```yaml
properties:
  foo:
    type: int
    default: 3
```

If property `foo` is missing in a matching node, then the output will be as if `foo = <3>;` had appeared in the DTS (except YAML data types are used for the default value).

Note that combining `default:` with `required: true` will raise an error.

For rules related to `default` in upstream Zephyr bindings, see [Rules for default values](#).

See [Example property definitions](#) for examples. Putting `default:` on any property type besides those used in the examples will raise an error.

**Enum values**  The `enum:` line is followed by a list of values the property may contain. If a property value in DTS is not in the `enum:` list in the binding, an error is raised. See [Example property definitions](#) for examples.

**Const**  This specifies a constant value the property must take. It is mainly useful for constraining the values of common properties for a particular piece of hardware.

**Child-binding**  `child-binding` can be used when a node has children that all share the same properties. Each child gets the contents of `child-binding` as its binding, though an explicit `compatible = ...` on the child node takes precedence, if a binding is found for it.

Consider a binding for a PWM LED node like this one, where the child nodes are required to have a `pwms` property:

```yaml
pwmleds {
  compatible = "pwm-leds";

  red_pwmLed {
    pwms = <&pwm3 4 15625000>;
  };

  green_pwmLed {
    pwms = <&pwm3 0 15625000>;
  };
  /* ... */
}
```

The binding would look like this:

```yaml
compatible: "pwm-leds"

child-binding:
  description: LED that uses PWM
```

(continues on next page)
child-binding also works recursively. For example, this binding:

```yaml
compatible: foo

child-binding:
  child-binding:
    properties:
      my-property:
        type: int
        required: true
```

will apply to the grandchild node in this DTS:

```yaml
parent {
  compatible = "foo";
  child {
    grandchild {
      my-property = <123>;
    };
  };
};
```

**Bus**  If the node is a bus controller, use `bus:` in the binding to say what type of bus. For example, a binding for a SPI peripheral on an SoC would look like this:

```yaml
compatible: "manufacturer,spi-peripheral"
bus: spi
# ...
```

The presence of this key in the binding informs the build system that the children of any node matching this binding appear on this type of bus.

This in turn influences the way `on-bus:` is used to match bindings for the child nodes.

For a single bus supporting multiple protocols, e.g. I3C and I2C, the `bus:` in the binding can have a list as value:

```yaml
compatible: "manufacturer,i3c-controller"
bus: [i3c, i2c]
# ...
```

**On-bus**  If the node appears as a device on a bus, use `on-bus:` in the binding to say what type of bus. For example, a binding for an external SPI memory chip should include this line:

```yaml
on-bus: spi
```

And a binding for an I2C based temperature sensor should include this line:

```yaml
on-bus: i2c
```
When looking for a binding for a node, the build system checks if the binding for the parent node contains `bus: <bus type>`. If it does, then only bindings with a matching `on-bus: <bus type>` and bindings without an explicit `on-bus` are considered. Bindings with an explicit `on-bus: <bus type>` are searched for first, before bindings without an explicit `on-bus`. The search repeats for each item in the node's `compatible` property, in order.

This feature allows the same device to have different bindings depending on what bus it appears on. For example, consider a sensor device with compatible `manufacturer,sensor` which can be used via either I2C or SPI.

The sensor node may therefore appear in the devicetree as a child node of either an SPI or an I2C controller, like this:

```plaintext
spi-bus@0 {
    /* ... some compatible with 'bus: spi', etc. ... */

    sensor@0 {
        compatible = "manufacturer,sensor";
        reg = <0>;
    }/* ... */
};

i2c-bus@0 {
    /* ... some compatible with 'bus: i2c', etc. ... */

    sensor@79 {
        compatible = "manufacturer,sensor";
        reg = <79>;
    }/* ... */
};
```

You can write two separate binding files which match these individual sensor nodes, even though they have the same compatible:

```plaintext
# manufacturer,sensor-spi.yaml, which matches sensor@0 on the SPI bus:
compatible: "manufacturer,sensor"
on-bus: spi

# manufacturer,sensor-i2c.yaml, which matches sensor@79 on the I2C bus:
compatible: "manufacturer,sensor"
properties:
    uses-clock-stretching:
        type: boolean
on-bus: i2c
```

Only `sensor@79` can have a `use-clock-stretching` property. The bus-sensitive logic ignores `manufacturer,sensor-i2c.yaml` when searching for a binding for `sensor@0`.

**Specifier cell names (**-cells**)** Specifier cells are usually used with `phandle-array` type properties briefly introduced above.

To understand the purpose of **-cells**, assume that some node has the following `pwms` property with type `phandle-array`:

```plaintext
my-device {
    pwms = &pwm0 1 2>, &pwm3 4>;
};
```
The tooling strips the final s from the property name of such properties, resulting in pwm. Then the value of the #pwm-cells property is looked up in each of the PWM controller nodes pwm0 and pwm3, like so:

```
pwm0: pwm@0 {
    compatible = "foo,pwm";
    #pwm-cells = <2>;
};
pwm3: pwm@3 {
    compatible = "bar,pwm";
    #pwm-cells = <1>;
};
```

The 1 2 part of the property value has two cells, 1 and 2, which matches #pwm-cells = <2>; so these cells are considered the specifier associated with pwm0 in the phandle array.

Similarly, the cell 4 is the specifier associated with pwm3.

The number of PWM cells in the specifiers in pwms must match the #pwm-cells values, as shown above. If there is a mismatch, an error is raised. For example, this node would result in an error:

```
my-bad-device {
    /* wrong: 2 cells given in the specifier, but #pwm-cells is 1 in pwm3. */
    pwms = <&pwm3 5 6>;
};
```

The binding for each PWM controller must also have a *-cells key, in this case pwm-cells, giving names to the cells in each specifier:

```
# foo,pwm.yaml
compatible: "foo,pwm"
...
pwm-cells:
    - channel
    - period

# bar,pwm.yaml
compatible: "bar,pwm"
...
pwm-cells:
    - period
```

A *-names (e.g. pwm-names) property can appear on the node as well, giving a name to each entry. This allows the cells in the specifiers to be accessed by name, e.g. using APIs like DT_PWMS_CHANNEL_BY_NAME.

Because other property names are derived from the name of the property by removing the final s, the property name must end in s. An error is raised if it doesn’t.

An alternative is using a specifier-space property to indicate the base property name for *-names and *-cells.

*-gpios properties are special-cased so that e.g. foo-gpios resolves to #gpio-cells rather than #foo-gpio-cells.

If the specifier is empty (e.g. #clock-cells = <0>), then *-cells can either be omitted (recommended) or set to an empty array. Note that an empty array is specified as e.g. clock-cells: [] in YAML.

All phandle-array type properties support mapping through *-map properties, e.g. gpio-map, as defined by the Devicetree specification.

5.2. Devicetree 989
Include Bindings can include other files, which can be used to share common property definitions between bindings. Use the `include:` key for this. Its value is either a string or a list.

In the simplest case, you can include another file by giving its name as a string, like this:

```
include: foo.yaml
```

If any file named `foo.yaml` is found (see *Where bindings are located* for the search process), it will be included into this binding.

Included files are merged into bindings with a simple recursive dictionary merge. The build system will check that the resulting merged binding is well-formed. It is allowed to include at any level, including child-binding, like this:

```
# foo.yaml will be merged with content at this level
include: foo.yaml

child-binding:
  # bar.yaml will be merged with content at this level
  include: bar.yaml
```

It is an error if a key appears with a different value in a binding and in a file it includes, with one exception: a binding can have `required:` true for a property definition for which the included file has `required:` false. The `required:` true takes precedence, allowing bindings to strengthen requirements from included files.

Note that weakening requirements by having `required:` false where the included file has `required:` true is an error. This is meant to keep the organization clean.

The file `base.yaml` contains definitions for many common properties. When writing a new binding, it is a good idea to check if `base.yaml` already defines some of the needed properties, and include it if it does.

Note that you can make a property defined in `base.yaml` obligatory like this, taking `reg` as an example:

```
reg:
  required: true
```

This relies on the dictionary merge to fill in the other keys for `reg`, like `type`.

To include multiple files, you can use a list of strings:

```
include:
  - foo.yaml
  - bar.yaml
```

This includes the files `foo.yaml` and `bar.yaml`. (You can write this list in a single line of YAML as `include: [foo.yaml, bar.yaml]`.)

When including multiple files, any overlapping `required` keys on properties in the included files are ORed together. This makes sure that a `required:` true is always respected.

In some cases, you may want to include some property definitions from a file, but not all of them. In this case, `include:` should be a list, and you can filter out just the definitions you want by putting a mapping in the list, like this:

```
include:
  - name: foo.yaml
    property-allowlist:
      - i-want-this-one
      - and-this-one
    - name: bar.yaml
      property-blocklist:
```

(continues on next page)
Each map element must have a name key which is the filename to include, and may have property-allowlist and property-blocklist keys that filter which properties are included.

You cannot have a single map element with both property-allowlist and property-blocklist keys. A map element with neither property-allowlist nor property-blocklist is valid; no additional filtering is done.

You can freely intermix strings and mappings in a single include:

```yaml
include:
  - foo.yaml
  - name: bar.yaml
    property-blocklist:
      - do-not-include-this-one
      - or-this-one
```

Finally, you can filter from a child binding like this:

```yaml
include:
  - name: bar.yaml
    child-binding:
      property-allowlist:
        - child-prop-to-allow
```

**Rules for mainline bindings**  This section includes general rules for writing bindings that you want to submit to the mainline Zephyr Project. (You don't need to follow these rules for bindings you don't intend to contribute to the Zephyr Project, but it's a good idea.)

Decisions made by the Zephyr devicetree maintainer override the contents of this section. If that happens, though, please let them know so they can update this page, or you can send a patch yourself.

**Always check for existing bindings**  Zephyr aims for devicetree *source compatibility with other operating systems*. Therefore, if there is an existing binding for your device in an authoritative location, you should try to replicate its properties when writing a Zephyr binding, and you must justify any Zephyr-specific divergences.

In particular, this rule applies if:

- There is an existing binding in the mainline Linux kernel. See `Documentation/devicetree/bindings` in *Linus's tree* for existing bindings and the *Linux devicetree documentation* for more information.
- Your hardware vendor provides an official binding outside of the Linux kernel.

**General rules**

- Bindings which match a compatible must have file names based on the compatible.
  - For example, a binding for compatible `vnd,foo` must be named `vnd,foo.yaml`.
  - If the binding is bus-specific, you can append the bus to the file name; for example, if the binding YAML has `on-bus: bar`, you may name the file `vnd,foo-bar.yaml`.
- All recommendations in *Default values for properties* are requirements when submitting the binding.

In particular, if you use the `default:` feature, you must justify the value in the property's description.
There are two ways to write property description: strings that are always OK.

If your description is short, it's fine to use this style:

```
description: my short string
```

If your description is long or spans multiple lines, you must use this style:

```
description: |
  My very long string
  goes here.
  Look at all these lines!
```

This | style prevents YAML parsers from removing the newlines in multi-line descriptions. This in turn makes these long strings display properly in the `Bindings index`.

Do not use any other style for long or multi-line strings.

Do not use uppercase letters (A through Z) or underscores (_). Use lowercase letters (a through z) instead of uppercase. Use dashes (-) instead of underscores. (The one exception to this rule is if you are replicating a well-established binding from somewhere like Linux.)

### Rules for vendor prefixes

The following general rules apply to vendor prefixes in `compatible` properties.

- If your device is manufactured by a specific vendor, then its compatible should have a vendor prefix.
- If your binding describes hardware with a well known vendor from the list in `dts/bindings/vendor-prefixes.txt`, you must use that vendor prefix.
- If your device is not manufactured by a specific hardware vendor, do not invent a vendor prefix. Vendor prefixes are not mandatory parts of compatible properties, and compatibles should not include them unless they refer to an actual vendor. There are some exceptions to this rule, but the practice is strongly discouraged.
- Do not submit additions to Zephyr's `dts/bindings/vendor-prefixes.txt` file unless you also include users of the new prefix. This means at least a binding and a devicetree using the vendor prefix, and should ideally include a device driver handling that compatible.

For custom bindings, you can add a custom `dts/bindings/vendor-prefixes.txt` file to any directory in your `DTS_ROOT`. The devicetree tooling will respect these prefixes, and will not generate warnings or errors if you use them in your own bindings or devicetrees.

- We sometimes synchronize Zephyr's vendor-prefixes.txt file with the Linux kernel's equivalent file; this process is exempt from the previous rule.
- If your binding is describing an abstract class of hardware with Zephyr specific drivers handling the nodes, it's usually best to use `zephyr` as the vendor prefix. See [Zephyr-specific binding (zephyr)] for examples.

### Rules for default values

In any case where `default:` is used in a devicetree binding, the description: for that property must explain why the value was selected and any conditions that would make it necessary to provide a different value. Additionally, if changing one property would require changing another to create a consistent configuration, then those properties should be made required.

There is no need to document the default value itself; this is already present in the `Bindings index` output.

There is a risk in using `default:` when the value in the binding may be incorrect for a particular board or hardware configuration. For example, defaulting the capacity of the connected power cell in a charging IC binding is likely to be incorrect. For such properties it's better to make the property `required: true`, forcing the user to make an explicit choice.
Driver developers should use their best judgment as to whether a value can be safely defaulted. Candidates for default values include:

- delays that would be different only under unusual conditions (such as intervening hardware)
- configuration for devices that have a standard initial configuration (such as a USB audio headset)
- defaults which match the vendor-specified power-on reset value (as long as they are independent from other properties)

Examples of how to write descriptions according to these rules:

```
properties:
cs-interval:
  type: int
default: 0
description: |
  Minimum interval between chip select deassertion and assertion.
  The default corresponds to the reset value of the register field.

hold-time-ms:
  type: int
default: 20
description: |
  Amount of time to hold the power enable GPIO asserted before initiating communication. The default was recommended in the manufacturer datasheet, and would only change under very cold temperatures.
```

Some examples of what **not** to do, and why:

```
properties:
  # Description doesn't mention anything about the default
  foo:
    type: int
default: 1
description: number of foos

  # Description mentions the default value instead of why it was chosen
  bar:
    type: int
default: 2
description: bar size; default is 2

  # Explanation of the default value is in a comment instead of the description. This won't be shown in the bindings index.
  baz:
    type: int
    # This is the recommended value chosen by the manufacturer.
    default: 2
description: baz time in milliseconds
```

**Inferred bindings**  Zephyr's devicetree scripts can “infer” a binding for the special `/zephyr/user` node based on the values observed in its properties.

This node matches a binding which is dynamically created by the build system based on the values of its properties in the final devicetree. It does not have a `compatible` property.

This node is meant for sample code and applications. The devicetree API provides it as a convenient container when only a few simple properties are needed, such as storing a hardware-dependent value,
phandle(s), or GPIO pin.

For example, with this DTS fragment:

```c
#include <zephyr/dt-bindings/gpio/gpio.h>

/ {
    zephyr,user {
        boolean;
        bytes = [81 82 83];
        number = <23>;
        numbers = <1>, <2>, <3>;
        string = "text";
        strings = "a", "b", "c";
        handle = <&gpio0>;
        handles = <&gpio0>, <&gpio1>;
        signal-gpios = <&gpio0 1 GPIO_ACTIVE_HIGH>;
    }
};
```

You can get the simple values like this:

```c
#define ZEPHYR_USER_NODE DT_PATH(zephyr_user)

DT_PROP(ZEPHYR_USER_NODE, boolean) // 1
DT_PROP(ZEPHYR_USER_NODE, bytes) // {0x81, 0x82, 0x83}
DT_PROP(ZEPHYR_USER_NODE, number) // 23
DT_PROP(ZEPHYR_USER_NODE, numbers) // {1, 2, 3}
DT_PROP(ZEPHYR_USER_NODE, string) // "text"
DT_PROP(ZEPHYR_USER_NODE, strings) // {"a", "b", "c"}
```

You can convert the phandles in the handle and handles properties to device pointers like this:

```c
const struct device *my_device =
    DEVICE_RT_GET(DT_PROP(ZEPHYR_USER_NODE, handle));
```

```c
const struct device *my_devices[] = {
    DEVICE_RT_GET(DT_PROP(ZEPHYR_USER_NODE, handles) idx),
};
```

And you can convert the pin defined in signal-gpios to a struct gpio_dt_spec, then use it like this:
```
#include <zephyr/drivers/gpio.h>
#define ZEPHYR_USER_NODE DT_PATH(zephyr_user)

const struct gpio_dt_spec signal =
    GPIO_DT_SPEC_GET(ZEPHYR_USER_NODE, signal_gpios);

/* Configure the pin */
gpio_pin_configure_dt(&signal, GPIO_OUTPUT_INACTIVE);

/* Set the pin to its active level */
gpio_pin_set_dt(&signal, 1);
```

(See `gpio_dt_spec`, `GPIO_DT_SPEC_GET`, and `gpio_pin_configure_dt()` for details on these APIs.)

Devicetree access from C/C++

This guide describes Zephyr's `<devicetree.h>` API for reading the devicetree from C source files. It assumes you're familiar with the concepts in Introduction to devicetree and Devicetree bindings. See Devicetree Reference for reference material.

A note for Linux developers  Linux developers familiar with devicetree should be warned that the API described here differs significantly from how devicetree is used on Linux.

Instead of generating a C header with all the devicetree data which is then abstracted behind a macro API, the Linux kernel would instead read the devicetree data structure in its binary form. The binary representation is parsed at runtime, for example to load and initialize device drivers.

Zephyr does not work this way because the size of the devicetree binary and associated handling code would be too large to fit comfortably on the relatively constrained devices Zephyr supports.

Node identifiers  To get information about a particular devicetree node, you need a node identifier for it. This is a just a C macro that refers to the node.

These are the main ways to get a node identifier:

**By path**
Use `DT_PATH()` along with the node's full path in the devicetree, starting from the root node. This is mostly useful if you happen to know the exact node you're looking for.

**By node label**
Use `DT_NODELABEL()` to get a node identifier from a node label. Node labels are often provided by SoC .dtsi to give nodes names that match the SoC datasheet, like i2c1, spi2, etc.

**By alias**
Use `DT_ALIAS()` to get a node identifier for a property of the special /aliases node. This is sometimes done by applications (like blinky, which uses the led0 alias) that need to refer to some device of a particular type ("the board's user LED") but don't care which one is used.

**By instance number**
This is done primarily by device drivers, as instance numbers are a way to refer to individual nodes based on a matching compatible. Get these with `DT_INST()`, but be careful doing so. See below.

**By chosen node**
Use `DT_CHOSEN()` to get a node identifier for /chosen node properties.

**By parent/child**
Use `DT_PARENT()` and `DT_CHILD()` to get a node identifier for a parent or child node, starting from a node identifier you already have.

5.2. Devicetree
Two node identifiers which refer to the same node are identical and can be used interchangeably. Here’s a DTS fragment for some imaginary hardware we’ll return to throughout this file for examples:

```dts
/dts-v1/;
/
{
    aliases {
        sensor-controller = &i2c1;
    };
    soc {
        i2c1: i2c@40002000 {
            compatible = "vnd,soc-i2c";
            label = "I2C_1";
            reg = <0x40002000 0x1000>;
            status = "okay";
            clock-frequency = < 100000 >;
        }
    }
};
```

Here are a few ways to get node identifiers for the `i2c@40002000` node:

- `DT_PATH(soc, i2c_40002000)`
- `DT_NODELABEL(i2c1)`
- `DT_ALIAS(sensor_controller)`
- `DT_INST(x, vnd_soc_i2c)` for some unknown number `x`. See the `DT_INST()` documentation for details.

**Important:** Non-alphanumeric characters like dash (-) and the at sign (@) in devicetree names are converted to underscores (_). The names in a DTS are also converted to lowercase.

**Node identifiers are not values** There is no way to store one in a variable. You cannot write:

```c
/* These will give you compiler errors: */
void *i2c_0 = DT_INST(0, vnd_soc_i2c);
unsigned int i2c_1 = DT_INST(1, vnd_soc_i2c);
long my_i2c = DT_NODELABEL(i2c1);
```

If you want something short to save typing, use C macros:

```c
/* Use something like this instead: */
#define MY_I2C DT_NODELABEL(i2c1)
#define INST(i) DT_INST(i, vnd_soc_i2c)
#define I2C_0 INST(0)
#define I2C_1 INST(1)
```

**Property access** The right API to use to read property values depends on the node and property.
• Simple properties
• reg properties
• interrupts properties
• phandle properties

Checking properties and values You can use `DT_NODE_HAS_PROP()` to check if a node has a property. For the example devicetree above:

```
DT_NODE_HAS_PROP(DT_NODELABEL(i2c1), clock_frequency) /* expands to 1 */
DT_NODE_HAS_PROP(DT_NODELABEL(i2c1), not_a_property) /* expands to 0 */
```

Simple properties Use `DT_PROP(node_id, property)` to read basic integer, boolean, string, numeric array, and string array properties.

For example, to read the clock-frequency property's value in the above example:

```
DT_PROP(DT_PATH(soc, i2c_40002000), clock_frequency) /* This is 100000, */
DT_PROP(DT_NODELABEL(i2c1), clock_frequency) /* and so is this, */
DT_PROP(DT_ALIAS(sensor_controller), clock_frequency) /* and this. */
```

**Important:** The DTS property `clock-frequency` is spelled `clock_frequency` in C. That is, properties also need special characters converted to underscores. Their names are also forced to lowercase.

Properties with string and boolean types work the exact same way. The `DT_PROP()` macro expands to a string literal in the case of strings, and the number 0 or 1 in the case of booleans. For example:

```
#define I2C1 DT_NODELABEL(i2c1)

DT_PROP(I2C1, status) /* expands to the string literal "okay" */
```

**Note:** Don’t use `DT_NODE_HAS_PROP()` for boolean properties. Use `DT_PROP()` instead as shown above. It will expand to either 0 or 1 depending on if the property is present or absent.

Properties with type array, uint8-array, and string-array work similarly, except `DT_PROP()` expands to an array initializer in these cases. Here is an example devicetree fragment:

```
foo: foo@1234 {
   a = <1000 2000 3000>; /* array */
   b = [aa bb cc dd]; /* uint8-array */
   c = "bar", "baz"; /* string-array */
};
```

Its properties can be accessed like this:

```
#define FOO DT_NODELABEL(foo)

int a[] = DT_PROP(FOO, a); /* {1000, 2000, 3000} */
unsigned char b[] = DT_PROP(FOO, b); /* {0xaa, 0xbb, 0xcc, 0xdd} */
char* c[] = DT_PROP(FOO, c); /* {"foo", "bar"} */
```

You can use `DT_PROP_LEN()` to get logical array lengths in number of elements.
size_t a_len = DT_PROP_LEN(FOO, a); /* 3 */
size_t b_len = DT_PROP_LEN(FOO, b); /* 4 */
size_t c_len = DT_PROP_LEN(FOO, c); /* 2 */

DT_PROP_LEN() cannot be used with the special reg or interrupts properties. These have alternative macros which are described next.

**reg properties**  
See *Important properties* for an introduction to reg.

Given a node identifier node_id, DT_NUM_REGS(node_id) is the total number of register blocks in the node's reg property.

You **cannot** read register block addresses and lengths with DT_PROP(node, reg). Instead, if a node only has one register block, use `DT_REG_ADDR()` or `DT_REG_SIZE()`:

- `DT_REG_ADDR(node_id)`: the given node's register block address
- `DT_REG_SIZE(node_id)`: its size

Use `DT_REG_ADDR_BY_IDX()` or `DT_REG_SIZE_BY_IDX()` instead if the node has multiple register blocks:

- `DT_REG_ADDR_BY_IDX(node_id, idx)`: address of register block at index idx
- `DT_REG_SIZE_BY_IDX(node_id, idx)`: size of block at index idx

The idx argument to these must be an integer literal or a macro that expands to one without requiring any arithmetic. In particular, idx cannot be a variable. This won't work:

```c
/* This will cause a compiler error. */
for (size_t i = 0; i < DT_NUM_REGS(node_id); i++) {
    size_t addr = DT_REG_ADDR_BY_IDX(node_id, i);
}
```

**interrupts properties**  
See *Important properties* for a brief introduction to interrupts.

Given a node identifier node_id, DT_NUM_IRQS(node_id) is the total number of interrupt specifiers in the node's interrupts property.

The most general purpose API macro for accessing these is `DT_IRQ_BY_IDX()`:

```
DT_IRQ_BY_IDX(node_id, idx, val)
```

Here, idx is the logical index into the interrupts array, i.e. it is the index of an individual interrupt specifier in the property. The val argument is the name of a cell within the interrupt specifier. To use this macro, check the bindings file for the node you are interested in to find the val names.

Most Zephyr devicetree bindings have a cell named irq, which is the interrupt number. You can use `DT_IRQN()` as a convenient way to get a processed view of this value.

**Warning:** Here, "processed" reflects Zephyr's devicetree *Scripts and tools*, which change the irq number in zephyr.dts to handle hardware constraints on some SoCs and in accordance with Zephyr's multilevel interrupt numbering.

This is currently not very well documented, and you'll need to read the scripts' source code and existing drivers for more details if you are writing a device driver.
phandle properties  Property values can refer to other nodes using the &another-node phandle syntax introduced in Writing property values. Properties which contain phandles have type phandle, phandles, or phandle-array in their bindings. We'll call these "phandle properties" for short.

You can convert a phandle to a node identifier using DT_PHANDLE(), DT_PHANDLE_BY_IDX(), or DT_PHANDLE_BY_NAME(), depending on the type of property you are working with.

One common use case for phandle properties is referring to other hardware in the tree. In this case, you usually want to convert the devicetree-level phandle to a Zephyr driver-level struct device. See Get a struct device from a devicetree node for ways to do that.

Another common use case is accessing specifier values in a phandle array. The general purpose APIs for this are DT_PHA_BY_IDX() and DT_PHA(). There are also hardware-specific short-hands like DT_GPIO_CTLR_BY_IDX(), DT_GPIO_CTLR(), DT_GPIO_LABEL_BY_IDX(), DT_GPIO_LABEL(), DT_GPIO_PIN_BY_IDX(), DT_GPIO_PIN(), DT_GPIO_FLAGS_BY_IDX(), and DT_GPIO_FLAGS().

See DT_PHA_HAS_CELL_AT_IDX() and DT_PROP_HAS_IDX() for ways to check if a specifier value is present in a phandle property.

Other APIs  Here are pointers to some other available APIs.

- DT_CHOSEN(), DT_HAS_CHOSEN(): for properties of the special /chosen node
- DT_HAS_COMPAT_STATUS_OKAY(), DT_NODE_HAS_COMPAT(): global- and node-specific tests related to the compatible property
- DT_BUS(): get a node’s bus controller, if there is one
- DT_ENUM_IDX(): for properties whose values are among a fixed list of choices
- Fixed flash partitions: APIs for managing fixed flash partitions. Also see Flash map, which wraps this in a more user-friendly API.

Device driver conveniences  Special purpose macros are available for writing device drivers, which usually rely on instance identifiers.

To use these, you must define DT_DRV_COMPAT to the compat value your driver implements support for. This compat value is what you would pass to DT_INST().

If you do that, you can access the properties of individual instances of your compatible with less typing, like this:

```c
#include <zephyr/devicetree.h>

#define DT_DRV_COMPAT my_driver_compat

/* This is same thing as DT_INST(0, my_driver_compat): */
DT_DRV_INST(0)

/*
 * This is the same thing as
 * DT_PROP(DT_INST(0, my_driver_compat), clock_frequency)
 */
DT_INST_PROP(0, clock_frequency)
```

See Instance-based APIs for a generic API reference.

Hardware specific APIs  Convenience macros built on top of the above APIs are also defined to help readability for hardware specific code. See Hardware specific APIs for details.
Generated macros  While the devicetree.h API is not generated, it does rely on a generated C header which is put into every application build directory: devicetree_generated.h. This file contains macros with devicetree data.

These macros have tricky naming conventions which the Devicetree API abstracts away. They should be considered an implementation detail, but it’s useful to understand them since they will frequently be seen in compiler error messages.

This section contains an Augmented Backus-Naur Form grammar for these generated macros, with examples and more details in comments. See RFC 7405 (which extends RFC 5234) for a syntax specification.

```
; An RFC 7405 ABNF grammar for devicetree macros.
;
; This does *not* cover macros pulled out of DT via Kconfig,
; like CONFIG_SRAM_BASE_ADDRESS, etc. It only describes the
; ones that start with DT_ and are directly generated.

; dt-macro: the top level nonterminal for a devicetree macro
;
; A dt-macro starts with uppercase "DT_", and is one of:
;
; - a <node-macro>, generated for a particular node
; - some <other-macro>, a catch-all for other types of macros

dt-macro = node-macro / other-macro

; node-macro: a macro related to a node
;
; A macro about a property value
node-macro = property-macro
; A macro about the pinctrl properties in a node.
node-macro = pinctrl-macro
; EXISTS macro: node exists in the devicetree
node-macro = / %s"DT_N" path-id %s"_EXISTS"
; Bus macros: the plain BUS is a way to access a node's bus controller.
; The additional dt-name suffix is added to match that node's bus type;
; the dt-name in this case is something like "spi" or "i2c".
node-macro = / %s"DT_N" path-id %s"_BUS" ["_" dt-name]
node-macro = / %s"DT_N" path-id %s"_REG_NUM"
node-macro = / %s"DT_N" path-id %s"_REG_IDX_" DIGIT "_EXISTS"
node-macro = / %s"DT_N" path-id %s"_REG_IDX_" DIGIT
   %s"_VAL_" ( %s"ADDRESS" / %s"SIZE")
node-macro = / %s"DT_N" path-id %s"_REG_NAME_" dt-name
   %s"_VAL_" ( %s"ADDRESS" / %s"SIZE")
;
; The interrupts property is also special.
node-macro = / %s"DT_N" path-id %s"_IRQ_NUM"
node-macro = / %s"DT_N" path-id %s"_IRQ_IDX_" DIGIT "_EXISTS"
node-macro = / %s"DT_N" path-id %s"_IRQ_IDX_" DIGIT
   %s"_VAL_" dt-name [ %s"_EXISTS" ]
node-macro = / %s"DT_N" path-id %s"_IRQ_NAME_" dt-name
   %s"_VAL_" dt-name [ %s"_EXISTS" ]
;
; The ranges property is also special.
node-macro = / %s"DT_N" path-id %s"_RANGES_NUM"
node-macro = / %s"DT_N" path-id %s"_RANGES_IDX_" DIGIT "_EXISTS"
node-macro = / %s"DT_N" path-id %s"_RANGES_IDX_" DIGIT
   %s"_VAL_" ( %s"CHILD_BUS_FLAGS" / %s"CHILD_BUS_ADDRESS" /
   %s"PARENT_BUS_ADDRESS" / %s"LENGTH")
```
node-macro =/ %s"DT_N" path-id %s"_RANGES_IDX_" DIGIT %s"_VAL_CHILD_BUS_FLAGS_EXISTS"

; Subnodes of the fixed-partitions compatible get macros which contain
; a unique ordinal value for each partition
node-macro =/ %s"DT_N" path-id %s"_PARTITION_ID_" DIGIT
; Macros are generated for each of a node's compatibles;
; dt-name in this case is something like "vnd_device".
node-macro =/ %s"DT_N" path-id %s"_COMPAT_MATCHES_" dt-name
node-macro =/ %s"DT_N" path-id %s"_COMPAT_VENDOR_IDX_" DIGIT "_EXISTS"
node-macro =/ %s"DT_N" path-id %s"_COMPAT_VENDOR_IDX_" DIGIT
node-macro =/ %s"DT_N" path-id %s"_COMPAT_MODEL_IDX_" DIGIT "_EXISTS"
node-macro =/ %s"DT_N" path-id %s"_COMPAT_MODEL_IDX_" DIGIT

; Every non-root node gets one of these macros, which expands to the node
; identifier for that node's parent in the devicetree.
node-macro =/ %s"DT_N" path-id %s"_PARENT"
; These are used internally by DT_FOREACH_PROP_ELEM(_SEP)(_VARGS), which
; iterates over each property element.
node-macro =/ %s"DT_N" path-id %s"_P_" prop-id %s"_FOREACH_PROP_ELEM"
node-macro =/ %s"DT_N" path-id %s"_P_" prop-id %s"_FOREACH_PROP_ELEM_SEP"
node-macro =/ %s"DT_N" path-id %s"_P_" prop-id %s"_FOREACH_PROP_ELEM_VARGS"
node-macro =/ %s"DT_N" path-id %s"_P_" prop-id %s"_FOREACH_PROP_ELEM_SEP_VARGS"

; These are used internally by DT_FOREACH_CHILD, which iterates over
; each child node.
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD"
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD_SEP"
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD_VARGS"
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD_SEP_VARGS"

; These are used internally by DT_FOREACH_CHILD_STATUS_OKAY, which iterates
; over each child node with status "okay".
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD_STATUS_OKAY"
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD_STATUS_OKAY_SEP"
node-macro =/ %s"DT_N" path-id %s"_FOREACH_CHILD_STATUS_OKAY_VARGS"

; The node's zero-based index in the list of it's parent's child nodes.
node-macro =/ %s"DT_N" path-id %s"_CHILD_IDX"

node-macro =/ %s"DT_N" path-id %s"_STATUS_" dt-name
; The node's status macro; dt-name in this case is something like "okay"
; or "disabled".
node-macro =/ %s"DT_N" path-id %s"_ORD"
; The node's dependency ordinal. This is a non-negative integer
; value that is used to represent dependency information.
node-macro =/ %s"DT_N" path-id %s"_PATH"
; The node's path, as a string literal
node-macro =/ %s"DT_N" path-id %s"_FULL_NAME"
; The dependency ordinals of a node's requirements (direct dependencies).
node-macro =/ %s"DT_N" path-id %s"_REQUIRES_ORDS"
; The dependency ordinals of a node supports (reverse direct dependencies).
node-macro =/ %s"DT_N" path-id %s"_SUPPORTS_ORDS"

; pinctrl-macro: a macro related to the pinctrl properties in a node
; These are a bit of a special case because they kind of form an array,
; but the array indexes correspond to pinctrl-DIGIT properties in a node.
So they're related to a node, but not just one property within the node.

The following examples assume something like this:

```
foo {
    pinctrl-0 = @bar@;
    pinctrl-1 = @baz@;
    pinctrl-names = "default", "sleep";
};
```

Total number of pinctrl-DIGIT properties in the node. May be zero.

```
#define DT_N_<node path>_PINCTRL_NUM 2
pinctrl-macro = %s"DT_N" path-id %s"_PINCTRL_NUM"
```

A given pinctrl-DIGIT property exists.

```
#define DT_N_<node path>_PINCTRL_IDX_0_EXISTS 1
#define DT_N_<node path>_PINCTRL_IDX_1_EXISTS 1
pinctrl-macro =/ %s"DT_N" path-id %s"_PINCTRL_IDX_" DIGIT %s"_EXIST"
```

A given pinctrl property name exists.

```
#define DT_N_<node path>_PINCTRL_NAME_default_EXISTS 1
#define DT_N_<node path>_PINCTRL_NAME_sleep_EXISTS 1
pinctrl-macro =/ %s"DT_N" path-id %s"_PINCTRL_NAME_" dt-name %s"_EXIST"
```

The corresponding index number of a named pinctrl property.

```
#define DT_N_<node path>_PINCTRL_NAME_default_IDX 0
#define DT_N_<node path>_PINCTRL_NAME_sleep_IDX 1
pinctrl-macro =/ %s"DT_N" path-id %s"_PINCTRL_NAME_" dt-name %s"_IDX"
```

The node identifier for the phandle in a named pinctrl property.

```
#define DT_N_<node path>_PINCTRL_NAME_default_IDX_0_PH <node id for 'bar'>
```

There's no need for a separate macro for access by index: that's covered by property-macro. We only need this because the map from names to properties is implicit in the structure of the DT.

```
pinctrl-macro =/ %s"DT_N" path-id %s"_PINCTRL_NAME_" dt-name %s"_IDX_" DIGIT %s"_PH"
```

----------------------------------------

property-macro: a macro related to a node property

These combine a node identifier with a "lowercase-and-underscores form" property name. The value expands to something related to the property's value.

The optional prop-suf suffix is when there's some specialized subvalue that deserves its own macro, like the macros for an array property's individual elements.

The "plain vanilla" macro for a property's value, with no prop-suf, looks like this:

```
DT_N_<node path>_P_<property name>
```

Components:
property-macro = %s"DT_N" path-id %s"_P_" prop-id [prop-suf]

; --------------------------------------------------------------------
; path-id: a node's path-based macro identifier
; This in "lowercase-and-underscores" form. I.e. it is
; the node's devicetree path converted to a C token by changing:
; - each slash (/) to _S_
; - all letters to lowercase
; - non-alphanumerics characters to underscores
;
; For example, the leaf node "bar-BAZ" in this devicetree:
;
; / {
;   foo@123 {
;     bar-BAZ {};
;   };
; }
;
; has path-id "_S_foo_123_S_bar_baz".
path-id = 1*( %s"_S_" dt-name )

;----------------------------------------------------------------------
; prop-id: a property identifier
; A property name converted to a C token by changing:
; - all letters to lowercase
; - non-alphanumeric characters to underscores
;
; Example node:
;
; chosen {
;   zephyr,console = &uart1;
;   WHY,AM_I_SHOUTING = "unclear";
; }
;
; The 'zephyr,console' property has prop-id 'zephyr_console'.
; 'WHY,AM_I_SHOUTING' has prop-id 'why_am_i_shouting'.
prop-id = dt-name

;----------------------------------------------------------------------
; prop-suf: a property-specific macro suffix
; Extra macros are generated for properties:
; - that are special to the specification ("reg", "interrupts", etc.)
; - with array types (uint8-array, phandle-array, etc.)
; - with "enum:" in their bindings
; - that have zephyr device API specific macros for phandle-arrays
; - related to phandle specifier names ("foo-names")

(continues on next page)
Here are some examples:

- `_EXISTS`: property, index or name existence flag
- `_SIZE`: logical property length
- `_IDX_<i>`: values of individual array elements
- `_IDX_<DIGIT>_VAL_<dt-name>`: values of individual specifier
- `_ADDR_<i>`: for reg properties, the i-th register block address
- `_LEN_<i>`: for reg properties, the i-th register block length

The different cases are not exhaustively documented here to avoid this file going stale. Please see devicetree.h if you need to know the details.

```
prop-suf = 1*( "_" gen-name ["_" dt-name] )
```

See examples below.

```
other-macro = %s"DT_N_" alternate-id
other-macro =/ %s"DT_N_INST_" dt-name %s"NUM_OKAY"
other-macro =/ %s"DT_FOREACH_HELPER"
other-macro =/ %s"DT_FOREACH_OKAY_HELPER"
other-macro =/ %s"DT_FOREACH_OKAY_" dt-name
other-macro =/ %s"DT_FOREACH_OKAY_VARGS_" dt-name
other-macro =/ %s"DT_CHOSEN_" dt-name
other-macro =/ %s"DT_COMPAT_" dt-name %s"BUS_" dt-name
other-macro =/ %s"DT_COMPAT_HAS_OKAY_" dt-name
other-macro =/ %s"DT_COMPAT_LABEL_" dt-name
```

Alternate-id: another way to specify a node besides a path-id

Example devicetree:
Node device@123 has these alternate-id values:

- ALIAS_dev
- NODELABEL_dev_1
- INST_0_vnd_device

The full alternate-id macros are:

```c
#define DT_N_INST_0_vnd_device DT_N_S_soc_S_device_123
#define DT_N_ALIAS_dev DT_N_S_soc_S_device_123
#define DT_N_NODELABEL_dev_1 DT_N_S_soc_S_device_123
```

These mainly exist to allow pasting an alternate-id macro onto a
"_P_<prop-id>" to access node properties given a node's alias, etc.

Notice that "inst"-type IDs have a leading instance identifier,
which is generated by the devicetree scripts. The other types of
alternate-id begin immediately with names taken from the devicetree.

**alternate-id = ( %s"ALIAS" / %s"NODELABEL" ) dt-name**

**alternate-id =/ %s"INST" 1*DIGIT "_" dt-name**

---

**miscellaneous helper definitions**

A dt-name is one or more:

- lowercase ASCII letters (a-z)
- numbers (0-9)
- underscores ("_")

They are the result of converting names or combinations of names
from devicetree to a valid component of a C identifier by
lowercasing letters (in practice, this is a no-op) and converting
non-alphanumeric characters to underscores.

You'll see these referred to as "lowercase-and-underscores" forms of
various devicetree identifiers throughout the documentation.

**dt-name = 1*( lower / DIGIT / "_" )**

**gen-name is used as a stand-in for a component of a generated macro
name which does not come from devicetree (dt-name covers that case).**

- uppercase ASCII letters (a-z)
- numbers (0-9)

(continues on next page)
Devicetree HOWTOs

This page has step-by-step advice for getting things done with devicetree.

Tip: See Troubleshooting devicetree for troubleshooting advice.

Get your devicetree and generated header  A board’s devicetree (BOARD.dts) pulls in common node definitions via #include preprocessor directives. This at least includes the SoC’s .dtsi. One way to figure out the devicetree’s contents is by opening these files, e.g. by looking in dts/<ARCH>/<vendor>/<soc>.dtsi, but this can be time consuming.

If you just want to see the “final” devicetree for your board, build an application and open the zephyr.dts file in the build directory.

Tip: You can build hello_world to see the “base” devicetree for your board without any additional changes from overlay files.

For example, using the qemu_cortex_m3 board to build hello_world:

```bash
# --cmake-only here just forces CMake to run, skipping the # build process to save time.
west build -b qemu_cortex_m3 samples/hello_world --cmake-only
```

You can change qemu_cortex_m3 to match your board.

CMake prints the input and output file locations like this:

```
-- Found BOARD.dts: .../zephyr/boards/arm/qemu_cortex_m3/qemu_cortex_m3.dts
-- Generated zephyr.dts: .../zephyr/build/zephyr/zephyr.dts
-- Generated devicetree_generated.h: .../zephyr/build/zephyr/include/generated/
    → devicetree_generated.h
```

The zephyr.dts file is the final devicetree in DTS format.
The devicetree_generated.h file is the corresponding generated header.
See Input and output files for details about these files.

Get a struct device from a devicetree node  When writing Zephyr applications, you’ll often want to get a driver-level struct device corresponding to a devicetree node.

For example, with this devicetree fragment, you might want the struct device for serial@0x0002000:
Start by making a **node identifier** for the device you are interested in. There are different ways to do this; pick whichever one works best for your requirements. Here are some examples:

```c
/* Option 1: by node label */
#define MY_SERIAL DT_NODELABEL(serial0)

/* Option 2: by alias */
#define MY_SERIAL DT_ALIAS(my_serial)

/* Option 3: by chosen node */
#define MY_SERIAL DT_CHOSEN(zephyr_console)

/* Option 4: by path */
#define MY_SERIAL DT_PATH(soc, serial@40002000)
```

Once you have a node identifier there are two ways to proceed. One way to get a device is to use `DEVICE_DT_GET()`:

```c
const struct device *const uart_dev = DEVICE_DT_GET(MY_SERIAL);
if (!device_is_ready(uart_dev)) {
    /* Not ready, do not use */
    return -ENODEV;
}
```

There are variants of `DEVICE_DT_GET()` such as `DEVICE_DT_GET_OR_NULL()`, `DEVICE_DT_GET_ONE()` or `DEVICE_DT_GET_ANY()`. This idiom fetches the device pointer at build-time, which means there is no runtime penalty. This method is useful if you want to store the device pointer as configuration data. But because the device may not be initialized, or may have failed to initialize, you must verify that the device is ready to be used before passing it to any API functions. (This check is done for you by `device_get_binding()`.)

In some situations the device cannot be known at build-time, e.g., if it depends on user input like in a shell application. In this case you can get the `struct device` by combining `device_get_binding()` with the device name:

```c
const char *dev_name = /* TODO: insert device name from user */;
const struct device *uart_dev = device_get_binding(dev_name);
```

You can then use `uart_dev` with UART API functions like `uart_configure()`. Similar code will work for other device types; just make sure you use the correct API for the device.

5.2. Devicetree
If you're having trouble, see *Troubleshooting devicetree*. The first thing to check is that the node has status = "okay", like this:

```c
#define MY_SERIAL DT_NODELABEL(my_serial)

#if DT_NODE_HAS_STATUS(MY_SERIAL, okay)
    const struct device *const uart_dev = DEVICE_DT_GET(MY_SERIAL);
#else
    #error "Node is disabled"
#endif
```

If you see the #error output, make sure to enable the node in your devicetree. In some situations your code will compile but it will fail to link with a message similar to:

```
...undefined reference to `_device_dts_ord_N'
collect2: error: ld returned 1 exit status
```

This likely means there's a Kconfig issue preventing the device driver from being built, resulting in a reference that does not exist. If your code compiles successfully, the last thing to check is if the device is ready, like this:

```c
if (!device_is_ready(uart_dev)) {
    printk("Device not ready\n");
}
```

If you find that the device is not ready, it likely means that the device's initialization function failed. Enabling logging or debugging driver code may help in such situations. Note that you can also use `device_get_binding()` to obtain a reference at runtime. If it returns `NULL` it can either mean that device's driver failed to initialize or that it does not exist.

### Find a devicetree binding

Devicetree bindings are YAML files which declare what you can do with the nodes they describe, so it's critical to be able to find them for the nodes you are using.

If you don't have them already, *Get your devicetree and generated header*. To find a node's binding, open the generated header file, which starts with a list of nodes in a block comment:

```c
/*
 * [...]
 * Nodes in dependency order (ordinal and path):
 * 0 /
 * 1 /aliases
 * 2 /chosen
 * 3 /flash@0
 * 4 /memory@20000000
 * (etc.)
 * [...]
 */
```

Make note of the path to the node you want to find, like `/flash@0`. Search for the node's output in the file, which starts with something like this if the node has a matching binding:

```c
/*
 * Devicetree node:
 * /flash@0
 * * Binding (compatible = soc-nv-flash):
 *   $ZEPHYR_BASE/dts/bindings/mtd/soc-nv-flash.yaml
 * [...]
 */
```
See \textit{Check for missing bindings} for troubleshooting.

**Set devicetree overlays** Devicetree overlays are explained in \textit{Introduction to devicetree}. The CMake variable DTC\_OVERLAY\_FILE contains a space- or semicolon-separated list of overlay files to use. If DTC\_OVERLAY\_FILE specifies multiple files, they are included in that order by the C preprocessor. A file in a Zephyr module can be referred to by escaping the Zephyr module dir variable like \\
\$\{ZEPHYR\_<module>_MODULE\_DIR\}/\<path-to>/dts.overlay when setting the DTC\_OVERLAY\_FILE variable.

You can set DTC\_OVERLAY\_FILE to contain exactly the files you want to use. Here is an example using using west build.

If you don't set DTC\_OVERLAY\_FILE, the build system will follow these steps, looking for files in your application configuration directory to use as devicetree overlays:

1. If the file boards/<BOARD>.overlay exists, it will be used.
2. If the current board has multiple revisions and boards/<BOARD>_<revision>.overlay exists, it will be used. This file will be used in addition to boards/<BOARD>.overlay if both exist.
3. If one or more files have been found in the previous steps, the build system stops looking and just uses those files.
4. Otherwise, if <BOARD>.overlay exists, it will be used, and the build system will stop looking for more files.
5. Otherwise, if app.overlay exists, it will be used.

All configuration files will be taken from the application's configuration directory except for files with an absolute path that are given with the DTC\_OVERLAY\_FILE argument.

See Application Configuration Directory on how the application configuration directory is defined.

Using Shields will also add devicetree overlay files.

The DTC\_OVERLAY\_FILE value is stored in the CMake cache and used in successive builds.

The \textit{build system} prints all the devicetree overlays it finds in the configuration phase, like this:

```
-- Found devicetree overlay: .../some/file.overlay
```

**Use devicetree overlays** See \textit{Set devicetree overlays} for how to add an overlay to the build.

Overlays can override node property values in multiple ways. For example, if your BOARD.dts contains this node:

```
/ {
    soc {
        serial0: serial@40002000 {
            status = "okay";
            current-speed = <115200>;
        };
        /* ... */
    };
}
```

These are equivalent ways to override the current-speed value in an overlay:

```
/* Option 1 */
&serial0 {
    current-speed = <9600>;
};
```

(continues on next page)
/* Option 2 */
&{soc/serial@40002000} {
    current-speed = <9600>;
};

We'll use the &serial0 style for the rest of these examples.

You can add aliases to your devicetree using overlays: an alias is just a property of the /aliases node. For example:

/ {
    aliases {
        my-serial = &serial0;
    }
};

Chosen nodes work the same way. For example:

/ {
    chosen {
        zephyr,console = &serial0;
    }
};

To delete a property (in addition to deleting properties in general, this is how to set a boolean property to false if it's true in BOARD.dts):

&serial0 {
    /delete-property/ some-unwanted-property;
};

You can add subnodes using overlays. For example, to configure a SPI or I2C child device on an existing bus node, do something like this:

/* SPI device example */
&spi1 {
    my_spi_device: temp-sensor@0 {
        compatible = "...";
        label = "TEMP_SENSOR_0";
        /* reg is the chip select number, if needed;
         * If present, it must match the node's unit address. */
        reg = <0>;

        /* Configure other SPI device properties as needed.
         * Find your device's DT binding for details. */
        spi-max-frequency = <4000000>;
    }
};

/* I2C device example */
&i2c2 {
    my_i2c_device: touchscreen@76 {
        compatible = "...";
        label = "TOUCHSCREEN";
        /* reg is the I2C device address.
         * It must match the node's unit address. */
        reg = <76>;
    }
};

(continues on next page)
Other bus devices can be configured similarly:

- create the device as a subnode of the parent bus
- set its properties according to its binding

Assuming you have a suitable device driver associated with the `my_spi_device` and `my_i2c_device` compatibles, you should now be able to enable the driver via Kconfig and get the struct device for your newly added bus node, then use it with that driver API.

**Write device drivers using devicetree APIs**  “Devicetree-aware” device drivers should create a struct device for each status = “okay” devicetree node with a particular compatible (or related set of compatibles) supported by the driver.

Writing a devicetree-aware driver begins by defining a devicetree binding for the devices supported by the driver. Use existing bindings from similar drivers as a starting point. A skeletal binding to get started needs nothing more than this:

```plaintext
description: <Human-readable description of your binding>
compatible: "foo-company,bar-device"
include: base.yaml
```

See [Find a devicetree binding](#) for more advice on locating existing bindings.

After writing your binding, your driver C file can then use the devicetree API to find status = "okay" nodes with the desired compatible, and instantiate a struct device for each one. There are two options for instantiating each struct device: using instance numbers, and using node labels.

In either case:

- Each struct device's name should be set to its devicetree node's label property. This allows the driver's users to get a struct device from a devicetree node in the usual way.
- Each device's initial configuration should use values from devicetree properties whenever practical. This allows users to configure the driver using devicetree overlays.

Examples for how to do this follow. They assume you've already implemented the device-specific configuration and data structures and API functions, like this:

```c
/* my_driver.c */
#include <zephyr/drivers/some_api.h>

/* Define data (RAM) and configuration (ROM) structures: */
struct my_dev_data {
    /* per-device values to store in RAM */
};
struct my_dev_cfg {
    uint32_t freq; /* Just an example: initial clock frequency in Hz */
    /* other configuration to store in ROM */
};

/* Implement driver API functions (drivers/some_api.h callbacks): */
static int my_driver_api_func1(const struct device *dev, uint32_t *foo) {
    /* ... */
}
static int my_driver_api_func2(const struct device *dev, uint64_t bar) {
    /* ... */
}
```

(continues on next page)
static struct some_api my_api_funcs = {
    .func1 = my_driver_api_func1,
    .func2 = my_driver_api_func2,
};

Option 1: create devices using instance numbers  Use this option, which uses Instance-based APIs, if possible. However, they only work when devicetree nodes for your driver's compatible are all equivalent, and you do not need to be able to distinguish between them.

To use instance-based APIs, begin by defining DT_DRV_COMPAT to the lowercase-and-underscores version of the compatible that the device driver supports. For example, if your driver's compatible is "vnd, my-device" in devicetree, you would define DT_DRV_COMPAT to vnd_my_device in your driver C file:

/*
 * Put this near the top of the file. After the includes is a good place.
 * (Note that you can therefore run "git grep DT_DRV_COMPAT drivers" in
 * the zephyr Git repository to look for example drivers using this style).
 */
#define DT_DRV_COMPAT vnd_my_device

Important:  As shown, the DT_DRV_COMPAT macro should have neither quotes nor special characters. Remove quotes and convert special characters to underscores when creating DT_DRV_COMPAT from the compatible property.

Finally, define an instantiation macro, which creates each struct device using instance numbers. Do this after defining my_api_funcs.

/*
 * This instantiation macro is named "CREATE_MY_DEVICE".
 * Its "inst" argument is an arbitrary instance number.
 * 
 */
#define CREATE_MY_DEVICE(inst) 
    static struct my_dev_data my_data_##inst = { 
        /* initialize RAM values as needed, e.g.: */ 
        .freq = DT_INST_PROP(inst, clock_frequency), 
    }; 
    static const struct my_dev_cfg my_cfg_##inst = { 
        /* initialize ROM values as needed. */ 
    }; 
static const struct my_dev_data my_data = { 
    /* initialize RAM values as needed, e.g.: */ 
    .freq = DT_INST_PROP(drv_comp, clock_frequency), 
}; 
static const struct my_dev_cfg my_cfg = { 
    /* initialize ROM values as needed. */ 
}; 
DEVICE_DT_INST_DEFINE(inst, 
    my_dev_init_function, 
    NULL, 
    my_data_##inst, 
    my_cfg_##inst, 
    MY_DEV_INIT_LEVEL, MY_DEV_INIT_PRIORITY, 
    &my_api_funcs);

Notice the use of APIs like DT_INST_PROP() and DEVICE_DT_INST_DEFINE() to access devicetree node data. These APIs retrieve data from the devicetree for instance number inst of the node with compatible determined by DT_DRV_COMPAT.

Finally, pass the instantiation macro to DT_INST_FOREACH_STATUS_OKAY():

1012 Chapter 5. Build and Configuration Systems
/* Call the device creation macro for each instance: */
DT_INST_FOREACH_STATUS_OKAY(CREATE_MY_DEVICE)

DT_INST_FOREACH_STATUS_OKAY expands to code which calls CREATE_MYDEVICE once for each enabled node with the compatible determined by DT_DRV_COMPAT. It does not append a semicolon to the end of the expansion of CREATE_MYDEVICE, so the macro’s expansion must end in a semicolon or function definition to support multiple devices.

**Option 2: create devices using node labels** Some device drivers cannot use instance numbers. One example is an SoC peripheral driver which relies on vendor HAL APIs specialized for individual IP blocks to implement Zephyr driver callbacks. Cases like this should use DT_NODELABEL to refer to individual nodes in the devicetree representing the supported peripherals on the SoC. The devicetree.h Generic APIs can then be used to access node data.

For this to work, your SoC’s dti file must define node labels like mydevice0, mydevice1, etc. appropriately for the IP blocks your driver supports. The resulting devicetree usually looks something like this:

```c
/ {
    soc {
        mydevice0: dev00 {
            compatible = "vnd,my-device";
        };
        mydevice1: dev01 {
            compatible = "vnd,my-device";
        };
    };
}
```

The driver can use the mydevice0 and mydevice1 node labels in the devicetree to operate on specific device nodes:

```c
/*
 * This is a convenience macro for creating a node identifier for
 * the relevant devices. An example use is MYDEV(0) to refer to
 * the node with label "mydevice0".
 */
#define MYDEV(idx) DT_NODELABEL(mydevice ## idx)

/*
 * Define your instantiation macro; "idx" is a number like 0 for mydevice0
 * or 1 for mydevice1. It uses MYDEV() to create the node label from the
 * index.
 */
#define CREATE_MY_DEVICE(idx) static struct my_dev_data my_data_##idx = { 
    .freq = DT_PROP(MYDEV(idx), clock_frequency),
};
static const struct my_dev_cfg my_cfg_##idx = { /* ... */ }; DEVICE_DT_DEFINE(MYDEV(idx),
    my_dev_init_function,
    NULL,
    &my_data_##idx,
    &my_cfg_##idx,
    MY_DEV_INIT_LEVEL, MY_DEV_INIT_PRIORITY,
    &my_api_funcs)
```
Notice the use of APIs like `DT_PROP()` and `DEVICE_DT_DEFINE()` to access devicetree node data.

Finally, manually detect each enabled devicetree node and use `CREATE_MY_DEVICE` to instantiate each struct device:

```c
#if DT_NODE_HAS_STATUS(DT_NODELABEL(mydevice0), okay)
CREATE_MY_DEVICE(0)
#endif

#if DT_NODE_HAS_STATUS(DT_NODELABEL(mydevice1), okay)
CREATE_MY_DEVICE(1)
#endif
```

Since this style does not use `DT_INST_FOREACH_STATUS_OKAY()`, the driver author is responsible for calling `CREATE_MY_DEVICE()` for every possible node, e.g. using knowledge about the peripherals available on supported SoCs.

**Device drivers that depend on other devices** At times, one struct device depends on another struct device and requires a pointer to it. For example, a sensor device might need a pointer to its SPI bus controller device. Some advice:

- Write your devicetree binding in a way that permits use of `Hardware specific APIs` from `devicetree.h` if possible.
- In particular, for bus devices, your driver's binding should include a file like `dts/bindings/spi/spi-device.yaml` which provides common definitions for devices addressable via a specific bus. This enables use of APIs like `DT_BUS()` to obtain a node identifier for the bus node. You can then get a struct device from a devicetree node for the bus in the usual way.

Search existing bindings and device drivers for examples.

**Applications that depend on board-specific devices** One way to allow application code to run unmodified on multiple boards is by supporting a devicetree alias to specify the hardware specific portions, as is done in the blinky-sample. The application can then be configured in `BOARD.dts` files or via device-tree overlays.

**Troubleshooting devicetree**

Here are some tips for fixing misbehaving devicetree related code.

See Devicetree HOWTOs for other “HOWTO” style information.

**Try again with a pristine build directory**

**Important:** Try this first, before doing anything else.

See Pristine Builds for examples, or just delete the build directory completely and retry.

This is general advice which is especially applicable to debugging devicetree issues, because the outputs are created during the CMake configuration phase, and are not always regenerated when one of their inputs changes.

**Make sure `<devicetree.h>` is included** Unlike Kconfig symbols, the `devicetree.h` header must be included explicitly.

Many Zephyr header files rely on information from devicetree, so including some other API may transiently include `devicetree.h`, but that's not guaranteed.
Make sure you're using the right names  

Remember that:

- In C/C++, devicetree names must be lowercased and special characters must be converted to underscores. Zephyr's generated devicetree header has DTS names converted in this way into the C tokens used by the preprocessor-based `<devicetree.h>` API.

- In overlays, use devicetree node and property names the same way they would appear in any DTS file. Zephyr overlays are just DTS fragments.

For example, if you're trying to get the `clock-frequency` property of a node with path `/soc/i2c@12340000` in a C/C++ file:

```c
/*
 * foo.c: lowercase-and-underscores names
 */

/* Don't do this: */
#define MY_CLOCK_FREQ DT_PROP(DT_PATH(soc, i2c@12340000), clock-frequency)
/*
 * @ should be _ - should be _ */

/* Do this instead: */
#define MY_CLOCK_FREQ DT_PROP(DT_PATH(soc, i2c_12340000), clock_frequency)
/*
 * ^ ^ */
```

And if you're trying to set that property in a devicetree overlay:

```c
/*
 * foo.overlay: DTS names with special characters, etc.
 */

/* Don't do this; you'll get devicetree errors. */
k{/soc/i2c_12340000/} {
    clock-frequency = <115200>;
};

/* Do this instead. Overlays are just DTS fragments. */
k{/soc/i2c@12340000/} {
    clock-frequency = <115200>;
};
```

Look at the preprocessor output  

To save preprocessor output when using GCC-based toolchains, add `-save-temps=obj` to the `EXTRA_CFLAGS` CMake variable. For example, to build hello_world with west with this option set, use:

```
west build -b BOARD samples/hello_world -- -DEXTRA_CFLAGS=-save-temps=obj
```

This will create a preprocessor output file named `foo.c.i` in the build directory for each source file `foo.c`.

You can then search for the file in the build directory to see what your devicetree macros expanded to. For example, on macOS and Linux, using `find` to find `main.c.i`:

```
$ find build -name main.c.i
build/CMakeFiles/app.dir/src/main.c.i
```

It's usually easiest to run a style formatter on the results before opening them. For example, to use `clang-format` to reformat the file in place:
You can then open the file in your favorite editor to view the final C results after preprocessing.

**Validate properties**  If you're getting a compile error reading a node property, check your node identifier and property. For example, if you get a build error on a line that looks like this:

```c
int baud_rate = DT_PROP(DT_NODELABEL(my_serial), current_speed);
```

Try checking the node by adding this to the file and recompiling:

```c
#if !DT_NODE_EXISTS(DT_NODELABEL(my_serial))
#error "whoops"
#endif
```

If you see the "whoops" error message when you rebuild, the node identifier isn't referring to a valid node. *Get your devicetree and generated header* and debug from there.

Some hints for what to check next if you don’t see the "whoops" error message:

* did you *Make sure you’re using the right names*?
* does the *property exist*?
* does the node have a *matching binding*?
* does the binding define the property?

**Check for missing bindings**  See *Devicetree bindings* for information about bindings, and *Bindings index* for information on bindings built into Zephyr.

If the build fails to *Find a devicetree binding* for a node, then either the node's compatible property is not defined, or its value has no matching binding. If the property is set, check for typos in its name. In a devicetree source file, compatible should look like "vnd,some-device" – *Make sure you're using the right names*.

If your binding file is not under zephyr/dts, you may need to set `DTS_ROOT`; see *Where bindings are located*.

**Errors with DT_INST() APIs**  If you're using an API like `DT_INST_PROP()`, you must define `DT_DRV_COMPAT` to the lowercase-and-underscores version of the compatible you are interested in. See *Option 1: create devices using instance numbers*.

**Devicetree versus Kconfig**

Along with devicetree, Zephyr also uses the Kconfig language to configure the source code. Whether to use devicetree or Kconfig for a particular purpose can sometimes be confusing. This section should help you decide which one to use.

In short:

* Use devicetree to describe *hardware* and its *boot-time configuration*. Examples include peripherals on a board, boot-time clock frequencies, interrupt lines, etc.
* Use Kconfig to configure *software support* to build into the final image. Examples include whether to add networking support, which drivers are needed by the application, etc.

In other words, devicetree mainly deals with hardware, and Kconfig with software.

For example, consider a board containing a SoC with 2 UART, or serial port, instances.
• The fact that the board has this UART hardware is described with two UART nodes in the device-tree. These provide the UART type (via the compatible property) and certain settings such as the address range of the hardware peripheral registers in memory (via the reg property).

• Additionally, the UART boot-time configuration is also described with devicetree. This could include configuration such as the RX IRQ line’s priority and the UART baud rate. These may be modifiable at runtime, but their boot-time configuration is described in devicetree.

• Whether or not to include software support for UART in the build is controlled via Kconfig. Applications which do not need to use the UARTs can remove the driver source code from the build using Kconfig, even though the board’s devicetree still includes UART nodes.

As another example, consider a device with a 2.4GHz, multi-protocol radio supporting both the Bluetooth Low Energy and 802.15.4 wireless technologies.

• Devicetree should be used to describe the presence of the radio hardware, what driver or drivers it’s compatible with, etc.

• Boot-time configuration for the radio, such as TX power in dBm, should also be specified using devicetree.

• Kconfig should determine which software features should be built for the radio, such as selecting a BLE or 802.15.4 protocol stack.

As another example, Kconfig options that formerly enabled a particular instance of a driver (that is itself enabled by Kconfig) have been removed. The devices are selected individually using devicetree’s status keyword on the corresponding hardware instance.

There are exceptions to these rules:

• Because Kconfig is unable to flexibly control some instance-specific driver configuration parameters, such as the size of an internal buffer, these options may be defined in devicetree. However, to make clear that they are specific to Zephyr drivers and not hardware description or configuration these properties should be prefixed with zephyr, e.g., zephyr,random-mac-address in the common Ethernet devicetree properties.

• Devicetree’s chosen keyword, which allows the user to select a specific instance of a hardware device to be used for a particular purpose. An example of this is selecting a particular UART for use as the system’s console.

5.2.2 Devicetree Reference

These pages contain reference material for Zephyr’s devicetree APIs and built-in bindings.

For the platform-independent details, see the Devicetree specification.

Devicetree API

This is a reference page for the <devicetree.h> API. The API is macro based. Use of these macros has no impact on scheduling. They can be used from any calling context and at file scope.

Some of these require a special macro named DT_DRV_COMPAT to be defined before they can be used; these are discussed individually below. These macros are generally meant for use within device drivers, though they can be used outside of drivers with appropriate care.

Contents

• Generic APIs
  – Node identifiers and helpers
  – Property access
- `ranges` property
- `reg` property
- `interrupts` property
- For-each macros
- Existence checks
- Inter-node dependencies
- Bus helpers

- **Instance-based APIs**

- **Hardware specific APIs**
  - CAN
  - Clocks
  - DMA
  - Fixed flash partitions
  - GPIO
  - IO channels
  - MBOX
  - Pinctrl (pin control)
  - PWM
  - Reset Controller
  - SPI

- **Chosen nodes**

- **Zephyr-specific chosen nodes**

---

**Generic APIs**  The APIs in this section can be used anywhere and do not require `DT_DRV_COMPAT` to be defined.

**Node identifiers and helpers**  A node identifier is a way to refer to a devicetree node at C preprocessor time. While node identifiers are not C values, you can use them to access devicetree data in C rvalue form using, for example, the `Property access` API.

The root node `/` has node identifier `DT_ROOT`. You can create node identifiers for other devicetree nodes using `DT_PATH()`, `DT_NODELABEL()`, `DT_ALIAS()`, and `DT_INST()`.

There are also `DT_PARENT()` and `DT_CHILD()` macros which can be used to create node identifiers for a given node's parent node or a particular child node, respectively.

The following macros create or operate on node identifiers.

```c
group devicetree-generic-id
```

**Defines**

```c
DT_INVALID_NODE
Name for an invalid node identifier.
```
This supports cases where factored macros can be invoked from paths where devicetree data may or may not be available. It is a preprocessor identifier that does not match any valid devicetree node identifier.

**DT_ROOT**

Node identifier for the root node in the devicetree.

**DT_PATH(...)**

Get a node identifier for a devicetree path.

The arguments to this macro are the names of non-root nodes in the tree required to reach the desired node, starting from the root. Non-alphanumeric characters in each name must be converted to underscores to form valid C tokens, and letters must be lowercased.

Example devicetree fragment:

```
/ {
  soc {
    serial1: serial@40001000 {
      status = "okay";
      current-speed = <115200>;
      ...
    }
  }
};
```

You can use `DT_PATH(soc, serial_40001000)` to get a node identifier for the `serial@40001000` node. Node labels like `serial1` cannot be used as `DT_PATH()` arguments; use `DT_NODELABEL()` for those instead.

Example usage with `DT_PROP()` to get the `current-speed` property:

```
DT_PROP(DT_PATH(soc, serial_40001000), current_speed) // 115200
```

(The `current-speed` property is also in lowercase-and-underscores form when used with this API.)

When determining arguments to `DT_PATH()`:

- the first argument corresponds to a child node of the root (`soc` above)
- a second argument corresponds to a child of the first argument (`serial_40001000` above, from the node name `serial@40001000` after lowercasing and changing @ to _)
- and so on for deeper nodes in the desired node's path

**Note:** This macro returns a node identifier from path components. To get a path string from a node identifier, use `DT_NODE_PATH()` instead.

**Parameters**

- `...` – lowercase-and-underscores node names along the node's path, with each name given as a separate argument
**Returns**

node identifier for the node with that path

\[ \text{DT_NODELABEL}(\text{label}) \]

Get a node identifier for a node label.

Convert non-alphanumeric characters in the node label to underscores to form valid C tokens, and lowercase all letters. Note that node labels are not the same thing as label properties.

Example devicetree fragment:

```
serial1: serial@40001000 {
    label = "UART_0";
    status = "okay";
    current-speed = <115200>;
    ...
};
```

The only node label in this example is `serial1`.

The string `UART_0` is not a node label; it's the value of a property named `label`.

You can use `DT_NODELABEL(serial1)` to get a node identifier for the `serial@40001000` node.

Example usage with `DT_PROP()` to get the current-speed property:

```
DT_PROP(DT_NODELABEL(serial1), current_speed) // 115200
```

Another example devicetree fragment:

```
cpu@0 {
    L2_0: l2-cache {
        cache-level = <2>;
        ...
    };
};
```

Example usage to get the cache-level property:

```
DT_PROP(DT_NODELABEL(12_0), cache_level) // 2
```

Notice how `L2_0` in the devicetree is lowercased to `12_0` in the `DT_NODELABEL()` argument.

**Parameters**

- `label` – lowercase-and-underscores node label name

**Returns**

node identifier for the node with that label

\[ \text{DT_ALIAS}(\text{alias}) \]

Get a node identifier from `/aliases`.

This macro's argument is a property of the `/aliases` node. It returns a node identifier for the node which is aliased. Convert non-alphanumeric characters in the alias property to underscores to form valid C tokens, and lowercase all letters.

Example devicetree fragment:
You can use `DT_ALIAS(my_serial)` to get a node identifier for the serial@40001000 node. Notice how `my-serial` in the devicetree becomes `my_serial` in the `DT_ALIAS()` argument. Example usage with `DT_PROP()` to get the current-speed property:

```
DT_PROP(DT_ALIAS(my_serial), current_speed)  // 115200
```

### Parameters

- alias – lowercase-and-underscores alias name.

### Returns

Node identifier for the node with that alias

**DT_INST(inst, compat)**

Get a node identifier for an instance of a compatible.

All nodes with a particular compatible property value are assigned instance numbers, which are zero-based indexes specific to that compatible. You can get a node identifier for these nodes by passing `DT_INST()` an instance number, `inst`, along with the lowercase-and-underscores version of the compatible, `compat`.

Instance numbers have the following properties:

- for each compatible, instance numbers start at 0 and are contiguous
- exactly one instance number is assigned for each node with a compatible, including disabled nodes
- enabled nodes (status property is `okay` or missing) are assigned the instance numbers starting from 0, and disabled nodes have instance numbers which are greater than those of any enabled node

No other guarantees are made. In particular:

- instance numbers **in no way reflect** any numbering scheme that might exist in SoC documentation, node labels or unit addresses, or properties of the /aliases node (use `DT_NODELABEL()` or `DT_ALIAS()` for those)
- there is **no general guarantee** that the same node will have the same instance number between builds, even if you are building the same application again in the same build directory
Example devicetree fragment:

```c
serial1: serial@40001000 {
    compatible = "vnd,soc-serial";
    status = "disabled";
    current-speed = <9600>;
    ...
};

serial2: serial@40002000 {
    compatible = "vnd,soc-serial";
    status = "okay";
    current-speed = <57600>;
    ...
};

serial3: serial@40003000 {
    compatible = "vnd,soc-serial";
    current-speed = <115200>;
    ...
};
```

Assuming no other nodes in the devicetree have compatible "vnd,soc-serial", that compatible has nodes with instance numbers 0, 1, and 2.

The nodes serial@40002000 and serial@40003000 are both enabled, so their instance numbers are 0 and 1, but no guarantees are made regarding which node has which instance number.

Since serial@40001000 is the only disabled node, it has instance number 2, since disabled nodes are assigned the largest instance numbers. Therefore:

```c
// Could be 57600 or 115200. There is no way to be sure:
// either serial@40002000 or serial@40003000 could
// have instance number 0, so this could be the current-speed
// property of either of those nodes.
DT_PROP(DT_INST(0, vnd_soc_serial), current_speed)

// Could be 57600 or 115200, for the same reason.
// If the above expression expands to 57600, then
// this expands to 115200, and vice-versa.
DT_PROP(DT_INST(1, vnd_soc_serial), current_speed)

// 9600, because there is only one disabled node, and
// disabled nodes are "at the end" of the instance
// number "list".
DT_PROP(DT_INST(2, vnd_soc_serial), current_speed)
```

Notice how "vnd,soc-serial" in the devicetree becomes vnd_soc_serial (without quotes) in the `DT_INST()` arguments. (As usual, current-speed in the devicetree becomes current_speed as well.)

Nodes whose compatible property has multiple values are assigned independent instance numbers for each compatible.

**Parameters**

- `inst` – instance number for compatible `compat`
• compat – lowercase-and-underscores compatible, without quotes

**Returns**

node identifier for the node with that instance number and compatible

\texttt{DT\_PARENT(node\_id)}

Get a node identifier for a parent node.

Example devicetree fragment:

```plaintext
parent: parent-node {
    child: child-node {
        ...
    };
};
```

The following are equivalent ways to get the same node identifier:

- \texttt{DT\_NODELABEL(parent)}
- \texttt{DT\_PARENT(DT\_NODELABEL(child))}

**Parameters**

- \texttt{node\_id} – node identifier

**Returns**

a node identifier for the node's parent

\texttt{DT\_GPARENT(node\_id)}

Get a node identifier for a grandparent node.

Example devicetree fragment:

```plaintext
gparent: grandparent-node {
    parent: parent-node {
        child: child-node { ... }
    };
};
```

The following are equivalent ways to get the same node identifier:

- \texttt{DT\_GPARENT(DT\_NODELABEL(child))}
- \texttt{DT\_PARENT(DT\_PARENT(DT\_NODELABEL(child))}

**Parameters**

- \texttt{node\_id} – node identifier

**Returns**

a node identifier for the node's parent's parent

\texttt{DT\_CHILD(node\_id, child)}

Get a node identifier for a child node.

Example devicetree fragment:
Example usage with `DT_PROP()` to get the status of the serial@40001000 node:

```c
#define SOC_NODE DT_NODELABEL(soc_label)
DT_PROP(DT_CHILD(SOC_NODE, serial_40001000), status) // "okay"
```

Node labels like `serial1` cannot be used as the child argument to this macro. Use `DT_NODELABEL()` for that instead.

You can also use `DT_FOREACH_CHILD()` to iterate over node identifiers for all of a node’s children.

**Parameters**

- `node_id` – node identifier
- `child` – lowercase-and-underscores child node name

**Returns**

node identifier for the node with the name referred to by ‘child’

**Example devicetree fragment:**

```
node-a {
    compatible = "vnd,device";
    status = "okay";
};

node-b {
    compatible = "vnd,device";
    status = "okay";
};

node-c {
    compatible = "vnd,device";
    status = "disabled";
};
```

**Example usage:**

```c
DT_COMPAT_GET_ANY_STATUS_OKAY(vnd_device)
```
This expands to a node identifier for either node-a or node-b. It will not expand to a node identifier for node-c, because that node does not have status okay.

**Parameters**
- compat – lowercase-and-underscores compatible, without quotes

**Returns**
node identifier for a node with that compatible, or DT_INVALID_NODE

**DT_NODE_PATH(node_id)**
Get a devicetree node's full path as a string literal.

This returns the path to a node from a node identifier. To get a node identifier from path components instead, use DT_PATH().

Example devicetree fragment:

```plaintext
/ {
  soc {
    node: my-node@12345678 { ... };
  };
};
```

Example usage:

```plaintext
DT_NODE_PATH(DT_NODELABEL(node)) // "/soc/my-node@12345678"
DT_NODE_PATH(DT_PATH(soc)) // "/soc"
DT_NODE_PATH(DT_ROOT) // "/
```

**Parameters**
- node_id – node identifier

**Returns**
the node's full path in the devicetree

**DT_NODE_FULL_NAME(node_id)**
Get a devicetree node's name with unit-address as a string literal.

This returns the node name and unit-address from a node identifier.

Example devicetree fragment:

```plaintext
/ {
  soc {
    node: my-node@12345678 { ... };
  };
};
```

Example usage:

```plaintext
DT_NODE_FULL_NAME(DT_NODELABEL(node)) // "my-node@12345678"
```

**Parameters**
- node_id – node identifier
**Returns**

the node's name with unit-address as a string in the devicetree

\[ \text{DT_NODE_NAME}(\text{node_id}) \]

Get a devicetree node's name and its unit-address as a string.

**Parameters**

- \( \text{node_id} \) – node identifier

**Returns**

the node's name with unit-address as a string in the devicetree

\[ \text{DT_NODE_ADDRESS}(\text{node_id}) \]

Get a devicetree node's address.

**Parameters**

- \( \text{node_id} \) – node identifier

**Returns**

the node's address in the devicetree

\[ \text{DT_NODE_CHILD_IDX}(\text{node_id}) \]

Get a devicetree node's index into its parent's list of children.

Indexes are zero-based.

It is an error to use this macro with the root node.

Example devicetree fragment:

```
parent {
    c1: child-1 {};
    c2: child-2 {};
};
```

Example usage:

```
DT_NODE_CHILD_IDX(DT_NODELABEL(c1))  // 0
DT_NODE_CHILD_IDX(DT_NODELABEL(c2))  // 1
```

**Parameters**

- \( \text{node_id} \) – node identifier

**Returns**

the node's index in its parent node's list of children

\[ \text{DT_SAME_NODE}(\text{node_id1}, \text{node_id2}) \]

Do \( \text{node_id1} \) and \( \text{node_id2} \) refer to the same node?

Both \( \text{node_id1} \) and \( \text{node_id2} \) must be node identifiers for nodes that exist in the devicetree (if unsure, you can check with \( \text{DT_NODE_EXISTS()} \)).

The expansion evaluates to 0 or 1, but may not be a literal integer 0 or 1.

**Parameters**

- \( \text{node_id1} \) – first node identifier
- \( \text{node_id2} \) – second node identifier

**Returns**

an expression that evaluates to 1 if the node identifiers refer to the same node, and evaluates to 0 otherwise

**Property access**

The following general-purpose macros can be used to access node properties. There are special-purpose APIs for accessing the \( \text{ranges property} \), \( \text{reg property} \) and \( \text{interrupts property} \).

Property values can be read using these macros even if the node is disabled, as long as it has a matching binding.

```
group devicetree-generic-prop
```
Defines

**DT_PROP(node_id, prop)**

Get a devicetree property value.

For properties whose bindings have the following types, this macro expands to:

- **string**: a string literal
- **boolean**: 0 if the property is false, or 1 if it is true
- **int**: the property's value as an integer literal
- **array, uint8-array, string-array**: an initializer expression in braces, whose elements are integer or string literals (like `{0, 1, 2}, {"hello", "world"}`, etc.)
- **phandle**: a node identifier for the node with that phandle

A property's type is usually defined by its binding. In some special cases, it has an assumed type defined by the devicetree specification even when no binding is available: `compatible` has type `string-array`, `status` has type `string`, and `interrupt-controller` has type `boolean`.

For other properties or properties with unknown type due to a missing binding, behavior is undefined.

For usage examples, see `DT_PATH()`, `DT_ALIAS()`, `DT_NODELABEL()`, and `DT_INST()` above.

**Parameters**

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name

**Returns**

a representation of the property's value

**DT_PROP_LEN(node_id, prop)**

Get a property's logical length.

Here, "length" is a number of elements, which may differ from the property's size in bytes.

The return value depends on the property's type:

- for types `array`, `string-array`, and `uint8-array`, this expands to the number of elements in the array
- for type phandles, this expands to the number of phandles
- for type phandle-array, this expands to the number of phandle and specifier blocks in the property

These properties are handled as special cases:

- reg property: use `DT_NUM_REGS(node_id)` instead
- interrupts property: use `DT_NUM_IRQS(node_id)` instead

It is an error to use this macro with the `ranges`, `dma-ranges`, `reg` or `interrupts` properties.

For other properties, behavior is undefined.

**Parameters**

- **node_id** – node identifier
- **prop** – a lowercase-and-underscores property with a logical length
Returns the property's length

DT_PROP_LEN_OR(node_id, prop, default_value)

Like DT_PROP_LEN(), but with a fallback to default_value.

If the property is defined (as determined by DT_NODE_HAS_PROP()), this expands to DT_PROP_LEN(node_id, prop). The default_value parameter is not expanded in this case.

Otherwise, this expands to default_value.

Parameters

• node_id – node identifier
• prop – a lowercase-and-underscores property with a logical length
• default_value – a fallback value to expand to

Returns the property's length or the given default value

DT_PROP_HAS_IDX(node_id, prop, idx)

Is index idx valid for an array type property?

If this returns 1, then DT_PROP_BY_IDX(node_id, prop, idx) or DT_PHA_BY_IDX(node_id, prop, idx, ...) are valid at index idx. If it returns 0, it is an error to use those macros with that index.

These properties are handled as special cases:

• reg property: use DT_REG_HAS_IDX(node_id, idx) instead
• interrupts property: use DT_IRQ_HAS_IDX(node_id, idx) instead

It is an error to use this macro with the reg or interrupts properties.

Parameters

• node_id – node identifier
• prop – a lowercase-and-underscores property with a logical length
• idx – index to check

Returns An expression which evaluates to 1 if idx is a valid index into the given property, and 0 otherwise.

DT_PROP_HAS_NAME(node_id, prop, name)

Is name name available in a foo-names property?

This property is handled as special case:

• interrupts property: use DT_IRQ_HAS_NAME(node_id, idx) instead

It is an error to use this macro with the interrupts property.

Example devicetree fragment:

```c
nx: node-x {
    foos = <&bar xx yy>, <&baz xx zz>;
    foo-names = "event", "error";
    status = "okay";
};
```
Example usage:

```
DT_PROP_HAS_NAME(nx, foos, event)  // 1
DT_PROP_HAS_NAME(nx, foos, failure)  // 0
```

**Parameters**
- `node_id` – node identifier
- `prop` – a lowercase-and-underscores `prop-names` type property
- `name` – a lowercase-and-underscores name to check

**Returns**
An expression which evaluates to 1 if “name” is an available name into the given property, and 0 otherwise.

```
DT_PROP_BYIDX(node_id, prop, idx)
```

Get the value at index `idx` in an array type property.

It might help to read the argument order as being similar to `node->property[index]`.

When the property’s binding has type array, string-array, uint8-array, or phandles, this expands to the `idx`-th array element as an integer, string literal, or node identifier respectively.

These properties are handled as special cases:

- `reg` property: use `DT_REG_ADDR_BY_IDX()` or `DT_REG_SIZE_BY_IDX()` instead
- `interrupts` property: use `DT_IRQ_BY_IDX()` instead

For non-array properties, behavior is undefined.

**Parameters**
- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

**Returns**
a representation of the `idx`-th element of the property

```
DT_PROP_OR(node_id, prop, default_value)
```

Like `DT_PROP()`, but with a fallback to `default_value`.

If the value exists, this expands to `DT_PROP(node_id, prop)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

**Parameters**
- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `default_value` – a fallback value to expand to

**Returns**
the property's value or `default_value`
DT_LABEL(node_id)

Equivalent to \( \text{DT_PROP}(\text{node_id, label}) \)

{
\textit{Deprecated:}

Use \( \text{DT_PROP}(\text{node_id, label}) \)

This is a convenience for the Zephyr device API, which uses label properties as \( \text{device_get_binding()} \) arguments.

\textbf{Parameters}

- node_id – node identifier

\textbf{Returns}

node's label property value

\textbf{DT_ENUM_IDX}(node_id, prop)

Get a property value's index into its enumeration values.

The return values start at zero.

Example devicetree fragment:

```plaintext
usb1: usb@12340000 {
   maximum-speed = "full-speed";
};
usb2: usb@12341000 {
   maximum-speed = "super-speed";
};
```

Example bindings fragment:

```plaintext
properties:
   maximum-speed:
      type: string
      enum:
         - "low-speed"
         - "full-speed"
         - "high-speed"
         - "super-speed"
```

Example usage:

```plaintext
\text{DT_ENUM_IDX(DT_NODELABEL(usb1), maximum_speed)} // 1
\text{DT_ENUM_IDX(DT_NODELABEL(usb2), maximum_speed)} // 3
```

\textbf{Parameters}

- node_id – node identifier

- prop – lowercase-and-underscores property name

\textbf{Returns}

zero-based index of the property's value in its enum: list
DT_ENUM_IDX_OR(node_id, prop, default_idx_value)

Like DT_ENUM_IDX(), but with a fallback to a default enum index.

If the value exists, this expands to its zero based index value thanks to DT_ENUM_IDX(node_id, prop).

Otherwise, this expands to provided default index enum value.

**Parameters**

- node_id – node identifier
- prop – lowercase-and-underscores property name
- default_idx_value – a fallback index value to expand to

**Returns**

zero-based index of the property's value in its enum if present, default_idx_value otherwise

DT_STRING_TOKEN(node_id, prop)

Get a string property's value as a token.

This removes “the quotes” from a string property's value, converting any non-alphanumeric characters to underscores. This can be useful, for example, when programmatically using the value to form a C variable or code.

**DT_STRING_TOKEN()** can only be used for properties with string type.

It is an error to use **DT_STRING_TOKEN()** in other circumstances.

Example devicetree fragment:

```plaintext
n1: node-1 {
    prop = "foo";
};
n2: node-2 {
    prop = "FOO";
}
n3: node-3 {
    prop = "123 foo";
};
```

Example bindings fragment:

```plaintext
properties:
    prop:
        type: string
```

Example usage:

```c
DT_STRING_TOKEN(DT_NODELABEL(n1), prop) // foo
DT_STRING_TOKEN(DT_NODELABEL(n2), prop) // FOO
DT_STRING_TOKEN(DT_NODELABEL(n3), prop) // 123_foo
```

Notice how:

- Unlike C identifiers, the property values may begin with a number. It's the user's responsibility not to use such values as the name of a C identifier.
• The uppercased "F00" in the DTS remains F00 as a token. It is not converted to foo.
• The whitespace in the DTS "123 foo" string is converted to 123_foo as a token.

Parameters
  • node_id – node identifier
  • prop – lowercase-and-underscores property name

Returns
  the value of prop as a token, i.e. without any quotes and with special characters
  converted to underscores

 DT_STRING_TOKEN_OR(node_id, prop, default_value)
  Like DT_STRING_TOKEN(), but with a fallback to default_value.
  If the value exists, this expands to DT_STRING_TOKEN(node_id, prop). The default_value
  parameter is not expanded in this case.
  Otherwise, this expands to default_value.

Parameters
  • node_id – node identifier
  • prop – lowercase-and-underscores property name
  • default_value – a fallback value to expand to

Returns
  the property's value as a token, or default_value

 DT_STRING_UPPER_TOKEN(node_id, prop)
  Like DT_STRING_TOKEN(), but uppercased.
  This removes “the quotes” from a string property's value, converting any non-alphanumeric
  characters to underscores, and capitalizing the result. This can be useful, for example, when
  programmatically using the value to form a C variable or code.
  DT_STRING_UPPER_TOKEN() can only be used for properties with string type.
  It is an error to use DT_STRING_UPPER_TOKEN() in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
    prop = "foo";
};
n2: node-2 {
    prop = "123 foo";
};
```

Example bindings fragment:

```
properties:
    prop:
        type: string
```

Example usage:
Notice how:

- Unlike C identifiers, the property values may begin with a number. It's the user's responsibility not to use such values as the name of a C identifier.
- The lowercased "foo" in the DTS becomes FOO as a token, i.e. it is uppercased.
- The whitespace in the DTS "123 foo" string is converted to 123_FOO as a token, i.e. it is uppercased and whitespace becomes an underscore.

**Parameters**

- node_id – node identifier
- prop – lowercase-and-underscores property name

**Returns**

the value of prop as an uppercased token, i.e. without any quotes and with special characters converted to underscores

DT_STRING_UPPER_TOKEN_OR(node_id, prop, default_value)

Like DT_STRING_UPPER_TOKEN(), but with a fallback to default_value.

If the value exists, this expands to DT_STRING_UPPER_TOKEN(node_id, prop). The default_value parameter is not expanded in this case. Otherwise, this expands to default_value.

**Parameters**

- node_id – node identifier
- prop – lowercase-and-underscores property name
- default_value – a fallback value to expand to

**Returns**

the property's value as an uppercased token, or default_value

DT_STRING_TOKEN_BY_IDX(node_id, prop, idx)

Get an element out of a string-array property as a token.

This removes “the quotes” from an element in the array, and converts non-alphanumeric characters to underscores. That can be useful, for example, when programmatically using the value to form a C variable or code.

DT_STRING_TOKEN_BY_IDX() can only be used for properties with string-array type.

It is an error to use DT_STRING_TOKEN_BY_IDX() in other circumstances.

Example devicetree fragment:

```plaintext
n1: node-1 {
    prop = "f1", "F2";
};
n2: node-2 {
    prop = "123 foo", "456 FOO";
};
```
Example bindings fragment:

```c
properties:
  prop:
    type: string-array
```

Example usage:

```c
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n1), prop, 0) // f1
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n1), prop, 1) // F2
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n2), prop, 0) // 123_foo
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n2), prop, 1) // 456_FOO
```

For more information, see `DT_STRING_TOKEN`.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

**Returns**

the element in `prop` at index `idx` as a token

```c
DT_STRING_UPPER_TOKEN_BY_IDX(node_id, prop, idx)
```

Like `DT_STRING_TOKEN_BY_IDX()`, but uppercased.

This removes “the quotes” and capitalizes an element in the array, and converts non-alphanumeric characters to underscores. That can be useful, for example, when programmatically using the value to form a C variable or code.

`DT_STRING_UPPER_TOKEN_BY_IDX()` can only be used for properties with string-array type.

It is an error to use `DT_STRING_UPPER_TOKEN_BY_IDX()` in other circumstances.

Example devicetree fragment:

```c
n1: node-1 {
  prop = "f1", "F2";
};
n2: node-2 {
  prop = "123 foo", "456 F00";
};
```

Example bindings fragment:

```c
properties:
  prop:
    type: string-array
```

Example usage:
For more information, see `DT_STRING_UPPER_TOKEN`.

Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – the index to get

Returns
the element in `prop` at index `idx` as an uppercased token

```
DT_PROP_BY_PHANDLE_IDX(node_id, phs, idx, prop)
```

Get a property value from a phandle in a property.

This is a shorthand for:

```
DT_PROP(DT_PHANDLE_BY_IDX(node_id, phs, idx), prop)
```

That is, `prop` is a property of the phandle's node, not a property of `node_id`.

Example devicetree fragment:

```
n1: node-1 {
    foo = <&n2 &n3>;
};
n2: node-2 {
    bar = <42>;
};
n3: node-3 {
    baz = <43>;
};
```

Example usage:

```
#define N1 DT_NODELABEL(n1)
DT_PROP_BY_PHANDLE_IDX(N1, foo, 0, bar) // 42
DT_PROP_BY_PHANDLE_IDX(N1, foo, 1, baz) // 43
```

Parameters

- `node_id` – node identifier
- `phs` – lowercase-and-underscores property with type `phandle`, `phandles`, or `phandle-array`
- `idx` – logical index into `phs`, which must be zero if `phs` has type `phandle`
- `prop` – lowercase-and-underscores property of the phandle's node
**Returns**

the property's value

DT_PROP_BY_PHANDLE_IDX_OR(node_id, phs, idx, prop, default_value)

Like DT_PROP_BY_PHANDLE_IDX(), but with a fallback to default_value.

If the value exists, this expands to DT_PROP_BY_PHANDLE_IDX(node_id, phs, idx, prop). The default_value parameter is not expanded in this case.

Otherwise, this expands to default_value.

**Parameters**

- node_id – node identifier
- phs – lowercase-and-underscores property with type phandle, phandles, or phandle-array
- idx – logical index into phs, which must be zero if phs has type phandle
- prop – lowercase-and-underscores property of the phandle's node
- default_value – a fallback value to expand to

**Returns**

the property's value

DT_PROP_BY_PHANDLE(node_id, ph, prop)

Get a property value from a phandle's node.

This is equivalent to DT_PROP_BY_PHANDLE_IDX(node_id, ph, 0, prop).

**Parameters**

- node_id – node identifier
- ph – lowercase-and-underscores property of node_id with type phandle
- prop – lowercase-and-underscores property of the phandle's node

**Returns**

the property's value

DT_PHA_BY_IDX(node_id, pha, idx, cell)

Get a phandle-array specifier cell value at an index.

It might help to read the argument order as being similar to node->phandle_array[index].cell. That is, the cell value is in the pha property of node_id, inside the specifier at index idx.

Example devicetree fragment:

```plaintext
gpio0: gpio@abcd1234 {
    #gpio-cells = <2>;
};

gpio1: gpio@1234abcd {
    #gpio-cells = <2>;
};

led: led_0 {
    gpios = <&gpio0 17 0x1>, <&gpio1 5 0x3>;
};
```
Bindings fragment for the gpio0 and gpio1 nodes:

```plaintext
gpio-cells:
- pin
- flags
```

Above, gpios has two elements:

- index 0 has specifier `<17 0x1>`, so its pin cell is 17, and its flags cell is 0x1
- index 1 has specifier `<5 0x3>`, so pin is 5 and flags is 0x3

Example usage:

```c
#define LED DT_NODELABEL(led)

DT_PHA_BY_IDX(LED, gpios, 0, pin) // 17
DT_PHA_BY_IDX(LED, gpios, 1, flags) // 0x3
```

**Parameters**
- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type phandle-array
- `idx` – logical index into pha
- `cell` – lowercase-and-underscores cell name within the specifier at pha index `idx`

**Returns**
- the cell's value

```c
DT_PHA_BY_IDX_OR(node_id, pha, idx, cell, default_value)
```
Like `DT_PHA_BY_IDX()`, but with a fallback to `default_value`.
If the value exists, this expands to `DT_PHA_BY_IDX(node_id, pha,idx, cell)`. The `default_value` parameter is not expanded in this case.
Otherwise, this expands to `default_value`.

**Parameters**
- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type phandle-array
- `idx` – logical index into pha
- `cell` – lowercase-and-underscores cell name within the specifier at pha index `idx`
- `default_value` – a fallback value to expand to

**Returns**
- the cell's value or `default_value`

```c
DT_PHA(node_id, pha, cell)
```
Equivalent to `DT_PHA_BY_IDX(node_id, pha, 0, cell)`

**Parameters**
- `node_id` – node identifier
• pha – lowercase-and-underscores property with type phandle-array
• cell – lowercase-and-underscores cell name

**Returns**
the cell's value

```
DT_PHA.OR(node_id, pha, cell, default_value)
```

Like `DT_PHA()`, but with a fallback to `default_value`. If the value exists, this expands to `DT_PHA(node_id, pha, cell)`. The `default_value` parameter is not expanded in this case. Otherwise, this expands to `default_value`.

**Parameters**

• `node_id` – node identifier
• `pha` – lowercase-and-underscores property with type phandle-array
• `cell` – lowercase-and-underscores cell name
• `default_value` – a fallback value to expand to

**Returns**
the cell's value or `default_value`

```
DT_PHA_BY_NAME(node_id, pha, name, cell)
```

Get a value within a phandle-array specifier by name. This is like `DT_PHA_BY_IDX()`, except it treats `pha` as a structure where each array element has a name. It might help to read the argument order as being similar to `node->phandle_struct.name.cell`. That is, the cell value is in the `pha` property of `node_id`, treated as a data structure where each array element has a name.

Example devicetree fragment:

```
n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
}
```

Bindings fragment for the “adc1” and “adc2” nodes:

```
io-channel-cells:
    - input
```

Example usage:

```
DT_PHA_BY_NAME(DT_NODELABEL(n), io_channels, sensor, input)  // 10
DT_PHA_BY_NAME(DT_NODELABEL(n), io_channels, bandgap, input)  // 20
```

**Parameters**

• `node_id` – node identifier
• `pha` – lowercase-and-underscores property with type phandle-array
• `name` – lowercase-and-underscores name of a specifier in `pha`
cell – lowercase-and-underscores cell name in the named specifier

Returns
the cell's value

DT_PHA_BY_NAME_OR(node_id, pha, name, cell, default_value)
Like DT_PHA_BY_NAME(), but with a fallback to default_value.
If the value exists, this expands to DT_PHA_BY_NAME(node_id, pha, name, cell). The default_value parameter is not expanded in this case.
Otherwise, this expands to default_value.

Parameters
• node_id – node identifier
• pha – lowercase-and-underscores property with type phandle-array
• name – lowercase-and-underscores name of a specifier in pha
• cell – lowercase-and-underscores cell name in the named specifier
• default_value – a fallback value to expand to

Returns
the cell's value or default_value

DT_PHANDLE_BY_NAME(node_id, pha, name)
Get a phandle's node identifier from a phandle array by name.
It might help to read the argument order as being similar to node->phandle_struct.name. phandle. That is, the phandle array is treated as a structure with named elements. The return value is the node identifier for a phandle inside the structure.

Example devicetree fragment:

```plaintext
adc1: adc@abcd1234 {
   foobar = "ADC_1";
};
adc2: adc@1234abcd {
   foobar = "ADC_2";
};
n: node {
   io-channels = &adc1 10, &adc2 20;
   io-channel-names = "SENSOR", "BANDGAP";
};
```

Above, “io-channels” has two elements:

• the element named “SENSOR” has phandle &adc1
• the element named “BANDGAP” has phandle &adc2

Example usage:

```plaintext
#define NODE DT_NODELABEL(n)
```
DT_PROP(DT_PHANDLE_BY_NAME(NODE, io_channels, sensor), foobar)  // “ADC_1”
DT_PROP(DT_PHANDLE_BY_NAME(NODE, io_channels, bandgap), foobar)  // “ADC_2”

Notice how devicetree properties and names are lowercased, and non-alphanumeric characters are converted to underscores.

**Parameters**
- `node_id` – node identifier
- `pha` – lowercase-and-underscores property with type phandle-array
- `name` – lowercase-and-underscores name of an element in `pha`

**Returns**
a node identifier for the node with that phandle

`DT_PHANDLE_BY_IDX(node_id, prop, idx)`
Get a node identifier for a phandle in a property.
When a node’s value at a logical index contains a phandle, this macro returns a node identifier for the node with that phandle.
Therefore, if `prop` has type phandle, `idx` must be zero. (A phandle type is treated as a phandles with a fixed length of 1).

Example devicetree fragment:

```plaintext
n1: node-1 {
    foo = <&n2 &n3>;
};
n2: node-2 { ... };
n3: node-3 { ... };
```

Above, `foo` has type phandles and has two elements:

- index 0 has phandle `&n2`, which is `node-2`’s phandle
- index 1 has phandle `&n3`, which is `node-3`’s phandle

Example usage:

```plaintext
#define N1 DT_NODELABEL(n1)
DT_PHANDLE_BY_IDX(N1, foo, 0)  // node identifier for node-2
DT_PHANDLE_BY_IDX(N1, foo, 1)  // node identifier for node-3
```

Behavior is analogous for phandle-arrays.

**Parameters**
- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name in `node_id` with type phandle, phandles or phandle-array
- `idx` – index into `prop`

**Returns**
node identifier for the node with the phandle at that index
DT_PHANDLE(node_id, prop)

Get a node identifier for a phandle property's value.

This is equivalent to `DT_PHANDLE_BY_IDX(node_id, prop, 0)`. Its primary benefit is readability when `prop` has type `phandle`.

**Parameters**

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property of `node_id` with type `phandle`

**Returns**

a node identifier for the node pointed to by “ph”

**ranges property**  Use these APIs instead of `Property access` to access the `ranges` property. Because this property’s semantics are defined by the devicetree specification, these macros can be used even for nodes without matching bindings. However, they take on special semantics when the node’s binding indicates it is a PCIe bus node, as defined in the PCI Bus Binding to: IEEE Std 1275-1994 Standard for Boot (Initialization Configuration) Firmware

**Definition**

```
DT_NUM_RANGES(node_id)

Get the number of range blocks in the `ranges` property.

Use this instead of `DT_PROP_LEN(node_id, ranges)`.

Example devicetree fragment:
```

cmie0: pcie@0 {
    compatible = "intel,pcie";
    reg = <0 1>;
    #address-cells = <3>;
    #size-cells = <2>;

    ranges = <0x1000000 0 0 0 0x3eff0000 0 0x1000>,
             <0x2000000 0 0x10000000 0 0x10000000 0 0x2eff0000>,
             <0x3000000 0x80 0 0x80 0 0x80 0>;
};

other: other@1 {
    reg = <1 1>;

    ranges = <0x0 0x0 0x0 0x3eff0000 0x1000>,
             <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};
```

Example usage:

```
DT_NUM_RANGES(DT_NODELABEL(pcie0)) // 3
DT_NUM_RANGES(DT_NODELABEL(other)) // 2
```

**Parameters**
• node_id – node identifier

DT_RANGES_HAS_IDX(node_id, idx)

Is idx a valid range block index?

If this returns 1, then DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(node_id, idx), DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(node_id, idx) or DT_RANGES_LENGTH_BY_IDX(node_id, idx) are valid. For DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx) the return value of DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(node_id, idx) will indicate validity. If it returns 0, it is an error to use those macros with index idx, including DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx).

Example devicetree fragment:

```plaintext
cicie0: pcie@0 {
  compatible = "intel,pcie";
  reg = <0 1>;
  #address-cells = <3>;
  #size-cells = <2>;

  ranges = <0x1000000 0 0 0 0x3eff0000 0 0x10000>,
           <0x2000000 0x10000000 0 0x10000000 0 0x2eff0000>,
           <0x3000000 0x80 0 0x80 0 0x80 0>;
};
other: other@1 {
  reg = <1 1>;

  ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
           <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};
```

Example usage:

```plaintext
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 0) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 1) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 2) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 3) // 0
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 0) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 1) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 2) // 0
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 3) // 0
```

Parameters

• node_id – node identifier
• idx – index to check

Returns

1 if idx is a valid register block index, 0 otherwise.

DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(node_id, idx)

Does a ranges property have child bus flags at index?
If this returns 1, then `DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx)` is valid. If it returns 0, it is an error to use this macro with index `idx`. This macro only returns 1 for PCIe buses (i.e. nodes whose bindings specify they are “pcie” bus nodes.)

Example devicetree fragment:

```
parent {
    #address-cells = <2>;

    pcie0: pcie00 {
        compatible = "intel,pcie";
        reg = <0 0 1>;
        #address-cells = <3>;
        #size-cells = <2>;

        ranges = <0x1000000 0 0x3eff0000 0x1000000>,
                <0x2000000 0 0x10000000 0x10000000 0x2eff0000>,
                <0x3000000 0x80 0 0x80 0 0x80 0>;
    };

    other: other01 {
        reg = <0 1 1>;

        ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
                 <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
    };
};
```

Example usage:

```
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 0) // 1
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 1) // 1
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 2) // 1
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 3) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 0) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 1) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 2) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 3) // 0
```

**Parameters**

- `node_id` – node identifier
- `idx` – logical index into the ranges array

**Returns**

1 if `idx` is a valid child bus flags index, 0 otherwise.

`DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx)`

Get the ranges property child bus flags at index.

When the node is a PCIe bus, the Child Bus Address has an extra cell used to store some flags, thus this cell is extracted from the Child Bus Address as Child Bus Flags field.

Example devicetree fragments:
Example usage:

```
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x1000000
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x2000000
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x3000000
```

**Parameters**

- `node_id` – node identifier
- `idx` – logical index into the ranges array

**Returns**

range child bus flags field at `idx`

**Example devicetree fragments:**

```
parent {
    #address-cells = <2>;

    pcie0: pcie@0 {
        compatible = "intel,pcie";
        reg = <0 0 1>;
        #address-cells = <3>;
        #size-cells = <2>;

        ranges = <0x1000000 0 0 0x3eff0000 0 0x10000>,
                 <0x2000000 0x10000000 0x10000000 0x2eff0000>,
                 <0x3000000 0x80 0x80 0x80 0x80 0>
    }
};

other: other@1 {
    reg = <0 1 1>;

    ranges = <0x0 0x0 0x3eff0000 0x10000>,
} (continues on next page)
```
Example usage:

```c
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x10000000
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 0) // 0
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 1) // 0x10000000
```

**Parameters**
- `node_id` – node identifier
- `idx` – logical index into the ranges array

**Returns**
- range child bus address field at `idx`

**DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(node_id, idx)**

Get the ranges property parent bus address at index.

Similarly to **DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX()**, this properly accounts for child bus flags cells when the node is a PCIe bus.

Example devicetree fragment:

```devicetree
parent {
    #address-cells = <2>;

    pcie0: pcie@0 {
        compatible = "intel,pcie";
        reg = <0 0 1>;
        #address-cells = <3>;
        #size-cells = <2>;
        ranges = <0x1000000 0 0 0 0x3eff0000 0x10000>,
                  <0x2000000 0x10000000 0x10000000 0x2eff0000>,
                  <0x3000000 0x80 0 0x80 0x80 0x80>;
    }

    other: other@1 {
        reg = <0 1 1>;
        ranges = <0x0 0x0 0x3eff0000 0x10000>,
                  <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
    }
}
```

Example usage:
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x3eff0000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x10000000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 0) // 0x3eff0000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 1) // 0x10000000

Parameters

- node_id – node identifier
- idx – logical index into the ranges array

Returns

range parent bus address field at idx

DT_RANGES_LENGTH_BY_IDX(node_id, idx)

Get the ranges property length at index.

Similarly to DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(), this properly accounts for child bus flags cells when the node is a PCIe bus.

Example devicetree fragment:

```
parent {
  #address-cells = <2>;

  pcie0: pcie00 {
    compatible = "intel,pcie";
    reg = <0 0 1>;
    #address-cells = <3>;
    #size-cells = <2>;

    ranges = <0x10000000 0 0 0x3eff0000 0 0x10000000 0 0x3eff0000>,
             <0x20000000 0x10000000 0x10000000 0x2eff0000>,
             <0x30000000 0x80 0x80 0x80 0x80>;
  }

  other: other0 {  
    reg = <0 1 1>;

    ranges = <0x0 0x0 0x3eff0000 0x10000>,
             <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
  }
};
```

Example usage:

```
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x10000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x2eff0000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(other), 0) // 0x10000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(other), 1) // 0x2eff0000
```

Parameters

- node_id – node identifier
• idx – logical index into the ranges array

**Returns**

range length field at idx

`DT_FOREACH_RANGE(node_id, fn)`

Invokes fn for each entry of node_id ranges property.

The macro fn must take two parameters, node_id which will be the node identifier of the node with the ranges property and idx the index of the ranges block.

Example devicetree fragment:

```c
n: node@0 {
    reg = <0 0 1>;
    ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
           <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};
```

Example usage:

```c
#define RANGE_LENGTH(node_id, idx) DT_RANGES_LENGTH_BY_IDX(node_id, idx),
const uint64_t *ranges_length[] = {
    DT_FOREACH_RANGE(DT_NODELABEL(n), RANGE_LENGTH)
};
```

This expands to:

```c
const char *ranges_length[] = {
    0x10000, 0x2eff0000,
};
```

**Parameters**

- node_id – node identifier
- fn – macro to invoke

**reg property** Use these APIs instead of *Property access* to access the reg property. Because this property’s semantics are defined by the devicetree specification, these macros can be used even for nodes without matching bindings.

**group devicetree-reg-prop**

**Defines**

`DT_NUM_REGS(node_id)`

Get the number of register blocks in the reg property.

Use this instead of `DT_PROP_LEN(node_id, reg)`.

**Parameters**
• node_id – node identifier

**Returns**
Number of register blocks in the node’s “reg” property.

**DT_REG_HAS_IDX(node_id, idx)**
Is idx a valid register block index?
If this returns 1, then **DT_REG_ADDR_BY_IDX(node_id, idx)** or **DT_REG_SIZE_BY_IDX(node_id, idx)** are valid. If it returns 0, it is an error to use those macros with index idx.

**Parameters**
• node_id – node identifier
• idx – index to check

**Returns**
1 if idx is a valid register block index, 0 otherwise.

**DT_REG_ADDR_BY_IDX(node_id, idx)**
Get the base address of the register block at index idx.

**Parameters**
• node_id – node identifier
• idx – index of the register whose address to return

**Returns**
address of the idx-th register block

**DT_REG_SIZE_BY_IDX(node_id, idx)**
Get the size of the register block at index idx.
This is the size of an individual register block, not the total number of register blocks in the property; use **DT_NUM_REGS()** for that.

**Parameters**
• node_id – node identifier
• idx – index of the register whose size to return

**Returns**
size of the idx-th register block

**DT_REG_ADDR(node_id)**
Get a node’s (only) register block address.
Equivalent to **DT_REG_ADDR_BY_IDX(node_id, 0)**.

**Parameters**
• node_id – node identifier

**Returns**
node’s register block address

**DT_REG_SIZE(node_id)**
Get a node’s (only) register block size.
Equivalent to **DT_REG_SIZE_BY_IDX(node_id, 0)**.

**Parameters**
• node_id – node identifier

**Returns**
node’s only register block’s size
DT_REG_ADDR_BY_NAME(node_id, name)
Get a register block’s base address by name.

**Parameters**
- `node_id` – node identifier
- `name` – lowercase-and-underscores register specifier name

**Returns**
address of the register block specified by name

DT_REG_SIZE_BY_NAME(node_id, name)
Get a register block’s size by name.

**Parameters**
- `node_id` – node identifier
- `name` – lowercase-and-underscores register specifier name

**Returns**
size of the register block specified by name

**interrupts property**  Use these APIs instead of *Property access* to access the `interrupts` property.
Because this property’s semantics are defined by the devicetree specification, some of these macros can
be used even for nodes without matching bindings. This does not apply to macros which take cell names
as arguments.

**group devicetree-interrupts-prop**

**Defines**

DT_NUM_IRQS(node_id)
Get the number of interrupt sources for the node.
Use this instead of `DT_PROP_LEN(node_id, interrupts)`.

**Parameters**
- `node_id` – node identifier

**Returns**
Number of interrupt specifiers in the node’s “interrupts” property.

DT_IRQ_HAS_IDX(node_id, idx)
Is `idx` a valid interrupt index?
If this returns 1, then `DT_IRQ_BY_IDX(node_id, idx)` is valid. If it returns 0, it is an error to
use that macro with this index.

**Parameters**
- `node_id` – node identifier
- `idx` – index to check

**Returns**
1 if the idx is valid for the interrupt property 0 otherwise.

DT_IRQ_HAS_CELL_AT_IDX(node_id, idx, cell)
Does an interrupts property have a named cell specifier at an index? If this returns 1, then
`DT_IRQ_BY_IDX(node_id, idx, cell)` is valid. If it returns 0, it is an error to use that macro.

**Parameters**
• node_id – node identifier
• idx – index to check
• cell – named cell value whose existence to check

**Returns**
1 if the named cell exists in the interrupt specifier at index idx 0 otherwise.

`DT_IRQ_HAS_CELL(node_id, cell)`

Equivalent to `DT_IRQ_HAS_CELL_AT_IDX(node_id, 0, cell)`

**Parameters**
• node_id – node identifier
• cell – named cell value whose existence to check

**Returns**
1 if the named cell exists in the interrupt specifier at index 0 0 otherwise.

`DT_IRQ_HAS_NAME(node_id, name)`

Does an interrupts property have a named specifier value at an index? If this returns 1, then `DT_IRQ_BY_NAME(node_id, name, cell)` is valid. If it returns 0, it is an error to use that macro.

**Parameters**
• node_id – node identifier
• name – lowercase-and-underscores interrupt specifier name

**Returns**
1 if “name” is a valid named specifier 0 otherwise.

`DT_IRQ_BY_IDX(node_id, idx, cell)`

Get a value within an interrupt specifier at an index.

It might help to read the argument order as being similar to “node->interrupts[index].cell”.

This can be used to get information about an individual interrupt when a device generates more than one.

Example devicetree fragment:

```
my-serial: serial@abcd1234 {
    interrupts = < 33 0 >, < 34 1 >;
};
```

Assuming the node’s interrupt domain has “#interrupt-cells = <2>;” and the individual cells in each interrupt specifier are named “irq” and “priority” by the node’s binding, here are some examples:

```
#define SERIAL DT_NODELABEL(my_serial)
```

<table>
<thead>
<tr>
<th>Example usage</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DT_IRQ_BY_IDX(SERIAL, 0, irq)</td>
<td>33</td>
</tr>
<tr>
<td>DT_IRQ_BY_IDX(SERIAL, 0, priority)</td>
<td>0</td>
</tr>
<tr>
<td>DT_IRQ_BY_IDX(SERIAL, 1, irq)</td>
<td>34</td>
</tr>
<tr>
<td>DT_IRQ_BY_IDX(SERIAL, 1, priority)</td>
<td>1</td>
</tr>
</tbody>
</table>

**Parameters**
• node_id – node identifier
• idx – logical index into the interrupt specifier array
• cell – cell name specifier

**Returns**
the named value at the specifier given by the index

`DT_IRQ_BY_NAME(node_id, name, cell)`
Get a value within an interrupt specifier by name.
It might help to read the argument order as being similar to `node->interrupts.name.cell`.
This can be used to get information about an individual interrupt when a device generates
more than one, if the bindings give each interrupt specifier a name.

**Parameters**
• node_id – node identifier  
• name – lowercase-and-underscores interrupt specifier name  
• cell – cell name specifier

**Returns**
the named value at the specifier given by the index

`DT_IRQ(node_id, cell)`
Get an interrupt specifier's value Equivalent to `DT_IRQ_BY_IDX(node_id, 0, cell)`.

**Parameters**
• node_id – node identifier  
• cell – cell name specifier

**Returns**
the named value at that index

`DT_IRQN(node_id)`
Get a node's (only) irq number.
Equivalent to `DT_IRQ(node_id, irq)`.
This is provided as a convenience for the common case where a node generates exactly one interrupt, and the IRQ number is in a cell named irq.

**Parameters**
• node_id – node identifier

**Returns**
the interrupt number for the node's only interrupt

**For-each macros**
There is currently only one “generic” for-each macro, `DT_FOREACH_CHILD()`, which allows iterating over the children of a devicetree node.

There are special-purpose for-each macros, like `DT_INST_FOREACH_STATUS_OKAY()`, but these require `DT_DRV_COMPAT` to be defined before use.

`group devicetree-generic-foreach`

**Defines**

`DT_FOREACH_NODE(fn)`
Invokes fn for every node in the tree.
The macro fn must take one parameter, which will be a node identifier. The macro is expanded once for each node in the tree. The order that nodes are visited in is not specified.
Parameters

- fn - macro to invoke

**DT_FOREACH_STATUS_OKAY_NODE(fn)**

Invokes fn for every status okay node in the tree.

