• iface – Network interface

Returns
0 if ok, <0 if error

Simple Network Time Protocol Library

Overview
The SNTP library implements IETF RFC4330 (Simple Network Time Protocol v4). SNTP provides a way to synchronize clocks in computer networks.

API Reference

group sntp
Simple Network Time Protocol API.

Functions

int sntp_init(struct sntp_ctx *ctx, struct sockaddr *addr, socklen_t addr_len)
Initialize SNTP context.

Parameters
• ctx – Address of sntp context.
• addr – IP address of NTP/SNTP server.
• addr_len – IP address length of NTP/SNTP server.

Returns
0 if ok, <0 if error.

int sntp_query(struct sntp_ctx *ctx, uint32_t timeout, struct sntp_time *time)
Perform SNTP query.

Parameters
• ctx – Address of sntp context.
• timeout – Timeout of waiting for sntp response (in milliseconds).
• time – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

Returns
0 if ok, <0 if error (-ETIMEDOUT if timeout).

void sntp_close(struct sntp_ctx *ctx)
Release SNTP context.

Parameters
• ctx – Address of sntp context.
int sntp_simple(const char *server, uint32_t timeout, struct sntp_time *time)

Convenience function to query SNTP in one-shot fashion.

Convenience wrapper which calls getaddrinfo(), sntp_init(), sntp_query(), and sntp_close().

Parameters

• server – Address of server in format addr[:port]
• timeout – Query timeout
• time – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

Returns

0 if ok, <0 if error (-ETIMEDOUT if timeout).

struct sntp_ctx

#include <sntp.h> SNTP context

Public Members

uint32_t expected_orig_ts

Timestamp when the request was sent from client to server. This is used to check if the originated timestamp in the server reply matches the one in client request.

struct sntp_time

#include <sntp.h> Time as returned by SNTP API, fractional seconds since 1 Jan 1970

SOCKS5 Proxy Support

Overview The SOCKS library implements SOCKS5 support, which allows Zephyr to connect to peer devices via a network proxy.

See this SOCKS5 Wikipedia article for a detailed overview of how SOCKS5 works.

For more information about the protocol itself, see IETF RFC1928 SOCKS Protocol Version 5.

SOCKS5 API The SOCKS5 support is enabled by CONFIG_SOCKS Kconfig variable. Application wanting to use the SOCKS5 must set the SOCKS5 proxy host address by calling setsockopt() like this:

```c
static int set_proxy(int sock, const struct sockaddr *proxy_addr, socklen_t proxy_addrlen)
{
    int ret;
    ret = setsockopt(sock, SOL_SOCKET, SO_SOCKS5, proxy_addr, proxy_addrlen);
    if (ret < 0) {
        // Handle error
    }
}
```

(continues on next page)
SOCKS5 Proxy Usage in MQTT  For MQTT client, there is `mqtt_client_set_proxy()` API that the application can call to setup SOCKS5 proxy. See `mqtt-publisher-sample` for usage example.

Trickle Timer Library

- **Overview**  The Trickle timer library implements IETF RFC6206 (Trickle Algorithm).
- **API Reference**

Overview  The Trickle timer library implements IETF RFC6206 (Trickle Algorithm).

The Trickle algorithm allows nodes in a lossy shared medium (e.g., low-power and lossy networks) to exchange information in a highly robust, energy efficient, simple, and scalable manner.

API Reference

group trickle

Trickle algorithm library.

Typedefs

typedef void (*net_trickle_cb_t)(struct net_trickle *trickle, bool do_suppress, void *user_data)

Trickle timer callback.

The callback is called after Trickle timeout expires.

**Param trickle**

The trickle context to use.

**Param do_suppress**

Is TX allowed (true) or not (false).

**Param user_data**

The user data given in `net_trickle_start()` call.

Functions

int net_trickle_create(struct net_trickle *trickle, uint32_t Imin, uint8_t Imax, uint8_t k)

Create a Trickle timer.

Parameters

- trickle – Pointer to Trickle struct.
- Imin – Imin configuration parameter in ms.
- Imax – Max number of doublings.
- k – Redundancy constant parameter. See RFC 6206 for details.

**Returns**
Return 0 if ok and <0 if error.

```c
int net_trickle_start(struct net_trickle *trickle, net_trickle_cb_t cb, void *user_data)
```
Start a Trickle timer.

**Parameters**
- trickle – Pointer to Trickle struct.
- cb – User callback to call at time T within the current trickle interval
- user_data – User pointer that is passed to callback.

**Returns**
Return 0 if ok and <0 if error.

```c
int net_trickle_stop(struct net_trickle *trickle)
```
Stop a Trickle timer.

**Parameters**
- trickle – Pointer to Trickle struct.

**Returns**
Return 0 if ok and <0 if error.

```c
void net_trickle_consistency(struct net_trickle *trickle)
```
To be called by the protocol handler when it hears a consistent network transmission.

**Parameters**
- trickle – Pointer to Trickle struct.

```c
void net_trickle_inconsistency(struct net_trickle *trickle)
```
To be called by the protocol handler when it hears an inconsistent network transmission.

**Parameters**
- trickle – Pointer to Trickle struct.

```c
static inline bool net_trickle_is_running(struct net_trickle *trickle)
```
Check if the Trickle timer is running or not.

**Parameters**
- trickle – Pointer to Trickle struct.

**Returns**
Return True if timer is running and False if not.

```c
struct net_trickle
```
#include <trickle.h> The variable names are taken directly from RFC 6206 when applicable. Note that the struct members should not be accessed directly but only via the Trickle API.

**Public Members**

- uint32_t Imin
  Min interval size in ms

- uint8_t Imax
  Max number of doublings
uint8_t k
    Redundancy constant
uint32_t I
    Current interval size
uint32_t Istart
    Start of the interval in ms
uint8_t c
    Consistency counter
uint32_t Imax_abs
    Max interval size in ms (not doublings)

net_trickle_cb_t cb
    Callback to be called when timer expires

Websocket Client API

- Overview
- Websocket Transport
- API Reference

Overview  The Websocket client library allows Zephyr to connect to a Websocket server. The Websocket client API can be used directly by application to establish a Websocket connection to server, or it can be used as a transport for other network protocols like MQTT.

See this Websocket Wikipedia article for a detailed overview of how Websocket works.

For more information about the protocol itself, see IETF RFC6455 The WebSocket Protocol.

Websocket Transport  The Websocket API allows it to be used as a transport for other high level protocols like MQTT. The Zephyr MQTT client library can be configured to use Websocket transport by enabling CONFIG_MQTT_LIB_WEBSOCKET and CONFIG_WEBSOCKET_CLIENT Kconfig options.

First a socket needs to be created and connected to the Websocket server:

sock = socket(family, SOCK_STREAM, IPPROTO_TCP);
...
ret = connect(sock, addr, addr_len);
...

The Websocket transport socket is then created like this:

ws_sock = websocket_connect(sock, &config, timeout, user_data);

The Websocket socket can then be used to send or receive data, and the Websocket client API will encapsulate the sent or received data to/from Websocket packet payload. Both the websocket_xxx() API or normal BSD socket API functions can be used to send and receive application data.
ret = websocket_send_msg(ws_sock, buf_to_send, buf_len, 
    WEBSOCKET_OPCODE_DATA_BINARY, true, true, 
    K_FOREVER);
...
ret = send(ws_sock, buf_to_send, buf_len, 0);

If normal BSD socket functions are used, then currently only TEXT data is supported. In order to send 
BINARY data, the `websocket_send_msg()` must be used.

When done, the Websocket transport socket must be closed.

ret = close(ws_sock);
or
ret = websocket_disconnect(ws_sock);

API Reference

group websocket
   Websocket API.

   Defines

   WEBSOCKET_FLAG_FINAL
      Message type values. Returned in `websocket_recv_msg()` Final frame

   WEBSOCKET_FLAG_TEXT
      Textual data

   WEBSOCKET_FLAG_BINARY
      Binary data

   WEBSOCKET_FLAG_CLOSE
      Closing connection

   WEBSOCKET_FLAG_PING
      Ping message

   WEBSOCKET_FLAG_PONG
      Pong message

   Typedefs

typedef int (*websocket_connect_cb_t)(int ws_sock, struct http_request *req, void *user_data)
   Callback called after Websocket connection is established.

   Param ws_sock
      Websocket id

   Param req
      HTTP handshake request
**Param user_data**

A valid pointer on some user data or NULL

**Return**

0 if ok, <0 if there is an error and connection should be aborted

**Enums**

```c
enum websocket_opcode

Values:

enumerator WEBSOCKET_OPCODE_CONTINUE = 0x00
enumerator WEBSOCKET_OPCODE_DATA_TEXT = 0x01
enumerator WEBSOCKET_OPCODE_DATA_BINARY = 0x02
enumerator WEBSOCKET_OPCODE_CLOSE = 0x08
enumerator WEBSOCKET_OPCODE_PING = 0x09
enumerator WEBSOCKET_OPCODE_PONG = 0x0A
```

**Functions**

```c
int websocket_connect(int http_sock, struct websocket_request *req, int32_t timeout, void *user_data)

Connect to a server that provides Websocket service. The callback is called after connection is established. The returned value is a new socket descriptor that can be used to send / receive data using the BSD socket API.

**Parameters**

- **http_sock** – Socket id to the server. Note that this socket is used to do HTTP handshakes etc. The actual Websocket connectivity is done via the returned websocket id. Note that the http_sock must not be closed after this function returns as it is used to deliver the Websocket packets to the Websocket server.
- **req** – Websocket request. User should allocate and fill the request data.
- **timeout** – Max timeout to wait for the connection. The timeout value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.
- **user_data** – User specified data that is passed to the callback.

**Returns**

WebSocket id to be used when sending/receiving Websocket data.
```

```c
int websocket_send_msg(int ws_sock, const uint8_t *payload, size_t payload_len, enum websocket_opcode opcode, bool mask, bool final, int32_t timeout)

Send websocket msg to peer.

The function will automatically add websocket header to the message.

**Parameters**

- **ws_sock** – Websocket id returned by `websocket_connect()`.
• payload – Websocket data to send.
• payload_len – Length of the data to be sent.
• opcode – Operation code (text, binary, ping, pong, close)
• mask – Mask the data, see RFC 6455 for details
• final – Is this final message for this message send. If final == false, then
the first message must have valid opcode and subsequent messages must have
opcode WEB_SOCKET_OPCODE_CONTINUE. If final == true and this is the
only message, then opcode should have proper opcode (text or binary) set.
• timeout – How long to try to send the message. The value is in milliseconds.
Value SYS_FOREVER_MS means to wait forever.

Returns
<0 if error, >=0 amount of bytes sent

int websocket_recv_msg(int ws_sock, uint8_t *buf, size_t buf_len, uint32_t *message_type,
uint64_t *remaining, int32_t timeout)
Receive websocket msg from peer.
The function will automatically remove websocket header from the message.

Parameters
• ws_sock – Websocket id returned by websocket_connect().
• buf – Buffer where websocket data is read.
• buf_len – Length of the data buffer.
• message_type – Type of the message.
• remaining – How much there is data left in the message after this read.
• timeout – How long to try to receive the message. The value is in milliseconds.
Value SYS_FOREVER_MS means to wait forever.

Returns
<0 if error, >=0 amount of bytes received

int websocket_disconnect(int ws_sock)
Close websocket.
One must call websocket_connect() after this call to re-establish the connection.

Parameters
• ws_sock – Websocket id returned by websocket_connect().

static inline void websocket_init(void)

struct websocket_request

#include <websocket.h> Websocket client connection request. This contains all the data that
is needed when doing a Websocket connection request.

Public Members

const char *host
Host of the Websocket server when doing HTTP handshakes.

const char *url
URL of the Websocket.
---

**http_header_cb_t optional_headers_cb**

User supplied callback function to call when optional headers need to be sent. This can be NULL, in which case the optional_headers field in `http_request` is used. The idea of this optional_headers callback is to allow user to send more HTTP header data that is practical to store in allocated memory.

```c
const char **optional_headers
```

A NULL terminated list of any optional headers that should be added to the HTTP request. May be NULL. If the optional_headers_cb is specified, then this field is ignored.

**websocket_connect_cb_t cb**

User supplied callback function to call when a connection is established.

```c
const struct http_parser_settings *http_cb
```

User supplied list of callback functions if the calling application wants to know the parsing status or the HTTP fields during the handshake. This is optional parameter and normally not needed but is useful if the caller wants to know something about the fields that the server is sending.

```c
uint8_t *tmp_buf
```

User supplied buffer where HTTP connection data is stored.

```c
size_t tmp_buf_len
```

Length of the user supplied temp buffer.

---

### Network Packet Capture

#### Overview

The `net_capture` API allows user to monitor the network traffic in one of the Zephyr network interfaces and send that traffic to external system for analysis. The monitoring can be setup either manually using `net-shell` or automatically by using the `net_capture` API.

#### Sample usage

See Network capture sample application and *Monitor Network Traffic* for details.

#### API Reference

**group net_capture**

Network packet capture support functions.

**Functions**

```c
int net_capture_setup(const char *remote_addr, const char *my_local_addr, const char *peer_addr, const struct device **dev)
```

Setup network packet capturing support.
Parameters

- `remote_addr` - The value tells the tunnel remote/outer endpoint IP address. The IP address can be either IPv4 or IPv6 address. This address is used to select the network interface where the tunnel is created.

- `my_local_addr` - The local/inner IP address of the tunnel. Can contain also port number which is used as UDP source port.

- `peer_addr` - The peer/inner IP address of the tunnel. Can contain also port number which is used as UDP destination port.

- `dev` - Network capture device. This is returned to the caller.

Returns

0 if ok, <0 if network packet capture setup failed

```c
static inline int net_capture_cleanup(const struct device *dev)
```

Cleanup network packet capturing support.

This should be called after the capturing is done and resources can be released.

Parameters

- `dev` - Network capture device. User must allocate using the `net_capture_setup()` function.

Returns

0 if ok, <0 if network packet capture cleanup failed

```c
static inline int net_capture_enable(const struct device *dev, struct net_if *iface)
```

Enable network packet capturing support.

This creates tunnel network interface where all the captured packets are pushed. The captured network packets are placed in UDP packets that are sent to tunnel peer.

Parameters

- `dev` - Network capture device
- `iface` - Network interface we are starting to capture packets.

Returns

0 if ok, <0 if network packet capture enable failed

```c
static inline bool net_capture_is_enabled(const struct device *dev)
```

Is network packet capture enabled or disabled.

Parameters

- `dev` - Network capture device

Returns

True if enabled, False if network capture is disabled.

```c
static inline int net_capture_disable(const struct device *dev)
```

Disable network packet capturing support.

Parameters

- `dev` - Network capture device

Returns

0 if ok, <0 if network packet capture disable failed

```c
static inline int net_capture_send(const struct device *dev, struct net_if *iface, struct net_pkt *pkt)
```

Send captured packet.

Parameters
Network Buffer Management

Network Buffer

- Overview
- Creating buffers
- Common Operations
- Reference Counting
- API Reference

Overview

Network buffers are a core concept of how the networking stack (as well as the Bluetooth stack) pass data around. The API for them is defined in include/zephyr/net/buf.h:

Creating buffers

Network buffers are created by first defining a pool of them:

```c
NET_BUF_POOL_DEFINE(pool_name, buf_count, buf_size, user_data_size, NULL);
```

The pool is a static variable, so if it's needed to be exported to another module a separate pointer is needed.

Once the pool has been defined, buffers can be allocated from it with:

```c
buf = net_buf_alloc(&pool_name, timeout);
```

There is no explicit initialization function for the pool or its buffers, rather this is done implicitly as net_buf_alloc() gets called.

If there is a need to reserve space in the buffer for protocol headers to be prepended later, it's possible to reserve this headroom with:

```c
net_buf_reserve(buf, headroom);
```

In addition to actual protocol data and generic parsing context, network buffers may also contain protocol-specific context, known as user data. Both the maximum data and user data capacity of the buffers is compile-time defined when declaring the buffer pool.

The buffers have native support for being passed through k_fifo kernel objects. This is a very practical feature when the buffers need to be passed from one thread to another. However, since a net_buf may have a fragment chain attached to it, instead of using the k_fifo_put() and k_fifo_get() APIs, special net_buf_put() and net_buf_get() APIs must be used when passing buffers through FIFOs. These APIs ensure that the buffer chains stay intact. The same applies for passing buffers through a singly linked list, in which case the net_buf_slist_put() and net_buf_slist_get() functions must be used instead of sys_slist_append() and sys_slist_get().

6.2. Networking
Common Operations  The network buffer API provides some useful helpers for encoding and decoding data in the buffers. To fully understand these helpers it’s good to understand the basic names of operations used with them:

Add
Add data to the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Requires that there is enough tailroom in the buffer. Some examples of APIs for adding data:

```c
void *net_buf_add(struct net_buf *buf, size_t len);
void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len);
uint8_t *net_buf_add_u8(struct net_buf *buf, uint8_t value);
void net_buf_add_le16(struct net_buf *buf, uint16_t value);
void net_buf_add_le32(struct net_buf *buf, uint32_t value);
```

Remove
Remove data from the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Some examples of APIs for removing data:

```c
void *net_buf_remove_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_remove_u8(struct net_buf *buf);
uint16_t net_buf_remove_le16(struct net_buf *buf);
uint32_t net_buf_remove_le32(struct net_buf *buf);
```

Push
Prepend data to the beginning of the buffer. Modifies both the data length value as well as the data pointer. Requires that there is enough headroom in the buffer. Some examples of APIs for pushing data:

```c
void *net_buf_push(struct net_buf *buf, size_t len);
void *net_buf_push_mem(struct net_buf *buf, const void *mem, size_t len);
void net_buf_push_u8(struct net_buf *buf, uint8_t value);
void net_buf_push_le16(struct net_buf *buf, uint16_t value);
```

Pull
Remove data from the beginning of the buffer. Modifies both the data length value as well as the data pointer. Some examples of APIs for pulling data:

```c
void *net_buf_pull(struct net_buf *buf, size_t len);
void *net_buf_pull_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_pull_u8(struct net_buf *buf);
uint16_t net_buf_pull_le16(struct net_buf *buf);
uint32_t net_buf_pull_le32(struct net_buf *buf);
```

The Add and Push operations are used when encoding data into the buffer, whereas the Remove and Pull operations are used when decoding data from a buffer.

Reference Counting  Each network buffer is reference counted. The buffer is initially acquired from a free buffers pool by calling `net_buf_alloc()`, resulting in a buffer with reference count 1. The reference count can be incremented with `net_buf_ref()` or decremented with `net_buf_unref()`. When the count drops to zero the buffer is automatically placed back to the free buffers pool.

API Reference

`group net_buf`

Network buffer library.
Defines

NET_BUF_SIMPLE_DEFINE(_name, _size)
Define a net_buf_simple stack variable.

This is a helper macro which is used to define a net_buf_simple object on the stack.

Parameters

• _name – Name of the net_buf_simple object.
• _size – Maximum data storage for the buffer.

NET_BUF_SIMPLE_DEFINE_STATIC(_name, _size)
Define a static net_buf_simple variable.

This is a helper macro which is used to define a static net_buf_simple object.

Parameters

• _name – Name of the net_buf_simple object.
• _size – Maximum data storage for the buffer.

NET_BUF_SIMPLE(_size)
Define a net_buf_simple stack variable and get a pointer to it.

This is a helper macro which is used to define a net_buf_simple object on the stack and the get a pointer to it as follows:

struct net_buf_simple *my_buf = NET_BUF_SIMPLE(10);

After creating the object it needs to be initialized by calling net_buf_simple_init().

Parameters

• _size – Maximum data storage for the buffer.

Returns

Pointer to stack-allocated net_buf_simple object.

NET_BUF_EXTERNAL_DATA
Flag indicating that the buffer’s associated data pointer, points to externally allocated memory. Therefore once ref goes down to zero, the pointed data will not need to be deallocated. This never needs to be explicitly set or unset by the net_buf API user. Such net_buf is exclusively instantiated via net_buf_alloc_with_data() function. Reference count mechanism however will behave the same way, and ref count going to 0 will free the net_buf but no the data pointer in it.

NET_BUF_POOL_HEAP_DEFINE(_name, _count, _ud_size, _destroy)
Define a new pool for buffers using the heap for the data.

Defines a net_buf_pool struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from the heap using k_malloc, so CONFIG_HEAP_MEM_POOL_SIZE must be set to a positive value. This kind of pool does not support blocking on the data allocation, so the timeout passed to net_buf_alloc will be always treated as K_NO_WAIT when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling net_buf_destroy() to complete the process of returning the buffer to the pool.
Parameters

- `_name` – Name of the pool variable.
- `_count` – Number of buffers in the pool.
- `_data_size` – Maximum data payload per buffer.
- `_ud_size` – User data space to reserve per buffer.
- `_destroy` – Optional destroy callback when buffer is freed.

```
NET_BUF_POOL_FIXED_DEFINE(_name, _count, _data_size, _ud_size, _destroy)
```

Define a new pool for buffers based on fixed-size data.

Defines a `net_buf_pool` struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through `net_buf_alloc`. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from a byte array of fixed sized chunks. This kind of pool does not support blocking on the data allocation, so the timeout passed to `net_buf_alloc` will be always treated as K_NO_WAIT when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling `net_buf_destroy()` to complete the process of returning the buffer to the pool.

Parameters

- `_name` – Name of the pool variable.
- `_count` – Number of buffers in the pool.
- `_data_size` – Total amount of memory available for data payloads.
- `_ud_size` – User data space to reserve per buffer.
- `_destroy` – Optional destroy callback when buffer is freed.

```
NET_BUF_POOL_VAR_DEFINE(_name, _count, _data_size, _ud_size, _destroy)
```

Define a new pool for buffers with variable size payloads.

Defines a `net_buf_pool` struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through `net_buf_alloc`. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be based on a memory pool from which variable size payloads may be allocated.

If provided with a custom destroy callback, this callback is responsible for eventually calling `net_buf_destroy()` to complete the process of returning the buffer to the pool.

Parameters

- `_name` – Name of the pool variable.
- `_count` – Number of buffers in the pool.
- `_data_size` – Total amount of memory available for data payloads.
- `_ud_size` – User data space to reserve per buffer.
NET_BUF_POOL_DEFINE(_name, _count, _size, _ud_size, _destroy)

Define a new pool for buffers.

Defines a net_buf_pool struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

If provided with a custom destroy callback this callback is responsible for eventually calling net_buf_destroy() to complete the process of returning the buffer to the pool.

Parameters

- _name – Name of the pool variable.
- _count – Number of buffers in the pool.
- _size – Maximum data size for each buffer.
- _ud_size – Amount of user data space to reserve.
- _destroy – Optional destroy callback when buffer is freed.

Typedefs

typedef struct net_buf *(net_buf_allocator_cb)(k_timeout_t timeout, void *user_data)

Network buffer allocator callback.

The allocator callback is called when net_buf_append_bytes needs to allocate a new net_buf.

Param timeout
Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Param user_data
The user data given in net_buf_append_bytes call.

Return
pointer to allocated net_buf or NULL on error.

Functions

static inline void net_buf_simple_init(struct net_buf_simple *buf, size_t reserve_head)
Initialize a net_buf_simple object.

This needs to be called after creating a net_buf_simple object using the NET_BUF_SIMPLE macro.

Parameters

- buf – Buffer to initialize.
- reserve_head – Headroom to reserve.

void net_buf_simple_init_with_data(struct net_buf_simple *buf, void *data, size_t size)
Initialize a net_buf_simple object with data.

Initialized buffer object with external data.

Parameters

- buf – Buffer to initialize.
- data – External data pointer
- size – Amount of data the pointed data buffer if able to fit.

static inline void net_buf_simple_reset(struct net_buf_simple *buf)
    Reset buffer.
    Reset buffer data so it can be reused for other purposes.

Parameters
- buf – Buffer to reset.

void net_buf_simple_clone(const struct net_buf_simple *original, struct net_buf_simple *clone)
    Clone buffer state, using the same data buffer.
    Initializes a buffer to point to the same data as an existing buffer. Allows operations on
    the same data without altering the length and offset of the original.

Parameters
- original – Buffer to clone.
- clone – The new clone.

void *net_buf_simple_add(struct net_buf_simple *buf, size_t len)
    Prepare data to be added at the end of the buffer.
    Increments the data length of a buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- len – Number of bytes to increment the length with.

Returns
    The original tail of the buffer.

void *net_buf_simple_add_mem(struct net_buf_simple *buf, const void *mem, size_t len)
    Copy given number of bytes from memory to the end of the buffer.
    Increments the data length of the buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- mem – Location of data to be added.
- len – Length of data to be added

Returns
    The original tail of the buffer.

uint8_t *net_buf_simple_add_u8(struct net_buf_simple *buf, uint8_t val)
    Add (8-bit) byte at the end of the buffer.
    Increments the data length of the buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- val – byte value to be added.

Returns
    Pointer to the value added
void net_buf_simple_add_le16(struct net_buf_simple *buf, uint16_t val)
    Add 16-bit value at the end of the buffer.
    Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a
    buffer to account for more data at the end.

    Parameters
    • buf – Buffer to update.
    • val – 16-bit value to be added.

void net_buf_simple_add_be16(struct net_buf_simple *buf, uint16_t val)
    Add 16-bit value at the end of the buffer.
    Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a
    buffer to account for more data at the end.

    Parameters
    • buf – Buffer to update.
    • val – 16-bit value to be added.

void net_buf_simple_add_le24(struct net_buf_simple *buf, uint32_t val)
    Add 24-bit value at the end of the buffer.
    Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a
    buffer to account for more data at the end.

    Parameters
    • buf – Buffer to update.
    • val – 24-bit value to be added.

void net_buf_simple_add_be24(struct net_buf_simple *buf, uint32_t val)
    Add 24-bit value at the end of the buffer.
    Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a
    buffer to account for more data at the end.

    Parameters
    • buf – Buffer to update.
    • val – 24-bit value to be added.

void net_buf_simple_add_le32(struct net_buf_simple *buf, uint32_t val)
    Add 32-bit value at the end of the buffer.
    Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a
    buffer to account for more data at the end.

    Parameters
    • buf – Buffer to update.
    • val – 32-bit value to be added.

void net_buf_simple_add_be32(struct net_buf_simple *buf, uint32_t val)
    Add 32-bit value at the end of the buffer.
    Adds 32-bit value in big endian format at the end of buffer. Increments the data length of a
    buffer to account for more data at the end.

    Parameters
    • buf – Buffer to update.
    • val – 32-bit value to be added.
void net_buf_simple_add_le48(struct net_buf_simple *buf, uint64_t val)
Add 48-bit value at the end of the buffer.

Add 48-bit value in little endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be added.

void net_buf_simple_add_be48(struct net_buf_simple *buf, uint64_t val)
Add 48-bit value at the end of the buffer.

Add 48-bit value in big endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be added.

void net_buf_simple_add_le64(struct net_buf_simple *buf, uint64_t val)
Add 64-bit value at the end of the buffer.

Add 64-bit value in little endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be added.

void net_buf_simple_add_be64(struct net_buf_simple *buf, uint64_t val)
Add 64-bit value at the end of the buffer.

Add 64-bit value in big endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be added.

void *net_buf_simple_remove_mem(struct net_buf_simple *buf, size_t len)
Remove data from the end of the buffer.

Removes data from the end of the buffer by modifying the buffer length.

Parameters
• buf – Buffer to update.
• len – Number of bytes to remove.

Returns
New end of the buffer data.

uint8_t net_buf_simple_remove_u8(struct net_buf_simple *buf)
Remove a 8-bit value from the end of the buffer.

Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 8-bit values.

Parameters
• buf – A valid pointer on a buffer.
Returns
The 8-bit removed value

```
uint16_t net_buf_simple_remove_le16(struct net_buf_simple *buf)
```
Remove and convert 16 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 16-bit little endian data.

Parameters
- `buf` – A valid pointer on a buffer.

Returns
16-bit value converted from little endian to host endian.

```
uint16_t net_buf_simple_remove_be16(struct net_buf_simple *buf)
```
Remove and convert 16 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 16-bit big endian data.

Parameters
- `buf` – A valid pointer on a buffer.

Returns
16-bit value converted from big endian to host endian.

```
uint32_t net_buf_simple_remove_le24(struct net_buf_simple *buf)
```
Remove and convert 24 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 24-bit little endian data.

Parameters
- `buf` – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.

```
uint32_t net_buf_simple_remove_be24(struct net_buf_simple *buf)
```
Remove and convert 24 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 24-bit big endian data.

Parameters
- `buf` – A valid pointer on a buffer.

Returns
24-bit value converted from big endian to host endian.

```
uint32_t net_buf_simple_remove_le32(struct net_buf_simple *buf)
```
Remove and convert 32 bits from the end of the buffer.
Same idea as with `net_buf_simple_remove_mem()`, but a helper for operating on 32-bit little endian data.

Parameters
- `buf` – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.
uint32_t net_buf_simple_remove_be32(struct net_buf_simple *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 32-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from big endian to host endian.

uint64_t net_buf_simple_remove_le48(struct net_buf_simple *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 48-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.

uint64_t net_buf_simple_remove_be48(struct net_buf_simple *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 48-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from big endian to host endian.

uint64_t net_buf_simple_remove_le64(struct net_buf_simple *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 64-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from little endian to host endian.

uint64_t net_buf_simple_remove_be64(struct net_buf_simple *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 64-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from big endian to host endian.

void *net_buf_simple_push(struct net_buf_simple *buf, size_t len)
Prepare data to be added to the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.
Parameters

- **buf** – Buffer to update.
- **len** – Number of bytes to add to the beginning.

>Returns*
The new beginning of the buffer data.

```c
void *net_buf_simple_push_mem(
    struct net_buf_simple *buf,
    const void *mem, size_t len)
```
Copy given number of bytes from memory to the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **mem** – Location of data to be added.
- **len** – Length of data to be added.

>Returns*
The new beginning of the buffer data.

```c
void net_buf_simple_push_le16(
    struct net_buf_simple *buf, uint16_t val)
```
Push 16-bit value to the beginning of the buffer.
Adds 16-bit value in little endian format to the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **val** – 16-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_be16(
    struct net_buf_simple *buf, uint16_t val)
```
Push 16-bit value to the beginning of the buffer.
Adds 16-bit value in big endian format to the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **val** – 16-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_u8(
    struct net_buf_simple *buf, uint8_t val)
```
Push 8-bit value to the beginning of the buffer.
Adds 8-bit value to the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **val** – 8-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_le24(
    struct net_buf_simple *buf, uint32_t val)
```
Push 24-bit value to the beginning of the buffer.
Adds 24-bit value in little endian format to the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **val** – 24-bit value to be pushed to the buffer.
void net_buf_simple_push_be24(struct net_buf_simple *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.
Adds 24-bit value in big endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be pushed to the buffer.

void net_buf_simple_push_le32(struct net_buf_simple *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.
Adds 32-bit value in little endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be pushed to the buffer.

void net_buf_simple_push_be32(struct net_buf_simple *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.
Adds 32-bit value in big endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be pushed to the buffer.

void net_buf_simple_push_le48(struct net_buf_simple *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.
Adds 48-bit value in little endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be pushed to the buffer.

void net_buf_simple_push_be48(struct net_buf_simple *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.
Adds 48-bit value in big endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 48-bit value to be pushed to the buffer.

void net_buf_simple_push_le64(struct net_buf_simple *buf, uint64_t val)
Push 64-bit value to the beginning of the buffer.
Adds 64-bit value in little endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be pushed to the buffer.
• buf – Buffer to update.
• val – 64-bit value to be pushed to the buffer.

```c
void *net_buf_simple_pull(struct net_buf_simple *buf, size_t len)
```

Removes data from the beginning of the buffer.

**Parameters**

- buf – Buffer to update.
- len – Number of bytes to remove.

**Returns**

New beginning of the buffer data.

```c
void *net_buf_simple_pull_mem(struct net_buf_simple *buf, size_t len)
```

Removes data from the beginning of the buffer.

**Parameters**

- buf – Buffer to update.
- len – Number of bytes to remove.

**Returns**

Pointer to the old location of the buffer data.

```c
uint8_t net_buf_simple_pull_u8(struct net_buf_simple *buf)
```

Removes a 8-bit value from the beginning of the buffer.

Same idea as with `net_buf_simple_pull()`, but a helper for operating on 8-bit values.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns**

The 8-bit removed value

```c
uint16_t net_buf_simple_pull_le16(struct net_buf_simple *buf)
```

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with `net_buf_simple_pull()`, but a helper for operating on 16-bit little endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns**

16-bit value converted from little endian to host endian.

```c
uint16_t net_buf_simple_pull_be16(struct net_buf_simple *buf)
```

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with `net_buf_simple_pull()`, but a helper for operating on 16-bit big endian data.

**Parameters**

- buf – A valid pointer on a buffer.

**Returns**

16-bit value converted from big endian to host endian.
uint32_t net_buf_simple_pull_le24(struct net_buf_simple *buf)
Remove and convert 24 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 24-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.

uint32_t net_buf_simple_pull_be24(struct net_buf_simple *buf)
Remove and convert 24 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 24-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from big endian to host endian.

uint32_t net_buf_simple_pull_le32(struct net_buf_simple *buf)
Remove and convert 32 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 32-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.

uint32_t net_buf_simple_pull_be32(struct net_buf_simple *buf)
Remove and convert 32 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 32-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from big endian to host endian.

uint64_t net_buf_simple_pull_le48(struct net_buf_simple *buf)
Remove and convert 48 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 48-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.

uint64_t net_buf_simple_pull_be48(struct net_buf_simple *buf)
Remove and convert 48 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 48-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.
Returns
48-bit value converted from big endian to host endian.

```
uint64_t net_buf_simple_pull_le64(struct *buf)
```

Remove and convert 64 bits from the beginning of the buffer.
Same idea as with `net_buf_simple_pull()`, but a helper for operating on 64-bit little endian data.

**Parameters**
- `buf` – A valid pointer on a buffer.

**Returns**
64-bit value converted from little endian to host endian.

```
uint64_t net_buf_simple_pull_be64(struct *buf)
```

Remove and convert 64 bits from the beginning of the buffer.
Same idea as with `net_buf_simple_pull()`, but a helper for operating on 64-bit big endian data.

**Parameters**
- `buf` – A valid pointer on a buffer.

**Returns**
64-bit value converted from big endian to host endian.

```
static inline uint8_t *net_buf_simple_tail(struct *buf)
```

Get the tail pointer for a buffer.
Get a pointer to the end of the data in a buffer.

**Parameters**
- `buf` – Buffer.

**Returns**
Tail pointer for the buffer.

```
size_t net_buf_simple_headroom(struct *buf)
```

Check buffer headroom.
Check how much free space there is in the beginning of the buffer.

`buf` A valid pointer on a buffer

**Returns**
Number of bytes available in the beginning of the buffer.

```
size_t net_buf_simple_tailroom(struct *buf)
```

Check buffer tailroom.
Check how much free space there is at the end of the buffer.

**Parameters**
- `buf` – A valid pointer on a buffer

**Returns**
Number of bytes available at the end of the buffer.

```
uint16_t net_buf_simple_max_len(struct *buf)
```

Check maximum `net_buf_simple::len` value.
This value is depending on the number of bytes being reserved as headroom.

**Parameters**
- `buf` – A valid pointer on a buffer
Returns
Number of bytes usable behind the `net_buf_simple::data` pointer.

```c
static inline void net_buf_simple_save(struct net_buf_simple *buf, struct net_buf_simple_state *state)
```

Save the parsing state of a buffer.
Saves the parsing state of a buffer so it can be restored later.

Parameters
- `buf` – Buffer from which the state should be saved.
- `state` – Storage for the state.

```c
static inline void net_buf_simple_restore(struct net_buf_simple *buf, struct net_buf_simple_state *state)
```

Restore the parsing state of a buffer.
Restores the parsing state of a buffer from a state previously stored by `net_buf_simple_save()`.

Parameters
- `buf` – Buffer to which the state should be restored.
- `state` – Stored state.

```c
struct net_buf_pool *net_buf_pool_get(int id)
```

Looks up a pool based on its ID.

Parameters
- `id` – Pool ID (e.g. from `buf->pool_id`).

Returns
Pointer to pool.

```c
int net_buf_id(struct net_buf *buf)
```

Get a zero-based index for a buffer.

This function will translate a buffer into a zero-based index, based on its placement in its buffer pool. This can be useful if you want to associate an external array of meta-data contexts with the buffers of a pool.

Parameters
- `buf` – Network buffer.

Returns
Zero-based index for the buffer.

```c
struct net_buf *net_buf_alloc_fixed(struct net_buf_pool *pool, k_timeout_t timeout)
```

Allocate a new fixed buffer from a pool.

Parameters
- `pool` – Which pool to allocate the buffer from.
- `timeout` – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for `net_buf_alloc()` to fail (return NULL) even if it was given K_FOREVER.

Returns
New buffer or NULL if out of buffers.
static inline struct net_buf *net_buf_alloc(struct net_buf_pool *pool, k_timeout_t timeout)

Parameters

• pool – Which pool to allocate the buffer from.
• timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for net_buf_alloc() to fail (return NULL) even if it was given K_FOREVER.

Returns

New buffer or NULL if out of buffers.

struct net_buf *net_buf_alloc_len(struct net_buf_pool *pool, size_t size, k_timeout_t timeout)

Allocate a new variable length buffer from a pool.

Parameters

• pool – Which pool to allocate the buffer from.
• size – Amount of data the buffer must be able to fit.
• timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for net_buf_alloc() to fail (return NULL) even if it was given K_FOREVER.

Returns

New buffer or NULL if out of buffers.

struct net_buf *net_buf_alloc_with_data(struct net_buf_pool *pool, void *data, size_t size, k_timeout_t timeout)

Allocate a new buffer from a pool but with external data pointer.

Allocate a new buffer from a pool, where the data pointer comes from the user and not from the pool.

Parameters

• pool – Which pool to allocate the buffer from.
• data – External data pointer
• size – Amount of data the pointed data buffer if able to fit.
• timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for net_buf_alloc() to fail (return NULL) even if it was given K_FOREVER.

Returns

New buffer or NULL if out of buffers.

struct net_buf *net_buf_get(struct k_fifo *fifo, k_timeout_t timeout)

Get a buffer from a FIFO.

This function is NOT thread-safe if the buffers in the FIFO contain fragments.

Parameters

• fifo – Which FIFO to take the buffer from.
• timeout – Affects the action taken should the FIFO be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.
Returns
New buffer or NULL if the FIFO is empty.

static inline void net_buf_destroy(struct net_buf *buf)
Destroy buffer from custom destroy callback.

This helper is only intended to be used from custom destroy callbacks. If no custom destroy
callback is given to NET_BUF_POOL_*_DEFINE() then there is no need to use this API.

Parameters
• buf – Buffer to destroy.

void net_buf_reset(struct net_buf *buf)
Reset buffer.
Reset buffer data and flags so it can be reused for other purposes.

Parameters
• buf – Buffer to reset.

void net_buf_simple_reserve(struct net_buf_simple *buf, size_t reserve)
Initialize buffer with the given headroom.
The buffer is not expected to contain any data when this API is called.

Parameters
• buf – Buffer to initialize.
• reserve – How much headroom to reserve.

void net_buf_slist_put(sys_slist_t *list, struct net_buf *buf)
Put a buffer into a list.
If the buffer contains follow-up fragments this function will take care of inserting them as well
into the list.

Parameters
• list – Which list to append the buffer to.
• buf – Buffer.

struct net_buf *net_buf_slist_get(sys_slist_t *list)
Get a buffer from a list.
If the buffer had any fragments, these will automatically be recovered from the list as well
and be placed to the buffer's fragment list.

Parameters
• list – Which list to take the buffer from.

Returns
New buffer or NULL if the FIFO is empty.

void net_buf_put(struct k_fifo *fifo, struct net_buf *buf)
Put a buffer to the end of a FIFO.
If the buffer contains follow-up fragments this function will take care of inserting them as well
into the FIFO.

Parameters
• fifo – Which FIFO to put the buffer to.
• buf – Buffer.
void net_buf_unref(struct net_buf *buf)
Decrements the reference count of a buffer.

The buffer is put back into the pool if the reference count reaches zero.

Parameters

• buf – A valid pointer on a buffer

struct net_buf *net_buf_ref(struct net_buf *buf)
Increment the reference count of a buffer.

Parameters

• buf – A valid pointer on a buffer

Returns

the buffer newly referenced

struct net_buf *net_buf_clone(struct net_buf *buf, k_timeout_t timeout)
Clone buffer.

Duplicate given buffer including any data and headers currently stored.

Parameters

• buf – A valid pointer on a buffer

• timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Returns

Cloned buffer or NULL if out of buffers.

static inline void *net_buf_user_data(const struct net_buf *buf)
Get a pointer to the user data of a buffer.

Parameters

• buf – A valid pointer on a buffer

Returns

Pointer to the user data of the buffer.

static inline void net_buf_reserve(struct net_buf *buf, size_t reserve)
Initialize buffer with the given headroom.

The buffer is not expected to contain any data when this API is called.

Parameters

• buf – Buffer to initialize.

• reserve – How much headroom to reserve.

static inline void *net_buf_add(struct net_buf *buf, size_t len)
Prepare data to be added at the end of the buffer.

Increments the data length of a buffer to account for more data at the end.

Parameters

• buf – Buffer to update.

• len – Number of bytes to increment the length with.

Returns

The original tail of the buffer.
static inline void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len)
  Copies the given number of bytes to the end of the buffer.
  Increments the data length of the buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- mem – Location of data to be added.
- len – Length of data to be added

Returns
  The original tail of the buffer.

static inline uint8_t *net_buf_add_u8(struct net_buf *buf, uint8_t val)
  Add (8-bit) byte at the end of the buffer.
  Increments the data length of the buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- val – byte value to be added.

Returns
  Pointer to the value added

static inline void net_buf_add_le16(struct net_buf *buf, uint16_t val)
  Add 16-bit value at the end of the buffer.
  Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a
  buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- val – 16-bit value to be added.

static inline void net_buf_add_be16(struct net_buf *buf, uint16_t val)
  Add 16-bit value at the end of the buffer.
  Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a
  buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- val – 16-bit value to be added.

static inline void net_buf_add_le24(struct net_buf *buf, uint32_t val)
  Add 24-bit value at the end of the buffer.
  Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a
  buffer to account for more data at the end.

Parameters
- buf – Buffer to update.
- val – 24-bit value to be added.

static inline void net_buf_add_be24(struct net_buf *buf, uint32_t val)
  Add 24-bit value at the end of the buffer.
  Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a
  buffer to account for more data at the end.
### Parameters
- **buf** – Buffer to update.
- **val** – 24-bit value to be added.

static inline void net_buf_add_le32(struct net_buf *buf, uint32_t val)

Add 32-bit value at the end of the buffer.

*Parameters*
- **buf** – Buffer to update.
- **val** – 32-bit value to be added.

static inline void net_buf_add_be32(struct net_buf *buf, uint32_t val)

Add 32-bit value at the end of the buffer.

*Parameters*
- **buf** – Buffer to update.
- **val** – 32-bit value to be added.

static inline void net_buf_add_le48(struct net_buf *buf, uint64_t val)

Add 48-bit value at the end of the buffer.

*Parameters*
- **buf** – Buffer to update.
- **val** – 48-bit value to be added.

static inline void net_buf_add_be48(struct net_buf *buf, uint64_t val)

Add 48-bit value at the end of the buffer.

*Parameters*
- **buf** – Buffer to update.
- **val** – 48-bit value to be added.

static inline void net_buf_add_le64(struct net_buf *buf, uint64_t val)

Add 64-bit value at the end of the buffer.

*Parameters*
- **buf** – Buffer to update.
- **val** – 64-bit value to be added.
Parameters

- buf – Buffer to update.
- val – 64-bit value to be added.

static inline void *net_buf_remove_mem(struct net_buf *buf, size_t len)
Removes data from the end of the buffer by modifying the buffer length.

Parameters

- buf – Buffer to update.
- len – Number of bytes to remove.

Returns

New end of the buffer data.

static inline uint8_t net_buf_remove_u8(struct net_buf *buf)
Removes a 8-bit value from the end of the buffer.

Same idea as with net_buf_remove_mem(), but a helper for operating on 8-bit values.

Parameters

- buf – A valid pointer on a buffer.

Returns

The 8-bit removed value

static inline uint16_t net_buf_remove_le16(struct net_buf *buf)
Remove and convert 16 bits from the end of the buffer.

Same idea as with net_buf_remove_mem(), but a helper for operating on 16-bit little endian data.

Parameters

- buf – A valid pointer on a buffer.

Returns

16-bit value converted from little endian to host endian.

static inline uint16_t net_buf_remove_be16(struct net_buf *buf)
Remove and convert 16 bits from the end of the buffer.

Same idea as with net_buf_remove_mem(), but a helper for operating on 16-bit big endian data.

Parameters

- buf – A valid pointer on a buffer.

Returns

16-bit value converted from big endian to host endian.

static inline uint32_t net_buf_remove_be24(struct net_buf *buf)
Remove and convert 24 bits from the end of the buffer.

Same idea as with net_buf_remove_mem(), but a helper for operating on 24-bit big endian data.

Parameters

- buf – A valid pointer on a buffer.

Returns

24-bit value converted from big endian to host endian.
static inline uint32_t net_buf_remove_le24(struct net_buf *buf)
Remove and convert 24 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 24-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.

static inline uint32_t net_buf_remove_le32(struct net_buf *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 32-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.

static inline uint32_t net_buf_remove_be32(struct net_buf *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 32-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from big endian to host endian.

static inline uint64_t net_buf_remove_le48(struct net_buf *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 48-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.

static inline uint64_t net_buf_remove_be48(struct net_buf *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 48-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from big endian to host endian.

static inline uint64_t net_buf_remove_le64(struct net_buf *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 64-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.
Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from little endian to host endian.

static inline uint64_t net_buf_remove_be64(struct net_buf *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 64-bit big endian
data.

Parameters
• buf – A valid pointer on a buffer

Returns
64-bit value converted from big endian to host endian.

static inline void *net_buf_push(struct net_buf *buf, size_t len)
Prepare data to be added at the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the
buffer.

Parameters
• buf – Buffer to update.
• len – Number of bytes to add to the beginning.

Returns
The new beginning of the buffer data.

static inline void *net_buf_push_mem(struct net_buf *buf, const void *mem, size_t len)
Copies the given number of bytes to the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the
buffer.

Parameters
• buf – Buffer to update.
• mem – Location of data to be added.
• len – Length of data to be added.

Returns
The new beginning of the buffer data.

static inline void net_buf_push_u8(struct net_buf *buf, uint8_t val)
Push 8-bit value to the beginning of the buffer.
Adds 8-bit value the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 8-bit value to be pushed to the buffer.

static inline void net_buf_push_le16(struct net_buf *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.
Adds 16-bit value in little endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• \texttt{val} – 16-bit value to be pushed to the buffer.

\begin{verbatim}
static inline void net_buf_push_be16(struct net_buf *buf, uint16_t val)
    Push 16-bit value to the beginning of the buffer.
    Adds 16-bit value in big endian format to the beginning of the buffer.

  Parameters
  • \texttt{buf} – Buffer to update.
  • \texttt{val} – 16-bit value to be pushed to the buffer.
\end{verbatim}

\begin{verbatim}
static inline void net_buf_push_le24(struct net_buf *buf, uint32_t val)
    Push 24-bit value to the beginning of the buffer.
    Adds 24-bit value in little endian format to the beginning of the buffer.

  Parameters
  • \texttt{buf} – Buffer to update.
  • \texttt{val} – 24-bit value to be pushed to the buffer.
\end{verbatim}

\begin{verbatim}
static inline void net_buf_push_be24(struct net_buf *buf, uint32_t val)
    Push 24-bit value to the beginning of the buffer.
    Adds 24-bit value in big endian format to the beginning of the buffer.

  Parameters
  • \texttt{buf} – Buffer to update.
  • \texttt{val} – 24-bit value to be pushed to the buffer.
\end{verbatim}

\begin{verbatim}
static inline void net_buf_push_le32(struct net_buf *buf, uint32_t val)
    Push 32-bit value to the beginning of the buffer.
    Adds 32-bit value in little endian format to the beginning of the buffer.

  Parameters
  • \texttt{buf} – Buffer to update.
  • \texttt{val} – 32-bit value to be pushed to the buffer.
\end{verbatim}

\begin{verbatim}
static inline void net_buf_push_be32(struct net_buf *buf, uint32_t val)
    Push 32-bit value to the beginning of the buffer.
    Adds 32-bit value in big endian format to the beginning of the buffer.

  Parameters
  • \texttt{buf} – Buffer to update.
  • \texttt{val} – 32-bit value to be pushed to the buffer.
\end{verbatim}

\begin{verbatim}
static inline void net_buf_push_le48(struct net_buf *buf, uint64_t val)
    Push 48-bit value to the beginning of the buffer.
    Adds 48-bit value in little endian format to the beginning of the buffer.

  Parameters
  • \texttt{buf} – Buffer to update.
  • \texttt{val} – 48-bit value to be pushed to the buffer.
\end{verbatim}

6.2. Networking
static inline void net_buf_push_be48(struct net_buf *buf, uint64_t val)
  Push 48-bit value to the beginning of the buffer.
  Adds 48-bit value in big endian format to the beginning of the buffer.

Parameters
  • buf – Buffer to update.
  • val – 48-bit value to be pushed to the buffer.

static inline void net_buf_push_le64(struct net_buf *buf, uint64_t val)
  Push 64-bit value to the beginning of the buffer.
  Adds 64-bit value in little endian format to the beginning of the buffer.

Parameters
  • buf – Buffer to update.
  • val – 64-bit value to be pushed to the buffer.

static inline void net_buf_push_be64(struct net_buf *buf, uint64_t val)
  Push 64-bit value to the beginning of the buffer.
  Adds 64-bit value in big endian format to the beginning of the buffer.

Parameters
  • buf – Buffer to update.
  • val – 64-bit value to be pushed to the buffer.

static inline void *net_buf_pull(struct net_buf *buf, size_t len)
  Remove data from the beginning of the buffer.
  Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

Parameters
  • buf – Buffer to update.
  • len – Number of bytes to remove.

Returns
  New beginning of the buffer data.

static inline void *net_buf_pull_mem(struct net_buf *buf, size_t len)
  Remove data from the beginning of the buffer.
  Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

Parameters
  • buf – Buffer to update.
  • len – Number of bytes to remove.

Returns
  Pointer to the old beginning of the buffer data.

static inline uint8_t net_buf_pull_u8(struct net_buf *buf)
  Remove a 8-bit value from the beginning of the buffer.
  Same idea as with net_buf_pull(), but a helper for operating on 8-bit values.

Parameters
  • buf – A valid pointer on a buffer.
Returns
The 8-bit removed value

static inline uint16_t net_buf_pull_le16(struct net_buf *buf)
Remove and convert 16 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 16-bit little endian data.
Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from little endian to host endian.

static inline uint16_t net_buf_pull_be16(struct net_buf *buf)
Remove and convert 16 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 16-bit big endian data.
Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.

static inline uint32_t net_buf_pull_le24(struct net_buf *buf)
Remove and convert 24 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 24-bit little endian data.
Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from big endian to host endian.

static inline uint32_t net_buf_pull_be24(struct net_buf *buf)
Remove and convert 24 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 24-bit big endian data.
Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.

static inline uint32_t net_buf_pull_le32(struct net_buf *buf)
Remove and convert 32 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 32-bit little endian data.
Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from big endian to host endian.

static inline uint32_t net_buf_pull_be32(struct net_buf *buf)
Remove and convert 32 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 32-bit big endian data.
Parameters
• buf – A valid pointer on a buffer
Returns
32-bit value converted from big endian to host endian.

static inline uint64_t net_buf_pull_le48(struct net_buf *buf)
Remove and convert 48 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 48-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.

static inline uint64_t net_buf_pull_be48(struct net_buf *buf)
Remove and convert 48 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 48-bit big endian data.

Parameters
• buf – A valid pointer on a buffer

Returns
64-bit value converted from big endian to host endian.

static inline uint64_t net_buf_pull_le64(struct net_buf *buf)
Remove and convert 64 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 64-bit little endian data.

Parameters
• buf – A valid pointer on a buffer

Returns
64-bit value converted from little endian to host endian.

static inline uint64_t net_buf_pull_be64(struct net_buf *buf)
Remove and convert 64 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 64-bit big endian data.

Parameters
• buf – A valid pointer on a buffer

Returns
Check buffer tailroom.
Check how much free space there is at the end of the buffer.

Parameters
• buf – A valid pointer on a buffer

Returns
Number of bytes available at the end of the buffer.

static inline size_t net_buf_tailroom(struct net_buf *buf)
Check buffer headroom.
Check how much free space there is in the beginning of the buffer.

buf A valid pointer on a buffer
Returns
Number of bytes available in the beginning of the buffer.

static inline uint16_t net_buf_max_len(struct net_buf *buf)
Check maximum net_buf::len value.
This value is depending on the number of bytes being reserved as headroom.

Parameters
• buf – A valid pointer on a buffer

Returns
Number of bytes usable behind the net_buf::data pointer.

static inline uint8_t *net_buf_tail(struct net_buf *buf)
Get the tail pointer for a buffer.
Get a pointer to the end of the data in a buffer.

Parameters
• buf – Buffer.

Returns
Tail pointer for the buffer.

struct net_buf *net_buf_frag_last(struct net_buf *frags)
Find the last fragment in the fragment list.

Returns
Pointer to last fragment in the list.

void net_buf_frag_insert(struct net_buf *parent, struct net_buf *frag)
Insert a new fragment to a chain of bufs.
Insert a new fragment into the buffer fragments list after the parent.
Note: This function takes ownership of the fragment reference so the caller is not required to unref.

Parameters
• parent – Parent buffer/fragment.
• frag – Fragment to insert.

struct net_buf *net_buf_frag_add(struct net_buf *head, struct net_buf *frag)
Add a new fragment to the end of a chain of bufs.
Append a new fragment into the buffer fragments list after the parent.
Note: This function takes ownership of the fragment reference so the caller is not required to unref.

Parameters
• head – Head of the fragment chain.
• frag – Fragment to add.

Returns
New head of the fragment chain. Either head (if head was non-NULL) or frag (if head was NULL).

struct net_buf *net_buf_frag_del(struct net_buf *parent, struct net_buf *frag)
Delete existing fragment from a chain of bufs.

Parameters
• parent – Parent buffer/fragment, or NULL if there is no parent.
• `frag` – Fragment to delete.

**Returns**

Pointer to the buffer following the fragment, or NULL if it had no further fragments.

```c
size_t net_buf_linearize(void *dst, size_t dst_len, struct net_buf *src, size_t offset, size_t len)
```

Copy bytes from `net_buf` chain starting at offset to linear buffer.

Copy (extract) `len` bytes from src `net_buf` chain, starting from `offset` in it, to a linear buffer `dst`. Return number of bytes actually copied, which may be less than requested, if `net_buf` chain doesn't have enough data, or destination buffer is too small.

**Parameters**

- `dst` – Destination buffer
- `dst_len` – Destination buffer length
- `src` – Source `net_buf` chain
- `offset` – Starting offset to copy from
- `len` – Number of bytes to copy

**Returns**

number of bytes actually copied

```c
size_t net_buf_append_bytes(struct net_buf *buf, size_t len, const void *value, k_timeout_t timeout, net_buf_allocator_cb allocate_cb, void *user_data)
```

Append data to a list of `net_buf`. If there is not enough space in the `net_buf` then more `net_buf` will be added, unless there are no free `net_buf` and timeout occurs. If not allocator is provided it attempts to allocate from the same pool as the original buffer.

**Parameters**

- `buf` – Network buffer.
- `len` – Total length of input data
- `value` – Data to be added
- `timeout` – Timeout is passed to the `net_buf` allocator callback.
- `allocate_cb` – When a new `net_buf` is required, use this callback.
- `user_data` – A user data pointer to be supplied to the `allocate_cb`. This pointer is can be anything from a mem_pool or a `net_pkt`, the logic is left up to the `allocate_cb` function.

**Returns**

Length of data actually added. This may be less than input length if other timeout than K_FOREVER was used, and there were no free fragments in a pool to accommodate all data.

```c
static inline struct net_buf *net_buf_skip(struct net_buf *buf, size_t len)
```

Skip N number of bytes in a `net_buf`.

Skip N number of bytes starting from fragment's offset. If the total length of data is placed in multiple fragments, this function will skip from all fragments until it reaches N number of bytes. Any fully skipped buffers are removed from the `net_buf` list.

**Parameters**

- `buf` – Network buffer.
- `len` – Total length of data to be skipped.
Returns

Pointer to the fragment or NULL and pos is 0 after successful skip, NULL and pos is 0xffff otherwise.

static inline size_t net_buf_frags_len(struct net_buf *buf)
Calculate amount of bytes stored in fragments.
Calculates the total amount of data stored in the given buffer and the fragments linked to it.

Parameters

• buf – Buffer to start off with.

Returns

Number of bytes in the buffer and its fragments.

struct net_buf_simple

#include <buf.h> Simple network buffer representation.
This is a simpler variant of the net_buf object (in fact net_buf uses net_buf_simple internally).
It doesn’t provide any kind of reference counting, user data, dynamic allocation, or in general
the ability to pass through kernel objects such as FIFOs.
The main use of this is for scenarios where the meta-data of the normal net_buf isn’t needed
and causes too much overhead. This could be e.g. when the buffer only needs to be allocated
on the stack or when the access to and lifetime of the buffer is well controlled and constrained.

Public Members

uint8_t *data
Pointer to the start of data in the buffer.

uint16_t len
Length of the data behind the data pointer.
To determine the max length, use net_buf_simple_max_len(), not size!

uint16_t size
Amount of data that net_buf_simple::__buf can store.

struct net_buf_simple_state

#include <buf.h> Parsing state of a buffer.
This is used for temporarily storing the parsing state of a buffer while giving control of the
parsing to a routine which we don’t control.

Public Members

uint16_t offset
Offset of the data pointer from the beginning of the storage

uint16_t len
Length of data
struct net_buf

#include <buf.h> Network buffer representation.

This struct is used to represent network buffers. Such buffers are normally defined through
the NET_BUF_POOL_*_DEFINE() APIs and allocated using the net_buf_alloc() API.

Public Members

sys_snodet node
	Allow placing the buffer into sys_slist_t

struct net_buf *frags
	Fragments associated with this buffer.

uint8_t ref
	Reference count.

uint8_t flags
	Bit-field of buffer flags.

uint8_t pool_id
	Where the buffer should go when freed up.

uint8_t *data
	Pointer to the start of data in the buffer.

uint16_t len
	Length of the data behind the data pointer.

uint16_t size
	Amount of data that this buffer can store.

uint8_t user_data[]
	System metadata for this buffer.

struct net_buf_data_cb

#include <buf.h>

struct net_buf_data_alloc

#include <buf.h>

struct net_buf_pool

#include <buf.h> Network buffer pool representation.

This struct is used to represent a pool of network buffers.

Public Members
struct k_lifo free
    LIFO to place the buffer into when free

const uint16_t buf_count
    Number of buffers in pool

uint16_t uninit_count
    Number of uninitialized buffers

void (*const destroy)(struct net_buf *buf)
    Optional destroy callback when buffer is freed.

const struct net_buf_data_alloc *alloc
    Data allocation handlers.

struct net_buf_pool_fixed
    #include <buf.h>

Packet Management

  - Data access

- **API Reference**

**Overview**  Network packets are the main data the networking stack manipulates. Such data is repre-
sented through the net_pkt structure which provides a means to hold the packet, write and read it, as
well as necessary metadata for the core to hold important information. Such an object is called net_pkt
in this document.

The data structure and the whole API around it are defined in include/zephyr/net/net_pkt.h.

**Architectural notes**  There are two network packets flows within the stack, TX for the transmission
path, and RX for the reception one. In both paths, each net_pkt is written and read from the beginning
to the end, or more specifically from the headers to the payload.

**Memory management**
**Allocation** All net_pkt objects come from a pre-defined pool of struct net_pkt. Such pool is defined via

\[ \text{NET_PKT_SLAB_DEFINE(name, count)} \]

Note, however, one will rarely have to use it, as the core provides already two pools, one for the TX path and one for the RX path.

Allocating a raw net_pkt can be done through:

```c
pkt = net_pkt_alloc(timeout);
```

However, by its nature, a raw net_pkt is useless without a buffer and needs various metadata information to become relevant as well. It requires at least to get the network interface it is meant to be sent through or through which it was received. As this is a very common operation, a helper exist:

```c
pkt = net_pkt_alloc_on_iface(iface, timeout);
```

A more complete allocator exists, where both the net_pkt and its buffer can be allocated at once:

```c
pkt = net_pkt_alloc_with_buffer(iface, size, family, proto, timeout);
```

See below how the buffer is allocated.

**Buffer allocation** The net_pkt object does not define its own buffer, but instead uses an existing object for this: \( \text{net_buf} \). (See Network Buffer for more information). However, it mostly hides the usage of such a buffer because net_pkt brings network awareness to buffer allocation and, as we will see later, its operation too.

To allocate a buffer, a net_pkt needs to have at least its network interface set. This works if the family of the packet is unknown at the time of buffer allocation. Then one could do:

```c
net_pkt_alloc_buffer(pkt, size, proto, timeout);
```

Where proto could be 0 if unknown (there is no IPPROTO_UNSPEC).

As seen previously, the net_pkt and its buffer can be allocated at once via \( \text{net_pkt_alloc_with_buffer()} \). It is actually the most widely used allocator.

The network interface, the family, and the protocol of the packet are used by the buffer allocation to determine if the requested size can be allocated. Indeed, the allocator will use the network interface to know the MTU and then the family and protocol for the headers space (if only these 2 are specified). If the whole fits within the MTU, the allocated space will be of the requested size plus, eventually, the headers space. If there is insufficient MTU space, the requested size will be shrunk so the possible headers space and new size will fit within the MTU.

For instance, on an Ethernet network interface, with an MTU of 1500 bytes:

```c
pkt = net_pkt_alloc_with_buffer(iface, 800, AF_INET4, IPPROTO_UDP, K_FOREVER);
```

will successfully allocate 800 + 20 + 8 bytes of buffer for the new net_pkt where:

```c
pkt = net_pkt_alloc_with_buffer(iface, 1600, AF_INET4, IPPROTO_UDP, K_FOREVER);
```

will successfully allocate 1500 bytes, and where 20 + 8 bytes (IPv4 + UDP headers) will not be used for the payload.

On the receiving side, when the family and protocol are not known:

```c
pkt = net_pkt_rx_alloc_with_buffer(iface, 800, AF_UNSPEC, 0, K_FOREVER);
```

will allocate 800 bytes and no extra header space. But a:
will allocate 1514 bytes, the MTU + Ethernet header space.

One can increase the amount of buffer space allocated by calling `net_pkt_alloc_buffer()`, as it will take into account the existing buffer. It will also account for the header space if net_pkt's family is a valid one, as well as the proto parameter. In that case, the newly allocated buffer space will be appended to the existing one, and not inserted in the front. Note however such a use case is rather limited. Usually, one should know from the start how much size should be requested.

**Deallocation**  Each net_pkt is reference counted. At allocation, the reference is set to 1. The reference count can be incremented with `net_pkt_ref()` or decremented with `net_pkt_unref()`. When the count drops to zero the buffer is also un-referenced and net_pkt is automatically placed back into the free net_pkt_slabs

If net_pkt's buffer is needed even after net_pkt deallocation, one will need to reference once more all the chain of net_buf before calling last net_pkt_unref. See Network Buffer for more information.

**Operations**  There are two ways to access the net_pkt buffer, explained in the following sections: basic read/write access and data access, the latter being the preferred way.

**Read and Write access**  As said earlier, though net_pkt uses net_buf for its buffer, it provides its own API to access it. Indeed, a network packet might be scattered over a chain of net_buf objects, the functions provided by net_buf are then limited for such case. Instead, net_pkt provides functions which hide all the complexity of potential non-contiguous access.

Data movement into the buffer is made through a cursor maintained within each net_pkt. All read/write operations affect this cursor. Note as well that read or write functions are strict on their length parameters: if it cannot r/w the given length it will fail. Length is not interpreted as an upper limit, it is instead the exact amount of data that must be read or written.

As there are two paths, TX and RX, there are two access modes: write and overwrite. This might sound a bit unusual, but is in fact simple and provides flexibility.

In write mode, whatever is written in the buffer affects the length of actual data present in the buffer. Buffer length should not be confused with the buffer size which is a limit any mode cannot pass. In overwrite mode then, whatever is written must happen on valid data, and will not affect the buffer length. By default, a newly allocated net_pkt is on write mode, and its cursor points to the beginning of its buffer.

Let's see now, step by step, the functions and how they behave depending on the mode.

When freshly allocated with a buffer of 500 bytes, a net_pkt has 0 length, which means no valid data is in its buffer. One could verify this by:

```
len = net_pkt_get_len(pkt);
```

Now, let's write 8 bytes:

```
net_pkt_write(pkt, data, 8);
```

The buffer length is now 8 bytes. There are various helpers to write a byte, or big endian uint16_t, uint32_t.

```
net_pkt_write_u8(pkt, &foo);
net_pkt_write_be16(pkt, &ba);
net_pkt_write_be32(pkt, &bar);
```
Logically, net_pkt's length is now 15. But if we try to read at this point, it will fail because there is nothing to read at the cursor where we are at in the net_pkt. It is possible, while in write mode, to read what has been already written by resetting the cursor of the net_pkt. For instance:

```c
net_pkt_cursor_init(pkt);
net_pkt_read(pkt, data, 15);
```

This will reset the cursor of the pkt to the beginning of the buffer and then let you read the actual 15 bytes present. The cursor is then again pointing at the end of the buffer.

To set a large area with the same byte, a memset function is provided:

```c
net_pkt_memset(pkt, 0, 5);
```

Our net_pkt has now a length of 20 bytes.

Switching between modes can be achieved via `net_pkt_set_overwrite()` function. It is possible to switch mode back and forth at any time. The net_pkt will be set to overwrite and its cursor reset:

```c
net_pkt_set_overwrite(pkt, true);
net_pkt_cursor_init(pkt);
```

Now the same operators can be used, but it will be limited to the existing data in the buffer, i.e. 20 bytes. If it is necessary to know how much space is available in the net_pkt call:

```c
net_pkt_available_buffer(pkt);
```

Or, if headers space needs to be accounted for, call:

```c
net_pkt_available_payload_buffer(pkt, proto);
```

If you want to place the cursor at a known position use the function `net_pkt_skip()`. For example, to go after the IP header, use:

```c
net_pkt_cursor_init(pkt);
net_pkt_skip(pkt, net_pkt_ip_header_len(pkt));
```

Data access Though the API shown previously is rather simple, it involves always copying things to and from the net_pkt buffer. In many occasions, it is more relevant to access the information stored in the buffer contiguously, especially with network packets which embed headers.