The macro fn must take one parameter, which will be a node identifier. The macro is expanded once for each node in the tree with status okay (as usual, a missing status property is treated as status okay). The order that nodes are visited in is not specified.

Parameters

- fn - macro to invoke

**DT_FOREACH_CHILD(node_id, fn)**

Invokes fn for each child of node_id.

The macro fn must take one parameter, which will be the node identifier of a child node of node_id.

The children will be iterated over in the same order as they appear in the final devicetree.

Example devicetree fragment:

```
n: node {
  child-1 {
    foobar = "foo";
  };
  child-2 {
    foobar = "bar";
  };
}
```

Example usage:

```c
#define FOOBAR_AND_COMMA(node_id) DT_PROP(node_id, foobar),
const char *child_foobars[] = {
    DT_FOREACH_CHILD(DT_NODELABEL(n), FOOBAR_AND_COMMA)
};
```

This expands to:

```c
const char *child_foobars[] = {
    "foo", "bar",
};
```

Parameters

- node_id - node identifier
- fn - macro to invoke

**DT_FOREACH_CHILD_SEP(node_id, fn, sep)**

Invokes fn for each child of node_id with a separator.

The macro fn must take one parameter, which will be the node identifier of a child node of node_id.
Example devicetree fragment:

```c
n: node {
    child-1 {
        ...
    };
    child-2 {
        ...
    };
};
```

Example usage:

```c
const char *child_names[] = {
    DT_FOREACH_CHILD_SEP(DT_NODELABEL(n), DT_NODE_FULL_NAME, (,))
};
```

This expands to:

```c
const char *child_names[] = {
    "child-1", "child-2"
};
```

Parameters

- `node_id` – node identifier
- `fn` – macro to invoke
- `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

```c
DT_FOREACH_CHILD_VARGS(node_id, fn, ...)
```

Invokes `fn` for each child of `node_id` with multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

The children will be iterated over in the same order as they appear in the final devicetree.

See also:

`DT_FOREACH_CHILD`

Parameters

- `node_id` – node identifier
- `fn` – macro to invoke
- `...` – variable number of arguments to pass to `fn`

```c
DT_FOREACH_CHILD_SEP_VARGS(node_id, fn, sep, ...)
```

Invokes `fn` for each child of `node_id` with separator and multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.
See also:

**DT_FOREACH_CHILD_VARGS**

Parameters

- node_id – node identifier
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- ... – variable number of arguments to pass to fn

DT_FOREACH_CHILD_STATUS_OKAY(node_id, fn)

Call fn on the child nodes with status okay

The macro fn should take one argument, which is the node identifier for the child node.

As usual, both a missing status and an ok status are treated as okay.

The children will be iterated over in the same order as they appear in the final devicetree.

Parameters

- node_id – node identifier
- fn – macro to invoke

DT_FOREACH_CHILD_STATUS_OKAY_SEP(node_id, fn, sep)

Call fn on the child nodes with status okay with separator.

The macro fn should take one argument, which is the node identifier for the child node.

As usual, both a missing status and an ok status are treated as okay.

See also:

**DT_FOREACH_CHILD_STATUS_OKAY**

Parameters

- node_id – node identifier
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_FOREACH_CHILD_STATUS_OKAY_VARGS(node_id, fn, ...)

Call fn on the child nodes with status okay with multiple arguments.

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

As usual, both a missing status and an ok status are treated as okay.

The children will be iterated over in the same order as they appear in the final devicetree.

See also:

**DT_FOREACH_CHILD_STATUS_OKAY**

Parameters
DT_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS(node_id, fn, sep, ...)
Call fn on the child nodes with status okay with separator and multiple arguments.
The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.
As usual, both a missing status and an ok status are treated as okay.

See also:
DT_FOREACH_CHILD_SEP_STATUS_OKAY

Parameters

- node_id – node identifier
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- ... – variable number of arguments to pass to fn

DT_FOREACH_PROP_ELEM(node_id, prop, fn)
Invokes fn for each element in the value of property prop.
The macro fn must take three parameters: fn(node_id, prop, idx). node_id and prop are the same as what is passed to DT_FOREACH_PROP_ELEM(), and idx is the current index into the array. The idx values are integer literals starting from 0.
Example devicetree fragment:

```plaintext
n: node {
    my-ints = <1 2 3>;
};
```
Example usage:

```plaintext
#define TIMES_TWO(node_id, prop, idz) \
    (2 * DT_PROP_BY_IDX(node_id, prop, idz)),

int array[] = {
    DT_FOREACH_PROP_ELEM(DT_NODELABEL(n), my_ints, TIMES_TWO)
};
```
This expands to:

```plaintext
int array[] = {
    (2 * 1), (2 * 2), (2 * 3),
};
```
In general, this macro expands to:
fn(node_id, prop, 0) fn(node_id, prop, 1) [...] fn(node_id, prop, n-1)

where \( n \) is the number of elements in \( prop \), as it would be returned by \( DT\_PROP\_LEN(node_id, prop) \).

The \( prop \) argument must refer to a property with type string, array, uint8-array, string-array, phandles, or phandle-array. It is an error to use this macro with properties of other types.

**Parameters**

- \( node\_id \) – node identifier
- \( prop \) – lowercase-and-underscores property name
- \( fn \) – macro to invoke

\( DT\_FOREACH\_PROP\_ELEM\_SEP(node\_id, prop, fn, sep) \)

Invokes \( fn \) for each element in the value of property \( prop \) with separator.

Example devicetree fragment:

```markdown
n: node {
    my-gpios = <&gpioa 0 GPIO\_ACTICE\_HIGH>,
              <&gpiob 1 GPIO\_ACTIVE\_HIGH>;
}
```

Example usage:

```c
struct gpio_dt_spec specs[] = {
    DT_FOREACH_PROP_ELEM_SEP(DT\_NODELABEL(n), my\_gpios,
                                GPIO\_DT\_SPEC\_BY\_IDX, (,)),
};
```

This expands as a first step to:

```c
struct gpio_dt_spec specs[] = {
    struct gpio_dt_spec specs[] = {
        GPIO\_DT\_SPEC\_BY\_IDX(DT\_NODELABEL(n), my\_gpios, 0),
        GPIO\_DT\_SPEC\_BY\_IDX(DT\_NODELABEL(n), my\_gpios, 1)
    }
};
```

The “prop” argument must refer to a property with type string, array, uint8-array, string-array, phandles, or phandle-array. It is an error to use this macro with properties of other types.

**See also:**

\( DT\_FOREACH\_PROP\_ELEM \)

**Parameters**

- \( node\_id \) – node identifier
- \( prop \) – lowercase-and-underscores property name
- \( fn \) – macro to invoke
- \( sep \) – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
DT_FOREACH_PROP_ELEM_VARS(node_id, prop, fn, ...)
Invokes fn for each element in the value of property prop with multiple arguments.

The macro fn must take multiple parameters: fn(node_id, prop, idx, ...). node_id and prop are the same as what is passed to DT_FOREACH_PROP_ELEM(), and idx is the current index into the array. The idx values are integer literals starting from 0. The remaining arguments are passed-in by the caller.

See also:
DT_FOREACH_PROP_ELEM

Parameters
• node_id – node identifier
• prop – lowercase-and-underscores property name
• fn – macro to invoke
• ... – variable number of arguments to pass to fn

DT_FOREACH_PROP_ELEM_SEP_VARS(node_id, prop, fn, sep, ...)
Invokes fn for each element in the value of property prop with multiple arguments and a separator.

See also:
DT_FOREACH_PROP_ELEM_VARS

Parameters
• node_id – node identifier
• prop – lowercase-and-underscores property name
• fn – macro to invoke
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
• ... – variable number of arguments to pass to fn

DT_FOREACH_STATUS_OKAY(compat, fn)
Invokes fn for each status okay node of a compatible.

This macro expands to:

fn(node_id_1) fn(node_id_2) ... fn(node_id_n)

where each node_id_<i> is a node identifier for some node with compatible compat and status okay. Whitespace is added between expansions as shown above.

Example devicetree fragment:

/ {
  a {
    compatible = "foo";
    status = "okay";
  };
  b {
    (continues on next page)
Example usage:

\[ \text{DT_FOREACH_STATUS_OKAY}(\text{foo}, \text{DT_NODE_PATH}) \]

This expands to one of the following:

\[ /a \quad /c \]
\[ /c \quad /a \]

“One of the following” is because no guarantees are made about the order that node identifiers are passed to \textit{fn} in the expansion.

(The /c string literal is present because a missing status property is always treated as if the status were set to \textit{okay}.)

Note also that \textit{fn} is responsible for adding commas, semicolons, or other terminators as needed.

**Parameters**

- \textit{compat} – lowercase-and-underscores devicetree compatible
- \textit{fn} – Macro to call for each enabled node. Must accept a node\_id as its only parameter.

\[ \text{DT_FOREACH_STATUS_OKAY_VARGS}(\text{compat}, \text{fn}, ...) \]

Invokes \textit{fn} for each status \textit{okay} node of a \textit{compatible} with multiple arguments.

This is like \textit{DT_FOREACH_STATUS_OKAY()} except you can also pass additional arguments to \textit{fn}.

Example devicetree fragment:

\[
/ \{
  a \{
    \text{compatible} = "foo";
    \text{val} = <3>;
  \};
  b \{
    \text{compatible} = "foo";
    \text{val} = <4>;
  \};
\};
\]

Example usage:

\[ \text{\#define MY\_FN}(\text{node\_id, operator}) \text{DT\_PROP}(\text{node\_id, val}) \text{operator} \]
\[ x = \text{DT\_FOREACH\_STATUS\_OKAY\_VARGS}(\text{foo, MY\_FN, +}) \ 0; \]
This expands to one of the following:

\[
x = 3 + 4 + 0;
x = 4 + 3 + 0;
\]

i.e. it sets x to 7. As with `DT_FOREACH_STATUS_OKAY()`, there are no guarantees about the order nodes appear in the expansion.

**Parameters**

- `compat` – lowercase-and-underscores devicetree compatible
- `fn` – Macro to call for each enabled node. Must accept a node_id as its only parameter.
- `...` – Additional arguments to pass to `fn`

**Existence checks**

This section documents miscellaneous macros that can be used to test if a node exists, how many nodes of a certain type exist, whether a node has certain properties, etc. Some macros used for special purposes (such as `DT_IRQ_HAS_IDX()` and all macros which require `DT_DRV_COMPAT`) are documented elsewhere on this page.

`group devicetree-generic-exist`

**Defines**

`DT_NODE_EXISTS(node_id)`

Does a node identifier refer to a node?

Tests whether a node identifier refers to a node which exists, i.e. is defined in the devicetree. It doesn’t matter whether or not the node has a matching binding, or what the node’s status value is. This is purely a check of whether the node exists at all.

**Parameters**

- `node_id` – a node identifier

**Returns**

1 if the node identifier refers to a node, 0 otherwise.

`DT_NODE_HAS_STATUS(node_id, status)`

Does a node identifier refer to a node with a status?

Example uses:

\[
\begin{align*}
&DT\_NODE\_HAS\_STATUS(DT\_PATH(soc, i2c_12340000), \text{okay}) \\
&DT\_NODE\_HAS\_STATUS(DT\_PATH(soc, i2c_12340000), \text{disabled})
\end{align*}
\]

Tests whether a node identifier refers to a node which:

- exists in the devicetree, and
- has a status property matching the second argument (except that either a missing status or an ok status in the devicetree is treated as if it were okay instead)

**Parameters**
• node_id – a node identifier
• status – a status as one of the tokens okay or disabled, not a string

Returns
1 if the node has the given status, 0 otherwise.

\texttt{DT\_HAS\_COMPAT\_STATUS\_OKAY(compat)}

Does the devicetree have a status okay node with a compatible?

Test for whether the devicetree has any nodes with status okay and the given compatible. That is, this returns 1 if and only if there is at least one \texttt{node_id} for which both of these expressions return 1:

\texttt{DT\_NODE\_HAS\_STATUS(node_id, okay)}
\texttt{DT\_NODE\_HAS\_COMPAT(node_id, compat)}

As usual, both a missing status and an \texttt{ok} status are treated as \texttt{okay}.

Parameters
• compat – lowercase-and-underscores compatible, without quotes

Returns
1 if both of the above conditions are met, 0 otherwise

\texttt{DT\_NUM\_INST\_STATUS\_OKAY(compat)}

Get the number of instances of a given compatible with status okay

Parameters
• compat – lowercase-and-underscores compatible, without quotes

Returns
Number of instances with status okay

\texttt{DT\_NODE\_HAS\_COMPAT(node_id, compat)}

Does a devicetree node match a compatible?

Example devicetree fragment:

```
\texttt{n: node {}
    \texttt{compatible = "vnd,specific-device", "generic-device";}
\texttt{}}
```

Example usages which evaluate to 1:

```
\texttt{DT\_NODE\_HAS\_COMPAT(DT\_NODELABEL(n), vnd_specific_device)}
\texttt{DT\_NODE\_HAS\_COMPAT(DT\_NODELABEL(n), generic_device)}
```

This macro only uses the value of the compatible property. Whether or not a particular compatible has a matching binding has no effect on its value, nor does the node's status.

Parameters
• node_id – node identifier
• compat – lowercase-and-underscores compatible, without quotes

Returns
1 if the node's compatible property contains \texttt{compat}, 0 otherwise.
DT_NODE_HAS_COMPAT_STATUS(node_id, compat, status)
   Does a devicetree node have a compatible and status?
   This is equivalent to:
   
   (DT_NODE_HAS_COMPAT(node_id, compat) &&
    DT_NODE_HAS_STATUS(node_id, status))

Parameters
   • node_id – node identifier
   • compat – lowercase-and-underscores compatible, without quotes
   • status – okay or disabled as a token, not a string

DT_NODE_HAS_PROP(node_id, prop)
   Does a devicetree node have a property?
   Tests whether a devicetree node has a property defined.
   This tests whether the property is defined at all, not whether a boolean property is true or false. To get a boolean property's truth value, use DT_PROP(node_id, prop) instead.

Parameters
   • node_id – node identifier
   • prop – lowercase-and-underscores property name

Returns
   1 if the node has the property, 0 otherwise.

DT_PHA_HAS_CELL_AT_IDX(node_id, pha, idx, cell)
   Does a phandle array have a named cell specifier at an index?
   If this returns 1, then the phandle-array property pha has a cell named cell at index idx, and therefore DT_PHA_BY_IDX(node_id,pha, idx, cell) is valid. If it returns 0, it's an error to use DT_PHA_BY_IDX() with the same arguments.

Parameters
   • node_id – node identifier
   • pha – lowercase-and-underscores property with type phandle-array
   • idx – index to check within pha
   • cell – lowercase-and-underscores cell name whose existence to check at index idx

Returns
   1 if the named cell exists in the specifier at index idx, 0 otherwise.

DT_PHA_HAS_CELL(node_id, pha, cell)
   Equivalent to DT_PHA_HAS_CELL_AT_IDX(node_id, pha, 0, cell)

Parameters
   • node_id – node identifier
   • pha – lowercase-and-underscores property with type phandle-array
   • cell – lowercase-and-underscores cell name whose existence to check at index idx

Returns
   1 if the named cell exists in the specifier at index 0, 0 otherwise.
Inter-node dependencies  The devicetree.h API has some support for tracking dependencies between nodes. Dependency tracking relies on a binary “depends on” relation between devicetree nodes, which is defined as the transitive closure of the following “directly depends on” relation:

- every non-root node directly depends on its parent node
- a node directly depends on any nodes its properties refer to by phandle
- a node directly depends on its interrupt-parent if it has an interrupts property

A dependency ordering of a devicetree is a list of its nodes, where each node n appears earlier in the list than any nodes that depend on n. A node's dependency ordinal is then its zero-based index in that list. Thus, for two distinct devicetree nodes n1 and n2 with dependency ordinals d1 and d2, we have:

- d1 != d2
- if n1 depends on n2, then d1 > d2
- d1 > d2 does not necessarily imply that n1 depends on n2

The Zephyr build system chooses a dependency ordering of the final devicetree and assigns a dependency ordinal to each node. Dependency related information can be accessed using the following macros. The exact dependency ordering chosen is an implementation detail, but cyclic dependencies are detected and cause errors, so it's safe to assume there are none when using these macros.

There are instance number-based conveniences as well; see DT_INST_DEP_ORD() and subsequent documentation.

### group devicetree-dep-ord

#### Defines

- **DT_DEP_ORD(node_id)**
  Get a node's dependency ordinal.
  
  **Parameters**
  - node_id – Node identifier
  
  **Returns**
  the node's dependency ordinal as an integer literal

- **DT_REQUIRES_DEP_ORDS(node_id)**
  Get a list of dependency ordinals of a node's direct dependencies.
  
  There is a comma after each ordinal in the expansion, including the last one:

  ```
  DT_REQUIRES_DEP_ORDS(my_node) // required_ord_1, ..., required_ord_n,
  ```

  The one case **DT_REQUIRES_DEP_ORDS()** expands to nothing is when given the root node identifier DT_ROOT as argument. The root has no direct dependencies; every other node at least depends on its parent.

  **Parameters**
  - node_id – Node identifier
  
  **Returns**
  a list of dependency ordinals, with each ordinal followed by a comma (,), or an empty expansion

- **DT_SUPPORTS_DEP_ORDS(node_id)**
  Get a list of dependency ordinals of what depends directly on a node.
  
  There is a comma after each ordinal in the expansion, including the last one:
DT_SUPPORTS_DEP_ORDS() may expand to nothing. This happens when node_id refers to a leaf node that nothing else depends on.

**Parameters**
- node_id – Node identifier

**Returns**
- a list of dependency ordinals, with each ordinal followed by a comma (,), or an empty expansion

**DT_INST_DEP_ORD(inst)**
Get a DT_DRV_COMPAT instance’s dependency ordinal.
Equivalent to DT_DEP_ORD(DT_DRV_INST(inst)).

**Parameters**
- inst – instance number

**Returns**
- The instance’s dependency ordinal

**DT_INSTQUIRES_DEP_ORDS(inst)**
Get a list of dependency ordinals of a DT_DRV_COMPAT instance’s direct dependencies.
Equivalent to DT_REQUIRES_DEP_ORDS(DT_DRV_INST(inst)).

**Parameters**
- inst – instance number

**Returns**
- a list of dependency ordinals for the nodes the instance depends on directly

**DT_INST_SUPPORTS_DEP_ORDS(inst)**
Get a list of dependency ordinals of what depends directly on a DT_DRV_COMPAT instance.
Equivalent to DT_SUPPORTS_DEP_ORDS(DT_DRV_INST(inst)).

**Parameters**
- inst – instance number

**Returns**
- a list of node identifiers for the nodes that depend directly on the instance

**Bus helpers** Zephyr’s devicetree bindings language supports a bus: key which allows bindings to declare that nodes with a given compatible describe system buses. In this case, child nodes are considered to be on a bus of the given type, and the following APIs may be used.

**group devicetree-generic-bus**

**Defines**

**DT_BUS(node_id)**
Node’s bus controller.
Get the node identifier of the node’s bus controller. This can be used with DT_PROP() to get properties of the bus controller.
It is an error to use this with nodes which do not have bus controllers.
Example devicetree fragment:

```
i2c@deadbeef {
    status = "okay";
    clock-frequency = <100000>;

    i2c_device: accelerometer@12 {
        ...
    };
};
```

Example usage:

```
DT_PROP(DT_BUS(DT_NODELABEL(i2c_device)), clock_frequency) // 100000
```

**Parameters**

- `node_id` – node identifier

**Returns**

a node identifier for the node's bus controller

```
DT_BUS_LABEL(node_id)
```

Node's bus controller's `label` property.

**Deprecated:**

If used to obtain a device instance with `device_get_binding`, consider using `DEVICE_DT_GET(DT_BUS(node))`.

**Parameters**

- `node_id` – node identifier

**Returns**

the label property of the node's bus controller `DT_BUS(node)`

```
DT_ON_BUS(node_id, bus)
```

Is a node on a bus of a given type?

Example devicetree overlay:

```
&i2c0 {
    temp: temperature-sensor@76 {
        compatible = "vnd,some-sensor";
        reg = <0x76>;
    };
};
```

Example usage, assuming `i2c0` is an I2C bus controller node, and therefore `temp` is on an I2C bus:

```
DT_ON_BUS(DT_NODELABEL(temp), i2c) // 1
DT_ON_BUS(DT_NODELABEL(temp), spi) // 0
```
Parameters
- node_id – node identifier
- bus – lowercase-and-underscores bus type as a C token (i.e. without quotes)

Returns
1 if the node is on a bus of the given type, 0 otherwise

Instance-based APIs
These are recommended for use within device drivers. To use them, define DT_DRV_COMPAT to the lowercase-and-underscores compatible the device driver implements support for. Here is an example devicetree fragment:

```c
serial@40001000 {
    compatible = "vnd,serial";
    status = "okay";
    current-speed = <115200>;
};
```

Example usage, assuming serial@40001000 is the only enabled node with compatible vnd,serial:

```c
#define DT_DRV_COMPAT vnd_serial
DT_DRV_INST(0)  // node identifier for serial@40001000
DT_INST_PROP(0, current_speed) // 115200
```

Warning: Be careful making assumptions about instance numbers. See `DT_INST()` for the API guarantees.

As shown above, the DT_INST_* APIs are conveniences for addressing nodes by instance number. They are almost all defined in terms of one of the Generic APIs. The equivalent generic API can be found by removing INST_ from the macro name. For example, DT_INST_PROP(inst, prop) is equivalent to DT_PROP(DT_DRV_INST(inst), prop). Similarly, DT_INST_REG_ADDR(inst) is equivalent to DT_REG_ADDR(DT_DRV_INST(inst)), and so on. There are some exceptions: DT_ANY_INST_ON_BUS_STATUS_OKAY() and DT_INST_FOREACH_STATUS_OKAY() are special-purpose helpers without straightforward generic equivalents.

Since DT_DRV_INST() requires DT_DRV_COMPAT to be defined, it’s an error to use any of these without that macro defined.

Note that there are also helpers available for specific hardware; these are documented in Hardware specific APIs.

```c
group devicetree-inst

Defines

DT_DRV_INST(inst)
Node identifier for an instance of a DT_DRV_COMPAT compatible.

Parameters
- inst – instance number

Returns
a node identifier for the node with DT_DRV_COMPAT compatible and instance number inst
```
DT_INST_PARENT(inst)
Get a DT_DRV_COMPAT parent's node identifier.

See also:
DT_PARENT

Parameters
• inst – instance number

Returns
a node identifier for the instance's parent

DT_INST_GPARENT(inst)
Get a DT_DRV_COMPAT grandparent's node identifier.

See also:
DT_GPARENT

Parameters
• inst – instance number

Returns
a node identifier for the instance's grandparent

DT_INST_CHILD(inst, child)
Get a node identifier for a child node of DT_DRV_INST(inst)

See also:
DT_CHILD

Parameters
• inst – instance number
• child – lowercase-and-underscores child node name

Returns
node identifier for the node with the name referred to by ‘child’

DT_INST_FOREACH_CHILD(inst, fn)
Call fn on all child nodes of DT_DRV_INST(inst).
The macro fn should take one argument, which is the node identifier for the child node.
The children will be iterated over in the same order as they appear in the final devicetree.

See also:
DT_FOREACH_CHILD

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier
DT_INST_FOREACH_CHILD_SEP (inst, fn, sep)

Call fn on all child nodes of DT_DRV_INST(inst) with a separator.

The macro fn should take one argument, which is the node identifier for the child node.

See also:

DT_FOREACH_CHILD_SEP

Parameters

• inst – instance number
• fn – macro to invoke on each child node identifier
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_INST_FOREACH_CHILD_VARGS (inst, fn, ...)

Call fn on all child nodes of DT_DRV_INST(inst).

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

The children will be iterated over in the same order as they appear in the final devicetree.

See also:

DT_FOREACH_CHILD

Parameters

• inst – instance number
• fn – macro to invoke on each child node identifier
• ... – variable number of arguments to pass to fn

DT_INST_FOREACH_CHILD_SEP_VARGS (inst, fn, sep, ...)

Call fn on all child nodes of DT_DRV_INST(inst) with separator.

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also:

DT_FOREACH_CHILD_SEP_VARGS

Parameters

• inst – instance number
• fn – macro to invoke on each child node identifier
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
• ... – variable number of arguments to pass to fn

5.2. Devicetree
DT_INST_FOREACH_CHILD_STATUS_OKAY(inst, fn)
Call fn on all child nodes of DT_DRV_INST(inst) with status okay.
The macro fn should take one argument, which is the node identifier for the child node.

See also:
DT_FOREACH_CHILD_STATUS_OKAY

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier

DT_INST_FOREACH_CHILD_STATUS_OKAY_SEP(inst, fn, sep)
Call fn on all child nodes of DT_DRV_INST(inst) with status okay and with separator.
The macro fn should take one argument, which is the node identifier for the child node.

See also:
DT_FOREACH_CHILD_STATUS_OKAY_SEP

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier
• sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_INST_FOREACH_CHILD_STATUS_OKAY_VARGS(inst, fn, ...)
Call fn on all child nodes of DT_DRV_INST(inst) with status okay and multiple arguments.
The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also:
DT_FOREACH_CHILD_STATUS_OKAY_VARGS

Parameters
• inst – instance number
• fn – macro to invoke on each child node identifier
• ... – variable number of arguments to pass to fn

DT_INST_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS(inst, fn, sep, ...)
Call fn on all child nodes of DT_DRV_INST(inst) with status okay and with separator and multiple arguments.
The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also:
DT_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS
Parameters

- **inst** – instance number
- **fn** – macro to invoke on each child node identifier
- **sep** – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- **...** – variable number of arguments to pass to **fn**

**DT_INST_ENUM_IDX**(inst, prop)

Get a `DT_DRV_COMPAT` value's index into its enumeration values.

**Parameters**

- **inst** – instance number
- **prop** – lowercase-and-underscores property name

**Returns**

zero-based index of the property's value in its enum: list

**DT_INST_ENUM_IDX_OR**(inst, prop, default_idx_value)

Like `DT_INST_ENUM_IDX()`, but with a fallback to a default enum index.

**Parameters**

- **inst** – instance number
- **prop** – lowercase-and-underscores property name
- **default_idx_value** – a fallback index value to expand to

**Returns**

zero-based index of the property's value in its enum if present, default_idx_value otherwise

**DT_INST_PROP**(inst, prop)

Get a `DT_DRV_COMPAT` instance property.

**Parameters**

- **inst** – instance number
- **prop** – lowercase-and-underscores property name

**Returns**

a representation of the property's value

**DT_INST_PROP_LEN**(inst, prop)

Get a `DT_DRV_COMPAT` property length.

**Parameters**

- **inst** – instance number
- **prop** – lowercase-and-underscores property name

**Returns**

logical length of the property

**DT_INST_PROP_HAS_IDX**(inst, prop, idx)

Is index idx valid for an array type property on a `DT_DRV_COMPAT` instance?

**Parameters**

- **inst** – instance number
- **prop** – lowercase-and-underscores property name
• idx – index to check

**Returns**
1 if idx is a valid index into the given property, 0 otherwise.

`DT_INST_PROP_HAS_NAME(inst, prop, name)`
Is name name available in a foo-names property?

**Parameters**
• inst – instance number
• prop – a lowercase-and-underscores prop-names type property
• name – a lowercase-and-underscores name to check

**Returns**
An expression which evaluates to 1 if name is an available name into the given property, and 0 otherwise.

`DT_INST_PROP_BY_IDX(inst, prop, idx)`
Get a DT_DRV_COMPAT element value in an array property.

**Parameters**
• inst – instance number
• prop – lowercase-and-underscores property name
• idx – the index to get

**Returns**
a representation of the idx-th element of the property

`DT_INST_PROP_OR(inst, prop, default_value)`
Like `DT_INST_PROP()`, but with a fallback to default_value.

**Parameters**
• inst – instance number
• prop – lowercase-and-underscores property name
• default_value – a fallback value to expand to

**Returns**
`DT_INST_PROP(inst, prop)` or default_value

`DT_INST_LABEL(inst)`
Get a DT_DRV_COMPAT instance’s label property.

*Deprecated:*
Use `DT_INST_PROP(inst, label)`

**Parameters**
• inst – instance number

**Returns**
instance’s label property value

`DT_INST_STRING_TOKEN(inst, prop)`
Get a DT_DRV_COMPAT instance’s string property’s value as a token.

**Parameters**
• inst – instance number
• prop – lowercase-and-underscores property string name

**Returns**
the value of prop as a token, i.e. without any quotes and with special characters converted to underscores

`DT_INST_STRING_UPPER_TOKEN(inst, prop)`
Like `DT_INST_STRING_TOKEN()`, but uppercased.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property string name

**Returns**
the value of prop as an uppercased token, i.e. without any quotes and with special characters converted to underscores

`DT_INST_STRING_TOKEN_BY_IDX(inst, prop, idx)`
Get an element out of string-array property as a token.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property string name
- idx – the index to get

**Returns**
the element in prop at index idx as a token

`DT_INST_STRING_UPPER_TOKEN_BY_IDX(inst, prop, idx)`
Like `DT_INST_STRING_TOKEN_BY_IDX()`, but uppercased.

**Parameters**
- inst – instance number
- prop – lowercase-and-underscores property string name
- idx – the index to get

**Returns**
the element in prop at index idx as an uppercased token

`DT_INST_PROP_BY_PHANDLE(inst, ph, prop)`
Get a DT_DRV_COMPAT instance's property value from a phandle's node.

**Parameters**
- inst – instance number
- ph – lowercase-and-underscores property of inst with type phandle
- prop – lowercase-and-underscores property of the phandle's node

**Returns**
the value of prop as described in the DT_PROP() documentation

`DT_INST_PROP_BY_PHANDLE_IDX(inst, phs, idx, prop)`
Get a DT_DRV_COMPAT instance's property value from a phandle in a property.

**Parameters**
- inst – instance number
- phs – lowercase-and-underscores property with type phandle, phandles, or phandle-array

5.2. Devicetree
- idx – logical index into “phs”, which must be zero if “phs” has type phandle
- prop – lowercase-and-underscores property of the phandle’s node

**Returns**
the value of prop as described in the `DT_PROP()` documentation.

`DT_INST_PHA_BY_IDX(inst, pha, idx, cell)`
Get a `DT_DRV_COMPAT` instance’s phandle-array specifier value at an index.

**Parameters**
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- idx – logical index into the property pha
- cell – binding’s cell name within the specifier at index idx

**Returns**
the value of the cell inside the specifier at index idx

`DT_INST_PHA_BY_IDX_OR(inst, pha, idx, cell, default_value)`
Like `DT_INST_PHA_BY_IDX()`, but with a fallback to default_value.

**Parameters**
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- idx – logical index into the property pha
- cell – binding’s cell name within the specifier at index idx
- default_value – a fallback value to expand to

**Returns**
`DT_INST_PHA(inst, pha, cell)`
Get a `DT_DRV_COMPAT` instance’s phandle-array specifier value
Equivalent to `DT_INST_PHA_BY_IDX(inst, pha, 0, cell)`

**Parameters**
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- cell – binding’s cell name for the specifier at pha index 0

**Returns**
the cell value

`DT_INST_PHA_OR(inst, pha, cell, default_value)`
Like `DT_INST_PHA()`, but with a fallback to default_value.

**Parameters**
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- cell – binding’s cell name for the specifier at pha index 0
- default_value – a fallback value to expand to

**Returns**
`DT_INST_PHA(inst, pha, cell)` or `default_value`
DT_INST_PHA_BY_NAME(inst, pha, name, cell)
Get a DT_DRV_COMPAT instance's value within a phandle-array specifier by name.

Parameters
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- name – lowercase-and-underscores name of a specifier in pha
- cell – binding's cell name for the named specifier

Returns
the cell value

DT_INST_PHA_BY_NAME_OR(inst, pha, name, cell, default_value)
Like DT_INST_PHA_BY_NAME(), but with a fallback to default_value.

Parameters
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- name – lowercase-and-underscores name of a specifier in pha
- cell – binding's cell name for the named specifier
- default_value – a fallback value to expand to

Returns
DT_INST_PHA_BY_NAME(inst, pha, name, cell) or default_value

DT_INST_PHANDLE_BY_NAME(inst, pha, name)
Get a DT_DRV_COMPAT instance's phandle node identifier from a phandle array by name.

Parameters
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- name – lowercase-and-underscores name of an element in pha

Returns
node identifier for the phandle at the element named “name”

DT_INST_PHANDLE_BY_IDX(inst, prop, idx)
Get a DT_DRV_COMPAT instance's node identifier for a phandle in a property.

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name in inst with type phandle, phandles or phandle-array
- idx – index into prop

Returns
a node identifier for the phandle at index idx in prop

DT_INST_PHANDLE(inst, prop)
Get a DT_DRV_COMPAT instance's node identifier for a phandle property's value.

Parameters
- inst – instance number
- prop – lowercase-and-underscores property of inst with type phandle
Returns a node identifier for the node pointed to by “ph”

\texttt{DT\_INST\_REG\_HAS\_IDX}(\texttt{inst, idx})

is \texttt{idx} a valid register block index on a \texttt{DT\_DRV\_COMPAT} instance?

\textbf{Parameters}

\begin{itemize}
  \item \texttt{inst} – instance number
  \item \texttt{idx} – index to check
\end{itemize}

\textbf{Returns}

1 if \texttt{idx} is a valid register block index, 0 otherwise.

\texttt{DT\_INST\_REG\_ADDR\_BY\_IDX}(\texttt{inst, idx})

Get a \texttt{DT\_DRV\_COMPAT} instance's \texttt{idx}-th register block's address.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{inst} – instance number
  \item \texttt{idx} – index of the register whose address to return
\end{itemize}

\textbf{Returns}

address of the instance's \texttt{idx}-th register block

\texttt{DT\_INST\_REG\_SIZE\_BY\_IDX}(\texttt{inst, idx})

Get a \texttt{DT\_DRV\_COMPAT} instance's \texttt{idx}-th register block's size.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{inst} – instance number
  \item \texttt{idx} – index of the register whose size to return
\end{itemize}

\textbf{Returns}

size of the instance's \texttt{idx}-th register block

\texttt{DT\_INST\_REG\_ADDR\_BY\_NAME}(\texttt{inst, name})

Get a \texttt{DT\_DRV\_COMPAT}'s register block address by name.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{inst} – instance number
  \item \texttt{name} – lowercase-and-underscores register specifier name
\end{itemize}

\textbf{Returns}

address of the register block with the given \texttt{name}

\texttt{DT\_INST\_REG\_SIZE\_BY\_NAME}(\texttt{inst, name})

Get a \texttt{DT\_DRV\_COMPAT}'s register block size by name.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{inst} – instance number
  \item \texttt{name} – lowercase-and-underscores register specifier name
\end{itemize}

\textbf{Returns}

size of the register block with the given \texttt{name}

\texttt{DT\_INST\_REG\_ADDR}(\texttt{inst})

Get a \texttt{DT\_DRV\_COMPAT}'s (only) register block address.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{inst} – instance number
\end{itemize}
Returns
    instance's register block address

DT_INST_REG_SIZE(inst)
    Get a DT_DRV_COMPAT's (only) register block size.

Parameters
    • inst – instance number

Returns
    instance's register block size

DT_INST_IRQ_BY_IDX(inst, idx, cell)
    Get a DT_DRV_COMPAT interrupt specifier value at an index.

Parameters
    • inst – instance number
    • idx – logical index into the interrupt specifier array
    • cell – cell name specifier

Returns
    the named value at the specifier given by the index

DT_INST_IRQ_BY_NAME(inst, name, cell)
    Get a DT_DRV_COMPAT interrupt specifier value by name.

Parameters
    • inst – instance number
    • name – lowercase-and-underscores interrupt specifier name
    • cell – cell name specifier

Returns
    the named value at the specifier given by the index

DT_INST_IRQ(inst, cell)
    Get a DT_DRV_COMPAT interrupt specifier's value.

Parameters
    • inst – instance number
    • cell – cell name specifier

Returns
    the named value at that index

DT_INST_IRQN(inst)
    Get a DT_DRV_COMPAT's (only) irq number.

Parameters
    • inst – instance number

Returns
    the interrupt number for the node's only interrupt

DT_INST_BUS(inst)
    Get a DT_DRV_COMPAT's bus node identifier.

Parameters
    • inst – instance number
Returns
node identifier for the instance's bus node

DT_INST_BUS_LABEL(inst)
Get a DT_DRV_COMPAT's bus node's label property.

Deprecated:
If used to obtain a device instance with device_get_binding, consider using DEVICE_DT_GET(DT_INST_BUS(inst)).

Parameters
• inst – instance number

Returns
the label property of the instance’s bus controller

DT_INST_ON_BUS(inst, bus)
Test if a DT_DRV_COMPAT's bus type is a given type.

Parameters
• inst – instance number
• bus – a binding’s bus type as a C token, lowercased and without quotes

Returns
1 if the given instance is on a bus of the given type, 0 otherwise

DT_INST_STRING_TOKEN_OR(inst, name, default_value)
Like DT_INST_STRING_TOKEN(), but with a fallback to default_value.

Parameters
• inst – instance number
• name – lowercase-and-underscores property name
• default_value – a fallback value to expand to

Returns
if prop exists, its value as a token, i.e. without any quotes and with special characters converted to underscores. Otherwise default_value

DT_INST_STRING_UPPER_TOKEN_OR(inst, name, default_value)
Like DT_INST_STRING_UPPER_TOKEN(), but with a fallback to default_value.

Parameters
• inst – instance number
• name – lowercase-and-underscores property name
• default_value – a fallback value to expand to

Returns
the property's value as an uppercased token, or default_value

DT_ANY_INST_ON_BUS_STATUS_OKAY(bus)
Test if any DT_DRV_COMPAT node is on a bus of a given type and has status okay.

This is a special-purpose macro which can be useful when writing drivers for devices which can appear on multiple buses. One example is a sensor device which may be wired on an I2C or SPI bus.

Example devicetree overlay:
Example usage, assuming i2c0 is an I2C bus controller node, and therefore temp is on an I2C bus:

```c
#define DT_DRV_COMPAT vnd_some_sensor
DT_ANY_INST_ON_BUS_STATUS_OKAY(i2c) // 1
```

**Parameters**

- bus – a binding’s bus type as a C token, lowercased and without quotes

**Returns**

1 if any enabled node with that compatible is on that bus type, 0 otherwise

```c
DT_INST_FOREACH_STATUS_OKAY(fn)
```

Call fn on all nodes with compatible DT_DRV_COMPAT and status okay

This macro calls fn(inst) on each inst number that refers to a node with status okay. Whitespace is added between invocations.

Example devicetree fragment:

```c
a {
    compatible = "vnd.device";
    status = "okay";
    foobar = "DEV_A";
}

b {
    compatible = "vnd.device";
    status = "okay";
    foobar = "DEV_B";
}

c {
    compatible = "vnd.device";
    status = "disabled";
    foobar = "DEV_C";
}
```

Example usage:

```c
#define DT_DRV_COMPAT vnd_device
#define MY_FN(inst) DT_INST_PROP(inst, foobar),
DT_INST_FOREACH_STATUS_OKAY(MY_FN)
```
This expands to:

```
MY_FN(0) MY_FN(1)
```

and from there, to either this:

```
"DEV_A", "DEV_B",
```

or this:

```
"DEV_B", "DEV_A",
```

No guarantees are made about the order that a and b appear in the expansion.

Note that fn is responsible for adding commas, semicolons, or other separators or terminators.

Device drivers should use this macro whenever possible to instantiate a struct device for each enabled node in the devicetree of the driver’s compatible DT_DRV_COMPAT.

**Parameters**

- fn – Macro to call for each enabled node. Must accept an instance number as its only parameter.

```
DT_INST_FOREACH_STATUS_OKAY_VARGS(fn, ...)
```

Call fn on all nodes with compatible DT_DRV_COMPAT and status okay with multiple arguments.

**See also:**

`DT_INST_FOREACH_STATUS_OKAY`

**Parameters**

- fn – Macro to call for each enabled node. Must accept an instance number as its only parameter.
- ... – variable number of arguments to pass to fn

```
DT_INST_FOREACH_PROP_ELEM(inst, prop, fn)
```

Invokes fn for each element of property prop for a DT_DRV_COMPAT instance.

Equivalent to `DT_FOREACH_PROP_ELEM(DT_DRV_INST(inst), prop, fn)`.

**Parameters**

- inst – instance number
- prop – lowercase-and-underscores property name
- fn – macro to invoke

```
DT_INST_FOREACH_PROP_ELEM_SEP(inst, prop, fn, sep)
```

Invokes fn for each element of property prop for a DT_DRV_COMPAT instance with a separator.

Equivalent to `DT_FOREACH_PROP_ELEM_SEP(DT_DRV_INST(inst), prop, fn, sep)`.

**Parameters**

- inst – instance number
- prop – lowercase-and-underscores property name
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
DT_INST_FOREACH_PROP_ELEM_VARGS(inst, prop, fn, ...)  
Invokes fn for each element of property prop for a DT_DRV_COMPAT instance with multiple arguments.  
Equivalent to DT_FOREACH_PROP_ELEM_VARGS(DT_DRV_INST(inst), prop, fn, VA_ARGS)

See also:  
DT_INST_FOREACH_PROP_ELEM

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name
- fn – macro to invoke
- ... – variable number of arguments to pass to fn

DT_INST_FOREACH_PROP_ELEM_SEP_VARGS(inst, prop, fn, sep, ...)  
Invokes fn for each element of property prop for a DT_DRV_COMPAT instance with multiple arguments and a separator.  
Equivalent to DT_FOREACH_PROP_ELEM_SEP_VARGS(DT_DRV_INST(inst), prop, fn, sep, VA_ARGS)

See also:  
DT_INST_FOREACH_PROP_ELEM

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- ... – variable number of arguments to pass to fn

DT_INST_NODE_HAS_PROP(inst, prop)  
Does a DT_DRV_COMPAT instance have a property?  

Parameters
- inst – instance number
- prop – lowercase-and-underscores property name

Returns
1 if the instance has the property, 0 otherwise.

DT_INST_PHA_HAS_CELL_AT_IDX(inst, pha, idx, cell)  
Does a phandle array have a named cell specifier at an index for a DT_DRV_COMPAT instance?  

Parameters
- inst – instance number
- pha – lowercase-and-underscores property with type phandle-array
- idx – index to check
• cell – named cell value whose existence to check

Returns
1 if the named cell exists in the specifier at index idx, 0 otherwise.

DT_INST_PHA_HAS_CELL(inst, pha, cell)
Does a phandle array have a named cell specifier at index 0 for a DT_DRV_COMPAT instance?

Parameters
• inst – instance number
• pha – lowercase-and-underscores property with type phandle-array
• cell – named cell value whose existence to check

Returns
1 if the named cell exists in the specifier at index 0, 0 otherwise.

DT_INST_IRQ_HAS_IDX(inst, idx)
is index valid for interrupt property on a DT_DRV_COMPAT instance?

Parameters
• inst – instance number
• idx – logical index into the interrupt specifier array

Returns
1 if the idx is valid for the interrupt property 0 otherwise.

DT_INST_IRQ_HAS_CELL_AT_IDX(inst, idx, cell)
Does a DT_DRV_COMPAT instance have an interrupt named cell specifier?

Parameters
• inst – instance number
• idx – index to check
• cell – named cell value whose existence to check

Returns
1 if the named cell exists in the interrupt specifier at index idx 0 otherwise.

DT_INST_IRQ_HAS_CELL(inst, cell)
Does a DT_DRV_COMPAT instance have an interrupt value?

Parameters
• inst – instance number
• cell – named cell value whose existence to check

Returns
1 if the named cell exists in the interrupt specifier at index 0 0 otherwise.

DT_INST_IRQ_HAS_NAME(inst, name)
Does a DT_DRV_COMPAT instance have an interrupt value?

Parameters
• inst – instance number
• name – lowercase-and-underscores interrupt specifier name

Returns
1 if name is a valid named specifier
Hardware specific APIs  The following APIs can also be used by including `<devicetree.h>`; no additional include is needed.

CAN  These conveniences may be used for nodes which describe CAN controllers/transceivers, and properties related to them.

group devicetree-can

Defines

```
DT_CAN_TRANSCEIVER_MAX_BITRATE(node_id, max)
```

Get the maximum transceiver bitrate for a CAN controller.

The bitrate will be limited to the maximum bitrate supported by the CAN controller. If no CAN transceiver is present in the devicetree, the maximum bitrate will be that of the CAN controller.

Example devicetree fragment:

```
transceiver0: can-phy0 {
    compatible = "vnd,can-transceiver";
    max-bitrate = <1000000>;
    #phy-cells = <0>;
};

can0: can@... {
    compatible = "vnd,can-controller";
    phys = <&transceiver0>;
};

can1: can@... {
    compatible = "vnd,can-controller";

    can-transceiver {
        max-bitrate = <2000000>;
    };
};
```

Example usage:

```
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can0), 5000000) // 1000000
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can1), 5000000) // 2000000
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can1), 1000000) // 1000000
```

Parameters

- node_id – node identifier
- max – maximum bitrate supported by the CAN controller

Returns

the maximum bitrate supported by the CAN controller/transceiver combination

```
DT_INST_CAN_TRANSCEIVER_MAX_BITRATE(inst, max)
```

Get the maximum transceiver bitrate for a DT_DRV_COMPAT CAN controller.
See also:  

\texttt{DT\_CAN\_TRANSCEIVER\_MAX\_BITRATE()}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{inst} – DT\_DRV\_COMPAT instance number
  \item \texttt{max} – maximum bitrate supported by the CAN controller
\end{itemize}

\textbf{Returns}

the maximum bitrate supported by the CAN controller/transceiver combination

\textbf{Clocks}  

These conveniences may be used for nodes which describe clock sources, and properties related to them.

\textit{group devicetree-clocks}

\textbf{Defines}

\texttt{DT\_CLOCKS\_HAS\_IDX(node\_id, idx)}

Test if a node has a clocks phandle-array property at a given index.

This expands to \texttt{1} if the given index is valid clocks property phandle-array index. Otherwise, it expands to \texttt{0}.

Example devicetree fragment:

\begin{verbatim}
n1: node-1 {
    clocks = <...>, <...>;
};
n2: node-2 {
    clocks = <...>;
};
\end{verbatim}

Example usage:

\begin{verbatim}
DT\_CLOCKS\_HAS\_IDX(DT\_NODELABEL(n1), 0) // 1
DT\_CLOCKS\_HAS\_IDX(DT\_NODELABEL(n1), 1) // 1
DT\_CLOCKS\_HAS\_IDX(DT\_NODELABEL(n1), 2) // 0
DT\_CLOCKS\_HAS\_IDX(DT\_NODELABEL(n2), 1) // 0
\end{verbatim}

\textbf{Parameters}

\begin{itemize}
  \item \texttt{node\_id} – node identifier; may or may not have any clocks property
  \item \texttt{idx} – index of a clocks property phandle-array whose existence to check
\end{itemize}

\textbf{Returns}

1 if the index exists, 0 otherwise

\texttt{DT\_CLOCKS\_HAS\_NAME(node\_id, name)}

Test if a node has a clock-names array property holds a given name.

This expands to \texttt{1} if the name is available as clocks-name array property cell. Otherwise, it expands to \texttt{0}.

Example devicetree fragment:
n1: node-1 {
    clocks = <...>, <...>;
    clock-names = "alpha", "beta";
};

n2: node-2 {
    clocks = <...>;
    clock-names = "alpha";
};

Example usage:

DT_CLOCKS_HAS_NAME(DT_NODELABEL(n1), alpha) // 1
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n1), beta) // 1
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n2), beta) // 0

Parameters

- node_id – node identifier; may or may not have any clock-names property.
- name – lowercase-and-underscores clock-names cell value name to check

Returns

1 if the clock name exists, 0 otherwise

DT_NUM_CLOCKS(node_id)

Get the number of elements in a clocks property.

Example devicetree fragment:

n1: node-1 {
    clocks = <&foo>, <&bar>;
};
n2: node-2 {
    clocks = <&foo>;
};

Example usage:

DT_NUM_CLOCKS(DT_NODELABEL(n1)) // 2
DT_NUM_CLOCKS(DT_NODELABEL(n2)) // 1

Parameters

- node_id – node identifier with a clocks property

Returns

number of elements in the property

DT_CLOCKS_CTLR_BY_IDX(node_id, idx)

Get the node identifier for the controller phandle from a “clocks” phandle-array property at an index.

Example devicetree fragment:

clk1: clock-controller@... { ... };
clk2: clock-controller@... { ... };

(continues on next page)
...continued from previous page...

n: node {
    clocks = <&clk1 10 20>, <&clk2 30 40>;
};

Example usage:

DT_CLOCKS_CTLR_BY_IDX(DT_NODELABEL(n), 0)) // DT_NODELABEL(clk1)
DT_CLOCKS_CTLR_BY_IDX(DT_NODELABEL(n), 1)) // DT_NODELABEL(clk2)

See also:

DT_PHANDLE_BY_IDX()

Parameters

• node_id – node identifier
• idx – logical index into “clocks”

Returns

the node identifier for the clock controller referenced at index “idx”

DT_CLOCKS_CTLR(node_id)

Equivalent to DT_CLOCKS_CTLR_BY_IDX(node_id, 0)

See also:

DT_CLOCKS_CTLR_BY_IDX()

Parameters

• node_id – node identifier

Returns

a node identifier for the clocks controller at index 0 in “clocks”

DT_CLOCKS_CTLR_BY_NAME(node_id, name)

Get the node identifier for the controller phandle from a clocks phandle-array property by
name.

Example devicetree fragment:

clk1: clock-controller@... { ... };
clk2: clock-controller@... { ... };
n: node {
    clocks = <&clk1 10 20>, <&clk2 30 40>;
    clock-names = "alpha", "beta";
};

Example usage:

DT_CLOCKS_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(clk2)

See also:

DT_PHANDLE_BY_NAME()

Parameters
• node_id – node identifier
• name – lowercase-and-underscores name of a clocks element as defined by the
  node's clock-names property

Returns
the node identifier for the clock controller referenced by name

DT_CLOCKS_CELL_BY_IDX(node_id, idx, cell)
Get a clock specifier's cell value at an index.

Example devicetree fragment:

```devicetree
clk1: clock-controller@... {
  compatible = "vnd,clock";
  #clock-cells = < 2 >;
};

n: node {
  clocks = < &clk1 10 20 >, < &clk1 30 40 >;
};
```

Bindings fragment for the vnd,clock compatible:

```devicetree
clock-cells:
- bus
- bits
```

Example usage:

```c
DT_CLOCKS_CELL_BY_IDX(DT_NODELABEL(n), 0, bus) // 10
DT_CLOCKS_CELL_BY_IDX(DT_NODELABEL(n), 1, bits) // 40
```

See also:

* DT_PHA_BY_IDX()

Parameters

• node_id – node identifier for a node with a clocks property
• idx – logical index into clocks property
• cell – lowercase-and-underscores cell name

Returns

the cell value at index "idx"

DT_CLOCKS_CELL_BY_NAME(node_id, name, cell)
Get a clock specifier's cell value by name.

Example devicetree fragment:

```devicetree
clk1: clock-controller@... {
  compatible = "vnd,clock";
  #clock-cells = < 2 >;
};

n: node {
  clocks = < &clk1 10 20 >, < &clk1 30 40 >;
  clock-names = "alpha", "beta";
};
```
Bindings fragment for the vnd,clock compatible:

```plaintext
clock-cells:
- bus
- bits
```

Example usage:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>DT_CLOCKS_CELL_BY_NAME(DT_NODELABEL(n), alpha, bus)</code> // 10</td>
<td>DT_CLOCKS_CELL_BY_NAME(DT_NODELABEL(n), beta, bits) // 40</td>
</tr>
</tbody>
</table>

See also:

`DT_PHA_BY_NAME()`

Parameters

- `node_id` – node identifier for a node with a clocks property
- `name` – lowercase-and-underscores name of a clocks element as defined by the node's clock-names property
- `cell` – lowercase-and-underscores cell name

Returns

the cell value in the specifier at the named element

```plaintext
DT_CLOCKS_CELL(node_id, cell)
```
Equivalent to `DT_CLOCKS_CELL_BY_IDX(node_id, 0, cell)`

See also:

`DT_CLOCKS_CELL_BY_IDX()`

Parameters

- `node_id` – node identifier for a node with a clocks property
- `cell` – lowercase-and-underscores cell name

Returns

the cell value at index 0

```plaintext
DT_INST_CLOCKS_HAS_IDX(inst, idx)
```
Equivalent to `DT_CLOCKS_HAS_IDX(DT_DRV_INST(inst), idx)`

Parameters

- `inst` – DT_DRV_COMPAT instance number; may or may not have any clocks property
- `idx` – index of a clocks property phandle-array whose existence to check

Returns

1 if the index exists, 0 otherwise

```plaintext
DT_INST_CLOCKS_HAS_NAME(inst, name)
```
Equivalent to `DT_CLOCK_HAS_NAME(DT_DRV_INST(inst), name)`

Parameters

- `inst` – DT_DRV_COMPAT instance number; may or may not have any clock-names property.
- `name` – lowercase-and-underscores clock-names cell value name to check
Returns
1 if the clock name exists, 0 otherwise

\texttt{DT\_INST\_NUM\_CLOCKS(inst)}

Equivalent to \texttt{DT\_NUM\_CLOCKS(DT\_DRV\_INST(inst))}

Parameters
\begin{itemize}
  \item \texttt{inst} – instance number
\end{itemize}

Returns
number of elements in the clocks property

\texttt{DT\_INST\_CLOCKS\_CTRL\_BY\_IDX(inst, idx)}

Get the node identifier for the controller phandle from a “clocks” phandle-array property at an index.

See also:
\texttt{DT\_CLOCKS\_CTRL\_BY\_IDX()}

Parameters
\begin{itemize}
  \item \texttt{inst} – instance number
  \item \texttt{idx} – logical index into “clocks”
\end{itemize}

Returns
the node identifier for the clock controller referenced at index “idx”

\texttt{DT\_INST\_CLOCKS\_CTRL(inst)}

Equivalent to \texttt{DT\_INST\_CLOCKS\_CTRL\_BY\_IDX(inst, 0)}

See also:
\texttt{DT\_CLOCKS\_CTRL()}

Parameters
\begin{itemize}
  \item \texttt{inst} – instance number
\end{itemize}

Returns
a node identifier for the clocks controller at index 0 in “clocks”

\texttt{DT\_INST\_CLOCKS\_CTRL\_BY\_NAME(inst, name)}

Get the node identifier for the controller phandle from a clocks phandle-array property by name.

See also:
\texttt{DT\_CLOCKS\_CTRL\_BY\_NAME()}

Parameters
\begin{itemize}
  \item \texttt{inst} – instance number
  \item \texttt{name} – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property
\end{itemize}

Returns
the node identifier for the clock controller referenced by the named element
DT_INST_CLOCKS_CELL_BY_IDX(inst, idx, cell)

Get a DT_DRV_COMPAT instance's clock specifier's cell value at an index.

See also:

DT_CLOCKS_CELL_BY_IDX()

Parameters

• inst – DT_DRV_COMPAT instance number
• idx – logical index into clocks property
• cell – lowercase-and-underscores cell name

Returns

the cell value at index “idx”

DT_INST_CLOCKS_CELL_BY_NAME(inst, name, cell)

Get a DT_DRV_COMPAT instance's clock specifier's cell value by name.

See also:

DT_CLOCKS_CELL_BY_NAME()

Parameters

• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a clocks element as defined by the node's clock-names property
• cell – lowercase-and-underscores cell name

Returns

the cell value in the specifier at the named element

DT_INST_CLOCKS_CELL(inst, cell)

Equivalent to DT_INST_CLOCKS_CELL_BY_IDX(inst, 0, cell)

Parameters

• inst – DT_DRV_COMPAT instance number
• cell – lowercase-and-underscores cell name

Returns

the value of the cell inside the specifier at index 0

DMA These conveniences may be used for nodes which describe direct memory access controllers or channels, and properties related to them.

group devicetree-dmas

Defines
DT_DMAS_CTLR_BY_IDX(node_id, idx)
Get the node identifier for the DMA controller from a dmas property at an index.

Example devicetree fragment:

dma1: dma@... { ... };
dma2: dma@... { ... };
n: node {
  dmas = <&dma1 1 2 0x400 0x3>,
    <&dma2 6 3 0x404 0x5>;
};

Example usage:

DT_DMAS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(dma1)
DT_DMAS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(dma2)

See also:
DT_PROP_BY_PHANDLE_IDX()

Parameters
• node_id – node identifier for a node with a dmas property
• idx – logical index into dmas property

Returns
the node identifier for the DMA controller referenced at index “idx”

DT_DMAS_CTLR_BY_NAME(node_id, name)
Get the node identifier for the DMA controller from a dmas property by name.

Example devicetree fragment:

dma1: dma@... { ... };
dma2: dma@... { ... };
n: node {
  dmas = <&dma1 1 2 0x400 0x3>,
    <&dma2 6 3 0x404 0x5>;
  dma-names = "tx", "rx";
};

Example usage:

DT_DMAS_CTLR_BY_NAME(DT_NODELABEL(n), tx) // DT_NODELABEL(dma1)
DT_DMAS_CTLR_BY_NAME(DT_NODELABEL(n), rx) // DT_NODELABEL(dma2)

See also:
DT_PHANDLE_BY_NAME()

Parameters
• node_id – node identifier for a node with a dmas property
• name – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property

5.2. Devicetree
Returns
the node identifier for the DMA controller in the named element

`DT_DMAS_CTLR(node_id)`
Equivalent to `DT_DMAS_CTLR_BY_IDX(node_id, 0)`

See also:
`DT_DMAS_CTLR_BY_IDX()`

Parameters
- `node_id` – node identifier for a node with a dmas property

Returns
the node identifier for the DMA controller at index 0 in the node’s “dmas” property

`DT_INST_DMAS_CTLR_BY_IDX(inst, idx)`
Get the node identifier for the DMA controller from a DT_DRV_COMPAT instance’s dmas property at an index.

See also:
`DT_DMAS_CTLR_BY_IDX()`

Parameters
- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into dmas property

Returns
the node identifier for the DMA controller referenced at index “idx”

`DT_INST_DMAS_CTLR_BY_NAME(inst, name)`
Get the node identifier for the DMA controller from a DT_DRV_COMPAT instance’s dmas property by name.

See also:
`DT_DMAS_CTLR_BY_NAME()`

Parameters
- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of a dmas element as defined by the node’s dma-names property

Returns
the node identifier for the DMA controller in the named element

`DT_INST_DMAS_CTLR(inst)`
Equivalent to `DT_INST_DMAS_CTLR_BY_IDX(inst, 0)`

See also:
`DT_DMAS_CTLR_BY_IDX()`
Parameters

- inst – DT_DRV_COMPAT instance number

Returns

the node identifier for the DMA controller at index 0 in the instance’s “dmas” property

`DT_DMAS_CELL_BY_IDX(node_id, idx, cell)`

Get a DMA specifier’s cell value at an index.

Example devicetree fragment:

```markdown
dma1: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
}

dma2: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
}

n: node {
    dmas = <&dma1 1 0x400>,
      <&dma2 6 0x404>;
}
```

Bindings fragment for the vnd,dma compatible:

```markdown
dma-cells:
  - channel
  - config
```

Example usage:

```markdown
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 0, channel) // 1
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 1, channel) // 6
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 0, config) // 0x400
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 1, config) // 0x404
```

See also:

`DT_PHA_BY_IDX()`

Parameters

- node_id – node identifier for a node with a dmas property
- idx – logical index into dmas property
- cell – lowercase-and-underscores cell name

Returns

the cell value at index “idx”

`DT_INST_DMAS_CELL_BY_IDX(inst, idx, cell)`

Get a DT_DRV_COMPAT instance’s DMA specifier’s cell value at an index.

See also:

`DT_DMAS_CELL_BY_IDX()`

5.2. Devicetree
Parameters

- inst – DT_DRV_COMPAT instance number
- idx – logical index into dmas property
- cell – lowercase-and-underscores cell name

Returns

the cell value at index “idx”

\texttt{DT_DMAS_CELL_BY_NAME(node\_id, name, cell)}

Get a DMA specifier's cell value by name.

Example devicetree fragment:

```markdown
dma1: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
}

dma2: dma@... {
    compatible = "vnd,dma";
    #dma-cells = <2>;
}

n: node {
    dmas = <&dma1 1 0x400>,
    <&dma2 6 0x404>;
    dma-names = "tx", "rx";
}
```

Bindings fragment for the vnd,dma compatible:

```markdown
dma-cells:
- channel
- config
```

Example usage:

```markdown
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), tx, channel) // 1
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), rx, channel) // 6
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), tx, config) // 0x400
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), rx, config) // 0x404
```

See also:

\textit{DT_PHA_BY_NAME()}

Parameters

- node\_id – node identifier for a node with a dmas property
- name – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property
- cell – lowercase-and-underscores cell name

Returns

the cell value in the specifier at the named element
DT_INST_DMAS_CELL_BY_NAME(inst, name, cell)

Get a DT_DRV_COMPAT instance’s DMA specifier’s cell value by name.

See also:

DT_DMAS_CELL_BY_NAME()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property
- `cell` – lowercase-and-underscores cell name

Returns

the cell value in the specifier at the named element

DT_DMAS_HAS_IDX(node_id, idx)

Is index “idx” valid for a dmas property?

Parameters

- `node_id` – node identifier for a node with a dmas property
- `idx` – logical index into dmas property

Returns

1 if the “dmas” property has index “idx”, 0 otherwise

DT_INST_DMAS_HAS_IDX(inst, idx)

Is index “idx” valid for a DT_DRV_COMPAT instance’s dmas property?

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into dmas property

Returns

1 if the “dmas” property has a specifier at index “idx”, 0 otherwise

DT_DMAS_HAS_NAME(node_id, name)

Does a dmas property have a named element?

Parameters

- `node_id` – node identifier for a node with a dmas property
- `name` – lowercase-and-underscores name of a dmas element as defined by the node’s dma-names property

Returns

1 if the dmas property has the named element, 0 otherwise

DT_INST_DMAS_HAS_NAME(inst, name)

Does a DT_DRV_COMPAT instance’s dmas property have a named element?

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of a dmas element as defined by the node’s dma-names property

Returns

1 if the dmas property has the named element, 0 otherwise
Fixed flash partitions  These conveniences may be used for the special-purpose fixed-partitions compatible used to encode information about flash memory partitions in the device tree. See See fixed-partition for more details.

group devicetree-fixed-partition

Defines

**DT_NODE_BY_FIXED_PARTITION_LABEL(label)**

Get a node identifier for a fixed partition with a given label property.

Example devicetree fragment:

```c
flash@... {
    partitions {
        compatible = "fixed-partitions";
        boot_partition: partition@0 {
            label = "mcuboot";
        }
        slot0_partition: partition@c000 {
            label = "image-0";
        }
    }
}
```

Example usage:

```c
DT_NODE_BY_FIXED_PARTITION_LABEL(mcuboot) // node identifier for boot_partition
DT_NODE_BY_FIXED_PARTITION_LABEL(image_0) // node identifier for slot0_partition
```

**Parameters**

- `label` – lowercase-and-underscores label property value

**Returns**

a node identifier for the partition with that label property

**DT_HAS_FIXED_PARTITION_LABEL(label)**

Test if a fixed partition with a given label property exists.

**Parameters**

- `label` – lowercase-and-underscores label property value

**Returns**

1 if any “fixed-partitions” child node has the given label, 0 otherwise.

**DT_FIXED_PARTITION_EXISTS(node_id)**

Test if fixed-partition compatible node exists.

**Parameters**

- `node_id` – DTS node to test

**Returns**

1 if node exists and is fixed-partition compatible, 0 otherwise.
DT_FIXED_PARTITION_ID(node_id)
Get a numeric identifier for a fixed partition.

Parameters
- node_id – node identifier for a fixed-partitions child node

Returns
the partition’s ID, a unique zero-based index number

DT_MTD_FROM_FIXED_PARTITION(node_id)
Get the node identifier of the flash device for a partition.

Parameters
- node_id – node identifier for a fixed-partitions child node

Returns
the node identifier of the memory technology device that contains the fixed-partitions node.

GPIO
These conveniences may be used for nodes which describe GPIO controllers/pins, and properties related to them.

group devicetree-gpio

Defines

DT_GPIO_CTLR_BY_IDX(node_id, gpio_pha, idx)
Get the node identifier for the controller phandle from a gpio phandle-array property at an index.

Example devicetree fragment:
```
gpio1: gpio@... { };  
gpio2: gpio@... { };  
n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
            <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Example usage:
```
DT_GPIO_CTLR_BY_IDX(DT_NODELABEL(n), gpios, 1) // DT_NODELABEL(gpio2)
```

See also:

DT_PHANDLE_BY_IDX()

Parameters
- node_id – node identifier
- gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
- idx – logical index into “gpio_pha”

Returns
the node identifier for the gpio controller referenced at index “idx”
DT_GPIO_CTLR(node_id, gpio_pha)
   Equivalent to DT_GPIO_CTLR_BY_IDX(node_id, gpio_pha, 0)

See also:
DT_GPIO_CTLR_BY_IDX()

Parameters
• node_id – node identifier
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
a node identifier for the gpio controller at index 0 in “gpio_pha”

DT_GPIO_LABEL_BY_IDX(node_id, gpio_pha, idx)
   Get a label property from a gpio phandle-array property at an index.

Deprecated:
   If used to obtain a device instance with device_get_binding, consider using
   DEVICE_DT_GET(DT_GPIO_CTLR_BY_IDX(node, gpio_pha, idx)).
   It's an error if the GPIO controller node referenced by the phandle in node_id's “gpio_pha”
   property at index “idx” has no label property.

Example devicetree fragment:

```plaintext
gpio1: gpio@... {
    label = "GPIO_1";
};

gpio2: gpio@... {
    label = "GPIO_2";
};

n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
           <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Example usage:

```plaintext
DT_GPIO_LABEL_BY_IDX(DT_NODELABEL(n), gpios, 1) // "GPIO_2"
```

See also:
DT_PHANDLE_BY_IDX()

Parameters
• node_id – node identifier
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
• idx – logical index into “gpio_pha”

Returns
the label property of the node referenced at index “idx”
DT_GPIO_LABEL(node_id, gpio_pha)

Equivalent to `DT_GPIO_LABEL_BY_IDX(node_id, gpio_pha, 0)`

**Deprecated:**
If used to obtain a device instance with `device_get_binding`, consider using `DEVICE_DT_GET(DT_GPIO_CTLR(node, gpio_pha))`.

**See also:**
`DT_GPIO_LABEL_BY_IDX()`

**Parameters**
- `node_id` - node identifier
- `gpio_pha` - lowercase-and-underscores GPIO property with type “phandle-array”

**Returns**
the label property of the node referenced at index 0

DT_GPIO_PIN_BY_IDX(node_id, gpio_pha, idx)

Get a GPIO specifier’s pin cell at an index.

This macro only works for GPIO specifiers with cells named “pin”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```plaintext
gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};

gpio2: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};

n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
        <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Bindings fragment for the vnd,gpio compatible:

```plaintext
gpio-cells:
- pin
- flags
```

Example usage:

```plaintext
DT_GPIO_PIN_BY_IDX(DT_NODELABEL(n), gpios, 0) // 10
DT_GPIO_PIN_BY_IDX(DT_NODELABEL(n), gpios, 1) // 30
```

**See also:**
`DT_PHA_BY_IDX()`

**Parameters**
• node_id – node identifier
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”
• idx – logical index into “gpio_pha”

**Returns**
the pin cell value at index “idx”

\[ \text{DT\_GPIO\_PIN} \text{(node\_id, gpio\_pha)} \]
Equivalent to \[ \text{DT\_GPIO\_PIN\_BY\_IDX} \text{(node\_id, gpio\_pha, 0)} \]

**See also:**
\[ \text{DT\_GPIO\_PIN\_BY\_IDX}() \]

**Parameters**
• node_id – node identifier
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

**Returns**
the pin cell value at index 0

\[ \text{DT\_GPIO\_FLAGS\_BY\_IDX} \text{(node\_id, gpio\_pha, idx)} \]
Get a GPIO specifier’s flags cell at an index.

This macro expects GPIO specifiers with cells named “flags”. If there is no “flags” cell in the GPIO specifier, zero is returned. Refer to the node’s binding to check specifier cell names if necessary.

Example devicetree fragment:

```dts
gpio1: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};
gpio2: gpio@... {
    compatible = "vnd,gpio";
    #gpio-cells = <2>;
};
n: node {
    gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
             <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

**Example usage:**

\[ \text{DT\_GPIO\_FLAGS\_BY\_IDX} \text{(DT\_NODELABEL(n), gpios, 0)} \] // GPIO_ACTIVE_LOW
\[ \text{DT\_GPIO\_FLAGS\_BY\_IDX} \text{(DT\_NODELABEL(n), gpios, 1)} \] // GPIO_ACTIVE_HIGH
See also:

\texttt{DT\_PH\_BY\_IDX()}

Parameters

\begin{itemize}
\item node\_id – node identifier
\item gpio\_pha – lowercase-and-underscores GPIO property with type “phandle-
array”
\item idx – logical index into “gpio\_pha”
\end{itemize}

Returns

the flags cell value at index “idx”, or zero if there is none

\texttt{DT\_GPIO\_FLAGS(node\_id, gpio\_pha)}

Equivalent to \texttt{DT\_GPIO\_FLAGS\_BY\_IDX(node\_id, gpio\_pha, 0)}

See also:

\texttt{DT\_GPIO\_FLAGS\_BY\_IDX()}

Parameters

\begin{itemize}
\item node\_id – node identifier
\item gpio\_pha – lowercase-and-underscores GPIO property with type “phandle-
array”
\end{itemize}

Returns

the flags cell value at index 0, or zero if there is none

\texttt{DT\_INST\_GPIO\_LABEL\_BY\_IDX(inst, gpio\_pha, idx)}

Get a label property from a DT\_DRV\_COMPAT instance's GPIO property at an index.

\textit{Deprecated:}

If used to obtain a device instance with device\_get\_binding, consider using \texttt{DEVICE\_DT\_GET(DT\_INST\_GPIO\_CTRL\_BY\_IDX(node, gpio\_pha, idx))}.

Parameters

\begin{itemize}
\item inst – DT\_DRV\_COMPAT instance number
\item gpio\_pha – lowercase-and-underscores GPIO property with type “phandle-
array”
\item idx – logical index into “gpio\_pha”
\end{itemize}

Returns

the label property of the node referenced at index “idx”

\texttt{DT\_INST\_GPIO\_LABEL(inst, gpio\_pha)}

Equivalent to \texttt{DT\_INST\_GPIO\_LABEL\_BY\_IDX(inst, gpio\_pha, 0)}

\textit{Deprecated:}

If used to obtain a device instance with device\_get\_binding, consider using \texttt{DEVICE\_DT\_GET(DT\_INST\_GPIO\_CTRL(node, gpio\_pha))}.

Parameters
• inst – DT_DRV_COMPAT instance number
• gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
the label property of the node referenced at index 0

\texttt{DT_INST_GPIO_PIN\_BY\_IDX(inst, gpio\_pha, idx)}
Get a DT\_DRV\_COMPAT instance’s GPIO specifier’s pin cell value at an index.

\textbf{See also:}
\textit{DT\_GPIO\_PIN\_BY\_IDX()}

\textbf{Parameters}
• inst – DT\_DRV\_COMPAT instance number
• gpio\_pha – lowercase-and-underscores GPIO property with type “phandle-array”
• idx – logical index into “gpio\_pha”

Returns
the pin cell value at index “idx”

\texttt{DT\_INST\_GPIO\_PIN(inst, gpio\_pha)}
Equivalent to \texttt{DT\_INST\_GPIO\_PIN\_BY\_IDX(inst, gpio\_pha, 0)}

\textbf{See also:}
\textit{DT\_INST\_GPIO\_PIN\_BY\_IDX()}

\textbf{Parameters}
• inst – DT\_DRV\_COMPAT instance number
• gpio\_pha – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
the pin cell value at index 0

\texttt{DT\_INST\_GPIO\_FLAGS\_BY\_IDX(inst, gpio\_pha, idx)}
Get a DT\_DRV\_COMPAT instance’s GPIO specifier’s flags cell at an index.

\textbf{See also:}
\textit{DT\_GPIO\_FLAGS\_BY\_IDX()}

\textbf{Parameters}
• inst – DT\_DRV\_COMPAT instance number
• gpio\_pha – lowercase-and-underscores GPIO property with type “phandle-array”
• idx – logical index into “gpio\_pha”

Returns
the flags cell value at index “idx”, or zero if there is none
DT_INST_GPIO_FLAGS(inst, gpio_pha)
Equivalent to DT_INST_GPIO_FLAGS_BY_IDX(inst, gpio_pha, 0)

See also:
DT_INST_GPIO_FLAGS_BY_IDX()

Parameters
- inst – DT_DRV_COMPAT instance number
- gpio_pha – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
the flags cell value at index 0, or zero if there is none

IO channels These are commonly used by device drivers which need to use IO channels (e.g. ADC or DAC channels) for conversion.

group devicetree-io-channels

Defines

DT_IO_CHANNELS_CTLR_BY_IDX(node_id, idx)
Get the node identifier for the node referenced by an io-channels property at an index.

Example devicetree fragment:

```
adc1: adc@... { ... };
adc2: adc@... { ... };
n: node {
  io-channels = <&adc1 10>, <&adc2 20>;
};
```

Example usage:

```
DT_IO_CHANNELS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(adc1)
DT_IO_CHANNELS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(adc2)
```

See also:
DT_PROP_BY_PHANDLE_IDX()

Parameters
- node_id – node identifier for a node with an io-channels property
- idx – logical index into io-channels property

Returns
the node identifier for the node referenced at index “idx”

DT_IO_CHANNELS_CTLR_BY_NAME(node_id, name)
Get the node identifier for the node referenced by an io-channels property by name.

Example devicetree fragment:
adc1: adc@... { ... };
adc2: adc@... { ... };

n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};

Example usage:

DT_IO_CHANNELS_CTLR_BY_NAME(DT_NODELABEL(n), sensor) // DT_NODELABEL(adc1)
DT_IO_CHANNELS_CTLR_BY_NAME(DT_NODELABEL(n), bandgap) // DT_NODELABEL(adc2)

See also:

DT_PHANDLE_BY_NAME()

Parameters

• node_id – node identifier for a node with an io-channels property
• name – lowercase-and-underscores name of an io-channels element as defined by the node's io-channel-names property

Returns

the node identifier for the node referenced at the named element

DT_IO_CHANNELS_CTLR(node_id)

Equivalent to DT_IO_CHANNELS_CTLR_BY_IDX(node_id, 0)

See also:

DT_IO_CHANNELS_CTLR_BY_IDX()

Parameters

• node_id – node identifier for a node with an io-channels property

Returns

the node identifier for the node referenced at index 0 in the node's “io-channels” property

DT_INST_IO_CHANNELS_CTLR_BY_IDX(inst, idx)

Get the node identifier from a DT_DRV_COMPAT instance's io-channels property at an index.

See also:

DT_IO_CHANNELS_CTLR_BY_IDX()

Parameters

• inst – DT_DRV_COMPAT instance number
• idx – logical index into io-channels property

Returns

the node identifier for the node referenced at index “idx”
DT_INST_IO_CHANNELS_CTLR_BY_NAME(inst, name)

Get the node identifier from a DT_DRV_COMPAT instance's io-channels property by name.

See also:

* DT_IO_CHANNELS_CTLR_BY_NAME()

Parameters

- inst – DT_DRV_COMPAT instance number
- name – lowercase-and-underscores name of an io-channels element as defined by the node's io-channel-names property

Returns

the node identifier for the node referenced at the named element

DT_INST_IO_CHANNELS_CTLR(inst)

Equivalent to DT_INST_IO_CHANNELS_CTLR_BY_IDX(inst, 0)

See also:

* DT_IO_CHANNELS_CTLR_BY_IDX()

Parameters

- inst – DT_DRV_COMPAT instance number

Returns

the node identifier for the node referenced at index 0 in the node's “io-channels” property

DT_IO_CHANNELS_INPUT_BY_IDX(node_id, idx)

Get an io-channels specifier input cell at an index.

This macro only works for io-channels specifiers with cells named “input”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

```
adci: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};
adc2: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};
n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
};
```

Bindings fragment for the vnd,adc compatible:

io-channel-cells:

- input

Example usage:
DT_IO_CHANNELS_INPUT_BY_IDX(DT_NODELABEL(n), 0) // 10
DT_IO_CHANNELS_INPUT_BY_IDX(DT_NODELABEL(n), 1) // 20

See also:

DT_PHA_BY_IDX()

Parameters

• node_id – node identifier for a node with an io-channels property
• idx – logical index into io-channels property

Returns

the input cell in the specifier at index “idx”

DT_IO_CHANNELS_INPUT_BY_NAME(node_id, name)

Get an io-channels specifier input cell by name.

This macro only works for io-channels specifiers with cells named “input”. Refer to the node’s binding to check if necessary.

Example devicetree fragment:

adc1: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};

adc2: adc@... {
    compatible = "vnd,adc";
    #io-channel-cells = <1>;
};

n: node {
    io-channels = <&adc1 10>, <&adc2 20>;
    io-channel-names = "SENSOR", "BANDGAP";
};

Bindings fragment for the vnd,adc compatible:

io-channel-cells:
• input

Example usage:

DT_IO_CHANNELS_INPUT_BY_NAME(DT_NODELABEL(n), sensor) // 10
DT_IO_CHANNELS_INPUT_BY_NAME(DT_NODELABEL(n), bandgap) // 20

See also:

DT_PHA_BY_NAME()

Parameters

• node_id – node identifier for a node with an io-channels property
• name – lowercase-and-underscores name of an io-channels element as defined by the node’s io-channel-names property

Returns

the input cell in the specifier at the named element
DT_IO_CHANNELS_INPUT(node_id)
   Equivalent to DT_IO_CHANNELS_INPUT_BY_IDX(node_id, 0)

See also:
   DT_IO_CHANNELS_INPUT_BY_IDX()

Parameters
   • node_id – node identifier for a node with an io-channels property

Returns
   the input cell in the specifier at index 0

DT_INST_IO_CHANNELS_INPUT_BY_IDX(inst, idx)
   Get an input cell from the “DT_DRV_INST(inst)” io-channels property at an index.

See also:
   DT_IO_CHANNELS_INPUT_BY_IDX()

Parameters
   • inst – DT_DRV_COMPAT instance number
   • idx – logical index into io-channels property

Returns
   the input cell in the specifier at index “idx”

DT_INST_IO_CHANNELS_INPUT_BY_NAME(inst, name)
   Get an input cell from the “DT_DRV_INST(inst)” io-channels property by name.

See also:
   DT_IO_CHANNELS_INPUT_BY_NAME()

Parameters
   • inst – DT_DRV_COMPAT instance number
   • name – lowercase-and-underscores name of an io-channels element as defined
            by the instance’s io-channel-names property

Returns
   the input cell in the specifier at the named element

DT_INST_IO_CHANNELS_INPUT(inst)
   Equivalent to DT_INST_IO_CHANNELS_INPUT_BY_IDX(inst, 0)

Parameters
   • inst – DT_DRV_COMPAT instance number

Returns
   the input cell in the specifier at index 0
These conveniences may be used for nodes which describe MBOX controllers/users, and properties related to them.

**group devicetree-mbox**

**Defines**

`DT_MBOX_CTLR_BY_NAME(node_id, name)`

Get the node identifier for the MBOX controller from a mboxes property by name.

Example devicetree fragment:

```markdown
mbox1: mbox-controller@... { ... };

n: node {
    mboxes = <&mbox1 8>,
             <&mbox1 9>;
    mbox-names = "tx", "rx";
}
```

Example usage:

```markdown
DT_MBOX_CTLR_BY_NAME(DT_NODELABEL(n), tx) // DT_NODELABEL(mbox1)
DT_MBOX_CTLR_BY_NAME(DT_NODELABEL(n), rx) // DT_NODELABEL(mbox1)
```

**See also:**

`DT_PHANDLE_BY_NAME()`

**Parameters**

- `node_id` – node identifier for a node with a mboxes property
- `name` – lowercase-and-underscores name of a mboxes element as defined by the node's mbox-names property

**Returns**

the node identifier for the MBOX controller in the named element

`DT_MBOX_CHANNEL_BY_NAME(node_id, name)`

Get a MBOX channel value by name.

Example devicetree fragment:

```markdown
mbox1: mbox@... {
    #mbox-cells = <1>;
}

n: node {
    mboxes = <&mbox1 1>,
             <&mbox1 6>;
    mbox-names = "tx", "rx";
}
```

Bindings fragment for the mbox compatible:

```markdown
mbox-cells:
    - channel
```
Parameters

- node_id – node identifier for a node with a mboxes property
- name – lowercase-and-underscores name of a mboxes element as defined by the
  node's mbox-names property

Returns

the channel value in the specifier at the named element or 0 if no channels are
supported

Pinctrl (pin control) These are used to access pin control properties by name or index.

Devicetree nodes may have properties which specify pin control (sometimes known as pin mux) settings.
These are expressed using pinctrl-<index> properties within the node, where the <index> values are
contiguous integers starting from 0. These may also be named using the pinctrl-names property.

Here is an example:

```plaintext
node {

  ...  
  pinctrl-0 = <&foo &bar ...>; 
  pinctrl-1 = <&baz ...>;  
  pinctrl-names = "default", "sleep"; 
}
```

Above, pinctrl-0 has name "default", and pinctrl-1 has name "sleep". The pinctrl-<index>
property values contain phandles. The &foo, &bar, etc. phandles within the properties point to nodes
whose contents vary by platform, and which describe a pin configuration for the node.

```
group devicetree-pinctrl
```

Defines

DT_PINCTRL_BY_IDX(node_id, pc_idx, idx)
Get a node identifier for a phandle in a pinctrl property by index.

Example devicetree fragment:

```plaintext
n: node {
    pinctrl-0 = <&foo &bar>;  
    pinctrl-1 = <&baz &blub>; 
}
```

Example usage:

```plaintext
DT_PINCTRL_BY_IDX(DT_NODELABEL(n), 0, 1) // DT_NODELABEL(bar)
DT_PINCTRL_BY_IDX(DT_NODELABEL(n), 1, 0) // DT_NODELABEL(baz)
```

Parameters

- node_id – node with a pinctrl-'pc_idx' property

5.2. Devicetree
• `pc_idx` – index of the pinctrl property itself
• `idx` – index into the value of the pinctrl property

**Returns**
node identifier for the phandle at index ‘idx’ in ‘pinctrl-‘pc_idx’

`DT_PINCTRL_0(node_id, idx)`
Get a node identifier from a pinctrl-0 property.
This is equivalent to:

`DT_PINCTRL_BY_IDX(node_id, 0, idx)`

It is provided for convenience since pinctrl-0 is commonly used.

**Parameters**
• `node_id` – node with a pinctrl-0 property
• `idx` – index into the pinctrl-0 property

**Returns**
node identifier for the phandle at index idx in the pinctrl-0 property of that node

`DT_PINCTRL_BY_NAME(node_id, name, idx)`
Get a node identifier for a phandle inside a pinctrl node by name.

Example devicetree fragment:
```plaintext
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz &blub>;
    pinctrl-names = "default", "sleep";
};
```

Example usage:

`DT_PINCTRL_BY_NAME(DT_NODELABEL(n), default, 1) // DT_NODELABEL(bar)`
`DT_PINCTRL_BY_NAME(DT_NODELABEL(n), sleep, 0) // DT_NODELABEL(baz)`

**Parameters**
• `node_id` – node with a named pinctrl property
• `name` – lowercase-and-underscores pinctrl property name
• `idx` – index into the value of the named pinctrl property

**Returns**
node identifier for the phandle at that index in the pinctrl property

`DT_PINCTRL_NAME_TO_IDX(node_id, name)`
Convert a pinctrl name to its corresponding index.

Example devicetree fragment:
```plaintext
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz &blub>;
    pinctrl-names = "default", "sleep";
};
```

Example usage:
DT_PINCTRL_NAME_TO_IDX(DT_NODELABEL(n), default) // 0
DT_PINCTRL_NAME_TO_IDX(DT_NODELABEL(n), sleep) // 1

Parameters
- node_id – node identifier with a named pinctrl property
- name – lowercase-and-underscores name name of the pinctrl whose index to get

Returns
integer literal for the index of the pinctrl property with that name

DT_PINCTRL_IDX_TO_NAME_TOKEN(node_id, pc_idx)
Convert a pinctrl property index to its name as a token.

This allows you to get a pinctrl property's name, and “remove the quotes” from it.

DT_PINCTRL_IDX_TO_NAME_TOKEN() can only be used if the node has a pinctrl-'pc_idx' property and a pinctrl-names property element for that index. It is an error to use it in other circumstances.

Example devicetree fragment:

```plaintext
n: node {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
    pinctrl-names = "default", "f.o.o2";
};
```

Example usage:

```
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 0) // default
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 1) // f_o_o2
```

The same caveats and restrictions that apply to DT_STRING_TOKEN()'s return value also apply here.

Parameters
- node_id – node identifier
- pc_idx – index of a pinctrl property in that node

Returns
name of the pinctrl property, as a token, without any quotes and with non-alphanumeric characters converted to underscores

DT_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(node_id, pc_idx)
Like DT_PINCTRL_IDX_TO_NAME_TOKEN(), but with an uppercased result.

This does the a similar conversion as DT_PINCTRL_IDX_TO_NAME_TOKEN(node_id, pc_idx). The only difference is that alphabetical characters in the result are uppercased.

Example devicetree fragment:

```plaintext
n: node {
    pinctrl-0 = <...>;
    pinctrl-1 = <...>;
    pinctrl-names = "default", "f.o.o2";
};
```
Example usage:

```c
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 0) // DEFAULT
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 1) // F_O_O2
```

The same caveats and restrictions that apply to `DT_STRING_UPPER_TOKEN()`'s return value also apply here.

`DT_NUM_PINCTRLS_BY_IDX(node_id, pc_idx)`

Get the number of phandles in a pinctrl property.

Example devicetree fragment:

```devicetree
n1: node-1 {
    pinctrl-0 = <&foo &bar>;
};
n2: node-2 {
    pinctrl-0 = <&baz>;
};
```

Example usage:

```c
DT_NUM_PINCTRLS_BY_IDX(DT_NODELABEL(n1), 0) // 2
DT_NUM_PINCTRLS_BY_IDX(DT_NODELABEL(n2), 0) // 1
```

**Parameters**

- `node_id` – node identifier with a pinctrl property
- `pc_idx` – index of the pinctrl property itself

**Returns**

number of phandles in the property with that index

`DT_NUM_PINCTRLS_BY_NAME(node_id, name)`

Like `DT_NUM_PINCTRLS_BY_IDX()`, but by name instead.

Example devicetree fragment:

```devicetree
n: node {
    pinctrl-0 = <&foo &bar>;
    pinctrl-1 = <&baz>
    pinctrl-names = "default", "sleep";
};
```

Example usage:

```c
DT_NUM_PINCTRLS_BY_NAME(DT_NODELABEL(n), default) // 2
DT_NUM_PINCTRLS_BY_NAME(DT_NODELABEL(n), sleep) // 1
```

**Parameters**

- `node_id` – node identifier with a pinctrl property
- `name` – lowercase-and-underscores name name of the pinctrl property

**Returns**

number of phandles in the property with that name
DT_NUM_PINCTRL_STATES(node_id)

Get the number of pinctrl properties in a node.
This expands to 0 if there are no pinctrl-i properties. Otherwise, it expands to the number of such properties.

Example devicetree fragment:

n1: node-1 {
  pinctrl-0 = <...>;
  pinctrl-1 = <...>;
};

n2: node-2 {
};

Example usage:

DT_NUM_PINCTRL_STATES(DT_NODELABEL(n1)) // 2
DT_NUM_PINCTRL_STATES(DT_NODELABEL(n2)) // 0

Parameters

- node_id – node identifier; may or may not have any pinctrl properties

Returns

number of pinctrl properties in the node

DT_PINCTRL_HAS_IDX(node_id, pc_idx)

Test if a node has a pinctrl property with an index.
This expands to 1 if the pinctrl-'idx' property exists. Otherwise, it expands to 0.

Example devicetree fragment:

n1: node-1 {
  pinctrl-0 = <...>;
  pinctrl-1 = <...>;
};

n2: node-2 {
};

Example usage:

DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 0) // 1
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 1) // 1
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 2) // 0
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n2), 0) // 0

Parameters

- node_id – node identifier; may or may not have any pinctrl properties
- pc_idx – index of a pinctrl property whose existence to check

Returns

1 if the property exists, 0 otherwise
DT_PINCTRL_HAS_NAME(node_id, name)
Test if a node has a pinctrl property with a name.
This expands to 1 if the named pinctrl property exists. Otherwise, it expands to 0.
Example devicetree fragment:

```
n1: node-1 {
   pinctrl-0 = <...>;
   pinctrl-names = "default";
};
n2: node-2 {
};
```

Example usage:

```
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n1), default) // 1
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n1), sleep)  // 0
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n2), default) // 0
```

Parameters
- **node_id** – node identifier; may or may not have any pinctrl properties
- **name** – lowercase-and-underscores pinctrl property name to check

Returns
1 if the property exists, 0 otherwise

DT_INST_PINCTRL_BY_IDX(inst, pc_idx, idx)
Get a node identifier for a phandle in a pinctrl property by index for a DT_DRV_COMPAT instance.
This is equivalent to `DT_PINCTRL_BY_IDX(DT_DRV_INST(inst), pc_idx, idx)`.

Parameters
- **inst** – instance number
- **pc_idx** – index of the pinctrl property itself
- **idx** – index into the value of the pinctrl property

Returns
node identifier for the phandle at index ‘idx’ in ‘pinctrl-‘pc_idx”

DT_INST_PINCTRL_0(inst, idx)
Get a node identifier from a pinctrl-0 property for a DT_DRV_COMPAT instance.
This is equivalent to:

```
DT_PINCTRL_BY_IDX(DT_DRV_INST(inst), 0, idx)
```

It is provided for convenience since pinctrl-0 is commonly used.

Parameters
- **inst** – instance number
- **idx** – index into the pinctrl-0 property

Returns
node identifier for the phandle at index idx in the pinctrl-0 property of that instance
DT_INST_PINCTRL_BY_NAME(inst, name, idx)
Get a node identifier for a phandle inside a pinctrl node for a DT_DRV_COMPAT instance.
This is equivalent to DT_PINCTRL_BY_NAME(DT_DRV_INST(inst), name, idx).

Parameters
• inst – instance number
• name – lowercase-and-underscores pinctrl property name
• idx – index into the value of the named pinctrl property

Returns
node identifier for the phandle at that index in the pinctrl property

DT_INST_PINCTRL_NAME_TO_IDX(inst, name)
Convert a pinctrl name to its corresponding index for a DT_DRV_COMPAT instance.
This is equivalent to DT_PINCTRL_NAME_TO_IDX(DT_DRV_INST(inst), name).

Parameters
• inst – instance number
• name – lowercase-and-underscores name of the pinctrl whose index to get

Returns
integer literal for the index of the pinctrl property with that name

DT_INST_PINCTRL_IDX_TO_NAME_TOKEN(inst, pc_idx)
Convert a pinctrl index to its name as an uppercased token.
This is equivalent to DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_DRV_INST(inst), pc_idx).

Parameters
• inst – instance number
• pc_idx – index of the pinctrl property itself

Returns
name of the pin control property as a token

DT_INST_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(inst, pc_idx)
Convert a pinctrl index to its name as an uppercase token.
This is equivalent to DT_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(DT_DRV_INST(inst), pc_idx).

Parameters
• inst – instance number
• pc_idx – index of the pinctrl property itself

Returns
name of the pin control property as an uppercase token

DT_INST_NUM_PINCTRLS_BY_IDX(inst, pc_idx)
Get the number of phandles in a pinctrl property for a DT_DRV_COMPAT instance.
This is equivalent to DT_NUM_PINCTRLS_BY_IDX(DT_DRV_INST(inst), pc_idx).

Parameters
• inst – instance number
• pc_idx – index of the pinctrl property itself

Returns
number of phandles in the property with that index

5.2. Devicetree
DT_INST_NUM_PINCTRLS_BY_NAME(inst, name)

Like DT_INST_NUM_PINCTRLS_BY_IDX(), but by name instead.
This is equivalent to DT_NUM_PINCTRLS_BY_NAME(DT_DRV_INST(inst), name).

Parameters

• inst – instance number
• name – lowercase-and-underscores name of the pinctrl property

Returns

number of phandles in the property with that name

DT_INST_NUM_PINCTRL_STATES(inst)

Get the number of pinctrl properties in a DT_DRV_COMPAT instance.
This is equivalent to DT_NUM_PINCTRL_STATES(DT_DRV_INST(inst)).

Parameters

• inst – instance number

Returns

number of pinctrl properties in the instance

DT_INST_PINCTRL_HAS_IDX(inst, pc_idx)

Test if a DT_DRV_COMPAT instance has a pinctrl property with an index.
This is equivalent to DT_PINCTRL_HAS_IDX(DT_DRV_INST(inst), pc_idx).

Parameters

• inst – instance number
• pc_idx – index of a pinctrl property whose existence to check

Returns

1 if the property exists, 0 otherwise

DT_INST_PINCTRL_HAS_NAME(inst, name)

Test if a DT_DRV_COMPAT instance has a pinctrl property with a name.
This is equivalent to DT_PINCTRL_HAS_NAME(DT_DRV_INST(inst), name).

Parameters

• inst – instance number
• name – lowercase-and-underscores pinctrl property name to check

Returns

1 if the property exists, 0 otherwise

PWM These conveniences may be used for nodes which describe PWM controllers and properties related to them.

group devicetree-pwms

Defines

DT_PWMS_CTRLR_BY_IDX(node_id, idx)

Get the node identifier for the PWM controller from a pwms property at an index.
Example devicetree fragment:
pwm1: pwm-controller@... { ... };
pwm2: pwm-controller@... { ... };
n: node {
    pwms = <&pwm1 1 PWM_POLARITY_NORMAL>,
           <&pwm2 3 PWM_POLARITY_INVERTED>;
};

Example usage:
DT_PWMS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(pwm1)
DT_PWMS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(pwm2)

See also:
DT_PROP_BY_PHANDLE_IDX()

Parameters

• node_id – node identifier for a node with a pwms property
• idx – logical index into pwms property

Returns

the node identifier for the PWM controller referenced at index “idx”

DT_PWMS_CTLR_BY_NAME(node_id, name)

Get the node identifier for the PWM controller from a pwms property by name.

Example devicetree fragment:
pwm1: pwm-controller@... { ... };
pwm2: pwm-controller@... { ... };
n: node { pwms = <&pwm1 1 PWM_POLARITY_NORMAL>,
           <&pwm2 3 PWM_POLARITY_INVERTED>; pwm-names = “alpha”, “beta”; }

Example usage:
DT_PWMS_CTLR_BY_NAME(DT_NODELABEL(n), alpha) // DT_NODELABEL(pwm1)
DT_PWMS_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(pwm2)

See also:
DT_PHANDLE_BY_NAME()

Parameters

• node_id – node identifier for a node with a pwms property
• name – lowercase-and-underscores name of a pwms element as defined by the
  node’s pwm-names property

Returns

the node identifier for the PWM controller in the named element

DT_PWMS_CTLR(node_id)
Equivalent to DT_PWMS_CTLR_BY_IDX(node_id, 0)
DT_PWMS_CTLR_BY_IDX()

Parameters

• node_id – node identifier for a node with a pwms property

Returns

the node identifier for the PWM controller at index 0 in the node's "pwms" property

DT_PWMS_CELL_BY_IDX(node_id, idx, cell)

Get PWM specifier's cell value at an index.

Example devicetree fragment:

```plaintext
pwm1: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
};

pwm2: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
};

n: node {
    pwms = <&pwm1 1 200000 PWM_POLARITY_NORMAL>,
          <&pwm2 3 100000 PWM_POLARITY_INVERTED>;
};
```

Bindings fragment for the “vnd,pwm” compatible:

```plaintext
pwm-cells:
    - channel
    - period
    - flags
```

Example usage:

```plaintext
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, channel) // 1
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, channel) // 3
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, period) // 200000
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, period) // 100000
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, flags) // PWM_POLARITY_NORMAL
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, flags) // PWM_POLARITY_INVERTED
```

See also:

DT_PHA_BY_IDX()

Parameters

• node_id – node identifier for a node with a pwms property
• idx – logical index into pwms property
• cell – lowercase-and-underscores cell name

Returns

the cell value at index “idx”
DT_PWMS_CELL_BY_NAME(node_id, name, cell)
Get a PWM specifier's cell value by name.

Example devicetree fragment:

```
pwm1: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
};

pwm2: pwm-controller@... {
    compatible = "vnd,pwm";
    #pwm-cells = <2>;
};

n: node {
    pwms = <&pwm1 1 200000 PWM_POLARITY_NORMAL>,
           <&pwm2 3 100000 PWM_POLARITY_INVERTED>;
    pwm-names = "alpha", "beta";
};
```

Bindings fragment for the “vnd,pwm” compatible:

```
pwm-cells:
- channel
- period
- flags
```

Example usage:

```
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, channel) // 1
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, channel) // 3
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, period) // 200000
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, period) // 100000
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, flags) // PWM_POLARITY_NORMAL
DT_PWMSgetCellByIndex(DT_NODELABEL(n), beta, flags) // PWM_POLARITY_INVERTED
```

See also:

`DT_PHA_BY_NAME()`

**Parameters**

- node_id – node identifier for a node with a pwms property
- name – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property
- cell – lowercase-and-underscores cell name

**Returns**
the cell value in the specifier at the named element

DT_PWMSCELL(node_id, cell)
Equivalent to `DT_PWMS_CELL_BY_IDX(node_id, 0, cell)`

See also:

`DT_PWMS_CELL_BY_IDX()`

5.2. Devicetree

1117
Parameters
• node_id – node identifier for a node with a pwms property
• cell – lowercase-and-underscores cell name

Returns
the cell value at index 0

DT_PWMS_CHANNEL_BY_IDX(node_id, idx)
Get a PWM specifier's channel cell value at an index.
This macro only works for PWM specifiers with cells named “channel”. Refer to the node’s binding to check if necessary.
This is equivalent to DT_PWMS_CELL_BY_IDX(node_id, idx, channel).

See also:
DT_PWMS_CELL_BY_IDX()

Parameters
• node_id – node identifier for a node with a pwms property
• idx – logical index into pwms property

Returns
the channel cell value at index “idx”

DT_PWMS_CHANNEL_BY_NAME(node_id, name)
Get a PWM specifier's channel cell value by name.
This macro only works for PWM specifiers with cells named “channel”. Refer to the node’s binding to check if necessary.
This is equivalent to DT_PWMS_CELL_BY_NAME(node_id, name, channel).

See also:
DT_PWMS_CELL_BY_NAME()

Parameters
• node_id – node identifier for a node with a pwms property
• name – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property

Returns
the channel cell value in the specifier at the named element

DT_PWMS_CHANNEL(node_id)
Equivalent to DT_PWMS_CHANNEL_BY_IDX(node_id, 0)

See also:
DT_PWMS_CHANNEL_BY_IDX()
**DT_PWMS_PERIOD_BY_IDX(node_id, idx)**

Get PWM specifier's period cell value at an index.

This macro only works for PWM specifiers with cells named “period”. Refer to the node's binding to check if necessary.

This is equivalent to `DT_PWMS_CELL_BY_IDX(node_id, idx, period)`.

**See also:**

`DT_PWMS_CELL_BY_IDX()`

**Parameters**

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property

**Returns**

the channel cell value at index 0

**Returns**

the period cell value at index “idx”

**DT_PWMS_PERIOD_BY_NAME(node_id, name)**

Get a PWM specifier's period cell value by name.

This macro only works for PWM specifiers with cells named “period”. Refer to the node's binding to check if necessary.

This is equivalent to `DT_PWMS_CELL_BY_NAME(node_id, name, period)`.

**See also:**

`DT_PWMS_CELL_BY_NAME()`

**Parameters**

- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

**Returns**

the period cell value in the specifier at the named element

**DT_PWMS_PERIOD(node_id)**

Equivalent to `DT_PWMS_PERIOD_BY_IDX(node_id, 0)`

**See also:**

`DT_PWMS_PERIOD_BY_IDX()`

**Parameters**

- `node_id` – node identifier for a node with a pwms property

**Returns**

the period cell value at index 0
DT_PWMS_FLAGS_BY_IDX(node_id, idx)
Get a PWM specifier's flags cell value at an index.
This macro expects PWM specifiers with cells named “flags”. If there is no “flags” cell in the
PWM specifier, zero is returned. Refer to the node's binding to check specifier cell names if
necessary.
This is equivalent to DT_PWMS_CELL_BY_IDX(node_id, idx, flags).

See also:

DT_PWMS_CELL_BY_IDX()

Parameters
• node_id – node identifier for a node with a pwms property
• idx – logical index into pwms property

Returns
the flags cell value at index “idx”, or zero if there is none

DT_PWMS_FLAGS_BY_NAME(node_id, name)
Get a PWM specifier's flags cell value by name.
This macro expects PWM specifiers with cells named “flags”. If there is no “flags” cell in the
PWM specifier, zero is returned. Refer to the node's binding to check specifier cell names if
necessary.
This is equivalent to DT_PWMS.Cell_BY_NAME(node_id, name, flags) if there is a flags cell,
but expands to zero if there is none.

See also:

DT_PWMS_CELL_BY_NAME()

Parameters
• node_id – node identifier for a node with a pwms property
• name – lowercase-and-underscores name of a pwms element as defined by the
node's pwm-names property

Returns
the flags cell value in the specifier at the named element, or zero if there is none

DT_PWMS_FLAGS(node_id)
Equivalent to DT_PWMS_FLAGS_BY_IDX(node_id, 0)

See also:

DT_PWMS_FLAGS_BY_IDX()
DT_INST_PWMS_CTLR_BY_IDX(inst, idx)
Get the node identifier for the PWM controller from a DT_DRV_COMPAT instance's pwms property at an index.

See also:
DT_PWMS_CTLR_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into pwms property

Returns
the node identifier for the PWM controller referenced at index “idx”

DT_INST_PWMS_CTLR_BY_NAME(inst, name)
Get the node identifier for the PWM controller from a DT_DRV_COMPAT instance’s pwms property by name.

See also:
DT_PWMS_CTLR_BY_NAME()

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property

Returns
the node identifier for the PWM controller in the named element

DT_INST_PWMS_CTLR(inst)
Equivalent to DT_INST_PWMS_CTLR_BY_IDX(inst, 0)

See also:
DT_PWMS_CTLR_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
the node identifier for the PWM controller at index 0 in the instance’s “pwms” property

DT_INST_PWMS_CELL_BY_IDX(inst, idx, cell)
Get a DT_DRV_COMPAT instance’s PWM specifier’s cell value at an index.

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into pwms property
• cell – lowercase-and-underscores cell name
Returns
the cell value at index “idx”

\[
\text{DT_INST_PWMS_CELL\_BY\_NAME}(\text{inst, name, cell})
\]
Get a DT\_DRV\_COMPAT instance’s PWM specifier’s cell value by name.

See also:

\[
\text{DT\_PWMS\_CELL\_BY\_NAME()}
\]

Parameters

- \text{inst} – DT\_DRV\_COMPAT instance number
- \text{name} – lowercase-and-underscores name of a pwms element as defined by the
  node’s pwm-names property
- \text{cell} – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

\[
\text{DT\_INST\_PWMS\_CELL}(\text{inst, cell})
\]
Equivalent to \[
\text{DT\_INST\_PWMS\_CELL\_BY\_IDX}(\text{inst, 0, cell})
\]

Parameters

- \text{inst} – DT\_DRV\_COMPAT instance number
- \text{cell} – lowercase-and-underscores cell name

Returns
the cell value at index 0

\[
\text{DT\_INST\_PWMS\_CHANNEL\_BY\_IDX}(\text{inst, idx})
\]
Equivalent to \[
\text{DT\_INST\_PWMS\_CELL\_BY\_IDX}(\text{inst, idx, channel})
\]

See also:

\[
\text{DT\_INST\_PWMS\_CELL\_BY\_IDX()}
\]

Parameters

- \text{inst} – DT\_DRV\_COMPAT instance number
- \text{idx} – logical index into pwms property

Returns
the channel cell value at index “idx”

\[
\text{DT\_INST\_PWMS\_CHANNEL\_BY\_NAME}(\text{inst, name})
\]
Equivalent to \[
\text{DT\_INST\_PWMS\_CELL\_BY\_NAME}(\text{inst, name, channel})
\]

See also:

\[
\text{DT\_INST\_PWMS\_CELL\_BY\_NAME()}
\]

Parameters

- \text{inst} – DT\_DRV\_COMPAT instance number
- \text{name} – lowercase-and-underscores name of a pwms element as defined by the
  node’s pwm-names property
Zephyr Project Documentation, Release 3.2.99

Returns
the channel cell value in the specifier at the named element

DT_INST_PWMS_CHANNEL(inst)
Equivalent to DT_INST_PWMS_CHANNEL_BY_IDX(inst, 0)

See also:
DT_INST_PWMS_CHANNEL_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
the channel cell value at index 0

DT_INST_PWMS_PERIOD_BY_IDX(inst, idx)
Equivalent to DT_INST_PWMS_CELL_BY_IDX(inst, idx, period)

See also:
DT_INST_PWMS_CELL_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – logical index into pwms property

Returns
the period cell value at index “idx”

DT_INST_PWMS_PERIOD_BY_NAME(inst, name)
Equivalent to DT_INST_PWMS_CELL_BY_NAME(inst, name, period)

See also:
DT_INST_PWMS_CELL_BY_NAME()

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a pwms element as defined by the
  node’s pwm-names property

Returns
the period cell value in the specifier at the named element

DT_INST_PWMS_PERIOD(inst)
Equivalent to DT_INST_PWMS_PERIOD_BY_IDX(inst, 0)

See also:
DT_INST_PWMS_PERIOD_BY_IDX()
Returns
the period cell value at index 0

\texttt{DT\_INST\_PWMS\_FLAGS\_BY\_IDX}(\textit{inst}, \textit{idx})
Equivalent to \texttt{DT\_INST\_PWMS\_CELL\_BY\_IDX}(\textit{inst}, \textit{idx}, \textit{flags})

See also:
\texttt{DT\_INST\_PWMS\_CELL\_BY\_IDX()}

Parameters
\begin{itemize}
\item \textit{inst} – DT\_DRV\_COMPAT instance number
\item \textit{idx} – logical index into pwms property
\end{itemize}

Returns
the flags cell value at index “\textit{idx}”, or zero if there is none

\texttt{DT\_INST\_PWMS\_FLAGS\_BY\_NAME}(\textit{inst}, \textit{name})
Equivalent to \texttt{DT\_INST\_PWMS\_CELL\_BY\_NAME}(\textit{inst}, \textit{name}, \textit{flags})

See also:
\texttt{DT\_INST\_PWMS\_CELL\_BY\_NAME()}

Parameters
\begin{itemize}
\item \textit{inst} – DT\_DRV\_COMPAT instance number
\item \textit{name} – lowercase-and-underscores name of a pwms element as defined by the
node’s pwm-names property
\end{itemize}

Returns
the flags cell value in the specifier at the named element, or zero if there is none

\texttt{DT\_INST\_PWMS\_FLAGS(\textit{inst})}
Equivalent to \texttt{DT\_INST\_PWMS\_FLAGS\_BY\_IDX}(\textit{inst}, 0)

See also:
\texttt{DT\_INST\_PWMS\_FLAGS\_BY\_IDX()}

Parameters
\begin{itemize}
\item \textit{inst} – DT\_DRV\_COMPAT instance number
\end{itemize}

Returns
the flags cell value at index 0, or zero if there is none

\textbf{Reset Controller}  These conveniences may be used for nodes which describe reset controllers and properties related to them.

\texttt{group devicetree-reset-controller}
Defines

**DT_RESET_CTLR_BY_IDX(node_id, idx)**

Get the node identifier for the controller phandle from a “resets” phandle-array property at an index.

Example devicetree fragment:

```plaintext
reset1: reset-controller@... { ... ;
reset2: reset-controller@... { ... ;
n: node {
    resets = <&reset1 10>, <&reset2 20>;
};
```

Example usage:

```
DT_RESET_CTLR_BY_IDX(DT_NODELABEL(n), 0)) // DT_NODELABEL(reset1)
DT_RESET_CTLR_BY_IDX(DT_NODELABEL(n), 1)) // DT_NODELABEL(reset2)
```

See also:

**DT_PHANDLE_BY_IDX()**

Parameters

- node_id – node identifier
- idx – logical index into “resets”

Returns

the node identifier for the reset controller referenced at index “idx”

**DT_RESET_CTLR(node_id)**

Equivalent to **DT_RESET_CTLR_BY_IDX(node_id, 0)**

See also:

**DT_RESET_CTLR_BY_IDX()**

Parameters

- node_id – node identifier

Returns

a node identifier for the reset controller at index 0 in “resets”

**DT_RESET_CTLR_BY_NAME(node_id, name)**

Get the node identifier for the controller phandle from a resets phandle-array property by name.

Example devicetree fragment:

```plaintext
reset1: reset-controller@... { ... ;
reset2: reset-controller@... { ... ;
n: node {
    resets = <&reset1 10>, <&reset2 20>;
};
```
reset-names = "alpha", "beta";

Example usage:

\[
\begin{align*}
\text{DT}_\text{RESET}_\text{CTRLR}_\text{BY}_\text{NAME}(\text{DT}_\text{NODELABEL}(n), \text{alpha}) & \text{ // DT}_\text{NODELABEL}(\text{reset1}) \\
\text{DT}_\text{RESET}_\text{CTRLR}_\text{BY}_\text{NAME}(\text{DT}_\text{NODELABEL}(n), \text{beta}) & \text{ // DT}_\text{NODELABEL}(\text{reset2}) \\
\end{align*}
\]

See also:

\textit{DT\_PHANDLE\_BY\_NAME()}

\textbf{Parameters}

- \textit{node\_id} – node identifier
- \textit{name} – lowercase-and-underscores name of a resets element as defined by the node's resets-names property

\textbf{Returns}

the node identifier for the reset controller referenced by name

\textbf{DT\_RESET\_CELL\_BY\_IDX(node\_id, idx, cell)}

Get a reset specifier's cell value at an index.

Example devicetree fragment:

\[
\begin{align*}
\text{reset: reset-controller@... } & \{ \\
\;&\text{ compatible = "vnd,reset";} \\
\;&\text{ #reset-cells = <1>;} \\
\};
\end{align*}
\]

\[
\begin{align*}
\text{n: node } & \{ \\
\;&\text{ resets = <&reset 10>;} \\
\};
\end{align*}
\]

Bindings fragment for the vnd,reset compatible:

\textbf{reset-cells:}

- \textit{id}

Example usage:

\[
\begin{align*}
\text{DT}_\text{RESET}_\text{CELL}_\text{BY}_\text{IDX}(\text{DT}_\text{NODELABEL}(n), 0, \text{id}) & \text{ // 10}
\end{align*}
\]

See also:

\textit{DT\_PHA\_BY\_IDX()}

\textbf{Parameters}

- \textit{node\_id} – node identifier for a node with a resets property
- \textit{idx} – logical index into resets property
- \textit{cell} – lowercase-and-underscores cell name

\textbf{Returns}

the cell value at index “idx”
DT_RESET_CELL_BY_NAME(node_id, name, cell)
Get a reset specifier's cell value by name.

Example devicetree fragment:

```dtb
reset: reset-controller@... {
    compatible = "vnd,reset";
    #reset-cells = <1>;
};

n: node {
    resets = <&reset 10>;
    reset-names = "alpha";
};
```

Bindings fragment for the vnd,reset compatible:

```dtb
reset-cells:
- id
```

Example usage:

```c
DT_RESET_CELL_BY_NAME(DT_NODELABEL(n), alpha, id) // 10
```

See also:

DT_PHA_BY_NAME()

Parameters

- node_id – node identifier for a node with a resets property
- name – lowercase-and-underscores name of a resets element as defined by the node's reset-names property
- cell – lowercase-and-underscores cell name

Returns

the cell value in the specifier at the named element

DT_RESET_CELL(node_id, cell)
Equivalent to DT_RESET_CELL_BY_IDX(node_id, 0, cell)

See also:

DT_RESET_CELL_BY_IDX()

Parameters

- node_id – node identifier for a node with a resets property
- cell – lowercase-and-underscores cell name

Returns

the cell value at index 0

DT_INST_RESET_CTLR_BY_IDX(inst, idx)
Get the node identifier for the controller phandle from a “resets” phandle-array property at an index.
See also:

`DT_RESET_CTLR_BY_IDX()`

**Parameters**
- inst – instance number
- idx – logical index into “resets”

**Returns**
the node identifier for the reset controller referenced at index “idx”

`DT_INST_RESET_CTLR(inst)`
Equivalent to `DT_INST_RESET_CTLR_BY_IDX(inst, 0)`

See also:

`DT_RESET_CTLR()`

**Parameters**
- inst – instance number

**Returns**
a node identifier for the reset controller at index 0 in “resets”

`DT_INST_RESET_CTLR_BY_NAME(inst, name)`
Get the node identifier for the controller phandle from a resets phandle-array property by name.

See also:

`DT_RESET_CTLR_BY_NAME()`

**Parameters**
- inst – instance number
- name – lowercase-and-underscores name of a resets element as defined by the node’s reset-names property

**Returns**
the node identifier for the reset controller referenced by the named element

`DT_INST_RESET_CELL_BY_IDX(inst, idx, cell)`
Get a DT_DRV_COMPAT instance’s reset specifier’s cell value at an index.

See also:

`DT_RESET_CELL_BY_IDX()`

**Parameters**
- inst – DT_DRV_COMPAT instance number
- idx – logical index into resets property
- cell – lowercase-and-underscores cell name

**Returns**
the cell value at index “idx”
DT_INST_RESET_CELL_BY_NAME(inst, name, cell)
Get a DT_DRV_COMPAT instance's reset specifier's cell value by name.

See also:
DT_RESET_CELL_BY_NAME()

Parameters
• inst – DT_DRV_COMPAT instance number
• name – lowercase-and-underscores name of a resets element as defined by the node's reset-names property
• cell – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_INST_RESET_CELL(inst, cell)
Equivalent to DT_INST_RESET_CELL_BY_IDX(inst, 0, cell)

Parameters
• inst – DT_DRV_COMPAT instance number
• cell – lowercase-and-underscores cell name

Returns
the value of the cell inside the specifier at index 0

DT_RESET_ID_BY_IDX(node_id, idx)
Get a Reset Controller specifier's id cell at an index.

This macro only works for Reset Controller specifiers with cells named "id". Refer to the node's binding to check if necessary.

Example devicetree fragment:

```plaintext
reset: reset-controller@... {
  compatible = "vnd,reset";
  #reset-cells = <1>;
};

n: node {
  resets = <&reset 10>;
};
```

Bindings fragment for the vnd,reset compatible:

```plaintext
reset-cells:
- id
```

Example usage:

```plaintext
DT_RESET_ID_BY_IDX(DT_NODELABEL(n), 0) // 10
```

See also:
DT_PHA_BY_IDX()

Parameters
• node_id – node identifier
• idx – logical index into “resets”

Returns
the id cell value at index “idx”

DT_RESET_ID(node_id)
Equivalent to DT_RESET_ID_BY_IDX(node_id, 0)

See also:
DT_RESET_ID_BY_IDX()

Parameters
• node_id – node identifier

Returns
the id cell value at index 0

DT_INST_RESET_ID_BY_IDX(inst, idx)
Get a DT_DRV_COMPAT instance’s Reset Controller specifier’s id cell value at an index.

See also:
DT_RESET_ID_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number
  • idx – logical index into “resets”

Returns
the id cell value at index “idx”

DT_INST_RESET_ID(inst)
Equivalent to DT_INST_RESET_ID_BY_IDX(inst, 0)

See also:
DT_INST_RESET_ID_BY_IDX()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
the id cell value at index 0

SPI These conveniences may be used for nodes which describe either SPI controllers or devices, depending on the case.

group devicetree-spi
Defines

DT_SPI_HAS_CS_GPIOS(spi)
Does a SPI controller node have chip select GPIOs configured?
SPI bus controllers use the “cs-gpios” property for configuring chip select GPIOs. Its value is a phandle-array which specifies the chip select lines.

Example devicetree fragment:

```
spi1: spi@... {
  compatible = "vnd.spi";
  cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
             <&gpio2 20 GPIO_ACTIVE_LOW>;
};
spi2: spi@... {
  compatible = "vnd.spi";
};
```

Example usage:

```
DT_SPI_HAS_CS_GPIOS(DT_NODELABEL(spi1)) // 1
DT_SPI_HAS_CS_GPIOS(DT_NODELABEL(spi2)) // 0
```

Parameters
- `spi` – a SPI bus controller node identifier

Returns
1 if “spi” has a cs-gpios property, 0 otherwise

DT_SPI_NUM_CS_GPIOS(spi)
Number of chip select GPIOs in a SPI controller’s cs-gpios property.

Example devicetree fragment:

```
spi1: spi@... {
  compatible = "vnd.spi";
  cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
             <&gpio2 20 GPIO_ACTIVE_LOW>;
};
spi2: spi@... {
  compatible = "vnd.spi";
};
```

Example usage:

```
DT_SPI_NUM_CS_GPIOS(DT_NODELABEL(spi1)) // 2
DT_SPI_NUM_CS_GPIOS(DT_NODELABEL(spi2)) // 0
```

Parameters
- `spi` – a SPI bus controller node identifier

Returns
Logical length of spi’s cs-gpios property, or 0 if “spi” doesn’t have a cs-gpios property

5.2. Devicetree
**DT_SPI_DEV_HAS_CS_GPIOS(spi_dev)**

Does a SPI device have a chip select line configured? Example devicetree fragment:

```c
spi1: spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
              <&gpio2 20 GPIO_ACTIVE_LOW>;
    a: spi-dev-a@0 {
        reg = <0>;
    };
    b: spi-dev-b@1 {
        reg = <1>;
    };
};
spi2: spi@... {
    compatible = "vnd.spi";
    c: spi-dev-c@0 {
        reg = <0>;
    };
};
```

Example usage:

```c
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(a)) // 1
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(b)) // 1
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(c)) // 0
```

**Parameters**

- *spi_dev* – a SPI device node identifier

**Returns**

1 if *spi_dev*'s bus node `DT_BUS(spi_dev)` has a chip select pin at index `DT_REG_ADDR(spi_dev)`, 0 otherwise

**DT_SPI_DEV_CS_GPIOS_CTLR(spi_dev)**

Get a SPI device’s chip select GPIO controller’s node identifier. Example devicetree fragment:

```c
gpio1: gpio@... {
};
gpio2: gpio@... {
};
spi@... {
    compatible = "vnd.spi"
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
              <&gpio2 20 GPIO_ACTIVE_LOW>;
    a: spi-dev-a@0 {
        reg = <0>;
    };
    b: spi-dev-b@1 {
```

(continues on next page)
Example usage:

```c
DT_SPI_DEV_CS_GPIOS_CTLR(DT_NODELABEL(a)) // DT_NODELABEL(gpio1)
DT_SPI_DEV_CS_GPIOS_CTLR(DT_NODELABEL(b)) // DT_NODELABEL(gpio2)
```

**Parameters**

- `spi_dev` – a SPI device node identifier

**Returns**

node identifier for `spi_dev`'s chip select GPIO controller

**Deprecated:**

If used to obtain a device instance with `device_get_binding`, consider using `DEVICE_DT_GET(DT_SPI_DEV_CS_GPIOS_CTLR(node))`.

Example devicetree fragment:

```c
gpio1: gpio@... {
    label = "GPIO_1";
};

gpio2: gpio@... {
    label = "GPIO_2";
};

spi1: spi@... {
    compatible = "vnd_spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>, <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
};
```

Example usage:

```c
DT_SPI_DEV_CS_GPIOS_LABEL(DT_NODELABEL(a)) // "GPIO_1"
DT_SPI_DEV_CS_GPIOS_LABEL(DT_NODELABEL(b)) // "GPIO_2"
```

**Parameters**

- `spi_dev` – a SPI device node identifier

**Returns**

label property of `spi_dev`'s chip select GPIO controller
DT_SPI_DEV_CS_GPIOS_PIN(spi_dev)
Get a SPI device's chip select GPIO pin number.

It's an error if the GPIO specifier for spi_dev's entry in its bus node's cs-gpios property has no pin cell.

Example devicetree fragment:

```
spi: spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
               <&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
}
```

Example usage:

```
DT_SPI_DEV_CS_GPIOS_PIN(DT_NODELABEL(a)) // 10
DT_SPI_DEV_CS_GPIOS_PIN(DT_NODELABEL(b)) // 20
```

**Parameters**

- spi_dev – a SPI device node identifier

**Returns**

pin number of spi_dev's chip select GPIO

DT_SPI_DEV_CS_GPIOS_FLAGS(spi_dev)
Get a SPI device's chip select GPIO flags.

Example devicetree fragment:

```
spi: spi@... {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };
}
```

Example usage:

```
DT_SPI_DEV_CS_GPIOS_FLAGS(DT_NODELABEL(a)) // GPIO_ACTIVE_LOW
```

If the GPIO specifier for spi_dev's entry in its bus node's cs-gpios property has no flags cell, this expands to zero.

**Parameters**

- spi_dev – a SPI device node identifier

**Returns**

flags value of spi_dev's chip select GPIO specifier, or zero if there is none
DT_INST_SPI_DEV_HAS_CS_GPIOS(inst)
   Equivalent to DT_SPI_DEV_HAS_CS_GPIOS(DT_DRV_INST(inst)).

See also:
DT_SPI_DEV_HAS_CS_GPIOS()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
1 if the instance's bus has a CS pin at index DT_INST_REG_ADDR(inst), 0 otherwise

DT_INST_SPI_DEV_CS_GPIOS_CTLR(inst)
   Get GPIO controller node identifier for a SPI device instance This is equivalent to
   DT_SPI_DEV_CS_GPIOS_CTLR(DT_DRV_INST(inst)).

See also:
DT_SPI_DEV_CS_GPIOS_CTLR()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
node identifier for instance's chip select GPIO controller

DT_INST_SPI_DEV_CS_GPIOS_LABEL(inst)
   Get GPIO controller name for a SPI device instance This is equivalent to
   DT_SPI_DEV_CS_GPIOS_LABEL(DT_DRV_INST(inst)).

Deprecated:
   If used to obtain a device instance with device_get_binding, consider using
   DEVICE_DT_GET(DT_INST_SPI_DEV_CS_GPIOS_CTLR(node)).

See also:
DT_SPI_DEV_CS_GPIOS_LABEL()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
label property of the instance’s chip select GPIO controller

DT_INST_SPI_DEV_CS_GPIOS_PIN(inst)
   Equivalent to DT_SPI_DEV_CS_GPIOS_PIN(DT_DRV_INST(inst)).

See also:
DT_SPI_DEV_CS_GPIOS_PIN()
• inst – DT_DRV_COMPAT instance number

Returns
pin number of the instance's chip select GPIO

DT_INST_SPI_DEV_CS_GPIOS_FLAGS(inst)
    DT_SPI_DEV_CS_GPIOS_FLAGS(DT_DRV_INST(inst)).

See also:
    DT_SPI_DEV_CS_GPIOS_FLAGS()

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
flags value of the instance's chip select GPIO specifier, or zero if there is none

Chosen nodes The special /chosen node contains properties whose values describe system-wide settings. The DT_CHOSEN() macro can be used to get a node identifier for a chosen node.

group devicetree-generic-chosen

Defines

DT_CHOSEN(prop)
    Get a node identifier for a /chosen node property.
    This is only valid to call if DT_HAS_CHOSEN(prop) is 1.

Parameters
• prop – lowercase-and-underscores property name for the /chosen node

Returns
    a node identifier for the chosen node property

DT_HAS_CHOSEN(prop)
    Test if the devicetree has a /chosen node.

Parameters
• prop – lowercase-and-underscores devicetree property

Returns
    1 if the chosen property exists and refers to a node, 0 otherwise

Zephyr-specific chosen nodes The following table documents some commonly used Zephyr-specific chosen nodes.

Sometimes, a chosen node's label property will be used to set the default value of a Kconfig option which in turn configures a hardware-specific device. This is usually for backwards compatibility in cases when the Kconfig option predates devicetree support in Zephyr. In other cases, there is no Kconfig option, and the devicetree node is used directly in the source code to select a device.
Table 5.1: Zephyr-specific chosen properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>zephyr, bt-c2h-uart</td>
<td>Selects the UART used for host communication in the bluetooth-hci-uart-sample</td>
</tr>
<tr>
<td>zephyr, bt-mon-uart</td>
<td>Sets UART device used for the Bluetooth monitor logging</td>
</tr>
<tr>
<td>zephyr, bt-uart</td>
<td>Sets UART device used by Bluetooth</td>
</tr>
<tr>
<td>zephyr, canbus</td>
<td>Sets the default CAN controller</td>
</tr>
<tr>
<td>zephyr, ccm</td>
<td>Core-Coupled Memory node on some STM32 SoCs</td>
</tr>
<tr>
<td>zephyr, code-partition</td>
<td>Flash partition that the Zephyr image's text section should be linked into</td>
</tr>
<tr>
<td>zephyr, console</td>
<td>Sets UART device used by console driver</td>
</tr>
<tr>
<td>zephyr, display</td>
<td>Sets the default display controller</td>
</tr>
<tr>
<td>zephyr, keyboard-scan</td>
<td>Sets the default keyboard scan controller</td>
</tr>
<tr>
<td>zephyr, ccm</td>
<td>Data Tightly Coupled Memory node on some Arm SoCs</td>
</tr>
<tr>
<td>zephyr, entropy</td>
<td>A device which can be used as a system-wide entropy source</td>
</tr>
<tr>
<td>zephyr, flash</td>
<td>A node whose reg is sometimes used to set the defaults for CONFIG_FLASH_BASE_ADDRESS and CONFIG_FLASH_SIZE</td>
</tr>
<tr>
<td>zephyr, flash-controller</td>
<td>The node corresponding to the flash controller device for the zephyr, flash node</td>
</tr>
<tr>
<td>zephyr, gdbstub-uart</td>
<td>Sets UART device used by the GDB stub subsystem</td>
</tr>
<tr>
<td>zephyr, ieee802154</td>
<td>Used by the networking subsystem to set the IEEE 802.15.4 device</td>
</tr>
<tr>
<td>zephyr, ipc</td>
<td>Used by the OpenAMP subsystem to specify the inter-process communication (IPC) device</td>
</tr>
<tr>
<td>zephyr, ipc_shm</td>
<td>A node whose reg is used by the OpenAMP subsystem to determine the base address and size of the shared memory (SHM) usable for interprocess-communication (IPC)</td>
</tr>
<tr>
<td>zephyr, itcm</td>
<td>Instruction Tightly Coupled Memory node on some Arm SoCs</td>
</tr>
<tr>
<td>zephyr, ocm</td>
<td>On-chip memory node on Xilinx Zynq-7000 and ZynqMP SoCs</td>
</tr>
<tr>
<td>zephyr, osdp-uart</td>
<td>Sets UART device used by OSDP subsystem</td>
</tr>
<tr>
<td>zephyr, ot-uart</td>
<td>Used by the OpenThread to specify UART device for Spinel protocol</td>
</tr>
<tr>
<td>zephyr, pcie-controller</td>
<td>The node corresponding to the PCIe Controller</td>
</tr>
<tr>
<td>zephyr, ppp-uart</td>
<td>Sets UART device used by PPP</td>
</tr>
<tr>
<td>zephyr, settings-partition</td>
<td>Fixed partition node. If defined this selects the partition used by the NVS and FCB settings backends.</td>
</tr>
<tr>
<td>zephyr, shell-uart</td>
<td>Sets UART device used by serial shell backend</td>
</tr>
<tr>
<td>zephyr, sram</td>
<td>A node whose reg sets the base address and size of SRAM memory available to the Zephyr image, used during linking</td>
</tr>
<tr>
<td>zephyr, tracing-uart</td>
<td>Sets UART device used by tracing subsystem</td>
</tr>
<tr>
<td>zephyr, uart-mcumgr</td>
<td>UART used for Device Management</td>
</tr>
<tr>
<td>zephyr, uart-pipe</td>
<td>Sets UART device used by serial pipe driver</td>
</tr>
<tr>
<td>zephyr, usb-device</td>
<td>USB device node. If defined and has a vbus-gpios property, these will be used by the USB subsystem to enable/disable VBUS</td>
</tr>
</tbody>
</table>

**Bindings index**

This page documents the available devicetree bindings. See Devicetree bindings for an introduction to the Zephyr bindings file format.

**Vendor index**  This section contains an index of hardware vendors. Click on a vendor's name to go to the list of bindings for that vendor.

- Generic or vendor-independent
- Altera Corp. (altr)
- AMS AG (ams)
- Analog Devices, Inc. (adi)

• Zhengzhou Winsen Electronics Technology Co., Ltd. (wisen)
• Unknown vendor

Bindings by vendor  This section contains available bindings, grouped by vendor. Within each group, bindings are listed by the “compatible” property they apply to, like this:

Vendor name (vendor prefix)

• <compatible-A>
• <compatible-B> (on <bus-name> bus)
• <compatible-C>
• ...

The text “(on <bus-name> bus)” appears when bindings may behave differently depending on the bus the node appears on. For example, this applies to some sensor device nodes, which may appear as children of either I2C or SPI bus nodes.

5.3 Configuration System (Kconfig)

The Zephyr kernel and subsystems can be configured at build time to adapt them for specific application and platform needs. Configuration is handled through Kconfig, which is the same configuration system used by the Linux kernel. The goal is to support configuration without having to change any source code.

Configuration options (often called symbols) are defined in Kconfig files, which also specify dependencies between symbols that determine what configurations are valid. Symbols can be grouped into menus and sub-menus to keep the interactive configuration interfaces organized.
The output from Kconfig is a header file autoconf.h with macros that can be tested at build time. Code for unused features can be compiled out to save space.

The following sections explain how to set Kconfig configuration options, go into detail on how Kconfig is used within the Zephyr project, and have some tips and best practices for writing Kconfig files.

5.3.1 Interactive Kconfig interfaces

There are two interactive configuration interfaces available for exploring the available Kconfig options and making temporary changes: menuconfig and guiconfig. menuconfig is a curses-based interface that runs in the terminal, while guiconfig is a graphical configuration interface.

**Note:** The configuration can also be changed by editing zephyr/.config in the application build directory by hand. Using one of the configuration interfaces is often handier, as they correctly handle dependencies between configuration symbols.

If you try to enable a symbol with unsatisfied dependencies in zephyr/.config, the assignment will be ignored and overwritten when re-configuring.

To make a setting permanent, you should set it in a *.conf file, as described in Setting Kconfig configuration values.

**Tip:** Saving a minimal configuration file (with e.g. D in menuconfig) and inspecting it can be handy when making settings permanent. The minimal configuration file only lists symbols that differ from their default value.

To run one of the configuration interfaces, do this:

1. Build your application as usual using either west or cmake:

   Using west:
   ```
   west build -b <board>
   ```

   Using CMake and ninja:
   ```
   mkdir build && cd build
   cmake -GNinja -DBOARD=<board> ..
   ninja
   ```

2. To run the terminal-based menuconfig interface, use either of these commands:

   ```
   west build -t menuconfig
   ```

   ```
   ninja menuconfig
   ```

   To run the graphical guiconfig, use either of these commands:

   ```
   west build -t guiconfig
   ```

   ```
   ninja guiconfig
   ```

   **Note:** If you get an import error for tkinter when trying to run guiconfig, you are missing required packages. See Install Linux Host Dependencies. The package you need is usually called something like python3-tk/python3-tkinter.
tkinter is not included by default in many Python installations, despite being part of the standard library.

The two interfaces are shown below:

![Image showing two interfaces: one for menus and another for icons.](image)

guiconfig always shows the help text and other information related to the currently selected item in the bottom window pane. In the terminal interface, press ? to view the same information.

**Note:** If you prefer to work in the guiconfig interface, then it's a good idea to check any changes to Kconfig files you make in single-menu mode, which is toggled via a checkbox at the top. Unlike full-tree mode, single-menu mode will distinguish between symbols defined with `config` and symbols defined with `menuconfig`, showing you what things would look like in the `menuconfig` interface.

3. Change configuration values in the `menuconfig` interface as follows:

   - Navigate the menu with the arrow keys. Common Vim key bindings are supported as well.
   - Use Space and Enter to enter menus and toggle values. Menus appear with `--->` next to them. Press ESC to return to the parent menu.

   Boolean configuration options are shown with `[ ]` brackets, while numeric and string-valued configuration symbols are shown with `( )` brackets. Symbol values that can’t be changed are shown as `--` or `--*--`.

   **Note:** You can also press Y or N to set a boolean configuration symbol to the corresponding value.

   - Press ? to display information about the currently selected symbol, including its help text. Press ESC or Q to return from the information display to the menu.

   In the guiconfig interface, either click on the image next to the symbol to change its value, or double-click on the row with the symbol (this only works if the symbol has no children, as double-clicking a symbol with children open/closes its menu instead).

   guiconfig also supports keyboard controls, which are similar to `menuconfig`. 
4. Pressing Q in the `menuconfig` interface will bring up the save-and-quit dialog (if there are changes to save):

Press Y to save the kernel configuration options to the default filename (`zephyr/.config`). You will typically save to the default filename unless you are experimenting with different configurations.

The `guiconfig` interface will also prompt for saving the configuration on exit if it has been modified.

**Note:** The configuration file used during the build is always `zephyr/.config`. If you have another saved configuration that you want to build with, copy it to `zephyr/.config`. Make sure to back up your original configuration file.

Also note that filenames starting with a dot are not listed by `ls` by default on Linux and macOS. Use the `-a` flag to see them.

Finding a symbol in the menu tree and navigating to it can be tedious. To jump directly to a symbol, press the `/` key (this also works in `guiconfig`). This brings up the following dialog, where you can search for symbols by name and jump to them. In `guiconfig`, you can also change symbol values directly within the dialog.

If you jump to a symbol that isn't currently visible (e.g., due to having unsatisfied dependencies), then show-all mode will be enabled. In show-all mode, all symbols are displayed, including currently invisible symbols. To turn off show-all mode, press A in `menuconfig` or Ctrl-A in `guiconfig`.

**Note:** Show-all mode can't be turned off if there are no visible items in the current menu.
### 5.3. Configuration System (Kconfig)

**WDT @ NAME** "Watchdog driver instance name"
**WDT_ESP32** "ESP32 Watchdog (WDT) Driver"
**WDT_ESP32_IRQ** "IRQ line for watchdog interrupt"
**WDT_QMSI** "QMSI Watchdog driver"
**WDT_SAM** "Atmel SAM MCU Family Watchdog (WDT) Driver"
**WDT_SAM0** "Atmel SAM0 series Watchdog (WDT) Driver"

Type text to narrow the search. Regexes are supported (via Python's 're' module). The up/down cursor keys step in the list. [Enter] jumps to the selected symbol. [ESC] aborts the search. Type multiple space-separated strings/regexes to find entries that match all of them. Type Ctrl-F to view the help of the selected item without leaving the dialog.
To figure out why a symbol you jumped to isn’t visible, inspect its dependencies, either by pressing \texttt{?} in \texttt{menuconfig} or in the information pane at the bottom in \texttt{guiconfig}. If you discover that the symbol depends on another symbol that isn’t enabled, you can jump to that symbol in turn to see if it can be enabled.

\textbf{Note:} In \texttt{menuconfig}, you can press Ctrl-F to view the help of the currently selected item in the jump-to dialog without leaving the dialog.

For more information on \texttt{menuconfig} and \texttt{guiconfig}, see the Python docstrings at the top of \texttt{menuconfig.py} and \texttt{guiconfig.py}.

\section*{5.3.2 Setting Kconfig configuration values}

The \texttt{menuconfig} and \texttt{guiconfig} interfaces can be used to test out configurations during application development. This page explains how to make settings permanent.

All Kconfig options can be searched in the Kconfig search page.

\textbf{Note:} Before making changes to Kconfig files, it’s a good idea to also go through the \texttt{Kconfig - Tips and Best Practices} page.

\section*{Visible and invisible Kconfig symbols}

When making Kconfig changes, it’s important to understand the difference between \textit{visible} and \textit{invisible} symbols.

\begin{itemize}
  \item A visible symbol is a symbol defined with a prompt. Visible symbols show up in the interactive configuration interfaces (hence \textit{visible}), and can be set in configuration files.

  Here’s an example of a visible symbol:

  \begin{verbatim}
  config FPU
  bool "Support floating point operations"
  depends on HAS_FPU
  \end{verbatim}

  The symbol is shown like this in \texttt{menuconfig}, where it can be toggled:

  \begin{verbatim}
  [ ] Support floating point operations
  \end{verbatim}

  \item An \textit{invisible} symbol is a symbol without a prompt. Invisible symbols are not shown in the interactive configuration interfaces, and users have no direct control over their value. They instead get their value from defaults or from other symbols.

  Here’s an example of an invisible symbol:

  \begin{verbatim}
  config CPU_HAS_FPU
  bool help
  "This symbol is y if the CPU has a hardware floating point unit."
  \end{verbatim}

  In this case, CPU\_HAS\_FPU is enabled through other symbols having select CPU\_HAS\_FPU.
Setting symbols in configuration files

Visible symbols can be configured by setting them in configuration files. The initial configuration is produced by merging a _defconfig file for the board with application settings, usually from prj.conf. See The Initial Configuration below for more details.

Assignments in configuration files use this syntax:

```
CONFIG_<symbol name>=<value>
```

There should be no spaces around the equals sign.

bool symbols can be enabled or disabled by setting them to y or n, respectively. The FPU symbol from the example above could be enabled like this:

```
CONFIG_FPU=y
```

**Note:** A boolean symbol can also be set to n with a comment formatted like this:

```
# CONFIG_SOME_OTHER_BOOL is not set
```

This is the format you will see in the merged configuration in zephyr/.config.

This style is accepted for historical reasons: Kconfig configuration files can be parsed as makefiles (though Zephyr doesn’t use this). Having n-valued symbols correspond to unset variables simplifies tests in Make.

Other symbol types are assigned like this:

```
CONFIG_SOME_STRING="cool value"
CONFIG_SOME_INT=123
```

Comments use a #:

```
# This is a comment
```

Assignments in configuration files are only respected if the dependencies for the symbol are satisfied. A warning is printed otherwise. To figure out what the dependencies of a symbol are, use one of the interactive configuration interfaces (you can jump directly to a symbol with /), or look up the symbol in the Kconfig search page.

The Initial Configuration

The initial configuration for an application comes from merging configuration settings from three sources:

1. A BOARD-specific configuration file stored in boards/<architecture>/<BOARD>/_defconfig
2. Any CMake cache entries prefix with CONFIG_
3. The application configuration

The application configuration can come from the sources below. By default, prj.conf is used.

1. If CONF_FILE is set, the configuration file(s) specified in it are merged and used as the application configuration. CONF_FILE can be set in various ways:
   1. In CMakeLists.txt, before calling find_package(Zephyr)
   2. By passing -DCONF_FILE=<conf file(s)> directly or via west
   3. From the CMake variable cache
2. Otherwise if CONF_FILE is set, and a single configuration file of the form prj.<build>.conf is used, then if file boards/<BOARD>.<build>.conf exists in same folder as file prj.<build>.conf, the result of merging prj.<build>.conf and boards/<BOARD>.<build>.conf is used.

3. Otherwise, prj.<BOARD>.conf is used if it exists in the application configuration directory.

4. Otherwise, if boards/<BOARD>.conf exists in the application configuration directory, the result of merging it with prj.conf is used.

5. Otherwise, if board revisions are used and boards/<BOARD>.<revision>.conf exists in the application configuration directory, the result of merging it with prj.conf and boards/<BOARD>.conf is used.

6. Otherwise, prj.conf is used if it exists in the application configuration directory.

All configuration files will be taken from the application's configuration directory except for files with an absolute path that are given with the CONF_FILE, OVERLAY_CONFIG, and DTC_OVERLAY_FILE arguments. For these, a file in a Zephyr module can be referred by escaping the Zephyr module dir variable like this \${ZEPHYR_<module>_MODULE_DIR}/<path-to>/<file> when setting any of said variables in the application's CMakeLists.txt.

See Application Configuration Directory on how the application configuration directory is defined.

If a symbol is assigned both in <BOARD>_defconfig and in the application configuration, the value set in the application configuration takes precedence.

The merged configuration is saved to zephyr/.config in the build directory.

As long as zephyr/.config exists and is up-to-date (is newer than any BOARD and application configuration files), it will be used in preference to producing a new merged configuration. zephyr/.config is also the configuration that gets modified when making changes in the interactive configuration interfaces.

Configuring invisible Kconfig symbols

When making changes to the default configuration for a board, you might have to configure invisible symbols. This is done in boards/<architecture>/<BOARD>/Kconfig.defconfig, which is a regular Kconfig file.

Note: Assignments in .config files have no effect on invisible symbols, so this scheme is not just an organizational issue.

Assigning values in Kconfig.defconfig relies on defining a Kconfig symbol in multiple locations. As an example, say we want to set FOO_WIDTH below to 32:

```plaintext
config FOO_WIDTH
  int
```

To do this, we extend the definition of FOO_WIDTH as follows, in Kconfig.defconfig:

```plaintext
if BOARD_MY_BOARD
  config FOO_WIDTH
default 32
endif
```

Note: Since the type of the symbol (int) has already been given at the first definition location, it does not need to be repeated here. Only giving the type once at the “base” definition of the symbol is a good idea for reasons explained in Common Kconfig shorthands.
default values in Kconfig.defconfig files have priority over default values given on the “base” definition of a symbol. Internally, this is implemented by including the Kconfig.defconfig files first. Kconfig uses the first default with a satisfied condition, where an empty condition corresponds to if y (is always satisfied).

Note that conditions from surrounding top-level if's are propagated to symbol properties, so the above default is equivalent to default 32 if BOARD_MY_BOARD.

**Warning:** When defining a symbol in multiple locations, dependencies are ORed together rather than ANDed together. It is not possible to make the dependencies of a symbol more restrictive by defining it in multiple locations.

For example, the direct dependencies of the symbol below becomes DEP1 || DEP2:

```plaintext
config FOO
    ... depends on DEP1
config FOO
    ... depends on DEP2
```

When making changes to Kconfig.defconfig files, always check the symbol's direct dependencies in one of the interactive configuration interfaces afterwards. It is often necessary to repeat dependencies from the base definition of the symbol to avoid weakening a symbol’s dependencies.

**Motivation for Kconfig.defconfig files** One motivation for this configuration scheme is to avoid making fixed BOARD-specific settings configurable in the interactive configuration interfaces. If all board configuration were done via `<BOARD>_defconfig`, all symbols would have to be visible, as values given in `<BOARD>_defconfig` have no effect on invisible symbols.

Having fixed settings be user-configurable would clutter up the configuration interfaces and make them harder to understand, and would make it easier to accidentally create broken configurations.

When dealing with fixed board-specific settings, also consider whether they should be handled via devicetree instead.

**Configuring choices** There are two ways to configure a Kconfig choice:

1. By setting one of the choice symbols to y in a configuration file.

   Setting one choice symbol to y automatically gives all other choice symbols the value n.

   If multiple choice symbols are set to y, only the last one set to y will be honored (the rest will get the value n). This allows a choice selection from a board defconfig file to be overridden from an application prj.conf file.

2. By changing the default of the choice in Kconfig.defconfig.

   As with symbols, changing the default for a choice is done by defining the choice in multiple locations. For this to work, the choice must have a name.

   As an example, assume that a choice has the following base definition (here, the name of the choice is FOO):

```plaintext
choice FOO
    bool "Foo choice"
    default B

config A
```

(continues on next page)
true "A"

config B
  bool "B"
endchoice

To change the default symbol of FOO to A, you would add the following definition to Kconfig.

defconfig:

choice FOO
default A
endchoice

The Kconfig.defconfig method should be used when the dependencies of the choice might not be satisfied. In that case, you're setting the default selection whenever the user makes the choice visible.

More Kconfig resources  The Kconfig - Tips and Best Practices page has some tips for writing Kconfig files.

The kconfiglib.py docstring docstring (at the top of the file) goes over how symbol values are calculated in detail.

5.3.3  Kconfig - Tips and Best Practices

This page covers some Kconfig best practices and explains some Kconfig behaviors and features that might be cryptic or that are easily overlooked.

Note:  The official Kconfig documentation is kconfig-language.rst and kconfig-macro-language.rst.
What to turn into Kconfig options

When deciding whether something belongs in Kconfig, it helps to distinguish between symbols that have prompts and symbols that don’t.

If a symbol has a prompt (e.g. bool "Enable foo"), then the user can change the symbol’s value in the menuconfig or guiconfig interface (see Interactive Kconfig interfaces), or by manually editing configuration files. Conversely, a symbol without a prompt can never be changed directly by the user, not even by manually editing configuration files.

Only put a prompt on a symbol if it makes sense for the user to change its value.

Symbols without prompts are called hidden or invisible symbols, because they don’t show up in menuconfig and guiconfig. Symbols that have prompts can also be invisible, when their dependencies are not satisfied.

Symbols without prompts can’t be configured directly by the user (they derive their value from other symbols), so less restrictions apply to them. If some derived setting is easier to calculate in Kconfig than e.g. during the build, then do it in Kconfig, but keep the distinction between symbols with and without prompts in mind.

See the optional prompts section for a way to deal with settings that are fixed on some machines and configurable on other machines.

What not to turn into Kconfig options

In Zephyr, Kconfig configuration is done after selecting a target board. In general, it does not make sense to use Kconfig for a value that corresponds to a fixed machine-specific setting. Usually, such settings should be handled via devicetree instead.

In particular, avoid adding new Kconfig options of the following types:

Options that specify a device in the system by name  For example, if you are writing an I2C device driver, avoid creating an option named MY_DEVICE_I2C_BUS_NAME for specifying the bus node your device is controlled by. See Device drivers that depend on other devices for alternatives.
Similarly, if your application depends on a hardware-specific PWM device to control an RGB LED, avoid creating an option like `MY_PWM_DEVICE_NAME`. See *Applications that depend on board-specific devices* for alternatives.

**Options that specify fixed hardware configuration**  For example, avoid `Kconfig` options specifying a GPIO pin.

An alternative applicable to device drivers is to define a GPIO specifier with type phandle-array in the device binding, and using the `GPIO` devicetree API from C. Similar advice applies to other cases where `devicetree.h` provides *Hardware specific APIs* for referring to other nodes in the system. Search the source code for drivers using these APIs for examples.

An application-specific devicetree binding to identify board specific properties may be appropriate. See `tests/drivers/gpio/gpio_basic_api` for an example.

For applications, see `blinky-sample` for a devicetree-based alternative.

**select statements**

The `select` statement is used to force one symbol to `y` whenever another symbol is `y`. For example, the following code forces `CONSOLE` to `y` whenever `USB_CONSOLE` is `y`:

```
config CONSOLE
  bool "Console support"
...

config USB_CONSOLE
  bool "USB console support"
  select CONSOLE
```

This section covers some pitfalls and good uses for `select`.

**select pitfalls**  `select` might seem like a generally useful feature at first, but can cause configuration issues if overused.

For example, say that a new dependency is added to the `CONSOLE` symbol above, by a developer who is unaware of the `USB_CONSOLE` symbol (or simply forgot about it):

```
config CONSOLE
  bool "Console support"
  depends on STRING_ROUTINES
...

config USB_CONSOLE
  bool "USB console support"
  select CONSOLE
```

Enabling `USB_CONSOLE` now forces `CONSOLE` to `y`, even if `STRING_ROUTINES` is `n`.

To fix the problem, the `STRING_ROUTINES` dependency needs to be added to `USB_CONSOLE` as well:

```
config USB_CONSOLE
  bool "USB console support"
  select CONSOLE
  depends on STRING_ROUTINES
...

config STRING_ROUTINES
  bool "Include string routines"
```

More insidious cases with dependencies inherited from `if` and `menu` statements are common.

An alternative attempt to solve the issue might be to turn the `depends` on into another `select`:  

---

1186 Chapter 5. Build and Configuration Systems
config CONSOLE
  bool "Console support"
  select STRING_ROUTINES

...

config USB_CONSOLE
  bool "USB console support"
  select CONSOLE

In practice, this often amplifies the problem, because any dependencies added to STRING_ROUTINES now need to be copied to both CONSOLE and USB_CONSOLE.

In general, whenever the dependencies of a symbol are updated, the dependencies of all symbols that (directly or indirectly) select it have to be updated as well. This is very often overlooked in practice, even for the simplest case above.

Chains of symbols selecting each other should be avoided in particular, except for simple helper symbols, as covered below in Using select for helper symbols.

Liberal use of select also tends to make Kconfig files harder to read, both due to the extra dependencies and due to the non-local nature of select, which hides ways in which a symbol might get enabled.

**Alternatives to select** For the example in the previous section, a better solution is usually to turn the select into a depends on:

config CONSOLE
  bool "Console support"

...

config USB_CONSOLE
  bool "USB console support"
  depends on CONSOLE

This makes it impossible to generate an invalid configuration, and means that dependencies only ever have to be updated in a single spot.

An objection to using depends on here might be that configuration files that enable USB_CONSOLE now also need to enable CONSOLE:

CONFIG_CONSOLE=y
CONFIG_USB_CONSOLE=y

This comes down to a trade-off, but if enabling CONSOLE is the norm, then a mitigation is to make CONSOLE default to y:

config CONSOLE
  bool "Console support"
  default y

This gives just a single assignment in configuration files:

CONFIG_USB_CONSOLE=y

Note that configuration files that do not want CONSOLE enabled now have to explicitly disable it:

CONFIG_CONSOLE=n
Using `select` for helper symbols  A good and safe use of `select` is for setting “helper” symbols that capture some condition. Such helper symbols should preferably have no prompt or dependencies.

For example, a helper symbol for indicating that a particular CPU/SoC has an FPU could be defined as follows:

```c
config CPU_HAS_FPU
  bool
  help
   If y, the CPU has an FPU
...

config SOC_FOO
  bool "FOO SoC"
  select CPU_HAS_FPU
...

config SOC_BAR
  bool "BAR SoC"
  select CPU_HAS_FPU
```

This makes it possible for other symbols to check for FPU support in a generic way, without having to look for particular architectures:

```c
config FPU
  bool "Support floating point operations"
  depends on CPU_HAS_FPU
```

The alternative would be to have dependencies like the following, possibly duplicated in several spots:

```c
config FPU
  bool "Support floating point operations"
  depends on SOC_FOO || SOC_BAR || ...
```

Invisible helper symbols can also be useful without `select`. For example, the following code defines a helper symbol that has the value y if the machine has some arbitrarily-defined “large” amount of memory:

```c
config LARGE_MEM
  def_bool MEM_SIZE >= 64
```

**Note:** This is short for the following:

```c
config LARGE_MEM
  bool
  default MEM_SIZE >= 64
```

**select recommendations** In summary, here are some recommended practices for `select`:

- Avoid selecting symbols with prompts or dependencies. Prefer `depends on`. If `depends on` causes annoying bloat in configuration files, consider adding a Kconfig default for the most common value.

  Rare exceptions might include cases where you’re sure that the dependencies of the selecting and selected symbol will never drift out of sync, e.g. when dealing with two simple symbols defined close to one another within the same `if`. 

Chapter 5. Build and Configuration Systems
Common sense applies, but be aware that `select` often causes issues in practice. `depends on` is usually a cleaner and safer solution.

- Select simple helper symbols without prompts and dependencies however much you like. They’re a great tool for simplifying Kconfig files.

**Lack of conditional includes**

`if` blocks add dependencies to each item within the `if`, as if `depends on` was used.

A common misunderstanding related to `if` is to think that the following code conditionally includes the file `Kconfig.other`:

```c
if DEP
    source "Kconfig.other"
endif
```

In reality, there are no conditional includes in Kconfig. `if` has no special meaning around a `source`.

**Note:** Conditional includes would be impossible to implement, because `if` conditions may contain (either directly or indirectly) forward references to symbols that haven’t been defined yet.

Say that `Kconfig.other` above contains this definition:

```c
cfg FOO
    bool "Support foo"
```

In this case, `FOO` will end up with this definition:

```c
cfg FOO
    bool "Support foo"
    depends on DEP
```

Note that it is redundant to add `depends on DEP` to the definition of `FOO` in `Kconfig.other`, because the `DEP` dependency has already been added by `if DEP`.

In general, try to avoid adding redundant dependencies. They can make the structure of the Kconfig files harder to understand, and also make changes more error-prone, since it can be hard to spot that the same dependency is added twice.

**“Stuck” symbols in menuconfig and guiconfig**

There is a common subtle gotcha related to interdependent configuration symbols with prompts. Consider these symbols:

```c
cfg FOO
    bool "Foo"

cfg STACK_SIZE
    hex "Stack size"
    default 0x200 if FOO
    default 0x100
```

Assume that the intention here is to use a larger stack whenever `FOO` is enabled, and that the configuration initially has `FOO` disabled. Also, remember that Zephyr creates an initial configuration in `zephyr/.config` in the build directory by merging configuration files (including e.g. `prj.conf`). This configuration file exists before `menuconfig` or `guiconfig` is run.
When first entering the configuration interface, the value of STACK_SIZE is 0x100, as expected. After enabling FOO, you might reasonably expect the value of STACK_SIZE to change to 0x200, but it stays as 0x100.

To understand what's going on, remember that STACK_SIZE has a prompt, meaning it is user-configurable, and consider that all Kconfig has to go on from the initial configuration is this:

```
CONFIG_STACK_SIZE=0x100
```

Since Kconfig can't know if the 0x100 value came from a default or was typed in by the user, it has to assume that it came from the user. Since STACK_SIZE is user-configurable, the value from the configuration file is respected, and any symbol defaults are ignored. This is why the value of STACK_SIZE appears to be “frozen” at 0x100 when toggling FOO.

The right fix depends on what the intention is. Here’s some different scenarios with suggestions:

- If STACK_SIZE can always be derived automatically and does not need to be user-configurable, then just remove the prompt:

  ```
  config STACK_SIZE
  hex
  default 0x200 if FOO
  default 0x100
  ```

  Symbols without prompts ignore any value from the saved configuration.

- If STACK_SIZE should usually be user-configurable, but needs to be set to 0x200 when FOO is enabled, then disable its prompt when FOO is enabled, as described in optional prompts:

  ```
  config STACK_SIZE
  hex "Stack size" if !FOO
  default 0x200 if FOO
  default 0x100
  ```

- If STACK_SIZE should usually be derived automatically, but needs to be set to a custom value in rare circumstances, then add another option for making STACK_SIZE user-configurable:

  ```
  config CUSTOM_STACK_SIZE
  bool "Use a custom stack size"
  help
  Enable this if you need to use a custom stack size. When disabled, a suitable stack size is calculated automatically.
  
  config STACK_SIZE
  hex "Stack size" if CUSTOM_STACK_SIZE
  default 0x200 if FOO
  default 0x100
  ```

  As long as CUSTOM_STACK_SIZE is disabled, STACK_SIZE will ignore the value from the saved configuration.

It is a good idea to try out changes in the menuconfig or guiconfig interface, to make sure that things behave the way you expect. This is especially true when making moderately complex changes like these.

**Assignments to promptless symbols in configuration files**

Assignments to hidden (promptless, also called invisible) symbols in configuration files are always ignored. Hidden symbols get their value indirectly from other symbols, via e.g. default and select.

A common source of confusion is opening the output configuration file (zephyr/.config), seeing a bunch of assignments to hidden symbols, and assuming that those assignments must be respected when
the configuration is read back in by Kconfig. In reality, all assignments to hidden symbols in `zephyr/.config` are ignored by Kconfig, like for other configuration files.

To understand why `zephyr/.config` still includes assignments to hidden symbols, it helps to realize that `zephyr/.config` serves two separate purposes:

1. It holds the saved configuration, and
2. It holds configuration output. `zephyr/.config` is parsed by the CMake files to let them query configuration settings, for example.

The assignments to hidden symbols in `zephyr/.config` are just configuration output. Kconfig itself ignores assignments to hidden symbols when calculating symbol values.

**Note:** A minimal configuration, which can be generated from within the `menuconfig` and `guiconfig` interfaces, could be considered closer to just a saved configuration, without the full configuration output.

**depends on and string/int/hex symbols**

`depends on` works not just for bool symbols, but also for string, int, and hex symbols (and for choices).

The Kconfig definitions below will hide the `FOO_DEVICE_FREQUENCY` symbol and disable any configuration output for it when `FOO_DEVICE` is disabled.

```c
config FOO_DEVICE
  bool "Foo device"

config FOO_DEVICE_FREQUENCY
  int "Foo device frequency"
  depends on FOO_DEVICE
```

In general, it's a good idea to check that only relevant symbols are ever shown in the `menuconfig/guiconfig` interface. Having `FOO_DEVICE_FREQUENCY` show up when `FOO_DEVICE` is disabled (and possibly hidden) makes the relationship between the symbols harder to understand, even if code never looks at `FOO_DEVICE_FREQUENCY` when `FOO_DEVICE` is disabled.

**menuconfig symbols**

If the definition of a symbol `F00` is immediately followed by other symbols that depend on `F00`, then those symbols become children of `F00`. If `F00` is defined with `config F00`, then the children are shown indented relative to `F00`. Defining `F00` with `menuconfig F00` instead puts the children in a separate menu rooted at `F00`.

`menuconfig` has no effect on evaluation. It's just a display option.

`menuconfig` can cut down on the number of menus and make the menu structure easier to navigate. For example, say you have the following definitions:

```c
menu "Foo subsystem"

config FOO_SUBSYSTEM
  bool "Foo subsystem"

if FOO_SUBSYSTEM

config FOO_FEATURE_1
  bool "Foo feature 1"
```

(continues on next page)
Zephyr Project Documentation, Release 3.2.99

config FOO_FEATURE_2
  bool "Foo feature 2"

config FOO_FREQUENCY
  int "Foo frequency"

... lots of other FOO-related symbols

defined # FOO_SUBSYSTEM

demenu

In this case, it's probably better to get rid of the menu and turn FOO_SUBSYSTEM into a menuconfig symbol:

menuconfig FOO_SUBSYSTEM
  bool "Foo subsystem"

if FOO_SUBSYSTEM

  config FOO_FEATURE_1
    bool "Foo feature 1"

  config FOO_FEATURE_2
    bool "Foo feature 2"

  config FOO_FREQUENCY
    int "Foo frequency"

... lots of other FOO-related symbols

defined # FOO_SUBSYSTEM

In the menuconfig interface, this will be displayed as follows:

[*] Foo subsystem --->

Note that making a symbol without children a menuconfig is meaningless. It should be avoided, because it looks identical to a symbol with all children invisible:

[*] I have no children ----
[*] All my children are invisible ----

Commas in macro arguments

Kconfig uses commas to separate macro arguments. This means a construct like this will fail:

config FOO
  bool
default y if $(dt_chosen_enabled,"zephyr,bar")

To solve this problem, create a variable with the text and use this variable as argument, as follows:

DT_CHOSEN_ZEPHYR_BAR := zephyr,bar

config FOO
  bool
default y if $(dt_chosen_enabled, $(DT_CHOSEN_ZEPHYR_BAR))
Checking changes in menuconfig/guiconfig

When adding new symbols or making other changes to Kconfig files, it is a good idea to look up the symbols in menuconfig or guiconfig afterwards. To get to a symbol quickly, use the jump-to feature (press `/`).

Here are some things to check:

• Are the symbols placed in a good spot? Check that they appear in a menu where they make sense, close to related symbols.
  If one symbol depends on another, then it's often a good idea to place it right after the symbol it depends on. It will then be shown indented relative to the symbol it depends on in the menuconfig interface, and in a separate menu rooted at the symbol in guiconfig. This also works if several symbols are placed after the symbol they depend on.

• Is it easy to guess what the symbols do from their prompts?

• If many symbols are added, do all combinations of values they can be set to make sense?
  For example, if two symbols FOO_SUPPORT and NO_FOO_SUPPORT are added, and both can be enabled at the same time, then that makes a nonsensical configuration. In this case, it's probably better to have a single FOO_SUPPORT symbol.

• Are there any duplicated dependencies?
  This can be checked by selecting a symbol and pressing `?` to view the symbol information. If there are duplicated dependencies, then use the Included via ... path shown in the symbol information to figure out where they come from.

Checking changes with scripts/kconfig/lint.py

After you make Kconfig changes, you can use the scripts/kconfig/lint.py script to check for some potential issues, like unused symbols and symbols that are impossible to enable. Use `--help` to see available options.

Some checks are necessarily a bit heuristic, so a symbol being flagged by a check does not necessarily mean there's a problem. If a check returns a false positive e.g. due to token pasting in C (CONFIG_FOO_##index##_BAR), just ignore it.

When investigating an unknown symbol FOO_BAR, it is a good idea to run `git grep FOO_BAR` to look for references. It is also a good idea to search for some components of the symbol name with e.g. `git grep FOO` and `git grep BAR`, as it can help uncover token pasting.

Style recommendations and shorthands

This section gives some style recommendations and explains some common Kconfig shorthands.

Factoring out common dependencies  If a sequence of symbols/choices share a common dependency, the dependency can be factored out with an `if`.

As an example, consider the following code:

```c
config FOO
    bool "Foo"
    depends on DEP

config BAR
    bool "Bar"
    depends on DEP
```
(continues on next page)
choice
    prompt "Choice"
    depends on DEP

config BAZ
    bool "Baz"

config QAZ
    bool "Qaz"

endchoice

Here, the DEP dependency can be factored out like this:

if DEP

config FOO
    bool "Foo"

config BAR
    bool "Bar"

choice
    prompt "Choice"

config BAZ
    bool "Baz"

config QAZ
    bool "Qaz"

endchoice
endif # DEP

Note: Internally, the second version of the code is transformed into the first.

If a sequence of symbols/choices with shared dependencies are all in the same menu, the dependency can be put on the menu itself:

menu "Foo features"
    depends on FOO_SUPPORT

config FOO_FEATURE_1
    bool "Foo feature 1"

config FOO_FEATURE_2
    bool "Foo feature 2"

endmenu

If FOO_SUPPORT is n, the entire menu disappears.
Redundant defaults  bool symbols implicitly default to n, and string symbols implicitly default to the empty string. Therefore, default n and default "" are (almost) always redundant.

The recommended style in Zephyr is to skip redundant defaults for bool and string symbols. That also generates clearer documentation: (Implicitly defaults to n instead of n if <dependencies, possibly inherited>).

Defaults should always be given for int and hex symbols, however, as they implicitly default to the empty string. This is partly for compatibility with the C Kconfig tools, though an implicit 0 default might be less likely to be what was intended compared to other symbol types as well.

The one case where default n/default "" is not redundant is when defining a symbol in multiple locations and wanting to override e.g. a default y on a later definition. Note that a default n does not override a previously defined default y.

That is, FOO will be set to n in the example below. If the default n was omitted in the first definition, FOO would have been set to y.

```plaintext
config FOO
  bool " foo"
  default n

config FOO
  bool " foo"
  default y
```

In the following example FOO will get the value y.

```plaintext
config FOO
  bool " foo"
  default y

config FOO
  bool " foo"
  default n
```

Common Kconfig shorthands  Kconfig has two shorthands that deal with prompts and defaults.

- `<type> "prompt"` is a shorthand for giving a symbol/choice a type and a prompt at the same time. These two definitions are equal:

```plaintext
config FOO
  bool " foo"
```

```plaintext
config FOO
  bool
  prompt " foo"
```

The first style, with the shorthand, is preferred in Zephyr.

- `def_<type> <value>` is a shorthand for giving a type and a value at the same time. These two definitions are equal:

```plaintext
config FOO
  def_bool BAR && BAZ
```

```plaintext
config FOO
  bool
  default BAR && BAZ
```
Using both the `<type> "prompt"` and the `def_<type> <value>` shorthand in the same definition is redundant, since it gives the type twice.

The `def_<type> <value>` shorthand is generally only useful for symbols without prompts, and somewhat obscure.

**Note:** For a symbol defined in multiple locations (e.g., in a `Kconfig.defconfig` file in Zephyr), it is best to only give the symbol type for the “base” definition of the symbol, and to use default (instead of `def_<type> value`) for the remaining definitions. That way, if the base definition of the symbol is removed, the symbol ends up without a type, which generates a warning that points to the other definitions. That makes the extra definitions easier to discover and remove.

**Prompt strings** For a Kconfig symbol that enables a driver/subsystem FOO, consider having just “Foo” as the prompt, instead of “Enable Foo support” or the like. It will usually be clear in the context of an option that can be toggled on/off, and makes things consistent.

**Header comments and other nits** A few formatting nits, to help keep things consistent:

- Use this format for any header comments at the top of `Kconfig` files:

  ```
  # <Overview of symbols defined in the file, preferably in plain English>
  (Blank line)
  # Copyright (c) 2019 ...
  # SPDX-License-Identifier: <License>
  (Blank line)
  (Kconfig definitions)
  ```

- Format comments as `# Comment` rather than `#Comment`
- Put a blank line before/after each top-level `if` and `endif`
- Use a single tab for each indentation
- Indent help text with two extra spaces

**Lesser-known/used Kconfig features**

This section lists some more obscure Kconfig behaviors and features that might still come in handy.

**The `imply` statement** The `imply` statement is similar to `select`, but respects dependencies and doesn’t force a value. For example, the following code could be used to enable USB keyboard support by default on the FOO SoC, while still allowing the user to turn it off:

```c
config SOC_FOO
    bool "FOO SoC"
    imply USB_KEYBOARD

...  

cfg USB_KEYBOARD
    bool "USB keyboard support"
```

`imply` acts like a suggestion, whereas `select` forces a value.
Optional prompts   A condition can be put on a symbol's prompt to make it optionally configurable by the user. For example, a value MASK that's hardcoded to 0xFF on some boards and configurable on others could be expressed as follows:

```plaintext
config MASK
    hex "Bitmask" if HAS_CONFIGURABLE_MASK
    default 0xFF
```

**Note:** This is short for the following:

```plaintext
config MASK
    hex
    prompt "Bitmask" if HAS_CONFIGURABLE_MASK
    default 0xFF
```

The HAS_CONFIGURABLE_MASK helper symbol would get selected by boards to indicate that MASK is configurable. When MASK is configurable, it will also default to 0xFF.

Optional choices   Defining a choice with the optional keyword allows the whole choice to be toggled off to select none of the symbols:

```plaintext
choice
    prompt "Use legacy protocol"
    optional

config LEGACY_PROTOCOL_1
    bool "Legacy protocol 1"

config LEGACY_PROTOCOL_2
    bool "Legacy protocol 2"
endchoice
```

In the menuconfig interface, this will be displayed e.g. as [*] Use legacy protocol (Legacy protocol 1) --->, where the choice can be toggled off to enable neither of the symbols.

Visible if conditions   Putting a visible if condition on a menu hides the menu and all the symbols within it, while still allowing symbol default values to kick in.

As a motivating example, consider the following code:

```plaintext
menu "Foo subsystem"
    depends on HAS_CONFIGURABLE_FOO

config FOO_SETTING_1
    int "Foo setting 1"
    default 1

config FOO_SETTING_2
    int "Foo setting 2"
    default 2
endmenu
```

When HAS_CONFIGURABLE_FOO is n, no configuration output is generated for FOO_SETTING_1 and FOO_SETTING_2, as the code above is logically equivalent to the following code:
config FOO_SETTING_1
    int "Foo setting 1"
    default 1
    depends on HAS_CONFIGURABLE_FOO

config FOO_SETTING_2
    int "Foo setting 2"
    default 2
    depends on HAS_CONFIGURABLE_FOO

If we want the symbols to still get their default values even when HAS_CONFIGURABLE_FOO is n, but not be configurable by the user, then we can use visible if instead:

menu "Foo subsystem"
    visible if HAS_CONFIGURABLE_FOO

config FOO_SETTING_1
    int "Foo setting 1"
    default 1

config FOO_SETTING_2
    int "Foo setting 2"
    default 2
endmenu

This is logically equivalent to the following:

config FOO_SETTING_1
    int "Foo setting 1" if HAS_CONFIGURABLE_FOO
    default 1

config FOO_SETTING_2
    int "Foo setting 2" if HAS_CONFIGURABLE_FOO
    default 2

Note: See the optional prompts section for the meaning of the conditions on the prompts.

When HAS_CONFIGURABLE is n, we now get the following configuration output for the symbols, instead of no output:

...  
CONFIG_FOO_SETTING_1=1  
CONFIG_FOO_SETTING_2=2  
...

Other resources

The Intro to symbol values section in the Kconfiglib docstring goes over how symbols values are calculated in more detail.

5.3.4 Custom Kconfig Preprocessor Functions

Kconfiglib supports custom Kconfig preprocessor functions written in Python. These functions are defined in scripts/kconfig/kconfigfunctions.py.
Most of the custom preprocessor functions are used to get devicetree information into Kconfig. For example, the default value of a Kconfig symbol can be fetched from a devicetree `reg` property.

### Devicetree-related Functions

The functions listed below are used to get devicetree information into Kconfig. See the Python docstrings in `scripts/kconfig/kconfigfunctions.py` for detailed documentation.

The `_int` version of each function returns the value as a decimal integer, while the `_hex` version returns a hexadecimal value starting with `0x`.

```text
$(dt_has_compat,<compatible string>)
$(dt_compat_enabled,<compatible string>)
$(dt_compat_on_bus,<compatible string>,<bus>)
$(dt_chosen_label,<property in /chosen>)
$(dt_chosen_enabled,<property in /chosen>)
$(dt_chosen_path,<property in /chosen>)
$(dt_chosen_has_compat,<property in /chosen>)
$(dt_path_enabled,<node path>)
$(dt_alias_enabled,<node alias>)
$(dt_nodelabel_enabled,<node label>)
$(dt_nodelabel_enabled_with_compat,<node label>,<compatible string>)
$(dt_chosen_reg_addr_int,<property in /chosen>[,[<index>,<unit>]])
$(dt_chosen_reg_addr_hex,<property in /chosen>[,[<index>,<unit>]])
$(dt_chosen_reg_size_int,<property in /chosen>[,[<index>,<unit>]])
$(dt_chosen_reg_size_hex,<property in /chosen>[,[<index>,<unit>]])
$(dt_node_reg_addr_int,<node path>[,[<index>,<unit>]])
$(dt_node_reg_addr_hex,<node path>[,[<index>,<unit>]])
$(dt_node_reg_size_int,<node path>[,[<index>,<unit>]])
$(dt_node_reg_size_hex,<node path>[,[<index>,<unit>]])
$(dt_compat_enabled,<compatible string>)
$(dt_chosen_enabled,<property in /chosen>)
$(dt_nodelabel_bool_prop,<node label>,<prop>)
$(dt_nodelabel_has_prop,<node label>,<prop>)
$(dt_node_has_prop,<node path>,<prop>)
$(dt_nodelabel_has_prop,<node label>,<prop>)
$(dt_node_int_prop_int,<node path>,<prop>[,[<unit>]])
$(dt_node_int_prop_hex,<node path>,<prop>[,[<unit>]])
$(dt_node_str_prop_equals,<node path>,<prop>,<value>)
$(dt_nodelabel_has_compat,<node label>,<compatible string>)
$(dt_node_has_compat,<node path>,<compatible string>)
$(dt_nodelabel_path,<node label>)
$(dt_node_parent,<node path>)
$(shields_list_contains,<shield name>)
```

### Example Usage

Assume that the devicetree for some board looks like this:

```text
{
  soc {
    #address-cells = <1>;
    #size-cells = <1>;
    spi0: spi@10014000 {
```
compatible = "sifive,spi0";
reg = <0x10014000 0x1000 0x20010000 0x3c0900>;
reg-names = "control", "mem";

The second entry in reg in spi@1001400 (<0x20010000 0x3c0900>) corresponds to mem, and has the address 0x20010000. This address can be inserted into Kconfig as follows:

```c
config FLASH_BASE_ADDRESS
    default $(dt_node_reg_addr_hex,/soc/spi@1001400,1)
```

After preprocessor expansion, this turns into the definition below:

```c
config FLASH_BASE_ADDRESS
    default 0x20010000
```

### 5.3.5 Kconfig extensions

Zephyr uses the Kconfiglib implementation of Kconfig, which includes some Kconfig extensions:

- Environment variables in source statements are expanded directly, meaning no “bounce” symbols with option env="ENV_VAR" need to be defined.

Note: option env has been removed from the C tools as of Linux 4.18 as well.

The recommended syntax for referencing environment variables is $(F00) rather than $F00. This uses the new Kconfig preprocessor. The $F00 syntax for expanding environment variables is only supported for backwards compatibility.

- The source statement supports glob patterns and includes each matching file. A pattern is required to match at least one file.

Consider the following example:

```c
source "foo/bar/*/Kconfig"
```

If the pattern foo/bar/*/Kconfig matches the files foo/bar/baz/Kconfig and foo/bar/qaz/Kconfig, the statement above is equivalent to the following two source statements:

```c
source "foo/bar/baz/Kconfig"
source "foo/bar/qaz/Kconfig"
```

If no files match the pattern, an error is generated.

The wildcard patterns accepted are the same as for the Python glob module.

For cases where it's okay for a pattern to match no files (or for a plain filename to not exist), a separate osource (optional source) statement is available. osource is a no-op if no file matches.

Note: source and osource are analogous to include and -include in Make.

- An rsource statement is available for including files specified with a relative path. The path is relative to the directory of the Kconfig file that contains the rsource statement.

As an example, assume that foo/Kconfig is the top-level Kconfig file, and that foo/bar/Kconfig has the following statements:
source "qaz/Kconfig1"
rsresource "qaz/Kconfig2"

This will include the two files foo/qaz/Kconfig1 and foo/bar/qaz/Kconfig2.
rsresource can be used to create Kconfig “subtrees” that can be moved around freely.
rsresource also supports glob patterns.
A drawback of rsresource is that it can make it harder to figure out where a file gets included, so only
use it if you need it.

• An orsource statement is available that combines osource and rsresource.
For example, the following statement will include Kconfig1 and Kconfig2 from the current directory (if they exist):
ORSOURCE "Kconfig[12]"

• def_int, def_hex, and def_string keywords are available, analogous to def_bool. These set the
type and add a default at the same time.

Users interested in optimizing their configuration for security should refer to the Zephyr Security Guide’s
section on the Hardening Tool.

5.4 Zephyr CMake Package

The Zephyr CMake package is a convenient way to create a Zephyr-based application.

**Note:** The Application types section introduces the application types used in this page.

The Zephyr CMake package ensures that CMake can automatically select a Zephyr installation to use for
building the application, whether it is a Zephyr repository application, a Zephyr workspace application, or
a Zephyr freestanding application.

When developing a Zephyr-based application, then a developer simply needs to write
find_package(Zephyr)
in the beginning of the application CMakeLists.txt file.

To use the Zephyr CMake package it must first be exported to the CMake user package registry. This is
means creating a reference to the current Zephyr installation inside the CMake user package registry.

**Ubuntu**
In Linux, the CMake user package registry is found in:

```
~/.cmake/packages/Zephyr
```

**macOS**
In macOS, the CMake user package registry is found in:

```
~/.cmake/packages/Zephyr
```

**Windows**
In Windows, the CMake user package registry is found in:

```
HKEY_CURRENT_USER\Software\Kitware\CMake\Packages\Zephyr
```

The Zephyr CMake package allows CMake to automatically find a Zephyr base. One or more Zephyr
installations must be exported. Exporting multiple Zephyr installations may be useful when developing
or testing Zephyr freestanding applications, Zephyr workspace application with vendor forks, etc..
5.4.1 Zephyr CMake package export (west)

When installing Zephyr using `west` then it is recommended to export Zephyr using `west zephyr-export`.

5.4.2 Zephyr CMake package export (without west)

Zephyr CMake package is exported to the CMake user package registry using the following commands:

```bash
cmake -P <PATH-TO-ZEPHYR>/share/zephyr-package/cmake/zephyr_export.cmake
```

This will export the current Zephyr to the CMake user package registry.

To also export the Zephyr Unitest CMake package, run the following command in addition:

```bash
cmake -P <PATH-TO-ZEPHYR>/share/zephyrunittest-package/cmake/zephyr_export.cmake
```

5.4.3 Zephyr Base Environment Setting

The Zephyr CMake package search functionality allows for explicitly specifying a Zephyr base using an environment variable.

To do this, use the following `find_package()` syntax:

```bash
find_package(Zephyr REQUIRED HINTS $ENV{ZEPHYR_BASE})
```

This syntax instructs CMake to first search for Zephyr using the Zephyr base environment setting `ZEPHYR_BASE` and then use the normal search paths.

5.4.4 Zephyr CMake Package Search Order

When Zephyr base environment setting is not used for searching, the Zephyr installation matching the following criteria will be used:

- A Zephyr repository application will use the Zephyr in which it is located. For example:

  ```
  <projects>/zephyr-workspace/zephyr
    └── samples
        └── hello_world
  ```

  in this example, `hello_world` will use `<projects>/zephyr-workspace/zephyr`.

- Zephyr workspace application will use the Zephyr that share the same workspace. For example:

  ```
  <projects>/zephyr-workspace
    └── zephyr
        └── ...
        └── my_applications
            └── my_first_app
  ```

  in this example, `my_first_app` will use `<projects>/zephyr-workspace/zephyr` as this Zephyr is located in the same workspace as the Zephyr workspace application.

  **Note:** The root of a Zephyr workspace is identical to `west topdir` if the workspace was installed using `west`.

- Zephyr freestanding application will use the Zephyr registered in the CMake user package registry. For example:
in this example, only `<projects>/zephyr-workspace-2/zephyr` is exported to the CMake package registry and therefore this Zephyr will be used by the Zephyr freestanding application `<home>/app`.

If user wants to test the application with `<projects>/zephyr-workspace-1/zephyr`, this can be done by using the Zephyr Base environment setting, meaning set ZEPHYR_BASE=``<projects>/zephyr-workspace-1/zephyr` before running CMake.

**Note:** The Zephyr package selected on the first CMake invocation will be used for all subsequent builds. To change the Zephyr package, for example to test the application using Zephyr base environment setting, then it is necessary to do a pristine build first (See Rebuilding an Application).

### 5.4.5 Zephyr CMake Package Version

When writing an application then it is possible to specify a Zephyr version number x.y.z that must be used in order to build the application.

Specifying a version is especially useful for a Zephyr freestanding application as it ensures the application is built with a minimal Zephyr version.

It also helps CMake to select the correct Zephyr to use for building, when there are multiple Zephyr installations in the system.

For example:

```cmake
find_package(Zephyr 2.2.0)
pject(app)
```

will require app to be built with Zephyr 2.2.0 as minimum. CMake will search all exported candidates to find a Zephyr installation which matches this version criteria.

Thus it is possible to have multiple Zephyr installations and have CMake automatically select between them based on the version number provided, see CMake package version for details.

For example:

```
<projects>/zephyr-workspace-2.a
  zephyr                     (Exported to CMake)
<projects>/zephyr-workspace-2.b
  zephyr                     (Exported to CMake)
<home>/app
  CMakeLists.txt
  prj.conf
  src
  main.c
```

**5.4. Zephyr CMake Package**
in this case, there are two released versions of Zephyr installed at their own workspaces. Workspace 2.a and 2.b, corresponding to the Zephyr version.

To ensure `app` is built with minimum version 2.a the following `find_package` syntax may be used:

```cpp
find_package(Zephyr 2.a)
project(app)
```

Note that both 2.a and 2.b fulfill this requirement.

CMake also supports the keyword `EXACT`, to ensure an exact version is used, if that is required. In this case, the application `CMakeLists.txt` could be written as:

```cpp
find_package(Zephyr 2.a EXACT)
project(app)
```

In case no Zephyr is found which satisfies the version required, as example, the application specifies

```cpp
find_package(Zephyr 2.z)
project(app)
```

then an error similar to below will be printed:

```
Could not find a configuration file for package "Zephyr" that is compatible with requested version "2.z".

The following configuration files were considered but not accepted:

<projects>/zephyr-workspace-2.a/zephyr/share/zephyr-package/cmake/ZephyrConfig.cmake, version: 2.a.0
<projects>/zephyr-workspace-2.b/zephyr/share/zephyr-package/cmake/ZephyrConfig.cmake, version: 2.b.0
```

**Note:** It can also be beneficial to specify a version number for Zephyr repository applications and Zephyr workspace applications. Specifying a version in those cases ensures the application will only build if the Zephyr repository or workspace is matching. This can be useful to avoid accidental builds when only part of a workspace has been updated.

### 5.4.6 Multiple Zephyr Installations (Zephyr workspace)

Testing out a new Zephyr version, while at the same time keeping the existing Zephyr in the workspace untouched is sometimes beneficial.

Or having both an upstream Zephyr, Vendor specific, and a custom Zephyr in same workspace.

For example:

```
<projects>/zephyr-workspace
  └── zephyr
      ├── zephyr-vendor
      ├── zephyr-custom
      └── ...
  └── my_applications
      └── my_first_app
```

in this setup, `find_package(Zephyr)` has the following order of precedence for selecting which Zephyr to use:

- Project name: `zephyr`
First project, when Zephyr projects are ordered lexicographical, in this case.

- zephyr-custom
- zephyr-vendor

This means that my_first_app will use `<projects>/zephyr-workspace/zephyr`.

It is possible to specify a Zephyr preference list in the application.

A Zephyr preference list can be specified as:

```cmake
set(ZEPHYR_PREFER "zephyr-custom" "zephyr-vendor")
find_package(Zephyr)
project(my_first_app)
```

the ZEPHYR_PREFER is a list, allowing for multiple Zephyrs. If a Zephyr is specified in the list, but not found in the system, it is simply ignored and find_package(Zephyr) will continue to the next candidate.

This allows for temporary creation of a new Zephyr release to be tested, without touching current Zephyr. When testing is done, the zephyr-test folder can simply be removed. Such a CMakeLists.txt could look as:

```cmake
set(ZEPHYR_PREFER "zephyr-test")
find_package(Zephyr)
project(my_first_app)
```

### 5.4.7 Zephyr Build Configuration CMake package

The Zephyr Build Configuration CMake package provides a possibility for a Zephyr based project to control Zephyr build settings in a generic way.

It is similar to the per-user .zephyrrc file that can be used to set Environment Variables, but it sets CMake variables instead. It also allows you to automatically share the build configuration among all users through the project repository. It also allows more advanced use cases, such as loading of additional CMake boilerplate code.

The Zephyr Build Configuration CMake package will be loaded in the Zephyr boilerplate code after initial properties and ZEPHYR_BASE has been defined, but before CMake code execution. This allows the Zephyr Build Configuration CMake package to setup or extend properties such as: DTS_ROOT, BOARD_ROOT, TOOLCHAIN_ROOT / other toolchain setup, fixed overlays, and any other property that can be controlled. It also allows inclusion of additional boilerplate code.

To provide a Zephyr Build Configuration CMake package, create ZephyrBuildConfig.cmake and place it in a Zephyr workspace top-level folder as:

```shell
<projects>/zephyr-workspace
  ├── zephyr
  │    └── ...  
  │         └── zephyr application (can be named anything)
  │                └── share/zephyrbuild-package/cmake/ZephyrBuildConfig.cmake
```

The Zephyr Build Configuration CMake package will not search in any CMake default search paths, and thus cannot be installed in the CMake package registry. There will be no version checking on the Zephyr Build Configuration package.

**Note:** share/zephyrbuild-package/cmake/ZephyrBuildConfig.cmake follows the same folder structure as the Zephyr CMake package.
It is possible to place ZephyrBuildConfig.cmake directly in a `<zephyr application>/cmake` folder or another folder, as long as that folder is honoring the CMake package search algorithm.

A sample ZephyrBuildConfig.cmake can be seen below.

```cmake
# ZephyrBuildConfig.cmake sample code
# To ensure final path is absolute and does not contain ../.. in variable.
get_filename_component(APPLICATION_PROJECT_DIR '${CMAKE_CURRENT_LIST_DIR}/../../..' ABSOLUTE)

# Add this project to list of board roots
list(APPEND BOARD_ROOT ${(APPLICATION_PROJECT_DIR})}

# Default to GNU Arm Embedded toolchain if no toolchain is set
if(NOT ENV{ZEPHYR_TOOLCHAIN_VARIANT})
  set(ZEPHYR_TOOLCHAIN_VARIANT gnuarmemb)
  find_program(GNU_ARM_GCC arm-none-eabi-gcc)
  if(NOT ${GNU_ARM_GCC} STREQUAL GNU_ARM_GCC-NOTFOUND)
    # The toolchain root is located above the path to the compiler.
    get_filename_component(GNUARMEMB_TOOLCHAIN_PATH ${GNU_ARM_GCC}/../..ABSOLUTE)
  endif()
endif()
endif()
```

### 5.4.8 Zephyr Build Configuration CMake package (Freestanding application)

The Zephyr Build Configuration CMake package can be located outside a Zephyr workspace, for example located with a Zephyr freestanding application.

Create the build configuration as described in the previous section, and then refer to the location of your Zephyr Build Configuration CMake package using the CMake variable ZephyrBuildConfiguration_ROOT.

1. At the CMake command line, like this:
   ```
   cmake -DZephyrBuildConfiguration_ROOT=<path-to-build-config> ...
   ```

2. At the top of your application's top level `CMakeLists.txt`, like this:
   ```
   set(ZephyrBuildConfiguration_ROOT <path-to-build-config>)
   find_package(Zephyr REQUIRED HINTS $ENV{ZEPHYR_BASE})
   ```
   If you choose this option, make sure to set the variable **before** calling `find_package(Zephyr ...)`, as shown above.

3. In a separate `CMake` script which is pre-loaded to populate the CMake cache, like this:
   ```
   # Put this in a file with a name like "zephyr-settings.cmake"
   set(ZephyrBuildConfiguration_ROOT <path-to-build-config>)
   CACHE STRING "pre-cached build config"
   ```

   You can tell the build system to use this file by adding `-C zephyr-settings.cmake` to your CMake command line. This principle is useful when not using `west` as both this setting and Zephyr modules can be specified using the same file. See Zephyr module **Without West.**
5.4.9 Zephyr CMake package source code

The Zephyr CMake package source code in share/zephyr-package/cmake and share/zephyrunittest-package/cmake contains the CMake config package which is used by the CMake find_package function. It also contains code for exporting Zephyr as a CMake config package.

The following is an overview of the files in these directories:

ZephyrConfigVersion.cmake
The Zephyr package version file. This file is called by CMake to determine if this installation fulfills the requirements specified by user when calling find_package(Zephyr ...). It is also responsible for detection of Zephyr repository or workspace only installations.

ZephyrUnittestConfigVersion.cmake
Same responsibility as ZephyrConfigVersion.cmake, but for unit tests. Includes ZephyrConfigVersion.cmake.

ZephyrConfig.cmake
The Zephyr package file. This file is called by CMake to for the package meeting which fulfills the requirements specified by user when calling find_package(Zephyr ...). This file is responsible for sourcing of boilerplate code.

ZephyrUnittestConfig.cmake
Same responsibility as ZephyrConfig.cmake, but for unit tests. Includes ZephyrConfig.cmake.

zephyr_package_search.cmake
Common file used for detection of Zephyr repository and workspace candidates. Used by ZephyrConfigVersion.cmake and ZephyrConfig.cmake for common code.

zephyr_export.cmake
See Zephyr CMake package export (without west).

5.5 Sysbuild (System build)

Sysbuild is a higher-level build system that can be used to combine multiple other build systems together. It is a higher-level layer that combines one or more Zephyr build systems and optional additional build systems into a hierarchical build system.

For example, you can use sysbuild to build a Zephyr application together with the MCUboot bootloader, flash them both onto your device, and debug the results.

Sysbuild works by configuring and building at least a Zephyr application and, optionally, as many additional projects as you want. The additional projects can be either Zephyr applications or other types of builds you want to run.

Like Zephyr's build system, sysbuild is written in CMake and uses Kconfig.

5.5.1 Definitions

The following are some key concepts used in this document:

Single-image build
When sysbuild is used to create and manage just one Zephyr application's build system.

Multi-image build
When sysbuild is used to manage multiple build systems. The word “image” is used because your main goal is usually to generate the binaries of the firmware application images from each build system.

Domain
Every Zephyr CMake build system managed by sysbuild.
Multi-domain
When more than one Zephyr CMake build system (domain) is managed by sysbuild.

5.5.2 Architectural Overview
This figure is an overview of sysbuild’s inputs, outputs, and user interfaces:

The following are some key sysbuild features indicated in this figure:
- You can run sysbuild either with `west build` or directly via `cmake`.
- You can use sysbuild to generate application images from each build system, shown above as ELF, BIN, and HEX files.
- You can configure sysbuild or any of the build systems it manages using various configuration variables. These variables are namedpaced so that sysbuild can direct them to the right build system. In some cases, such as the `BOARD` variable, these are shared among multiple build systems.
- Sysbuild itself is also configured using Kconfig. For example, you can instruct sysbuild to build the MCUboot bootloader, as well as to build and link your main Zephyr application as an MCUboot child image, using sysbuild’s Kconfig files.
- Sysbuild integrates with west’s Building, Flashing and Debugging commands. It does this by managing the Flash and debug runners, and specifically the `runners.yaml` files that each Zephyr build system will contain. These are packed into a global view of how to flash and debug each build system in a `domains.yaml` file generated and managed by sysbuild.

5.5.3 Building with sysbuild
As mentioned above, you can run sysbuild via `west build` or `cmake`.

`west build`
Here is an example. For details, see *Sysbuild (multi-domain builds)* in the *west build* documentation.

```
west build -b reel_board --sysbuild samples/hello_world
```

**Tip:** To configure *west build* to use --sysbuild by default from now on, run:

```
w west config build.sysbuild True
```

Since sysbuild supports both single- and multi-image builds, this lets you use sysbuild all the time, without worrying about what type of build you are running.

To turn this off, run this before generating your build system:

```
w west config build.sysbuild False
```

To turn this off for just one *west build* command, run:

```
w west build --no-sysbuild ...
```

```
w west build
```

```
w west build -b reel_board --sysbuild samples/hello_world --DSB_CONFIG_BOOTLOADER_MCUBOOT=y -DCONFIG_DEBUG_OPTIMIZATIONS=y -Dmcuboot_DEBUG_OPTIMIZATIONS=y
```

```
w cmake
```

```
w cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world share/sysbuild
```

```
w ninja -Cbuild
```

To use sysbuild directly with CMake, you must specify the sysbuild project as the source folder, and give -DAPP_DIR=<path-to-sample> as an extra CMake argument. APP_DIR is the path to the main Zephyr application managed by sysbuild.

### 5.5.4 Configuration namespaces

When building a single Zephyr application without sysbuild, all CMake cache settings and Kconfig build options given on the command line as -D<var>=<value> or -DCONFIG_<var>=<value> are handled by the Zephyr build system.

However, when sysbuild combines multiple Zephyr build systems, there could be Kconfig settings exclusive to sysbuild (and not used by any of the applications). To handle this, sysbuild has namespaces for configuration variables. You can use these namespaces to direct settings either to sysbuild itself or to a specific Zephyr application managed by sysbuild using the information in these sections.

The following example shows how to build hello_world with MCUboot enabled, applying to both images debug optimizations:

```
w west build
```

```
w west build -b reel_board --sysbuild samples/hello_world --DSB_CONFIG_BOOTLOADER_MCUBOOT=y -DCONFIG_DEBUG_OPTIMIZATIONS=y -Dmcuboot_DEBUG_OPTIMIZATIONS=y
```

```
w cmake
```

```
w cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONFIG_BOOTLOADER_MCUBOOT=y -DCONFIG_DEBUG_OPTIMIZATIONS=y -Dmcuboot_DEBUG_OPTIMIZATIONS=y -Dshare/sysbuild
```

```
w ninja -Cbuild
```

See the following subsections for more information.
CMake variable namespacing

CMake variable settings can be passed to CMake using \(-D<var>=<value>\) on the command line. You can also set Kconfig options via CMake as \(-DCONFIG_\_<var>=<value>\) or \(-D<namespace>_CONFIG_\_<var>=<value>\).

Since sysbuild is the entry point for the build system, and sysbuild is written in CMake, all CMake variables are first processed by sysbuild.

Sysbuild creates a namespace for each domain. The namespace prefix is the domain's application name. See Adding Zephyr applications to sysbuild for more information.

To set the variable <var> in the namespace <namespace>, use this syntax:
\[-D<namespace>_<var>=<value>\]

For example, to set the CMake variable FOO in the my_sample application build system to the value BAR, run the following commands:

```
west build
west build --sysbuild ... -- -Dmy_sample_FOO=BAR
```

cmake

cmake -Dmy_sample_FOO=BAR ...

Kconfig namespacing

To set the sysbuild Kconfig option <var> to the value <value>, use this syntax:
\[-DSB_CONFIG_\_<var>=<value>\]

In the previous example, SB_CONFIG is the namespace prefix for sysbuild's Kconfig options. To set a Zephyr application's Kconfig option instead, use this syntax:
\[-D<namespace>_CONFIG_\_<var>=<value>\]

In the previous example, <namespace> is the application name discussed above in CMake variable namespacing.

For example, to set the Kconfig option FOO in the my_sample application build system to the value BAR, run the following commands:

```
west build
west build --sysbuild ... -- -Dmy_sample_CONFIG_FOO=BAR
```

cmake

cmake -Dmy_sample_CONFIG_FOO=BAR ...

Tip: When no <namespace> is used, the Kconfig setting is passed to the main Zephyr application my_sample.

This means that passing \(-DCONFIG_\_<var>=<value>\) and \(-Dmy_sample_CONFIG_\_<var>=<value>\) are equivalent.

This allows you to build the same application with or without sysbuild using the same syntax for setting Kconfig values at CMake time. For example, the following commands will work in the same way:
5.5.5 Sysbuild flashing using `west flash`

You can use `west flash` to flash applications with sysbuild. When invoking `west flash` on a build consisting of multiple images, each image is flashed in sequence. Extra arguments such as `--runner jlink` are passed to each invocation. For more details, see `Multi-domain flashing`.

5.5.6 Sysbuild debugging using `west debug`

You can use `west debug` to debug the main application, whether you are using sysbuild or not. Just follow the existing `west debug` guide to debug the main sample.

To debug a different domain (Zephyr application), such as mcuboot, use the `--domain` argument, as follows:

```
wester debug --domain mcuboot
```

For more details, see `Multi-domain debugging`.

5.5.7 Building a sample with MCUboot

Sysbuild supports MCUboot natively.

To build a sample like `hello_world` with MCUboot, enable MCUboot and build and flash the sample as follows:

```
wester build
```

```
wester build -b reel_board --sysbuild samples/hello_world -- -DSB_CONFIG_BOOTLOADER_MCUBOOT=y
```

```
cmake
```

```
cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONFIG_BOOTLOADER_MCUBOOT=y share/sysbuild
```

```
ninja -Cbuild
```

This builds `hello_world` and `mcuboot` for the `reel_board`, and then flashes both the `mcuboot` and `hello_world` application images to the board.

More detailed information regarding the use of MCUboot with Zephyr can be found in the [MCUboot with Zephyr documentation page](https://mcuboot.com/documentation) on the MCUboot website.

**Note:** MCUBoot default configuration will perform a full chip erase when flashed. This can be controlled through the MCUBoot Kconfig option `CONFIG_ZEPHYR_TRY_MASS_ERASE`. If this option is enabled, then flashing only MCUBoot, for example using `west flash --domain mcuboot`, may erase the entire flash, including the main application image.
5.5.8 Sysbuild Kconfig file

You can set sysbuild's Kconfig options for a single application using configuration files. By default, sysbuild looks for a configuration file named `sysbuild.conf` in the application top-level directory.

In the following example, there is a `sysbuild.conf` file that enables building and flashing with MCUboot whenever sysbuild is used:

```bash
<html>/application
  ├── CMakeLists.txt
  │    └── prj.conf
  └── sysbuild.conf
```

```
SB_CONFIG_BOOTLOADER_MCUBOOT=y
```

You can set a configuration file to use with the `-DSB_CONF_FILE=<sysbuild-conf-file>` CMake build setting.

For example, you can create `sysbuild-mcuboot.conf` and then specify this file when building with sysbuild, as follows:

```bash
west build
```

```bash
west build -b reel_board --sysbuild samples/hello_world -- -DSB_CONF_FILE=sysbuild-
  mcuboot.conf
```

```bash
cmake
```

```bash
cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONF_-
  FILE=sysbuild-mcuboot.conf share/sysbuild
```

```
ninja -Cbuild
```

5.5.9 Adding Zephyr applications to sysbuild

You can use the `ExternalZephyrProject_Add()` function to add Zephyr applications as sysbuild domains. Call this CMake function from your application's `sysbuild.cmake` file, or any other CMake file you know will run as part sysbuild CMake invocation.

Targeting the same board

To include `my_sample` as another sysbuild domain, targeting the same board as the main image, use this example:

```c
ExternalZephyrProject_Add(
    APPLICATION my_sample
    SOURCE_DIR <path-to>/my_sample
)
```

This could be useful, for example, if your board requires you to build and flash an SoC-specific bootloader along with your main application.

Targeting a different board

In sysbuild and Zephyr CMake build system a board may refer to:

- A physical board with a single core SoC.
- A specific core on a physical board with a multi-core SoC, such as nrf5340dk_nrf5340.
A specific SoC on a physical board with multiple SoCs, such as nrf9160dk_nrf9160 and nrf9160dk_nrf52840.

If your main application, for example, is built for mps2_an521, and your helper application must target the mps2_an521_remote board (cpu1), add a CMake function call that is structured as follows:

```cmake
ExternalZephyrProject_Add(
  APPLICATION my_sample
  SOURCE_DIR <path-to>/my_sample
  BOARD mps2_an521_remote
)
```

This could be useful, for example, if your main application requires another helper Zephyr application to be built and flashed alongside it, but the helper runs on another core in your SoC.

**Targeting conditionally using Kconfig**

You can control whether extra applications are included as sysbuild domains using Kconfig.

If the extra application image is specific to the board or an application, you can create two additional files: `sysbuild.cmake` and `Kconfig.sysbuild`.

For an application, this would look like this:

```plaintext
<home>/application
 ├── CMakeLists.txt
 ├── prj.conf
 ├── Kconfig.sysbuild
 └── sysbuild.cmake
```

In the previous example, `sysbuild.cmake` would be structured as follows:

```cmake
if(SB_CONFIG_SECOND_SAMPLE)
  ExternalZephyrProject_Add(
    APPLICATION second_sample
    SOURCE_DIR <path-to>/second_sample
  )
endif()
```

`Kconfig.sysbuild` would be structured as follows:

```cmake
source "sysbuild/Kconfig"
config SECOND_SAMPLE
  bool "Second sample"
  default y
```

This will include `second_sample` by default, while still allowing you to disable it using the Kconfig option `SECOND_SAMPLE`.

For more information on setting sysbuild Kconfig options, see [Kconfig namespace](#).

**Zephyr application configuration**

When adding a Zephyr application to sysbuild, such as MCUboot, then the configuration files from the application (MCUboot) itself will be used.

When integrating multiple applications with each other, then it is often necessary to make adjustments to the configuration of extra images.
Sysbuild gives users the ability of creating Kconfig fragments or devicetree overlays that will be used together with the application's default configuration. Sysbuild also allows users to change Application Configuration Directory in order to give users full control of an image's configuration.

**Zephyr application Kconfig fragment and devicetree overlay**  In the folder of the main application, create a Kconfig fragment or a devicetree overlay under a sysbuild folder, where the name of the file is `<image>.conf` or `<image>.overlay`, for example if your main application includes `my_sample` then create a `sysbuild/my_sample.conf` file or a devicetree overlay `sysbuild/my_sample.overlay`.

A Kconfig fragment could look as:

```
# sysbuild/my_sample.conf
CONFIG_FOO=n
```

**Zephyr application configuration directory** In the folder of the main application, create a new folder under `sysbuild/<image>/`. This folder will then be used as `APPLICATION_CONFIG_DIR` when building `<image>`. As an example, if your main application includes `my_sample` then create a `sysbuild/my_sample/` folder and place any configuration files in there as you would normally do:

```
<home>/application
 └── CMakeLists.txt
     └── prj.conf
         └── sysbuild
             └── my_sample
                 └── prj.conf
                     └── app.overlay
                         └── boards
                             └── <board_A>.conf
                             └── <board_A>.overlay
                             └── <board_B>.conf
                             └── <board_B>.overlay
```

All configuration files under the `sysbuild/my_sample/` folder will now be used when `my_sample` is included in the build, and the default configuration files for `my_sample` will be ignored.

This give you full control on how images are configured when integrating those with application.

### 5.5.10 Adding non-Zephyr applications to sysbuild

You can include non-Zephyr applications in a multi-image build using the standard CMake module ExternalProject. Please refer to the CMake documentation for usage details.

When using ExternalProject, the non-Zephyr application will be built as part of the sysbuild build invocation, but `west flash` or `west debug` will not be aware of the application. Instead, you must manually flash and debug the application.
Chapter 6

Connectivity

6.1 Bluetooth

This section contains information regarding the Bluetooth stack of the Zephyr OS. You can use this information to understand the principles behind the operation of the layers and how they were implemented. Zephyr includes a complete Bluetooth Low Energy stack from application to radio hardware, as well as portions of a Classical Bluetooth (BR/EDR) Host layer.

6.1.1 Overview

- **Supported Features**

Since its inception, Zephyr has had a strong focus on Bluetooth and, in particular, on Bluetooth Low Energy (BLE). Through the contributions of several companies and individuals involved in existing open source implementations of the Bluetooth specification (Linux's BlueZ) as well as the design and development of BLE radio hardware, the protocol stack in Zephyr has grown to be mature and feature-rich, as can be seen in the section below.

**Supported Features**

Zephyr comes integrated with a feature-rich and highly configurable Bluetooth stack.

- Bluetooth 5.0 compliant (ESR10)
  - Highly configurable
    - Features, buffer sizes/counts, stack sizes, etc.
  - Portable to all architectures supported by Zephyr (including big and little endian, alignment flavors and more)
  - Support for all combinations of Host and Controller builds:
    - Controller-only (HCI) over UART, SPI, and USB physical transports
    - Host-only over UART, SPI, and IPM (shared memory)
    - Combined (Host + Controller)
- Bluetooth-SIG qualified
  - Controller on Nordic Semiconductor hardware
Conformance tests run regularly on all layers

- Bluetooth Low Energy Controller support (LE Link Layer)
  - Unlimited role and connection count, all roles supported
  - Concurrent multi-protocol support ready
  - Intelligent scheduling of roles to minimize overlap
  - Portable design to any open BLE radio, currently supports Nordic Semiconductor nRF51 and nRF52, as well as proprietary radios
  - Supports little and big endian architectures, and abstracts the hard real-time specifics so that they can be encapsulated in a hardware-specific module
  - Support for Controller (HCI) builds over different physical transports

- Bluetooth Host support
  - Generic Access Profile (GAP) with all possible LE roles
    * Peripheral & Central
    * Observer & Broadcaster
  - GATT (Generic Attribute Profile)
    * Server (to be a sensor)
    * Client (to connect to sensors)
  - Pairing support, including the Secure Connections feature from Bluetooth 4.2
  - Non-volatile storage support for permanent storage of Bluetooth-specific settings and data
  - Bluetooth mesh support
    * Relay, Friend Node, Low-Power Node (LPN) and GATT Proxy features
    * Both Provisioning bearers supported (PB-ADV & PB-GATT)
    * Highly configurable, fits as small as 16k RAM devices
  - IPSP/6LoWPAN for IPv6 connectivity over Bluetooth LE
    * IPSP node sample application
  - Basic Bluetooth BR/EDR (Classic) support
    * Generic Access Profile (GAP)
    * Logical Link Control and Adaptation Protocol (L2CAP)
    * Serial Port emulation (RFCOMM protocol)
    * Service Discovery Protocol (SDP)
  - Clean HCI driver abstraction
    * 3-Wire (H:5) & 5-Wire (H:4) UART
    * SPI
    * Local controller support as a virtual HCI driver
  - Verified with multiple popular controllers
6.1.2 Bluetooth Stack Architecture

Overview

This page describes the software architecture of Zephyr's Bluetooth protocol stack.

Note: Zephyr supports mainly Bluetooth Low Energy (BLE), the low-power version of the Bluetooth specification. Zephyr also has limited support for portions of the BR/EDR Host. Throughout this architecture document we use BLE interchangeably for Bluetooth except when noted.

BLE Layers

There are 3 main layers that together constitute a full Bluetooth Low Energy protocol stack:

- **Host**: This layer sits right below the application, and is comprised of multiple (non real-time) network and transport protocols enabling applications to communicate with peer devices in a standard and interoperable way.

- **Controller**: The Controller implements the Link Layer (LE LL), the low-level, real-time protocol which provides, in conjunction with the Radio Hardware, standard-interoperable over-the-air communication. The LL schedules packet reception and transmission, guarantees the delivery of data, and handles all the LL control procedures.

- **Radio Hardware**: Hardware implements the required analog and digital baseband functional blocks that permit the Link Layer firmware to send and receive in the 2.4GHz band of the spectrum.

Host Controller Interface

The Bluetooth Specification describes the format in which a Host must communicate with a Controller. This is called the Host Controller Interface (HCI) protocol. HCI can be implemented over a range of different physical transports like UART, SPI, or USB. This protocol defines the commands that a Host can send to a Controller and the events that it can expect in return, and also the format for user and protocol data that needs to go over the air. The HCI ensures that different Host and Controller implementations can communicate in a standard way making it possible to combine Hosts and Controllers from different vendors.

Configurations

The three separate layers of the protocol and the standardized interface make it possible to implement the Host and Controller on different platforms. The two following configurations are commonly used:

- **Single-chip configuration**: In this configuration, a single microcontroller implements all three layers and the application itself. This can also be called a system-on-chip (SoC) implementation. In this case the BLE Host and the BLE Controller communicate directly through function calls and queues in RAM. The Bluetooth specification does not specify how HCI is implemented in this single-chip configuration and so how HCI commands, events, and data flows between the two can be implementation-specific. This configuration is well suited for those applications and designs that require a small footprint and the lowest possible power consumption, since everything runs on a single IC.

- **Dual-chip configuration**: This configuration uses two separate ICs, one running the Application and the Host, and a second one with the Controller and the Radio Hardware. This is sometimes also called a connectivity-chip configuration. This configuration allows for a wider variety of combinations of Hosts when using the Zephyr OS as a Controller. Since HCI ensures interoperability among Host and Controller implementations, including of course Zephyr's very own BLE Host and Controller, users of the Zephyr Controller can choose to use whatever Host running on any platform they prefer. For example, the host can be the Linux BLE Host stack (BlueZ) running on any processor capable of supporting Linux. The Host processor may of course also run Zephyr and the Zephyr OS BLE Host. Conversely, combining an IC running the Zephyr Host with an external Controller that does not run Zephyr is also supported.
**Build Types** The Zephyr software stack as an RTOS is highly configurable, and in particular, the BLE subsystem can be configured in multiple ways during the build process to include only the features and layers that are required to reduce RAM and ROM footprint as well as power consumption. Here's a short list of the different BLE-enabled builds that can be produced from the Zephyr project codebase:

- **Controller-only build**: When built as a BLE Controller, Zephyr includes the Link Layer and a special application. This application is different depending on the physical transport chosen for HCI:
  - hci_uart
  - hci_usb
  - hci_spi
  This application acts as a bridge between the UART, SPI or USB peripherals and the Controller subsystem, listening for HCI commands, sending application data and responding with events and received data. A build of this type sets the following Kconfig option values:
    - CONFIG_BT =y
    - CONFIG_BT_HCI =y
    - CONFIG_BT_HCI_RAW =y
    - CONFIG_BT_CTLR =y
    - CONFIG_BT_LL_SW_SPLIT =y (if using the open source Link Layer)

- **Host-only build**: A Zephyr OS Host build will contain the Application and the BLE Host, along with an HCI driver (UART or SPI) to interface with an external Controller chip. A build of this type sets the following Kconfig option values:
  - CONFIG_BT =y
  - CONFIG_BT_HCI =y
  - CONFIG_BT_CTLR =n

All of the samples located in samples/bluetooth except for the ones used for Controller-only builds can be built as Host-only

- **Combined build**: This includes the Application, the Host and the Controller, and it is used exclusively for single-chip (SoC) configurations. A build of this type sets the following Kconfig option values:
  - CONFIG_BT =y
  - CONFIG_BT_HCI =y
  - CONFIG_BT_CTLR =y
  - CONFIG_BT_LL_SW_SPLIT =y (if using the open source Link Layer)

All of the samples located in samples/bluetooth except for the ones used for Controller-only builds can be built as Combined

The picture below shows the SoC or single-chip configuration when using a Zephyr combined build (a build that includes both a BLE Host and a Controller in the same firmware image that is programmed onto the chip):

When using connectivity or dual-chip configurations, several Host and Controller combinations are possible, some of which are depicted below:

When using a Zephyr Host (left side of image), two instances of Zephyr OS must be built with different configurations, yielding two separate images that must be programmed into each of the chips respectively. The Host build image contains the application, the BLE Host and the selected HCI driver (UART or SPI), while the Controller build runs either the hci_uart, or the hci_spi app to provide an interface to the BLE Controller.
6.1. Bluetooth

Fig. 6.1: A Combined build on a Single-Chip configuration

Fig. 6.2: Host-only and Controller-only builds on dual-chip configurations
This configuration is not limited to using a Zephyr OS Host, as the right side of the image shows. One can indeed take one of the many existing GNU/Linux distributions, most of which include Linux's own BLE Host (BlueZ), to connect it via UART or USB to one or more instances of the Zephyr OS Controller build. BlueZ as a Host supports multiple Controllers simultaneously for applications that require more than one BLE radio operating at the same time but sharing the same Host stack.

**Source tree layout**

The stack is split up as follows in the source tree:

- **subsys/bluetooth/host**
  The host stack. This is where the HCI command and event handling as well as connection tracking happens. The implementation of the core protocols such as L2CAP, ATT, and SMP is also here.

- **subsys/bluetooth/controller**
  Bluetooth Controller implementation. Implements the controller-side of HCI, the Link Layer as well as access to the radio transceiver.

- **include/bluetooth/**
  Public API header files. These are the header files applications need to include in order to use Bluetooth functionality.

- **drivers/bluetooth/**
  HCI transport drivers. Every HCI transport needs its own driver. For example, the two common types of UART transport protocols (3-Wire and 5-Wire) have their own drivers.

- **samples/bluetooth/**
  Sample Bluetooth code. This is a good reference to get started with Bluetooth application development.

- **tests/bluetooth/**
  Test applications. These applications are used to verify the functionality of the Bluetooth stack, but are not necessary the best source for sample code (see samples/bluetooth instead).

- **doc/guides/bluetooth/**
  Extra documentation, such as PICS documents.

**Host**

The Bluetooth Host implements all the higher-level protocols and profiles, and most importantly, provides a high-level API for applications. The following diagram depicts the main protocol & profile layers of the host.

![Bluetooth Host protocol & profile layers](image)

Fig. 6.3: Bluetooth Host protocol & profile layers.
Lowest down in the host stack sits a so-called HCI driver, which is responsible for abstracting away the details of the HCI transport. It provides a basic API for delivering data from the controller to the host, and vice-versa.

Perhaps the most important block above the HCI handling is the Generic Access Profile (GAP). GAP simplifies Bluetooth LE access by defining four distinct roles of BLE usage:

- **Connection-oriented roles**
  - Peripheral (e.g. a smart sensor, often with a limited user interface)
  - Central (typically a mobile phone or a PC)

- **Connection-less roles**
  - Broadcaster (sending out BLE advertisements, e.g. a smart beacon)
  - Observer (scanning for BLE advertisements)

Each role comes with its own build-time configuration option: `CONFIG_BT_PERIPHERAL`, `CONFIG_BT_CENTRAL`, `CONFIG_BT_BROADCASTER` & `CONFIG_BT_OBSERVER`. Of the connection-oriented roles central implicitly enables observer role, and peripheral implicitly enables broadcaster role. Usually the first step when creating an application is to decide which roles are needed and go from there. Bluetooth mesh is a slightly special case, requiring at least the observer and broadcaster roles, and possibly also the Peripheral role. This will be described in more detail in a later section.

**Peripheral role** Most Zephyr-based BLE devices will most likely be peripheral-role devices. This means that they perform connectable advertising and expose one or more GATT services. After registering services using the `bt_gatt_service_register()` API the application will typically start connectable advertising using the `bt_le_adv_start()` API.

There are several peripheral sample applications available in the tree, such as samples/bluetooth/peripheral_hr.

**Central role** Central role may not be as common for Zephyr-based devices as peripheral role, but it is still a plausible one and equally well supported in Zephyr. Rather than accepting connections from other devices a central role device will scan for available peripheral device and choose one to connect to. Once connected, a central will typically act as a GATT client, first performing discovery of available services and then accessing one or more supported services.

To initially discover a device to connect to the application will likely use the `bt_le_scan_start()` API, wait for an appropriate device to be found (using the scan callback), stop scanning using `bt_le_scan_stop()` and then connect to the device using `bt_conn_create_le()`. If the central wants to keep automatically reconnecting to the peripheral it should use the `bt_le_set_auto_conn()` API.

There are some sample applications for the central role available in the tree, such as samples/bluetooth/central_hr.

**Observer role** An observer role device will use the `bt_le_scan_start()` API to scan for device, but it will not connect to any of them. Instead it will simply utilize the advertising data of found devices, combining it optionally with the received signal strength (RSSI).

**Broadcaster role** A broadcaster role device will use the `bt_le_adv_start()` API to advertise specific advertising data, but the type of advertising will be non-connectable, i.e. other device will not be able to connect to it.

**Connections** Connection handling and the related APIs can be found in the *Connection Management* section.
Security  To achieve a secure relationship between two Bluetooth devices a process called pairing is used. This process can either be triggered implicitly through the security properties of GATT services, or explicitly using the `bt_conn_security()` API on a connection object.

To achieve a higher security level, and protect against Man-In-The-Middle (MITM) attacks, it is recommended to use some out-of-band channel during the pairing. If the devices have a sufficient user interface this “channel” is the user itself. The capabilities of the device are registered using the `bt_conn_auth_cb_register()` API. The `bt_conn_auth_cb` struct that’s passed to this API has a set of optional callbacks that can be used during the pairing - if the device lacks some feature the corresponding callback may be set to NULL. For example, if the device does not have an input method but does have a display, the `passkey_entry` and `passkey_confirm` callbacks would be set to NULL, but the `passkey_display` would be set to a callback capable of displaying a passkey to the user.

Depending on the local and remote security requirements & capabilities, there are four possible security levels that can be reached:

- **BT_SECURITY_L1**
  - No encryption and no authentication.

- **BT_SECURITY_L2**
  - Encryption but no authentication (no MITM protection).

- **BT_SECURITY_L3**
  - Encryption and authentication using the legacy pairing method from Bluetooth 4.0 and 4.1.

- **BT_SECURITY_L4**
  - Encryption and authentication using the LE Secure Connections feature available since Bluetooth 4.2.

**Note:** Mesh has its own security solution through a process called provisioning. It follows a similar procedure as pairing, but is done using separate mesh-specific APIs.

**L2CAP**  L2CAP stands for the Logical Link Control and Adaptation Protocol. It is a common layer for all communication over Bluetooth connections, however an application comes in direct contact with it only when using it in the so-called Connection-oriented Channels (CoC) mode. More information on this can be found in the L2CAP API section.

**GATT**  The Generic Attribute Profile is the most common means of communication over LE connections. A more detailed description of this layer and the API reference can be found in the GATT API reference section.

**Mesh**  Mesh is a little bit special when it comes to the needed GAP roles. By default, mesh requires both observer and broadcaster role to be enabled. If the optional GATT Proxy feature is desired, then peripheral role should also be enabled.

The API reference for mesh can be found in the Mesh API reference section.

**LE Audio**  The LE audio is a set of profiles and services that utilizes GATT and Isochronous Channel to provide audio over Bluetooth Low Energy. The architecture and API references can be found in Bluetooth Audio Architecture.

**Persistent storage**  The Bluetooth host stack uses the settings subsystem to implement persistent storage to flash. This requires the presence of a flash driver and a designated “storage” partition on flash. A typical set of configuration options needed will look something like the following:
Once enabled, it is the responsibility of the application to call settings_load() after having initialized Bluetooth (using the bt_enable() API).

**Bluetooth Low Energy Controller**

**Hardware Requirements**

**Nordic Semiconductor**  The Nordic Semiconductor Bluetooth Low Energy Controller implementation requires the following hardware peripherals.

1. **Clock**
   - A Low Frequency Clock (LFCLOCK) or sleep clock, for low power consumption between Bluetooth radio events
   - A High Frequency Clock (HFCLOCK) or active clock, for high precision packet timing and software based transceiver state switching with inter-frame space (tIFS) timing inside Bluetooth radio events

2. **Real Time Counter (RTC)**
   - 1 instance
   - 2 capture/compare registers

3. **Timer**
   - 2 instances, one each for packet timing and tIFS software switching, respectively
   - 7 capture/compare registers (3 mandatory, 1 optional for ISR profiling, 4 for single timer tIFS switching) on first instance
   - 4 capture/compare registers for second instance, if single tIFS timer is not used.

4. **Programmable Peripheral Interconnect (PPI)**
   - 21 channels (20 channels when not using pre-defined channels)
   - 2 channel groups for software-based tIFS switching

5. **Distributed Programmable Peripheral Interconnect (DPPI)**
   - 20 channels
   - 2 channel groups for s/w tIFS switching

6. **Software Interrupt (SWI)**
   - 3 instances, for Lower Link Layer, Upper Link Layer High priority, and Upper Link Layer Low priority execution

7. **Radio**
   - 2.4 GHz radio transceiver with multiple radio standards such as 1 Mbps, 2 Mbps and Long Range Bluetooth Low Energy technology

8. **Random Number Generator (RNG)**
   - 1 instance
9. AES electronic codebook mode encryption (ECB)
   • 1 instance
10. Cipher Block Chaining - Message Authentication Code with Counter Mode encryption (CCM)
    • 1 instance
11. Accelerated address resolver (AAR)
    • 1 instance
12. GPIO
    • 2 GPIO pins for PA and LNA, 1 each.
    • 10 Debug GPIO pins (optional)
13. GPIO tasks and events (GPIOTE)
    • 1 instance
    • 1 channel for PA/LNA
14. Temperature sensor (TEMP)
    • For RC calibration
15. Interprocess Communication peripheral (IPC)
    • For HCI interface
16. UART
    • For HCI interface

Split

6.1.3 Bluetooth Audio Architecture

![Bluetooth Audio Architecture Diagram]

Fig. 6.4: Bluetooth Audio Architecture
Generic Audio Framework (GAF)

The Generic Audio Framework (GAF) is considered the middleware of the Bluetooth LE Audio architecture. The GAF contains the profiles and services that allows higher layer applications and profiles to set up streams, change volume, control media and telephony and more. The GAF builds on GATT, GAP and isochronous channels (ISO).

GAF uses GAP to connect, advertise and synchronize to other devices. GAF uses GATT to configure streams, associate streams with content (e.g. media or telephony), control volume and more. GAF uses ISO for the audio streams themselves, both as unicast (connected) audio streams or broadcast (unconnected) audio streams.

GAF mandates the use of the LC3 codec, but also supports other codecs.

![Fig. 6.5: Generic Audio Framework](image)

The top-level profiles TMAP and HAP are not part of the GAF, but rather provide top-level requirements for how to use the GAF.

GAF has been implemented in Zephyr with the following structure.

![Fig. 6.6: Zephyr Generic Audio Framework](image)

Currently CAP (and CAS) as well as CCP (and TBS) are not yet implemented in Zephyr. Similarly the top-level profiles TMAP and HAP are also not yet implemented.

6.1. Bluetooth
Using the Bluetooth Audio Stack  To use any of the profiles in the Bluetooth Audio Stack, including the top-level profiles outside of GAF, CONFIG_BT_AUDIO shall be enabled. This Kconfig option allows the enabling of the individual profiles inside of the Bluetooth Audio Stack. Each profile can generally be enabled on its own, but enabling higher-layer profiles (such as CAP, TMAP and HAP) will typically require enabling some of the lower layer profiles.

It is, however, possible to create a device that uses e.g. only Stream Control (with just the BAP), without using any of the content control or rendering/capture control profiles, or vice versa. Using the higher layer profiles will however typically provide a better user experience and better interoperability with other devices.

Stream Control (BAP)  Stream control is implemented by the Basic Audio Profile. This profile defines multiple roles:

- Unicast Client
- Unicast Server
- Broadcast Source
- Broadcast Sink
- Scan Delegator (not yet implemented)
- Broadcast assistant (not yet implemented)

Each role can be enabled individually, and it is possible to support more than one role.

The API reference for stream control can be found in Bluetooth Audio.

Rendering and Capture Control  Rendering and capture control is implemented by the Volume Control Profile (VCP) and Microphone Input Control Profile (MICP).

The VCP implementation supports the following roles

- Volume Control Service (VCS) Server
- Volume Control Service (VCS) Client

The MICP implementation supports the following roles

- Microphone Input Control Profile (MICP) Microphone Device (server)
- Microphone Input Control Profile (MICP) Microphone Controller (client)

The API reference for volume control can be found in Bluetooth Volume Control.

The API reference for microphone input control can be found in Bluetooth Microphone Input Control.

Content Control  Content control is implemented by the Call Control Profile (CCP) and Media Control Profile (MCP).

The CCP implementation is not yet implemented in Zephyr.

The MCP implementation supports the following roles

- Media Control Service (MCS) Server via the Media Proxy module
- Media Control Client (MCC)

The API reference for media control can be found in Bluetooth Media Control.
Coordinated Sets  Coordinated Sets is implemented by the Coordinated Sets Identification Profile (CSIP).

The CSIP implementation supports the following roles

- Coordinated Set Identification Service (CSIP) Set Member
- Coordinated Set Identification Service (CSIP) Set Coordinator

The API reference for media control can be found in Bluetooth Coordinated Sets.

6.1.4 Bluetooth Qualification

Qualification Listings

The Zephyr BLE stack has obtained qualification listings for both the Host and the Controller. See the tables below for a list of qualification listings

### Host qualifications

<table>
<thead>
<tr>
<th>Zephyr version</th>
<th>Link</th>
<th>Qualifying Company</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.2.x</td>
<td>QDID 151074</td>
<td>Demant A/S</td>
</tr>
<tr>
<td>1.14.x</td>
<td>QDID 139258</td>
<td>The Linux Foundation</td>
</tr>
<tr>
<td>1.13</td>
<td>QDID 119517</td>
<td>Nordic Semiconductor</td>
</tr>
</tbody>
</table>

### Mesh qualifications

<table>
<thead>
<tr>
<th>Zephyr version</th>
<th>Link</th>
<th>Qualifying Company</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.14.x</td>
<td>QDID 139259</td>
<td>The Linux Foundation</td>
</tr>
</tbody>
</table>

### Controller qualifications

<table>
<thead>
<tr>
<th>Zephyr version</th>
<th>Link</th>
<th>Qualifying Company</th>
<th>Compatible Hardware</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.2.x</td>
<td>QDID 150092</td>
<td>Nordic Semiconductor</td>
<td>nRF52x</td>
</tr>
<tr>
<td>1.14.x</td>
<td>QDID 135679</td>
<td>Nordic Semiconductor</td>
<td>nRF52x</td>
</tr>
<tr>
<td>1.9 to 1.13</td>
<td>QDID 101395</td>
<td>Nordic Semiconductor</td>
<td>nRF52x</td>
</tr>
</tbody>
</table>

ICS Features

The ICS features for each supported protocol & profile can be found in the following documents:

GAP ICS  PTS version: 8.0.3

M - mandatory
O - optional

### Device Configuration

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Selected</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TSPC_GAP_0_1</td>
<td>False</td>
<td>BR/EDR (C.1)</td>
</tr>
<tr>
<td>TSPC_GAP_0_2</td>

6.1.5 Bluetooth tools

This page lists and describes tools that can be used to assist during Bluetooth stack or application development in order to help, simplify and speed up the development process.

**Mobile applications**

It is often useful to make use of existing mobile applications to interact with hardware running Zephyr, to test functionality without having to write any additional code or requiring extra hardware.

The recommended mobile applications for interacting with Zephyr are:

- **Android:**
  - nRF Connect for Android
  - nRF Mesh for Android
  - LightBlue for Android

- **iOS:**
  - nRF Connect for iOS
  - nRF Mesh for iOS
  - LightBlue for iOS
Using BlueZ with Zephyr

The Linux Bluetooth Protocol Stack, BlueZ, comes with a very useful set of tools that can be used to debug and interact with Zephyr's BLE Host and Controller. In order to benefit from these tools you will need to make sure that you are running a recent version of the Linux Kernel and BlueZ:

- Linux Kernel 4.10+
- BlueZ 4.45+

Additionally, some of the BlueZ tools might not be bundled by default by your Linux distribution. If you need to build BlueZ from scratch to update to a recent version or to obtain all of its tools you can follow the steps below:

```
git clone git://git.kernel.org/pub/scm/bluetooth/bluez.git
cd bluez
./bootstrap-configure --disable-android --disable-midi
make
```

You can then find `btattach`, `btmgmt` and `btproxy` in the `tools/` folder and `btmon` in the `monitor/` folder.

You'll need to enable BlueZ's experimental features so you can access its most recent BLE functionality. Do this by editing the file `/lib/systemd/system/bluetooth.service` and making sure to include the `-E` option in the daemon's execution start line:

```
ExecStart=/usr/libexec/bluetooth/bluetoothd -E
```

Finally, reload and restart the daemon:

```
sudo systemctl daemon-reload
sudo systemctl restart bluetooth
```

Running on QEMU and Native POSIX

It's possible to run Bluetooth applications using either the QEMU emulator or Native POSIX. In either case, a Bluetooth controller needs to be exported from the host OS (Linux) to the emulator. For this purpose you will need some tools described in the Using BlueZ with Zephyr section.

Using the Host System Bluetooth Controller  The host OS's Bluetooth controller is connected in the following manner:

- To the second QEMU serial line using a UNIX socket. This socket gets used with the help of the QEMU option `-serial unix:/tmp/blt-server-bredr`. This option gets passed to QEMU through QEMU_EXTRA_FLAGS automatically whenever an application has enabled Bluetooth support.

- To a serial port in Native POSIX through the use of a command-line option passed to the Native POSIX executable: `--bt-dev=hci0`

On the host side, BlueZ allows you to export its Bluetooth controller through a so-called user channel for QEMU and Native POSIX to use.

**Note:** You only need to run `btproxy` when using QEMU. Native POSIX handles the UNIX socket proxying automatically.

If you are using QEMU, in order to make the Controller available you will need one additional step using `btproxy`:

1. Make sure that the Bluetooth controller is down
2. Use the `btproxy` tool to open the listening UNIX socket, type:
sudo tools/btproxy -u -i 0
Listening on /tmp/bt-server-bredr

You might need to replace -i 0 with the index of the Controller you wish to proxy.

If you see **Received unknown host packet type 0x00** when running QEMU, then add -z to the `btproxy` command line to ignore any null bytes transmitted at startup.

Once the hardware is connected and ready to use, you can then proceed to building and running a sample:

- Choose one of the Bluetooth sample applications located in `samples/bluetooth`.
- To run a Bluetooth application in QEMU, type:

  ```shell
  west build -b qemu_x86 samples/bluetooth/<sample>
  west build -t run
  ```

  Running QEMU now results in a connection with the second serial line to the `bt-server-bredr` UNIX socket, letting the application access the Bluetooth controller.

- To run a Bluetooth application in Native POSIX, first build it:

  ```shell
  west build -b native_posix samples/bluetooth/<sample>
  ```

  And then run it with:

  ```shell
  $ sudo ./build/zephyr/zephyr.exe --bt-dev=hci0
  ```

**Using a Zephyr-based BLE Controller** Depending on which hardware you have available, you can choose between two transports when building a single-mode, Zephyr-based BLE Controller:

- UART: Use the `hci_uart` sample and follow the instructions in `bluetooth-hci-uart-qemu-posix`.
- USB: Use the `hci_usb` sample and then treat it as a Host System Bluetooth Controller (see previous section)

**HCI Tracing** When running the Host on a computer connected to an external Controller, it is very useful to be able to see the full log of exchanges between the two, in the format of a *Host Controller Interface* log. In order to see those logs, you can use the built-in `btmon` tool from BlueZ:

```shell
$ btmon
```

**Using Zephyr-based Controllers with BlueZ**

If you want to test a Zephyr-powered BLE Controller using BlueZ's Bluetooth Host, you will need a few tools described in the *Using BlueZ with Zephyr* section. Once you have installed the tools you can then use them to interact with your Zephyr-based controller:

```shell
sudo tools/btmgmt --index 0
[hci0]# auto-power
[hci0]# find -1
```

You might need to replace `--index 0` with the index of the Controller you wish to manage. Additional information about `btmgmt` can be found in its manual pages.

---

6.1. Bluetooth

1249
6.1.6 Developing Bluetooth Applications

Bluetooth applications are developed using the common infrastructure and approach that is described in the Application Development section of the documentation. Additional information that is only relevant to Bluetooth applications can be found in this page.

Hardware setup

This section describes the options you have when building and debugging Bluetooth applications with Zephyr. Depending on the hardware that is available to you, the requirements you have and the type of development you prefer you may pick one or another setup to match your needs.

There are 4 possible hardware setups to use with Zephyr and Bluetooth:

1. Embedded
2. QEMU with an external Controller
3. Native POSIX with an external Controller
4. Simulated nRF52 with BabbleSim

Embedded This setup relies on all software running directly on the embedded platform(s) that the application is targeting. All the Configurations and Build Types are supported but you might need to build Zephyr more than once if you are using a dual-chip configuration or if you have multiple cores in your SoC each running a different build type (e.g., one running the Host, the other the Controller).

To start developing using this setup follow the Getting Started Guide, choose one (or more if you are using a dual-chip solution) boards that support Bluetooth and then run the application).

Embedded HCI tracing When running both Host and Controller in actual Integrated Circuits, you will only see normal log messages on the console by default, without any way of accessing the HCI traffic between the Host and the Controller. However, there is a special Bluetooth logging mode that converts the console to use a binary protocol that interleaves both normal log messages as well as the HCI traffic.

Set the following Kconfig options to enable this protocol before building your application:

```bash
CONFIG_BT_DEBUG_MONITOR_UART=y
CONFIG_UART_CONSOLE=n
```

Setting `CONFIG_BT_DEBUG_MONITOR_UART` to `y` replaces the `CONFIG_BT_DEBUG_LOG` option, and setting `CONFIG_UART_CONSOLE` to `n` disables the default printk/printf hooks.

To decode the binary protocol that will now be sent to the console UART you need to use the btmon tool from BlueZ:

```bash
$ btmon --tty <console TTY> --tty-speed 115200
```

Host on Linux with an external Controller

Note: This is currently only available on GNU/Linux

This setup relies on a “dual-chip” configuration which is comprised of the following devices:

1. A Host-only application running in the QEMU emulator or the native_posix native port of Zephyr
2. A Controller, which can be one of two types:
   - A commercially available Controller
   - A Controller-only build of Zephyr
Warning: Certain external Controllers are either unable to accept the Host to Controller flow control parameters that Zephyr sets by default (Qualcomm), or do not transmit any data from the Controller to the Host (Realtek). If you see a message similar to:

```
<wrn> bt_hci_core: opcode 0x0c33 status 0x12
```

when booting your sample of choice (make sure you have enabled CONFIG_BT_DEBUG_LOG in your prj.conf before running the sample), or if there is no data flowing from the Controller to the Host, then you need to disable Host to Controller flow control. To do so, set CONFIG_BT_HCI_ACL_FLOW_CONTROL=n in your prj.conf.

QEMU You can run the Zephyr Host on the QEMU emulator and have it interact with a physical external Bluetooth Controller. Refer to Running on QEMU and Native POSIX for full instructions on how to build and run an application in this setup.

Native POSIX

Note: This is currently only available on GNU/Linux

The Native POSIX target builds your Zephyr application with the Zephyr kernel, and some minimal HW emulation as a native Linux executable. This executable is a normal Linux program, which can be debugged and instrumented like any other, and it communicates with a physical external Controller.

Refer to Running on QEMU and Native POSIX for full instructions on how to build and run an application in this setup.

Simulated nRF52 with BabbleSim

Note: This is currently only available on GNU/Linux

The nrf52_bsim board, is a simulated target board which emulates the necessary peripherals of a nrf52 SOC to be able to develop and test BLE applications. This board, uses:

- BabbleSim to simulate the nrf52 modem and the radio environment.
- The POSIX arch to emulate the processor.
- Models of the nrf52 HW

Just like with the native_posix target, the build result is a normal Linux executable. You can find more information on how to run simulations with one or several devices in this board's documentation.

Currently, only Combined builds are possible, as this board does not yet have any models of a UART, or USB which could be used for an HCI interface towards another real or simulated device.

Initialization

The Bluetooth subsystem is initialized using the bt_enable() function. The caller should ensure that function succeeds by checking the return code for errors. If a function pointer is passed to bt_enable(), the initialization happens asynchronously, and the completion is notified through the given function.

Bluetooth Application Example

A simple Bluetooth beacon application is shown below. The application initializes the Bluetooth Subsystem and enables non-connectable advertising, effectively acting as a Bluetooth Low Energy broadcaster.
/* Set Advertisement data. Based on the Eddystone specification:
 * https://github.com/google/eddystone/blob/master/protocol-specification.md
 * https://github.com/google/eddystone/tree/master/eddystone-url
 */

static const struct bt_data ad[] = {
    BT_DATA_BYTES(BT_DATA_FLAGS, BT_LE_AD_NO_BREDR),
    BT_DATA_BYTES(BT_DATA_UUID16_ALL, 0xaa, 0xfe),
    BT_DATA_BYTES(BT_DATA_SVC_DATA16,
        0xaa, 0xfe, /* Eddystone UUID */
        0x10, /* Eddystone-URL frame type */
        0x00, /* Calibrated Tx power at 0m */
        0x00, /* URL Scheme Prefix http://www. */
        'z', 'e', 'p', 'h', 'y', 'r',
        'p', 'r', 'o', 'j', 'e', 'c', 't',
        0x08) /* .org */
};

/* Set Scan Response data */

static const struct bt_data sd[] = {
    BT_DATA(BT_DATA_NAME_COMPLETE, DEVICE_NAME, DEVICE_NAME_LEN),
};

static void bt_ready(int err)
{
    char addr_s[BT_ADDR_LE_STR_LEN];
    bt_addr_le_t addr = {0};
    size_t count = 1;

    if (err) {
        printk("Bluetooth init failed (err %d)\n", err);
        return;
    }

    printk("Bluetooth initialized\n");

    /* Start advertising */
    err = bt_le_adv_start(BT_LE_ADV_NCONN.IDENTITY, ad, ARRAY_SIZE(ad),
        sd, ARRAY_SIZE(sd));
    if (err) {
        printk("Advertising failed to start (err %d)\n", err);
        return;
    }

    /* For connectable advertising you would use
     * bt_le_oob_get_local(). For non-connectable non-identity
     * advertising an non-resolvable private address is used;
     * there is no API to retrieve that.
     */

    bt_id_get(&addr, &count);
    bt_addr_le_to_str(&addr, addr_s, sizeof(addr_s));
    printk("Beacon started, advertising as %s\n", addr_s);
}
(continues on next page)
The key APIs employed by the beacon sample are `bt_enable()` that's used to initialize Bluetooth and then `bt_le_adv_start()` that's used to start advertising a specific combination of advertising and scan response data.

### 6.1.7 AutoPTS on Windows 10 with nRF52 board

**Overview**

This tutorial shows how to setup AutoPTS client and server to run both on Windows 10. We use WSL1 with Ubuntu only to build a Zephyr project to an elf file, because Zephyr SDK is not available on Windows yet. Tutorial covers only nRF52840dk.

**Update Windows and drivers**

Update Windows in:

* Start -> Settings -> Update & Security -> Windows Update

Update drivers, following the instructions from your hardware vendor.

**Install Python 3**

Download and install Python 3. Setup was tested with versions >=3.8. Let the installer add the Python installation directory to the PATH and disable the path length limitation.
Install Git

Download and install Git. During installation enable option: Enable experimental support for pseudo consoles. We will use Git Bash as Windows terminal.
Install PTS 8

Install latest PTS from https://www.bluetooth.org. Remember to install drivers from installation directory “C:/Program Files (x86)/Bluetooth SIG/Bluetooth PTS/PTS Driver/win64/CSRBlueCoreUSB.inf”

Note: Starting with PTS 8.0.1 the Bluetooth Protocol Viewer is no longer included. So to capture Bluetooth events, you have to download it separately.

Setup Zephyr project for Windows

Perform Windows setup from Getting Started Guide.

Install nrftools

Connect devices
**Flash board**

In Device Manager find COM port of your nrf board. In my case it is COM3.
In Git Bash, go to zephyrproject

```bash
cd ~/zephyrproject
```

Build the auto-pts tester app

```bash
west build -p auto -b nrf52840dk_nrf52840 zephyr/tests/bluetooth/tester/
```

You can display flashing options with:

```bash
west flash --help
```

and flash board with built earlier elf file:

```bash
west flash --skip-rebuild --board-dir /dev/ttyS2 --elf-file ~/zephyrproject/build/zephyr/zephyr.elf
```

Note that west does not accept COMs, so use /dev/ttyS2 as the COM3 equivalent, /dev/ttyS2 as the COM3 equivalent, etc. (/dev/ttyS + decremented COM number).

**Setup auto-pts project**

In Git Bash, clone project repo:

```bash
git clone https://github.com/intel/auto-pts.git
```

Go into the project folder:

```bash
cd auto-pts
```

Install required python modules:
pip3 install --user wheel
pip3 install --user -r autoptsserver_requirements.txt
pip3 install --user -r autoptsclient_requirements.txt

Install socat.exe

Download and extract socat.exe from https://sourceforge.net/projects/unix-utils/files/socat/1.7.3.2/ into folder ~/socat-1.7.3.2-1-x86_64/.

Add path to directory of socat.exe to PATH:
Running AutoPTS

Server and client by default will run on localhost address. Run server:

```bash
python ./autoptsserver.py -S 65000
```

**Note:** If the error “ImportError: No module named pywintypes” appeared after the fresh setup, uninstall and install the pywin32 module:

```bash
pip install --upgrade --force-reinstall pywin32
```

Run client:

```bash
python ./autoptsclient-zephyr.py zephyr-master ~/zephyrproject/build/zephyr/zephyr.˓→elf -t COM3 -b nrf52 -S 65000 -C 65001
```
At the first run, when Windows asks, enable connection through firewall:

---

Troubleshooting

- “When running actual hardware test mode, I have only BTP TIMEOUTs.”

This is a problem with connection between auto-pts client and board. There are many possible causes. Try:

- Clean your auto-pts and zephyr repos with

  Warning: This command will force the irreversible removal of all uncommitted files in the repo.