These headers are, most of the time, a known fixed set of bytes. It is then more natural to have a structure representing a certain type of header. In addition to this, if it is known the header size appears in a contiguous area of the buffer, it will be way more efficient to cast the actual position in the buffer to the type of header. Either for reading or writing the fields of such header, accessing it directly will save memory.

Net pkt comes with a dedicated API for this, built on top of the previously described API. It is able to handle both contiguous and non-contiguous access transparently.

There are two macros used to define a data access descriptor: `NET_PKT_DATA_ACCESS_DEFINE` when it is not possible to tell if the data will be in a contiguous area, and `NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE` when it is guaranteed the data is in a contiguous area.

Let's take the example of IP and UDP. Both IPv4 and IPv6 headers are always found at the beginning of the packet and are small enough to fit in a net_buf of 128 bytes (for instance, though 64 bytes could be chosen).
It would be the same for struct net_ipv4_hdr. For a UDP header it is likely not to be in a contiguous area in IPv6 for instance so:

```c
NET_PKT_DATA_ACCESS_DEFINE(udp_access, struct net_udp_hdr);
struct net_udp_hdr *udp_hdr;
udp_hdr = (struct net_udp_hdr *)net_pkt_get_data(pkt, &udp_access);
```

At this point, the cursor of the net_pkt points at the beginning of the requested data. On the RX path, these headers will be read but not modified so to proceed further the cursor needs to advance past the data. There is a function dedicated for this:

```c
net_pkt_acknowledge_data(pkt, &ipv4_access);
```

On the TX path, however, the header fields have been modified. In such a case:

```c
net_pkt_set_data(pkt, &ipv4_access);
```

If the data are in a contiguous area, it will advance the cursor relevantly. If not, it will write the data and the cursor will be updated. Note that `net_pkt_set_data()` could be used in the RX path as well, but it is slightly faster to use `net_pkt_acknowledge_data()` as this one does not care about contiguity at all, it just advances the cursor via `net_pkt_skip()` directly.

### API Reference

#### group net_pkt

Network packet management library.

#### Defines

**NET_PKT_SLAB_DEFINE(name, count)**

Create a net_pkt slab.

A net_pkt slab is used to store meta-information about network packets. It must be coupled with a data fragment pool (:macro:`NET_PKT_DATA_POOL_DEFINE`) used to store the actual packet data. The macro can be used by an application to define additional custom per-context TX packet slabs (see :func:`net_context_setup_pools`).

**Parameters**

- `name` – Name of the slab.
- `count` – Number of net_pkt in this slab.

**NET_PKT_TX_SLAB_DEFINE(name, count)**

Create a data fragment net_buf pool.

A net_buf pool is used to store actual data for network packets. It must be coupled with a net_pkt slab (:macro:`NET_PKT_SLAB_DEFINE`) used to store the packet meta-information. The macro can be used by an application to define additional custom per-context TX packet pools (see :func:`net_context_setup_pools`).

**Parameters**

6.2. Networking 1867
• name – Name of the pool.
• count – Number of net_buf in this pool.

net_pkt_print_frags(pkt)
Print fragment list and the fragment sizes.
Only available if debugging is activated.

Parameters
• pkt – Network pkt.

NET_PKT_DATA_ACCESS_DEFINE(_name, _type)
NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE(_name, _type)

Functions

struct net_buf *net_pkt_get_reserve_rx_data(size_t min_len, k_timeout_t timeout)
Get RX DATA buffer from pool. Normally you should use net_pkt_get_frag() instead.
Normally this version is not useful for applications but is mainly used by network fragmenta-
tion code.

Parameters
• min_len – Minimum length of the requested fragment.
• timeout – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns
Network buffer if successful, NULL otherwise.

struct net_buf *net_pkt_get_reserve_tx_data(size_t min_len, k_timeout_t timeout)
Get TX DATA buffer from pool. Normally you should use net_pkt_get_frag() instead.
Normally this version is not useful for applications but is mainly used by network fragmenta-
tion code.

Parameters
• min_len – Minimum length of the requested fragment.
• timeout – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns
Network buffer if successful, NULL otherwise.

struct net_buf *net_pkt_get_frag(struct net_pkt *pkt, size_t min_len, k_timeout_t timeout)
Get a data fragment that might be from user specific buffer pool or from global DATA pool.

Parameters
• pkt – Network packet.
• min_len – Minimum length of the requested fragment.
• timeout – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns
Network buffer if successful, NULL otherwise.
void net_pkt_unref(struct net_pkt *pkt)
Place packet back into the available packets slab.
Releases the packet to other use. This needs to be called by application after it has finished with the packet.

Parameters
• pkt – Network packet to release.

struct net_pkt *net_pkt_ref(struct net_pkt *pkt)
Increase the packet ref count.
Mark the packet to be used still.

Parameters
• pkt – Network packet to ref.

Returns
Network packet if successful, NULL otherwise.

struct net_buf *net_pkt_frag_ref(struct net_buf *frag)
Increase the packet fragment ref count.
Mark the fragment to be used still.

Parameters
• frag – Network fragment to ref.

Returns
a pointer on the referenced Network fragment.

void net_pkt_frag_unref(struct net_buf *frag)
Decrease the packet fragment ref count.

Parameters
• frag – Network fragment to unref.

struct net_buf *net_pkt_frag_del(struct net_pkt *pkt, struct net_buf *parent, struct net_buf *frag)
Delete existing fragment from a packet.

Parameters
• pkt – Network packet from which frag belongs to.
• parent – parent fragment of frag, or NULL if none.
• frag – Fragment to delete.

Returns
Pointer to the following fragment, or NULL if it had no further fragments.

void net_pkt_frag_add(struct net_pkt *pkt, struct net_buf *frag)
Add a fragment to a packet at the end of its fragment list.

Parameters
• pkt – pkt Network packet where to add the fragment
• frag – Fragment to add

void net_pkt_frag_insert(struct net_pkt *pkt, struct net_buf *frag)
Insert a fragment to a packet at the beginning of its fragment list.

Parameters
• pkt – pkt Network packet where to insert the fragment
void net_pkt_compact(struct net_pkt *pkt)
Compact the fragment list of a packet.
After this there is no more any free space in individual fragments.

Parameters
• pkt – Network packet.

void net_pkt_get_info(struct k_mem_slab **rx, struct k_mem_slab **tx, struct net_buf_pool **rx_data, struct net_buf_pool **tx_data)
Get information about predefined RX, TX and DATA pools.

Parameters
• rx – Pointer to RX pool is returned.
• tx – Pointer to TX pool is returned.
• rx_data – Pointer to RX DATA pool is returned.
• tx_data – Pointer to TX DATA pool is returned.

struct net_pkt *net_pkt_alloc(k_timeout_t timeout)
Allocate an initialized net_pkt.
for the time being, 2 pools are used. One for TX and one for RX. This allocator has to be used for TX.

Parameters
• timeout – Maximum time to wait for an allocation.

Returns
a pointer to a newly allocated net_pkt on success, NULL otherwise.

struct net_pkt *net_pkt_alloc_from_slab(struct k_mem_slab *slab, k_timeout_t timeout)
Allocate an initialized net_pkt from a specific slab.
unlike net_pkt_alloc() which uses core slabs, this one will use an external slab (see NET_PKT_SLAB_DEFINE()). Do not use it unless you know what you are doing. Basically, only net_context should be using this, in order to allocate packet and then buffer on its local slab/pool (if any).

Parameters
• slab – The slab to use for allocating the packet
• timeout – Maximum time to wait for an allocation.

Returns
a pointer to a newly allocated net_pkt on success, NULL otherwise.

struct net_pkt *net_pkt_rx_alloc(k_timeout_t timeout)
Allocate an initialized net_pkt for RX.
for the time being, 2 pools are used. One for TX and one for RX. This allocator has to be used for RX.

Parameters
• timeout – Maximum time to wait for an allocation.

Returns
a pointer to a newly allocated net_pkt on success, NULL otherwise.
Allocate a network packet for a specific network interface.

**Parameters**
- `iface` – The network interface the packet is supposed to go through.
- `timeout` – Maximum time to wait for an allocation.

**Returns**
a pointer to a newly allocated `net_pkt` on success, NULL otherwise.

Allocate buffer for a `net_pkt`.

: such allocator will take into account space necessary for headers, MTU, and existing buffer (if any). Beware that, due to all these criteria, the allocated size might be smaller/bigger than requested one.

**Parameters**
- `pkt` – The network packet requiring buffer to be allocated.
- `size` – The size of buffer being requested.
- `proto` – The IP protocol type (can be 0 for none).
- `timeout` – Maximum time to wait for an allocation.

**Returns**
0 on success, negative errno code otherwise.

Allocate a network packet and buffer at once.

**Parameters**
- `iface` – The network interface the packet is supposed to go through.
- `size` – The size of buffer.
- `family` – The family to which the packet belongs.
- `proto` – The IP protocol type (can be 0 for none).
- `timeout` – Maximum time to wait for an allocation.

**Returns**
a pointer to a newly allocated `net_pkt` on success, NULL otherwise.

Append a buffer in packet.

**Parameters**
- `pkt` – Network packet where to append the buffer
- `buffer` – Buffer to append

6.2. Networking
size_t net_pkt_available_buffer(struct net_pkt *pkt)
Get available buffer space from a pkt.

Note: Reserved bytes (headroom) in any of the fragments are not considered to be available.

Parameters
• pkt – The net_pkt which buffer availability should be evaluated

Returns
the amount of buffer available

size_t net_pkt_available_payload_buffer(struct net_pkt *pkt, enum net_ip_protocol proto)
Get available buffer space for payload from a pkt.

Unlike net_pkt_available_buffer(), this will take into account the headers space.

Note: Reserved bytes (headroom) in any of the fragments are not considered to be available.

Parameters
• pkt – The net_pkt which payload buffer availability should be evaluated
• proto – The IP protocol type (can be 0 for none).

Returns
the amount of buffer available for payload

void net_pkt_trim_buffer(struct net_pkt *pkt)
Trim net_pkt buffer.
This will basically check for unused buffers and deallocate them relevantly

Parameters
• pkt – The net_pkt which buffer will be trimmed

int net_pkt_remove_tail(struct net_pkt *pkt, size_t length)
Remove length bytes from tail of packet.
This function does not take packet cursor into account. It is a helper to remove unneeded bytes from tail of packet (like appended CRC). It takes care of buffer deallocation if removed bytes span whole buffer(s).

Parameters
• pkt – Network packet
• length – Number of bytes to be removed

Return values
• 0 – On success.
• -EINVAL – If packet length is shorter than length.

void net_pkt_cursor_init(struct net_pkt *pkt)
Initialize net_pkt cursor.
This will initialize the net_pkt cursor from its buffer.

Parameters
• pkt – The net_pkt whose cursor is going to be initialized

static inline void net_pkt_cursor_backup(struct net_pkt *pkt, struct net_pkt_cursor *backup)
Backup net_pkt cursor.

Parameters
• pkt – The net_pkt whose cursor is going to be backed up
• backup – The cursor where to backup net_pkt cursor

static inline void net_pkt_cursor_restore(struct net_pkt *pkt, struct net_pkt_cursor *backup)
Restore net_pkt cursor from a backup.

Parameters
• pkt – The net_pkt whose cursor is going to be restored
• backup – The cursor from where to restore net_pkt cursor

static inline void *net_pkt_cursor_get_pos(struct net_pkt *pkt)
Returns current position of the cursor.

Parameters
• pkt – The net_pkt whose cursor position is going to be returned

Returns
cursor’s position

int net_pkt_skip(struct net_pkt *pkt, size_t length)
Skip some data from a net_pkt.
net_pkt’s cursor should be properly initialized Cursor position will be updated after the operation. Depending on the value of pkt->overwrite bit, this function will affect the buffer length or not. If it’s true, it will advance the cursor to the requested length. If it’s false, it will do the same but if the cursor was already also at the end of existing data, it will increment the buffer length. So in this case, its behavior is just like net_pkt_write or net_pkt_memset, difference being that it will not affect the buffer content itself (which may be just garbage then).

Parameters
• pkt – The net_pkt whose cursor will be updated to skip given amount of data from the buffer.
• length – Amount of data to skip in the buffer

Returns
0 in success, negative errno code otherwise.

int net_pkt_memset(struct net_pkt *pkt, int byte, size_t length)
Memset some data in a net_pkt.
net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The net_pkt whose buffer to fill starting at the current cursor position.
• byte – The byte to write in memory
• length – Amount of data to memset with given byte

Returns
0 in success, negative errno code otherwise.
int net_pkt_copy(struct net_pkt *pkt_dst, struct net_pkt *pkt_src, size_t length)

Copy data from a packet into another one.

Both net_pkt cursors should be properly initialized and, if needed, positioned using net_pkt_skip. The cursors will be updated after the operation.

Parameters

• pkt_dst – Destination network packet.
• pkt_src – Source network packet.
• length – Length of data to be copied.

Returns

0 on success, negative errno code otherwise.

struct net_pkt *net_pkt_clone(struct net_pkt *pkt, k_timeout_t timeout)

Clone pkt and its buffer. The cloned packet will be allocated on the same pool as the original one.

Parameters

• pkt – Original pkt to be cloned
• timeout – Timeout to wait for free buffer

Returns

NULL if error, cloned packet otherwise.

struct net_pkt *net_pkt_rx_clone(struct net_pkt *pkt, k_timeout_t timeout)

Clone pkt and its buffer. The cloned packet will be allocated on the RX packet poll.

Parameters

• pkt – Original pkt to be cloned
• timeout – Timeout to wait for free buffer

Returns

NULL if error, cloned packet otherwise.

struct net_pkt *net_pkt_shallow_clone(struct net_pkt *pkt, k_timeout_t timeout)

Clone pkt and increase the refcount of its buffer.

Parameters

• pkt – Original pkt to be shallow cloned
• timeout – Timeout to wait for free packet

Returns

NULL if error, cloned packet otherwise.

int net_pkt_read(struct net_pkt *pkt, void *data, size_t length)

Read some data from a net_pkt.

net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

• pkt – The network packet from where to read some data
• data – The destination buffer where to copy the data
• length – The amount of data to copy

Returns

0 on success, negative errno code otherwise.
```c
static inline int net_pkt_read_u8(struct net_pkt *pkt, uint8_t *data)

int net_pkt_read_be16(struct net_pkt *pkt, uint16_t *data)
    Read uint16_t big endian data from a net_pkt.
    net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip.
    Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to read
• data – The destination uint16_t where to copy the data

Returns
  0 on success, negative errno code otherwise.

int net_pkt_read_le16(struct net_pkt *pkt, uint16_t *data)
    Read uint16_t little endian data from a net_pkt.
    net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip.
    Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to read
• data – The destination uint16_t where to copy the data

Returns
  0 on success, negative errno code otherwise.

int net_pkt_read_be32(struct net_pkt *pkt, uint32_t *data)
    Read uint32_t big endian data from a net_pkt.
    net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip.
    Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to read
• data – The destination uint32_t where to copy the data

Returns
  0 on success, negative errno code otherwise.

int net_pkt_write(const void *data, size_t length)
    Write data into a net_pkt.
    net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip.
    Cursor position will be updated after the operation.

Parameters
• pkt – The network packet where to write
• data – Data to be written
• length – Length of the data to be written

Returns
  0 on success, negative errno code otherwise.

static inline int net_pkt_write_u8(struct net_pkt *pkt, uint8_t data)
static inline int net_pkt_write_be16(struct net_pkt *pkt, uint16_t data)
static inline int net_pkt_write_be32(struct net_pkt *pkt, uint32_t data)
```
static inline int net_pkt_write_le32(struct net_pkt *pkt, uint32_t data)
static inline int net_pkt_write_le16(struct net_pkt *pkt, uint16_t data)
size_t net_pkt_remaining_data(struct net_pkt *pkt)

Get the amount of data which can be read from current cursor position.

Parameters
• pkt – Network packet

Returns
Amount of data which can be read from current pkt cursor

int net_pkt_update_length(struct net_pkt *pkt, size_t length)

Update the overall length of a packet.

Unlike net_pkt_pull() below, this does not take packet cursor into account. It’s mainly a helper
dedicated for ipv4 and ipv6 input functions. It shrinks the overall length by given parameter.

Parameters
• pkt – Network packet
• length – The new length of the packet

Returns
0 on success, negative errno code otherwise.

int net_pkt_pull(struct net_pkt *pkt, size_t length)

Remove data from the packet at current location.

net_pkt’s cursor should be properly initialized and, eventually, properly positioned using
net_pkt_skip/read/write. Note that net_pkt’s cursor is reset by this function.

Parameters
• pkt – Network packet
• length – Number of bytes to be removed

Returns
0 on success, negative errno code otherwise.

uint16_t net_pkt_get_current_offset(struct net_pkt *pkt)

Get the actual offset in the packet from its cursor.

Parameters
• pkt – Network packet.

Returns
a valid offset on success, 0 otherwise as there is nothing that can be done to
evaluate the offset.

bool net_pkt_is_contiguous(struct net_pkt *pkt, size_t size)

Check if a data size could fit contiguously.

net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip.

Parameters
• pkt – Network packet.
• size – The size to check for contiguity

Returns
true if that is the case, false otherwise.
size_t net_pkt_get_contiguous_len(struct net_pkt *pkt)
Get the contiguous buffer space

Parameters
• pkt – Network packet

Returns
The available contiguous buffer space in bytes starting from the current cursor
position. 0 in case of an error.

void *net_pkt_get_data(struct net_pkt *pkt, struct net_pkt_data_access *access)
Get data from a network packet in a contiguous way.
net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip.
Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to get the data.
• access – A pointer to a valid net_pkt_data_access describing the data to get in
a contiguous way.

Returns
a pointer to the requested contiguous data, NULL otherwise.

int net_pkt_set_data(struct net_pkt *pkt, struct net_pkt_data_access *access)
Set contiguous data into a network packet.
net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip.
Cursor position will be updated after the operation.

Parameters
• pkt – The network packet to where the data should be set.
• access – A pointer to a valid net_pkt_data_access describing the data to set.

Returns
0 on success, a negative errno otherwise.

static inline int net_pkt_acknowledge_data(struct net_pkt *pkt, struct net_pkt_data_access *access)

Acknowledge previously contiguous data taken from a network packet Packet needs to be set
to overwrite mode.

struct net_pkt_cursor

#include <net_pkt.h>

Public Members

struct net_buf *buf
Current net_buf pointer by the cursor

uint8_t *pos
Current position in the data buffer of the net_buf

struct net_pkt

#include <net_pkt.h> Network packet.

Note that if you add new fields into net_pkt, remember to update net_pkt_clone() function.
Public Members

intptr_t fifo
The fifo is used by RX/TX threads and by socket layer. The \textit{net_pkt} is queued via fifo to the processing thread.

struct \_k\_mem\_slab *slab
Slab pointer from where it belongs to

union \textit{net\_pkt}.[anonymous] [anonymous]
buffer holding the packet

struct \textit{net\_pkt\_cursor} cursor
Internal buffer iterator used for reading/writing

struct net\_context *context
Network connection context

struct net\_if *iface
Network interface

struct net\_pkt\_data\_access
#include <net\_pkt.h>

Virtual LAN (VLAN) Support

- \textit{Overview}
- \textit{API Reference}

\textbf{Overview} Virtual LAN (VLAN) is a partitioned and isolated computer network at the data link layer (OSI layer 2). For ethernet network this refers to IEEE 802.1Q

In Zephyr, each individual VLAN is modeled as a virtual network interface. This means that there is an ethernet network interface that corresponds to a real physical ethernet port in the system. A virtual network interface is created for each VLAN, and this virtual network interface connects to the real network interface. This is similar to how Linux implements VLANs. The \textit{eth0} is the real network interface and \textit{vlan0} is a virtual network interface that is run on top of \textit{eth0}.

VLAN support must be enabled at compile time by setting option \texttt{CONFIG\_NET\_VLAN} and \texttt{CONFIG\_NET\_VLAN\_COUNT} to reflect how many network interfaces there will be in the system. For example, if there is one network interface without VLAN support, and two with VLAN support, the \texttt{CONFIG\_NET\_VLAN\_COUNT} option should be set to 3.
Even if VLAN is enabled in a `prj.conf` file, the VLAN needs to be activated at runtime by the application. The VLAN API provides a `net_eth_vlan_enable()` function to do that. The application needs to give the network interface and desired VLAN tag as a parameter to that function. The VLAN tagging for a given network interface can be disabled by a `net_eth_vlan_disable()` function. The application needs to configure the VLAN network interface itself, such as setting the IP address, etc.

See also the VLAN sample application for API usage example. The source code for that sample application can be found at `samples/net/vlan`.

The net-shell module contains `net vlan add` and `net vlan del` commands that can be used to enable or disable VLAN tags for a given network interface.

See the IEEE 802.1Q spec for more information about ethernet VLANs.

**API Reference**

group vlan_api
   VLAN definitions and helpers.

**Defines**

`NET_VLAN_TAG_UNSPEC`
   Unspecified VLAN tag value

**Functions**

static inline uint16_t `net_eth_vlan_get_vid(uint16_t tci)`
   Get VLAN identifier from TCI.
   
   **Parameters**
   - `tci` – VLAN tag control information.
   
   **Returns**
   VLAN identifier.

static inline uint8_t `net_eth_vlan_get_dei(uint16_t tci)`
   Get Drop Eligible Indicator from TCI.
   
   **Parameters**
   - `tci` – VLAN tag control information.
   
   **Returns**
   Drop eligible indicator.

static inline uint8_t `net_eth_vlan_get_pcp(uint16_t tci)`
   Get Priority Code Point from TCI.
   
   **Parameters**
   - `tci` – VLAN tag control information.
   
   **Returns**
   Priority code point.

static inline uint16_t `net_eth_vlan_set_vid(uint16_t tci, uint16_t vid)`
   Set VLAN identifier to TCI.
   
   **Parameters**
   - `tci` – VLAN tag control information.
• vid – VLAN identifier.

Returns
New TCI value.

static inline uint16_t net_eth_vlan_set_dei(uint16_t tci, bool dei)
Set Drop Eligible Indicator to TCI.

Parameters
• tci – VLAN tag control information.
• dei – Drop eligible indicator.

Returns
New TCI value.

static inline uint16_t net_eth_vlan_set_pcp(uint16_t tci, uint8_t pcp)
Set Priority Code Point to TCI.

Parameters
• tci – VLAN tag control information.
• pcp – Priority code point.

Returns
New TCI value.

Link Layer Discovery Protocol

Overview  The Link Layer Discovery Protocol (LLDP) is a vendor-neutral link layer protocol used by network devices for advertising their identity, capabilities, and neighbors on a wired Ethernet network. For more information, see this LLDP Wikipedia article.

API Reference

group lldp
LLDP definitions and helpers.

Defines

net_lldp_set_lldpdu(iface)
Set LLDP protocol data unit (LLDPDU) for the network interface.

Parameters
• iface – Network interface

Returns
<0 if error, index in lldp array if iface is found there
net_lldp_unset_lldpdu(iface)
Unset LLDP protocol data unit (LLDPDU) for the network interface.

**Parameters**
- `iface` – Network interface

**Typedefs**

typedef enum *net_verdict* (*net_lldp_recv_cb_t*)(struct *net_if* *iface*, struct *net_pkt* *pkt*)
LLDP Receive packet callback.
Callback gets called upon receiving packet. It is responsible for freeing packet or indicating to the stack that it needs to free packet by returning correct `net_verdict`.

Returns:
- `NET_DROP`, if packet was invalid, rejected or we want the stack to free it. In this case the core stack will free the packet.
- `NET_OK`, if the packet was accepted, in this case the ownership of the `net_pkt` goes to callback and core network stack will forget it.

** Enums**

enum net_lldp_tlv_type
TLV Types. Please refer to table 8-1 from IEEE 802.1AB standard.
Values:

enumerator LLDP_TLV_END_LLDPDU = 0
   End Of LLDPDU (optional)

enumerator LLDP_TLV_CHASSIS_ID = 1
   Chassis ID (mandatory)

enumerator LLDP_TLV_PORT_ID = 2
   Port ID (mandatory)

enumerator LLDP_TLV_TTL = 3
   Time To Live (mandatory)

enumerator LLDP_TLV_PORT_DESC = 4
   Port Description (optional)

enumerator LLDP_TLV_SYSTEM_NAME = 5
   System Name (optional)

enumerator LLDP_TLV_SYSTEM_DESC = 6
   System Description (optional)

enumerator LLDP_TLV_SYSTEM_CAPABILITIES = 7
   System Capability (optional)
enumerator LLDP_TLV_MANAGEMENT_ADDR = 8
    Management Address (optional)

enumerator LLDP_TLV_ORG_SPECIFIC = 127
    Org specific TLVs (optional)

Functions

int net_lldp_config(struct net_if *iface, const struct net_lldpdu *lldpdu)
    Set the LLDP data unit for a network interface.

    Parameters

    • iface – Network interface
    • lldpdu – LLDP data unit struct

    Returns

    0 if ok, <0 if error

int net_lldp_config_optional(struct net_if *iface, const uint8_t *tlv, size_t len)
    Set the Optional LLDP TLVs for a network interface.

    Parameters

    • iface – Network interface
    • tlv – LLDP optional TLVs following mandatory part
    • len – Length of the optional TLVs

    Returns

    0 if ok, <0 if error

void net_lldp_init(void)
    Initialize LLDP engine.

int net_lldp_register_callback(struct net_if *iface, net_lldp_recv_cb_t cb)
    Register LLDP Rx callback function.

    Parameters

    • iface – Network interface
    • cb – Callback function

    Returns

    0 if ok, < 0 if error

enum net_verdict net_lldp_recv(struct net_if *iface, struct net_pkt *pkt)
    Parse LLDP packet.

    Parameters

    • iface – Network interface
    • pkt – Network packet

    Returns

    Return the policy for network buffer

struct net_lldp_chassis_tlv
    #include <lldp.h> Chassis ID TLV, see chapter 8.5.2 in IEEE 802.1AB
**Public Members**

```c
uint16_t type_length
    7 bits for type, 9 bits for length
```

```c

Zephyr Project Documentation, Release 3.2.99

struct net_lldp_port_tlv port_id
Mandatory Port TLV

struct net_lldp_time_to_live_tlv ttl
Mandatory TTL TLV

IEEE 802.1Qav

Overview Credit-based shaping is an alternative scheduling algorithm used in network schedulers to achieve fairness when sharing a limited network resource. Zephyr has support for configuring a credit-based shaper described in the IEEE 802.1Qav-2009 standard. Zephyr does not implement the actual shaper; it only provides a way to configure the shaper implemented by the Ethernet device driver.

Enabling 802.1Qav To enable 802.1Qav shaper, the Ethernet device driver must declare that it supports credit-based shaping. The Ethernet driver's capability function must return ETHERNET_QAV value for this purpose. Typically also priority queues ETHERNET_PRIORITY_QUEUES need to be supported.

static enum ethernet_hw_caps eth_get_capabilities(const struct device *dev)
{
    ARG_UNUSED(dev);
    return ETHERNET_QAV | ETHERNET_PRIORITY_QUEUES |
           ETHERNET_HW_VLAN | ETHERNET_LINK_10BASE_T |
           ETHERNET_LINK_100BASE_T;
}

See sam-e70-xplained board Ethernet driver drivers/ethernet/eth_sam_gmac.c for an example.

Configuring 802.1Qav The application can configure the credit-based shaper like this:

```c
#include <zephyr/net/net_if.h>
#include <zephyr/net/ethernet.h>
#include <zephyr/net/ethernet_mgmt.h>

static void qav_set_status(struct net_if *iface,
               int queue_id, bool enable)
{
    struct ethernet_req_params params;
    int ret;
    memset(&params, 0, sizeof(params));
    params.qav_param.queue_id = queue_id;
    params.qav_param.enabled = enable;
    params.qav_param.type = ETHERNET_QAV_PARAM_TYPE_STATUS;

    /* Disable or enable Qav for a queue */
    ret = net_mgmt(NET_REQUEST_ETHERNET_SET_QAV_PARAM,
                   iface, &params,
                   sizeof(struct ethernet_req_params));
    if (ret) {
        LOG_ERR("Cannot %s Qav for queue %d for interface %p",
                 enable ? "enable" : "disable",
```
(continues on next page)
queue_id, iface);
}

static void qav_set_bandwidth_and_slope(struct net_if *iface,
        int queue_id,
        unsigned int bandwidth,
        unsigned int idle_slope)
{
    struct ethernet_req_params params;
    int ret;

    memset(&params, 0, sizeof(params));

    params.qav_param.queue_id = queue_id;
    params.qav_param.delta_bandwidth = bandwidth;
    params.qav_param.type = ETHERNET_QAV_PARAM_TYPE_DELTA_BANDWIDTH;

    ret = net_mgmt(NET_REQUEST_ETHERNET_SET_QAV_PARAM,
                   iface, &params,
                   sizeof(struct ethernet_req_params));
    if (ret) {
        LOG_ERR("Cannot set Qav delta bandwidth %u for 
                "queue %d for interface %p",
                bandwidth, queue_id, iface);
    }

    params.qav_param.idle_slope = idle_slope;
    params.qav_param.type = ETHERNET_QAV_PARAM_TYPE_IDLE_SLOPE;

    ret = net_mgmt(NET_REQUEST_ETHERNET_SET_QAV_PARAM,
                   iface, &params,
                   sizeof(struct ethernet_req_params));
    if (ret) {
        LOG_ERR("Cannot set Qav idle slope %u for 
                "queue %d for interface %p",
                idle_slope, queue_id, iface);
    }
}

Overview   Ethernet is a networking technology commonly used in local area networks (LAN). For more information, see this Ethernet Wikipedia article.

Zephyr supports following Ethernet features:

- 10, 100 and 1000 Mbit/sec links
- Auto negotiation
- Half/full duplex
- Promiscuous mode
- TX and RX checksum offloading
- MAC address filtering
- Virtual LANs
- Priority queues
• IEEE 802.1AS (gPTP)
• IEEE 802.1Qav (credit based shaping)
• LLDP (Link Layer Discovery Protocol)

Not all Ethernet device drivers support all of these features. You can see what is supported by `net iface net-shell` command. It will print currently supported Ethernet features.

**API Reference**

group ethernet

Ethernet support functions.

**Defines**

`ETH_NETDEVICE_INIT(dev_id, name, init_fn, pm, data, config, prio, api, mtu)`

Create an Ethernet network interface and bind it to network device.

**Parameters**

• dev_id – Network device id.
• name – The name this instance of the driver exposes to the system.
• init_fn – Address to the init function of the driver.
• pm – Reference to struct `pm_device` associated with the device. (optional).
• data – Pointer to the device’s private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• mtu – Maximum transfer unit in bytes for this network interface.

`ETH_NETDEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, prio, api, mtu)`

Like `ETH_NETDEVICE_INIT` but taking metadata from a devicetree. Create an Ethernet network interface and bind it to network device.

**Parameters**

• node_id – The devicetree node identifier.
• init_fn – Address to the init function of the driver.
• pm – Reference to struct `pm_device` associated with the device. (optional).
• data – Pointer to the device’s private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• mtu – Maximum transfer unit in bytes for this network interface.
ETH_NET_DEVICE_DT_INST_DEFINE(inst, ...)
Like ETH_NETDEVICE DT DEFINE for an instance of a DT_DRV_COMPAT compatible.

**Parameters**

- inst – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to ETH_NET_DEVICE_DT_DEFINE.
- ... – other parameters as expected by ETH_NET_DEVICE_DT_DEFINE.

**Enums**

enum ethernet_hw_caps
   Ethernet hardware capabilities

**Values:**

enumerator ETHERNET_HW_TX_CHKSUM_OFFLOAD = BIT(0)
   TX Checksum offloading supported for all of IPv4, UDP, TCP

eenumerator ETHERNET_HW_RX_CHKSUM_OFFLOAD = BIT(1)
   RX Checksum offloading supported for all of IPv4, UDP, TCP

eenumerator ETHERNET_HW_VLAN = BIT(2)
   VLAN supported

eenumerator ETHERNET_AUTO_NEGOTIATION_SET = BIT(3)
   Enabling/disabling auto negotiation supported

eenumerator ETHERNET_LINK_10BASE_T = BIT(4)
   10 Mbits link supported

eenumerator ETHERNET_LINK_100BASE_T = BIT(5)
   100 Mbits link supported

eenumerator ETHERNET_LINK_1000BASE_T = BIT(6)
   1 Gbits link supported

eenumerator ETHERNET_DUPLEX_SET = BIT(7)
   Changing duplex (half/full) supported

eenumerator ETHERNET_PTP = BIT(8)
   IEEE 802.1AS (gPTP) clock supported

eenumerator ETHERNET_QAV = BIT(9)
   IEEE 802.1Qav (credit-based shaping) supported

eenumerator ETHERNET_PROMISC_MODE = BIT(10)
   Promiscuous mode supported

eenumerator ETHERNET_PRIORITY_QUEUES = BIT(11)
   Priority queues available
enumerator ETHERNET_HW_FILTERING = BIT (12)
    MAC address filtering supported

enumerator ETHERNET_LLDP = BIT (13)
    Link Layer Discovery Protocol supported

enumerator ETHERNET_HW_VLAN_TAG_STRIP = BIT (14)
    VLAN Tag stripping

enumerator ETHERNET_DSA_SLAVE_PORT = BIT (15)
    DSA switch

enumerator ETHERNET_DSA_MASTER_PORT = BIT (16)

enumerator ETHERNET_QBV = BIT (17)
    IEEE 802.1Qbv (scheduled traffic) supported

enumerator ETHERNET_QBU = BIT (18)
    IEEE 802.1Qbu (frame preemption) supported

enumerator ETHERNET_TXTIME = BIT (19)
    TXTIME supported

enum ethernet_flags
    Values:
    enumerator ETH_CARRIER_UP

Functions

void ethernet_init(struct net_if *iface)
    Initialize Ethernet L2 stack for a given interface.

Parameters
    • iface – A valid pointer to a network interface

void net_eth_ipv4_mcast_to_mac_addr(const struct in_addr *ipv4_addr, struct net_eth_addr *mac_addr)
    Convert IPv4 multicast address to Ethernet address.

Parameters
    • ipv4_addr – IPv4 multicast address
    • mac_addr – Output buffer for Ethernet address

void net_eth_ipv6_mcast_to_mac_addr(const struct in6_addr *ipv6_addr, struct net_eth_addr *mac_addr)
    Convert IPv6 multicast address to Ethernet address.

Parameters
    • ipv6_addr – IPv6 multicast address
    • mac_addr – Output buffer for Ethernet address
static inline enum 

ethernet_hw_caps

net_eth_get_hw_capabilities(struct net_if *iface)

Return ethernet device hardware capability information.

Parameters

• iface – Network interface

Returns

Hardware capabilities

static inline int

net_eth_vlan_enable(struct net_if *iface, uint16_t tag)

Add VLAN tag to the interface.

Parameters

• iface – Interface to use.
• tag – VLAN tag to add

Returns

0 if ok, <0 if error

static inline int

net_eth_vlan_disable(struct net_if *iface, uint16_t tag)

Remove VLAN tag from the interface.

Parameters

• iface – Interface to use.
• tag – VLAN tag to remove

Returns

0 if ok, <0 if error

static inline uint16_t

net_eth_get_vlan_tag(struct net_if *iface)

Return VLAN tag specified to network interface.

Parameters

• iface – Network interface.

Returns

VLAN tag for this interface or NET_VLAN_TAG_UNSPEC if VLAN is not configured for that interface.

static inline struct net_if *

net_eth_get_vlan_iface(struct net_if *iface, uint16_t tag)

Return network interface related to this VLAN tag.

Parameters

• iface – Master network interface. This is used to get the pointer to ethernet L2 context
• tag – VLAN tag

Returns

Network interface related to this tag or NULL if no such interface exists.

static inline bool

net_eth_is_vlan_enabled(struct ethernet_context *ctx, struct net_if *iface)

Check if VLAN is enabled for a specific network interface.

Parameters

• ctx – Ethernet context
• iface – Network interface

Returns

True if VLAN is enabled for this network interface, false if not.
static inline bool net_eth_get_vlan_status(struct net_if *iface)
    Get VLAN status for a given network interface (enabled or not).

    Parameters
    • iface – Network interface

    Returns
    True if VLAN is enabled for this network interface, false if not.

global void net_eth_carrier_on(struct net_if *iface)
    Inform ethernet L2 driver that ethernet carrier is detected. This happens when cable is connected.

    Parameters
    • iface – Network interface

void net_eth_carrier_off(struct net_if *iface)
    Inform ethernet L2 driver that ethernet carrier was lost. This happens when cable is disconnected.

    Parameters
    • iface – Network interface

int net_eth_promisc_mode(struct net_if *iface, bool enable)
    Set promiscuous mode either ON or OFF.

    Parameters
    • iface – Network interface
    • enable – on (true) or off (false)

    Returns
    0 if mode set or unset was successful, <0 otherwise.

static inline const struct device *net_eth_get_ptp_clock(struct net_if *iface)
    Return PTP clock that is tied to this ethernet network interface.

    Parameters
    • iface – Network interface

    Returns
    Pointer to PTP clock if found, NULL if not found or if this ethernet interface does not support PTP.

const struct device *net_eth_get_ptp_clock_by_index(int index)
    Return PTP clock that is tied to this ethernet network interface index.

    Parameters
    • index – Network interface index

    Returns
    Pointer to PTP clock if found, NULL if not found or if this ethernet interface index does not support PTP.

static inline int net_eth_get_ptp_port(struct net_if *iface)
    Return PTP port number attached to this interface.

    Parameters
    • iface – Network interface

    Returns
    Port number, no such port if < 0
struct ethernet_qav_param
    
    #include <ethernet.h>

Public Members

int queue_id
    ID of the priority queue to use

denum ethernet_qav_param_type type
    Type of Qav parameter

bool enabled
    True if Qav is enabled for queue

unsigned int delta_bandwidth
    Delta Bandwidth (percentage of bandwidth)

unsigned int idle_slope
    Idle Slope (bits per second)

unsigned int oper_idle_slope
    Oper Idle Slope (bits per second)

unsigned int traffic_class
    Traffic class the queue is bound to

struct ethernet_qbv_param
    
    #include <ethernet.h>

Public Members

int port_id
    Port id

enum ethernet_qbv_param_type type
    Type of Qbv parameter

enum ethernet_qbv_state_type state
    What state (Admin/Oper) parameters are these

bool enabled
    True if Qbv is enabled or not

bool gate_status[NET_TC_TX_COUNT]
    True = open, False = closed
enum ethernet_gate_state_operation operation
    GateState operation

uint32_t time_interval
    Time interval ticks (nanoseconds)

uint16_t row
    Gate control list row

uint32_t gate_control_list_len
    Number of entries in gate control list

struct net_ptp_extended_time base_time
    Base time

struct net_ptp_time cycle_time
    Cycle time

uint32_t extension_time
    Extension time (nanoseconds)

struct ethernet_qbu_param
    #include <ethernet.h>

Public Members

int port_id
    Port id

denum ethernet_qbu_param_type type
    Type of Qbu parameter

uint32_t hold_advance
    Hold advance (nanoseconds)

uint32_t release_advance
    Release advance (nanoseconds)

denum ethernet_qbu_preempt_status frame_preempt_statuses[NET_TC_TX_COUNT]
    sequence of framePreemptionAdminStatus values.

bool enabled
    True if Qbu is enabled or not

bool link_partner_status
    Link partner status (from Qbr)
uint8_t additional_fragment_size
    Additional fragment size (from Qbr). The minimum non-final fragment size is (addi-
tional_fragment_size + 1) * 64 octets

struct ethernet_filter
    #include <ethernet.h>

Public Members

enum ethernet_filter_type type
    Type of filter

struct net_eth_addr mac_address
    MAC address to filter

bool set
    Set (true) or unset (false) the filter

struct ethernet_txtime_param
    #include <ethernet.h>

Public Members

enum ethernet_txtime_param_type type
    Type of TXTIME parameter

int queue_id
    Queue number for configuring TXTIME

bool enable_txtime
    Enable or disable TXTIME per queue

struct ethernet_api
    #include <ethernet.h>

Public Members

struct net_if_api iface_api
    The net_if_api must be placed in first position in this struct so that we are compatible
    with network interface API.

int (*start)(const struct device *dev)
    Start the device

int (*stop)(const struct device *dev)
    Stop the device
enum ethernet_hw_caps (*get_capabilities)(const struct device *dev)
    Get the device capabilities

int (*set_config)(const struct device *dev, enum ethernet_config_type type, const struct ethernet_config *config)
    Set specific hardware configuration

int (*get_config)(const struct device *dev, enum ethernet_config_type type, struct ethernet_config *config)
    Get hardware specific configuration

int (*send)(const struct device *dev, struct net_pkt *pkt)
    Send a network packet

struct ethernet_context
    #include <ethernet.h> Ethernet L2 context that is needed for VLAN

Public Members

atomic_t flags
    Flags representing ethernet state, which are accessed from multiple threads.

struct k_work carrier_work
    Carrier ON/OFF handler worker. This is used to create network interface UP/DOWN event when ethernet L2 driver notices carrier ON/OFF situation. We must not create another network management event from inside management handler thus we use worker thread to trigger the UP/DOWN event.

struct net_if *iface
    Network interface.

enum net_l2_flags ethernet_l2_flags
    This tells what L2 features does ethernet support.

bool is_net_carrier_up
    Is network carrier up

bool is_init
    Is this context already initialized

group ethernet_mii
    Ethernet MII (media independent interface) functions.

Defines

MII_BMCR
    Basic Mode Control Register
MII_BMSR
   Basic Mode Status Register

MII_PHYID1R
   PHY ID 1 Register

MII_PHYID2R
   PHY ID 2 Register

MII_ANAR
   Auto-Negotiation Advertisement Register

MII_ANLPAR
   Auto-Negotiation Link Partner Ability Reg

MII_ANER
   Auto-Negotiation Expansion Register

MII_ANNPTR
   Auto-Negotiation Next Page Transmit Register

MII_ANLPRNPR
   Auto-Negotiation Link Partner Received Next Page Reg

MII_MMD_ACR
   MMD Access Control Register

MII_MMD_AADR
   MMD Access Address Data Register

MII_ESTAT
   Extended Status Register

MII_BMCR_RESET
   PHY reset

MII_BMCR_LOOPBACK
   enable loopback mode

MII_BMCR_SPEED_LSB
   10=1000Mbps 01=100Mbps; 00=10Mbps

MII_BMCR_AUTONEG_ENABLE
   Auto-Negotiation enable

MII_BMCR_POWER_DOWN
   power down mode
MII_BMCR_ISOLATE
isolate electrically PHY from MII

MII_BMCR_AUTONEG_RESTART
restart auto-negotiation

MII_BMCR_DUPLEX_MODE
full duplex mode

MII_BMCR_SPEED_MSB
10=1000Mbps 01=100Mbps; 00=10Mbps

MII_BMCR_SPEED_MASK
Link Speed Field

MII_BMCR_SPEED_10
select speed 10 Mb/s

MII_BMCR_SPEED_100
select speed 100 Mb/s

MII_BMCR_SPEED_1000
select speed 1000 Mb/s

MII_BMSR_100BASE_T4
100BASE-T4 capable

MII_BMSR_100BASE_X_FULL
100BASE-X full duplex capable

MII_BMSR_100BASE_X_HALF
100BASE-X half duplex capable

MII_BMSR_10_FULL
10 Mb/s full duplex capable

MII_BMSR_10_HALF
10 Mb/s half duplex capable

MII_BMSR_100BASE_T2_FULL
100BASE-T2 full duplex capable

MII_BMSR_100BASE_T2_HALF
100BASE-T2 half duplex capable

MII_BMSR_EXTEND_STATUS
extend status information in reg 15
MII_BMSR_MF_PREAMB_SUPPR
  PHY accepts management frames with preamble suppressed

MII_BMSR_AUTONEG_COMPLETE
  Auto-negotiation process completed

MII_BMSR_REMOTE_FAULT
  remote fault detected

MII_BMSR_AUTONEG_ABILITY
  PHY is able to perform Auto-Negotiation

MII_BMSR_LINK_STATUS
  link is up

MII_BMSR_JABBER_DETECT
  jabber condition detected

MII_BMSR_EXTEND_CAPAB
  extended register capabilities

MII_ADVERTISE_NEXT_PAGE
  next page

MII_ADVERTISE_LPACK
  link partner acknowledge response

MII_ADVERTISE_REMOTE_FAULT
  remote fault

MII_ADVERTISE_ASYM_PAUSE
  try for asymmetric pause

MII_ADVERTISE_PAUSE
  try for pause

MII_ADVERTISE_100BASE_T4
  try for 100BASE-T4 support

MII_ADVERTISE_100_FULL
  try for 100BASE-X full duplex support

MII_ADVERTISE_100_HALF
  try for 100BASE-X support

MII_ADVERTISE_10_FULL
  try for 10 Mb/s full duplex support
IEEE 802.15.4

Overview  IEEE 802.15.4 is a technical standard which defines the operation of low-rate wireless personal area networks (LR-WPANs). For more detailed overview of this standard, see this IEEE 802.15.4 Wikipedia article. Also, see IEEE GET Program for creating an IEEE account and downloading the specification.

Zephyr supports IEEE 802.15.4 with Thread and 6LoWPAN. The Thread implementation is based on OpenThread. The IPv6 header compression in 6LoWPAN is shared with the Bluetooth IPSP (IP support profile).

API Reference

IEEE 802.15.4

group ieee802154

Enums

enum ieee802154_channel
IEEE 802.15.4 Channel assignments.
Channel numbering for 868 MHz, 915 MHz, and 2450 MHz bands.

• Channel 0 is for 868.3 MHz.
• Channels 1-10 are for 906 to 924 MHz with 2 MHz channel spacing.
• Channels 11-26 are for 2405 to 2530 MHz with 5 MHz channel spacing.
For more information, please refer to 802.15.4-2015 Section 10.1.2.2.

Values:

enumerator IEEE802154_SUB_GHZ_CHANNEL_MIN = 0
enumerator IEEE802154_SUB_GHZ_CHANNEL_MAX = 10
enumerator IEEE802154_2_4_GHZ_CHANNEL_MIN = 11
enumerator IEEE802154_2_4_GHZ_CHANNEL_MAX = 26
enum ieee802154_hw_caps

Values:

enumerator IEEE802154_FILTER_TYPE_SHORT_ADDR
enumerator IEEE802154_FILTER_TYPE_PAN_ID
enumerator IEEE802154_FILTER_TYPE_SRC_IEEE_ADDR
enumerator IEEE802154_FILTER_TYPE_SRC_SHORT_ADDR

enum ieee802154_event

Values:

enumerator IEEE802154_EVENT_TX_STARTED
enumerator IEEE802154_EVENT_RX_FAILED
enumerator IEEE802154_EVENT_SLEEP

denum iee802154_rx_fail_reason

Values:

enumerator IEEE802154_RX_FAIL_NOT_RECEIVED
enumerator IEEE802154_RX_FAIL_INVALID_FCS
enumerator IEEE802154_RX_FAIL_ADDR_FILTERED
enumerator IEEE802154_RX_FAIL_OTHER

denum iee802154_tx_mode

IEEE802.15.4 Transmission mode.

Values:

enumerator IEEE802154_TX_MODE_DIRECT
Transmit packet immediately, no CCA.
enumerator IEEE802154_TX_MODE_CCA
Perform CCA before packet transmission.
enumerator IEEE802154_TX_MODE_CSM_CA
Perform full CSMA CA procedure before packet transmission.
enumerator IEEE802154_TX_MODE_TXTIME
Transmit packet in the future, at specified time, no CCA.
enumerator IEEE802154_TX_MODE_TXTIME_CCA
Transmit packet in the future, perform CCA before transmission.

denum iee802154_fpb_mode

IEEE802.15.4 Frame Pending Bit table address matching mode.

Values:

enumerator IEEE802154_FPB_ADDR_MATCH_THREAD
The pending bit shall be set only for addresses found in the list.
enumerator IEEE802154_FPB_ADDR_MATCH_ZIGBEE
The pending bit shall be cleared for short addresses found in the list.

denum iee802154_config_type

IEEE802.15.4 driver configuration types.

Values:
enumerator IEEE802154_CONFIG_AUTO_ACK_FPB
Indicates how radio driver should set Frame Pending bit in ACK responses for Data Requests. If enabled, radio driver should determine whether to set the bit or not based on the information provided with IEEE802154_CONFIG_ACK_FPB config and FPB address matching mode specified. Otherwise, Frame Pending bit should be set to 1 (see IEEE Std 802.15.4-2006, 7.2.2.3.1).

enumerator IEEE802154_CONFIG_ACK_FPB
Indicates whether to set ACK Frame Pending bit for specific address or not. Disabling the Frame Pending bit with no address provided (NULL pointer) should disable it for all enabled addresses.

enumerator IEEE802154_CONFIG_PAN_COORDINATOR
Indicates whether the device is a PAN coordinator.

enumerator IEEE802154_CONFIG_PROMISCUOUS
Enable/disable promiscuous mode.

enumerator IEEE802154_CONFIG_EVENT_HANDLER
Specifies new radio event handler. Specifying NULL as a handler will disable radio events notification.

enumerator IEEE802154_CONFIG_MAC_KEYS
Updates MAC keys and key index for radios supporting transmit security.

enumerator IEEE802154_CONFIG_FRAME_COUNTER
Sets the current MAC frame counter value for radios supporting transmit security.

enumerator IEEE802154_CONFIG_RX_SLOT
Configure a radio reception slot. This can be used for any scheduler reception, e.g.: Zigbee GP device, CSL, TSCH, etc.

In order to configure a CSL receiver the upper layer should combine several configuration options in the following way:

i. Use IEEE802154_CONFIG_ENH_ACK_HEADER_IE once to inform the radio driver of the short and extended addresses of the peer to which it should inject CSL IEs.

ii. Use IEEE802154_CONFIG_CSL_RX_TIME periodically, before each use of IEEE802154_CONFIG_CSL_PERIOD setting parameters of the nearest CSL RX window, and before each use of IEEE_CONFIG_RX SLOT setting parameters of the following (not the nearest one) CSL RX window, to allow the radio driver to calculate the proper CSL Phase to the nearest CSL window to inject in the CSL IEs for both transmitted data and ack frames.

iii. Use IEEE802154_CONFIG_CSL_PERIOD on each value change to update the current CSL period value which will be injected in the CSL IEs together with the CSL Phase based on IEEE802154_CONFIG_CSL_RX_TIME.

iv. Use IEEE802154_CONFIG_RX SLOT periodically to schedule the immediate receive window earlier enough before the expected window start time, taking into account possible clock drifts and scheduling uncertainties.

This diagram shows the usage of the four options over time: Start CSL Schedule CSL window

```
ENH_ACK_HEADER_IE CSL_RX_TIME (following window) | | | CSL_RX_TIME (nearest window) | | | RX SLOT (nearest window) | | | | | | | | CELPERIOD | | | | | | | | | | v v v v v
+-------------------^---"---#8212;[ CSL window ]---#8212;+ ^ | | | &#8212; loop ---#8212;+
```

Chapter 6. Connectivity
enum IEEE802154_CONFIG_CSL_PERIOD
    Configure CSL receiver (Endpoint) period

enum IEEE802154_CONFIG_CSL_RX_TIME
    Configure the next CSL receive window center, in units of microseconds, based on the radio time.

enum IEEE802154_CONFIG_ENH_ACK_HEADER_IE
    Indicates whether to inject IE into ENH ACK Frame for specific address or not. Disabling the ENH ACK with no address provided (NULL pointer) should disable it for all enabled addresses.

Functions

static inline bool ieee802154_is_ar_flag_set(struct net_buf *frag)
    Check if AR flag is set on the frame inside given net_pkt.

    Parameters
        • frag – A valid pointer on a net_buf structure, must not be NULL, and its length should be at least made of 1 byte (ACK frames are the smallest frames on 15.4 and made of 3 bytes, not not counting the FCS part).

    Returns
        True if AR flag is set, False otherwise

c enum net_verdict ieee802154_radio_handle_ack(struct net_if *iface, struct net_pkt *pkt)
    Radio driver ACK handling function that hw drivers should use.

    ACK handling requires fast handling and thus such function helps to hook directly the hw drivers to the radio driver.

    Parameters
        • iface – A valid pointer on a network interface that received the packet
        • pkt – A valid pointer on a packet to check

    Returns
        NET_OK if it was handled, NET_CONTINUE otherwise

void ieee802154_init(struct net_if *iface)
    Initialize L2 stack for a given interface.

    Parameters
        • iface – A valid pointer on a network interface

#include <ieee802154.h>

#include <ieee802154.h>

#include <ieee802154_radio.h>
struct ieee802154_key
    #include <ieee802154_radio.h>

struct ieee802154_config
    #include <ieee802154_radio.h> IEEE802.15.4 driver configuration data.

**Public Members**

struct ieee802154_config.[anonymous].[anonymous] auto_ack_fpb
    IEEE802154_CONFIG_AUTO_ACK_FPB

struct ieee802154_config.[anonymous].[anonymous] ack_fpb
    IEEE802154_CONFIG_ACK_FPB

bool pan_coordinator
    IEEE802154_CONFIG_PAN_COORDINATOR

bool promiscuous
    IEEE802154_CONFIG_PROMISCUOUS

**ieee802154_event_cb_t event_handler**
    IEEE802154_CONFIG_EVENT_HANDLER

struct ieee802154_key *mac_keys
    IEEE802154_CONFIG_MAC_KEYS

    Pointer to an array containing a list of keys used for MAC encryption. Refer to secKeyIdLookupDescriptor and secKeyDescriptor in IEEE 802.15.4

    The variable length array is terminated by key_value field set to NULL.

uint32_t frame_counter
    IEEE802154_CONFIG_FRAME_COUNTER

struct ieee802154_config.[anonymous].[anonymous] rx_slot
    IEEE802154_CONFIG_RX_SLOT

uint32_t csl_period
    IEEE802154_CONFIG_CSL_PERIOD

uint32_t csl_rx_time
    IEEE802154_CONFIG_CSL_RX_TIME

const uint8_t *ext_addr
    The extended address is expected to be passed starting with the most significant
    octet and ending with the least significant octet. A device with an extended address
    01:23:45:67:89:ab:cd:ef as written in the usual big-endian hex notation should provide a
    pointer to an array containing values in the exact same order.
struct ieee802154_config.[anonymous].[anonymous] ack_ie
    IEEE802154_CONFIG_ENH_ACK_HEADER_IE

union ieee802154_config.[anonymous] [anonymous]
    Configuration data.

struct ieee802154_radio_api
    #include <ieee802154_radio.h> IEEE 802.15.4 radio interface API.

Public Members

struct net_if_api iface_api
    Mandatory to get in first position. A network device should indeed provide a pointer on
    such net_if_api structure. So we make current structure pointer that can be casted to a
    net_if_api structure pointer.

enum ieee802154_hw_caps (*get_capabilities)(const struct device *dev)
    Get the device capabilities

int (*cca)(const struct device *dev)
    Clear Channel Assessment - Check channel's activity

int (*set_channel)(const struct device *dev, uint16_t channel)
    Set current channel, channel is in CPU byte order.

int (*filter)(const struct device *dev, bool set, enum ieee802154_filter_type type, const struct ieee802154_filter *filter)
    Set/Unset filters (for IEEE802154_HW_FILTER)

int (*set_txpower)(const struct device *dev, int16_t dbm)
    Set TX power level in dbm

int (*tx)(const struct device *dev, enum ieee802154_tx_mode mode, struct net_pkt *pkt, struct net_buf *frag)
    Transmit a packet fragment

int (*start)(const struct device *dev)
    Start the device

int (*stop)(const struct device *dev)
    Stop the device

int (*configure)(const struct device *dev, enum ieee802154_config_type type, const struct ieee802154_config *config)
    Set specific radio driver configuration.

uint16_t (*get_subg_channel_count)(const struct device *dev)
    Get the available amount of Sub-GHz channels
int (*ed_scan)(const struct device *dev, uint16_t duration, energy_scan_done_cb_t done_cb)

Run an energy detection scan. Note: channel must be set prior to request this function. duration parameter is in ms.

uint64_t (*get_time)(const struct device *dev)

Get the current radio time in microseconds

uint8_t (*get_sch_acc)(const struct device *dev)

Get the current accuracy, in units of \pm ppm, of the clock used for scheduling delayed receive or transmit radio operations. Note: Implementations may optimize this value based on operational conditions (i.e.: temperature).

Public Members

uint32_t channel_set
The set of channels to scan, use above macros to manage it

uint32_t duration
Duration of scan, per-channel, in milliseconds

uint16_t channel
Current channel in use as a result

uint16_t pan_id
Current pan_id in use as a result

union ieee802154_req_params.[anonymous] [anonymous]
Result address

uint8_t len
length of address

uint8_t lqi
Link quality information, between 0 and 255

struct ieee802154_security_params
#include <ieee802154_mgmt.h> Security parameters.
Used to setup the link-layer security settings
Thread protocol

- Overview
- Internet connectivity
- Sample usage

Overview  Thread is a low-power mesh networking technology, designed specifically for home automation applications. It is an IPv6-based standard, which uses 6LoWPAN technology over IEEE 802.15.4 protocol. IP connectivity lets you easily connect a Thread mesh network to the internet with a Thread Border Router.

The Thread specification provides a high level of network security. Mesh networks built with Thread are secure - only authenticated devices can join the network and all communications within the mesh are encrypted. More information about Thread protocol can be found at Thread Group website.

Zephyr integrates an open source Thread protocol implementation called OpenThread, documented on the OpenThread website.

Internet connectivity  A Thread Border Router is required to connect mesh network to the internet. An open source implementation of Thread Border Router is provided by the OpenThread community. See OpenThread Border Router guide for instructions on how to set up a Border Router.

Sample usage  You can try using OpenThread with the Zephyr Echo server and Echo client samples, which provide out-of-the-box configuration for OpenThread. To enable OpenThread support in these samples, build them with overlay-ot.conf overlay config file. See sockets-echo-server-sample and sockets-echo-client-sample for details.

Point-to-Point Protocol (PPP) Support

- Overview
- Testing

Overview  Point-to-Point Protocol (PPP) is a data link layer (layer 2) communications protocol used to establish a direct connection between two nodes. PPP is used over many types of serial links since IP packets cannot be transmitted over a modem line on their own, without some data link protocol.

In Zephyr, each individual PPP link is modelled as a network interface. This is similar to how Linux implements PPP.

PPP support must be enabled at compile time by setting option CONFIG_NET_PPP and CONFIG_NET_L2_PPP. The PPP support in Zephyr 2.0 is still experimental and the implementation supports only these protocols:

- LCP (Link Control Protocol, RFC1661)
- HDLC (High-level data link control, RFC1662)
- IPCP (IP Control Protocol, RFC1332)
- IPV6CP (IPv6 Control Protocol, RFC5072)

See also the samples/net/sockets/echo_server/overlay-ppp.conf file for configuration option examples. For using PPP with GSM modem, see Generic GSM Modem for additional information.
Testing  See the net-tools README file for more details on how to test the Zephyr PPP against pppd running in Linux.

Protocols

CoAP

- API Reference

Overview  The Constrained Application Protocol (CoAP) is a specialized web transfer protocol for use with constrained nodes and constrained (e.g., low-power, lossy) networks. It provides a convenient API for RESTful Web services that support CoAP’s features. For more information about the protocol itself, see IETF RFC7252 The Constrained Application Protocol.

Zephyr provides a CoAP library which supports client and server roles. The library is configurable as per user needs. The Zephyr CoAP library is implemented using plain buffers. Users of the API create sockets for communication and pass the buffer to the library for parsing and other purposes. The library itself doesn’t create any sockets for users.

On top of CoAP, Zephyr has support for LWM2M “Lightweight Machine 2 Machine” protocol, a simple, low-cost remote management and service enablement mechanism. See Lightweight M2M (LWM2M) for more information.

Supported RFCs:

- RFC7252: The Constrained Application Protocol (CoAP)
- RFC6690: Constrained RESTful Environments (CoRE) Link Format
- RFC7959: Block-Wise Transfers in the Constrained Application Protocol (CoAP)
- RFC7641: Observing Resources in the Constrained Application Protocol (CoAP)

Note: Not all parts of these RFCs are supported. Features are supported based on Zephyr requirements.

Sample Usage

CoAP Server  To create a CoAP server, resources for the server need to be defined. The .well-known/core resource should be added before all other resources that should be included in the responses of the .well-known/core resource.
An application reads data from the socket and passes the buffer to the CoAP library to parse the message. If the CoAP message is proper, the library uses the buffer along with resources defined above to call the correct callback function to handle the CoAP request from the client. It's the callback function's responsibility to either reply or act according to CoAP request.

```c
coap_packet_parse(&request, data, data_len, options, opt_num);
...
coap_handle_request(&request, resources, options, opt_num,
                    client_addr, client_addr_len);
```

If `CONFIG_COAP_URI_WILDCARD` enabled, server may accept multiple resources using MQTT-like wildcard style:

- the plus symbol represents a single-level wild card in the path;
- the hash symbol represents the multi-level wild card in the path.

```c
static const char * const led_set[] = { "led","+","set", NULL };
static const char * const btn_get[] = { "button","#", NULL };
static const char * const no_wc[] = { "test","+1", NULL };
```

It accepts /led/0/set, led/1234/set, led/any/set, /button/door/1, /test/+1, but returns -ENOENT for /led/1, /test/21, /test/1.

This option is enabled by default, disable it to avoid unexpected behaviour with resource path like '/some_resource/+/#'.

**CoAP Client** If the CoAP client knows about resources in the CoAP server, the client can start prepare CoAP requests and wait for responses. If the client doesn't know about resources in the CoAP server, it can request resources through the `.well-known/core` CoAP message.

```c
/* Initialize the CoAP message */
char *path = "test";
struct coap_packet request;
uint8_t data[100];
uint8_t payload[20];

coap_packet_init(&request, data, sizeof(data),
                 1, COAP_TYPE_CON, 8, coap_next_token(),
                 COAP_METHOD_GET, coap_next_id());

/* Append options */
coap_packet_append_option(&request, COAP_OPTION_URI_PATH,
                          path, strlen(path));
```
Testing

There are various ways to test Zephyr CoAP library.

libcoap

libcoap implements a lightweight application-protocol for devices that are resource constrained, such as by computing power, RF range, memory, bandwidth, or network packet sizes. Sources can be found here libcoap. libcoap has a script (examples/etsi_coaptest.sh) to test coap-server functionality in Zephyr.

See the net-tools project for more details.

The coap-server-sample sample can be built and executed on QEMU as described in Networking with QEMU.

Use this command on the host to run the libcoap implementation of the ETSI test cases:

```bash
sudo ./libcoap/examples/etsi_coaptest.sh -i tap0 2001:db8::1
```

TTCN3

Eclipse has TTCN3 based tests to run against CoAP implementations.

Install eclipse-titan and set symbolic links for titan tools

```bash
sudo apt-get install eclipse-titan
cd /usr/share/titan
sudo ln -s /usr/bin bin
sudo ln /usr/bin/titanver bin
sudo ln -s /usr/bin/mctr_cli bin
sudo ln -s /usr/include/titan include
sudo ln -s /usr/lib/titan lib
export TTCN3_DIR=/usr/share/titan
git clone https://github.com/eclipse/titan.misc.git
cd titan.misc
```

Follow the instruction to setup CoAP test suite from here:

- https://github.com/eclipse/titan.misc
- https://github.com/eclipse/titan.misc/tree/master/CoAP_Conf

After the build is complete, the coap-server-sample sample can be built and executed on QEMU as described in Networking with QEMU.

Change the client (test suite) and server (Zephyr coap-server sample) addresses in coap.cfg file as per your setup.

Execute the test cases with following command.