  ```
git clean -fdx
  ```

then build and flash tester elf again.
• If you have set up Windows on virtual machine, check if guest extensions are installed properly or change USB compatibility mode in VM settings to USB 2.0.
• Check, if firewall in not blocking python.exe or socat.exe.
• Check if board sends ready event after restart (hex 00 00 80 ff 00 00). Open serial connection to board with e.g. PuTTy with proper COM and baud rate. After board reset you should see some strings in console.
• Check if socat.exe creates tunnel to board. Run in console

```
socat.exe -x -v tcp-listen:65123 /dev/ttyS2,raw,b115200
```

where /dev/ttyS2 is the COM3 equivalent. Open PuTTy, set connection type to Raw, IP to 127.0.0.1, port to 65123. After board reset you should see some strings in console.

### 6.1.8 AutoPTS on Linux

#### Overview

This tutorial shows how to setup AutoPTS client on Linux with AutoPTS server running on Windows 10 virtual machine. Tested with Ubuntu 20.4 and Linux Mint 20.4.

You must have a Zephyr development environment set up. See [Getting Started Guide](#) for details.

Supported methods to test zephyr bluetooth host:

- Testing Zephyr Host Stack on QEMU
- Testing Zephyr Host Stack on native posix
- Testing Zephyr combined (controller + host) build on Real hardware (such as nRF52)

For running with QEMU or native posix, see [Running on QEMU and Native POSIX](#).

#### Setup Linux

**Install nrftools (only required in the actual hardware test mode)**

After you extract archive, you will see 2 .deb files, e.g.:

- JLink_Linux_V688a_x86_64.deb
- nRF-Command-Line-Tools_10_12_1_Linux-amd64.deb

and README.md. To install the tools, double click on each .deb file or follow instructions from README.md.

**Setup Windows 10 virtual machine**

Choose and install your hypervisor like VMWare Workstation(preferred) or VirtualBox. On VirtualBox could be some issues, if your host has fewer than 6 CPU.

Create Windows virtual machine instance. Make sure it has at least 2 cores and installed guest extensions. Setup tested with VirtualBox 6.1.18 and VMWare Workstation 16.1.1 Pro.

**Update Windows**  Update Windows in:  
Start -> Settings -> Update & Security -> Windows Update

**Setup static IP**

**VMWare Works**  On Linux, open Virtual Network Editor app and create network:
Open virtual machine network settings. Add custom adapter:

If you type 'ifconfig' in terminal, you should be able to find your host IP:
VirtualBox  Go to:
File -> Host Network Manager
and create network:

Open virtual machine network settings. On adapter 1 you will have created by default NAT. Add adapter 2:
Windows  Setup static IP on Windows virtual machine. Go to Settings -> Network & Internet -> Ethernet -> Unidentified network -> Edit and set:
Install Python 3  Download and install latest Python 3 on Windows. Let the installer add the Python installation directory to the PATH and disable the path length limitation.

Install Git  Download and install Git. During installation enable option: Enable experimental support for pseudo consoles. We will use Git Bash as Windows terminal.
Install PTS 8  On Windows virtual machine, install latest PTS from https://www.bluetooth.org. Remember to install drivers from installation directory “C:/Program Files (x86)/Bluetooth SIG/Bluetooth PTS/PTS Driver/win64/CSRBlueCoreUSB.inf”

Note: Starting with PTS 8.0.1 the Bluetooth Protocol Viewer is no longer included. So to capture Bluetooth events, you have to download it separately.

Connect PTS dongle  With VirtualBox there should be no problem. Just find dongle in Devices -> USB and connect.

With VMWare you might need to use some trick, if you cannot find dongle in VM -> Removable Devices. Type in Linux terminal:

`usb-devices`

and find in output your PTS Bluetooth USB dongle
Note Vendor and ProdID number. Close VMWare Workstation and open .vmx of your virtual machine (path similar to /home/codecoup/vmware/Windows 10/Windows 10.vmx) in text editor. Write anywhere in the file following line:

```
usb.autoConnect.device0 = "0x0a12:0x0001"
```

just replace 0xa12 with Vendor number and 0x0001 with ProdID number you found earlier.

Connect devices (only required in the actual hardware test mode)
Flash board (only required in the actual hardware test mode)

On Linux, go to ~/zephyrproject. There should be already ~/zephyrproject/build directory. Flash board:

```
west flash
```

Setup auto-pts project

AutoPTS client on Linux  Clone auto-pts project:
git clone https://github.com/intel/auto-pts.git

Install socat, that is used to transfer BTP data stream from UART’s tty file:

```bash
sudo apt-get install python-setuptools socat
```

Install required python modules:

```bash
cd auto-pts
pip3 install --user wheel
pip3 install --user -r autoptsclient_requirements.txt
```

**Autopts server on Windows virtual machine**  In Git Bash, clone auto-pts project repo:

```bash
git clone https://github.com/intel/auto-pts.git
```

Install required python modules:

```bash
cd auto-pts
pip3 install --user wheel
pip3 install --user -r autoptsserver_requirements.txt
```

Restart virtual machine.

**Running AutoPTS**

Server and client by default will run on localhost address. Run server:

```bash
python ./autoptsserver.py
```

Testing Zephyr Host Stack on QEMU:

```bash
# A Bluetooth controller needs to be mounted.
# For running with HCI UART, please visit: https://docs.zephyrproject.org/latest/
# samples/bluetooth/hci_uart/README.html#bluetooth-hci-uart
python ./autoptsclient-zephyr.py "C:\Users\USER_NAME\Documents\Profile Tuning Suite\PTS_PROJECT\PTS_PROJECT.pqw6" \
~/zephyrproject/build/zephyr/zephyr.elf -i SERVER_IP -l LOCAL_IP
```

Testing Zephyr Host Stack on native posix:

```bash
# A Bluetooth controller needs to be mounted.
# For running with HCI UART, please visit: https://docs.zephyrproject.org/latest/
# samples/bluetooth/hci_uart/README.html#bluetooth-hci-uart
west build -b native_posix zephyr/tests/bluetooth/tester/ -DOVERLAY_CONFIG=overlay-\n~native.conf
```

(continues on next page)
Testing Zephyr combined (controller + host) build on nRF52:

**Note:** If the error “ImportError: No module named pywintypes” appeared after the fresh setup, uninstall and install the pywin32 module:

```
pip install --upgrade --force-reinstall pywin32
```

Run client:

```
python ./autoptsclient-zephyr.py zephyr-master ~/zephyrproject/build/zephyr/zephyr.elf -t /dev/ACM0 -b nrf52 -l 192.168.2.1 -i 192.168.2.2
```

At the first run, when Windows asks, enable connection through firewall:
Troubleshooting

- “After running one test, I need to restart my Windows virtual machine to run another, because of fail verdict from APICOM in PTS logs.”

It means your virtual machine has not enough processor cores or memory. Try to add more in settings. Note that a host with 4 CPUs could be not enough with VirtualBox as hypervisor. In this case, choose rather VMWare Workstation.

- “I cannot start autoptsserver-zephyr.py. I always got error:"

One or more of the following steps should help:

- Close all PTS Windows.
- Replug PTS bluetooth dongle.
- Delete temporary workspace. You will find it in auto-pts-code/workspaces/zephyr/zephyr-master/ as temp_zephyr-master. Be careful, do not remove the original one zephyr-master.pqw6.
- Restart Windows virtual machine.

6.1.9 Bluetooth APIs

Attribute Protocol (ATT)

API Reference

**group bt_att**

Attribute Protocol (ATT)

**Defines**

- **BT_ATT_ERR_SUCCESS**

 Enums

 enum bt_att_chan_opt
     
     ATT channel option bit field values.

     **Note:** `BT_ATT_CHAN_OPT_UNENHANCED_ONLY` and `BT_ATT_CHAN_OPT_ENHANCED_ONLY` are mutually exclusive and both bits may not be set.

     Values:

     enumerator BT_ATT_CHAN_OPT_NONE = 0x0
         Both Enhanced and Unenhanced channels can be used

     enumerator BT_ATT_CHAN_OPT_UNENHANCED_ONLY = BIT(0)
         Only Unenhanced channels will be used

     enumerator BT_ATT_CHAN_OPT_ENHANCED_ONLY = BIT(1)
         Only Enhanced channels will be used

 Functions

 int bt_eatt_connect(struct bt_conn *conn, size_t num_channels)
     Connect Enhanced ATT channels.

     Sends a series of Credit Based Connection Requests to connect `num_channels` Enhanced ATT channels. The peer may have limited resources and fewer channels may be created.

     **Parameters**

     • conn – The connection to send the request on
     • num_channels – The number of Enhanced ATT beares to request. Must be in the range 1 - `CONFIG_BT_EATT_MAX`, inclusive.

     **Return values**

     • -EINVAL – if `num_channels` is not in the allowed range or `conn` is NULL.
     • -ENOMEM – if less than `num_channels` are allocated.
     • 0 – in case of success

     **Returns**

     0 in case of success or negative value in case of error.

 size_t bt_eatt_count(struct bt_conn *conn)
     Get number of EATT channels connected.

     **Parameters**

8.1 Bluetooth
• conn – The connection to get the number of EATT channels for.

**Returns**
The number of EATT channels connected. Returns 0 if conn is NULL or not connected.

**Bluetooth Audio**

**API Reference**

**group** bt_audio

Bluetooth Audio.

**Defines**

BT_AUDIO_BROADCAST_ID_SIZE

BT_AUDIO_CONTEXT_TYPE_ANY
    Any known context.

BT_AUDIO_UNICAST_ANNOUNCEMENT_GENERAL

BT_AUDIO_UNICAST_ANNOUNCEMENT_TARGETED

BROADCAST_SNK_STREAM_CNT

BROADCAST_SNK_SUBGROUP_CNT

BT_CODEC_DATA(_type, _bytes...)
    Helper to declare elements of bt_codec_data arrays.
    This macro is mainly for creating an array of struct bt_codec_data elements inside bt_codec
    which is then passed to the likes of bt_audio_stream_config or bt_audio_stream_reconfig.

**Parameters**

• _type – Type of advertising data field
• _bytes – Variable number of single-byte parameters

BT_CODEC(_id, _cid, _vid, _data, _meta)
    Helper to declare bt_codec structure.

**Parameters**

• _id – Codec ID
• _cid – Company ID
• _vid – Vendor ID
• _data – Codec Specific Data in IVT format
• _meta – Codec Specific Metadata in IVT format
BT_CODEC_QOS(interval, framing, phy, sdu, rtn, latency, pd)
Helper to declare elements of bt_codec_qos.

Parameters

- interval – SDU interval (usec)
- framing – Framing
- phy – Target PHY
- sdu – Maximum SDU Size
- rtn – Retransmission number
- latency – Maximum Transport Latency (msec)
- pd – Presentation Delay (usec)

BT_CODEC_QOS_UNFRAMED(interval, sdu, rtn, latency, pd)
Helper to declare Input Unframed bt_codec_qos.

Parameters

- interval – SDU interval (usec)
- sdu – Maximum SDU Size
- rtn – Retransmission number
- latency – Maximum Transport Latency (msec)
- pd – Presentation Delay (usec)

BT_CODEC_QOS_FRAMED(interval, sdu, rtn, latency, pd)
Helper to declare Input Framed bt_codec_qos.

Parameters

- interval – SDU interval (usec)
- sdu – Maximum SDU Size
- rtn – Retransmission number
- latency – Maximum Transport Latency (msec)
- pd – Presentation Delay (usec)

BT_CODEC_QOS_PREF(unframed_supported, phy, rtn, latency, pd_min, pd_max, pref_pd_min, pref_pd_max)
Helper to declare elements of bt_codec_qos_pref.

Parameters

- unframed_supported – Unframed PDUs supported
- phy – Preferred Target PHY
- rtn – Preferred Retransmission number
- latency – Preferred Maximum Transport Latency (msec)
- pd_min – Minimum Presentation Delay (usec)
- pd_max – Maximum Presentation Delay (usec)
- pref_pd_min – Preferred Minimum Presentation Delay (usec)
- pref_pd_max – Preferred Maximum Presentation Delay (usec)

BT_AUDIO_LC3_PRESET(codec, qos)
Helper to declare an LC3 preset structure
BT_AUDIO_LC3_UNICAST_PRESET_8_1_1(_loc, _stream_context)

Helper to declare LC3 Unicast 8_1_1 codec configuration.

Parameters

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_8_2_1(_loc, _stream_context)

Helper to declare LC3 Unicast 8_2_1 codec configuration.

Parameters

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_16_1_1(_loc, _stream_context)

Helper to declare LC3 Unicast 16_1_1 codec configuration.

Parameters

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_16_2_1(_loc, _stream_context)

Helper to declare LC3 Unicast 16_2_1 codec configuration.

Mandatory to support as both unicast client and server

Parameters

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_24_1_1(_loc, _stream_context)

Helper to declare LC3 Unicast 24_1_1 codec configuration.

Parameters

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_24_2_1(_loc, _stream_context)

Helper to declare LC3 Unicast 24_2_1 codec configuration.

Mandatory to support as unicast server

Parameters

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_32_1_1(_loc, _stream_context)

Helper to declare LC3 Unicast 32_1_1 codec configuration.

Parameters

• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_32_2_1(_loc, _stream_context)

Helper to declare LC3 Unicast 32_2_1 codec configuration.
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_441_1_1(_loc, _stream_context)
Helper to declare LC3 Unicast 441_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_441_2_1(_loc, _stream_context)
Helper to declare LC3 Unicast 441_2_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_1_1(_loc, _stream_context)
Helper to declare LC3 Unicast 48_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_2_1(_loc, _stream_context)
Helper to declare LC3 Unicast 48_2_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_3_1(_loc, _stream_context)
Helper to declare LC3 Unicast 48_3_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_4_1(_loc, _stream_context)
Helper to declare LC3 Unicast 48_4_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_5_1(_loc, _stream_context)
Helper to declare LC3 Unicast 8_5_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIOCONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_6_1(_loc, _stream_context)
Helper to declare LC3 Unicast 48_6_1 codec configuration.
• _loc – Audio channel location bitfield (`bt_audio_location`)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_8_1_2(_loc, _stream_context)
Helper to declare LC3 Unicast 8_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (`bt_audio_location`)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_8_2_2(_loc, _stream_context)
Helper to declare LC3 Unicast 8_2_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (`bt_audio_location`)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_16_1_2(_loc, _stream_context)
Helper to declare LC3 Unicast 16_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (`bt_audio_location`)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_16_2_2(_loc, _stream_context)
Helper to declare LC3 Unicast 16_2_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (`bt_audio_location`)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_24_1_2(_loc, _stream_context)
Helper to declare LC3 Unicast 24_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (`bt_audio_location`)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_24_2_2(_loc, _stream_context)
Helper to declare LC3 Unicast 24_2_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (`bt_audio_location`)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_32_1_2(_loc, _stream_context)
Helper to declare LC3 Unicast 32_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (`bt_audio_location`)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_32_2_2(_loc, _stream_context)
Helper to declare LC3 Unicast 32_2_2 codec configuration.
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_441_1_2(_loc, _stream_context)
Helper to declare LC3 Unicast 441_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_441_2_2(_loc, _stream_context)
Helper to declare LC3 Unicast 441_2_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_1_2(_loc, _stream_context)
Helper to declare LC3 Unicast 48_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_2_2(_loc, _stream_context)
Helper to declare LC3 Unicast 48_2_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_3_2(_loc, _stream_context)
Helper to declare LC3 Unicast 48_3_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_4_2(_loc, _stream_context)
Helper to declare LC3 Unicast 48_4_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_5_2(_loc, _stream_context)
Helper to declare LC3 Unicast 48_5_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_UNICAST_PRESET_48_6_2(_loc, _stream_context)
Helper to declare LC3 Unicast 48_6_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_8_1_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 8_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_8_2_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 8_2_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_16_1_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 16_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_16_2_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 16_2_1 codec configuration.
Mandatory to support as both broadcast source and sink

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_24_1_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 24_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_24_2_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 24_2_1 codec configuration.
Mandatory to support as broadcast sink

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_32_1_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 32_1_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)
BT_AUDIO_LC3_BROADCAST_PRESET_32_2_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 32_2_1 codec configuration.

Parameters
- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_441_1_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 441_1_1 codec configuration.

Parameters
- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_441_2_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 441_2_1 codec configuration.

Parameters
- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_48_1_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 48_1_1 codec configuration.

Parameters
- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_48_2_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 48_2_1 codec configuration.

Parameters
- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_48_3_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 48_3_1 codec configuration.

Parameters
- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_48_4_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 48_4_1 codec configuration.

Parameters
- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_48_5_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 48_5_1 codec configuration.

Parameters
- _loc – Audio channel location bitfield (bt_audio_location)
- _stream_context – Stream context (BT_AUDIO_CONTEXT_*)
BT_AUDIO_LC3_BROADCAST_PRESET_48_6_1(_loc, _stream_context)
Helper to declare LC3 Broadcast 48_6_1 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_8_1_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 8_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_8_2_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 8_2_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_16_1_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 16_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_16_2_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 16_2_2 codec configuration.

Mandatory to support as both broadcast source and sink

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_24_1_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 24_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_24_2_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 24_2_2 codec configuration.

Mandatory to support as broadcast sink

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_32_1_2(_loc, _stream_context)
Helper to declare LC3 Broadcast 32_1_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (*bt_audio_location*)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

**BT_AUDIO_LC3_BROADCAST_PRESET_32_2_2(_loc, _stream_context)**

Helper to declare LC3 Broadcast 32_2_2 codec configuration.

**Parameters**
• _loc – Audio channel location bitfield (*bt_audio_location*)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

**BT_AUDIO_LC3_BROADCAST_PRESET_441_1_2(_loc, _stream_context)**

Helper to declare LC3 Broadcast 441_1_2 codec configuration.

**Parameters**
• _loc – Audio channel location bitfield (*bt_audio_location*)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

**BT_AUDIO_LC3_BROADCAST_PRESET_441_2_2(_loc, _stream_context)**

Helper to declare LC3 Broadcast 441_2_2 codec configuration.

**Parameters**
• _loc – Audio channel location bitfield (*bt_audio_location*)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

**BT_AUDIO_LC3_BROADCAST_PRESET_48_1_2(_loc, _stream_context)**

Helper to declare LC3 Broadcast 48_1_2 codec configuration.

**Parameters**
• _loc – Audio channel location bitfield (*bt_audio_location*)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

**BT_AUDIO_LC3_BROADCAST_PRESET_48_2_2(_loc, _stream_context)**

Helper to declare LC3 Broadcast 48_2_2 codec configuration.

**Parameters**
• _loc – Audio channel location bitfield (*bt_audio_location*)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

**BT_AUDIO_LC3_BROADCAST_PRESET_48_3_2(_loc, _stream_context)**

Helper to declare LC3 Broadcast 48_3_2 codec configuration.

**Parameters**
• _loc – Audio channel location bitfield (*bt_audio_location*)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

**BT_AUDIO_LC3_BROADCAST_PRESET_48_4_2(_loc, _stream_context)**

Helper to declare LC3 Broadcast 48_4_2 codec configuration.

**Parameters**
• _loc – Audio channel location bitfield (*bt_audio_location*)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

**BT_AUDIO_LC3_BROADCAST_PRESET_48_5_2(_loc, _stream_context)**

Helper to declare LC3 Broadcast 48_5_2 codec configuration.

**Parameters**
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

BT_AUDIO_LC3_BROADCAST_PRESET_48_6_2(_loc, _stream_context)

Helper to declare LC3 Broadcast 48_6_2 codec configuration.

Parameters
• _loc – Audio channel location bitfield (bt_audio_location)
• _stream_context – Stream context (BT_AUDIO_CONTEXT_*)

Enums

enum bt_audio_context

Audio Context Type for Generic Audio.
These values are defined by the Generic Audio Assigned Numbers, bluetooth.com

Values:

enumerator BT_AUDIO_CONTEXT_TYPE_PROHIBITED = 0
enumerator BT_AUDIO_CONTEXT_TYPE_UNSPECIFIED = BIT(0)
enumerator BT_AUDIO_CONTEXT_TYPE_CONVERSATIONAL = BIT(1)
enumerator BT_AUDIO_CONTEXT_TYPE_MEDIA = BIT(2)
enumerator BT_AUDIO_CONTEXT_TYPE_GAME = BIT(3)
enumerator BT_AUDIO_CONTEXT_TYPE_INSTRUCTIONAL = BIT(4)
enumerator BT_AUDIO_CONTEXT_TYPE_VOICE_ASSISTANTS = BIT(5)
enumerator BT_AUDIO_CONTEXT_TYPE_LIVE = BIT(6)
enumerator BT_AUDIO_CONTEXT_TYPE_SOUND_EFFECTS = BIT(7)
enumerator BT_AUDIO_CONTEXT_TYPE_NOTIFICATIONS = BIT(8)
enumerator BT_AUDIO_CONTEXT_TYPE_RINGTONE = BIT(9)
enumerator BT_AUDIO_CONTEXT_TYPE_ALERTS = BIT(10)
enumerator BT_AUDIO_CONTEXT_TYPE_EMERGENCY_ALARM = BIT(11)
enum bt_audio_parental_rating
    Parental rating defined by the Generic Audio assigned numbers (bluetooth.com).
The numbering scheme is aligned with Annex F of EN 300 707 v1.2.1 which defined parental rating for viewing.
Values:

enumerator BT_AUDIO_PARENTAL_RATING_NO_RATING = 0x00
enumerator BT_AUDIO_PARENTAL_RATING_AGE_ANY = 0x01
enumerator BT_AUDIO_PARENTAL_RATING_AGE_5_OR ABOVE = 0x02
enumerator BT_AUDIO_PARENTAL_RATING_AGE_6_OR ABOVE = 0x03
enumerator BT_AUDIO_PARENTAL_RATING_AGE_7_OR ABOVE = 0x04
enumerator BT_AUDIO_PARENTAL_RATING_AGE_8_OR ABOVE = 0x05
enumerator BT_AUDIO_PARENTAL_RATING_AGE_9_OR ABOVE = 0x06
enumerator BT_AUDIO_PARENTAL_RATING_AGE_10_OR ABOVE = 0x07
enumerator BT_AUDIO_PARENTAL_RATING_AGE_11_OR ABOVE = 0x08
enumerator BT_AUDIO_PARENTAL_RATING_AGE_12_OR ABOVE = 0x09
enumerator BT_AUDIO_PARENTAL_RATING_AGE_13_OR ABOVE = 0x0A
enumerator BT_AUDIO_PARENTAL_RATING_AGE_14_OR ABOVE = 0x0B
enumerator BT_AUDIO_PARENTAL_RATING_AGE_15_OR ABOVE = 0x0C
enumerator BT_AUDIO_PARENTAL_RATING_AGE_16_OR ABOVE = 0x0D
enumerator BT_AUDIO_PARENTAL_RATING_AGE_17_OR ABOVE = 0x0E
enumerator BT_AUDIO_PARENTAL_RATING_AGE_18_OR ABOVE = 0x0F

enum bt_audio_metadata_type
    Codec metadata type IDs.
    Metadata types defined by the Generic Audio assigned numbers (bluetooth.com).
    Values:
enumerator BT_AUDIO_METADATA_TYPE_PREF_CONTEXT = 0x01
Preferred audio context.

Bitfield of preferred audio contexts.
If 0, the context type is not a preferred use case for this codec configuration.
See the BT_AUDIO_CONTEXT_* for valid values.

enumerator BT_AUDIO_METADATA_TYPE_STREAM_CONTEXT = 0x02
Streaming audio context.

Bitfield of streaming audio contexts.
If 0, the context type is not a preferred use case for this codec configuration.
See the BT_AUDIO_CONTEXT_* for valid values.

enumerator BT_AUDIO_METADATA_TYPE_PROGRAM_INFO = 0x03
UTF-8 encoded title or summary of stream content

enumerator BT_AUDIO_METADATA_TYPE_STREAM_LANG = 0x04
Stream language.

3 octet lower case language code defined by ISO 639-3

enumerator BT_AUDIO_METADATA_TYPE_CCID_LIST = 0x05
Array of 8-bit CCID values

enumerator BT_AUDIO_METADATA_TYPE_PARENTAL_RATING = 0x06
Parental rating.

See @ref bt_audio_parental_rating for valid values.

enumerator BT_AUDIO_METADATA_TYPE_PROGRAM_INFO_URI = 0x07
UTF-8 encoded URI for additional Program information

enumerator BT_AUDIO_METADATA_TYPE_EXTENDED = 0xFE
Extended metadata

enumerator BT_AUDIO_METADATA_TYPE_VENDOR = 0xFF
Vendor specific metadata
enum bt_audio_location
{
    Location values for BT Audio.
    These values are defined by the Generic Audio Assigned Numbers, bluetooth.com

Values:

    enumerator BT_AUDIO_LOCATION_FRONT_LEFT = BIT(0)
    enumerator BT_AUDIO_LOCATION_FRONT_RIGHT = BIT(1)
    enumerator BT_AUDIO_LOCATION_FRONT_CENTER = BIT(2)
    enumerator BT_AUDIO_LOCATION_LOW_FREQ_EFFECTS_1 = BIT(3)
    enumerator BT_AUDIO_LOCATION_BACK_LEFT = BIT(4)
    enumerator BT_AUDIO_LOCATION_BACK_RIGHT = BIT(5)
    enumerator BT_AUDIO_LOCATION_FRONT_LEFT_OF_CENTER = BIT(6)
    enumerator BT_AUDIO_LOCATION_FRONT_RIGHT_OF_CENTER = BIT(7)
    enumerator BT_AUDIO_LOCATION_BACK_CENTER = BIT(8)

    enumerator BT_AUDIO_LOCATION_SIDE_LEFT = BIT(10)
    enumerator BT_AUDIO_LOCATION_SIDE_RIGHT = BIT(11)
    enumerator BT_AUDIO_LOCATION_TOP_FRONT_LEFT = BIT(12)
    enumerator BT_AUDIO_LOCATION_TOP_FRONT_RIGHT = BIT(13)
    enumerator BT_AUDIO_LOCATION_TOP_FRONT_CENTER = BIT(14)
    enumerator BT_AUDIO_LOCATION_TOP_CENTER = BIT(15)
    enumerator BT_AUDIO_LOCATION_TOP_BACK_LEFT = BIT(16)
    enumerator BT_AUDIO_LOCATION_TOP_BACK_RIGHT = BIT(17)
    enumerator BT_AUDIO_LOCATION_TOP_SIDE_LEFT = BIT(18)
    enumerator BT_AUDIO_LOCATION_TOP_SIDE_RIGHT = BIT(19)
enumerator BT_AUDIO_LOCATION_TOP_BACK_CENTER = \textit{BIT}(20)

enumerator BT_AUDIO_LOCATION_BOTTOM_FRONT_CENTER = \textit{BIT}(21)

enumerator BT_AUDIO_LOCATION_BOTTOM_FRONT_LEFT = \textit{BIT}(22)

enumerator BT_AUDIO_LOCATION_BOTTOM_FRONT_RIGHT = \textit{BIT}(23)

enumerator BT_AUDIO_LOCATION_FRONT_LEFT_WIDE = \textit{BIT}(24)

enumerator BT_AUDIO_LOCATION_FRONT_RIGHT_WIDE = \textit{BIT}(25)

enumerator BT_AUDIO_LOCATION_LEFT_SURROUND = \textit{BIT}(26)

enumerator BT_AUDIO_LOCATION_RIGHT_SURROUND = \textit{BIT}(27)

\begin{verbatim}
enum bt_audio_dir
    Audio Capability type.
    Values:
    
enumerator BT_AUDIO_DIR_SINK = 0x01
    enumerator BT_AUDIO_DIR_SOURCE = 0x02
\end{verbatim}

\begin{verbatim}
enum [anonymous]
    Codec QoS Framing.
    Values:
    
enumerator BT_CODEC_QOS_UNFRAMED = 0x00
    enumerator BT_CODEC_QOS_FRAMED = 0x01
\end{verbatim}

\begin{verbatim}
enum [anonymous]
    Codec QoS Preferred PHY.
    Values:
    
enumerator BT_CODEC_QOS_1M = \textit{BIT}(0)
    enumerator BT_CODEC_QOS_2M = \textit{BIT}(1)
    enumerator BT_CODEC_QOS_CODED = \textit{BIT}(2)
\end{verbatim}
Functions

```c
int bt_audio_unicast_client_register_cb(const struct bt_audio_unicast_client_cb *cb)
```
Register unicast client callbacks.

Only one callback structure can be registered, and attempting to registering more than one will result in an error.

**Parameters**
- `cb` – Unicast client callback structure.

**Returns**
- 0 in case of success or negative value in case of error.

```c
void bt_audio_stream_cb_register(struct bt_audio_stream *stream, struct bt_audio_stream_ops *ops)
```
Register Audio callbacks for a stream.

**Parameters**
- `stream` – Stream object.
- `ops` – Stream operations structure.

```c
struct bt_codec_data
#include <audio.h> Codec configuration structure.
```

```c
struct bt_codec
#include <audio.h> Codec structure.
```

**Public Members**

```c
uint8_t path_id
```
Data path ID

- `BT_ISO_DATA_PATH_HCI` for HCI path, or any other value for vendor specific ID.

```c
uint8_t id
```
Codec ID

```c
uint16_t cid
```
Codec Company ID

```c
uint16_t vid
```
Codec Company Vendor ID

```c
struct bt_audio_base_bis_data
#include <audio.h>
```

```c
struct bt_audio_base_subgroup
#include <audio.h>
```
Public Members

struct bt_codec codec
    Codec information for the subgroup
    If the data_count of the codec is 0, then codec specific data may be found for each BIS in the bis_data.

struct bt_audio_base
    #include <audio.h>

struct bt_codec_qos
    #include <audio.h> Codec QoS structure.

Public Members

uint8_t phy
    QoS PHY

uint8_t framing
    QoS Framing

uint8_t rtn
    QoS Retransmission Number

uint16_t sdu
    QoS SDU

uint16_t latency
    QoS Transport Latency

uint32_t interval
    QoS Frame Interval

uint32_t pd
    QoS Presentation Delay

struct bt_codec_qos_pref
    #include <audio.h> Audio Stream Quality of Service Preference structure.

Public Members

bool unframed_supported
    Unframed PDUs supported.
    Unlike the other fields, this is not a preference but whether the codec supports unframed ISOAL PDUs.
uint8_t phy
   Preferred PHY

uint8_t rtn
   Preferred Retransmission Number

uint16_t latency
   Preferred Transport Latency

uint32_t pd_min
   Minimum Presentation Delay.
   Unlike the other fields, this is not a preference but a minimum requirement.

uint32_t pd_max
   Maximum Presentation Delay.
   Unlike the other fields, this is not a preference but a maximum requirement.

uint32_t pref_pd_min
   Preferred minimum Presentation Delay.

uint32_t pref_pd_max
   Preferred maximum Presentation Delay

struct bt_audio_lc3_preset
   #include <audio.h> Struct to hold a BAP defined LC3 preset

Public Members

struct bt_codec codec
   The LC3 Codec

struct bt_codec_qos qos
   The BAP spec defined QoS values

struct bt_audio_stream
   #include <audio.h> Audio stream structure.
   Audio Streams represents a stream configuration of a Remote Endpoint and a Local Capability.

Note: Audio streams are unidirectional although its QoS can be configured to be bidirectional if stream are linked, in which case the QoS must be symmetric in both directions.

Public Members

struct bt_conn *conn
   Connection reference
struct bt_audio_ep *ep  
   Endpoint reference

cnst struct bt_codec *codec  
   Codec Configuration

struct bt_codec_qos *qos  
   QoS Configuration

struct bt_audio_stream_ops *ops  
   Audio stream operations

void *user_data  
   Stream user data

struct bt_audio_unicast_client_cb
   #include <audio.h> Unicast Client callback structure

**Public Members**

void (*location)(struct bt_conn *conn, enum bt_audio_dir dir, enum bt_audio_location loc)  
   Remote Unicast Server Audio Locations.
   This callback is called whenever the audio locations is read from the server or otherwise notified to the client.
   **Param conn**  
   Connection to the remote unicast server.
   **Param dir**  
   Direction of the location.
   **Param loc**  
   The location bitfield value.
   **Return**  
   0 in case of success or negative value in case of error.

void (*available_contexts)(struct bt_conn *conn, enum bt_audio_context snk_ctx, enum bt_audio_context src_ctx)  
   Remote Unicast Server Available Contexts.
   This callback is called whenever the available contexts are read from the server or otherwise notified to the client.
   **Param conn**  
   Connection to the remote unicast server.
   **Param snk_ctx**  
   The sink context bitfield value.
   **Param src_ctx**  
   The source context bitfield value.
   **Return**  
   0 in case of success or negative value in case of error.

struct bt_audio_unicast_server_cb
   #include <audio.h> Unicast Server callback structure
Public Members

int (*config)(struct bt_conn *conn, const struct bt_audio_ep *ep, enum bt_audio_dir dir, const struct bt_codec *codec, struct bt_audio_stream **stream, struct bt_codec_qos_pref *const pref)

Endpoint config request callback.
Config callback is called whenever an endpoint is requested to be configured

Param conn [in] Connection object.
Param ep [in] Local Audio Endpoint being configured.
Param dir [in] Direction of the endpoint.
Param codec [in] Codec configuration.
Param stream [out] Pointer to stream that will be configured for the endpoint.
Param pref [out] Pointer to a QoS preference object that shall be populated with values. Invalid values will reject the codec configuration request.
Return 0 in case of success or negative value in case of error.

int (*reconfig)(struct bt_audio_stream *stream, enum bt_audio_dir dir, const struct bt_codec *codec, struct bt_codec_qos_pref *const pref)

Stream reconfig request callback.
Reconfig callback is called whenever an Audio Stream needs to be reconfigured with different codec configuration.

Param stream [in] Stream object being reconfigured.
Param dir [in] Direction of the endpoint.
Param codec [in] Codec configuration.
Param pref [out] Pointer to a QoS preference object that shall be populated with values. Invalid values will reject the codec configuration request.
Return 0 in case of success or negative value in case of error.

int (*qos)(struct bt_audio_stream *stream, const struct bt_codec_qos *qos)

Stream QoS request callback.
QoS callback is called whenever an Audio Stream Quality of Service needs to be configured.

Param stream Stream object being reconfigured.
Param qos Quality of Service configuration.
Return 0 in case of success or negative value in case of error.

int (*enable)(struct bt_audio_stream *stream, const struct bt_codec_data *meta, size_t meta_count)

Stream Enable request callback.
Enable callback is called whenever an Audio Stream is requested to be enabled to stream.

- **Param stream**: Stream object being enabled.
- **Param meta**: Metadata entries
- **Param meta_count**: Number of metadata entries
- **Return**: 0 in case of success or negative value in case of error.

```c
int (*start)(struct bt_audio_stream *stream)
```

Start request callback.

Start callback is called whenever an Audio Stream is requested to start streaming.

- **Param stream**: Stream object.
- **Return**: 0 in case of success or negative value in case of error.

```c
int (*metadata)(struct bt_audio_stream *stream, const struct bt_codec_data *meta, size_t meta_count)
```

Metadata update request callback.

Metadata callback is called whenever an Audio Stream is requested to update its metadata.

- **Param stream**: Stream object.
- **Param meta**: Metadata entries
- **Param meta_count**: Number of metadata entries
- **Return**: 0 in case of success or negative value in case of error.

```c
int (*disable)(struct bt_audio_stream *stream)
```

Disable request callback.

Disable callback is called whenever an Audio Stream is requested to disable the stream.

- **Param stream**: Stream object being disabled.
- **Return**: 0 in case of success or negative value in case of error.

```c
int (*stop)(struct bt_audio_stream *stream)
```

Stop callback.

Stop callback is called whenever an Audio Stream is requested to stop streaming.

- **Param stream**: Stream object.
- **Return**: 0 in case of success or negative value in case of error.

```c
int (*release)(struct bt_audio_stream *stream)
```

Release callback.

Release callback is called whenever a new Audio Stream needs to be released and thus deallocated.
Param stream
  Stream object.

Return
  0 in case of success or negative value in case of error.

struct bt_audio_broadcast_sink_cb
#include <audio.h> Broadcast Audio Sink callback structure

Public Members

bool (*scan_recv)(const struct bt_le_scan_recv_info *info, struct net_buf_simple *ad, uint32_t broadcast_id)
  Scan receive callback. Scan receive callback is called whenever a broadcast source has been found.
  Param info
    Advertiser packet information.
  Param ad
    Buffer containing advertiser data.
  Param broadcast_id
    24-bit broadcast ID
  Return
    true to sync to the broadcaster, else false. Syncing to the broadcaster will stop the current scan.

void (*pa_synced)(struct bt_audio_broadcast_sink *sink, struct bt_le_per_adv_sync *sync, uint32_t broadcast_id)
  Periodic advertising sync callback. Called when synchronized to a periodic advertising. When synchronized a bt_audio_broadcast_sink structure is allocated for future use.
  Param sink
    Pointer to the allocated sink structure.
  Param sync
    Pointer to the periodic advertising sync.
  Param broadcast_id
    24-bit broadcast ID previously reported by scan_recv.

void (*base_recv)(struct bt_audio_broadcast_sink *sink, const struct bt_audio_base *base)
  Broadcast Audio Source Endpoint (BASE) received. Callback for when we receive a BASE from a broadcaster after syncing to the broadcaster's periodic advertising.
  Param sink
    Pointer to the sink structure.
  Param base
    Broadcast Audio Source Endpoint (BASE).

void (*syncable)(struct bt_audio_broadcast_sink *sink, bool encrypted)
  Broadcast sink is syncable. Called whenever a broadcast sink is not synchronized to audio, but the audio is synchronizable. This is inferred when a BIGInfo report is received.
  Once this callback has been called, it is possible to call bt_audio_broadcast_sink_sync() to synchronize to the audio stream(s).
**Param sink**
Pointer to the sink structure.

**Param encrypted**
Whether or not the broadcast is encrypted

```c
void (*scan_term)(int err)
Scan terminated callback.
```

Scan terminated callback is called whenever a scan started by `bt_audio_broadcast_sink_scan_start()` is terminated before `bt_audio_broadcast_sink_scan_stop()`.

Typical reasons for this are that the periodic advertising has synchronized (success criteria) or the scan timed out. It may also be called if the periodic advertising failed to synchronize.

**Param err**
0 in case of success or negative value in case of error.

```c
void (*pa_sync_lost)(struct bt_audio_broadcast_sink *sink)
Periodic advertising synchronization lost callback.
```

The periodic advertising synchronization lost callback is called if the periodic advertising sync is lost. If this happens, the sink object is deleted. To synchronize to the broadcaster again, `bt_audio_broadcast_sink_scan_start()` must be called.

**Param sink**
Pointer to the sink structure.

```c
#include <audio.h> Stream operation.
```

**Public Members**

```c
void (*started)(struct bt_audio_stream *stream)
Stream started callback.
```

Started callback is called whenever an Audio Stream has been started and will be usable for streaming.

**Param stream**
Stream object that has been started.

```c
void (*stopped)(struct bt_audio_stream *stream)
Stream stopped callback.
```

Stopped callback is called whenever an Audio Stream has been stopped.

**Param stream**
Stream object that has been stopped.

```
struct bt_audio_stream_ops
```

```
typedef void (*bt_audio_discover_func_t)(struct bt_conn *conn, struct bt_codec *codec, struct bt_audio_ep *ep, struct bt_audio_discover_params *params)
```

**Typedefs**

```c
typedef void (*bt_audio_discover_func_t)(struct bt_conn *conn, struct bt_codec *codec, struct bt_audio_ep *ep, struct bt_audio_discover_params *params)
```
Discover Audio capabilities and endpoints callback function.
If discovery procedure has complete both cap and ep are set to NULL.

**Functions**

```c
int bt_audio_discover(struct bt_conn *conn, struct bt_audio_discover_params *params)
```

Discover remote capabilities and endpoints.

This procedure is used by a client to discover remote capabilities and endpoints and notifies
via params callback.

**Note:** This procedure is asynchronous therefore the parameters need to remain valid while
it is active.

**Parameters**

- conn – Connection object
- params – Discover parameters

```c
int bt_audio_stream_config(struct bt_conn *conn, struct bt_audio_stream *stream, struct bt_audio_ep *ep, struct bt_codec *codec)
```

Configure Audio Stream.

This procedure is used by a client to configure a new stream using the remote endpoint, local
capability and codec configuration.

**Parameters**

- conn – Connection object
- stream – Stream object being configured
- ep – Remote Audio Endpoint being configured
- codec – Codec configuration

**Returns**

Allocated Audio Stream object or NULL in case of error.

```c
int bt_audio_stream_reconfig(struct bt_audio_stream *stream, const struct bt_codec *codec)
```

Reconfigure Audio Stream.

This procedure is used by a unicast client or unicast server to reconfigure a stream to use a
different local codec configuration.

This can only be done for unicast streams.

**Parameters**

- stream – Stream object being reconfigured
- codec – Codec configuration

**Returns**

0 in case of success or negative value in case of error.

```c
int bt_audio_stream_qos(struct bt_conn *conn, struct bt_audio_unicast_group *group)
```

Configure Audio Stream QoS.

This procedure is used by a client to configure the Quality of Service of streams in a unicast
group. All streams in the group for the specified conn will have the Quality of Service
configured. This shall only be used to configure unicast streams.
Parameters

- **conn** – Connection object
- **group** – Unicast group object

Returns

0 in case of success or negative value in case of error.

```c
int bt_audio_stream_enable(struct bt_audio_stream *stream, struct bt_codec_data *meta, size_t meta_count)
```

Enable Audio Stream.

This procedure is used by a client to enable a stream.

This shall only be called for unicast streams, as broadcast streams will always be enabled once created.

Parameters

- **stream** – Stream object
- **meta_count** – Number of metadata entries
- **meta** – Metadata entries

Returns

0 in case of success or negative value in case of error.

```c
int bt_audio_stream_metadata(struct bt_audio_stream *stream, struct bt_codec_data *meta, size_t meta_count)
```

Change Audio Stream Metadata.

This procedure is used by a unicast client or unicast server to change the metadata of a stream.

Parameters

- **stream** – Stream object
- **meta_count** – Number of metadata entries
- **meta** – Metadata entries

Returns

0 in case of success or negative value in case of error.

```c
int bt_audio_stream_disable(struct bt_audio_stream *stream)
```

Disable Audio Stream.

This procedure is used by a unicast client or unicast server to disable a stream.

This shall only be called for unicast streams, as broadcast streams will always be enabled once created.

Parameters

- **stream** – Stream object

Returns

0 in case of success or negative value in case of error.

```c
int bt_audio_stream_start(struct bt_audio_stream *stream)
```

Start Audio Stream.

This procedure is used by a unicast client or unicast server to make a stream start streaming.

This shall only be called for unicast streams. Broadcast sinks will always be started once synchronized, and broadcast source streams shall be started with `bt_audio_broadcast_source_start()`.

Parameters
• stream – Stream object

Returns
0 in case of success or negative value in case of error.

int bt_audio_stream_stop(struct bt_audio_stream *stream)
Stop Audio Stream.
This procedure is used by a client to make a stream stop streaming.
This shall only be called for unicast streams. Broadcast sinks cannot be stopped. Broadcast
sources shall be stopped with bt_audio_broadcast_source_stop().

Parameters
• stream – Stream object

Returns
0 in case of success or negative value in case of error.

int bt_audio_stream_release(struct bt_audio_stream *stream)
Release Audio Stream.
This procedure is used by a unicast client or unicast server to release a unicast stream.
Broadcast sink streams cannot be released, but can be deleted by
bt_audio_broadcast_sink_delete(). Broadcast source streams cannot be released, but can
be deleted by bt_audio_broadcast_source_delete().

Parameters
• stream – Stream object

Returns
0 in case of success or negative value in case of error.

int bt_audio_stream_send(struct bt_audio_stream *stream, struct net_buf *buf, uint16_t
seq_num, uint32_t ts)
Send data to Audio stream.
Send data from buffer to the stream.

Note: Data will not be sent to linked streams since linking is only consider for procedures
affecting the state machine.

Parameters
• stream – Stream object.
• buf – Buffer containing data to be sent.
• seq_num – Packet Sequence number. This value shall be incremented for each
call to this function and at least once per SDU interval for a specific channel.
• ts – Timestamp of the SDU in microseconds (us). This value can be used
to transmit multiple SDUs in the same SDU interval in a CIG or BIG. Can be
omitted by using BT_ISO_TIMESTAMP_NONE which will simply enqueue the
ISO SDU in a FIFO manner.

Returns
Bytes sent in case of success or negative value in case of error.

int bt_audio_unicast_group_create(struct bt_audio_unicast_group_param params[], size_t
num_param, struct bt_audio_unicast_group **unicast_group)
Create audio unicast group.

Create a new audio unicast group with one or more audio streams as a unicast client. Streams in a unicast group shall share the same interval, framing and latency (see `bt_codec_qos`).

**Parameters**

- `params` – `[in]` Array of stream parameters being used for the group.
- `num_param` – `[in]` Number of parameters in `params`.
- `unicast_group` – `[out]` Pointer to the unicast group created

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_audio_unicast_group_add_streams(
    struct bt_audio_unicast_group *unicast_group,
    struct bt_audio_unicast_group_param params[],
    size_t num_param)
```

Add streams to a unicast group as a unicast client.

This function can be used to add additional streams to a `bt_audio_unicast_group`.

This can be called at any time before any of the streams in the group has been started (see `bt_audio_stream_ops.started()`). This can also be called after the streams have been stopped (see `bt_audio_stream_ops.stopped()`).

Once a stream has been added to a unicast group, it cannot be removed. To remove a stream from a group, the group must be deleted with `bt_audio_unicast_group_delete()`, but this will require all streams in the group to be released first.

**Parameters**

- `unicast_group` – Pointer to the unicast group
- `params` – Array of stream parameters with streams being added to the group.
- `num_param` – Number of parameters in `params`.

**Returns**

0 in case of success or negative value in case of error.

```c
int bt_audio_unicast_group_delete(struct bt_audio_unicast_group *unicast_group)
```

Delete audio unicast group.

Delete a audio unicast group as a client. All streams in the group shall be in the idle or configured state.

**Parameters**

- `unicast_group` – Pointer to the unicast group to delete

**Returns**

Zero on success or (negative) error code otherwise.

```c
struct bt_audio_discover_params
    #include <audio.h>
```

**Public Members**

```c
enum bt_audio_dir dir
    Capabilities type
```
bt_audio_discover_func_t func
    Callback function

uint8_t num_caps
    Number of capabilities found

uint8_t num_eps
    Number of endpoints found

uint8_t err
    Error code.

struct bt_audio_unicast_group_param
    Parameter struct for the unicast group functions.
    Parameter struct for the bt_audio_unicast_group_create() and bt_audio_unicast_group_add_streams() functions.

Public Members

struct bt_audio_stream *stream
    Pointer to a stream object.

struct bt_codec_qos *qos
    The QoS settings for the bt_audio_unicast_group_param::stream.

enum bt_audio_dir dir
    The direction of the bt_audio_unicast_group_param::stream.
    If two streams are being used for the same ACL connection but in different directions, they may use the same CIS.

bt_audio_server

Functions

int bt_audio_unicast_server_register_cb(const struct bt_audio_unicast_server_cb *cb)
    Register unicast server callbacks.
    Only one callback structure can be registered, and attempting to registering more than one will result in an error.

    Parameters
    • cb – Unicast server callback structure.

    Returns
    0 in case of success or negative value in case of error.

int bt_audio_unicast_server_unregister_cb(const struct bt_audio_unicast_server_cb *cb)
    Unregister unicast server callbacks.
    May only unregister a callback structure that has previously been registered by bt_audio_unicast_server_register_cb().
Parameters

- cb – Unicast server callback structure.

Returns

0 in case of success or negative value in case of error.

group bt_audio_broadcast

Audio Broadcast APIs.

Functions

int bt_audio_broadcast_source_create(struct bt_audio_broadcast_source_create_param *param, struct bt_audio_broadcast_source **source)

Create audio broadcast source.

Create a new audio broadcast source with one or more audio streams.
The broadcast source will be visible for scanners once this has been called, and the device will advertise audio announcements.

No audio data can be sent until bt_audio_broadcast_source_start() has been called and no audio information (BIGInfo) will be visible to scanners (see bt_le_per_adv_sync_cb).

Parameters

- param – [in] Pointer to parameters used to create the broadcast source.
- source – [out] Pointer to the broadcast source created

Returns

Zero on success or (negative) error code otherwise.

int bt_audio_broadcast_source_reconfig(struct bt_audio_broadcast_source *source, struct bt_codec *codec, struct bt_codec_qos *qos)

Reconfigure audio broadcast source.

Reconfigure an audio broadcast source with a new codec and codec quality of service parameters.

Parameters

- source – Pointer to the broadcast source
- codec – Codec configuration.
- qos – Quality of Service configuration

Returns

Zero on success or (negative) error code otherwise.

int bt_audio_broadcast_source_start(struct bt_audio_broadcast_source *source, struct bt_le_ext_adv *adv)

Start audio broadcast source.

Start an audio broadcast source with one or more audio streams. The broadcast source will start advertising BIGInfo, and audio data can be streamed.

Parameters

- source – Pointer to the broadcast source
- adv – Pointer to an extended advertising set with periodic advertising configured.

Returns

Zero on success or (negative) error code otherwise.
int bt_audio_broadcast_source_stop(struct bt_audio_broadcast_source *source)
Stop audio broadcast source.

Stop an audio broadcast source. The broadcast source will stop advertising BIGInfo, and audio data can no longer be streamed.

Parameters
  • source – Pointer to the broadcast source

Returns
  Zero on success or (negative) error code otherwise.

int bt_audio_broadcast_source_delete(struct bt_audio_broadcast_source *source)
Delete audio broadcast source.

Delete an audio broadcast source. The broadcast source will stop advertising entirely, and the source can no longer be used.

Parameters
  • source – Pointer to the broadcast source

Returns
  Zero on success or (negative) error code otherwise.

int bt_audio_broadcast_source_get_id(const struct bt_audio_broadcast_source *source, uint32_t *const broadcast_id)
Get the broadcast ID of a broadcast source.

This will return the 3-octet broadcast ID that should be advertised in the extended advertising data with `BT_UUID_BROADCAST_AUDIO_VAL` as `BT_DATA_SVC_DATA16`.

See table 3.14 in the Basic Audio Profile v1.0.1 for the structure.

Parameters
  • source – [in] Pointer to the broadcast source.
  • broadcast_id – [out] Pointer to the 3-octet broadcast ID.

Returns
  int 0 if on success, errno on error.

int bt_audio_broadcast_source_get_base(struct bt_audio_broadcast_source *source, struct net_buf_simple *base_buf)
Get the Broadcast Audio Stream Endpoint of a broadcast source.

This will encode the BASE of a broadcast source into a buffer, that can be used for advertisement. The encoded BASE will thus be encoded as little-endian. The BASE shall be put into the periodic advertising data (see `bt_le_per_adv_set_data()`).

See table 3.15 in the Basic Audio Profile v1.0.1 for the structure.

Parameters
  • source – Pointer to the broadcast source.
  • base_buf – Pointer to a buffer where the BASE will be inserted.

Returns
  int 0 if on success, errno on error.

void bt_audio_broadcast_sink_register_cb(struct bt_audio_broadcast_sink_cb *cb)
Register Broadcast sink callbacks.

Parameters
  • cb – Broadcast sink callback structure.
int bt_audio_broadcast_sink_scan_start(const struct bt_le_scan_param *param)

Start scan for broadcast sources.

Starts a scan for broadcast sources. Scan results will be received by the scan_recv callback. Only reports from devices advertising broadcast audio support will be sent. Note that a broadcast source may advertise broadcast audio capabilities, but may not be streaming.

Parameters
• param – Scan parameters.

Returns
Zero on success or (negative) error code otherwise.

int bt_audio_broadcast_sink_scan_stop(void)

Stop scan for broadcast sources.

Stops ongoing scanning for broadcast sources.

Returns
Zero on success or (negative) error code otherwise.

int bt_audio_broadcast_sink_sync(struct bt_audio_broadcast_sink *sink, uint32_t indexes_bitfield, struct bt_audio_stream *streams[], const uint8_t broadcast_code[16])

Sync to a broadcaster's audio.

Parameters
• sink – Pointer to the sink object from the base_recv callback.
• indexes_bitfield – Bitfield of the BIS index to sync to. To sync to e.g. BIS index 1 and 2, this should have the value of BIT(1) | BIT(2).
• streams – Stream object pointers to be used for the receiver. If multiple BIS indexes shall be synchronized, multiple streams shall be provided.
• broadcast_code – The 16-octet broadcast code. Shall be supplied if the broadcast is encrypted (see the syncable callback).

Returns
0 in case of success or negative value in case of error.

int bt_audio_broadcast_sink_stop(struct bt_audio_broadcast_sink *sink)

Stop audio broadcast sink.

Stop an audio broadcast sink. The broadcast sink will stop receiving BIGInfo, and audio data can no longer be streamed.

Parameters
• sink – Pointer to the broadcast sink

Returns
Zero on success or (negative) error code otherwise.

int bt_audio_broadcast_sink_delete(struct bt_audio_broadcast_sink *sink)

Release a broadcast sink.

Once a broadcast sink has been allocated after the pa_synced callback, it can be deleted using this function. If the sink has synchronized to any broadcast audio streams, these must first be stopped using bt_audio_stream_stop.

Parameters
• sink – Pointer to the sink object to delete.

Returns
0 in case of success or negative value in case of error.
struct bt_audio_broadcast_source_stream_param
#include <audio.h>

Public Members

struct bt_audio_stream *stream
Audio stream

size_t data_count
The number of elements in the data array.
The BIS specific data may be omitted and this set to 0.

struct bt_codec_data *data
BIS Codec Specific Configuration

struct bt_audio_broadcast_source_subgroup_param
#include <audio.h>

Public Members

size_t params_count
The number of parameters in stream_params

struct bt_audio_broadcast_source_stream_param *params
Array of stream parameters

struct bt_codec *codec
Subgroup Codec configuration.

struct bt_audio_broadcast_source_create_param
#include <audio.h>

Public Members

size_t params_count
The number of parameters in subgroup_params

struct bt_audio_broadcast_source_subgroup_param *params
Array of stream parameters

struct bt_codec_qos *qos
Quality of Service configuration.

group bt_audio_codec_cfg
Audio codec Config APIs.
Functions to parse codec config data when formatted as LTV wrapped into bt_codec.
 Enums

enum bt_audio_codec_parse_err
   Codec parser error codes for Codec config parsing APIs.
   Values:

   enumerator BT_AUDIO_CODEC_PARSE_ERR_SUCCESS = 0
      The requested type is not present in the data set.

   enumerator BT_AUDIO_CODEC_PARSE_ERR_TYPE_NOT_FOUND = -1
      The requested type is not present in the data set.

   enumerator BT_AUDIO_CODEC_PARSE_ERR_INVALID_VALUE_FOUND = -2
      The value found is invalid.

   enumerator BT_AUDIO_CODEC_PARSE_ERR_INVALID_PARAM = -3
      The parameters specified to the function call are not valid.

 Functions

 int bt_codec_cfg_get_freq(const struct bt_codec *codec)
 Extract the frequency from a codec configuration.

   Parameters
      • codec – The codec configuration to extract data from.

   Returns
      The frequency in Hz if found else a negative value of type
      bt_audio_codec_parse_err.

 int bt_codec_cfg_get_frame_duration_us(const struct bt_codec *codec)
 Extract frame duration from BT codec config.

   Parameters
      • codec – The codec configuration to extract data from.

   Returns
      Frame duration in microseconds if value is found else a negative value of type
      bt_audio_codec_parse_err.

 int bt_codec_cfg_get_chan_allocation_val(const struct bt_codec *codec, uint32_t *chan_allocation)
 Extract channel allocation from BT codec config.

 The value returned is a bit field representing one or more audio locations
 as specified by bt_audio_location Shall match one or more of the bits set in
 BT_PAC_SNK_LOC/BT_PAC_SRC_LOC.

 Up to the configured BT_CODEC_LC3_CHAN_COUNT number of channels can be present.

   Parameters
      • codec – The codec configuration to extract data from.
      • chan_allocation – Pointer to the variable to store the extracted value in.
Returns

BT_AUDIO_CODEC_PARSE_SUCCESS if value is found and stored in the pointer provided else a negative value of type bt_audio_codec_parse_err.

int bt_codec_cfg_get_octets_per_frame(const struct bt_codec *codec)

Extract frame size in octets from BT codec config.

The overall SDU size will be octets_per_frame * blocks_per_sdu.

The Bluetooth specificationa are not clear about this value - it does not state that the codec shall use this SDU size only. A codec like LC3 supports variable bit-rate (per SDU) hence it might be allowed for an encoder to reduce the frame size below this value. Hence it is recommended to use the received SDU size and divide by blocks_per_sdu rather than relying on this octets_per_sdu value to be fixed.

Parameters

• codec – The codec configuration to extract data from.

Returns

Frame length in octets if value is found else a negative value of type bt_audio_codec_parse_err.

int bt_codec_cfg_get_frame_blocks_per_sdu(const struct bt_codec *codec, bool fallback_to_default)

Extract number of audio frame blocks in each SDU from BT codec config.

The overall SDU size will be octets_per_frame * frame_blocks_per_sdu * number-of-channels.

If this value is not present a default value of 1 shall be used.

A frame block is one or more frames that represents data for the same period of time but for different channels. If the stream have two audio channels and this value is two there will be four frames in the SDU.

Parameters

• codec – The codec configuration to extract data from.

• fallback_to_default – If true this function will return the default value of 1 if the type is not found. In this case the function will only fail if a NULL pointer is provided.

Returns

The count of codec frames in each SDU if value is found else a negative value of type bt_audio_codec_parse_err - unless when fallback_to_default is true then the value 1 is returned if frames per sdu is not found.

bool bt_codec_get_val(const struct bt_codec *codec, uint8_t type, const struct bt_codec_data **data)

Lookup a specific value based on type.

Depending on context bt_codec will be either codec capabilities, codec configuration or meta data.

Typically types used are: bt_codec_capability_type bt_codec_config_type bt_audio_metadata_type

Parameters

• codec – The codec data to search in.

• type – The type id to look for

• data – Pointer to the data-pointer to update when item is found

Returns

True if the type is found, false otherwise.
Connection Management

The Zephyr Bluetooth stack uses an abstraction called `bt_conn` to represent connections to other devices. The internals of this struct are not exposed to the application, but a limited amount of information (such as the remote address) can be acquired using the `bt_conn_get_info()` API. Connection objects are reference counted, and the application is expected to use the `bt_conn_ref()` API whenever storing a connection pointer for a longer period of time, since this ensures that the object remains valid (even if the connection would get disconnected). Similarly the `bt_conn_unref()` API is to be used when releasing a reference to a connection.

An application may track connections by registering a `bt_conn_cb` struct using the `bt_conn_cb_register()` or `BT_CONN_CB_DEFINE` APIs. This struct lets the application define callbacks for connection & disconnection events, as well as other events related to a connection such as a change in the security level or the connection parameters. When acting as a central the application will also get hold of the connection object through the return value of the `bt_conn_create_le()` API.

API Reference

group bt_conn

Connection management.

Defines

`BT_LE_CONN_PARAM_INIT(int_min, int_max, lat, to)`

Initialize connection parameters.

Parameters

- `int_min` – Minimum Connection Interval (N * 1.25 ms)
- `int_max` – Maximum Connection Interval (N * 1.25 ms)
- `lat` – Connection Latency
- `to` – Supervision Timeout (N * 10 ms)

`BT_LE_CONN_PARAM(int_min, int_max, lat, to)`

Helper to declare connection parameters inline

Parameters

- `int_min` – Minimum Connection Interval (N * 1.25 ms)
- `int_max` – Maximum Connection Interval (N * 1.25 ms)
- `lat` – Connection Latency
- `to` – Supervision Timeout (N * 10 ms)

`BT_LE_CONN_PARAM_DEFAULT`  
Default LE connection parameters: Connection Interval: 30-50 ms Latency: 0 Timeout: 4 s

`BT_CONN_LE_PHY_PARAM_INIT(_pref_tx_phy, _pref_rx_phy)`

Initialize PHY parameters

Parameters

- `_pref_tx_phy` – Bitmask of preferred transmit PHYs.
- `_pref_rx_phy` – Bitmask of preferred receive PHYs.
BT_CONN_LE_PHY_PARAM(_pref_tx_phy, _pref_rx_phy)
Helper to declare PHY parameters inline

Parameters
• _pref_tx_phy – Bitmask of preferred transmit PHYs.
• _pref_rx_phy – Bitmask of preferred receive PHYs.

BT_CONN_LE_PHY_PARAM_1M
Only LE 1M PHY

BT_CONN_LE_PHY_PARAM_2M
Only LE 2M PHY

BT_CONN_LE_PHY_PARAM_CODED
Only LE Coded PHY.

BT_CONN_LE_PHY_PARAM_ALL
All LE PHYs.

BT_CONN_LE_DATA_LEN_PARAM_INIT(_tx_max_len, _tx_max_time)
Initialize transmit data length parameters

Parameters
• _tx_max_len – Maximum Link Layer transmission payload size in bytes.
• _tx_max_time – Maximum Link Layer transmission payload time in us.

BT_CONN_LE_DATA_LEN_PARAM(_tx_max_len, _tx_max_time)
Helper to declare transmit data length parameters inline

Parameters
• _tx_max_len – Maximum Link Layer transmission payload size in bytes.
• _tx_max_time – Maximum Link Layer transmission payload time in us.

BT_LE_DATA_LEN_PARAM_DEFAULT
Default LE data length parameters.

BT_LE_DATA_LEN_PARAM_MAX
Maximum LE data length parameters.

BT_CONN_INTERVAL_TO_MS(interval)

BT_CONN_ROLE_MASTER
Connection role (central or peripheral)

BT_CONN_ROLE_SLAVE

BT_CONN_LE_CREATE_PARAM_INIT(_options, _interval, _window)
Initialize create connection parameters.

Parameters
• _options – Create connection options.
• _interval – Create connection scan interval (N * 0.625 ms).
• _window – Create connection scan window (N * 0.625 ms).

BT_CONN_LE_CREATE_PARAM(_options, _interval, _window)
Helper to declare create connection parameters inline

Parameters
• _options – Create connection options.
• _interval – Create connection scan interval (N * 0.625 ms).
• _window – Create connection scan window (N * 0.625 ms).

BT_CONN_LE_CREATE_CONN
Default LE create connection parameters. Scan continuously by setting scan interval equal to scan window.

BT_CONN_LE_CREATE_CONN_AUTO
Default LE create connection using filter accept list parameters. Scan window: 30 ms. Scan interval: 60 ms.

BT_CONN_CB_DEFINE(_name)
Register a callback structure for connection events.

Parameters
• _name – Name of callback structure.

BT_PASSKEY_INVALID
Special passkey value that can be used to disable a previously set fixed passkey.

BT_BR_CONN_PARAM_INIT(role_switch)
Initialize BR/EDR connection parameters.

Parameters
• role_switch – True if role switch is allowed

BT_BR_CONN_PARAM(role_switch)
Helper to declare BR/EDR connection parameters inline

Parameters
• role_switch – True if role switch is allowed

BT_BR_CONN_PARAM_DEFAULT
Default BR/EDR connection parameters: Role switch allowed

Enums

enum [anonymous]
Connection PHY options

Values:

enumerator BT_CONN_LE_PHY_OPT_NONE = 0
Convenience value when no options are specified.
enumerator BT_CONN_LE_PHY_OPT_CODED_S2 = \textit{BIT}(0)

LE Coded using S=2 coding preferred when transmitting.

denumerator BT_CONN_LE_PHY_OPT_CODED_S8 = \textit{BIT}(1)

LE Coded using S=8 coding preferred when transmitting.

\texttt{enum [anonymous]}

\texttt{Connection Type}

\texttt{Values:}

\texttt{enumerator BT_CONN_TYPE_LE = \textit{BIT}(0)}

LE Connection Type

\texttt{enumerator BT_CONN_TYPE_BR = \textit{BIT}(1)}

BR/EDR Connection Type

\texttt{enumerator BT_CONN_TYPE_SCO = \textit{BIT}(2)}

SCO Connection Type

\texttt{enumerator BT_CONN_TYPE_ISO = \textit{BIT}(3)}

ISO Connection Type

\texttt{enumerator BT_CONN_TYPE_ALL = BT_CONN_TYPE_LE | BT_CONN_TYPE_BR | BT_CONN_TYPE_SCO | BT_CONN_TYPE_ISO}

All Connection Type

\texttt{enum [anonymous]}

\texttt{Values:}

\texttt{enumerator BT_CONN_ROLE_CENTRAL = 0}

\texttt{enumerator BT_CONN_ROLE_PERIPHERAL = 1}

\texttt{enum bt_conn_state}

\texttt{Values:}

\texttt{enumerator BT_CONN_STATE_DISCONNECTED}

Channel disconnected

\texttt{enumerator BT_CONN_STATE_CONNECTING}

Channel in connecting state

\texttt{enumerator BT_CONN_STATE_CONNECTED}

Channel connected and ready for upper layer traffic on it

\texttt{enumerator BT_CONN_STATE_DISCONNECTING}

Channel in disconnecting state
enum bt_security_t
    Security level.
    Values:
    
    enumerator BT_SECURITY_L0
        Level 0: Only for BR/EDR special cases, like SDP
    
    enumerator BT_SECURITY_L1
        Level 1: No encryption and no authentication.
    
    enumerator BT_SECURITY_L2
        Level 2: Encryption and no authentication (no MITM).
    
    enumerator BT_SECURITY_L3
        Level 3: Encryption and authentication (MITM).
    
    enumerator BT_SECURITY_L4
        Level 4: Authenticated Secure Connections and 128-bit key.
    
    enumerator BT_SECURITY_FORCE_PAIR = BIT(7)
        Bit to force new pairing procedure, bit-wise OR with requested security level.

enum bt_security_flag
    Security Info Flags.
    Values:
    
    enumerator BT_SECURITY_FLAG_SC = BIT(0)
        Paired with Secure Connections.
    
    enumerator BT_SECURITY_FLAG_OOB = BIT(1)
        Paired with Out of Band method.

enum bt_conn_le_tx_power_phy
    Values:
    
    enumerator BT_CONN_LE_TX_POWER_PHY_NONE
        Convenience macro for when no PHY is set.
    
    enumerator BT_CONN_LE_TX_POWER_PHY_1M
        LE 1M PHY
    
    enumerator BT_CONN_LE_TX_POWER_PHY_2M
        LE 2M PHY
    
    enumerator BT_CONN_LE_TX_POWER_PHY_CODED_S8
        LE Coded PHY using S=8 coding.
enumerator BT_CONN_LE_TX_POWER_PHY_CODED_S2
   LE Coded PHY using S=2 coding.

enum [anonymous]
   Values:

   enumerator BT_CONN_LE_OPT_NONE = 0
      Convenience value when no options are specified.

   enumerator BT_CONN_LE_OPT_CODED = BIT(0)
      Enable LE Coded PHY.

      Enable scanning on the LE Coded PHY.

   enumerator BT_CONN_LE_OPT_NO_1M = BIT(1)
      Disable LE 1M PHY.

      Disable scanning on the LE 1M PHY.

      @note Requires @ref BT_CONN_LE_OPT_CODED.

enum bt_security_err
   Values:

   enumerator BT_SECURITY_ERR_SUCCESS
      Security procedure successful.

   enumerator BT_SECURITY_ERR_AUTH_FAIL
      Authentication failed.

   enumerator BT_SECURITY_ERR_PIN_OR_KEY_MISSING
      PIN or encryption key is missing.

   enumerator BT_SECURITY_ERR_OOB_NOT_AVAILABLE
      OOB data is not available.

   enumerator BT_SECURITY_ERR_AUTH_REQUIREMENT
      The requested security level could not be reached.

   enumerator BT_SECURITY_ERR_PAIR_NOT_SUPPORTED
      Pairing is not supported

   enumerator BT_SECURITY_ERR_PAIR_NOT_ALLOWED
      Pairing is not allowed.

   enumerator BT_SECURITY_ERR_INVALID_PARAM
      Invalid parameters.
enumerator BT_SECURITY_ERR_KEY_REJECTED
   Distributed Key Rejected

enumerator BT_SECURITY_ERR_UNSPECIFIED
   Pairing failed but the exact reason could not be specified.

Functions

struct bt_conn *bt_conn_ref(struct bt_conn *conn)
   Increment a connection's reference count.
   Increment the reference count of a connection object.

   Note: Will return NULL if the reference count is zero.

Parameters
• conn – Connection object.

Returns
Connection object with incremented reference count, or NULL if the reference count is zero.

void bt_conn_unref(struct bt_conn *conn)
   Decrement a connection's reference count.
   Decrement the reference count of a connection object.

Parameters
• conn – Connection object.

void bt_conn_foreach(int type, void (*func)(struct bt_conn *conn, void *data), void *data)
   Iterate through all existing connections.

Parameters
• type – Connection Type
• func – Function to call for each connection.
• data – Data to pass to the callback function.

struct bt_conn *bt_conn_lookup_addr_le(uint8_t id, const bt_addr_le_t *peer)
   Look up an existing connection by address.
   Look up an existing connection based on the remote address.
   The caller gets a new reference to the connection object which must be released with bt_conn_unref() once done using the object.

Parameters
• id – Local identity (in most cases BT_ID_DEFAULT).
• peer – Remote address.

Returns
Connection object or NULL if not found.
const bt_addr_le_t *bt_conn_get_dst(const struct bt_conn *conn)
Get destination (peer) address of a connection.

Parameters
• conn – Connection object.

Returns
Destination address.

uint8_t bt_conn_index(const struct bt_conn *conn)
Get array index of a connection.
This function is used to map bt_conn to index of an array of connections. The array has
CONFIG_BT_MAX_CONN elements.

Parameters
• conn – Connection object.

Returns
Index of the connection object. The range of the returned value is
0..CONFIG_BT_MAX_CONN-1

int bt_conn_get_info(const struct bt_conn *conn, struct bt_conn_info *info)
Get connection info.

Parameters
• conn – Connection object.
• info – Connection info object.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_get_remote_info(struct bt_conn *conn, struct bt_conn_remote_info *remote_info)
Get connection info for the remote device.

Note: In order to retrieve the remote version (version, manufacturer and subversion)
CONFIG_BT_REMOTE_VERSION must be enabled

Note: The remote information is exchanged directly after the connection has been es-
blished. The application can be notified about when the remote information is available
through the remote_info_available callback.

Parameters
• conn – Connection object.
• remote_info – Connection remote info object.

Returns
Zero on success or (negative) error code on failure.

Returns
-EBUSY The remote information is not yet available.

int bt_conn_le_get_tx_power_level(struct bt_conn *conn, struct bt_conn_le tx_power
*tx_power_level)
Get connection transmit power level.

Parameters
• conn – Connection object.
• tx_power_level – Transmit power level descriptor.

**Returns**

Zero on success or (negative) error code on failure.

**Returns**
- ENOBUSFS HCI command buffer is not available.

```c
int bt_conn_le_param_update(struct bt_conn *conn, const struct bt_le_conn_param *param)
```

Update the connection parameters.

If the local device is in the peripheral role then updating the connection parameters will be delayed. This delay can be configured by through the `CONFIG_BT_CONN_PARAM_UPDATE_TIMEOUT` option.

**Parameters**

• conn – Connection object.
• param – Updated connection parameters.

**Returns**

Zero on success or (negative) error code on failure.

```c
int bt_conn_le_data_len_update(struct bt_conn *conn, const struct bt_conn_le_data_len_param *param)
```

Update the connection transmit data length parameters.

**Parameters**

• conn – Connection object.
• param – Updated data length parameters.

**Returns**

Zero on success or (negative) error code on failure.

```c
int bt_conn_le_phy_update(struct bt_conn *conn, const struct bt_conn_le_phy_param *param)
```

Update the connection PHY parameters.

Update the preferred transmit and receive PHYs of the connection. Use `BT_GAP_LE_PHY_NONE` to indicate no preference.

**Parameters**

• conn – Connection object.
• param – Updated connection parameters.

**Returns**

Zero on success or (negative) error code on failure.

```c
int bt_conn_disconnect(struct bt_conn *conn, uint8_t reason)
```

Disconnect from a remote device or cancel pending connection.

Disconnect an active connection with the specified reason code or cancel pending outgoing connection.

The disconnect reason for a normal disconnect should be: `BT_HCI_ERR_REMOTE_USER_TERM_CONN`.

The following disconnect reasons are accepted:

• `BT_HCI_ERR_AUTH_FAIL`
• `BT_HCI_ERR_REMOTE_USER_TERM_CONN`
• `BT_HCI_ERR_REMOTE_LOW_RESOURCES`
• BT_HCI_ERR_REMOTE_POWER_OFF
• BT_HCI_ERR_UNSUPP_REMOTE_FEATURE
• BT_HCI_ERR_PAIRING_NOT_SUPPORTED
• BT_HCI_ERR_UNACCEPT_CONN_PARAM

Parameters
• conn – Connection to disconnect.
• reason – Reason code for the disconnection.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_le_create(const bt_addr_le_t *peer, const struct bt_conn_le_create_param *create_param, const struct bt_le_conn_param *conn_param, struct bt_conn **conn)

Initiate an LE connection to a remote device.

Allows initiate new LE link to remote peer using its address.

The caller gets a new reference to the connection object which must be released with bt_conn_unref() once done using the object.

This uses the General Connection Establishment procedure.

The application must disable explicit scanning before initiating a new LE connection.

When CONFIG_BT_PRIVACY enabled and peer is an identity address from a local bond, this API will connect to an advertisement with either:

• the address being an RPA resolved from the IRK obtained during bonding.
• the passed identity address, if the local identity is not in Network Privacy Mode.

Parameters
• peer – [in] Remote address.
• create_param – [in] Create connection parameters.
• conn_param – [in] Initial connection parameters.
• conn – [out] Valid connection object on success.

Returns
Zero on success or (negative) error code on failure.

int bt_conn_le_create_auto(const struct bt_conn_le_create_param *create_param, const struct bt_le_conn_param *conn_param)

Automatically connect to remote devices in the filter accept list..

This uses the Auto Connection Establishment procedure. The procedure will continue until a single connection is established or the procedure is stopped through bt_conn_create_auto_stop.

To establish connections to all devices in the the filter accept list the procedure should be started again in the connected callback after a new connection has been established.

Parameters
• create_param – Create connection parameters
• conn_param – Initial connection parameters.

Returns
Zero on success or (negative) error code on failure.
Returns
-ENOMEM No free connection object available.

int bt_conn_create_auto_stop(void)
Stop automatic connect creation.

Returns
Zero on success or (negative) error code on failure.

int bt_le_set_auto_conn(const bt_addr_le_t *addr, const struct bt_le_conn_param *param)
Automatically connect to remote device if it’s in range.
This function enables/disables automatic connection initiation. Every time the device loses the connection with peer, this connection will be re-established if connectable advertisement from peer is received.

Note: Auto connect is disabled during explicit scanning.

Parameters
• addr – Remote Bluetooth address.
• param – If non-NULL, auto connect is enabled with the given parameters. If NULL, auto connect is disabled.

Returns
Zero on success or error code otherwise.

int bt_conn_set_security(struct bt_conn *conn, bt_security_t sec)
Set security level for a connection.
This function enable security (encryption) for a connection. If the device has bond information for the peer with sufficiently strong key encryption will be enabled. If the connection is already encrypted with sufficiently strong key this function does nothing.
If the device has no bond information for the peer and is not already paired then the pairing procedure will be initiated. If the device has bond information or is already paired and the keys are too weak then the pairing procedure will be initiated.
This function may return error if required level of security is not possible to achieve due to local or remote device limitation (e.g., input output capabilities), or if the maximum number of paired devices has been reached.
This function may return error if the pairing procedure has already been initiated by the local device or the peer device.

Note: When CONFIG_BT_SMP_SC_ONLY is enabled then the security level will always be level 4.

Note: When CONFIG_BT_SMP_OOB_LEGACY_PAIR_ONLY is enabled then the security level will always be level 3.

Parameters
• conn – Connection object.
• sec – Requested security level.

Returns
0 on success or negative error
bt_security_t bt_conn_get_security(const struct bt_conn *conn)
    Get security level for a connection.

    Returns
    Connection security level

uint8_t bt_conn_enc_key_size(const struct bt_conn *conn)
    Get encryption key size.
    This function gets encryption key size. If there is no security (encryption) enabled 0 will be returned.

    Parameters
    • conn – Existing connection object.

    Returns
    Encryption key size.

void bt_conn_cb_register(struct bt_conn_cb *cb)
    Register connection callbacks.
    Register callbacks to monitor the state of connections.

    Parameters
    • cb – Callback struct. Must point to memory that remains valid.

void bt_set_bondable(bool enable)
    Enable/disable bonding.
    Set/clear the Bonding flag in the Authentication Requirements of SMP Pairing Request/Response data. The initial value of this flag depends on BT_BONDABLE Kconfig setting. For the vast majority of applications calling this function shouldn’t be needed.

    Parameters
    • enable – Value allowing/disallowing to be bondable.

void bt_set_oob_data_flag(bool enable)
    Allow/disallow remote OOB data to be used for pairing.
    Set/clear the OOB data flag for SMP Pairing Request/Response data. The initial value of this flag depends on BT_OOB_DATA_PRESENT Kconfig setting.

    Parameters
    • enable – Value allowing/disallowing remote OOB data.

int bt_le_oob_set_legacy_tk(struct bt_conn *conn, const uint8_t *tk)
    Set OOB Temporary Key to be used for pairing.
    This function allows to set OOB data for the LE legacy pairing procedure. The function should only be called in response to the oob_data_request() callback provided that the legacy method is user pairing.

    Parameters
    • conn – Connection object
    • tk – Pointer to 16 byte long TK array

    Returns
    Zero on success or -EINVAL if NULL

int bt_le_oob_set_sc_data(struct bt_conn *conn, const struct bt_le_oob_sc_data *oobd_local, const struct bt_le_oob_sc_data *oobd_remote)
Set OOB data during LE Secure Connections (SC) pairing procedure.

This function allows to set OOB data during the LE SC pairing procedure. The function should only be called in response to the `oob_data_request()` callback provided that LE SC method is used for pairing.

The user should submit OOB data according to the information received in the callback. This may yield three different configurations: with only local OOB data present, with only remote OOB data present or with both local and remote OOB data present.

**Parameters**

- `conn` – Connection object
- `oobd_local` – Local OOB data or NULL if not present
- `oobd_remote` – Remote OOB data or NULL if not present

**Returns**

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
int bt_le_oob_get_sc_data(struct bt_conn *conn, const struct bt_le_oob_sc_data **oobd_local, const struct bt_le_oob_sc_data **oobd_remote)
```

Get OOB data used for LE Secure Connections (SC) pairing procedure.

This function allows to get OOB data during the LE SC pairing procedure that were set by the `bt_le_oob_set_sc_data()` API.

---

**Note:** The OOB data will only be available as long as the connection object associated with it is valid.

**Parameters**

- `conn` – Connection object
- `oobd_local` – Local OOB data or NULL if not set
- `oobd_remote` – Remote OOB data or NULL if not set

**Returns**

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
int bt_passkey_set(unsigned int passkey)
```

Set a fixed passkey to be used for pairing.

This API is only available when the `CONFIG_BT_FIXED_PASSKEY` configuration option has been enabled.

Sets a fixed passkey to be used for pairing. If set, the `pairing_confirm()` callback will be called for all incoming pairings.

**Parameters**

- `passkey` – A valid passkey (0 - 999999) or `BT_PASSKEY_INVALID` to disable a previously set fixed passkey.

**Returns**

0 on success or a negative error code on failure.
int bt_conn_auth_cb_register(const struct bt_conn_auth_cb *cb)
Register authentication callbacks.
Register callbacks to handle authenticated pairing. Passing NULL unregisters a previous callbacks structure.

Parameters
  • cb – Callback struct.

Returns
Zero on success or negative error code otherwise

int bt_conn_auth_cb_overlay(struct bt_conn *conn, const struct bt_conn_auth_cb *cb)
Overlay authentication callbacks used for a given connection.
This function can be used only for Bluetooth LE connections. The CONFIG_BT_SMP must be enabled for this function.
The authentication callbacks for a given connection cannot be overlaid if security procedures in the SMP module have already started. This function can be called only once per connection.

Parameters
  • conn – Connection object.
  • cb – Callback struct.

Returns
Zero on success or negative error code otherwise

int bt_conn_auth_info_cb_register(struct bt_conn_auth_info_cb *cb)
Register authentication information callbacks.
Register callbacks to get authenticated pairing information. Multiple registrations can be done.

Parameters
  • cb – Callback struct.

Returns
Zero on success or negative error code otherwise

int bt_conn_auth_info_cb_unregister(struct bt_conn_auth_info_cb *cb)
Unregister authentication information callbacks.
Unregister callbacks to stop getting authenticated pairing information.

Parameters
  • cb – Callback struct.

Returns
Zero on success or negative error code otherwise

int bt_conn_auth_passkey_entry(struct bt_conn *conn, unsigned int passkey)
Reply with entered passkey.
This function should be called only after passkey_entry callback from bt_conn_auth_cb structure was called.

Parameters
  • conn – Connection object.
  • passkey – Entered passkey.

Returns
Zero on success or negative error code otherwise
int bt_conn_auth_cancel(struct bt_conn *conn)
   Cancel ongoing authenticated pairing.
   This function allows to cancel ongoing authenticated pairing.

   **Parameters**
   - conn – Connection object.

   **Returns**
   Zero on success or negative error code otherwise

int bt_conn_auth_passkey_confirm(struct bt_conn *conn)
   Reply if passkey was confirmed to match by user.
   This function should be called only after passkey_confirm callback from \textit{bt_conn_auth_cb} structure was called.

   **Parameters**
   - conn – Connection object.

   **Returns**
   Zero on success or negative error code otherwise

int bt_conn_auth_pairing_confirm(struct bt_conn *conn)
   Reply if incoming pairing was confirmed by user.
   This function should be called only after pairing_confirm callback from \textit{bt_conn_auth_cb} structure was called if user confirmed incoming pairing.

   **Parameters**
   - conn – Connection object.

   **Returns**
   Zero on success or negative error code otherwise

int bt_conn_auth_pincode_entry(struct bt_conn *conn, const char *pin)
   Reply with entered PIN code.
   This function should be called only after PIN code callback from \textit{bt_conn_auth_cb} structure was called. It's for legacy 2.0 devices.

   **Parameters**
   - conn – Connection object.
   - pin – Entered PIN code.

   **Returns**
   Zero on success or negative error code otherwise

struct bt_conn * bt_conn_create_br(const bt_addr_t *peer, const struct bt_br_conn_param *param)
   Initiate an BR/EDR connection to a remote device.
   Allows initiate new BR/EDR link to remote peer using its address.
   The caller gets a new reference to the connection object which must be released with \textit{bt_conn_unref()} once done using the object.

   **Parameters**
   - peer – Remote address.
   - param – Initial connection parameters.

   **Returns**
   Valid connection object on success or NULL otherwise.
struct bt_conn *bt_conn_create_sco(const bt_addr_t *peer)
Initiate an SCO connection to a remote device.
Allows initiate new SCO link to remote peer using its address.
The caller gets a new reference to the connection object which must be released with bt_conn_unref() once done using the object.

Parameters
- peer – Remote address.

Returns
Valid connection object on success or NULL otherwise.

struct bt_le_conn_param
#include <conn.h> Connection parameters for LE connections

    Scan window LE Coded PHY (N * 0.625 MS)
    Set zero to use same as LE 1M PHY scan window.

uint16_t timeout
    Connection initiation timeout (N * 10 MS)
    Set zero to use the default CONFIG_BT_CREATE_CONN_TIMEOUT timeout.

Note: Unused in bt_conn_le_create_auto

struct bt_conn_cb
    #include <conn.h> Connection callback structure.
    This structure is used for tracking the state of a connection. It is registered with the help of the bt_conn_cb_register() API. It's permissible to register multiple instances of this bt_conn_cb type, in case different modules of an application are interested in tracking the connection state. If a callback is not of interest for an instance, it may be set to NULL and will as a consequence not be used for that instance.

Public Members
```

6.1. Bluetooth
void (*connected)(struct bt_conn *conn, uint8_t err)
A new connection has been established.
This callback notifies the application of a new connection. In case the err parameter is
non-zero it means that the connection establishment failed.

err can mean either of the following:
• BT_HCI_ERR_UNKNOWN_CONN_ID Creating the connection started by
  bt_conn_le_create was canceled either by the user through bt_conn_disconnect
  or by the timeout in the host through bt_conn_le_create_param timeout parameter,
  which defaults to CONFIG_BT_CREATE_CONN_TIMEOUT seconds.
• BT_HCI_ERR_ADV_TIMEOUT High duty cycle directed connectable advertiser started by
  bt_le_adv_start failed to be connected within the timeout.

Note: If the connection was established from an advertising set then the advertising set
cannot be restarted directly from this callback. Instead use the connected callback of the
advertising set.

Param conn
    New connection object.
Param err
    HCI error. Zero for success, non-zero otherwise.

void (*disconnected)(struct bt_conn *conn, uint8_t reason)
A connection has been disconnected.
This callback notifies the application that a connection has been disconnected.
When this callback is called the stack still has one reference to the connection object. If
the application in this callback tries to start either a connectable advertiser or create a
new connection this might fail because there are no free connection objects available. To
avoid this issue it is recommended to either start connectable advertise or create a new
connection using k_work_submit or increase CONFIG_BT_MAX_CONN.

Param conn
    Connection object.
Param reason
    BT_HCI_ERR_* reason for the disconnection.

bool (*le_param_req)(struct bt_conn *conn, struct bt_le_conn_param *param)
LE connection parameter update request.
This callback notifies the application that a remote device is requesting to update the
connection parameters. The application accepts the parameters by returning true, or
rejects them by returning false. Before accepting, the application may also adjust the
parameters to better suit its needs.

It is recommended for an application to have just one of these callbacks for simplicity.
However, if an application registers multiple it needs to manage the potentially different
requirements for each callback. Each callback gets the parameters as returned by previous
callbacks, i.e. they are not necessarily the same ones as the remote originally sent.
If the application does not have this callback then the default is to accept the parameters.

Param conn
    Connection object.
Param param
    Proposed connection parameters.
Return
    true to accept the parameters, or false to reject them.
void (*le_param_updated)(struct bt_conn *conn, uint16_t interval, uint16_t latency, uint16_t timeout)

The parameters for an LE connection have been updated.

This callback notifies the application that the connection parameters for an LE connection have been updated.

**Param conn**
Connection object.

**Param interval**
Connection interval.

**Param latency**
Connection latency.

**Param timeout**
Connection supervision timeout.

void (*identity_resolved)(struct bt_conn *conn, const bt_addr_le_t *rpa, const bt_addr_le_t *identity)

Remote Identity Address has been resolved.

This callback notifies the application that a remote Identity Address has been resolved.

**Param conn**
Connection object.

**Param rpa**
Resolvable Private Address.

**Param identity**
Identity Address.

void (*security_changed)(struct bt_conn *conn, bt_security_t level, enum bt_security_err err)

The security level of a connection has changed.

This callback notifies the application that the security of a connection has changed.

The security level of the connection can either have been increased or remain unchanged. An increased security level means that the pairing procedure has been performed or the bond information from a previous connection has been applied. If the security level remains unchanged this means that the encryption key has been refreshed for the connection.

**Param conn**
Connection object.

**Param level**
New security level of the connection.

**Param err**

void (*remote_info_available)(struct bt_conn *conn, struct bt_conn_remote_info *remote_info)

Remote information procedures has completed.

This callback notifies the application that the remote information has been retrieved from the remote peer.

**Param conn**
Connection object.

**Param remote_info**
Connection information of remote device.

void (*le_phy_updated)(struct bt_conn *conn, struct bt_conn_le_phy_info *param)

The PHY of the connection has changed.
This callback notifies the application that the PHY of the connection has changed.

**Param conn**
Connection object.

**Param info**
Connection LE PHY information.

```c
void (*le_data_len_updated)(struct bt_conn *conn, struct bt_conn_le_data_len_info *info)
```

The data length parameters of the connection has changed.

This callback notifies the application that the maximum Link Layer payload length or transmission time has changed.

**Param conn**
Connection object.

**Param info**
Connection data length information.

```c
struct bt_conn_oob_info
```

```
#include <conn.h> Info Structure for OOB pairing
```

**Public Types**

struct bt_conn_auth_cb
   #include <conn.h> Authenticated pairing callback structure

Public Members

enum bt_security_err (*pairing_accept)(struct bt_conn *conn, const struct
   bt_conn_pairing_feat *const feat)
   Query to proceed incoming pairing or not.
   On any incoming pairing req/rsp this callback will be called for the application to decide
   whether to allow for the pairing to continue.
   The pairing info received from the peer is passed to assist making the decision.
   As this callback is synchronous the application should return a response value immedi-
   ately. Otherwise it may affect the timing during pairing. Hence, this information should
   not be conveyed to the user to take action.
   The remaining callbacks are not affected by this, but do notice that other callbacks can
   be called during the pairing. Eg. if pairing_confirm is registered both will be called for
   Just-Works pairings.
   This callback may be unregistered in which case pairing continues as if the Kconfig flag
   was not set.
   This callback is not called for BR/EDR Secure Simple Pairing (SSP).
   
   Param conn
      Connection where pairing is initiated.
   
   Param feat
      Pairing req/resp info.

   void (*passkey_display)(struct bt_conn *conn, unsigned int passkey)
      Display a passkey to the user.
When called the application is expected to display the given passkey to the user, with the expectation that the passkey will then be entered on the peer device. The passkey will be in the range of 0 - 999999, and is expected to be padded with zeroes so that six digits are always shown. E.g. the value 37 should be shown as 000037.

This callback may be set to NULL, which means that the local device lacks the ability to display a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop displaying the passkey.

**Param conn**  
Connection where pairing is currently active.

**Param passkey**  
Passkey to show to the user.

```c
void (*passkey_entry)(struct bt_conn *conn)
```

Request the user to enter a passkey.

When called the user is expected to enter a passkey. The passkey must be in the range of 0 - 999999, and should be expected to be zero-padded, as that's how the peer device will typically be showing it (e.g. 37 would be shown as 000037).

Once the user has entered the passkey its value should be given to the stack using the `bt_conn_auth_passkey_entry()` API.

This callback may be set to NULL, which means that the local device lacks the ability to enter a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to enter a passkey.

**Param conn**  
Connection where pairing is currently active.

```c
void (*passkey_confirm)(struct bt_conn *conn, unsigned int passkey)
```

Request the user to confirm a passkey.

When called the user is expected to confirm that the given passkey is also shown on the peer device. The passkey will be in the range of 0 - 999999, and should be zero-padded to always be six digits (e.g. 37 would be shown as 000037).

Once the user has confirmed the passkey to match, the `bt_conn_auth_passkey_confirm()` API should be called. If the user concluded that the passkey doesn't match the `bt_conn_auth_cancel()` API should be called.

This callback may be set to NULL, which means that the local device lacks the ability to confirm a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to confirm a passkey.

**Param conn**  
Connection where pairing is currently active.

**Param passkey**  
Passkey to be confirmed.

```c
void (*oob_data_request)(struct bt_conn *conn, struct bt_conn_oob_info *info)
```

Request the user to provide Out of Band (OOB) data.

When called the user is expected to provide OOB data. The required data are indicated by the information structure.

For LE Secure Connections OOB pairing, the user should provide local OOB data, remote OOB data or both depending on their availability. Their value should be given to the stack using the `bt_le_oob_set_sc_data()` API.

This callback must be set to non-NULL in order to support OOB pairing.
**Param conn**
Connection where pairing is currently active.

**Param info**
OOB pairing information.

```c
void (*cancel)(struct bt_conn *conn)
```
Cancel the ongoing user request.

This callback will be called to notify the application that it should cancel any previous user request (passkey display, entry or confirmation).

This may be set to NULL, but must always be provided whenever the passkey_display, passkey_entry passkey_confirm or pairing_confirm callback has been provided.

**Param conn**
Connection where pairing is currently active.

```c
void (*pairing_confirm)(struct bt_conn *conn)
```
Request confirmation for an incoming pairing.

This callback will be called to confirm an incoming pairing request where none of the other user callbacks is applicable.

If the user decides to accept the pairing the `bt_conn_auth_pairing_confirm()` API should be called. If the user decides to reject the pairing the `bt_conn_auth_cancel()` API should be called.

This callback may be set to NULL, which means that the local device lacks the ability to confirm a pairing request. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to confirm a pairing request.

**Param conn**
Connection where pairing is currently active.

```c
void (*pincode_entry)(struct bt_conn *conn, bool highsec)
```
Request the user to enter a passkey.

This callback will be called for a BR/EDR (Bluetooth Classic) connection where pairing is being performed. Once called the user is expected to enter a PIN code with a length between 1 and 16 digits. If the `highsec` parameter is set to true the PIN code must be 16 digits long.

Once entered, the PIN code should be given to the stack using the `bt_conn_auth_pincode_entry()` API.

This callback may be set to NULL, however in that case pairing over BR/EDR will not be possible. If provided, the cancel callback must be provided as well.

**Param conn**
Connection where pairing is currently active.

**Param highsec**
true if 16 digit PIN is required.

```c
struct bt_conn_auth_info_cb
#include <conn.h> Authenticated pairing information callback structure
```

**Public Members**

```c
void (*pairing_complete)(struct bt_conn *conn, bool bonded)
```
This callback notifies the application that the pairing procedure has been completed.

**Param conn**
Connection object.

**Param bonded**
Bond information has been distributed during the pairing procedure.

```c
void (*pairing_failed)(struct bt_conn *conn, enum bt_security_err reason)
```

notify that pairing process has failed.

**Param conn**
Connection object.

**Param reason**
Pairing failed reason

```c
void (*bond_deleted)(uint8_t id, const bt_addr_le_t *peer)
```

Notify that bond has been deleted.

This callback notifies the application that the bond information for the remote peer has been deleted

**Param id**
Which local identity had the bond.

**Param peer**
Remote address.

```c
sys_snode_t node
```
Internally used field for list handling

```c
#include <conn.h> Connection parameters for BR/EDR connections
```

**Bluetooth Controller**

**API Reference**

**group bt_ctrl**
Bluetooth Controller.

**Functions**

```c
void bt_ctlr_set_public_addr(const uint8_t *addr)
```
Set public address for controller.

Should be called before `bt_enable()`.

**Parameters**

- `addr` – Public address
group bt_gatt_csip
  Coordinated Set Identification Profile (CSIP)

Defines

BT_CSIP_SET_COORDINATOR_DISCOVER_TIMER_VALUE
  Recommended timer for member discovery

BT_CSIP_SET_COORDINATOR_MAX_CSIS_INSTANCES

BT_CSIP_READ_SIRK_REQ_RSP_ACCEPT
  Accept the request to read the SIRK as plaintext

BT_CSIP_READ_SIRK_REQ_RSP_ACCEPT_ENC
  Accept the request to read the SIRK, but return encrypted SIRK

BT_CSIP_READ_SIRK_REQ_RSP_REJECT
  Reject the request to read the SIRK

BT_CSIP_READ_SIRK_REQ_RSP_OOB_ONLY
  SIRK is available only via an OOB procedure

BT_CSIP_SET_SIRK_SIZE
  Size of the Set Identification Resolving Key (SIRK)

BT_CSIP_RSI_SIZE
  Size of the Resolvable Set Identifier (RSI)

BT_CSIP_ERROR_LOCK_DENIED
  Service is already locked

BT_CSIP_ERROR_LOCK_RELEASE_DENIED
  Service is not locked

BT_CSIP_ERROR_LOCK_INVAL_VALUE
  Invalid lock value

BT_CSIP_ERROR_SIRK_OOB_ONLY
  SIRK only available out-of-band

BT_CSIP_ERROR_LOCK_ALREADY_GRANTED
  Client is already owner of the lock

6.1. Bluetooth
Helper to declare `bt_data` array including RSI.

This macro is mainly for creating an array of struct `bt_data` elements which is then passed to e.g. `bt_le_ext_adv_start()`.

**Parameters**

• `_rsi` – Pointer to the RSI value

**Typedefs**

typedef void (*bt_csip_set_coordinator_discover_cb)(struct bt_conn *conn, const struct bt_csip_set_coordinator_set_member *member, int err, size_t set_count)

Callback for discovering Coordinated Set Identification Services.

**Param conn**

Pointer to the remote device.

**Param member**

Pointer to the set member.

**Param err**

0 on success, or an errno value on error.

**Param set_count**

Number of sets on the member.

typedef void (*bt_csip_set_coordinator_lock_set_cb)(int err)

Callback for locking a set across one or more devices.

**Param err**

0 on success, or an errno value on error.

typedef void (*bt_csip_set_coordinator_lock_changed_cb)(struct bt_csip_set_coordinator_csis_inst *inst, bool locked)

Callback when the lock value on a set of a connected device changes.

**Param inst**

The Coordinated Set Identification Service instance that was changed.

**Param locked**

Whether the lock is locked or release.

**Return**

int Return 0 on success, or an errno value on error.

typedef void (*bt_csip_set_coordinator_ordered_access_cb_t)(const struct bt_csip_set_coordinator_set_info *set_info, int err, bool locked, struct bt_csip_set_coordinator_set_member *member)

Callback for `bt_csip_set_coordinator_ordered_access()`

If any of the set members supplied to `bt_csip_set_coordinator_ordered_access()` is in the locked state, this will be called with `locked` true and `member` will be the locked member, and the ordered access procedure is cancelled. Likewise, if any error occurs, the procedure will also be aborted.

**Param set_info**

Pointer to the a specific `set_info` struct.

**Param err**

Error value. 0 on success, GATT error or errno on fail.
**Param locked**
Whether the lock is locked or release.

**Param member**
The locked member if `locked` is true, otherwise NULL.

typedef bool (*bt_csip_set_coordinator_ordered_access_t)(const struct bt_csip_set_coordinator_set_info *set_info, struct bt_csip_set_coordinator_set_member *members[], size_t count)

Callback function definition for `bt_csip_set_coordinator_ordered_access()`

**Param set_info**
Pointer to the a specific set_info struct.

**Param members**
Array of members ordered by rank. The procedure shall be done on the members in ascending order.

**Param count**
Number of members in `members`.

**Return**
true if the procedures can be successfully done, or false to stop the procedure.

### Functions

```c
void *bt_csip_set_member_svc_decl_get(const struct bt_csip_set_member_svc_inst *svc_inst)
```

Get the service declaration attribute.

The first service attribute can be included in any other GATT service.

**Parameters**

- `svc_inst` – Pointer to the Coordinated Set Identification Service.

**Returns**

The first CSIS attribute instance.

```c
int bt_csip_set_member_register(const struct bt_csip_set_member_register_param *param, struct bt_csip_set_member_svc_inst **svc_inst)
```

Register a Coordinated Set Identification Service instance.

This will register and enable the service and make it discoverable by clients.

This shall only be done as a server.

**Parameters**

- `param` – Coordinated Set Identification Service register parameters.
- `svc_inst` – [out] Pointer to the registered Coordinated Set Identification Service.

**Returns**

0 if success, errno on failure.

```c
void bt_csip_set_member_print_sirk(const struct bt_csip_set_member_svc_inst *svc_inst)
```

Print the SIRK to the debug output.

**Parameters**

- `svc_inst` – Pointer to the Coordinated Set Identification Service.
int bt_csip_set_member_generate_rsi(const struct bt_csip_set_member_svc_inst *svc_inst, uint8_t rsi[6])

Generate the Resolvable Set Identifier (RSI) value.
This will generate RSI for given svc_inst instance.

Parameters
• svc_inst – Pointer to the Coordinated Set Identification Service.
• rsi – Pointer to the 6-octet newly generated RSI data.

Returns
int 0 if on success, errno on error.

int bt_csip_set_member_lock(struct bt_csip_set_member_svc_inst *svc_inst, bool lock, bool force)

Locks a specific Coordinated Set Identification Service instance on the server.

Parameters
• svc_inst – Pointer to the Coordinated Set Identification Service.
• lock – If true lock the set, if false release the set.
• force – This argument only have meaning when lock is false (release) and will force release the lock, regardless of who took the lock.

Returns
0 on success, GATT error on error.

int bt_csip_set_coordinator_discover(struct bt_conn *conn)

Initialise the csip_set_coordinator instance for a connection. This will do a discovery on the device and prepare the instance for following commands.

Parameters
• conn – Pointer to remote device to perform discovery on.

Returns
int Return 0 on success, or an errno value on error.

bool bt_csip_set_coordinator_is_set_member(const uint8_t set_sirk[16], struct bt_data *data)

Check if advertising data indicates a set member.

Parameters
• set_sirk – The SIRK of the set to check against
• data – The advertising data

Returns
true if the advertising data indicates a set member, false otherwise

int bt_csip_set_coordinator_register_cb(struct bt_csip_set_coordinator_cb *cb)

Registers callbacks for csip_set_coordinator.

Parameters
• cb – Pointer to the callback structure.

Returns
Return 0 on success, or an errno value on error.

int bt_csip_set_coordinator_ordered_access(const struct bt_csip_set_coordinator_set_member *members[], uint8_t count, const struct bt_csip_set_coordinator_set_info *set_info, bt_csip_set_coordinator_ordered_access_t cb)
Access Coordinated Set devices in an ordered manner as a client.

This function will read the lock state of all devices and if all devices are in the unlocked state, then cb will be called with the same members as provided by members, but where the members are ordered by rank (if present). Once this procedure is finished or an error occurs, bt_csip_set_coordinator_cb::ordered_access will be called.

This procedure only works if all the members have the lock characteristic, and all either has rank = 0 or unique ranks.

If any of the members are in the locked state, the procedure will be cancelled.

This can only be done on members that are bonded.

**Parameters**

- `members` – Array of set members to access.
- `count` – Number of set members in `members`.
- `set_info` – Pointer to the a specific set_info struct, as a member may be part of multiple sets.
- `cb` – The callback function to be called for each member.

```c
int bt_csip_set_coordinator_lock(const struct bt_csip_set_coordinator_set_member **members, uint8_t count, const struct bt_csip_set_coordinator_set_info *set_info)
```

Lock an array of set members.

The members will be locked starting from lowest rank going up.

TODO: If locking fails, the already locked members will not be unlocked.

**Parameters**

- `members` – Array of set members to lock.
- `count` – Number of set members in `members`.
- `set_info` – Pointer to the a specific set_info struct, as a member may be part of multiple sets.

**Returns**

Return 0 on success, or an errno value on error.

```c
int bt_csip_set_coordinator_release(const struct bt_csip_set_coordinator_set_member **members, uint8_t count, const struct bt_csip_set_coordinator_set_info *set_info)
```

Release an array of set members.

The members will be released starting from highest rank going down.

**Parameters**

- `members` – Array of set members to lock.
- `count` – Number of set members in `members`.
- `set_info` – Pointer to the a specific set_info struct, as a member may be part of multiple sets.

**Returns**

Return 0 on success, or an errno value on error.

```c
struct bt_csip_set_member_cb

#include <csip.h> Callback structure for the Coordinated Set Identification Service
```

6.1. Bluetooth
Public Members

void (*lock_changed)(struct bt_conn *conn, struct bt_csip_set_member_svc_inst *svc_inst, bool locked)

Callback whenever the lock changes on the server.

- **Param conn**
  The connection to the client that changed the lock. NULL if server changed it, either by calling `bt_csip_set_member_lock()` or by timeout.

- **Param svc_inst**
  Pointer to the Coordinated Set Identification Service.

- **Param locked**
  Whether the lock was locked or released.

uint8_t (*sirk_read_req)(struct bt_conn *conn, struct bt_csip_set_member_svc_inst *svc_inst)

Request from a peer device to read the sirk.

- **Param conn**
  The connection to the client that requested to read the SIRK.

- **Param svc_inst**
  Pointer to the Coordinated Set Identification Service.

- **Return**
  A BT_CSIP_READ_SIRK_REQ_RSP_* response code.

#include <csip.h>

Register structure for Coordinated Set Identification Service

Public Members

uint8_t set_size

Size of the set.

If set to 0, the set size characteristic won't be initialized.

uint8_t set_sirk[16]

The unique Set Identity Resolving Key (SIRK)

This shall be unique between different sets, and shall be the same for each set member for each set.

bool lockable

Boolean to set whether the set is lockable by clients.

Setting this to false will disable the lock characteristic.

uint8_t rank

Rank of this device in this set.

If the lockable parameter is set to true, this shall be > 0 and <= to the set_size. If the lockable parameter is set to false, this may be set to 0 to disable the rank characteristic.

struct bt_csip_set_member_cb *cb

Pointer to the callback structure.
struct bt_csip_set_coordinator_set_info
#include <csip.h> Information about a specific set

**Public Members**

uint8_t set_sirk[16]
The 16 octet set Set Identity Resolving Key (SIRK)
The Set SIRK may not be exposed by the server over Bluetooth, and may require an out-of-band solution.

uint8_t set_size
The size of the set.
Will be 0 if not exposed by the server.

uint8_t rank
The rank of the set on on the remote device.
Will be 0 if not exposed by the server.

struct bt_csip_set_coordinator_csis_inst
#include <csip.h> Struct representing a coordinated set instance on a remote device.
The values in this struct will be populated during discovery of sets (bt_csip_set_coordinator_discover()).

**Public Members**

void *svc_inst
Internally used pointer value

struct bt_csip_set_coordinator_set_member
#include <csip.h> Struct representing a remote device as a set member

**Public Members**

struct bt_csip_set_coordinator_csis_inst insts[0]
Array of Coordinated Set Identification Service instances for the remote device

Cryptography

API Reference

group bt_crypto
Cryptography.
Functions

int bt_rand(void *buf, size_t len)

Generate random data.

A random number generation helper which utilizes the Bluetooth controller's own RNG.

Parameters

• buf – Buffer to insert the random data
• len – Length of random data to generate

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error

int bt_encrypt_le(const uint8_t key[16], const uint8_t plaintext[16], uint8_t enc_data[16])

AES encrypt little-endian data.

An AES encrypt helper is used to request the Bluetooth controller's own hardware to encrypt the plaintext using the key and returns the encrypted data.

Parameters

• key – 128 bit LS byte first key for the encryption of the plaintext
• plaintext – 128 bit LS byte first plaintext data block to be encrypted
• enc_data – 128 bit LS byte first encrypted data block

Returns

Zero on success or error code otherwise.

int bt_encrypt_be(const uint8_t key[16], const uint8_t plaintext[16], uint8_t enc_data[16])

AES encrypt big-endian data.

An AES encrypt helper is used to request the Bluetooth controller's own hardware to encrypt the plaintext using the key and returns the encrypted data.

Parameters

• key – 128 bit MS byte first key for the encryption of the plaintext
• plaintext – 128 bit MS byte first plaintext data block to be encrypted
• enc_data – 128 bit MS byte first encrypted data block

Returns

Zero on success or error code otherwise.

int bt_ccm_decrypt(const uint8_t key[16], uint8_t nonce[13], const uint8_t *enc_data, size_t len, const uint8_t *aad, size_t aad_len, uint8_t *plaintext, size_t mic_size)

Decrypt big-endian data with AES-CCM.

Decrypts and authorizes enc_data with AES-CCM, as described in https://tools.ietf.org/html/rfc3610.

Assumes that the MIC follows directly after the encrypted data.

Parameters

• key – 128 bit MS byte first key
• nonce – 13 byte MS byte first nonce
• enc_data – Encrypted data
• len – Length of the encrypted data
• aad – Additional input data
• aad_len – Additional input data length
• plaintext – Plaintext buffer to place result in
• mic_size – Size of the trailing MIC (in bytes)

Return values
• 0 – Successfully decrypted the data.
• -EINVAL – Invalid parameters.
• -EBADMSG – Authentication failed.

int bt_ccm_encrypt(const uint8_t key[16], uint8_t nonce[13], const uint8_t *plaintext, size_t len, const uint8_t *aad, size_t aad_len, uint8_t *enc_data, size_t mic_size)

Encrypt big-endian data with AES-CCM.
Encrypts and generates a MIC from plaintext with AES-CCM, as described in https://tools.ietf.org/html/rfc3610.
Places the MIC directly after the encrypted data.

Parameters
• key – 128 bit MS byte first key
• nonce – 13 byte MS byte first nonce
• plaintext – Plaintext buffer to encrypt
• len – Length of the encrypted data
• aad – Additional input data
• aad_len – Additional input data length
• enc_data – Buffer to place encrypted data in
• mic_size – Size of the trailing MIC (in bytes)

Return values
• 0 – Successfully encrypted the data.
• -EINVAL – Invalid parameters.

Data Buffers

API Reference

group bt_buf

Data buffers.

Defines

BT_BUF_RESERVE

BT_BUF_SIZE(size)
Helper to include reserved HCI data in buffer calculations

BT_BUF_ACL_SIZE(size)
Helper to calculate needed buffer size for HCI ACL packets

BT_BUF_EVT_SIZE(size)
Helper to calculate needed buffer size for HCI Event packets.
BT_BUF_CMD_SIZE(size)
    Helper to calculate needed buffer size for HCI Command packets.

BT_BUF_ISO_SIZE(size)
    Helper to calculate needed buffer size for HCI ISO packets.

BT_BUF_ACL_RX_SIZE
    Data size needed for HCI ACL RX buffers

BT_BUF_EVT_RX_SIZE
    Data size needed for HCI Event RX buffers

BT_BUF_ISO_RX_SIZE

BT_BUF_ISO_RX_COUNT

BT_BUF_RX_SIZE
    Data size needed for HCI ACL, HCI ISO or Event RX buffers

BT_BUF_RX_COUNT
    Buffer count needed for HCI ACL, HCI ISO or Event RX buffers

BT_BUF_CMD_TX_SIZE
    Data size needed for HCI Command buffers.

Enums

define bt_buf_type
    Possible types of buffers passed around the Bluetooth stack

    Values:

    enumerator BT_BUF_CMD
        HCI command

    enumerator BT_BUF_EVT
        HCI event

    enumerator BT_BUF_ACL_OUT
        Outgoing ACL data

    enumerator BT_BUF_ACL_IN
        Incoming ACL data

    enumerator BT_BUF_ISO_OUT
        Outgoing ISO data

    enumerator BT_BUF_ISO_IN
        Incoming ISO data
enumerator BT_BUF_H4
H:4 data

Functions

struct net_buf *bt_buf_get_rx(enum bt_buf_type type, k_timeout_t timeout)
Allocate a buffer for incoming data
This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_recv_prio().

Parameters
• type – Type of buffer. Only BT_BUF.EVT, BT_BUF_ACL_IN and
  BT_BUF_ISO_IN are allowed.
• timeout – Non-negative waiting period to obtain a buffer or one of the special
  values K_NO_WAIT and K_FOREVER.

Returns
A new buffer.

struct net_buf *bt_buf_get_tx(enum bt_buf_type type, k_timeout_t timeout, const void *data,
  size_t size)
Allocate a buffer for outgoing data
This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_send().

Parameters
• type – Type of buffer. Only BT_BUF_CMD, BT_BUF_ACL_OUT or BT_BUF_H4,
  when operating on H:4 mode, are allowed.
• timeout – Non-negative waiting period to obtain a buffer or one of the special
  values K_NO_WAIT and K_FOREVER.
• data – Initial data to append to buffer.
• size – Initial data size.

Returns
A new buffer.

struct net_buf *bt_buf_get_cmd_complete(k_timeout_t timeout)
Allocate a buffer for an HCI Command Complete/Status Event
This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_recv_prio().

Parameters
• timeout – Non-negative waiting period to obtain a buffer or one of the special
  values K_NO_WAIT and K_FOREVER.

Returns
A new buffer.

struct net_buf *bt_buf_get_evt(uint8_t evt, bool discardable, k_timeout_t timeout)
Allocate a buffer for an HCI Event
This will set the buffer type so bt_buf_set_type() does not need to be explicitly called before bt_recv_prio() or bt_recv().

Parameters
• evt – HCI event code
• discardable – Whether the driver considers the event discardable.
• timeout – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.

Returns
A new buffer.

static inline void bt_buf_set_type(struct net_buf *buf, enum bt_buf_type type)
Set the buffer type

Parameters
• buf – Bluetooth buffer
• type – The BT_* type to set the buffer to

static inline enum bt_buf_type bt_buf_get_type(struct net_buf *buf)
Get the buffer type

Parameters
• buf – Bluetooth buffer

Returns
The BT_* type to of the buffer

struct bt_buf_data
#include <buf.h> This is a base type for bt_buf user data.

Generic Access Profile (GAP)

API Reference

group bt_gap
Generic Access Profile.

Defines

BT_ID_DEFAULT
Convenience macro for specifying the default identity. This helps make the code more readable, especially when only one identity is supported.

BT_DATA(_type, _data, _data_len)
Helper to declare elements of bt_data arrays.
This macro is mainly for creating an array of struct bt_data elements which is then passed to e.g. bt_le_adv_start().

Parameters
• _type – Type of advertising data field
• _data – Pointer to the data field payload
• _data_len – Number of bytes behind the _data pointer
BT_DATA_BYTES(_type, _bytes...)
Helper to declare elements of bt_data arrays.
This macro is mainly for creating an array of struct bt_data elements which is then passed to e.g. bt_le_adv_start().

Parameters
- _type – Type of advertising data field
- _bytes – Variable number of single-byte parameters

BT_LE_ADV_PARAM_INIT(_options, _int_min, _int_max, _peer)
Initialize advertising parameters.

Parameters
- _options – Advertising Options
- _int_min – Minimum advertising interval
- _int_max – Maximum advertising interval
- _peer – Peer address, set to NULL for undirected advertising or address of peer for directed advertising.

BT_LE_ADV_PARAM(_options, _int_min, _int_max, _peer)
Helper to declare advertising parameters inline.

Parameters
- _options – Advertising Options
- _int_min – Minimum advertising interval
- _int_max – Maximum advertising interval
- _peer – Peer address, set to NULL for undirected advertising or address of peer for directed advertising.

BT_LE_ADV_CONN_DIR(_peer)

BT_LE_ADV_CONN

BT_LE_ADV_CONN_NAME

BT_LE_ADV_CONN_NAME_AD

BT_LE_ADV_CONN_DIR_LOW_DUTY(_peer)

BT_LE_ADV_NCONN
Non-connectable advertising with private address

BT_LE_ADV_NCONN_NAME
Non-connectable advertising with BT_LE_ADV_OPT_USE_NAME

BT_LE_ADV_NCONN_IDENTITY
Non-connectable advertising with BT_LE_ADV_OPT_USE_IDENTITY

BT_LE_EXT_ADV_CONN_NAME
Connectable extended advertising with BT_LE_ADV_OPT_USE_NAME
**BT_LE_EXT_ADV_SCAN_NAME**
Scannable extended advertising with **BT_LE_ADV_OPT_USE_NAME**

**BT_LE_EXT_ADV_NCONN**
Non-connectable extended advertising with private address

**BT_LE_EXT_ADV_NCONN_NAME**
Non-connectable extended advertising with **BT_LE_ADV_OPT_USE_NAME**

**BT_LE_EXT_ADV_NCONN_IDENTITY**
Non-connectable extended advertising with **BT_LE_ADV_OPT_USE_IDENTITY**

**BT_LE_EXT_ADV_CODED_NCONN**
Non-connectable extended advertising on coded PHY with private address

**BT_LE_EXT_ADV_CODED_NCONN_NAME**
Non-connectable extended advertising on coded PHY with **BT_LE_ADV_OPT_USE_NAME**

**BT_LE_EXT_ADV_CODED_NCONN_IDENTITY**
Non-connectable extended advertising on coded PHY with **BT_LE_ADV_OPT_USE_IDENTITY**

**BT_LE_EXT_ADV_START_PARAM_INIT**(_timeout, _n_evts)
Helper to initialize extended advertising start parameters inline

**Parameters**
- _timeout – Advertiser timeout
- _n_evts – Number of advertising events

**BT_LE_EXT_ADV_START_PARAM**(_timeout, _n_evts)
Helper to declare extended advertising start parameters inline

**Parameters**
- _timeout – Advertiser timeout
- _n_evts – Number of advertising events

**BT_LE_EXT_ADV_START_DEFAULT**

**BT_LE_PER_ADV_PARAM_INIT**(_int_min, _int_max, _options)
Helper to declare periodic advertising parameters inline

**Parameters**
- _int_min – Minimum periodic advertising interval
- _int_max – Maximum periodic advertising interval
- _options – Periodic advertising properties bitfield.

**BT_LE_PER_ADV_PARAM**(_int_min, _int_max, _options)
Helper to declare periodic advertising parameters inline

**Parameters**
- _int_min – Minimum periodic advertising interval
- _int_max – Maximum periodic advertising interval
- _options – Periodic advertising properties bitfield.
**BT_LE_PER_ADV_DEFAULT**

**BT_LE_SCAN_OPT_FILTER_WHITELIST**

**BT_LE_SCAN_PARAM_INIT(_type, _options, _interval, _window)**
Initialize scan parameters.

**Parameters**
- `_type` – Scan Type, `BT_LE_SCAN_TYPE_ACTIVE` or `BT_LE_SCAN_TYPE_PASSIVE`.
- `_options` – Scan options
- `_interval` – Scan Interval (N * 0.625 ms)
- `_window` – Scan Window (N * 0.625 ms)

**BT_LE_SCAN_PARAM(_type, _options, _interval, _window)**
Helper to declare scan parameters inline.

**Parameters**
- `_type` – Scan Type, `BT_LE_SCAN_TYPE_ACTIVE` or `BT_LE_SCAN_TYPE_PASSIVE`.
- `_options` – Scan options
- `_interval` – Scan Interval (N * 0.625 ms)
- `_window` – Scan Window (N * 0.625 ms)

**BT_LE_SCAN_ACTIVE**
Helper macro to enable active scanning to discover new devices.

**BT_LE_SCAN_PASSIVE**
Helper macro to enable passive scanning to discover new devices.

This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

**BT_LE_SCAN_CODED_ACTIVE**
Helper macro to enable active scanning to discover new devices. Include scanning on Coded PHY in addition to 1M PHY.

**BT_LE_SCAN_CODED_PASSIVE**
Helper macro to enable passive scanning to discover new devices. Include scanning on Coded PHY in addition to 1M PHY.

This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

**Typedefs**

typedef void (*bt_ready_cb_t)(int err)
Callback for notifying that Bluetooth has been enabled.

**Param err**
zero on success or (negative) error code otherwise.
typedef void bt_le_scan_cb_t(const bt_addr_le_t *addr, int8_t rssi, uint8_t adv_type, struct net_buf_simple *buf)

Callback type for reporting LE scan results.
A function of this type is given to the bt_le_scan_start() function and will be called for any discovered LE device.

**Param addr**
Advertiser LE address and type.

**Param rssi**
Strength of advertiser signal.

**Param adv_type**
Type of advertising response from advertiser. Uses the BT_GAP_ADV_TYPE_ values.

**Param buf**
Buffer containing advertiser data.

typedef void bt_br_discovery_cb_t(struct bt_br_discovery_result *results, size_t count)

Callback type for reporting BR/EDR discovery (inquiry) results.
A callback of this type is given to the bt_br_discovery_start() function and will be called at the end of the discovery with information about found devices populated in the results array.

**Param results**
Storage used for discovery results

**Param count**
Number of valid discovery results.

**Enums**

eenum [anonymous]
Advertising options

Values:

enumerator BT_LE_ADV_OPT_NONE = 0
Convenience value when no options are specified.

eenumerator BT_LE_ADV_OPT_CONNECTABLE = BIT(0)
Advertise as connectable.
Advertise as connectable. If not connectable then the type of advertising is determined by providing scan response data. The advertiser address is determined by the type of advertising and/or enabling privacy CONFIG_BT_PRIVACY.

eenumerator BT_LE_ADV_OPT_ONE_TIME = BIT(1)
Advertise one time.

Don't try to resume connectable advertising after a connection. This option is only meaningful when used together with BT_LE_ADV_OPT_CONNECTABLE. If set the advertising will be stopped when bt_le_adv_stop() is called or when an incoming (peripheral) connection happens. If this option is not set the stack will take care of keeping advertising enabled even as connections occur. If Advertising directed or the advertiser was started with bt_le_ext_adv_start then this behavior is the default behavior and this flag has no effect.
enumerator BT_LE_ADV_OPT_USE_IDENTITY = BIT(2)
Advertise using identity address.
Advertise using the identity address as the advertiser address.

**Note:** The address used for advertising will not be the same as returned by `bt_le_oob_get_local`, instead `bt_id_get` should be used to get the LE address.

**Warning:** This will compromise the privacy of the device, so care must be taken when using this option.

enumerator BT_LE_ADV_OPT_USE_NAME = BIT(3)
Advertise using GAP device name.

Include the GAP device name automatically when advertising. By default the GAP device name is put at the end of the scan response data.
When advertising using @ref BT_LE_ADV_OPT_EXT_ADV and not @ref BT_LE_ADV_OPT_SCANNABLE then it will be put at the end of the advertising data.
If the GAP device name does not fit into advertising data it will be converted to a shortened name if possible.
@ref BT_LE_ADV_OPT_FORCE_NAME_IN_AD can be used to force the device name to appear in the advertising data of an advert with scan response data.

The application can set the device name itself by including the following in the advertising data.

@code
 BT_DATA(BT_DATA_NAME_COMPLETE, name, sizeof(name) - 1)
@endcode

enumerator BT_LE_ADV_OPT_DIR_MODE_LOW_DUTY = BIT(4)
Low duty cycle directed advertising.

Use low duty directed advertising mode, otherwise high duty mode will be used.

enumerator BT_LE_ADV_OPT_DIR_ADDR_RPA = BIT(5)
Directed advertising to privacy-enabled peer.

Enable use of Resolvable Private Address (RPA) as the target address in directed advertisements. This is required if the remote device is privacy-enabled and supports address resolution of the target address in directed advertisement. It is the responsibility of the application to check that the remote device supports address resolution of directed advertisements by reading its Central Address Resolution characteristic.

enumerator BT_LE_ADV_OPT_FILTER_SCAN_REQ = BIT(6)
Use filter accept list to filter devices that can request scan response data.

enumerator BT_LE_ADV_OPT_FILTER_CONN = BIT(7)
Use filter accept list to filter devices that can connect.
enumerator BT_LE_ADV_OPT_NOTIFY_SCAN_REQ = BIT(8)
    Notify the application when a scan response data has been sent to an active scanner.

enumerator BT_LE_ADV_OPT_SCANNABLE = BIT(9)
    Support scan response data.
    When used together with BT_LE_ADV_OPT_EXT_ADV then this option cannot be used together with the BT_LE_ADV_OPT_CONNECTABLE option. When used together with BT_LE_ADV_OPT_EXT_ADV then scan response data must be set.

enumerator BT_LE_ADV_OPT_EXT_ADV = BIT(10)
    Advertise with extended advertising.
    This options enables extended advertising in the advertising set. In extended advertising the advertising set will send a small header packet on the three primary advertising channels. This small header points to the advertising data packet that will be sent on one of the 37 secondary advertising channels. The advertiser will send primary advertising on LE 1M PHY, and secondary advertising on LE 2M PHY. Connections will be established on LE 2M PHY.
    Without this option the advertiser will send advertising data on the three primary advertising channels.

    **Note:** Enabling this option requires extended advertising support in the peer devices scanning for advertisement packets.

enumerator BT_LE_ADV_OPT_NO_2M = BIT(11)
    Disable use of LE 2M PHY on the secondary advertising channel.
    Disabling the use of LE 2M PHY could be necessary if scanners don't support the LE 2M PHY. The advertiser will send primary advertising on LE 1M PHY, and secondary advertising on LE 1M PHY. Connections will be established on LE 1M PHY.

    **Note:** Cannot be set if BT_LE_ADV_OPT_CODED is set.

    **Note:** Requires BT_LE_ADV_OPT_EXT_ADV.

enumerator BT_LE_ADV_OPT_CODED = BIT(12)
    Advertise on the LE Coded PHY (Long Range).
    The advertiser will send both primary and secondary advertising on the LE Coded PHY. This gives the advertiser increased range with the trade-off of lower data rate and higher power consumption. Connections will be established on LE Coded PHY.

    **Note:** Requires BT_LE_ADV_OPT_EXT_ADV

enumerator BT_LE_ADV_OPT_ANONYMOUS = BIT(13)
    Advertise without a device address (identity or RPA).

    **Note:** Requires BT_LE_ADV_OPT_EXT_ADV
enumerator BT_LE_ADV_OPT_USE_TX_POWER = BIT(14)
Advertise with transmit power.

Note: Requires BT_LE_ADV_OPT_EXT_ADV

enumerator BT_LE_ADV_OPT_DISABLE_CHAN_37 = BIT(15)
Disable advertising on channel index 37.

enumerator BT_LE_ADV_OPT_DISABLE_CHAN_38 = BIT(16)
Disable advertising on channel index 38.

enumerator BT_LE_ADV_OPT_DISABLE_CHAN_39 = BIT(17)
Disable advertising on channel index 39.

enumerator BT_LE_ADV_OPT_FORCE_NAME_IN_AD = BIT(18)
Put GAP device name into advert data.
Will place the GAP device name into the advertising data rather than the scan response data.

Note: Requires BT_LE_ADV_OPT_USE_NAME

enum [anonymous]
Periodic Advertising options

Values:

enumerator BT_LE_PER_ADV_OPT_NONE = 0
Convenience value when no options are specified.

enumerator BT_LE_PER_ADV_OPT_USE_TX_POWER = BIT(1)
Advertise with transmit power.

Note: Requires BT_LE_ADV_OPT_EXT_ADV

enumerator BT_LE_PER_ADV_OPT_INCLUDE_ADI = BIT(2)
Advertise with included AdvDataInfo (ADI).

Note: Requires BT_LE_ADV_OPT_EXT_ADV

enum [anonymous]
Periodic advertising sync options

Values:

enumerator BT_LE_PER_ADV_SYNC_OPT_NONE = 0
Convenience value when no options are specified.
enumerator BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST = BIT(0)
    Use the periodic advertising list to sync with advertiser.
    When this option is set, the address and SID of the parameters are ignored.

enumerator BT_LE_PER_ADV_SYNC_OPT_REPORTING_INITIALLY_DISABLED = BIT(1)
    Disables periodic advertising reports.
    No advertisement reports will be handled until enabled.

enumerator BT_LE_PER_ADV_SYNC_OPT_FILTER_DUPLICATE = BIT(2)
    Filter duplicate Periodic Advertising reports

enumerator BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOA = BIT(3)
    Sync with Angle of Arrival (AoA) constant tone extension

enumerator BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOD_1US = BIT(4)
    Sync with Angle of Departure (AoD) 1 us constant tone extension

enumerator BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOD_2US = BIT(5)
    Sync with Angle of Departure (AoD) 2 us constant tone extension

enumerator BT_LE_PER_ADV_SYNC_OPT_SYNC_ONLY_CONST_TONE_EXT = BIT(6)
    Do not sync to packets without a constant tone extension

enum [anonymous]
    Periodic Advertising Sync Transfer options

Values:

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_NONE = 0
    Convenience value when no options are specified.

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOA = BIT(0)
    No Angle of Arrival (AoA)
    Do not sync with Angle of Arrival (AoA) constant tone extension

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOD_1US = BIT(1)
    No Angle of Departure (AoD) 1 us.
    Do not sync with Angle of Departure (AoD) 1 us constant tone extension

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOD_2US = BIT(2)
    No Angle of Departure (AoD) 2.
    Do not sync with Angle of Departure (AoD) 2 us constant tone extension

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_ONLY_CTE = BIT(3)
    Only sync to packets with constant tone extension

enum [anonymous]
    Values:
enumerator BT_LE_SCAN_OPT_NONE = 0
    Convenience value when no options are specified.

enumerator BT_LE_SCAN_OPT_FILTER_DUPLICATE = BIT(0)
    Filter duplicates.

enumerator BT_LE_SCAN_OPT_FILTER_ACCEPT_LIST = BIT(1)
    Filter using filter accept list.

enumerator BT_LE.Scan_OPT_CODED = BIT(2)
    Enable scan on coded PHY (Long Range).

enumerator BT_LE_SCAN_OPT_NO_1M = BIT(3)
    Disable scan on 1M phy.

    **Note:** Requires `BT_LE_SCAN_OPT_CODED`.

enum [anonymous]

    Values:

enumerator BT.LE_SCAN_TYPE_PASSIVE = 0x00
    Scan without requesting additional information from advertisers.

enumerator BT_LE_SCAN_TYPE_ACTIVE = 0x01
    Scan and request additional information from advertisers.

    Using this scan type will automatically send scan requests to all devices. Scan responses
    are received in the same manner and using the same callbacks as advertising reports.

Functions

int bt_enable(bt_ready_cb_t cb)

    Enable Bluetooth.

    Enable Bluetooth. Must be the called before any calls that require communication with the
    local Bluetooth hardware.

    When `CONFIG_BT_SETTINGS` is enabled, the application must load the Bluetooth settings after
    this API call successfully completes before Bluetooth APIs can be used. Loading the settings be-
    fore calling this function is insufficient. Bluetooth settings can be loaded with `settings_load()`
    or `settings_load_subtree()` with argument “bt”. The latter selectively loads only Bluetooth set-
    tings and is recommended if `settings_load()` has been called earlier.

    **Parameters**

    • `cb` – Callback to notify completion or NULL to perform the enabling syn-
        chronously.

    **Returns**

    Zero on success or (negative) error code otherwise.
int bt_disable(void)
Disable Bluetooth.
Disable Bluetooth. Can't be called before bt_enable has completed.
Close and release HCI resources. Result is architecture dependent.

Returns
Zero on success or (negative) error code otherwise.

bool bt_is_ready(void)
Check if Bluetooth is ready.

Returns
true when Bluetooth is ready, false otherwise

int bt_set_name(const char *name)
Set Bluetooth Device Name.
Set Bluetooth GAP Device Name.
When advertising with device name in the advertising data the name should be updated by calling bt_le_adv_update_data or bt_le_ext_adv_set_data.

Parameters
• name – New name

Returns
Zero on success or (negative) error code otherwise.

const char *bt_get_name(void)
Get Bluetooth Device Name.
Get Bluetooth GAP Device Name.

Returns
Bluetooth Device Name

uint16_t bt_get_appearance(void)
Get local Bluetooth appearance.
Bluetooth Appearance is a description of the external appearance of a device in terms of an Appearance Value.

See also:
https://specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf

Returns
Appearance Value of local Bluetooth host.

int bt_set_appearance(uint16_t new_appearance)
Set local Bluetooth appearance.
Automatically preserves the new appearance across reboots if CONFIG_BT_SETTINGS is enabled.
This symbol is linkable if CONFIG_BT_DEVICE_APPEARANCE_DYNAMIC is enabled.

Parameters
• new_appearance – Appearance Value

Return values
• 0 – Success.
• other – Persistent storage failed. Appearance was not updated.

```c
void bt_id_get(bt_addr_le_t *addrs, size_t *count)
```

Get the currently configured identities.

Returns an array of the currently configured identity addresses. To make sure all available identities can be retrieved, the number of elements in the `addrs` array should be `CONFIG_BT_ID_MAX`. The identity identifier that some APIs expect (such as advertising parameters) is simply the index of the identity in the `addrs` array.

If `addrs` is passed as NULL, then returned `count` contains the count of all available identities that can be retrieved with a subsequent call to this function with non-NULL `addrs` parameter.

---

**Note:** Deleted identities may show up as `BT_ADDR_LE_ANY` in the returned array.

---

### Parameters

- `addrs` – Array where to store the configured identities.
- `count` – Should be initialized to the array size. Once the function returns it will contain the number of returned identities.

```c
int bt_id_create(bt_addr_le_t *addr, uint8_t *irk)
```

Create a new identity.

Create a new identity using the given address and IRK. This function can be called before calling `bt_enable()`, in which case it can be used to override the controller’s public address (in case it has one). However, the new identity will only be stored persistently in flash when this API is used after `bt_enable()`. The reason is that the persistent settings are loaded after `bt_enable()` and would therefore cause potential conflicts with the stack blindly overwriting what’s stored in flash. The identity will also not be written to flash in case a pre-defined address is provided, since in such a situation the app clearly has some place it got the address from and will be able to repeat the procedure on every power cycle, i.e. it would be redundant to also store the information in flash.

Generating random static address or random IRK is not supported when calling this function before `bt_enable()`.

If the application wants to have the stack randomly generate identities and store them in flash for later recovery, the way to do it would be to first initialize the stack (using `bt_enable`), then call `settings_load()`, and after that check with `bt_id_get()` how many identities were recovered. If an insufficient amount of identities were recovered the app may then call `bt_id_create()` to create new ones.

### Parameters

- `addr` – Address to use for the new identity. If NULL or initialized to `BT_ADDR_LE_ANY` the stack will generate a new random static address for the identity and copy it to the given parameter upon return from this function (in case the parameter was non-NULL).
- `irk` – Identity Resolving Key (16 bytes) to be used with this identity. If set to all zeroes or NULL, the stack will generate a random IRK for the identity and copy it back to the parameter upon return from this function (in case the parameter was non-NULL). If privacy `CONFIG_BT_PRIVACY` is not enabled this parameter must be NULL.

### Returns

Identity identifier (>= 0) in case of success, or a negative error code on failure.
Reset/reclaim an identity for reuse.

The semantics of the `addr` and `irk` parameters of this function are the same as with `bt_id_create()`. The difference is the first `id` parameter that needs to be an existing identity (if it doesn't exist this function will return an error). When given an existing identity this function will disconnect any connections created using it, remove any pairing keys or other data associated with it, and then create a new identity in the same slot, based on the `addr` and `irk` parameters.

**Note:** the default identity (BT_ID_DEFAULT) cannot be reset, i.e. this API will return an error if asked to do that.

**Parameters**

- `id` – Existing identity identifier.
- `addr` – Address to use for the new identity. If NULL or initialized to BT_ADDR_LE_ANY the stack will generate a new static random address for the identity and copy it to the given parameter upon return from this function (in case the parameter was non-NULL).
- `irk` – Identity Resolving Key (16 bytes) to be used with this identity. If set to all zeroes or NULL, the stack will generate a random IRK for the identity and copy it back to the parameter upon return from this function (in case the parameter was non-NULL). If privacy CONFIG_BT_PRIVACY is not enabled this parameter must be NULL.

**Returns**

Identity identifier (>= 0) in case of success, or a negative error code on failure.

Delete an identity.

When given a valid identity this function will disconnect any connections created using it, remove any pairing keys or other data associated with it, and then flag it as deleted, so that it can not be used for any operations. To take back into use the slot the identity was occupying the `bt_id_reset()` API needs to be used.

**Note:** the default identity (BT_ID_DEFAULT) cannot be deleted, i.e. this API will return an error if asked to do that.

**Parameters**

- `id` – Existing identity identifier.

**Returns**

0 in case of success, or a negative error code on failure.

Start advertising.

Set advertisement data, scan response data, advertisement parameters and start advertising.

When the advertisement parameter peer address has been set the advertising will be directed to the peer. In this case advertisement data and scan response data parameters are ignored. If the mode is high duty cycle the timeout will be `BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT`. 

```c
int bt_id_reset(uint8_t id, bt_addr_le_t *addr, uint8_t *irk)
```

```c
int bt_id_delete(uint8_t id)
```

```c
int bt_le_adv_start(const struct bt_le_adv_param *param, const struct bt_data *ad, size_t ad_len, const struct bt_data *sd, size_t sd_len)
```
Parameters

- `param` – Advertising parameters.
- `ad` – Data to be used in advertisement packets.
- `ad_len` – Number of elements in ad
- `sd` – Data to be used in scan response packets.
- `sd_len` – Number of elements in sd

Returns

Zero on success or (negative) error code otherwise.

Returns

-ENOMEM No free connection objects available for connectable advertiser.
-CONNREFUSED When connectable advertising is requested and there is already maximum number of connections established in the controller. This error code is only guaranteed when using Zephyr controller, for other controllers code returned in this case may be -EIO.

```c
int bt_le_adv_update_data(const struct bt_data *ad, size_t ad_len, const struct bt_data *sd, size_t sd_len)
```

Update advertising.
Update advertisement and scan response data.

Parameters

- `ad` – Data to be used in advertisement packets.
- `ad_len` – Number of elements in ad
- `sd` – Data to be used in scan response packets.
- `sd_len` – Number of elements in sd

Returns

Zero on success or (negative) error code otherwise.

```c
int bt_le_adv_stop(void)
```

Stop advertising.

Stop ongoing advertising.

Returns

Zero on success or (negative) error code otherwise.

```c
int bt_le_ext_adv_create(const struct bt_le_adv_param *param, const struct bt_le_ext_adv_cb *cb, struct bt_le_ext_adv **adv)
```

Create advertising set.

Create a new advertising set and set advertising parameters. Advertising parameters can be updated with `bt_le_ext_adv_update_param`.

Parameters

- `cb` – [in] Callback struct to notify about advertiser activity. Can be NULL. Must point to valid memory during the lifetime of the advertising set.
- `adv` – [out] Valid advertising set object on success.

Returns

Zero on success or (negative) error code otherwise.
int bt_le_ext_adv_start(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_start_param *param)
Start advertising with the given advertising set.

If the advertiser is limited by either the timeout or number of advertising events the application will be notified by the advertiser sent callback once the limit is reached. If the advertiser is limited by both the timeout and the number of advertising events then the limit that is reached first will stop the advertiser.

Parameters
• adv – Advertising set object.
• param – Advertise start parameters.

int bt_le_ext_adv_stop(struct bt_le_ext_adv *adv)
Stop advertising with the given advertising set.

Stop advertising with a specific advertising set. When using this function the advertising sent callback will not be called.

Parameters
• adv – Advertising set object.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_ext_adv_set_data(struct bt_le_ext_adv *adv, const struct bt_data *ad, size_t ad_len, const struct bt_data *sd, size_t sd_len)
Set an advertising set's advertising or scan response data.

Set advertisement data or scan response data. If the advertising set is currently advertising then the advertising data will be updated in subsequent advertising events.

When both BT_LE_ADV_OPT_EXT_ADV and BT_LE_ADV_OPT_SCANNABLE are enabled then advertising data is ignored. When BT_LE_ADV_OPT_SCANNABLE is not enabled then scan response data is ignored.

If the advertising set has been configured to send advertising data on the primary advertising channels then the maximum data length is BT_GAP_ADV_MAX_ADV_DATA_LEN bytes. If the advertising set has been configured for extended advertising, then the maximum data length is defined by the controller with the maximum possible of BT_GAP_ADV_MAX_EXT_ADV_DATA_LEN bytes.

Note: Not all scanners support extended data length advertising data.

Note: When updating the advertising data while advertising the advertising data and scan response data length must be smaller or equal to what can be fit in a single advertising packet. Otherwise the advertiser must be stopped.

Parameters
• adv – Advertising set object.
• ad – Data to be used in advertisement packets.
• ad_len – Number of elements in ad
• sd – Data to be used in scan response packets.
• sd_len – Number of elements in sd

Returns
Zero on success or (negative) error code otherwise.
int bt_le_ext_adv_update_param(struct bt_le_ext_adv *adv, const struct bt_le_adv_param *param)

Update advertising parameters.

Update the advertising parameters. The function will return an error if the advertiser set is currently advertising. Stop the advertising set before calling this function.

**Note:** When changing the option `BT_LE_ADV_OPT_USE_NAME` then `bt_le_ext_adv_set_data` needs to be called in order to update the advertising data and scan response data.

**Parameters**
- `adv` – Advertising set object.
- `param` – Advertising parameters.

**Returns**
Zero on success or (negative) error code otherwise.

int bt_le_ext_adv_delete(struct bt_le_ext_adv *adv)
Delete advertising set.

Delete advertising set. This will free up the advertising set and make it possible to create a new advertising set.

**Returns**
Zero on success or (negative) error code otherwise.

uint8_t bt_le_ext_adv_get_index(struct bt_le_ext_adv *adv)
Get array index of an advertising set.

This function is used to map bt_adv to index of an array of advertising sets. The array has `CONFIG_BT_EXT_ADV_MAX_ADV_SET` elements.

**Parameters**
- `adv` – Advertising set.

**Returns**
Index of the advertising set object. The range of the returned value is 0..`CONFIG_BT_EXT_ADV_MAX_ADV_SET-1`

int bt_le_ext_adv_get_info(const struct bt_le_ext_adv *adv, struct bt_le_ext_adv_info *info)
Get advertising set info.

**Parameters**
- `adv` – Advertising set object
- `info` – Advertising set info object

**Returns**
Zero on success or (negative) error code on failure.

int bt_le_per_adv_set_param(struct bt_le_ext_adv *adv, const struct bt_le_per_adv_param *param)
Set or update the periodic advertising parameters.

The periodic advertising parameters can only be set or updated on an extended advertisement set which is neither scannable, connectable nor anonymous.

**Parameters**
- `adv` – Advertising set object.
- `param` – Advertising parameters.
Zephyr Project Documentation, Release 3.2.99

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_set_data(const struct bt_le_ext_adv *adv, const struct bt_data *ad, size_t ad_len)
Set or update the periodic advertising data.
The periodic advertisement data can only be set or updated on an extended advertisement set which is neither scannable, connectable nor anonymous.

Parameters
• adv – Advertising set object.
• ad – Advertising data.
• ad_len – Advertising data length.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_start(struct bt_le_ext_adv *adv)
Starts periodic advertising.
Enabling the periodic advertising can be done independently of extended advertising, but both periodic advertising and extended advertising shall be enabled before any periodic advertising data is sent. The periodic advertising and extended advertising can be enabled in any order.
Once periodic advertising has been enabled, it will continue advertising until bt_le_per_adv_stop() has been called, or if the advertising set is deleted by bt_le_ext_adv_delete(). Calling bt_le_ext_adv_stop() will not stop the periodic advertising.

Parameters
• adv – Advertising set object.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_stop(struct bt_le_ext_adv *adv)
Stops periodic advertising.
Disabling the periodic advertising can be done independently of extended advertising. Disabling periodic advertising will not disable extended advertising.

Parameters
• adv – Advertising set object.

Returns
Zero on success or (negative) error code otherwise.

uint8_t bt_le_per_adv_sync_get_index(struct bt_le_per_adv_sync *per_adv_sync)
Get array index of an periodic advertising sync object.
This function is get the index of an array of periodic advertising sync objects. The array has CONFIG_BT_PER_ADV_SYNC_MAX elements.

Parameters
• per_adv_sync – The periodic advertising sync object.

Returns
Index of the periodic advertising sync object. The range of the returned value is 0..CONFIG_BT_PER_ADV_SYNC_MAX-1
struct bt_le_per_adv_sync *bt_le_per_adv_sync_lookup_index(uint8_t index)
Get a periodic advertising sync object from the array index.

This function is to get the periodic advertising sync object from the array index. The array has CONFIG_BT_PER_ADV_SYNC_MAX elements.

Parameters
• index – The index of the periodic advertising sync object. The range of the index value is 0..CONFIG_BT_PER_ADV_SYNC_MAX-1

Returns
The periodic advertising sync object of the array index or NULL if invalid index.

int bt_le_per_adv_sync_get_info(struct bt_le_per_adv_sync *per_adv_sync, struct bt_le_per_adv_sync_info *info)
Get periodic adv sync information.

Parameters
• per_adv_sync – Periodic advertising sync object.
• info – Periodic advertising sync info object

Returns
Zero on success or (negative) error code on failure.

struct bt_le_per_adv_sync *bt_le_per_adv_sync_lookup_addr(const bt_addr_le_t *adv_addr, uint8_t sid)
Look up an existing periodic advertising sync object by advertiser address.

Parameters
• adv_addr – Advertiser address.
• sid – The advertising set ID.

Returns
Periodic advertising sync object or NULL if not found.

int bt_le_per_adv_sync_create(const struct bt_le_per_adv_sync_param *param, struct bt_le_per_adv_sync **out_sync)
Create a periodic advertising sync object.

Create a periodic advertising sync object that can try to synchronize to periodic advertising reports from an advertiser. Scan shall either be disabled or extended scan shall be enabled.

Parameters
• param – [in] Periodic advertising sync parameters.
• out_sync – [out] Periodic advertising sync object on.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_delete(struct bt_le_per_adv_sync *per_adv_sync)
Delete periodic advertising sync.

Delete the periodic advertising sync object. Can be called regardless of the state of the sync. If the syncing is currently syncing, the syncing is cancelled. If the sync has been established, it is terminated. The periodic advertising sync object will be invalidated afterwards.

If the state of the sync object is syncing, then a new periodic advertising sync object may not be created until the controller has finished canceling this object.

Parameters
• per_adv_sync – The periodic advertising sync object.
Returns
Zero on success or (negative) error code otherwise.

void bt_le_per_adv_sync_cb_register(struct bt_le_per_adv_sync_cb *cb)
Register periodic advertising sync callbacks.
Adds the callback structure to the list of callback structures for periodic advertising syncs.
This callback will be called for all periodic advertising sync activity, such as synced, terminated
and when data is received.

Parameters
• cb – Callback struct. Must point to memory that remains valid.

int bt_le_per_adv_sync_recv_enable(struct bt_le_per_adv_sync *per_adv_sync)
Enables receiving periodic advertising reports for a sync.
If the sync is already receiving the reports, -EALREADY is returned.

Parameters
• per_adv_sync – The periodic advertising sync object.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_recv_disable(struct bt_le_per_adv_sync *per_adv_sync)
Disables receiving periodic advertising reports for a sync.
If the sync report receiving is already disabled, -EALREADY is returned.

Parameters
• per_adv_sync – The periodic advertising sync object.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_transfer(const struct bt_le_per_adv_sync *per_adv_sync, const struct
bt_conn *conn, uint16_t service_data)
Transfer the periodic advertising sync information to a peer device.
This will allow another device to quickly synchronize to the same periodic advertising train
that this device is currently synced to.

Parameters
• per_adv_sync – The periodic advertising sync to transfer.
• conn – The peer device that will receive the sync information.
• service_data – Application service data provided to the remote host.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_set_info_transfer(const struct bt_le_ext_adv *adv, const struct bt_conn
*conn, uint16_t service_data)
Transfer the information about a periodic advertising set.
This will allow another device to quickly synchronize to periodic advertising set from this
device.

Parameters
• adv – The periodic advertising set to transfer info of.
• conn – The peer device that will receive the information.
• service_data – Application service data provided to the remote host.
Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_transfer_subscribe(const struct bt_conn *conn, const struct bt_le_per_adv_sync_transfer_param *param)
Subscribe to periodic advertising sync transfers (PASTs).
Sets the parameters and allow other devices to transfer periodic advertising syncs.

Parameters
• conn – The connection to set the parameters for. If NULL default parameters for all connections will be set. Parameters set for specific connection will always have precedence.
• param – The periodic advertising sync transfer parameters.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_sync_transfer.unsubscribe(const struct bt_conn *conn)
Unsubscribe from periodic advertising sync transfers (PASTs).
Remove the parameters that allow other devices to transfer periodic advertising syncs.

Parameters
• conn – The connection to remove the parameters for. If NULL default parameters for all connections will be removed. Unsubscribing for a specific device, will still allow other devices to transfer periodic advertising syncs.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_list_add(const bt_addr_le_t *addr, uint8_t sid)
Add a device to the periodic advertising list.
Add peer device LE address to the periodic advertising list. This will make it possibly to automatically create a periodic advertising sync to this device.

Parameters
• addr – Bluetooth LE identity address.
• sid – The advertising set ID. This value is obtained from the \texttt{bt\_le\_scan\_recv\_info} in the scan callback.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_list_remove(const bt_addr_le_t *addr, uint8_t sid)
Remove a device from the periodic advertising list.
Removes peer device LE address from the periodic advertising list.

Parameters
• addr – Bluetooth LE identity address.
• sid – The advertising set ID. This value is obtained from the \texttt{bt\_le\_scan\_recv\_info} in the scan callback.

Returns
Zero on success or (negative) error code otherwise.

int bt_le_per_adv_list_clear(void)
Clear the periodic advertising list.
Clears the entire periodic advertising list.

6.1. Bluetooth
Returns
Zero on success or (negative) error code otherwise.

```c
int bt_le_scan_start(const struct bt_le_scan_param *param, bt_le_scan_cb_t cb)
```
Start (LE) scanning.
Start LE scanning with given parameters and provide results through the specified callback.

Note: The LE scanner by default does not use the Identity Address of the local device when CONFIG_BT_PRIVACY is disabled. This is to prevent the active scanner from disclosing the identity information when requesting additional information from advertisers. In order to enable directed advertiser reports then CONFIG_BT_SCAN_WITH_IDENTITY must be enabled.

Parameters
- **param** – Scan parameters.
- **cb** – Callback to notify scan results. May be NULL if callback registration through `bt_le_scan_cb_register` is preferred.

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
int bt_le_scan_stop(void)
```
Stop (LE) scanning.
Stops ongoing LE scanning.

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
void bt_le_scan_cb_register(struct bt_le_scan_cb *cb)
```
Register scanner packet callbacks.
Adds the callback structure to the list of callback structures that monitors scanner activity.
This callback will be called for all scanner activity, regardless of what API was used to start the scanner.

Parameters
- **cb** – Callback struct. Must point to memory that remains valid.

```c
void bt_le_scan_cb_unregister(struct bt_le_scan_cb *cb)
```
Unregister scanner packet callbacks.
Remove the callback structure from the list of scanner callbacks.

Parameters
- **cb** – Callback struct. Must point to memory that remains valid.

```c
int bt_le_filter_accept_list_add(const bt_addr_le_t *addr)
```
Add device (LE) to filter accept list.
Add peer device LE address to the filter accept list.

Note: The filter accept list cannot be modified when an LE role is using the filter accept list, i.e. advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.
6.1. Bluetooth

Parameters

- addr – Bluetooth LE identity address.

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
static inline int bt_le_whitelist_add(const bt_addr_le_t *addr)
int bt_le_filter_accept_list_remove(const bt_addr_le_t *addr)
    Remove device (LE) from filter accept list.
    Remove peer device LE address from the filter accept list.
```

Note: The filter accept list cannot be modified when an LE role is using the filter accept list, i.e., advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

Parameters

- addr – Bluetooth LE identity address.

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
static inline int bt_le_whitelist_rem(const bt_addr_le_t *addr)
int bt_le_filter_accept_list_clear(void)
    Clear filter accept list.
    Clear all devices from the filter accept list.
```

Note: The filter accept list cannot be modified when an LE role is using the filter accept list, i.e., advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
static inline int bt_le_whitelist_clear(void)
int bt_le_set_chan_map(uint8_t chan_map[5])
    Set (LE) channel map.
```

Parameters

- chan_map – Channel map.

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

```c
int bt_le_set_rpa_timeout(uint16_t new_rpa_timeout)
    Set the Resolvable Private Address timeout in runtime.
    The new RPA timeout value will be used for the next RPA rotation and all subsequent rotations until another override is scheduled with this API.
```
Initially, the if CONFIG_BT_RPA_TIMEOUT is used as the RPA timeout.
This symbol is linkable if CONFIG_BT_RPA_TIMEOUT_DYNAMIC is enabled.

**Parameters**
- `new_rpa_timeout` – Resolvable Private Address timeout in seconds

**Return values**
- 0 – Success.
- -EINVAL – RPA timeout value is invalid. Valid range is 1s - 3600s.

```c
void bt_data_parse(struct net_buf_simple *ad, bool (*func)(struct bt_data *data, void *user_data), void *user_data)
```
A helper for parsing advertising (or EIR or OOB) data.

**Warning:** This helper function will consume `ad` when parsing. The user should make a copy if the original data is to be used afterwards

**Parameters**
- `ad` – Advertising data as given to the bt_le_scan_cb_t callback.
- `func` – Callback function which will be called for each element that’s found in the data. The callback should return true to continue parsing, or false to stop parsing.
- `user_data` – User data to be passed to the callback.

```c
int bt_le_oob_get_local(uint8_t id, struct bt_le_oob *oob)
```
Get local LE Out of Band (OOB) information.

This function allows to get local information that are useful for Out of Band pairing or connection creation.

If privacy CONFIG_BT_PRIVACY is enabled this will result in generating new Resolvable Private Address (RPA) that is valid for CONFIG_BT_RPA_TIMEOUT seconds. This address will be used for advertising started by `bt_le_adv_start`, active scanning and connection creation.

**Note:** If privacy is enabled the RPA cannot be refreshed in the following cases:
- Creating a connection in progress, wait for the connected callback. In addition when extended advertising CONFIG_BT_EXT_ADV is not enabled or not supported by the controller:
- Advertiser is enabled using a Random Static Identity Address for a different local identity.
- The local identity conflicts with the local identity used by other roles.

**Parameters**
- `id` – [in] Local identity, in most cases BT_ID_DEFAULT.
- `oob` – [out] LE OOB information

**Returns**
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.
int bt_le_ext_adv_oob_get_local(struct bt_le_ext_adv *adv, struct bt_le_oob *oob)
Get local LE Out of Band (OOB) information.

This function allows to get local information that are useful for Out of Band pairing or connection creation.

If privacy CONFIG_BT_PRIVACY is enabled this will result in generating new Resolvable Private Address (RPA) that is valid for CONFIG_BT_RPA_TIMEOUT seconds. This address will be used by the advertising set.

**Note:** When generating OOB information for multiple advertising set all OOB information needs to be generated at the same time.

**Note:** If privacy is enabled the RPA cannot be refreshed in the following cases:

- Creating a connection in progress, wait for the connected callback.

**Parameters**

- **adv** – [in] The advertising set object
- **oob** – [out] LE OOB information

**Returns**

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_br_discovery_start(const struct bt_br_discovery_param *param, struct bt_br_discovery_result *results, size_t count, bt_br_discovery_cb_t cb)
Start BR/EDR discovery.

Start BR/EDR discovery (inquiry) and provide results through the specified callback. When bt_br_discovery_cb_t is called it indicates that discovery has completed. If more inquiry results were received during session than fits in provided result storage, only ones with highest RSSI will be reported.

**Parameters**

- **param** – Discovery parameters.
- **results** – Storage for discovery results.
- **count** – Number of results in storage. Valid range: 1-255.
- **cb** – Callback to notify discovery results.

**Returns**

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int bt_br_discovery_stop(void)
Stop BR/EDR discovery.

Stops ongoing BR/EDR discovery. If discovery was stopped by this call results won’t be reported.

**Returns**

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.
int bt_br_oob_get_local(struct bt_br_oob *oob)
Get BR/EDR local Out Of Band information.

This function allows to get local controller information that are useful for Out Of Band pairing or connection creation process.

Parameters
• oob – Out Of Band information

int bt_br_set_discoverable(bool enable)
Enable/disable set controller in discoverable state.

Allows make local controller to listen on INQUIRY SCAN channel and responds to devices making general inquiry. To enable this state it’s mandatory to first be in connectable state.

Parameters
• enable – Value allowing/disallowing controller to become discoverable.

Returns
Negative if fail set to requested state or requested state has been already set. Zero if done successfully.

int bt_br_set_connectable(bool enable)
Enable/disable set controller in connectable state.

Allows make local controller to be connectable. It means the controller start listen to devices requests on PAGE SCAN channel. If disabled also resets discoverability if was set.

Parameters
• enable – Value allowing/disallowing controller to be connectable.

Returns
Negative if fail set to requested state or requested state has been already set. Zero if done successfully.

int bt_unpair(uint8_t id, const bt_addr_le_t *addr)
Clear pairing information.

Parameters
• id – Local identity (mostly just BT_ID_DEFAULT).
• addr – Remote address, NULL or BT_ADDR_LE_ANY to clear all remote devices.

Returns
0 on success or negative error value on failure.

void bt_foreach_bond(uint8_t id, void (*func)(const struct bt_bond_info *info, void *user_data), void *user_data)
Iterate through all existing bonds.

Parameters
• id – Local identity (mostly just BT_ID_DEFAULT).
• func – Function to call for each bond.
• user_data – Data to pass to the callback function.

int bt_configure_data_path(uint8_t dir, uint8_t id, uint8_t vs_config_len, const uint8_t *vs_config)
Configure vendor data path.

Request the Controller to configure the data transport path in a given direction between the Controller and the Host.
Parameters

- dir – Direction to be configured, BT_HCI_DATAPATH_DIR_HOST_TO_CTLR or BT_HCI_DATAPATH_DIR_CTLR_TO_HOST
- id – Vendor specific logical transport channel ID, range [BT_HCI_DATAPATH_ID_VS..BT_HCI_DATAPATH_ID_VS_END]
- vs_config_len – Length of additional vendor specific configuration data
- vs_config – Pointer to additional vendor specific configuration data

Returns

0 in case of success or negative value in case of error.

```c
struct bt_le_ext_adv_sent_info
    #include <bluetooth.h>

Public Members

uint8_t num_sent
    The number of advertising events completed.
```

```c
struct bt_le_ext_adv_connected_info
    #include <bluetooth.h>

Public Members

struct bt_conn *conn
    Connection object of the new connection
```

```c
struct bt_le_ext_adv_scanned_info
    #include <bluetooth.h>

Public Members

bt_addr_le_t *addr
    Active scanner LE address and type
```

```c
struct bt_le_ext_adv_cb
    #include <bluetooth.h>

Public Members

void (*sent)(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_sent_info *info)
    The advertising set has finished sending adv data.
    This callback notifies the application that the advertising set has finished sending advertising data. The advertising set can either have been stopped by a timeout or because the specified number of advertising events has been reached.
```
void (*connected)(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_connected_info *info)
The advertising set has accepted a new connection.

Param adv
  The advertising set object.

Param info
  Information about the sent event.

void (*scanned)(struct bt_le_ext_adv *adv, struct bt_le_ext_adv_scanned_info *info)
The advertising set has sent scan response data.

Param adv
  The advertising set object.

Param addr
  Information about the scanned event.

struct bt_data
  #include <bluetooth.h> Bluetooth data.
  
Description of different data types that can be encoded into advertising data. Used to form arrays that are passed to the bt_le_adv_start() function.

struct bt_le_adv_param
  #include <bluetooth.h> LE Advertising Parameters.

Public Members

uint8_t id
  Local identity.
  
Note: When extended advertising CONFIG_BT_EXT_ADV is not enabled or not supported by the controller it is not possible to scan and advertise simultaneously using two different random addresses.

uint8_t sid
  Advertising Set Identifier, valid range 0x00 - 0x0f.
  
Note: Requires BT_LE_ADV_OPT_EXT_ADV

uint8_t secondary_max_skip
  Secondary channel maximum skip count.
Maximum advertising events the advertiser can skip before it must send advertising data on the secondary advertising channel.

**Note:** Requires `BT_LE_ADV_OPT_EXT_ADV`

```c
uint32_t options
    Bit-field of advertising options

uint32_t interval_min
    Minimum Advertising Interval (N * 0.625 milliseconds) Minimum Advertising Interval shall be less than or equal to the Maximum Advertising Interval. The Minimum Advertising Interval and Maximum Advertising Interval should not be the same value (as stated in Bluetooth Core Spec 5.2, section 7.8.5) Range: 0x0020 to 0x4000

uint32_t interval_max
    Maximum Advertising Interval (N * 0.625 milliseconds) Minimum Advertising Interval shall be less than or equal to the Maximum Advertising Interval. The Minimum Advertising Interval and Maximum Advertising Interval should not be the same value (as stated in Bluetooth Core Spec 5.2, section 7.8.5) Range: 0x0020 to 0x4000

const bt_addr_le_t *peer
    Directed advertising to peer.
    When this parameter is set the advertiser will send directed advertising to the remote device.
    The advertising type will either be high duty cycle, or low duty cycle if the `BT_LE_ADV_OPT_DIR_MODE_LOW_DUTY` option is enabled. When using `BT_LE_ADV_OPT_EXT_ADV` then only low duty cycle is allowed.
    In case of connectable high duty cycle if the connection could not be established within the timeout the connected() callback will be called with the status set to `BT_HCI_ERR_ADV_TIMEOUT`.

struct bt_le_per_adv_param
    #include <bluetooth.h>

Public Members

uint16_t interval_min
    Minimum Periodic Advertising Interval (N * 1.25 ms)
    Shall be greater or equal to `BT_GAP_PER_ADV_MIN_INTERVAL` and less or equal to `interval_max`.

uint16_t interval_max
    Maximum Periodic Advertising Interval (N * 1.25 ms)
    Shall be less or equal to `BT_GAP_PER_ADV_MAX_INTERVAL` and greater or equal to `interval_min`.

uint32_t options
    Bit-field of periodic advertising options
struct bt_le_ext_adv_start_param
#include <bluetooth.h>

Public Members

uint16_t timeout
Advertiser timeout (N * 10 ms).
Application will be notified by the advertiser sent callback. Set to zero for no timeout.
When using high duty cycle directed connectable advertising then this parameters must be set to a non-zero value less than or equal to the maximum of BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT.
If privacy CONFIG_BT_PRIVACY is enabled then the timeout must be less than CONFIG_BT_RPA_TIMEOUT.

uint8_t num_events
Number of advertising events.
Application will be notified by the advertiser sent callback. Set to zero for no limit.

struct bt_le_ext_adv_info
#include <bluetooth.h> Advertising set info structure.

Public Members

int8_t tx_power
Currently selected Transmit Power (dBM).

const bt_addr_le_t *addr
Current local advertising address used.

struct bt_le_per_adv_sync_synced_info
#include <bluetooth.h>

Public Members

const bt_addr_le_t *addr
Advertiser LE address and type.

uint8_t sid
Advertiser SID

uint16_t interval
Periodic advertising interval (N * 1.25 ms)

uint8_t phy
Advertiser PHY
bool recv_enabled  
True if receiving periodic advertisements, false otherwise.

uint16_t service_data  
Service Data provided by the peer when sync is transferred.
Will always be 0 when the sync is locally created.

struct bt_conn *conn  
Peer that transferred the periodic advertising sync.
Will always be 0 when the sync is locally created.

struct bt_le_per_adv_sync_term_info  
#include <bluetooth.h>

Public Members

const bt_addr_le_t *addr  
Advertiser LE address and type.

uint8_t sid  
Advertiser SID

uint8_t reason  
Cause of periodic advertising termination

struct bt_le_per_adv_sync_recv_info  
#include <bluetooth.h>

Public Members

const bt_addr_le_t *addr  
Advertiser LE address and type.

uint8_t sid  
Advertiser SID

int8_t tx_power  
The TX power of the advertisement.

int8_t rssi  
The RSSI of the advertisement excluding any CTE.

uint8_t cte_type  
The Constant Tone Extension (CTE) of the advertisement (bt_df_cte_type)

struct bt_le_per_adv_sync_state_info  
#include <bluetooth.h>
Public Members

bool recv_enabled
    True if receiving periodic advertisements, false otherwise.

struct bt_le_per_adv_sync_cb
    #include <bluetooth.h>

Public Members

void (*synced)(struct bt_le_per_adv_sync *sync, struct bt_le_per_adv_sync_synced_info *info)
    The periodic advertising has been successfully synced.
    This callback notifies the application that the periodic advertising set has been successfully
    synced, and will now start to receive periodic advertising reports.
    Param sync
        The periodic advertising sync object.
    Param info
        Information about the sync event.

void (*term)(struct bt_le_per_adv_sync *sync, const struct bt_le_per_adv_sync_term_info *info)
    The periodic advertising sync has been terminated.
    This callback notifies the application that the periodic advertising sync has been termi-
    nated, either by local request, remote request or because due to missing data, e.g. by
    being out of range or sync.
    Param sync
        The periodic advertising sync object.

void (*recv)(struct bt_le_per_adv_sync *sync, const struct bt_le_per_adv_sync_recv_info *info, struct net_buf_simple *buf)
    Periodic advertising data received.
    This callback notifies the application of an periodic advertising report.
    Param sync
        The advertising set object.
    Param info
        Information about the periodic advertising event.
    Param buf
        Buffer containing the periodic advertising data.

void (*state_changed)(struct bt_le_per_adv_sync *sync, const struct bt_le_per_adv_sync_state_info *info)
    The periodic advertising sync state has changed.
    This callback notifies the application about changes to the sync state. Initialize sync and
    termination is handled by their individual callbacks, and won’t be notified here.
    Param sync
        The periodic advertising sync object.
    Param info
        Information about the state change.
void (*biginfo)(struct bt_le_per_adv_sync *sync, const struct bt_iso_biginfo *biginfo)
BIGInfo advertising report received.
This callback notifies the application of a BIGInfo advertising report. This is received if the advertiser is broadcasting isochronous streams in a BIG. See iso.h for more information.

   **Param sync**
   The advertising set object.

   **Param biginfo**
   The BIGInfo report.

void (*cte_report_cb)(struct bt_le_per_adv_sync *sync, struct bt_df_per_adv_sync_iq_samples_report const *info)
Callback for IQ samples report collected when sampling CTE received with periodic advertising PDU.

   **Param sync**
   The periodic advertising sync object.

   **Param info**
   Information about the sync event.

struct bt_le_per_adv_sync_param
#include <bluetooth.h>

**Public Members**

*bt_addr_le_t* addr
Periodic Advertiser Address.

Only valid if not using the periodic advertising list (BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST)

*uint8_t* sid
Advertiser SID.

Only valid if not using the periodic advertising list (BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST)

*uint32_t* options
Bit-field of periodic advertising sync options.

*uint16_t* skip
Maximum event skip.

Maximum number of periodic advertising events that can be skipped after a successful receive. Range: 0x0000 to 0x01F3

*uint16_t* timeout
Synchronization timeout (N * 10 ms)
Synchronization timeout for the periodic advertising sync. Range 0x000A to 0x4000 (100 ms to 163840 ms)

*struct bt_le_per_adv_sync_info*
#include <bluetooth.h> Advertising set info structure.
Public Members

`bt_addr_le_t addr`
Periodic Advertiser Address

`uint8_t sid`
Advertiser SID

`uint16_t interval`
Periodic advertising interval (N * 1.25 ms)

`uint8_t phy`
Advertiser PHY

```c
struct bt_le_per_adv_sync_transfer_param
#include <bluetooth.h>
```

Public Members

`uint16_t skip`
Maximum event skip.
The number of periodic advertising packets that can be skipped after a successful receive.

`uint16_t timeout`
Synchronization timeout (N * 10 ms)
Synchronization timeout for the periodic advertising sync. Range 0x000A to 0x4000 (100 ms to 163840 ms)

`uint32_t options`
Periodic Advertising Sync Transfer options

```c
struct bt_le_scan_param
#include <bluetooth.h>
```
LE scan parameters

Public Members

`uint8_t type`
Scan type (BT_LE_SCAN_TYPE_ACTIVE or BT_LE_SCAN_TYPE_PASSIVE)

`uint32_t options`
Bit-field of scanning options.

`uint16_t interval`
Scan interval (N * 0.625 ms)

`uint16_t window`
Scan window (N * 0.625 ms)
uint16_t timeout
    Scan timeout (N * 10 ms)
    Application will be notified by the scan timeout callback. Set zero to disable timeout.

uint16_t interval_coded
    Scan interval LE Coded PHY (N * 0.625 MS)
    Set zero to use same as LE 1M PHY scan interval.

uint16_t window_coded
    Scan window LE Coded PHY (N * 0.625 MS)
    Set zero to use same as LE 1M PHY scan window.

struct bt_le_scan_recv_info
    #include <bluetooth.h> LE advertisement and scan response packet information

Public Members

const bt_addr_le_t *addr
    Advertiser LE address and type.
    If advertiser is anonymous then this address will be BT_ADDR_LE_ANY.

uint8_t sid
    Advertising Set Identifier.

int8_t rssi
    Strength of advertiser signal.

int8_t tx_power
    Transmit power of the advertiser.

uint8_t adv_type
    Advertising packet type.
    Uses the BT_GAP_ADV_TYPE_* value.
    May indicate that this is a scan response if the type is BT_GAP_ADV_TYPE_SCAN_RSP.

uint16_t adv_props
    Advertising packet properties bitfield.
    Uses the BT_GAP_ADV_PROP_* values. May indicate that this is a scan response if the value contains the BT_GAP_ADV_PROP_SCAN_RESPONSE bit.

uint16_t interval
    Periodic advertising interval.
    If 0 there is no periodic advertising.

uint8_t primary_phy
    Primary advertising channel PHY.
uint8_t secondary_phy
Secondary advertising channel PHY.

struct bt_le_scan_cb
#include <bluetooth.h> Listener context for (LE) scanning.

Public Members

void (*recv)(const struct bt_le_scan_recv_info *info, struct net_buf_simple *buf)
Advertisement packet and scan response received callback.

Param info
Advertiser packet and scan response information.

Param buf
Buffer containing advertiser data.

void (*timeout)(void)
The scanner has stopped scanning after scan timeout.

struct bt_le_oob_sc_data
#include <bluetooth.h> LE Secure Connections pairing Out of Band data.

Public Members

uint8_t r[16]
Random Number.

uint8_t c[16]
Confirm Value.

struct bt_le_oob
#include <bluetooth.h> LE Out of Band information.

Public Members

bt_addr_le_t addr
LE address. If privacy is enabled this is a Resolvable Private Address.

struct bt_le_oob_sc_data le_sc_data
LE Secure Connections pairing Out of Band data.

struct bt_br_discovery_result
#include <bluetooth.h> BR/EDR discovery result structure.

Public Members
bt_addr_t addr
    Remote device address

int8_t rssi
    RSSI from inquiry

tUint8_t cod[3]
    Class of Device

tUint8_t eir[240]
    Extended Inquiry Response

struct bt_br_discovery_param
    #include <bluetooth.h> BR/EDR discovery parameters

Public Members

uint8_t length
    Maximum length of the discovery in units of 1.28 seconds. Valid range is 0x01 - 0x30.

bool limited
    True if limited discovery procedure is to be used.

struct bt_br_oob
    #include <bluetooth.h>

Public Members

bt_addr_t addr
    BR/EDR address.

struct bt_bond_info
    #include <bluetooth.h> Information about a bond with a remote device.

Public Members

bt_addr_le_t addr
    Address of the remote device.

group bt_addr
    Bluetooth device address definitions and utilities.

Defines

```
BT_ADDR_LE_RANDOM

BT_ADDR_LE_PUBLIC_ID

BT_ADDR_LE_RANDOM_ID

BT_ADDR_LE_UNRESOLVED

BT_ADDR_LE_ANONYMOUS

BT_ADDR_SIZE
   Length in bytes of a standard Bluetooth address

BT_ADDR_LE_SIZE
   Length in bytes of an LE Bluetooth address. Not packed, so no sizeof()

BT_ADDR_ANY
   Bluetooth device “any” address, not a valid address

BT_ADDR_NONE
   Bluetooth device “none” address, not a valid address

BT_ADDR_LE_ANY
   Bluetooth LE device “any” address, not a valid address

BT_ADDR_LE_NONE
   Bluetooth LE device “none” address, not a valid address

BT_ADDR_IS_RPA(a)
   Check if a Bluetooth LE random address is resolvable private address.

BT_ADDR_IS_NRPA(a)
   Check if a Bluetooth LE random address is a non-resolvable private address.

BT_ADDR_IS_STATIC(a)
   Check if a Bluetooth LE random address is a static address.

BT_ADDR_SET_RPA(a)
   Set a Bluetooth LE random address as a resolvable private address.

BT_ADDR_SET_NRPA(a)
   Set a Bluetooth LE random address as a non-resolvable private address.

BT_ADDR_SET_STATIC(a)
   Set a Bluetooth LE random address as a static address.

BT_ADDR_STR_LEN
   Recommended length of user string buffer for Bluetooth address.
   The recommended length guarantee the output of address conversion will not lose valuable
   information about address being processed.
```
BT_ADDR_LE_STR_LEN

Recommended length of user string buffer for Bluetooth LE address.

The recommended length guarantee the output of address conversion will not lose valuable information about address being processed.

Functions

static inline int bt_addr_cmp(const bt_addr_t *a, const bt_addr_t *b)

Compare Bluetooth device addresses.

Parameters

• a – First Bluetooth device address to compare
• b – Second Bluetooth device address to compare

Returns

negative value if $a < b$, 0 if $a == b$, else positive

static inline int bt_addr_le_cmp(const bt_addr_le_t *a, const bt_addr_le_t *b)

Compare Bluetooth LE device addresses.

See also:

bt_addr_le_eq

Parameters

• a – First Bluetooth LE device address to compare
• b – Second Bluetooth LE device address to compare

Returns

negative value if $a < b$, 0 if $a == b$, else positive

static inline bool bt_addr_le_eq(const bt_addr_le_t *a, const bt_addr_le_t *b)

Determine equality of two Bluetooth LE device addresses.

The Bluetooth LE addresses are equal iff both the types and the 48-bit addresses are numerically equal.

Return values

• true – if the two addresses are equal
• false – otherwise

static inline void bt_addr_copy(bt_addr_t *dst, const bt_addr_t *src)

Copy Bluetooth device address.

Parameters

• dst – Bluetooth device address destination buffer.
• src – Bluetooth device address source buffer.

static inline void bt_addr_le_copy(bt_addr_le_t *dst, const bt_addr_le_t *src)

Copy Bluetooth LE device address.

Parameters

• dst – Bluetooth LE device address destination buffer.
• src – Bluetooth LE device address source buffer.
int bt_addr_le_create_nrpa(bt_addr_le_t *addr)
Create a Bluetooth LE random non-resolvable private address.

int bt_addr_le_create_static(bt_addr_le_t *addr)
Create a Bluetooth LE random static address.

static inline bool bt_addr_le_is_rpa(const bt_addr_le_t *addr)
Check if a Bluetooth LE address is a random private resolvable address.

Parameters
• addr – Bluetooth LE device address.

Returns
true if address is a random private resolvable address.

static inline bool bt_addr_le_is_identity(const bt_addr_le_t *addr)
Check if a Bluetooth LE address is valid identity address.

Valid Bluetooth LE identity addresses are either public address or random static address.

Parameters
• addr – Bluetooth LE device address.

Returns
true if address is a valid identity address.

static inline int bt_addr_to_str(const bt_addr_t *addr, char *str, size_t len)
Converts binary Bluetooth address to string.

Parameters
• addr – Address of buffer containing binary Bluetooth address.
• str – Address of user buffer with enough room to store formatted string containing binary address.
• len – Length of data to be copied to user string buffer. Refer to BT_ADDR_STR_LEN about recommended value.

Returns
Number of successfully formatted bytes from binary address.

static inline int bt_addr_le_to_str(const bt_addr_le_t *addr, char *str, size_t len)
Converts binary LE Bluetooth address to string.

Parameters
• addr – Address of buffer containing binary LE Bluetooth address.
• str – Address of user buffer with enough room to store formatted string containing binary LE address.
• len – Length of data to be copied to user string buffer. Refer to BT_ADDR_LE_STR_LEN about recommended value.

Returns
Number of successfully formatted bytes from binary address.

int bt_addr_from_str(const char *str, bt_addr_t *addr)
Convert Bluetooth address from string to binary.

Parameters
• str – [in] The string representation of a Bluetooth address.
• addr – [out] Address of buffer to store the Bluetooth address
Returns
Zero on success or (negative) error code otherwise.

int bt_addr_le_from_str(const char *str, const char *type, bt_addr_le_t *addr)
Convert LE Bluetooth address from string to binary.

Parameters
• str – [in] The string representation of an LE Bluetooth address.
• type – [in] The string representation of the LE Bluetooth address type.
• addr – [out] Address of buffer to store the LE Bluetooth address

Returns
Zero on success or (negative) error code otherwise.

BT_GAP_PER_ADV_MAX_TIMEOUT

BT_GAP_PER_ADV_INTERVAL_TO_MS(interval)
Minimum Periodic Advertising Interval (N * 1.25 ms)

Maximum Periodic Advertising Interval (N * 1.25 ms)

Convert periodic advertising interval (N * 1.25 ms) to milliseconds.
5 / 4 represents 1.25 ms unit.

BT_LE_SUPP_FEAT_40_ENCODE(w64)
Encode 40 least significant bits of 64-bit LE Supported Features into array values in little-endian format.

Helper macro to encode 40 least significant bits of 64-bit LE Supported Features value into advertising data. The number of bits that are encoded is a number of LE Supported Features defined by BT 5.3 Core specification.

Example of how to encode the 0x000000DFF00DF00D into advertising data.

\[
\text{BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_40_ENCODE(0x000000DFF00DF00D))}
\]

**Parameters**

- `w64` – LE Supported Features value (64-bits)

**Returns**

The comma separated values for LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.
BT_LE_SUPP_FEAT_32_ENCODE(w64)

Encode 4 least significant bytes of 64-bit LE Supported Features into 4 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 4 least significant bytes into advertising data. Other 4 bytes are not encoded.

Example of how to encode the 0x000000DFF00DF00D into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_32_ENCODE(0x000000DFF00DF00D))
```

**Parameters**

- `w64` – LE Supported Features value (64-bits)

**Returns**

The comma separated values for LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.

BT_LE_SUPP_FEAT_24_ENCODE(w64)

Encode 3 least significant bytes of 64-bit LE Supported Features into 3 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 3 least significant bytes into advertising data. Other 5 bytes are not encoded.

Example of how to encode the 0x000000DFF00DF00D into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_24_ENCODE(0x000000DFF00DF00D))
```

**Parameters**

- `w64` – LE Supported Features value (64-bits)

**Returns**

The comma separated values for LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.

BT_LE_SUPP_FEAT_16_ENCODE(w64)

Encode 2 least significant bytes of 64-bit LE Supported Features into 2 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 3 least significant bytes into advertising data. Other 6 bytes are not encoded.

Example of how to encode the 0x000000DFF00DF00D into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_16_ENCODE(0x000000DFF00DF00D))
```

**Parameters**

- `w64` – LE Supported Features value (64-bits)
Returns
The comma separated values for LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.

`BT_LE_SUPP_FEAT_8_ENCODE(w64)`
Encode the least significant byte of 64-bit LE Supported Features into single byte long array.
Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes the least significant byte into advertising data. Other 7 bytes are not encoded.
Example of how to encode the `0x000000DFF00DF00D` into advertising data.

```c
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_8_ENCODE(0x000000DFF00DF00D))
```

Parameters
- `w64` – LE Supported Features value (64-bits)

Returns
The value of least significant byte of LE Supported Features value that may be used directly as an argument for `BT_DATA_BYTES`.

`BT_LE_SUPP_FEAT_VALIDATE(w64)`
Validate whether LE Supported Features value does not use bits that are reserved for future use.
Helper macro to check if `w64` has zeros as bits 40-63. The macro is compliant with BT 5.3 Core Specification where bits 0-40 has assigned values. In case of invalid value, build time error is reported.

Enums

c
```
enum [anonymous]
LE PHY types
Values:

enumerator BT_GAP_LE_PHY_NONE = 0
    Convenience macro for when no PHY is set.

enumerator BT_GAP_LE_PHY_1M = BIT(0)
    LE 1M PHY

enumerator BT_GAP_LE_PHY_2M = BIT(1)
    LE 2M PHY

enumerator BT_GAP_LE_PHY_CODED = BIT(2)
    LE Coded PHY
```
```c
enum [anonymous]
Advertising PDU types
Values:
```
enumerator BT_GAP_ADV_TYPE_ADV_IND = 0x00
   Scannable and connectable advertising.

enumerator BT_GAP_ADV_TYPE_ADV_DIRECT_IND = 0x01
   Directed connectable advertising.

enumerator BT_GAP_ADV_TYPE_ADV_SCAN_IND = 0x02
   Non-connectable and scannable advertising.

enumerator BT_GAP_ADV_TYPE_ADV_NONCONN_IND = 0x03
   Non-connectable and non-scannable advertising.

enumerator BT_GAP_ADV_TYPE_SCAN_RSP = 0x04
   Additional advertising data requested by an active scanner.

enumerator BT_GAP_ADV_TYPE_EXT_ADV = 0x05
   Extended advertising, see advertising properties.

enum [anonymous]
   Advertising PDU properties
   Values:

   enumerator BT_GAP_ADV_PROP_CONNECTABLE = BIT(0)
      Connectable advertising.

   enumerator BT_GAP_ADV_PROP_SCANNABLE = BIT(1)
      Scannable advertising.

   enumerator BT_GAP_ADV_PROP_DIRECTED = BIT(2)
      Directed advertising.

   enumerator BT_GAP_ADV_PROP_SCAN_RESPONSE = BIT(3)
      Additional advertising data requested by an active scanner.

   enumerator BT_GAP_ADV_PROP_EXT_ADV = BIT(4)
      Extended advertising.

enum [anonymous]
   Constant Tone Extension (CTE) types
   Values:

   enumerator BT_GAP_CTE_AOA = 0x00
      Angle of Arrival

   enumerator BT_GAP_CTE_AOD_1US = 0x01
      Angle of Departure with 1 us slots
enumerator BT_GAP_CTE_AOD_2US = 0x02
   Angle of Departure with 2 us slots

enumerator BT_GAP_CTE_NONE = 0xFF
   No extensions

enum [anonymous]
   Peripheral sleep clock accuracy (SCA) in ppm (parts per million)
   Values:

   enumerator BT_GAP_SCA_UNKNOWN = 0

   enumerator BT_GAP_SCA_251_500 = 0

   enumerator BT_GAP_SCA_151_250 = 1

   enumerator BT_GAP_SCA_101_150 = 2

   enumerator BT_GAP_SCA_76_100 = 3

   enumerator BT_GAP_SCA_51_75 = 4

   enumerator BT_GAP_SCA_31_50 = 5

   enumerator BT_GAP_SCA_21_30 = 6

   enumerator BT_GAP_SCA_0_20 = 7

Generic Attribute Profile (GATT)

GATT layer manages the service database providing APIs for service registration and attribute declaration.

Services can be registered using `bt_gatt_service_register()` API which takes the `bt_gatt_service` struct that provides the list of attributes the service contains. The helper macro `BT_GATT_SERVICE()` can be used to declare a service.

Attributes can be declared using the `bt_gatt_attr` struct or using one of the helper macros:

- `BT_GATT_PRIMARY_SERVICE`
  Declares a Primary Service.
- `BT_GATT_SECONDARY_SERVICE`
  Declares a Secondary Service.
- `BT_GATT_INCLUDE_SERVICE`
  Declares a Include Service.
- `BT_GATT_CHARACTERISTIC`
  Declares a Characteristic.
- `BT_GATT_DESCRIPTOR`
  Declares a Descriptor.
BT_GATT_ATTRIBUTE
Declares an Attribute.

BT_GATT_CCC
Declares a Client Characteristic Configuration.

BT_GATT_CEP
Declares a Characteristic Extended Properties.

BT_GATT_CUD
Declares a Characteristic User Format.

Each attribute contains a uuid, which describes their type, a read callback, a write callback and a set of permission. Both read and write callbacks can be set to NULL if the attribute permission don’t allow their respective operations.

**Note:** 32-bit UUIDs are not supported in GATT. All 32-bit UUIDs shall be converted to 128-bit UUIDs when the UUID is contained in an ATT PDU.

**Note:** Attribute read and write callbacks are called directly from RX Thread thus it is not recommended to block for long periods of time in them.

Attribute value changes can be notified using `bt_gatt_notify()` API, alternatively there is `bt_gatt_notify_cb()` where it is possible to pass a callback to be called when it is necessary to know the exact instant when the data has been transmitted over the air. Indications are supported by `bt_gatt_indicate()` API.

Client procedures can be enabled with the configuration option: `CONFIG_BT_GATT_CLIENT`

Discover procedures can be initiated with the use of `bt_gatt_discover()` API which takes the `bt_gatt_discover_params` struct which describes the type of discovery. The parameters also serve as a filter when setting the uuid field only attributes which matches will be discovered, in contrast setting it to NULL allows all attributes to be discovered.

**Note:** Caching discovered attributes is not supported.

Read procedures are supported by `bt_gatt_read()` API which takes the `bt_gatt_read_params` struct as parameters. In the parameters one or more attributes can be set, though setting multiple handles requires the option: `CONFIG_BT_GATT_READ_MULTIPLE`

Write procedures are supported by `bt_gatt_write()` API and takes `bt_gatt_write_params` struct as parameters. In case the write operation don’t require a response `bt_gatt_write_without_response()` or `bt_gatt_write_without_response_cb()` APIs can be used, with the later working similarly to `bt_gatt_notify_cb()`.

Subscriptions to notification and indication can be initiated with use of `bt_gatt_subscribe()` API which takes `bt_gatt_subscribe_params` as parameters. Multiple subscriptions to the same attribute are supported so there could be multiple notify callback being triggered for the same attribute. Subscriptions can be removed with use of `bt_gatt_unsubscribe()` API.

**Note:** When subscriptions are removed notify callback is called with the data set to NULL.

**API Reference**

`group bt_gatt`

Generic Attribute Profile (GATT)
Defines

BT_GATT_ERR(_att_err)
Construct error return value for attribute read and write callbacks.

Parameters
- _att_err – ATT error code

Returns
Appropriate error code for the attribute callbacks.

BT_GATT_CHRC_BROADCAST
Characteristic broadcast property.

Characteristic Properties Bit field values
If set, permits broadcasts of the Characteristic Value using Server Characteristic Configuration Descriptor.

BT_GATT_CHRC_READ
Characteristic read property.
If set, permits reads of the Characteristic Value.

BT_GATT_CHRC_WRITE_WITHOUT_RESP
Characteristic write without response property.
If set, permits write of the Characteristic Value without response.

BT_GATT_CHRC_WRITE
Characteristic write with response property.
If set, permits write of the Characteristic Value with response.

BT_GATT_CHRC_NOTIFY
Characteristic notify property.
If set, permits notifications of a Characteristic Value without acknowledgment.

BT_GATT_CHRC_INDICATE
Characteristic indicate property.
If set, permits indications of a Characteristic Value with acknowledgment.

BT_GATT_CHRC_AUTH
Characteristic Authenticated Signed Writes property.
If set, permits signed writes to the Characteristic Value.

BT_GATT_CHRC_EXT_PROP
Characteristic Extended Properties property.
If set, additional characteristic properties are defined in the Characteristic Extended Properties Descriptor.

BT_GATT_CEP_RELIABLE_WRITE
Characteristic Extended Properties Bit field values
BT_GATT_CEP_WRITABLE_AUX

BT_GATT_CCC_NOTIFY
  Client Characteristic Configuration Notification.
  Client Characteristic Configuration Values
  If set, changes to Characteristic Value shall be notified.

BT_GATT_CCC_INDICATE
  Client Characteristic Configuration Indication.
  If set, changes to Characteristic Value shall be indicated.

BT_GATT_SCC_BROADCAST
  Server Characteristic Configuration Broadcast.
  Server Characteristic Configuration Values
  If set, the characteristic value shall be broadcast in the advertising data when the server is
  advertising.

Typedefs

typedef ssize_t (*bt_gatt_attr_read_func_t)(struct bt_conn *conn, const struct bt_gatt_attr
  *attr, void *buf, uint16_t len, uint16_t offset)
  Attribute read callback.
  The callback can also be used locally to read the contents of the attribute in which case no
  connection will be set.
  
  **Param conn**
  The connection that is requesting to read

  **Param attr**
  The attribute that's being read

  **Param buf**
  Buffer to place the read result in

  **Param len**
  Length of data to read

  **Param offset**
  Offset to start reading from

  **Return**
  Number of bytes read, or in case of an error `BT_GATT_ERR()` with a specific
  BT_ATT_ERR_* error code.

  typedef ssize_t (*bt_gatt_attr_write_func_t)(struct bt_conn *conn, const struct bt_gatt_attr
  *attr, const void *buf, uint16_t len, uint16_t offset, uint8_t flags)
  Attribute write callback.

  **Param conn**
  The connection that is requesting to write

  **Param attr**
  The attribute that's being written
**Param buf**
Buffer with the data to write

**Param len**
Number of bytes in the buffer

**Param offset**
Offset to start writing from

**Param flags**
Flags (BT_GATT_WRITE_FLAG_*)

**Return**
Number of bytes written, or in case of an error BT_GATT_ERR() with a specific BT_ATT_ERR_* error code.

**Enums**

e num bt_gatt_perm
GATT attribute permission bit field values

*Values:*

enumerator BT_GATT_PERM_NONE = 0
No operations supported, e.g. for notify-only

enumerator BT_GATT_PERM_READ = BIT(0)
Attribute read permission.

enumerator BT_GATT_PERM_WRITE = BIT(1)
Attribute write permission.

enumerator BT_GATT_PERM_READ_ENCRYPT = BIT(2)
Attribute read permission with encryption.

If set, requires encryption for read access.

enumerator BT_GATT_PERM_WRITE_ENCRYPT = BIT(3)
Attribute write permission with encryption.

If set, requires encryption for write access.

enumerator BT_GATT_PERM_READ_AUTHEN = BIT(4)
Attribute read permission with authentication.

If set, requires encryption using authenticated link-key for read access.
enumerator BT_GATT_PERM_WRITE_AUTHEN = \textit{BIT}(5)
Attribute write permission with authentication.

If \textit{set}, requires encryption using authenticated link-key for write access.

enumerator BT_GATT_PERM_PREPARE_WRITE = \textit{BIT}(6)
Attribute prepare write permission.

If \textit{set}, allows prepare writes \textbf{with} use of BT_GATT_WRITE_FLAG_PREPARE passed to write callback.

enumerator BT_GATT_PERM_READ_LESC = \textit{BIT}(7)
Attribute read permission with LE Secure Connection encryption.

If \textit{set}, requires that LE Secure Connections \textbf{is} used for read access.

enumerator BT_GATT_PERM_WRITE_LESC = \textit{BIT}(8)
Attribute write permission with LE Secure Connection encryption.

If \textit{set}, requires that LE Secure Connections \textbf{is} used for write access.

den \{anonymous\}
GATT attribute write flags

\textit{Values:}

enumerator BT_GATT_WRITE_FLAG_PREPARE = \textit{BIT}(0)
Attribute prepare write flag.

If \textit{set}, write callback should only check \textit{if} the device \textit{is} authorized but no data shall be written.

enumerator BT_GATT_WRITE_FLAG_CMD = \textit{BIT}(1)
Attribute write command flag.

If \textit{set}, indicates that write operation \textit{is} a command (Write without response) which doesn't \textbf{generate} any response.

enumerator BT_GATT_WRITE_FLAG_EXECUTE = \textit{BIT}(2)
Attribute write execute flag.
If set, indicates that write operation is a execute, which indicates the end of a long write, and will come after 1 or more
@ref BT_GATT_WRITE_FLAG_PREPARE.

```c
struct bt_gatt_attr
#include <gatt.h> GATT Attribute structure.

group bt_gatt_server

Defines

BT_GATT_SERVICE_DEFINE(_name,...)
    Statically define and register a service.
    Helper macro to statically define and register a service.

    Parameters
    • _name – Service name.

BT_GATT_SERVICE_INSTANCE_DEFINE(_name,_instances,_instance_num,_attrs_def)
    Statically define service structure array.
    Helper macro to statically define service structure array. Each element of the array is linked
to the service attribute array which is also defined in this scope using _attrs_def macro.

    Parameters
    • _name – Name of service structure array.
    • _instances – Array of instances to pass as user context to the attribute callbacks.
    • _instance_num – Number of elements in instance array.
    • _attrs_def – Macro provided by the user that defines attribute array for the
service. This macro should accept single parameter which is the instance con-
text.

BT_GATT_SERVICE(_attrs)
    Service Structure Declaration Macro.
    Helper macro to declare a service structure.

    Parameters
    • _attrs – Service attributes.

BT_GATT_PRIMARY_SERVICE(_service)
    Primary Service Declaration Macro.
    Helper macro to declare a primary service attribute.

    Parameters
    • _service – Service attribute value.
BT_GATT_SECONDARY_SERVICE(_service)
Secondary Service Declaration Macro.
Helper macro to declare a secondary service attribute.

Note: A secondary service is only intended to be included from a primary service or another secondary service or other higher layer specification.

Parameters
- _service – Service attribute value.

BT_GATT_INCLUDE_SERVICE(_service_incl)
Include Service Declaration Macro.
Helper macro to declare database internal include service attribute.

Parameters
- _service_incl – the first service attribute of service to include

BT_GATT_CHRC_INIT(_uuid, _handle, _props)
BT_GATT_CHARACTERISTIC(_uuid, _props, _perm, _read, _write, _user_data)
Characteristic and Value Declaration Macro.
Helper macro to declare a characteristic attribute along with its attribute value.

Parameters
- _uuid – Characteristic attribute uuid.
- _props – Characteristic attribute properties, a bitmap of BT_GATT_CHRC_* macros.
- _perm – Characteristic Attribute access permissions, a bitmap of bt_gatt_perm values.
- _read – Characteristic Attribute read callback (bt_gatt_attr_read_func_t).
- _write – Characteristic Attribute write callback (bt_gatt_attr_write_func_t).
- _user_data – Characteristic Attribute user data.

BT_GATT_CCC_MAX
BT_GATT_CCC_INITIALIZER(_changed, _write, _match)
Initialize Client Characteristic Configuration Declaration Macro.
Helper macro to initialize a Managed CCC attribute value.

Parameters
- _changed – Configuration changed callback.
- _write – Configuration write callback.
- _match – Configuration match callback.

BT_GATT_CCC_MANAGED(_ccc, _perm)
Managed Client Characteristic Configuration Declaration Macro.
Helper macro to declare a Managed CCC attribute.

Parameters
- _ccc – CCC attribute user data, shall point to a _bt_gatt_ccc.
• _perm – CCC access permissions, a bitmap of `bt_gatt_perm` values.

```c
BT_GATT_CCC(_changed, _perm)
```

Client Characteristic Configuration Declaration Macro.

Helper macro to declare a CCC attribute.

**Parameters**

• _changed – Configuration changed callback.
• _perm – CCC access permissions, a bitmap of `bt_gatt_perm` values.

```c
BT_GATT_CEP(_value)
```

Characteristic Extended Properties Declaration Macro.

Helper macro to declare a CEP attribute.

**Parameters**

• _value – Pointer to a struct `bt_gatt_cep`.

```c
BT_GATT_CUD(_value, _perm)
```

Characteristic User Format Descriptor Declaration Macro.

Helper macro to declare a CUD attribute.

**Parameters**

• _value – User description NULL-terminated C string.
• _perm – Descriptor attribute access permissions, a bitmap of `bt_gatt_perm` values.

```c
BT_GATT_CPF(_value)
```

Characteristic Presentation Format Descriptor Declaration Macro.

Helper macro to declare a CPF attribute.

**Parameters**

• _value – Pointer to a struct `bt_gatt_cpf`.

```c
BT_GATT_DESCRIPTOR(_uuid, _perm, _read, _write, _user_data)
```

Descriptor Declaration Macro.

Helper macro to declare a descriptor attribute.

**Parameters**

• _uuid – Descriptor attribute uuid.
• _perm – Descriptor attribute access permissions, a bitmap of `bt_gatt_perm` values.
• _read – Descriptor attribute read callback (`bt_gatt_attr_read_func_t`).
• _write – Descriptor attribute write callback (`bt_gatt_attr_write_func_t`).
• _user_data – Descriptor attribute user data.

```c
BT_GATT_ATTRIBUTE(_uuid, _perm, _read, _write, _user_data)
```

Attribute Declaration Macro.

Helper macro to declare an attribute.

**Parameters**

• _uuid – Attribute uuid.
• _perm – Attribute access permissions, a bitmap of `bt_gatt_perm` values.
• _read – Attribute read callback (`bt_gatt_attr_read_func_t`).
• _write – Attribute write callback (bt_gatt_attr_write_func_t).
• _user_data – Attribute user data.

Typedefs

typedef uint8_t (*bt_gatt_attr_func_t)(const struct bt_gatt_attr *attr, uint16_t handle, void *user_data)

Attribute iterator callback.

  **Param** attr
  Attribute found.

  **Param** handle
  Attribute handle found.

  **Param** user_data
  Data given.

  **Return**
  BT_GATT_ITER_CONTINUE if should continue to the next attribute.

  **Return**
  BT_GATT_ITER_STOP to stop.

typedef void (*bt_gatt_complete_func_t)(struct bt_conn *conn, void *user_data)

Notification complete result callback.

  **Param** conn
  Connection object.

  **Param** user_data
  Data passed in by the user.

typedef void (*bt_gatt_indicate_func_t)(struct bt_conn *conn, struct bt_gatt_indicate_params *params, uint8_t err)

Indication complete result callback.

  **Param** conn
  Connection object.

  **Param** params
  Indication params object.

  **Param** err
  ATT error code

typedef void (*bt_gatt_indicate_params_destroy_t)(struct bt_gatt_indicate_params *params)

Enums

enum [anonymous]

  **Values:**

  enumerator BT_GATT_ITER_STOP = 0

  enumerator BT_GATT_ITER_CONTINUE
Functions

```c
void bt_gatt_cb_register(struct bt_gatt_cb *cb)
    Register GATT callbacks.
    Register callbacks to monitor the state of GATT.

    Parameters
    • cb – Callback struct.
```

```c
int bt_gatt_service_register(struct bt_gatt_service *svc)
    Register GATT service.
    Register GATT service. Applications can make use of macros such as
    BT_GATT_PRIMARY_SERVICE, BT_GATT_CHARACTERISTIC, BT_GATT_DESCRIPTOR,
    etc.
    When using CONFIG_BT_SETTINGS then all services that should have bond configuration
    loaded, i.e. CCC values, must be registered before calling settings_load.
    When using CONFIG_BT_GATT_CACHING and CONFIG_BT_SETTINGS then all services that should
    be included in the GATT Database Hash calculation should be added before calling settings_load.
    All services registered after settings_load will trigger a new database hash calculation
    and a new hash stored.

    Parameters
    • svc – Service containing the available attributes

    Returns
    0 in case of success or negative value in case of error.
```

```c
int bt_gatt_service_unregister(struct bt_gatt_service *svc)
    Unregister GATT service.

    Parameters
    • svc – Service to be unregistered.

    Returns
    0 in case of success or negative value in case of error.
```

```c
bool bt_gatt_service_is_registered(const struct bt_gatt_service *svc)
    Check if GATT service is registered.

    Parameters
    • svc – Service to be checked.

    Returns
    true if registered or false if not register.
```

```c
void bt_gatt_foreach_attr_type(uint16_t start_handle, uint16_t end_handle, const struct bt_uuid *uuid, const void *attr_data, uint16_t num_matches,
    bt_gatt_attr_func_t func, void *user_data)
    Attribute iterator by type.
    Iterate attributes in the given range matching given UUID and/or data.

    Parameters
    • start_handle – Start handle.
    • end_handle – End handle.
    • uuid – UUID to match, passing NULL skips UUID matching.
    • attr_data – Attribute data to match, passing NULL skips data matching.
```

1408 Chapter 6. Connectivity
• `num_matches` – Number matches, passing 0 makes it unlimited.
• `func` – Callback function.
• `user_data` – Data to pass to the callback.

static inline void bt_gatt_foreach_attr(uint16_t start_handle, uint16_t end_handle, bt_gatt_attr_func_t func, void *user_data)

Attribute iterator.
Iterate attributes in the given range.

Parameters
• `start_handle` – Start handle.
• `end_handle` – End handle.
• `func` – Callback function.
• `user_data` – Data to pass to the callback.

struct bt_gatt_attr *bt_gatt_attr_next(const struct bt_gatt_attr *attr)

Iterate to the next attribute.
Iterate to the next attribute following a given attribute.

Parameters
• `attr` – Current Attribute.

Returns
The next attribute or NULL if it cannot be found.

struct bt_gatt_attr *bt_gatt_find_by_uuid(const struct bt_gatt_attr *attr, uint16_t attr_count, const struct bt_uuid *uuid)

Find Attribute by UUID.
Find the attribute with the matching UUID. To limit the search to a service set the attr to the service attributes and the attr_count to the service attribute count.

Parameters
• `attr` – Pointer to an attribute that serves as the starting point for the search of a match for the UUID. Passing NULL will search the entire range.
• `attr_count` – The number of attributes from the starting point to search for a match for the UUID. Set to 0 to search until the end.
• `uuid` – UUID to match.

uint16_t bt_gatt_attr_get_handle(const struct bt_gatt_attr *attr)

Get Attribute handle.

Parameters
• `attr` – Attribute object.

Returns
Handle of the corresponding attribute or zero if the attribute could not be found.

uint16_t bt_gatt_attr_value_handle(const struct bt_gatt_attr *attr)

Get the handle of the characteristic value descriptor.

Note: The `user_data` of the attribute must of type `bt_gatt_chrc`.

6.1. Bluetooth
• attr – A Characteristic Attribute.

**Returns**

the handle of the corresponding Characteristic Value. The value will be zero (the invalid handle) if attr was not a characteristic attribute.

```c
ssize_t bt_gatt_attr_read(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t buf_len, uint16_t offset, const void *value, uint16_t value_len)
```

Generic Read Attribute value helper.

Read attribute value from local database storing the result into buffer.

**Parameters**

- conn – Connection object.
- attr – Attribute to read.
- buf – Buffer to store the value.
- buf_len – Buffer length.
- offset – Start offset.
- value – Attribute value.
- value_len – Length of the attribute value.

**Returns**

number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_service(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
```

Read Service Attribute helper.

Read service attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a `bt_uuid`.

**Parameters**

- conn – Connection object.
- attr – Attribute to read.
- buf – Buffer to store the value read.
- len – Buffer length.
- offset – Start offset.

**Returns**

number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_included(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
```

Read Include Attribute helper.

Read include service attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a `bt_gatt_include`.
Parameters

- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
- `offset` – Start offset.

Returns

the number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_chrc(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
```

Read Characteristic Attribute helper.

Read characteristic attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a `bt_gatt_chrc`.

---

Parameters

- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
- `offset` – Start offset.

Returns

the number of bytes read in case of success or negative values in case of error.

```c
ssize_t bt_gatt_attr_read_ccc(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)
```

Read Client Characteristic Configuration Attribute helper.

Read CCC attribute value from local database storing the result into buffer after encoding it.

**Note:** Only use this with attributes which user_data is a `_bt_gatt_ccc`.

---

Parameters

- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
- `offset` – Start offset.

Returns

the number of bytes read in case of success or negative values in case of error.
ssize_t bt_gatt_attr_write_ccc(struct bt_conn *conn, const struct bt_gatt_attr *attr, const void *buf, uint16_t len, uint16_t offset, uint8_t flags)

Write Client Characteristic Configuration Attribute helper.
Write value in the buffer into CCC attribute.

Note: Only use this with attributes which user_data is a _bt_gatt_ccc.

Parameters
- conn – Connection object.
- attr – Attribute to read.
- buf – Buffer to store the value read.
- len – Buffer length.
- offset – Start offset.
- flags – Write flags.

Returns
number of bytes written in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_cep(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic Extended Properties Attribute helper.
Read CEP attribute value from local database storing the result into buffer after encoding it.

Note: Only use this with attributes which user_data is a bt_gatt_cep.

Parameters
- conn – Connection object
- attr – Attribute to read
- buf – Buffer to store the value read
- len – Buffer length
- offset – Start offset

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_cud(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic User Description Descriptor Attribute helper.
Read CUD attribute value from local database storing the result into buffer after encoding it.

Note: Only use this with attributes which user_data is a NULL-terminated C string.

Parameters
- conn – Connection object
- attr – Attribute to read
buf – Buffer to store the value read

len – Buffer length

offset – Start offset

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t bt_gatt_attr_read_cpf(struct bt_conn *conn, const struct bt_gatt_attr *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic Presentation format Descriptor Attribute helper.
Read CPF attribute value from local database storing the result into buffer after encoding it.

Note: Only use this with attributes which user_data is a bt_gatt_pf.

Parameters
- conn – Connection object
- attr – Attribute to read
- buf – Buffer to store the value read
- len – Buffer length
- offset – Start offset

Returns
number of bytes read in case of success or negative values in case of error.

int bt_gatt_notify_cb(struct bt_conn *conn, struct bt_gatt_notify_params *params)

Notify attribute value change.
This function works in the same way as bt_gatt_notify. With the addition that after sending the notification the callback function will be called.
The callback is run from System Workqueue context. When called from the System Workqueue context this API will not wait for resources for the callback but instead return an error. The number of pending callbacks can be increased with the CONFIG_BT_CONN_TX_MAX option.
Alternatively it is possible to notify by UUID by setting it on the parameters, when using this method the attribute if provided is used as the start range when looking up for possible matches.

Parameters
- conn – Connection object.
- params – Notification parameters.

Returns
0 in case of success or negative value in case of error.

int bt_gatt_notify_multiple(struct bt_conn *conn, uint16_t num_params, struct bt_gatt_notify_params params[])

Send multiple notifications in a single PDU.
The GATT Server will send a single ATT_MULTIPLE_HANDLE_VALUE_NTF PDU containing all the notifications passed to this API.

All params must have the same func and user_data (due to implementation limitation). But func(user_data) will be invoked for each parameter.
As this API may block to wait for Bluetooth Host resources, it is not recommended to call it from a cooperative thread or a Bluetooth callback.

The peer's GATT Client must write to this device's Client Supported Features attribute and set the bit for Multiple Handle Value Notifications before this API can be used.

Only use this API to force the use of the ATT_MULTIPLE_HANDLE_VALUE_NTF PDU. For standard applications, bt_gatt_notify_cb is preferred, as it will use this PDU if supported and automatically fallback to ATT_HANDLE_VALUE_NTF when not supported by the peer.

This API has an additional limitation: it only accepts valid attribute references and not UUIDs like bt_gatt_notify and bt_gatt_notify_cb.

**Parameters**

- **conn** – Target client. Notifying all connected clients by passing NULL is not yet supported, please use bt_gatt_notify instead.
- **num_params** – Element count of `params` array. Has to be greater than 1.
- **params** – Array of notification parameters. It is okay to free this after calling this function.

**Return values**

- **0** – Success. The PDU is queued for sending.
- **-EINVAL**
  - One of the attribute handles is invalid.
  - Only one parameter was passed. This API expects 2 or more.
  - Not all `func` were equal or not all `user_data` were equal.
  - One of the characteristics is not notifiable.
  - An UUID was passed in one of the parameters.
- **-ERANGE**
  - The notifications cannot all fit in a single ATT_MULTIPLE.Handle.VALUE.NTF.
  - They exceed the MTU of all open ATT bearers.
- **-EPERM** – The connection has a lower security level than required by one of the attributes.
- **-EOPNOTSUPP** – The peer hasn't yet communicated that it supports this PDU type.

```c
static inline int bt_gatt_notify(struct bt_conn *conn, const struct bt_gatt_attr *attr, const void *data, uint16_t len)
```

**Notify attribute value change.**

Send notification of attribute value change, if connection is NULL notify all peer that have notification enabled via CCC otherwise do a direct notification only the given connection.

The attribute object on the parameters can be the so called Characteristic Declaration, which is usually declared with `BT_GATT_CHARACTERISTIC` followed by `BT_GATT_CCC`, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using `BT_GATT_CHARACTERISTIC`.

**Parameters**

- **conn** – Connection object.
- **attr** – Characteristic or Characteristic Value attribute.
- **data** – Pointer to Attribute data.
• `len` – Attribute value length.

**Returns**

0 in case of success or negative value in case of error.

```c
static inline int bt_gatt_notify_uuid(struct bt_conn *conn, const struct bt_uuid *uuid, const struct bt_gatt_attr *attr, const void *data, uint16_t len)
```

Notify attribute value change by UUID.

Send notification of attribute value change, if connection is NULL notify all peer that have notification enabled via CCC otherwise do a direct notification only on the given connection.

The attribute object is the starting point for the search of the UUID.

**Parameters**

• `conn` – Connection object.
• `uuid` – The UUID. If the server contains multiple services with the same UUID, then the first occurrence, starting from the attr given, is used.
• `attr` – Pointer to an attribute that serves as the starting point for the search of a match for the UUID.
• `data` – Pointer to Attribute data.
• `len` – Attribute value length.

**Returns**

0 in case of success or negative value in case of error.

```c
int bt_gatt_indicate(struct bt_conn *conn, struct bt_gatt_indicate_params *params)
```

Indicate attribute value change.

Send an indication of attribute value change. if connection is NULL indicate all peer that have notification enabled via CCC otherwise do a direct indication only the given connection.

The attribute object on the parameters can be the so called Characteristic Declaration, which is usually declared with `BT_GATT_CHARACTERISTIC` followed by `BT_GATT_CCC`, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using `BT_GATT_CHARACTERISTIC`.

Alternatively it is possible to indicate by UUID by setting it on the parameters, when using this method the attribute if provided is used as the start range when looking up for possible matches.

**Note:** This procedure is asynchronous therefore the parameters need to remains valid while it is active. The procedure is active until the destroy callback is run.

**Parameters**

• `conn` – Connection object.
• `params` – Indicate parameters.

**Returns**

0 in case of success or negative value in case of error.

```c
bool bt_gatt_is_subscribed(struct bt_conn *conn, const struct bt_gatt_attr *attr, uint16_t ccc_type)
```

Check if connection have subscribed to attribute.

Check if connection has subscribed to attribute value change.

The attribute object can be the so called Characteristic Declaration, which is usually declared with `BT_GATT_CHARACTERISTIC` followed by `BT_GATT_CCC`, or the Characteristic Value
Declaration which is automatically created after the Characteristic Declaration when using BT_GATT_CHARACTERISTIC, or the Client Characteristic Configuration Descriptor (CCCD) which is created by BT_GATT_CCC.

**Parameters**

- `conn` – Connection object.
- `attr` – Attribute object.
- `ccc_type` – The subscription type, `BT_GATT_CCC_NOTIFY` and/or `BT_GATT_CCC_INDICATE`.

**Returns**

true if the attribute object has been subscribed.

```c
uint16_t bt_gatt_get_mtu(struct bt_conn *conn)
```

Get ATT MTU for a connection.

Get negotiated ATT connection MTU, note that this does not equal the largest amount of attribute data that can be transferred within a single packet.

**Parameters**

- `conn` – Connection object.

**Returns**

MTU in bytes

```c
struct bt_gatt_ccc_cfg
```

#Include `<gatt.h>` GATT CCC configuration entry.

**Public Members**

```c
uint8_t id
```

Local identity, BT_ID_DEFAULT in most cases.

```c
bt_addr_le_t peer
```

Remote peer address.

```c
uint16_t value
```

Configuration value.

```c
struct bt_gatt_notify_params
```

#Include `<gatt.h>`

**Public Members**

```c
const struct bt_uuid *uuid
```

Notification Attribute UUID type.

Optional, use to search for an attribute with matching UUID when the attribute object pointer is not known.
const struct bt_gatt_attr *attr
    Notification Attribute object.
    Optional if uuid is provided, in this case it will be used as start range to search for the attribute with the given UUID.

const void *data
    Notification Value data

uint16_t len
    Notification Value length

bt_gatt_complete_func_t func
    Notification Value callback

void *user_data
    Notification Value callback user data

struct bt_gatt_indicate_params
    #include <gatt.h> GATT Indicate Value parameters.

**Public Members**

const struct bt_uuid *uuid
    Indicate Attribute UUID type.
    Optional, use to search for an attribute with matching UUID when the attribute object pointer is not known.

const struct bt_gatt_attr *attr
    Indicate Attribute object.
    Optional if uuid is provided, in this case it will be used as start range to search for the attribute with the given UUID.

bt_gatt_indicate_func_t func
    Indicate Value callback

bt_gatt_indicate_params_destroy_t destroy
    Indicate operation complete callback

const void *data
    Indicate Value data

uint16_t len
    Indicate Value length

**GATT Client**

group bt_gatt_client
**Typedefs**

```c
typedef uint8_t (*bt_gatt_discover_func_t)(struct bt_conn *conn, const struct bt_gatt_attr *attr, struct bt_gatt_discover_params *params)
```

Discover attribute callback function.

If discovery procedure has completed this callback will be called with `attr` set to NULL. This will not happen if procedure was stopped by returning `BT_GATT_ITER_STOP`.

The attribute object as well as its UUID and value objects are temporary and must be copied to in order to cache its information. Only the following fields of the attribute contains valid information:

- `uuid` UUID representing the type of attribute.
- `handle` Handle in the remote database.
- `user_data` The value of the attribute, if the discovery type maps to an ATT operation that provides this information. NULL otherwise. See below.

The effective type of `attr->user_data` is determined by `params`. Note that the fields `params->type` and `params->uuid` are left unchanged by the discovery procedure.

<table>
<thead>
<tr>
<th><code>params-&gt;type</code></th>
<th><code>params-&gt;uuid</code></th>
<th>Type of <code>attr-&gt;user_data</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>BT_GATT_DISCOVER_PRIMARY</code></td>
<td>any</td>
<td><code>bt_gatt_service_val</code></td>
</tr>
<tr>
<td><code>BT_GATT_DISCOVER_SECONDARY</code></td>
<td>any</td>
<td><code>bt_gatt_service_val</code></td>
</tr>
<tr>
<td><code>BT_GATT_DISCOVER_INCLUDE</code></td>
<td>any</td>
<td><code>bt_gatt_include</code></td>
</tr>
<tr>
<td><code>BT_GATT_DISCOVER_CHARACTERISTIC</code></td>
<td>any</td>

<td>any</td>
<td>NULL</td>
</tr>
<tr>
<td><code>BT_GATT_DISCOVER_ATTRIBUTE</code></td>
<td>any</td>
<td>NULL</td>
</tr>
</tbody>
</table>

Also consider if using read-by-type instead of discovery is more convenient. See `bt_gatt_read` with `bt_gatt_read_params::handle_count` set to 0.

**Param conn**

Connection object.

**Param attr**

Attribute found, or NULL if not found.

**Param params**

Discovery parameters given.

**Return**

- `BT_GATT_ITER_CONTINUE` to continue discovery procedure.
- `BT_GATT_ITER_STOP` to stop discovery procedure.

```c
typedef uint8_t (*bt_gatt_read_func_t)(struct bt_conn *conn, uint8_t err, struct bt_gatt_read_params *params, const void *data, uint16_t length)
```

Read callback function.
**Param conn**
Connection object.

**Param err**
ATT error code.

**Param params**
Read parameters used.

**Param data**
Attribute value data. NULL means read has completed.

**Param length**
Attribute value length.

**Return**
BT_GATT_ITER_CONTINUE if should continue to the next attribute.

**Return**
BT_GATT_ITER_STOP to stop.

```c
typedef void (*bt_gatt_write_func_t)(struct bt_conn *conn, uint8_t err, struct bt_gatt_write_params *params)
```
Write callback function.

**Param conn**
Connection object.

**Param err**
ATT error code.

**Param params**
Write parameters used.

```c
typedef uint8_t (*bt_gatt_notify_func_t)(struct bt_conn *conn, struct bt_gatt_subscribe_params *params, const void *data, uint16_t length)
```
Notification callback function.

In the case of an empty notification, the data pointer will be non-NULL while the length will be 0, which is due to the special case where a data NULL pointer means unsubscribed.

**Param conn**
Connection object. May be NULL, indicating that the peer is being unpaired

**Param params**
Subscription parameters.

**Param data**
Attribute value data. If NULL then subscription was removed.

**Param length**
Attribute value length.

**Return**
BT_GATT_ITER_CONTINUE to continue receiving value notifications.
BT_GATT_ITER_STOP to unsubscribe from value notifications.

```c
typedef void (*bt_gatt_subscribe_func_t)(struct bt_conn *conn, uint8_t err, struct bt_gatt_subscribe_params *params)
```
Subscription callback function.

**Param conn**
Connection object.
**Param err**
ATT error code.

**Param params**
Subscription parameters used.

**Enums**

```plaintext
enum [anonymous]
  GATT Discover types

Values:

enumerator BT_GATT_DISCOVER_PRIMARY
  Discover Primary Services.

enumerator BT_GATT_DISCOVER_SECONDARY
  Discover Secondary Services.

enumerator BT_GATT_DISCOVER_INCLUDE
  Discover Included Services.

enumerator BT_GATT_DISCOVER_CHARACTERISTIC
  Discover Characteristic Values.
```

Discover Characteristic Value and its properties.

```plaintext
enumerator BT_GATT_DISCOVER_DESCRIPTOR
  Discover Descriptors.
```

Discover Attributes which are not services or characteristics.

@note The use of this type of discover is not recommended for discovering in ranges across multiple services/characteristics as it may incur in extra round trips.

```plaintext
enumerator BT_GATT_DISCOVER_ATTRIBUTE
  Discover Attributes.
```

Discover Attributes of any type.

@note The use of this type of discover is not recommended for discovering in ranges across multiple services/characteristics as it may incur in more round trips.

```plaintext
enumerator BT_GATT_DISCOVER_STD_CHAR_DESC
  Discover standard characteristic descriptor values.
```
Discover standard characteristic descriptor values and their properties.
Supported descriptors:
- Characteristic Extended Properties
- Client Characteristic Configuration
- Server Characteristic Configuration
- Characteristic Presentation Format

```c
enum [anonymous]
Subscription flags

Values:

enumerator BT_GATT_SUBSCRIBE_FLAG_VOLATILE
Persistence flag.

If set, indicates that the subscription is not saved on the GATT server side. Therefore, upon disconnection, the subscription will be automatically removed from the client's subscriptions list and when the client reconnects, it will have to issue a new subscription.

enumerator BT_GATT_SUBSCRIBE_FLAG_NO_RESUB
No resubscribe flag.

By default when BT_GATT_SUBSCRIBE_FLAG_VOLATILE is unset, the subscription will be automatically renewed when the client reconnects, as a workaround for GATT servers that do not persist subscriptions.

This flag will disable the automatic resubscription. It is useful if the application layer knows that the GATT server remembers subscriptions from previous connections and wants to avoid renewing the subscriptions.

enumerator BT_GATT_SUBSCRIBE_FLAG_WRITE_PENDING
Write pending flag.

If set, indicates write operation is pending waiting remote end to respond.

enumerator BT_GATT_SUBSCRIBE_NUM_FLAGS
```

**Functions**

```c
int bt_gatt_exchange_mtu(struct bt_conn *conn, struct bt_gatt_exchange_params *params)
Exchange MTU.
```
This client procedure can be used to set the MTU to the maximum possible size the buffers can hold.