```bash
```
ttcn3_start coaptests coap.cfg

Sample output of ttcn3 tests looks like this.
Verdict statistics: 0 none (0.00 %), 10 pass (100.00 %), 0 inconc (0.00 %), 0 fail (0.00 %), 0 error (0.00 %).
Test execution summary: 10 test cases were executed. Overall verdict: pass

API Reference

group coap
    COAP library.

Defines

COAP_REQUEST_MASK

COAP_CODE_EMPTY

COAP_TOKEN_MAX_LEN

GET_BLOCK_NUM(v)

GET_BLOCK_SIZE(v)

GET_MORE(v)

COAP_WELL_KNOWN_CORE_PATH
    This resource should be added before all other resources that should be included in the responses of the .well-known/core resource.

Typedefs

typedef int (*coap_method_t)(struct coap_resource *resource, struct coap_packet *request, struct sockaddr *addr, socklen_t addr_len)
    Type of the callback being called when a resource's method is invoked by the remote entity.

typedef void (*coap_notify_t)(struct coap_resource *resource, struct coap_observer *observer)
    Type of the callback being called when a resource's has observers to be informed when an update happens.

typedef int (*coap_reply_t)(const struct coap_packet *response, struct coap_reply *reply, const struct sockaddr *from)
    Helper function to be called when a response matches the a pending request.
 Enums

 enum coap_option_num
   Set of CoAP packet options we are aware of.
   Users may add options other than these to their packets, provided they know how to format
   them correctly. The only restriction is that all options must be added to a packet in numeric
   order.
   Refer to RFC 7252, section 12.2 for more information.
   Values:

   enumerator COAP_OPTION_IF_MATCH = 1

   enumerator COAP_OPTION_URI_HOST = 3

   enumerator COAP_OPTION_ETAG = 4

   enumerator COAP_OPTION_IF_NONE_MATCH = 5

   enumerator COAP_OPTION_OBSERVE = 6

   enumerator COAP_OPTION_URI_PORT = 7

   enumerator COAP_OPTION_LOCATION_PATH = 8

   enumerator COAP_OPTION_URI_PATH = 11

   enumerator COAP_OPTION_CONTENT_FORMAT = 12

   enumerator COAP_OPTION_MAX_AGE = 14

   enumerator COAP_OPTION_URI_QUERY = 15

   enumerator COAP_OPTION_ACCEPT = 17

   enumerator COAP_OPTION_LOCATION_QUERY = 20

   enumerator COAP_OPTION_BLOCK2 = 23

   enumerator COAP_OPTION_BLOCK1 = 27

   enumerator COAP_OPTION_SIZE2 = 28

   enumerator COAP_OPTION_PROXY_URI = 35

   enumerator COAP_OPTION_PROXY_SCHEME = 39
enumerator COAP_OPTION_SIZE1 = 60

enum coap_method
Available request methods.
To be used when creating a request or a response.
Values:

enumerator COAP_METHOD_GET = 1
enumerator COAP_METHOD_POST = 2
enumerator COAP_METHOD_PUT = 3
enumerator COAP_METHOD_DELETE = 4
enumerator COAP_METHOD_FETCH = 5
enumerator COAP_METHOD_PATCH = 6
enumerator COAP_METHOD_IPATCH = 7

enum coap_msgtype
CoAP packets may be of one of these types.
Values:

enumerator COAP_TYPE_CON = 0
    Confirmable message.
    The packet is a request or response the destination end-point must acknowledge.
enumerator COAP_TYPE_NON_CON = 1
    Non-confirmable message.
    The packet is a request or response that doesn’t require acknowledgements.
enumerator COAP_TYPE_ACK = 2
    Acknowledge.
    Response to a confirmable message.
enumerator COAP_TYPE_RESET = 3
    Reset.
    Rejecting a packet for any reason is done by sending a message of this type.

enum coap_response_code
Set of response codes available for a response packet.
To be used when creating a response.
Values:
enumerator COAP_RESPONSE_CODE_OK = ((2 << 5) | (0))
enumerator COAP_RESPONSE_CODE_CREATED = ((2 << 5) | (1))
enumerator COAP_RESPONSE_CODE_DELETED = ((2 << 5) | (2))
enumerator COAP_RESPONSE_CODE_VALID = ((2 << 5) | (3))
enumerator COAP_RESPONSE_CODE_CHANGED = ((2 << 5) | (4))
enumerator COAP_RESPONSE_CODE_CONTENT = ((2 << 5) | (5))
enumerator COAP_RESPONSE_CODE_CONTINUE = ((2 << 5) | (31))
enumerator COAP_RESPONSE_CODE_BAD_REQUEST = ((4 << 5) | (0))
enumerator COAP_RESPONSE_CODE_UNAUTHORIZED = ((4 << 5) | (1))
enumerator COAP_RESPONSE_CODE_BAD_OPTION = ((4 << 5) | (2))
enumerator COAP_RESPONSE_CODE_FORBIDDEN = ((4 << 5) | (3))
enumerator COAP_RESPONSE_CODE_NOTFOUND = ((4 << 5) | (4))
enumerator COAP_RESPONSE_CODE_NOT_ALLOWED = ((4 << 5) | (5))
enumerator COAP_RESPONSE_CODE_NOT_ACCEPTABLE = ((4 << 5) | (6))
enumerator COAP_RESPONSE_CODE_INCOMPLETE = ((4 << 5) | (8))
enumerator COAP_RESPONSE_CODE_CONFLICT = ((4 << 5) | (9))
enumerator COAP_RESPONSE_CODE_PRECONDITION_FAILED = ((4 << 5) | (12))
enumerator COAP_RESPONSE_CODE_REQUEST_TOO_LARGE = ((4 << 5) | (13))
enumerator COAP_RESPONSE_CODE_UNSUPPORTED_CONTENT_FORMAT = ((4 << 5) | (15))
enumerator COAP_RESPONSE_CODE_UNPROCESSABLE_ENTITY = ((4 << 5) | (22))
enumerator COAP_RESPONSE_CODE_TOO_MANY_REQUESTS = ((4 << 5) | (29))
enumerator COAP_RESPONSE_CODE_INTERNAL_ERROR = ((5 << 5) | (0))
enumerator COAP_RESPONSE_CODE_NOT_IMPLEMENTED = ((5 << 5) | (1))
enumerator COAP_RESPONSE_CODE_BAD_GATEWAY = ((5 << 5) | (2))

enumerator COAP_RESPONSE_CODE_SERVICE_UNAVAILABLE = ((5 << 5) | (3))

enumerator COAP_RESPONSE_CODE_GATEWAY_TIMEOUT = ((5 << 5) | (4))

enumerator COAP_RESPONSE_CODE_PROXYING_NOT_SUPPORTED = ((5 << 5) | (5))

enum coap_content_format
Set of Content-Format option values for CoAP.
To be used when encoding or decoding a Content-Format option.
Values:

enumerator COAPCONTENTFORMATTEXTPLAIN = 0

enumerator COAPCONTENTFORMATAPPLINKFORMAT = 40

enumerator COAPCONTENTFORMATAPPXML = 41

enumerator COAPCONTENTFORMATAPP OCTETSTREAM = 42

enumerator COAPCONTENTFORMATAPPEXI = 47

enumerator COAPCONTENTFORMATAPPJSON = 50

enumerator COAPCONTENTFORMATAPPJSONPATCHJSON = 51

enumerator COAPCONTENTFORMATAPPMERGEPATCHJSON = 52

enumerator COAPCONTENTFORMATAPP CBOR = 60

enum coap_block_size
Represents the size of each block that will be transferred using block-wise transfers [RFC7959]:
Each entry maps directly to the value that is used in the wire.
Values:

enumerator COAP_BLOCK_16

enumerator COAP_BLOCK_32

enumerator COAP_BLOCK_64

enumerator COAP_BLOCK_128
enumerator COAP_BLOCK_256
enumerator COAP_BLOCK_512
enumerator COAP_BLOCK_1024

Functions

uint8_t coap_header_get_version(const struct coap_packet *cpkt)
Returns the version present in a CoAP packet.

Parameters
• cpkt – CoAP packet representation

Returns
the CoAP version in packet

uint8_t coap_header_get_type(const struct coap_packet *cpkt)
Returns the type of the CoAP packet.

Parameters
• cpkt – CoAP packet representation

Returns
the type of the packet

uint8_t coap_header_get_token(const struct coap_packet *cpkt, uint8_t *token)
Returns the token (if any) in the CoAP packet.

Parameters
• cpkt – CoAP packet representation
• token – Where to store the token, must point to a buffer containing at least
  COAP_TOKEN_MAX_LEN bytes

Returns
Token length in the CoAP packet (0 - COAP_TOKEN_MAX_LEN).

uint8_t coap_header_get_code(const struct coap_packet *cpkt)
Returns the code of the CoAP packet.

Parameters
• cpkt – CoAP packet representation

Returns
the code present in the packet

uint16_t coap_header_get_id(const struct coap_packet *cpkt)
Returns the message id associated with the CoAP packet.

Parameters
• cpkt – CoAP packet representation

Returns
the message id present in the packet
const uint8_t *coap_packet_get_payload(const struct coap_packet *cpkt, uint16_t *len)

Returns the data pointer and length of the CoAP packet.

**Parameters**
- `cpkt` – CoAP packet representation
- `len` – Total length of CoAP payload

**Returns**
- Data pointer and length if payload exists
- NULL pointer and length set to 0 in case there is no payload

```c
int coap_packet_parse(struct coap_packet *cpkt, uint8_t *data, uint16_t len, struct coap_option *options, uint8_t opt_num)
```

Parses the CoAP packet in data, validating it and initializing `cpkt`. `data` must remain valid while `cpkt` is used.

**Parameters**
- `cpkt` – Packet to be initialized from received data.
- `data` – Data containing a CoAP packet, its `data` pointer is positioned on the start of the CoAP packet.
- `len` – Length of the data
- `options` – Parse options and cache its details.
- `opt_num` – Number of options

**Return values**
- 0 – in case of success.
- -EINVAL – in case of invalid input args.
- -EBADMSG – in case of malformed coap packet header.
- -EILSEQ – in case of malformed coap options.

```c
int coap_packet_init(struct coap_packet *cpkt, uint8_t *data, uint16_t max_len, uint8_t ver, uint8_t type, uint8_t token_len, const uint8_t *token, uint8_t code, uint16_t id)
```

Creates a new CoAP Packet from input data.

**Parameters**
- `cpkt` – New packet to be initialized using the storage from `data`.
- `data` – Data that will contain a CoAP packet information
- `max_len` – Maximum allowable length of data
- `ver` – CoAP header version
- `type` – CoAP header type
- `token_len` – CoAP header token length
- `token` – CoAP header token
- `code` – CoAP header code
- `id` – CoAP header message id

**Returns**
- 0 in case of success or negative in case of error.
int coap_ack_init(struct coap_packet *cpkt, const struct coap_packet *req, uint8_t *data, uint16_t max_len, uint8_t code)

Create a new CoAP Acknowledgment message for given request.

This function works like coap_packet_init, filling CoAP header type, CoAP header token, and CoAP header message id fields according to acknowledgment rules.

Parameters

- `cpkt` – New packet to be initialized using the storage from `data`.
- `req` – CoAP request packet that is being acknowledged
- `data` – Data that will contain a CoAP packet information
- `max_len` – Maximum allowable length of data
- `code` – CoAP header code

Returns

0 in case of success or negative in case of error.

uint8_t *coap_next_token(void)

Returns a randomly generated array of 8 bytes, that can be used as a message's token.

Returns

a 8-byte pseudo-random token.

uint16_t coap_next_id(void)

Helper to generate message ids.

Returns

a new message id

int coap_find_options(const struct coap_packet *cpkt, uint16_t code, struct coap_option *options, uint16_t veclen)

Return the values associated with the option of value `code`.

Parameters

- `cpkt` – CoAP packet representation
- `code` – Option number to look for
- `options` – Array of `coap_option` where to store the value of the options found
- `veclen` – Number of elements in the options array

Returns

The number of options found in packet matching code, negative on error.

int coap_packet_append_option(struct coap_packet *cpkt, uint16_t code, const uint8_t *value, uint16_t len)

Appends an option to the packet.

Note: options must be added in numeric order of their codes. Otherwise error will be returned.

TODO: Add support for placing options according to its delta value.

Parameters

- `cpkt` – Packet to be updated
- `code` – Option code to add to the packet, see `coap_option_num`
- `value` – Pointer to the value of the option, will be copied to the packet
- `len` – Size of the data to be added

Returns

0 in case of success or negative in case of error.
unsigned int coap_option_value_to_int(const struct coap_option *option)

Converts an option to its integer representation.

Assumes that the number is encoded in the network byte order in the option.

Parameters

• option – Pointer to the option value, retrieved by coap_find_options()

Returns

The integer representation of the option

int coap_append_option_int(struct coap_packet *cpkt, uint16_t code, unsigned int val)

Appends an integer value option to the packet.

The option must be added in numeric order of their codes, and the least amount of bytes will
be used to encode the value.

Parameters

• cpkt – Packet to be updated
• code – Option code to add to the packet, see coap_option_num
• val – Integer value to be added

Returns

0 in case of success or negative in case of error.

int coap_packet_append_payload_marker(struct coap_packet *cpkt)

Append payload marker to CoAP packet.

Parameters

• cpkt – Packet to append the payload marker (0xFF)

Returns

0 in case of success or negative in case of error.

int coap_packet_append_payload(struct coap_packet *cpkt, const uint8_t *payload, uint16_t payload_len)

Append payload to CoAP packet.

Parameters

• cpkt – Packet to append the payload
• payload – CoAP packet payload
• payload_len – CoAP packet payload len

Returns

0 in case of success or negative in case of error.

int coap_handle_request(struct coap_packet *cpkt, struct coap_resource *resources, struct coap_option *options, uint8_t opt_num, struct sockaddr *addr, socklen_t addr_len)

When a request is received, call the appropriate methods of the matching resources.

Parameters

• cpkt – Packet received
• resources – Array of known resources
• options – Parsed options from coap_packet_parse()
• opt_num – Number of options
• addr – Peer address
• `addr_len` – Peer address length

**Return values**

- 0 – in case of success.
- -ENOTSUP – in case of invalid request code.
- -EPERM – in case resource handler is not implemented.
- -ENOENT – in case the resource is not found.

```c
static inline uint16_t coap_block_size_to_bytes(enum coap_block_size block_size)
```

Helper for converting the enumeration to the size expressed in bytes.

**Parameters**

- `block_size` – The block size to be converted

**Returns**

The size in bytes that the `block_size` represents

```c
int coap_block_transfer_init(struct coap_block_context *ctx, enum coap_block_size block_size,
size_t total_size)
```

Initializes the context of a block-wise transfer.

**Parameters**

- `ctx` – The context to be initialized
- `block_size` – The size of the block
- `total_size` – The total size of the transfer, if known

**Returns**

0 in case of success or negative in case of error.

```c
int coap_append_block1_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
```

Append BLOCK1 option to the packet.

**Parameters**

- `cpkt` – Packet to be updated
- `ctx` – Block context from which to retrieve the information for the Block1 option

**Returns**

0 in case of success or negative in case of error.

```c
int coap_append_block2_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
```

Append BLOCK2 option to the packet.

**Parameters**

- `cpkt` – Packet to be updated
- `ctx` – Block context from which to retrieve the information for the Block2 option

**Returns**

0 in case of success or negative in case of error.

```c
int coap_append_size1_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
```

Append SIZE1 option to the packet.

**Parameters**

- `cpkt` – Packet to be updated
- `ctx` – Block context from which to retrieve the information for the Size1 option
Zephyr Project Documentation, Release 3.2.99

Returns
0 in case of success or negative in case of error.

int coap_append_size2_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append SIZE2 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Size2 option

Returns
0 in case of success or negative in case of error.

int coap_get_option_int(const struct coap_packet *cpkt, uint16_t code)
Get the integer representation of a CoAP option.

Parameters
• cpkt – Packet to be inspected
• code – CoAP option code

Returns
Integer value >= 0 in case of success or negative in case of error.

int coap_update_from_block(const struct coap_packet *cpkt, struct coap_block_context *ctx)
Retrieves BLOCK{1,2} and SIZE{1,2} from cpkt and updates ctx accordingly.

Parameters
• cpkt – Packet in which to look for block-wise transfers options
• ctx – Block context to be updated

Returns
0 in case of success or negative in case of error.

int coap_next_block_for_option(const struct coap_packet *cpkt, struct coap_block_context *ctx, enum coap_option_num option)
Updates ctx according to option set in cpkt so after this is called the current entry indicates the correct offset in the body of data being transferred.

Parameters
• cpkt – Packet in which to look for block-wise transfers options
• ctx – Block context to be updated
• option – Either COAP_OPTION_BLOCK1 or COAP_OPTION_BLOCK2

Returns
The offset in the block-wise transfer, 0 if the transfer has finished or a negative value in case of an error.

size_t coap_next_block(const struct coap_packet *cpkt, struct coap_block_context *ctx)
Updates ctx so after this is called the current entry indicates the correct offset in the body of data being transferred.

Parameters
• cpkt – Packet in which to look for block-wise transfers options
• ctx – Block context to be updated

Returns
The offset in the block-wise transfer, 0 if the transfer has finished.

6.2. Networking 1923
void coap_observer_init(struct coap_observer *observer, const struct coap_packet *request, const struct sockaddr *addr)

Indicates that the remote device referenced by addr, with request, wants to observe a resource.

Parameters
- observer – Observer to be initialized
- request – Request on which the observer will be based
- addr – Address of the remote device

bool coap_register_observer(struct coap_resource *resource, struct coap_observer *observer)

After the observer is initialized, associate the observer with an resource.

Parameters
- resource – Resource to add an observer
- observer – Observer to be added

Returns
true if this is the first observer added to this resource.

void coap_remove_observer(struct coap_resource *resource, struct coap_observer *observer)

Remove this observer from the list of registered observers of that resource.

Parameters
- resource – Resource in which to remove the observer
- observer – Observer to be removed

struct coap_observer *coap_find_observer_by_addr(struct coap_observer *observers, size_t len, const struct sockaddr *addr)

Returns the observer that matches address addr.

Parameters
- observers – Pointer to the array of observers
- len – Size of the array of observers
- addr – Address of the endpoint observing a resource

Returns
A pointer to a observer if a match is found, NULL otherwise.

struct coap_observer *coap_observer_next_unused(struct coap_observer *observers, size_t len)

Returns the next available observer representation.

Parameters
- observers – Pointer to the array of observers
- len – Size of the array of observers

Returns
A pointer to a observer if there's an available observer, NULL otherwise.

void coap_reply_init(struct coap_reply *reply, const struct coap_packet *request)

Indicates that a reply is expected for request.

Parameters
- reply – Reply structure to be initialized
- request – Request from which reply will be based
int coap_pending_init(struct coap_pending *pending, const struct coap_packet *request, const struct sockaddr *addr, uint8_t retries)

Initialize a pending request with a request.
The request's fields are copied into the pending struct, so request doesn't have to live for as long as the pending struct lives, but “data” that needs to live for at least that long.

Parameters
- pending – Structure representing the waiting for a confirmation message, initialized with data from request
- request – Message waiting for confirmation
- addr – Address to send the retransmission
- retries – Maximum number of retransmissions of the message.

Returns
0 in case of success or negative in case of error.

struct coap_pending *coap_pending_next_unused(struct coap_pending *pendings, size_t len)

Returns the next available pending struct, that can be used to track the retransmission status of a request.

Parameters
- pendings – Pointer to the array of coap_pending structures
- len – Size of the array of coap.pending structures

Returns
pointer to a free coap_pending structure, NULL in case none could be found.

struct coap_reply *coap_reply_next_unused(struct coap_reply *replies, size_t len)

Returns the next available reply struct, so it can be used to track replies and notifications received.

Parameters
- replies – Pointer to the array of coap_reply structures
- len – Size of the array of coap_reply structures

Returns
pointer to a free coap_reply structure, NULL in case none could be found.

struct coap_pending *coap_pending_received(const struct coap_packet *response, struct coap_pending *pendings, size_t len)

After a response is received, returns if there is any matching pending request exits. User has to clear all pending retransmissions related to that response by calling coap_pending_clear().

Parameters
- response – The received response
- pendings – Pointer to the array of coap_reply structures
- len – Size of the array of coap_reply structures

Returns
pointer to the associated coap_pending structure, NULL in case none could be found.

struct coap_reply *coap_response_received(const struct coap_packet *response, const struct sockaddr *from, struct coap_reply *replies, size_t len)

After a response is received, call coap_reply_t handler registered in coap_reply structure.
Parameters

- **response** – A response received
- **from** – Address from which the response was received
- **replies** – Pointer to the array of `coap_reply` structures
- **len** – Size of the array of `coap_reply` structures

**Returns**

Pointer to the reply matching the packet received, NULL if none could be found.

```c
struct coap_pending *coap_pending_next_to_expire(struct coap_pending *pendings, size_t len)
```

Returns the next pending about to expire, `pending->timeout` informs how many ms to next expiration.

**Parameters**

- **pendings** – Pointer to the array of `coap_pending` structures
- **len** – Size of the array of `coap_pending` structures

**Returns**

The next `coap_pending` to expire, NULL if none is about to expire.

```c
bool coap_pending_cycle(struct coap_pending *pending)
```

After a request is sent, user may want to cycle the pending retransmission so the timeout is updated.

**Parameters**

- **pending** – Pending representation to have its timeout updated

**Returns**

false if this is the last retransmission.

```c
void coap_pending_clear(struct coap_pending *pending)
```

Cancels the pending retransmission, so it again becomes available.

**Parameters**

- **pending** – Pending representation to be canceled

```c
void coap_pendings_clear(struct coap_pending *pendings, size_t len)
```

Cancels all pending retransmissions, so they become available again.

**Parameters**

- **pendings** – Pointer to the array of `coap_pending` structures
- **len** – Size of the array of `coap_pending` structures

```c
void coap_reply_clear(struct coap_reply *reply)
```

Cancels awaiting for this reply, so it becomes available again. User responsibility to free the memory associated with data.

**Parameters**

- **reply** – The reply to be canceled

```c
void coap_replies_clear(struct coap_reply *replies, size_t len)
```

Cancels all replies, so they become available again.

**Parameters**

- **replies** – Pointer to the array of `coap_reply` structures
- **len** – Size of the array of `coap_reply` structures
int coap_resource_notify(struct coap_resource *resource)
    Indicates that this resource was updated and that the notify callback should be called for every
    registered observer.

    Parameters
    • resource – Resource that was updated

    Returns
    0 in case of success or negative in case of error.

bool coap_request_is_observe(const struct coap_packet *request)
    Returns if this request is enabling observing a resource.

    Parameters
    • request – Request to be checked

    Returns
    True if the request is enabling observing a resource, False otherwise

int coap_well_known_core_get(struct coap_resource *resource, struct coap_packet *request, struct coap_packet *response, uint8_t *data, uint16_t len)

struct coap_resource
    #include <coap.h> Description of CoAP resource.
    CoAP servers often want to register resources, so that clients can act on them, by fetching
    their state or requesting updates to them.

    Public Members

    coap_method_t get
       Which function to be called for each CoAP method

struct coap_observer
    #include <coap.h> Represents a remote device that is observing a local resource.

struct coap_packet
    #include <coap.h> Representation of a CoAP Packet.

struct coap_option
    #include <coap.h>

struct coap_pending
    #include <coap.h> Represents a request awaiting for an acknowledgment (ACK).

struct coap_reply
    #include <coap.h> Represents the handler for the reply of a request, it is also used when
    observing resources.

struct coap_block_context
    #include <coap.h> Represents the current state of a block-wise transaction.
In case you want to add attributes to the resources included in the ‘well-known/core’ ‘virtual’ resource, the ‘user_data’ field should point to a valid `coap_core_metadata` structure.

HTTP client

- Overview
- Sample Usage
- API Reference

Overview  The HTTP client library allows you to send HTTP requests and parse HTTP responses. The library communicates over the sockets API but it does not create sockets on its own.

The application must be responsible for creating a socket and passing it to the library. Therefore, depending on the application’s needs, the library can communicate over either a plain TCP socket (HTTP) or a TLS socket (HTTPS).

Sample Usage  The API of the HTTP client library has a single function.

The following is an example of a request structure created correctly:

```c
struct http_request req = { 0 };
static uint8_t recv_buf[512];

req.method = HTTP_GET;
req.url = "/";
req.host = "localhost";
req.protocol = "HTTP/1.1";
req.response = response_cb;
req.recv_buf = recv_buf;
req.recv_buf_len = sizeof(recv_buf);

/* sock is a file descriptor referencing a socket that has been connected */
/* to the HTTP server. */
ret = http_client_req(sock, &req, 5000, NULL);
```

If the server responds to the request, the library provides the response to the application through the response callback registered in the request structure. As the library can provide the response in chunks, the application must be able to process these.

Together with the structure containing the response data, the callback function also provides information about whether the library expects to receive more data.

The following is an example of a very simple response handling function:

```c
static void response_cb(struct http_response *rsp,
                        enum http_final_call final_data,
                        void *user_data)
{
    if (final_data == HTTP_DATA_MORE) {
        LOG_INF("Partial data received (%zd bytes)", rsp->data_len);
    } else if (final_data == HTTP_DATA_FINAL) {
```

(continues on next page)
LOG_INF("All the data received (%zd bytes)", rsp->data_len);
}

LOG_INF("Response status %s", rsp->http_status);
}

See HTTP client sample application for more information about the library usage.

**API Reference**

**group** http_client

HTTP client API.

**Defines**

HTTP_CRLF

HTTP_STATUS_STR_SIZE

**Typedefs**

typedef int (*http_payload_cb_t)(int sock, struct http_request *req, void *user_data)

Callback used when data needs to be sent to the server.

- **Param sock**
  Socket id of the connection

- **Param req**
  HTTP request information

- **Param user_data**
  User specified data specified in http_client_req()

- **Return**
  \(\geq 0\) amount of data sent, in this case http_client_req() should continue sending data, \(< 0\) if http_client_req() should return the error code to the caller.

typedef int (*http_header_cb_t)(int sock, struct http_request *req, void *user_data)

Callback can be used if application wants to construct additional HTTP headers when the HTTP request is sent. Usage of this is optional.

- **Param sock**
  Socket id of the connection

- **Param req**
  HTTP request information

- **Param user_data**
  User specified data specified in http_client_req()

- **Return**
  \(\geq 0\) amount of data sent, in this case http_client_req() should continue sending data, \(< 0\) if http_client_req() should return the error code to the caller.
typedef void (*http_response_cb_t)(struct http_response *rsp, enum http_final_call final_data, void *user_data)
  Callback used when data is received from the server.

  **Param rsp**
  HTTP response information

  **Param final_data**
  Does this data buffer contain all the data or is there still more data to come.

  **Param user_data**
  User specified data specified in http_client_req()

**Enums**

enum http_final_call
  Values:

  enumerator HTTP_DATA_MORE = 0

  enumerator HTTP_DATA_FINAL = 1

**Functions**

int http_client_req(int sock, struct http_request *req, int32_t timeout, void *user_data)
  Do a HTTP request. The callback is called when data is received from the HTTP server. The
  caller must have created a connection to the server before calling this function so connect()
  call must have be done successfully for the socket.

  **Parameters**
  • sock – Socket id of the connection.
  • req – HTTP request information
  • timeout – Max timeout to wait for the data. The timeout value cannot be 0 as there
    would be no time to receive the data. The timeout value is in milliseconds.
  • user_data – User specified data that is passed to the callback.

  **Returns**
  <0 if error, >=0 amount of data sent to the server

struct http_response
  #include <client.h> HTTP response from the server.

**Public Members**

const struct http_parser_settings *http_cb
  HTTP parser settings for the application usage
http_response_cb_t cb

User provided HTTP response callback which is called when a response is received to a sent HTTP request.

uint8_t *body_frag_start

recv_buffer that contains header + body

```
+-------------------------------+   +------------------------+
| body_frag_len                 | → | data len               |
+-------------------------------+   +------------------------+
```

recv_buffer that contains body only

```
+------------------------------+   +------------------------+
| body_frag_len                | → | data len               |
+------------------------------+   +------------------------+
```

size_t body_frag_len

Length of the body fragment contained in the recv_buf

uint8_t *recv_buf

Where the response is stored, this is to be provided by the user.

size_t recv_buf_len

Response buffer maximum length

size_t data_len

Length of the data in the result buf. If the value is larger than recv_buf_len, then it means that the data is truncated and could not be fully copied into recv_buf. This can only happen if the user did not set the response callback. If the callback is set, then the HTTP client API will call response callback many times so that all the data is delivered to the user. Will be zero in the event of a null response.

size_t content_length

HTTP Content-Length field value. Will be set to zero in the event of a null response.

size_t processed

Amount of data given to the response callback so far, including the current data given to the callback. This should be equal to the content_length field once the entire body has been received. Will be zero if a null response is given.

uint16_t http_status_code

Numeric HTTP status code which corresponds to the textual description. Set to zero if
null response is given. Otherwise, will be a 3-digit integer code if valid HTTP response is
given.

```
struct http_client_internal_data
#include <client.h> HTTP client internal data that the application should not touch
```

**Public Members**

```
struct k_work_delayable work
Work for handling timeout
```

```
struct http_parser parser
HTTP parser context
```

```
struct http_parser_settings parser_settings
HTTP parser settings
```

```
struct http_response response
HTTP response specific data (filled by http_client_req() when data is received)
```

```
void *user_data
User data
```

```
int sock
HTTP socket
```

```
k_timeout_t timeout
Request timeout
```

```
struct http_request
#include <client.h> HTTP client request. This contains all the data that is needed when doing
a HTTP request.
```

**Public Members**

```
struct http_client_internal_data internal
HTTP client request internal data
```

```
enum http_method method
The HTTP method: GET, HEAD, OPTIONS, POST, ...
```

```
http_response_cb_t response
User supplied callback function to call when response is received.
```

```
const struct http_parser_settings *http_cb
User supplied list of HTTP callback functions if the calling application wants to know the
parsing status or the HTTP fields. This is optional and normally not needed.
```
The user supplied buffer where received data is stored.

Length of the user supplied receive buffer.

The URL for this request, for example: /index.html

The HTTP protocol, for example “HTTP/1.1”

The HTTP header fields (application specific) The Content-Type may be specified here or in the next field. Depending on your application, the Content-Type may vary, however some header fields may remain constant through the application’s life cycle. This is a NULL terminated list of header fields.

The value of the Content-Type header field, may be NULL

Hostname to be used in the request

Port number to be used in the request

User supplied callback function to call when payload needs to be sent. This can be NULL in which case the payload field in http_request is used. The idea of this payload callback is to allow user to send more data that is practical to store in allocated memory.

Payload, may be NULL

Payload length is used to calculate Content-Length. Set to 0 for chunked transfers.

User supplied callback function to call when optional headers need to be sent. This can be NULL, in which case the optional_headers field in http_request is used. The idea of this optional_headers callback is to allow user to send more HTTP header data that is practical to store in allocated memory.

A NULL terminated list of any optional headers that should be added to the HTTP request. May be NULL. If the optional_headers_cb is specified, then this field is ignored. Note that there are two similar fields that contain headers, the header_fields above and this optional_headers. This is done like this to support Websocket use case where Websocket will use header_fields variable and any optional application specific headers will be placed into this field.
Overview  Lightweight Machine to Machine (LwM2M) is an application layer protocol designed with device management, data reporting and device actuation in mind. Based on CoAP/UDP, LwM2M is a standard defined by the Open Mobile Alliance and suitable for constrained devices by its use of CoAP packet-size optimization and a simple, stateless flow that supports a REST API.

One of the key differences between LwM2M and CoAP is that an LwM2M client initiates the connection to an LwM2M server. The server can then use the REST API to manage various interfaces with the client.

LwM2M uses a simple resource model with the core set of objects and resources defined in the specification.

Example LwM2M object and resources: Device  Object definition

<table>
<thead>
<tr>
<th>Object ID</th>
<th>Name</th>
<th>Instance</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Device</td>
<td>Single</td>
<td>Mandatory</td>
</tr>
</tbody>
</table>

Resource definitions

* R=Read, W=Write, E=Execute
The server could query the Manufacturer resource for Device object instance 0 (the default and only instance) by sending a READ 3/0/0 operation to the client.

The full list of registered objects and resource IDs can be found in the LwM2M registry.

Zephyr’s LwM2M library lives in the subsys/net/lib/lwm2m, with a client sample in samples/net/lwm2m_client. For more information about the provided sample see: lwm2m-client-sample. The sample can be configured to use normal unsecure network sockets or sockets secured via DTLS.

The Zephyr LwM2M library implements the following items:

- engine to process networking events and core functions
- RD client which performs BOOTSTRAP and REGISTRATION functions
- SenML CBOR, SenML JSON, CBOR, TLV, JSON, and plain text formatting functions
- LwM2M Technical Specification Enabler objects such as Security, Server, Device, Firmware Update, etc.
- Extended IPSO objects such as Light Control, Temperature Sensor, and Timer

By default, the library implements LwM2M specification 1.0.2 and can be set to LwM2M specification 1.1.1 with a Kconfig option.

For more information about LwM2M visit OMA Specworks LwM2M.

Sample usage To use the LwM2M library, start by creating an LwM2M client context lwm2m_ctx structure:

```c
/* LwM2M client context */
static struct lwm2m_ctx client;
```

Create callback functions for LwM2M resource executions:
static int device_reboot_cb(uint16_t obj_inst_id, uint8_t *args, uint16_t args_len)
{
    LOG_INF("Device rebooting.");
    LOG_PANIC();
    sys_reboot(0);
    return 0; /* won't reach this */
}

The LwM2M RD client can send events back to the sample. To receive those events, setup a callback function:

static void rd_client_event(struct lwm2m_ctx *client, enum lwm2m_rd_client_event client_event)
{
    switch (client_event) {
    case LWM2M_RD_CLIENT_EVENT_NONE:
        /* do nothing */
        break;
    case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_FAILURE:
        LOG_DBG("Bootstrap registration failure!");
        break;
    case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_COMPLETE:
        LOG_DBG("Bootstrap registration complete");
        break;
    case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_TRANSFER_COMPLETE:
        LOG_DBG("Bootstrap transfer complete");
        break;
    case LWM2M_RD_CLIENT_EVENT_REGISTRATION_FAILURE:
        LOG_DBG("Registration failure!");
        break;
    case LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE:
        LOG_DBG("Registration complete");
        break;
    case LWM2M_RD_CLIENT_EVENT_REG_TIMEOUT:
        LOG_DBG("Registration timeout!");
        break;
    case LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE:
        LOG_DBG("Registration update complete");
        break;
    case LWM2M_RD_CLIENT_EVENT_DEREGISTER_FAILURE:
        LOG_DBG("Deregister failure!");
        break;
    case LWM2M_RD_CLIENT_EVENT_DISCONNECT:
        LOG_DBG("Disconnected");
        break;
    }
}
Next we assign Security resource values to let the client know where and how to connect as well as set the Manufacturer and Reboot resources in the Device object with some data and the callback we defined above:

```c
/*
 *  Server URL of default Security object = 0/0/0
 *  Use leshan.eclipse.org server IP (5.39.83.206) for connection
 */
lwm2m_engine_set_string("0/0/0", "coap://5.39.83.206");

/*
 *  Security Mode of default Security object = 0/0/2
 *  3 = NoSec mode (no security beware!)
 */
lwm2m_engine_set_u8("0/0/2", 3);

#define CLIENT_MANUFACTURER "Zephyr Manufacturer"

/*
 *  Manufacturer resource of Device object = 3/0/0
 *  We use lwm2m_engine_set_res_data() function to set a pointer to the
 *  CLIENT_MANUFACTURER string.
 *  Note the LWM2M_RES_DATA_FLAG_RO flag which stops the engine from
 *  trying to assign a new value to the buffer.
 */
lwm2m_engine_set_res_data("3/0/0", CLIENT_MANUFACTURER,
                        sizeof(CLIENT_MANUFACTURER),
                        LWM2M_RES_DATA_FLAG_RO);

/* Reboot resource of Device object = 3/0/4 */
lwm2m_engine_register_exec_callback("3/0/4", device_reboot_cb);
```

Lastly, we start the LwM2M RD client (which in turn starts the LwM2M engine). The second parameter of `lwm2m_rd_client_start()` is the client endpoint name. This is important as it needs to be unique per LwM2M server:

```c
(void)memset(&client, 0x0, sizeof(client));
lwm2m_rd_client_start(&client, "unique-endpoint-name", 0, rd_client_event);
```

### Using LwM2M library with DTLS

The Zephyr LwM2M library can be used with DTLS transport for secure communication by selecting `CONFIG_LWM2M_DTLS_SUPPORT`. In the client initialization we need to create a PSK and identity. These need to match the security information loaded onto the LwM2M server. Normally, the endpoint name is used to lookup the related security information:

```c
/* "000102030405060708090a0b0c0d0e0f" */
static unsigned char client_psk[] = {
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
    0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f
};

static const char client_identity[] = "Client_identity";
```

Next we alter the Security object resources to include DTLS security information. The server URL
should begin with `coaps://` to indicate security is required. Assign a 0 value (Pre-shared Key mode) to the Security Mode resource. Lastly, set the client identity and PSK resources.

```c
/* Use coaps:// for server URL protocol */
lwm2m_engine_set_string("0/0/0", "coaps://5.39.83.206");
/* 0 = Pre-Shared Key mode */
lwm2m_engine_set_u8("0/0/2", 0);
/* Set the client identity */
lwm2m_engine_set_string("0/0/3", (char *)client_identity);
/* Set the client pre-shared key (PSK) */
lwm2m_engine_set_opaque("0/0/5", (void *)client_psk, sizeof(client_psk));
```

Before calling `lwm2m_rd_client_start()` assign the tls_tag # where the LwM2M library should store the DTLS information prior to connection (normally a value of 1 is ok here).

```c
(void)memset(&client, 0x0, sizeof(client));
client.tls_tag = 1; /* <---- */
lwm2m_rd_client_start(&client, "endpoint-name", 0, rd_client_event);
```

For a more detailed LwM2M client sample see: lwm2m-client-sample.

**Multi-thread usage** Writing a value to a resource can be done using functions like `lwm2m_engine_set_u8`. When writing to multiple resources, the function `lwm2m_registry_lock` will ensure that the client halts until all writing operations are finished:

```c
lwm2m_registry_lock();
lwm2m_engine_set_u32("1/0/1", 60);
lwm2m_engine_set_u8("5/0/3", 0);
lwm2m_engine_set_float("3303/0/5700", &value);
lwm2m_registry_unlock();
```

This is especially useful if the server is composite-observing the resources being written to. Locking will then ensure that the client only updates and sends notifications to the server after all operations are done, resulting in fewer messages in general.

**Support for time series data** LwM2M version 1.1 adds support for SenML CBOR and SenML JSON data formats. These data formats add support for time series data. Time series formats can be used for READ, NOTIFY and SEND operations. When data cache is enabled for a resource, each write will create a timestamped entry in a cache, and its content is then returned as a content in in READ, NOTIFY or SEND operation for a given resource.

Data cache is only supported for resources with a fixed data size.

Supported resource types:
- Signed and unsigned 8-64-bit integers
- Float
- Boolean

**Enabling and configuring** Enable data cache by selecting `CONFIG_LWM2M_RESOURCE_DATA_CACHE_SUPPORT`. Application needs to allocate an array of `lwm2m_time_series_elem` structures and then enable the cache by calling `lwm2m_engine_enable_cache()` for a given resource. Each resource must be enabled separately and each resource needs their own storage.

```c
/* Allocate data cache storage */
static struct lwm2m_time_series_elem temperature_cache[10];
```
LwM2M engine have room for four resources that have cache enabled. Limit can be increased by changing `CONFIG_LWM2M_MAX_CACHED_RESOURCES`. This affects a static memory usage of engine.

Data caches depends on one of the SenML data formats `CONFIG_LWM2M_RW_SENML_CBOR_SUPPORT` or `CONFIG_LWM2M_RW_SENML_JSON_SUPPORT` and needs `CONFIG_POSIX_CLOCK` so it can request a timestamp from the system and `CONFIG_RING_BUFFER` for ring buffer.

**Read and Write operations** Full content of data cache is written into a payload when any READ, SEND or NOTIFY operation internally reads the content of a given resource. This has a side effect that any read callbacks registered for a that resource are ignored when cache is enabled. Data is written into a cache when any of the `lwm2m_engine_set_*` functions are called. To filter the data entering the cache, application may register a validation callback using `lwm2m_engine_register_validate_callback()`.

**Limitations** Cache size should be manually set so small that the content can fit normal packets sizes. When cache is full, new values are dropped.

**LwM2M engine and application events** The Zephyr LwM2M engine defines events that can be sent back to the application through callback functions. The engine state machine shows when the events are spawned. Events depicted in the diagram are listed in the table. The events are prefixed with `LWM2M_RD_CLIENT_EVENT_`.

![State machine for the LwM2M engine](image-url)
### Table 6.20: LwM2M RD Client events

<table>
<thead>
<tr>
<th>Event ID</th>
<th>Event Name</th>
<th>Description</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>NONE</td>
<td>No event</td>
<td>Do nothing</td>
</tr>
<tr>
<td>1</td>
<td>BOOT-STRAP_REG_FAILURE</td>
<td>Bootstrap registration failed. Occurs if there is a timeout or failure in bootstrap registration.</td>
<td>Retry bootstrap</td>
</tr>
<tr>
<td>2</td>
<td>BOOT-STRAP_REG_COMPLETE</td>
<td>Bootstrap registration complete. Occurs after successful bootstrap registration.</td>
<td>No actions needed</td>
</tr>
<tr>
<td>3</td>
<td>BOOT-STRAP_TRANSFER_COMPLETE</td>
<td>Bootstrap finish command received from the server.</td>
<td>No actions needed, client</td>
</tr>
<tr>
<td></td>
<td></td>
<td>proceeds to registration.</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>REGISTRATION_FAILURE</td>
<td>Registration to LwM2M server failed. Occurs if there is a failure in the registration.</td>
<td>Retry registration</td>
</tr>
<tr>
<td>5</td>
<td>REGISTRATION_COMPLETE</td>
<td>Registration to LwM2M server successful. Occurs after a successful registration reply from the LwM2M server or when session resumption is used.</td>
<td>No actions needed</td>
</tr>
<tr>
<td>6</td>
<td>REG_TIMEOUT</td>
<td>Registration or registration update timeout. Occurs if there is a timeout during registration. NOTE: If registration fails without a timeout, a full registration is triggered automatically and no registration update failure event is generated.</td>
<td>No actions needed, client</td>
</tr>
<tr>
<td></td>
<td></td>
<td>proceeds to idle state automatically.</td>

**LwM2M shell**  
For testing the client it is possible to enable Zephyr’s shell and LwM2M specific commands which support changing the state of the client. Operations supported are read, write and execute resources. Client start, stop, pause and resume are also available. The feature is enabled by selecting `CONFIG_LWM2M_SHELL`. The shell is meant for testing so productions systems should not enable it.

One imaginable scenario, where to use the shell, would be executing client side actions over UART when a server side tests would require those. It is assumed that not all tests are able to trigger required actions from the server side.

```
uart:\$ lwm2m
lwm2m - LwM2M commands
Subcommands:
exec :Execute a resource
```
exec PATH

read : Read value from LwM2M resource
read PATH [OPTIONS]
-s Read value as string (default)
-b Read value as bool (1/0)
-uX Read value as uintX_t
-sX Read value as intX_t
-f Read value as float

write : Write into LwM2M resource
write PATH [OPTIONS] VALUE
-s Value as string (default)
-b Value as bool
-uX Value as uintX_t
-sX Value as intX_t
-f Value as float

start : Start the LwM2M RD (Registration / Discovery) Client
start EP_NAME [BOOTSTRAP FLAG]
-b Set the bootstrap flag (default 0)

stop : Stop the LwM2M RD (De-register) Client
stop [OPTIONS]
-f Force close the connection

update : Trigger Registration Update of the LwM2M RD Client

pause : LwM2M engine thread pause
resume : LwM2M engine thread resume

API Reference

group lwm2m_api

LwM2M high-level API.
LwM2M high-level interface is defined in this header.

Note: The implementation assumes UDP module is enabled.

Note: For more information refer to Technical Specification OMA-TS-LightweightM2M_Core-V1_1_1-20190617-A

Defines

LWM2M_OBJECT_SECURITY_ID
LwM2M Objects managed by OMA for LwM2M tech specification. Objects in this range have IDs from 0 to 1023.

LWM2M_OBJECT_SERVER_ID
LWM2M_OBJECT_ACCESS_CONTROL_ID

LWM2M_OBJECT_DEVICE_ID

LWM2M_OBJECT_CONNECTIVITY_MONITORING_ID

LWM2M_OBJECT_FIRMWARE_ID

LWM2M_OBJECT_LOCATION_ID

LWM2M_OBJECT_CONNECTIVITY_STATISTICS_ID

LWM2M_OBJECT_SOFTWARE_MANAGEMENT_ID

LWM2M_OBJECT_PORTFOLIO_ID

LWM2M_OBJECT_EVENT_LOG_ID

LWM2M_OBJECT_GATEWAY_ID

IPSO_OBJECT_GENERIC_SENSOR_ID

LwM2M Objects produced by 3rd party Standards Development Organizations. Objects in this range have IDs from 2048 to 10240 Refer to the OMA LightweightM2M (LwM2M) Object and Resource Registry: http://www.openmobilealliance.org/wp/OMNA/LwM2M/LwM2MRegistry.html.

IPSO_OBJECT_TEMP_SENSOR_ID

IPSO_OBJECT_HUMIDITY_SENSOR_ID

IPSO_OBJECT_LIGHT_CONTROL_ID

IPSO_OBJECT_ACCELEROMETER_ID

IPSO_OBJECT_CURRENT_SENSOR_ID

IPSO_OBJECT_PRESSURE_ID

IPSO_OBJECT_BUZZER_ID

IPSO_OBJECT_TIMER_ID

IPSO_OBJECT_ONOFF_SWITCH_ID

IPSO_OBJECT_PUSH_BUTTON_ID
UCIFI_OBJECT_BATTERY_ID

IPSO_OBJECT_FILLING_LEVEL_SENSOR_ID

LWM2M_DEVICE_PWR_SRC_TYPE_DC_POWER
    Power source types used for the “Available Power Sources” resource of the LwM2M Device object.

LWM2M_DEVICE_PWR_SRC_TYPE_BAT_INT

LWM2M_DEVICE_PWR_SRC_TYPE_BAT_EXT

LWM2M_DEVICE_PWR_SRC_TYPE_UNUSED

LWM2M_DEVICE_PWR_SRC_TYPE_PWR_OVER_ETH

LWM2M_DEVICE_PWR_SRC_TYPE_USB

LWM2M_DEVICE_PWR_SRC_TYPE_AC_POWER

LWM2M_DEVICE_PWR_SRC_TYPE_SOLAR

LWM2M_DEVICE_PWR_SRC_TYPE_MAX

LWM2M_DEVICE_ERROR_NONE
    Error codes used for the “Error Code” resource of the LwM2M Device object. An LwM2M client can register one of the following error codes via the lwm2m_device_add_err() function.

LWM2M_DEVICE_ERROR_LOW_POWER

LWM2M_DEVICE_ERROR_EXT_POWER_SUPPLY_OFF

LWM2M_DEVICE_ERROR_GPS_FAILURE

LWM2M_DEVICE_ERROR_LOW_SIGNAL_STRENGTH

LWM2M_DEVICE_ERROR_OUT_OF_MEMORY

LWM2M_DEVICE_ERROR_SMS_FAILURE

LWM2M_DEVICE_ERROR_NETWORK_FAILURE

LWM2M_DEVICE_ERROR_PERIPHERAL_FAILURE
Battery status codes used for the “Battery Status” resource (3/0/20) of the LwM2M Device object. As the battery status changes, an LwM2M client can set one of the following codes via:

```c
lwm2m_engine_set_u8("3/0/20", [battery status])
```

- **LWM2M_DEVICE_BATTERY_STATUS_NORMAL**
- **LWM2M_DEVICE_BATTERY_STATUS_CHARGING**
- **LWM2M_DEVICE_BATTERY_STATUS_CHARGE_COMP**
- **LWM2M_DEVICE_BATTERY_STATUS_DAMAGED**
- **LWM2M_DEVICE_BATTERY_STATUS_LOW**
- **LWM2M_DEVICE_BATTERY_STATUS_NOT_INST**
- **LWM2M_DEVICE_BATTERY_STATUS_UNKNOWN**

**STATE_IDLE**

LwM2M Firmware Update object states.

An LwM2M client or the LwM2M Firmware Update object use the following codes to represent the LwM2M Firmware Update state (5/0/3).

- **STATE_DOWNLOADING**
- **STATE_DOWNLOADED**
- **STATE_UPDATING**

**RESULT_DEFAULT**

LwM2M Firmware Update object result codes.

After processing a firmware update, the client sets the result via one of the following codes via `lwm2m_engine_set_u8("5/0/5", [result code])`

- **RESULT_SUCCESS**
- **RESULT_NO_STORAGE**
- **RESULT_OUT_OF_MEM**
- **RESULT_CONNECTION_LOST**
- **RESULT_INTEGRITY_FAILED**
- **RESULT_UNSUP_FW**
- **RESULT_INVALID_URI**
RESULT_UPDATE_FAILED

RESULT_UNSUP_PROTO

LWM2M_OBJLNK_MAX_ID
   Maximum value for ObjLnk resource fields.

LWM2M_RES_DATA_READ_ONLY
   Resource read-only value bit.

LWM2M_RES_DATA_FLAG_RO
   Resource read-only flag.

LWM2M_HAS_RES_FLAG(res, f)
   Read resource flags helper macro.

LWM2M_RD_CLIENT_EVENT_REG_UPDATE_FAILURE
   Define for old event name keeping backward compatibility.

LWM2M_RD_CLIENT_FLAG_BOOTSTRAP
   Run bootstrap procedure in current session.

LWM2M_MAX_PATH_STR_LEN
   LwM2M path maximum length.

**Typedefs**

typedef void (*lwm2m_socket_fault_cb_t)(int error)

typedef void (*lwm2m_observe_cb_t)(enum lwm2m_observe_event event, struct lwm2m_obj_path *path, void *user_data)
   Observe callback indicating observer adds and deletes, and notification ACKs and timeouts.

   **Param event**
   [in] Observer add/delete or notification ack/timeout

   **Param path**
   [in] LwM2M path

   **Param user_data**
   [in] Pointer to user_data buffer, as provided in send_traceable_notification(). Used to determine for which data the ACKed/timed out notification was.

typedef void (*lwm2m_ctx_event_cb_t)(struct lwm2m_ctx *ctx, enum lwm2m_rd_client_event event)
   Asynchronous RD client event callback.

   **Param ctx**
   [in] LwM2M context generating the event

   **Param event**
   [in] LwM2M RD client event code

6.2. Networking
typedef void (*lwm2m_engine_get_data_cb_t)(uint16_t obj_inst_id, uint16_t res_id, uint16_t res_inst_id, size_t *data_len)

Asynchronous callback to get a resource buffer and length.

Prior to accessing the data buffer of a resource, the engine can use this callback to get the buffer pointer and length instead of using the resource’s data buffer.

The client or LwM2M objects can register a function of this type via:

\( \text{lwm2m_engine_register_read_callback()} \), \( \text{lwm2m_engine_register_pre_write_callback()} \)

- **Param obj_inst_id**
  - [in] Object instance ID generating the callback.

- **Param res_id**
  - [in] Resource ID generating the callback.

- **Param res_inst_id**
  - [in] Resource instance ID generating the callback (typically 0 for non-multi instance resources).

- **Param data_len**
  - [out] Length of the data buffer.

- **Return**
  - Callback returns a pointer to the data buffer or NULL for failure.

typedef int (*lwm2m_engine_set_data_cb_t)(uint16_t obj_inst_id, uint16_t res_id, uint16_t res_inst_id, uint8_t *data, uint16_t data_len, bool last_block, size_t total_size)

Asynchronous callback when data has been set to a resource buffer.

After changing the data of a resource buffer, the LwM2M engine can make use of this callback to pass the data back to the client or LwM2M objects.

A function of this type can be registered via:

\( \text{lwm2m_engine_register_validate_callback()} \), \( \text{lwm2m_engine_register_post_write_callback()} \)

- **Param obj_inst_id**
  - [in] Object instance ID generating the callback.

- **Param res_id**
  - [in] Resource ID generating the callback.

- **Param res_inst_id**
  - [in] Resource instance ID generating the callback (typically 0 for non-multi instance resources).

- **Param data**
  - [in] Pointer to data.

- **Param data_len**
  - [in] Length of the data.

- **Param last_block**
  - [in] Flag used during block transfer to indicate the last block of data. For non-block transfers this is always false.

- **Param total_size**
  - [in] Expected total size of data for a block transfer. For non-block transfers this is 0.

- **Return**
  - Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.
typedef int (*lwm2m_engine_user_cb_t)(uint16_t obj_inst_id)

Asynchronous event notification callback.

Various object instance and resource-based events in the LwM2M engine can trigger a callback of this function type: object instance create, and object instance delete.

Register a function of this type via: lwm2m_engine_register_create_callback()
  lwm2m_engine_register_delete_callback()

Param obj_inst_id
  [in] Object instance ID generating the callback.

Return
  Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

typedef int (*lwm2m_engine_execute_cb_t)(uint16_t obj_inst_id, uint8_t *args, uint16_t args_len)

Asynchronous execute notification callback.

Resource executes trigger a callback of this type.

Register a function of this type via: lwm2m_engine_register_exec_callback()

Param obj_inst_id
  [in] Object instance ID generating the callback.

Param args
  [in] Pointer to execute arguments payload. (This can be NULL if no arguments are provided)

Param args_len
  [in] Length of argument payload in bytes.

Return
  Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

Enums

double enum lwm2m_observe_event
  Observe callback events.

  Values:

  enumerator LWM2M_OBSERVE_EVENT_OBSERVER_ADDED
  enumerator LWM2M_OBSERVE_EVENT_OBSERVER_REMOVED
  enumerator LWM2M_OBSERVE_EVENT_NOTIFY_ACK
  enumerator LWM2M_OBSERVE_EVENT_NOTIFY_TIMEOUT

double enum lwm2m_rd_client_event
  LwM2M RD client events.

  LwM2M client events are passed back to the event_cb function in lwm2m_rd_client_start()

  Values:
enumerator LWM2M_RD_CLIENT_EVENT_NONE
enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_FAILURE
enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_COMPLETE
enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_TRANSFER_COMPLETE
enumerator LWM2M_RD_CLIENT_EVENT_REGISTRATION_FAILURE
enumerator LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE
enumerator LWM2M_RD_CLIENT_EVENT_REG_TIMEOUT
enumerator LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE
enumerator LWM2M_RD_CLIENT_EVENT_DEREGISTER_FAILURE
enumerator LWM2M_RD_CLIENT_EVENT_DISCONNECT
enumerator LWM2M_RD_CLIENT_EVENT_QUEUE_MODE_RX_OFF
enumerator LWM2M_RD_CLIENT_EVENT_ENGINE_SUSPENDED
enumerator LWM2M_RD_CLIENT_EVENT_NETWORK_ERROR

Functions

int lwm2m_device_add_err(uint8_t error_code)
  Register a new error code with LwM2M Device object.

Parameters

Returns
  0 for success or negative in case of error.

int lwm2m_engine_update_observer_min_period(struct lwm2m_ctx *client_ctx, const char *pathstr, uint32_t period_s)
  Change an observer’s pmin value.

LwM2M clients use this function to modify the pmin attribute for an observation being made. Example to update the pmin of a temperature sensor value being observed:
lwm2m_engine_update_observer_min_period("client_ctx, 3303/0/5700", 5);

Parameters
  • client_ctx – [in] LwM2M context
  • pathstr – [in] LwM2M path string “obj/obj-inst/res”
  • period_s – [in] Value of pmin to be given (in seconds).
Returns
0 for success or negative in case of error.

```
int lwm2m_engine_update_observer_max_period(struct lwm2m_ctx *client_ctx, const char *pathstr, uint32_t period_s)
```

Change an observer's pmax value.

LwM2M clients use this function to modify the pmax attribute for an observation being made. Example to update the pmax of a temperature sensor value being observed:
lwm2m_engine_update_observer_max_period("client_ctx, 3303/0/5700", 5);

Parameters
- `client_ctx` – [in] LwM2M context
- `pathstr` – [in] LwM2M path string "obj/obj-inst/res"
- `period_s` – [in] Value of pmax to be given (in seconds).

Returns
0 for success or negative in case of error.

```
int lwm2m_engine_create_obj_inst(const char *pathstr)
```

Create an LwM2M object instance.

LwM2M clients use this function to create non-default LwM2M objects: Example to create first temperature sensor object: lwm2m_engine_create_obj_inst("3303/0");

Parameters
- `pathstr` – [in] LwM2M path string "obj/obj-inst"

Returns
0 for success or negative in case of error.

```
int lwm2m_engine_delete_obj_inst(const char *pathstr)
```

Delete an LwM2M object instance.

LwM2M clients use this function to delete LwM2M objects.

Parameters
- `pathstr` – [in] LwM2M path string "obj/obj-inst"

Returns
0 for success or negative in case of error.

```
void lwm2m_registry_lock(void)
```

Locks the registry for this thread.

Use this function before writing to multiple resources. This halts the lwm2m main thread until all the write-operations are finished.

```
void lwm2m_registry_unlock(void)
```

Unlocks the registry previously locked by `lwm2m_registry_lock()`.

```
int lwm2m_engine_setopaque(const char *pathstr, const char *data_ptr, uint16_t data_len)
```

Set resource (instance) value (opaque buffer)

Parameters
- `pathstr` – [in] LwM2M path string "obj/obj-inst/res(/res-inst)"
- `data_ptr` – [in] Data buffer
- `data_len` – [in] Length of buffer

Returns
0 for success or negative in case of error.
int lwm2m_engine_set_string(const char *pathstr, const char *data_ptr)
    Set resource (instance) value (string)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• data_ptr – [in] NULL terminated char buffer

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_u8(const char *pathstr, uint8_t value)
    Set resource (instance) value (u8)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] u8 value

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_u16(const char *pathstr, uint16_t value)
    Set resource (instance) value (u16)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] u16 value

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_u32(const char *pathstr, uint32_t value)
    Set resource (instance) value (u32)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] u32 value

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_u64(const char *pathstr, uint64_t value)
    Set resource (instance) value (u64)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] u64 value

Returns
0 for success or negative in case of error.

int lwm2m_engine_set_s8(const char *pathstr, int8_t value)
    Set resource (instance) value (s8)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] s8 value

Returns
0 for success or negative in case of error.
int lwm2m_engine_set_s16(const char *pathstr, int16_t value)

Set resource (instance) value (s16)

**Parameters**

- pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)"
- value – [in] s16 value

**Returns**

0 for success or negative in case of error.

int lwm2m_engine_set_s32(const char *pathstr, int32_t value)

Set resource (instance) value (s32)

**Parameters**

- pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)"
- value – [in] s32 value

**Returns**

0 for success or negative in case of error.

int lwm2m_engine_set_s64(const char *pathstr, int64_t value)

Set resource (instance) value (s64)

**Parameters**

- pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)"
- value – [in] s64 value

**Returns**

0 for success or negative in case of error.

int lwm2m_engine_set_bool(const char *pathstr, bool value)

Set resource (instance) value (bool)

**Parameters**

- pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)"
- value – [in] bool value

**Returns**

0 for success or negative in case of error.

int lwm2m_engine_set_float(const char *pathstr, const double *value)

Set resource (instance) value (double)

**Parameters**

- pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)"
- value – [in] double value

**Returns**

0 for success or negative in case of error.

int lwm2m_engine_set_objlnk(const char *pathstr, const struct lwm2m_objlnk *value)

Set resource (instance) value (ObjLnk)

**Parameters**

- pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)"
- value – [in] pointer to the  lwm2m_objlnk  structure

**Returns**

0 for success or negative in case of error.
int lwm2m_engine_set_time(const char *pathstr, time_t value)

Set resource (instance) value (Time)

Parameters

• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] Epoch timestamp

Returns

0 for success or negative in case of error.

int lwm2m_engine_getOpaque(const char *pathstr, void *buf, uint16_t buflen)

Get resource (instance) value (opaque buffer)

Parameters

• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• buf – [out] Data buffer to copy data into
• buflen – [in] Length of buffer

Returns

0 for success or negative in case of error.

int lwm2m_engine_get_string(const char *pathstr, void *str, uint16_t strlen)

Get resource (instance) value (string)

Parameters

• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• str – [out] String buffer to copy data into
• strlen – [in] Length of buffer

Returns

0 for success or negative in case of error.

int lwm2m_engine_get_u8(const char *pathstr, uint8_t *value)

Get resource (instance) value (u8)

Parameters

• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] u8 buffer to copy data into

Returns

0 for success or negative in case of error.

int lwm2m_engine_get_u16(const char *pathstr, uint16_t *value)

Get resource (instance) value (u16)

Parameters

• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] u16 buffer to copy data into

Returns

0 for success or negative in case of error.

int lwm2m_engine_get_u32(const char *pathstr, uint32_t *value)

Get resource (instance) value (u32)

Parameters

• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] u32 buffer to copy data into
Returns
0 for success or negative in case of error.

int lwm2m_engine_get_u64(const char *pathstr, uint64_t *value)
Get resource (instance) value (u64)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] u64 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_s8(const char *pathstr, int8_t *value)
Get resource (instance) value (s8)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] s8 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_s16(const char *pathstr, int16_t *value)
Get resource (instance) value (s16)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] s16 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_s32(const char *pathstr, int32_t *value)
Get resource (instance) value (s32)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] s32 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_s64(const char *pathstr, int64_t *value)
Get resource (instance) value (s64)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] s64 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_bool(const char *pathstr, bool *value)
Get resource (instance) value (bool)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] bool buffer to copy data into
Returns
0 for success or negative in case of error.

```c
int lwm2m_engine_get_float(const char *pathstr, double *buf)
```
Get resource (instance) value (double)

**Parameters**
- `pathstr` - [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- `buf` - [out] double buffer to copy data into

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_get_objlnk(const char *pathstr, struct lwm2m_objlnk *buf)
```
Get resource (instance) value (ObjLnk)

**Parameters**
- `pathstr` - [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- `buf` - [out] `lwm2m_objlnk` buffer to copy data into

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_get_time(const char *pathstr, time_t *buf)
```
Get resource (instance) value (Time)

**Parameters**
- `pathstr` - [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- `buf` - [out] `time_t` pointer to copy data

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_register_read_callback(const char *pathstr, lwm2m_engine_get_data_cb_t cb)
```
Set resource (instance) read callback.

LwM2M clients can use this to set the callback function for resource reads when data handling in the LwM2M engine needs to be bypassed. For example reading back opaque binary data from external storage.

This callback should not generally be used for any data that might be observed as engine does not have any knowledge of data changes.

When separate buffer for data should be used, use `lwm2m_engine_set_res_buf()` instead to set the storage.

**Parameters**
- `pathstr` - [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- `cb` - [in] Read resource callback

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_register_pre_write_callback(const char *pathstr, lwm2m_engine_get_data_cb_t cb)
```
Set resource (instance) pre-write callback.

This callback is triggered before setting the value of a resource. It can pass a special data buffer to the engine so that the actual resource value can be calculated later, etc.

**Parameters**
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• cb – [in] Pre-write resource callback

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_register_validate_callback(const char *pathstr, lwm2m_engine_set_data_cb_t cb)
```

Set resource (instance) validation callback.

This callback is triggered before setting the value of a resource to the resource data buffer. The callback allows an LwM2M client or object to validate the data before writing and notify an error if the data should be discarded for any reason (by returning a negative error code).

**Note:** All resources that have a validation callback registered are initially decoded into a temporary validation buffer. Make sure that `CONFIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE` is large enough to store each of the validated resources (individually).

**Parameters**

• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• cb – [in] Validate resource data callback

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_register_post_write_callback(const char *pathstr, lwm2m_engine_set_data_cb_t cb)
```

Set resource (instance) post-write callback.

This callback is triggered after setting the value of a resource to the resource data buffer. It allows an LwM2M client or object to post-process the value of a resource or trigger other related resource calculations.

**Parameters**

• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• cb – [in] Post-write resource callback

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_register_exec_callback(const char *pathstr, lwm2m_engine_execute_cb_t cb)
```

Set resource execute event callback.

This event is triggered when the execute method of a resource is enabled.

**Parameters**

• pathstr – [in] LwM2M path string “obj/obj-inst/res”
• cb – [in] Execute resource callback

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_register_create_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)
```

Set object instance create event callback.

This event is triggered when an object instance is created.

6.2. Networking
Parameters

• obj_id – [in] LwM2M object id
• cb – [in] Create object instance callback

Returns

0 for success or negative in case of error.

int lwm2m_engine_register_delete_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)

Set object instance delete event callback.

This event is triggered when an object instance is deleted.

Parameters

• obj_id – [in] LwM2M object id
• cb – [in] Delete object instance callback

Returns

0 for success or negative in case of error.

int lwm2m_engine_set_res_buf(const char *pathstr, void *buffer_ptr, uint16_t buffer_len, uint16_t data_len, uint8_t data_flags)

Set data buffer for a resource.

Use this function to set the data buffer and flags for the specified LwM2M resource.

Parameters

• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• buffer_ptr – [in] Data buffer pointer
• buffer_len – [in] Length of buffer
• data_len – [in] Length of existing data in the buffer
• data_flags – [in] Data buffer flags (such as read-only, etc)

Returns

0 for success or negative in case of error.

int lwm2m_engine_set_res_data(const char *pathstr, void *data_ptr, uint16_t data_len, uint8_t data_flags)

Set data buffer for a resource.

Use this function to set the data buffer and flags for the specified LwM2M resource.

Deprecated:

Use lwm2m_engine_set_res_buf() instead, so you can define buffer size and data size separately.

Parameters

• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• data_ptr – [in] Data buffer pointer
• data_len – [in] Length of buffer
• data_flags – [in] Data buffer flags (such as read-only, etc)

Returns

0 for success or negative in case of error.
int lwm2m_engine_set_res_data_len(const char *pathstr, uint16_t data_len)
Update data size for a resource.

Use this function to set the new size of data in the buffer if you write to a buffer received by lwm2m_engine_get_res_buf().

Parameters
  • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
  • data_len – [in] Length of data

Returns
  0 for success or negative in case of error.

int lwm2m_engine_get_res_buf(const char *pathstr, void **buffer_ptr, uint16_t *buffer_len, uint16_t *data_len, uint8_t *data_flags)
Get data buffer for a resource.

Use this function to get the data buffer information for the specified LwM2M resource.

If you directly write into the buffer, you must use lwm2m_engine_set_res_data_len() function to update the new size of the written data.

All parameters except pathstr can NULL if you don’t want to read those values.

Parameters
  • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
  • buffer_ptr – [out] Data buffer pointer
  • buffer_len – [out] Length of buffer
  • data_len – [out] Length of existing data in the buffer
  • data_flags – [out] Data buffer flags (such as read-only, etc)

Returns
  0 for success or negative in case of error.

int lwm2m_engine_get_res_data(const char *pathstr, void **data_ptr, uint16_t *data_len, uint8_t *data_flags)
Get data buffer for a resource.

Use this function to get the data buffer information for the specified LwM2M resource.

Deprecated:
  Use lwm2m_engine_get_res_buf() as it can tell you the size of the buffer as well.

Parameters
  • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
  • data_ptr – [out] Data buffer pointer
  • data_len – [out] Length of existing data in the buffer
  • data_flags – [out] Data buffer flags (such as read-only, etc)

Returns
  0 for success or negative in case of error.

int lwm2m_engine_create_res_inst(const char *pathstr)
Create a resource instance.

LwM2M clients use this function to create multi-resource instances: Example to create 0 instance of device available power sources: lwm2m_engine_create_res_inst(“3/0/6/0”);
Parameters
  • pathstr – [in] LwM2M path string “obj/obj-inst/res/res-inst”

Returns
  0 for success or negative in case of error.

int lwm2m_engine_delete_res_inst(const char *pathstr)
Delete a resource instance.
Use this function to remove an existing resource instance

Parameters
  • pathstr – [in] LwM2M path string “obj/obj-inst/res/res-inst”

Returns
  0 for success or negative in case of error.

int lwm2m_engine_update_service_period(k_work_handler_t service, uint32_t period_ms)
Update the period of a given service.
Allow the period modification on an existing service created with
lwm2m_engine_add_service(). Example to frequency at which a periodic_service changes it’s
values : lwm2m_engine_update_service(device_periodic_service,5*MSEC_PER_SEC);

Parameters
  • service – [in] Handler of the periodic_service
  • period_ms – [in] New period for the periodic_service (in milliseconds)

Returns
  0 for success or negative in case of error.

int lwm2m_update_device_service_period(uint32_t period_ms)
Update the period of the device service.
Change the duration of the periodic device service that notifies the current time.

Parameters
  • period_ms – [in] New period for the device service (in milliseconds)

Returns
  0 for success or negative in case of error.

bool lwm2m_engine_path_is_observed(const char *pathstr)
Check whether a path is observed.

Parameters
  • pathstr – [in] LwM2M path string to check, e.g. “3/0/1”

Returns
  true when there exists an observation of the same level or lower as the given
  path, false if it doesn’t or path is not a valid LwM2M-path. E.g. true if path refers
to a resource and the parent object has an observation, false for the inverse.

int lwm2m_engine_stop(struct lwm2m_ctx *client_ctx)
Stop the LwM2M engine.
LwM2M clients normally do not need to call this function as it is called within
lwm2m_rd_client. However, if the client does not use the RD client implementation, it will
need to be called manually.

Parameters
  • client_ctx – [in] LwM2M context
int lwm2m_engine_start(struct lwm2m_ctx *client_ctx)

Start the LwM2M engine.

LwM2M clients normally do not need to call this function as it is called by lwm2m_rd_client_start(). However, if the client does not use the RD client implementation, it will need to be called manually.

Parameters

• client_ctx – [in] LwM2M context

Returns

0 for success or negative in case of error.

void lwm2m_acknowledge(struct lwm2m_ctx *client_ctx)

Acknowledge the currently processed request with an empty ACK.

LwM2M engine by default sends piggybacked responses for requests. This function allows to send an empty ACK for a request earlier (from the application callback). The LwM2M engine will then send the actual response as a separate CON message after all callbacks are executed.

Parameters

• client_ctx – [in] LwM2M context

int lwm2m_rd_client_start(struct lwm2m_ctx *client_ctx, const char *ep_name, uint32_t flags, lwm2m_ctx_event_cb_t event_cb, lwm2m_observe_cb_t observe_cb)

Start the LwM2M RD (Registration / Discovery) Client.

The RD client sits just above the LwM2M engine and performs the necessary actions to implement the “Registration interface”. For more information see Section “Client Registration Interface” of LwM2M Technical Specification.

NOTE: lwm2m_engine_start() is called automatically by this function.

Parameters

• client_ctx – [in] LwM2M context

• ep_name – [in] Registered endpoint name

• flags – [in] Flags used to configure current LwM2M session.

• event_cb – [in] Client event callback function

• observe_cb – [in] Observe callback function called when an observer was added or deleted, and when a notification was acked or has timed out

Returns

0 for success, -EINVALPROGRESS when client is already running or negative error codes in case of failure.

int lwm2m_rd_client_stop(struct lwm2m_ctx *client_ctx, lwm2m_ctx_event_cb_t event_cb, bool deregister)

Stop the LwM2M RD (De-register) Client.

The RD client sits just above the LwM2M engine and performs the necessary actions to implement the “Registration interface”. For more information see Section “Client Registration Interface” of the LwM2M Technical Specification.

Parameters

• client_ctx – [in] LwM2M context

• event_cb – [in] Client event callback function
- deregister – [in] True to deregister the client if registered. False to force close the connection.

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_pause(void)
```
Suspend the LwM2M engine Thread.

Suspend LwM2M engine. Use case could be when network connection is down. LwM2M Engine indicate before it suspend by LWM2M_RD_CLIENT_EVENT_ENGINE_SUSPENDED event.

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_resume(void)
```
Resume the LwM2M engine thread.

Resume suspended LwM2M engine. After successful resume call engine will do full registration or registration update based on suspended time. Event’s LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE or WM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE indicate that client is connected to server.

**Returns**
0 for success or negative in case of error.

```c
void lwm2m_rd_client_update(void)
```
Trigger a Registration Update of the LwM2M RD Client.

```c
char * lwm2m_path_log_buf(char *buf, struct lwm2m_obj_path *path)
```
Helper function to print path objects’ contents to log.

**Parameters**
- `buf` – [in] The buffer to use for formatting the string
- `path` – [in] The path to stringify

**Returns**
Resulting formatted path string

```c
int lwm2m_engine_send(struct lwm2m_ctx *ctx, char const *path_list[], uint8_t path_list_size, bool confirmation_request)
```
LwM2M SEND operation to given path list

**Parameters**
- `ctx` – LwM2M context
- `path_list` – LwM2M Path string list
- `path_list_size` – Length of path list. Max size is ConfigurationManager.LWM2M_COMPOSITE_PATH_LIST_SIZE
- `confirmation_request` – True request confirmation for operation.

**Returns**
0 for success or negative in case of error.

```c
struct lwm2m_ctx * lwm2m_rd_client_ctx(void)
```
Returns LwM2M context
int lwm2m_engine_enable_cache(char const *resource_path, struct lwm2m_time_series_elem *data_cache, size_t cache_len)

Enable data cache for a resource.

Application may enable caching of resource data by allocating buffer for LwM2M engine to use. Buffer must be size of struct lwm2m_time_series_elem times cache_len

Parameters

- resource_path – LwM2M resourcepath string “obj/obj-inst/res(/res-inst)”
- data_cache – Pointer to Data cache array
- cache_len – number of cached entries

Returns

0 for success or negative in case of error.

struct lwm2m_obj_path

#include <lwm2m.h>

struct lwm2m_ctx

#include <lwm2m.h> LwM2M context structure to maintain information for a single LwM2M connection.

Public Members

struct sockaddr remote_addr

Destination address storage

struct coap_pending pending[CONFIG_LWM2M_ENGINE_MAX_PENDING + 1]

Private CoAP and networking structures + 1 is for RD Client own message

void *processed_req

A pointer to currently processed request, for internal LwM2M engine use. The underlying type is struct lwm2m_message, but since it’s declared in a private header and not exposed to the application, it’s stored as a void pointer.

bool use_dtls

Flag to indicate if context should use DTLS. Enabled via the use of coaps:// protocol prefix in connection information. NOTE: requires CONFIG_LWM2M_DTLS_SUPPORT=y

bool connection_suspended

Flag to indicate that the socket connection is suspended. With queue mode, this will tell if there is a need to reconnect.

int sec_obj_inst

Current index of Security Object used for server credentials

int srv_obj_inst

Current index of Server Object used in this context.
### MQTT

**Overview**  
MQTT (Message Queuing Telemetry Transport) is an application layer protocol which works on top of the TCP/IP stack. It is a lightweight publish/subscribe messaging transport for machine-to-machine communication. For more information about the protocol itself, see [http://mqtt.org/](http://mqtt.org/).

Zephyr provides an MQTT client library built on top of BSD sockets API. The library is configurable at a per-client basis, with support for MQTT versions 3.1.0 and 3.1.1. The Zephyr MQTT implementation can be used with either plain sockets communicating over TCP, or with secure sockets communicating over TLS. See [BSD Sockets](https://www.zephyrproject.org/book/zephyr-network.html) for more information about Zephyr sockets.

MQTT clients require an MQTT server to connect to. Such a server, called an MQTT Broker, is responsible for managing client subscriptions and distributing messages published by clients. There are many implementations of MQTT brokers, one of them being Eclipse Mosquitto. See [https://mosquitto.org/](https://mosquitto.org/) for more information about the Eclipse Mosquitto project.

**Sample usage**  
To create an MQTT client, a client context structure and buffers need to be defined:
/* Buffers for MQTT client. */
static uint8_t rx_buffer[256];
static uint8_t tx_buffer[256];

/* MQTT client context */
static struct mqtt_client client_ctx;

Multiple MQTT client instances can be created in the application and managed independently. Additionally, a structure for MQTT Broker address information is needed. This structure must be accessible throughout the lifespan of the MQTT client and can be shared among MQTT clients:

/* MQTT Broker address information. */
static struct sockaddr_storage broker;

An MQTT client library will notify MQTT events to the application through a callback function created to handle respective events:

void mqtt_evt_handler(struct mqtt_client *client,
    const struct mqtt_evt *evt)
{
    switch (evt->type) {
        /* Handle events here. */
    }
}

For a list of possible events, see API Reference.

The client context structure needs to be initialized and set up before it can be used. An example configuration for TCP transport is shown below:

mqtt_client_init(&client_ctx);

/* MQTT client configuration */
client_ctx.broker = &broker;
client_ctx.evt_cb = mqtt_evt_handler;
client_ctx.client_id.utf8 = (uint8_t *)"zephyr_mqtt_client";
client_ctx.client_id.size = sizeof("zephyr_mqtt_client") - 1;
client_ctx.password = NULL;
client_ctx.user_name = NULL;
client_ctx.protocol_version = MQTT_VERSION_3_1_1;
client_ctx.transport.type = MQTT_TRANSPORT_NON_SECURE;

/* MQTT buffers configuration */
client_ctx.rx_buf = rx_buffer;
client_ctx.rx_buf_size = sizeof(rx_buffer);
client_ctx.tx_buf = tx_buffer;
client_ctx.tx_buf_size = sizeof(tx_buffer);

After the configuration is set up, the MQTT client can connect to the MQTT broker. Call the `mqtt_connect` function, which will create the appropriate socket, establish a TCP/TLS connection, and send an MQTT CONNECT message. When notified, the application should call the `mqtt_input` function to process the response received. Note, that `mqtt_input` is a non-blocking function, therefore the application should use socket `poll` to wait for the response. If the connection was successful, `MQTT_EVT_CONNACK` will be notified to the application through the callback function.

rc = mqtt_connect(&client_ctx);
if (rc != 0) {
    return rc;
}
In the above code snippet, the MQTT callback function should set the `connected` flag upon a successful connection. If the connection fails at the MQTT level or a timeout occurs, the connection will be aborted, and the underlying socket closed.

After the connection is established, an application needs to call `mqtt_input` and `mqtt_live` functions periodically to process incoming data and upkeep the connection. If an MQTT message is received, an MQTT callback function will be called and an appropriate event notified.

The connection can be closed by calling the `mqtt_disconnect` function.

Zephyr provides sample code utilizing the MQTT client API. See `mqtt-publisher-sample` for more information.

**Using MQTT with TLS** The Zephyr MQTT library can be used with TLS transport for secure communication by selecting a secure transport type (`MQTT_TRANSPORT_SECURE`) and some additional configuration information:

```c
client_ctx.transport.type = MQTT_TRANSPORT_SECURE;
struct mqtt_sec_config *tls_config = &client_ctx.transport.tls.config;

tls_config->peer_verify = TLS_PEER_VERIFY_REQUIRED;
tls_config->cipher_list = NULL;
tls_config->sec_tag_list = m_sec_tags;
tls_config->sec_tag_count = ARRAY_SIZE(m_sec_tags);
tls_config->hostname = MQTT_BROKER_HOSTNAME;
```

In this sample code, the `m_sec_tags` array holds a list of tags, referencing TLS credentials that the MQTT library should use for authentication. We do not specify `cipher_list`, to allow the use of all cipher suites available in the system. We set `hostname` field to broker hostname, which is required for server authentication. Finally, we enforce peer certificate verification by setting the `peer_verify` field.

Note, that TLS credentials referenced by the `m_sec_tags` array must be registered in the system first. For more information on how to do that, refer to `secure sockets documentation`.

An example of how to use TLS with MQTT is also present in `mqtt-publisher-sample`.

**API Reference**

**group mqtt_socket**

MQTT Client Implementation.

MQTT Client’s Application interface is defined in this header.

**Note:** The implementation assumes TCP module is enabled.
**Note:** By default the implementation uses MQTT version 3.1.1.

### Defines

`MQTT_UTF8_LITERAL(literal)`

Initialize UTF-8 encoded string from C literal string.

Use it as follows:

```c
struct mqtt_utf8 password = MQTT_UTF8_LITERAL("my_pass");
```

#### Parameters

- `literal` - **[in]** Literal string from which to generate `mqtt_utf8` object.

### Typedefs

```c
typedef void (*mqtt_evt_cb_t)(struct mqtt_client *client, const struct mqtt_evt *evt);
```

Asynchronous event notification callback registered by the application.

#### Param `client`

- **[in]** Identifies the client for which the event is notified.

#### Param `evt`

- **[in]** Event description along with result and associated parameters (if any).

### Enums

```c
enum mqtt_evt_type
```

MQTT Asynchronous Events notified to the application from the module through the callback registered by the application.

#### Values:

- `MQTT_EVT_CONNACK`  
  Acknowledgment of connection request. Event result accompanying the event indicates whether the connection failed or succeeded.

- `MQTT_EVT_DISCONNECT`  
  Disconnection Event. MQTT Client Reference is no longer valid once this event is received for the client.

- `MQTT_EVT_PUBLISH`  
  Publish event received when message is published on a topic client is subscribed to.

  **Note:** PUBLISH event structure only contains payload size, the payload data parameter should be ignored. Payload content has to be read manually with `mqtt_read_publish_payload` function.

- `MQTT_EVT_PUBACK`  
  Acknowledgment for published message with QoS 1.
enumerator MQTT_EVT_PUBREC
   Reception confirmation for published message with QoS 2.

enumerator MQTT_EVT_PUBREL
   Release of published message with QoS 2.

enumerator MQTT_EVT_PUBCOMP
   Confirmation to a publish release message with QoS 2.

enumerator MQTT_EVT_SUBACK
   Acknowledgment to a subscribe request.

enumerator MQTT_EVT_UNSUBACK
   Acknowledgment to a unsubscribe request.

enumerator MQTT_EVT_PINGRESP
   Ping Response from server.

enum mqtt_version
   MQTT version protocol level.
   Values:

   enumerator MQTT_VERSION_3_1_0 = 3
      Protocol level for 3.1.0.

   enumerator MQTT_VERSION_3_1_1 = 4
      Protocol level for 3.1.1.

enum mqtt_qos
   MQTT Quality of Service types.
   Values:

   enumerator MQTT_QOS_0_AT_MOST_ONCE = 0x00
      Lowest Quality of Service, no acknowledgment needed for published message.

   enumerator MQTT_QOS_1_AT_LEAST_ONCE = 0x01
      Medium Quality of Service, if acknowledgment expected for published message, duplicate messages permitted.

   enumerator MQTT_QOS_2_EXACTLY_ONCE = 0x02
      Highest Quality of Service, acknowledgment expected and message shall be published only once. Message not published to interested parties unless client issues a PUBREL.

enum mqtt_conn_return_code
   MQTT CONNACK return codes.
   Values:
enumerator MQTT_CONNECTION_ACCEPTED = 0x00
    Connection accepted.

enumerator MQTT_UNACCEPTABLE_PROTOCOL_VERSION = 0x01
    The Server does not support the level of the MQTT protocol requested by the Client.

enumerator MQTT_IDENTIFIER_REJECTED = 0x02
    The Client identifier is correct UTF-8 but not allowed by the Server.

enumerator MQTT_SERVER_UNAVAILABLE = 0x03
    The Network Connection has been made but the MQTT service is unavailable.

enumerator MQTT_BAD_USER_NAME_OR_PASSWORD = 0x04
    The data in the user name or password is malformed.

enumerator MQTT_NOT_AUTHORIZED = 0x05
    The Client is not authorized to connect.

enum mqtt_suback_return_code
    MQTT SUBACK return codes.
    Values:

enumerator MQTT_SUBACK_SUCCESS_QoS_0 = 0x00
    Subscription with QoS 0 succeeded.

enumerator MQTT_SUBACK_SUCCESS_QoS_1 = 0x01
    Subscription with QoS 1 succeeded.

enumerator MQTT_SUBACK_SUCCESS_QoS_2 = 0x02
    Subscription with QoS 2 succeeded.

enumerator MQTT_SUBACK_FAILURE = 0x80
    Subscription for a topic failed.

enum mqtt_transport_type
    MQTT transport type.
    Values:

enumerator MQTT_TRANSPORT_NON_SECURE
    Use non secure TCP transport for MQTT connection.

dependent mqtt_transport_type
    Shall not be used as a transport type. Indicator of maximum transport types possible.

Functions
void mqtt_client_init(struct mqtt_client *client)
Initializes the client instance.

Note: Shall be called to initialize client structure, before setting any client parameters and before connecting to broker.

Parameters
- client – [in] Client instance for which the procedure is requested. Shall not be NULL.

int mqtt_connect(struct mqtt_client *client)
API to request new MQTT client connection.

Note: This memory is assumed to be resident until mqtt_disconnect is called.

Note: Any subsequent changes to parameters like broker address, user name, device id, etc. have no effect once MQTT connection is established.

Note: Default protocol revision used for connection request is 3.1.1. Please set client.protocol_version = MQTT_VERSION_3_1_0 to use protocol 3.1.0.

Note: Please modify CONFIG_MQTT_KEEPALIVE time to override default of 1 minute.

Parameters
- client – [in] Client instance for which the procedure is requested. Shall not be NULL.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_publish(struct mqtt_client *client, const struct mqtt_publish_param *param)
API to publish messages on topics.

Parameters
- client – [in] Client instance for which the procedure is requested. Shall not be NULL.
- param – [in] Parameters to be used for the publish message. Shall not be NULL.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_publish_qos1_ack(struct mqtt_client *client, const struct mqtt_puback_param *param)
API used by client to send acknowledgment on receiving QoS1 publish message. Should be called on reception of MQTT_EVT_PUBLISH with QoS level MQTT_QOS_1_AT_LEAST_ONCE.

Parameters
- client – [in] Client instance for which the procedure is requested. Shall not be NULL.
- param – [in] Identifies message being acknowledged.
Returns
0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_publish_qos2_receive(struct mqtt_client *client, const struct mqtt_pubrec_param *param)
```

API used by client to send acknowledgment on receiving QoS2 publish message. Should be called on reception of `MQTT_EVT_PUBLISH` with QoS level `MQTT_QOS_2_EXactly_once`.

Parameters
- `client` – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.
- `param` – [in] Identifies message being acknowledged.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_publish_qos2_release(struct mqtt_client *client, const struct mqtt_pubrel_param *param)
```

API used by client to request release of QoS2 publish message. Should be called on reception of `MQTT_EVT_PUBREC`.

Parameters
- `client` – [in] Client instance for which the procedure is requested. Shall not be NULL.
- `param` – [in] Identifies message being released.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_publish_qos2_complete(struct mqtt_client *client, const struct mqtt_pubcomp_param *param)
```

API used by client to send acknowledgment on receiving QoS2 publish release message. Should be called on reception of `MQTT_EVT_PUBREL`.

Parameters
- `client` – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.
- `param` – [in] Identifies message being completed.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_subscribe(struct mqtt_client *client, const struct mqtt_subscription_list *param)
```

API to request subscription of one or more topics on the connection.

Parameters
- `client` – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.
- `param` – [in] Subscription parameters. Shall not be NULL.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_unsubscribe(struct mqtt_client *client, const struct mqtt_subscription_list *param)
```

API to request unsubscription of one or more topics on the connection.

Note: QoS included in topic description is unused in this API.
Parameters

- **client** – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.

- **param** – [in] Parameters describing topics being unsubscribed from. Shall not be NULL.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_ping(struct mqtt_client *client)
```

API to send MQTT ping. The use of this API is optional, as the library handles the connection keep-alive on its own, see `mqtt_live`.

Parameters

- **client** – [in] Identifies client instance for which procedure is requested.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_disconnect(struct mqtt_client *client)
```

API to disconnect MQTT connection.

Parameters

- **client** – [in] Identifies client instance for which procedure is requested.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_abort(struct mqtt_client *client)
```

API to abort MQTT connection. This will close the corresponding transport without closing the connection gracefully at the MQTT level (with disconnect message).

Parameters

- **client** – [in] Identifies client instance for which procedure is requested.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_keepalive_time_left(const struct mqtt_client *client)
```

Helper function to determine when next keep alive message should be sent. Can be used for instance as a source for `poll` timeout.

Parameters

- **client** – [in] Client instance for which the procedure is requested. Shall not be NULL.

Returns

0 or a negative error code (errno.h) indicating reason of failure.
• client – [in] Client instance for which the procedure is requested.

Returns
Time in milliseconds until next keep alive message is expected to be sent. Function will return -1 if keep alive messages are not enabled.

int mqtt_input(struct mqtt_client *client)
Receive an incoming MQTT packet. The registered callback will be called with the packet content.

Note: In case of PUBLISH message, the payload has to be read separately with mqtt_read_publish_payload function. The size of the payload to read is provided in the publish event structure.

Note: This is a non-blocking call.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_read_publish_payload(struct mqtt_client *client, void *buffer, size_t length)
Read the payload of the received PUBLISH message. This function should be called within the MQTT event handler, when MQTT PUBLISH message is notified.

Note: This is a non-blocking call.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.
• buffer – [out] Buffer where payload should be stored.
• length – [in] Length of the buffer, in bytes.

Returns
Number of bytes read or a negative error code (errno.h) indicating reason of failure.

int mqtt_read_publish_payload_blocking(struct mqtt_client *client, void *buffer, size_t length)
Blocking version of mqtt_read_publish_payload function.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.
• buffer – [out] Buffer where payload should be stored.
• length – [in] Length of the buffer, in bytes.

Returns
Number of bytes read or a negative error code (errno.h) indicating reason of failure.
int mqtt_readall_publish_payload(struct mqtt_client *client, uint8_t *buffer, size_t length)

Blocking version of mqtt_read_publish_payload function which runs until the required number of bytes are read.

**Parameters**

- **client** – [in] Client instance for which the procedure is requested. Shall not be NULL.
- **buffer** – [out] Buffer where payload should be stored.
- **length** – [in] Number of bytes to read.

**Returns**

0 if success, otherwise a negative error code (errno.h) indicating reason of failure.

**struct mqtt_utf8**

```c
#include <mqtt.h>
```

Abstracts UTF-8 encoded strings.

**Public Members**

- **const uint8_t *utf8**
  Pointer to UTF-8 string.
- **uint32_t size**
  Size of UTF string, in bytes.

**struct mqtt_binstr**

```c
#include <mqtt.h>
```

Abstracts binary strings.

**Public Members**

- **uint8_t *data**
  Pointer to binary stream.
- **uint32_t len**
  Length of binary stream.

**struct mqtt_topic**

```c
#include <mqtt.h>
```

Abstracts MQTT UTF-8 encoded topic that can be subscribed to or published.

**Public Members**

- **struct mqtt_utf8 topic**
  Topic on to be published or subscribed to.
- **uint8_t qos**
  Quality of service requested for the subscription. mqtt_qos for details.

**struct mqtt_publish_message**

```c
#include <mqtt.h>
```

Parameters for a publish message.
Public Members

struct mqtt_topic topic
    Topic on which data was published.

struct mqtt_binstr payload
    Payload on the topic published.

struct mqtt_connack_param
    #include <mqtt.h> Parameters for a connection acknowledgment (CONNACK).

Public Members

uint8_t session_present_flag
    The Session Present flag enables a Client to establish whether the Client and Server have a consistent view about whether there is already stored Session state.

enum mqtt_conn_return_code return_code
    The appropriate non-zero Connect return code indicates if the Server is unable to process a connection request for some reason.

struct mqtt_puback_param
    #include <mqtt.h> Parameters for MQTT publish acknowledgment (PUBACK).

struct mqtt_pubrec_param
    #include <mqtt.h> Parameters for MQTT publish receive (PUBREC).

struct mqtt_pubrel_param
    #include <mqtt.h> Parameters for MQTT publish release (PUBREL).

struct mqtt_pubcomp_param
    #include <mqtt.h> Parameters for MQTT publish complete (PUBCOMP).

struct mqtt_suback_param
    #include <mqtt.h> Parameters for MQTT subscription acknowledgment (SUBACK).

struct mqtt_unsuback_param
    #include <mqtt.h> Parameters for MQTT unsubscribe acknowledgment (UNSUBACK).

struct mqtt_publish_param
    #include <mqtt.h> Parameters for a publish message.

Public Members

struct mqtt_publish_message message
    Messages including topic, QoS and its payload (if any) to be published.
uint16_t message_id
Message id used for the publish message. Redundant for QoS 0.

uint8_t dup_flag
Duplicate flag. If 1, it indicates the message is being retransmitted. Has no meaning with QoS 0.

uint8_t retain_flag
Retain flag. If 1, the message shall be stored persistently by the broker.

struct mqtt_subscription_list
#include <mqtt.h> List of topics in a subscription request.

Public Members

struct mqtt_topic *list
Array containing topics along with QoS for each.

uint16_t list_count
Number of topics in the subscription list

uint16_t message_id
Message id used to identify subscription request.

union mqtt_evt_param
#include <mqtt.h> Defines event parameters notified along with asynchronous events to the application.

Public Members

struct mqtt_connack_param connack
Parameters accompanying MQTT_EVT_CONNACK event.

struct mqtt_publish_param publish
Parameters accompanying MQTT_EVT_PUBLISH event.

Note: PUBLISH event structure only contains payload size, the payload data parameter should be ignored. Payload content has to be read manually with mqtt_read_publish_payload function.

struct mqtt_puback_param puback
Parameters accompanying MQTT_EVT_PUBACK event.

struct mqtt_pubrec_param pubrec
Parameters accompanying MQTT_EVT_PUBREC event.
struct mqtt_pubrel_param pubrel
    Parameters accompanying MQTT_EVT_PUBREL event.

struct mqtt_pubcomp_param pubcomp
    Parameters accompanying MQTT_EVT_PUBCOMP event.

struct mqtt_suback_param suback
    Parameters accompanying MQTT_EVT_SUBACK event.

struct mqtt_unsuback_param unsuback
    Parameters accompanying MQTT_EVT_UNSUBACK event.

struct mqtt_evt
    #include <mqtt.h> Defines MQTT asynchronous event notified to the application.

    Public Members

    enum mqtt_evt_type type
        Identifies the event.

    union mqtt_evt_param param
        Contains parameters (if any) accompanying the event.

    int result
        Event result. 0 or a negative error code (errno.h) indicating reason of failure.

struct mqtt_sec_config
    #include <mqtt.h> TLS configuration for secure MQTT transports.

    Public Members

    int peer_verify
        Indicates the preference for peer verification.

    uint32_t cipher_count
        Indicates the number of entries in the cipher list.

    int *cipher_list
        Indicates the list of ciphers to be used for the session. May be NULL to use the default ciphers.

    uint32_t sec_tag_count
        Indicates the number of entries in the sec tag list.

    sec_tag_t *sec_tag_list
        Indicates the list of security tags to be used for the session.
const char *hostname
    Peer hostname for certificate verification. May be NULL to skip hostname verification.

int cert_nocopy
    Indicates the preference for copying certificates to the heap.

struct mqtt_transport
    #include <mqtt.h> MQTT transport specific data.

Public Members

enum mqtt_transport_type type
    Transport type selection for client instance. mqtt_transport_type for possible values.
    MQTT_TRANSPORT_MAX is not a valid type.

int sock
    Socket descriptor.

struct mqtt_internal
    #include <mqtt.h> MQTT internal state.

Public Members

struct sys_mutex mutex
    Internal. Mutex to protect access to the client instance.

uint32_t last_activity
    Internal. Wall clock value (in milliseconds) of the last activity that occurred. Needed for
    periodic PING.

uint32_t state
    Internal. Client's state in the connection.

uint32_t rx_buf_datalen
    Internal. Packet length read so far.

uint32_t remaining_payload
    Internal. Remaining payload length to read.

struct mqtt_client
    #include <mqtt.h> MQTT Client definition to maintain information relevant to the client.

Public Members

struct mqtt_internal internal
    MQTT client internal state.
struct **mqtt_transport** transport
MQTT transport configuration and data.

struct **mqtt_utf8** client_id
Unique client identification to be used for the connection.

const void *broker
Broker details, for example, address, port. Address type should be compatible with transport used.

struct **mqtt_utf8** *user_name
User name (if any) to be used for the connection. NULL indicates no user name.

struct **mqtt_utf8** *password
Password (if any) to be used for the connection. Note that if password is provided, user name shall also be provided. NULL indicates no password.

struct **mqtt_topic** *will_topic
Will topic and QoS. Can be NULL.

struct **mqtt_utf8** *will_message
Will message. Can be NULL. Non NULL value valid only if will topic is not NULL.

mqtt_evt_cb_t evt_cb
Application callback registered with the module to get MQTT events.

uint8_t *rx_buf
Receive buffer used for MQTT packet reception in RX path.

uint32_t rx_buf_size
Size of receive buffer.

uint8_t *tx_buf
Transmit buffer used for creating MQTT packet in TX path.

uint32_t tx_buf_size
Size of transmit buffer.

uint16_t keepalive
Keepalive interval for this client in seconds. Default is CONFIG_MQTT_KEEPALIVE.

uint8_t protocol_version
MQTT protocol version.

int8_t unacked_ping
Unanswered PINGREQ count on this connection.

uint8_t will_retain
Will retain flag, 1 if will message shall be retained persistently.

```c
uint8_t clean_session

Clean session flag indicating a fresh (1) or a retained session (0). Default is CONFIG_MQTT_CLEAN_SESSION.
```

**MQTT-SN**

- **Overview**
  MQTT-SN is a variant of the well-known MQTT protocol - see MQTT.
  In contrast to MQTT, MQTT-SN does not require a TCP transport, but is designed to be used over any message-based transport. Originally, it was mainly created with ZigBee in mind, but others like Bluetooth, UDP or even a UART can be used just as well.
  Zephyr provides an MQTT-SN client library built on top of BSD sockets API. The library is configurable at a per-client basis, with support for MQTT-SN version 1.2. The Zephyr MQTT-SN implementation can be used with any message-based transport, but support for UDP is already built-in.
  The MQTT-SN spec v1.2 can be found here: [https://www.oasis-open.org/committees/download.php/66091/MQTT-SN_spec_v1.2.pdf](https://www.oasis-open.org/committees/download.php/66091/MQTT-SN_spec_v1.2.pdf)

- **Sample usage**
  To create an MQTT-SN client, a client context structure and buffers need to be defined:

  ```c
  /* Buffers for MQTT client. */
  static uint8_t rx_buffer[256];
  static uint8_t tx_buffer[256];
  
  /* MQTT-SN client context */
  static struct mqtt_sn_client client;
  
  Multiple MQTT-SN client instances can be created in the application and managed independently. Additionally, a structure for the transport is needed as well. The library already comes with an example implementation for UDP.

  ```

  ```c
  /* MQTT Broker address information. */
  static struct mqtt_sn_transport tp;
  
  The MQTT-SN library will inform clients about certain events using a callback.

  ```

  ```c
  static void evt_cb(struct mqtt_sn_client *client,
                     const struct mqtt_sn_evt *evt)
  {
      switch(evt->type) {
        
      /* Handle events here. */
  ```

  (continues on next page)
For a list of possible events, see API Reference.

The client context structure needs to be initialized and set up before it can be used. An example configuration for UDP transport is shown below:

```c
struct mqtt_sn_data client_id = MQTT_SN_DATA_STRING_LITERAL("ZEPHYR");
struct sockaddr_in gateway = {0};
uint8_t tx_buf[256];
uint8_t rx_buf[256];
mqtt_sn_transport_udp_init(&tp, (struct sockaddr*)&gateway, sizeof((gateway)));
mqtt_sn_client_init(&client, &client_id, &tp.tp, evt_cb, tx_buf, sizeof(tx_buf), rx_buf, sizeof(rx_buf));
```

After the configuration is set up, the MQTT-SN client can connect to the gateway. While the MQTT-SN protocol offers functionality to discover gateways through an advertisement mechanism, this is not implemented yet in the library.

Call the mqtt_sn_connect function, which will send a CONNECT message. The application should periodically call the mqtt_sn_input function to process the response received. The application does not have to call mqtt_sn_input if it knows that no data has been received (e.g. when using Bluetooth). Note that mqtt_sn_input is a non-blocking function, if the transport struct contains a poll compatible function pointer. If the connection was successful, MQTT_SN_EVT_CONNECTED will be notified to the application through the callback function.

```c
er = mqtt_sn_connect(&client, false, true);
__ASSERT(err == 0, "mqtt_sn_connect() failed %d", err);
while (1) {
    mqtt_sn_input(&client);
    if (connected) {
        mqtt_sn_publish(&client, MQTT_SN_QOS_0, &topic_p, false, &pubdata);
    }
    k_sleep(K_MSEC(500));
}
```

In the above code snippet, the event handler function should set the connected flag upon a successful connection. If the connection fails at the MQTT level or a timeout occurs, the connection will be aborted.

After the connection is established, an application needs to call mqtt_input function periodically to process incoming data. Connection upkeep, on the other hand, is done automatically using a k_work item. If a MQTT message is received, an MQTT callback function will be called and an appropriate event notified.

The connection can be closed by calling the mqtt_sn_disconnect function. This has no effect on the transport, however. If you want to close the transport (e.g. the socket), call mqtt_sn_client_deinit, which will deinit the transport as well.

Zephyr provides sample code utilizing the MQTT-SN client API. See mqtt-sn-publisher-sample for more information.

**Deviations from the standard**  Certain parts of the protocol are not yet supported in the library. * Pre-defined topic IDs * QoS -1 - it’s most useful with predefined topics * Gateway discovery using ADVERTISE,
SEARCHGW and GWINFO messages. * Setting the will topic and message after the initial connect * Forwarder Encapsulation

**API Reference**

`group mqtt_sn_socket`

MQTT-SN Client Implementation.

MQTT-SN Client's Application interface is defined in this header. Targets protocol version 1.2.

**Defines**

```c
MQTT_SN_DATA_STRING_LITERAL(literal)
```

Initialize memory buffer from C literal string.

Use it as follows:

```c
struct mqtt_sn_data topic = MQTT_SN_DATA_STRING_LITERAL("/zephyr");
```

**Parameters**

- `literal` - [in] Literal string from which to generate `mqtt_sn_data` object.

```c
MQTT_SN_DATA_BYTES(...)
```

Initialize memory buffer from single bytes.

Use it as follows:

```c
struct mqtt_sn_data data = MQTT_SN_DATA_BYTES(0x13, 0x37);
```

**Typedefs**

```c
typedef void (*mqtt_sn_evt_cb_t)(struct mqtt_sn_client *client, const struct mqtt_sn_evt *evt)
```

Asynchronous event notification callback registered by the application.

**Param client**

[in] Identifies the client for which the event is notified.

**Param evt**

[in] Event description along with result and associated parameters (if any).

** Enums**

`enum mqtt_sn_qos`

Quality of Service. QoS 0-2 work the same as basic MQTT, QoS -1 is an MQTT-SN addition. QOS -1 is not supported yet.

**Values:**

- `enumerator MQTT_SN_QOS_0` QOS 0
- `enumerator MQTT_SN_QOS_1` QOS 1
enumerator MQTT_SN_QOS_2
QOS 2

enumerator MQTT_SN_QOS_M1
QOS -1

enum mqtt_sn_topic_type
MQTT-SN topic types.
Values:

enumerator MQTT_SN_TOPIC_TYPE_NORMAL

enumerator MQTT_SN_TOPIC_TYPE_PREDEF

enumerator MQTT_SN_TOPIC_TYPE_SHORT

enum mqtt_sn_return_code
Values:

enumerator MQTT_SN_CODE_ACCEPTED = 0x00
Accepted

enumerator MQTT_SN_CODE_REJECTED_CONGESTION = 0x01
Rejected: congestion

enumerator MQTT_SN_CODE_REJECTED_TOPIC_ID = 0x02
Rejected: Invalid Topic ID

enumerator MQTT_SN_CODE_REJECTED_NOTSUP = 0x03
Rejected: Not Supported

enum mqtt_sn_evt_type
Event types that can be emitted by the library.
Values:

enumerator MQTT_SN_EVT_CONNECTED
Connected to a gateway

enumerator MQTT_SN_EVT_DISCONNECTED
Disconnected

enumerator MQTT_SN_EVT_AWAKE
Entered AWAKE state

enumerator MQTT_SN_EVT_AWAKE
Entered AWAKE state
enumerator MQTT_SN_EVT_PUBLISH
  Received a PUBLISH message

enumerator MQTT_SN_EVT_PINGRESP
  Received a PINGRESP

Functions

```c
int mqtt_sn_client_init(struct mqtt_sn_client *client, const struct mqtt_sn_data *client_id,
                        struct mqtt_sn_transport *transport, mqtt_sn_evt_cb_t evt_cb, void *tx,
                        size_t txsz, void *rx, size_t rxsz)
```
Initialize a client.

```c
void mqtt_sn_client_deinit(struct mqtt_sn_client *client)
```
Deinitialize the client.

This removes all topics and publishes, and also deinit the transport.

```c
int mqtt_sn_connect(struct mqtt_sn_client *client, bool will, bool clean_session)
```
Connect the client.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_sn_disconnect(struct mqtt_sn_client *client)
```
Disconnect the client.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_sn_sleep(struct mqtt_sn_client *client, uint16_t duration)
```
Set the client into sleep state for the given duration (seconds).

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_sn_subscribe(struct mqtt_sn_client *client, enum mqtt_sn_qos qos, struct mqtt_sn_data *topic_name)
```
Subscribe to a given topic.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_sn_unsubscribe(struct mqtt_sn_client *client, enum mqtt_sn_qos qos, struct mqtt_sn_data *topic_name)
```
Unsubscribe from a topic.

```c
int mqtt_sn_publish(struct mqtt_sn_client *client, enum mqtt_sn_qos qos, struct mqtt_sn_data *topic_name, bool retain, struct mqtt_sn_data *data)
```
Publish a value.

If the topic is not yet registered with the gateway, the library takes care of it.

**Returns**
0 or a negative error code (errno.h) indicating reason of failure.

```c
int mqtt_sn_input(struct mqtt_sn_client *client)
```
Check the transport for new incoming data.

Call this function periodically, or if you have good reason to believe there is any data. If the client’s transport struct contains a poll-function, this function is non-blocking.
**Returns**

0 or a negative error code (errno.h) indicating reason of failure.

```c
struct mqtt_sn_data
    #include <mqtt_sn.h> Abstracts memory buffers.
```

**Public Members**

```c
const uint8_t *data
    Pointer to data.
uint16_t size
    Size of data, in bytes.
```

```c
union mqtt_sn_evt_param
    #include <mqtt_sn.h> Event metadata.
```

**Public Members**

```c
struct mqtt_sn_data data
```

```c
enum mqtt_sn_topic_type topic_type
```

```c
uint16_t topic_id
```

```c
struct mqtt_sn_evt_param.[anonymous] publish
```

```c
struct mqtt_sn_evt
    #include <mqtt_sn.h> MQTT-SN event structure to be handled by the event callback.
```

```c
struct mqtt_sn_transport
    #include <mqtt_sn.h> Structure to describe an MQTT-SN transport.
```

MQTT-SN does not require transports to be reliable or to hold a connection. Transports just need to be frame-based, so you can use UDP, ZigBee, or even a simple UART, given some kind of framing protocol is used.

**Public Members**

```c
int (*init)(struct mqtt_sn_transport *transport)
    Will be called once on client init to initialize the transport.
    Use this to open sockets or similar. May be NULL.
```

```c
void (*deinit)(struct mqtt_sn_transport *transport)
    Will be called on client deinit.
    Use this to close sockets or similar. May be NULL.
```
int (*msg_send)(struct mqtt_sn_client *client, void *buf, size_t sz)
Will be called by the library when it wants to send a message.

ssize_t (*recv)(struct mqtt_sn_client *client, void *buffer, size_t length)
Will be called by the library when it wants to receive a message.
Implementations should follow recv conventions.

int (*poll)(struct mqtt_sn_client *client)
Check if incoming data is available.
If poll() returns a positive number, recv must not block.
May be NULL, but recv should not block then either.
Return
Positive number if data is available, or zero if there is none. Negative values signal errors.

struct mqtt_sn_client
#include <mqtt_sn.h> Structure describing an MQTT-SN client.

Public Members

struct mqtt_sn_data client_id
1-23 character unique client ID

struct mqtt_sn_data will_topic
Must be initialized before connecting with will=true

struct mqtt_sn_data will_msg
Must be initialized before connecting with will=true

Network System Management

Network Configuration Library

- Overview
- Sample usage
- API Reference

Overview  The network configuration library sets up networking devices in a semi-automatic way during the system boot, based on user-supplied Kconfig options.
The following Kconfig options affect how configuration library will setup the system:
Table 6.21: Kconfig options for network configuration library

<table>
<thead>
<tr>
<th>Option name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIG_NET_CONFIG_SETTINGS</td>
<td>This option controls whether the network system is configured or initialized at all. If not set, then the config library is not used for initialization and the application needs to do all the network related configuration itself. If this option is set, then the user can optionally configure static IP addresses to be set to the first network interface in the system. Typically setting static IP addresses is only usable in testing and should not be used in production code. See the config library Kconfig file subsys/net/lib/config/Kconfig for specific options to set the static IP addresses.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_AUTO_INIT</td>
<td>The networking system is automatically configured when the device is started.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_INIT_TIMEOUT</td>
<td>This tells how long to wait for the networking to be ready and available. If for example IPv4 address from DHCPv4 is not received within this limit, then a call to net_config_init() will return error during the device startup.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_NEED_IPV4</td>
<td>The network application needs IPv4 support to function properly. This option makes sure the network application is initialized properly in order to use IPv4. If CONFIG_NET_IPV4 is not enabled, then setting this option will automatically enable IPv4.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_NEED_IPV6</td>
<td>The network application needs IPv6 support to function properly. This option makes sure the network application is initialized properly in order to use IPv6. If CONFIG_NET_IPV6 is not enabled, then setting this option will automatically enable IPv6.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_NEED_IPV6_ROUTER</td>
<td>If IPv6 is enabled, then this option tells that the network application needs IPv6 router to exists before continuing. This means in practice that the application wants to wait until it receives IPv6 router advertisement message before continuing.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_BT_NODE</td>
<td>Enables application to operate in Bluetooth node mode which requires GATT service to be registered and start advertising as peripheral.</td>
</tr>
</tbody>
</table>

Sample usage  If CONFIG_NET_CONFIG_AUTO_INIT is set, then the configuration library is automatically enabled and run during the device boot. In this case, the library will call net_config_init() automatically and the application does not need to do any network configuration.

If you want to use the network configuration library but without automatic initialization, you can call net_config_init() manually. The flags parameter can be used to give hints to the library about what kind of functionality the application wishes to have before the actual application starts.

API Reference

*group net_config*

Network configuration library.

*Defines*

6.2. Networking 1985
NET_CONFIG_NEED_ROUTER
Application needs routers to be set so that connectivity to remote network is possible. For IPv6 networks, this means that the device should receive IPv6 router advertisement message before continuing.

NET_CONFIG_NEED_IPV6
Application needs IPv6 subsystem configured and initialized. Typically this means that the device has IPv6 address set.

NET_CONFIG_NEED_IPV4
Application needs IPv4 subsystem configured and initialized. Typically this means that the device has IPv4 address set.

Functions

int net_config_init(const char *app_info, uint32_t flags, int32_t timeout)
Initialize this network application.

This will call net_config_init_by_iface() with NULL network interface.

Parameters

• app_info – String describing this application.
• flags – Flags related to services needed by the client.
• timeout – How long to wait the network setup before continuing the startup.

Returns
0 if ok, <0 if error.

int net_config_init_by_iface(struct net_if *iface, const char *app_info, uint32_t flags, int32_t timeout)
Initialize this network application using a specific network interface.

If network interface is set to NULL, then the default one is used in the configuration.

Parameters

• iface – Initialize networking using this network interface.
• app_info – String describing this application.
• flags – Flags related to services needed by the client.
• timeout – How long to wait the network setup before continuing the startup.

Returns
0 if ok, <0 if error.

int net_config_init_app(const struct device *dev, const char *app_info)
Initialize this network application.

If CONFIG_NET_CONFIG_AUTO_INIT is set, then this function is called automatically when the device boots. If that is not desired, unset the config option and call the function manually when the application starts.

Parameters

• dev – Network device to use. The function will figure out what network interface to use based on the device. If the device is NULL, then default network interface is used by the function.
• app_info – String describing this application.
Returns
0 if ok, <0 if error.

DHCPv4

Overview
The Dynamic Host Configuration Protocol (DHCP) is a network management protocol used on IPv4 networks. A DHCPv4 server dynamically assigns an IPv4 address and other network configuration parameters to each device on a network so they can communicate with other IP networks. See this DHCP Wikipedia article for a detailed overview of how DHCP works.

Note that Zephyr only supports DHCP client functionality.

Sample usage
See dhcpv4-client-sample for details.

API Reference

Functions

void net_dhcpv4_start(struct net_if *iface)
Start DHCPv4 client on an iface.

Start DHCPv4 client on a given interface. DHCPv4 client will start negotiation for IPv4 address. Once the negotiation is success IPv4 address details will be added to interface.

Parameters
• iface – A valid pointer on an interface

void net_dhcpv4_stop(struct net_if *iface)
Stop DHCPv4 client on an iface.

Stop DHCPv4 client on a given interface. DHCPv4 client will remove all configuration obtained from a DHCP server from the interface and stop any further negotiation with the server.

Parameters
• iface – A valid pointer on an interface

void net_dhcpv4_restart(struct net_if *iface)
Restart DHCPv4 client on an iface.

Restart DHCPv4 client on a given interface. DHCPv4 client will restart the state machine without any of the initial delays used in start.

Parameters
• iface – A valid pointer on an interface

6.2. Networking
Hostname Configuration

**Overview**  A networked device might need a hostname, for example, if the device is configured to be a mDNS responder (see DNS Resolve for details) and needs to respond to `<hostname>.local` DNS queries.

The `CONFIG_NET_HOSTNAME_ENABLE` must be set in order to store the hostname and enable the relevant APIs. If the option is enabled, then the default hostname is set to be `zephyr` by `CONFIG_NET_HOSTNAME` option.

If the same firmware image is used to flash multiple boards, then it is not practical to use the same hostname in all of the boards. In that case, one can enable `CONFIG_NET_HOSTNAME_UNIQUE` which will add a unique postfix to the hostname. By default the link local address of the first network interface is used as a postfix. In Ethernet networks, the link local address refers to MAC address. For example, if the link local address is `01:02:03:04:05:06`, then the unique hostname could be `zephyr010203040506`. If you want to set the prefix yourself, then call `net_hostname_set_postfix()` before the network interfaces are created. For example for the Ethernet networks, the initialization priority is set by `CONFIG_ETH_INIT_PRIORITY` so you would need to set the postfix before that. The postfix can be set only once.

**API Reference**

*group net_hostname*

Network hostname configuration library.

**Defines**

`NET_HOSTNAME_MAX_LEN`

**Functions**

`static inline const char * net_hostname_get(void)`

Get the device hostname.

Return pointer to device hostname.

**Returns**

- Pointer to hostname or NULL if not set.

`static inline void net_hostname_init(void)`

Initialize and set the device hostname.

`static inline int net_hostname_set_postfix(const uint8_t *hostname_postfix, int postfix_len)`

Set the device hostname postfix.

Set the device hostname to some value. This is only used if `CONFIG_NET_HOSTNAME_UNIQUE` is set.

**Parameters**

- `hostname_postfix` – Usually link address. The function will convert this to a string.
- `postfix_len` – Length of the hostname_postfix array.
Returns
0 if ok, <0 if error

Network Core Helpers

• Overview
• API Reference

Overview The network subsystem contains two functions for sending and receiving data from the network. The `net_recv_data()` is typically used by network device driver when the received network data needs to be pushed up in the network stack for further processing. All the data is received via a network interface which is typically created by the device driver.

For sending, the `net_send_data()` can be used. Typically applications do not call this function directly as there is the BSD Sockets API for sending and receiving network data.

API Reference

`group net_core`

Network core library.

Enums

enum net_verdict
Net Verdict.

Values:

enumerator NET_OK
Packet has been taken care of.

enumerator NET_CONTINUE
Packet has not been touched, other part should decide about its fate.

enumerator NET_DROP
Packet must be dropped.

Functions

`int net_recv_data(struct net_if *iface, struct net_pkt *pkt)`

Called by lower network stack or network device driver when a network packet has been received. The function will push the packet up in the network stack for further processing.

Parameters

• `iface` – Network interface where the packet was received.
• `pkt` – Network packet data.

Returns
0 if ok, <0 if error.
int net_send_data(struct net_pkt *pkt)
    Send data to network.
    Send data to network. This should not be used normally by applications as it requires that the
    network packet is properly constructed.

Parameters
• pkt – Network packet.

Returns
0 if ok, <0 if error. If <0 is returned, then the caller needs to unref the pkt in
order to avoid memory leak.

Network Interface

• Overview
• Network interface state management
• API Reference

Overview  The network interface is a nexus that ties the network device drivers and the upper part of
the network stack together. All the sent and received data is transferred via a network interface. The
network interfaces cannot be created at runtime. A special linker section will contain information about
them and that section is populated at linking time.

Network interfaces are created by NETDEVICE_INIT() macro. For Ethernet network, a macro called
ETH_NETDEVICE_INIT() should be used instead as it will create VLAN interfaces automatically if
CONFIG_NET_VLAN is enabled. These macros are typically used in network device driver source code.

The network interface can be turned ON by calling net_if_up() and OFF by calling net_if_down().
When the device is powered ON, the network interface is also turned ON by default.

The network interfaces can be referenced either by a struct net_if * pointer or by a network interface
index. The network interface can be resolved from its index by calling net_if_get_by_index() and from
interface pointer by calling net_if_get_by_iface().

The IP address for network devices must be set for them to be connectable. In a typical dynamic net-
work environment, IP addresses are set automatically by DHCPv4, for example. If needed though, the
application can set a device's IP address manually. See the API documentation below for functions such
as net_if_ipv4_addr_add() that do that.

The net_if_get_default() returns a default network interface. What this default interface means can
be configured via options like CONFIG_NET_DEFAULT_IF_FIRST and CONFIG_NET_DEFAULT_IF_ETHERNET.
See Kconfig file subsys/net/ip/Kconfig what options are available for selecting the default network inter-
face.

The transmitted and received network packets can be classified via a network packet priority. This is
typically done in Ethernet networks when virtual LANs (VLANs) are used. Higher priority packets can
be sent or received earlier than lower priority packets. The traffic class setup can be configured by
CONFIG_NET_TC_TX_COUNT and CONFIG_NET_TC_RX_COUNT options.

If the CONFIG_NET_PROMISC_MODE is enabled and if the underlying network technology supports
promiscuous mode, then it is possible to receive all the network packets that the network device driver
is able to receive. See Promiscuous Mode API for more details.

Network interface state management  Zephyr distinguishes between two interface states: adminis-
trative state and operational state, as described in RFC 2863. The administrative state indicate whether
an interface is turned ON or OFF. This state is represented by NET_IF_UP flag and is controlled by the
application. It can be changed by calling \texttt{net_if_up()} or \texttt{net_if_down()} functions. Network drivers or L2 implementations should not change administrative state on their own.

Bringing an interface up however not always means that the interface is ready to transmit packets. Because of that, operational state, which represents the internal interface status, was implemented. The operational state is updated whenever one of the following conditions take place:

- The interface is brought up/down by the application (administrative state changes).
- The interface is notified by the driver/L2 that PHY status has changed.
- The interface is notified by the driver/L2 that it joined/left a network.

The PHY status is represented with \texttt{NET_IF_LOWER_UP} flag and can be changed with \texttt{net_if_carrier_on()} and \texttt{net_if_carrier_off()}. By default, the flag is set on a newly initialized interface. An example of an event that changes the carrier state is Ethernet cable being plugged in or out.

The network association status is represented with \texttt{NET_IF_DORMANT} flag and can be changed with \texttt{net_if_dormant_on()} and \texttt{net_if_dormant_off()}. By default, the flag is cleared on a newly initialized interface. An example of an event that changes the dormant state is a Wi-Fi driver successfully connecting to an access point. In this scenario, driver should set the dormant state to ON during initialization, and once it detects that it connected to a Wi-Fi network, the dormant state should be set to OFF.

The operational state of an interface is updated as follows:

- \texttt{!net_if_is_admin_up()}  
  Interface is in \texttt{NET_IF_OPER_DOWN}.
- \texttt{net_if_is_admin_up() && !net_if_is_carrier_ok()}  
  Interface is in \texttt{NET_IF_OPER_DOWN} or \texttt{NET_IF_OPER_LOWERLAYERDOWN} if the interface is stacked (virtual).
- \texttt{net_if_is_admin_up() && net_if_is_carrier_ok() && net_if_is_dormant()}  
  Interface is in \texttt{NET_IF_OPER_DORMANT}.
- \texttt{net_if_is_admin_up() && net_if_is_carrier_ok() && !net_if_is_dormant()}  
  Interface is in \texttt{NET_IF_OPER_UP}.

Only after an interface enters \texttt{NET_IF_OPER_UP} state the \texttt{NET_IF_RUNNING} flag is set on the interface indicating that the interface is ready to be used by the application.

API Reference

group net_if

Network Interface abstraction layer.

Defines

\texttt{NET_DEVICE_INIT(dev_id, name, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)}

Create a network interface and bind it to network device.

Parameters

- \texttt{dev_id} – Network device id.
- \texttt{name} – The name this instance of the driver exposes to the system.
- \texttt{init_fn} – Address to the init function of the driver.
- \texttt{pm} – Reference to struct \texttt{pm_device} associated with the device. (optional).
• data – Pointer to the device’s private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• l2 – Network L2 layer for this network interface.
• l2_ctx_type – Type of L2 context data.
• mtu – Maximum transfer unit in bytes for this network interface.

NET_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)

Like NET_DEVICE_INIT but taking metadata from a devicetree node. Create a network interface and bind it to network device.

Parameters
• node_id – The devicetree node identifier.
• init_fn – Address to the init function of the driver.
• pm – Reference to struct pm_device associated with the device. (optional).
• data – Pointer to the device’s private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• l2 – Network L2 layer for this network interface.
• l2_ctx_type – Type of L2 context data.
• mtu – Maximum transfer unit in bytes for this network interface.

NET_DEVICE_DT_INST_DEFINE(inst, ...

Like NET_DEVICE_DT_DEFINE for an instance of a DT_DRV_COMPAT compatible.

Parameters
• inst – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to NET_DEVICE_DT_DEFINE.
• ... – other parameters as expected by NET_DEVICE_DT_DEFINE.

NET_DEVICE_INIT_INSTANCE(dev_id, name, instance, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)

Create multiple network interfaces and bind them to network device. If your network device needs more than one instance of a network interface, use this macro below and provide a different instance suffix each time (0, 1, 2, ... or a, b, c ... whatever works for you)

Parameters
• dev_id – Network device id.
• name – The name this instance of the driver exposes to the system.
• instance – Instance identifier.
• init_fn – Address to the init function of the driver.
• pm – Reference to struct pm_device associated with the device. (optional).
• data – Pointer to the device's private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• l2 – Network L2 layer for this network interface.
• l2_ctx_type – Type of L2 context data.
• mtu – Maximum transfer unit in bytes for this network interface.

NET_DEVICE_DT_DEFINE_INSTANCE(node_id, instance, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)

Like NET_DEVICE_OFFLOAD_INIT but taking metadata from a devicetree. Create multiple network interfaces and bind them to network device. If your network device needs more than one instance of a network interface, use this macro below and provide a different instance suffix each time (0, 1, 2, … or a, b, c … whatever works for you)

Parameters
• node_id – The devicetree node identifier.
• instance – Instance identifier.
• init_fn – Address to the init function of the driver.
• pm – Reference to struct pm_device associated with the device. (optional).
• data – Pointer to the device's private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• l2 – Network L2 layer for this network interface.
• l2_ctx_type – Type of L2 context data.
• mtu – Maximum transfer unit in bytes for this network interface.

NET_DEVICE_DT_INST_DEFINE_INSTANCE(inst, ...

Like NET_DEVICE_DT_DEFINE_INSTANCE for an instance of a DT_DRV_COMPAT compatible.

Parameters
• inst – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to NET_DEVICE_DT_DEFINE_INSTANCE.
• … – other parameters as expected by NET_DEVICE_DT_DEFINE_INSTANCE.

NET_DEVICE_OFFLOAD_INIT(dev_id, name, init_fn, pm, data, config, prio, api, mtu)

Create a offloaded network interface and bind it to network device. The offloaded network interface is implemented by a device vendor HAL or similar.

Parameters
• dev_id – Network device id.
• name – The name this instance of the driver exposes to the system.
• init_fn – Address to the init function of the driver.
• pm – Reference to struct pm_device associated with the device. (optional).
• data – Pointer to the device’s private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• mtu – Maximum transfer unit in bytes for this network interface.

NET_DEVICE_DT_OFFLOAD_DEFINE(node_id, init_fn, pm, data, config, prio, api, mtu)

Like NET_DEVICE_OFFLOAD_INIT but taking metadata from a devicetree node. Create a offloaded network interface and bind it to network device. The offloaded network interface is implemented by a device vendor HAL or similar.

Parameters
• node_id – The devicetree node identifier.
• init_fn – Address to the init function of the driver.
• pm – Reference to struct pm_device associated with the device. (optional).
• data – Pointer to the device’s private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• mtu – Maximum transfer unit in bytes for this network interface.

NET_DEVICE_DT_INST_OFFLOAD_DEFINE(inst, ...)

Like NET_DEVICE_DT_OFFLOAD_DEFINE for an instance of a DT_DRV_COMPAT compatible.

Parameters
• inst – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to NET_DEVICE_DT_OFFLOAD_DEFINE.
• ... – other parameters as expected by NET_DEVICE_DT_OFFLOAD_DEFINE.

Typedefs

typedef int (*net_socket_create_t)(int, int, int)

A function prototype to create an offloaded socket. The prototype is compatible with socket() function.

typedef void (*net_if_mcast_callback_t)(struct net_if *iface, const struct net_addr *addr, bool is_joined)

Define callback that is called whenever IPv6 multicast address group is joined or left.

Param iface
A pointer to a struct net_if to which the multicast address is attached.

Param addr
IP multicast address.

Param is_joined
True if the address is joined, false if left.
typedef void (*net_if_link_callback_t)(struct net_if *iface, struct net_linkaddr *dst, int status)
Define callback that is called after a network packet has been sent.

- **Param iface**
  A pointer to a struct net_if to which the net_pkt was sent to.

- **Param dst**
  Link layer address of the destination where the network packet was sent.

- **Param status**
  Send status, 0 is ok, < 0 error.

typedef void (*net_if_cb_t)(struct net_if *iface, void *user_data)
Callback used while iterating over network interfaces.

- **Param iface**
  Pointer to current network interface

- **Param user_data**
  A valid pointer to user data or NULL

**Enums**

enum net_if_flag
Network interface flags.

- **Values:**

  - enumerator NET_IF_UP
  Interface is admin up.

  - enumerator NET_IF_POINTOPOINT
  Interface is pointopoint

  - enumerator NET_IF_PROMISC
  Interface is in promiscuous mode

  - enumerator NET_IF_NO_AUTO_START
  Do not start the interface immediately after initialization. This requires that either the device driver or some other entity will need to manually take the interface up when needed. For example for Ethernet this will happen when the driver calls the net_eth_carrier_on() function.

  - enumerator NET_IF_SUSPENDED
  Power management specific: interface is being suspended

  - enumerator NET_IF_FORWARD_MULTICASTS
  Flag defines if received multicasts of other interface are forwarded on this interface. This activates multicast routing / forwarding for this interface.

  - enumerator NET_IF_IPV4
  Interface supports IPv4
enumerator NET_IF_IPV6
Interface supports IPv6

enumerator NET_IF_RUNNING
Interface up and running (ready to receive and transmit).

enumerator NET_IF_LOWER_UP
Driver signals L1 is up.

enumerator NET_IF_DORMANT
Driver signals dormant.

enum net_if_oper_state
Network interface operational status (RFC 2863).
Values:
	enumerator NET_IF_OPER_UNKNOWN
	enumerator NET_IF_OPER_NOTPRESENT
	enumerator NET_IF_OPER_DOWN
	enumerator NET_IF_OPER_LOWERLAYERDOWN
	enumerator NET_IF_OPER_TESTING
	enumerator NET_IF_OPER_DORMANT
	enumerator NET_IF_OPER_UP

Functions

static inline void net_if_flag_set(struct net_if *iface, enum net_if_flag value)
Set a value in network interface flags.

Parameters

• iface – Pointer to network interface
• value – Flag value

static inline bool net_if_flag_test_and_set(struct net_if *iface, enum net_if_flag value)
Test and set a value in network interface flags.

Parameters

• iface – Pointer to network interface
• value – Flag value

Returns
true if the bit was set, false if it wasn’t.
static inline void net_if_flag_clear(struct net_if *iface, enum net_if_flag value)
    Clear a value in network interface flags.

    Parameters
    • iface – Pointer to network interface
    • value – Flag value

static inline bool net_if_flag_test_and_clear(struct net_if *iface, enum net_if_flag value)
    Test and clear a value in network interface flags.

    Parameters
    • iface – Pointer to network interface
    • value – Flag value

    Returns
    true if the bit was set, false if it wasn't.

static inline bool net_if_flag_is_set(struct net_if *iface, enum net_if_flag value)
    Check if a value in network interface flags is set.

    Parameters
    • iface – Pointer to network interface
    • value – Flag value

    Returns
    True if the value is set, false otherwise

static inline enum net_if_oper_state net_if_oper_state_set(struct net_if *iface, enum net_if_oper_state oper_state)
    Set an operational state on an interface.

    Parameters
    • iface – Pointer to network interface
    • oper_state – Operational state to set

    Returns
    The new operational state of an interface

static inline enum net_if_oper_state net_if_oper_state(struct net_if *iface)
    Get an operational state of an interface.

    Parameters
    • iface – Pointer to network interface

    Returns
    Operational state of an interface

enum net_verdict net_if_send_data(struct net_if *iface, struct net_pkt *pkt)
    Send a packet through a net iface.

    return verdict about the packet

    Parameters
    • iface – Pointer to a network interface structure
    • pkt – Pointer to a net packet to send
static inline const struct net_l2 *net_if_l2(struct net_if *iface)
Get a pointer to the interface L2.

Parameters
• iface – a valid pointer to a network interface structure

Returns
a pointer to the iface L2

enum net_verdict net_if_recv_data(struct net_if *iface, struct net_pkt *pkt)
Input a packet through a net iface.

Parameters
• iface – Pointer to a network interface structure
• pkt – Pointer to a net packet to input

Returns
verdict about the packet

static inline void *net_if_l2_data(struct net_if *iface)
Get a pointer to the interface L2 private data.

Parameters
• iface – a valid pointer to a network interface structure

Returns
a pointer to the iface L2 data

static inline const struct device *net_if_get_device(struct net_if *iface)
Get an network interface's device.

Parameters
• iface – Pointer to a network interface structure

Returns
a pointer to the device driver instance

void net_if_queue_tx(struct net_if *iface, struct net_pkt *pkt)
Queue a packet to the net interface TX queue.

Parameters
• iface – Pointer to a network interface structure
• pkt – Pointer to a net packet to queue

static inline bool net_if_is_ip_offloaded(struct net_if *iface)
Return the IP offload status.

Parameters
• iface – Network interface

Returns
True if IP offloading is active, false otherwise.

static inline struct net_offload *net_if_offload(struct net_if *iface)
Return the IP offload plugin.

Parameters
• iface – Network interface

Returns
NULL if there is no offload plugin defined, valid pointer otherwise
static inline bool net_if_is_socket_offloaded(struct net_if *iface)
Return the socket offload status.

Parameters
• iface – Network interface

Returns
True if socket offloading is active, false otherwise.

static inline void net_if_socket_offload_set(struct net_if *iface, net_socket_create_t socket_offload)
Set the function to create an offloaded socket.

Parameters
• iface – Network interface
• socket_offload – A function to create an offloaded socket

static inline net_socket_create_t net_if_socket_offload(struct net_if *iface)
Return the function to create an offloaded socket.

Parameters
• iface – Network interface

Returns
NULL if the interface is not socket offloaded, valid pointer otherwise

static inline struct net_linkaddr *net_if_get_link_addr(struct net_if *iface)
Get an network interface's link address.

Parameters
• iface – Pointer to a network interface structure

Returns
a pointer to the network link address

static inline struct net_if_config *net_if_get_config(struct net_if *iface)
Return network configuration for this network interface.

Parameters
• iface – Pointer to a network interface structure

Returns
Pointer to configuration

static inline void net_if_start_dad(struct net_if *iface)
Start duplicate address detection procedure.

Parameters
• iface – Pointer to a network interface structure

void net_if_start_rs(struct net_if *iface)
Start neighbor discovery and send router solicitation message.

Parameters
• iface – Pointer to a network interface structure

static inline void net_if_stop_rs(struct net_if *iface)
Stop neighbor discovery.

Parameters
• iface – Pointer to a network interface structure

6.2. Networking
static inline int net_if_set_link_addr(struct net_if *iface, uint8_t *addr, uint8_t len, enum net_link_type type)

Set a network interface's link address.

Parameters
• iface – Pointer to a network interface structure
• addr – A pointer to a uint8_t buffer representing the address. The buffer must remain valid throughout interface lifetime.
• len – length of the address buffer
• type – network bearer type of this link address

Returns
0 on success

static inline uint16_t net_if_get_mtu(struct net_if *iface)

Get an network interface's MTU.

Parameters
• iface – Pointer to a network interface structure

Returns
the MTU

static inline void net_if_set_mtu(struct net_if *iface, uint16_t mtu)

Set an network interface's MTU.

Parameters
• iface – Pointer to a network interface structure
• mtu – New MTU, note that we store only 16 bit mtu value.

static inline void net_if_addr_set_lf(struct net_if_addr *ifaddr, bool is_infinite)

Set the infinite status of the network interface address.

Parameters
• ifaddr – IP address for network interface
• is_infinite – Infinite status

struct net_if *net_if_get_by_link_addr(struct net_linkaddr *ll_addr)

Get an interface according to link layer address.

Parameters
• ll_addr – Link layer address.

Returns
Network interface or NULL if not found.

struct net_if *net_if_lookup_by_dev(const struct device *dev)

Find an interface from it's related device.

Parameters
• dev – A valid struct device pointer to relate with an interface

Returns
a valid struct net_if pointer on success, NULL otherwise

static inline struct net_if_config *net_if_config_get(struct net_if *iface)

Get network interface IP config.

Parameters
• iface – Interface to use.

**Returns**
NULL if not found or pointer to correct config settings.

```c
void net_if_router_rm(struct net_if_router *router)
```
Remove a router from the system.

**Parameters**
• router – Pointer to existing router

```c
void net_if_set_default(struct net_if *iface)
```
Set the default network interface.

**Parameters**
• iface – New default interface, or NULL to revert to the one set by Kconfig.

```c
struct net_if *net_if_get_default(void)
```
Get the default network interface.

**Returns**
Default interface or NULL if no interfaces are configured.

```c
struct net_if *net_if_get_first_by_type(const struct net_l2 *l2)
```
Get the first network interface according to its type.

**Parameters**
• l2 – Layer 2 type of the network interface.

**Returns**
First network interface of a given type or NULL if no such interfaces was found.

```c
struct net_if *net_if_get_first_up(void)
```
Get the first network interface which is up.

**Returns**
First network interface which is up or NULL if all interfaces are down.

```c
int net_if_config_ipv6_get(struct net_if *iface, struct net_if_ipv6 **ipv6)
```
Allocate network interface IPv6 config.

This function will allocate new IPv6 config.

**Parameters**
• iface – Interface to use.

**Returns**
0 if ok, <0 if error

```c
int net_if_config_ipv6_put(struct net_if *iface)
```
Release network interface IPv6 config.

**Parameters**
• iface – Interface to use.

**Returns**
0 if ok, <0 if error

```c
struct net_if_addr *net_if_ipv6_addr_lookup(const struct in6_addr *addr, struct net_if **iface)
```
Check if this IPv6 address belongs to one of the interfaces.

**Parameters**
• addr – IPv6 address
• iface – Pointer to interface is returned

Returns
Pointer to interface address, NULL if not found.

struct net_if_addr *net_if_ipv6_addr_lookup_by_iface(struct net_if *iface, struct in6_addr *addr)

Check if this IPv6 address belongs to this specific interface.

Parameters
• iface – Network interface
• addr – IPv6 address

Returns
Pointer to interface address, NULL if not found.

int net_if_ipv6_addr_lookup_by_index(const struct in6_addr *addr)

Check if this IPv6 address belongs to one of the interface indices.

Parameters
• addr – IPv6 address

Returns
>0 if address was found in given network interface index, all other values mean address was not found

struct net_if_addr *net_if_ipv6_addr_add(struct net_if *iface, struct in6_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)

Add a IPv6 address to an interface.