The Response comes in callback `params->func`. The callback is run from the context specified by `config BT_RECV_CONTEXT`. `params` must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Note:** Shall only be used once per connection.

### Parameters
- `conn` – Connection object.
- `params` – Exchange MTU parameters.

### Return values
- **0** – Successfully queued request. Will call `params->func` on resolution.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_L2CAP_TX_BUF_COUNT`.
- **-EALREADY** – The MTU exchange procedure has been already performed.

```c
int bt_gatt_discover(struct bt_conn *conn, struct bt_gatt_discover_params *params)
```

GATT Discover function.

This procedure is used by a client to discover attributes on a server.

Primary Service Discovery: Procedure allows to discover primary services either by Discover All Primary Services or Discover Primary Services by Service UUID. Include Service Discovery: Procedure allows to discover all Include Services within specified range. Characteristic Discovery: Procedure allows to discover all characteristics within specified handle range as well as discover characteristics with specified UUID. Descriptors Discovery: Procedure allows to discover all characteristic descriptors within specified range.

For each attribute found the callback is called which can then decide whether to continue discovering or stop.

The Response comes in callback `params->func`. The callback is run from the BT RX thread. `params` must remain valid until start of callback where `iter.attr` is `NULL` or callback will return `BT_GATT_ITER_STOP`.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

### Parameters
- `conn` – Connection object.
- `params` – Discover parameters.

### Return values
- **0** – Successfully queued request. Will call `params->func` on resolution.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_L2CAP_TX_BUF_COUNT`.
int bt_gatt_read(struct bt_conn *conn, struct bt_gatt_read_params *params)
Read Attribute Value by handle.

This procedure read the attribute value and return it to the callback.

When reading attributes by UUID the callback can be called multiple times depending on how many instances of given the UUID exists with the start_handle being updated for each instance.

If an instance does contain a long value which cannot be read entirely the caller will need to read the remaining data separately using the handle and offset.

The Response comes in callback params->func. The callback is run from the context specified by 'config BT_RECV_CONTEXT'. params must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Parameters
• conn – Connection object.
• params – Read parameters.

Return values
• 0 – Successfully queued request. Will call params->func on resolution.
• -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.

int bt_gatt_write(struct bt_conn *conn, struct bt_gatt_write_params *params)
Write Attribute Value by handle.

The Response comes in callback params->func. The callback is run from the context specified by 'config BT_RECV_CONTEXT'. params must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from Bluetooth event context. When called from Bluetooth context, this function will instead return -ENOMEM if it would block to avoid a deadlock.

Parameters
• conn – Connection object.
• params – Write parameters.

Return values
• 0 – Successfully queued request. Will call params->func on resolution.
• -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside Bluetooth event context to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.

int bt_gatt_write_without_response_cb(struct bt_conn *conn, uint16_t handle, const void *data, uint16_t length, bool sign, bt_gatt_complete_func_t func, void *user_data)
Write Attribute Value by handle without response with callback.

This function works in the same way as bt_gatt_write_without_response. With the addition that after sending the write the callback function will be called.

The callback is run from System Workqueue context. When called from the System Workqueue context this API will not wait for resources for the callback but instead return an error. The number of pending callbacks can be increased with the CONFIG_BT_CONN_TX_MAX option.
This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

**Note:** By using a callback it also disable the internal flow control which would prevent sending multiple commands without waiting for their transmissions to complete, so if that is required the caller shall not submit more data until the callback is called.

### Parameters
- **conn** – Connection object.
- **handle** – Attribute handle.
- **data** – Data to be written.
- **length** – Data length.
- **sign** – Whether to sign data
- **func** – Transmission complete callback.
- **user_data** – User data to be passed back to callback.

### Return values
- **0** – Successfully queued request.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_L2CAP_TX_BUF_COUNT`.

```c
static inline int bt_gatt_write_without_response(struct bt_conn *conn, uint16_t handle, const void *data, uint16_t length, bool sign)
```

Write Attribute Value by handle without response.

This procedure write the attribute value without requiring an acknowledgment that the write was successfully performed

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

### Parameters
- **conn** – Connection object.
- **handle** – Attribute handle.
- **data** – Data to be written.
- **length** – Data length.
- **sign** – Whether to sign data

### Return values
- **0** – Successfully queued request.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_L2CAP_TX_BUF_COUNT`.

```c
```
int bt_gatt_subscribe(struct bt_conn *conn, struct bt_gatt_subscribe_params *params)
  Subscribe Attribute Value Notification.

  This procedure subscribe to value notification using the Client Characteristic Configuration handle. If notification received subscribe value callback is called to return notified value. One may then decide whether to unsubscribe directly from this callback. Notification callback with NULL data will not be called if subscription was removed by this method.

  The Response comes in callback params->subscribe. The callback is run from the context specified by 'config BT_RECV_CONTEXT'. params must remain valid until start of callback. The Notification callback params->notify is also called from the BT RX thread.

  This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

  Note: Notifications are asynchronous therefore the parameters need to remain valid while subscribed.

Parameters
  • conn – Connection object.
  • params – Subscribe parameters.

Return values
  • 0 – Successfully queued request. Will call params->write on resolution.
  • -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.

int bt_gatt_resubscribe(uint8_t id, const bt_addr_le_t *peer, struct bt_gatt_subscribe_params *params)
  Resubscribe Attribute Value Notification subscription.

  Resubscribe to Attribute Value Notification when already subscribed from a previous connection. The GATT server will remember subscription from previous connections when bonded, so resubscribing can be done without performing a new subscribe procedure after a power cycle.

  Note: Notifications are asynchronous therefore the parameters need to remain valid while subscribed.

Parameters
  • id – Local identity (in most cases BT_ID_DEFAULT).
  • peer – Remote address.
  • params – Subscribe parameters.

Returns
  0 in case of success or negative value in case of error.
int bt_gatt_unsubscribe(struct bt_conn *conn, struct bt_gatt_subscribe_params *params)

Unsubscribe Attribute Value Notification.

This procedure unsubscribe to value notification using the Client Characteristic Configuration handle. Notification callback with NULL data will be called if subscription was removed by this call, until then the parameters cannot be reused.

The Response comes in callback params->func. The callback is run from the BT RX thread.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Parameters

- conn – Connection object.
- params – Subscribe parameters.

Return values

- 0 – Successfully queued request. Will call params->write on resolution.
- -ENOMEM – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_L2CAP_TX_BUF_COUNT.

void bt_gatt_cancel(struct bt_conn *conn, void *params)

Try to cancel the first pending request identified by params.

This function does not release params for reuse. The usual callbacks for the request still apply. A successful cancel simulates a BT_ATT_ERR_UNLIKELY response from the server.

This function can cancel the following request functions:

- bt_gatt_exchange_mtu
- bt_gatt_discover
- bt_gatt_read
- bt_gatt_write
- bt_gatt_subscribe
- bt_gatt_unsubscribe

Parameters

- conn – The connection the request was issued on.
- params – The address params used in the request function call.

struct bt_gatt_exchange_params

#include <gatt.h> GATT Exchange MTU parameters.

Public Members

void (*func)(struct bt_conn *conn, uint8_t err, struct bt_gatt_exchange_params *params)

Response callback

struct bt_gatt_discover_params

#include <gatt.h> GATT Discover Attributes parameters.
Public Members

const struct bt_uuid *uuid
    Discover UUID type

bt_gatt_discover_func_t func
    Discover attribute callback

uint16_t attr_handle
    Include service attribute declaration handle

uint16_t start_handle
    Included service start handle
    Discover start handle

uint16_t end_handle
    Included service end handle
    Discover end handle

uint8_t type
    Discover type

struct bt_gatt_read_params
    #include <gatt.h> GATT Read parameters.

Public Members

bt_gatt_read_func_t func
    Read attribute callback.

size_t handle_count
    If equals to 1 single.handle and single.offset are used. If greater than 1 multiple.handles are used. If equals to 0 by_uuid is used for Read Using Characteristic UUID.

uint16_t handle
    Attribute handle.

uint16_t offset
    Attribute data offset.

uint16_t *handles
    Attribute handles to read with Read Multiple Characteristic Values.

bool variable
    If true use Read Multiple Variable Length Characteristic Values procedure. The values of the set of attributes may be of variable or unknown length. If false use Read Multiple Characteristic Values procedure. The values of the set of attributes must be of a known fixed length, with the exception of the last value that can have a variable length.

```c
uint16_t start_handle
    First requested handle number.

uint16_t end_handle
    Last requested handle number.

const struct bt_uuid *uuid
    2 or 16 octet UUID.
```

```c
struct bt_gatt_write_params
    #include <gatt.h> GATT Write parameters.

Public Members

bt_gatt_write_func_t func
    Response callback

uint16_t handle
    Attribute handle

uint16_t offset
    Attribute data offset

const void *data
    Data to be written

uint16_t length
    Length of the data
```

```c
struct bt_gatt_subscribe_params
    #include <gatt.h> GATT Subscribe parameters.

Public Members

bt_gatt_notify_func_t notify
    Notification value callback

bt_gatt_subscribe_func_t subscribe
    Subscribe CCC write request response callback If given, called with the subscription parameters given when subscribing

bt_gatt_write_func_t write
    Deprecated:

uint16_t value_handle
    Subscribe value handle
```
uint16_t ccc_handle
   Subscribe CCC handle

uint16_t value
   Subscribe value

bt_security_t min_security
   Minimum required security for received notification. Notifications and indications received over a connection with a lower security level are silently discarded.

atomic_t flags[ATOMIC_BITMAP_SIZE(BT_GATT_SUBSCRIBE_NUM_FLAGS)]
   Subscription flags

**HCI Drivers**

**API Reference**

**group bt_hci_driver**
   HCI drivers.

IS_BT_QUIRK_NO_AUTO_DLE(bt_dev)

BT_HCI_EVT_FLAG_RECV_PRIO

BT_HCI_EVT_FLAG_RECV

**Enums**

**enum [anonymous]**
   **Values:**

   enumerator BT_QUIRK_NO_RESET = BIT(0)

   enumerator BT_QUIRK_NO_AUTO_DLE = BIT(1)

**enum bt_hci_driver_bus**
   Possible values for the 'bus' member of the **bt_hci_driver** struct
   **Values:**

   enumerator BT_HCI_DRIVER_BUS_VIRTUAL = 0

   enumerator BT_HCI_DRIVER_BUS_USB = 1

   enumerator BT_HCI_DRIVER_BUS_PCCARD = 2
enumerator BT_HCI_DRIVER_BUS_UART = 3
enumerator BT_HCI_DRIVER_BUS_RS232 = 4
enumerator BT_HCI_DRIVER_BUS_PCI = 5
enumerator BT_HCI_DRIVER_BUS_SDIO = 6
enumerator BT_HCI_DRIVER_BUS_SPI = 7
enumerator BT_HCI_DRIVER_BUS_I2C = 8
enumerator BT_HCI_DRIVER_BUS_IPM = 9

Functions

static inline uint8_t bt_hci_evt_get_flags(uint8_t evt)
Get HCI event flags.
Helper for the HCI driver to get HCI event flags that describes rules that must be followed.
When CONFIG_BT_RECV_BLOCKING is enabled the flags BT_HCI_EVT_FLAG_RECV and BT_HCI_EVT_FLAG_RECV_PRIO indicates if the event should be given to bt_recv or bt_recv_prio.

Parameters

- evt – HCI event code.

Returns

HCI event flags for the specified event.

int bt_recv(struct net_buf *buf)
Receive data from the controller/HCI driver.
This is the main function through which the HCI driver provides the host with data from the controller. The buffer needs to have its type set with the help of bt_buf_set_type() before calling this API.
When CONFIG_BT_RECV_BLOCKING is defined then this API should not be used for so-called high priority HCI events, which should instead be delivered to the host stack through bt_recv_prio().

Parameters

- buf – Network buffer containing data from the controller.

Returns

0 on success or negative error number on failure.

int bt_recv_prio(struct net_buf *buf)
Receive high priority data from the controller/HCI driver.
This is the same as bt_recv(), except that it should be used for so-called high priority HCI events. There's a separate bt_hci_evt_get_flags() helper that can be used to identify which events have the BT_HCI_EVT_FLAG_RECV_PRIO flag set.
As with bt_recv(), the buffer needs to have its type set with the help of bt_buf_set_type() before calling this API. The only exception is so called high priority HCI events which should be delivered to the host stack through bt_recv_prio() instead.
Parameters

- `buf` – Network buffer containing data from the controller.

Returns

0 on success or negative error number on failure.

```c
uint8_t bt_read_static_addr(struct bt_hci_vs_static_addr addrs[], uint8_t size)
```

Read static addresses from the controller.

Parameters

- `addrs` – Random static address and Identity Root (IR) array.
- `size` – Size of array.

Returns

Number of addresses read.

```c
int bt_hci_driver_register(const struct bt_hci_driver *drv)
```

Register a new HCI driver to the Bluetooth stack.

This needs to be called before any application code runs. The `bt_enable()` API will fail if there is no driver registered.

Parameters

- `drv` – A `bt_hci_driver` struct representing the driver.

Returns

0 on success or negative error number on failure.

```c
int bt_hci_transport_setup(const struct device *dev)
```

Setup the HCI transport, which usually means to reset the Bluetooth IC.

Note: A weak version of this function is included in the H4 driver, so defining it is optional per board.

Parameters

- `dev` – The device structure for the bus connecting to the IC

Returns

0 on success, negative error value on failure

```c
struct net_buf *bt_hci_evt_create(uint8_t evt, uint8_t len)
```

Allocate an HCI event buffer.

This function allocates a new buffer for an HCI event. It is given the OpCode and the total length of the parameters. Upon successful return the buffer is ready to have the parameters encoded into it.

Parameters

- `len` – Length of event parameters.

Returns

Newly allocated buffer.

```c
struct net_buf *bt_hci_cmd_complete_create(uint16_t op, uint8_t plen)
```

Allocate an HCI Command Complete event buffer.

This function allocates a new buffer for HCI Command Complete event. It is given the OpCode (encoded e.g. using the BT_OP macro) and the total length of the parameters. Upon successful return the buffer is ready to have the parameters encoded into it.
Parameters

- plen – Length of command parameters.

Returns

Newly allocated buffer.

```c
struct net_buf *bt_hci_cmd_status_create(uint16_t op, uint8_t status)
```

Allocate an HCI Command Status event buffer.

This function allocates a new buffer for HCI Command Status event. It is given the OpCode (encoded e.g. using the BT_OP macro) and the status code. Upon successful return the buffer is ready to have the parameters encoded into it.

Parameters

- status – Status code.

Returns

Newly allocated buffer.

```c
struct bt_hci_driver
```

#include <hci_driver.h>

Abstraction which represents the HCI transport to the controller.

This struct is used to represent the HCI transport to the Bluetooth controller.

Public Members

```c
const char *name
```

Name of the driver

```c
enum bt_hci_driver_bus bus
```

Bus of the transport (BT_HCI_DRIVER_BUS_*)

```c
uint32_t quirks
```

Specific controller quirks. These are set by the HCI driver and acted upon by the host. They can either be statically set at buildtime, or set at runtime before the HCI driver's `open()` callback returns.

```c
int (*open)(void)
```

Open the HCI transport.

Opens the HCI transport for operation. This function must not return until the transport is ready for operation, meaning it is safe to start calling the `send()` handler.

If the driver uses its own RX thread, i.e. `CONFIG_BT_RECV_BLOCKING` is set, then this function is expected to start that thread.

Return

0 on success or negative error number on failure.

```c
int (*close)(void)
```

Close the HCI transport.

Closes the HCI transport. This function must not return until the transport is closed.

If the driver uses its own RX thread, i.e. `CONFIG_BT_RECV_BLOCKING` is set, then this function is expected to abort that thread.
Return
0 on success or negative error number on failure.

int (*send)(struct net_buf *buf)
Send HCI buffer to controller.
Send an HCI command or ACL data to the controller. The exact type of the data can be checked with the help of bt_buf_get_type().

Note: This function must only be called from a cooperative thread.

Param buf
Buffer containing data to be sent to the controller.
Return
0 on success or negative error number on failure.

int (*setup)(void)
HCI vendor-specific setup.
Executes vendor-specific commands sequence to initialize BT Controller before BT Host executes Reset sequence.

Note: CONFIG_BT_HCI_SETUP must be selected for this field to be available.

Return
0 on success or negative error number on failure.

HCI RAW channel

Overview
HCI RAW channel API is intended to expose HCI interface to the remote entity. The local Bluetooth controller gets owned by the remote entity and host Bluetooth stack is not used. RAW API provides direct access to packets which are sent and received by the Bluetooth HCI driver.

API Reference

group hci_raw
HCI RAW channel.

Defines

BT_HCI_ERR_EXT_HANDLED
BT_HCI_RAW_CMD_EXT(_op, _min_len, _func)
Helper macro to define a command extension

Parameters
• _op – Opcode of the command.
• _min_len – Minimal length of the command.
• _func – Handler function to be called.
Enums

enum [anonymous]

Values:

enumerator BT_HCI_RAW_MODE_PASSTHROUGH = 0x00

Passthrough mode

> While in this mode the buffers are passed as is between the stack and the driver.

enumerator BT_HCI_RAW_MODE_H4 = 0x01

H:4 mode

> While in this mode H:4 headers will added into the buffers according to the buffer type when coming from the stack and will be removed and used to set the buffer type.

Functions

int bt_send(struct net_buf *buf)

Send packet to the Bluetooth controller.

Send packet to the Bluetooth controller. Caller needs to implement netbuf pool.

Parameters

- buf – netbuf packet to be send

Returns

Zero on success or (negative) error code otherwise.

int bt_hci_raw_set_mode(uint8_t mode)

Set Bluetooth RAW channel mode.

Set access mode of Bluetooth RAW channel.

Parameters

- mode – Access mode.

Returns

Zero on success or (negative) error code otherwise.

uint8_t bt_hci_raw_get_mode(void)

Get Bluetooth RAW channel mode.

Get access mode of Bluetooth RAW channel.

Returns

Access mode.

void bt_hci_raw_cmd_ext_register(struct bt_hci_raw_cmd_ext *cmds, size_t size)

Register Bluetooth RAW command extension table.

Register Bluetooth RAW channel command extension table, opcodes in this table are intercepted to sent to the handler function.

Parameters

- cmds – Pointer to the command extension table.
• size – Size of the command extension table.

```c
int bt_enable_raw(struct k_fifo *rx_queue)
```

Enable Bluetooth RAW channel:
Enable Bluetooth RAW HCI channel.

**Parameters**

• `rx_queue` – netbuf queue where HCI packets received from the Bluetooth controller are to be queued. The queue is defined in the caller while the available buffers pools are handled in the stack.

**Returns**

Zero on success or (negative) error code otherwise.

```c
struct bt_hci_raw_cmd_ext
#include <hci_raw.h>
```

**Public Members**

```c
uint16_t op
   Opcode of the command

size_t min_len
   Minimal length of the command

uint8_t (*func)(struct net_buf *buf)
   Handler function.
   Handler function to be called when a command is intercepted.
   **Param buf**
   Buffer containing the command.
   **Return**
   HCI Status code or BT_HCI_ERR_EXT_HANDLED if command has been handled already and a response has been sent as oppose to BT_HCI_ERR_SUCCESS which just indicates that the command can be sent to the controller to be processed.
```

**Hands Free Profile (HFP)**

**API Reference**

`group bt_hfp`  
Hands Free Profile (HFP)

**Defines**

```c
HFP_HF_CMD_OK

HFP_HF_CMD_ERROR

HFP_HF_CMD_CME_ERROR
```
HFP_HF_CMD_UNKNOWN_ERROR

Enums

enum bt_hfp_hf_at_cmd

Values:

enumerator BT_HFP_HF_ATA
enumerator BT_HFP_HF_AT_CHUP

Functions

int bt_hfp_hf_register(struct bt_hfp_hf_cb *cb)

Register HFP HF profile.

Register Handsfree profile callbacks to monitor the state and get the required HFP details to display.

Parameters

• cb – callback structure.

Returns

0 in case of success or negative value in case of error.

int bt_hfp_hf_send_cmd(struct bt_conn *conn, enum bt_hfp_hf_at_cmd cmd)

Handsfree client Send AT.

Send specific AT commands to handsfree client profile.

Parameters

• conn – Connection object.
• cmd – AT command to be sent.

Returns

0 in case of success or negative value in case of error.

struct bt_hfp_hf_cmd_complete

#include <hfp_hf.h> HFP HF Command completion field.

struct bt_hfp_hf_cb

#include <hfp_hf.h> HFP profile application callback.

Public Members

void (*connected)(struct bt_conn *conn)

HF connected callback to application

If this callback is provided it will be called whenever the connection completes.

Param conn

Connection object.
void (*)(struct bt_conn *conn)
    HF disconnected callback to application
    If this callback is provided it will be called whenever the connection gets disconnected,
    including when a connection gets rejected or cancelled or any error in SLC establishment.
    
    **Param conn**
    Connection object.

void (*)(struct bt_conn *conn, uint32_t value)
    HF indicator Callback
    This callback provides service indicator value to the application
    
    **Param conn**
    Connection object.
    
    **Param value**
    service indicator value received from the AG.

void (*)(struct bt_conn *conn, uint32_t value)
    HF indicator Callback
    This callback provides call indicator value to the application
    
    **Param conn**
    Connection object.
    
    **Param value**
    call indicator value received from the AG.

void (*)(struct bt_conn *conn, uint32_t value)
    HF indicator Callback
    This callback provides call setup indicator value to the application
    
    **Param conn**
    Connection object.
    
    **Param value**
    call setup indicator value received from the AG.

void (*)(struct bt_conn *conn, uint32_t value)
    HF indicator Callback
    This callback provides call held indicator value to the application
    
    **Param conn**
    Connection object.
    
    **Param value**
    call held indicator value received from the AG.

void (*)(struct bt_conn *conn, uint32_t value)
    HF indicator Callback
    This callback provides signal indicator value to the application
    
    **Param conn**
    Connection object.
    
    **Param value**
    signal indicator value received from the AG.

void (*)(struct bt_conn *conn, uint32_t value)
    HF indicator Callback
    This callback provides roaming indicator value to the application

6.1. Bluetooth
**Param conn**
Connection object.

**Param value**
roaming indicator value received from the AG.

```c
void (*battery)(struct bt_conn *conn, uint32_t value)
```
HF indicator Callback

This callback battery service indicator value to the application

**Param conn**
Connection object.

**Param value**
battery indicator value received from the AG.

```c
void (*ring_indication)(struct bt_conn *conn)
```
HF incoming call Ring indication callback to application

If this callback is provided it will be called whenever there is an incoming call.

**Param conn**
Connection object.

```c
void (*cmd_complete_cb)(struct bt_conn *conn, struct bt_hfp_hf_cmd_complete *cmd)
```
HF notify command completed callback to application

The command sent from the application is notified about its status

**Param conn**
Connection object.

**Param cmd**
structure contains status of the command including cme.

---

**Logical Link Control and Adaptation Protocol (L2CAP)**

L2CAP layer enables connection-oriented channels which can be enable with the configuration option: `CONFIG_BT_L2CAP_DYNAMIC_CHANNEL`. This channels support segmentation and reassembly transparently, they also support credit based flow control making it suitable for data streams.

Channels instances are represented by the `bt_l2cap_chan` struct which contains the callbacks in the `bt_l2cap_chan_ops` struct to inform when the channel has been connected, disconnected or when the encryption has changed. In addition to that it also contains the `recv` callback which is called whenever an incoming data has been received. Data received this way can be marked as processed by returning 0 or using `bt_l2cap_chan_recv_complete()` API if processing is asynchronous.

---

**Note:** The `recv` callback is called directly from RX Thread thus it is not recommended to block for long periods of time.

For sending data the `bt_l2cap_chan_send()` API can be used noting that it may block if no credits are available, and resuming as soon as more credits are available.

Servers can be registered using `bt_l2cap_server_register()` API passing the `bt_l2cap_server` struct which informs what `pmap` it should listen to, the required security level `sec_level`, and the callback `accept` which is called to authorize incoming connection requests and allocate channel instances.

Client channels can be initiated with use of `bt_l2cap_chan_connect()` API and can be disconnected with the `bt_l2cap_chan_disconnect()` API. Note that the later can also disconnect channel instances created by servers.
API Reference

group bt_l2cap

L2CAP.

Defines

BT_L2CAP_HDR_SIZE
L2CAP PDU header size, used for buffer size calculations

BT_L2CAP_TX_MTU
Maximum Transmission Unit (MTU) for an outgoing L2CAP PDU.

BT_L2CAP_RX_MTU
Maximum Transmission Unit (MTU) for an incoming L2CAP PDU.

BT_L2CAP_BUF_SIZE(mtu)
Helper to calculate needed buffer size for L2CAP PDUs. Useful for creating buffer pools.

Parameters
• mtu – Needed L2CAP PDU MTU.

Returns
Needed buffer size to match the requested L2CAP PDU MTU.

BT_L2CAP_SDU_HDR_SIZE
L2CAP SDU header size, used for buffer size calculations

BT_L2CAP_SDU_TX_MTU
Maximum Transmission Unit for an unsegmented outgoing L2CAP SDU.

The Maximum Transmission Unit for an outgoing L2CAP SDU when sent without segmentation, i.e. a single L2CAP SDU will fit inside a single L2CAP PDU.

The MTU for outgoing L2CAP SDUs with segmentation is defined by the size of the application buffer pool.

BT_L2CAP_SDU_RX_MTU
Maximum Transmission Unit for an unsegmented incoming L2CAP SDU.

The Maximum Transmission Unit for an incoming L2CAP SDU when sent without segmentation, i.e. a single L2CAP SDU will fit inside a single L2CAP PDU.

The MTU for incoming L2CAP SDUs with segmentation is defined by the size of the application buffer pool. The application will have to define an alloc_buf callback for the channel in order to support receiving segmented L2CAP SDUs.

BT_L2CAP_SDU_BUF_SIZE(mtu)
Helper to calculate needed buffer size for L2CAP SDUs. Useful for creating buffer pools.

Parameters
• mtu – Required BT_L2CAP_*_SDU.

Returns
Needed buffer size to match the requested L2CAP SDU MTU.
BT_L2CAP_LE_CHAN(_ch)

Helper macro getting container object of type bt_l2cap_le_chan address having the same container chan member address as object in question.

**Parameters**

- _ch – Address of object of bt_l2cap_chan type

**Returns**

Address of in memory bt_l2cap_le_chan object type containing the address of in question object.

BT_L2CAP_CHAN_SEND_RESERVE

Headroom needed for outgoing L2CAP PDUs.

BT_L2CAP_SDU_CHAN_SEND_RESERVE

Headroom needed for outgoing L2CAP SDUs.

**Typedefs**

typedef void (*bt_l2cap_chan_destroy_t)(struct bt_l2cap_chan *chan)

Channel destroy callback.

**Param chan**

Channel object.

typedef enum bt_l2cap_chan_state bt_l2cap_chan_state_t

Life-span states of L2CAP CoC channel.

Used only by internal APIs dealing with setting channel to proper state depending on operational context.

typedef enum bt_l2cap_chan_status bt_l2cap_chan_status_t

Status of L2CAP channel.

** Enums **

eenum bt_l2cap_chan_state

Life-span states of L2CAP CoC channel.

Used only by internal APIs dealing with setting channel to proper state depending on operational context.

**Values:**

- enumerator BT_L2CAP_DISCONNECTED
  Channel disconnected

- enumerator BT_L2CAP_CONNECTING
  Channel in connecting state

- enumerator BT_L2CAP_CONFIG
  Channel in config state, BR/EDR specific
enumerator BT_L2CAP_CONNECTED
- Channel ready for upper layer traffic on it

enumerator BT_L2CAP_DISCONNECTING
- Channel in disconnecting state

enum bt_l2cap_chan_status
- Status of L2CAP channel.
  Values:

  enumerator BT_L2CAP_STATUS_OUT
  - Channel output status

  enumerator BT_L2CAP_STATUS_SHUTDOWN
  - Channel shutdown status.
  
  Once this status is notified it means the channel will no longer be able to transmit or receive data.

  enumerator BT_L2CAP_STATUS_ENCRYPT_PENDING
  - Channel encryption pending status.

  enumerator BT_L2CAP_NUM_STATUS

Functions

int bt_l2cap_server_register(struct bt_l2cap_server *server)
- Register L2CAP server.
  Register L2CAP server for a PSM, each new connection is authorized using the accept() call-back which in case of success shall allocate the channel structure to be used by the new connection.
  For fixed, SIG-assigned PSMs (in the range 0x0001-0x007f) the PSM should be assigned to server->psm before calling this API. For dynamic PSMs (in the range 0x0080-0x00ff) server->psm may be pre-set to a given value (this is however not recommended) or be left as 0, in which case upon return a newly allocated value will have been assigned to it. For dynamically allocated values the expectation is that it's exposed through a GATT service, and that's how L2CAP clients discover how to connect to the server.

  Parameters

  • server – Server structure.

  Returns

  0 in case of success or negative value in case of error.

int bt_l2cap_br_server_register(struct bt_l2cap_server *server)
- Register L2CAP server on BR/EDR oriented connection.
  Register L2CAP server for a PSM, each new connection is authorized using the accept() call-back which in case of success shall allocate the channel structure to be used by the new connection.
Parameters

• server – Server structure.

Returns

0 in case of success or negative value in case of error.

int bt_l2cap_ecred_chan_connect(struct bt_conn *conn, struct bt_l2cap_chan **chans, uint16_t psm)

Connect Enhanced Credit Based L2CAP channels.

Connect up to 5 L2CAP channels by PSM, once the connection is completed each channel connected() callback will be called. If the connection is rejected disconnected() callback is called instead.

Parameters

• conn – Connection object.
• chans – Array of channel objects.
• psm – Channel PSM to connect to.

Returns

0 in case of success or negative value in case of error.

int bt_l2cap_ecred_chan_reconfigure(struct bt_l2cap_chan **chans, uint16_t mtu)

Reconfigure Enhanced Credit Based L2CAP channels.

Reconfigure up to 5 L2CAP channels. Channels must be from the same bt_conn. Once reconfiguration is completed each channel reconfigured() callback will be called. MTU cannot be decreased on any of provided channels.

Parameters

• chans – Array of channel objects. Null-terminated. Elements after the first 5 are silently ignored.
• mtu – Channel MTU to reconfigure to.

Returns

0 in case of success or negative value in case of error.

int bt_l2cap_chan_connect(struct bt_conn *conn, struct bt_l2cap_chan *chan, uint16_t psm)

Connect L2CAP channel.

Connect L2CAP channel by PSM, once the connection is completed channel connected() callback will be called. If the connection is rejected disconnected() callback is called instead. Channel object passed (over an address of it) as second parameter shouldn’t be instantiated in application as standalone. Instead of, application should create transport dedicated L2CAP objects, i.e. type of bt_l2cap_le_chan for LE and/or type of bt_l2cap_br_chan for BR/EDR. Then pass to this API the location (address) of bt_l2cap_chan type object which is a member of both transport dedicated objects.

Parameters

• conn – Connection object.
• chan – Channel object.
• psm – Channel PSM to connect to.

Returns

0 in case of success or negative value in case of error.
int bt_l2cap_chan_disconnect(struct bt_l2cap_chan *chan)
Disconnect L2CAP channel.

Disconnect L2CAP channel, if the connection is pending it will be canceled and as a result the channel disconnected() callback is called. Regarding to input parameter, to get details see reference description to bt_l2cap_chan_connect() API above.

Parameters
• chan – Channel object.

Returns
0 in case of success or negative value in case of error.

int bt_l2cap_chan_send(struct bt_l2cap_chan *chan, struct net_buf *buf)
Send data to L2CAP channel.

Send data from buffer to the channel. If credits are not available, buf will be queued and sent as and when credits are received from peer. Regarding to first input parameter, to get details see reference description to bt_l2cap_chan_connect() API above.

When sending L2CAP data over an BR/EDR connection the application is sending L2CAP PDUs. The application is required to have reserved BT_L2CAP_CHAN_SEND_RESERVE bytes in the buffer before sending. The application should use the BT_L2CAP_BUF_SIZE() helper to correctly size the buffers for the outgoing buffer pool.

When sending L2CAP data over an LE connection the application is sending L2CAP SDUs. The application can optionally reserve BT_L2CAP_SDU_CHAN_SEND_RESERVE bytes in the buffer before sending. By reserving bytes in the buffer the stack can use this buffer as a segment directly, otherwise it will have to allocate a new segment for the first segment. If the application is reserving the bytes it should use the BT_L2CAP_BUF_SIZE() helper to correctly size the buffers for the outgoing buffer pool. When segmenting an L2CAP SDU into L2CAP PDUs the stack will first attempt to allocate buffers from the original buffer pool of the L2CAP SDU before using the stacks own buffer pool.

Note: Buffer ownership is transferred to the stack in case of success, in case of an error the caller retains the ownership of the buffer.

Returns
Bytes sent in case of success or negative value in case of error.

int bt_l2cap_chan_recv_complete(struct bt_l2cap_chan *chan, struct net_buf *buf)
Complete receiving L2CAP channel data.

Complete the reception of incoming data. This shall only be called if the channel recv callback has returned -EINPROGRESS to process some incoming data. The buffer shall contain the original user_data as that is used for storing the credits/segments used by the packet.

Parameters
• chan – Channel object.
• buf – Buffer containing the data.

Returns
0 in case of success or negative value in case of error.

struct bt_l2cap_chan
#include <l2cap.h> L2CAP Channel structure.

6.1. Bluetooth 1443
Public Members

struct bt_conn *conn
    Channel connection reference

const struct bt_l2cap_chan_ops *ops
    Channel operations reference

struct bt_l2cap_le_endpoint
    #include <l2cap.h> LE L2CAP Endpoint structure.

Public Members

uint16_t cid
    Endpoint Channel Identifier (CID)

uint16_t mtu
    Endpoint Maximum Transmission Unit

uint16_t mps
    Endpoint Maximum PDU payload Size

uint16_t init_credits
    Endpoint initial credits

atomic_t credits
    Endpoint credits

struct bt_l2cap_le_chan
    #include <l2cap.h> LE L2CAP Channel structure.

Public Members

struct bt_l2cap_chan chan
    Common L2CAP channel reference object

struct bt_l2cap_le_endpoint rx
    Channel Receiving Endpoint.

If the application has set an alloc_buf channel callback for the channel to support receiving segmented L2CAP SDUs the application should initialize the MTU of the Receiving Endpoint. Otherwise the MTU of the receiving endpoint will be initialized to BT_L2CAP_SDU_RX_MTU by the stack.

uint16_t pending_rx_mtu
    Pending RX MTU on ECFC reconfigure, used internally by stack
struct bt_l2cap_le_endpoint tx
    Channel Transmission Endpoint

struct kfifo tx_queue
    Channel Transmission queue

struct netbuf *tx_buf
    Channel Pending Transmission buffer

struct k_work tx_work
    Channel Transmission work

struct bt_l2cap_br_endpoint
    #include <l2cap.h> BREDR L2CAP Endpoint structure.

Public Members

uint16_t cid
    Endpoint Channel Identifier (CID)

uint16_t mtu
    Endpoint Maximum Transmission Unit

struct bt_l2cap_br_chan
    #include <l2cap.h> BREDR L2CAP Channel structure.

Public Members

    Common L2CAP channel reference object

struct bt_l2cap_br_endpoint rx
    Channel Receiving Endpoint

struct bt_l2cap_br_endpoint tx
    Channel Transmission Endpoint

uint16_t psm
    Remote PSM to be connected

uint8_t ident
    Helps match request context during CoC

struct bt_l2cap_chan_ops
    #include <l2cap.h> L2CAP Channel operations structure.
Public Members

```c
void (*connected)(struct bt_l2cap_chan *chan)
   Channel connected callback.
   If this callback is provided it will be called whenever the connection completes.
   **Param chan**
   The channel that has been connected

void (*disconnected)(struct bt_l2cap_chan *chan)
   Channel disconnected callback.
   If this callback is provided it will be called whenever the channel is disconnected, including when a connection gets rejected.
   **Param chan**
   The channel that has been Disconnected

void (*encrypt_change)(struct bt_l2cap_chan *chan, uint8_t hci_status)
   Channel encrypt_change callback.
   If this callback is provided it will be called whenever the security level changed (indirectly link encryption done) or authentication procedure fails. In both cases security initiator and responder got the final status (HCI status) passed by related to encryption and authentication events from local host’s controller.
   **Param chan**
   The channel which has made encryption status changed.
   **Param status**
   HCI status of performed security procedure caused by channel security requirements. The value is populated by HCI layer and set to 0 when success and to non-zero (reference to HCI Error Codes) when security/authentication failed.

struct net_buf *(*alloc_seg)(struct bt_l2cap_chan *chan)
   Channel alloc_seg callback.
   If this callback is provided the channel will use it to allocate buffers to store segments. This avoids wasting big SDU buffers with potentially much smaller PDUs. If this callback is supplied, it must return a valid buffer.
   **Param chan**
   The channel requesting a buffer.
   **Return**
   Allocated buffer.

struct net_buf *(*alloc_buf)(struct bt_l2cap_chan *chan)
   Channel alloc_buf callback.
   If this callback is provided the channel will use it to allocate buffers to store incoming data. Channels that require segmentation must set this callback. If the application has not set a callback the L2CAP SDU MTU will be truncated to BT_L2CAP_SDU_RX_MTU.
   **Param chan**
   The channel requesting a buffer.
   **Return**
   Allocated buffer.

int (*recv)(struct bt_l2cap_chan *chan, struct net_buf *buf)
   Channel recv callback.
   **Param chan**
   The channel receiving data.
```
**Param** buf
  Buffer containing incoming data.

**Return**
  0 in case of success or negative value in case of error.

**Return**
  -EINPROGRESS in case where user has to confirm once the data has been processed by calling `bt_l2cap_chan_recv_complete` passing back the buffer received with its original user_data which contains the number of segments/credits used by the packet.

```c
void (*sent)(struct bt_l2cap_chan *chan)
```
Channel sent callback.

If this callback is provided it will be called whenever a SDU has been completely sent.

**Param chan**
The channel which has sent data.

```c
void (*status)(struct bt_l2cap_chan *chan, atomic_t *status)
```
Channel status callback.

If this callback is provided it will be called whenever the channel status changes.

**Param chan**
The channel which status changed

**Param status**
The channel status

```c
void (*reconfigured)(struct bt_l2cap_chan *chan)
```
Channel reconfigured callback.

If this callback is provided it will be called whenever peer or local device requested reconfiguration. Application may check updated MTU and MPS values by inspecting chan->le endpoints.

**Param chan**
The channel which was reconfigured

```c
struct bt_l2cap_server
```

#include `<l2cap.h>` L2CAP Server structure.

**Public Members**

```c
uint16_t psm
```
Server PSM.

Possible values: 0 A dynamic value will be auto-allocated when `bt_l2cap_server_register()` is called.

0x0001-0x007f Standard, Bluetooth SIG-assigned fixed values.

0x0080-0x00ff Dynamically allocated. May be pre-set by the application before server registration (not recommended however), or auto-allocated by the stack if the app gave 0 as the value.

```c
bt_security_t sec_level
```
Required minimum security level
int (*accept)(struct bt_conn *conn, struct bt_l2cap_chan **chan)

Server accept callback.

This callback is called whenever a new incoming connection requires authorization.

**Param conn**
The connection that is requesting authorization

**Param chan**
Pointer to received the allocated channel

**Return**
0 in case of success or negative value in case of error.

**Return**
-ENOMEM if no available space for new channel.

**Return**
-EACCES if application did not authorize the connection.

**Return**
-EPERM if encryption key size is too short.

Media Proxy

`group bt_media_proxy`

Media proxy module.

The media proxy module is the connection point between media players and media controllers. A media player has (access to) media content and knows how to navigate and play this content. A media controller reads or gets information from a player and controls the player by setting player parameters and giving the player commands.

The media proxy module allows media player implementations to make themselves available to media controllers. And it allows controllers to access, and get updates from, any player.

The media proxy module allows both local and remote control of local player instances: A media controller may be a local application, or it may be a Media Control Service relaying requests from a remote Media Control Client. There may be either local or remote control, or both, or even multiple instances of each.

[Experimental] Users should note that the APIs can change as a part of ongoing development.

Functions

int media_proxy_ctrl_register(struct media_proxy_ctrl_cbs *ctrl_cbs)
Register a controller with the media_proxy.

Parameters
• ctrl_cbs – Callbacks to the controller

Returns
0 if success, errno on failure

int media_proxy_ctrl_discover_player(struct bt_conn *conn)
Discover a remote media player.
Discover a remote media player instance. The remote player instance will be discovered, and accessed, using Bluetooth, via the media control client and a remote media control service. This call will start a GATT discovery of the Media Control Service on the peer, and setup handles and subscriptions.
This shall be called once before any other actions can be executed for the remote player. The remote player instance will be returned in the discover_player() callback.

Parameters
• conn – The connection to do discovery for

Returns
0 if success, errno on failure

int media_proxy_ctrl_get_player_name(struct media_player *player)
Read Media Player Name.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_icon_id(struct media_player *player)
Read Icon Object ID.
Get an ID (48 bit) that can be used to retrieve the Icon Object from an Object Transfer Service
See the Media Control Service spec v1.0 sections 3.2 and 4.1 for a description of the Icon Object.
Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_icon_url(struct media_player *player)
Read Icon URL.
Get a URL to the media player's icon.

Parameters
• player – Media player instance pointer
int media_proxy_ctrl_get_track_title(struct media_player *player)

Read Track Title.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_track_duration(struct media_player *player)

Read Track Duration.

The duration of a track is measured in hundredths of a second.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_track_position(struct media_player *player)

Read Track Position.

The position of the player (the playing position) is measured in hundredths of a second from
the beginning of the track.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_set_track_position(struct media_player *player, int32_t position)

Set Track Position.

Set the playing position of the media player in the current track. The position is given in in
hundredths of a second, from the beginning of the track of the track for positive values, and
(backwards) from the end of the track for negative values.

Parameters
• player – Media player instance pointer
• position – The track position to set

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_playback_speed(struct media_player *player)

Get Playback Speed.

The playback speed parameter is related to the actual playback speed as follows: actual play-
back speed = $2^\text{(speed parameter/64)}$

A speed parameter of 0 corresponds to unity speed playback (i.e. playback at “normal” speed).
A speed parameter of -128 corresponds to playback at one fourth of normal speed, 127 corre-
sponds to playback at almost four times the normal speed.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.
int media_proxy_ctrl_set_playback_speed(struct media_player *player, int8_t speed)
Set Playback Speed.

See the get_playback_speed() function for an explanation of the playback speed parameter.

Note that the media player may not support all possible values of the playback speed parameter. If the value given is not supported, and is higher than the current value, the player should set the playback speed to the next higher supported value. (And correspondingly to the next lower supported value for given values lower than the current value.)

Parameters
• player – Media player instance pointer
• speed – The playback speed parameter to set

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_seeking_speed(struct media_player *player)
Get Seeking Speed.

The seeking speed gives the speed with which the player is seeking. It is a factor, relative to real-time playback speed - a factor four means seeking happens at four times the real-time playback speed. Positive values are for forward seeking, negative values for backwards seeking.

The seeking speed is not settable - a non-zero seeking speed is the result of “fast rewind” of “fast forward” commands.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_track_segments_id(struct media_player *player)
Read Current Track Segments Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Segments Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.10 and 4.2 for a description of the Track Segments Object.

Requires Object Transfer Service

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_current_track_id(struct media_player *player)
Read Current Track Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.11 and 4.3 for a description of the Current Track Object.

Requires Object Transfer Service

Parameters
• player – Media player instance pointer
Returns
0 if success, errno on failure.

```
int media_proxy_ctrl_set_current_track_id(struct media_player *player, uint64_t id)
```

Set Current Track Object ID.
Change the player’s current track to the track given by the ID. (Behaves similarly to the goto track command.)

Requires Object Transfer Service

Parameters
- `player` – Media player instance pointer
- `id` – The ID of a track object

Returns
0 if success, errno on failure.

```
int media_proxy_ctrl_get_next_track_id(struct media_player *player)
```

Read Next Track Object ID.
Get an ID (48 bit) that can be used to retrieve the Next Track Object from an Object Transfer Service.

Requires Object Transfer Service

Parameters
- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

```
int media_proxy_ctrl_set_next_track_id(struct media_player *player, uint64_t id)
```

Set Next Track Object ID.
Change the player’s next track to the track given by the ID.

Requires Object Transfer Service

Parameters
- `player` – Media player instance pointer
- `id` – The ID of a track object

Returns
0 if success, errno on failure.

```
int media_proxy_ctrl_get_parent_group_id(struct media_player *player)
```

Read Parent Group Object ID.
Get an ID (48 bit) that can be used to retrieve the Parent Track Object from an Object Transfer Service.
The parent group is the parent of the current group.

See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Track Object.

Requires Object Transfer Service

Parameters
- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

---

6.1. Bluetooth
int media_proxy_ctrl_get_current_group_id(struct media_player *player)
Read Current Group Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service.

See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Group Object.

Requires Object Transfer Service.

Parameters
- player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_set_current_group_id(struct media_player *player, uint64_t id)
Set Current Group Object ID.

Change the player's current group to the group given by the ID, and the current track to the first track in that group.

Requires Object Transfer Service.

Parameters
- player – Media player instance pointer
- id – The ID of a group object

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_playing_order(struct media_player *player)
Read Playing Order.

Parameters
- player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_set_playing_order(struct media_player *player, uint8_t order)
Set Playing Order.

Set the media player's playing order

Parameters
- player – Media player instance pointer
- order – The playing order to set

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_playing_orders_supported(struct media_player *player)
Read Playing Orders Supported.

Read a bitmap containing the media player's supported playing orders.

Parameters
- player – Media player instance pointer

Returns
0 if success, errno on failure.
int media_proxy_ctrl_get_media_state(struct media_player *player)
Read Media State.

Read the media player's state

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

int media_proxy_ctrl_send_command(struct media_player *player, const struct mpl_cmd *command)
Send Command.

Send a command to the media player. Commands may cause the media player to change its state. May result in two callbacks - one for the actual sending of the command to the player, one for the result of the command from the player.

Parameters
• player – Media player instance pointer
• command – The command to send

Returns
0 if success, errno on failure.

int media_proxy_ctrl_get_commands_supported(struct media_player *player)
Read Commands Supported.

Read a bitmap containing the media player's supported command opcodes.

Parameters
• player – Media player instance pointer

Returns
0 if success, errno on failure.

Set Search.

Write a search to the media player. If the search is successful, the search results will be available as a group object in the Object Transfer Service (OTS).

May result in up to three callbacks
• one for the actual sending of the search to the player
• one for the result code for the search from the player
• if the search is successful, one for the search results object ID in the OTs

Requires Object Transfer Service

Parameters
• player – Media player instance pointer
• search – The search to write

Returns
0 if success, errno on failure.
int media_proxy_ctrl_get_search_results_id(struct media_player *player)

Read Search Results Object ID.

Get an ID (48 bit) that can be used to retrieve the Search Results Object from an Object Transfer Service.

The search results object is a group object. The search results object only exists if a successful search operation has been done.

Requires Object Transfer Service

**Parameters**

- player – Media player instance pointer

**Returns**

0 if success, errno on failure.

```c
uint8_t media_proxy_ctrl_get_content_ctrl_id(struct media_player *player)
```

Read Content Control ID.

The content control ID identifies a content control service on a device, and links it to the corresponding audio stream.

**Parameters**

- player – Media player instance pointer

**Returns**

0 if success, errno on failure.

```c
int media_proxy_pl_register(struct media_proxy_pl_calls *pl_calls)
```

Register a player with the media proxy.

Register a player with the media proxy module, for use by media controllers.

The media proxy may call any non-NULL function pointers in the supplied `media_proxy_pl_calls` structure.

**Parameters**

- pl_calls – Function pointers to the media player's calls

**Returns**

0 if success, errno on failure.

```c
int media_proxy_pl_init(void)
```

```c
struct bt_ots *bt_mcs_get_ots(void)
```

```c
void media_proxy_pl_track_changed_cb(void)
```

Track changed callback.

To be called when the player's current track is changed.

```c
void media_proxy_pl_track_title_cb(char *title)
```

Track title callback.

To be called when the player's current track is changed.

**Parameters**

- title – The title of the track

```c
void media_proxy_pl_track_duration_cb(int32_t duration)
```

Track duration callback.

To be called when the current track's duration is changed (e.g. due to a track change).

The track duration is given in hundredths of a second.
Parameters

• duration – The track duration

`void media_proxy_pl_track_position_cb(int32_t position)`

Track position callback.
To be called when the media player’s position in the track is changed, or when the player is paused or similar.
Exception: This callback should not be called when the position changes during regular playback, i.e. while the player is playing and playback happens at a constant speed.
The track position is given in hundredths of a second from the start of the track.

Parameters

• position – The media player’s position in the track

`void media_proxy_pl_playback_speed_cb(int8_t speed)`

Playback speed callback.
To be called when the playback speed is changed.

Parameters

• speed – The playback speed parameter

`void media_proxy_pl_seeking_speed_cb(int8_t speed)`

Seeking speed callback.
To be called when the seeking speed is changed.

Parameters

• speed – The seeking speed factor

`void media_proxy_pl_current_track_id_cb(uint64_t id)`

Current track object ID callback.
To be called when the ID of the current track is changed (e.g. due to a track change).

Parameters

• id – The ID of the current track object in the OTS

`void media_proxy_pl_next_track_id_cb(uint64_t id)`

Next track object ID callback.
To be called when the ID of the current track is changed

Parameters

• id – The ID of the next track object in the OTS

`void media_proxy_pl_parent_group_id_cb(uint64_t id)`

Parent group object ID callback.
To be called when the ID of the parent group is changed

Parameters

• id – The ID of the parent group object in the OTS

`void media_proxy_pl_current_group_id_cb(uint64_t id)`

Current group object ID callback.
To be called when the ID of the current group is changed

Parameters

• id – The ID of the current group object in the OTS
void media_proxy_pl_playing_order_cb(uint8_t order)
    // Playing order callback.
    // To be called when the playing order is changed
    Parameters
    • order – The playing order

void media_proxy_pl_media_state_cb(uint8_t state)
    // Media state callback.
    // To be called when the media state is changed
    Parameters
    • state – The media player’s state

void media_proxy_pl_command_cb(const struct mpl_cmd_ntf *cmd_ntf)
    // Command callback.
    // To be called when a command has been sent, to notify whether the command was successfully performed or not. See the MEDIA_PROXY_CMD_* result code defines.
    Parameters
    • cmd_ntf – The result of the command

void media_proxy_pl_commands_supported_cb(uint32_t opcodes)
    // Commands supported callback.
    // To be called when the set of commands supported is changed
    Parameters
    • opcodes – The supported commands opcodes

void media_proxy_pl_search_cb(uint8_t result_code)
    // Search callback.
    // To be called when a search has been set to notify whether the search was successfully performed or not. See the MEDIA_PROXY_SEARCH_* result code defines.
    // The actual results of the search, if successful, can be found in the search results object.
    Parameters
    • result_code – The result (success or failure) of the search

void media_proxy_pl_search_results_id_cb(uint64_t id)
    // Search Results object ID callback.
    // To be called when the ID of the search results is changed (typically as the result of a new successful search).
    Parameters
    • id – The ID of the search results object in the OTS

#include <media_proxy.h>
struct mpl_cmd
    // Media player command.

#include <media_proxy.h>
struct mpl_cmd_ntf
    // Media command notification.

#include <media_proxy.h>
struct mpl_sci
    // Search control item.
Public Members

   Given by a controller when registering

Public Members

void (*local_player_instance)(struct media_player *player, int err)
   Media Player Instance callback.
   Called when the local Media Player instance is registered or read (TODO). Also called if
   the local player instance is already registered when the controller is registered. Provides
   the controller with the pointer to the local player instance.
   Param player
      Media player instance pointer
   Param err
      Error value. 0 on success, or errno on negative value.

void (*player_name_recv)(struct media_player *player, int err, const char *name)
   Media Player Name receive callback.
   Called when the Media Player Name is read or changed See also media_proxy_ctrl_name_get()
   Param player
      Media player instance pointer
   Param err
      Error value. 0 on success, GATT error on positive value or errno on negative value.
   Param name
      The name of the media player

void (*icon_id_recv)(struct media_player *player, int err, uint64_t id)
   Media Player Icon Object ID receive callback.
   Called when the Media Player Icon Object ID is read See also media_proxy_ctrl_get_icon_id()
   Param player
      Media player instance pointer
void (*icon_url_recv)(struct media_player *player, int err, const char *url)
Media Player Icon URL receive callback.
Called when the Media Player Icon URL is read See also media_proxy_ctrl_get_icon_url()
  Param player
  Media player instance pointer
  Param err
  Error value. 0 on success, GATT error on positive value or errno on negative value.
  Param url
  The URL of the icon

void (*track_changed_recv)(struct media_player *player, int err)
Track changed receive callback.
Called when the Current Track is changed
  Param player
  Media player instance pointer
  Param err
  Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*track_title_recv)(struct media_player *player, int err, const char *title)
Track Title receive callback.
Called when the Track Title is read or changed See also media_proxy_ctrl_get_track_title()
  Param player
  Media player instance pointer
  Param err
  Error value. 0 on success, GATT error on positive value or errno on negative value.
  Param title
  The title of the current track

void (*track_duration_recv)(struct media_player *player, int err, int32_t duration)
Track Duration receive callback.
Called when the Track Duration is read or changed See also media_proxy_ctrl_get_track_duration()
  Param player
  Media player instance pointer
  Param err
  Error value. 0 on success, GATT error on positive value or errno on negative value.
  Param duration
  The duration of the current track

void (*track_position_recv)(struct media_player *player, int err, int32_t position)
Track Position receive callback.
Called when the Track Position is read or changed See also media_proxy_ctrl_get_track_position() and media_proxy_ctrl_set_track_position()
void (*track_position_write)(struct media_player *player, int err, int32_t position)

Track Position write callback.

Called when the Track Position is written. See also media_proxy_ctrl_set_track_position().

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param position
The player's position in the track

void (*playback_speed_recv)(struct media_player *player, int err, int8_t speed)

Playback Speed receive callback.

Called when the Playback Speed is read or changed. See also media_proxy_ctrl_get_playback_speed() and media_proxy_ctrl_set_playback_speed().

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param speed
The playback speed parameter

void (*playback_speed_write)(struct media_player *player, int err, int8_t speed)

Playback Speed write callback.

Called when the Playback Speed is written. See also media_proxy_ctrl_set_playback_speed().

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param speed
The playback speed parameter attempted to write

void (*seeking_speed_recv)(struct media_player *player, int err, int8_t speed)

Seeking Speed receive callback.

Called when the Seeking Speed is read or changed. See also media_proxy_ctrl_get_seeking_speed().

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param speed
The seeking speed factor
void (*track_segments_id_recv)(struct media_player *player, int err, uint64_t id)

Track Segments Object ID receive callback.

Called when the Track Segments Object ID is read. See also media_proxy_ctrl_get_track_segments_id().

_param player
Media player instance pointer

_param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

_param id
The ID of the track segments object in Object Transfer Service (48 bits)

void (*current_track_id_recv)(struct media_player *player, int err, uint64_t id)

Current Track Object ID receive callback.

Called when the Current Track Object ID is read or changed. See also media_proxy_ctrl_get_current_track_id() and media_proxy_ctrl_set_current_track_id().

_param player
Media player instance pointer

_param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

_param id
The ID of the current track object in Object Transfer Service (48 bits)

void (*current_track_id_write)(struct media_player *player, int err, uint64_t id)

Current Track Object ID write callback.

Called when the Current Track Object ID is written. See also media_proxy_ctrl_set_current_track_id().

_param player
Media player instance pointer

_param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

_param id
The ID (48 bits) attempted to write

void (*next_track_id_recv)(struct media_player *player, int err, uint64_t id)

Next Track Object ID receive callback.

Called when the Next Track Object ID is read or changed. See also media_proxy_ctrl_get_next_track_id() and media_proxy_ctrl_set_next_track_id().

_param player
Media player instance pointer

_param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

_param id
The ID of the next track object in Object Transfer Service (48 bits)

void (*next_track_id_write)(struct media_player *player, int err, uint64_t id)

Next Track Object ID write callback.

Called when the Next Track Object ID is written. See also media_proxy_ctrl_set_next_track_id().
void (*parent_group_id_recv)(struct media_player *player, int err, uint64_t id)

Parent Group Object ID receive callback.

Called when the Parent Group Object ID is read or changed See also media_proxy_ctrl_get_parent_group_id()

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param id
The ID (48 bits) attempted to write

void (*current_group_id_recv)(struct media_player *player, int err, uint64_t id)

Current Group Object ID receive callback.

Called when the Current Group Object ID is read or changed See also media_proxy_ctrl_get_current_group_id() and media_proxy_ctrl_set_current_group_id()

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param id
The ID of the parent group object in Object Transfer Service (48 bits)

void (*current_group_id_write)(struct media_player *player, int err, uint64_t id)

Current Group Object ID write callback.

Called when the Current Group Object ID is written See also media_proxy_ctrl_set_current_group_id()

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param id
The ID (48 bits) attempted to write

void (*playing_order_recv)(struct media_player *player, int err, uint8_t order)

Playing Order receive callback.

Called when the Playing Order is read or changed See also media_proxy_ctrl_get_playing_order() and media_proxy_ctrl_set_playing_order()

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param order
The playing order

void (*playing_order_write)(struct media_player *player, int err, uint8_t order)
Playing Order write callback.
Called when the Playing Order is written See also media_proxy_ctrl_set_playing_order()
 _param player
  Media player instance pointer
 _param err
  Error value. 0 on success, GATT error on positive value or errno on negative value.
 _param order
  The playing order attempted to write

void (*playing_orders_supported_recv)(struct media_player *player, int err, uint16_t orders)
Playing Orders Supported receive callback.
Called when the Playing Orders Supported is read See also media_proxy_ctrl_get_playing_orders_supported()
 _param player
  Media player instance pointer
 _param err
  Error value. 0 on success, GATT error on positive value or errno on negative value.
 _param orders
  The playing orders supported

void (*media_state_recv)(struct media_player *player, int err, uint8_t state)
Media State receive callback.
Called when the Media State is read or changed See also media_proxy_ctrl_get_media_state() and media_proxy_ctrl_send_command()
 _param player
  Media player instance pointer
 _param err
  Error value. 0 on success, GATT error on positive value or errno on negative value.
 _param state
  The media player state

void (*command_send)(struct media_player *player, int err, const struct mpl_cmd *cmd)
Command send callback.
Called when a command has been sent See also media_proxy_ctrl_send_command()
 _param player
  Media player instance pointer
 _param err
  Error value. 0 on success, GATT error on positive value or errno on negative value.
 _param cmd
  The command sent

void (*command_recv)(struct media_player *player, int err, const struct mpl_cmd_ntf *result)
Command result receive callback.
Called when a command result has been received
See also media_proxy_ctrl_send_command()

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param result**
The result received

```c
void (*commands_supported_recv)(struct media_player *player, int err, uint32_t opcodes)
```
Commands supported receive callback.

Called when the Commands Supported is read or changed
See also media_proxy_ctrl_get_commands_supported()

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param opcodes**
The supported command opcodes (bitmap)

```c
void (*search_send)(struct media_player *player, int err, const struct mpl_search *search)
```
Search send callback.

Called when a search has been sent
See also media_proxy_ctrl_send_search()

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param search**
The search sent

```c
void (*search_recv)(struct media_player *player, int err, uint8_t result_code)
```
Search result code receive callback.

Called when a search result code has been received
See also media_proxy_ctrl_send_search()

The search result code tells whether the search was successful or not. For a successful search, the actual results of the search (i.e. what was found as a result of the search) can be accessed using the Search Results Object ID. The Search Results Object ID has a separate callback - search_results_id_recv().

**Param player**
Media player instance pointer

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

**Param result_code**
Search result code

```c
void (*search_results_id_recv)(struct media_player *player, int err, uint64_t id)
```
Search Results Object ID receive callback
See also media_proxy_ctrl_get_search_results_id()

Called when the Search Results Object ID is read or changed

6.1. Bluetooth
void (*content_ctrl_id_recv)(struct media_player *player, int err, uint8_t ccid)

Content Control ID receive callback.
Called when the Content Control ID is read. See also `media_proxy_ctrl_get_content_ctrl_id()`

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param id
The ID of the search results object in Object Transfer Service (48 bits)

struct media_proxy_pl_calls

#include <media_proxy.h> Available calls in a player, that the media proxy can call.

Given by a player when registering.

Public Members

const char *(*get_player_name)(void)

Read Media Player Name.

Return
The name of the media player

uint64_t (*get_icon_id)(void)

Read Icon Object ID.

Get an ID (48 bit) that can be used to retrieve the Icon Object from an Object Transfer Service
See the Media Control Service spec v1.0 sections 3.2 and 4.1 for a description of the Icon Object.

Return
The Icon Object ID

const char *(*get_icon_url)(void)

Read Icon URL.

Get a URL to the media player's icon.

Return
The URL of the Icon

const char *(*get_track_title)(void)

Read Track Title.

Return
The title of the current track
int32_t (*get_track_duration)(void)
Read Track Duration.

The duration of a track is measured in hundredths of a second.

Return
The duration of the current track

int32_t (*get_track_position)(void)
Read Track Position.

The position of the player (the playing position) is measured in hundredths of a second from the beginning of the track

Return
The position of the player in the current track

void (*set_track_position)(int32_t position)
Set Track Position.

Set the playing position of the media player in the current track. The position is given in hundredths of a second, from the beginning of the track for positive values, and (backwards) from the end of the track for negative values.

Param position
The player position to set

int8_t (*get_playback_speed)(void)
Get Playback Speed.

The playback speed parameter is related to the actual playback speed as follows: actual playback speed = \(2^{\text{speed\_parameter}/64}\)

A speed parameter of 0 corresponds to unity speed playback (i.e. playback at “normal” speed). A speed parameter of -128 corresponds to playback at one fourth of normal speed, 127 corresponds to playback at almost four times the normal speed.

Return
The playback speed parameter

void (*set_playback_speed)(int8_t speed)
Set Playback Speed.

See the get_playback_speed() function for an explanation of the playback speed parameter.

Note that the media player may not support all possible values of the playback speed parameter. If the value given is not supported, and is higher than the current value, the player should set the playback speed to the next higher supported value. (And correspondingly to the next lower supported value for given values lower than the current value.)

Param speed
The playback speed parameter to set

int8_t (*get_seeking_speed)(void)
Get Seeking Speed.

The seeking speed gives the speed with which the player is seeking. It is a factor, relative to real-time playback speed - a factor four means seeking happens at four times the real-time playback speed. Positive values are for forward seeking, negative values for backwards seeking.

The seeking speed is not settable - a non-zero seeking speed is the result of “fast rewind” of “fast forward” commands.

6.1. Bluetooth
Return
The seeking speed factor

uint64_t (*get_track_segments_id)(void)
Read Current Track Segments Object ID.
Get an ID (48 bit) that can be used to retrieve the Current Track Segments Object from an Object Transfer Service
See the Media Control Service spec v1.0 sections 3.10 and 4.2 for a description of the Track Segments Object.

Return
Current Track Segments Object ID

uint64_t (*get_current_track_id)(void)
Read Current Track Object ID.
Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service
See the Media Control Service spec v1.0 sections 3.11 and 4.3 for a description of the Current Track Object.

Return
The Current Track Object ID

void (*set_current_track_id)(uint64_t id)
Set Current Track Object ID.
Change the player's current track to the track given by the ID. (Behaves similarly to the goto track command.)

Param id
The ID of a track object

uint64_t (*get_next_track_id)(void)
Read Next Track Object ID.
Get an ID (48 bit) that can be used to retrieve the Next Track Object from an Object Transfer Service

Return
The Next Track Object ID

void (*set_next_track_id)(uint64_t id)
Set Next Track Object ID.
Change the player's next track to the track given by the ID.

Param id
The ID of a track object

uint64_t (*get_parent_group_id)(void)
Read Parent Group Object ID.
Get an ID (48 bit) that can be used to retrieve the Parent Track Object from an Object Transfer Service
The parent group is the parent of the current group.
See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Track Object.

Return
The Current Group Object ID
uint64_t (*get_current_group_id)(void)
  Read Current Group Object ID.
  Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object
  Transfer Service
  See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the
  Current Group Object.
  \textbf{Return}
  The Current Group Object ID

void (*set_current_group_id)(uint64_t id)
  Set Current Group Object ID.
  Change the player's current group to the group given by the ID, and the current track to
  the first track in that group.
  \textbf{Param id}
  The ID of a group object

uint8_t (*get_playing_order)(void)
  Read Playing Order.
  return The media player's current playing order

void (*set_playing_order)(uint8_t order)
  Set Playing Order.
  Set the media player's playing order. See the MEDIA_PROXY_PLAYING_ORDER_* de-
  fines.
  \textbf{Param order}
  The playing order to set

uint16_t (*get_playing_orders_supported)(void)
  Read Playing Orders Supported.
  Read a bitmap containing the media player's supported playing orders. See the ME-
  DIA_PROXY_PLAYING_ORDERS_SUPPORTED_* defines.
  \textbf{Return}
  The media player's supported playing orders

uint8_t (*get_media_state)(void)
  Read Media State.
  Read the media player's state See the MEDIA_PROXY_MEDIA_STATE_* defines.
  \textbf{Return}
  The media player's state

void (*send_command)(const struct mpl_cmd *command)
  Send Command.
  Send a command to the media player. For command opcodes (play, pause, ...) - see the
  MEDIA_PROXY_OP_* defines.
  \textbf{Param command}
  The command to send

uint32_t (*get_commands_supported)(void)
  Read Commands Supported.
Read a bitmap containing the media player's supported command opcodes. See the ME-
DIA_PROXY_OP_SUP_* defines.

**Return**
The media player's supported command opcodes

```c
void (*send_search)(const struct mpl_search *search)
```
Set Search.

Write a search to the media player. (For the formatting of a search, see the Media Control Service spec and the mcs.h file.)

**Param search**
The search to write

```c
uint64_t (*get_search_results_id)(void)
```
Read Search Results Object ID.

Get an ID (48 bit) that can be used to retrieve the Search Results Object from an Object Transfer Service

The search results object is a group object. The search results object only exists if a successful search operation has been done.

**Return**
The Search Results Object ID

```c
uint8_t (*get_content_ctrl_id)(void)
```
Read Content Control ID.

The content control ID identifies a content control service on a device, and links it to the corresponding audio stream.

**Return**
The content control ID for the media player

**Media Control Client**

`group bt_gatt_mcc`

Bluetooth Media Control Client (MCC) interface.

Updated to the Media Control Profile specification revision 1.0

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Typedefs**

```c
typedef void (*bt_mcc_discover_mcs_cb)(struct bt_conn *conn, int err)
```
Callback function for `bt_mcc_discover_mcs()`

Called when a media control server is discovered

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

```c
typedef void (*bt_mcc_read_player_name_cb)(struct bt_conn *conn, int err, const char *name)
```
Callback function for `bt_mcc_read_player_name()`

Called when the player name is read or notified
Param conn
   The connection that was used to initialise the media control client

Param err
   Error value. 0 on success, GATT error or errno on fail

Param name
   Player name

typedef void (*bt_mcc_read_icon_url_cb)(struct bt_conn *conn, int err, const char *icon_url)
   Callback function for bt_mcc_read_icon_url()
   Called when the icon URL is read

   Param conn
      The connection that was used to initialise the media control client

   Param err
      Error value. 0 on success, GATT error or errno on fail

   Param icon_url
      The URL of the Icon

typedef void (*bt_mcc_track_changed_ntf_cb)(struct bt_conn *conn, int err)
   Callback function for track changed notifications.
   Called when a track change is notified.
   The track changed characteristic is a special case. It can not be read or set, it can only be notified.

   Param conn
      The connection that was used to initialise the media control client

   Param err
      Error value. 0 on success, GATT error or errno on fail

typedef void (*bt_mcc_read_track_title_cb)(struct bt_conn *conn, int err, const char *title)
   Callback function for bt_mcc_read_track_title()
   Called when the track title is read or notified

   Param conn
      The connection that was used to initialise the media control client

   Param err
      Error value. 0 on success, GATT error or errno on fail

   Param title
      The title of the track

typedef void (*bt_mcc_read_track_duration_cb)(struct bt_conn *conn, int err, int32_t dur)
   Callback function for bt_mcc_read_track_duration()
   Called when the track duration is read or notified

   Param conn
      The connection that was used to initialise the media control client

   Param err
      Error value. 0 on success, GATT error or errno on fail

   Param dur
      The duration of the track
typedef void (*bt_mcc_read_track_position_cb)(struct bt_conn *conn, int err, int32_t pos)
Callback function for bt_mcc_read_track_position()
Called when the track position is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param pos
The Track Position

typedef void (*bt_mcc_set_track_position_cb)(struct bt_conn *conn, int err, int32_t pos)
Callback function for bt_mcc_set_track_position()
Called when the track position is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param pos
The Track Position set (or attempted to set)

typedef void (*bt_mcc_read_playback_speed_cb)(struct bt_conn *conn, int err, int8_t speed)
Callback function for bt_mcc_read_playback_speed()
Called when the playback speed is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param speed
The Playback Speed

typedef void (*bt_mcc_set_playback_speed_cb)(struct bt_conn *conn, int err, int8_t speed)
Callback function for bt_mcc_set_playback_speed()
Called when the playback speed is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param speed
The Playback Speed set (or attempted to set)

typedef void (*bt_mcc_read_seeking_speed_cb)(struct bt_conn *conn, int err, int8_t speed)
Callback function for bt_mcc_read_seeking_speed()
Called when the seeking speed is read or notified

Param conn
The connection that was used to initialise the media control client
**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param speed**
The Seeking Speed

typedef void (*bt_mcc_read_playing_order_cb)(struct bt_conn *conn, int err, uint8_t order)
Callback function for `bt_mcc_read_playing_order()`
Called when the playing order is read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param order**
The playback order

typedef void (*bt_mcc_set_playing_order_cb)(struct bt_conn *conn, int err, uint8_t order)
Callback function for `bt_mcc_set_playing_order()`
Called when the playing order is set

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param order**
The Playing Order set (or attempted to set)

typedef void (*bt_mcc_read_playing_orders_supported_cb)(struct bt_conn *conn, int err, uint16_t orders)
Callback function for `bt_mcc_read_playing_orders_supported()`
Called when the supported playing orders are read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param orders**
The playing orders supported (bitmap)

typedef void (*bt_mcc_read_media_state_cb)(struct bt_conn *conn, int err, uint8_t state)
Callback function for `bt_mcc_read_media_state()`
Called when the media state is read or notified

**Param conn**
The connection that was used to initialise the media control client

**Param err**
Error value. 0 on success, GATT error or errno on fail

**Param state**
The Media State
typedef void (*bt_mcc_send_cmd_cb)(struct bt_conn *conn, int err, const struct mpl_cmd *cmd)

Callback function for bt_mcc_send_cmd()

Called when a command is sent, i.e. when the media control point is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param cmd
The command sent

typedef void (*bt_mcc_cmd_ntf_cb)(struct bt_conn *conn, int err, const struct mpl_cmd_ntf *ntf)

Callback function for command notifications.

Called when the media control point is notified

Notifications for commands (i.e. for writes to the media control point) use a different parameter structure than what is used for sending commands (writing to the media control point)

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param ntf
The command notification

datatype void (*bt_mcc_read_opcodes_supported_cb)(struct bt_conn *conn, int err, uint32_t opcodes)

Callback function for bt_mcc_read_opcodes_supported()

Called when the supported opcodes (commands) are read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param opcodes
The supported opcodes

datatype void (*bt_mcc_read_content_control_id_cb)(struct bt_conn *conn, int err, uint8_t ccid)

Callback function for bt_mcc_read_content_control_id()

Called when the content control ID is read

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param ccid
The Content Control ID
Functions

int bt_mcc_init(struct bt_mcc_cb *cb)
Initialize Media Control Client.

Parameters
• cb – Callbacks to be used

Returns
0 if success, errno on failure.

int bt_mcc_discover_mcs(struct bt_conn *conn, bool subscribe)
Discover Media Control Service.

Discover Media Control Service (MCS) on the server given by the connection Optionally subscribe to notifications.

Shall be called once, after media control client initialization and before using other media control client functionality.

Parameters
• conn – Connection to the peer device
• subscribe – Whether to subscribe to notifications

Returns
0 if success, errno on failure.

int bt_mcc_read_player_name(struct bt_conn *conn)
Read Media Player Name.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_icon_url(struct bt_conn *conn)
Read Icon Object URL.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_track_title(struct bt_conn *conn)
Read Track Title.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_track_duration(struct bt_conn *conn)
Read Track Duration.

Parameters
• conn – Connection to the peer device

Returns
0 if success, errno on failure.
int bt_mcc_read_track_position(struct bt_conn *conn)
  Read Track Position.

Parameters
  • conn – Connection to the peer device

Returns
  0 if success, errno on failure.

int bt_mcc_set_track_position(struct bt_conn *conn, int32_t pos)
  Set Track position.

Parameters
  • conn – Connection to the peer device
  • pos – Track position

Returns
  0 if success, errno on failure.

int bt_mcc_read_playback_speed(struct bt_conn *conn)
  Read Playback speed.

Parameters
  • conn – Connection to the peer device

Returns
  0 if success, errno on failure.

int bt_mcc_set_playback_speed(struct bt_conn *conn, int8_t speed)
  Set Playback Speed.

Parameters
  • conn – Connection to the peer device
  • speed – Playback speed

Returns
  0 if success, errno on failure.

int bt_mcc_read_seeking_speed(struct bt_conn *conn)
  Read Seeking speed.

Parameters
  • conn – Connection to the peer device

Returns
  0 if success, errno on failure.

int bt_mcc_read_playing_order(struct bt_conn *conn)
  Read Playing Order.

Parameters
  • conn – Connection to the peer device

Returns
  0 if success, errno on failure.

int bt_mcc_set_playing_order(struct bt_conn *conn, uint8_t order)
  Set Playing Order.

Parameters
  • conn – Connection to the peer device
• order – Playing order

**Returns**

0 if success, errno on failure.

```c
int bt_mcc_read_playing_orders_supported(struct bt_conn *conn)
```

Read Playing Orders Supported.

**Parameters**

• conn – Connection to the peer device

**Returns**

0 if success, errno on failure.

```c
int bt_mcc_read_media_state(struct bt_conn *conn)
```

Read Media State.

**Parameters**

• conn – Connection to the peer device

**Returns**

0 if success, errno on failure.

```c
int bt_mcc_send_cmd(struct bt_conn *conn, const struct mpl_cmd *cmd)
```

Send a command.

Write a command (e.g. “play”, “pause”) to the server's media control point.

**Parameters**

• conn – Connection to the peer device

• cmd – The command to send

**Returns**

0 if success, errno on failure.

```c
int bt_mcc_read_opcodes_supported(struct bt_conn *conn)
```

Read Opcodes Supported.

**Parameters**

• conn – Connection to the peer device

**Returns**

0 if success, errno on failure.

```c
int bt_mcc_read_content_control_id(struct bt_conn *conn)
```

Read Content Control ID.

**Parameters**

• conn – Connection to the peer device

**Returns**

0 if success, errno on failure.

```c
struct bt_mcc_cb

#include <mcc.h> Media control client callbacks.
```

---

**Bluetooth Mesh Profile**

The Bluetooth mesh profile adds secure wireless multi-hop communication for Bluetooth Low Energy. This module implements the Bluetooth Mesh Profile Specification v1.0.1.

Read more about Bluetooth mesh on the Bluetooth SIG Website.
Core  The core provides functionality for managing the general Bluetooth mesh state.

Low Power Node  The Low Power Node (LPN) role allows battery powered devices to participate in a mesh network as a leaf node. An LPN interacts with the mesh network through a Friend node, which is responsible for relaying any messages directed to the LPN. The LPN saves power by keeping its radio turned off, and only wakes up to either send messages or poll the Friend node for any incoming messages. The radio control and polling is managed automatically by the mesh stack, but the LPN API allows the application to trigger the polling at any time through `bt_mesh_lpn_poll()`. The LPN operation parameters, including poll interval, poll event timing and Friend requirements is controlled through the `CONFIG_BT_MESH_LOW_POWER` option and related configuration options.

Replay Protection List  The Replay Protection List (RPL) is used to hold recently received sequence numbers from elements within the mesh network to perform protection against replay attacks. To keep a node protected against replay attacks after reboot, it needs to store the entire RPL in the persistent storage before it is powered off. Depending on the amount of traffic in a mesh network, storing recently seen sequence numbers can make flash wear out sooner or later. To mitigate this, `CONFIG_BT_MESH_RPL_STORE_TIMEOUT` can be used. This option postpones storing of RPL entries in the persistent storage.

This option, however, doesn’t completely solve the issue as the node may get powered off before the timer to store the RPL is fired. To ensure that messages can not be replayed, the node can initiate storage of the pending RPL entry (or entries) at any time (or sufficiently before power loss) by calling `bt_mesh_rpl_pending_store()`. This is up to the node to decide, which RPL entries are to be stored in this case.

Setting `CONFIG_BT_MESH_RPL_STORE_TIMEOUT` to -1 allows to completely switch off the timer, which can help to significantly reduce flash wear out. This moves the responsibility of storing RPL to the user application and requires that sufficient power backup is available from the time this API is called until all RPL entries are written to the flash.

Finding the right balance between `CONFIG_BT_MESH_RPL_STORE_TIMEOUT` and calling `bt_mesh_rpl_pending_store()` may reduce a risk of security vulnerability and flash wear out.

API reference

group bt_mesh
  Bluetooth mesh.

  Defines

  BT_MESH_NET_PRIMARY
  BT_MESH_FEAT_RELAY
    Relay feature
  BT_MESH_FEAT_PROXY
    GATT Proxy feature
  BT_MESH_FEAT_FRIEND
    Friend feature
BT_MESH_FEAT_LOW_POWER
Low Power Node feature

BT_MESH_FEAT_SUPPORTED

BT_MESH_LPN_CB_DEFINE(_name)
Register a callback structure for Friendship events.

Parameters
• _name – Name of callback structure.

BT_MESH_FRIEND_CB_DEFINE(_name)
Register a callback structure for Friendship events.
Registers a callback structure that will be called whenever Friendship gets established or terminated.

Parameters
• _name – Name of callback structure.

Functions

int bt_mesh_init(const struct bt_mesh_prov *prov, const struct bt_mesh_comp *comp)
Initialize Mesh support.

After calling this API, the node will not automatically advertise as unprovisioned, rather the bt_mesh_prov_enable() API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

Parameters
• prov – Node provisioning information.
• comp – Node Composition.

Returns
Zero on success or (negative) error code otherwise.

void bt_mesh_reset(void)
Reset the state of the local Mesh node.

Resets the state of the node, which means that it needs to be reprovisioned to become an active node in a Mesh network again.

After calling this API, the node will not automatically advertise as unprovisioned, rather the bt_mesh_prov_enable() API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

int bt_mesh_suspend(void)
Suspend the Mesh network temporarily.

This API can be used for power saving purposes, but the user should be aware that leaving the local node suspended for a long period of time may cause it to become permanently disconnected from the Mesh network. If at all possible, the Friendship feature should be used instead, to make the node into a Low Power Node.

Returns
0 on success, or (negative) error code on failure.
int bt_mesh_resume(void)
    Resume a suspended Mesh network.

    This API resumes the local node, after it has been suspended using the \texttt{bt_mesh_suspend()} API.

    \textbf{Returns}
    0 on success, or (negative) error code on failure.

void bt_mesh_iv_update_test(bool enable)
    Toggle the IV Update test mode.

    This API is only available if the IV Update test mode has been enabled in Kconfig. It is needed for passing most of the IV Update qualification test cases.

    \textbf{Parameters}
    \begin{itemize}
    \item \texttt{enable} – true to enable IV Update test mode, false to disable it.
    \end{itemize}

bool bt_mesh_iv_update(void)
    Toggle the IV Update state.

    This API is only available if the IV Update test mode has been enabled in Kconfig. It is needed for passing most of the IV Update qualification test cases.

    \textbf{Returns}
    true if IV Update In Progress state was entered, false otherwise.

int bt_mesh_lpn_set(bool enable)
    Toggle the Low Power feature of the local device.

    Enables or disables the Low Power feature of the local device. This is exposed as a run-time feature, since the device might want to change this e.g. based on being plugged into a stable power source or running from a battery power source.

    \textbf{Parameters}
    \begin{itemize}
    \item \texttt{enable} – true to enable LPN functionality, false to disable it.
    \end{itemize}

    \textbf{Returns}
    Zero on success or (negative) error code otherwise.

int bt_mesh_lpn_poll(void)
    Send out a Friend Poll message.

    Send a Friend Poll message to the Friend of this node. If there is no established Friendship the function will return an error.

    \textbf{Returns}
    Zero on success or (negative) error code otherwise.

int bt_mesh_friend_terminate(uint16_t lpn_addr)
    Terminate Friendship.

    Terminated Friendship for given LPN.

    \textbf{Parameters}
    \begin{itemize}
    \item \texttt{lpn_addr} – Low Power Node address.
    \end{itemize}

    \textbf{Returns}
    Zero on success or (negative) error code otherwise.

void bt_mesh_rpl_pending_store(uint16_t addr)
    Store pending RPL entry(ies) in the persistent storage.

    This API allows the user to store pending RPL entry(ies) in the persistent storage without waiting for the timeout.
**Note:** When flash is used as the persistent storage, calling this API too frequently may wear it out.

**Parameters**

- `addr` – Address of the node which RPL entry needs to be stored or `BT_MESH_ADDR_ALL_NODES` to store all pending RPL entries.

```c
#include <main.h>
struct bt_mesh_lpn_cb
```

**Public Members**

```c
void (*established)(uint16_t net_idx, uint16_t friend_addr, uint8_t queue_size, uint8_t recv_window)
```

Friendship established.

This callback notifies the application that friendship has been successfully established.

- **Param net_idx**
  - NetKeyIndex used during friendship establishment.
- **Param friend_addr**
  - Friend address.
- **Param queue_size**
  - Friend queue size.
- **Param recv_window**
  - Low Power Node's listens duration for Friend response.

```c
void (*terminated)(uint16_t net_idx, uint16_t friend_addr)
```

Friendship terminated.

This callback notifies the application that friendship has been terminated.

- **Param net_idx**
  - NetKeyIndex used during friendship establishment.
- **Param friend_addr**
  - Friend address.

```c
void (*polled)(uint16_t net_idx, uint16_t friend_addr, bool retry)
```

Local Poll Request.

This callback notifies the application that the local node has polled the friend node.

This callback will be called before `bt_mesh_lpn_cb::established` when attempting to establish a friendship.

- **Param net_idx**
  - NetKeyIndex used during friendship establishment.
- **Param friend_addr**
  - Friend address.
- **Param retry**
  - Retry or first poll request for each transaction.

```c
#include <main.h>
struct bt_mesh_friend_cb
```

**6.1. Bluetooth**

```
```
Public Members

void (*established)(uint16_t net_idx, uint16_t lpn_addr, uint8_t recv_delay, uint32_t polltimeout)

Friendship established.
This callback notifies the application that friendship has been successfully established.
  \textbf{Param net_idx}  
  NetKeyIndex used during friendship establishment.
  \textbf{Param lpn_addr}  
  Low Power Node address.
  \textbf{Param recv_delay}  
  Receive Delay in units of 1 millisecond.
  \textbf{Param polltimeout}  
  PollTimeout in units of 1 millisecond.

void (*terminated)(uint16_t net_idx, uint16_t lpn_addr)

Friendship terminated.
This callback notifies the application that friendship has been terminated.
  \textbf{Param net_idx}  
  NetKeyIndex used during friendship establishment.
  \textbf{Param lpn_addr}  
  Low Power Node address.

void (*polled)(uint16_t net_idx, uint16_t lpn_addr)

Friend Poll Request.
This callback notifies the application that the low power node has polled the friend node.
This callback will be called before \texttt{bt\_mesh\_friend\_cb::established} when attempting to establish a friendship.
  \textbf{Param net_idx}  
  NetKeyIndex used during friendship establishment.
  \textbf{Param lpn_addr}  
  LPN address.

Access layer  The access layer is the application's interface to the Bluetooth mesh network. The access layer provides mechanisms for compartmentalizing the node behavior into elements and models, which are implemented by the application.

Mesh models  The functionality of a mesh node is represented by models. A model implements a single behavior the node supports, like being a light, a sensor or a thermostat. The mesh models are grouped into \textit{elements}. Each element is assigned its own unicast address, and may only contain one of each type of model. Conventionally, each element represents a single aspect of the mesh node behavior. For instance, a node that contains a sensor, two lights and a power outlet would spread this functionality across four elements, with each element instantiating all the models required for a single aspect of the supported behavior.

The node's element and model structure is specified in the node composition data, which is passed to \texttt{bt\_mesh\_init()} during initialization. The Bluetooth SIG have defined a set of foundation models (see \textit{Foundation models}) and a set of models for implementing common behavior in the Bluetooth Mesh Model Specification. All models not specified by the Bluetooth SIG are vendor models, and must be tied to a Company ID.

Mesh models have several parameters that can be configured either through initialization of the mesh stack or with the \textit{Configuration Server}:
Opcode list  The opcode list contains all message opcodes the model can receive, as well as the minimum acceptable payload length and the callback to pass them to. Models can support any number of opcodes, but each opcode can only be listed by one model in each element.

The full opcode list must be passed to the model structure in the composition data, and cannot be changed at runtime. The end of the opcode list is determined by the special `BT_MESH_MODEL_OP_END` entry. This entry must always be present in the opcode list, unless the list is empty. In that case, `BT_MESH_MODEL_NO_OPS` should be used in place of a proper opcode list definition.

AppKey list  The AppKey list contains all the application keys the model can receive messages on. Only messages encrypted with application keys in the AppKey list will be passed to the model.

The maximum number of supported application keys each model can hold is configured with the `CONFIG_BT_MESH_MODEL_KEY_COUNT` configuration option. The contents of the AppKey list is managed by the Configuration Server.

Subscription list  A model will process all messages addressed to the unicast address of their element (given that the utilized application key is present in the AppKey list). Additionally, the model will process packets addressed to any group or virtual address in its subscription list. This allows nodes to address multiple nodes throughout the mesh network with a single message.

The maximum number of supported addresses in the Subscription list each model can hold is configured with the `CONFIG_BT_MESH_MODEL_GROUP_COUNT` configuration option. The contents of the subscription list is managed by the Configuration Server.

Model publication  The models may send messages in two ways:

- By specifying a set of message parameters in a `bt_mesh_msg_ctx`, and calling `bt_mesh_model_send()`.
- By setting up a `bt_mesh_model_pub` structure and calling `bt_mesh_model_publish()`.

When publishing messages with `bt_mesh_model_publish()`, the model will use the publication parameters configured by the Configuration Server. This is the recommended way to send unprompted model messages, as it passes the responsibility of selecting message parameters to the network administrator, which likely knows more about the mesh network than the individual nodes will.

To support publishing with the publication parameters, the model must allocate a packet buffer for publishing, and pass it to `bt_mesh_model_pub.msg`. The Config Server may also set up period publication for the publication message. To support this, the model must populate the `bt_mesh_model_pub.update` callback. The `bt_mesh_model_pub.update` callback will be called right before the message is published, allowing the model to change the payload to reflect its current state.

By setting `bt_mesh_model_pub.retr_update` to 1, the model can configure the `bt_mesh_model_pub.update` callback to be triggered on every retransmission. This can, for example, be used by models that make use of a Delay parameter, which can be adjusted for every retransmission. The `bt Mesh_model pub_is_retransmission()` function can be used to differentiate a first publication and a retransmission. The `BT_MESH_PUB_MSG_TOTAL` and `BT_MESH_PUB_MSG_NUM` macros can be used to return total number of transmissions and the retransmission number within one publication interval.

Extended models  The Bluetooth mesh specification allows the mesh models to extend each other. When a model extends another, it inherits that model's functionality, and extension can be used to construct complex models out of simple ones, leveraging the existing model functionality to avoid defining new opcodes. Models may extend any number of models, from any element. When one model extends another in the same element, the two models will share subscription lists. The mesh stack implements this by merging the subscription lists of the two models into one, combining the number of subscriptions the models can have in total. Models may extend models that extend others, creating an “extension tree”. All models in an extension tree share a single subscription list per element it spans.
Model extensions are done by calling `bt_mesh_model_extend()` during initialization. A model can only be extended by one other model, and extensions cannot be circular. Note that binding of node states and other relationships between the models must be defined by the model implementations.

The model extension concept adds some overhead in the access layer packet processing, and must be explicitly enabled with `CONFIG_BT_MESH_MODEL_EXTENSIONS` to have any effect.

**Model data storage**  Mesh models may have data associated with each model instance that needs to be stored persistently. The access API provides a mechanism for storing this data, leveraging the internal model instance encoding scheme. Models can store one user defined data entry per instance by calling `bt_mesh_model_data_store()`. To be able to read out the data the next time the device reboots, the model's `bt_mesh_model_cb.settings_set` callback must be populated. This callback gets called when model specific data is found in the persistent storage. The model can retrieve the data by calling the `read_cb` passed as a parameter to the callback. See the `Settings` module documentation for details.

**API reference**  

`group bt_mesh_access`

Access layer.

**Defines**

- `BT_MESH_ADDR_UNASSIGNED`
- `BT_MESH_ADDR_ALL_NODES`
- `BT_MESH_ADDR_PROXIES`
- `BT_MESH_ADDR_FRIENDS`
- `BT_MESH_ADDR_RELAYS`
- `BT_MESH_KEY_UNUSED`
- `BT_MESH_KEY_ANY`
- `BT_MESH_KEY_DEV`
- `BT_MESH_KEY_DEV_LOCAL`
- `BT_MESH_KEY_DEV_REMOTE`
- `BT_MESH_KEY_DEV_ANY`
- `BT_MESH_ADDR_IS_UNICAST(addr)`
- `BT_MESH_ADDR_IS_GROUP(addr)`
- `BT_MESH_ADDR_IS_FIXED_GROUP(addr)`
BT_MESH_ADDR_IS_VIRTUAL(addr)
BT_MESH_ADDR_IS_RFU(addr)
BT_MESH_IS_DEV_KEY(key)

BT_MESH_APP_SEG_SDU_MAX
    Maximum size of an access message segment (in octets).

BT_MESH_APP_UNSEG_SDU_MAX
    Maximum payload size of an unsegmented access message (in octets).

BT_MESH_RX_SEG_MAX
    Maximum number of segments supported for incoming messages.

BT_MESH_TX_SEG_MAX
    Maximum number of segments supported for outgoing messages.

BT_MESH_TX_SDU_MAX
    Maximum possible payload size of an outgoing access message (in octets).

BT_MESH_RX_SDU_MAX
    Maximum possible payload size of an incoming access message (in octets).

BT_MESH_ELEM(_loc, _mods, _vnd_mods)
    Helper to define a mesh element within an array.
    In case the element has no SIG or Vendor models the helper macro BT_MESH_MODEL_NONE can be given instead.

    Parameters
    • _loc – Location Descriptor.
    • _mods – Array of models.
    • _vnd_mods – Array of vendor models.

BT_MESH_MODEL_ID_CFG_SRV

BT_MESH_MODEL_ID_CFG_CLI

BT_MESH_MODEL_ID_HEALTH_SRV

BT_MESH_MODEL_ID_HEALTH_CLI

BT_MESH_MODEL_ID_GEN_ONOFF_SRV

BT_MESH_MODEL_ID_GEN_ONOFF_CLI

BT_MESH_MODEL_ID_GEN_LEVEL_SRV

BT_MESH_MODEL_ID_GEN_LEVEL_CLI
6.1. Bluetooth

BT_MESH_MODEL_ID_TIME_CLI

BT_MESH_MODEL_ID_SCENE_SRV

BT_MESH_MODEL_ID_SCENE_SETUP_SRV

BT_MESH_MODEL_ID_LIGHT_LC_CLI

BT_MESH_MODEL_OP_1(b0)

BT_MESH_MODEL_OP_2(b0, b1)

BT_MESH_MODEL_OP_3(b0, cid)

BT_MESH_LEN_EXACT(len)
   Macro for encoding exact message length for fixed-length messages.

BT_MESH_LEN_MIN(len)
   Macro for encoding minimum message length for variable-length messages.

BT_MESH_MODEL_OP_END
   End of the opcode list. Must always be present.

BT_MESH_MODEL_NO_OPS
   Helper to define an empty opcode list.

BT_MESH_MODEL_NONE
   Helper to define an empty model array

BT_MESH_MODEL_CNT_CB(_id, _op, _pub, _user_data, _keys, _grps, _cb)
   Composition data SIG model entry with callback functions with specific number of keys & groups.

   Parameters
   • _id – Model ID.
   • _op – Array of model opcode handlers.
   • _pub – Model publish parameters.
   • _user_data – User data for the model.
   • _keys – Number of keys that can be bound to the model. Shall not exceed CONFIG_BT_MESH_MODEL_KEY_COUNT.
   • _grps – Number of addresses that the model can be subscribed to. Shall not exceed CONFIG_BT_MESH_MODEL_GROUP_COUNT.
   • _cb – Callback structure, or NULL to keep no callbacks.

BT_MESH_MODEL_CNT_VND_CB(_company, _id, _op, _pub, _user_data, _keys, _grps, _cb)
   Composition data vendor model entry with callback functions with specific number of keys & groups.

   Parameters
   • _company – Company ID.
   • _id – Model ID.
   • _op – Array of model opcode handlers.
   • _pub – Model publish parameters.
   • _user_data – User data for the model.
   • _keys – Number of keys that can be bound to the model. Shall not exceed CONFIG_BT_MESH_MODEL_KEY_COUNT.
• `_grps` – Number of addresses that the model can be subscribed to. Shall not exceed `CONFIG_BT_MESH_MODEL_GROUP_COUNT`.

• `_cb` – Callback structure, or NULL to keep no callbacks.

`BT_MESH_MODEL_CB(_id, _op, _pub, _user_data, _cb)`
Composition data SIG model entry with callback functions.

**Parameters**

- `_id` – Model ID.
- `_op` – Array of model opcode handlers.
- `_pub` – Model publish parameters.
- `_user_data` – User data for the model.
- `_cb` – Callback structure, or NULL to keep no callbacks.

`BT_MESH_MODEL_VND_CB(_company, _id, _op, _pub, _user_data, _cb)`
Composition data vendor model entry with callback functions.

**Parameters**

- `_company` – Company ID.
- `_id` – Model ID.
- `_op` – Array of model opcode handlers.
- `_pub` – Model publish parameters.
- `_user_data` – User data for the model.
- `_cb` – Callback structure, or NULL to keep no callbacks.

`BT_MESH_MODEL(_id, _op, _pub, _user_data)`
Composition data SIG model entry.

**Parameters**

- `_id` – Model ID.
- `_op` – Array of model opcode handlers.
- `_pub` – Model publish parameters.
- `_user_data` – User data for the model.

`BT_MESH_MODEL_VND(_company, _id, _op, _pub, _user_data)`
Composition data vendor model entry.

**Parameters**

- `_company` – Company ID.
- `_id` – Model ID.
- `_op` – Array of model opcode handlers.
- `_pub` – Model publish parameters.
- `_user_data` – User data for the model.

`BT_MESH_TRANSMIT(count, int_ms)`
Encode transmission count & interval steps.

**Parameters**

- `count` – Number of retransmissions (first transmission is excluded).
• int_ms – Interval steps in milliseconds. Must be greater than 0, less than or equal to 320, and a multiple of 10.

**Returns**
Mesh transmit value that can be used e.g. for the default values of the configuration model data.

**BT_MESH_TRANSMIT_COUNT** (transmit)
Decode transmit count from a transmit value.

**Parameters**
- transmit – Encoded transmit count & interval value.

**Returns**
Transmission count (actual transmissions is N + 1).

**BT_MESH_TRANSMIT_INT** (transmit)
Decode transmit interval from a transmit value.

**Parameters**
- transmit – Encoded transmit count & interval value.

**Returns**
Transmission interval in milliseconds.

**BT_MESH_PUB_TRANSMIT** (count, int_ms)
Encode Publish Retransmit count & interval steps.

**Parameters**
- count – Number of retransmissions (first transmission is excluded).
- int_ms – Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**Returns**
Mesh transmit value that can be used e.g. for the default values of the configuration model data.

**BT_MESH_PUB_TRANSMIT_COUNT** (transmit)
Decode Publish Retransmit count from a given value.

**Parameters**
- transmit – Encoded Publish Retransmit count & interval value.

**Returns**
Retransmission count (actual transmissions is N + 1).

**BT_MESH_PUB_TRANSMIT_INT** (transmit)
Decode Publish Retransmit interval from a given value.

**Parameters**
- transmit – Encoded Publish Retransmit count & interval value.

**Returns**
Transmission interval in milliseconds.

**BT_MESH_PUB_MSG_TOTAL** (pub)
Get total number of messages within one publication interval including initial publication.

**Parameters**
- pub – Model publication context.

**Returns**
total number of messages.
BT_MESH_PUB_MSG_NUM(pub)
Get message number within one publication interval.
Meant to be used inside bt_mesh_model_pub::update.

Parameters
• pub – Model publication context.

Returns
message number starting from 1.

BT_MESH_MODEL_PUB_DEFINE(_name, _update, _msg_len)
Define a model publication context.

Parameters
• _name – Variable name given to the context.
• _update – Optional message update callback (may be NULL).
• _msg_len – Length of the publication message.

BT_MESH_TTL_DEFAULT
Special TTL value to request using configured default TTL

BT_MESH_TTL_MAX
Maximum allowed TTL value

Functions

int bt_mesh_model_send(struct bt_mesh_model *model, struct bt_mesh_msg_ctx *ctx, struct net_buf_simple *msg, const struct bt_mesh_send_cb *cb, void *cb_data)
Send an Access Layer message.

Parameters
• model – Mesh (client) Model that the message belongs to.
• ctx – Message context, includes keys, TTL, etc.
• msg – Access Layer payload (the actual message to be sent).
• cb – Optional “message sent” callback.
• cb_data – User data to be passed to the callback.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_model_publish(struct bt_mesh_model *model)
Send a model publication message.

Before calling this function, the user needs to ensure that the model publication message (bt_mesh_model_pub::msg) contains a valid message to be sent. Note that this API is only to be used for non-period publishing. For periodic publishing the app only needs to make sure that bt_mesh_model_pub::msg contains a valid message whenever the bt_mesh_model_pub::update callback is called.

Parameters
• model – Mesh (client) Model that’s publishing the message.

Returns
0 on success, or (negative) error code on failure.
static inline bool bt_mesh_model_pub_is_retransmission(const struct bt_mesh_model *model)
Check if a message is being retransmitted.

Meant to be used inside the bt_mesh_model_pub::update callback.

Parameters
• model – Mesh Model that supports publication.

Returns
true if this is a retransmission, false if this is a first publication.

struct bt_mesh_elem *bt_mesh_model_elem(struct bt_mesh_model *mod)
Get the element that a model belongs to.

Parameters
• mod – Mesh model.

Returns
Pointer to the element that the given model belongs to.

struct bt_mesh_model *bt_mesh_model_find(const struct bt_mesh_elem *elem, uint16_t id)
Find a SIG model.

Parameters
• elem – Element to search for the model in.
• id – Model ID of the model.

Returns
A pointer to the Mesh model matching the given parameters, or NULL if no SIG model with the given ID exists in the given element.

struct bt_mesh_model *bt_mesh_model_find_vnd(const struct bt_mesh_elem *elem, uint16_t company, uint16_t id)
Find a vendor model.

Parameters
• elem – Element to search for the model in.
• company – Company ID of the model.
• id – Model ID of the model.

Returns
A pointer to the Mesh model matching the given parameters, or NULL if no vendor model with the given ID exists in the given element.

static inline bool bt_mesh_model_in_primary(const struct bt_mesh_model *mod)
Get whether the model is in the primary element of the device.

Parameters
• mod – Mesh model.

Returns
true if the model is on the primary element, false otherwise.

int bt_mesh_model_data_store(struct bt_mesh_model *mod, bool vnd, const char *name, const void *data, size_t data_len)
Immediately store the model's user data in persistent storage.

Parameters
• mod – Mesh model.
• vnd – This is a vendor model.
• name – Name/key of the settings item. Only `SETTINGS_MAX_DIR_DEPTH` bytes will be used at most.
• data – Model data to store, or NULL to delete any model data.
• data_len – Length of the model data.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_model_extend(struct bt_mesh_model *extending_mod, struct bt_mesh_model *base_mod)
```

Let a model extend another.

Mesh models may be extended to reuse their functionality, forming a more complex model. A Mesh model may extend any number of models, in any element. The extensions may also be nested, ie a model that extends another may itself be extended.

A set of models that extend each other form a model extension list.

All models in an extension list share one subscription list per element. The access layer will utilize the combined subscription list of all models in an extension list and element, giving the models extended subscription list capacity.

**Parameters**
• extending_mod – Mesh model that is extending the base model.
• base_mod – The model being extended.

**Return values**
0 – Successfully extended the base_mod model.

```c
bool bt_mesh_model_is_extended(struct bt_mesh_model *model)
```

Check if model is extended by another model.

**Parameters**
• model – The model to check.

**Return values**
true – If model is extended by another model, otherwise false

```c
struct bt_mesh_elem
```

```c
#include <access.h> Abstraction that describes a Mesh Element
```

### Public Members

```c
uint16_t addr
```
Unicast Address. Set at runtime during provisioning.

```c
const uint16_t loc
```
Location Descriptor (GATT Bluetooth Namespace Descriptors)

```c
const uint8_t model_count
```
The number of SIG models in this element

```c
const uint8_t vnd_model_count
```
The number of vendor models in this element

6.1. Bluetooth
struct bt_mesh_model *const models
    The list of SIG models in this element

struct bt_mesh_model *const vnd_models
    The list of vendor models in this element

struct bt_mesh_model_op
    #include <access.h> Model opcode handler.

Public Members

cst uint32_t opcode
    OpCode encoded using the BT_MESH_MODEL_OP_* macros

cst ssize_t len
    Message length. If the message has variable length then this value indicates minimum
    message length and should be positive. Handler function should verify precise length
    based on the contents of the message. If the message has fixed length then this value
    should be negative. Use BT_MESH_LEN_* macros when defining this value.

int (*const func)(struct bt_mesh_model *model, struct bt_mesh_msg_ctx *ctx, struct
    net_buf_simple *buf)
    Handler function for this opcode.
        Param model
            Model instance receiving the message.
        Param ctx
            Message context for the message.
        Param buf
            Message buffer containing the message payload, not including the opcode.
    Return
        Zero on success or (negative) error code otherwise.

struct bt_mesh_model_pub
    #include <access.h> Model publication context.
    The context should primarily be created using the BT_MESH_MODEL_PUB_DEFINE macro.

Public Members

struct bt_mesh_model *mod
    The model the context belongs to. Initialized by the stack.

uint16_t addr
    Publish Address.

uint16_t key
    Publish AppKey Index.

uint16_t cred
    Friendship Credentials Flag.
uint16_t send_rel
    Force reliable sending (segment acks)

uint16_t fast_period
    Use FastPeriodDivisor

uint16_t retr_update
    Call update callback on every retransmission.

uint8_t ttl
    Publish Time to Live.

uint8_t retransmit
    Retransmit Count & Interval Steps.

uint8_t period
    Publish Period.

uint8_t period_div
    Divisor for the Period.

uint8_t count
    Transmissions left.

uint32_t period_start
    Start of the current period.

struct net_buf_simple *msg
    Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the
BT_MESH_MODEL_PUB_DEFINE macro.

```
BT_MESH_MODEL_PUB_DEFINE(name, update, size);
```

int (*update)(struct bt_mesh_model *mod)
    Callback for updating the publication buffer.

    When set to NULL, the model is assumed not to support periodic publishing. When
    set to non-NULL the callback will be called periodically and is expected to update
    bt_mesh_model_pub::msg with a valid publication message.

    If the callback returns non-zero, the publication is skipped and will resume on the next
    periodic publishing interval.

    When bt_mesh_model_pub::retr_update is set to 1, the callback will be called on every
    retransmission.

    **Param mod**
    The Model the Publication Context belongs to.

    **Return**
    Zero on success or (negative) error code otherwise.

6.1. Bluetooth
struct \texttt{k\_work\_delayable} timer

Publish Period Timer. Only for stack-internal use.

struct bt\_mesh\_model\_cb

\#include <access.h> Model callback functions.

**Public Members**

\begin{verbatim}
int (*const settings_set)(struct bt\_mesh\_model *model, const char *name, size\_t len\_rd, settings\_read\_cb read\_cb, void *cb\_arg)
Set value handler of user data tied to the model.
\end{verbatim}

**See also:**

settings\_handler::h\_set

**Param** model
Model to set the persistent data of.

**Param** name
Name/key of the settings item.

**Param** len\_rd
The size of the data found in the backend.

**Param** read\_cb
Function provided to read the data from the backend.

**Param** cb\_arg
Arguments for the read function provided by the backend.

**Return**
0 on success, error otherwise.

\begin{verbatim}
int (*const start)(struct bt\_mesh\_model *model)
Callback called when the mesh is started.
This handler gets called after the node has been provisioned, or after all mesh data has been loaded from persistent storage.
When this callback fires, the mesh model may start its behavior, and all Access APIs are ready for use.
**Param** model
Model this callback belongs to.
**Return**
0 on success, error otherwise.
\end{verbatim}

\begin{verbatim}
int (*const init)(struct bt\_mesh\_model *model)
Model init callback.
Called on every model instance during mesh initialization.
If any of the model init callbacks return an error, the Mesh subsystem initialization will be aborted, and the error will be returned to the caller of bt\_mesh\_init.
**Param** model
Model to be initialized.
**Return**
0 on success, error otherwise.
\end{verbatim}
void (*const reset)(struct bt_mesh_model *model)

Model reset callback.
Called when the mesh node is reset. All model data is deleted on reset, and the model should clear its state.

**Note:** If the model stores any persistent data, this needs to be erased manually.

**Param model**
Model this callback belongs to.

```
struct bt_mesh_mod_id_vnd
#include <access.h> Vendor model ID
```

**Public Members**

```
uint16_t company
Vendor's company ID
```

```
uint16_t id
Model ID
```

```
struct bt_mesh_model
#include <access.h> Abstraction that describes a Mesh Model instance
```

**Public Members**

```
const uint16_t id
SIG model ID
```

```
const struct bt_mesh_mod_id_vnd vnd
Vendor model ID
```

```
struct bt_mesh_model_pub *const pub
Model Publication
```

```
uint16_t *const keys
AppKey List
```

```
uint16_t *const groups
Subscription List (group or virtual addresses)
```

```
const struct bt_mesh_model_op *const op
Opcode handler list
```

```
const struct bt_mesh_model_cb *const cb
Model callback structure.
```

6.1. Bluetooth
void *user_data

Model-specific user data

struct bt_mesh_send_cb

#include <access.h> Callback structure for monitoring model message sending

Public Members

void (*start)(uint16_t duration, int err, void *cb_data)
Handler called at the start of the transmission.
  Param duration
  The duration of the full transmission.
  Param err
  Error occurring during sending.
  Param cb_data
  Callback data, as passed to the send API.

void (*end)(int err, void *cb_data)
Handler called at the end of the transmission.
  Param err
  Error occurring during sending.
  Param cb_data
  Callback data, as passed to the send API.

struct bt_mesh_comp

#include <access.h> Node Composition

Public Members

uint16_t cid
  Company ID

uint16_t pid
  Product ID

uint16_t vid
  Version ID

size_t elem_count
  The number of elements in this device.

struct bt_mesh_elem *elem
  List of elements.

Foundation models The Bluetooth mesh specification defines four foundation models that can be used by network administrators to configure and diagnose mesh nodes.
**Configuration Server**  The Configuration Server model is a foundation model defined by the Bluetooth mesh specification. The Configuration Server model controls most parameters of the mesh node. It does not have an API of its own, but relies on a *Configuration Client* to control it.

..note::
The `bt_mesh_cfg_srv` structure has been deprecated. The initial values of the Relay, Beacon, Friend, Network transmit and Relay retransmit should be set through Kconfig, and the Heartbeat feature should be controlled through the *Heartbeat* API.

The Configuration Server model is mandatory on all Bluetooth mesh nodes, and should be instantiated in the first element.

**API reference**

*group bt_mesh_cfg_srv*

Configuration Server Model.

**Defines**

`BT_MESH_MODEL_CFG_SRV`

Generic Configuration Server model composition data entry.

**Configuration Client**  The Configuration Client model is a foundation model defined by the Bluetooth mesh specification. It provides functionality for configuring most parameters of a mesh node, including encryption keys, model configuration and feature enabling.

The Configuration Client model communicates with a *Configuration Server* model using the device key of the target node. The Configuration Client model may communicate with servers on other nodes or self-configure through the local Configuration Server model.

All configuration functions in the Configuration Client API have `net_idx` and `addr` as their first parameters. These should be set to the network index and primary unicast address that the target node was provisioned with.

The Configuration Client model is optional, but should be instantiated on the first element if it is present in the composition data.

**API reference**

*group bt_mesh_cfg_cli*

Configuration Client Model.

**Defines**

`BT_MESH_MODEL_CFG_CLI(cli_data)`

Generic Configuration Client model composition data entry.

**Parameters**

- `cli_data` – Pointer to a *Configuration Client Model* instance.

`BT_MESH_PUB_PERIOD_100MS(steps)`

Helper macro to encode model publication period in units of 100ms.

**Parameters**

- `steps` – Number of 100ms steps.
Returns

Encoded value that can be assigned to $bt\_mesh\_cfg\_cli\_mod\_pub\_period$

$BT\_MESH\_PUB\_PERIOD\_SEC(steps)$

Helper macro to encode model publication period in units of 1 second.

Parameters

• $steps$ – Number of 1 second steps.

Returns

Encoded value that can be assigned to $bt\_mesh\_cfg\_cli\_mod\_pub\_period$

$BT\_MESH\_PUB\_PERIOD\_10SEC(steps)$

Helper macro to encode model publication period in units of 10 seconds.

Parameters

• $steps$ – Number of 10 second steps.

Returns

Encoded value that can be assigned to $bt\_mesh\_cfg\_cli\_mod\_pub\_period$

$BT\_MESH\_PUB\_PERIOD\_10MIN(steps)$

Helper macro to encode model publication period in units of 10 minutes.

Parameters

• $steps$ – Number of 10 minute steps.

Functions

int $bt\_mesh\_cfg\_node\_reset(uint16\_t net\_idx, uint16\_t addr, bool *status)$

Reset the target node and remove it from the network.

Parameters

• $net\_idx$ – Network index to encrypt with.
• $addr$ – Target node address.
• $status$ – Status response parameter

Returns

0 on success, or (negative) error code on failure.

int $bt\_mesh\_cfg\_comp\_data\_get(uint16\_t net\_idx, uint16\_t addr, uint8\_t page, uint8\_t *rsp,$

struct $net\_buf\_simple *comp)$

Get the target node's composition data.

If the other device does not have the given composition data page, it will return the largest page number it supports that is less than the requested page index. The actual page the device responds with is returned in $rsp$.

This method can be used asynchronously by setting $rsp$ and $comp$ as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

• $net\_idx$ – Network index to encrypt with.
• $addr$ – Target node address.
• $page$ – Composition data page, or 0xff to request the first available page.
int bt_mesh_cfg_beacon_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
Get the target node's network beacon state.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• status – Status response parameter, returns one of
  BT_MESH_BEACON_DISABLED or BT_MESH_BEACON_ENABLED on suc-
  cess.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_krp_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint8_t *phase)
Get the target node's network key refresh phase state.

This method can be used asynchronously by setting status and phase as NULL. This way the
method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index.
• status – Status response parameter.
• phase – Pointer to the Key Refresh variable to fill.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_krp_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t transition, uint8_t *status, uint8_t *phase)
Set the target node's network key refresh phase parameters.

This method can be used asynchronously by setting status and phase as NULL. This way the
method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index.
• transition – Transition parameter.
• status – Status response parameter.
• phase – Pointer to the new Key Refresh phase. Will return the actual Key
  Refresh phase after updating.
Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_beacon_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node's network beacon state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New network beacon state, should be one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED`.
- `status` – Status response parameter. Returns one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED` on success.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_ttl_get(uint16_t net_idx, uint16_t addr, uint8_t *ttl)
```

Get the target node's Time To Live value.

This method can be used asynchronously by setting `ttl` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `ttl` – TTL response buffer.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_ttl_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *ttl)
```

Set the target node's Time To Live value.

This method can be used asynchronously by setting `ttl` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New Time To Live value.
- `ttl` – TTL response buffer.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_friend_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```

Get the target node's Friend feature status.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
• **addr** – Target node address.

• **status** – Status response parameter. Returns one of `BT_MESH_FRIEND_DISABLED`, `BT_MESH_FRIEND_ENABLED` or `BT_MESH_FRIEND_NOT_SUPPORTED` on success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_friend_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node's Friend feature state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• **net_idx** – Network index to encrypt with.

• **addr** – Target node address.

• **val** – New Friend feature state. Should be one of `BT_MESH_FRIEND_DISABLED` or `BT_MESH_FRIEND_ENABLED`.

• **status** – Status response parameter. Returns one of `BT_MESH_FRIEND_DISABLED`, `BT_MESH_FRIEND_ENABLED` or `BT_MESH_FRIEND_NOT_SUPPORTED` on success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_gatt_proxy_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```

Get the target node's Proxy feature state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• **net_idx** – Network index to encrypt with.

• **addr** – Target node address.

• **status** – Status response parameter. Returns one of `BT_MESH_GATT_PROXY_DISABLED`, `BT_MESH_GATT_PROXY_ENABLED` or `BT_MESH_GATT_PROXY_NOT_SUPPORTED` on success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_gatt_proxy_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node's Proxy feature state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• **net_idx** – Network index to encrypt with.

• **addr** – Target node address.

• **val** – New Proxy feature state. Must be one of `BT_MESH_GATT_PROXY_DISABLED` or `BT_MESH_GATT_PROXY_ENABLED`.

• **status** – Status response parameter. Returns one of `BT_MESH_GATT_PROXY_DISABLED`, `BT_MESH_GATT_PROXY_ENABLED` or `BT_MESH_GATT_PROXY_NOT_SUPPORTED` on success.
Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_net_transmit_get(uint16_t net_idx, uint16_t addr, uint8_t *transmit)
```
Get the target node's network_transmit state.