Parameters
• iface – Network interface
• addr – IPv6 address
• addr_type – IPv6 address type
• vlifetime – Validity time for this address

Returns
Pointer to interface address, NULL if cannot be added

bool net_if_ipv6_addr_add_by_index(int index, struct in6_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)

Add a IPv6 address to an interface by index.

Parameters
• index – Network interface index
• addr – IPv6 address
• addr_type – IPv6 address type
• vlifetime – Validity time for this address

Returns
True if ok, false if address could not be added

void net_if_ipv6_addr_update_lifetime(struct net_if_addr *ifaddr, uint32_t vlifetime)

Update validity lifetime time of an IPv6 address.

Parameters
• ifaddr – Network IPv6 address
vlifetime – Validity time for this address

bool net_if_ipv6_addr_rm(struct net_if *iface, const struct in6_addr *addr)
Remove an IPv6 address from an interface.

Parameters
• iface – Network interface
• addr – IPv6 address

Returns
True if successfully removed, false otherwise

bool net_if_ipv6_addr_rm_by_index(int index, const struct in6_addr *addr)
Remove an IPv6 address from an interface by index.

Parameters
• index – Network interface index
• addr – IPv6 address

Returns
True if successfully removed, false otherwise

struct net_if_mcast_addr *net_if_ipv6_maddr_add(struct net_if *iface, const struct in6_addr *addr)
Add a IPv6 multicast address to an interface.

Parameters
• interface – Network interface
• addr – IPv6 multicast address

Returns
Pointer to interface multicast address, NULL if cannot be added

bool net_if_ipv6_maddr_rm(struct net_if *iface, const struct in6_addr *addr)
Remove an IPv6 multicast address from an interface.

Parameters
• iface – Network interface
• addr – IPv6 multicast address

Returns
True if successfully removed, false otherwise

struct net_if_mcast_addr *net_if_ipv6_maddr_lookup(const struct in6_addr *addr, struct net_if **iface)
Check if this IPv6 multicast address belongs to a specific interface or one of the interfaces.

Parameters
• addr – IPv6 address
• iface – If iface is null, then pointer to interface is returned, otherwise the iface value needs to be matched.

Returns
Pointer to interface multicast address, NULL if not found.

void net_if_mcast_mon_register(struct net_if_mcast_monitor *mon, struct net_if *iface, net_if_mcast_callback_t cb)
Register a multicast monitor.

Parameters
• **mon** – Monitor handle. This is a pointer to a monitor storage structure which should be allocated by caller, but does not need to be initialized.

• **iface** – Network interface

• **cb** – Monitor callback

```c
def void net_if_mcast_mon_unregister(struct net_if_mcast_monitor *mon)
    Unregister a multicast monitor.

Parameters
• **mon** – Monitor handle
```

```c
def void net_if_mcast_mon_register(struct net_if *iface, const struct net_addr *addr, bool is_joined)
    Call registered multicast monitors.

Parameters
• **iface** – Network interface
• **addr** – Multicast address
• **is_joined** – Is this multicast address joined (true) or not (false)
```

```c
def void net_if_ipv6_maddr_join(struct net_if_ipv6_mcast_addr *addr)
    Mark a given multicast address to be joined.

Parameters
• **addr** – IPv6 multicast address
```

```c
def static inline bool net_if_ipv6_maddr_is_joined(struct net_if_ipv6_mcast_addr *addr)
    Check if given multicast address is joined or not.

Parameters
• **addr** – IPv6 multicast address

Returns
True if address is joined, False otherwise.
```

```c
def void net_if_ipv6_maddr_leave(struct net_if_ipv6_mcast_addr *addr)
    Mark a given multicast address to be left.

Parameters
• **addr** – IPv6 multicast address
```

```c
def struct net_if_ipv6_prefix *net_if_ipv6_prefix_get(struct net_if *iface, struct in6_addr *addr)
    Return prefix that corresponds to this IPv6 address.

Parameters
• **iface** – Network interface
• **addr** – IPv6 address

Returns
Pointer to prefix, NULL if not found.
```

```c
def struct net_if_ipv6_prefix *net_if_ipv6_prefix_lookup(struct net_if *iface, struct in6_addr *addr, uint8_t len)
    Check if this IPv6 prefix belongs to this interface.

Parameters
• **iface** – Network interface
• **addr** – IPv6 address
• len – Prefix length

**Returns**

Pointer to prefix, NULL if not found.

```c
struct net_if_ipv6_prefix *net_if_ipv6_prefix_add(struct net_if *iface, struct in6_addr *prefix,
uint8_t len, uint32_t lifetime)
```

Add a IPv6 prefix to an network interface.

**Parameters**

• iface – Network interface
• prefix – IPv6 address
• len – Prefix length
• lifetime – Prefix lifetime in seconds

**Returns**

Pointer to prefix, NULL if the prefix was not added.

```c
bool net_if_ipv6_prefix_rm(struct net_if *iface, struct in6_addr *addr, uint8_t len)
```

Remove an IPv6 prefix from an interface.

**Parameters**

• iface – Network interface
• addr – IPv6 prefix address
• len – Prefix length

**Returns**

True if successfully removed, false otherwise

```c
static inline void net_if_ipv6_prefix_set_lf(struct net_if_ipv6_prefix *prefix, bool is_infinite)
```

Set the infinite status of the prefix.

**Parameters**

• prefix – IPv6 address
• is_infinite – Infinite status

```c
void net_if_ipv6_prefix_set_timer(struct net_if_ipv6_prefix *prefix, uint32_t lifetime)
```

Set the prefix lifetime timer.

**Parameters**

• prefix – IPv6 address
• lifetime – Prefix lifetime in seconds

```c
void net_if_ipv6_prefix_unset_timer(struct net_if_ipv6_prefix *prefix)
```

Unset the prefix lifetime timer.

**Parameters**

• prefix – IPv6 address

```c
bool net_if_ipv6_addr_onlink(struct net_if **iface, struct in6_addr *addr)
```

Check if this IPv6 address is part of the subnet of our network interface.

**Parameters**

• iface – Network interface. This is returned to the caller. The iface can be NULL in which case we check all the interfaces.
• addr – IPv6 address
Returns
True if address is part of our subnet, false otherwise

static inline struct in6_addr *net_if_router_ipv6(struct net_if_router *router)
Get the IPv6 address of the given router.

Parameters
• router – a network router

Returns
pointer to the IPv6 address, or NULL if none

struct net_if_router *net_if_ipv6_router_lookup(struct net_if *iface, struct in6_addr *addr)
Check if IPv6 address is one of the routers configured in the system.

Parameters
• iface – Network interface
• addr – IPv6 address

Returns
Pointer to router information, NULL if cannot be found

struct net_if_router *net_if_ipv6_router_find_default(struct net_if *iface, struct in6_addr *addr)
Find default router for this IPv6 address.

Parameters
• iface – Network interface. This can be NULL in which case we go through all
  the network interfaces to find a suitable router.
• addr – IPv6 address

Returns
Pointer to router information, NULL if cannot be found

void net_if_ipv6_router_update_lifetime(struct net_if_router *router, uint16_t lifetime)
Update validity lifetime time of a router.

Parameters
• router – Network IPv6 address
• lifetime – Lifetime of this router.

struct net_if_router *net_if_ipv6_router_add(struct net_if *iface, struct in6_addr *addr,
   uint16_t router_lifetime)
Add IPv6 router to the system.

Parameters
• iface – Network interface
• addr – IPv6 address
• router_lifetime – Lifetime of the router

Returns
Pointer to router information, NULL if could not be added

bool net_if_ipv6_router_rm(struct net_if_router *router)
Remove IPv6 router from the system.

Parameters
• router – Router information.
uint8_t net_if_ipv6_get_hop_limit(struct net_if *iface)

Get IPv6 hop limit specified for a given interface. This is the default value but can be overridden by the user.

Parameters
• iface – Network interface

Returns
Hop limit

void net_ipv6_set_hop_limit(struct net_if *iface, uint8_t hop_limit)

Set the default IPv6 hop limit of a given interface.

Parameters
• iface – Network interface
• hop_limit – New hop limit

static inline void net_if_ipv6_set_base_reachable_time(struct net_if *iface, uint32_t reachable_time)

Set IPv6 reachable time for a given interface.

Parameters
• iface – Network interface
• reachable_time – New reachable time

static inline uint32_t net_if_ipv6_get_reachable_time(struct net_if *iface)

Get IPv6 reachable timeout specified for a given interface.

Parameters
• iface – Network interface

Returns
Reachable timeout

uint32_t net_if_ipv6_calc_reachable_time(struct net_if_ipv6 *ipv6)

Calculate next reachable time value for IPv6 reachable time.

Parameters
• ipv6 – IPv6 address configuration

Returns
Reachable time

static inline void net_if_ipv6_set_reachable_time(struct net_if_ipv6 *ipv6)

Set IPv6 reachable time for a given interface. This requires that base reachable time is set for the interface.

Parameters
• ipv6 – IPv6 address configuration

static inline void net_if_ipv6_set_retrans_timer(struct net_if *iface, uint32_t retrans_timer)

Set IPv6 retransmit timer for a given interface.

Parameters
• iface – Network interface
• retrans_timer – New retransmit timer
static inline uint32_t net_if_ipv6_get_retrans_timer(struct net_if *iface)
Get IPv6 retransmit timer specified for a given interface.

Parameters
• iface – Network interface

Returns
Retransmit timer

static inline const struct in6_addr *net_if_ipv6_select_src_addr(struct net_if *iface, const struct in6_addr *dst)
Get a IPv6 source address that should be used when sending network data to destination.

Parameters
• iface – Interface that was used when packet was received. If the interface is not known, then NULL can be given.
• dst – IPv6 destination address

Returns
Pointer to IPv6 address to use, NULL if no IPv6 address could be found.

static inline struct net_if *net_if_ipv6_select_src_iface(const struct in6_addr *dst)
Get a network interface that should be used when sending IPv6 network data to destination.

Parameters
• dst – IPv6 destination address

Returns
Pointer to network interface to use, NULL if no suitable interface could be found.

struct in6_addr *net_if_ipv6_get_ll(struct net_if *iface, enum net_addr_state addr_state)
Get a IPv6 link local address in a given state.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr_state – IPv6 address state (preferred, tentative, deprecated)

Returns
Pointer to link local IPv6 address, NULL if no proper IPv6 address could be found.

struct in6_addr *net_if_ipv6_get_ll_addr(enum net_addr_state state, struct net_if **iface)
Return link local IPv6 address from the first interface that has a link local address matching give state.

Parameters
• state – IPv6 address state (ANY, TENTATIVE, PREFERRED, DEPRECATED)
• iface – Pointer to interface is returned

Returns
Pointer to IPv6 address, NULL if not found.

void net_if_ipv6_dad_failed(struct net_if *iface, const struct in6_addr *addr)
Stop IPv6 Duplicate Address Detection (DAD) procedure if we find out that our IPv6 address is already in use.

Parameters
• iface – Interface where the DAD was running.
• addr – IPv6 address that failed DAD
struct in6_addr *net_if_ipv6_get_global_addr(enum net_addr_state state, struct net_if **iface)

Return global IPv6 address from the first interface that has a global IPv6 address matching the given state.

Parameters
- state – IPv6 address state (ANY, TENTATIVE, PREFERRED, DEPRECATED)
- iface – Caller can give an interface to check. If iface is set to NULL, then all the interfaces are checked. Pointer to interface where the IPv6 address is defined is returned to the caller.

Returns
Pointer to IPv6 address, NULL if not found.

int net_if_config_ipv4_get(struct net_if *iface, struct net_if_ipv4 **ipv4)

Allocate network interface IPv4 config.

This function will allocate new IPv4 config.

Parameters
- iface – Interface to use.
- ipv4 – Pointer to allocated IPv4 struct is returned to caller.

Returns
0 if ok, <0 if error

int net_if_config_ipv4_put(struct net_if *iface)

Release network interface IPv4 config.

Parameters
- iface – Interface to use.

Returns
0 if ok, <0 if error

uint8_t net_if_ipv4_get_ttl(struct net_if *iface)

Get IPv4 time-to-live value specified for a given interface.

Parameters
- iface – Network interface

Returns
Time-to-live

void net_if_ipv4_set_ttl(struct net_if *iface, uint8_t ttl)

Set IPv4 time-to-live value specified to a given interface.

Parameters
- iface – Network interface
- ttl – Time-to-live value

struct net_if_addr *net_if_ipv4_addr_lookup(const struct in_addr *addr, struct net_if **iface)

Check if this IPv4 address belongs to one of the interfaces.

Parameters
- addr – IPv4 address
- iface – Interface is returned

Returns
Pointer to interface address, NULL if not found.
struct net_if_addr *net_if_ipv4_addr_add(struct net_if *iface, struct in_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)

Add a IPv4 address to an interface.

Parameters
- iface – Network interface
- addr – IPv4 address
- addr_type – IPv4 address type
- vlifetime – Validity time for this address

Returns
- Pointer to interface address, NULL if cannot be added

bool net_if_ipv4_addr_rm(struct net_if *iface, const struct in_addr *addr)

Remove a IPv4 address from an interface.

Parameters
- iface – Network interface
- addr – IPv4 address

Returns
- True if successfully removed, false otherwise

int net_if_ipv4_addr_lookup_by_index(const struct in_addr *addr)

Check if this IPv4 address belongs to one of the interface indices.

Parameters
- addr – IPv4 address

Returns
- >0 if address was found in given network interface index, all other values mean address was not found

bool net_if_ipv4_addr_add_by_index(int index, struct in_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)

Add a IPv4 address to an interface by network interface index.

Parameters
- index – Network interface index
- addr – IPv4 address
- addr_type – IPv4 address type
- vlifetime – Validity time for this address

Returns
- True if ok, false if the address could not be added

bool net_if_ipv4_addr_rm_by_index(int index, const struct in_addr *addr)

Remove a IPv4 address from an interface by interface index.

Parameters
- index – Network interface index
- addr – IPv4 address

Returns
- True if successfully removed, false otherwise
struct net_if_mcast_addr *net_if_ipv4_maddr_add(struct net_if *iface, const struct in_addr *addr)

Add a IPv4 multicast address to an interface.

Parameters

• iface – Network interface
• addr – IPv4 multicast address

Returns

Pointer to interface multicast address, NULL if cannot be added

bool net_if_ipv4_maddr_rm(struct net_if *iface, const struct in_addr *addr)

Remove an IPv4 multicast address from an interface.

Parameters

• iface – Network interface
• addr – IPv4 multicast address

Returns

True if successfully removed, false otherwise

struct net_if_mcast_addr *net_if_ipv4_maddr_lookup(const struct in_addr *addr, struct net_if **iface)

Check if this IPv4 multicast address belongs to a specific interface or one of the interfaces.

Parameters

• addr – IPv4 address
• iface – If *iface is null, then pointer to interface is returned, otherwise the *iface value needs to be matched.

Returns

Pointer to interface multicast address, NULL if not found.

void net_if_ipv4_maddr_join(struct net_if_mcast_addr *addr)

Mark a given multicast address to be joined.

Parameters

• addr – IPv4 multicast address

static inline bool net_if_ipv4_maddr_is_joined(struct net_if_mcast_addr *addr)

Check if given multicast address is joined or not.

Parameters

• addr – IPv4 multicast address

Returns

True if address is joined, False otherwise.

void net_if_ipv4_maddr_leave(struct net_if_mcast_addr *addr)

Mark a given multicast address to be left.

Parameters

• addr – IPv4 multicast address

static inline struct in_addr *net_if_router_ipv4(struct net_if_router *router)

Get the IPv4 address of the given router.

Parameters

• router – a network router
**Returns**
pointer to the IPv4 address, or NULL if none

```c
struct net_if_router *net_if_ipv4_router_lookup(struct net_if *iface, struct in_addr *addr)
```

Check if IPv4 address is one of the routers configured in the system.

**Parameters**
- `iface` – Network interface
- `addr` – IPv4 address

**Returns**
Pointer to router information, NULL if cannot be found

```c
struct net_if_router *net_if_ipv4_router_find_default(struct net_if *iface, struct in_addr *addr)
```

Find default router for this IPv4 address.

**Parameters**
- `iface` – Network interface. This can be NULL in which case we go through all the network interfaces to find a suitable router.
- `addr` – IPv4 address

**Returns**
Pointer to router information, NULL if cannot be found

```c
struct net_if_router *net_if_ipv4_router_add(struct net_if *iface, struct in_addr *addr, bool is_default, uint16_t router_lifetime)
```

Add IPv4 router to the system.

**Parameters**
- `iface` – Network interface
- `addr` – IPv4 address
- `is_default` – Is this router the default one
- `router_lifetime` – Lifetime of the router

**Returns**
Pointer to router information, NULL if could not be added

```c
bool net_if_ipv4_router_rm(struct net_if_router *router)
```

Remove IPv4 router from the system.

**Parameters**
- `router` – Router information.

**Returns**
True if successfully removed, false otherwise

```c
bool net_if_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
```

Check if the given IPv4 address belongs to local subnet.

**Parameters**
- `iface` – Interface to use. Must be a valid pointer to an interface.
- `addr` – IPv4 address

**Returns**
True if address is part of local subnet, false otherwise.
bool net_if_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
Check if the given IPv4 address is a broadcast address.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr – IPv4 address, this should be in network byte order

Returns
True if address is a broadcast address, false otherwise.

static inline struct net_if *net_if_ipv4_select_src_iface(const struct in_addr *dst)
Get a network interface that should be used when sending IPv4 network data to destination.

Parameters
• dst – IPv4 destination address

Returns
Pointer to network interface to use, NULL if no suitable interface could be found.

static inline const struct in_addr *net_if_ipv4_select_src_addr(struct net_if *iface, const struct in_addr *dst)
Get a IPv4 source address that should be used when sending network data to destination.

Parameters
• iface – Interface to use when sending the packet. If the interface is not known, then NULL can be given.
• dst – IPv4 destination address

Returns
Pointer to IPv4 address to use, NULL if no IPv4 address could be found.

struct in_addr *net_if_ipv4_get_ll(struct net_if *iface, enum net_addr_state addr_state)
Get a IPv4 link local address in a given state.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr_state – IPv4 address state (preferred, tentative, deprecated)

Returns
Pointer to link local IPv4 address, NULL if no proper IPv4 address could be found.

struct in_addr *net_if_ipv4_get_global_addr(struct net_if *iface, enum net_addr_state addr_state)
Get a IPv4 global address in a given state.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr_state – IPv4 address state (preferred, tentative, deprecated)

Returns
Pointer to link local IPv4 address, NULL if no proper IPv4 address could be found.

void net_if_ipv4_set_netmask(struct net_if *iface, const struct in_addr *netmask)
Set IPv4 netmask for an interface.

Parameters
• iface – Interface to use.
• netmask – IPv4 netmask
bool net_if_ipv4_set_netmask_by_index(int index, const struct in_addr *netmask)
Set IPv4 netmask for an interface index.

Parameters
• index – Network interface index
• netmask – IPv4 netmask

Returns
True if netmask was added, false otherwise.

void net_if_ipv4_set_gw(struct net_if *iface, const struct in_addr *gw)
Set IPv4 gateway for an interface.

Parameters
• iface – Interface to use.
• gw – IPv4 address of a gateway

bool net_if_ipv4_set_gw_by_index(int index, const struct in_addr *gw)
Set IPv4 gateway for an interface index.

Parameters
• index – Network interface index
• gw – IPv4 address of a gateway

Returns
True if gateway was added, false otherwise.

struct net_if *net_if_select_src_iface(const struct sockaddr *dst)
Get a network interface that should be used when sending IPv6 or IPv4 network data to destination.

Parameters
• dst – IPv6 or IPv4 destination address

Returns
Pointer to network interface to use. Note that the function will return the default network interface if the best network interface is not found.

void net_if_register_link_cb(struct net_if_link_cb *link, net_if_link_callback_t cb)
Register a link callback.

Parameters
• link – Caller specified handler for the callback.
• cb – Callback to register.

void net_if_unregister_link_cb(struct net_if_link_cb *link)
Unregister a link callback.

Parameters
• link – Caller specified handler for the callback.

void net_if_call_link_cb(struct net_if *iface, struct net_linkaddr *lladdr, int status)
Call a link callback function.

Parameters
• iface – Network interface.
• lladdr – Destination link layer address
• status – 0 is ok, < 0 error
bool net_if_need_calc_rx_checksum(struct net_if *iface)

Check if received network packet checksum calculation can be avoided or not. For example many ethernet devices support network packet offloading in which case the IP stack does not need to calculate the checksum.

Parameters

• iface – Network interface

Returns

True if checksum needs to be calculated, false otherwise.

bool net_if_need_calc_tx_checksum(struct net_if *iface)

Check if network packet checksum calculation can be avoided or not when sending the packet. For example many ethernet devices support network packet offloading in which case the IP stack does not need to calculate the checksum.

Parameters

• iface – Network interface

Returns

True if checksum needs to be calculated, false otherwise.

struct net_if *net_if_get_by_index(int index)

Get interface according to index.

This is a syscall only to provide access to the object for purposes of assigning permissions.

Parameters

• index – Interface index

Returns

Pointer to interface or NULL if not found.

int net_if_get_by_iface(struct net_if *iface)

Get interface index according to pointer.

Parameters

• iface – Pointer to network interface

Returns

Interface index

void net_if_foreach(net_if_cb_t cb, void *user_data)

Go through all the network interfaces and call callback for each interface.

Parameters

• cb – User-supplied callback function to call

• user_data – User specified data

int net_if_up(struct net_if *iface)

Bring interface up.

Parameters

• iface – Pointer to network interface

Returns

0 on success

static inline bool net_if_is_up(struct net_if *iface)

Check if interface is is up and running.

Parameters
• iface – Pointer to network interface

**Returns**
True if interface is up, False if it is down.

```c
int net_if_down(struct net_if *iface)
```

Bring interface down.

**Parameters**
• iface – Pointer to network interface

**Returns**
0 on success

```c
static inline bool net_if_is_admin_up(struct net_if *iface)
```

Check if interface was brought up by the administrator.

**Parameters**
• iface – Pointer to network interface

**Returns**
True if interface is admin up, false otherwise.

```c
void net_if_carrier_on(struct net_if *iface)
```

Underlying network device has detected the carrier (cable connected).

The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

**Parameters**
• iface – Pointer to network interface

```c
void net_if_carrier_off(struct net_if *iface)
```

Underlying network device has lost the carrier (cable disconnected).

The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

**Parameters**
• iface – Pointer to network interface

**Returns**
True if carrier is present, false otherwise.

```c
static inline bool net_if_is_carrier_ok(struct net_if *iface)
```

Check if carrier is present on network device.

**Parameters**
• iface – Pointer to network interface

**Returns**
True if carrier is present, false otherwise.

```c
void net_if_dormant_on(struct net_if *iface)
```

Mark interface as dormant. Dormant state indicates that the interface is not ready to pass packets yet, but is waiting for some event (for example Wi-Fi network association).

The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

**Parameters**
• iface – Pointer to network interface
void net_if_dormant_off(struct net_if *iface)
Mark interface as not dormant.

The function should be used by the respective network device driver or L2 implementation to
update its state on a network interface.

Parameters
• iface – Pointer to network interface

static inline bool net_if_is_dormant(struct net_if *iface)
Check if the interface is dormant.

Parameters
• iface – Pointer to network interface

Returns
True if interface is dormant, false otherwise.

int net_if_set_promisc(struct net_if *iface)
Set network interface into promiscuous mode.

Note that not all network technologies will support this.

Parameters
• iface – Pointer to network interface

Returns
0 on success, <0 if error

void net_if_unset_promisc(struct net_if *iface)
Set network interface into normal mode.

Parameters
• iface – Pointer to network interface

bool net_if_is_promisc(struct net_if *iface)
Check if promiscuous mode is set or not.

Parameters
• iface – Pointer to network interface

Returns
True if interface is in promisc mode, False if interface is not in in promiscuous
mode.

static inline bool net_if_are_pending_tx_packets(struct net_if *iface)
Check if there are any pending TX network data for a given network interface.

Parameters
• iface – Pointer to network interface

Returns
True if there are pending TX network packets for this network interface, False
otherwise.

struct net_if_addr
#include <net_if.h> Network Interface unicast IP addresses.
Stores the unicast IP addresses assigned to this network interface.
Public Members

struct net_addr address
    IP address

enum net_addr_type addr_type
    How the IP address was set

enum net_addr_state addr_state
    What is the current state of the address

uint8_t is_infinite
    Is the IP address valid forever

uint8_t is_used
    Is this IP address used or not

uint8_t is_mesh_local
    Is this IP address usage limited to the subnet (mesh) or not

struct net_if_mcast_addr
    #include <net_if.h> Network Interface multicast IP addresses.
    Stores the multicast IP addresses assigned to this network interface.

Public Members

struct net_addr address
    IP address

uint8_t is_used
    Is this multicast IP address used or not

uint8_t is_joined
    Did we join to this group

struct net_if_ipv6_prefix
    #include <net_if.h> Network Interface IPv6 prefixes.
    Stores the multicast IP addresses assigned to this network interface.

Public Members

struct net_timeout lifetime
    Prefix lifetime

struct in6_addr prefix
    IPv6 prefix
struct net_if *iface
    Backpointer to network interface where this prefix is used

uint8_t len
    Prefix length

uint8_t is_infinite
    Is the IP prefix valid forever

uint8_t is_used
    Is this prefix used or not

struct net_if_router
    #include <net_if.h> Information about routers in the system.
    Stores the router information.

Public Members

sys_snodo_t node
    Slist lifetime timer node

struct net_addr address
    IP address

struct net_if *iface
    Network interface the router is connected to

uint32_t life_start
    Router life timer start

uint16_t lifetime
    Router lifetime

uint8_t is_used
    Is this router used or not

uint8_t is_default
    Is default router

uint8_t is_infinite
    Is the router valid forever

```
struct net_traffic_class
#include <net_if.h> Network traffic class.
Traffic classes are used when sending or receiving data that is classified with different priorities. So some traffic can be marked as high priority and it will be sent or received first. Each network packet that is transmitted or received goes through a fifo to a thread that will transmit it.

Public Members

struct k_fifo fifo
Fifo for handling this Tx or Rx packet

struct k_thread handler
Traffic class handler thread

k_thread_stack_t *stack
Stack for this handler

struct net_if_dev
#include <net_if.h> Network Interface Device structure.
Used to handle a network interface on top of a device driver instance. There can be many net_if_dev instance against the same device.
Such interface is mainly to be used by the link layer, but is also tight to a network context: it then makes the relation with a network context and the network device.
Because of the strong relationship between a device driver and such network interface, each net_if_dev should be instantiated by

Public Members

const struct device *dev
The actually device driver instance the net_if is related to

const struct net_l2 *const 12
Interface’s L2 layer

void *12_data
Interface’s private L2 data pointer

struct net_linkaddr link_addr
The hardware link address

uint16_t mtu
The hardware MTU

eenum net_if_oper_state oper_state
RFC 2863 operational status
struct net_if
#include <net_if.h> Network Interface structure.
Used to handle a network interface on top of a net_if_dev instance. There can be many net_if instance against the same net_if_dev instance.

Public Members

struct net_if_dev *if_dev
The net_if_dev instance the net_if is related to

struct net_if_config config
Network interface instance configuration

struct net_if_mcast_monitor
#include <net_if.h> Multicast monitor handler struct.
Stores the multicast callback information. Caller must make sure that the variable pointed by this is valid during the lifetime of registration. Typically this means that the variable cannot be allocated from stack.

Public Members

sys_snnode_t node
Node information for the slist.

struct net_if *iface
Network interface

net_if_mcast_callback_t cb
Multicast callback

struct net_if_link_cb
#include <net_if.h> Link callback handler struct.
Stores the link callback information. Caller must make sure that the variable pointed by this is valid during the lifetime of registration. Typically this means that the variable cannot be allocated from stack.

Public Members

sys_snnode_t node
Node information for the slist.

net_if_link_callback_t cb
Link callback
L2 Layer Management

- **Overview**
- **L2 layer API**
- **Network Device drivers**
  - Ethernet device driver
  - IEEE 802.15.4 device driver
- **API Reference**

**Overview**  The L2 stack is designed to hide the whole networking link-layer part and the related device drivers from the upper network stack. This is made through a `net_if` declared in `include/zephyr/net/net_if.h`.

The upper layers are unaware of implementation details beyond the net_if object and the generic API provided by the L2 layer in `include/zephyr/net/net_l2.h` as `net_l2`.

Only the L2 layer can talk to the device driver, linked to the net_if object. The L2 layer dictates the API provided by the device driver, specific for that device, and optimized for working together.

Currently, there are L2 layers for *Ethernet*, *IEEE 802.15.4 Soft-MAC*, Bluetooth IPSP, *CANBUS*, *OpenThread*, Wi-Fi, and a dummy layer example that can be used as a template for writing a new one.

**L2 layer API**  In order to create an L2 layer, or a driver for a specific L2 layer, one needs to understand how the L3 layer interacts with it and how the L2 layer is supposed to behave. See also *network stack architecture* for more details. The generic L2 API has these functions:

- **recv()**: All device drivers, once they receive a packet which they put into a `net_pkt`, will push this buffer to the network stack via `net_recv_data()`. At this point, the network stack does not know what to do with it. Instead, it passes the buffer along to the L2 stack's `recv()` function for handling. The L2 stack does what it needs to do with the packet, for example, parsing the link layer header, or handling link-layer only packets. The `recv()` function will return `NET_DROP` in case of an erroneous packet, `NET_OK` if the packet was fully consumed by the L2, or `NET_CONTINUE` if the network stack should then handle it.

- **send()**: Similar to receive function, the network stack will call this function to actually send a network packet. All relevant link-layer content will be generated and added by this function. The `send()` function returns the number of bytes sent, or a negative error code if there was a failure sending the network packet.

- **enable()**: This function is used to enable/disable traffic over a network interface. The function returns `<0` if error and `>=0` if no error.

- **get_flags()**: This function will return the capabilities of an L2 driver, for example whether the L2 supports multicast or promiscuous mode.

**Network Device drivers**  Network device drivers fully follows Zephyr device driver model as a basis. Please refer to *Device Driver Model*.

There are, however, two differences:

- The `driver_api` pointer must point to a valid `net_if_api` pointer.
- The network device driver must use `NET_DEVICE_INIT_INSTANCE()` or `ETH_NET_DEVICE_INIT()` for Ethernet devices. These macros will call the `DEVICE_DEFINE()` macro, and also instantiate a unique `net_if` related to the created device driver instance.
Implementing a network device driver depends on the L2 stack it belongs to: Ethernet, IEEE 802.15.4, etc. In the next section, we will describe how a device driver should behave when receiving or sending a network packet. The rest is hardware dependent and is not detailed here.

**Ethernet device driver**  On reception, it is up to the device driver to fill in the network packet with as many data buffers as required. The network packet itself is a `net_pkt` and should be allocated through `net_pkt_rx_alloc_with_buffer()`. Then all data buffers will be automatically allocated and filled by `net_pkt_write()`.

After all the network data has been received, the device driver needs to call `net_recv_data()`. If that call fails, it will be up to the device driver to unreference the buffer via `net_pkt_unref()`.

On sending, the device driver send function will be called, and it is up to the device driver to send the network packet all at once, with all the buffers.

Each Ethernet device driver will need, in the end, to call `ETH_NET_DEVICE_INIT()` like this:

```c
ETH_NET_DEVICE_INIT(..., CONFIG_ETH_INIT_PRIORITY,
                     &the_valid_net_if_api_instance, 1500);
```

**IEEE 802.15.4 device driver**  Device drivers for IEEE 802.15.4 L2 work basically the same as for Ethernet. What has been described above, especially for `recv()`, applies here as well. There are two specific differences however:

- It requires a dedicated device driver API: `ieee802154_radio_api`, which overloads `net_if_api`. This is because 802.15.4 L2 needs more from the device driver than just `send()` and `recv()` functions. This dedicated API is declared in `include/zephyr/net/ieee802154_radio.h`. Each and every IEEE 802.15.4 device driver must provide a valid pointer on such relevantly filled-in API structure.

- Sending a packet is slightly different than in Ethernet. IEEE 802.15.4 sends relatively small frames, 127 bytes all inclusive: frame header, payload and frame checksum. Buffers are meant to fit such frame size limitation. But a buffer containing an IPv6/UDP packet might have more than one fragment. IEEE 802.15.4 drivers handle only one buffer at a time. This is why the `ieee802154_radio_api` requires a `tx` function pointer which differs from the `net_if_api send function pointer`. Instead, the IEEE 802.15.4 L2, provides a generic `ieee802154_radio_send()` meant to be given as `net_if send` function. It turn, the implementation of `ieee802154_radio_send()` will ensure the same behavior: sending one buffer at a time through `ieee802154_radio_api tx` function, and unreferencing the network packet only when all the transmission were successful.

Each IEEE 802.15.4 device driver, in the end, will need to call `NET_DEVICE_INIT_INSTANCE()` that way:

```c
NET_DEVICE_INIT_INSTANCE(...,
                          the_device_init_prio,
                          &the_valid_ieee802154_radio_api_instance,
                          IEEE802154_L2,
                          NET_L2_GET_CTX_TYPE(IEEE802154_L2), 125);
```

**API Reference**

`group net_12`

   Network Layer 2 abstraction layer.

** Enums**
enum net_l2_flags
L2 flags
Values:

enumerator NET_L2_MULTICAST = BIT(0)
   IP multicast supported
enumerator NET_L2_MULTICAST_SKIP_JOIN_SOLICIT_NODE = BIT(1)
   Do not join solicited node multicast group
enumerator NET_L2_PROMISC_MODE = BIT(2)
   Is promiscuous mode supported
enumerator NET_L2_POINT_TO_POINT = BIT(3)
   Is this L2 point-to-point with tunneling so no need to have IP address etc to network interface.

struct net_l2
#include <net_l2.h> Network L2 structure.
Used to provide an interface to lower network stack.

Public Members

enum net_verdict (*recv)(struct net_if *iface, struct net_pkt *pkt)
This function is used by net core to get iface’s L2 layer parsing what’s relevant to itself.

int (*send)(struct net_if *iface, struct net_pkt *pkt)
This function is used by net core to push a packet to lower layer (interface’s L2), which in turn might work on the packet relevantly. (adding proper header etc…) Returns a negative error code, or the number of bytes sent otherwise.

int (*enable)(struct net_if *iface, bool state)
This function is used to enable/disable traffic over a network interface. The function returns <0 if error and >=0 if no error.

enum net_l2_flags (*get_flags)(struct net_if *iface)
Return L2 flags for the network interface.

Network Traffic Offloading

- Network Offloading
  - Overview
  - API Reference
- Socket Offloading
  - Overview
Network Offloading

Overview  The network offloading API provides hooks that a device vendor can use to provide an alternate implementation for an IP stack. This means that the actual network connection creation, data transfer, etc., is done in the vendor HAL instead of the Zephyr network stack.

API Reference

```
group net_offload
    Network offloading interface.
```

Socket Offloading

Overview  In addition to the network offloading API, Zephyr allows offloading of networking functionality at the socket API level. With this approach, vendors who provide an alternate implementation of the networking stack, exposing socket API for their networking devices, can easily integrate it with Zephyr. See drivers/wifi/simplelink/simplelink_sockets.c for a sample implementation on how to integrate network offloading at socket level.

Link Layer Address Handling

```
• Overview
• API Reference
```

Overview  The link layer addresses are set for network interfaces so that L2 connectivity works correctly in the network stack. Typically the link layer addresses are 6 bytes long like in Ethernet but for IEEE 802.15.4 the link layer address length is 8 bytes.

API Reference

```
group net_linkaddr
    Network link address library.
```

 Defines

```
NET_LINK_ADDR_MAX_LENGTH
    Maximum length of the link address
```

 Enums

```
enum net_link_type
    Type of the link address. This indicates the network technology that this address is used in. Note that in order to save space we store the value into a uint8_t variable, so please do not introduce any values > 255 in this enum.
    Values:
```
enumerator NET_LINK_UNKNOWN = 0
    Unknown link address type.

enumerator NET_LINK_IEEE802154
    IEEE 802.15.4 link address.

enumerator NET_LINK_BLUETOOTH
    Bluetooth IPSP link address.

enumerator NET_LINK_ETHERNET
    Ethernet link address.

enumerator NET_LINK_DUMMY
    Dummy link address. Used in testing apps and loopback support.

enumerator NET_LINK_CANBUS_RAW
    CANBUS link address.

Functions

static inline bool net_linkaddr_cmp(struct net_linkaddr *lladdr1, struct net_linkaddr *lladdr2)
    Compare two link layer addresses.

Parameters

• lladdr1 – Pointer to a link layer address
• lladdr2 – Pointer to a link layer address

Returns

True if the addresses are the same, false otherwise.

static inline int net_linkaddr_set(struct net_linkaddr_storage *lladdr_store, uint8_t *new_addr, uint8_t new_len)
    Set the member data of a link layer address storage structure.

Parameters

• lladdr_store – The link address storage structure to change.
• new_addr – Array of bytes containing the link address.
• new_len – Length of the link address array. This value should always be <= NET_LINK_ADDR_MAX_LENGTH.

struct net_linkaddr
#include <net_linkaddr.h> Hardware link address structure.
Used to hold the link address information

Public Members

uint8_t *addr
    The array of byte representing the address
uint8_t len
Length of that address array

uint8_t type
What kind of address is this for

struct net_linkaddr_storage
#include <net_linkaddr.h> Hardware link address structure.
Used to hold the link address information. This variant is needed when we have to store the
link layer address.
Note that you cannot cast this to net_linkaddr as uint8_t * is handled differently than uint8_t
addr[] and the fields are purposely in different order.

Public Members

uint8_t type
What kind of address is this for

uint8_t len
The real length of the ll address.

uint8_t addr[6]
The array of bytes representing the address

Ethernet Management

• Overview
• API Reference

Overview Ethernet management API provides functions to manage the Ethernet network interface low
level status. The caller of these functions can:
• raise carrier ON or carrier OFF management events
• raise VLAN enabled or VLAN disabled management events

Typically the carrier OFF event would be generated by the Ethernet device driver when it notices that
the Ethernet cable is disconnected. The carrier ON event would be generated if the Ethernet device
driver notices that the Ethernet cable is re-connected.

Currently the VLAN events are generated by the Ethernet L2 layer when a specific VLAN tag is either
enabled or disabled.

The user application can monitor these events if it needs to act when the corresponding status changes.

API Reference
group ethernet_mgmt
Ethernet library.
Functions

void ethernet_mgmt_raise_carrier_on_event(struct net_if *iface)
   Raise CARRIER_ON event when Ethernet is connected.

Parameters
   • iface – Ethernet network interface.

void ethernet_mgmt_raise_carrier_off_event(struct net_if *iface)
   Raise CARRIER_OFF event when Ethernet is disconnected.

Parameters
   • iface – Ethernet network interface.

void ethernet_mgmt_raise_vlan_enabled_event(struct net_if *iface, uint16_t tag)
   Raise VLAN_ENABLED event when VLAN is enabled.

Parameters
   • iface – Ethernet network interface.
   • tag – VLAN tag which is enabled.

void ethernet_mgmt_raise_vlan_disabled_event(struct net_if *iface, uint16_t tag)
   Raise VLAN_DISABLED event when VLAN is disabled.

Parameters
   • iface – Ethernet network interface.
   • tag – VLAN tag which is disabled.

Traffic Classification

Overview  Traffic classification is an automated process that categorizes computer network traffic according to various parameters. For Zephyr, the VLAN priority code point (PCP) is used to classify both received and sent network packets. See more information about VLAN priority at IEEE 802.1Q.

By default, all network traffic is treated equal in Zephyr. If desired, the option CONFIG_NET_TC_TX_COUNT can be used to set the number of transmit queues. The option CONFIG_NET_TC_RX_COUNT can be used to set the number of receive queues. Each traffic class queue corresponds to a specific kernel work queue. The VLAN priority is mapped to a certain traffic class according to rules specified in IEEE 802.1Q spec chapter I.3, chapter 8.6.6 table 8-4, and chapter 34.5 table 34-1. Each traffic class is in turn mapped to a certain kernel work queue. The maximum number of traffic classes for both Rx and Tx is 8.

See subsys/net/ip/net_tc.c for details of how various mappings are done.

Network Packet Filtering

- Overview
- Examples
- API Reference
Overview  The Network Packet Filtering facility provides the infrastructure to construct custom rules for accepting and/or denying packet transmission and reception. This can be used to create a basic firewall, control network traffic, etc.

The CONFIG_NET_PKT_FILTER must be set in order to enable the relevant APIs.

Both the transmission and reception paths may have a list of filter rules. Each rule is made of a set of conditions and a packet outcome. Every packet is subjected to the conditions attached to a rule. When all the conditions for a given rule are true then the packet outcome is immediately determined as specified by the current rule and no more rules are considered. If one condition is false then the next rule in the list is considered.

Packet outcome is either NET_OK to accept the packet or NET_DROP to drop it.

A rule is represented by a npf_rule object. It can be inserted to, appended to or removed from a rule list contained in a npf_rule_list object using npf_insert_rule(), npf_append_rule(), and npf_remove_rule(). Currently, two such rule lists exist: npf_send_rules for outgoing packets, and npf_recv_rules for incoming packets.

If a filter rule list is empty then NET_OK is assumed. If a non-empty rule list runs to the end then NET_DROP is assumed. However it is recommended to always terminate a non-empty rule list with an explicit default termination rule, either npf_default_ok or npf_default_drop.

Rule conditions are represented by a npf_test. This structure can be embedded into a larger structure when a specific condition requires extra test data. It is up to the test function for such conditions to retrieve the outer structure from the provided npf_test structure pointer.

Convenience macros are provided in include/zephyr/net/net_pkt_filter.h to statically define condition instances for various conditions, and NPF_RULE() to create a rule instance to tie them.

Examples  Here’s an example usage:

```c
static NPF_SIZE_MAX(maxsize_200, 200);
static NPF_ETH_TYPE_MATCH(ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(small_ip_pkt, NET_OK, ip_packet, maxsize_200);

void install_my_filter(void)
{
    npf_insert_recv_rule(&npf_default_drop);
    npf_insert_recv_rule(&small_ip_pkt);
}
```

The above would accept IP packets that are 200 bytes or smaller, and drop all other packets.

Another (less efficient) way to achieve the same result could be:

```c
static NPF_SIZE_MIN(minsize_201, 201);
static NPF_ETH_TYPE_UNMATCH(not_ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(reject_big_pkts, NET_DROP, minsize_201);
static NPF_RULE(reject_non_ip, NET_DROP, not_ip_packet);

void install_my_filter(void) {
    npf_append_recv_rule(&reject_big_pkts);
    npf_append_recv_rule(&reject_non_ip);
    npf_append_recv_rule(&npf_default_ok);
}
```

API Reference
**group** net_pkt_filter

Network Packet Filter API.

**Defines**

- npf_insert_send_rule(rule)
- npf_insert_recv_rule(rule)
- npf_append_send_rule(rule)
- npf_append_recv_rule(rule)
- npf_remove_send_rule(rule)
- npf_remove_recv_rule(rule)
- npf_remove_all_send_rules()
- npf_remove_all_recv_rules()

**NPF_RULE(_name, _result, ...)**

Statically define one packet filter rule.

This creates a rule from a variable amount of filter conditions. This rule can then be inserted or appended to the rule list for a given network packet path.

Example:

```c
static NPF_SIZE_MAX(maxsize_200, 200);
static NPF_ETH_TYPE_MATCH(ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(small_ip_pkt, NET_OK, ip_packet, maxsize_200);

void install_my_filter(void)
{
    npf_insert_recv_rule(&npf_default_drop);
    npf_insert_recv_rule(&small_ip_pkt);
}
```

The above would accept IP packets that are 200 bytes or smaller, and drop all other packets. Another (less efficient) way to create the same result could be:

```c
static NPF_SIZE_MIN(minsize_201, 201);
static NPF_ETH_TYPE_UNMATCH(not_ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(reject_big_pkts, NET_DROP, minsize_201);
static NPF_RULE(reject_non_ip, NET_DROP, not_ip_packet);

void install_my_filter(void) {
    npf_append_recv_rule(&reject_big_pkts);
    npf_append_recv_rule(&reject_non_ip);
    npf_append_recv_rule(&npf_default_ok);
}
```
The first rule in the list for which all conditions are true determines the fate of the packet. If one condition is false then the next rule in the list is evaluated.

**Parameters**

- `_name` – Name for this rule.
- `_result` – Fate of the packet if all conditions are true, either `NET_OK` or `NET_DROP`.
- `...` – List of conditions for this rule.

**Functions**

```c
void npf_insert_rule(struct npf_rule_list *rules, struct npf_rule *rule)
Insert a rule at the front of given rule list.

Parameters

- `rules` – the affected rule list
- `rule` – the rule to be inserted
```

```c
void npf_append_rule(struct npf_rule_list *rules, struct npf_rule *rule)
Append a rule at the end of given rule list.

Parameters

- `rules` – the affected rule list
- `rule` – the rule to be appended
```

```c
bool npf_remove_rule(struct npf_rule_list *rules, struct npf_rule *rule)
Remove a rule from the given rule list.

Parameters

- `rules` – the affected rule list
- `rule` – the rule to be removed

Return values

- `true` – if given rule was found in the rule list and removed
```

```c
bool npf_remove_all_rules(struct npf_rule_list *rules)
Remove all rules from the given rule list.

Parameters

- `rules` – the affected rule list

Return values

- `true` – if at least one rule was removed from the rule list
```

**Variables**

```c
struct npf_rule npf_default_ok
Default rule list termination for accepting a packet.

struct npf_rule npf_default_drop
Default rule list termination for rejecting a packet.
```
struct npf_rule_list npf_send_rules
    rule list applied to outgoing packets

struct npf_rule_list npf_recv_rules
    rule list applied to incoming packets

struct npf_test
    #include <net_pkt_filter.h> common filter test structure to be embedded into larger structures

Public Members

npf_test_fn_t *fn
    packet condition test function

struct npf_rule
    #include <net_pkt_filter.h> filter rule structure

Public Members

enum net_verdict result
    result if all tests pass

uint32_t nb_tests
    number of tests for this rule

struct npf_test *tests[]
    pointers to npf_test instances

struct npf_rule_list
    #include <net_pkt_filter.h> rule set for a given test location

group npf_basic_cond

Defines

NPF_IFACE_MATCH(_name, _iface)
    Statically define an “interface match” packet filter condition.
    Parameters
    • _name – Name of the condition
    • _iface – Interface to match

NPF_IFACE_UNMATCH(_name, _iface)
    Statically define an “interface unmatch” packet filter condition.
    Parameters
    • _name – Name of the condition
    • _iface – Interface to exclude
NPF_ORIG_IFACE_MATCH(_name, _iface)
    Statically define an “orig interface match” packet filter condition.

    Parameters
    • _name – Name of the condition
    • _iface – Interface to match

NPF_ORIG_IFACE_UNMATCH(_name, _iface)
    Statically define an “orig interface unmatch” packet filter condition.

    Parameters
    • _name – Name of the condition
    • _iface – Interface to exclude

NPF_SIZE_MIN(_name, _size)
    Statically define a “data minimum size” packet filter condition.

    Parameters
    • _name – Name of the condition
    • _size – Lower bound of the packet's data size

NPF_SIZE_MAX(_name, _size)
    Statically define a “data maximum size” packet filter condition.

    Parameters
    • _name – Name of the condition
    • _size – Higher bound of the packet's data size

NPF_SIZE_BOUNDS(_name, _min_size, _max_size)
    Statically define a “data bounded size” packet filter condition.

    Parameters
    • _name – Name of the condition
    • _min_size – Lower bound of the packet's data size
    • _max_size – Higher bound of the packet's data size

group npf_eth_cond

Defines

NPF_ETH_SRC_ADDR_MATCH(_name, _addr_array)
    Statically define a “source address match” packet filter condition.

    This tests if the packet source address matches any of the Ethernet addresses contained in the provided set.

    Parameters
    • _name – Name of the condition
    • _addr_array – Array of struct net_eth_addr items to test against

NPF_ETH_SRC_ADDR_UNMATCH(_name, _addr_array)
    Statically define a “source address unmatch” packet filter condition.

    This tests if the packet source address matches none of the Ethernet addresses contained in the provided set.
Parameters

- `_name` – Name of the condition
- `_addr_array` – Array of `struct net_eth_addr` items to test against

NPF_ETH_DST_ADDR_MATCH(_name, _addr_array)

Statically define a “destination address match” packet filter condition.

This tests if the packet destination address matches any of the Ethernet addresses contained in the provided set.

Parameters

- `_name` – Name of the condition
- `_addr_array` – Array of `struct net_eth_addr` items to test against

NPF_ETH_DST_ADDR_UNMATCH(_name, _addr_array)

Statically define a “destination address unmatch” packet filter condition.

This tests if the packet destination address matches none of the Ethernet addresses contained in the provided set.

Parameters

- `_name` – Name of the condition
- `_addr_array` – Array of `struct net_eth_addr` items to test against
- `...` – up to 6 mask bytes

NPF_ETH_SRC_ADDR_MASK_MATCH(_name, _addr_array, ...)  

Statically define a “source address match with mask” packet filter condition.

This tests if the packet source address matches any of the Ethernet addresses contained in the provided set after applying specified mask.

Parameters

- `_name` – Name of the condition
- `_addr_array` – Array of `struct net_eth_addr` items to test against
- `...` – up to 6 mask bytes

NPF_ETH_DST_ADDR_MASK_MATCH(_name, _addr_array, ...)

Statically define a “destination address match with mask” packet filter condition.

This tests if the packet destination address matches any of the Ethernet addresses contained in the provided set after applying specified mask.

Parameters

- `_name` – Name of the condition
- `_type` – Ethernet type to match

NPF_ETH_TYPE_MATCH(_name, _type)

Statically define an “Ethernet type match” packet filter condition.

Parameters

- `_name` – Name of the condition
- `_type` – Ethernet type to match

NPF_ETH_TYPE_UNMATCH(_name, _type)

Statically define an “Ethernet type unmatch” packet filter condition.

Parameters
- **_name** – Name of the condition
- **_type** – Ethernet type to exclude

**Network Shell**  Network shell provides helpers for figuring out network status, enabling/disabling features, and issuing commands like ping or DNS resolving. Note that `net-shell` should probably not be used in production code as it will require extra memory. See also `generic shell` for detailed shell information.

The following `net-shell` commands are implemented:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>net allocs</td>
<td>Print network memory allocations. Only available if <code>CONFIG_NET_DEBUG_NET_PKT_ALLOC</code> is set.</td>
</tr>
<tr>
<td>net arp</td>
<td>Print information about IPv4 ARP cache. Only available if <code>CONFIG_NET_ARP</code> is set in IPv4 enabled networks.</td>
</tr>
<tr>
<td>net capture</td>
<td>Monitor network traffic. See Monitor Network Traffic for details.</td>
</tr>
<tr>
<td>net conn</td>
<td>Print information about network connections.</td>
</tr>
<tr>
<td>net dns</td>
<td>Show how DNS is configured. The command can also be used to resolve a DNS name. Only available if <code>CONFIG_NET_DNS_RESOLVER</code> is set.</td>
</tr>
<tr>
<td>net events</td>
<td>Enable network event monitoring. Only available if <code>CONFIG_NET_MGMT_EVENT_MONITOR</code> is set.</td>
</tr>
<tr>
<td>net gptp</td>
<td>Print information about gPTP support. Only available if <code>CONFIG_NET_GPTP</code> is set.</td>
</tr>
<tr>
<td>net iface</td>
<td>Print information about network interfaces.</td>
</tr>
<tr>
<td>net ipv6</td>
<td>Print IPv6 specific information and configuration. Only available if <code>CONFIG_NET_IPV6</code> is set.</td>
</tr>
<tr>
<td>net mem</td>
<td>Print information about network memory usage. The command will print more information if <code>CONFIG_NET_BUF_POOL_USAGE</code> is set.</td>
</tr>
<tr>
<td>net nbr</td>
<td>Print neighbor information. Only available if <code>CONFIG_NET_IPV6</code> is set.</td>
</tr>
<tr>
<td>net ping</td>
<td>Ping a network host.</td>
</tr>
<tr>
<td>net route</td>
<td>Show IPv6 network routes. Only available if <code>CONFIG_NETROUTE</code> is set.</td>
</tr>
<tr>
<td>net stats</td>
<td>Show network statistics.</td>
</tr>
<tr>
<td>net tcp</td>
<td>Connect/send data/close TCP connection. Only available if <code>CONFIG_NET_TCP</code> is set.</td>
</tr>
<tr>
<td>net vlan</td>
<td>Show Ethernet virtual LAN information. Only available if <code>CONFIG_NET_VLAN</code> is set.</td>
</tr>
</tbody>
</table>

**Time Sensitive Networking**

generic Precision Time Protocol (gPTP)

- **Overview**
- **Supported features**
- **Supported hardware**
- **Enabling the stack**
- **Application interfaces**
- **Testing**
- **API Reference**

**Overview**  This gPTP stack supports the protocol and procedures as defined in the IEEE 802.1AS-2011 standard (Timing and Synchronization for Time-Sensitive Applications in Bridged Local Area Networks).
Supported features The stack handles communications and state machines defined in the IEEE 802.1AS-2011 standard. Mandatory requirements for a full-duplex point-to-point link endpoint, as defined in Annex A of the standard, are supported.

The stack is in principle capable of handling communications on multiple network interfaces (also defined as “ports” in the standard) and thus act as a 802.1AS bridge. However, this mode of operation has not been validated on the Zephyr OS.

Supported hardware Although the stack itself is hardware independent, Ethernet frame timestamping support must be enabled in ethernet drivers.

Boards supported:
- frdm_k64f
- nucleo_h743zi_board
- nucleo_h745zi_q_board
- nucleo_f767zi_board
- sam_e70_xplained
- native_posix (only usable for simple testing, limited capabilities due to lack of hardware clock)
- qemu_x86 (emulated, limited capabilities due to lack of hardware clock)

Enabling the stack The following configuration option must me enabled in prj.conf file.
- CONFIG_NET_GPTP

Application interfaces Only two Application Interfaces as defined in section 9 of the standard are available:
- ClockTargetPhaseDiscontinuity interface (gptp_register_phase_dis_cb())
- ClockTargetEventCapture interface (gptp_event_capture())

Testing The stack has been informally tested using the OpenAVnu gPTP and Linux ptp4l daemons. The gPTP sample application from the Zephyr source distribution can be used for testing.

API Reference

`group gptp`

generic Precision Time Protocol (gPTP) support

**Typedefs**

typedef void (*gptp_phase_dis_callback_t)(uint8_t *gm_identity, uint16_t *time_base, struct gptp_scaled_ns *last_gm_ph_change, double *last_gm_freq_change)

Define callback that is called after a phase discontinuity has been sent by the grandmaster.

**Param gm_identity**
A pointer to first element of a ClockIdentity array. The size of the array is GPTP_CLOCK_ID_LEN.

**Param time_base**
A pointer to the value of timeBaseIndicator of the current grandmaster.
**Param last_gm_ph_change**
A pointer to the value of lastGmPhaseChange received from grandmaster.

**Param last_gm_freq_change**
A pointer to the value of lastGmFreqChange received from the grandmaster.

typedef void (*gptp_port_cb_t)(int port, struct net_if *iface, void *user_data)
Callback used while iterating over gPTP ports.

**Param port**
Port number

**Param iface**
Pointer to network interface

**Param user_data**
A valid pointer to user data or NULL

**Functions**

```c
void gptp_register_phase_dis_cb(
    struct gptp_phase_dis_cb *phase_dis,
    gptp_phase_dis_callback_t cb)
```
Register a phase discontinuity callback.

**Parameters**

- phase_dis – Caller specified handler for the callback.
- cb – Callback to register.

```c
void gptp_unregister_phase_dis_cb(
    struct gptp_phase_dis_cb *phase_dis)
```
Unregister a phase discontinuity callback.

**Parameters**

- phase_dis – Caller specified handler for the callback.

```c
void gptp_call_phase_dis_cb(void)
```
Call a phase discontinuity callback function.

```c
int gptp_event_capture(
    struct net_ptp_time *slave_time, bool *gm_present)
```
Get gPTP time.

**Parameters**

- slave_time – A pointer to structure where timestamp will be saved.
- gm_present – A pointer to a boolean where status of the presence of a grand master will be saved.

**Returns**

Error code. 0 if no error.

```c
char *gptp_sprint_clock_id(
    const uint8_t *clk_id, char *output, size_t output_len)
```
Utility function to print clock id to a user supplied buffer.

**Parameters**

- clk_id – Clock id
- output – Output buffer
- output_len – Output buffer len

**Returns**

Pointer to output buffer
void gptp_foreach_port(gptp_port_cb_t cb, void *user_data)
Go through all the gPTP ports and call callback for each of them.

Parameters
• cb – User-supplied callback function to call
• user_data – User specified data

struct gptp_domain *gptp_get_domain(void)
Get gPTP domain.
This contains all the configuration / status of the gPTP domain.

Returns
Pointer to domain or NULL if not found.

void gptp_clk_src_time_invoke(struct gptp_clk_src_time_invoke_params *arg)
This interface is used by the ClockSource entity to provide time to the ClockMaster entity of a
time-aware system.

Parameters
• arg – Current state and parameters of the ClockSource entity.

struct gptp_hdr *gptp_get_hdr(struct net_pkt *pkt)
Return pointer to gPTP packet header in network packet.

Parameters
• pkt – Network packet (received or sent)

Returns
Pointer to gPTP header.

struct gptp_scaled_ns
#include <gptp.h> Scaled Nanoseconds.

Public Members

int32_t high
High half.

int64_t low
Low half.

struct gptp_uscaled_ns
#include <gptp.h> UScaled Nanoseconds.

Public Members

uint32_t high
High half.

uint64_t low
Low half.
struct gptp_port_identity
    
    #include <gptp.h> Port Identity.

Public Members

    uint8_t clk_id[GPTP_CLOCK_ID_LEN]
    
    Clock identity of the port.

    uint16_t port_number
    
    Number of the port.

struct gptp_flags
    
    #include <gptp.h>

Public Members

    uint8_t octets[2]
    
    Byte access.

    uint16_t all
    
    Whole field access.

struct gptp_hdr
    
    #include <gptp.h>

Public Members

    uint8_t message_type
    
    Type of the message.

    uint8_t transport_specific
    
    Transport specific, always 1.

    uint8_t ptp_version
    
    Version of the PTP, always 2.

    uint8_t reserved0
    
    Reserved field.

    uint16_t message_length
    
    Total length of the message from the header to the last TLV.

    uint8_t domain_number
    
    Domain number, always 0.
struct gptp_flags flags
Message flags.

int64_t correction_field
Correction Field. The content depends of the message type.

uint32_t reserved2
Reserved field.

struct gptp_port_identity port_id
Port Identity of the sender.

uint16_t sequence_id
Sequence Id.

uint8_t control
Control value. Sync: 0, Follow-up: 2, Others: 5.

int8_t log_msg_interval
Message Interval in Log2 for Sync and Announce messages.

struct gptp_phase_dis_cb
#include <gptp.h> Phase discontinuity callback structure.
Stores the phase discontinuity callback information. Caller must make sure that the variable pointed by this is valid during the lifetime of registration. Typically this means that the variable cannot be allocated from stack.

Public Members

sys_snode_t node
Node information for the slist.

struct gptp_phase_dis_callback_t cb
Phase discontinuity callback.

struct gptp_clk_src_time_invoke_params
#include <gptp.h> ClockSourceTime.invoke function parameters.
Parameters passed by ClockSourceTime.invoke function.

Public Members

double last_gm_freq_change
Frequency change on the last Time Base Indicator Change.
Overview

The PTP time struct can store time information in high precision format (nanoseconds). The extended timestamp format can store the time in fractional nanoseconds accuracy. The PTP time format is used in generic Precision Time Protocol (gPTP) implementation.

API Reference

group ptp_time

Precision Time Protocol time specification.

struct net_ptp_time

#include <ptp_time.h> Precision Time Protocol Timestamp format.

This structure represents a timestamp according to the Precision Time Protocol standard.

Seconds are encoded as a 48 bits unsigned integer. Nanoseconds are encoded as a 32 bits unsigned integer.

Public Members

union net_ptp_time.[anonymous] [anonymous]

Seconds encoded on 48 bits.

uint32_t nanosecond

Nanoseconds.

struct net_ptp_extended_time

#include <ptp_time.h> Precision Time Protocol Extended Timestamp format.

This structure represents an extended timestamp according to the Precision Time Protocol standard.

Seconds are encoded as 48 bits unsigned integer. Fractional nanoseconds are encoded as 48 bits, their unit is $2^{*(-16)}$ ns.
Public Members

union net_ptp_extended_time.[anonymous] [anonymous]
Seconds encoded on 48 bits.

union net_ptp_extended_time.[anonymous] [anonymous]
Fractional nanoseconds on 48 bits.

Generic GSM Modem

Overview The generic GSM modem driver allows the user to connect Zephyr to a GSM modem which
provides a data connection to cellular operator's network. The Zephyr uses PPP (Point-to-Point Protocol)
to connect to the GSM modem using UART. Note that some cellular modems have proprietary offloading
support using AT commands, but usually those modems also support 3GPP standards and provide PPP
connection to them. See GSM modem sample application how to setup Zephyr to use the GSM modem.

The GSM muxing, that is defined in GSM 07.10, and which allows mixing of AT commands and
PPP traffic, is also supported in this version of Zephyr. One needs to enable CONFIG_GSM_MUX
and CONFIG_UART_MUX configuration options to enable muxing.

zperf: Network Traffic Generator

Overview zperf is a shell utility which allows to generate network traffic in Zephyr. The tool may be
used to evaluate network bandwidth.

zperf is compatible with iPerf_2.0.5. Note that in newer iPerf versions, an error message like this is
printed and the server reported statistics are missing.

LAST PACKET NOT RECEIVED!!!

zperf can be enabled in any application, a dedicated sample is also present in Zephyr. See zperf sample
application for details.

Sample Usage If Zephyr acts as a client, iPerf must be executed in server mode. For example, the
following command line must be used for UDP testing:

$ iperf -s -l 1K -u -V -B 2001:db8::2

For TCP testing, the command line would look like this:

$ iperf -s -l 1K -V -B 2001:db8::2

In the Zephyr console, zperf can be executed as follows:

zperf udp upload 2001:db8::2 5001 10 1K 1M

For TCP the zperf command would look like this:

zperf tcp upload 2001:db8::2 5001 10 1K 1M
If the IP addresses of Zephyr and the host machine are specified in the config file, zperf can be started as follows:

```
zperf udp upload2 v6 10 1K 1M
```
or like this if you want to test TCP:

```
zperf tcp upload2 v6 10 1K 1M
```

If Zephyr is acting as a server, set the download mode as follows for UDP:

```
zperf udp download 5001
```
or like this for TCP:

```
zperf tcp download 5001
```

and in the host side, iPerf must be executed with the following command line if you are testing UDP:

```
$ iperf -l 1K -u -V -c 2001:db8::1 -p 5001
```

and this if you are testing TCP:

```
$ iperf -l 1K -V -c 2001:db8::1 -p 5001
```

iPerf output can be limited by using the -b option if Zephyr is not able to receive all the packets in orderly manner.

### 6.3 LoRa and LoRaWAN

#### 6.3.1 Overview

LoRa (abbrev. for Long Range) is a proprietary low-power wireless communication protocol developed by the Semtech Corporation. LoRa acts as the physical layer (PHY) based on the chirp spread spectrum (CSS) modulation technique. LoRaWAN (for Long Range Wide Area Network) defines a networking layer on top of the LoRa PHY. Zephyr provides APIs for LoRa to send raw data packets directly over the wireless interface as well as APIs for LoRaWAN to connect the end device to the internet through a gateway.

The Zephyr implementation is based on Semtech’s LoRaMac-node library, which is included as a Zephyr module.

The LoRaWAN specification is published by the LoRa Alliance.

#### 6.3.2 Configuration Options

**LoRa PHY**

Related configuration options can be found under drivers/lora/Kconfig.

- `CONFIG_LORA`
- `CONFIG_LORA_SHELL`
- `CONFIG_LORA_INIT_PRIORITY`
LoRaWAN

Related configuration options can be found under `subsys/lorawan/Kconfig`.

- `CONFIG_LORAWAN`
- `CONFIG_LORAWAN_SYSTEM_MAX_RX_ERROR`
- `CONFIG_LORAMAC_REGION_AS923`
- `CONFIG_LORAMAC_REGION_AU915`
- `CONFIG_LORAMAC_REGION_CN470`
- `CONFIG_LORAMAC_REGION_CN779`
- `CONFIG_LORAMAC_REGION_EU433`
- `CONFIG_LORAMAC_REGION_EU868`
- `CONFIG_LORAMAC_REGION_KR920`
- `CONFIG_LORAMAC_REGION_IN865`
- `CONFIG_LORAMAC_REGION_US915`
- `CONFIG_LORAMAC_REGION_RU864`

6.3.3 API Reference

LoRa PHY

group lora_api

 Enums

enum lora_signal_bandwidth

Values:

enumerator BW_125_KHZ = 0
enumerator BW_250_KHZ
enumerator BW_500_KHZ

enum lora_datarate

Values:

enumerator SF_6 = 6
enumerator SF_7
enumerator SF_8
enumerator SF_9
enumerator SF_10
enumerator SF_11
enumerator SF_12

enum lora_coding_rate
  Values:
  enumerator CR_4_5 = 1
  enumerator CR_4_6 = 2
  enumerator CR_4_7 = 3
  enumerator CR_4_8 = 4

Functions

static inline int lora_config(const struct device *dev, struct lora_modem_config *config)
  Configure the LoRa modem.

  Parameters
  • dev – LoRa device
  • config – Data structure containing the intended configuration for the modem

  Returns
  0 on success, negative on error

static inline int lora_send(const struct device *dev, uint8_t *data, uint32_t data_len)
  Send data over LoRa.

  Note: This blocks until transmission is complete.

  Parameters
  • dev – LoRa device
  • data – Data to be sent
  • data_len – Length of the data to be sent

  Returns
  0 on success, negative on error

static inline int lora_send_async(const struct device *dev, uint8_t *data, uint32_t data_len,
                                 struct k_poll_signal *async)
  Asynchronously send data over LoRa.

  Note: This returns immediately after starting transmission, and locks the LoRa modem until
  the transmission completes.
Parameters

- `dev` – LoRa device
- `data` – Data to be sent
- `data_len` – Length of the data to be sent
- `async` – A pointer to a valid and ready to be signaled struct `k_poll_signal`. (Note: if NULL this function will not notify the end of the transmission).

Returns

0 on success, negative on error

```c
static inline int lora_recv(const struct device *dev, uint8_t *data, uint8_t size, k_timeout_t timeout, int16_t *rssi, int8_t *snr)
```

Receive data over LoRa.

**Note:** This is a blocking call.

Parameters

- `dev` – LoRa device
- `data` – Buffer to hold received data
- `size` – Size of the buffer to hold the received data. Max size allowed is 255.
- `timeout` – Duration to wait for a packet.
- `rssi` – RSSI of received data
- `snr` – SNR of received data

Returns

Length of the data received on success, negative on error

```c
static inline int lora_recv_async(const struct device *dev, lora_recv_cb cb)
```

Receive data asynchronously over LoRa.

Receive packets continuously under the configuration previously setup by `lora_config`. Reception is cancelled by calling this function again with `cb` = NULL. This can be done within the callback handler.

Parameters

- `dev` – Modem to receive data on.
- `cb` – Callback to run on receiving data. If NULL, any pending asynchronous receptions will be cancelled.

Returns

0 when reception successfully setup, negative on error

```c
static inline int lora_test_cw(const struct device *dev, uint32_t frequency, int8_t tx_power, uint16_t duration)
```

Transmit an unmodulated continuous wave at a given frequency.

**Note:** Only use this functionality in a test setup where the transmission does not interfere with other devices.
• dev – LoRa device
• frequency – Output frequency (Hertz)
• tx_power – TX power (dBm)
• duration – Transmission duration in seconds.

**Returns**
0 on success, negative on error

```c
struct lora_modem_config
#include <lora.h>
```

### Public Members

`bool iq_inverted`
Invert the In-Phase and Quadrature (IQ) signals. Normally this should be set to false. In advanced use-cases where a differentiation is needed between “uplink” and “downlink” traffic, the IQ can be inverted to create two different channels on the same frequency.

`bool public_network`
Sets the sync-byte to use:
- false: for using the private network sync-byte
- true: for using the public network sync-byte

The public network sync-byte is only intended for advanced usage. Normally the private network sync-byte should be used for peer to peer communications and the LoRaWAN APIs should be used for interacting with a public network.

### LoRaWAN

**group lorawan_api**

### Defines

`LW_RECV_PORT_ANY`

### Enums

**enum lorawan_class**
LoRaWAN class types.

**Values:**
- enumerator LORAWAN_CLASS_A = 0x00
- enumerator LORAWAN_CLASS_B = 0x01
- enumerator LORAWAN_CLASS_C = 0x02
enum lorawan_act_type
LoRaWAN activation types.
Values:
    enumerator LORAWAN_ACT_OTAA = 0
    enumerator LORAWAN_ACT_ABP

defined lorawan_datarate
LoRaWAN datarate types.
Values:
    enumerator LORAWAN_DR_0 = 0
    enumerator LORAWAN_DR_1
    enumerator LORAWAN_DR_2
    enumerator LORAWAN_DR_3
    enumerator LORAWAN_DR_4
    enumerator LORAWAN_DR_5
    enumerator LORAWAN_DR_6
    enumerator LORAWAN_DR_7
    enumerator LORAWAN_DR_8
    enumerator LORAWAN_DR_9
    enumerator LORAWAN_DR_10
    enumerator LORAWAN_DR_11
    enumerator LORAWAN_DR_12
    enumerator LORAWAN_DR_13
    enumerator LORAWAN_DR_14
    enumerator LORAWAN_DR_15
enum lorawan_region
    LoRaWAN region types.
    
    Values:

    enumerator LORAWAN_REGION_AS923

    enumerator LORAWAN_REGION_AU915

    enumerator LORAWAN_REGION_CN470

    enumerator LORAWAN_REGION_CN779

    enumerator LORAWAN_REGION_EU433

    enumerator LORAWAN_REGION_EU868

    enumerator LORAWAN_REGION_KR920

    enumerator LORAWAN_REGION_IN865

    enumerator LORAWAN_REGION_US915

    enumerator LORAWAN_REGION_RU864

enum lorawan_message_type
    LoRaWAN message types.
    
    Values:

    enumerator LORAWAN_MSG_UNCONFIRMED = 0

    enumerator LORAWAN_MSG_CONFIRMED

Functions

int lorawan_set_battery_level_callback(uint8_t (*battery_lvl_cb)(void))
    Add battery level callback function.

    Provide the LoRaWAN stack with a function to be called whenever a battery level needs to be read. As per LoRaWAN specification the callback needs to return "0: node is connected to an external power source,
    1..254: battery level, where 1 is the minimum and 254 is the maximum value,
    255: the node was not able to measure the battery level"

    Should no callback be provided the lorawan backend will report 255.

    Parameters
battery_lvl_cb – Pointer to the battery level function

Returns
0 if successful, negative errno code if failure

void lorawan_register_downlink_callback(struct lorawan_downlink_cb *cb)
Register a callback to be run on downlink packets.

Parameters
• cb – Pointer to structure containing callback parameters

void lorawan_register_dr_changed_callback(void (*dr_cb)(enum lorawan_datarate))
Register a callback to be called when the datarate changes.
The callback is called once upon successfully joining a network and again each time the
datarate changes due to ADR.
The callback function takes one parameter:
• dr - updated datarate

Parameters
• dr_cb – Pointer to datarate update callback

int lorawan_join(const struct lorawan_join_config *config)
Join the LoRaWAN network.
Join the LoRaWAN network using OTAA or AWB.

Parameters
• config – Configuration to be used

Returns
0 if successful, negative errno code if failure

int lorawan_start(void)
Start the LoRaWAN stack.
This function need to be called before joining the network.

Returns
0 if successful, negative errno code if failure

int lorawan_send(uint8_t port, uint8_t *data, uint8_t len, enum lorawan_message_type type)
Send data to the LoRaWAN network.
Send data to the connected LoRaWAN network.

Parameters
• port – Port to be used for sending data. Must be set if the payload is not empty.
• data – Data buffer to be sent
• len – Length of the buffer to be sent. Maximum length of this buffer is 255
  bytes but the actual payload size varies with region and datarate.
• type – Specifies if the message shall be confirmed or unconfirmed. Must be
  one of lorawan_message_type.

Returns
0 if successful, negative errno code if failure
int lorawan_set_class(enum lorawan_class dev_class)
  Set the current device class.
  Change the current device class. This function may be called before or after a network connection has been established.
  **Parameters**
  • dev_class – New device class
  **Returns**
  0 if successful, negative errno code if failure

int lorawan_set_conf_msg_tries(uint8_t tries)
  Set the number of tries used for transmissions.
  **Parameters**
  • tries – Number of tries to be used
  **Returns**
  0 if successful, negative errno code if failure

void lorawan_enable_adr(bool enable)
  Enable Adaptive Data Rate (ADR)
  Control whether adaptive data rate (ADR) is enabled. When ADR is enabled, the data rate is treated as a default data rate that will be used if the ADR algorithm has not established a data rate. ADR should normally only be enabled for devices with stable RF conditions (i.e., devices in a mostly static location).
  **Parameters**
  • enable – Enable or Disable adaptive data rate.

int lorawan_set_datarate(enum lorawan_datarate dr)
  Set the default data rate.
  Change the default data rate.
  **Parameters**
  • dr – Data rate used for transmissions
  **Returns**
  0 if successful, negative errno code if failure

enum lorawan_datarate lorawan_get_min_datarate(void)
  Get the minimum possible datarate.
  The minimum possible datarate may change in response to a TxParamSetupReq command from the network server.
  **Returns**
  Minimum possible data rate

void lorawan_get_payload_sizes(uint8_t *max_next_payload_size, uint8_t *max_payload_size)
  Get the current payload sizes.
  Query the current payload sizes. The maximum payload size varies with datarate, while the current payload size can be less due to MAC layer commands which are inserted into uplink packets.
  **Parameters**
  • max_next_payload_size – Maximum payload size for the next transmission
  • max_payload_size – Maximum payload size for this datarate
int lorawan_set_region(enum lorawan_region region)
    Set the region and frequency to be used.

    Control the LoRa region and frequency settings. This should be called before lorawan_start().
    If you only have support for a single region selected via Kconfig, this function does not need
    to be called at all.

    Parameters
    • region – The region to be selected

    Returns
    0 if successful, negative errno otherwise

struct lorawan_join_otaa
    #include <lorawan.h> LoRaWAN join parameters for over-the-Air activation (OTAA)
    Note that all of the fields use LoRaWAN 1.1 terminology.
    All parameters are optional if a secure element is present in which case the values stored in
    the secure element will be used instead.

    Public Members

    uint8_t *join_eui
        Join EUI

    uint8_t *nwk_key
        Network Key

    uint8_t *app_key
        Application Key

    uint32_t dev_nonce
        Device Nonce
        Starting with LoRaWAN 1.0.4 the DevNonce must be monotonically increasing for each
        OTAA join with the same EUI. The DevNonce should be stored in non-volatile memory by
        the application.

struct lorawan_join_abp
    #include <lorawan.h>

    Public Members

    uint32_t dev_addr
        Device address on the network

    uint8_t *app_skey
        Application session key

    uint8_t *nwk_skey
        Network session key

```c
uint8_t *app_eui

Application EUI
```

```c
struct lorawan_join_config
#include <lorawan.h>
```

**Public Members**

```c
uint8_t *dev_eui

Device EUI. Optional if a secure element is present.
```

```c
struct lorawan_downlink_cb
#include <lorawan.h>
```

**Public Members**

```c
void (*)(uint8_t port, bool data_pending, int16_t rssi, int8_t snr, uint8_t len, const uint8_t *data)

Callback function to run on downlink data.
```

**Note:** Callbacks are run on the system workqueue, and should therefore be as short as possible.

- **Param port**
  - Port message was sent on

- **Param data_pending**
  - Network server has more downlink packets pending

- **Param rssi**
  - Received signal strength in dBm

- **Param snr**
  - Signal to Noise ratio in dBm

- **Param len**
  - Length of data received, will be 0 for ACKs

- **Param data**
  - Data received, will be NULL for ACKs

```c
sys_snnode_t node

Node for callback list
```

### 6.4 USB-C device support

#### 6.4.1 USB-C device stack

The USB-C device stack is a hardware independent interface between a Type-C Port Controller (TCPC) and customer applications. It is a port of the Google ChromeOS Type-C Port Manager (TCPM) stack. It provides the following functionalities:

- Uses the APIs provided by the Type-C Port Controller drivers to interact with the Type-C Port Controller.
• Provides a programming interface that’s used by a customer applications. The APIs is described in include/zephyr/usb_c/usbc.h

Currently the device stack only support implementation of Sink devices.

List of samples for different purposes.

Implementing a Sink Type-C and Power Delivery USB-C device

The configuration of a USB-C Device is done in the stack layer and devicetree.
The following devicetree, structures and callbacks need to be defined:
• Devicetree usb-c-connector node referencing a TCPC
• Devicetree vbus node referencing a VBUS measurement device
• User defined structure that encapsulates application specific data
• Policy callbacks

For example, for the Sample USB-C Sink application:

Each Physical Type-C port is represented in the devicetree by a usb-c-connector compatible node:

```c
port1: usbc-port01 {
    compatible = "usb-c-connector";
    reg = <1>;
    tcpc = <&ucpd1>;
    vbus = <&vbus1>;
    power-role = "sink";
    sink-pdos = <PDO_FIXED(5000, 100, 0)>;
}
```

VBUS is measured by a device that’s referenced in the devicetree by a usb-c-vbus-adc compatible node:

```c
vbus1: vbus {
    compatible = "zephyr,usb-c-vbus-adc";
    io-channels = <&adc2 8>;
    output-ohms = <49900>;
    full-ohms = <(330000 + 49900)>
}
```

A user defined structure is defined and later registered with the subsystem and can be accessed from callback through an API:

```c
/**
 * @brief A structure that encapsulates Port data.
 */
static struct port1_data_t {
    /** Sink Capabilities */
    uint32_t snk_caps[DT_PROP_LEN(DT_NODELABEL(port1), sink_pdos)];
    /** Number of Sink Capabilities */
    int snk_cap_cnt;
    /** Source Capabilities */
    uint32_t src_caps[PDO_MAX_DATA_OBJECTS];
    /** Number of Source Capabilities */
    int src_cap_cnt;
    /** Power Supply Ready flag */
    atomic_t ps_ready;
} port1_data = {
    .snk_caps = {DT_FOREACH_PROP_ELEM(DT_NODELABEL(port1), sink_pdos, SINK_PDO)},
    (continues on next page)
```
These callbacks are used by the subsystem to set or get application specific data:

```c
static int port1_policy_cb_get_snk_cap(const struct device *dev,
    uint32_t **pdos,
    int *num_pdos)
{
    struct port1_data_t *dpm_data = usbc_get_dpm_data(dev);
    *pdos = dpm_data->snk_caps;
    num_pdos = &dpm_data->snk_cap_cnt;
    return 0;
}

static void port1_policy_cb_set_src_cap(const struct device *dev,
    const uint32_t *pdos,
    const int num_pdos)
{
    struct port1_data_t *dpm_data;
    int num;
    int i;

    dpm_data = usbc_get_dpm_data(dev);
    num = num_pdos;
    if (num > PDO_MAX_DATA_OBJECTS) {
        num = PDO_MAX_DATA_OBJECTS;
    }
    for (i = 0; i < num; i++) {
        dpm_data->src_caps[i] = *(pdos + i);
    }
    dpm_data->src_cap_cnt = num;
}

static uint32_t port1_policy_cb_get_rdo(const struct device *dev)
{
    struct port1_data_t *dpm_data = usbc_get_dpm_data(dev);
    return build_rdo(dpm_data);
}
```

This callback is used by the subsystem to query if a certain action can be taken:

```c
bool port1_policy_check(const struct device *dev,
    const enum usbc_policy_check_t policy_check)
{
    switch (policy_check) {
    case CHECK_POWER_ROLE_SWAP:
```
/* Reject power role swaps */
return false;
case CHECK_DATA_ROLE_SWAP_TO_DFP:
    /* Reject data role swap to DFP */
    return false;
case CHECK_DATA_ROLE_SWAP_TO_UFP:
    /* Accept data role swap to UFP */
    return true;
case CHECK_SNK_AT_DEFAULT_LEVEL:
    /* This device is always at the default power level */
    return true;
default:
    /* Reject all other policy checks */
    return false;
}

This callback is used by the subsystem to notify the application of an event:

static void port1_notify(const struct device *dev,
                        const enum usbc_policy_notify_t policy_notify)
{
    struct port1_data_t *dpm_data = usbc_get_dpm_data(dev);

    switch (policy_notify) {
    case PROTOCOL_ERROR:
        break;
    case MSG_DISCARDED:
        break;
    case MSG_ACCEPT_RECEIVED:
        break;
    case MSG_REJECTED_RECEIVED:
        break;
    case MSG_NOT_SUPPORTED_RECEIVED:
        break;
    case TRANSITION_PS:
        atomic_set_bit(&dpm_data->ps_ready, 0);
        break;
    case PD_CONNECTED:
        break;
    case NOT_PD_CONNECTED:
        break;
    case POWER_CHANGE_0A0:
        LOG_INF("PWR 0A");
        break;
    case POWER_CHANGE_DEF:
        LOG_INF("PWR DEF");
        break;
    case POWER_CHANGE_1A5:
        LOG_INF("PWR 1A5");
        break;
    case POWER_CHANGE_3A0:
        LOG_INF("PWR 3A0");
        break;
    case DATA_ROLE_IS_UFP:
        break;
    }
}
break;
case DATA_ROLE_IS_DFP:
    break;
case PORT_PARTNER_NOT_RESPONSIVE:
    LOG_INF("Port Partner not PD Capable");
    break;
case SNK_TRANSITION_TO_DEFAULT:
    break;
case HARD_RESET_RECEIVED:
    break;
}
}

Registering the callbacks:

    /* Register USB-C Callbacks */
    /* Register Policy Check callback */
    usbc_set_policy_cb_check(usbc_port1, port1_policy_check);
    /* Register Policy Notify callback */
    usbc_set_policy_cb_notify(usbc_port1, port1_notify);
    /* Register Policy Get Sink Capabilities callback */
    usbc_set_policy_cb_get_snk_cap(usbc_port1, port1_policy_cb_get_snk_cap);
    /* Register Policy Set Source Capabilities callback */
    usbc_set_policy_cb_get_src_cap(usbc_port1, port1_policy_cb_get_src_cap);
    /* Register Policy Get Request Data Object callback */
    usbc_set_policy_cb_get_rdo(usbc_port1, port1_policy_cb_get_rdo);

Register the user defined structure:

    /* Set Application port data object. This object is passed to the policy... callbacks */
    port1_data.ps_ready = ATOMIC_INIT(0);
    usbc_set_dpm_data(usbc_port1, &port1_data);

Start the USB-C subsystem:

    /* Start the USB-C Subsystem */
    usbc_start(usbc_port1);

API reference

group _usbc_device_api
    USB-C Device APIs.

Defines

FIXED_5V_100MA_RDO
    This Request Data Object (RDO) value can be returned from the policy_cb_get_rdo if
    5V@100mA with the following options are sufficient for the Sink to operate.
    The RDO is configured as follows: Maximum operating current 100mA Operating current
    100mA Unchunked Extended Messages Not Supported No USB Suspend Not USB Communications
    Capable No capability mismatch Don’t giveback Object position 1 (5V PDO)
Enums

enum usbc_policy_request_t
Device Policy Manager requests.

Values:

enumerator REQUEST_NOP
No request

enumerator REQUEST_TC_DISABLED
Request Type-C layer to transition to Disabled State

enumerator REQUEST_TC_ERROR_RECOVERY
Request Type-C layer to transition to Error Recovery State

enumerator REQUEST_TC_END
End of Type-C requests

enumerator REQUEST_PE_DR_SWAP
Request Policy Engine layer to perform a Data Role Swap

enumerator REQUEST_PE_HARD_RESET_SEND
Request Policy Engine layer to send a hard reset

enumerator REQUEST_PE_SOFT_RESET_SEND
Request Policy Engine layer to send a soft reset

enumerator REQUEST_PE_GET_SRC_CAPS
Request Policy Engine layer to get Source Capabilities from port partner

enum usbc_policy_notify_t
Device Policy Manager notifications.

Values:

enumerator MSG_ACCEPT_RECEIVED
Power Delivery Accept message was received

enumerator MSG_REJECTED_RECEIVED
Power Delivery Reject message was received

enumerator MSG_DISCARDED
Power Delivery discarded the message being transmitted

enumerator MSG_NOT_SUPPORTED_RECEIVED
Power Delivery Not Supported message was received

enumerator DATA_ROLE_IS_UFP
Data Role has been set to Upstream Facing Port (UFP)
enumerator DATA_ROLE_IS_DFP
    Data Role has been set to Downstream Facing Port (DFP)

enumerator PD_CONNECTED
    A PD Explicit Contract is in place

enumerator NOT_PD_CONNECTED
    No PD Explicit Contract is in place

enumerator TRANSITION_PS
    Transition the Power Supply

enumerator PORT_PARTNER_NOT_RESPONSIVE
    Port partner is not responsive

enumerator PROTOCOL_ERROR
    Protocol Error occurred

enumerator SNK_TRANSITION_TO_DEFAULT
    Transition the Sink to default

enumerator HARD_RESET_RECEIVED
    Hard Reset Received

enumerator POWER_CHANGE_0A0
    Sink SubPower state at 0V

enumerator POWER_CHANGE_DEF
    Sink SubPower state a 5V / 500mA

enumerator POWER_CHANGE_1A5
    Sink SubPower state a 5V / 1.5A

enumerator POWER_CHANGE_3A0
    Sink SubPower state a 5V / 3A

definition enum usbc_policy_check_t
    Device Policy Manager checks.

    Values:

        enumerator CHECK_POWER_ROLE_SWAP
            Check if Power Role Swap is allowed

        enumerator CHECK_DATA_ROLE_SWAP_TO_DFP
            Check if Data Role Swap to DFP is allowed

        enumerator CHECK_DATA_ROLE_SWAP_TO_UFP
            Check if Data Role Swap to UFP is allowed
enumerator CHECK_SNK_AT_DEFAULT_LEVEL
Check if Sink is at default level

enum usbc_policy_wait_t
Device Policy Manager Wait message notifications.

Values:

enumerator WAIT_SINK_REQUEST
The port partner is unable to meet the sink request at this time

counter WAIT_POWER_ROLE_SWAP
The port partner is unable to do a Power Role Swap at this time

counter WAIT_DATA_ROLE_SWAP
The port partner is unable to do a Data Role Swap at this time

counter WAIT_VCONN_SWAP
The port partner is unable to do a VCONN Swap at this time

Functions

int usbc_start(const struct device *dev)
Start the USB-C Subsystem.

Parameters
• dev – Runtime device structure

Return values
0 – on success

int usbc_suspend(const struct device *dev)
Suspend the USB-C Subsystem.

Parameters
• dev – Runtime device structure

Return values
0 – on success

int usbc_request(const struct device *dev, const enum usbc_policy_request_t req)
Make a request of the USB-C Subsystem.

Parameters
• dev – Runtime device structure
• req – request

Return values
0 – on success

void usbc_set_dpm_data(const struct device *dev, void *dpm_data)
Set pointer to Device Policy Manager (DPM) data.

Parameters
• dev – Runtime device structure
void *usbc_get_dpm_data(const struct device *dev)
Get pointer to Device Policy Manager (DPM) data.

Parameters
• dev – Runtime device structure

Return values
• pointer – to dpm data that was set with usbc_set_dpm_data
• NULL – if dpm data was not set

void usbc_set_vconn_control_cb(const struct device *dev, const tcpc_vconn_control_cb_t cb)
Set the callback used to set VCONN control.

Parameters
• dev – Runtime device structure
• cb – VCONN control callback

void usbc_set_policy_cb_check(const struct device *dev, const policy_cb_check_t cb)
Set the callback used to check a policy.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_notify(const struct device *dev, const policy_cb_notify_t cb)
Set the callback used to notify Device Policy Manager of a policy change.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_wait_notify(const struct device *dev, const policy_cb_wait_notify_t cb)
Set the callback used to notify Device Policy Manager of WAIT message reception.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_get_snk_cap(const struct device *dev, const policy_cb_get_snk_cap_t cb)
Set the callback used to get the Sink Capabilities.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_set_src_cap(const struct device *dev, const policy_cb_set_src_cap_t cb)
Set the callback used to store the received Port Partner's Source Capabilities.

Parameters
• dev – Runtime device structure
• cb – callback
void usbc_set_policy_cb_get_rdo(const struct device *dev, const policy_cb_get_rdo_t cb)
Set the callback used to get the Request Data Object (RDO)

Parameters

• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_is_snk_at_default(const struct device *dev, const policy_cb_is_snk_at_default_t cb)
Set the callback used to check if the sink power supply is at the default level.

Parameters

• dev – Runtime device structure
• cb – callback
Chapter 7

Hardware Support

7.1 Architecture-related Guides

7.1.1 Zephyr support status on ARC processors

Overview

This page describes current state of Zephyr for ARC processors and some future plans. Please note that
- plans are given without exact deadlines
- software features require corresponding hardware to be present and configured the proper way
- not all the features can be enabled at the same time

Support status

Legend: Y - yes, supported; N - no, not supported; WIP - Work In Progress; TBD - to be decided

### Notes

#### 7.1.2 Arm Cortex-M Developer Guide

### Overview

This page contains detailed information about the status of the Arm Cortex-M architecture porting in the Zephyr RTOS and describes key aspects when developing Zephyr applications for Arm Cortex-M-based platforms.

### Key supported features

The table below summarizes the status of key OS features in the different Arm Cortex-M implementation variants.

---

1. usage of CCMs is limited on SMP systems
2. except the systems with secure features (SecureShield) due to HW limitation
3. We only support save/restore ACCL/ACCH registers in task’s context. Rest of DSP/AGU registers save/restore isn’t implemented but kernel itself does not use these registers. This allows single task per core to use DSP/AGU safely.
4. Single-thread kernel is support only for single core targets
5. QEMU doesn’t support all the ARC processor’s HW features. For the detailed info please check the ARC QEMU documentation

**Notes**

1 SysTick is optional in Cortex-M1
2 Stack limit checking only in Secure builds in Cortex-M23
## OS features

### Threads

**Thread stack alignment**  Each Zephyr thread is defined with its own stack memory. By default, Cortex-M enforces a double word thread stack alignment, see `CONFIG_STACK_ALIGN_DOUBLE_WORD`. If MPU-based HW-assisted stack overflow detection (`CONFIG_MPU_STACK_GUARD`) is enabled, thread stacks need to be aligned with a larger value, reflected by `CONFIG_ARM_MPU_REGION_MIN_ALIGN_AND_SIZE`.

In Arm v6-M and Arm v7-M architecture variants, thread stacks are additionally required to be aligned with a value equal to their size, in applications that need to support user mode (`CONFIG_USERSPACE`). The thread stack sizes in that case need to be a power of two. This is all reflected by `CONFIG_MPU_REQUIRES_POWER_OF_TWO_ALIGNMENT`, that is enforced in Arm v6-M and Arm v7-M builds with user mode support.

**Stack pointers**  While executing in thread mode the processor is using the Process Stack Pointer (PSP). The processor uses the Main Stack Pointer (MSP) while executing in handler mode, that is, while servicing exceptions and HW interrupts. Using PSP in thread mode facilitates thread stack pointer manipulation during thread context switching, without affecting the current execution context flow in handler mode.

In Arm Cortex-M builds a single interrupt stack memory is shared among exceptions and interrupts. The size of the interrupt stack needs to be selected taking into consideration nested interrupts, each pushing an additional stack frame. Developers can modify the interrupt stack size using `CONFIG_ISR_STACK_SIZE`.

The interrupt stack is also used during early boot so the kernel can initialize the main thread's stack before switching to the main thread.

**Thread context switching**  In Arm Cortex-M builds, the PendSV exception is used in order to trigger a context switch to a different thread. PendSV exception is always present in Cortex-M implementations. PendSV is configured with the lowest possible interrupt priority level, in all Cortex-M variants. The main reasons for that design are

- to utilize the tail chaining feature of Cortex-M processors, and thus limit the number of context switch operations that occur.
- to not impact the interrupt latency observed by HW interrupts.

As a result, context switch in Cortex-M is non-atomic, i.e. it may be preempted by HW interrupts, however, a context-switch operation must be completed before a new thread context-switch may start.

Typically a thread context-switch will perform the following operations

- When switching-out the current thread, the processor stores
  - the callee-saved registers (R4 - R11) in the thread’s container for callee-saved registers, which is located in kernel memory
  - the thread’s current operation *mode*
    - user or privileged execution mode
    - presence of an active floating point context
    - the EXC_RETURN value of the current handler context (PendSV)
  - the floating point callee-saved registers (S16 - S31) in the thread’s container for FP callee-saved registers, if the current thread has an active FP context
  - the PSP of the current thread which points to the beginning of the current thread's exception stack frame. The latter contains the caller-saved context and the return address of the switched-out thread.

- When switching-in a new thread the processor
restores the new thread’s callee-saved registers from the thread’s container for callee-saved registers
restores the new thread’s operation mode
restores the FP callee-saved registers if the switched-in thread had an active FP context before being switched-out
re-programs the dynamic MPU regions to allow a user thread access its stack and application memories, and/or programs a stack-overflow MPU guard at the bottom of the thread’s privileged stack
restores the PSP for the incoming thread and re-programs the stack pointer limit register (if applicable, see CONFIG_BUILTIN_STACK_GUARD)
optionally does a stack limit checking for the switched-in thread, if sentinel-based stack limit checking is enabled (see CONFIG_STACK_SENTINEL).

PendSV exception return sequence restores the new thread’s caller-saved registers and the return address, as part of unstacking the exception stack frame.

The implementation of the context-switch mechanism is present in arch/arm/core/aarch32/swap_helper.S.

Stack limit checking (Arm v8-M)  Armv8-M and Armv8.1-M variants support stack limit checking using the MSPLIM and PSPLIM core registers. The feature is enabled when CONFIG_BUILTIN_STACK_GUARD is set. When stack limit checking is enabled, both the thread’s privileged or user stack, as well as the interrupt stack are guarded by PSPLIM and MSPLIM registers, respectively. MSPLIM is configured once during kernel boot, while PSLIM is re-programmed during every thread context-switch or during system calls, when the thread switches from using its default stack to using its privileged stack, and vice versa. PSPLIM re-programming

• has a relatively low runtime overhead (programming is done with MSR instructions)
• does not impact interrupt latency
• does not require any memory areas to be reserved for stack guards
• does not make use of MPU regions

It is, therefore, considered as a lightweight but very efficient stack overflow detection mechanism in Cortex-M applications.

Stack overflows trigger the dedicated UsageFault exception provided by Arm v8-M.

Interrupt handling features  This section describes certain aspects around exception and interrupt handling in Arm Cortex-M.

Interrupt priority levels  The number of available (configurable) interrupt priority levels is determined by the number of implemented interrupt priority bits in NVIC; this needs to be described for each Cortex-M platform using DeviceTree:

```plaintext
&nvic {
    arm,num-irq-priority-bits = <#priority-bits>;
};
```

Reserved priority levels  A number of interrupt priority levels are reserved for the OS.

By design, system fault exceptions have the highest priority level. In Baseline Cortex-M, this is actually enforced by hardware, as HardFault is the only available processor fault exception, and its priority is higher than any configurable exception priority.
In **Mainline Cortex-M**, the available fault exceptions (e.g. MemManageFault, UsageFault, etc.) are assigned the highest configurable priority level. (CONFIG_CPU_CORTEX_M_HAS_PROGRAMMABLE_FAULT_PRIOS signifies explicitly that the Cortex-M implementation supports configurable fault priorities.)

This priority level is never shared with HW interrupts (an exception to this rule is described below). As a result, processor faults occurring in regular ISRs will be handled by the corresponding fault handler and will not escalate to a HardFault, **similar to processor faults occurring in thread mode**.

SVC exception is normally configured with the highest configurable priority level (an exception to this rule will be described below). SVCs are used by the Zephyr kernel to dispatch system calls, trigger runtime system errors (e.g. Kernel oops or panic), or implement IRQ offloading.

In Baseline Cortex-M the priority level of SVC may be shared with other exceptions or HW interrupts that are also given the highest configurable priority level (As a result of this, kernel runtime errors during interrupt handling will escalate to HardFault. Additional logic in the fault handling routines ensures that such runtime errors are detected successfully).

In Mainline Cortex-M, however, the SVC priority level is **reserved**, thus normally it is only shared with the fault exceptions of configurable priority. This simplifies the fault handling routines in Mainline Cortex-M architecture, since runtime kernel errors are serviced by the SVC handler (i.e no HardFault escalation, even if the kernel errors occur in ISR context).

HW interrupts in Mainline Cortex-M builds are allocated a priority level lower than the SVC.

One exception to the above rules is when Zephyr applications support Zero Latency Interrupts (ZLIs). Such interrupts are designed to have a priority level higher than any HW or system interrupt. If the ZLI feature is enabled in Mainline Cortex-M builds (see CONFIG_ZERO_LATENCY_IRQS), then

- ZLIs are assigned the highest configurable priority level
- SVCs are assigned the second highest configurable priority level
- Regular HW interrupts are assigned priority levels lower than SVC.

The priority level configuration in Cortex-M is implemented in include/arch/arm/aarch32/exc.h.

**Locking and unlocking IRQs** In Baseline Cortex-M locking interrupts is implemented using the PRI-MASK register.

`arch_irq_lock()` will set the PRIMASK register to 1, eventually, masking all IRQs with configurable priority. While this fulfils the OS requirement of locking interrupts, the consequence is that kernel runtime errors (triggering SVCs) will escalate to HardFault.

In Mainline Cortex-M locking interrupts is implemented using the BASEPRI register (Mainline Cortex-M builds select CONFIG_CPU_CORTEX_M_HAS_BASEPRI to signify that BASEPRI register is implemented.). By modifying BASEPRI (or BASEPRI_MAX) arch_irq_lock() masks all system and HW interrupts with the exception of

- SVCs
- processor faults
- ZLIs

This allows zero latency interrupts to be triggered inside OS critical sections. Additionally, this allows system (processor and kernel) faults to be handled by Zephyr in **exactly the same way**, regardless of whether IRQs have been locked or not when the error occurs. It also allows for system calls to be dispatched while IRQs are locked.

**Note:** Mainline Cortex-M fault handling is designed and configured in a way that all processor and kernel faults are handled by the corresponding exception handlers and never result in HardFault escalation. In other words, a HardFault may only occur in Zephyr applications that have modified the default
fault handling configurations. The main reason for this design was to reserve the HardFault exception for handling exceptional error conditions in safety critical applications.

**Dynamic direct interrupts** Cortex-M builds support the installation of direct interrupt service routines during runtime. Direct interrupts are designed for performance-critical interrupt handling and do not go through all of the common Zephyr interrupt handling code.

Direct dynamic interrupts are enabled via switching on CONFIG_DYNAMIC_DIRECT_INTERRUPTS.

Note that enabling direct dynamic interrupts requires enabling support for dynamic interrupts in the kernel, as well (see CONFIG_DYNAMIC_INTERRUPTS).

**Zero Latency interrupts** As described above, in Mainline Cortex-M applications, the Zephyr kernel reserves the highest configurable interrupt priority level for its own use (SVC). SVCs will not be masked by interrupt locking. Zero-latency interrupt can be used to set up an interrupt at the highest interrupt priority which will not be blocked by interrupt locking. To use the ZLI feature CONFIG_ZERO_LATENCY_IRQS needs to be enabled.

Zero latency IRQs have minimal interrupt latency, as they will always preempt regular HW or system interrupts.

Note, however, that since ZLI ISRs will run at a priority level higher than the kernel exceptions they **cannot use** any kernel functionality. Additionally, since the ZLI interrupt priority level is equal to processor fault priority level, faults occurring in ZLI ISRs will escalate to HardFault and will not be handled in the same way as regular processor faults. Developers need to be aware of this limitation.

**CPU Idling** The Cortex-M architecture port implements both k_cpu_idle() and k_cpu_atomic_idle(). The implementation is present in arch/arm/core/aarch32/cpu_idle.S.

In both implementations, the processor will attempt to put the core to low power mode. In k_cpu_idle() the processor ends up executing WFI (Wait For Interrupt) instruction, while in k_cpu_atomic_idle() the processor will execute a WFE (Wait For Event) instruction.

When using the CPU idling API in Cortex-M it is important to note the following:

- Both k_cpu_idle() and k_cpu_atomic_idle() are assumed to be invoked with interrupts locked. This is taken care of by the kernel if the APIs are called by the idle thread.
- After waking up from low power mode, both functions will restore interrupts unconditionally, that is, regardless of the interrupt lock status before the CPU idle API was called.

The Zephyr CPU Idling mechanism is detailed in **CPU Idling**.

**Memory protection features** This section describes certain aspects around memory protection features in Arm Cortex-M applications.

**User mode system calls** User mode is supported in Cortex-M platforms that implement the standard (Arm) MPU or a similar core peripheral logic for memory access policy configuration and control, such as the NXP MPU for Kinetis platforms. (Currently, CONFIG_ARCH_HAS_USERSPACE is selected if CONFIG_ARM_MPU is enabled by the user in the board default Kconfig settings).

A thread performs a system call by triggering a (synchronous) SVC exception, where

- up to 5 arguments are placed on registers R1 - R5
- system call ID is placed on register R6.

The SVC Handler will branch to the system call preparation logic, which will perform the following operations.
• switch the thread's PSP to point to the beginning of the thread's privileged stack area, optionally reprogramming the PSPLIM if stack limit checking is enabled
• modify CONTROL register to switch to privileged mode
• modify the return address in the SVC exception stack frame, so that after exception return the system call dispatcher is executed (in thread privileged mode)

Once the system call execution is completed the system call dispatcher will restore the user's original PSP and PSPLIM and switch the CONTROL register back to unprivileged mode before returning back to the caller of the system call.

System calls execute in thread mode and can be preempted by interrupts at any time. A thread may also be context-switched-out while doing a system call; the system call will resume as soon as the thread is switched-in again.

The system call dispatcher executes at SVC priority, therefore it cannot be preempted by HW interrupts (with the exception of ZLIs), which may observe some additional interrupt latency if they occur during a system call preparation.

**MPU-assisted stack overflow detection** Cortex-M platforms with MPU may enable `CONFIG_MPU_STACK_GUARD` to enable the MPU-based stack overflow detection mechanism. The following points need to be considered when enabling the MPU stack guards

• stack overflows are triggering processor faults as soon as they occur
• the mechanism is essential for detecting stack overflows in supervisor threads, or user threads in privileged mode; stack overflows in threads in user mode will always be detected regardless of `CONFIG_MPU_STACK_GUARD` being set.
• stack overflows are always detected, however, the mechanism does not guarantee that no memory corruption occurs when supervisor threads overflow their stack memory
• `CONFIG_MPU_STACK_GUARD` will normally reserve one MPU region for programming the stack guard (in certain Arm v8-M configurations with `CONFIG_MPU_GAP_FILLING` enabled 2 MPU regions are required to implement the guard feature)
• MPU guards are re-programmed at every context-switch, adding a small overhead to the thread swap routine. Compared, however, to the `CONFIG_BUILTIN_STACK_GUARD` feature, no re-programming occurs during system calls.
• When `CONFIG_HW_STACK_PROTECTION` is enabled on Arm v8-M platforms the native stack limit checking mechanism is used by default instead of the MPU-based stack overflow detection mechanism; users may override this setting by manually enabling `CONFIG_MPU_STACK_GUARD` in these scenarios.

**Memory map and MPU considerations**

**Fixed MPU regions** By default, when `CONFIG_ARM_MPU` is enabled a set of fixed MPU regions are programmed during system boot.

• One MPU region programs the entire flash area as read-execute. User can override this setting by enabling `CONFIG_MPU_ALLOW_FLASH_WRITE`, which programs the flash with RWX permissions. If `CONFIG_USERSPACE` is enabled unprivileged access on the entire flash area is allowed.
• One MPU region programs the entire SRAM area with privileged-only RW permissions. That is, an MPU region is utilized to disallow execute permissions on SRAM. (An exception to this setting is when `CONFIG_MPU_GAP_FILLING` is disabled (Arm v8-M only); in that case no SRAM MPU programming is done so the access is determined by the default Arm memory map policies, allowing for privileged-only RWX permissions on SRAM).
• All the memory regions defined in the devicetree with the compatible zephyr,memory-region and at least the property zephyr,memory-region-mpu defining the MPU permissions for the memory region. See the next section for more details.

The above MPU regions are defined in soc/arm/common/cortex_m/arm_mpu_regions.c. Alternative MPU configurations are allowed by enabling CONFIG_CPU_HAS_CUSTOM_FIXED_SOC_MPU_REGIONS. When enabled, this option signifies that the Cortex-M SoC will define and configure its own fixed MPU regions in the SoC definition.

Fixed MPU regions defined in devicetree The user can define memory regions to be allocated and created in the linker script using nodes with the zephyr,memory-region devicetree compatible. When the property zephyr,memory-region-mpu is present in such a node, a new MPU region will be allocated and programmed during system boot.

The property zephyr,memory-region-mpu is a string carrying the attributes for the MPU region. It is converted to a C token for use defining the attributes of the MPU region.

For example, to define a new non-cacheable memory region in devicetree:

```c
sram_no_cache: memory@20300000 {
    compatible = "zephyr,memory-region", "mmio-sram";
    reg = <0x20300000 0x100000>;
    zephyr,memory-region = "SRAM_NO_CACHE";
    zephyr,memory-region-mpu = "RAM_NOCACHE";
};
```

This will automatically create a new MPU entry in soc/arm/common/cortex_m/arm_mpu_regions.c with the correct name, base, size and attributes gathered directly from the devicetree. See include/zephyr/linker/devicetree_regions.h for more details.

Static MPU regions Additional static MPU regions may be programmed once during system boot. These regions are required to enable certain features

• a RX region to allow execution from SRAM, when CONFIG_ARCH_HAS_RAMFUNC_SUPPORT is enabled and users have defined functions to execute from SRAM.

• a RX region for relocating text sections to SRAM, when CONFIG_CODE_DATA_RELOCATION_SRAM is enabled

• a no-cache region to allow for a none-cacheable SRAM area, when CONFIG_NOCACHE_MEMORY is enabled

• a possibly unprivileged RW region for GCOV code coverage accounting area, when CONFIG_COVERAGE_GCOV is enabled

• a no-access region to implement null pointer dereference detection, when CONFIG_NULL_POINTER_EXCEPTION_DETECTION_MPU is enabled

The boundaries of these static MPU regions are derived from symbols exposed by the linker, in include/linker/linker-defs.h.

Dynamic MPU regions Certain thread-specific MPU regions may be re-programmed dynamically, at each thread context switch:

• an unprivileged RW region for the current thread's stack area (for user threads)

• a read-only region for the MPU stack guard

• unprivileged RW regions for the partitions of the current thread's application memory domain.
**Considerations**  The number of available MPU regions for a Cortex-M platform is a limited resource. Most platforms have 8 MPU regions, while some Cortex-M33 or Cortex-M7 platforms may have up to 16 MPU regions. Therefore there is a relatively strict limitation on how many fixed, static and dynamic MPU regions may be programmed simultaneously. For platforms with 8 available MPU regions it might not be possible to enable all the aforementioned features that require MPU region programming. In most practical applications, however, only a certain set of features is required and 8 MPU regions are, in many cases, sufficient.

In Arm v8-M processors the MPU architecture does not allow programmed MPU regions to overlap. `CONFIG_MPU_GAP_FILLING` controls whether the fixed MPU region covering the entire SRAM is programmed. When it does, a full SRAM area partitioning is required, in order to program the static and the dynamic MPU regions. This increases the total number of required MPU regions. When `CONFIG_MPU_GAP_FILLING` is not enabled the fixed MPU region covering the entire SRAM is not programmed, thus, the static and dynamic regions are simply programmed on top of the always-existing background region (full-SRAM partitioning is not required). Note, however, that the background SRAM region allows execution from SRAM, so when `CONFIG_MPU_GAP_FILLING` is not set Zephyr is not protected against attacks that attempt to execute malicious code from SRAM.

**Floating Point Services**  Both unshared and shared FP registers mode are supported in Cortex-M (see Floating Point Services for more details).

When FPU support is enabled in the build (`CONFIG_FPU` is enabled), the sharing FP registers mode (`CONFIG_FPU_SHARING`) is enabled by default. This is done as some compiler configurations may activate a floating point context by generating FP instructions for any thread, regardless of whether floating point calculations are performed, and that context must be preserved when switching such threads in and out.

The developers can still disable the FP sharing mode in their application projects, and switch to Unshared FP registers mode, if it is guaranteed that the image code does not generate FP instructions outside the single thread context that is allowed (and supposed) to do so.

Under FPU sharing mode, the callee-saved FPU registers are saved and restored in context-switch, if the corresponding threads have an active FP context. This adds some runtime overhead on the swap routine. In addition to the runtime overhead, the sharing FPU mode

- requires additional memory for each thread to save the callee-saved FP registers
- requires additional stack memory for each thread, to stack the caller-saved FP registers, upon exception entry, if an FP context is active. Note, however, that since lazy stacking is enabled, there is no runtime overhead of FP context stacking in regular interrupts (FP state preservation is only activated in the swap routine in PendSV interrupt).

**Misc**

**Chain-loadable images**  Cortex-M applications may either be standalone images or chain-loadable, for instance, by a bootloader. Application images chain-loadable by bootloaders (or other applications) normally occupy a specific area in the flash denoted as their code partition. `CONFIG_USE_DT_CODE_PARTITION` will ensure that a Zephyr chain-loadable image will be linked into its code partition, specified in Device-Tree.

**HW initialization at boot**  In order to boot properly, chain-loaded applications may require that the core Arm hardware registers and peripherals are initialized in their reset values. Enabling `CONFIG_INIT_ARCH_HW_AT_BOOT` Zephyr to force the initialization of the internal Cortex-M architectural state during boot to the reset values as specified by the corresponding Arm architecture manual.

**Software vector relaying**  In Cortex-M platforms that implement the VTOR register (see `CONFIG_CPU_CORTEX_M_HAS_VTOR`), chain-loadable images relocate the Cortex-M vector table by updating the VTOR register with the offset of the image vector table.
Baseline Cortex-M platforms without VTOR register might not be able to relocate their vector table which remains at a fixed location. Therefore, a chain-loadable image will require an alternative way to route HW interrupts and system exceptions to its own vector table; this is achieved with software vector relaying.

When a bootloader image enables CONFIG_SW_VECTOR_RELAY it is able to relay exceptions and interrupts based on a vector table pointer that is set by the chain-loadable application. The latter sets the CONFIG_SW_VECTOR_RELAY_CLIENT option to instruct the boot sequence to set the vector table pointer in SRAM so that the bootloader can forward the exceptions and interrupts to the chain-loadable image's software vector table.

While this feature is intended for processors without VTOR register, it may also be used in Mainline Cortex-M platforms.

**Code relocation** Cortex-M support the code relocation feature. When CONFIG_CODE_DATA_RELOCATION_SRAM is selected, Zephyr will relocate .text, data and .bss sections from the specified files and place it in SRAM. It is possible to relocate only parts of the code sections into SRAM, without relocating the whole image text and data sections. More details on the code relocation feature can be found in *Code And Data Relocation*.

**Linking Cortex-M applications**

Most Cortex-M platforms make use of the default Cortex-M GCC linker script in include/arch/arm/aarch32/cortex-m/scripts/linked.ld, although it is possible for platforms to use a custom linker script as well.

**CMSIS**

Cortex-M CMSIS headers are hosted in a standalone module repository: zephyrproject-rtos/cmsis. CONFIG_CPU_CORTEX_M selects CONFIG_HAS_CMSIS_CORE to signify that CMSIS headers are available for all supported Cortex-M variants.

**Testing**

A list of unit tests for the Cortex-M porting and miscellaneous features is present in tests/arch/arm/. The tests suites are continuously extended and new test suites are added, in an effort to increase the coverage of the Cortex-M architecture support in Zephyr.

**QEMU**

We use QEMU to verify the implemented features of the Cortex-M architecture port in Zephyr. Adequate coverage is achieved by defining and utilizing a list of QEMU targets, each with a specific architecture variant and Arm peripheral support list.

The table below lists the QEMU platform targets defined in Zephyr along with the corresponding Cortex-M implementation variant and the peripherals these targets emulate.
Maintainers & Collaborators

The status of the Arm Cortex-M architecture port in Zephyr is: maintained. The updated list of maintainers and collaborators for Cortex-M can be found in MAINTAINERS.yml.

7.1.3 Zephyr support status on RISC-V processors

Overview

This page describes current state of Zephyr for RISC-V processors. Currently, there's support for some boards, as well as Qemu support and support for some FPGA implementations such as neorv32 and litex_vexriscv.

Zephyr support includes PMP, user mode, several ISA extensions as well as semihosting.

User mode and PMP support

When the platform has Physical Memory Protection (PMP) support, enabling it on Zephyr allows user space support and stack protection to be selected.

ISA extensions

It’s possible to set in Zephyr which ISA extensions (RV32/64I(E)MAFD(G)QC) are available on a given platform, by setting the appropriate RISCV_ISA_* kconfig. Look at arch/riscv/Kconfig.isa for more information.

Note that Zephyr SDK toolchain support may not be defined for all combinations.

SMP support

SMP is supported on RISC-V, but currently only on Qemu platforms. In order to test the SMP support, one can use qemu_riscv32_smp or qemu_riscv64_smp boards.

7.1.4 Semihosting Guide
Overview

Semihosting is a mechanism that enables code running on ARM and RISC-V targets to communicate and use the Input/Output facilities on a host computer that is running a debugger or emulator.

More complete documentation on the available functionality is available at the ARM Github documentation.

The RISC-V functionality borrows from the ARM definitions, as described at the RISC-V Github documentation.

File Operations

Semihosting enables files on the host computer to be opened, read, and modified by an application. This can be useful when attempting to validate the behaviour of code across datasets that are larger than what can fit into ROM of an emulated platform. File paths can be either absolute, or relative to the directory of the running process.

```c
const char *path = "./data.bin";
long file_len, bytes_read, fd;
uint8_t buffer[16];

/* Open the data file for reading */
fd = semihost_open(path, SEMIHOST_OPEN_RB);
if (fd < 0) {
    return -ENOENT;
}

/* Read all data from the file */
file_len = semihost_flen(fd);
while(file_len > 0) {
    bytes_read = semihost_read(fd, buffer, MIN(file_len, sizeof(buffer)));
    if (bytes_read < 0) {
        break;
    }
    /* Process read data */
    do_data_processing(buffer, bytes_read);
    /* Update remaining length */
    file_len -= bytes_read;
}
/* Close the file */
semihost_close(fd);
```

7.1.5 Additional Functionality

Additional functionality is available by running semihosting instructions directly with `semihost_exec()` with one of the instructions defined in `semihost_instr`. For complete documentation on the required arguments and return codes, see the ARM Github documentation.

API Reference

```
group semihost

 Enums
```

7.1. Architecture-related Guides
enum semihost_instr
    Semihosting instructions.

Values:

denumerator SEMIHOST_OPEN = 0x01
    Open a file or stream on the host system.

denumerator SEMIHOST_ISTTY = 0x09
    Check whether a file is associated with a stream/terminal

denumerator SEMIHOST_WRITE = 0x05
    Write to a file or stream.

denumerator SEMIHOST_READ = 0x06
    Read from a file at the current cursor position.

denumerator SEMIHOST_CLOSE = 0x02
    Closes a file on the host which has been opened by SEMIHOST_OPEN.

denumerator SEMIHOST_FLEN = 0x0C
    Get the length of a file.

denumerator SEMIHOST_SEEK = 0x0A
    Set the file cursor to a given position in a file.

denumerator SEMIHOST_TMPNAM = 0x0D
    Get a temporary absolute file path to create a temporary file.

denumerator SEMIHOST_REMOVE = 0x0E
    Remove a file on the host system. Possibly insecure!

denumerator SEMIHOST_RENAME = 0x0F
    Rename a file on the host system. Possibly insecure!

denumerator SEMIHOST_WRITEC = 0x03
    Write one character to the debug terminal.

denumerator SEMIHOST_WRITE0 = 0x04
    Write a NULL terminated string to the debug terminal.

denumerator SEMIHOST_READC = 0x07
    Read one character from the debug terminal.

denumerator SEMIHOST_CLOCK = 0x10

denumerator SEMIHOST_ELAPSED = 0x30

denumerator SEMIHOST_TICKFREQ = 0x31
enumerator SEMIHOST_TIME = 0x11
enumerator SEMIHOST_ERRNO = 0x13
    Retrieve the errno variable from semihosting operations.
enumerator SEMIHOST_GET_CMDLINE = 0x15
    Get commandline parameters for the application to run with
enumerator SEMIHOST_HEAPINFO = 0x16
enumerator SEMIHOST_ISERROR = 0x08
enumerator SEMIHOST_SYSTEM = 0x12

eum semihost_open_mode
    Modes to open a file with.
    Behaviour corresponds to equivalent fopen strings. i.e. SEMIHOST_OPEN_RB_PLUS == "rb+"
    Values:
enumerator SEMIHOST_OPEN_R = 0
enumerator SEMIHOST_OPEN_RB = 1
enumerator SEMIHOST_OPEN_R_PLUS = 2
enumerator SEMIHOST_OPEN_RB_PLUS = 3
enumerator SEMIHOST_OPEN_W = 4
enumerator SEMIHOST_OPEN_WB = 5
enumerator SEMIHOST_OPEN_W_PLUS = 6
enumerator SEMIHOST_OPEN_WB_PLUS = 7
enumerator SEMIHOST_OPEN_A = 8
enumerator SEMIHOST_OPEN_AB = 9
enumerator SEMIHOST_OPEN_A_PLUS = 10
enumerator SEMIHOST_OPEN_AB_PLUS = 11
Functions

long semihost_exec(enum semihost_instr instr, void *args)
    Manually execute a semihosting instruction.

Parameters
• instr – instruction code to run
• args – instruction specific arguments

Returns
integer return code of instruction

char semihost_poll_in(void)
    Read a byte from the console.

Returns
char byte read from the console.

void semihost_poll_out(char c)
    Write a byte to the console.

Parameters
• c – byte to write to console

long semihost_open(const char *path, long mode)
    Open a file on the host system.

Parameters
• path – file path to open. Can be absolute or relative to current directory of the
  running process.
• mode – value from semihost_open_mode.

Return values
• handle – positive handle on success.
• -1 – on failure.

long semihost_close(long fd)
    Close a file.

Parameters
• fd – handle returned by semihost_open.

Return values
• 0 – on success.
• -1 – on failure.

long semihost_flen(long fd)
    Query the size of a file.

Parameters
• fd – handle returned by semihost_open.

Return values
• positive – file size on success.
• -1 – on failure.
long semihost_seek(long fd, long offset)
Seeks to an absolute position in a file.

Parameters
- fd – handle returned by semihost_open.
- offset – offset from the start of the file in bytes.

Return values
- 0 – on success.
- -errno – negative error code on failure.

long semihost_read(long fd, void *buf, long len)
Read the contents of a file into a buffer.

Parameters
- fd – handle returned by semihost_open.
- buf – buffer to read data into.
- len – number of bytes to read.

Return values
- read – number of bytes read on success.
- -errno – negative error code on failure.

long semihost_write(long fd, const void *buf, long len)
Write the contents of a buffer into a file.

Parameters
- fd – handle returned by semihost_open.
- buf – buffer to write data from.
- len – number of bytes to write.

Return values
- 0 – on success.
- -errno – negative error code on failure.

7.1.6 x86 Developer Guide

Overview

This page contains information on certain aspects when developing for x86-based platforms.

Virtual Memory

During very early boot, page tables are loaded so technically the kernel is executing in virtual address space. By default, physical and virtual memory are identity mapped and thus giving the appearance of execution taking place in physical address space. The physical address space is marked by kconfig CONFIG_SRAM_BASE_ADDRESS and CONFIG_SRAM_SIZE while the virtual address space is marked by CONFIG_KERNEL_VM_BASE and CONFIG_KERNEL_VM_SIZE. Note that CONFIG_SRAM_OFFSET controls where the Zephyr kernel is being placed in the memory, and its counterpart CONFIG_KERNEL_VM_OFFSET.
Separate Virtual Address Space from Physical Address Space  On 32-bit x86, it is possible to have separate physical and virtual address space. Code and data are linked in virtual address space, but are still loaded in physical memory. However, during boot, code and data must be available and also addressable in physical address space before `vm_enter` inside `arch/x86/core/ia32/crt0.S`. After `vm_enter`, code execution is done via virtual addresses and data can be referred via their virtual addresses. This is possible as the page table generation script (`arch/x86/gen_mmu.py`) identity maps the physical addresses at the page directory level, in addition to mapping virtual addresses to the physical memory. Later in the boot process, the entries for identity mapping at the page directory level are cleared in `z_x86_mmu_init()`, effectively removing the identity mapping of physical memory. This unmapping must be done for userspace isolation or else they would be able to access restricted memory via physical addresses. Since the identity mapping is done at the page directory level, there is no need to allocate additional space for the page table. However, additional space may still be required for additional page directory table.

There are restrictions on where virtual address space can be:

- Physical and virtual address spaces must be disjoint. This is required as the entries in page directory table will be cleared. If they are not disjoint, it would clear the entries needed for virtual addresses.
  - If `CONFIG_X86_PAE` is enabled (=y), each address space must reside in their own 1GB region, due to each entry of PDP (Page Directory Pointer) covers 1GB of memory. For example:
    * Assuming `CONFIG_SRAM_OFFSET` and `CONFIG_KERNEL_VM_OFFSET` are both 0x0.
    * `CONFIG_SRAM_BASE_ADDRESS == 0x00000000` and `CONFIG_KERNEL_VM_BASE = 0x40000000` is valid, while
    * `CONFIG_SRAM_BASE_ADDRESS == 0x00000000` and `CONFIG_KERNEL_VM_BASE = 0x20000000` is not.
  - If `CONFIG_X86_PAE` is disabled (=n), each address space must reside in their own 4MB region, due to each entry of PD (Page Directory) covers 4MB of memory.
  - Both `CONFIG_SRAM_BASE_ADDRESS` and `CONFIG_KERNEL_VM_BASE` must also align with the starting addresses of targeted regions.

Specifying Additional Memory Mappings at Build Time

The page table generation script (`arch/x86/gen_mmu.py`) generates the necessary multi-level page tables for code execution and data access using the kernel image produced by the first linker pass. Additional command line arguments can be passed to the script to generate additional memory mappings. This is useful for static mappings and/or device MMIO access during very early boot. To pass extra command line arguments to the script, populate a CMake list named `X86_EXTRA_GEN_MMU_ARGUMENTS` in the board configuration file. Here is an example:

```
set(X86_EXTRA_GEN_MMU_ARGUMENTS
    --map 0xA0000000,0x2000
    --map 0x80000000,0x400000,LWUX,0xB0000000)
```

The argument `--map` takes the following value: `<physical address>,<size>[,<flags:LUWX>[,<virtual address>]]`, where:

- `<physical address>` is the physical address of the mapping. (Required)
- `<size>` is the size of the region to be mapped. (Required)
- `<flags>` is the flag associated with the mapping: (Optional)
  - L: Large page at the page directory level.
  - U: Allow userspace access.
  - W: Read/write.
  - X: Allow execution.

2082 Chapter 7. Hardware Support
– D: Cache disabled.
  * Default is small page (4KB), supervisor only, read only, and execution disabled.
  • <virtual address> is the virtual address of the mapping. (Optional)

Note that specifying additional memory mappings requires larger storage space for the pre-allocated page tables (both kernel and per-domain tables). `CONFIG_X86_EXTRA_PAGE_TABLE_PAGES` is needed to specify how many more memory pages to be reserved for the page tables. If the needed space is not exactly the same as required space, the `gen_mmu.py` script will print out a message indicating what needs to be the value for the kconfig.

### 7.2 Peripheral and Hardware Emulators

#### 7.2.1 Overview

Zephyr supports a simple emulator framework to support testing of drivers without requiring real hardware.

Emulators are used to emulate hardware devices, to support testing of various subsystems. For example, it is possible to write an emulator for an I2C compass such that it appears on the I2C bus and can be used just like a real hardware device.

Emulators often implement special features for testing. For example a compass may support returning bogus data if the I2C bus speed is too high, or may return invalid measurements if calibration has not yet been completed. This allows for testing that high-level code can handle these situations correctly. Test coverage can therefore approach 100% if all failure conditions are emulated.

#### 7.2.2 Concept

The diagram below shows application code / high-level tests at the top. This is the ultimate application we want to run.

Below that are peripheral drivers, such as the AT24 EEPROM driver. We can test peripheral drivers using an emulation driver connected via a native_posix I2C controller/emulator which passes I2C traffic from the AT24 driver to the AT24 simulator.

Separately we can test the STM32 and NXP I2C drivers on real hardware using API tests. These require some sort of device attached to the bus, but with this, we can validate much of the driver functionality.

Putting the two together, we can test the application and peripheral code entirely on native_posix. Since we know that the I2C driver on the real hardware works, we should expect the application and peripheral drivers to work on the real hardware also.

Using the above framework we can test an entire application (e.g. Embedded Controller) on native_posix using emulators for all non-chip drivers:

The 'real' code is shown in green. The Zephyr emulation-framework code is shown in yellow. The blue boxes are the extra code we have to write to emulate the peripherals.

With this approach we can:

- Write individual tests for each driver (green), covering all failure modes, error conditions, etc.
- Ensure 100% test coverage for drivers (green)
- Write tests for combinations of drivers, such as GPIOs provided by an I2C GPIO expander driver talking over an I2C bus, with the GPIOs controlling a charger. All of this can work in the emulated environment or on real hardware.
- Write a complex application that ties together all of these pieces and runs on native_posix. We can develop on a host, use source-level debugging, etc.
• Transfer the application to any board which provides the required features (e.g. I2C, enough GPIOs), by adding kconfig and devicetree fragments.

7.2.3 Available emulators

Zephyr includes the following emulators:

• EEPROM, which uses a file as the EEPROM contents
• I2C emulator driver, allowing drivers to be connected to an emulator so that tests can be performed without access to the real hardware
• SPI emulator driver, which does the same for SPI
• eSPI emulator driver, which does the same for eSPI. The emulator is being developed to support more functionalities.
• CAN loopback driver

A GPIO emulator is planned but is not yet complete.

7.2.4 Samples

Here are some examples present in Zephyr:

1. Bosch BMI160 sensor driver connected via both I2C and SPI to an emulator:

```shell
west build -b native_posix tests/drivers/sensor/accel/
```

2. Simple test of the EEPROM emulator:

```shell
west build -b native_posix tests/drivers/eeprom
```

3. The same test has a second EEPROM which is an Atmel AT24 EEPROM driver connected via I2C an emulator:

```shell
west build -b native_posix tests/drivers/eeprom
```

7.3 Peripherals

7.3.1 ADC

Overview

API Reference

```shell
group adc_interface
    ADC driver APIs.
```

Defines
ADC_CHANNEL_CFG_DT(node_id)
Get ADC channel configuration from a given devicetree node.

This returns a static initializer for a struct `adc_channel_cfg` filled with data from a given devicetree node.

Example devicetree fragment:

```plaintext
kadc {
    #address-cells = <1>;
    #size-cells = <0>;

    channel@0 {
        reg = <0>;
        zephyr,gain = "ADC_GAIN_1_6";
        zephyr,reference = "ADC_REF_INTERNAL";
        zephyr,acquisition-time = <ADC_ACQ_TIME(ADC_ACQ_TIME_MICROSECONDS, 20)>
        zephyr,input-positive = <NRF_SAADC_AIN6>;
        zephyr,input-negative = <NRF_SAADC_AIN7>;
    }

    channel@1 {
        reg = <1>;
        zephyr,gain = "ADC_GAIN_1_6";
        zephyr,reference = "ADC_REF_INTERNAL";
        zephyr,acquisition-time = <ADC_ACQ_TIME_DEFAULT>;
        zephyr,input-positive = <NRF_SAADC_AIN0>;
    }
};
```

Example usage:

```c
static const struct adc_channel_cfg ch0_cfg_dt =
    ADC_CHANNEL_CFG_DT(DT_CHILD(DT_NODELABEL(adc), channel_0));
static const struct adc_channel_cfg ch1_cfg_dt =
    ADC_CHANNEL_CFG_DT(DT_CHILD(DT_NODELABEL(adc), channel_1));
```

// Initializes 'ch0_cfg_dt' to:
// {
//    .channel_id = 0,
//    .gain = ADC_GAIN_1_6,
//    .reference = ADC_REF_INTERNAL,
//    .acquisition_time = ADC_ACQ_TIME(ADC_ACQ_TIME_MICROSECONDS, 20),
//    .differential = true,
//    .input_positive = NRF_SAADC_AIN6,
//    .input-negative = NRF_SAADC_AIN7,
// }
// and 'ch1_cfg_dt' to:
// {
//    .channel_id = 1,
//    .gain = ADC_GAIN_1_6,
//    .reference = ADC_REF_INTERNAL,
//    .acquisition_time = ADC_ACQ_TIME_DEFAULT,
//    .input_positive = NRF_SAADC_AIN0,
// }
```
Parameters

- node_id – Devicetree node identifier.

Returns

Static initializer for an `adc_channel_cfg` structure.

`ADC_DT_SPEC_GET_BY_IDX(node_id, idx)`

Get ADC io-channel information from devicetree.

This returns a static initializer for an `adc_dt_spec` structure given a devicetree node and a channel index. The node must have the “io-channels” property defined.

Example devicetree fragment:

```c
/ {
    zephyr,user {
        io-channels = <&adc0 1>, <&adc0 3>;
    };
};
&adc0 {
    #address-cells = <1>;
    #size-cells = <0>;
    channel@3 {
        reg = <3>;
        zephyr,gain = "ADC_GAIN_1_5";
        zephyr,reference = "ADC_REF_VDD_1_4";
        zephyr,vref-mv = <750>;
        zephyr,acquisition-time = <ADC_ACQ_TIME_DEFAULT>;
        zephyr,resolution = <12>;
        zephyr,oversampling = <4>;
    }
};
```

Example usage:

```c
static const struct adc_dt_spec adc_chan0 =
    ADC_DT_SPEC_GET_BY_IDX(DT_PATH(zephyr_user), 0);
static const struct adc_dt_spec adc_chan1 =
    ADC_DT_SPEC_GET_BY_IDX(DT_PATH(zephyr_user), 1);

// Initializes 'adc_chan0' to:
// { 
//   .dev = DEVICE_DT_GET(DT_NODELABEL(adc0)),
//   .channel_id = 1,
// }
// and 'adc_chan1' to:
// { 
//   .dev = DEVICE_DT_GET(DT_NODELABEL(adc0)),
//   .channel_id = 3,
//   .channel_cfg_dt_node_exists = true,
//   .channel_cfg = {
//     .channel_id = 3,
//     .gain = ADC_GAIN_1_5,
//     .reference = ADC_REF_VDD_1_4,
// };
```

(continues on next page)
// .acquisition_time = ADC_ACQ_TIME_DEFAULT,
// },
// .vref_mv = 750,
// .resolution = 12,
// .oversampling = 4,
// }

See also:

`ADC_DT_SPEC_GET()`

Parameters

- `node_id` – Devicetree node identifier.
- `idx` – Channel index.

Returns
Static initializer for an `adc_dt_spec` structure.

`ADC_DT_SPEC_INST_GET_BY_IDX(inst, idx)`

Get ADC io-channel information from a DT_DRV_COMPAT devicetree instance.

See also:

`ADC_DT_SPEC_GET_BY_IDX()`

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – Channel index.

Returns
Static initializer for an `adc_dt_spec` structure.

`ADC_DT_SPEC_GET(node_id)`

Equivalent to `ADC_DT_SPEC_GET_BY_IDX(node_id, 0)`.

See also:

`ADC_DT_SPEC_GET_BY_IDX()`

Parameters

- `node_id` – Devicetree node identifier.

Returns
Static initializer for an `adc_dt_spec` structure.

`ADC_DT_SPEC_INST_GET(inst)`

Equivalent to `ADC_DT_SPEC_INST_GET_BY_IDX(inst, 0)`.

See also:

`ADC_DT_SPEC_GET()`

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
Static initializer for an adc_dt_spec structure.

typedef enum adc_action (*adc_sequence_callback)(const struct device *dev, const struct adc_sequence *sequence, uint16_t sampling_index)

Type definition of the optional callback function to be called after a requested sampling is done.

Param dev
Pointer to the device structure for the driver instance.

Param sequence
Pointer to the sequence structure that triggered the sampling. This parameter points to a copy of the structure that was supplied to the call that started the sampling sequence, thus it cannot be used with the CONTAINER_OF() macro to retrieve some other data associated with the sequence. Instead, the adc_sequence_options::user_data field should be used for such purpose.

Param sampling_index
Index (0-65535) of the sampling done.

Return
Action to be performed by the driver. See adc_action.

typedef int (*adc_api_channel_setup)(const struct device *dev, const struct adc_channel_cfg *channel_cfg)

Type definition of ADC API function for configuring a channel. See adc_channel_setup() for argument descriptions.

typedef int (*adc_api_read)(const struct device *dev, const struct adc_sequence *sequence)

Type definition of ADC API function for setting a read request. See adc_read() for argument descriptions.

typedef int (*adc_api_read_async)(const struct device *dev, const struct adc_sequence *sequence, struct k_poll_signal *async)

Type definition of ADC API function for setting an asynchronous read request. See adc_read_async() for argument descriptions.

Enums

enum adc_gain
ADC channel gain factors.

Values:

enumerator ADC_GAIN_1_6
x 1/6.

enumerator ADC_GAIN_1_5
x 1/5.
enumerator ADC_GAIN_1_4
    x 1/4.
enumerator ADC_GAIN_1_3
    x 1/3.
enumerator ADC_GAIN_2_5
    x 2/5.
enumerator ADC_GAIN_1_2
    x 1/2.
enumerator ADC_GAIN_2_3
    x 2/3.
enumerator ADC_GAIN_4_5
    x 4/5.
enumerator ADC_GAIN_1
    x 1.
enumerator ADC_GAIN_2
    x 2.
enumerator ADC_GAIN_3
    x 3.
enumerator ADC_GAIN_4
    x 4.
enumerator ADC_GAIN_6
    x 6.
enumerator ADC_GAIN_8
    x 8.
enumerator ADC_GAIN_12
    x 12.
enumerator ADC_GAIN_16
    x 16.
enumerator ADC_GAIN_24
    x 24.
enumerator ADC_GAIN_32
    x 32.
enumerator ADC_GAIN_64
   x 64.

enumerator ADC_GAIN_128
   x 128.

denum adc_reference
   ADC references.
   Values:

   enumerator ADC_REF_VDD_1
      VDD.

   enumerator ADC_REF_VDD_1_2
      VDD/2.

   enumerator ADC_REF_VDD_1_3
      VDD/3.

   enumerator ADC_REF_VDD_1_4
      VDD/4.

   enumerator ADC_REF_INTERNAL
      Internal.

   enumerator ADC_REF_EXTERNAL0
      External, input 0.

   enumerator ADC_REF_EXTERNAL1
      External, input 1.

denum adc_action
   Action to be performed after a sampling is done.
   Values:

   enumerator ADC_ACTION_CONTINUE = 0
      The sequence should be continued normally.

   enumerator ADC_ACTION_REPEAT
      The sampling should be repeated. New samples or sample should be read from the ADC and written in the same place as the recent ones.

   enumerator ADC_ACTION_FINISH
      The sequence should be finished immediately.

Functions

7.3. Peripherals
int adc_gain_invert(enum adc_gain gain, int32_t *value)
Invert the application of gain to a measurement value.
For example, if the gain passed in is ADC_GAIN_1_6 and the referenced value is 10, the value after the function returns is 60.

Parameters
• gain – the gain used to amplify the input signal.
• value – a pointer to a value that initially has the effect of the applied gain but has that effect removed when this function successfully returns. If the gain cannot be reversed the value remains unchanged.

Return values
• 0 – if the gain was successfully reversed
• -EINVAL – if the gain could not be interpreted

int adc_channel_setup(const struct device *dev, const struct adc_channel_cfg *channel_cfg)
Configure an ADC channel.
It is required to call this function and configure each channel before it is selected for a read request.

Parameters
• dev – Pointer to the device structure for the driver instance.
• channel_cfg – Channel configuration.

Return values
• 0 – On success.
• -EINVAL – If a parameter with an invalid value has been provided.

static inline int adc_channel_setup_dt(const struct adc_dt_spec *spec)
Configure an ADC channel from a struct adc_dt_spec.
See also:
adc_channel_setup()

Parameters
• spec – ADC specification from Devicetree.

Returns
A value from adc_channel_setup() or -ENOTSUP if information from Devicetree is not valid.

int adc_read(const struct device *dev, const struct adc_sequence *sequence)
Set a read request.

If invoked from user mode, any sequence struct options for callback must be NULL.

Parameters
• dev – Pointer to the device structure for the driver instance.
• sequence – Structure specifying requested sequence of samplings.

Return values
• 0 – On success.
-EINVAL – If a parameter with an invalid value has been provided.
-ENOMEM – If the provided buffer is too small to hold the results of all requested samplings.
-ENOTSUP – If the requested mode of operation is not supported.
-EBUSY – If another sampling was triggered while the previous one was still in progress. This may occur only when samplings are done with intervals, and it indicates that the selected interval was too small. All requested samples are written in the buffer, but at least some of them were taken with an extra delay compared to what was scheduled.