This method can be used asynchronously by setting `transmit` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_net_transmit_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *transmit)
```
Set the target node's network transmit parameters.

This method can be used asynchronously by setting `transmit` as NULL. This way the method will not wait for response and will return immediately after sending the command.

See also:
`BT_MESH_TRANSMIT`.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New encoded network transmit parameters.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_relay_get(uint16_t net_idx, uint16_t addr, uint8_t *status, uint8_t *transmit)
```
Get the target node's Relay feature state.

This method can be used asynchronously by setting `status` and `transmit` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `status` – Status response parameter. Returns one of `BT_MESH_RELAY_DISABLED`, `BT_MESH_RELAY_ENABLED` or `BT_MESH_RELAY_NOT_SUPPORTED` on success.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_relay_set(uint16_t net_idx, uint16_t addr, uint8_t new_relay, uint8_t new_transmit, uint8_t *status, uint8_t *transmit)

Set the target node's Relay parameters.

This method can be used asynchronously by setting status and transmit as NULL. This way the method will not wait for response and will return immediately after sending the command.

See also:
BT_MESH_TRANSMIT.

Parameters
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **new_relay** – New relay state. Must be one of BT_MESH_RELAY_DISABLED or BT_MESH_RELAY_ENABLED.
- **new_transmit** – New encoded relay transmit parameters.
- **status** – Status response parameter. Returns one of BT_MESH_RELAY_DISABLED, BT_MESH_RELAY_ENABLED or BT_MESH_RELAY_NOT_SUPPORTED on success.
- **transmit** – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_net_key_add(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const uint8_t net_key[16], uint8_t *status)

Add a network key to the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index.
- **net_key** – Network key.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_net_key_get(uint16_t net_idx, uint16_t addr, uint16_t *keys, size_t *key_cnt)

Get a list of the target node's network key indexes.

This method can be used asynchronously by setting keys or key_cnt as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **keys** – Net key index list response parameter. Will be filled with all the returned network key indexes it can fill.
• **key_cnt** – Net key index list length. Should be set to the capacity of the **keys** list when calling. Will return the number of returned network key indexes upon success.

### Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_net_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status)
```

Delete a network key from the target node.

This method can be used asynchronously by setting **status** as NULL. This way the method will not wait for response and will return immediately after sending the command.

### Parameters
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **key_net_idx** – Network key index.
• **status** – Status response parameter.

### Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_app_key_add(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, const uint8_t app_key[16], uint8_t *status)
```

Add an application key to the target node.

This method can be used asynchronously by setting **status** as NULL. This way the method will not wait for response and will return immediately after sending the command.

### Parameters
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **key_net_idx** – Network key index the application key belongs to.
• **key_app_idx** – Application key index.
• **app_key** – Application key.
• **status** – Status response parameter.

### Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_app_key_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint16_t *keys, size_t *key_cnt)
```

Get a list of the target node’s application key indexes for a specific network key.

This method can be used asynchronously by setting **status** and (**keys** or **key_cnt**) as NULL. This way the method will not wait for response and will return immediately after sending the command.

### Parameters
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **key_net_idx** – Network key index to request the app key indexes of.
• **status** – Status response parameter.

• **keys** – App key index list response parameter. Will be filled with all the returned application key indexes it can fill.

• **key_cnt** – App key index list length. Should be set to the capacity of the **keys** list when calling. Will return the number of returned application key indexes upon success.

### Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_app_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, uint8_t *status)
```

Delete an application key from the target node.

This method can be used asynchronously by setting **status** as NULL. This way the method will not wait for response and will return immediately after sending the command.

### Parameters
• **net_idx** – Network index to encrypt with.

• **addr** – Target node address.

• **key_net_idx** – Network key index the application key belongs to.

• **key_app_idx** – Application key index.

• **status** – Status response parameter.

### Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_app_bind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)
```

Bind an application to a SIG model on the target node.

This method can be used asynchronously by setting **status** as NULL. This way the method will not wait for response and will return immediately after sending the command.

### Parameters
• **net_idx** – Network index to encrypt with.

• **addr** – Target node address.

• **elem_addr** – Element address the model is in.

• **mod_app_idx** – Application index to bind.

• **mod_id** – Model ID.

• **status** – Status response parameter.

### Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_app_unbind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)
```

Unbind an application from a SIG model on the target node.

This method can be used asynchronously by setting **status** as NULL. This way the method will not wait for response and will return immediately after sending the command.

### Parameters
• **net_idx** – Network index to encrypt with.

• **addr** – Target node address.
• elem_addr – Element address the model is in.
• mod_app_idx – Application index to unbind.
• mod_id – Model ID.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_app_bind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                 uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid,
                                 uint8_t *status)

Bind an application to a vendor model on the target node.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_app_idx – Application index to bind.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_app_unbind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                   uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid,
                                   uint8_t *status)

Unbind an application from a vendor model on the target node.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_app_idx – Application index to unbind.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_app_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                            uint16_t mod_id, uint8_t *status, uint16_t *apps, size_t *app_cnt)

Get a list of all applications bound to a SIG model on the target node.
This method can be used asynchronously by setting status and (apps or app_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `status` – Status response parameter.
- `apps` – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
- `app_cnt` – App index list length. Should be set to the capacity of the apps list when calling. Will return the number of returned application key indexes upon success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_app_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                 uint16_t mod_id, uint16_t cid, uint8_t *status,
                                 uint16_t *apps, size_t *app_cnt)
```

Get a list of all applications bound to a vendor model on the target node.

This method can be used asynchronously by setting status and (apps or app_cnt) as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.
- `apps` – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
- `app_cnt` – App index list length. Should be set to the capacity of the apps list when calling. Will return the number of returned application key indexes upon success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_pub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                            uint16_t mod_id, struct bt_mesh_cfg_mod_pub *pub, uint8_t *status)
```

Get publish parameters for a SIG model on the target node.

This method can be used asynchronously by setting status and pub as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• pub – Publication parameter return buffer.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_pub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                 uint16_t mod_id, uint16_t cid, struct bt_mesh_cfg_mod_pub
                                 *pub, uint8_t *status)

Get publish parameters for a vendor model on the target node.

This method can be used asynchronously by setting status and pub as NULL. This way the
method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• cid – Company ID of the model.
• pub – Publication parameter return buffer.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_pub_set(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t
mod_id, struct bt_mesh_cfg_mod_pub *pub, uint8_t *status)

Set publish parameters for a SIG model on the target node.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

pub shall not be NULL.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• pub – Publication parameters.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_pub_set_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                 uint16_t mod_id, uint16_t cid, struct bt_mesh_cfg_mod_pub
                                 *pub, uint8_t *status)
Set publish parameters for a vendor model on the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

d pub shall not be NULL.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- mod_id – Model ID.
- cid – Company ID of the model.
- pub – Publication parameters.
- status – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_sub_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Add a group address to a SIG model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- sub_addr – Group address to add to the subscription list.
- mod_id – Model ID.
- status – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_sub_add_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status)

Add a group address to a vendor model's subscription list.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- sub_addr – Group address to add to the subscription list.
- mod_id – Model ID.
- cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_sub_del(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint8_t *status)

Delete a group address in a SIG model’s subscription list.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• sub_addr – Group address to add to the subscription list.
• mod_id – Model ID.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_sub_del_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Delete a group address in a vendor model’s subscription list.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• sub_addr – Group address to add to the subscription list.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_mod_sub_overwrite(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint8_t *status)

Overwrite all addresses in a SIG model’s subscription list with a group address.

Deletes all subscriptions in the model’s subscription list, and adds a single group address instead.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• **elem_addr** – Element address the model is in.
• **sub_addr** – Group address to add to the subscription list.
• **mod_id** – Model ID.
• **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_sub_overwrite_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                       uint16_t sub_addr, uint16_t mod_id, uint16_t cid,
                                       uint8_t *status)
```

Overwrite all addresses in a vendor model’s subscription list with a group address.

Deletes all subscriptions in the model’s subscription list, and adds a single group address instead.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **sub_addr** – Group address to add to the subscription list.
• **mod_id** – Model ID.
• **cid** – Company ID of the model.
• **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_sub_va_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const
                                uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr,
                                uint8_t *status)
```

Add a virtual address to a SIG model’s subscription list.

This method can be used asynchronously by setting `status` and `virt_addr` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **elem_addr** – Element address the model is in.
• **label** – Virtual address label to add to the subscription list.
• **mod_id** – Model ID.
• **virt_addr** – Virtual address response parameter.
• **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.
Add a virtual address to a vendor model’s subscription list.
This method can be used asynchronously by setting \texttt{status} and \texttt{virt\_addr} as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- \texttt{net\_idx} – Network index to encrypt with.
- \texttt{addr} – Target node address.
- \texttt{elem\_addr} – Element address the model is in.
- \texttt{label} – Virtual address label to add to the subscription list.
- \texttt{mod\_id} – Model ID.
- \texttt{cid} – Company ID of the model.
- \texttt{virt\_addr} – Virtual address response parameter.
- \texttt{status} – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

Delete a virtual address in a SIG model’s subscription list.
This method can be used asynchronously by setting \texttt{status} and \texttt{virt\_addr} as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- \texttt{net\_idx} – Network index to encrypt with.
- \texttt{addr} – Target node address.
- \texttt{elem\_addr} – Element address the model is in.
- \texttt{label} – Virtual address parameter to add to the subscription list.
- \texttt{mod\_id} – Model ID.
- \texttt{virt\_addr} – Virtual address response parameter.
- \texttt{status} – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

Delete a virtual address in a vendor model’s subscription list.
This method can be used asynchronously by setting \texttt{status} and \texttt{virt\_addr} as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- \texttt{net\_idx} – Network index to encrypt with.
- \texttt{addr} – Target node address.
- \texttt{elem\_addr} – Element address the model is in.
• label – Virtual address label to add to the subscription list.
• mod_id – Model ID.
• cid – Company ID of the model.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_sub_va_overwrite(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                      const uint8_t label[16], uint16_t mod_id, uint16_t
                                      *virt_addr, uint8_t *status)
```

Overwrite all addresses in a SIG model’s subscription list with a virtual address.
Deletes all subscriptions in the model’s subscription list, and adds a single group address instead.
This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address label to add to the subscription list.
• mod_id – Model ID.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_sub_va_overwrite_vnd(uint16_t net_idx, uint16_t addr, uint16_t
                                         elem_addr, const uint8_t label[16], uint16_t
                                         mod_id, uint16_t cid, uint16_t *virt_addr, uint8_t
                                         *status)
```

Overwrite all addresses in a vendor model’s subscription list with a virtual address.
Deletes all subscriptions in the model’s subscription list, and adds a single group address instead.
This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address label to add to the subscription list.
• mod_id – Model ID.
• cid – Company ID of the model.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.
Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_sub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status, uint16_t *subs, size_t *sub_cnt)
```

Get the subscription list of a SIG model on the target node.

This method can be used asynchronously by setting `status` and (`subs` or `sub_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `status` – Status response parameter.
- `subs` – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
- `sub_cnt` – Subscription list element count. Should be set to the capacity of the subs list when calling. Will return the number of returned subscriptions upon success.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_mod_sub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, uint8_t *status, uint16_t *subs, size_t *sub_cnt)
```

Get the subscription list of a vendor model on the target node.

This method can be used asynchronously by setting `status` and (`subs` or `sub_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.
- `subs` – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
- `sub_cnt` – Subscription list element count. Should be set to the capacity of the subs list when calling. Will return the number of returned subscriptions upon success.

Returns
0 on success, or (negative) error code on failure.
int bt_mesh_cfg_hb_sub_set(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_hb_sub *sub, uint8_t *status)
Set the target node's Heartbeat subscription parameters.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.
sub shall not be null.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• sub – New Heartbeat subscription parameters.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_hb_sub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_hb_sub *sub, uint8_t *status)
Get the target node's Heartbeat subscription parameters.
This method can be used asynchronously by setting status and sub as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• sub – Heartbeat subscription parameter return buffer.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_hb_pub_set(uint16_t net_idx, uint16_t addr, const struct bt_mesh_cfg_hb_pub *pub, uint8_t *status)
Set the target node's Heartbeat publication parameters.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.
pub shall not be NULL;

Note: The target node must already have received the specified network key.
Get the target node's Heartbeat publication parameters.

This method can be used asynchronously by setting `status` and `pub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `pub` – Heartbeat publication parameter return buffer.
- `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

Delete all group addresses in a SIG model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

Delete all group addresses in a vendor model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_net_key_update(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const uint8_t net_key[16], uint8_t *status)

0 on success, or (negative) error code on failure.
Update a network key to the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- net_idx – Network index to encrypt with.
- addr – Target node address.
- key_net_idx – Network key index.
- net_key – Network key.
- status – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_app_key_update(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                                uint16_t key_app_idx, const uint8_t app_key[16], uint8_t *status)
```

Update an application key to the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- net_idx – Network index to encrypt with.
- addr – Target node address.
- key_net_idx – Network key index the application key belongs to.
- key_app_idx – Application key index.
- app_key – Application key.
- status – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_node_identity_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
                                  uint8_t new_identity, uint8_t *status, uint8_t *identity)
```

Set the Node Identity parameters.

This method can be used asynchronously by setting status and identity as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- net_idx – Network index to encrypt with.
- addr – Target node address.
- new_identity – New identity state. Must be one of `BT_MESH_NODE_IDENTITY_STOPPED` or `BT_MESH_NODE_IDENTITY_RUNNING`
- key_net_idx – Network key index the application key belongs to.
- status – Status response parameter.
- identity – Identity response parameter.

**Returns**

0 on success, or (negative) error code on failure.
int bt_mesh_cfg_node_identity_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx,
int8_t *status, int8_t *identity)

Get the Node Identity parameters.
This method can be used asynchronously by setting status and identity as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- key_net_idx – Network key index the application key belongs to.
- status – Status response parameter.
- identity – Identity response parameter. Must be one of BT_MESH_NODE_IDENTITY_STOPPED or BT_MESH_NODE_IDENTITY_RUNNING

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_lpn_timeout_get(uint16_t net_idx, uint16_t addr, uint16_t unicast_addr,
int32_t *polltimeout)

Get the Low Power Node Polltimeout parameters.
This method can be used asynchronously by setting polltimeout as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- unicast_addr – LPN unicast address.
- polltimeout – Poll timeout response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_node_reset(uint16_t net_idx, uint16_t addr, bool *status)

Reset the target node and remove it from the network.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- status – Status response parameter

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_comp_data_get(uint16_t net_idx, uint16_t addr, uint8_t page, uint8_t *rsp, struct net_buf_simple *comp)

Get the target node’s composition data.
If the other device does not have the given composition data page, it will return the largest page number it supports that is less than the requested page index. The actual page the device responds with is returned in rsp.
This method can be used asynchronously by setting rsp and comp as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
Zephyr Project Documentation, Release 3.2.99

- net_idx – Network index to encrypt with.
- addr – Target node address.
- page – Composition data page, or 0xff to request the first available page.
- rsp – Return parameter for the returned page number, or NULL.
- comp – Composition data buffer to fill.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_beacon_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```
Get the target node's network beacon state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- net_idx – Network index to encrypt with.
- addr – Target node address.
- status – Status response parameter, returns one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED` on success.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_krp_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint8_t *phase)
```
Get the target node's network key refresh phase state.

This method can be used asynchronously by setting `status` and `phase` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- net_idx – Network index to encrypt with.
- addr – Target node address.
- key_net_idx – Network key index.
- status – Status response parameter.
- phase – Pointer to the Key Refresh variable to fill.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_krp_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t transition, uint8_t *status, uint8_t *phase)
```
Set the target node's network key refresh phase parameters.

This method can be used asynchronously by setting `status` and `phase` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- net_idx – Network index to encrypt with.
- addr – Target node address.
- key_net_idx – Network key index.
- transition – Transition parameter.
- status – Status response parameter.
• phase – Pointer to the new Key Refresh phase. Will return the actual Key Refresh phase after updating.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_beacon_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
```

Set the target node's network beacon state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New network beacon state, should be one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED`.
- `status` – Status response parameter. Returns one of `BT_MESH_BEACON_DISABLED` or `BT_MESH_BEACON_ENABLED` on success.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_ttl_get(uint16_t net_idx, uint16_t addr, uint8_t *ttl)
```

Get the target node's Time To Live value.

This method can be used asynchronously by setting `ttl` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `ttl` – TTL response buffer.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_ttl_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *ttl)
```

Set the target node's Time To Live value.

This method can be used asynchronously by setting `ttl` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New Time To Live value.
- `ttl` – TTL response buffer.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_friend_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
```

Get the target node's Friend feature status.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• net_idx – Network index to encrypt with.
• addr – Target node address.
• status – Status response parameter. Returns one of
  BT_MESH_FRIEND_DISABLED, BT_MESH_FRIEND_ENABLED or
  BT_MESH_FRIEND_NOT_SUPPORTED on success.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_friend_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
Set the target node’s Friend feature state.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• val – New Friend feature state. Should be one of
  BT_MESH_FRIEND_DISABLED or BT_MESH_FRIEND_ENABLED.
• status – Status response parameter. Returns one of
  BT_MESH_FRIEND_DISABLED, BT_MESH_FRIEND_ENABLED or
  BT_MESH_FRIEND_NOT_SUPPORTED on success.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_gatt_proxy_get(uint16_t net_idx, uint16_t addr, uint8_t *status)
Get the target node’s Proxy feature state.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• status – Status response parameter. Returns one of
  BT_MESH_GATT_PROXY_DISABLED, BT_MESH_GATT_PROXY_ENABLED or
  BT_MESH_GATT_PROXY_NOT_SUPPORTED on success.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_gatt_proxy_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)
Set the target node’s Proxy feature state.

This method can be used asynchronously by setting status as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• val – New Proxy feature state. Must be one of
  BT_MESH_GATT_PROXY_DISABLED or BT_MESH_GATT_PROXY_ENABLED.
• status – Status response parameter. Returns one of
  BT_MESH_GATT_PROXY_DISABLED, BT_MESH_GATT_PROXY_ENABLED
  or BT_MESH_GATT_PROXY_NOT_SUPPORTED on success.

Returns
  0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_net_transmit_get(uint16_t net_idx, uint16_t addr, uint8_t *transmit)
Get the target node's network transmit state.
This method can be used asynchronously by setting transmit as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
  • net_idx – Network index to encrypt with.
  • addr – Target node address.
  • transmit – Network transmit response parameter. Returns the en-
    coded network transmission parameters on success. Decoded with
    BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT.

Returns
  0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_net_transmit_set(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *
  transmit)
Set the target node's network transmit parameters.
This method can be used asynchronously by setting transmit as NULL. This way the method
will not wait for response and will return immediately after sending the command.

See also:
  BT_MESH_TRANSMIT.

Parameters
  • net_idx – Network index to encrypt with.
  • addr – Target node address.
  • val – New encoded network transmit parameters.
  • transmit – Network transmit response parameter. Returns the en-
    coded network transmission parameters on success. Decoded with
    BT_MESH_TRANSMIT_COUNT and BT_MESH_TRANSMIT_INT.

Returns
  0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_relay_get(uint16_t net_idx, uint16_t addr, uint8_t *
  status, uint8_t *
  transmit)
Get the target node's Relay feature state.
This method can be used asynchronously by setting status and transmit as NULL. This way the method
will not wait for response and will return immediately after sending the command.

Parameters
  • net_idx – Network index to encrypt with.
  • addr – Target node address.
• **status** – Status response parameter. Returns one of `BT_MESH_RELAY_DISABLED`, `BT_MESH_RELAY_ENABLED` or `BT_MESH_RELAY_NOT_SUPPORTED` on success.

• **transmit** – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with `BT_MESH_TRANSMIT_COUNT` and `BT_MESH_TRANSMIT_INT`.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_relay_set(uint16_t net_idx, uint16_t addr, uint8_t new_relay, uint8_t new_transmit, uint8_t *status, uint8_t *transmit)
```

Set the target node's Relay parameters.

This method can be used asynchronously by setting `status` and `transmit` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**See also:**

`BT_MESH_TRANSMIT`.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **new_relay** – New relay state. Must be one of `BT_MESH_RELAY_DISABLED` or `BT_MESH_RELAY_ENABLED`.
- **new_transmit** – New encoded relay transmit parameters.
- **status** – Status response parameter. Returns one of `BT_MESH_RELAY_DISABLED`, `BT_MESH_RELAY_ENABLED` or `BT_MESH_RELAY_NOT_SUPPORTED` on success.
- **transmit** – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with `BT_MESH_TRANSMIT_COUNT` and `BT_MESH_TRANSMIT_INT`.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_net_key_add(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const uint8_t net_key[16], uint8_t *status)
```

Add a network key to the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index.
- **net_key** – Network key.
- **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.
int bt_mesh_cfg_cli_net_key_get(uint16_t net_idx, uint16_t addr, uint16_t *keys, size_t *key_cnt)

Get a list of the target node’s network key indexes. This method can be used asynchronously by setting keys or key_cnt as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• keys – Net key index list response parameter. Will be filled with all the returned network key indexes it can fill.
• key_cnt – Net key index list length. Should be set to the capacity of the keys list when calling. Will return the number of returned network key indexes upon success.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_net_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status)

Delete a network key from the target node. This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_app_key_add(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, const uint8_t app_key[16], uint8_t *status)

Add an application key to the target node. This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index the application key belongs to.
• key_app_idx – Application key index.
• app_key – Application key.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.
int bt_mesh_cfg_cli_app_key_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, 
uint8_t *status, uint16_t *keys, size_t *key_cnt)

Get a list of the target node’s application key indexes for a specific network key.

This method can be used asynchronously by setting status and (keys or key_cnt) as NULL. 
This way the method will not wait for response and will return immediately after sending the 
command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index to request the app key indexes of.
• status – Status response parameter.
• keys – App key index list response parameter. Will be filled with all the re-
turned application key indexes it can fill.
• key_cnt – App key index list length. Should be set to the capacity of the keys 
list when calling. Will return the number of returned application key indexes 
upon success.

Returns
 0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_app_key_del(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, 
uint16_t key_app_idx, uint8_t *status)

Delete an application key from the target node.

This method can be used asynchronously by setting status as NULL. This way the method 
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index the application key belongs to.
• key_app_idx – Application key index.
• status – Status response parameter.

Returns
 0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_app_bind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, 
uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)

Bind an application to a SIG model on the target node.

This method can be used asynchronously by setting status as NULL. This way the method 
will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_app_idx – Application index to bind.
• mod_id – Model ID.
• status – Status response parameter.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_app_unbind(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)

Unbind an application from a SIG model on the target node.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_app_idx – Application index to unbind.
• mod_id – Model ID.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_app_bind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid, uint8_t *status)

Bind an application to a vendor model on the target node.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_app_idx – Application index to bind.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_app_unbind_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid, uint8_t *status)

Unbind an application from a vendor model on the target node.
This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• `mod_app_idx` – Application index to unbind.
• `mod_id` – Model ID.
• `cid` – Company ID of the model.
• `status` – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_app_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status, uint16_t *apps, size_t *app_cnt)
```

Get a list of all applications bound to a SIG model on the target node.

This method can be used asynchronously by setting `status` and (`apps` or `app_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• `net_idx` – Network index to encrypt with.
• `addr` – Target node address.
• `elem_addr` – Element address the model is in.
• `mod_id` – Model ID.
• `status` – Status response parameter.
• `apps` – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
• `app_cnt` – App index list length. Should be set to the capacity of the `apps` list when calling. Will return the number of returned application key indexes upon success.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_app_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, uint8_t *status, uint16_t *apps, size_t *app_cnt)
```

Get a list of all applications bound to a vendor model on the target node.

This method can be used asynchronously by setting `status` and (`apps` or `app_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• `net_idx` – Network index to encrypt with.
• `addr` – Target node address.
• `elem_addr` – Element address the model is in.
• `mod_id` – Model ID.
• `cid` – Company ID of the model.
• `status` – Status response parameter.
• `apps` – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
• `app_cnt` – App index list length. Should be set to the capacity of the `apps` list when calling. Will return the number of returned application key indexes upon success.
**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_pub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, struct bt_mesh_cfg_cli_mod_pub *pub,
                                uint8_t *status)
```

Get publish parameters for a SIG model on the target node.

This method can be used asynchronously by setting `status` and `pub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `pub` – Publication parameter return buffer.
- `status` – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_pub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                    uint16_t mod_id, uint16_t cid, struct bt_mesh_cfg_cli_mod_pub *pub,
                                    uint8_t *status)
```

Get publish parameters for a vendor model on the target node.

This method can be used asynchronously by setting `status` and `pub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `pub` – Publication parameter return buffer.
- `status` – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_pub_set(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, struct bt_mesh_cfg_cli_mod_pub *pub,
                                uint8_t *status)
```

Set publish parameters for a SIG model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

`pub` shall not be NULL.

**Parameters**

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
elem_addr – Element address the model is in.
• mod_id – Model ID.
• pub – Publication parameters.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_pub_set_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                  uint16_t mod_id, uint16_t cid, struct bt_mesh_cfg_cli_mod_pub *pub, uint8_t *status)
```

Set publish parameters for a vendor model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

`pub` shall not be NULL.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• cid – Company ID of the model.
• pub – Publication parameters.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t sub_addr, uint16_t mod_id, uint8_t *status)
```

Add a group address to a SIG model’s subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• sub_addr – Group address to add to the subscription list.
• mod_id – Model ID.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_add_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                    uint16_t sub_addr, uint16_t mod_id, uint16_t cid,
                                    uint8_t *status)
```

Add a group address to a vendor model’s subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.
Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_del(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t sub_addr, uint16_t mod_id, uint8_t *status)
```

Delete a group address in a SIG model’s subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_mod_sub_del_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                   uint16_t sub_addr, uint16_t mod_id, uint16_t cid,
                                   uint8_t *status)
```

Delete a group address in a vendor model’s subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.
int bt_mesh_cfg_cli_mod_sub_overwrite(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint8_t *status)

Overwrite all addresses in a SIG model's subscription list with a group address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **sub_addr** – Group address to add to the subscription list.
- **mod_id** – Model ID.
- **status** – Status response parameter.

**Returns**
- 0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_overwrite_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Overwrite all addresses in a vendor model's subscription list with a group address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **sub_addr** – Group address to add to the subscription list.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **status** – Status response parameter.

**Returns**
- 0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_va_add(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr, uint8_t *status)

Add a virtual address to a SIG model's subscription list.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address label to add to the subscription list.
• mod_id – Model ID.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_va_add_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
        const uint8_t label[16], uint16_t mod_id, uint16_t cid, uint16_t *virt_addr, uint8_t *status)

Add a virtual address to a vendor model’s subscription list.

This method can be used asynchronously by setting status and virt_addr as NULL. This way
the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address label to add to the subscription list.
• mod_id – Model ID.
• cid – Company ID of the model.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_mod_sub_va_del(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
        const uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr, uint8_t *status)

Delete a virtual address in a SIG model’s subscription list.

This method can be used asynchronously by setting status and virt_addr as NULL. This way
the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address parameter to add to the subscription list.
• mod_id – Model ID.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.
Delete a virtual address in a vendor model’s subscription list.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **label** – Virtual address label to add to the subscription list.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **virt_addr** – Virtual address response parameter.
- **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

Overwrite all addresses in a SIG model’s subscription list with a virtual address.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **label** – Virtual address label to add to the subscription list.
- **mod_id** – Model ID.
- **virt_addr** – Virtual address response parameter.
- **status** – Status response parameter.

**Returns**

0 on success, or (negative) error code on failure.

Overwrite all addresses in a vendor model’s subscription list with a virtual address.

This method can be used asynchronously by setting status and virt_addr as NULL. This way the method will not wait for response and will return immediately after sending the command.
Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• label – Virtual address label to add to the subscription list.
• mod_id – Model ID.
• cid – Company ID of the model.
• virt_addr – Virtual address response parameter.
• status – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_mod_sub_get(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                uint16_t mod_id, uint8_t *status, uint16_t *subs, size_t *sub_cnt)
```

Get the subscription list of a SIG model on the target node.

This method can be used asynchronously by setting status and (subs or sub_cnt) as NULL.
This way the method will not wait for response and will return immediately after sending the command.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• status – Status response parameter.
• subs – Subscription list response parameter. Will be filled with all the returned
  subscriptions it can fill.
• sub_cnt – Subscription list element count. Should be set to the capacity of the
  subs list when calling. Will return the number of returned subscriptions upon
  success.

Returns

0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_mod_sub_get_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr,
                                    uint16_t mod_id, uint8_t *status, uint16_t *subs, size_t *sub_cnt)
```

Get the subscription list of a vendor model on the target node.

This method can be used asynchronously by setting status and (subs or sub_cnt) as NULL.
This way the method will not wait for response and will return immediately after sending the command.

Parameters

• net_idx – Network index to encrypt with.
• addr – Target node address.
• elem_addr – Element address the model is in.
• mod_id – Model ID.
• **cid** – Company ID of the model.
• **status** – Status response parameter.
• **subs** – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
• **sub_cnt** – Subscription list element count. Should be set to the capacity of the subs list when calling. Will return the number of returned subscriptions upon success.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_sub_set(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_sub *sub, uint8_t *status)
```

Set the target node’s Heartbeat subscription parameters.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

sub shall not be null.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **sub** – New Heartbeat subscription parameters.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_sub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_sub *sub, uint8_t *status)
```

Get the target node’s Heartbeat subscription parameters.

This method can be used asynchronously by setting status and sub as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**
• **net_idx** – Network index to encrypt with.
• **addr** – Target node address.
• **sub** – Heartbeat subscription parameter return buffer.
• **status** – Status response parameter.

**Returns**
0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_hb_pub_set(uint16_t net_idx, uint16_t addr, const struct bt_mesh_cfg_cli_hb_pub *pub, uint8_t *status)
```

Set the target node’s Heartbeat publication parameters.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

pub shall not be NULL;

**Note:** The target node must already have received the specified network key.
Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `pub` – New Heartbeat publication parameters.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_hb_pub_get(uint16_t net_idx, uint16_t addr, struct bt_mesh_cfg_cli_hb_pub *pub, uint8_t *status)
```

Get the target node’s Heartbeat publication parameters.

This method can be used asynchronously by setting `status` and `pub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `pub` – Heartbeat publication parameter return buffer.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_mod_sub_del_all(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status)
```

Delete all group addresses in a SIG model’s subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

```
int bt_mesh_cfg_cli_mod_sub_del_all_vnd(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t elem_mod_id, uint16_t mod_id, uint16_t cid, uint8_t *status)
```

Delete all group addresses in a vendor model’s subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
• mod_id – Model ID.
• cid – Company ID of the model.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_net_key_update(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const uint8_t net_key[16], uint8_t *status)

Update a network key to the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index.
• net_key – Network key.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_app_key_update(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, const uint8_t app_key[16], uint8_t *status)

Update an application key to the target node.

This method can be used asynchronously by setting status as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• key_net_idx – Network key index the application key belongs to.
• key_app_idx – Application key index.
• app_key – Application key.
• status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_cfg_cli_node_identity_set(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t new_identity, uint8_t *status, uint8_t *identity)

Set the Node Identity parameters.

This method can be used asynchronously by setting status and identity as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters
• net_idx – Network index to encrypt with.
• addr – Target node address.
• **new_identity** – New identity state. Must be one of \texttt{BT_MESH_NODE_IDENTITY_STOPPED} or \texttt{BT_MESH_NODE_IDENTITY_RUNNING}.

• **key_net_idx** – Network key index the application key belongs to.

• **status** – Status response parameter.

• **identity** – Identity response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_node_identity_get(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint8_t *identity)
```

Get the Node Identity parameters.

This method can be used asynchronously by setting \texttt{status} and \texttt{identity} as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• **net_idx** – Network index to encrypt with.

• **addr** – Target node address.

• **key_net_idx** – Network key index the application key belongs to.

• **status** – Status response parameter.

• **identity** – Identity response parameter. Must be one of \texttt{BT_MESH_NODE_IDENTITY_STOPPED} or \texttt{BT_MESH_NODE_IDENTITY_RUNNING}.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_cfg_cli_lpn_timeout_get(uint16_t net_idx, uint16_t addr, uint16_t unicast_addr, int32_t *polltimeout)
```

Get the Low Power Node Polltimeout parameters.

This method can be used asynchronously by setting \texttt{polltimeout} as NULL. This way the method will not wait for response and will return immediately after sending the command.

**Parameters**

• **net_idx** – Network index to encrypt with.

• **addr** – Target node address.

• **unicast_addr** – LPN unicast address.

• **polltimeout** – Poll timeout response parameter.

**Returns**

0 on success, or (negative) error code on failure.

```c
int32_t bt_mesh_cfg_cli_timeout_get(void)
```

Get the current transmission timeout value.

**Returns**

The configured transmission timeout in milliseconds.

```c
void bt_mesh_cfg_cli_timeout_set(int32_t timeout)
```

Set the transmission timeout value.

**Parameters**

• **timeout** – The new transmission timeout.
int bt_mesh_comp_p0_get(struct bt_mesh_comp_p0 *comp, struct net_buf_simple *buf)

Create a composition data page 0 representation from a buffer.

The composition data page object will take ownership over the buffer, which should not be manipulated directly after this call.

This function can be used in combination with `bt_mesh_cfg_cli_comp_data_get` to read out composition data page 0 from other devices:

```c
NET_BUF_SIMPLE_DEFINE(buf, BT_MESH_RX_SDU_MAX);
struct bt_mesh_comp_p0 comp;
err = bt_mesh_cfg_cli_comp_data_get(net_idx, addr, 0, &page, &buf);
if (!err) {
    bt_mesh_comp_p0_get(&comp, &buf);
}
```

**Parameters**
- `buf` – Network buffer containing composition data.
- `comp` – Composition data structure to fill.

**Returns**
0 on success, or (negative) error code on failure.

```c
struct bt_mesh_comp_p0_elem *bt_mesh_comp_p0_elem_pull(const struct bt_mesh_comp_p0 *comp, struct bt_mesh_comp_p0_elem *elem)
```

Pull a composition data page 0 element from a composition data page 0 instance.

Each call to this function will pull out a new element from the composition data page, until all elements have been pulled.

**Parameters**
- `comp` – Composition data page
- `elem` – Element to fill.

**Returns**
A pointer to `elem` on success, or NULL if no more elements could be pulled.

```c
uint16_t bt_mesh_comp_p0_elem_mod(struct bt_mesh_comp_p0_elem *elem, int idx)
```

Get a SIG model from the given composition data page 0 element.

**Parameters**
- `elem` – Element to read the model from.
- `idx` – Index of the SIG model to read.

**Returns**
The Model ID of the SIG model at the given index, or 0xffff if the index is out of bounds.

```c
struct bt_mesh_mod_id_vnd bt_mesh_comp_p0_elem_mod_vnd(struct bt_mesh_comp_p0_elem *elem, int idx)
```

Get a vendor model from the given composition data page 0 element.

**Parameters**
- `elem` – Element to read the model from.
- `idx` – Index of the vendor model to read.
Returns

The model ID of the vendor model at the given index, or {0xffff, 0xffff} if the index is out of bounds.

```c
struct bt_mesh_cfg_cli_cb
#include <cfg_cli.h> Mesh Configuration Client Status messages callback

Public Members

void (*mod_sub_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t sub_addr, uint32_t mod_id)
Optional callback for Model Sub Status messages.
Handles received Model Sub Status messages from a server.

Param cli  
Client that received the status message.

Param addr  
Address of the sender.

Param status  
Status Code for requesting message.

Param elem_addr  
The unicast address of the element.

Param sub_addr  
The sub address.

Param mod_id  
The model ID within the element.

void (*node_reset_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr)
Optional callback for Node Reset Status messages.
Handles received Node Reset Status messages from a server.

Param cli  
Client that received the status message.

Param addr  
Address of the sender.

void (*beacon_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for Beacon Status messages.
Handles received Beacon Status messages from a server.

Param cli  
Client that received the status message.

Param addr  
Address of the sender.

Param status  
Status Code for requesting message.

void (*ttl_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for Default TTL Status messages.
Handles received Default TTL Status messages from a server.

Param cli  
Client that received the status message.

Param addr  
Address of the sender.
Param status
   Status Code for requesting message.

void (*friend_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for Friend Status messages.
Handles received Friend Status messages from a server.
   Param cli
      Client that received the status message.
   Param addr
      Address of the sender.
   Param status
      Status Code for requesting message.

void (*gatt_proxy_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for GATT Proxy Status messages.
Handles received GATT Proxy Status messages from a server.
   Param cli
      Client that received the status message.
   Param addr
      Address of the sender.
   Param status
      Status Code for requesting message.

void (*network_transmit_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status)
Optional callback for Network Transmit Status messages.
Handles received Network Transmit Status messages from a server.
   Param cli
      Client that received the status message.
   Param addr
      Address of the sender.
   Param status
      Status Code for requesting message.

void (*relay_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint8_t transmit)
Optional callback for Relay Status messages.
Handles received Relay Status messages from a server.
   Param cli
      Client that received the status message.
   Param addr
      Address of the sender.
   Param status
      Status Code for requesting message.
   Param transmit
      The relay retransmit count and interval steps.

void (*net_key_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx)
Optional callback for NetKey Status messages.
Handles received NetKey Status messages from a server.
   Param cli
      Client that received the status message.
**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

**Param net_idx**
The index of the NetKey.

```c
void (*app_key_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint16_t app_idx)
```
Optional callback for AppKey Status messages.
Handles received AppKey Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

**Param net_idx**
The index of the NetKey.

**Param app_idx**
The index of the AppKey.

```c
void (*mod_app_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t app_idx, uint32_t mod_id)
```
Optional callback for Model App Status messages.
Handles received Model App Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

**Param elem_addr**
The unicast address of the element.

**Param app_idx**
The sub address.

**Param mod_id**
The model ID within the element.

```c
void (*node_identity_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint8_t identity)
```
Optional callback for Node Identity Status messages.
Handles received Node Identity Status messages from a server.

**Param cli**
Client that received the status message.

**Param addr**
Address of the sender.

**Param status**
Status Code for requesting message.

**Param net_idx**
The index of the NetKey.

**Param identity**
The node identity state.

```c
void (*lpn_timeout_status)(struct bt_mesh_cfg_cli *cli, uint16_t addr, uint16_t elem_addr, uint32_t timeout)
```

Optional callback for LPN PollTimeout Status messages. Handles received LPN PollTimeout Status messages from a server.

- **Param cli**
  - Client that received the status message.
- **Param addr**
  - Address of the sender.
- **Param elem_addr**
  - The unicast address of the LPN.
- **Param timeout**
  - Current value of PollTimeout timer of the LPN.

```c
struct bt_mesh_cfgCli
  #include <cfg_cli.h> Mesh Configuration Client Model Context

Public Members

struct bt_mesh_cfg_hb_sub
    #include <cfg_cli.h> Heartbeat subscription configuration parameters.

Public Members

uint16_t src
    Source address to receive Heartbeat messages from.
uint16_t dst
Destination address to receive Heartbeat messages on.

uint8_t period
Logarithmic subscription period to keep listening for. The decoded subscription period is
\((1 << (period - 1))\) seconds, or 0 seconds if period is 0.

uint8_t count
Logarithmic Heartbeat subscription receive count. The decoded Heartbeat count is \((1 << (count - 1))\) if count is between 1 and 0xfe, 0 if count is 0 and 0xffff if count is 0xff.
Ignored in Heartbeat subscription set.

uint8_t min
Minimum hops in received messages, ie the shortest registered path from the publishing
node to the subscribing node. A Heartbeat received from an immediate neighbor has hop
count = 1.
Ignored in Heartbeat subscription set.

uint8_t max
Maximum hops in received messages, ie the longest registered path from the publishing
node to the subscribing node. A Heartbeat received from an immediate neighbor has hop
count = 1.
Ignored in Heartbeat subscription set.

struct bt_mesh_cfg_cli hb_sub
#include <cfg_cli.h> Heartbeat subscription configuration parameters.

Public Members

uint16_t src
Source address to receive Heartbeat messages from.

uint16_t dst
Destination address to receive Heartbeat messages on.

uint8_t period
Logarithmic subscription period to keep listening for. The decoded subscription period is
\((1 << (period - 1))\) seconds, or 0 seconds if period is 0.

uint8_t count
Logarithmic Heartbeat subscription receive count. The decoded Heartbeat count is \((1 << (count - 1))\) if count is between 1 and 0xfe, 0 if count is 0 and 0xffff if count is 0xff.
Ignored in Heartbeat subscription set.

uint8_t min
Minimum hops in received messages, ie the shortest registered path from the publishing

count = 1.
Ignored in Heartbeat subscription set.
struct bt_mesh_cfg_hb_pub
#include <cfg_cli.h> Heartbeat publication configuration parameters.

Public Members

uint16_t dst
Heartbeat destination address.

uint8_t count
Logarithmic Heartbeat count. Decoded as (1 << (count - 1)) if count is between 1 and 0x11, 0 if count is 0, or “indefinitely” if count is 0xff.
When used in Heartbeat publication set, this parameter denotes the number of Heartbeat messages to send.
When returned from Heartbeat publication get, this parameter denotes the number of Heartbeat messages remaining to be sent.

uint8_t period
Logarithmic Heartbeat publication transmit interval in seconds. Decoded as (1 << (period - 1)) if period is between 1 and 0x11. If period is 0, Heartbeat publication is disabled.

uint8_t ttl
Publication message Time To Live value.

uint16_t feat
Bitmap of features that trigger Heartbeat publications. Legal values are BT_MESH_FEAT_RELAY, BT_MESH_FEAT_PROXY, BT_MESH_FEAT_FRIEND and BT_MESH_FEAT_LOW_POWER

uint16_t net_idx
Network index to publish with.

struct bt_mesh_cfg_cli_hb_pub

uint16_t loc
   Element location

size_t nsig
   The number of SIG models in this element

size_t nvnd
   The number of vendor models in this element

Health Server  The Health Server model provides attention callbacks and node diagnostics for Health Client models. It is primarily used to report faults in the mesh node and map the mesh nodes to their physical location.

Faults  The Health Server model may report a list of faults that have occurred in the device’s lifetime. Typically, the faults are events or conditions that may alter the behavior of the node, like power outages or faulty peripherals. Faults are split into warnings and errors. Warnings indicate conditions that are close to the limits of what the node is designed to withstand, but not necessarily damaging to the device. Errors indicate conditions that are outside of the node’s design limits, and may have caused invalid behavior or permanent damage to the device.

Fault values 0x01 to 0x7f are reserved for the Bluetooth mesh specification, and the full list of specification defined faults are available in Health faults. Fault values 0x80 to 0xff are vendor specific. The list of faults are always reported with a company ID to help interpreting the vendor specific faults.

Attention state  The attention state is used to make the device call attention to itself through some physical behavior like blinking, playing a sound or vibrating. The attention state may be used during provisioning to let the user know which device they’re provisioning, as well as through the Health models at runtime.

The attention state is always assigned a timeout in the range of one to 255 seconds when enabled. The Health Server API provides two callbacks for the application to run their attention calling behavior: bt_mesh_health_srv.cb.attn_on is called at the beginning of the attention period, bt_mesh_health_srv.cb.attn_off is called at the end.

The remaining time for the attention period may be queried through bt_mesh_health_srv.attn_timer.

API reference

group bt_mesh_health_srv
   Health Server Model.

Defines

BT_MESH_HEALTH_PUB_DEFINE(_name, _max_faults)
   A helper to define a health publication context

Parameters

• _name – Name given to the publication context variable.
• _max_faults – Maximum number of faults the element can have.
Define a new health server model. Note that this API needs to be repeated for each element that the application wants to have a health server model on. Each instance also needs a unique `bt_mesh_health_srv` and `bt_mesh_model_pub` context.

**Parameters**
- `srv` – Pointer to a unique struct `bt_mesh_health_srv`.
- `pub` – Pointer to a unique struct `bt_mesh_model_pub`.

**Returns**
New mesh model instance.

### Functions

**int bt_mesh_fault_update (struct bt_mesh_elem *elem)**

Notify the stack that the fault array state of the given element has changed.

This prompts the Health server on this element to publish the current fault array if periodic publishing is disabled.

**Parameters**
- `elem` – Element to update the fault state of.

**Returns**
0 on success, or (negative) error code otherwise.

**int bt_mesh_health_srv_fault_update (struct bt_mesh_elem *elem)**

Notify the stack that the fault array state of the given element has changed.

This prompts the Health server on this element to publish the current fault array if periodic publishing is disabled.

**Parameters**
- `elem` – Element to update the fault state of.

**Returns**
0 on success, or (negative) error code otherwise.

**struct bt_mesh_health_srv_cb**

`#include <health_srv.h>` Callback function for the Health Server model

### Public Members

**int (*fault_get_cur) (struct bt_mesh_model *model, uint8_t *test_id, uint16_t *company_id, uint8_t *faults, uint8_t *fault_count)**

Callback for fetching current faults.

Fault values may either be defined by the specification, or by a vendor. Vendor specific faults should be interpreted in the context of the accompanying Company ID. Specification defined faults may be reported for any Company ID, and the same fault may be presented for multiple Company IDs.

All faults shall be associated with at least one Company ID, representing the device vendor or some other vendor whose vendor specific fault values are used.

If there are multiple Company IDs that have active faults, return only the faults associated with one of them at the time. To report faults for multiple Company IDs, interleave which Company ID is reported for each call.
int (*fault_get_reg)(struct bt_mesh_model *model, uint16_t company_id, uint8_t *test_id, uint8_t *faults, uint8_t *fault_count)
 Callback for fetching all registered faults.
 Registered faults are all past and current faults since the last call to fault_clear. Only faults associated with the given Company ID should be reported.
 Fault values may either be defined by the specification, or by a vendor. Vendor specific faults should be interpreted in the context of the accompanying Company ID. Specification defined faults may be reported for any Company ID, and the same fault may be presented for multiple Company IDs.

int (*fault_clear)(struct bt_mesh_model *model, uint16_t company_id)
 Clear all registered faults associated with the given Company ID.

int (*fault_test)(struct bt_mesh_model *model, uint8_t test_id, uint16_t company_id)
 Run a self-test.
 The Health server may support up to 256 self-tests for each Company ID. The behavior for all test IDs are vendor specific, and should be interpreted based on the accompanying Company ID. Test failures should result in changes to the fault array.

Param company_id
Company ID to run test for.

Return
0 if the test execution was started successfully, or (negative) error code otherwise. Note that the fault array will not be reported back to the client if the test execution didn't start.

void (*attn_on)(struct bt_mesh_model *model)
Start calling attention to the device.

The attention state is used to map an element address to a physical device. When this callback is called, the device should start some physical procedure meant to call attention to itself, like blinking, buzzing, vibrating or moving. If there are multiple Health server instances on the device, the attention state should also help identify the specific element the server is in.

The attention calling behavior should continue until the attn_off callback is called.

Param model
Health Server model to start the attention state of.

void (*attn_off)(struct bt_mesh_model *model)
Stop the attention state.

Any physical activity started to call attention to the device should be stopped.

Param model

struct bt_mesh_health_srv

#include <health_srv.h> Mesh Health Server Model Context

Public Members

struct bt_mesh_model *model
Composition data model entry pointer.

Health Client  The Health Client model interacts with a Health Server model to read out diagnostics and control the node's attention state.

All message passing functions in the Health Client API have cli as their first parameter. This is a pointer to the client model instance to be used in this function call. The second parameter is the ctx or message context. Message context contains netkey index, appkey index and unicast address that the target node uses.

The Health Client model is optional, and may be instantiated in any element. However, if a Health Client model is instantiated in an element other than the first, an instance must also be present in the first element.

See Health faults for a list of specification defined fault values.

API reference

**group** bt_mesh_health_cli
Health Client Model.

**Defines**

BT_MESH_MODEL_HEALTH_CLI(cli_data)
Generic Health Client model composition data entry.

**Parameters**

- cli_data – Pointer to a Health Client Model instance.

**Functions**

int bt_mesh_health_cli_set(struct bt_mesh_model *model)
Set Health client model instance to use for communication.

**Parameters**

- model – Health Client model instance from the composition data.

**Returns**

0 on success, or (negative) error code on failure.

int bt_mesh_health_fault_get(uint16_t addr, uint16_t app_idx, uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)
Get the registered fault state for the given Company ID.

This method can be used asynchronously by setting test_id and (faults or fault_count) as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the fault_status callback in bt_mesh_health_cli struct.

See also:

Health faults

Parameters

• addr – Target node element address.
• app_idx – Application index to encrypt with.
• cid – Company ID to get the registered faults of.
• test_id – Test ID response buffer.
• faults – Fault array response buffer.
• fault_count – Fault count response buffer.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_health_fault_clear(uint16_t addr, uint16_t app_idx, uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)

Clear the registered faults for the given Company ID.

This method can be used asynchronously by setting test_id and (faults or fault_count) as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the fault_status callback in bt_mesh_health_cli struct.

See also:

Health faults

Parameters

• addr – Target node element address.
• app_idx – Application index to encrypt with.
• cid – Company ID to clear the registered faults for.
• test_id – Test ID response buffer.
• faults – Fault array response buffer.
• fault_count – Fault count response buffer.

Returns

0 on success, or (negative) error code on failure.
int bt_mesh_health_fault_clear_unack(uint16_t addr, uint16_t app_idx, uint16_t cid)
Clear the registered faults for the given Company ID (unacked).

See also:

*Health faults*

**Parameters**

- **addr** – Target node element address.
- **app_idx** – Application index to encrypt with.
- **cid** – Company ID to clear the registered faults for.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_fault_test(uint16_t addr, uint16_t app_idx, uint16_t cid, uint8_t test_id, uint8_t *faults, size_t *fault_count)
```
Invoke a self-test procedure for the given Company ID.

This method can be used asynchronously by setting `faults` or `fault_count` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `fault_status` callback in `bt_mesh_health_cli` struct.

**Parameters**

- **addr** – Target node element address.
- **app_idx** – Application index to encrypt with.
- **cid** – Company ID to invoke the test for.
- **test_id** – Test ID response buffer.
- **faults** – Fault array response buffer.
- **fault_count** – Fault count response buffer.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_fault_test_unack(uint16_t addr, uint16_t app_idx, uint16_t cid, uint8_t test_id)
```
Invoke a self-test procedure for the given Company ID (unacked).

**Parameters**

- **addr** – Target node element address.
- **app_idx** – Application index to encrypt with.
- **cid** – Company ID to invoke the test for.
- **test_id** – Test ID response buffer.

**Returns**

0 on success, or (negative) error code on failure.
int bt_mesh_health_period_get(uint16_t addr, uint16_t app_idx, uint8_t *divisor)

Get the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by \(1 << \text{divisor}\). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

This method can be used asynchronously by setting divisor as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the period_status callback in `bt_mesh_health_cli` struct.

**Parameters**

- `addr` – Target node element address.
- `app_idx` – Application index to encrypt with.
- `divisor` – Health period divisor response buffer.

**Returns**

0 on success, or (negative) error code on failure.

int bt_mesh_health_period_set(uint16_t addr, uint16_t app_idx, uint8_t divisor, uint8_t *updated_divisor)

Set the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by \(1 << \text{divisor}\). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

This method can be used asynchronously by setting updated_divisor as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the period_status callback in `bt_mesh_health_cli` struct.

**Parameters**

- `addr` – Target node element address.
- `app_idx` – Application index to encrypt with.
- `divisor` – New Health period divisor.
- `updated_divisor` – Health period divisor response buffer.

**Returns**

0 on success, or (negative) error code on failure.

int bt_mesh_health_period_set_unack(uint16_t addr, uint16_t app_idx, uint8_t divisor)

Set the target node's Health fast period divisor (unacknowledged).

This is an unacknowledged version of this API.

**Parameters**

- `addr` – Target node element address.
- `app_idx` – Application index to encrypt with.
- `divisor` – New Health period divisor.
Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_attention_get(uint16_t addr, uint16_t app_idx, uint8_t *attention)
Get the current attention timer value.
This method can be used asynchronously by setting attention as NULL. This way the method
will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the attention_status call-back in bt_mesh_health_cli struct.

Parameters
• addr – Target node element address.
• app_idx – Application index to encrypt with.
• attention – Attention timer response buffer, measured in seconds.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_attention_set(uint16_t addr, uint16_t app_idx, uint8_t attention, uint8_t *updated_attention)
Set the attention timer.
This method can be used asynchronously by setting updated_attention as NULL. This way the method
will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the attention_status call-back in bt_mesh_health_cli struct.

Parameters
• addr – Target node element address.
• app_idx – Application index to encrypt with.
• attention – New attention timer time, in seconds.
• updated_attention – Attention timer response buffer, measured in seconds.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_attention_set_unack(uint16_t addr, uint16_t app_idx, uint8_t attention)
Set the attention timer (unacknowledged).

Parameters
• addr – Target node element address.
• app_idx – Application index to encrypt with.
• attention – New attention timer time, in seconds.

Returns
0 on success, or (negative) error code on failure.

int bt_mesh_health_cli_fault_get(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx,
uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)
Get the registered fault state for the given Company ID.
This method can be used asynchronously by setting test_id and (faults or fault_count ) as NULL. This way the method will not wait for response and will return immediately after sending the command.
To process the response arguments of an async method, register the `fault_status` callback in `bt_mesh_health_cli` struct.

See also:

*Health faults*

Parameters

- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `cid` – Company ID to get the registered faults of.
- `test_id` – Test ID response buffer.
- `faults` – Fault array response buffer.
- `fault_count` – Fault count response buffer.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_clear(
    struct bt_mesh_health_cli *cli,
    struct bt_mesh_msg_ctx *ctx,
    uint16_t cid,
    uint8_t *test_id,
    uint8_t *faults,
    size_t *fault_count
)
```

Clear the registered faults for the given Company ID.

This method can be used asynchronously by setting `test_id` and (`faults` or `fault_count`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `fault_status` callback in `bt_mesh_health_cli` struct.

See also:

*Health faults*

Parameters

- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `cid` – Company ID to clear the registered faults for.
- `test_id` – Test ID response buffer.
- `faults` – Fault array response buffer.
- `fault_count` – Fault count response buffer.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_clear_unack(
    struct bt_mesh_health_cli *cli,
    struct bt_mesh_msg_ctx *ctx,
    uint16_t cid
)
```

Clear the registered faults for the given Company ID (unacked).

See also:

*Health faults*
Parameters

- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `cid` – Company ID to clear the registered faults for.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_healthCli_fault_test(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid, uint8_t test_id, uint8_t *faults, size_t *fault_count)
```

Invoke a self-test procedure for the given Company ID.

This method can be used asynchronously by setting `faults` or `fault_count` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `fault_status` callback in `bt_mesh_health_cli` struct.

Parameters

- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `cid` – Company ID to invoke the test for.
- `test_id` – Test ID response buffer.
- `faults` – Fault array response buffer.
- `fault_count` – Fault count response buffer.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_fault_test_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint16_t cid, uint8_t test_id)
```

Invoice a self-test procedure for the given Company ID (unacked).

Parameters

- `cli` – Client model to send on.
- `ctx` – Message context, or NULL to use the configured publish parameters.
- `cid` – Company ID to invoke the test for.
- `test_id` – Test ID response buffer.

Returns

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_period_get(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t *divisor)
```

Get the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by \((1 \ll \text{divisor})\). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.
This method can be used asynchronously by setting divisor as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the period_status callback in bt_mesh_health_cli struct.

Parameters
- cli – Client model to send on.
- ctx – Message context, or NULL to use the configured publish parameters.
- divisor – Health period divisor response buffer.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_period_set(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t divisor, uint8_t *updated_divisor)
```

Set the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by (1 << divisor). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

This method can be used asynchronously by setting updated_divisor as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the period_status callback in bt_mesh_health_cli struct.

Parameters
- cli – Client model to send on.
- ctx – Message context, or NULL to use the configured publish parameters.
- divisor – New Health period divisor.
- updated_divisor – Health period divisor response buffer.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_period_set_unack(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t divisor)
```

Set the target node's Health fast period divisor (unacknowledged).

This is an unacknowledged version of this API.

Parameters
- cli – Client model to send on.
- ctx – Message context, or NULL to use the configured publish parameters.
- divisor – New Health period divisor.

Returns
0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_attention_get(struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t *attention)
```

Get the current attention timer value.

This method can be used asynchronously by setting attention as NULL. This way the method will not wait for response and will return immediately after sending the command.
To process the response arguments of an async method, register the attention_status callback in `bt_mesh_health_cli` struct.

**Parameters**

- cli – Client model to send on.
- ctx – Message context, or NULL to use the configured publish parameters.
- attention – Attention timer response buffer, measured in seconds.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_attention_set(
    struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t attention, uint8_t *updated_attention)
```

Set the attention timer.

This method can be used asynchronously by setting `updated_attention` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the attention_status callback in `bt_mesh_health_cli` struct.

**Parameters**

- cli – Client model to send on.
- ctx – Message context, or NULL to use the configured publish parameters.
- attention – New attention timer time, in seconds.
- updated_attention – Attention timer response buffer, measured in seconds.

**Returns**

0 on success, or (negative) error code on failure.

```c
int bt_mesh_health_cli_attention_set_unack(
    struct bt_mesh_health_cli *cli, struct bt_mesh_msg_ctx *ctx, uint8_t attention)
```

Set the attention timer (unacknowledged).

**Parameters**

- cli – Client model to send on.
- ctx – Message context, or NULL to use the configured publish parameters.
- attention – New attention timer time, in seconds.

**Returns**

0 on success, or (negative) error code on failure.

```c
int32_t bt_mesh_health_cli_timeout_get(void)
```

Get the current transmission timeout value.

**Returns**

The configured transmission timeout in milliseconds.

```c
void bt_mesh_health_cli_timeout_set(int32_t timeout)
```

Set the transmission timeout value.

**Parameters**

- timeout – The new transmission timeout.

```c
#include "health_cli.h" // Health Client Model Context
```
Public Members

struct bt_mesh_model *model

Composition data model entry pointer.

struct bt_mesh_model_pub pub

Publication structure instance

struct net_buf_simple pub_buf

Publication buffer

uint8_t pub_data[BT_MESH_MODEL_BUF_LEN(BT_MESH_MODEL_OP_2(0x80, 0x32), 3)]

Publication data

void (*period_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t divisor)

Optional callback for Health Period Status messages.
Handles received Health Period Status messages from a Health server. The divisor param represents the period divisor value.

Param cli
Health client that received the status message.

Param addr
Address of the sender.

Param divisor
Health Period Divisor value.

void (*attention_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t attention)

Optional callback for Health Attention Status messages.
Handles received Health Attention Status messages from a Health server. The attention param represents the current attention value.

Param cli
Health client that received the status message.

Param addr
Address of the sender.

Param attention
Current attention value.

void (*fault_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t test_id, uint16_t cid, uint8_t *faults, size_t fault_count)

Optional callback for Health Fault Status messages.
Handles received Health Fault Status messages from a Health server. The fault array represents all faults that are currently present in the server's element.

See also:
Health faults

Param cli
Health client that received the status message.

Param addr
Address of the sender.

Param test_id
Identifier of a most recently performed test.
**Param cid**
Company Identifier of the node.

**Param faults**
Array of faults.

**Param fault_count**
Number of faults in the fault array.

```c
void (*current_status)(struct bt_mesh_health_cli *cli, uint16_t addr, uint8_t test_id, uint16_t cid, uint8_t *faults, size_t fault_count)
```
Optional callback for Health Current Status messages.
Handles received Health Current Status messages from a Health server. The fault array represents all faults that are currently present in the server's element.

**See also:**

*Health faults*

**Param cli**
Health client that received the status message.

**Param addr**
Address of the sender.

**Param test_id**
Identifier of a most recently performed test.

**Param cid**
Company Identifier of the node.

**Param faults**
Array of faults.

**Param fault_count**
Number of faults in the fault array.

**Message**  
The Bluetooth mesh message provides set of structures, macros and functions used for preparing message buffers, managing message and acknowledged message contexts.

**API reference**

*group bt_mesh_msg*
Message.

**Defines**

*Bt.MESH_MIC_SHORT*
Length of a short Mesh MIC.

*Bt.MESH_MIC_LONG*
Length of a long Mesh MIC.

*Bt_MESH_MODEL_OP_LEN(_op)*
Helper to determine the length of an opcode.

**Parameters**

- _op – Opcode.
BT_MESH_MODEL_BUF_LEN(_op, _payload_len)
Helper for model message buffer length.
Returns the length of a Mesh model message buffer, including the opcode length and a short MIC.

Parameters
- _op – Opcode of the message.
- _payload_len – Length of the model payload.

BT_MESH_MODEL_BUF_LEN_LONG_MIC(_op, _payload_len)
Helper for model message buffer length.
Returns the length of a Mesh model message buffer, including the opcode length and a long MIC.

Parameters
- _op – Opcode of the message.
- _payload_len – Length of the model payload.

BT_MESH_MODEL_BUF_DEFINE(_buf, _op, _payload_len)
Define a Mesh model message buffer using NET_BUF_SIMPLE_DEFINE.

Parameters
- _buf – Buffer name.
- _op – Opcode of the message.
- _payload_len – Length of the model message payload.

Functions

void bt_mesh_model_msg_init(struct net_buf_simple *msg, uint32_t opcode)
Initialize a model message.
Clears the message buffer contents, and encodes the given opcode. The message buffer will be ready for filling in payload data.

Parameters
- msg – Message buffer.
- opcode – Opcode to encode.

static inline void bt_mesh_msg_ack_ctx_init(struct bt_mesh_msg_ack_ctx *ack)
Initialize an acknowledged message context.
Initializes semaphore used for synchronization between bt_mesh_msg_ack_ctx_wait and bt_mesh_msg_ack_ctx_rx calls. Call this function before using bt_mesh_msg_ack_ctx.

Parameters
- ack – Acknowledged message context to initialize.

static inline void bt_mesh_msg_ack_ctx_reset(struct bt_mesh_msg_ack_ctx *ack)
Reset the synchronization semaphore in an acknowledged message context.
This function aborts call to bt_mesh_msg_ack_ctx_wait.

Parameters
- ack – Acknowledged message context to be reset.
void bt_mesh_msg_ack_ctx_clear(struct bt_mesh_msg_ack_ctx *ack)

Clear parameters of an acknowledged message context.

This function clears the opcode, remote address and user data set by `bt_mesh_msg_ack_ctx_prepare`.

**Parameters**

- ack – Acknowledged message context to be cleared.

int bt_mesh_msg_ack_ctx_prepare(struct bt_mesh_msg_ack_ctx *ack, uint32_t op, uint16_t dst, void *user_data)

Prepare an acknowledged message context for the incoming message to wait.

This function sets the opcode, remote address of the incoming message and stores the user data. Use this function before calling `bt_mesh_msg_ack_ctx_wait`.

**Parameters**

- ack – Acknowledged message context to prepare.
- dst – Destination address of the message.
- user_data – User data for the acknowledged message context.

**Returns**

0 on success, or (negative) error code on failure.

static inline bool bt_mesh_msg_ack_ctx_busy(struct bt_mesh_msg_ack_ctx *ack)

Check if the acknowledged message context is initialized with an opcode.

**Parameters**

- ack – Acknowledged message context.

**Returns**

true if the acknowledged message context is initialized with an opcode, false otherwise.

int bt_mesh_msg_ack_ctx_wait(struct bt_mesh_msg_ack_ctx *ack, k_timeout_t timeout)

Wait for a message acknowledge.

This function blocks execution until `bt_mesh_msg_ack_ctx_rx` is called or by timeout.

**Parameters**

- ack – Acknowledged message context of the message to wait for.
- timeout – Wait timeout.

**Returns**

0 on success, or (negative) error code on failure.

static inline void bt_mesh_msg_ack_ctx_rx(struct bt_mesh_msg_ack_ctx *ack)

Mark a message as acknowledged.

This function unblocks call to `bt_mesh_msg_ack_ctx_wait`.

**Parameters**

- ack – Context of a message to be acknowledged.

bool bt_mesh_msg_ack_ctx_match(const struct bt_mesh_msg_ack_ctx *ack, uint32_t op, uint16_t addr, void **user_data)

Check if an opcode and address of a message matches the expected one.

**Parameters**

- ack – Acknowledged message context to be checked.
• addr – Source address of the incoming message.
• user_data – If not NULL, returns a user data stored in the acknowledged message context by \texttt{bt\_mesh\_msg\_ack\_ctx\_prepare}.

**Returns**
true if the incoming message matches the expected one, false otherwise.

```c
struct bt_mesh_msg_ctx
#include <msg.h> Message sending context.
```

**Public Members**

```c
uint16_t net_idx
    NetKey Index of the subnet to send the message on.

uint16_t app_idx
    AppKey Index to encrypt the message with.

uint16_t addr
    Remote address.

uint16_t recv_dst
    Destination address of a received message. Not used for sending.

int8_t recv_rssi
    RSSI of received packet. Not used for sending.

uint8_t recv_ttl
    Received TTL value. Not used for sending.

bool send_rel
    Force sending reliably by using segment acknowledgment

uint8_t send_ttl
    TTL, or BT\_MESH\_TTL\_DEFAULT for default TTL.
```

```c
struct bt_mesh_msg_ack_ctx
#include <msg.h> Acknowledged message context for tracking the status of model messages pending a response.
```

**Public Members**

```c
struct k_sem sem
    Sync semaphore.

uint32_t op
    Opcode we're waiting for.
```
uint16_t dst
   Address of the node that should respond.

void *user_data
   User specific parameter.

Provisioning Provisioning is the process of adding devices to a mesh network. It requires two devices operating in the following roles:

- The *provisioner* represents the network owner, and is responsible for adding new nodes to the mesh network.
- The *provisionee* is the device that gets added to the network through the Provisioning process. Before the provisioning process starts, the provisionee is an *unprovisioned device*.

The Provisioning module in the Zephyr Bluetooth mesh stack supports both the Advertising and GATT Provisioning bearers for the provisionee role, as well as the Advertising Provisioning bearer for the provisioner role.

The Provisioning process All Bluetooth mesh nodes must be provisioned before they can participate in a Bluetooth mesh network. The Provisioning API provides all the functionality necessary for a device to become a provisioned mesh node. Provisioning is a five-step process, involving the following steps:

- Beaconing
- Invitation
- Public key exchange
- Authentication
- Provisioning data transfer

Beaconing To start the provisioning process, the unprovisioned device must first start broadcasting the Unprovisioned Beacon. This makes it visible to nearby provisioners, which can initiate the provisioning. To indicate that the device needs to be provisioned, call `bt_mesh_prov_enable()`. The device starts broadcasting the Unprovisioned Beacon with the device UUID and the OOB information field, as specified in the `prov` parameter passed to `bt_mesh_init()`. Additionally, a Uniform Resource Identifier (URI) may be specified, which can point the provisioner to the location of some Out Of Band information, such as the device's public key or an authentication value database. The URI is advertised in a separate beacon, with a URI hash included in the unprovisioned beacon, to tie the two together.

Uniform Resource Identifier The Uniform Resource Identifier shall follow the format specified in the Bluetooth Core Specification Supplement. The URI must start with a URI scheme, encoded as a single utf-8 data point, or the special *none* scheme, encoded as 0x01. The available schemes are listed on the Bluetooth website.

Examples of encoded URIs:

<table>
<thead>
<tr>
<th>URI</th>
<th>Encoded</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://example.com">http://example.com</a></td>
<td>\x16//example.com</td>
</tr>
<tr>
<td><a href="https://www.zephyrproject.org/">https://www.zephyrproject.org/</a></td>
<td>\x17//www.zephyrproject.org/</td>
</tr>
<tr>
<td>just a string</td>
<td>\x01just a string</td>
</tr>
</tbody>
</table>
**Provisioning invitation** The provisioner initiates the Provisioning process by sending a Provisioning invitation. The invitations prompts the provisionee to call attention to itself using the Health Server Attention state, if available.

The Unprovisioned device automatically responds to the invite by presenting a list of its capabilities, including the supported Out of Band Authentication methods.

**Public key exchange** Before the provisioning process can begin, the provisioner and the unprovisioned device exchange public keys, either in-band or Out of Band (OOB).

In-band public key exchange is a part of the provisioning process and always supported by the unprovisioned device and provisioner.

If the application wants to support public key exchange via OOB, it needs to provide public and private keys to the mesh stack. The unprovisioned device will reflect this in its capabilities. The provisioner obtains the public key via any available OOB mechanism (e.g. the device may advertise a packet containing the public key or it can be encoded in a QR code printed on the device packaging). Note that even if the unprovisioned device has specified the public key for the Out of Band exchange, the provisioner may choose to exchange the public key in-band if it can’t retrieve the public key via OOB mechanism. In this case, a new key pair will be generated by the mesh stack for each Provisioning process.

To enable support of OOB public key on the unprovisioned device side, CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY needs to be enabled. The application must provide public and private keys before the Provisioning process is started by initializing pointers to bt_mesh_prov.public_key_be and bt_mesh_prov.private_key_be. The keys needs to be provided in big-endian bytes order.

To provide the device’s public key obtained via OOB, call bt_mesh_prov.remote_pub_key_set() on the provisioner side.

**Authentication** After the initial exchange, the provisioner selects an Out of Band (OOB) Authentication method. This allows the user to confirm that the device the provisioner connected to is actually the device they intended, and not a malicious third party.

The Provisioning API supports the following authentication methods for the provisionee:

- **Static OOB**: An authentication value is assigned to the device in production, which the provisioner can query in some application specific way.
- **Input OOB**: The user inputs the authentication value. The available input actions are listed in bt_mesh_input_action_t.
- **Output OOB**: Show the user the authentication value. The available output actions are listed in bt_mesh_output_action_t.

The application must provide callbacks for the supported authentication methods in bt_mesh_prov as well as enabling the supported actions in bt_mesh_prov.output_actions and bt_mesh_prov.input_actions.

When an Output OOB action is selected, the authentication value should be presented to the user when the output callback is called, and remain until the bt_mesh_prov.input_complete or bt_mesh_prov.complete callback is called. If the action is blink, beep or vibrate, the sequence should be repeated after a delay of three seconds or more.

When an Input OOB action is selected, the user should be prompted when the application receives the bt_mesh_prov.input callback. The user response should be fed back to the Provisioning API through bt_mesh_input_string() or bt_mesh_input_number(). If no user response is recorded within 60 seconds, the Provisioning process is aborted.

**Data transfer** After the device has been successfully authenticated, the provisioner transfers the Provisioning data:
• Unicast address
• A network key
• IV index
• Network flags
  – Key refresh
  – IV update

Additionally, a device key is generated for the node. All this data is stored by the mesh stack, and the provisioning `bt_mesh_prov_complete` callback gets called.

**Provisioning security** Depending on the choice of public key exchange mechanism and authentication method, the provisioning process can be secure or insecure.

On May 24th 2021, ANSSI disclosed a set of vulnerabilities in the Bluetooth mesh provisioning protocol that showcased how the low entropy provided by the Blink, Vibrate, Push, Twist and Input/Output numeric OOB methods could be exploited in impersonation and MITM attacks. In response, the Bluetooth SIG has reclassified these OOB methods as insecure in the Mesh Profile specification erratum 16350, as AuthValue may be brute forced in real time. To ensure secure provisioning, applications should use a static OOB value and OOB public key transfer.

**API reference**

```
group bt_mesh_prov
  Provisioning.

Enums

enum bt_mesh_output_action_t
  Available Provisioning output authentication actions.

### Functions

**int bt_mesh_input_string(const char *str)**

Provide provisioning input OOB string.

This is intended to be called after the `bt_mesh_prov` input callback has been called with `BT_MESH_ENTER_STRING` as the action.

**Parameters**

• str – String.

**Returns**

Zero on success or (negative) error code otherwise.

**int bt_mesh_input_number(uint32_t num)**

Provide provisioning input OOB number.

This is intended to be called after the `bt_mesh_prov` input callback has been called with `BT_MESH_ENTER_NUMBER` as the action.

**Parameters**

• num – Number.

**Returns**

Zero on success or (negative) error code otherwise.

**int bt_mesh_prov_remote_pub_key_set(const uint8_t public_key[64])**

Provide Device public key.

**Parameters**

• public_key – Device public key in big-endian.

**Returns**

Zero on success or (negative) error code otherwise.

**int bt_mesh_auth_method_set_input(bt_mesh_input_action_t action, uint8_t size)**

Use Input OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use the specified Input OOB authentication action. When using `BT_MESH_PUSH`, `BT_MESH_TWIST` or `BT_MESH_ENTER_NUMBER`, the `bt_mesh_prov::output_number` callback is called with a random number that has to be entered on the unprovisioned device.

When using `BT_MESH_ENTER_STRING`, the `bt_mesh_prov::output_string` callback is called with a random string that has to be entered on the unprovisioned device.

**Parameters**

• action – Authentication action used by the unprovisioned device.

• size – Authentication size.

**Returns**

Zero on success or (negative) error code otherwise.

**int bt_mesh_auth_method_set_output(bt_mesh_output_action_t action, uint8_t size)**

Use Output OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use the specified Output OOB authentication action. The `bt_mesh_prov::output` callback will be called.
When using `BT_MESH_BLINK`, `BT_MESH_BEEP`, `BT_MESH_VIBRATE` or `BT_MESH_DISPLAY_NUMBER`, and the application has to call `bt_mesh_input_number` with the random number indicated by the unprovisioned device.

When using `BT_MESH_DISPLAY_STRING`, the application has to call `bt_mesh_input_string` with the random string displayed by the unprovisioned device.

**Parameters**

- `action` – Authentication action used by the unprovisioned device.
- `size` – Authentication size.

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_mesh_auth_method_set_static(const uint8_t *static_val, uint8_t size)
```

Use static OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use static OOB authentication, and use the given static authentication value when provisioning.

**Parameters**

- `static_val` – Static OOB value.
- `size` – Static OOB value size.

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_mesh_auth_method_set_none(void)
```

Don’t use OOB authentication.

Provisioner only.

Don’t use any authentication when provisioning new devices. This is the default behavior.

**Warning:** Not using any authentication exposes the mesh network to impersonation attacks, where attackers can pretend to be the unprovisioned device to gain access to the network. Authentication is strongly encouraged.

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_mesh_prov_enable(bt_mesh_prov_bearer_t bearers)
```

Enable specific provisioning bearers.

Enable one or more provisioning bearers.

**Parameters**

- `bearers` – Bit-wise or of provisioning bearers.

**Returns**

Zero on success or (negative) error code otherwise.

```c
int bt_mesh_prov_disable(bt_mesh_prov_bearer_t bearers)
```

Disable specific provisioning bearers.

Disable one or more provisioning bearers.

**Parameters**

- `bearers` – Bit-wise or of provisioning bearers.

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_provision(const uint8_t net_key[16], uint16_t net_idx, uint8_t flags, uint32_t iv_index, uint16_t addr, const uint8_t dev_key[16])
```

Provision the local Mesh Node.

This API should normally not be used directly by the application. The only exception is for testing purposes where manual provisioning is desired without an actual external provisioner.

**Parameters**
- `net_key` – Network Key
- `net_idx` – Network Key Index
- `flags` – Provisioning Flags
- `iv_index` – IV Index
- `addr` – Primary element address
- `dev_key` – Device Key

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_provision_adv(const uint8_t uuid[16], uint16_t net_idx, uint16_t addr, uint8_t attention_duration)
```

Provision a Mesh Node using PB-ADV.

**Parameters**
- `uuid` – UUID
- `net_idx` – Network Key Index
- `addr` – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- `attention_duration` – The attention duration to be send to remote device

**Returns**
Zero on success or (negative) error code otherwise.

```c
int bt_mesh_provision_gatt(const uint8_t uuid[16], uint16_t net_idx, uint16_t addr, uint8_t attention_duration)
```

Provision a Mesh Node using PB-GATT.

**Parameters**
- `uuid` – UUID
- `net_idx` – Network Key Index
- `addr` – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- `attention_duration` – The attention duration to be send to remote device

**Returns**
Zero on success or (negative) error code otherwise.

```c
bool bt_mesh_is_provisioned(void)
```

Check if the local node has been provisioned.

This API can be used to check if the local node has been provisioned or not. It can e.g. be helpful to determine if there was a stored network in flash, i.e. if the network was restored after calling `settings_load()`.  

1584 Chapter 6. Connectivity
**Returns**

True if the node is provisioned. False otherwise.

```c
struct bt_mesh_dev_capabilities
    #include <main.h> Device Capabilities.

Public Members

uint8_t elem_count
    Number of elements supported by the device

uint16_t algorithms
    Supported algorithms and other capabilities

uint8_t pub_key_type
    Supported public key types

uint8_t static_oob
    Supported static OOB Types

bt_mesh_output_action_t output_actions
    Supported Output OOB Actions

bt_mesh_input_action_t input_actions
    Supported Input OOB Actions

uint8_t output_size
    Maximum size of Output OOB supported

uint8_t input_size
    Maximum size in octets of Input OOB supported
```

```c
struct bt_mesh_prov
    #include <main.h> Provisioning properties & capabilities.

Public Members

const uint8_t *uuid
    The UUID that's used when advertising as unprovisioned

const char *uri
    Optional URI. This will be advertised separately from the unprovisioned beacon, however the unprovisioned beacon will contain a hash of it so the two can be associated by the provisioner.

bt_mesh_prov_oob_info_t oob_info
    Out of Band information field.
```
const uint8_t *public_key_be
Pointer to Public Key in big-endian for OOB public key type support.
Remember to enable CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY when initializing this parameter.
Must be used together with bt_mesh_prov::private_key_be.

const uint8_t *private_key_be
Pointer to Private Key in big-endian for OOB public key type support.
Remember to enable CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY when initializing this parameter.
Must be used together with bt_mesh_prov::public_key_be.

const uint8_t *static_val
Static OOB value

uint8_t static_val_len
Static OOB value length

uint8_t output_size
Maximum size of Output OOB supported

uint16_t output_actions
Supported Output OOB Actions

uint8_t input_size
Maximum size of Input OOB supported

uint16_t input_actions
Supported Input OOB Actions

void (*capabilities)(const struct bt_mesh_dev_capabilities *cap)
Provisioning Capabilities.
This callback notifies the application that the provisioning capabilities of the unprovisioned device has been received.
The application can consequently call bt_mesh_auth_method_set_* to select suitable provisioning oob authentication method.
When this callback returns, the provisioner will start authentication with the chosen method.
  Param cap
capabilities supported by device.

int (*output_number)(bt_mesh_output_action_t act, uint32_t num)
Output of a number is requested.
This callback notifies the application that it should output the given number using the given action.
  Param act
  Action for outputting the number.
  Param num
  Number to be outputted.
Return
Zero on success or negative error code otherwise

int (*output_string)(const char *str)
Output of a string is requested.
This callback notifies the application that it should display the given string to the user.
Param str
String to be displayed.
Return
Zero on success or negative error code otherwise

int (*input)(bt_mesh_input_action_t act, uint8_t size)
Input is requested.
This callback notifies the application that it should request input from the user using the given action. The requested input will either be a string or a number, and the application needs to consequently call the \texttt{bt\_mesh\_input\_string()} or \texttt{bt\_mesh\_input\_number()} functions once the data has been acquired from the user.
Param act
Action for inputting data.
Param num
Maximum size of the inputted data.
Return
Zero on success or negative error code otherwise

void (*input_complete)(void)
The other device finished their OOB input.
This callback notifies the application that it should stop displaying its output OOB value, as the other party finished their OOB input.

void (*unprovisioned_beacon)(uint8_t uuid[16], bt_mesh_prov_oob_info_t oob_info,
uint32_t *uri_hash)
Unprovisioned beacon has been received.
This callback notifies the application that an unprovisioned beacon has been received.
Param uuid
UUID
Param oob_info
OOB Information
Param uri_hash
Pointer to URI Hash value. NULL if no hash was present in the beacon.

void (*unprovisioned_beacon_gatt)(uint8_t uuid[16], bt_mesh_prov_oob_info_t oob_info)
PB-GATT Unprovisioned Advertising has been received.
This callback notifies the application that an PB-GATT unprovisioned Advertising has been received.
Param uuid
UUID
Param oob_info
OOB Information

void (*link_open)(bt_mesh_prov_bearer_t bearer)
Provisioning link has been opened.
This callback notifies the application that a provisioning link has been opened on the given provisioning bearer.

**Param bearer**
Provisioning bearer.

```c
void (*link_close)(bt_mesh_prov_bearer_t bearer)
```
Provisioning link has been closed.

This callback notifies the application that a provisioning link has been closed on the given provisioning bearer.

**Param bearer**
Provisioning bearer.

```c
void (*complete)(uint16_t net_idx, uint16_t addr)
```
Provisioning is complete.

This callback notifies the application that provisioning has been successfully completed, and that the local node has been assigned the specified NetKeyIndex and primary element address.

**Param net_idx**
NetKeyIndex given during provisioning.

**Param addr**
Primary element address.

```c
void (*node_added)(uint16_t net_idx, uint8_t uuid[16], uint16_t addr, uint8_t num_elem)
```
A new node has been added to the provisioning database.

This callback notifies the application that provisioning has been successfully completed, and that a node has been assigned the specified NetKeyIndex and primary element address.

**Param net_idx**
NetKeyIndex given during provisioning.

**Param uuid**
UUID of the added node.

**Param addr**
Primary element address.

**Param num_elem**
Number of elements that this node has.

```c
void (*reset)(void)
```
Node has been reset.

This callback notifies the application that the local node has been reset and needs to be reprovisioned. The node will not automatically advertise as unprovisioned, rather the `bt_mesh_prov_enable()` API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

**Proxy**
The Proxy feature allows legacy devices like phones to access the Bluetooth mesh network through GATT. The Proxy feature is only compiled in if the ```CONFIG_BT_MESH_GATT_PROXY``` option is set. The Proxy feature state is controlled by the ```Configuration Server```, and the initial value can be set with ```bt_mesh_cfg_srv.gatt_proxy```.

**API reference**

```c
#include <bt_mesh_proxy.h>
```
Proxy.
Defines

BT_MESH_PROXY_CB_DEFINE(_name)

Register a callback structure for Proxy events.

Registers a structure with callback functions that gets called on various Proxy events.

Parameters

• _name – Name of callback structure.

Functions

int bt_mesh_proxy_identity_enable(void)

Enable advertising with Node Identity.

This API requires that GATT Proxy support has been enabled. Once called each subnet will start advertising using Node Identity for the next 60 seconds.

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_proxy_connect(uint16_t net_idx)

Allow Proxy Client to auto connect to a network.

This API allows a proxy client to auto-connect a given network.

Parameters

• net_idx – Network Key Index

Returns

0 on success, or (negative) error code on failure.

int bt_mesh_proxy_disconnect(uint16_t net_idx)

Disallow Proxy Client to auto connect to a network.

This API disallows a proxy client to connect a given network.

Parameters

• net_idx – Network Key Index

Returns

0 on success, or (negative) error code on failure.

struct bt_mesh_proxy_cb

#include <proxy.h> Callbacks for the Proxy feature.

Should be instantiated with BT_MESH_PROXY_CB_DEFINE.

Public Members

void (*identity_enabled)(uint16_t net_idx)

Started sending Node Identity beacons on the given subnet.

Param net_idx

Network index the Node Identity beacons are running on.

void (*identity_disabled)(uint16_t net_idx)

Stopped sending Node Identity beacons on the given subnet.

Param net_idx

Network index the Node Identity beacons were running on.
Heartbeat  The Heartbeat feature provides functionality for monitoring Bluetooth mesh nodes and determining the distance between nodes.

The Heartbeat feature is configured through the Configuration Server model.

Heartbeat messages  Heartbeat messages are sent as transport control packets through the network, and are only encrypted with a network key. Heartbeat messages contain the original Time To Live (TTL) value used to send the message and a bitfield of the active features on the node. Through this, a receiving node can determine how many relays the message had to go through to arrive at the receiver, and what features the node supports.

Available Heartbeat feature flags:

- `BT_MESH_FEAT_RELAY`
- `BT_MESH_FEAT_PROXY`
- `BT_MESH_FEAT_FRIEND`
- `BT_MESH_FEAT_LOW_POWER`

Heartbeat publication  Heartbeat publication is controlled through the Configuration models, and can be triggered in two ways:

Periodic publication  The node publishes a new Heartbeat message at regular intervals. The publication can be configured to stop after a certain number of messages, or continue indefinitely.

Triggered publication  The node publishes a new Heartbeat message every time a feature changes. The set of features that can trigger the publication is configurable.

The two publication types can be combined.

Heartbeat subscription  A node can be configured to subscribe to Heartbeat messages from one node at the time. To receive a Heartbeat message, both the source and destination must match the configured subscription parameters.

Heartbeat subscription is always time limited, and throughout the subscription period, the node keeps track of the number of received Heartbeats as well as the minimum and maximum received hop count.

All Heartbeats received with the configured subscription parameters are passed to the `bt_mesh_hb_cb::recv` event handler.

When the Heartbeat subscription period ends, the `bt_mesh_hb_cb::sub_end` callback gets called.

API reference

```c

// Defines

#define BT_MESH_HB_CB_DEFINE(_name)  
    
BT_MESH_HB_CB_DEFINE(_name)  
    Register a callback structure for Heartbeat events.  
    Registers a callback structure that will be called whenever Heartbeat events occur

    Parameters

    - _name – Name of callback structure.
```

Chapter 6. Connectivity
Functions

void bt_mesh_hb_pub_get(struct bt_mesh_hb_pub *get)
    Get the current Heartbeat publication parameters.

    Parameters
    • get – Heartbeat publication parameters return buffer.

void bt_mesh_hb_sub_get(struct bt_mesh_hb_sub *get)
    Get the current Heartbeat subscription parameters.

    Parameters
    • get – Heartbeat subscription parameters return buffer.

struct bt_mesh_hb_pub
    #include <heartbeat.h> Heartbeat Publication parameters

    Public Members

    uint16_t dst
        Destination address.

    uint16_t count
        Remaining publish count.

    uint8_t ttl
        Time To Live value.

    uint16_t feat
        Bitmap of features that trigger a Heartbeat publication if they change. Legal values are
        BT_MESH_FEAT_RELAY, BT_MESH_FEAT_PROXY, BT_MESH_FEAT_FRIEND and
        BT_MESH_FEAT_LOW_POWER.

    uint16_t net_idx
        Network index used for publishing.

    uint32_t period
        Publication period in seconds.

struct bt_mesh_hb_sub
    #include <heartbeat.h> Heartbeat Subscription parameters.

    Public Members

    uint32_t period
        Subscription period in seconds.

    uint32_t remaining
        Remaining subscription time in seconds.
uint16_t src
Source address to receive Heartbeats from.

uint16_t dst
Destination address to received Heartbeats on.

uint16_t count
The number of received Heartbeat messages so far.

uint8_t min_hops
Minimum hops in received messages, ie the shortest registered path from the publishing node to the subscribing node. A Heartbeat received from an immediate neighbor has hop count = 1.

uint8_t max_hops
Maximum hops in received messages, ie the longest registered path from the publishing node to the subscribing node. A Heartbeat received from an immediate neighbor has hop count = 1.

struct bt_mesh_hb_cb
#include <heartbeat.h> Heartbeat callback structure

Public Members

void (*recv)(const struct bt_mesh_hb_sub *sub, uint8_t hops, uint16_t feat)
Receive callback for heartbeats.
Gets called on every received Heartbeat that matches the current Heartbeat subscription parameters.
    Param sub
    Current Heartbeat subscription parameters.
    Param hops
    The number of hops the Heartbeat was received with.
    Param feat
    The feature set of the publishing node. The value is a bitmap of BT_MESH_FEAT_RELAY, BT_MESH_FEAT_PROXY, BT_MESH_FEAT_FRIEND and BT_MESH_FEAT_LOW_POWER.

void (*sub_end)(const struct bt_mesh_hb_sub *sub)
Subscription end callback for heartbeats.
Gets called when the subscription period ends, providing a summary of the received heart- beat messages.
    Param sub
    Current Heartbeat subscription parameters.

void (*pub_sent)(const struct bt_mesh_hb_pub *pub)
Publication sent callback for heartbeats.
Gets called when the heartbeat is successfully published.
    Param pub
    Current Heartbeat publication parameters.
Runtime Configuration  The runtime configuration API allows applications to change their runtime configuration directly, without going through the Configuration models.

Bluetooth mesh nodes should generally be configured by a central network configurator device with a Configuration Client model. Each mesh node instantiates a Configuration Server model that the Configuration Client can communicate with to change the node configuration. In some cases, the mesh node can't rely on the Configuration Client to detect or determine local constraints, such as low battery power or changes in topology. For these scenarios, this API can be used to change the configuration locally.

nums

enum bt_mesh_feat_state
    Bluetooth mesh feature states
    Values:

    enumerator BT_MESH_FEATURE_DISABLED
        Feature is supported, but disabled.

    enumerator BT_MESH_FEATURE_ENABLED
        Feature is supported and enabled.

    enumerator BT_MESH_FEATURE_NOT_SUPPORTED
        Feature is not supported, and cannot be enabled.

Functions

void bt_mesh_beacon_set(bool beacon)
    Enable or disable sending of the Secure Network Beacon.
    Parameters
    • beacon – New Secure Network Beacon state.

bool bt_mesh_beacon_enabled(void)
    Get the current Secure Network Beacon state.
    Returns
    Whether the Secure Network Beacon feature is enabled.

int bt_mesh_default_ttl_set(uint8_t default_ttl)
    Set the default TTL value.
    The default TTL value is used when no explicit TTL value is set. Models will use the default
    TTL value when \texttt{bt\_mesh\_msg\_ctx::send\_ttl} is \texttt{BT\_MESH\_TTL\_DEFAULT}.
    Parameters
    • default_ttl – The new default TTL value. Valid values are 0x00 and 0x02 to
      \texttt{BT\_MESH\_TTL\_MAX}.
    Return values
    • 0 – Successfully set the default TTL value.
    • -EINVAL – Invalid TTL value.

uint8_t bt_mesh_default_ttl_get(void)
    Get the current default TTL value.
    Returns
    The current default TTL value.
void bt_mesh_net_transmit_set(uint8_t xmit)
    Set the Network Transmit parameters.
    The Network Transmit parameters determine the parameters local messages are transmitted
    with.

    **See also:**
    
    *BT_MESH_TRANSMIT*

    **Parameters**
    
    * xmit – New Network Transmit parameters. Use *BT_MESH_TRANSMIT* for encoding.

uint8_t bt_mesh_net_transmit_get(void)
    Get the current Network Transmit parameters.
    The *BT_MESH_TRANSMIT_COUNT* and *BT_MESH_TRANSMIT_INT* macros can be used to de-
    code the Network Transmit parameters.

    **Returns**
    
    The current Network Transmit parameters.

int bt_mesh_relay_set(enum bt_mesh_feat_state relay, uint8_t xmit)
    Configure the Relay feature.
    Enable or disable the Relay feature, and configure the parameters to transmit relayed mes-
    sages with.
    Support for the Relay feature must be enabled through the *CONFIG_BT_MESH_RELAY* configu-
    ration option.

    **See also:**
    
    *BT_MESH_TRANSMIT*

    **Parameters**
    
    * relay – New Relay feature state. Must be one of *
      *BT_MESH_FEATURE_ENABLED* and *BT_MESH_FEATURE_DISABLED*.
    * xmit – New Relay retransmit parameters. Use *BT_MESH_TRANSMIT* for encod-
      ing.

    **Return values**
    
    * 0 – Successfully changed the Relay configuration.
    * -ENOTSUP – The Relay feature is not supported.
    * -EINVAL – Invalid parameter.
    * -EALREADY – Already using the given parameters.

enum bt_mesh_feat_state bt_mesh_relay_get(void)
    Get the current Relay feature state.

    **Returns**
    
    The Relay feature state.
uint8_t bt_mesh_relay_retransmit_get(void)
Get the current Relay Retransmit parameters.

The `BT_MESH_TRANSMIT_COUNT` and `BT_MESH_TRANSMIT_INT` macros can be used to de-
code the Relay Retransmit parameters.

**Returns**
The current Relay Retransmit parameters, or 0 if relay is not supported.

int bt_mesh_gatt_proxy_set(enum bt_mesh_feat_state gatt_proxy)
Enable or disable the GATT Proxy feature.
Support for the GATT Proxy feature must be enabled through the
`CONFIG_BT_MESH_GATT_PROXY` configuration option.

**Note:** The GATT Proxy feature only controls a Proxy node's ability to relay messages to
the mesh network. A node that supports GATT Proxy will still advertise Connectable Proxy
beacons, even if the feature is disabled. The Proxy feature can only be fully disabled through
compile time configuration.

**Parameters**
- gatt_proxy – New GATT Proxy state. Must be one of
  `BT_MESH_FEATURE_ENABLED` and `BT_MESH_FEATURE_DISABLED`.

**Return values**
- 0 – Successfully changed the GATT Proxy feature state.
- -ENOTSUP – The GATT Proxy feature is not supported.
- -EINVAL – Invalid parameter.
- -EALREADY – Already in the given state.

enum bt_mesh_feat_state bt_mesh_gatt_proxy_get(void)
Get the current GATT Proxy state.

**Returns**
The GATT Proxy feature state.

int bt_mesh_friend_set(enum bt_mesh_feat_state friendship)
Enable or disable the Friend feature.
Any active friendships will be terminated immediately if the Friend feature is disabled.
Support for the Friend feature must be enabled through the `CONFIG_BT_MESH_FRIEND` config-
uration option.

**Parameters**
- friendship – New Friend feature state. Must be one of
  `BT_MESH_FEATURE_ENABLED` and `BT_MESH_FEATURE_DISABLED`.

**Return values**
- 0 – Successfully changed the Friend feature state.
- -ENOTSUP – The Friend feature is not supported.
- -EINVAL – Invalid parameter.
- -EALREADY – Already in the given state.
enum bt_mesh_feat_state bt_mesh_friend_get(void)
    Get the current Friend state.

    Returns
    The Friend feature state.

Bluetooth Mesh Shell The Bluetooth mesh shell subsystem provides a set of Bluetooth mesh shell commands for the Shell module. It allows for testing and exploring the Bluetooth mesh API through an interactive interface, without having to write an application.

The Bluetooth mesh shell interface provides access to most Bluetooth mesh features, including provisioning, configuration, and message sending.

Prerequisites The Bluetooth mesh shell subsystem depends on the application to create the composition data and do the mesh initialization.

Application The Bluetooth mesh shell subsystem is most easily used through the Bluetooth mesh shell application under tests/bluetooth/mesh_shell. See Shell for information on how to connect and interact with the Bluetooth mesh shell application.

Basic usage The Bluetooth mesh shell subsystem adds a single mesh command, which holds a set of sub-commands. Every time the device boots up, make sure to call mesh init before any of the other Bluetooth mesh shell commands can be called:

```
uart:~$ mesh init
```

This is done to ensure that all available log will be printed to the shell output.

Provisioning The mesh node must be provisioned to become part of the network. This is only necessary the first time the device boots up, as the device will remember its provisioning data between reboots.

The simplest way to provision the device is through self-provisioning. To do this the user must provision the device with the default network key and address 0x0001, execute:

```
uart:~$ mesh prov local 0 0x0001
```

Since all mesh nodes use the same values for the default network key, this can be done on multiple devices, as long as they’re assigned non-overlapping unicast addresses. Alternatively, to provision the device into an existing network, the unprovisioned beacon can be enabled with mesh prov pb-adv on or mesh prov pb-gatt on. The beacons can be picked up by an external provisioner, which can provision the node into its network.

Once the mesh node is part of a network, its transmission parameters can be controlled by the general configuration commands:

- To set the destination address, call mesh target dst <addr>.
- To set the network key index, call mesh target net <NetIdx>.
- To set the application key index, call mesh target app <AppIdx>.

By default, the transmission parameters are set to send messages to the provisioned address and network key.

6.1. Bluetooth
Configuration  By setting the destination address to the local unicast address (0x0001 in the `mesh local` command above), we can perform self-configuration through any of the `Models` commands.

A good first step is to read out the node’s own composition data:

```
uart:~$ mesh models cfg get-comp
```

This prints a list of the composition data of the node, including a list of its model IDs.

Next, since the device has no application keys by default, it’s a good idea to add one:

```
uart:~$ mesh models cfg appkey add 0 0
```

**Message sending**  With an application key added (see above), the mesh node’s transition parameters are all valid, and the Bluetooth mesh shell can send raw mesh messages through the network.

For example, to send a Generic OnOff Set message, call:

```
uart:~$ mesh test net-send 82020100
```

**Note:** All multibyte fields model messages are in little endian, except the opcode.

The message will be sent to the current destination address, using the current network and application key indexes. As the destination address points to the local unicast address by default, the device will only send packets to itself. To change the destination address to the All Nodes broadcast address, call:

```
uart:~$ mesh target dst 0xffff
```

With the destination address set to 0xffff, any other mesh nodes in the network with the configured network and application keys will receive and process the messages we send.

**Note:** To change the configuration of the device, the destination address must be set back to the local unicast address before issuing any configuration commands.

Sending raw mesh packets is a good way to test model message handler implementations during development, as it can be done without having to implement the sending model. By default, only the reception of the model messages can be tested this way, as the Bluetooth mesh shell only includes the foundation models. To receive a packet in the mesh node, you have to add a model with a valid opcode handler list to the composition data in `subsys/bluetooth/mesh/shell.c`, and print the incoming message to the shell in the handler callback.

**Parameter formats**  The Bluetooth mesh shell commands are parsed with a variety of formats:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integers</td>
<td>The default format unless something else is specified. Can be either decimal or hexadecimal.</td>
<td>1234, 0xabcd01234</td>
</tr>
<tr>
<td>Hexstrings</td>
<td>For raw byte arrays, like UUIDs, key values and message payloads, the parameters should be formatted as an unbroken string of hexadecimal values without any prefix.</td>
<td>deadbeef01234</td>
</tr>
<tr>
<td>Booleans</td>
<td>Boolean values are denoted in the API documentation as <code>&lt;val: on, off&gt;</code>.</td>
<td>on, off, enabled, disabled, 1, 0</td>
</tr>
</tbody>
</table>
Commands  The Bluetooth mesh shell implements a large set of commands. Some of the commands accept parameters, which are mentioned in brackets after the command name. For example, mesh lpn set <value: off, on>. Mandatory parameters are marked with angle brackets (e.g. <NetKeyIndex>), and optional parameters are marked with square brackets (e.g. [destination address]).

The Bluetooth mesh shell commands are divided into the following groups:

- General configuration
- Target
- Low Power Node
- Testing
- Provisioning
- Proxy
- Models
- Configuration database

Note: Some commands depend on specific features being enabled in the compile time configuration of the application. Not all features are enabled by default. The list of available Bluetooth mesh shell commands can be shown in the shell by calling mesh without any arguments.

General configuration

mesh init
Initialize the mesh shell. This command must be run before any other mesh command.

mesh reset-local
Reset the local mesh node to its initial unprovisioned state. This command will also clear the Configuration Database (CDB) if present.

Target  The target commands enables the user to monitor and set the target destination address, network index and application index for the shell. These parameters are used by several commands, like provisioning, Configuration Client, etc.

mesh target dst [destination address]
Get or set the message destination address. The destination address determines where mesh packets are sent with the shell, but has no effect on modules outside the shell's control.

- destination address: If present, sets the new 16-bit mesh destination address. If omitted, the current destination address is printed.

mesh target net [NetIdx]
Get or set the message network index. The network index determines which network key is used to encrypt mesh packets that are sent with the shell, but has no effect on modules outside the shell's control. The network key must already be added to the device, either through provisioning or by a Configuration Client.
• **NetIdx**: If present, sets the new network index. If omitted, the current network index is printed.

```
mesh target app [AppIdx]
```

Get or set the message application index. The application index determines which application key is used to encrypt mesh packets that are sent with the shell, but has no effect on modules outside the shell’s control. The application key must already be added to the device by a Configuration Client, and must be bound to the current network index.

• **AppIdx**: If present, sets the new application index. If omitted, the current application index is printed.

### Low Power Node

```
mesh lpn set <value: off, on>
```

Enable or disable Low Power operation. Once enabled, the device will turn off its radio and start polling for friend nodes.

• **value**: Sets whether Low Power operation is enabled.

```
mesh lpn poll
```

Perform a poll to the friend node, to receive any pending messages. Only available when LPN is enabled.

### Testing

```
mesh test net-send <Hex string>
```

Send a raw mesh message with the current destination address, network and application index. The message opcode must be encoded manually.

• **hex string**: Raw hexadecimal representation of the message to send.

```
mesh test iv-update
```

Force an IV update.

```
mesh test iv-update-test <value: off, on>
```

Set the IV update test mode. In test mode, the IV update timing requirements are bypassed.

• **value**: Enable or disable the IV update test mode.

```
mesh test rpl-clear
```

Clear the replay protection list, forcing the node to forget all received messages.

**Warning:** Clearing the replay protection list breaks the security mechanisms of the mesh node, making it susceptible to message replay attacks. This should never be performed in a real deployment.

### Health Server Test
mesh test health-srv add-fault <Fault ID>

Register a new Health Server Fault for the Linux Foundation Company ID.

- Fault ID: ID of the fault to register (0x0001 to 0xFFFF)

mesh test health-srv del-fault [Fault ID]

Remove registered Health Server faults for the Linux Foundation Company ID.

- Fault ID: If present, the given fault ID will be deleted. If omitted, all registered faults will be cleared.

**Provisioning** To allow a device to broadcast connectable unprovisioned beacons, the CONFIG_BT_MESH_PROVDEVICE configuration option must be enabled, along with the CONFIG_BT_MESH_PB_GATT option.

mesh prov pb-gatt <val: off, on>

Start or stop advertising a connectable unprovisioned beacon. The connectable unprovisioned beacon allows the mesh node to be discovered by nearby GATT based provisioners, and provisioned through the GATT bearer.

- val: Enable or disable provisioning with GATT

To allow a device to broadcast unprovisioned beacons, the CONFIG_BT_MESH_PROVDEVICE configuration option must be enabled, along with the CONFIG_BT_MESH_PB_ADV option.

mesh prov pb-adv <val: off, on>

Start or stop advertising the unprovisioned beacon. The unprovisioned beacon allows the mesh node to be discovered by nearby advertising-based provisioners, and provisioned through the advertising bearer.

- val: Enable or disable provisioning with advertiser

To allow a device to provision devices, the CONFIG_BT_MESH_PROVISIONER and CONFIG_BT_MESH_PB_ADV configuration options must be enabled.

mesh prov remote-adv <UUID> <NetKeyIndex> <addr> <AttentionDuration>

Provision a nearby device into the mesh. The mesh node starts scanning for unprovisioned beacons with the given UUID. Once found, the unprovisioned device will be added to the mesh network with the given unicast address, and given the network key indicated by NetKeyIndex.

- UUID: UUID of the unprovisioned device.
- NetKeyIndex: Index of the network key to pass to the device.
- addr: First unicast address to assign to the unprovisioned device. The device will occupy as many addresses as it has elements, and all must be available.
- AttentionDuration: The duration in seconds the unprovisioned device will identify itself for, if supported. See Attention state for details.

To allow a device to provision devices over GATT, the CONFIG_BT_MESH_PROVISIONER and CONFIG_BT_MESH_PB_GATT_CLIENT configuration options must be enabled.
mesh prov remote-gatt <UUID> <NetKeyIndex> <addr> <AttentionDuration>

Provision a nearby device into the mesh. The mesh node starts scanning for connectable advertising for PB-GATT with the given UUID. Once found, the unprovisioned device will be added to the mesh network with the given unicast address, and given the network key indicated by NetKeyIndex.

- **UUID**: UUID of the unprovisioned device.
- **NetKeyIndex**: Index of the network key to pass to the device.
- **addr**: First unicast address to assign to the unprovisioned device. The device will occupy as many addresses as it has elements, and all must be available.
- **AttentionDuration**: The duration in seconds the unprovisioned device will identify itself for, if supported. See Attention state for details.

mesh prov uuid [UUID: 1-16 hex values]

Get or set the mesh node’s UUID, used in the unprovisioned beacons.

- **UUID**: If present, new 128-bit UUID value. Any missing bytes will be zero. If omitted, the current UUID will be printed. To enable this command, the BT_MESH_SHELL_PROV_CTX_INSTANCE option must be enabled.

mesh prov input-num <number>

Input a numeric OOB authentication value. Only valid when prompted by the shell during provisioning. The input number must match the number presented by the other participant in the provisioning.

- **number**: Decimal authentication number.

mesh prov input-str <string>

Input an alphanumeric OOB authentication value. Only valid when prompted by the shell during provisioning. The input string must match the string presented by the other participant in the provisioning.

- **string**: Unquoted alphanumeric authentication string.

mesh prov static-oob [val: 1-16 hex values]

Set or clear the static OOB authentication value. The static OOB authentication value must be set before provisioning starts to have any effect. The static OOB value must be same on both participants in the provisioning. To enable this command, the BT_MESH_SHELL_PROV_CTX_INSTANCE option must be enabled.

- **val**: If present, indicates the new hexadecimal value of the static OOB. If omitted, the static OOB value is cleared.

mesh prov local <NetKeyIndex> <addr> [IVIndex]

Provision the mesh node itself. If the Configuration database is enabled, the network key must be created. Otherwise, the default key value is used.

- **NetKeyIndex**: Index of the network key to provision.
- **addr**: First unicast address to assign to the device. The device will occupy as many addresses as it has elements, and all must be available.
- **IVIndex**: Indicates the current network IV index. Defaults to 0 if omitted.
mesh prov beacon-listen <val: off, on>

Enable or disable printing of incoming unprovisioned beacons. Allows a provisioner device to detect nearby unprovisioned devices and provision them. To enable this command, the BT_MESH_SHELL_PROV_CTX_INSTANCE option must be enabled.

- **val**: Whether to enable the unprovisioned beacon printing.

mesh prov remote-pub-key <PubKey>

Provide Device public key.

- **PubKey**: Device public key in big-endian.

mesh prov auth-method input <Action> <Size>

From the provisioner device, instruct the unprovisioned device to use the specified Input OOB authentication action.

- **Action**: Input action. **Allowed values**:
  - 0: No input action.
  - 1: Push action set.
  - 2: Twist action set.
  - 4: Enter number action set.
  - 8: Enter String action set.
- **Size**: Authentication size.

mesh prov auth-method output <Action> <Size>

From the provisioner device, instruct the unprovisioned device to use the specified Output OOB authentication action.

- **Action**: Output action. **Allowed values**:
  - 0: No output action.
  - 1: Blink action set.
  - 2: Vibrate action set.
  - 4: Display number action set.
  - 8: Display String action set.
- **Size**: Authentication size.

mesh prov auth-method static <Value>

From the provisioner device, instruct the unprovisioned device to use static OOB authentication, and use the given static authentication value when provisioning.

- **Value**: Static OOB value.

mesh prov auth-method none <Value>

From the provisioner device, don't use any authentication when provisioning new devices. This is the default behavior.
Proxy  The Proxy Server module is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_GATT_PROXY configuration option.

mesh proxy identity-enable
Enable the Proxy Node Identity beacon, allowing Proxy devices to connect explicitly to this device. The beacon will run for 60 seconds before the node returns to normal Proxy beacons.

The Proxy Client module is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_PROXY_CLIENT configuration option.

mesh proxy connect <NetKeyIndex>
Auto-Connect a nearby proxy server into the mesh.
  • NetKeyIndex: Index of the network key to connect.

mesh proxy disconnect <NetKeyIndex>
Disconnect the existing proxy connection.
  • NetKeyIndex: Index of the network key to disconnect.

Models

Configuration Client  The Configuration Client model is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_CFG_CLI configuration option. This is implemented as a separate module (mesh models cfg) inside the mesh models subcommand list. This module will work on any instance of the Configuration Client model if the mentioned shell configuration options is enabled, and as long as the Configuration Client model is present in the model composition of the application. This shell module can be used for configuring itself and other nodes in the mesh network.

The Configuration Client uses general message parameters set by mesh target dst and mesh target net to target specific nodes. When the Bluetooth mesh shell node is provisioned, given that the BT_MESH_SHELL_PROV_CTX_INSTANCE option is enabled with the shell provisioning context initialized, the Configuration Client model targets itself by default. Similarly, when another node has been provisioned by the Bluetooth mesh shell, the Configuration Client model targets the new node. In most common use-cases, the Configuration Client is depending on the provisioning features and the Configuration database to be fully functional. The Configuration Client always sends messages using the Device key bound to the destination address, so it will only be able to configure itself and the mesh nodes it provisioned. The following steps are an example of how you can set up a device to start using the Configuration Client commands:

  • Initialize the client node (mesh init).
  • Create the CDB (mesh cdb create).
  • Provision the local device (mesh prov local).
  • The shell module should now target itself.
  • Monitor the composition data of the local node (mesh models cfg get-comp).
  • Configure the local node as desired with the Configuration Client commands.
  • Provision other devices (mesh prov beacon-listen) (mesh prov remote-adv) (mesh prov remote-gatt).
  • The shell module should now target the newly added node.
  • Monitor the newly provisioned nodes and their addresses (mesh cdb show).
  • Monitor the composition data of the target device (mesh models cfg get-comp).
• Configure the node as desired with the Configuration Client commands.

**mesh models cfg target get**
Get the target Configuration server for the Configuration Client model.

**mesh models cfg help**
Print information for the Configuration Client shell module.

**mesh models cfg reset**
Reset the target device.

**mesh models cfg timeout [timeout in seconds]**
Get and set the Config Client model timeout used during message sending.

• timeout in seconds: If present, set the Config Client model timeout in seconds. If omitted, the current timeout is printed.

**mesh models cfg get-comp [page]**
Read a composition data page. The full composition data page will be printed. If the target does not have the given page, it will return the last page before it.

• page: The composition data page to request. Defaults to 0 if omitted.

**mesh models cfg beacon [val: off, on]**
Get or set the network beacon transmission.

• val: If present, enables or disables sending of the network beacon. If omitted, the current network beacon state is printed.

**mesh models cfg ttl [ttl: 0x00, 0x02-0x7f]**
Get or set the default TTL value.

• ttl: If present, sets the new default TTL value. If omitted, the current default TTL value is printed.

**mesh models cfg friend [val: off, on]**
Get or set the Friend feature.

• val: If present, enables or disables the Friend feature. If omitted, the current Friend feature state is printed:
  – 0x00: The feature is supported, but disabled.
  – 0x01: The feature is enabled.
  – 0x02: The feature is not supported.
mesh models cfg gatt-proxy [val: off, on]
Get or set the GATT Proxy feature.
• val: If present, enables or disables the GATT Proxy feature. If omitted, the current GATT Proxy feature state is printed:
  – 0x00: The feature is supported, but disabled.
  – 0x01: The feature is enabled.
  – 0x02: The feature is not supported.

mesh models cfg relay [val: off, on] [count: 0-7] [interval: 10-320]
Get or set the Relay feature and its parameters.
• val: If present, enables or disables the Relay feature. If omitted, the current Relay feature state is printed:
  – 0x00: The feature is supported, but disabled.
  – 0x01: The feature is enabled.
  – 0x02: The feature is not supported.
• count: Sets the new relay retransmit count if val is on. Ignored if val is off. Defaults to 2 if omitted.
• interval: Sets the new relay retransmit interval in milliseconds if val is on. Ignored if val is off. Defaults to 20 if omitted.

mesh models cfg node-id <NetKeyIndex> [Identity]
Get or Set of current Node Identity state of a subnet.
• NetKeyIndex: The network key index to Get/Set.
• Identity: If present, sets the identity of Node Identity state.

mesh models cfg polltimeout-get <LPN Address>
Get current value of the PollTimeout timer of the LPN within a Friend node.
• addr Address of Low Power node.

mesh models cfg net-transmit-param [count: 0-7] [interval: 10-320]
Get or set the network transmit parameters.
• count: Sets the number of additional network transmits for every sent message.
• interval: Sets the new network retransmit interval in milliseconds.

mesh models cfg netkey add <NetKeyIndex> [val]
Add a network key to the target node. Adds the key to the Configuration Database if enabled.
• NetKeyIndex: The network key index to add.
• val: If present, sets the key value as a 128-bit hexadecimal value. Any missing bytes will be zero. Only valid if the key does not already exist in the Configuration Database. If omitted, the default key value is used.
mesh models cfg netkey upd <NetKeyIndex> [val]

Update a network key to the target node.

• NetKeyIndex: The network key index to updated.
• val: If present, sets the key value as a 128-bit hexadecimal value. Any missing bytes will be zero. If omitted, the default key value is used.

mesh models cfg netkey get

Get a list of known network key indexes.

mesh models cfg netkey del <NetKeyIndex>

Delete a network key from the target node.

• NetKeyIndex: The network key index to delete.

mesh models cfg appkey add <NetKeyIndex> <AppKeyIndex> [val]

Add an application key to the target node. Adds the key to the Configuration Database if enabled.

• NetKeyIndex: The network key index the application key is bound to.
• AppKeyIndex: The application key index to add.
• val: If present, sets the key value as a 128-bit hexadecimal value. Any missing bytes will be zero. Only valid if the key does not already exist in the Configuration Database. If omitted, the default key value is used.

mesh models cfg appkey upd <NetKeyIndex> <AppKeyIndex> [val]

Update an application key to the target node.

• NetKeyIndex: The network key index the application key is bound to.
• AppKeyIndex: The application key index to update.
• val: If present, sets the key value as a 128-bit hexadecimal value. Any missing bytes will be zero. If omitted, the default key value is used.

mesh models cfg appkey get <NetKeyIndex>

Get a list of known application key indexes bound to the given network key index.