```c
int adc_read_async(const struct device *dev, const struct adc_sequence *sequence, struct k_poll_signal *async)
```

Set an asynchronous read request.

If invoked from user mode, any sequence struct options for callback must be NULL.

**Note:** This function is available only if `CONFIG_ADC_ASYNC` is selected.

### Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `sequence` – Structure specifying requested sequence of samplings.
- `async` – Pointer to a valid and ready to be signaled struct `k_poll_signal`. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

### Returns
0 on success, negative error code otherwise. See `adc_read()` for a list of possible error codes.

```c
static inline uint16_t adc_ref_internal(const struct device *dev)
```

Get the internal reference voltage.

Returns the voltage corresponding to `ADC_REF_INTERNAL`, measured in millivolts.

**Returns**
a positive value is the reference voltage value. Returns zero if reference voltage information is not available.

```c
static inline int adc_raw_to_millivolts(int32_t ref_mv, enum adc_gain gain, uint8_t resolution, int32_t *valp)
```

Convert a raw ADC value to millivolts.

This function performs the necessary conversion to transform a raw ADC measurement to a voltage in millivolts.

**Parameters**
- `ref_mv` – the reference voltage used for the measurement, in millivolts. This may be from `adc_ref_internal()` or a known external reference.
- `gain` – the ADC gain configuration used to sample the input
- `resolution` – the number of bits in the absolute value of the sample. For differential sampling this needs to be one less than the resolution in struct `adc_sequence`.
• valp – pointer to the raw measurement value on input, and the corresponding millivolt value on successful conversion. If conversion fails the stored value is left unchanged.

**Return values**

• 0 – on successful conversion
• -EINVAL – if the gain is not reversible

```c
static inline int adc_raw_to_millivolts_dt(const struct adc_dt_spec *spec, int32_t *valp)
```

Convert a raw ADC value to millivolts using information stored in a struct `adc_dt_spec`.

**See also:**

`adc_raw_to_millivolts()`

**Parameters**

• spec – [in] ADC specification from Devicetree.
• valp – [inout] Pointer to the raw measurement value on input, and the corresponding millivolt value on successful conversion. If conversion fails the stored value is left unchanged.

**Returns**

A value from `adc_raw_to_millivolts()` or -ENOTSUP if information from Device-tree is not valid.

```c
static inline int adc_sequence_init_dt(const struct adc_dt_spec *spec, struct adc_sequence *seq)
```

Initialize a struct `adc_sequence` from information stored in struct `adc_dt_spec`.

Note that this function only initializes the following fields:

• `adc_sequence::channels`
• `adc_sequence::resolution`
• `adc_sequence::oversampling`

Other fields should be initialized by the caller.

**Parameters**

• spec – [in] ADC specification from Devicetree.
• seq – [out] Sequence to initialize.

**Return values**

• 0 – On success
• -ENOTSUP – If spec does not have valid channel configuration

```c
struct adc_channel_cfg
#include <adc.h> Structure for specifying the configuration of an ADC channel.
```

**Public Members**

```c
enum adc_gain gain
   Gain selection.
```
enum \texttt{adc\_reference} reference
\begin{quote}
Reference selection.
\end{quote}

\texttt{uint16\_t\ acquisition\_time}
\begin{quote}
Acquisition time. Use the \texttt{ADC\_ACQ\_TIME} macro to compose the value for this field or pass \texttt{ADC\_ACQ\_TIME\_DEFAULT} to use the default setting for a given hardware (e.g. when the hardware does not allow to configure the acquisition time). Particular drivers do not necessarily support all the possible units. Value range is 0-16383 for a given unit.
\end{quote}

\texttt{uint8\_t\ channel\_id}
\begin{quote}
Channel identifier. This value primarily identifies the channel within the ADC API - when a read request is done, the corresponding bit in the “channels” field of the “adc\_sequence” structure must be set to include this channel in the sampling. For hardware that does not allow selection of analog inputs for given channels, but rather have dedicated ones, this value also selects the physical ADC input to be used in the sampling. Otherwise, when it is needed to explicitly select an analog input for the channel, or two inputs when the channel is a differential one, the selection is done in “input\_positive” and “input\_negative” fields. Particular drivers indicate which one of the above two cases they support by selecting or not a special hidden Kconfig option named \texttt{ADC\_CONFIGURABLE\_INPUTS}. If this option is not selected, the macro \texttt{CONFIG\_ADC\_CONFIGURABLE\_INPUTS} is not defined and consequently the mentioned two fields are not present in this structure. While this API allows identifiers from range 0-31, particular drivers may support only a limited number of channel identifiers (dependent on the underlying hardware capabilities or configured via a dedicated Kconfig option).
\end{quote}

\texttt{uint8\_t\ differential}
\begin{quote}
Channel type: single-ended or differential.
\end{quote}

\textbf{struct adc\_dt\_spec}
\begin{quote}
\texttt{#include <adc.h>} Container for ADC channel information specified in devicetree.
\end{quote}

\textbf{See also:}
\begin{quote}
\texttt{ADC\_DT\_SPEC\_GET\_BY\_IDX}
\end{quote}
\textbf{See also:}
\begin{quote}
\texttt{ADC\_DT\_SPEC\_GET}
\end{quote}

\textbf{Public Members}

\texttt{const\ struct device *dev}
\begin{quote}
Pointer to the device structure for the ADC driver instance used by this io-channel.
\end{quote}

\texttt{uint8\_t\ channel\_id}
\begin{quote}
ADC channel identifier used by this io-channel.
\end{quote}

\texttt{bool\ channel\_cfg\_dt\_node\_exists}
\begin{quote}
Flag indicating whether configuration of the associated ADC channel is provided as a child node of the corresponding ADC controller in devicetree.
\end{quote}
struct adc_channel_cfg channel_cfg

Configuration of the associated ADC channel specified in devicetree. This field is valid only when channel_cfg_dt_node_exists is set to true.

uint16_t vref_mv

Voltage of the reference selected for the channel or 0 if this value is not provided in devicetree. This field is valid only when channel_cfg_dt_node_exists is set to true.

uint8_t resolution

ADC resolution to be used for that channel. This field is valid only when channel_cfg_dt_node_exists is set to true.

uint8_t oversampling

Oversampling setting to be used for that channel. This field is valid only when channel_cfg_dt_node_exists is set to true.

struct adc_sequence_options

#include <adc.h> Structure defining additional options for an ADC sampling sequence.

Public Members

uint32_t interval_us

Interval between consecutive samplings (in microseconds), 0 means sample as fast as possible, without involving any timer. The accuracy of this interval is dependent on the implementation of a given driver. The default routine that handles the intervals uses a kernel timer for this purpose, thus, it has the accuracy of the kernel's system clock. Particular drivers may use some dedicated hardware timers and achieve a better precision.

adc_sequence_callback callback

Callback function to be called after each sampling is done. Optional - set to NULL if it is not needed.

void *user_data

Pointer to user data. It can be used to associate the sequence with any other data that is needed in the callback function.

uint16_t extra_samplings

Number of extra samplings to perform (the total number of samplings is 1 + extra_samplings).

struct adc_sequence

#include <adc.h> Structure defining an ADC sampling sequence.

Public Members

const struct adc_sequence_options *options

Pointer to a structure defining additional options for the sequence. If NULL, the sequence consists of a single sampling.
uint32_t channels

Bit-mask indicating the channels to be included in each sampling of this sequence. All selected channels must be configured with `adc_channel_setup()` before they are used in a sequence. The least significant bit corresponds to channel 0.

void *buffer

Pointer to a buffer where the samples are to be written. Samples from subsequent samplings are written sequentially in the buffer. The number of samples written for each sampling is determined by the number of channels selected in the “channels” field. The values written to the buffer represent a sample from each selected channel starting from the one with the lowest ID. The buffer must be of an appropriate size, taking into account the number of selected channels and the ADC resolution used, as well as the number of samplings contained in the sequence.

size_t buffer_size

Specifies the actual size of the buffer pointed by the “buffer” field (in bytes). The driver must ensure that samples are not written beyond the limit and it must return an error if the buffer turns out to be not large enough to hold all the requested samples.

uint8_t resolution

ADC resolution. For single-ended channels the sample values are from range: 0 .. \(^2^{\text{resolution} - 1}\), for differential ones:

- \(^2^{\text{resolution} - 1}..2^{\text{resolution} - 1} - 1\).

uint8_t oversampling

Oversampling setting. Each sample is averaged from \(^2^{\text{oversampling}}\) conversion results. This feature may be unsupported by a given ADC hardware, or in a specific mode (e.g. when sampling multiple channels).

bool calibrate

Perform calibration before the reading is taken if requested.

The impact of channel configuration on the calibration process is specific to the underlying hardware. ADC implementations that do not support calibration should ignore this flag.

struct adc_driver_api

#include <adc.h> ADC driver API.

This is the mandatory API any ADC driver needs to expose.

7.3.2 Audio

Audio Codec

Overview The Audio Codec API provides access to digital audio codecs.

Configuration Options Related configuration options:

- `CONFIG_AUDIO_CODEC`
API Reference

**group audio_codec_interface**

Abstraction for audio codecs.

** Enums**

```c
enum audio_pcm_rate_t
  PCM audio sample rates
  Values:

  enumerator AUDIO_PCM_RATE_8K = 8000
  enumerator AUDIO_PCM_RATE_16K = 16000
  enumerator AUDIO_PCM_RATE_24K = 24000
  enumerator AUDIO_PCM_RATE_32K = 32000
  enumerator AUDIO_PCM_RATE_44P1K = 44100
  enumerator AUDIO_PCM_RATE_48K = 48000
  enumerator AUDIO_PCM_RATE_96K = 96000
  enumerator AUDIO_PCM_RATE_192K = 192000

enum audio_pcm_width_t
  PCM audio sample bit widths
  Values:

  enumerator AUDIO_PCM_WIDTH_16_BITS = 16
  enumerator AUDIO_PCM_WIDTH_20_BITS = 20
  enumerator AUDIO_PCM_WIDTH_24_BITS = 24
  enumerator AUDIO_PCM_WIDTH_32_BITS = 32

enum audio_dai_type_t
  Digital Audio Interface (DAI) type
  Values:

  enumerator AUDIO_DAI_TYPE_I2S
  enumerator AUDIO_DAI_TYPE_INVALID
```
enum audio_property_t
    Codec properties that can be set by \texttt{audio_codec_set_property()}
    \textit{Values:}
    \begin{itemize}
        \item enumerator \texttt{AUDIO_PROPERTY_OUTPUT_VOLUME}
        \item enumerator \texttt{AUDIO_PROPERTY_OUTPUT_MUTE}
    \end{itemize}

enum audio_channel_t
    Audio channel identifiers to use in \texttt{audio_codec_set_property()}
    \textit{Values:}
    \begin{itemize}
        \item enumerator \texttt{AUDIO_CHANNEL_FRONT_LEFT}
        \item enumerator \texttt{AUDIO_CHANNEL_FRONT_RIGHT}
        \item enumerator \texttt{AUDIO_CHANNEL_LFE}
        \item enumerator \texttt{AUDIO_CHANNEL_FRONT_CENTER}
        \item enumerator \texttt{AUDIO_CHANNEL_REAR_LEFT}
        \item enumerator \texttt{AUDIO_CHANNEL_REAR_RIGHT}
        \item enumerator \texttt{AUDIO_CHANNEL_REAR_CENTER}
        \item enumerator \texttt{AUDIO_CHANNEL_SIDE_LEFT}
        \item enumerator \texttt{AUDIO_CHANNEL_SIDE_RIGHT}
        \item enumerator \texttt{AUDIO_CHANNEL_ALL}
    \end{itemize}

\textbf{Functions}

\begin{verbatim}
static inline int audio_codec_configure(const struct device *dev, struct audio_codec_cfg *cfg)
Configure the audio codec.
Configure the audio codec device according to the configuration parameters provided as input
\begin{description}
\item[Parameters]
\begin{itemize}
    \item \texttt{dev} – Pointer to the device structure for codec driver instance.
    \item \texttt{cfg} – Pointer to the structure containing the codec configuration.
\end{itemize}
\item[Returns]
\begin{itemize}
    \item 0 on success, negative error code on failure
\end{itemize}
\end{verbatim}

7.3. Peripherals
static inline void
audio_codec_start_output(const struct device *dev)
Set codec to start output audio playback.

Parameters
• dev – Pointer to the device structure for codec driver instance.

static inline void
audio_codec_stop_output(const struct device *dev)
Set codec to stop output audio playback.

Parameters
• dev – Pointer to the device structure for codec driver instance.

static inline int
audio_codec_set_property(const struct device *dev,
audio_property_t property,
audio_channel_t channel,
audio_property_value_t val)
Set a codec property defined by audio_property_t.
Set a property such as volume level, clock configuration etc.

Parameters
• dev – Pointer to the device structure for codec driver instance.
• property – The codec property to set
• channel – The audio channel for which the property has to be set
• val – pointer to a property value of type audio_codec_property_value_t

Returns
0 on success, negative error code on failure

static inline int
audio_codec_apply_properties(const struct device *dev)
Atomically apply any cached properties.
Following one or more invocations of audio_codec_set_property, that may have been cached
by the driver, audio_codec_apply_properties can be invoked to apply all the properties as
atomic as possible

Parameters
• dev – Pointer to the device structure for codec driver instance.

Returns
0 on success, negative error code on failure

enumerator DMIC_STATE_INITIALIZED

enumerator DMIC_STATE_CONFIGURED

enumerator DMIC_STATE_ACTIVE

enumerator DMIC_STATE_PAUSED

enum dmic_trigger
    
DMIC driver trigger commands

Values:

enumerator DMIC_TRIGGER_STOP

enumerator DMIC_TRIGGER_START

7.3. Peripherals
enumerator DMIC_TRIGGER_PAUSE
enumerator DMIC_TRIGGER_RELEASE
enumerator DMIC_TRIGGER_RESET

enum pdm_lr
  PDM Channels LEFT / RIGHT
  Values:
  enumerator PDM_CHAN_LEFT
  enumerator PDM_CHAN_RIGHT

Functions

static inline uint32_t dmic_build_channel_map(uint8_t channel, uint8_t pdm, enum pdm_lr lr)
  Build the channel map to populate struct pdm_chan_cfg
  Returns the map of PDM controller and LEFT/RIGHT channel shifted to the bit position corresponding to the input logical channel value
  Parameters
      • channel – The logical channel number
      • pdm – The PDM hardware controller number
      • lr – LEFT/RIGHT channel within the chosen PDM hardware controller
  Returns
      Bit-map containing the PDM and L/R channel information

static inline void dmic_parse_channel_map(uint32_t channel_map_lo, uint32_t channel_map_hi, uint8_t channel, uint8_t *pdm, enum pdm_lr *lr)
  Helper function to parse the channel map in pdm_chan_cfg
  Returns the PDM controller and LEFT/RIGHT channel corresponding to the channel map and the logical channel provided as input
  Parameters
      • channel_map_lo – Lower order/significant bits of the channel map
      • channel_map_hi – Higher order/significant bits of the channel map
      • channel – The logical channel number
      • pdm – Pointer to the PDM hardware controller number
      • lr – Pointer to the LEFT/RIGHT channel within the PDM controller

static inline uint32_t dmic_build_clk_skew_map(uint8_t pdm, uint8_t skew)
  Build a bit map of clock skew values for each PDM channel
  Returns the bit-map of clock skew value shifted to the bit position corresponding to the input PDM controller value
  Parameters
      • pdm – The PDM hardware controller number
• skew – The skew to apply for the clock output from the PDM controller

Returns
Bit-map containing the clock skew information

static inline int dmic_configure(const struct device *dev, struct dmic_cfg *cfg)
Configure the DMIC driver and controller(s)
Configures the DMIC driver device according to the number of channels, channel mapping,
PDM I/O configuration, PCM stream configuration, etc.

Parameters
• dev – Pointer to the device structure for DMIC driver instance
• cfg – Pointer to the structure containing the DMIC configuration

Returns
0 on success, a negative error code on failure

static inline int dmic_trigger(const struct device *dev, enum dmic_trigger cmd)
Send a command to the DMIC driver
Sends a command to the driver to perform a specific action

Parameters
• dev – Pointer to the device structure for DMIC driver instance
• cmd – The command to be sent to the driver instance

Returns
0 on success, a negative error code on failure

static inline int dmic_read(const struct device *dev, uint8_t stream, void **buffer, size_t *size, int32_t timeout)
Read received decimated PCM data stream
Optionally waits for audio to be received and provides the received audio buffer from the requested stream

Parameters
• dev – Pointer to the device structure for DMIC driver instance
• stream – Stream identifier
• buffer – Pointer to the received buffer address
• size – Pointer to the received buffer size
• timeout – Timeout in milliseconds to wait in case audio is not yet received, or SYS_FOREVER_MS

Returns
0 on success, a negative error code on failure

struct pdm_io_cfg
#include <dmic.h> PDM Input/Output signal configuration

struct pcm_stream_cfg
#include <dmic.h> Configuration of the PCM streams to be output by the PDM hardware

I2S

Overview  The I2S (Inter-IC Sound) API provides support for the standard I2S interface as well as common non-standard extensions such as PCM Short/Long Frame Sync and Left/Right Justified Data Formats.

Configuration Options  Related configuration options:

- CONFIG_I2S

API Reference

group i2s_interface

I2S (Inter-IC Sound) Interface.

The I2S API provides support for the standard I2S interface standard as well as common non-standard extensions such as PCM Short/Long Frame Sync, Left/Right Justified Data Format.

Defines

I2S_FMT_DATA_FORMAT_SHIFT
Data Format bit field position.

I2S_FMT_DATA_FORMAT_MASK
Data Format bit field mask.

I2S_FMT_DATA_FORMAT_I2S
Standard I2S Data Format.
Serial data is transmitted in two’s complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The MSB is always sent one clock period after the WS changes. Left channel data are sent first indicated by WS = 0, followed by right channel data indicated by WS = 1.

I2S_FMT_DATA_FORMAT_PCM_SHORT
PCM Short Frame Sync Data Format.
Serial data is transmitted in two’s complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the falling edge of the clock signal (SCK). The falling edge of the frame sync signal (WS) indicates the start of the PCM word. The frame sync is one clock cycle long. An arbitrary number of data words can be sent in one frame.
I2S_FMT_DATA_FORMAT_PCM_LONG

PCM Long Frame Sync Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the falling edge of the clock signal (SCK). The rising edge of the frame sync signal (WS) indicates the start of the PCM word. The frame sync has an arbitrary length, however it has to fall before the start of the next frame. An arbitrary number of data words can be sent in one frame.

I2S_FMT_DATA_FORMAT_LEFT_JUSTIFIED

Left Justified Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The bits within the data word are left justified such that the MSB is always sent in the clock period following the WS transition. Left channel data are sent first indicated by WS = 1, followed by right channel data indicated by WS = 0.

I2S_FMT_DATA_FORMAT_RIGHT_JUSTIFIED

Right Justified Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The bits within the data word are right justified such that the LSB is always sent in the clock period preceding the WS transition. Left channel data are sent first indicated by WS = 1, followed by right channel data indicated by WS = 0.
I2S_FMT_DATA_ORDER_MSB
Send MSB first

I2S_FMT_DATA_ORDER_LSB
Send LSB first

I2S_FMT_DATA_ORDER_INV
Invert bit ordering, send LSB first

I2S_FMT_CLK_FORMAT_SHIFT
Data Format bit field position.

I2S_FMT_CLK_FORMAT_MASK
Data Format bit field mask.

I2S_FMT_BIT_CLK_INV
Invert bit clock

I2S_FMT_FRAME_CLK_INV
Invert frame clock

I2S_FMT_CLK_NF_NB
NF represents "Normal Frame" whereas IF represents "Inverted Frame" NB represents "Normal Bit Clk" whereas IB represents "Inverted Bit clk"

I2S_FMT_CLK_NF_IB

I2S_FMT_CLK_IF_NB

I2S_FMT_CLK_IF_IB

I2S_OPT_BIT_CLK_CONT
Run bit clock continuously

I2S_OPT_BIT_CLK_GATED
Run bit clock when sending data only

I2S_OPT_BIT_CLK_MASTER
I2S driver is bit clock master

I2S_OPT_BIT_CLK_SLAVE
I2S driver is bit clock slave
I2S_OPT_FRAME_CLK_MASTER
I2S driver is frame clock master

I2S_OPT_FRAME_CLK_SLAVE
I2S driver is frame clock slave

I2S_OPT_LOOPBACK
Loop back mode.
In loop back mode RX input will be connected internally to TX output. This is used primarily for testing.

I2S_OPT_PINGPONG
Ping pong mode.
In ping pong mode TX output will keep alternating between a ping buffer and a pong buffer. This is normally used in audio streams when one buffer is being populated while the other is being played (DMAed) and vice versa. So, in this mode, 2 sets of buffers fixed in size are used. Static Arrays are used to achieve this and hence they are never freed.

**Typedefs**

typedef uint8_t i2s_fmt_t

typedef uint8_t i2s_opt_t

** Enums**

enum i2s_dir
I2C Direction.

*Values:*

enumerator I2S_DIR_RX
Receive data

enumerator I2S_DIR_TX
Transmit data

enumerator I2S_DIR_BOTH
Both receive and transmit data

enum i2s_state
Interface state

*Values:*

enumerator I2S_STATE_NOT_READY
The interface is not ready.
The interface was initialized but is not yet ready to receive / transmit data. Call i2s_configure() to configure interface and change its state to READY.

enumerator I2S_STATE_READY
The interface is ready to receive / transmit data.

enumerator I2S_STATE_RUNNING
The interface is receiving / transmitting data.

enumerator I2S_STATE_STOPPING
The interface is draining its transmit queue.

enumerator I2S_STATE_ERROR
TX buffer underrun or RX buffer overrun has occurred.

enum i2s_trigger_cmd
Trigger command
Values:

enumerator I2S_TRIGGER_START
Start the transmission / reception of data.

If I2S_DIR_TX is set some data has to be queued for transmission by the i2s_write() function. This trigger can be used in READY state only and changes the interface state to RUNNING.

enumerator I2S_TRIGGER_STOP
Stop the transmission / reception of data.

Stop the transmission / reception of data at the end of the current memory block. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When the current TX / RX block is transmitted / received the state is changed to READY. Subsequent START trigger will resume transmission / reception where it stopped.

enumerator I2S_TRIGGER_DRAIN
Empty the transmit queue.

Send all data in the transmit queue and stop the transmission. If the trigger is applied to the RX queue it has the same effect as I2S_TRIGGER_STOP. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When all TX blocks are transmitted the state is changed to READY.
enumerator I2S_TRIGGER_DROP
Discard the transmit / receive queue.

| Stop the transmission / reception immediately and discard the contents of the respective queue. This trigger can be used in any state other than NOT_READY and changes the interface state to READY. |

enumerator I2S_TRIGGER_PREPARE
Prepare the queues after underrun/overrun error has occurred.

| This trigger can be used in ERROR state only and changes the interface state to READY. |

## Functions

```c
int i2s_configure(const struct device *dev, enum i2s_dir dir, const struct i2s_config *cfg)
```

Configure operation of a host I2S controller.

- The `dir` parameter specifies if Transmit (TX) or Receive (RX) direction will be configured by data provided via `cfg` parameter.
- The function can be called in NOT READY or READY state only. If executed successfully the function will change the interface state to READY.
- If the function is called with the parameter `cfg->frame_clk_freq` set to 0 the interface state will be changed to NOT READY.

### Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX, TX, or both, as defined by I2S_DIR_*.
  - The I2S_DIR_BOTH value may not be supported by some drivers. For those, the RX and TX streams need to be configured separately.
- `cfg` – Pointer to the structure containing configuration parameters.

### Return values
- 0 – If successful.
- -EINVAL – Invalid argument.
- -ENOSYS – I2S_DIR_BOTH value is not supported.

```c
static inline const struct i2s_config *i2s_config_get(const struct device *dev, enum i2s_dir dir)
```

Fetch configuration information of a host I2S controller.

### Parameters
- `dev` – Pointer to the device structure for the driver instance
- `dir` – Stream direction: RX or TX as defined by I2S_DIR_*

### Return values
- Pointer – to the structure containing configuration parameters, or NULL if unconfigured

### Functions

7.3. Peripherals
static inline int i2s_read(const struct device *dev, void **mem_block, size_t *size)

Read data from the RX queue.

Data received by the I2S interface is stored in the RX queue consisting of memory blocks preallocated by this function from rx_mem_slab (as defined by i2s_configure). Ownership of the RX memory block is passed on to the user application which has to release it.

The data is read in chunks equal to the size of the memory block. If the interface is in READY state the number of bytes read can be smaller.

If there is no data in the RX queue the function will block waiting for the next RX memory block to fill in. This operation can timeout as defined by i2s_configure. If the timeout value is set to K_NO_WAIT the function is non-blocking.

Reading from the RX queue is possible in any state other than NOT_READY. If the interface is in the ERROR state it is still possible to read all the valid data stored in RX queue. Afterwards the function will return -EIO error.

**Parameters**

- dev – Pointer to the device structure for the driver instance.
- mem_block – Pointer to the RX memory block containing received data.
- size – Pointer to the variable storing the number of bytes read.

**Return values**

- 0 – If successful.
- -EIO – The interface is in NOT_READY or ERROR state and there are no more data blocks in the RX queue.
- -EBUSY – Returned without waiting.
- -EAGAIN – Waiting period timed out.

int i2s_buf_read(const struct device *dev, void *buf, size_t *size)

Read data from the RX queue into a provided buffer.

Data received by the I2S interface is stored in the RX queue consisting of memory blocks preallocated by this function from rx_mem_slab (as defined by i2s_configure). Calling this function removes one block from the queue which is copied into the provided buffer and then freed.

The provided buffer must be large enough to contain a full memory block of data, which is parameterized for the channel via i2s_configure().

This function is otherwise equivalent to i2s_read().

**Parameters**

- dev – Pointer to the device structure for the driver instance.
- buf – Destination buffer for read data, which must be at least the as large as the configured memory block size for the RX channel.
- size – Pointer to the variable storing the number of bytes read.

**Return values**

- 0 – If successful.
- -EIO – The interface is in NOT_READY or ERROR state and there are no more data blocks in the RX queue.
- -EBUSY – Returned without waiting.
- -EAGAIN – Waiting period timed out.
static inline int i2s_write(const struct device *dev, void *mem_block, size_t size)
    Write data to the TX queue.

Data to be sent by the I2S interface is stored first in the TX queue. TX queue consists of
memory blocks preallocated by the user from tx_mem_slab (as defined by i2s_configure).
This function takes ownership of the memory block and will release it when all data are
transmitted.

If there are no free slots in the TX queue the function will block waiting for the next TX
memory block to be send and removed from the queue. This operation can timeout as defined
by i2s_configure. If the timeout value is set to K_NO_WAIT the function is non-blocking.

Writing to the TX queue is only possible if the interface is in READY or RUNNING state.

Parameters

• dev – Pointer to the device structure for the driver instance.
• mem_block – Pointer to the TX memory block containing data to be sent.
• size – Number of bytes to write. This value has to be equal or smaller than the
  size of the memory block.

Return values

• 0 – If successful.
• -EIO – The interface is not in READY or RUNNING state.
• -EBUSY – Returned without waiting.
• -EAGAIN – Waiting period timed out.

int i2s_buf_write(const struct device *dev, void *buf, size_t size)
    Write data to the TX queue from a provided buffer.

This function acquires a memory block from the I2S channel TX queue and copies the provided
data buffer into it. It is otherwise equivalent to i2s_write().

Parameters

• dev – Pointer to the device structure for the driver instance.
• buf – Pointer to a buffer containing the data to transmit.
• size – Number of bytes to write. This value has to be equal or smaller than the
  size of the channel's TX memory block configuration.

Return values

• 0 – If successful.
• -EIO – The interface is not in READY or RUNNING state.
• -EBUSY – Returned without waiting.
• -EAGAIN – Waiting period timed out.
• -ENOMEM – No memory in TX slab queue.
• -EINVAL – Size parameter larger than TX queue memory block.

int i2s_trigger(const struct device *dev, enum i2s_dir dir, enum i2s_trigger_cmd cmd)
    Send a trigger command.

Parameters

• dev – Pointer to the device structure for the driver instance.
• dir – Stream direction: RX, TX, or both, as defined by I2S_DIR_. The
  I2S_DIR_BOTH value may not be supported by some drivers. For those, trig-
  gering need to be done separately for the RX and TX streams.
• **cmd** – Trigger command.

**Return values**

• **0** – If successful.
• **EINVAL** – Invalid argument.
• **EIO** – The trigger cannot be executed in the current state or a DMA channel cannot be allocated.
• **ENOMEM** – RX/TX memory block not available.
• **ENOSYS** – I2S_DIR_BOTH value is not supported.

```c
struct i2s_config
    #include <i2s.h> Interface configuration options.

Memory slab pointed to by the mem_slab field has to be defined and initialized by the user.
For I2S driver to function correctly number of memory blocks in a slab has to be at least 2
per queue. Size of the memory block should be multiple of frame_size where frame_size =
(channels * word_size_bytes). As an example 16 bit word will occupy 2 bytes, 24 or 32 bit
word will occupy 4 bytes.

Please check Zephyr Kernel Primer for more information on memory slabs.
```

**Remark**

When I2S data format is selected parameter channels is ignored, number of words in a frame
is always 2.

**Param word_size**

Number of bits representing one data word.

**Param channels**

Number of words per frame.

**Param format**

Data stream format as defined by I2S_FMT_* constants.

**Param options**

Configuration options as defined by I2S_OPT_* constants.

**Param frame_clk_freq**

Frame clock (WS) frequency, this is sampling rate.

**Param mem_slab**

memory slab to store RX/TX data.

**Param block_size**

Size of one RX/TX memory block (buffer) in bytes.

**Param timeout**

Read/Write timeout. Number of milliseconds to wait in case TX queue is full or
RX queue is empty, or 0, or SYS_FOREVER_MS.

**DAI**

**Overview**

The DAI (Digital Audio Interface) is a generic high level API for audio drivers. It can be
configured with bespoke data for vendor specific configuration.
Configuration Options
Related configuration options:

- `CONFIG_DAI`

API Reference

group dai_interface

DAI Interface.
The DAI API provides support for the standard I2S (SSP) and its common variants. It supports also DMIC, HDA and SDW backends. The API has a config function with bespoke data argument for device/vendor specific config. There are also optional timestamping functions to get device specific audio clock time.

Enums

define enum dai_type
types of DAI.
The type of the DAI. This ID type is used to configure bespoke DAI HW settings.
DAIs have a lot of physical link feature variability and therefore need different configuration data to cater for different use cases. We usually need to pass extra bespoke configuration prior to DAI start.

Values:

enumerator DAI_LEGACY_I2S = 0

denum dai_dir
    Dai Direction.
    Values:

    enumerator DAI_DIR_RX = 1
        Receive data

    enumerator DAI_DIR_TX
        Transmit data

    enumerator DAI_DIR_BOTH
        Both receive and transmit data

denum dai_state
    Interface state
    Values:

    enumerator DAI_STATE_NOT_READY = 0
        The interface is not ready.

    The interface was initialized but is not yet ready to receive / transmit data. Call dai_config_set() to configure interface and change its state to READY.

    enumerator DAI_STATE_READY
        The interface is ready to receive / transmit data.

    enumerator DAI_STATE_RUNNING
        The interface is receiving / transmitting data.
enumerator DAI_STATE_PRE_RUNNING
   The interface is clocking but not receiving / transmitting data.

enumerator DAI_STATE_PAUSED
   The interface paused

enumerator DAI_STATE_STOPPING
   The interface is draining its transmit queue.

enumerator DAI_STATE_ERROR
   TX buffer underrun or RX buffer overrun has occurred.

enum dai_trigger_cmd
   Trigger command
   Values:

   enumerator DAI_TRIGGER_START = 0
      Start the transmission / reception of data.

   enumerator DAI_TRIGGER_PRE_START
      Optional - Pre Start the transmission / reception of data.

   enumerator DAI_TRIGGER_STOP
      Stop the transmission / reception of data.

   enumerator DAI_TRIGGER_PAUSE
      Pause the transmission / reception of data.

   If DAI_DIR_TX is set some data has to be queued for transmission by
   the dai_write() function. This trigger can be used in READY state
   only and changes the interface state to RUNNING.

   enumerator DAI_TRIGGER_PRE_START
      Optional - Pre Start the transmission / reception of data.

   Allows the DAI and downstream codecs to prepare for audio Tx/Rx by
   starting any required clocks for downstream PLL/FLL locking.

   enumerator DAI_TRIGGER_STOP
      Stop the transmission / reception of data.

   Stop the transmission / reception of data at the end of the current
   memory block. This trigger can be used in RUNNING state only and at
   first changes the interface state to STOPPING. When the current TX /
   RX block is transmitted / received the state is changed to READY.
   Subsequent START trigger will resume transmission / reception where
   it stopped.

   enumerator DAI_TRIGGER_PAUSE
      Pause the transmission / reception of data.

   Pause the transmission / reception of data at the end of the current
   memory block. Behavior is implementation specific but usually this
   state doesn't completely stop the clocks or transmission. The dai
   (continues on next page)
could be transmitting 0's (silence), but it is not consuming data from outside.

enumerator DAI_TRIGGER_POST_STOP
Optional - Post Stop the transmission / reception of data.

Allows the DAI and downstream codecs to shutdown cleanly after audio Tx/Rx by stopping any required clocks for downstream audio completion.

enumerator DAI_TRIGGER_DRAIN
Empty the transmit queue.

Send all data in the transmit queue and stop the transmission. If the trigger is applied to the RX queue it has the same effect as DAI_TRIGGER_STOP. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When all TX blocks are transmitted the state is changed to READY.

enumerator DAI_TRIGGER_DROP
Discard the transmit / receive queue.

Stop the transmission / reception immediately and discard the contents of the respective queue. This trigger can be used in any state other than NOT_READY and changes the interface state to READY.

enumerator DAI_TRIGGER_PREPARE
Prepare the queues after underrun/overrun error has occurred.

This trigger can be used in ERROR state only and changes the interface state to READY.

enumerator DAI_TRIGGER_RESET
Reset.

This trigger frees resources and moves the driver back to initial state.

enumerator DAI_TRIGGER_COPY
Copy.

This trigger prepares for data copying.
Functions

static inline int dai_probe(const struct device *dev)

Probes a DAI driver.

The function will be called to power up the device and update for example possible reference count of the users. It can be used also to initialize internal variables and memory allocation.

Parameters

• dev – Pointer to the device structure for the driver instance.

Return values

0 – If successful.

static inline int dai_remove(const struct device *dev)

Removes a DAI driver.

The function will be called to unregister/unbind the device, for example to power down the device or decrease the usage reference count.

Parameters

• dev – Pointer to the device structure for the driver instance.

Return values

0 – If successful.

static inline int dai_config_set(const struct device *dev, const struct dai_config *cfg, const void *bespoke_cfg)

Configures a DAI driver.

The dir parameter specifies if Transmit (TX) or Receive (RX) direction will be configured by data provided via cfg parameter.

The function can be called in NOT_READY or READY state only. If executed successfully the function will change the interface state to READY.

If the function is called with the parameter cfg->frame_clk_freq set to 0 the interface state will be changed to NOT_READY.

Parameters

• dev – Pointer to the device structure for the driver instance.

• cfg – Pointer to the structure containing configuration parameters.

• bespoke_cfg – Pointer to the structure containing bespoke config.

Return values

• 0 – If successful.

• -EINVAL – Invalid argument.

• -ENOSYS – DAI_DIR_BOTH value is not supported.

static inline const struct dai_config *dai_config_get(const struct device *dev, enum dai_dir dir)

Fetches configuration information of a DAI driver.

Parameters

• dev – Pointer to the device structure for the driver instance.

• dir – Stream direction: RX or TX as defined by DAI_DIR_*

Return values

Pointer – to the structure containing configuration parameters, or NULL if un-configured.
static inline const struct dai_properties *dai_get_properties(const struct device *dev, enum dai_dir dir, int stream_id)

Fetch properties of a DAI driver.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX or TX as defined by DAI_DIR_*.
- `stream_id` – Stream id: some drivers may have stream specific properties, this id specifies the stream.

**Return values**

- Pointer to the structure containing properties, or NULL if error or no properties.

static inline int dai_trigger(const struct device *dev, enum dai_dir dir, enum dai_trigger_cmd cmd)

Send a trigger command.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX, TX, or both, as defined by DAI_DIR_*.
  The DAI_DIR_BOTH value may not be supported by some drivers. For those, triggering need to be done separately for the RX and TX streams.
- `cmd` – Trigger command.

**Return values**

- 0 – If successful.
- EINVAL – Invalid argument.
- EIO – The trigger cannot be executed in the current state or a DMA channel cannot be allocated.
- ENOMEM – RX/TX memory block not available.
- ENOSYS – DAI_DIR_BOTH value is not supported.

static inline int dai_ts_config(const struct device *dev, struct dai_ts_cfg *cfg)

Configures timestamping in attached DAI.

Optional method.

**Parameters**

- `dev` – Component device.
- `cfg` – Timestamp config.

**Return values**

- 0 – If successful.

static inline int dai_ts_start(const struct device *dev, struct dai_ts_cfg *cfg)

Starts timestamping.

Optional method.

**Parameters**

- `dev` – Component device.
- `cfg` – Timestamp config.
Return values
0 – If successful.

static inline int dai_ts_stop(const struct device *dev, struct dai_ts_cfg *cfg)

Stops timestamping.
Optional method.

Parameters
• dev – Component device.
• cfg – Timestamp config.

Return values
0 – If successful.

static inline int dai_ts_get(const struct device *dev, struct dai_ts_cfg *cfg, struct dai_ts_data *tsd)

Gets timestamp.
Optional method.

Parameters
• dev – Component device.
• cfg – Timestamp config.
• tsd – Receives timestamp data.

Return values
0 – If successful.

struct dai_properties
#include <dai.h> Properties of DAI.

This struct is used with APIs get_properties function to query DAI properties like fifo address and dma handshake. These are needed for example to setup dma outside the driver code.

 Param fifo_address
Fifo hw address for e.g. when connecting to dma.

 Param fifo_depth
Fifo depth.

 Param dma_hs_id
Dma handshake id.

 Param reg_init_delay
Delay for initializing registers.

 Param stream_id
Stream ID.

struct dai_config
#include <dai.h> Generic Dai interface configuration options.

Main dai config struct

 Param dai_type
Type of the dai.

 Param dai_index
Index of the dai.
Param channels
   Number of audio channels, words in frame.

Param rate
   Frame clock (WS) frequency, sampling rate.

Param format
   Dai specific data stream format.

Param options
   Dai specific configuration options.

Param word_size
   Number of bits representing one data word.

Param block_size
   Size of one RX/TX memory block (buffer) in bytes.

struct dai_ts_cfg
   #include <dai.h>

struct dai_ts_data
   #include <dai.h>

7.3.3 Controller Area Network (CAN)

CAN Controller

- Overview
- Sending
- Receiving
- Setting the bitrate
- SocketCAN
- Samples
- CAN Controller API Reference
- CAN Transceiver API Reference

Overview  Controller Area Network is a two-wire serial bus specified by the Bosch CAN Specification, Bosch CAN with Flexible Data-Rate specification and the ISO 11898-1:2003 standard. CAN is mostly known for its application in the automotive domain. However, it is also used in home and industrial automation and other products.

A CAN transceiver is an external device that converts the logic level signals from the CAN controller to the bus-levels. The bus lines are called CAN High (CAN H) and CAN Low (CAN L). The transmit wire from the controller to the transceiver is called CAN TX, and the receive wire is called CAN RX. These wires use the logic levels whereas the bus-level is interpreted differentially between CAN H and CAN L. The bus can be either in the recessive (logical one) or dominant (logical zero) state. The recessive state is when both lines, CAN H and CAN L, at roughly at the same voltage level. This state is also the idle state. To write a dominant bit to the bus, open-drain transistors tie CAN H to Vdd and CAN L to ground. The first and last node use a 120-ohm resistor between CAN H and CAN L to terminate the bus. The dominant state always overrides the recessive state. This structure is called a wired-AND.
**Warning:** CAN controllers can only initialize when the bus is in the idle (recessive) state for at least 11 recessive bits. Therefore you have to make sure that CAN RX is high, at least for a short time. This is also necessary for loopback mode.

![CAN Node Diagram](image)

The bit-timing as defined in ISO 11898-1:2003 looks as following:

![CAN Timing Diagram](image)

A single bit is split into four segments.

- **Sync_Seg:** The nodes synchronize at the edge of the Sync_Seg. It is always one time quantum in length.
- **Prop_Seg:** The signal propagation delay of the bus and other delays of the transceiver and node.
- **Phase_Seg1 and Phase_Seg2:** Define the sampling point. The bit is sampled at the end of Phase_Seg1.

The bit-rate is calculated from the time of a time quantum and the values defined above. A bit has the length of Sync_Seg plus Prop_Seg plus Phase_Seg1 plus Phase_Seg2 multiplied by the time of single time quantum. The bit-rate is the inverse of the length of a single bit.

A bit is sampled at the sampling point. The sample point is between Phase_Seg1 and Phase_Seg2 and therefore is a parameter that the user needs to choose. The CiA recommends setting the sample point to 87.5% of the bit.

The resynchronization jump width (SJW) defines the amount of time quantum the sample point can be moved. The sample point is moved when resynchronization is needed.

The timing parameters (SJW, bitrate, and sampling point, or bitrate, Prop_Seg, Phase_Seg1, and Phase_Seg2) are initially set from the device-tree and can be changed at run-time from the timing-API.

CAN uses so-called identifiers to identify the frame instead of addresses to identify a node. This identifier can either have 11-bit width (Standard or Basic Frame) or 29-bit in case of an Extended Frame. The Zephyr CAN API supports both Standard and Extended identifiers concurrently. A CAN frame starts with a dominant Start Of Frame bit. After that, the identifiers follow. This phase is called the arbitration phase. During the arbitration phase, write collisions are allowed. They resolve by the fact that dominant bits override recessive bits. Nodes monitor the bus and notice when their transmission is being overridden and in case, abort their transmission. This effectively gives lower number identifiers priority over higher number identifiers.
Filters are used to whitelist identifiers that are of interest for the specific node. An identifier that doesn’t match any filter is ignored. Filters can either match exactly or a specified part of the identifier. This method is called masking. As an example, a mask with 11 bits set for standard or 29 bits set for extended identifiers must match perfectly. Bits that are set to zero in the mask are ignored when matching an identifier. Most CAN controllers implement a limited number of filters in hardware. The number of filters is also limited in Kconfig to save memory.

Errors may occur during transmission. In case a node detects an erroneous frame, it partially overrides the current frame with an error-frame. Error-frames can either be error passive or error active, depending on the state of the controller. In case the controller is in error active state, it sends six consecutive dominant bits, which is a violation of the stuffing rule that all nodes can detect. The sender may resend the frame right after.

An initialized node can be in one of the following states:

- Error-active
- Error-passive
- Bus-off

After initialization, the node is in the error-active state. In this state, the node is allowed to send active error frames, ACK, and overload frames. Every node has a receive- and transmit-error counter. If either the receive- or the transmit-error counter exceeds 127, the node changes to error-passive state. In this state, the node is not allowed to send error-active frames anymore. If the transmit-error counter increases further to 255, the node changes to the bus-off state. In this state, the node is not allowed to send any dominant bits to the bus. Nodes in the bus-off state may recover after receiving 128 occurrences of 11 concurrent recessive bits.

You can read more about CAN bus in this CAN Wikipedia article.

Zephyr supports following CAN features:

- Standard and Extended Identifiers
- Filters with Masking
- Loopback and Silent mode
- Remote Request

Sending  The following code snippets show how to send data.

This basic sample sends a CAN frame with standard identifier 0x123 and eight bytes of data. When passing NULL as the callback, as shown in this example, the send function blocks until the frame is sent and acknowledged by at least one other node or an error occurred. The timeout only takes effect on acquiring a mailbox. When a transmitting mailbox is assigned, sending cannot be canceled.

```c
struct can_frame frame = {
    .flags = 0,
    .id = 0x123,
    .dlc = 8,
    .data = {1,2,3,4,5,6,7,8}
};
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
int ret;

ret = can_send(can_dev, &frame, K_MSEC(100), NULL, NULL);
if (ret != 0) {
    LOG_ERR("Sending failed [%d]", ret);
}
```

This example shows how to send a frame with extended identifier 0x1234567 and two bytes of data. The provided callback is called when the message is sent, or an error occurred. Passing `K_FOREVER` to
the timeout causes the function to block until a transfer mailbox is assigned to the frame or an error occurred. It does not block until the message is sent like the example above.

```c
void tx_callback(const struct device *dev, int error, void *user_data)
{
    char *sender = (char *)user_data;
    if (error != 0) {
        LOG_ERR("Sending failed [%d]\nSender: %s\n", error, sender);
    }
}

int send_function(const struct device *can_dev)
{
    struct can_frame frame = {
        .flags = CAN_FRAME_IDE,
        .id = 0x1234567,
        .dlc = 2
    };
    frame.data[0] = 1;
    frame.data[1] = 2;
    return can_send(can_dev, &frame, K_FOREVER, tx_irq_callback, "Sender 1");
}
```

### Receiving
Frames are only received when they match a filter. The following code snippets show how to receive frames by adding filters.

Here we have an example for a receiving callback as used for `can_add_rx_filter()`. The user data argument is passed when the filter is added.

```c
void rx_callback_function(const struct device *dev, struct can_frame *frame, void *user_data)
{
    ... do something with the frame ...
}
```

The following snippet shows how to add a filter with a callback function. It is the most efficient but also the most critical way to receive messages. The callback function is called from an interrupt context, which means that the callback function should be as short as possible and must not block. Adding callback functions is not allowed from userspace context.

The filter for this example is configured to match the identifier 0x123 exactly.

```c
const struct can_filter my_filter = {
    .flags = CAN_FILTER_DATA,
    .id = 0x123,
    .id_mask = CAN_STD_ID_MASK
};
int filter_id;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
filter_id = can_add_rx_filter(can_dev, rx_callback_function, callback_arg, &my_filter);
if (filter_id < 0) {
    LOG_ERR("Unable to add rx filter [%d]", filter_id);
}
```
Here an example for `can_add_rx_filter_msgq()` is shown. With this function, it is possible to receive frames synchronously. This function can be called from userspace context. The size of the message queue should be as big as the expected backlog.

The filter for this example is configured to match the extended identifier 0x1234567 exactly.

```c
const struct can_filter my_filter = {
    .flags = CAN_FILTER_DATA | CAN_FILTER_IDE,
    .id = 0x1234567,
    .id_mask = CAN_EXT_ID_MASK
};

filter_id = can_add_rx_filter_msgq(can_dev, &my_can_msgq, &my_filter);
if (filter_id < 0) {
    LOG_ERR("Unable to add rx msgq \[%d\]", filter_id);
    return;
}
```

```c
while (true) {
    k_msgq_get(&my_can_msgq, &rx_frame, K_FOREVER);
    ... do something with the frame ...
}
```

`can_remove_rx_filter()` removes the given filter.

```c
can_remove_rx_filter(can_dev, filter_id);
```

### Setting the bitrate

The bitrate and sampling point is initially set at runtime. To change it from the application, one can use the `can_set_timing()` API. The `can_calc_timing()` function can calculate timing from a bitrate and sampling point in permille. The following example sets the bitrate to 250k baud with the sampling point at 87.5%.

```c
struct can_timing timing;

ret = can_calc_timing(can_dev, &timing, 250000, 875);
```

```c
if (ret > 0) {
    LOG_INF("Sample-Point error: %d", ret);
}
```

```c
if (ret < 0) {
    LOG_ERR("Failed to calc a valid timing");
    return;
}
```

```c
ret = can_stop(can_dev);
if (ret != 0) {
    LOG_ERR("Failed to stop CAN controller");
}
```

```c
ret = can_set_timing(can_dev, &timing);
if (ret != 0) {
    LOG_ERR("Failed to set timing");
}
```

(continues on next page)
A similar API exists for calculating and setting the timing for the data phase for CAN-FD capable controllers. See `can_set_timing_data()` and `can_calc_timing_data()`.

**SocketCAN**  Zephyr additionally supports SocketCAN, a BSD socket implementation of the Zephyr CAN API. SocketCAN brings the convenience of the well-known BSD Socket API to Controller Area Networks. It is compatible with the Linux SocketCAN implementation, where many other high-level CAN projects build on top. Note that frames are routed to the network stack instead of passed directly, which adds some computation and memory overhead.

**Samples**  We have two ready-to-build samples demonstrating use of the Zephyr CAN API: Zephyr CAN counter sample and SocketCAN sample.

**CAN Controller API Reference**

**group can_interface**

CAN Interface.

**CAN controller configuration**

```c
int can_get_core_clock(const struct device *dev, uint32_t *rate)
{
    Get the CAN core clock rate.
    Returns the CAN core clock rate. One time quantum is 1/(core clock rate).

    Parameters:
    • dev – Pointer to the device structure for the driver instance.
    • rate – [out] CAN core clock rate in Hz.

    Returns:
    0 on success, or a negative error code on error.
}
```

```c
int can_get_max_bitrate(const struct device *dev, uint32_t *max_bitrate)
{
    Get maximum supported bitrate.
    Get the maximum supported bitrate for the CAN controller/transceiver combination.

    Parameters:
    • dev – Pointer to the device structure for the driver instance.
    • max_bitrate – [out] Maximum supported bitrate in bits/s

    Return values:
    • -EIO – General input/output error.
    • -ENOSYS – If this function is not implemented by the driver.
```
const struct can_timing *can_get_timing_min(const struct device *dev)
Get the minimum supported timing parameter values.

Parameters
- dev – Pointer to the device structure for the driver instance.

Returns
Pointer to the minimum supported timing parameter values.

const struct can_timing *can_get_timing_max(const struct device *dev)
Get the maximum supported timing parameter values.

Parameters
- dev – Pointer to the device structure for the driver instance.

Returns
Pointer to the maximum supported timing parameter values.

int can_calc_timing(const struct device *dev, struct can_timing *res, uint32_t bitrate, uint16_t sample_pnt)
Calculate timing parameters from bitrate and sample point.
Calculate the timing parameters from a given bitrate in bits/s and the sampling point in permill (1/1000) of the entire bit time. The bitrate must always match perfectly. If no result can be reached for the given parameters, -EINVAL is returned.

Note: The requested sample_pnt will not always be matched perfectly. The algorithm calculates the best possible match.

Parameters
- dev – Pointer to the device structure for the driver instance.
- res – [out] Result is written into the can_timing struct provided.
- bitrate – Target bitrate in bits/s.
- sample_pnt – Sampling point in permill of the entire bit time.

Return values
- 0 – or positive sample point error on success.
- -EINVAL – if the requested bitrate or sample point is out of range.
- -ENOTSUP – if the requested bitrate is not supported.
- -EIO – if can_get_core_clock() is not available.

const struct can_timing *can_get_timing_data_min(const struct device *dev)
Get the minimum supported timing parameter values for the data phase.
Same as can_get_timing_min() but for the minimum values for the data phase.

Note: CONFIG_CAN_FD_MODE must be selected for this function to be available.

Parameters
- dev – Pointer to the device structure for the driver instance.

Returns
Pointer to the minimum supported timing parameter values, or NULL if CAN-FD support is not implemented by the driver.
const struct can_timing *can_get_timing_data_max(const struct device *dev)
Get the maximum supported timing parameter values for the data phase.
Same as can_get_timing_max() but for the maximum values for the data phase.

**Note:** CONFIG_CAN_FD_MODE must be selected for this function to be available.

**Parameters**
- dev – Pointer to the device structure for the driver instance.

**Returns**
Pointer to the maximum supported timing parameter values, or NULL if CAN-FD support is not implemented by the driver.

int can_calc_timing_data(const struct device *dev, struct can_timing *res, uint32_t bitrate, uint16_t sample_pnt)
Calculate timing parameters for the data phase.
Same as can_calc_timing() but with the maximum and minimum values from the data phase.

**Note:** CONFIG_CAN_FD_MODE must be selected for this function to be available.

**Parameters**
- dev – Pointer to the device structure for the driver instance.
- res – [out] Result is written into the can_timing struct provided.
- bitrate – Target bitrate for the data phase in bits/s
- sample_pnt – Sampling point for the data phase in permille of the entire bit time.

**Return values**
- 0 – or positive sample point error on success.
- -EINVAL – if the requested bitrate or sample point is out of range.
- -ENOTSUP – if the requested bitrate is not supported.
- -EIO – if can_get_core_clock() is not available.

int can_set_timing_data(const struct device *dev, const struct can_timing *timing_data)
Configure the bus timing for the data phase of a CAN-FD controller.
If the sjw equals CAN_SJW_NO_CHANGE, the sjw parameter is not changed.

**See also:**
can_set_timing()

**Note:** CONFIG_CAN_FD_MODE must be selected for this function to be available.

**Parameters**
- dev – Pointer to the device structure for the driver instance.
- timing_data – Bus timings for data phase
Return values

- 0 – If successful.
- -EBUSY – if the CAN controller is not in stopped state.
- -EINVAL – if the requested bitrate is out of range.
- -ENOTSUP – if the requested bitrate not supported by the CAN controller/transceiver combination.
- -ERANGE – if the resulting sample point is off by more than +/- 5%.
- -EIO – General input/output error, failed to set bitrate.

```
int can_set_bitrate_data(const struct device *dev, uint32_t bitrate_data)
```

Set the bitrate for the data phase of the CAN-FD controller.

CAN in Automation (CiA) 301 v4.2.0 recommends a sample point location of 87.5% percent for all bitrates. However, some CAN controllers have difficulties meeting this for higher bitrates.

This function defaults to using a sample point of 75.0% for bitrates over 800 kbit/s, 80.0% for bitrates over 500 kbit/s, and 87.5% for all other bitrates. This is in line with the sample point locations used by the Linux kernel.

See also:

can_set_bitrate()

Note: CONFIG_CAN_FD_MODE must be selected for this function to be available.

Parameters

- dev – Pointer to the device structure for the driver instance.
- bitrate_data – Desired data phase bitrate.

Return values

- 0 – If successful.
- -EBUSY – if the CAN controller is not in stopped state.
- -EINVAL – if the requested bitrate is out of range.
- -ENOTSUP – if the requested bitrate not supported by the CAN controller/transceiver combination.
- -ERANGE – if the resulting sample point is off by more than +/- 5%.
- -EIO – General input/output error, failed to set bitrate.

```
int can_calc_prescaler(const struct device *dev, struct can_timing *timing, uint32_t bitrate)
```

Fill in the prescaler value for a given bitrate and timing.

Fill the prescaler value in the timing struct. The sjw, prop_seg, phase_seg1 and phase_seg2 must be given.

The returned bitrate error is remainder of the division of the clock rate by the bitrate times the timing segments.

Parameters

- dev – Pointer to the device structure for the driver instance.
- timing – Result is written into the can_timing struct provided.
- bitrate – Target bitrate.

Return values
• 0 – or positive bitrate error.
• Negative – error code on error.

int can_set_timing(const struct device *dev, const struct can_timing *timing)
Configure the bus timing of a CAN controller.
If the sjw equals CAN_SJW_NO_CHANGE, the sjw parameter is not changed.

**See also:**
can_set_timing_data()

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `timing` – Bus timings.

**Return values**
- 0 – If successful.
- -EBUSY – if the CAN controller is not in stopped state.
- -EIO – General input/output error, failed to configure device.

int can_get_capabilities(const struct device *dev, can_mode_t *cap)
Get the supported modes of the CAN controller.
The returned capabilities may not necessarily be supported at the same time (e.g. some CAN
controllers support both CAN_MODE_LOOPBACK and CAN_MODE_LISTENONLY, but not at the same
time).

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `cap` – [out] Supported capabilities.

**Return values**
- 0 – If successful.
- -EIO – General input/output error, failed to get capabilities.

int can_start(const struct device *dev)
Start the CAN controller.
Bring the CAN controller out of CAN_STATE_STOPPED. This will reset the RX/TX error coun-
ters, enable the CAN controller to participate in CAN communication, and enable the CAN
 tranceiver, if supported.

**See also:**
can_stop()

**See also:**
can_transceiver_enable()

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.

**Return values**
- 0 – if successful.
• -EALREADY – if the device is already started.
• -EIO – General input/output error, failed to start device.

int can_stop(const struct device *dev)
Stop the CAN controller.

Bring the CAN controller into CAN_STATE_STOPPED. This will disallow the CAN controller from participating in CAN communication, abort any pending CAN frame transmissions, and disable the CAN transceiver, if supported.

See also:
can_start()
See also:
can_transceiver_disable()

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – if successful.
• -EALREADY – if the device is already stopped.
• -EIO – General input/output error, failed to stop device.

int can_set_mode(const struct device *dev, can_mode_t mode)
Set the CAN controller to the given operation mode.

Parameters
• dev – Pointer to the device structure for the driver instance.
• mode – Operation mode.

Return values
• 0 – If successful.
• -EBUSY – if the CAN controller is not in stopped state.
• -EIO – General input/output error, failed to configure device.

int can_set_bitrate(const struct device *dev, uint32_t bitrate)
Set the bitrate of the CAN controller.

CAN in Automation (CiA) 301 v4.2.0 recommends a sample point location of 87.5% percent for all bitrates. However, some CAN controllers have difficulties meeting this for higher bitrates.

This function defaults to using a sample point of 75.0% for bitrates over 800 kbit/s, 80.0% for bitrates over 500 kbit/s, and 87.5% for all other bitrates. This is in line with the sample point locations used by the Linux kernel.

See also:
can_set_bitrate_data()

Parameters
• dev – Pointer to the device structure for the driver instance.
• bitrate – Desired arbitration phase bitrate.

Return values
• 0 – If successful.
• -EBUSY – if the CAN controller is not in stopped state.
• -EINVAL – if the requested bitrate is out of range.
• -ENOTSUP – if the requested bitrate not supported by the CAN controller/transceiver combination.
• -ERANGE – if the resulting sample point is off by more than +/- 5%.
• -EIO – General input/output error, failed to set bitrate.

CAN_SJW_NO_CHANGE
Synchronization Jump Width (SJW) value to indicate that the SJW should not be changed by the timing calculation.

Transmitting CAN frames

int can_send(const struct device *dev, const struct can_frame *frame, k_timeout_t timeout, can_tx_callback_t callback, void *user_data)

Queue a CAN frame for transmission on the CAN bus.

Queue a CAN frame for transmission on the CAN bus with optional timeout and completion callback function.

Queued CAN frames are transmitted in order according to their priority:

• The lower the CAN-ID, the higher the priority.
• Data frames have higher priority than Remote Transmission Request (RTR) frames with identical CAN-IDs.
• Frames with standard (11-bit) identifiers have higher priority than frames with extended (29-bit) identifiers with identical base IDs (the higher 11 bits of the extended identifier).
• Transmission order for queued frames with the same priority is hardware dependent.

By default, the CAN controller will automatically retry transmission in case of lost bus arbitration or missing acknowledge. Some CAN controllers support disabling automatic retransmissions via CAN_MODE_ONE_SHOT.

Note: If transmitting segmented messages spanning multiple CAN frames with identical CAN-IDs, the sender must ensure to only queue one frame at a time if FIFO order is required.

Parameters
• dev – Pointer to the device structure for the driver instance.
• frame – CAN frame to transmit.
• timeout – Timeout waiting for an empty TX mailbox or K_FOREVER.
• callback – Optional callback for when the frame was sent or a transmission error occurred. If NULL, this function is blocking until frame is sent. The callback must be NULL if called from user mode.
• user_data – User data to pass to callback function.
Return values

- 0 – if successful.
- -EINVAL – if an invalid parameter was passed to the function.
- -ENOTSUP – if an unsupported parameter was passed to the function.
- -ENETDOWN – if the CAN controller is in stopped state.
- -ENETUNREACH – if the CAN controller is in bus-off state.
- -EBUSY – if CAN bus arbitration was lost (only applicable if automatic retransmissions are disabled).
- -EIO – if a general transmit error occurred (e.g. missing ACK if automatic retransmissions are disabled).
- -EAGAIN – on timeout.

Receiving CAN frames

static inline int can_add_rx_filter(const struct device *dev, can_rx_callback_t callback, void *user_data, const struct can_filter *filter)

Add a callback function for a given CAN filter.

Add a callback to CAN identifiers specified by a filter. When a received CAN frame matching the filter is received by the CAN controller, the callback function is called in interrupt context.

If a frame matches more than one attached filter, the priority of the match is hardware dependent.

The same callback function can be used for multiple filters.

Parameters

- dev – Pointer to the device structure for the driver instance.
- callback – This function is called by the CAN controller driver whenever a frame matching the filter is received.
- user_data – User data to pass to callback function.
- filter – Pointer to a can_filter structure defining the filter.

Return values

- filter_id – on success.
- -ENOSPC – if there are no free filters.
- -EINVAL – if the requested filter type is invalid.
- -ENOTSUP – if the requested filter type is not supported.

int can_add_rx_filter_msgq(const struct device *dev, struct k_msgq *msgq, const struct can_filter *filter)

Wrapper function for adding a message queue for a given filter.

Wrapper function for can_add_rx_filter() which puts received CAN frames matching the filter in a message queue instead of calling a callback.

If a frame matches more than one attached filter, the priority of the match is hardware dependent.

The same message queue can be used for multiple filters.
Note: The message queue must be initialized before calling this function and the caller must have appropriate permissions on it.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **msgq** – Pointer to the already initialized k_msgq struct.
- **filter** – Pointer to a can_filter structure defining the filter.

Return values

- **filter_id** – on success.
- **-ENOSPC** – if there are no free filters.
- **-ENOTSUP** – if the requested filter type is not supported.

```c
void can_remove_rx_filter(const struct device *dev, int filter_id)
```

Remove a CAN RX filter.

This routine removes a CAN RX filter based on the filter ID returned by `can_add_rx_filter()` or `can_add_rx_filter_msgq()`.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **filter_id** – Filter ID

```c
int can_get_max_filters(const struct device *dev, bool ide)
```

Get maximum number of RX filters.

Get the maximum number of concurrent RX filters for the CAN controller.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **ide** – Get the maximum standard (11-bit) CAN ID filters if false, or extended (29-bit) CAN ID filters if true.

Return values

- **Positive** – number of maximum concurrent filters.
- **-EIO** – General input/output error.
- **-ENOSYS** – If this function is not implemented by the driver.

```c
CAN_MSGQ_DEFINE(name, max_frames)
```

Statically define and initialize a CAN RX message queue.

The message queue's ring buffer contains space for `max_frames` CAN frames.

See also:

- `can_add_rx_filter_msgq()`

Parameters

- **name** – Name of the message queue.
- **max_frames** – Maximum number of CAN frames that can be queued.
CAN bus error reporting and handling

```c
int can_get_state(const struct device *dev, enum can_state *state, struct can_bus_err_cnt *err_cnt)
```

Get current CAN controller state.

Returns the current state and optionally the error counter values of the CAN controller.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `state` – [out] Pointer to the state destination enum or NULL.
- `err_cnt` – [out] Pointer to the err_cnt destination structure or NULL.

**Return values**

- 0 – If successful.
- -EIO – General input/output error, failed to get state.

```c
int can_recover(const struct device *dev, k_timeout_t timeout)
```

Recover from bus-off state.

Recover the CAN controller from bus-off state to error-active state.

**Note:** CONFIG_CAN_AUTO_BUS_OFF_RECOVERY must be deselected for this function to be available.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `timeout` – Timeout for waiting for the recovery or K_FOREVER.

**Return values**

- 0 – on success.
- -ENETDOWN – if the CAN controller is in stopped state.
- -EAGAIN – on timeout.

```c
static inline void can_set_state_change_callback(const struct device *dev, can_state_change_callback_t callback, void *user_data)
```

Set a callback for CAN controller state change events.

Set the callback for CAN controller state change events. The callback function will be called in interrupt context.

Only one callback can be registered per controller. Calling this function again overrides any previously registered callback.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `callback` – Callback function.
- `user_data` – User data to pass to callback function.
**CAN utility functions**

static inline uint8_t can_dlc_to_bytes(uint8_t dlc)
Convert from Data Length Code (DLC) to the number of data bytes.

**Parameters**
- dlc – Data Length Code (DLC).

**Return values**
Number – of bytes.

static inline uint8_t can_bytes_to_dlc(uint8_t num_bytes)
Convert from number of bytes to Data Length Code (DLC)

**Parameters**
- num_bytes – Number of bytes.

**Return values**
Data – Length Code (DLC).

**CAN frame definitions**

**CAN_STD_ID_MASK**
Bit mask for a standard (11-bit) CAN identifier.

**CAN_MAX_STD_ID**
Maximum value for a standard (11-bit) CAN identifier.

**CAN_EXT_ID_MASK**
Bit mask for an extended (29-bit) CAN identifier.

**CAN_MAX_EXT_ID**
Maximum value for an extended (29-bit) CAN identifier.

**CAN_MAX_DLC**
Maximum data length code for CAN 2.0A/2.0B.

**CANFD_MAX_DLC**
Maximum data length code for CAN-FD.

**CAN controller mode flags**

**CAN_MODE_NORMAL**
Normal mode.

**CAN_MODE_LOOPBACK**
Controller is in loopback mode (receives own frames).

**CAN_MODE_LISTENONLY**
Controller is not allowed to send dominant bits.
CAN_MODE_FD
    Controller allows transmitting/receiving CAN-FD frames.

CAN_MODE_ONE_SHOT
    Controller does not retransmit in case of lost arbitration or missing ACK

CAN_MODE_3_SAMPLES
    Controller uses triple sampling mode

CAN frame flags

CAN_FRAME_IDE
    Frame uses extended (29-bit) CAN ID

CAN_FRAME_RTR
    Frame is a Remote Transmission Request (RTR)

CAN_FRAME_FDF
    Frame uses CAN-FD format (FDF)

CAN_FRAME_BRS
    Frame uses CAN-FD Baud Rate Switch (BRS). Only valid in combination with CAN_FRAME_FDF.

CAN filter flags

CAN_FILTER_IDE
    Filter matches frames with extended (29-bit) CAN IDs

CAN_FILTER_RTR
    Filter matches Remote Transmission Request (RTR) frames

CAN_FILTER_DATA
    Filter matches data frames

Defines

CAN_STATS_BIT0_ERROR_INC(dev_)
    Increment the bit0 error counter for a CAN device.
    The bit0 error counter is incremented when the CAN controller is unable to transmit a dominant bit.

Parameters
    • dev_ – Pointer to the device structure for the driver instance.
CAN_STATS_BIT1_ERROR_INC(dev_)
Increment the bit1 (recessive) error counter for a CAN device.
The bit1 error counter is incremented when the CAN controller is unable to transmit a recessive bit.

Parameters
• dev_ – Pointer to the device structure for the driver instance.

CAN_STATS_STUFF_ERROR_INC(dev_)
Increment the stuffing error counter for a CAN device.
The stuffing error counter is incremented when the CAN controller detects a bit stuffing error.

Parameters
• dev_ – Pointer to the device structure for the driver instance.

CAN_STATS_CRC_ERROR_INC(dev_)
Increment the CRC error counter for a CAN device.
The CRC error counter is incremented when the CAN controller detects a frame with an invalid CRC.

Parameters
• dev_ – Pointer to the device structure for the driver instance.

CAN_STATS_FORM_ERROR_INC(dev_)
Increment the form error counter for a CAN device.
The form error counter is incremented when the CAN controller detects a fixed-form bit field containing illegal bits.

Parameters
• dev_ – Pointer to the device structure for the driver instance.

CAN_STATS_ACK_ERROR_INC(dev_)
Increment the acknowledge error counter for a CAN device.
The acknowledge error counter is incremented when the CAN controller does not monitor a dominant bit in the ACK slot.

Parameters
• dev_ – Pointer to the device structure for the driver instance.

CAN_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, level, prio, api, ...)
Like DEVICE_DTDEFINE() with CAN device specifics.
Defines a device which implements the CAN API. May generate a custom device_state container struct and init_fn wrapper when needed depending on CONFIG_CAN_STATS.

Parameters
• node_id – The devicetree node identifier.
• init_fn – Name of the init function of the driver.
• pm – PM device resources reference (NULL if device does not use PM).
• data – Pointer to the device’s private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• level – The initialization level. See SYS_INIT() for details.
• **prio** – Priority within the selected initialization level. See SYS_INIT() for details.

• **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

```c
CAN_DEVICE_DT_INST_DEFINE(inst, ...)
```

Like `CAN_DEVICE_DT_DEFINE()` for an instance of a DT_DRV_COMPAT compatible.

### Parameters

- **inst** – Instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to `CAN_DEVICE_DT_DEFINE()`.

- **...** – Other parameters as expected by `CAN_DEVICE_DT_DEFINE()`.

### Typedefs

```c
typedef uint32_t can_mode_t
```

Provides a type to hold CAN controller configuration flags.

The lower 24 bits are reserved for common CAN controller mode flags. The upper 8 bits are reserved for CAN controller/driver specific flags.

**See also:**

`CAN_MODE_FLAGS`.

```c
typedef void (*can_tx_callback_t)(const struct device *dev, int error, void *user_data)
```

Defines the application callback handler function signature.

**Param dev**

- Pointer to the device structure for the driver instance.

**Param error**

- Status of the performed send operation. See the list of return values for `can_send()` for value descriptions.

**Param user_data**

- User data provided when the frame was sent.

```c
typedef void (*can_rx_callback_t)(const struct device *dev, struct can_frame *frame, void *user_data)
```

Defines the application callback handler function signature for receiving.

**Param dev**

- Pointer to the device structure for the driver instance.

**Param frame**

- Received frame.

**Param user_data**

- User data provided when the filter was added.

```c
typedef void (*can_state_change_callback_t)(const struct device *dev, enum can_state state, struct can_bus_err_cnt *err_cnt, void *user_data)
```

Defines the state change callback handler function signature.

**Param dev**

- Pointer to the device structure for the driver instance.
**Param state**
State of the CAN controller.

**Param err_cnt**
CAN controller error counter values.

**Param user_data**
User data provided the callback was set.

### Enums

```c
enum can_state
{
    CAN_STATE_ERROR_ACTIVE,
    CAN_STATE_ERROR_WARNING,
    CAN_STATE_ERROR_PASSIVE,
    CAN_STATE_BUS_OFF,
    CAN_STATE_STOPPED
};
```

Defines the state of the CAN controller.

**Values:**

- enumerator **CAN_STATE_ERROR_ACTIVE**
  Error-active state (RX/TX error count < 96).

- enumerator **CAN_STATE_ERROR_WARNING**
  Error-warning state (RX/TX error count < 128).

- enumerator **CAN_STATE_ERROR_PASSIVE**
  Error-passive state (RX/TX error count < 256).

- enumerator **CAN_STATE_BUS_OFF**
  Bus-off state (RX/TX error count >= 256).

- enumerator **CAN_STATE_STOPPED**
  CAN controller is stopped and does not participate in CAN communication.

### Public Members

```c
struct can_frame
{
    #include <can.h> CAN frame structure.

    uint32_t id
    Standard (11-bit) or extended (29-bit) CAN identifier.

    uint8_t dlc
    Data Length Code (DLC) indicating data length in bytes.

    uint8_t flags
    Flags.

    See also: CAN_FRAME_FLAGS.
```
uint16_t timestamp
Captured value of the free-running timer in the CAN controller when this frame was received. The timer is incremented every bit time and captured at the start of frame bit (SOF).

Note: CONFIG_CAN_RX_TIMESTAMP must be selected for this field to be available.

union can_frame.[anonymous] [anonymous]
The frame payload data.

struct can_filter
#include <can.h> CAN filter structure.

Public Members

uint32_t id
CAN identifier to match.

uint32_t mask
CAN identifier matching mask. If a bit in this mask is 0, the value of the corresponding bit in the id field is ignored by the filter.

uint8_t flags
Flags.

See also:
CAN_FILTER_FLAGS.

struct can_bus_err_cnt
#include <can.h> CAN controller error counters.

Public Members

uint8_t tx_err_cnt
Value of the CAN controller transmit error counter.

uint8_t rx_err_cnt
Value of the CAN controller receive error counter.

struct can_timing
#include <can.h> CAN bus timing structure.

This struct is used to pass bus timing values to the configuration and bitrate calculation functions.

The propagation segment represents the time of the signal propagation. Phase segment 1 and phase segment 2 define the sampling point. The prop_seg and phase_seg1 values affect the sampling point in the same way and some controllers only have a register for the sum of those two. The sync segment always has a length of 1 time quantum (see below).
<table>
<thead>
<tr>
<th>sync_seg</th>
<th>prop_seg</th>
<th>phase_seg1</th>
<th>phase_seg2</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td></td>
<td>^</td>
<td>^</td>
</tr>
<tr>
<td>Sampling-Point</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

1 time quantum (tq) has the length of 1/(core_clock / prescaler). The bitrate is defined by the core clock divided by the prescaler and the sum of the segments:

\[
br = \frac{\text{core_clock}}{\text{prescaler}} \div (1 + \text{prop_seg} + \text{phase_seg1} + \text{phase_seg2})
\]

The Synchronization Jump Width (SJW) defines the amount of time quanta the sample point can be moved. The sample point is moved when resynchronization is needed.

**Public Members**

```c
uint16_t sjw
    Synchronisation jump width.
```

```c
uint16_t prop_seg
    Propagation segment.
```

```c
uint16_t phase_seg1
    Phase segment 1.
```

```c
uint16_t phase_seg2
    Phase segment 2.
```

```c
uint16_t prescaler
    Prescaler value.
```

```c
struct can_device_state
    #include <can.h> CAN specific device state which allows for CAN device class specific additions.
```

**CAN Transceiver API Reference**

**group can_transceiver**

CAN Transceiver Driver APIs.

**Functions**

```c
static inline int can_transceiver_enable(const struct device *dev)
    Enable CAN transceiver.
    Enable the CAN transceiver.
```

**See also:**

`can_start()`
Note: The CAN transceiver is controlled by the CAN controller driver and should not normally be controlled by the application.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- 0 – If successful.
- -EIO – General input/output error, failed to enable device.

```c
static inline int can_transceiver_disable(const struct device *dev)
```

Disable CAN transceiver.

Disable the CAN transceiver.

See also:

can_stop()

Note: The CAN transceiver is controlled by the CAN controller driver and should not normally be controlled by the application.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- 0 – If successful.
- -EIO – General input/output error, failed to disable device.

ISO-TP Transport Protocol

Overview

ISO-TP is a transport protocol defined in the ISO-Standard ISO15765-2 Road vehicles - Diagnostic communication over Controller Area Network (DoCAN). Part2: Transport protocol and network layer services. As its name already implies, it is originally designed, and still used in road vehicle diagnostic over Controller Area Networks. Nevertheless, it's not limited to applications in road vehicles or the automotive domain.

This transport protocol extends the limited payload data size for classical CAN (8 bytes) and CAN-FD (64 bytes) to theoretically four gigabytes. Additionally, it adds a flow control mechanism to influence the sender's behavior. ISO-TP segments packets into small fragments depending on the payload size of the CAN frame. The header of those segments is called Protocol Control Information (PCI).

Packets smaller or equal to seven bytes on Classical CAN are called single-frames (SF). They don’t need to fragment and do not have any flow-control.

Packets larger than that are segmented into a first-frame (FF) and as many consecutive-frames as required. The FF contains information about the length of the entire payload data and additionally, the
first few bytes of payload data. The receiving peer sends back a flow-control-frame (FC) to either deny, postpone, or accept the following consecutive frames. The FC also defines the conditions of sending, namely the block-size (BS) and the minimum separation time between frames (STmin). The block size defines how many CF the sender is allowed to send, before he has to wait for another FC.

  Unexpected PDU received

- **ISOTP_N_WFT_OVRN**
  Maximum number of WAIT flowStatus PDUs exceeded

- **ISOTP_N_BUFFER_OVFLW**
  FlowStatus OVFLW PDU was received

- **ISOTP_N_ERROR**
  General error
```
ISOTP_NO_FREE_FILTER
   Implementation specific errors Can't bind or send because the CAN device has no filter left

ISOTP_NO_NET_BUF_LEFT
   No net buffer left to allocate

ISOTP_NO_BUF_DATA_LEFT
   Not sufficient space in the buffer left for the data

ISOTP_NO_CTX_LEFT
   No context buffer left to allocate

ISOTP_RECV_TIMEOUT
   Timeout for recv

ISOTP_FIXED_ADDR_SA_POS
   Position of fixed source address (SA)

ISOTP_FIXED_ADDR_SA_MASK
   Mask to obtain fixed source address (SA)

ISOTP_FIXED_ADDR_TA_POS
   Position of fixed target address (TA)

ISOTP_FIXED_ADDR_TA_MASK
   Mask to obtain fixed target address (TA)

ISOTP_FIXEDAddr_PRIo_POS
   Position of priority in fixed addressing mode

ISOTP_FIXED_ADDR_PRIo_MASK
   Mask for priority in fixed addressing mode

ISOTP_FIXED_ADDR_RX_MASK

Typedefs

typedef void (*isotp_tx_callback_t)(int error_nr, void *arg)

Functions

int isotp_bind(struct isotp_recv_ctx *ctx, const struct device *can_dev, const struct isotp_msg_id *rx_addr, const struct isotp_msg_id *tx_addr, const struct isotp_fc_opts *opts, k_timeout_t timeout)

Bind an address to a receiving context.

This function binds an RX and TX address combination to an RX context. When data arrives from the specified address, it is buffered and can be read by calling isotp_recv. When calling this routine, a filter is applied in the CAN device, and the context is initialized. The context must be valid until calling unbind.
Parameters

- `ctx` – Context to store the internal states.
- `can_dev` – The CAN device to be used for sending and receiving.
- `rx_addr` – Identifier for incoming data.
- `tx_addr` – Identifier for FC frames.
- `opts` – Flow control options.
- `timeout` – Timeout for FF SF buffer allocation.

Return values

- `ISOTP_N_OK` – on success
- `ISOTP_NO_FREE_FILTER` – if CAN device has no filters left.

```c
void isotp_unbind(struct isotp_recv_ctx *ctx)
```

Unbind a context from the interface.

This function removes the binding from `isotp_bind`. The filter is detached from the CAN device, and if a transmission is ongoing, buffers are freed. The context can be discarded safely after calling this function.

Parameters

- `ctx` – Context that should be unbound.

```c
int isotp_recv(struct isotp_recv_ctx *ctx, uint8_t *data, size_t len, k_timeout_t timeout)
```

Read out received data from fifo.

This function reads the data from the receive FIFO of the context. It blocks if the FIFO is empty. If an error occurs, the function returns a negative number and leaves the data buffer unchanged.

Parameters

- `ctx` – Context that is already bound.
- `data` – Pointer to a buffer where the data is copied to.
- `len` – Size of the buffer.
- `timeout` – Timeout for incoming data.

Return values

- Number – of bytes copied on success
- `ISOTP_WAIT_TIMEOUT` – when “timeout” timed out
- `ISOTP_N_*` – on error

```c
int isotp_recv_net(struct isotp_recv_ctx *ctx, struct net_buf **buffer, k_timeout_t timeout)
```

Get the net buffer on data reception.

This function reads incoming data into net-buffers. It blocks until the entire packet is received, BS is reached, or an error occurred. If BS was zero, the data is in a single `net_buf`. Otherwise, the data is fragmented in chunks of BS size. The net-buffers are referenced and must be freed with `net_buf_unref` after the data is processed.

Parameters

- `ctx` – Context that is already bound.
- `buffer` – Pointer where the `net_buf` pointer is written to.
- `timeout` – Timeout for incoming data.

Return values
Send data.

This function is used to send data to a peer that listens to the tx_addr. An internal work-queue is used to transfer the segmented data. Data and context must be valid until the transmission has finished. If a complete_cb is given, this function is non-blocking, and the callback is called on completion with the return value as a parameter.

**Parameters**

- *ctx* – Context to store the internal states.
- *can_dev* – The CAN device to be used for sending and receiving.
- *data* – Data to be sent.
- *len* – Length of the data to be sent.
- *rx_addr* – Identifier for FC frames.
- *tx_addr* – Identifier for outgoing frames the receiver listens on.
- *complete_cb* – Function called on completion or NULL.
- *cb_arg* – Argument passed to the complete callback.

**Return values**

- ISOTP_N_OK – on success
- ISOTP_N_* – on error

```c
struct isotp_msg_id

#include <isotp.h> ISO-TP message id struct.
Used to pass addresses to the bind and send functions.

**Public Members**

union isotp_msg_id [anonymous]

  CAN identifier

  If ISO-TP fixed addressing is used, isotp_bind ignores SA and priority sections and modifies TA section in flow control frames.

uint8_t ext_addr

ISO-TP extended address (if used)

uint8_t ide

Indicates the CAN identifier type (0 for standard or 1 for extended)

uint8_t use_ext_addr

Indicates if ISO-TP extended addressing is used
uint8_t use_fixed_addr
    Indicates if ISO-TP fixed addressing (acc. to SAE J1939) is used

struct isotp_fc_opts
    #include <isotp.h> ISO-TP frame control options struct.
    Used to pass the options to the bind and send functions.

Public Members

uint8_t bs
    Block size. Number of CF PDUs before next CF is sent

uint8_t stmin
    Minimum separation time. Min time between frames

7.3.4 Coredump Device

Overview

The coredump device is a pseudo-device driver with two types. A COREDUMP_TYPE_MEMCPY type exposes device tree bindings for memory address/size values to be included in any dump. And the driver exposes an API to add/remove dump memory regions at runtime. A COREDUMP_TYPE_CALLBACK device requires exactly one entry in the memory-regions array with a size of 0 and a desired size. The driver will statically allocate memory of the desired size and provide an API to register a callback function to fill that memory when a dump occurs.

Configuration Options

Related configuration options:

- CONFIG_COREDUMP_DEVICE

API Reference

group coredump_device_interface
    Coredump pseudo-device driver APIs.

Typedefs

typedef void (*coredump_dump_callback_t)(uintptr_t dump_area, size_t dump_area_size)
    Callback that occurs at dump time, data copied into dump_area will be included in the dump that is generated.

Param dump_area
    Pointer to area to copy data into for inclusion in dump

Param dump_area_size
    Size of available memory at dump_area
Functions

static inline bool coredump_device_register_memory(const struct device *dev, struct
coredump_mem_region_node *region)

Register a region of memory to be stored in core dump at the time it is generated.

Parameters
• dev – Pointer to the device structure for the driver instance.
• region – Struct describing memory to be collected

Returns
true if registration succeeded

Returns
false if registration failed

static inline bool coredump_device_unregister_memory(const struct device *dev, struct
coredump_mem_region_node *region)

Unregister a region of memory to be stored in core dump at the time it is generated.

Parameters
• dev – Pointer to the device structure for the driver instance.
• region – Struct describing memory to be collected

Returns
true if unregistration succeeded

Returns
false if unregistration failed

static inline bool coredump_device_register_callback(const struct device *dev,
coredump_dump_callback_t callback)

Register a callback to be invoked at dump time.

Parameters
• dev – Pointer to the device structure for the driver instance.
• callback – Callback to be invoked at dump time

Returns
true if registration succeeded

Returns
false if registration failed

struct coredump_mem_region_node
#include <coredump.h> Structure describing a region in memory that may be stored in core
dump at the time it is generated.

Instances of this are passed to the coredump_device_register_memory() and coredump_device_unregister_memory() functions to indicate addition and removal of memory regions to be captured

7.3.5 Counter

Overview

API Reference

```c
typedef void (*counter_alarm_callback_t)(const struct device *dev, uint8_t chan_id, uint32_t ticks, void *user_data)
```

Alarm callback.

- **Param dev**
  Pointer to the device structure for the driver instance.

- **Param chan_id**
  Channel ID.

- **Param ticks**
  Counter value that triggered the alarm.

- **Param user_data**
  User data.

```c
typedef void (*counter_top_callback_t)(const struct device *dev, void *user_data)
```

Callback called when counter turns around.

- **Param dev**
  Pointer to the device structure for the driver instance.

- **Param user_data**
  User data provided in `counter_set_top_value`.

```c
typedef int (*counter_api_start)(const struct device *dev)
```

```c
typedef int (*counter_api_stop)(const struct device *dev)
```

```c
typedef int (*counter_api_get_value)(const struct device *dev, uint32_t *ticks)
```

```c
typedef int (*counter_api_get_value_64)(const struct device *dev, uint64_t *ticks)
```

```c
typedef int (*counter_api_set_alarm)(const struct device *dev, uint8_t chan_id, const struct counter_alarm_cfg *alarm_cfg)
```
typedef int (*counter_api_cancel_alarm)(const struct device *dev, uint8_t chan_id)

typedef int (*counter_api_set_top_value)(const struct device *dev, const struct counter_top_cfg *cfg)

typedef uint32_t (*counter_api_get_pending_int)(const struct device *dev)

typedef uint32_t (*counter_api_get_top_value)(const struct device *dev)

typedef uint32_t (*counter_api_get_guard_period)(const struct device *dev, uint32_t flags)

typedef int (*counter_api_set_guard_period)(const struct device *dev, uint32_t ticks, uint32_t flags)

typedef uint32_t (*counter_api_get_freq)(const struct device *dev)

Functions

bool counter_is_counting_up(const struct device *dev)
    Function to check if counter is counting up.

Parameters
    • dev – [in] Pointer to the device structure for the driver instance.

Return values
    • true – if counter is counting up.
    • false – if counter is counting down.

uint8_t counter_get_num_of_channels(const struct device *dev)
    Function to get number of alarm channels.

Parameters
    • dev – [in] Pointer to the device structure for the driver instance.

Returns
    Number of alarm channels.

uint32_t counter_get_frequency(const struct device *dev)
    Function to get counter frequency.

Parameters
    • dev – [in] Pointer to the device structure for the driver instance.

Returns
    Frequency of the counter in Hz, or zero if the counter does not have a fixed frequency.

uint32_t counter_us_to_ticks(const struct device *dev, uint64_t us)
    Function to convert microseconds to ticks.

Parameters
    • dev – [in] Pointer to the device structure for the driver instance.
Returns
Converted ticks. Ticks will be saturated if exceed 32 bits.

uint64_t counter_ticks_to_us(const struct device *dev, uint32_t ticks)
Function to convert ticks to microseconds.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• ticks – [in] Ticks.

Returns
Converted microseconds.

uint32_t counter_get_max_top_value(const struct device *dev)
Function to retrieve maximum top value that can be set.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Returns
Max top value.

int counter_start(const struct device *dev)
Start counter device in free running mode.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• Negative – errno code if failure.

int counter_stop(const struct device *dev)
Stop counter device.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• -ENOTSUP – if the device doesn’t support stopping the counter.

int counter_get_value(const struct device *dev, uint32_t *ticks)
Get current counter value.

Parameters
• dev – Pointer to the device structure for the driver instance.
• ticks – Pointer to where to store the current counter value

Return values
• 0 – If successful.
• Negative – error code on failure getting the counter value

int counter_get_value_64(const struct device *dev, uint64_t *ticks)
Get current counter 64-bit value.

Parameters
• dev – Pointer to the device structure for the driver instance.
ticks – Pointer to where to store the current counter value

Return values
- 0 – If successful.
- Negative – error code on failure getting the counter value

```c
int counter_set_channel_alarm(const struct device *dev, uint8_t chan_id, const struct counter_alarm_cfg *alarm_cfg)
```

Set a single shot alarm on a channel.
After expiration alarm can be set again, disabling is not needed. When alarm expiration
handler is called, channel is considered available and can be set again in that context.

**Note:** API is not thread safe.

Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `chan_id` – Channel ID.
- `alarm_cfg` – Alarm configuration.

Return values
- 0 – If successful.
- ENOTSUP – if request is not supported (device does not support interrupts or
  requested channel).
- EINVAL – if alarm settings are invalid.
- ETIME – if absolute alarm was set too late.
- EBUSY – if alarm is already active.

```c
int counter_cancel_channel_alarm(const struct device *dev, uint8_t chan_id)
```

Cancel an alarm on a channel.

**Note:** API is not thread safe.

Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `chan_id` – Channel ID.

Return values
- 0 – If successful.
- ENOTSUP – if request is not supported or the counter was not started yet.

```c
int counter_set_top_value(const struct device *dev, const struct counter_top_cfg *cfg)
```

Set counter top value.

Function sets top value and optionally resets the counter to 0 or top value depending on
counter direction. On turnaround, counter can be reset and optional callback is periodically
called. Top value can only be changed when there is no active channel alarm.

COUNTER_TOP_CFG_DONT_RESET prevents counter reset. When counter is running
while top value is updated, it is possible that counter progresses outside the new top
value. In that case, error is returned and optionally driver can reset the counter (see COUNTER_TOP_CFG_RESET_WHEN_LATE).

**Parameters**
- **dev** – Pointer to the device structure for the driver instance.
- **cfg** – Configuration. Cannot be NULL.

**Return values**
- **0** – If successful.
- **-ENOTSUP** – if request is not supported (e.g. top value cannot be changed or counter cannot/must be reset during top value update).
- **-EBUSY** – if any alarm is active.
- **-ETIME** – if COUNTER_TOP_CFG_DONT_RESET was set and new top value is smaller than current counter value (counter counting up).

```c
int counter_get_pending_int(const struct device *dev)
```

Function to get pending interrupts.

The purpose of this function is to return the interrupt status register for the device. This is especially useful when waking up from low power states to check the wake up source.

**Parameters**
- **dev** – Pointer to the device structure for the driver instance.

**Return values**
- **1** – if any counter interrupt is pending.
- **0** – if no counter interrupt is pending.

```c
uint32_t counter_get_top_value(const struct device *dev)
```

Function to retrieve current top value.

**Parameters**
- **dev** – **[in]** Pointer to the device structure for the driver instance.

**Returns**
- Top value.

```c
int counter_set_guard_period(const struct device *dev, uint32_t ticks, uint32_t flags)
```

Set guard period in counter ticks.

Setting non-zero guard period enables detection of setting absolute alarm too late. It limits how far in the future absolute alarm can be set.

Detection of too late setting is vital since if it is not detected alarm is delayed by full period of the counter (up to 32 bits). Because of the wrapping, it is impossible to distinguish alarm which is short in the past from alarm which is targeted to expire after full counter period. In order to detect too late setting, longest possible alarm is limited. Absolute value cannot exceed: (now + top_value - guard_period) % top_value.

Guard period depends on application and counter frequency. If it is expected that absolute alarms setting might be delayed then guard period should exceed maximal potential delay. If use case allows, guard period can be set very high (e.g. half of the counter top value).

After initialization guard period is set to 0 and late detection is disabled.

**Parameters**
- **dev** – Pointer to the device structure for the driver instance.
- **ticks** – Guard period in counter ticks.
• flags – See Counter guard period flags.

**Return values**

• 0 – if successful.
• -ENOTSUP – if function or flags are not supported.
• -EINVAL – if ticks value is invalid.

```c
uint32_t counter_get_guard_period(const struct device *dev, uint32_t flags)
```

Return guard period.

See `counter_set_guard_period`.

**Parameters**

• dev – Pointer to the device structure for the driver instance.
• flags – See Counter guard period flags.

**Returns**

Guard period given in counter ticks or 0 if function or flags are not supported.

```c
struct counter_alarm_cfg
```

#include <counter.h> Alarm callback structure.

**Param callback**

Callback called on alarm (cannot be NULL).

**Param ticks**

Number of ticks that triggers the alarm. It can be relative (to now) or absolute value (see COUNTER_ALARM_CFG_ABSOLUTE). Absolute alarm cannot be set further in future than top value decremented by the guard period. Relative alarm ticks cannot exceed current top value (see `counter_get_top_value`). If counter is clock driven then ticks can be converted to microseconds (see `counter_ticks_to_us`). Alternatively, counter implementation may count asynchronous events.

**Param user_data**

User data returned in callback.

**Param flags**

Alarm flags. See Alarm configuration flags.

```c
struct counter_top_cfg
```

#include <counter.h> Top value configuration structure.

**Param ticks**

Top value.

**Param callback**

Callback function. Can be NULL.

**Param user_data**

User data passed to callback function. Not valid if callback is NULL.

**Param flags**

Flags. See Flags used by.

```c
struct counter_config_info
```

#include <counter.h> Structure with generic counter features.

**Param max_top_value**

Maximal (default) top value on which counter is reset (cleared or reloaded).
**Param freq**
Frequency of the source clock if synchronous events are counted.

**Param flags**
Flags. See Counter device capabilities.

**Param channels**
Number of channels that can be used for setting alarm, see `counter_set_channel_alarm`.

```c
struct counter_driver_api
#include <counter.h>
```

### 7.3.6 Clock Control

**Overview**

The clock control API provides access to clocks in the system, including the ability to turn them on and off.

**Configuration Options**

Related configuration options:
- `CONFIG_CLOCK_CONTROL`

**API Reference**

`group clock_control_interface`

Clock Control Interface.

**Defines**

`CLOCK_CONTROL_SUBSYS_ALL`

**Typedefs**

```c
typedef void *clock_control_subsys_t

clock_control_subsys_t is a type to identify a clock controller sub-system. Such data pointed is opaque and relevant only to the clock controller driver instance being used.
```

```c
typedef void *clock_control_subsys_rate_t

clock_control_subsys_rate_t is a type to identify a clock controller sub-system rate. Such data pointed is opaque and relevant only to set the clock controller rate of the driver instance being used.
```

```c
typedef void (*clock_control_cb_t)(const struct device *dev, clock_control_subsys_t subsys, void *user_data)

Callback called on clock started.
```
Param dev
Device structure whose driver controls the clock.

Param subsys
Opaque data representing the clock.

Param user_data
User data.

typedef int (*clock_control)(const struct device *dev, clock_control_subsys_t sys)

typedef int (*clock_control_get)(const struct device *dev, clock_control_subsys_t sys, uint32_t *rate)

typedef int (*clock_control_async_on_fn)(const struct device *dev, clock_control_subsys_t sys, clock_control_cb_t cb, void *user_data)

typedef enum clock_control_status (*clock_control_get_status_fn)(const struct device *dev, clock_control_subsys_t sys)

typedef int (*clock_control_set)(const struct device *dev, clock_control_subsys_t sys, clock_control_subsys_rate_t rate)

typedef int (*clock_control_configure_fn)(const struct device *dev, clock_control_subsys_t sys, void *data)

Enums

enum clock_control_status
Current clock status.
Values:

enumerator CLOCK_CONTROL_STATUS_STARTING

enumerator CLOCK_CONTROL_STATUS_OFF

enumerator CLOCK_CONTROL_STATUS_ON

enumerator CLOCK_CONTROL_STATUS_UNKNOWN

Functions

static inline int clock_control_on(const struct device *dev, clock_control_subsys_t sys)
Enable a clock controlled by the device.

On success, the clock is enabled and ready when this function returns. This function may
sleep, and thus can only be called from thread context.

Use clock_control_async_on() for non-blocking operation.

Parameters

• dev – Device structure whose driver controls the clock.
• `sys` – Opaque data representing the clock.

Returns
0 on success, negative errno on failure.

```c
static inline int clock_control_off(const struct device *dev, clock_control_subsys_t sys)
```

Disable a clock controlled by the device.

This function is non-blocking and can be called from any context. On success, the clock is disabled when this function returns.

Parameters
• `dev` – Device structure whose driver controls the clock
• `sys` – Opaque data representing the clock

Returns
0 on success, negative errno on failure.

```c
static inline int clock_control_async_on(const struct device *dev, clock_control_subsys_t sys,
                                         clock_control_cb_t cb, void *user_data)
```

Request clock to start with notification when clock has been started.

Function is non-blocking and can be called from any context. User callback is called when clock is started.

Parameters
• `dev` – Device.
• `sys` – A pointer to an opaque data representing the sub-system.
• `cb` – Callback.
• `user_data` – User context passed to the callback.

Return values
• 0 – if start is successfully initiated.
• -EALREADY – if clock was already started and is starting or running.
• -ENOTSUP – If the requested mode of operation is not supported.
• -ENOSYS – if the interface is not implemented.
• other – negative errno on vendor specific error.

```c
static inline enum clock_control_status clock_control_get_status(const struct device *dev,
                                                      clock_control_subsys_t sys)
```

Get clock status.

Parameters
• `dev` – Device.
• `sys` – A pointer to an opaque data representing the sub-system.

Returns
Status.

```c
static inline int clock_control_get_rate(const struct device *dev, clock_control_subsys_t sys,
                                         uint32_t *rate)
```

Obtain the clock rate of given sub-system.

Parameters
• `dev` – Pointer to the device structure for the clock controller driver instance
• `sys` – A pointer to an opaque data representing the sub-system

7.3. Peripherals
• **rate** – [out] Subsystem clock rate

**Return values**

• 0 – on successful rate reading.
• -EAGAIN – if rate cannot be read. Some drivers do not support returning the rate when the clock is off.
• -ENOTSUP – if reading the clock rate is not supported for the given sub-system.
• -ENOSYS – if the interface is not implemented.

```c
static inline int clock_control_set_rate(const struct device *dev,
                                         clock_control_subsys_t sys,
                                         clock_control_subsys_rate_t rate)
```

Set the rate of the clock controlled by the device.

On success, the new clock rate is set and ready when this function returns. This function may sleep, and thus can only be called from thread context.

**Parameters**

• dev – Device structure whose driver controls the clock.
• sys – Opaque data representing the clock.
• rate – Opaque data representing the clock rate to be used.

**Return values**

• -EALREADY – if clock was already in the given rate.
• -ENOTSUP – If the requested mode of operation is not supported.
• -ENOSYS – if the interface is not implemented.
• other – negative errno on vendor specific error.

```c
static inline int clock_control_configure(const struct device *dev,
                                          clock_control_subsys_t sys,
                                          void *data)
```

Configure a source clock.

This function is non-blocking and can be called from any context. On success, the selected clock is configured as per caller's request.

It is caller's responsibility to ensure that subsequent calls to the API provide the right information to allows clock_control driver to perform the right action (such as using the right clock source on clock_control_get_rate call).

data is implementation specific and could be used to convey supplementary information required for expected clock configuration.

**Parameters**

• dev – Device structure whose driver controls the clock
• sys – Opaque data representing the clock
• data – Opaque data providing additional input for clock configuration

**Return values**

• 0 – On success
• -ENOSYS – If the device driver does not implement this call
• -errno – Other negative errno on failure.
7.3.7 DAC

Overview

The DAC API provides access to Digital-to-Analog Converter (DAC) devices.

Configuration Options

Related configuration options:

- CONFIG_DAC

API Reference

```c
#include <dac.h>
```

Structure for specifying the configuration of a DAC channel.

**Param channel_id**

Channel identifier of the DAC that should be configured.

Functions

```c
int dac_channel_setup(const struct device *dev, const struct dac_channel_cfg *channel_cfg);
```

Configure a DAC channel.

It is required to call this function and configure each channel before it is selected for a write request.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `channel_cfg` – Channel configuration.

**Return values**

- 0 – On success.
- -EINVAL – If a parameter with an invalid value has been provided.
- -ENOTSUP – If the requested resolution is not supported.

```c
int dac_write_value(const struct device *dev, uint8_t channel, uint32_t value);
```

Write a single value to a DAC channel.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `channel` – Number of the channel to be used.
- `value` – Data to be written to DAC output registers.

**Return values**

- 0 – On success.
- -EINVAL – If a parameter with an invalid value has been provided.
7.3.8 Display Interface

API Reference

Generic Display Interface

```c
typedef int (*display_blanking_on_api)(const struct device *dev)
    Callback API to turn on display blanking See display_blanking_on() for argument description.

typedef int (*display_blanking_off_api)(const struct device *dev)
    Callback API to turn off display blanking See display_blanking_off() for argument description.

typedef int (*display_write_api)(const struct device *dev, const uint16_t x, const uint16_t y,
    const struct display_buffer_descriptor *desc, const void *buf)
    Callback API for writing data to the display See display_write() for argument description.

typedef int (*display_read_api)(const struct device *dev, const uint16_t x, const uint16_t y,
    const struct display_buffer_descriptor *desc, void *buf)
    Callback API for reading data from the display See display_read() for argument description.

typedef void *(*display_get_framebuffer_api)(const struct device *dev)
    Callback API to get framebuffer pointer See display_get_framebuffer() for argument description.

typedef int (*display_set_brightness_api)(const struct device *dev, const uint8_t brightness)
    Callback API to set display brightness See display_set_brightness() for argument description.

typedef int (*display_set_contrast_api)(const struct device *dev, const uint8_t contrast)
    Callback API to set display contrast See display_set_contrast() for argument description.

typedef void (*display_get_capabilities_api)(const struct device *dev, struct display_capabilities *capabilities)
    Callback API to get display capabilities See display_get_capabilities() for argument description.

typedef int (*display_set_pixel_format_api)(const struct device *dev, const enum display_pixel_format pixel_format)
    Callback API to set pixel format used by the display See display_set_pixel_format() for argument description.

typedef int (*display_set_orientation_api)(const struct device *dev, const enum display_orientation orientation)
    Callback API to set orientation used by the display See display_set_orientation() for argument description.
```
Enums

enum display_pixel_format
    Display pixel formats.
    Display pixel format enumeration.
    In case a pixel format consists out of multiple bytes the byte order is big endian.
    Values:

enumerator PIXEL_FORMAT_RGB_888 = BIT(0)
enumerator PIXEL_FORMAT_MONO01 = BIT(1)
enumerator PIXEL_FORMAT_MONO10 = BIT(2)
enumerator PIXEL_FORMAT_ARGB_8888 = BIT(3)
enumerator PIXEL_FORMAT_RGB_565 = BIT(4)
enumerator PIXEL_FORMAT_BGR_565 = BIT(5)

enum display_screen_info
    Values:

enumerator SCREEN_INFO_MONO_VTILED = BIT(0)
    If selected, one octet represents 8 pixels ordered vertically, otherwise ordered horizontally.
enumerator SCREEN_INFO_MONO_MSB_FIRST = BIT(1)
    If selected, the MSB represents the first pixel, otherwise MSB represents the last pixel.
enumerator SCREEN_INFO_EPID = BIT(2)
    Electrophoretic Display.
enumerator SCREEN_INFO_DOUBLE_BUFFER = BIT(3)
    Screen has two alternating ram buffers
enumerator SCREEN_INFO_X_ALIGNMENT_WIDTH = BIT(4)
    Screen has x alignment constrained to width.

enum display_orientation
    Enumeration with possible display orientation.
    Values:

enumerator DISPLAY_ORIENTATION_NORMAL
enumerator DISPLAY_ORIENTATION_ROTATED_90
Functions

static inline int display_write(const struct device *dev, const uint16_t x, const uint16_t y, const struct display_buffer_descriptor *desc, const void *buf)

Write data to display.

Parameters

• dev – Pointer to device structure
• x – x Coordinate of the upper left corner where to write the buffer
• y – y Coordinate of the upper left corner where to write the buffer
• desc – Pointer to a structure describing the buffer layout
• buf – Pointer to buffer array

Return values

0 – on success else negative errno code.

static inline int display_read(const struct device *dev, const uint16_t x, const uint16_t y, const struct display_buffer_descriptor *desc, void *buf)

Read data from display.

Parameters

• dev – Pointer to device structure
• x – x Coordinate of the upper left corner where to read from
• y – y Coordinate of the upper left corner where to read from
• desc – Pointer to a structure describing the buffer layout
• buf – Pointer to buffer array

Return values

0 – on success else negative errno code.

static inline void *display_get_framebuffer(const struct device *dev)

Get pointer to framebuffer for direct access.

Parameters

• dev – Pointer to device structure

Return values

Pointer – to frame buffer or NULL if direct framebuffer access is not supported

static inline int display_blanking_on(const struct device *dev)

Turn display blanking on.

This function blanks the complete display. The content of the frame buffer will be retained while blanking is enabled and the frame buffer will be accessible for read and write operations.

In case backlight control is supported by the driver the backlight is turned off. The backlight configuration is retained and accessible for configuration.

In case the driver supports display blanking the initial state of the driver would be the same as if this function was called.

Parameters
• dev – Pointer to device structure

**Return values**

0 – on success else negative errno code.

static inline int display_blanking_off(const struct device *dev)

Turn display blanking off.

Restore the frame buffer content to the display. In case backlight control is supported by the driver the backlight configuration is restored.

**Parameters**

• dev – Pointer to device structure

**Return values**

0 – on success else negative errno code.

static inline int display_set_brightness(const struct device *dev, uint8_t brightness)

Set the brightness of the display.

Set the brightness of the display in steps of 1/256, where 255 is full brightness and 0 is minimal.

**Parameters**

• dev – Pointer to device structure
• brightness – Brightness in steps of 1/256

**Return values**

0 – on success else negative errno code.

static inline int display_set_contrast(const struct device *dev, uint8_t contrast)

Set the contrast of the display.

Set the contrast of the display in steps of 1/256, where 255 is maximum difference and 0 is minimal.

**Parameters**

• dev – Pointer to device structure
• contrast – Contrast in steps of 1/256

**Return values**

0 – on success else negative errno code.

static inline void display_get_capabilities(const struct device *dev, struct display_capabilities *capabilities)

Get display capabilities.

**Parameters**

• dev – Pointer to device structure
• capabilities – Pointer to capabilities structure to populate

static inline int display_set_pixel_format(const struct device *dev, const enum display_pixel_format pixel_format)

Set pixel format used by the display.

**Parameters**

• dev – Pointer to device structure
• pixel_format – Pixel format to be used by display

**Return values**

0 – on success else negative errno code.
static inline int display_set_orientation(const struct device *dev, const enum display_orientation orientation)

Set display orientation.

**Parameters**

- dev – Pointer to device structure
- orientation – Orientation to be used by display

**Return values**

0 – on success else negative errno code.

```c
struct display_capabilities
#include <display.h> Structure holding display capabilities.
```

**Public Members**

- `uint16_t x_resolution`  
  Display resolution in the X direction

- `uint16_t y_resolution`  
  Display resolution in the Y direction

- `uint32_t supported_pixel_formats`  
  Bitwise or of pixel formats supported by the display

- `uint32_t screen_info`  
  Information about display panel

- `enum display_pixel_format current_pixel_format`  
  Currently active pixel format for the display

- `enum display_orientation current_orientation`  
  Current display orientation

```c
struct display_buffer_descriptor
#include <display.h> Structure to describe display data buffer layout.
```

**Public Members**

- `uint32_t buf_size`  
  Data buffer size in bytes

- `uint16_t width`  
  Data buffer row width in pixels

- `uint16_t height`  
  Data buffer column height in pixels
uint16_t pitch
   Number of pixels between consecutive rows in the data buffer

struct display_driver_api
   #include <display.h> Display driver API API which a display driver should expose.

Grove LCD Display

group grove_display

Functions

void lcd_print(const struct device *dev, char *data, uint32_t size)
Send text to the screen.

Parameters

• dev – Pointer to device structure for driver instance.
• data – the ASCII text to display
• size – the length of the text in bytes

void lcd_cursor_pos_set(const struct device *dev, uint8_t col, uint8_t row)
Set text cursor position for next additions.

Parameters

• dev – Pointer to device structure for driver instance.
• col – the column for the cursor to be moved to (0-15)
• row – the row it should be moved to (0 or 1)

void lcd_clear(const struct device *dev)
Clear the current display.

Parameters

• dev – Pointer to device structure for driver instance.

void lcd_display_state_set(const struct device *dev, uint8_t opt)
Function to change the display state.
This function provides the user the ability to change the state of the display as per needed. Controlling things like powering on or off the screen, the option to display the cursor or not, and the ability to blink the cursor.

Parameters

• dev – Pointer to device structure for driver instance.
• opt – An 8bit bitmask of GLCD_DS_ * options.

uint8_t lcd_display_state_get(const struct device *dev)
return the display feature set associated with the device

Parameters

• dev – the Grove LCD to get the display features set

Returns
the display feature set associated with the device.

void lcd_input_state_set(const struct device *dev, uint8_t opt)
Function to change the input state.
This function provides the user the ability to change the state of the text input. Controlling things like text entry from the left or right side, and how far to increment on new text.
Parameters

• dev – Pointer to device structure for driver instance.
• opt – A bitmask of GLCD_IS_* options

uint8_t glcd_input_state_get(const struct device *dev)
return the input set associated with the device

Parameters

• dev – the Grove LCD to get the input features set

Returns

the input set associated with the device.

void glcd_function_set(const struct device *dev, uint8_t opt)
Function to set the functional state of the display.

This function provides the user the ability to change the state of the display as per needed. Controlling things like the number of rows, dot size, and text display quality.

Parameters

• dev – Pointer to device structure for driver instance.
• opt – A bitmask of GLCD_FS_* options

uint8_t glcd_function_get(const struct device *dev)
return the function set associated with the device

Parameters

• dev – the Grove LCD to get the functions set

Returns

the function features set associated with the device.

void glcd_color_select(const struct device *dev, uint8_t color)
Set LCD background to a predefined color.

Parameters

• dev – Pointer to device structure for driver instance.
• color – One of the predefined color options

void glcd_color_set(const struct device *dev, uint8_t r, uint8_t g, uint8_t b)
Set LCD background to custom RGB color value.

Parameters

• dev – Pointer to device structure for driver instance.
• r – A numeric value for the red color (max is 255)
• g – A numeric value for the green color (max is 255)
• b – A numeric value for the blue color (max is 255)

BBC micro:bit Display

group mb_display
BBC micro:bit display APIs.
**Defines**

`MB_IMAGE(_rows...)`

Generate an image object from a given array rows/columns.

This helper takes an array of 5 rows, each consisting of 5 0/1 values which correspond to the columns of that row. The value 0 means the pixel is disabled whereas a 1 means the pixel is enabled.

The pixels go from left to right and top to bottom, i.e. top-left corner is the first row’s first value, top-right is the first rows last value, and bottom-right corner is the last value of the last (5th) row. As an example, the following would create a smiley face image:

**Parameters**

- `_rows` – Each of the 5 rows represented as a 5-value column array.

**Returns**

Image bitmap that can be passed e.g. to `mb_display_image()`.

**Enums**

```cpp
eenum mb_display_mode
    Display mode.
    First 16 bits are reserved for modes, last 16 for flags.
    Values:

    enumerator MB_DISPLAY_MODE_DEFAULT
        Default mode (“single” for images, “scroll” for text).

    enumerator MB_DISPLAY_MODE_SINGLE
        Display images sequentially, one at a time.

    enumerator MB_DISPLAY_MODE_SCROLL
        Display images by scrolling.

    enumerator MB_DISPLAY_FLAG_LOOP = BIT(16)
        Loop back to the beginning when reaching the last image.
```

**Functions**

```c
struct mb_display *mb_display_get(void)
    Get a pointer to the BBC micro:bit display object.

Returns
    Pointer to display object.

void mb_display_image(struct mb_display *disp, uint32_t mode, int32_t duration, const struct mb_image *img, uint8_t img_count)
    Display one or more images on the BBC micro:bit LED display.
    This function takes an array of one or more images and renders them sequentially on the micro:bit display. The call is asynchronous, i.e. the processing of the display happens in the background. If there is another image being displayed it will be canceled and the new one takes over.
```
Parameters

- `disp` – Display object.
- `mode` – One of the MB_DISPLAY_MODE_* options.
- `duration` – Duration how long to show each image (in milliseconds), or SYS_FOREVER_MS.
- `img` – Array of image bitmaps (struct mb_image objects).
- `img_count` – Number of images in ‘img’ array.

```c
void mb_display_print(struct mb_display *disp, uint32_t mode, int32_t duration, const char *fmt, ...)
```

Print a string of characters on the BBC micro:bit LED display.
This function takes a printf-style format string and outputs it in a scrolling fashion to the display.
The call is asynchronous, i.e. the processing of the display happens in the background. If there is another image or string being displayed it will be canceled and the new one takes over.

Parameters

- `disp` – Display object.
- `mode` – One of the MB_DISPLAY_MODE_* options.
- `duration` – Duration how long to show each character (in milliseconds), or SYS_FOREVER_MS.
- `fmt` – printf-style format string
- `...` – Optional list of format arguments.

```c
void mb_display_stop(struct mb_display *disp)
```

Stop the ongoing display of an image.

Parameters

- `disp` – Display object.

```c
struct mb_image
```

#include <mb_display.h> Representation of a BBC micro:bit display image.

This struct should normally not be used directly, rather created using the MB_IMAGE() macro.

Monochrome Character Framebuffer

**group monochrome_character_framebuffer**

Public Monochrome Character Framebuffer API.

**Defines**

```c
FONT_ENTRY_DEFINE(_name, _width, _height, _caps, _data, _fc, _lc)
```

Macro for creating a font entry.

Parameters

- `_name` – Name of the font entry.
- `_width` – Width of the font in pixels
- `_height` – Height of the font in pixels.
- caps – Font capabilities.
- data – Raw data of the font.
- fc – Character mapped to first font element.
- lc – Character mapped to last font element.

Enums

enum cfb_display_param
  Values:
  
  enumerator CFB_DISPLAY_HEIGH = 0
  enumerator CFB_DISPLAY_WIDTH
  enumerator CFB_DISPLAY_PPT
  enumerator CFB_DISPLAY_ROWS
  enumerator CFB_DISPLAY_COLS

enum cfb_font_caps
  Values:
  
  enumerator CFB_FONT_MONO_VPACKED = BIT(0)
  enumerator CFB_FONT_MONO_HPACKED = BIT(1)
  enumerator CFB_FONT_MSB_FIRST = BIT(2)

Functions

int cfb_print(const struct device *dev, char *str, uint16_t x, uint16_t y)
  Print a string into the framebuffer.
    Parameters
    • dev – Pointer to device structure for driver instance
    • str – String to print
    • x – Position in X direction of the beginning of the string
    • y – Position in Y direction of the beginning of the string

    Returns
    0 on success, negative value otherwise

int cfb_framebuffer_clear(const struct device *dev, bool clear_display)
  Clear framebuffer.
    Parameters
    • dev – Pointer to device structure for driver instance
returns 0 on success, negative value otherwise

int cfb_framebuffer_invert(const struct device *dev)
Invert Pixels.

Parameters
• dev – Pointer to device structure for driver instance

Returns 0 on success, negative value otherwise

int cfb_invert_area(const struct device *dev, uint16_t x, uint16_t y, uint16_t width, uint16_t height)
Invert Pixels in selected area.

Parameters
• dev – Pointer to device structure for driver instance
• x – Position in X direction of the beginning of area
• y – Position in Y direction of the beginning of area
• width – Width of area in pixels
• height – Height of area in pixels

Returns 0 on success, negative value otherwise

int cfb_framebuffer_finalize(const struct device *dev)
Finalize framebuffer and write it to display RAM, invert or reorder pixels if necessary.

Parameters
• dev – Pointer to device structure for driver instance

Returns 0 on success, negative value otherwise

int cfb_get_display_parameter(const struct device *dev, enum cfb_display_param)
Get display parameter.

Parameters
• dev – Pointer to device structure for driver instance
• cfb_display_param – One of the display parameters

Returns Display parameter value

int cfb_framebuffer_set_font(const struct device *dev, uint8_t idx)
Set font.

Parameters
• dev – Pointer to device structure for driver instance
• idx – Font index

Returns 0 on success, negative value otherwise

7.3. Peripherals
int cfb_get_font_size(const struct device *dev, uint8_t idx, uint8_t *width, uint8_t *height)
Get font size.

**Parameters**
- `dev` – Pointer to device structure for driver instance
- `idx` – Font index
- `width` – Pointers to the variable where the font width will be stored.
- `height` – Pointers to the variable where the font height will be stored.

**Returns**
0 on success, negative value otherwise

int cfb_get_numof_fonts(const struct device *dev)
Get number of fonts.

**Parameters**
- `dev` – Pointer to device structure for driver instance

**Returns**
number of fonts

int cfb_framebuffer_init(const struct device *dev)
Initialize Character Framebuffer.

**Parameters**
- `dev` – Pointer to device structure for driver instance

**Returns**
0 on success, negative value otherwise

```
struct cfb_font
#include <cfb.h>
```

### 7.3.9 DMA

**Overview**

**API Reference**

**group** dma_interface
DMA Interface.

**Defines**

DMA_MAGIC

DMA_BUF_ADDR_ALIGNMENT(node)
Get the device tree property describing the buffer address alignment
Useful when statically defining or allocating buffers for DMA usage where memory alignment often matters.

**Parameters**
- `node` – Node identifier, e.g. `DT_NODELABEL(dma_0)`
Returns
alignment Memory byte alignment required for DMA buffers

DMA_BUF_SIZE_ALIGNMENT(node)
Get the device tree property describing the buffer size alignment
Useful when statically defining or allocating buffers for DMA usage where memory alignment often matters.

Parameters
• node – Node identifier, e.g. DT_NODELABEL(dma_0)

Returns
alignment Memory byte alignment required for DMA buffers

DMA_COPY_ALIGNMENT(node)
Get the device tree property describing the minimal chunk of data possible to be copied

Parameters
• node – Node identifier, e.g. DT_NODELABEL(dma_0)

Returns
minimal Minimal chunk of data possible to be copied

Typedefs
typedef void (*dma_callback_t)(const struct device *dev, void *user_data, uint32_t channel, int status)
Callback function for DMA transfer completion.
If enabled, callback function will be invoked at transfer completion or when error happens.

Param dev
Pointer to the DMA device calling the callback.

Param user_data
A pointer to some user data or NULL

Param channel
The channel number

Param status
0 on success, a negative errno otherwise

Enums
eenum dma_channel_direction
Values:

enumerator MEMORY_TO_MEMORY = 0x0

enumerator MEMORY_TO_PERIPHERAL

enumerator PERIPHERAL_TO_MEMORY

enumerator PERIPHERAL_TO_PERIPHERAL
enumerator HOST_TO_MEMORY

enumerator MEMORY_TO_HOST

enumerator DMA_CHANNEL_DIRECTION_COMMON_COUNT
  Number of all common channel directions.

enumerator DMA_CHANNEL_DIRECTION_PRIV_START = DMA_CHANNEL_DIRECTION_COMMON_COUNT
  This and higher values are dma controller or soc specific. Refer to the specified dma driver header file.

enumerator DMA_CHANNEL_DIRECTION_MAX = 0x7
  Maximum allowed value (3 bit field!)

enum dma_addr_adj
  Valid values for source_addr_adj and dest_addr_adj
  Values:

  enumerator DMA_ADDR_ADJ_INCREMENT

  enumerator DMA_ADDR_ADJ_DECREMENT

  enumerator DMA_ADDR_ADJ_NO_CHANGE

enum dma_channel_filter
  Values:

  enumerator DMA_CHANNEL_NORMAL

  enumerator DMA_CHANNEL_PERIODIC

enum dma_attribute_type
  Values:

  enumerator DMA_ATTR_BUFFER_ADDRESS_ALIGNMENT

  enumerator DMA_ATTR_BUFFER_SIZE_ALIGNMENT

  enumerator DMA_ATTR_COPY_ALIGNMENT

Functions

static inline int dma_config(const struct device *dev, uint32_t channel, struct dma_config *config)
  Configure individual channel for DMA transfer.

Parameters
  • dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel to configure
• config – Data structure containing the intended configuration for the selected channel

**Return values**
• 0 – if successful.
• Negative – errno code if failure.

```c
static inline int dma_reload(const struct device *dev, uint32_t channel, uint32_t src, uint32_t dst, size_t size)
```

Reload buffer(s) for a DMA channel.

**Parameters**
• dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel to configure selected channel
• src – source address for the DMA transfer
• dst – destination address for the DMA transfer
• size – size of DMA transfer

**Return values**
• 0 – if successful.
• Negative – errno code if failure.

```c
int dma_start(const struct device *dev, uint32_t channel)
```

Enables DMA channel and starts the transfer, the channel must be configured beforehand.

Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid.

**Parameters**
• dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel where the transfer will be processed

**Return values**
• 0 – if successful.
• Negative – errno code if failure.

```c
int dma_stop(const struct device *dev, uint32_t channel)
```

Stops the DMA transfer and disables the channel.

Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid.

**Parameters**
• dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel where the transfer was being processed

**Return values**
• 0 – if successful.
• Negative – errno code if failure.
int dma_suspend(const struct device *dev, uint32_t channel)
Suspend a DMA channel transfer.
Implementations must check the validity of the channel state and ID passed in and return -EINVAL if either are invalid.

Parameters
• dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel to suspend

Return values
• 0 – If successful.
• -ENOSYS – If not implemented.
• -EINVAL – If invalid channel id or state.
• -errno – Other negative errno code failure.

int dma_resume(const struct device *dev, uint32_t channel)
Resume a DMA channel transfer.
Implementations must check the validity of the channel state and ID passed in and return -EINVAL if either are invalid.

Parameters
• dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel to resume

Return values
• 0 – If successful.
• -ENOSYS – If not implemented
• -EINVAL – If invalid channel id or state.
• -errno – Other negative errno code failure.

int dma_request_channel(const struct device *dev, void *filter_param)
request DMA channel.
request DMA channel resources return -EINVAL if there is no valid channel available.

Parameters
• dev – Pointer to the device structure for the driver instance.
• filter_param – filter function parameter

Return values
• dma – channel if successful.
• Negative – errno code if failure.

void dma_release_channel(const struct device *dev, uint32_t channel)
release DMA channel.
release DMA channel resources

Parameters
• dev – Pointer to the device structure for the driver instance.
• channel – channel number
int dma_chan_filter(const struct device *dev, int channel, void *filter_param)

DMA channel filter.
filter channel by attribute

Parameters
• dev – Pointer to the device structure for the driver instance.
• channel – channel number
• filter_param – filter attribute

Return values
Negative – errno code if not support

static inline int dma_get_status(const struct device *dev, uint32_t channel, struct dma_status *stat)

get current runtime status of DMA transfer
Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid or -ENOSYS if not supported.

Parameters
• dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel where the transfer was being processed
• stat – a non-NULL dma_status object for storing DMA status

Return values
• non-negative – if successful.
• Negative – errno code if failure.

static inline int dma_get_attribute(const struct device *dev, uint32_t type, uint32_t *value)

get attribute of a dma controller
This function allows to get a device specific static or runtime attribute like required address and size alignment of a buffer. Implementations must check the validity of the type passed in and return -EINVAL if it is invalid or -ENOSYS if not supported.

Parameters
• dev – Pointer to the device structure for the driver instance.
• type – Numeric identification of the attribute
• value – A non-NULL pointer to the variable where the read value is to be placed

Return values
• non-negative – if successful.
• Negative – errno code if failure.

static inline uint32_t dma_width_index(uint32_t size)

Look-up generic width index to be used in registers.
WARNING: This look-up works for most controllers, but may not work for yours. Ensure your controller expects the most common register bit values before using this convenience function. If your controller does not support these values, you will have to write your own look-up inside the controller driver.

Parameters
• size – width of bus (in bytes)
Return values

common – DMA index to be placed into registers.

static inline uint32_t dma_burst_index(uint32_t burst)

Look-up generic burst index to be used in registers.

WARNING: This look-up works for most controllers, but may not work for yours. Ensure your controller expects the most common register bit values before using this convenience function. If your controller does not support these values, you will have to write your own look-up inside the controller driver.

Parameters

• burst – number of bytes to be sent in a single burst

Return values

common – DMA index to be placed into registers.

struct dma_block_config

#include <dma.h> DMA block configuration structure.

Param source_address

is block starting address at source

Param source_gather_interval

is the address adjustment at gather boundary

Param dest_address

is block starting address at destination

Param dest_scatter_interval

is the address adjustment at scatter boundary

Param dest_scatter_count

is the continuous transfer count between scatter boundaries

Param source_gather_count

is the continuous transfer count between gather boundaries

Param block_size

is the number of bytes to be transferred for this block.

Param config

is a bit field with the following parts:

<table>
<thead>
<tr>
<th>Bit Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_gather_en</td>
<td>[ 0 ]</td>
</tr>
<tr>
<td>source_addr_adj</td>
<td>[ 2 : 3 ]</td>
</tr>
<tr>
<td>dest_addr_adj</td>
<td>[ 4 : 5 ]</td>
</tr>
<tr>
<td>flow_control_mode</td>
<td>[ 12 ]</td>
</tr>
</tbody>
</table>
(continued from previous page)

<table>
<thead>
<tr>
<th>reserved</th>
<th>[ 13 : 15 ]</th>
</tr>
</thead>
</table>

availability.
1-source request postponed until
destination request happens.

struct dma_config

#include <dma.h> DMA configuration structure.

Param dma_slot
[ 0 : 7 ] - which peripheral and direction (HW specific)

Param channel_direction
[ 8 : 10 ] - 000-memory to memory, 001-memory to peripheral, 010-peripheral to memory, 011-peripheral to peripheral, 100-host to memory 101-memory to host...

Param complete_callback_en
[ 11 ] - 0-callback invoked at completion only 1-callback invoked at completion of each block

Param error_callback_en
[ 12 ] - 0-error callback enabled 1-error callback disabled

Param source_handshake

Param dest_handshake
[ 14 ] - 0-HW, 1-SW

Param channel_priority
[ 15 : 18 ] - DMA channel priority

Param source_chaining_en
[ 19 ] - enable/disable source block chaining 0-disable, 1-enable

Param dest_chaining_en
[ 20 ] - enable/disable destination block chaining. 0-disable, 1-enable

Param linked_channel
[ 21 : 27 ] - after channel count exhaust will initiate a channel service request at this channel

Param cyclic
[ 28 ] - enable/disable cyclic buffer 0-disable, 1-enable

Param reserved
[ 29 : 31 ]

Param source_data_size
[ 0 : 15 ] - width of source data (in bytes)

Param dest_data_size
[ 16 : 31 ] - width of dest data (in bytes)

Param source_burst_length
[ 0 : 15 ] - number of source data units

Param dest_burst_length
[ 16 : 31 ] - number of destination data units

Param block_count
is the number of blocks used for block chaining, this depends on availability of the DMA controller.

7.3. Peripherals
Param user_data
    private data from DMA client.

Param dma_callback
    see dma_callback_t for details

struct dma_status
    #include <dma.h> DMA runtime status structure
    busy - is current DMA transfer busy or idle
    dir - DMA transfer direction
    pending_length - data length pending to be transferred in bytes or platform dependent.
    free - free buffer space
    write_position - write position in a circular dma buffer
    read_position - read position in a circular dma buffer

struct dma_context
    #include <dma.h> DMA context structure
    Note: the dma_context shall be the first member of DMA client driver Data, got by dev->data
    magic - magic code to identify the context
    dma_channels - dma channels
    atomic - driver atomic_t pointer

7.3.10 EC Host Command

Overview

API Reference

group ec_host_cmd_periph_interface
    EC Host Command Interface.

Defines

EC_HOST_CMD_HANDLER(_id, _function, _version_mask, _request_type, _response_type)
    Statically define and register a host command handler.
    Helper macro to statically define and register a host command handler that has a compile-
    time-fixed sizes for its both request and response structures.

Parameters
    • _id – Id of host command to handle request for.
    • _function – Name of handler function.
    • _version_mask – The bitfield of all versions that the _function supports. E.g. 
      \texttt{BIT(0)} corresponds to version 0.
    • _request_type – The datatype of the request parameters for _function.
    • _response_type – The datatype of the response parameters for _function.

EC_HOST_CMD_HANDLER_UNBOUND(_id, _function, _version_mask)
    Statically define and register a host command handler without sizes.
    Helper macro to statically define and register a host command handler whose request or
    response structure size is not known as compile time.

Parameters
    • _id – Id of host command to handle request for.
• _function – Name of handler function.
• _version_mask – The bitfield of all versions that the _function supports. E.g.
  \textit{BIT(0)} corresponds to version 0.

Typedefs

typedef enum \texttt{ec\_host\_cmd\_status} (*\texttt{ec\_host\_cmd\_handler\_cb})(\texttt{struct ec\_host\_cmd\_handler\_args} *\texttt{args})

Enums

enum \texttt{ec\_host\_cmd\_status}

  Values:

  enumerator \texttt{EC\_HOST\_CMD\_SUCCESS} = 0
  Host command was successful.

  enumerator \texttt{EC\_HOST\_CMD\_INVALID\_COMMAND} = 1
  The specified command id is not recognized or supported.

  enumerator \texttt{EC\_HOST\_CMD\_ERROR} = 2
  Generic Error.

  enumerator \texttt{EC\_HOST\_CMD\_INVALID\_PARAM} = 3
  One of more of the input request parameters is invalid.

  enumerator \texttt{EC\_HOST\_CMD\_ACCESS\_DENIED} = 4
  Host command is not permitted.

  enumerator \texttt{EC\_HOST\_CMD\_INVALID\_RESPONSE} = 5
  Response was invalid (e.g. not version 3 of header).

  enumerator \texttt{EC\_HOST\_CMD\_INVALID\_VERSION} = 6
  Host command id version unsupported.

  enumerator \texttt{EC\_HOST\_CMD\_INVALID\_CHECKSUM} = 7
  Checksum did not match.

  enumerator \texttt{EC\_HOST\_CMD\_IN\_PROGRESS} = 8
  A host command is currently being processed.

  enumerator \texttt{EC\_HOST\_CMD\_UNAVAILABLE} = 9
  Requested information is currently unavailable.

  enumerator \texttt{EC\_HOST\_CMD\_TIMEOUT} = 10
  Timeout during processing.
enumerator EC_HOST_CMD_OVERFLOW = 11
    Data or table overflow.

enumerator EC_HOST_CMD_INVALID_HEADER = 12
    Header is invalid or unsupported (e.g. not version 3 of header).

enumerator EC_HOST_CMD_REQUEST_TRUNCATED = 13
    Did not receive all expected request data.

enumerator EC_HOST_CMD_RESPONSE_TOO_BIG = 14