• NetKeyIndex: Network key indexes to get a list of application key indexes from.

mesh models cfg appkey del <NetKeyIndex> <AppKeyIndex>

Delete an application key from the target node.

• NetKeyIndex: The network key index the application key is bound to.
• AppKeyIndex: The application key index to delete.
mesh models cfg model app-bind <addr> <AppIndex> <Model ID> [Company ID]

Bind an application key to a model. Models can only encrypt and decrypt messages sent with application keys they are bound to.

- **addr**: Address of the element the model is on.
- **AppIndex**: The application key to bind to the model.
- **Model ID**: The model ID of the model to bind the key to.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model app-unbind <addr> <AppIndex> <Model ID> [Company ID]

Unbind an application key from a model.

- **addr**: Address of the element the model is on.
- **AppIndex**: The application key to unbind from the model.
- **Model ID**: The model ID of the model to unbind the key from.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model app-get <elem addr> <Model ID> [Company ID]

Get a list of application keys bound to a model.

- **elem addr**: Address of the element the model is on.
- **Model ID**: The model ID of the model to get the bound keys of.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model pub <addr> <mod id> [cid] [<PubAddr> <AppKeyIndex> <cred: off, on> <ttl> <period> <count> <interval>]

Get or set the publication parameters of a model. If all publication parameters are included, they become the new publication parameters of the model. If all publication parameters are omitted, print the current publication parameters of the model.

- **addr**: Address of the element the model is on.
- **Model ID**: The model ID of the model to get the bound keys of.
- **cid**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

Publication parameters:

- **PubAddr**: The destination address to publish to.
- **AppKeyIndex**: The application key index to publish with.
- **cred**: Whether to publish with Friendship credentials when acting as a Low Power Node.
- **ttl**: TTL value to publish with (0x00 to 0x07f).
- **period**: Encoded publication period, or 0 to disable periodic publication.
- **count**: Number of retransmission for each published message (0 to 7).
- **interval**: The interval between each retransmission, in milliseconds. Must be a multiple of 50.
mesh models cfg model pub-va <addr> <UUID> <AppKeyIndex> <cred: off, on> <ttl> <period> <count> <interval> <mod id> [cid]

Set the publication parameters of a model.

- **addr**: Address of the element the model is on.
- **Model ID**: The model ID of the model to get the bound keys of.
- **cid**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

Publication parameters:

- **UUID**: The destination virtual address to publish to.
- **AppKeyIndex**: The application key index to publish with.
- **cred**: Whether to publish with Friendship credentials when acting as a Low Power Node.
- **ttl**: TTL value to publish with (0x00 to 0x07f).
- **period**: Encoded publication period, or 0 to disable periodic publication.
- **count**: Number of retransmission for each published message (0 to 7).
- **interval**: The interval between each retransmission, in milliseconds. Must be a multiple of 50.

mesh models cfg model sub-add <elem addr> <sub addr> <Model ID> [Company ID]

Subscription the model to a group address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

- **elem addr**: Address of the element the model is on.
- **sub addr**: 16-bit group address the model should subscribe to (0xc000 to 0xFEFF).
- **Model ID**: The model ID of the model to add the subscription to.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-del <elem addr> <sub addr> <Model ID> [Company ID]

Unsubscribe a model from a group address.

- **elem addr**: Address of the element the model is on.
- **sub addr**: 16-bit group address the model should remove from its subscription list (0xc000 to 0xFEFF).
- **Model ID**: The model ID of the model to add the subscription to.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-add-va <elem addr> <Label UUID> <Model ID> [Company ID]

Subscribe the model to a virtual address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

- **elem addr**: Address of the element the model is on.
- **Label UUID**: 128-bit label UUID of the virtual address to subscribe to. Any omitted bytes will be zero.
• Model ID: The model ID of the model to add the subscription to.
• Company ID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-del-va <elem addr> <Label UUID> <Model ID> [Company ID]

Unsubscribe a model from a virtual address.
• elem addr: Address of the element the model is on.
• Label UUID: 128-bit label UUID of the virtual address to remove the subscription of. Any omitted bytes will be zero.
• Model ID: The model ID of the model to add the subscription to.
• Company ID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-ow <elem addr> <sub addr> <Model ID> [Company ID]

Overwrite all model subscriptions with a single new group address.
• elem addr: Address of the element the model is on.
• sub addr: 16-bit group address the model should added to the subscription list (0xc000 to 0xFEFF).
• Model ID: The model ID of the model to add the subscription to.
• Company ID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-ow-va <elem addr> <Label UUID> <Model ID> [Company ID]

Overwrite all model subscriptions with a single new virtual address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.
• elem addr: Address of the element the model is on.
• Label UUID: 128-bit label UUID of the virtual address as the new Address to be added to the subscription list. Any omitted bytes will be zero.
• Model ID: The model ID of the model to add the subscription to.
• Company ID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

mesh models cfg model sub-del-all <elem addr> <Model ID> [Company ID]

Remove all group and virtual address subscriptions from of a model.
• elem addr: Address of the element the model is on.
• Model ID: The model ID of the model to Unsubscribe all.
• Company ID: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.
**mesh models cfg model sub-get <elem addr> <Model ID> [Company ID]**

Get a list of addresses the model subscribes to.

- **elem addr**: Address of the element the model is on.
- **Model ID**: The model ID of the model to get the subscription list of.
- **Company ID**: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

**mesh models cfg krp <NetKeyIdx> [Phase]**

Get or set the key refresh phase of a subnet.

- **NetKeyIdx**: The identified network key used to Get/Set the current Key Refresh Phase state.
- **Phase**: New Key Refresh Phase. Valid phases are 0, 1 or 2.

**mesh models cfg hb-sub [<src> <dst> <period>]**

Get or set the Heartbeat subscription parameters. A node only receives Heartbeat messages matching the Heartbeat subscription parameters. Sets the Heartbeat subscription parameters if present, or prints the current Heartbeat subscription parameters if called with no parameters.

- **src**: Unicast source address to receive Heartbeat messages from.
- **dst**: Destination address to receive Heartbeat messages on.
- **period**: Logarithmic representation of the Heartbeat subscription period:
  - 0: Heartbeat subscription will be disabled.
  - 1 to 17: The node will subscribe to Heartbeat messages for $2^{(period - 1)}$ seconds.

**mesh models cfg hb-pub [<dst> <count> <period> <ttl> <features> <NetKeyIndex>]**

Get or set the Heartbeat publication parameters. Sets the Heartbeat publication parameters if present, or prints the current Heartbeat publication parameters if called with no parameters.

- **dst**: Destination address to publish Heartbeat messages to.
- **count**: Logarithmic representation of the number of Heartbeat messages to publish periodically:
  - 0: Heartbeat messages are not published periodically.
  - 1 to 17: The node will periodically publish $2^{(count - 1)}$ Heartbeat messages.
  - 255: Heartbeat messages will be published periodically indefinitely.
- **period**: Logarithmic representation of the Heartbeat publication period:
  - 0: Heartbeat messages are not published periodically.
  - 1 to 17: The node will publish Heartbeat messages every $2^{(period - 1)}$ seconds.
- **ttl**: The TTL value to publish Heartbeat messages with (0x00 to 0x7f).
- **features**: Bitfield of features that should trigger a Heartbeat publication when changed:
  - Bit 0: Relay feature.
  - Bit 1: Proxy feature.
  - Bit 2: Friend feature.
– Bit 3: Low Power feature.

- NetKeyIndex: Index of the network key to publish Heartbeat messages with.

**Health Client**  
The Health Client model is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_HEALTH_CLI` configuration option. This is implemented as a separate module (`mesh models health`) inside the `mesh models` subcommand list. This module will work on any instance of the Health Client model if the mentioned shell configuration options is enabled, and as long as one or more Health Client model(s) is present in the model composition of the application. This shell module can be used to trigger interaction between Health Clients and Servers on devices in a Mesh network.

By default, the module will choose the first Health Client instance in the model composition when using the Health Client commands. To choose a specific Health Client instance the user can utilize the commands `mesh models health instance set` and `mesh models health instance get-all`.

The Health Client may use the general messages parameters set by `mesh target dst`, `mesh target net` and `mesh target app` to target specific nodes. If the shell target destination address is set to zero, the targeted Health Client will attempt to publish messages using its configured publication parameters.

```
mesh models health instance set <Elem_idx>

Set the Health Client model instance to use.

- Elem_idx: Element index of Health Client model.
```

```
mesh models health instance get-all

Prints all available Health Client model instances on the device.
```

```
mesh models health fault-get <Company ID>

Get a list of registered faults for a Company ID.

- Company ID: Company ID to get faults for.
```

```
mesh models health fault-clear <Company ID>

Clear the list of faults for a Company ID.

- Company ID: Company ID to clear the faults for.
```

```
mesh models health fault-clear-unack <Company ID>

Clear the list of faults for a Company ID without requesting a response.

- Company ID: Company ID to clear the faults for.
```

```
mesh models health fault-test <Company ID> <Test ID>

Invoke a self-test procedure, and show a list of triggered faults.

- Company ID: Company ID to perform self-tests for.
- Test ID: Test to perform.
```
mesh models health fault-test-unack <Company ID> <Test ID>

Invoke a self-test procedure without requesting a response.
- Company ID: Company ID to perform self-tests for.
- Test ID: Test to perform.

mesh models health period-get

Get the current Health Server publish period divisor.

mesh models health period-set <divisor>

Set the current Health Server publish period divisor. When a fault is detected, the Health Server will start publishing fault status with a reduced interval. The reduced interval is determined by the Health Server publish period divisor: Fault publish period = Publish period / $2^{\text{divisor}}$.
- divisor: The new Health Server publish period divisor.

mesh models health period-set-unack <divisor>

Set the current Health Server publish period divisor. When a fault is detected, the Health Server will start publishing fault status with a reduced interval. The reduced interval is determined by the Health Server publish period divisor: Fault publish period = Publish period / $2^{\text{divisor}}$.
- divisor: The new Health Server publish period divisor.

mesh models health attention-get

Get the current Health Server attention state.

mesh models health attention-set <timer>

Enable the Health Server attention state for some time.
- timer: Duration of the attention state, in seconds (0 to 255)

mesh models health attention-set-unack <timer>

Enable the Health Server attention state for some time without requesting a response.
- timer: Duration of the attention state, in seconds (0 to 255)

**Configuration database** The Configuration database is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_CDB configuration option. The Configuration database is only available on provisioner devices, and allows them to store all information about the mesh network. To avoid conflicts, there should only be one mesh node in the network with the Configuration database enabled. This node is the Configurator, and is responsible for adding new nodes to the network and configuring them.

mesh cdb create [NetKey]

Create a Configuration database.
- NetKey: Optional network key value of the primary network key (NetKeyIndex=0). Defaults to the default key value if omitted.
mesh cdb clear
Clear all data from the Configuration database.

mesh cdb show
Show all data in the Configuration database.

mesh cdb node-add <UUID> <addr> <num-elem> <NetKeyIdx> [DevKey]
Manually add a mesh node to the configuration database. Note that devices provisioned with mesh provision and mesh provision-adv will be added automatically if the Configuration Database is enabled and created.

- UUID: 128-bit hexadecimal UUID of the node. Any omitted bytes will be zero.
- addr: Unicast address of the node, or 0 to automatically choose the lowest available address.
- num-elem: Number of elements on the node.
- NetKeyIdx: The network key the node was provisioned with.
- DevKey: Optional 128-bit device key value for the device. If omitted, a random value will be generated.

mesh cdb node-del <addr>
Delete a mesh node from the Configuration database. If possible, the node should be reset with mesh reset before it is deleted from the Configuration database, to avoid unexpected behavior and uncontrolled access to the network.

- addr: Address of the node to delete.

mesh cdb subnet-add <NetKeyIdx> [<NetKey>]
Add a network key to the Configuration database. The network key can later be passed to mesh nodes in the network. Note that adding a key to the Configuration database does not automatically add it to the local node's list of known network keys.

- NetKeyIdx: Key index of the network key to add.
- NetKey: Optional 128-bit network key value. Any missing bytes will be zero. If omitted, a random value will be generated.

mesh cdb subnet-del <NetKeyIdx>
Delete a network key from the Configuration database.

- NetKeyIdx: Key index of the network key to delete.

mesh cdb app-key-add <NetKeyIdx> <AppKeyIdx> [<AppKey>]
Add an application key to the Configuration database. The application key can later be passed to mesh nodes in the network. Note that adding a key to the Configuration database does not automatically add it to the local node's list of known application keys.

- NetKeyIdx: Network key index the application key is bound to.
- AppKeyIdx: Key index of the application key to add.
- AppKey: Optional 128-bit application key value. Any missing bytes will be zero. If omitted, a random value will be generated.
mesh cdb app-key-del <AppKeyId>

Delete an application key from the Configuration database.
  • AppKeyId: Key index of the application key to delete.

Bluetooth Microphone Control

API Reference

group bt_gatt_micp
  Microphone Input Control Profile (MICP)
  [Experimental] Users should note that the APIs can change as a part of ongoing development.

Defines

BT_MICP_MIC_DEV_AICS_CNT

BT_MICP_ERR_MUTE_DISABLED
  Application error codes

BT_MICP_ERR_VAL_OUT_OF_RANGE

BT_MICP_MUTE_UNMUTED
  Microphone Input Control Profile mute states

BT_MICP_MUTE_MUTED

BT_MICP_MUTE_DISABLED

Functions

int bt_micp_mic_dev_register(struct bt_micp_mic_dev_register_param *param)
  Initialize the Microphone Input Control Profile Microphone Device.
  This will enable the Microphone Input Control Service instance and make it discoverable by Microphone Controllers.
  Parameters
    • param – Pointer to an initialization structure.
  Returns
    0 if success, errno on failure.

int bt_micp_mic_dev_included_get(struct bt_micp_included *included)
  Get Microphone Device included services.
  Requires that CONFIG_BT_MICP_MIC_DEV_AICS is enabled.
  Parameters
    • included – Pointer to store the result in.
Returns
0 if success, errno on failure.

int bt_micp_mic_dev_unmute(void)
Unmute the Microphone Device.

Returns
0 on success, GATT error value on fail.

int bt_micp_mic_dev_mute(void)
Mute the Microphone Device.

Returns
0 on success, GATT error value on fail.

int bt_micp_mic_dev_mute_disable(void)
Disable the mute functionality on the Microphone Device.
Can be reenabled by called bt_micp_mic_dev_mute or bt_micp_mic_dev_unmute.

Returns
0 on success, GATT error value on fail.

int bt_micp_mic_dev_mute_get(void)
Read the mute state on the Microphone Device.

Returns
0 on success, GATT error value on fail.

int bt_micp_mic_ctlr_included_get(struct bt_micp_mic_ctlr *mic_ctlr, struct bt_micp_included *included)
Get Microphone Input Control Profile included services.
Returns a pointer to a struct that contains information about the Microphone Input Control Profile included services instances, such as pointers to the Audio Input Control Service instances.
Requires that CONFIG_BT_MICP_MIC_CTLR_AICS is enabled.

Parameters
• mic_ctlr – Microphone Controller instance pointer.
• included – [out] Pointer to store the result in.

Returns
0 if success, errno on failure.

int bt_micp_mic_ctlr_conn_get(const struct bt_micp_mic_ctlr *mic_ctlr, struct bt_conn **conn)
Get the connection pointer of a Microphone Controller instance.
Get the Bluetooth connection pointer of a Microphone Controller instance.

Parameters
• mic_ctlr – Microphone Controller instance pointer.
• conn – Connection pointer.

Returns
0 if success, errno on failure.

int bt_micp_mic_ctlr_discover(struct bt_conn *conn, struct bt_micp_mic_ctlr **mic_ctlr)
Discover Microphone Input Control Service.
This will start a GATT discovery and setup handles and subscriptions. This shall be called once before any other actions can be executed for the peer device, and the bt_micp_mic_ctlr_cb::discover callback will notify when it is possible to start remote operations.
Parameters
- `conn` – The connection to initialize the profile for.
- `mic_ctlr` – [out] Valid remote instance object on success.

Returns
0 on success, GATT error value on fail.

```c
int bt_micp_mic_ctlr_unmute(struct bt_micp_mic_ctlr *mic_ctlr)
```
Unmute a remote Microphone Device.

Parameters
- `mic_ctlr` – Microphone Controller instance pointer.

Returns
0 on success, GATT error value on fail.

```c
int bt_micp_mic_ctlr_mute(struct bt_micp_mic_ctlr *mic_ctlr)
```
Mute a remote Microphone Device.

Parameters
- `mic_ctlr` – Microphone Controller instance pointer.

Returns
0 on success, GATT error value on fail.

```c
int bt_micp_mic_ctlr_mute_get(struct bt_micp_mic_ctlr *mic_ctlr)
```
Read the mute state of a remote Microphone Device.

Parameters
- `mic_ctlr` – Microphone Controller instance pointer.

Returns
0 on success, GATT error value on fail.

```c
int bt_micp_mic_ctlr_cb_register(struct bt_micp_mic_ctlr_cb *cb)
```
Registers the callbacks used by Microphone Controller.

This can only be done as the client.

Parameters
- `cb` – The callback structure.

Returns
0 if success, errno on failure.

```c
struct bt_micp_mic_dev_register_param
#include <micp.h>  // Register parameters structure for Microphone Input Control Service.
```

Public Members

```c
struct bt_micp_mic_dev_cb *cb
```
Microphone Input Control Profile callback structure.
struct bt_micp_included

#include <micp.h> Microphone Input Control Profile included services.

Used for to represent the Microphone Input Control Profile included service instances, for either a Microphone Controller or a Microphone Device. The instance pointers either represent local service instances, or remote service instances.

Public Members

uint8_t aics_cnt

Number of Audio Input Control Service instances

struct bt_aics **aics

Array of pointers to Audio Input Control Service instances

struct bt_micp_mic_dev_cb

#include <micp.h>

Public Members

void (*mute)(uint8_t mute)

Callback function for Microphone Device mute.

Called when the value is read with bt_micp_mic_dev_mute_get(), or if the value is changed by either the Microphone Device or a Microphone Controller.

Param mute

The mute setting of the Microphone Input Control Service.

struct bt_micp_mic_ctlr_cb

#include <micp.h>

Public Members

void (*mute)(struct bt_micp_mic_ctlr *mic_ctlr, int err, uint8_t mute)

Callback function for Microphone Input Control Profile mute.

Called when the value is read, or if the value is changed by either the Microphone Device or a Microphone Controller.

Param mic_ctlr

Microphone Controller instance pointer.

Param err

Error value. 0 on success, GATT error or errno on fail. For notifications, this will always be 0.

Param mute

The mute setting of the Microphone Input Control Service.

void (*discover)(struct bt_micp_mic_ctlr *mic_ctlr, int err, uint8_t aics_count)

Callback function for bt_micp_mic_ctlr_discover().

Param mic_ctlr

Microphone Controller instance pointer.
**Param err**
- Error value. 0 on success, GATT error or errno on fail.

**Param aics_count**
- Number of Audio Input Control Service instances on peer device.

```c
void (*mute_written)(struct bt_micp_mic_ctlr *mic_ctlr, int err)
```
- Callback function for Microphone Input Control Profile mute/unmute.

**Param mic_ctlr**
- Microphone Controller instance pointer.

**Param err**
- Error value. 0 on success, GATT error or errno on fail.

```c
void (*unmute_written)(struct bt_micp_mic_ctlr *mic_ctlr, int err)
```
- Callback function for Microphone Input Control Profile mute/unmute.

**Param mic_ctlr**
- Microphone Controller instance pointer.

**Param err**
- Error value. 0 on success, GATT error or errno on fail.

---

**Serial Port Emulation (RFCOMM)**

**API Reference**

**group bt_rfcomm**

RFCOMM.

**Typedefs**

```c
typedef enum bt_rfcomm_role bt_rfcomm_role_t
```
- Role of RFCOMM session and dlc. Used only by internal APIs.

**Enums**

```c
enum [anonymous]
```
- **Values:**

  ```c
  enumerator BT_RFCOMM_CHAN_HFP_HF = 1
  
  enumerator BT_RFCOMM_CHAN_HFP_AG
  
  enumerator BT_RFCOMM_CHAN_HSP_AG
  
  enumerator BT_RFCOMM_CHAN_HSP_HS
  
  enumerator BT_RFCOMM_CHAN_SPP
  
  enum bt_rfcomm_role
  ```
- Role of RFCOMM session and dlc. Used only by internal APIs.

- **Values:**
enumerator BT_RFCOMM_ROLE_ACCEPTOR

enumerator BT_RFCOMM_ROLE_INITIATOR

Functions

int bt_rfcomm_server_register(struct bt_rfcomm_server *server)
Register RFCOMM server.
Register RFCOMM server for a channel, each new connection is authorized using the accept() callback which in case of success shall allocate the dlc structure to be used by the new connection.

Parameters
• server – Server structure.

Returns
0 in case of success or negative value in case of error.

int bt_rfcomm_dlc_connect(struct bt_conn *conn, struct bt_rfcomm_dlc *dlc, uint8_t channel)
Connect RFCOMM channel.
Connect RFCOMM dlc by channel, once the connection is completed dlc connected() callback will be called. If the connection is rejected disconnected() callback is called instead.

Parameters
• conn – Connection object.
• dlc – Dlc object.
• channel – Server channel to connect to.

Returns
0 in case of success or negative value in case of error.

int bt_rfcomm_dlc_send(struct bt_rfcomm_dlc *dlc, struct net_buf *buf)
Send data to RFCOMM.
Send data from buffer to the dlc. Length should be less than or equal to mtu.

Parameters
• dlc – Dlc object.
• buf – Data buffer.

Returns
Bytes sent in case of success or negative value in case of error.

int bt_rfcomm_dlc_disconnect(struct bt_rfcomm_dlc *dlc)
Disconnect RFCOMM dlc.
Disconnect RFCOMM dlc, if the connection is pending it will be canceled and as a result the dlc disconnected() callback is called.

Parameters
• dlc – Dlc object.

Returns
0 in case of success or negative value in case of error.
struct net_buf *bt_rfcomm_create_pdu(struct net_buf_pool *pool)
Allocate the buffer from pool after reserving head room for RFCOMM, L2CAP and ACL headers.

Parameters

• pool – Which pool to take the buffer from.

Returns

New buffer.

struct bt_rfcomm_dlc_ops
#include <rfcomm.h> RFCOMM DLC operations structure.

Public Members

void (*connected)(struct bt_rfcomm_dlc *dlc)
DLC connected callback
If this callback is provided it will be called whenever the connection completes.
    Param dlc
                          The dlc that has been connected

void (*disconnected)(struct bt_rfcomm_dlc *dlc)
DLC disconnected callback
If this callback is provided it will be called whenever the dlc is disconnected, including when a connection gets rejected or cancelled (both incoming and outgoing)
    Param dlc
                          The dlc that has been Disconnected

void (*recv)(struct bt_rfcomm_dlc *dlc, struct net_buf *buf)
DLC recv callback
    Param dlc
                          The dlc receiving data.
    Param buf
                         Buffer containing incoming data.

struct bt_rfcomm_dlc
#include <rfcomm.h> RFCOMM DLC structure.

struct bt_rfcomm_server
#include <rfcomm.h>

Public Members

uint8_t channel
Server Channel

int (*accept)(struct bt_conn *conn, struct bt_rfcomm_dlc **dlc)
Server accept callback
This callback is called whenever a new incoming connection requires authorization.
**Param conn**
The connection that is requesting authorization

**Param dlc**
Pointer to received the allocated dlc

**Return**
0 in case of success or negative value in case of error.

---

**Bluetooth standard services**

**Battery Service**

* group bt_bas  
Battery Service (BAS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Functions**

```c
uint8_t bt_bas_get_battery_level(void)
Read battery level value.
Read the characteristic value of the battery level

**Returns**
The battery level in percent.
```

```c
int bt_bas_set_battery_level(uint8_t level)
Update battery level value.
Update the characteristic value of the battery level This will send a GATT notification to all current subscribers.

**Parameters**
- level – The battery level in percent.

**Returns**
Zero in case of success and error code in case of error.
```

**Heart Rate Service**

* group bt_hrs  
Heart Rate Service (HRS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Functions**

```c
int bt_hrs_notify(uint16_t heartrate)
Notify heart rate measurement.
This will send a GATT notification to all current subscribers.

**Parameters**
- heartrate – The heartrate measurement in beats per minute.

**Returns**
Zero in case of success and error code in case of error.
```
Immediate Alert Service

**group bt_ias**

Immediate Alert Service (IAS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

**Defines**

`BT_IAS_CB_DEFINE(_name)`

Register a callback structure for immediate alert events.

**Parameters**

- `_name` – Name of callback structure.

** Enums**

`enum bt_ias_alert_lvl`

**Values:**

- `enumerator BT_IAS_ALERT_LVL_NO_ALERT`  
  No alerting should be done on device

- `enumerator BT_IAS_ALERT_LVL_MILD_ALERT`  
  Device shall alert

- `enumerator BT_IAS_ALERT_LVL_HIGH_ALERT`  
  Device should alert in strongest possible way

**Functions**

`int bt_ias_local_alert_stop(void)`  
Method for stopping alert locally.

**Returns**

Zero in case of success and error code in case of error.

`int bt_ias_client_alert_write(struct bt_conn *conn, enum bt_ias_alert_lvl)`  
Set alert level.

**Parameters**

- `conn` – Bluetooth connection object
- `bt_ias_alert_lvl` – Level of alert to write

**Returns**

Zero in case of success and error code in case of error.

`int bt_ias_discover(struct bt_conn *conn)`  
Discover Immediate Alert Service.

**Parameters**

- `conn` – Bluetooth connection object

**Returns**

Zero in case of success and error code in case of error.
int bt_ias_client_cb_register(const struct bt_ias_client_cb *cb)
    Register Immediate Alert Client callbacks.

    Parameters
    • cb – The callback structure

    Returns
    Zero in case of success and error code in case of error.

struct bt_ias_cb
#include <ias.h>  Immediate Alert Service callback structure.

Public Members

void (*no_alert)(void)
    Callback function to stop alert.
    This callback is called when peer commands to disable alert.

void (*mild_alert)(void)
    Callback function for alert level value.
    This callback is called when peer commands to alert.

void (*high_alert)(void)
    Callback function for alert level value.
    This callback is called when peer commands to alert in the strongest possible way.

struct bt_ias_client_cb
#include <ias.h>

Public Members

void (*discover)(struct bt_conn *conn, int err)
    Callback function for bt_ias_discover.
    This callback is called when discovery procedure is complete.
    
    Param conn
    Bluetooth connection object.
    
    Param err
    0 on success, ATT error or negative errno otherwise

Object Transfer Service

group bt_ots
    Object Transfer Service (OTS)
    [Experimental] Users should note that the APIs can change as a part of ongoing development.
Defines

**BT_OTS_OBJ_ID_SIZE**
Size of OTS object ID (in bytes).

**BT_OTS_OBJ_ID_MIN**
Minimum allowed value for object ID (except ID for directory listing)

**BT_OTS_OBJ_ID_MAX**
Maximum allowed value for object ID (except ID for directory listing)

**OTS_OBJ_ID_DIR_LIST**
ID of the Directory Listing Object.

**BT_OTS_OBJ_ID_MASK**
Mask for OTS object IDs, preserving the 48 bits.

**BT_OTS_OBJ_ID_STR_LEN**
Length of OTS object ID string (in bytes).

**BT_OTS_OBJ_SET_PROP_DELETE(prop)**
Set **BT_OTS_OBJ_PROP_DELETE** property.

**Parameters**
• prop – Object properties.

**BT_OTS_OBJ_SET_PROP_EXECUTE(prop)**
Set **BT_OTS_OBJ_PROP_EXECUTE** property.

**Parameters**
• prop – Object properties.

**BT_OTS_OBJ_SET_PROP_READ(prop)**
Set **BT_OTS_OBJ_PROP_READ** property.

**Parameters**
• prop – Object properties.

**BT_OTS_OBJ_SET_PROP_WRITE(prop)**
Set **BT_OTS_OBJ_PROP_WRITE** property.

**Parameters**
• prop – Object properties.

**BT_OTS_OBJ_SET_PROP_APPEND(prop)**
Set **BT_OTS_OBJ_PROP_APPEND** property.

**Parameters**
• prop – Object properties.

**BT_OTS_OBJ_SET_PROP_TRUNCATE(prop)**
Set **BT_OTS_OBJ_PROP_TRUNCATE** property.

**Parameters**
• prop – Object properties.
BT_OTS_OBJ_SET_PROP_PATCH(prop)
    Set $BT_OTS_OBJ_PROP_PATCH$ property.

Parameters
    • prop – Object properties.

BT_OTS_OBJ_SET_PROP_MARKED(prop)
    Set $BT_OTS_OBJ_SET_PROP_MARKED$ property.

Parameters
    • prop – Object properties.

BT_OTS_OBJ_GET_PROP_DELETE(prop)
    Get $BT_OTS_OBJ_PROP_DELETE$ property.

Parameters
    • prop – Object properties.

BT_OTS_OBJ_GET_PROP_EXECUTE(prop)
    Get $BT_OTS_OBJ_PROP_EXECUTE$ property.

Parameters
    • prop – Object properties.

BT_OTS_OBJ_GET_PROP_READ(prop)
    Get $BT_OTS_OBJ_PROP_READ$ property.

Parameters
    • prop – Object properties.

BT_OTS_OBJ_GET_PROP_WRITE(prop)
    Get $BT_OTS_OBJ_PROP_WRITE$ property.

Parameters
    • prop – Object properties.

BT_OTS_OBJ_GET_PROP_APPEND(prop)
    Get $BT_OTS_OBJ_PROP_APPEND$ property.

Parameters
    • prop – Object properties.

BT_OTS_OBJ_GET_PROP_TRUNCATE(prop)
    Get $BT_OTS_OBJ_PROP_TRUNCATE$ property.

Parameters
    • prop – Object properties.

BT_OTS_OBJ_GET_PROP_PATCH(prop)
    Get $BT_OTS_OBJ_PROP_PATCH$ property.

Parameters
    • prop – Object properties.

BT_OTS_OBJ_GET_PROP_MARKED(prop)
    Get $BT_OTS_OBJ_PROP_MARKED$ property.

Parameters
    • prop – Object properties.
BT_OTS_OACP_SET_FEAT_CREATE(feat)
    Set `BT_OTS_OACP_SET_FEAT_CREATE` feature.
    
    Parameters
    • `feat` – OTS features.

BT_OTS_OACP_SET_FEAT_DELETE(feat)
    Set `BT_OTS_OACP_FEAT_DELETE` feature.
    
    Parameters
    • `feat` – OTS features.

BT_OTS_OACP_SET_FEAT_CHECKSUM(feat)
    Set `BT_OTS_OACP_FEAT_CHECKSUM` feature.
    
    Parameters
    • `feat` – OTS features.

BT_OTS_OACP_SET_FEAT_EXECUTE(feat)
    Set `BT_OTS_OACP_FEAT_EXECUTE` feature.
    
    Parameters
    • `feat` – OTS features.

BT_OTS_OACP_SET_FEAT_READ(feat)
    Set `BT_OTS_OACP_FEAT_READ` feature.
    
    Parameters
    • `feat` – OTS features.

BT_OTS_OACP_SET_FEAT_WRITE(feat)
    Set `BT_OTS_OACP_FEAT_WRITE` feature.
    
    Parameters
    • `feat` – OTS features.

BT_OTS_OACP_SET_FEAT_APPEND(feat)
    Set `BT_OTS_OACP_FEAT_APPEND` feature.
    
    Parameters
    • `feat` – OTS features.

BT_OTS_OACP_SET_FEAT_TRUNCATE(feat)
    Set `BT_OTS_OACP_FEAT_TRUNCATE` feature.
    
    Parameters
    • `feat` – OTS features.

BT_OTS_OACP_SET_FEAT_PATCH(feat)
    Set `BT_OTS_OACP_FEAT_PATCH` feature.
    
    Parameters
    • `feat` – OTS features.

BT_OTS_OACP_SET_FEAT_ABORT(feat)
    Set `BT_OTS_OACP_FEAT_ABORT` feature.
    
    Parameters
    • `feat` – OTS features.
Get `BT_OTS_OACP_FEAT_CREATE` feature.

**Parameters**

- `feat` – OTS features.

Get `BT_OTS_OACP_FEAT_DELETE` feature.

**Parameters**

- `feat` – OTS features.

Get `BT_OTS_OACP_FEAT_CHECKSUM` feature.

**Parameters**

- `feat` – OTS features.

Get `BT_OTS_OACP_FEAT_EXECUTE` feature.

**Parameters**

- `feat` – OTS features.

Get `BT_OTS_OACP_FEAT_READ` feature.

**Parameters**

- `feat` – OTS features.

Get `BT_OTS_OACP_FEAT_WRITE` feature.

**Parameters**

- `feat` – OTS features.

Get `BT_OTS_OACP_FEAT_APPEND` feature.

**Parameters**

- `feat` – OTS features.

Get `BT_OTS_OACP_FEAT_TRUNCATE` feature.

**Parameters**

- `feat` – OTS features.

Get `BT_OTS_OACP_FEAT_PATCH` feature.

**Parameters**

- `feat` – OTS features.

Get `BT_OTS_OACP_FEAT_ABORT` feature.

**Parameters**

- `feat` – OTS features.
BT_OTS_OLCP_SET_FEAT_GO_TO(\texttt{feat})
Set \texttt{BT_OTS_OLCP_FEAT_GO_TO} feature.

Parameters
• \texttt{feat} – OTS features.

BT_OTS_OLCP_SET_FEAT_ORDER(\texttt{feat})
Set \texttt{BT_OTS_OLCP_FEAT_ORDER} feature.

Parameters
• \texttt{feat} – OTS features.

BT_OTS_OLCP_SET_FEAT_NUM_REQ(\texttt{feat})
Set \texttt{BT_OTS_OLCP_FEAT_NUM_REQ} feature.

Parameters
• \texttt{feat} – OTS features.

BT_OTS_OLCP_SET_FEAT_CLEAR(\texttt{feat})
Set \texttt{BT_OTS_OLCP_FEAT_CLEAR} feature.

Parameters
• \texttt{feat} – OTS features.

BT_OTS_OLCP_GET_FEAT_GO_TO(\texttt{feat})
Get \texttt{BT_OTS_OLCP_GET_FEAT_GO_TO} feature.

Parameters
• \texttt{feat} – OTS features.

BT_OTS_OLCP_GET_FEAT_ORDER(\texttt{feat})
Get \texttt{BT_OTS_OLCP_GET_FEAT_ORDER} feature.

Parameters
• \texttt{feat} – OTS features.

BT_OTS_OLCP_GET_FEAT_NUM_REQ(\texttt{feat})
Get \texttt{BT_OTS_OLCP_GET_FEAT_NUM_REQ} feature.

Parameters
• \texttt{feat} – OTS features.

BT_OTS_OLCP_GET_FEAT_CLEAR(\texttt{feat})
Get \texttt{BT_OTS_OLCP_GET_FEAT_CLEAR} feature.

Parameters
• \texttt{feat} – OTS features.

BT_OTS_DATE_TIME_FIELD_SIZE

BT_OTS_STOP

BT_OTS_CONTINUE

6.1. Bluetooth
**Typedefs**

typedef int (*bt_ots_client_dirlisting_cb)(struct `bt_ots_obj_metadata` *meta)

Directory listing object metadata callback.

If a directory listing is decoded using `bt_ots_client_decode_dirlisting()`, this callback will be called for each object in the directory listing.

**Param meta**
The metadata of the decoded object

**Return**
int `BT_OTS_STOP` or `BT_OTS_CONTINUE`. `BT_OTS_STOP` can be used to stop the decoding.

**Enums**

enum [anonymous]
Properties of an OTS object.

**Values:**

enumerator `BT_OTS_OBJ_PROP_DELETE` = 0
Bit 0 Deletion of this object is permitted

enumerator `BT_OTS_OBJ_PROP_EXECUTE` = 1
Bit 1 Execution of this object is permitted

enumerator `BT_OTS_OBJ_PROP_READ` = 2
Bit 2 Reading this object is permitted

enumerator `BT_OTS_OBJ_PROP_WRITE` = 3
Bit 3 Writing data to this object is permitted

enumerator `BT_OTS_OBJ_PROP_APPEND` = 4
Bit 4 Appending data to this object is permitted.

Appending data increases its Allocated Size.

enumerator `BT_OTS_OBJ_PROP_TRUNCATE` = 5
Bit 5 Truncation of this object is permitted

enumerator `BT_OTS_OBJ_PROP_PATCH` = 6
Bit 6 Patching this object is permitted.

Patching this object overwrites some of the object’s existing contents.
enumerator BT_OTS_OBJ_PROP_MARKED = 7
   Bit 7 This object is a marked object

enum [anonymous]
   Object Action Control Point Feature bits.
   Values:

   enumerator BT_OTS_OACP_FEAT_CREATE = 0
      Bit 0 OACP Create Op Code Supported

   enumerator BT_OTS_OACP_FEAT_DELETE = 1
      Bit 1 OACP Delete Op Code Supported

   enumerator BT_OTS_OACP_FEAT_CHECKSUM = 2
      Bit 2 OACP Calculate Checksum Op Code Supported

   enumerator BT_OTS_OACP_FEAT_EXECUTE = 3
      Bit 3 OACP Execute Op Code Supported

   enumerator BT_OTS_OACP_FEAT_READ = 4
      Bit 4 OACP Read Op Code Supported

   enumerator BT_OTS_OACP_FEAT_WRITE = 5
      Bit 5 OACP Write Op Code Supported

   enumerator BT_OTS_OACP_FEAT_APPEND = 6
      Bit 6 Appending Additional Data to Objects Supported

   enumerator BT_OTS_OACP_FEAT_TRUNCATE = 7
      Bit 7 Truncation of Objects Supported

   enumerator BT_OTS_OACP_FEAT_PATCH = 8
      Bit 8 Patching of Objects Supported

   enumerator BT_OTS_OACP_FEAT_ABORT = 9
      Bit 9 OACP Abort Op Code Supported

enum bt_ots_oacp_write_op_mode
   Values:

   enumerator BT_OTS_OACP_WRITE_OP_MODE_NONE = 0

   enumerator BT_OTS_OACP_WRITE_OP_MODE_TRUNCATE = BIT(1)

enum [anonymous]
   Object List Control Point Feature bits.
   Values:
enumerator BT_OTS_OLCP_FEAT_GO_TO = 0
    Bit 0 OLCP Go To Op Code Supported
enumerator BT_OTS_OLCP_FEAT_ORDER = 1
    Bit 1 OLCP Order Op Code Supported
enumerator BT_OTS_OLCP_FEAT_NUM_REQ = 2
    Bit 2 OLCP Request Number of Objects Op Code Supported
enumerator BT_OTS_OLCP_FEAT_CLEAR = 3
    Bit 3 OLCP Clear Marking Op Code Supported

enum [anonymous]
    Object metadata request bit field values.
    Values:

    enumerator BT_OTS_METADATA_REQ_NAME = BIT(0)
        Request object name.
enumerator BT_OTS_METADATA_REQ_TYPE = BIT(1)
    Request object type.
enumerator BT_OTS_METADATA_REQ_SIZE = BIT(2)
    Request object size.
enumerator BT_OTS_METADATA_REQ_CREATED = BIT(3)
    Request object first created time.
enumerator BT_OTS_METADATA_REQ_MODIFIED = BIT(4)
    Request object last modified time.
enumerator BT_OTS_METADATA_REQ_ID = BIT(5)
    Request object ID.
enumerator BT_OTS_METADATA_REQ_PROPS = BIT(6)
    Request object properties.
enumerator BT_OTS_METADATA_REQ_ALL = 0x7F
    Request all object metadata.

Functions

int bt_ots_obj_add(struct bt_ots *ots, const struct bt_ots_obj_add_param *param)
    Add an object to the OTS instance.
    This function adds an object to the OTS database. When the object is being added, a callback
    obj_created() is called to notify the user about a new object ID.

    Parameters
        • ots – OTS instance.
• param – Object addition parameters.

Returns
ID of created object in case of success.

Returns
negative value in case of error.

int bt_ots_obj_delete(struct bt_ots *ots, uint64_t id)
Delete an object from the OTS instance.
This function deletes an object from the OTS database. When the object is deleted a callback
obj_deleted() is called to notify the user about this event. At this point, it is possible to free
allocated buffer for object data.

Parameters
• ots – OTS instance.
• id – ID of the object to be deleted (uint48).

Returns
0 in case of success or negative value in case of error.

void *bt_ots_svc_decl_get(struct bt_ots *ots)
Get the service declaration attribute.
This function is enabled for CONFIG_BT_OTS_SECONDARY_SVC configuration. The first ser-
vice attribute can be included in any other GATT service.

Parameters
• ots – OTS instance.

Returns
The first OTS attribute instance.

int bt_ots_init(struct bt_ots *ots, struct bt_ots_init *ots_init)
Initialize the OTS instance.

Parameters
• ots – OTS instance.
• ots_init – OTS initialization descriptor.

Returns
0 in case of success or negative value in case of error.

struct bt_ots *bt_ots_free_instance_get(void)
Get a free instance of OTS from the pool.

Returns
OTS instance in case of success or NULL in case of error.

int bt_ots_client_register(struct bt_ots_client *ots_inst)
Register an Object Transfer Service Instance.
Register an Object Transfer Service instance discovered on the peer. Call this function when
an OTS instance is discovered (discovery is to be handled by the higher layer).

Parameters

Returns
int 0 if success, ERRNO on failure.
uint8_t bt_ots_client_indicate_handler(struct bt_conn *conn, struct bt_gatts_subscribe_params *params, const void *data, uint16_t length)

OTS Indicate Handler function. Set this function as callback for indicate handler when discovering OTS.

**Parameters**

- **conn** – Connection object. May be NULL, indicating that the peer is being unpaired.
- **params** – Subscription parameters.
- **data** – Attribute value data. If NULL then subscription was removed.
- **length** – Attribute value length.

int bt_ots_client_read_feature(struct bt_ots_client *otc_inst, struct bt_conn *conn)

Read the OTS feature characteristic.

**Parameters**

- **otc_inst** – Pointer to the OTC instance.
- **conn** – Pointer to the connection object.

**Returns**

int 0 if success, ERRNO on failure.

int bt_ots_client_select_id(struct bt_ots_client *otc_inst, struct bt_conn *conn, uint64_t obj_id)

Select an object by its Object ID.

**Parameters**

- **otc_inst** – Pointer to the OTC instance.
- **conn** – Pointer to the connection object.
- **obj_id** – Object’s ID.

**Returns**

int 0 if success, ERRNO on failure.

int bt_ots_client_select_first(struct bt_ots_client *otc_inst, struct bt_conn *conn)

Select the first object.

**Parameters**

- **otc_inst** – Pointer to the OTC instance.
- **conn** – Pointer to the connection object.

**Returns**

int 0 if success, ERRNO on failure.

int bt_ots_client_select_last(struct bt_ots_client *otc_inst, struct bt_conn *conn)

Select the last object.

**Parameters**

- **otc_inst** – Pointer to the OTC instance.
- **conn** – Pointer to the connection object.

**Returns**

int 0 if success, ERRNO on failure.
int bt_ots_client_select_next(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Select the next object.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_prev(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Select the previous object.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_read_object_metadata(struct bt_ots_client *otc_inst, struct bt_conn *conn,
uint8_t metadata)
Read the metadata of the current object.
The metadata are returned in the obj_metadata_read() callback.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.
• metadata – Bitfield (BT_OTS_METADATA_REQ_*) of the metadata to read.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_read_object_data(struct bt_ots_client *otc_inst, struct bt_conn *conn)
Read the data of the current selected object.
This will trigger an OACP read operation for the current size of the object with a 0 offset and then expect receiving the content via the L2CAP CoC.
The data of the object are returned in the obj_data_read() callback.

Parameters
• otc_inst – Pointer to the OTC instance.
• conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_write_object_data(struct bt_ots_client *otc_inst, struct bt_conn *conn,
const void *buf, size_t len, off_t offset, enum
bt_ots_oacp_write_op_mode mode)
Write the data of the current selected object.
This will trigger an OACP write operation for the current size of the object with a specified offset and then expect transferring the content via the L2CAP CoC.
The length of the data written to object is returned in the obj_data_written() callback.

Parameters
• otc_inst – Pointer to the OTC instance.
• `conn` – Pointer to the connection object.
• `buf` – Pointer to the data buffer to be written.
• `len` – Size of data.
• `offset` – Offset to write, usually 0.
• `mode` – Mode Parameter for OACP Write Op Code. See `bt_ots_oacp_write_op_mode`.

Returns
int 0 if success, ERRNO on failure.

```c
int bt_ots_client_decode_dirlisting(uint8_t *data, uint16_t length, bt_ots_client_dirlisting_cb cb)
```
Decode Directory Listing object into object metadata.
If the Directory Listing object contains multiple objects, then the callback will be called for each of them.

Parameters
• `data` – The data received for the directory listing object.
• `length` – Length of the data.
• `cb` – The callback that will be called for each object.

```c
static inline int bt_ots_obj_id_to_str(uint64_t obj_id, char *str, size_t len)
```
Converts binary OTS Object ID to string.

Parameters
• `obj_id` – Object ID.
• `str` – Address of user buffer with enough room to store formatted string containing binary Object ID.
• `len` – Length of data to be copied to user string buffer. Refer to `BT_OTS_OBJ_ID_STR_LEN` about recommended value.

Returns
Number of successfully formatted bytes from binary ID.

```c
void bt_ots_metadata_display(struct bt_ots_obj_metadata *metadata, uint16_t count)
```
Displays one or more object metadata as text with LOG_INF.

Parameters
• `metadata` – Pointer to the first (or only) metadata in an array.
• `count` – Number of metadata objects to display information of.

```c
struct bt_ots_obj_type
#include <ots.h> Type of an OTS object.
```

```c
struct bt_ots_obj_size
#include <ots.h> Descriptor for OTS Object Size parameter.
```

Public Members

```c
uint32_t cur
Current Size.
```
### Public Members

#### uint32_t alloc

Allocated Size.

#### struct bt_ots_feat

*include <ots.h>* Features of the OTS.

#### struct bt_ots_date_time

*include <ots.h>* Date and Time structure.

#### struct bt_ots_obj_metadata

*include <ots.h>* Metadata of an OTS object.

Used by the server as a descriptor for OTS object initialization. Used by the client to present object metadata to the application.

### Public Members

#### struct bt_ots_obj_type type

Object Type.

#### struct bt_ots_obj_size size

Object Size.

#### uint32_t props

Object Properties.

#### struct bt_ots_obj_add_param

*include <ots.h>* Descriptor for OTS object addition.

### Public Members

#### uint32_t size

Object size to allocate.

#### struct bt_ots_obj_type type

Object type.

#### struct bt_ots_obj_created_desc

*include <ots.h>* Descriptor for OTS created object.

Descriptor for OTS object created by the application. This descriptor is returned by `bt_ots_cb::obj_created` callback which contains further documentation on distinguishing between server and client object creation.

### Public Members
char *name
Object name.
The object name as a NULL terminated string.
When the server creates a new object the name shall be > 0 and <= BT_OTS_OBJ_MAX_NAME_LEN When the client creates a new object the name shall be an empty string

struct bt_ots_obj_size size
Object size.
bt_ots_obj_size::alloc shall be >= bt_ots_obj_add_param::size
When the server creates a new object bt_ots_obj_size::cur shall be <= bt_ots_obj_add_param::size When the client creates a new object bt_ots_obj_size::cur shall be 0

uint32_t props
Object properties.

struct bt_ots_cb
#include <ots.h> OTS callback structure.

Public Members

int (*obj_created)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const struct bt_ots_obj_add_param *add_param, struct bt_ots_obj_created_desc *created_desc)
Object created callback.
This callback is called whenever a new object is created. Application can reject this request by returning an error when it does not have necessary resources to hold this new object. This callback is also triggered when the server creates a new object with bt_ots_obj_add() API.

Param ots
OTS instance.

Param conn
The connection that is requesting object creation or NULL if object is created by bt_ots_obj_add().

Param id
Object ID.

Param add_param
Object creation requested parameters.

Param created_desc
Created object descriptor that shall be filled by the receiver of this callback.

Return
0 in case of success or negative value in case of error.

Return
-ENOTSUP if object type is not supported

Return
-ENOMEM if no available space for new object.

Return
-EINVAL if an invalid parameter is provided

Return
other negative values are treated as a generic operation failure
int (*obj_deleted)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id)

Object deleted callback.

This callback is called whenever an object is deleted. It is also triggered when the server deletes an object with bt_ots_obj_delete() API.

**Param**
- **ots**: OTS instance.
- **conn**: The connection that deleted the object or NULL if this request came from the server.
- **id**: Object ID.

**RetVal**
- When an error is indicated by using a negative value, the object delete procedure is aborted and a corresponding failed status is returned to the client.
- **Return**: 0 in case of success.
- -EBUSY if the object is locked. This is generally not expected to be returned by the application as the OTS layer tracks object accesses. An object locked status is returned to the client.
- Other negative values in case of error. A generic operation failed status is returned to the client.

void (*obj_selected)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id)

Object selected callback.

This callback is called on successful object selection.

**Param**
- **ots**: OTS instance.
- **conn**: The connection that selected new object.
- **id**: Object ID.

ssize_t (*obj_read)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, void **data, size_t len, off_t offset)

Object read callback.

This callback is called multiple times during the Object read operation. OTS module will keep requesting successive Object fragments from the application until the read operation is completed. The end of read operation is indicated by NULL data parameter.

**Param**
- **ots**: OTS instance.
- **conn**: The connection that read object.
- **id**: Object ID.
- **data**: In: NULL once the read operations is completed. Out: Next chunk of data to be sent.
- **len**: Remaining length requested by the client.
- **offset**: Object data offset.

**Return**
- Data length to be sent via data parameter. This value shall be smaller or equal
to the len parameter.

Return
Negative value in case of an error.

ssize_t (*obj_write)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const void *data, size_t len, off_t offset, size_t rem)
Object write callback.

This callback is called multiple times during the Object write operation. OTS module will keep providing successive Object fragments to the application until the write operation is completed. The offset and length of each write fragment is validated by the OTS module to be within the allocated size of the object. The remaining length indicates data length remaining to be written and will decrease each write iteration until it reaches 0 in the last write fragment.

Param ots
OTS instance.

Param conn
The connection that wrote object.

Param id
Object ID.

Param data
Next chunk of data to be written.

Param len
Length of the current chunk of data in the buffer.

Param offset
Object data offset.

Param rem
Remaining length in the write operation.

Return
Number of bytes written in case of success, if the number of bytes written does not match len, -EIO is returned to the L2CAP layer.

Return
A negative value in case of an error.

Return
-EINPROGRESS has a special meaning and is unsupported at the moment. It should not be returned.

void (*obj_name_written)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const char *cur_name, const char *new_name)
Object name written callback.

This callback is called when the object name is written. This is a notification to the application that the object name will be updated by the OTS service implementation.

Param ots
OTS instance.

Param conn
The connection that wrote object name.

Param id
Object ID.

Param cur_name
Current object name.

Param new_name
New object name.
#include <ots.h> OTS client instance.

struct bt_ots_client_cb
#include <ots.h> OTS client callback structure

Public Members

void (*obj_selected)(struct bt_ots_client *ots_inst, struct bt_conn *conn, int err)
   Callback function when a new object is selected.
   Called when the a new object is selected and the current object has changed. The
   cur_object in ots_inst will have been reset, and metadata should be read again with
   bt_ots_client_read_object_metadata().
   Param ots_inst
       Pointer to the OTC instance.
   Param conn
       The connection to the peer device.
   Param err
       Error code (bt_otsOlcp_res_code).

int (*obj_data_read)(struct bt_ots_client *ots_inst, struct bt_conn *conn, uint32_t offset,
                                  uint32_t len, uint8_t *data_p, bool is_complete)
   Callback function for the data of the selected object.
   Called when the data of the selected object are read using
   bt_ots_client_read_object_data().
   Param ots_inst
       Pointer to the OTC instance.
   Param conn
       The connection to the peer device.
   Param offset
       Offset of the received data.
   Param len
       Length of the received data.
   Param data_p
       Pointer to the received data.
   Param is_complete
       Indicate if the whole object has been received.
   Return
       int BT_OTS_STOP or BT_OTS_CONTINUE. BT_OTS_STOP can be used to stop
       reading.

void (*obj_metadata_read)(struct bt_ots_client *ots_inst, struct bt_conn *conn, int err,
                                  uint8_t metadata_read)
   Callback function for metadata of the selected object.
   Called when metadata of the selected object are read using
   bt_ots_client_read_object_metadata(). Not all of the metadata may have been
   initialized.
   Param ots_inst
       Pointer to the OTC instance.
   Param conn
       The connection to the peer device.
   Param err
       Error value. 0 on success, GATT error or ERRNO on fail.
**Param metadata_read**

Bitfield of the metadata that was successfully read.

```c
void (*obj_data_written)(struct bt_ots_client *ots_inst, struct bt_conn *conn, size_t len)
```

Callback function for the data of the write object.

Called when the data of the selected object is written using `bt_ots_client_write_object_data()`.

**Param ots_inst**

Pointer to the OTC instance.

**Param conn**

The connection to the peer device.

**Param len**

Length of the written data.

Declare an array of 8-bit elements in an attribute.

**BT_SDP_ARRAY_8(...)**

Declare an array of 16-bit elements in an attribute.

**BT_SDP_ARRAY_16(...)**

Declare an array of 32-bit elements in an attribute.

**BT_SDP_ARRAY_32(...)**

Declare a fixed-size data element header.

**Parameters**

- `_type` – Data element header containing type and size descriptors.
BT_SDP_TYPE_SIZE_VAR(_type, _size)
Declare a variable-size data element header.

**Parameters**
- _type – Data element header containing type and size descriptors.
- _size – The actual size of the data.

BT_SDP_DATA_ELEM_LIST(...) 
Declare a list of data elements.

BT_SDP_NEW_SERVICE
SDP New Service Record Declaration Macro.
Helper macro to declare a new service record. Default attributes: Record Handle, Record State, Language Base, Root Browse Group

BT_SDP_LIST(_att_id, _type_size, _data_elem_seq)
Generic SDP List Attribute Declaration Macro.
Helper macro to declare a list attribute.

**Parameters**
- _att_id – List Attribute ID.
- _data_elem_seq – Data element sequence for the list.
- _type_size – SDP type and size descriptor.

BT_SDP_SERVICE_ID(_uuid)
SDP Service ID Attribute Declaration Macro.
Helper macro to declare a service ID attribute.

**Parameters**
- _uuid – Service ID 16bit UUID.

BT_SDP_SERVICE_NAME(_name)
SDP Name Attribute Declaration Macro.
Helper macro to declare a service name attribute.

**Parameters**
- _name – Service name as a string (up to 256 chars).

BT_SDP_SUPPORTED_FEATURES(_features)
SDP Supported Features Attribute Declaration Macro.
Helper macro to declare supported features of a profile/protocol.

**Parameters**
- _features – Feature mask as 16bit unsigned integer.

BT_SDP_RECORD(_attrs)
SDP Service Declaration Macro.
Helper macro to declare a service.

**Parameters**
- _attrs – List of attributes for the service record.
Typedefs

typedef uint8_t (*bt_sdp_discover_func_t)(struct bt_conn *conn, struct bt_sdp_client_result *result)

Callback type reporting to user that there is a resolved result on remote for given UUID and the result record buffer can be used by user for further inspection.

A function of this type is given by the user to the bt_sdp_discover_params object. It'll be called on each valid record discovery completion for given UUID. When UUID resolution gives back no records then NULL is passed to the user. Otherwise user can get valid record(s) and then the internal hint 'next record' is set to false saying the UUID resolution is complete or the hint can be set by caller to true meaning that next record is available for given UUID. The returned function value allows the user to control retrieving follow-up resolved records if any. If the user doesn't want to read more resolved records for given UUID since current record data fulfills its requirements then should return BT_SDP_DISCOVER_UUID_STOP. Otherwise returned value means more subcall iterations are allowable.

**Param conn**
Connection object identifying connection to queried remote.

**Param result**
Object pointing to logical unparsed SDP record collected on base of response driven by given UUID.

**Return**
BT_SDP_DISCOVER_UUID_STOP in case of no more need to read next record data and continue discovery for given UUID. By returning BT_SDP_DISCOVER_UUID_CONTINUE user allows this discovery continuation.

Enums

enum [anonymous]
Helper enum to be used as return value of bt_sdp_discover_func_t. The value informs the caller to perform further pending actions or stop them.

**Values:**

enumerator BT_SDP_DISCOVER_UUID_STOP = 0

enumerator BT_SDP_DISCOVER_UUID_CONTINUE

enum bt_sdp_proto
Protocols to be asked about specific parameters.

**Values:**

enumerator BT_SDP_PROTO_RFCOMM = 0x0003

enumerator BT_SDP_PROTO_L2CAP = 0x0100

Functions
int bt_sdp_register_service(struct bt_sdp_record *service)

Register a Service Record. Applications can make use of macros such as BT_SDP_DECLARE_SERVICE, BT_SDP_LIST, BT_SDP_SERVICE_ID, BT_SDP_SERVICE_NAME, etc. A service declaration must start with BT_SDP_NEW_SERVICE.

**Parameters**

- service – Service record declared using BT_SDP_DECLARE_SERVICE.

**Returns**

0 in case of success or negative value in case of error.

int bt_sdp_discover(struct bt_conn *conn, const struct bt_sdp_discover_params *params)

Allows user to start SDP discovery session.

The function performs SDP service discovery on remote server driven by user delivered discovery parameters. Discovery session is made as soon as no SDP transaction is ongoing between peers and if any then this one is queued to be processed at discovery completion of previous one. On the service discovery completion the callback function will be called to get feedback to user about findings.

**Parameters**

- conn – Object identifying connection to remote.
- params – SDP discovery parameters.

**Returns**

0 in case of success or negative value in case of error.

int bt_sdp_discover_cancel(struct bt_conn *conn, const struct bt_sdp_discover_params *params)

Release waiting SDP discovery request.

It can cancel valid waiting SDP client request identified by SDP discovery parameters object.

**Parameters**

- conn – Object identifying connection to remote.
- params – SDP discovery parameters.

**Returns**

0 in case of success or negative value in case of error.

int bt_sdp_get_proto_param(const struct net_buf *buf, enum bt_sdp_proto proto, uint16_t *param)

Give to user parameter value related to given stacked protocol UUID.

API extracts specific parameter associated with given protocol UUID available in Protocol Descriptor List attribute.

**Parameters**

- buf – Original buffered raw record data.
- proto – Known protocol to be checked like RFCOMM or L2CAP.
- param – On success populated by found parameter value.

**Returns**

0 on success when specific parameter associated with given protocol value is found, or negative if error occurred during processing.
Get additional parameter value related to given stacked protocol UUID.

API extracts specific parameter associated with given protocol UUID available in Additional Protocol Descriptor List attribute.

**Parameters**

- **buf** – Original buffered raw record data.
- **proto** – Known protocol to be checked like RFCOMM or L2CAP.
- **param_index** – There may be more than one parameter related to the given protocol UUID. This function returns the result that is indexed by this parameter. It’s value is from 0, 0 means the first matched result, 1 means the second matched result.
- **param** – [out] On success populated by found parameter value.

**Returns**

0 on success when a specific parameter associated with a given protocol value is found, or negative if error occurred during processing.

Get profile version.

Helper API extracting remote profile version number. To get it proper generic profile parameter needs to be selected usually listed in SDP Interoperability Requirements section for given profile specification.

**Parameters**

- **buf** – Original buffered raw record data.
- **profile** – Profile family identifier the profile belongs.
- **version** – On success populated by found version number.

**Returns**

0 on success, negative value if error occurred during processing.

Get SupportedFeatures attribute value.

Allows if exposed by remote retrieve SupportedFeature attribute.

**Parameters**

- **buf** – Buffer holding original raw record data from remote.
- **features** – On success object to be populated with SupportedFeature mask.

**Returns**

0 on success if feature found and valid, negative in case any error

SDP Generic Data Element Value.

SDP Attribute Value.

SDP Service Record Value.
struct bt_sdp_client_result
   #include <sdp.h> Generic SDP Client Query Result data holder.

struct bt_sdp_discover_params
   #include <sdp.h> Main user structure used in SDP discovery of remote.

   Public Members

   const struct bt_uuid *uuid
       UUID (service) to be discovered on remote SDP entity

   bt_sdp_discover_func_t func
       Discover callback to be called on resolved SDP record

   struct net_buf_pool *pool
       Memory buffer enabled by user for SDP query results

Functions

6.1. Bluetooth
```c
int bt_vcp_vol_rend_included_get(struct bt_vcp_included *included)
Get Volume Control Service included services.
Returns a pointer to a struct that contains information about the Volume Control Service included service instances, such as pointers to the Volume Offset Control Service (Volume Offset Control Service) or Audio Input Control Service (AICS) instances.

Parameters
    • included – [out] Pointer to store the result in.

Returns
    0 if success, errno on failure.
```

```c
int bt_vcp_vol_rend_register(struct bt_vcp_vol_rend_register_param *param)
Register the Volume Control Service.
This will register and enable the service and make it discoverable by clients.

Parameters
    • param – Volume Control Service register parameters.

Returns
    0 if success, errno on failure.
```

```c
int bt_vcp_vol_rend_set_step(uint8_t volume_step)
Set the Volume Control Service volume step size.
Set the value that the volume changes, when changed relatively with e.g. bt_vcp_vol_rend_vol_down or bt_vcp_vol_rend_vol_up.
This can only be done as the server.

Parameters
    • volume_step – The volume step size (1-255).

Returns
    0 if success, errno on failure.
```

```c
int bt_vcp_vol_rend_get_state(void)
Get the Volume Control Service volume state.

Returns
    0 if success, errno on failure.
```

```c
int bt_vcp_vol_rend_get_flags(void)
Get the Volume Control Service flags.

Returns
    0 if success, errno on failure.
```

```c
int bt_vcp_vol_rend_vol_down(void)
Turn the volume down by one step on the server.

Returns
    0 if success, errno on failure.
```

```c
int bt_vcp_vol_rend_vol_up(void)
Turn the volume up by one step on the server.

Returns
    0 if success, errno on failure.
```
int bt_vcp_vol_rend_unmute_vol_down(void)
Turn the volume down and unmute the server.

**Returns**
0 if success, errno on failure.

int bt_vcp_vol_rend_unmute_vol_up(void)
Turn the volume up and unmute the server.

**Returns**
0 if success, errno on failure.

int bt_vcp_vol_rend_set_vol(uint8_t volume)
Set the volume on the server.

**Parameters**
- volume – The absolute volume to set.

**Returns**
0 if success, errno on failure.

int bt_vcp_vol_rend_unmute(void)
Unmute the server.

**Returns**
0 if success, errno on failure.

int bt_vcp_vol_rend_mute(void)
Mute the server.

**Returns**
0 if success, errno on failure.

int bt_vcp_vol_ctlr_cb_register(struct bt_vcp_vol_ctlr_cb *cb)
Registers the callbacks used by the Volume Controller.

**Parameters**
- cb – The callback structure.

**Returns**
0 if success, errno on failure.

int bt_vcp_vol_ctlr_discover(struct bt_conn *conn, struct bt_vcp_vol_ctlr **vol_ctlr)
Discover Volume Control Service and included services.

This will start a GATT discovery and setup handles and subscriptions. This shall be called once before any other actions can be executed for the peer device, and the \texttt{bt\_vcp\_vol\_ctlr\_cb::discover} callback will notify when it is possible to start remote operations.

This shall only be done as the client,

**Parameters**
- conn – The connection to discover Volume Control Service for.

**Returns**
0 if success, errno on failure.

int bt_vcp_vol_ctlr_conn_get(const struct bt_vcp_vol_ctlr *vol_ctlr, struct bt_conn **conn)
Get the connection pointer of a client instance.

Get the Bluetooth connection pointer of a Volume Control Service client instance.

**Parameters**
• `vol_ctlr` – Volume Controller instance pointer.
• `conn` – [out] Connection pointer.

**Returns**
0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_included_get(struct bt_vcp_vol_ctlr *vol_ctlr, struct bt_vcp_included *included)
```

Get Volume Control Service included services.

Returns a pointer to a struct that contains information about the Volume Control Service included service instances, such as pointers to the Volume Offset Control Service (Volume Offset Control Service) or Audio Input Control Service (AICS) instances.

**Parameters**
• `vol_ctlr` – Volume Controller instance pointer.
• `included` – [out] Pointer to store the result in.

**Returns**
0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_read_state(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Read the volume state of a remote Volume Renderer.

**Parameters**
• `vol_ctlr` – Volume Controller instance pointer.

**Returns**
0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_read_flags(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Read the volume flags of a remote Volume Renderer.

**Parameters**
• `vol_ctlr` – Volume Controller instance pointer.

**Returns**
0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_vol_down(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Turn the volume down one step on a remote Volume Renderer.

**Parameters**
• `vol_ctlr` – Volume Controller instance pointer.

**Returns**
0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_vol_up(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Turn the volume up one step on a remote Volume Renderer.

**Parameters**
• `vol_ctlr` – Volume Controller instance pointer.

**Returns**
0 if success, errno on failure.

```c
int bt_vcp_vol_ctlr_unmute_vol_down(struct bt_vcp_vol_ctlr *vol_ctlr)
```

Turn the volume down one step and unmute on a remote Volume Renderer.

**Parameters**
• `vol_ctlr` – Volume Controller instance pointer.
Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_unmute_vol_up(struct bt_vcp_vol_ctlr *vol_ctlr)
Turn the volume up one step and unmute on a remote Volume Renderer.

Parameters
• vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_set_vol(struct bt_vcp_vol_ctlr *vol_ctlr, uint8_t volume)
Set the absolute volume on a remote Volume Renderer.

Parameters
• vol_ctlr – Volume Controller instance pointer.
• volume – The absolute volume to set.

Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_unmute(struct bt_vcp_vol_ctlr *vol_ctlr)
Unmute a remote Volume Renderer.

Parameters
• vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int bt_vcp_vol_ctlr_mute(struct bt_vcp_vol_ctlr *vol_ctlr)
Mute a remote Volume Renderer.

Parameters
• vol_ctlr – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

struct bt_vcp_vol_rend_register_param
#include <vcp.h> Register structure for Volume Control Service

Public Members

uint8_t step
Initial step size (1-255)

uint8_t mute
Initial mute state (0-1)

uint8_t volume
Initial volume level (0-255)

struct bt_vocs_register_param vocs_param[0]
Register parameters for Volume Offset Control Services
struct bt_aics_register_param aics_param[0]
    Register parameters for Audio Input Control Services

struct bt_vcp_vol_rend_cb *cb
    Volume Control Service callback structure.

struct bt_vcp_included
    #include <vcp.h> Volume Control Service included services.
    Used for to represent the Volume Control Service included service instances, for either a client or a server. The instance pointers either represent local server instances, or remote service instances.

**Public Members**

uint8_t vocs_cnt
    Number of Volume Offset Control Service instances

struct bt_vocs **vocs
    Array of pointers to Volume Offset Control Service instances

uint8_t aics_cnt
    Number of Audio Input Control Service instances

struct bt_aics **aics
    Array of pointers to Audio Input Control Service instances

struct bt_vcp_vol_rend_cb
    #include <vcp.h>

**Public Members**

void (*state)(int err, uint8_t volume, uint8_t mute)
    Callback function for Volume Control Service volume state.
    Called when the value is locally read with bt_vcp_vol_rend_get_state(), or if the state is changed by either the Volume Renderer or a remote Volume Controller.
    **Param err**
    Error value. 0 on success, GATT error on positive value or errno on negative value.
    **Param volume**
    The volume of the Volume Control Service server.
    **Param mute**
    The mute setting of the Volume Control Service server.

void (*flags)(int err, uint8_t flags)
    Callback function for Volume Control Service flags.
    Called when the value is locally read as the server. Called when the value is remotely read as the client. Called if the value is changed by either the server or client.
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param flags
The flags of the Volume Control Service server.

```c
#include <vcp.h>
```

Public Members

```c
void (*state)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t volume, uint8_t mute)
```

Callback function for Volume Control Profile volume state. Called when the value is remotely read as the Volume Controller. Called if the value is changed by either the Volume Renderer or Volume Controller, and notified to the to Volume Controller.

- **Param vol_ctlr**: Volume Controller instance pointer.
- **Param err**: Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param volume**: The volume of the Volume Renderer.
- **Param mute**: The mute setting of the Volume Renderer.

```c
void (*flags)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t flags)
```

Callback function for Volume Control Profile volume flags. Called when the value is remotely read as the Volume Controller. Called if the value is changed by the Volume Renderer.

A non-zero value indicates the the volume has been changed on the Volume Renderer since it was booted.

- **Param vol_ctlr**: Volume Controller instance pointer.
- **Param err**: Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param flags**: The flags of the Volume Renderer.

```c
void (*discover)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t vocs_count, uint8_t aics_count)
```

Callback function for `bt_vcp_vol_ctlr_discover()`.

This callback is called once the discovery procedure is completed.

- **Param vol_ctlr**: Volume Controller instance pointer.
- **Param err**: Error value. 0 on success, GATT error on positive value or errno on negative value.
- **Param vocs_count**: Number of Volume Offset Control Service instances on the remote Volume Renderer.
**Param aics_count**

Number of Audio Input Control Service instances the remote Volume Renderer.

```c
void (*vol_down)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_vol_down()`. Called when the volume down procedure is completed.

- **Param vol_ctlr**
  Volume Controller instance pointer.

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*vol_up)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_vol_up()`. Called when the volume up procedure is completed.

- **Param vol_ctlr**
  Volume Controller instance pointer.

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*mute)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_mute()`. Called when the mute procedure is completed.

- **Param vol_ctlr**
  Volume Controller instance pointer.

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*unmute)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_unmute()`. Called when the unmute procedure is completed.

- **Param vol_ctlr**
  Volume Controller instance pointer.

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*vol_down_unmute)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_vol_down_unmute()`. Called when the volume down and unmute procedure is completed.

- **Param vol_ctlr**
  Volume Controller instance pointer.

- **Param err**
  Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*vol_up_unmute)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```

Callback function for `bt_vcp_vol_ctlr_vol_up_unmute()`. Called when the volume up and unmute procedure is completed.
**Param vol_ctlr**
Volume Controller instance pointer.

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

```c
void (*vol_set)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)
```
Callback function for `bt_vcp_vol_ctlr_vol_set()`.
Called when the set absolute volume procedure is completed.

**Param vol_ctlr**
Volume Controller instance pointer.

**Param err**
Error value. 0 on success, GATT error on positive value or errno on negative value.

---

**Universal Unique Identifiers (UUIDs)**

**API Reference**

**group bt_uuid**

UUIDs.

**Defines**

- **BT_UUID_SIZE_16**
  Size in octets of a 16-bit UUID

- **BT_UUID_SIZE_32**
  Size in octets of a 32-bit UUID

- **BT_UUID_SIZE_128**
  Size in octets of a 128-bit UUID

- **BT_UUID_INIT_16(value)**
  Initialize a 16-bit UUID.

  **Parameters**
  - value – 16-bit UUID value in host endianness.

- **BT_UUID_INIT_32(value)**
  Initialize a 32-bit UUID.

  **Parameters**
  - value – 32-bit UUID value in host endianness.

- **BT_UUID_INIT_128(value...)**
  Initialize a 128-bit UUID.

  **Parameters**
  - value – 128-bit UUID array values in little-endian format. Can be combined with **BT_UUID_128_ENCODE** to initialize a UUID from the readable form of UUIDs.
BT_UUID_DECLARE_16(value)
Help to declare a 16-bit UUID inline.

Parameters
• value – 16-bit UUID value in host endianness.

Returns
Pointer to a generic UUID.

BT_UUID_DECLARE_32(value)
Helper to declare a 32-bit UUID inline.

Parameters
• value – 32-bit UUID value in host endianness.

Returns
Pointer to a generic UUID.

BT_UUID_DECLARE_128(value...)
Helper to declare a 128-bit UUID inline.

Parameters
• value – 128-bit UUID array values in little-endian format. Can be combined with BT_UUID_128_ENCODE to declare a UUID from the readable form of UUIDs.

Returns
Pointer to a generic UUID.

BT_UUID_16(__u)
Helper macro to access the 16-bit UUID from a generic UUID.

BT_UUID_32(__u)
Helper macro to access the 32-bit UUID from a generic UUID.

BT_UUID_128(__u)
Helper macro to access the 128-bit UUID from a generic UUID.

BT_UUID_128_ENCODE(w32, w1, w2, w3, w48)
Encode 128 bit UUID into array values in little-endian format.

Helper macro to initialize a 128-bit UUID array value from the readable form of UUIDs, or encode 128-bit UUID values into advertising data Can be combined with BT_UUID_DECLARE_128 to declare a 128-bit UUID.

Example of how to declare the UUID 6E400001-B5A3-F393-E0A9-E50E24DCCA9E

```
BT_UUID_DECLARE_128(  
    BT_UUID_128_ENCODE(0x6E400001, 0xB5A3, 0xF393, 0xE0A9, 0xE50E24DCCA9E))
```

Example of how to encode the UUID 6E400001-B5A3-F393-E0A9-E50E24DCCA9E into advertising data.

```
BT_DATA_BYTES(BT_DATA_UUID128_ALL,  
    BT_UUID_128_ENCODE(0x6E400001, 0xB5A3, 0xF393, 0xE0A9, 0xE50E24DCCA9E))
```

Just replace the hyphen by the comma and add 0x prefixes.

Parameters
• w32 – First part of the UUID (32 bits)
• w1 – Second part of the UUID (16 bits)
• w2 – Third part of the UUID (16 bits)
• w3 – Fourth part of the UUID (16 bits)
• w48 – Fifth part of the UUID (48 bits)

**Returns**
The comma separated values for UUID 128 initializer that may be used directly as an argument for `BT_UUID_INIT_128` or `BT_UUID_DECLARE_128`.

```
BT_UUID_16_ENCODE(w16)
```
Encode 16-bit UUID into array values in little-endian format.
Helper macro to encode 16-bit UUID values into advertising data.
Example of how to encode the UUID 0x180a into advertising data.

```
BT_DATA_BYTES(BT_DATA_UUID16_ALL, BT_UUID_16_ENCODE(0x180a))
```

**Parameters**
• w16 – UUID value (16-bits)

**Returns**
The comma separated values for UUID 16 value that may be used directly as an argument for `BT_DATA_BYTES`.

```
BT_UUID_32_ENCODE(w32)
```
Encode 32-bit UUID into array values in little-endian format.
Helper macro to encode 32-bit UUID values into advertising data.
Example of how to encode the UUID 0x180a01af into advertising data.

```
BT_DATA_BYTES(BT_DATA_UUID32_ALL, BT_UUID_32_ENCODE(0x180a01af))
```

**Parameters**
• w32 – UUID value (32-bits)

**Returns**
The comma separated values for UUID 32 value that may be used directly as an argument for `BT_DATA_BYTES`.

```
BT_UUID_STR_LEN
```
Recommended length of user string buffer for Bluetooth UUID.
The recommended length guarantee the output of UUID conversion will not lose valuable information about the UUID being processed. If the length of the UUID is known the string can be shorter.

```
BT_UUID_GAP_VAL
```
Generic Access UUID value.

```
BT_UUID_GAP
```
Generic Access.

---

6.1. Bluetooth
BT_UUID_GATT_VAL
  Generic attribute UUID value.

BT_UUID_GATT
  Generic Attribute.

BT_UUID_IAS_VAL
  Immediate Alert Service UUID value.

BT_UUID_IAS
  Immediate Alert Service.

BT_UUID_LLS_VAL
  Link Loss Service UUID value.

BT_UUID_LLS
  Link Loss Service.

BT_UUID_TPS_VAL
  Tx Power Service UUID value.

BT_UUID_TPS
  Tx Power Service.

BT_UUID_CTS_VAL
  Current Time Service UUID value.

BT_UUID_CTS
  Current Time Service.

BT_UUID_HTS_VAL
  Health Thermometer Service UUID value.

BT_UUID_HTS
  Health Thermometer Service.

BT_UUID_DIS_VAL
  Device Information Service UUID value.

BT_UUID_DIS
  Device Information Service.

BT_UUID_HRS_VAL
  Heart Rate Service UUID value.

BT_UUID_HRS
  Heart Rate Service.
BT_UUID_BAS_VAL
Battery Service UUID value.

BT_UUID_BAS
Battery Service.

BT_UUID_HIDS_VAL
HID Service UUID value.

BT_UUID_HIDS
HID Service.

BT_UUID_RSCS_VAL
Running Speed and Cadence Service UUID value.

BT_UUID_RSCS
Running Speed and Cadence Service.

BT_UUID_CSC_VAL
Cycling Speed and Cadence Service UUID value.

BT_UUID_CSC
Cycling Speed and Cadence Service.

BT_UUID_ESS_VAL
Environmental Sensing Service UUID value.

BT_UUID_ESS
Environmental Sensing Service.

BT_UUID_BMS_VAL
Bond Management Service UUID value.

BT_UUID_BMS
Bond Management Service.

BT_UUID_CGMS_VAL
Continuous Glucose Monitoring Service UUID value.

BT_UUID_CGMS
Continuous Glucose Monitoring Service.

BT_UUID_IPSS_VAL
IP Support Service UUID value.

BT_UUID_IPSS
IP Support Service.
BT_UUID_HPS_VAL
    HTTP Proxy Service UUID value.

BT_UUID_HPS
    HTTP Proxy Service.

BT_UUID_OTS_VAL
    Object Transfer Service UUID value.

BT_UUID_OTS
    Object Transfer Service.

BT_UUID_MESH_PROV_VAL
    Mesh Provisioning Service UUID value.

BT_UUID_MESH_PROV
    Mesh Provisioning Service.

BT_UUID_MESH_PROXY_VAL
    Mesh Proxy Service UUID value.

BT_UUID_MESH_PROXY
    Mesh Proxy Service.

BT_UUID_AICS_VAL
    Audio Input Control Service value.

BT_UUID_AICS
    Audio Input Control Service.

BT_UUID_VCS_VAL
    Volume Control Service value.

BT_UUID_VCS
    Volume Control Service.

BT_UUID_VOCS_VAL
    Volume Offset Control Service value.

BT_UUID_VOCS
    Volume Offset Control Service.

BT_UUID_CSIS_VAL
    Coordinated Set Identification Service value.

BT_UUID_CSIS
    Coordinated Set Identification Service.
BT_UUID_MCS_VAL
  Media Control Service value.

BT_UUID_MCS
  Media Control Service.

BT_UUID_GMCS_VAL
  Generic Media Control Service value.

BT_UUID_GMCS
  Generic Media Control Service.

BT_UUID_TBS_VAL
  Telephone Bearer Service value.

BT_UUID_TBS
  Telephone Bearer Service.

BT_UUID_GTBS_VAL
  Generic Telephone Bearer Service value.

BT_UUID_GTBS
  Generic Telephone Bearer Service.

BT_UUID_MICS_VAL
  Microphone Input Control Service value.

BT_UUID_MICS
  Microphone Input Control Service.

BT_UUID_ASCS_VAL
  Audio Stream Control Service value.

BT_UUID_ASCS
  Audio Stream Control Service.

BT_UUID_BASS_VAL
  Broadcast Audio Scan Service value.

BT_UUID_BASS
  Broadcast Audio Scan Service.

BT_UUID_PACS_VAL
  Published Audio Capabilities Service value.

BT_UUID_PACS
  Published Audio Capabilities Service.
BT_UUID_BASIC_AUDIO_VAL
Basic Audio Announcement Service value.

BT_UUID_BASIC_AUDIO
Basic Audio Announcement Service.

BT_UUID_BROADCAST_AUDIO_VAL
Broadcast Audio Announcement Service value.

BT_UUID_BROADCAST_AUDIO
Broadcast Audio Announcement Service.

BT_UUID_CAS_VAL
Common Audio Service value.

BT_UUID_CAS
Common Audio Service.

BT_UUID_HAS_VAL
Hearing Access Service value.

BT_UUID_HAS
Hearing Access Service.

BT_UUID_GATT_PRIMARY_VAL
GATT Primary Service UUID value.

BT_UUID_GATT_PRIMARY
GATT Primary Service.

BT_UUID_GATT_SECONDARY_VAL
GATT Secondary Service UUID value.

BT_UUID_GATT_SECONDARY
GATT Secondary Service.

BT_UUID_GATT_INCLUDE_VAL
GATT Include Service UUID value.

BT_UUID_GATT_INCLUDE
GATT Include Service.

BT_UUID_GATT_CHRC_VAL
GATT Characteristic UUID value.

BT_UUID_GATT_CHRC
GATT Characteristic.
BT_UUID_GATT_CEP_VAL
GATT Characteristic Extended Properties UUID value.

BT_UUID_GATT_CEP
GATT Characteristic Extended Properties.

BT_UUID_GATT_CUD_VAL
GATT Characteristic User Description UUID value.

BT_UUID_GATT_CUD
GATT Characteristic User Description.

BT_UUID_GATT_CCC_VAL
GATT Client Characteristic Configuration UUID value.

BT_UUID_GATT_CCC
GATT Client Characteristic Configuration.

BT_UUID_GATT_SCC_VAL
GATT Server Characteristic Configuration UUID value.

BT_UUID_GATT_SCC
GATT Server Characteristic Configuration.

BT_UUID_GATTCPF_VAL
GATT Characteristic Presentation Format UUID value.

BT_UUID_GATTCPF
GATT Characteristic Presentation Format.

BT_UUID_GATT_CAF_VAL
GATT Characteristic Aggregated Format UUID value.

BT_UUID_GATT_CAF
GATT Characteristic Aggregated Format.

BT_UUID_VALID_RANGE_VAL
Valid Range Descriptor UUID value.

BT_UUID_VALID_RANGE
Valid Range Descriptor.

BT_UUID_HIDS_EXT_REPORT_VAL
HID External Report Descriptor UUID value.

BT_UUID_HIDS_EXT_REPORT
HID External Report Descriptor.
BG_UUID_HIDS_REPORT_REF_VAL
HID Report Reference Descriptor UUID value.

BG_UUID_HIDS_REPORT_REF
HID Report Reference Descriptor.

BG_UUID_ES_CONFIGURATION_VAL
Environmental Sensing Configuration Descriptor UUID value.

BG_UUID_ES_CONFIGURATION
Environmental Sensing Configuration Descriptor.

BG_UUID_ES_MEASUREMENT_VAL
Environmental Sensing Measurement Descriptor UUID value.

BG_UUID_ES_MEASUREMENT
Environmental Sensing Measurement Descriptor.

BG_UUID_ES_TRIGGER_SETTING_VAL
Environmental Sensing Trigger Setting Descriptor UUID value.

BG_UUID_ES_TRIGGER_SETTING
Environmental Sensing Trigger Setting Descriptor.

BG_UUID_GAP_DEVICE_NAME_VAL
GAP Characteristic Device Name UUID value.

BG_UUID_GAP_DEVICE_NAME
GAP Characteristic Device Name.

BG_UUID_GAP_APPEARANCE_VAL
GAP Characteristic Appearance UUID value.

BG_UUID_GAP_APPEARANCE
GAP Characteristic Appearance.

BG_UUID_GAP_PPCP_VAL
GAP Characteristic Peripheral Preferred Connection Parameters UUID value.

BG_UUID_GAP_PPCP
GAP Characteristic Peripheral Preferred Connection Parameters.

BG_UUID_GATT_SC_VAL
GATT Characteristic Service Changed UUID value.

BG_UUID_GATT_SC
GATT Characteristic Service Changed.
BT_UUID_ALERT_LEVEL_VAL
Alert Level UUID value.

BT_UUID_ALERT_LEVEL
Alert Level.

BT_UUID_TPS_TX_POWER_LEVEL_VAL
TPS Characteristic Tx Power Level UUID value.

BT_UUID_TPS_TX_POWER_LEVEL
TPS Characteristic Tx Power Level.

BT_UUID_BAS_BATTERY_LEVEL_VAL
BAS Characteristic Battery Level UUID value.

BT_UUID_BAS_BATTERY_LEVEL
BAS Characteristic Battery Level.

BT_UUID_HTS_MEASUREMENT_VAL
HTS Characteristic Measurement Value UUID value.

BT_UUID_HTS_MEASUREMENT
HTS Characteristic Measurement Value.

BT_UUID_HIDS_BOOT_KB_IN_REPORT_VAL
HID Characteristic Boot Keyboard Input Report UUID value.

BT_UUID_HIDS_BOOT_KB_IN_REPORT
HID Characteristic Boot Keyboard Input Report.

BT_UUID_DIS_SYSTEM_ID_VAL
DIS Characteristic System ID UUID value.

BT_UUID_DIS_SYSTEM_ID
DIS Characteristic System ID.

BT_UUID_DIS_MODEL_NUMBER_VAL
DIS Characteristic Model Number String UUID value.

BT_UUID_DIS_MODEL_NUMBER
DIS Characteristic Model Number String.

BT_UUID_DIS_SERIAL_NUMBER_VAL
DIS Characteristic Serial Number String UUID value.

BT_UUID_DIS_SERIAL_NUMBER
DIS Characteristic Serial Number String.
BT_UUID_DIS_FIRMWARE_REVISION_VAL
DIS Characteristic Firmware Revision String UUID value.

BT_UUID_DIS_FIRMWARE_REVISION
DIS Characteristic Firmware Revision String.

BT_UUID_DIS_HARDWARE_REVISION_VAL
DIS Characteristic Hardware Revision String UUID value.

BT_UUID_DIS_HARDWARE_REVISION
DIS Characteristic Hardware Revision String.

BT_UUID_DIS_SOFTWARE_REVISION_VAL
DIS Characteristic Software Revision String UUID value.

BT_UUID_DIS_SOFTWARE_REVISION
DIS Characteristic Software Revision String.

BT_UUID_DIS_MANUFACTURER_NAME_VAL
DIS Characteristic Manufacturer Name String UUID Value.

BT_UUID_DIS_MANUFACTURER_NAME
DIS Characteristic Manufacturer Name String.

BT_UUID_DIS_PNP_ID_VAL
DIS Characteristic PnP ID UUID value.

BT_UUID_DIS_PNP_ID
DIS Characteristic PnP ID.

BT_UUID_CTS_CURRENT_TIME_VAL
CTS Characteristic Current Time UUID value.

BT_UUID_CTS_CURRENT_TIME
CTS Characteristic Current Time.

BT_UUID_MAGN_DECLINATION_VAL
Magnetic Declination Characteristic UUID value.

BT_UUID_MAGN_DECLINATION
Magnetic Declination Characteristic.

BT_UUID_HIDS_BOOT_KB_OUT_REPORT_VAL
HID Boot Keyboard Output Report Characteristic UUID value.

BT_UUID_HIDS_BOOT_KB_OUT_REPORT
HID Boot Keyboard Output Report Characteristic.
BT_UUID_HIDS_BOOT_MOUSE_IN_REPORT_VAL
HID Boot Mouse Input Report Characteristic UUID value.

BT_UUID_HIDS_BOOT_MOUSE_IN_REPORT
HID Boot Mouse Input Report Characteristic.

BT_UUID_HRS_MEASUREMENT_VAL
HRS Characteristic Measurement Interval UUID value.

BT_UUID_HRS_MEASUREMENT
HRS Characteristic Measurement Interval.

BT_UUID_HRS_BODY_SENSOR_VAL
HRS Characteristic Body Sensor Location.

BT_UUID_HRS_BODY_SENSOR
HRS Characteristic Control Point.

BT_UUID_HRS_CONTROL_POINT_VAL
HRS Characteristic Control Point UUID value.

BT_UUID_HRS_CONTROL_POINT
HRS Characteristic Control Point.

BT_UUID_HIDS_INFO_VAL
HID Information Characteristic UUID value.

BT_UUID_HIDS_INFO
HID Information Characteristic.

BT_UUID_HIDS_REPORT_MAP_VAL
HID Report Map Characteristic UUID value.

BT_UUID_HIDS_REPORT_MAP
HID Report Map Characteristic.

BT_UUID_HIDS_CTRL_POINT_VAL
HID Control Point Characteristic UUID value.

BT_UUID_HIDS_CTRL_POINT
HID Control Point Characteristic.

BT_UUID_HIDS_REPORT_VAL
HID Report Characteristic UUID value.

BT_UUID_HIDS_REPORT
HID Report Characteristic.

6.1. Bluetooth
BT_UUID_HIDS_PROTOCOL_MODE_VAL
HID Protocol Mode Characteristic UUID value.

BT_UUID_HIDS_PROTOCOL_MODE
HID Protocol Mode Characteristic.

BT_UUID_RECORD_ACCESS_CONTROL_POINT_VAL
Record Access Control Point Characteristic value.

BT_UUID_RECORD_ACCESS_CONTROL_POINT
Record Access Control Point.

BT_UUID_RSC_MEASUREMENT_VAL
RSC Measurement Characteristic UUID value.

BT_UUID_RSC_MEASUREMENT
RSC Measurement Characteristic.

BT_UUID_RSC_FEATURE_VAL
RSC Feature Characteristic UUID value.

BT_UUID_RSC_FEATURE
RSC Feature Characteristic.

BT_UUID_CSC_MEASUREMENT_VAL
CSC Measurement Characteristic UUID value.

BT_UUID_CSC_MEASUREMENT
CSC Measurement Characteristic.

BT_UUID_CSC_FEATURE_VAL
CSC Feature Characteristic UUID value.

BT_UUID_CSC_FEATURE
CSC Feature Characteristic.

BT_UUID_SENSOR_LOCATION_VAL
Sensor Location Characteristic UUID value.

BT_UUID_SENSOR_LOCATION
Sensor Location Characteristic.

BT_UUID_SC_CONTROL_POINT_VAL
SC Control Point Characteristic UUID value.

BT_UUID_SC_CONTROL_POINT
SC Control Point Characteristic.
BT_UUID_ELEVATION_VAL
Elevation Characteristic UUID value.

BT_UUID_ELEVATION
Elevation Characteristic.

BT_UUID_PRESSURE_VAL
Pressure Characteristic UUID value.

BT_UUID_PRESSURE
Pressure Characteristic.

BT_UUID_TEMPERATURE_VAL
Temperature Characteristic UUID value.

BT_UUID_TEMPERATURE
Temperature Characteristic.

BT_UUID_HUMIDITY_VAL
Humidity Characteristic UUID value.

BT_UUID_HUMIDITY
Humidity Characteristic.

BT_UUID_TRUE_WIND_SPEED_VAL
True Wind Speed Characteristic UUID value.

BT_UUID_TRUE_WIND_SPEED
True Wind Speed Characteristic.

BT_UUID_TRUE_WIND_DIR_VAL
True Wind Direction Characteristic UUID value.

BT_UUID_TRUE_WIND_DIR
True Wind Direction Characteristic.

BT_UUID_APPARENT_WIND_SPEED_VAL
Apparent Wind Speed Characteristic UUID value.

BT_UUID_APPARENT_WIND_SPEED
Apparent Wind Speed Characteristic.

BT_UUID_APPARENT_WIND_DIR_VAL
Apparent Wind Direction Characteristic UUID value.

BT_UUID_APPARENT_WIND_DIR
Apparent Wind Direction Characteristic.
BT_UUID_GUST_FACTOR_VAL
Gust Factor Characteristic UUID value.

BT_UUID_GUST_FACTOR
Gust Factor Characteristic.

BT_UUID_POLLEN_CONCENTRATION_VAL
Pollen Concentration Characteristic UUID value.

BT_UUID_POLLEN_CONCENTRATION
Pollen Concentration Characteristic.

BT_UUID_UV_INDEX_VAL
UV Index Characteristic UUID value.

BT_UUID_UV_INDEX
UV Index Characteristic.

BT_UUID_IRRADIANCE_VAL
Irradiance Characteristic UUID value.

BT_UUID_IRRADIANCE
Irradiance Characteristic.

BT_UUID_RAINFALL_VAL
Rainfall Characteristic UUID value.

BT_UUID_RAINFALL
Rainfall Characteristic.

BT_UUID_WIND_CHILL_VAL
Wind Chill Characteristic UUID value.

BT_UUID_WIND_CHILL
Wind Chill Characteristic.

BT_UUID_HEAT_INDEX_VAL
Heat Index Characteristic UUID value.

BT_UUID_HEAT_INDEX
Heat Index Characteristic.

BT_UUID_DEW_POINT_VAL
Dew Point Characteristic UUID value.

BT_UUID_DEW_POINT
Dew Point Characteristic.
BT_UUID_DESC_VALUE_CHANGED_VAL
Descriptor Value Changed Characteristic UUID value.

BT_UUID_DESC_VALUE_CHANGED
Descriptor Value Changed Characteristic.

BT_UUID_MAGN_FLUX_DENSITY_2D_VAL
Magnetic Flux Density - 2D Characteristic UUID value.

BT_UUID_MAGN_FLUX_DENSITY_2D
Magnetic Flux Density - 2D Characteristic.

BT_UUID_MAGN_FLUX_DENSITY_3D_VAL
Magnetic Flux Density - 3D Characteristic UUID value.

BT_UUID_MAGN_FLUX_DENSITY_3D
Magnetic Flux Density - 3D Characteristic.

BT_UUID_BAR_PRESSURE_TREND_VAL
Barometric Pressure Trend Characteristic UUID value.

BT_UUID_BAR_PRESSURE_TREND
Barometric Pressure Trend Characteristic.

BT_UUID_BMS_CONTROL_POINT_VAL
Bond Management Control Point UUID value.

BT_UUID_BMS_CONTROL_POINT
Bond Management Control Point.

BT_UUID_BMS_FEATURE_VAL
Bond Management Feature UUID value.

BT_UUID_BMS_FEATURE
Bond Management Feature.

BT_UUID_CENTRAL_ADDR_RES_VAL
Central Address Resolution Characteristic UUID value.

BT_UUID_CENTRAL_ADDR_RES
Central Address Resolution Characteristic.

BT_UUID_CGM_MEASUREMENT_VAL
CGM Measurement Characteristic value.

BT_UUID_CGM_MEASUREMENT
CGM Measurement Characteristic.

6.1. Bluetooth
BT_UUID_CGM_FEATURE_VAL
CGM Feature Characteristic value.

BT_UUID_CGM_FEATURE
CGM Feature Characteristic.

BT_UUID_CGM_STATUS_VAL
CGM Status Characteristic value.

BT_UUID_CGM_STATUS
CGM Status Characteristic.

BT_UUID_CGM_SESSION_START_TIME_VAL
CGM Session Start Time Characteristic value.

BT_UUID_CGM_SESSION_START_TIME
CGM Session Start Time.

BT_UUID_CGM_SESSION_RUN_TIME_VAL
CGM Session Run Time Characteristic value.

BT_UUID_CGM_SESSION_RUN_TIME
CGM Session Run Time.

BT_UUID_CGM_SPECIFIC_OPS_CONTROL_POINT_VAL
CGM Specific Ops Control Point Characteristic value.

BT_UUID_CGM_SPECIFIC_OPS_CONTROL_POINT
CGM Specific Ops Control Point.

BT_UUID_URI_VAL
URI UUID value.

BT_UUID_URI
URI.

BT_UUID_HTTP_HEADERS_VAL
HTTP Headers UUID value.

BT_UUID_HTTP_HEADERS
HTTP Headers.

BT_UUID_HTTP_STATUS_CODE_VAL
HTTP Status Code UUID value.

BT_UUID_HTTP_STATUS_CODE
HTTP Status Code.
BT_UUID_HTTP_ENTITY_BODY_VAL
HTTP Entity Body UUID value.

BT_UUID_HTTP_ENTITY_BODY
HTTP Entity Body.

BT_UUID_HTTP_CONTROL_POINT_VAL
HTTP Control Point UUID value.

BT_UUID_HTTP_CONTROL_POINT
HTTP Control Point.

BT_UUID_HTTPS_SECURITY_VAL
HTTPS Security UUID value.

BT_UUID_HTTPS_SECURITY
HTTPS Security.

BT_UUID_OTS_FEATURE_VAL
OTS Feature Characteristic UUID value.

BT_UUID_OTS_FEATURE
OTS Feature Characteristic.

BT_UUID_OTS_NAME_VAL
OTS Object Name Characteristic UUID value.

BT_UUID_OTS_NAME
OTS Object Name Characteristic.

BT_UUID_OTS_TYPE_VAL
OTS Object Type Characteristic UUID value.

BT_UUID_OTS_TYPE
OTS Object Type Characteristic.

BT_UUID_OTS_SIZE_VAL
OTS Object Size Characteristic UUID value.

BT_UUID_OTS_SIZE
OTS Object Size Characteristic.

BT_UUID_OTS_FIRST_CREATED_VAL
OTS Object First-Created Characteristic UUID value.

BT_UUID_OTS_FIRST_CREATED
OTS Object First-Created Characteristic.

6.1. Bluetooth
**BT_UUID_OTS_LAST_MODIFIED_VAL**
OTS Object Last-Modified Characteristic UUID value.

**BT_UUID_OTS_LAST_MODIFIED**
OTS Object Last-Modified Characteristic.

**BT_UUID_OTS_ID_VAL**
OTS Object ID Characteristic UUID value.

**BT_UUID_OTS_ID**
OTS Object ID Characteristic.

**BT_UUID_OTS_PROPERTIES_VAL**
OTS Object Properties Characteristic UUID value.

**BT_UUID_OTS_PROPERTIES**
OTS Object Properties Characteristic.

**BT_UUID_OTS_ACTION_CP_VAL**
OTS Object Action Control Point Characteristic UUID value.

**BT_UUID_OTS_ACTION_CP**
OTS Object Action Control Point Characteristic.

**BT_UUID_OTS_LIST_CP_VAL**
OTS Object List Control Point Characteristic UUID value.

**BT_UUID_OTS_LIST_CP**
OTS Object List Control Point Characteristic.

**BT_UUID_OTS_LIST_FILTER_VAL**
OTS Object List Filter Characteristic UUID value.

**BT_UUID_OTS_LIST_FILTER**
OTS Object List Filter Characteristic.

**BT_UUID_OTS_CHANGED_VAL**
OTS Object Changed Characteristic UUID value.

**BT_UUID_OTS_CHANGED**
OTS Object Changed Characteristic.

**BT_UUID_OTS_TYPE_UNSPECIFIED_VAL**
OTS Unspecified Object Type UUID value.

**BT_UUID_OTS_TYPE_UNSPECIFIED**
OTS Unspecified Object Type.
BT_UUID_OTS_DIRECTORY_LISTING_VAL
OTS Directory Listing UUID value.

BT_UUID_OTS_DIRECTORY_LISTING
OTS Directory Listing.

BT_UUID_MESH_PROV_DATA_IN_VAL
Mesh Provisioning Data In UUID value.

BT_UUID_MESH_PROV_DATA_IN
Mesh Provisioning Data In.

BT_UUID_MESH_PROV_DATA_OUT_VAL
Mesh Provisioning Data Out UUID value.

BT_UUID_MESH_PROV_DATA_OUT
Mesh Provisioning Data Out.

BT_UUID_MESH_PROXY_DATA_IN_VAL
Mesh Proxy Data In UUID value.

BT_UUID_MESH_PROXY_DATA_IN
Mesh Proxy Data In.

BT_UUID_MESH_PROXY_DATA_OUT_VAL
Mesh Proxy Data Out UUID value.

BT_UUID_MESH_PROXY_DATA_OUT
Mesh Proxy Data Out.

BT_UUID_GATT_CLIENT_FEATURES_VAL
Client Supported Features UUID value.

BT_UUID_GATT_CLIENT_FEATURES
Client Supported Features.

BT_UUID_GATT_DB_HASH_VAL
Database Hash UUID value.

BT_UUID_GATT_DB_HASH
Database Hash.

BT_UUID_GATT_SERVER_FEATURES_VAL
Server Supported Features UUID value.

BT_UUID_GATT_SERVER_FEATURES
Server Supported Features.
BT_UUID_AICS_STATE_VAL
Audio Input Control Service State value.

BT_UUID_AICS_STATE
Audio Input Control Service State.

BT_UUID_AICS_GAIN_SETTINGS_VAL
Audio Input Control Service Gain Settings Properties value.

BT_UUID_AICS_GAIN_SETTINGS
Audio Input Control Service Gain Settings Properties.

BT_UUID_AICS_INPUT_TYPE_VAL
Audio Input Control Service Input Type value.

BT_UUID_AICS_INPUT_TYPE
Audio Input Control Service Input Type.

BT_UUID_AICS_INPUT_STATUS_VAL
Audio Input Control Service Input Status value.

BT_UUID_AICS_INPUT_STATUS
Audio Input Control Service Input Status.

BT_UUID_AICS_CONTROL_VAL
Audio Input Control Service Control Point value.

BT_UUID_AICS_CONTROL
Audio Input Control Service Control Point.

BT_UUID_AICS_DESCRIPTION_VAL
Audio Input Control Service Input Description value.

BT_UUID_AICS_DESCRIPTION
Audio Input Control Service Input Description.

BT_UUID_VCS_STATE_VAL
Volume Control Setting value.

BT_UUID_VCS_STATE
Volume Control Setting.

BT_UUID_VCS_CONTROL_VAL
Volume Control Control point value.

BT_UUID_VCS_CONTROL
Volume Control Control point.
6.1. Bluetooth

BT_UUID_VCS_FLAGS_VAL
  Volume Control Flags value.

BT_UUID_VCS_FLAGS
  Volume Control Flags.

BT_UUID_VOCS_STATE_VAL
  Volume Offset State value.

BT_UUID_VOCS_STATE
  Volume Offset State.

BT_UUID_VOCS_LOCATION_VAL
  Audio Location value.

BT_UUID_VOCS_LOCATION
  Audio Location.

BT_UUID_VOCS_CONTROL_VAL
  Volume Offset Control Point value.

BT_UUID_VOCS_CONTROL
  Volume Offset Control Point.

BT_UUID_VOCS_DESCRIPTION_VAL
  Volume Offset Audio Output Description value.

BT_UUID_VOCS_DESCRIPTION
  Volume Offset Audio Output Description.

BT_UUID_CSIS_SET_SIRK_VAL
  Set Identity Resolving Key value.

BT_UUID_CSIS_SET_SIRK
  Set Identity Resolving Key.

BT_UUID_CSIS_SET_SIZE_VAL
  Set size value.

BT_UUID_CSIS_SET_SIZE
  Set size.

BT_UUID_CSIS_SET_LOCK_VAL
  Set lock value.

BT_UUID_CSIS_SET_LOCK
  Set lock.
BT_UUID_CSIS_RANK_VAL
   Rank value.

BT_UUID_CSIS_RANK
   Rank.

BT_UUID_MCS_PLAYER_NAME_VAL
   Media player name value.

BT_UUID_MCS_PLAYER_NAME
   Media player name.

BT_UUID_MCS_ICON_OBJ_ID_VAL
   Media Icon Object ID value.

BT_UUID_MCS_ICON_OBJ_ID
   Media Icon Object ID.

BT_UUID_MCS_ICON_URL_VAL
   Media Icon URL value.

BT_UUID_MCS_ICON_URL
   Media Icon URL.

BT_UUID_MCS_TRACK_CHANGED_VAL
   Track Changed value.

BT_UUID_MCS_TRACK_CHANGED
   Track Changed.

BT_UUID_MCS_TRACK_TITLE_VAL
   Track Title value.

BT_UUID_MCS_TRACK_TITLE
   Track Title.

BT_UUID_MCS_TRACK_DURATION_VAL
   Track Duration value.

BT_UUID_MCS_TRACK_DURATION
   Track Duration.

BT_UUID_MCS_TRACK_POSITION_VAL
   Track Position value.

BT_UUID_MCS_TRACK_POSITION
   Track Position.
BT_UUID_MCS_PLAYBACK_SPEED_VAL
Playback Speed value.

BT_UUID_MCS_PLAYBACK_SPEED
Playback Speed.

BT_UUID_MCS_SEEKING_SPEED_VAL
Seeking Speed value.

BT_UUID_MCS_SEEKING_SPEED
Seeking Speed.

BT_UUID_MCS_TRACK_SEGMENTS_OBJ_ID_VAL
Track Segments Object ID value.

BT_UUID_MCS_TRACK_SEGMENTS_OBJ_ID
Track Segments Object ID.

BT_UUID_MCS_CURRENT_TRACK_OBJ_ID_VAL
Current Track Object ID value.

BT_UUID_MCS_CURRENT_TRACK_OBJ_ID
Current Track Object ID.

BT_UUID_MCS_NEXT_TRACK_OBJ_ID_VAL
Next Track Object ID value.

BT_UUID_MCS_NEXT_TRACK_OBJ_ID
Next Track Object ID.

BT_UUID_MCS_PARENT_GROUP_OBJ_ID_VAL
Parent Group Object ID value.

BT_UUID_MCS_PARENT_GROUP_OBJ_ID
Parent Group Object ID.

BT_UUID_MCS_CURRENT_GROUP_OBJ_ID_VAL
Group Object ID value.

BT_UUID_MCS_CURRENT_GROUP_OBJ_ID
Group Object ID.

BT_UUID_MCS_PLAYING_ORDER_VAL
Playing Order value.

BT_UUID_MCS_PLAYING_ORDER
Playing Order.
BT_UUID_MCS_PLAYING_ORDERS_VAL
Playing Orders supported value.

BT_UUID_MCS_PLAYING_ORDERS
Playing Orders supported.

BT_UUID_MCS_MEDIA_STATE_VAL
Media State value.

BT_UUID_MCS_MEDIA_STATE
Media State.

BT_UUID_MCS_MEDIA_CONTROL_POINT_VAL
Media Control Point value.

BT_UUID_MCS_MEDIA_CONTROL_POINT
Media Control Point.

BT_UUID_MCS_MEDIA_CONTROL_OPCODES_VAL
Media control opcodes supported value.

BT_UUID_MCS_MEDIA_CONTROL_OPCODES
Media control opcodes supported.

BT_UUID_MCS_SEARCH_RESULTS_OBJ_ID_VAL
Search result object ID value.

BT_UUID_MCS_SEARCH_RESULTS_OBJ_ID
Search result object ID.

BT_UUID_MCS_SEARCH_CONTROL_POINT_VAL
Search control point value.

BT_UUID_MCS_SEARCH_CONTROL_POINT
Search control point.

BT_UUID_OTS_TYPE_MPL_ICON_VAL
Media Player Icon Object Type value.

BT_UUID_OTS_TYPE_MPL_ICON
Media Player Icon Object Type.

BT_UUID_OTS_TYPE_TRACK_SEGMENT_VAL
Track Segments Object Type value.

BT_UUID_OTS_TYPE_TRACK_SEGMENT
Track Segments Object Type.
BT_UUID_OTS_TYPE_TRACK_VAL
Track Object Type value.

BT_UUID_OTS_TYPE_TRACK
Track Object Type.

BT_UUID_OTS_TYPE_GROUP_VAL
Group Object Type value.

BT_UUID_OTS_TYPE_GROUP
Group Object Type.

BT_UUID_TBS_PROVIDER_NAME_VAL
Bearer Provider Name value.

BT_UUID_TBS_PROVIDER_NAME
Bearer Provider Name.

BT_UUID_TBS_UCI_VAL
Bearer UCI value.

BT_UUID_TBS_UCI
Bearer UCI.

BT_UUID_TBS_TECHNOLOGY_VAL
Bearer Technology value.

BT_UUID_TBS_TECHNOLOGY
Bearer Technology.

BT_UUID_TBS_URI_LIST_VAL
Bearer URI Prefixes Supported List value.

BT_UUID_TBS_URI_LIST
Bearer URI Prefixes Supported List.

BT_UUID_TBS_SIGNAL_STRENGTH_VAL
Bearer Signal Strength value.

BT_UUID_TBS_SIGNAL_STRENGTH
Bearer Signal Strength.

BT_UUID_TBS_SIGNAL_INTERVAL_VAL
Bearer Signal Strength Reporting Interval value.

BT_UUID_TBS_SIGNAL_INTERVAL
Bearer Signal Strength Reporting Interval.

6.1. Bluetooth
BT_UUID_TBS_LIST_CURRENT_CALLS_VAL
Bearer List Current Calls value.

BT_UUID_TBS_LIST_CURRENT_CALLS
Bearer List Current Calls.

BT_UUID_CCID_VAL
Content Control ID value.

BT_UUID_CCID
Content Control ID.

BT_UUID_TBS_STATUS_FLAGS_VAL
Status flags value.

BT_UUID_TBS_STATUS_FLAGS
Status flags.

BT_UUID_TBS_INCOMING_URI_VAL
Incoming Call Target Caller ID value.

BT_UUID_TBS_INCOMING_URI
Incoming Call Target Caller ID.

BT_UUID_TBS_CALL_STATE_VAL
Call State value.

BT_UUID_TBS_CALL_STATE
Call State.

BT_UUID_TBS_CALL_CONTROL_POINT_VAL
Call Control Point value.

BT_UUID_TBS_CALL_CONTROL_POINT
Call Control Point.

BT_UUID_TBS_OPTIONAL_OPCODES_VAL
Optional Opcodes value.

BT_UUID_TBS_OPTIONAL_OPCODES
Optional Opcodes.

BT_UUID_TBS_TERMINATE_REASON_VAL
Terminate reason value.

BT_UUID_TBS_TERMINATE_REASON
Terminate reason.
BT_UUID_TBS_INCOMING_CALL_VAL
Incoming Call value.

BT_UUID_TBS_INCOMING_CALL
Incoming Call.

BT_UUID_TBS_FRIENDLY_NAME_VAL
Incoming Call Friendly name value.

BT_UUID_TBS_FRIENDLY_NAME
Incoming Call Friendly name.

BT_UUID_MICS_MUTE_VAL
Microphone Input Control Service Mute value.

BT_UUID_MICS_MUTE
Microphone Input Control Service Mute.

BT_UUID_ASCS_ASE_SNK_VAL
Audio Stream Endpoint Sink Characteristic value.

BT_UUID_ASCS_ASE_SNK
Audio Stream Endpoint Sink Characteristic.

BT_UUID_ASCS_ASE_SRC_VAL
Audio Stream Endpoint Source Characteristic value.

BT_UUID_ASCS_ASE_SRC
Audio Stream Endpoint Source Characteristic.

BT_UUID_ASCS_ASE_CP_VAL
Audio Stream Endpoint Control Point Characteristic value.

BT_UUID_ASCS_ASE_CP
Audio Stream Endpoint Control Point Characteristic.

BT_UUID_BASS_CONTROL_POINT_VAL
Broadcast Audio Scan Service Scan State value.

BT_UUID_BASS_CONTROL_POINT
Broadcast Audio Scan Service Scan State.

BT_UUID_BASS_RECV_STATE_VAL
Broadcast Audio Scan Service Receive State value.

BT_UUID_BASS_RECV_STATE
Broadcast Audio Scan Service Receive State.
BT_UUID_PACS_SNK_VAL
  Sink PAC Characteristic value.

BT_UUID_PACS_SNK
  Sink PAC Characteristic.

BT_UUID_PACS_SNK_LOC_VAL
  Sink PAC Locations Characteristic value.

BT_UUID_PACS_SNK_LOC
  Sink PAC Locations Characteristic.

BT_UUID_PACS_SRC_VAL
  Source PAC Characteristic value.

BT_UUID_PACS_SRC
  Source PAC Characteristic.

BT_UUID_PACS_SRC_LOC_VAL
  Source PAC Locations Characteristic value.

BT_UUID_PACS_SRC_LOC
  Source PAC Locations Characteristic.

BT_UUID_PACS_AVAILABLE_CONTEXT_VAL
  Available Audio Contexts Characteristic value.

BT_UUID_PACS_AVAILABLE_CONTEXT
  Available Audio Contexts Characteristic.

BT_UUID_PACS_SUPPORTED_CONTEXT_VAL
  Supported Audio Context Characteristic value.

BT_UUID_PACS_SUPPORTED_CONTEXT
  Supported Audio Context Characteristic.

BT_UUID_HAS_HEARING_AID_FEATURES_VAL
  Hearing Aid Features Characteristic value.

BT_UUID_HAS_HEARING_AID_FEATURES
  Hearing Aid Features Characteristic.

BT_UUID_HAS_PRESET_CONTROL_POINT_VAL
  Hearing Aid Preset Control Point Characteristic value.

BT_UUID_HAS_PRESET_CONTROL_POINT
  Hearing Aid Preset Control Point Characteristic.
BT_UUID_HAS_ACTIVE_PRESET_INDEX_VAL
   Active Preset Index Characteristic value.

BT_UUID_HAS_ACTIVE_PRESET_INDEX
   Active Preset Index Characteristic.

Enums

enum [anonymous]
    Bluetooth UUID types.
    Values:

    enumerator BT_UUID_TYPE_16
        UUID type 16-bit.

    enumerator BT_UUID_TYPE_32
        UUID type 32-bit.

    enumerator BT_UUID_TYPE_128
        UUID type 128-bit.

Functions

int bt_uuid_cmp(const struct bt_uuid *u1, const struct bt_uuid *u2)
    Compare Bluetooth UUIDs.
    Compares 2 Bluetooth UUIDs, if the types are different both UUIDs are first converted to 128
    bits format before comparing.

    Parameters
     • u1 – First Bluetooth UUID to compare
     • u2 – Second Bluetooth UUID to compare

    Returns
        negative value if u1 < u2, 0 if u1 == u2, else positive

bool bt_uuid_create(struct bt_uuid *uuid, const uint8_t *data, uint8_t data_len)
    Create a bt_uuid from a little-endian data buffer.
    Create a bt_uuid from a little-endian data buffer. The data_len parameter is used to determine
    whether the UUID is in 16, 32 or 128 bit format (length 2, 4 or 16). Note: 32 bit format is
    not allowed over the air.

    Parameters
     • uuid – Pointer to the bt_uuid variable
     • data – pointer to UUID stored in little-endian data buffer
• data_len – length of the UUID in the data buffer

Returns
true if the data was valid and the UUID was successfully created.

void bt_uuid_to_str(const struct bt_uuid *uuid, char *str, size_t len)
Convert Bluetooth UUID to string.
Converts Bluetooth UUID to string. UUID can be in any format, 16-bit, 32-bit or 128-bit.

Parameters
• uuid – Bluetooth UUID
• str – pointer where to put converted string
• len – length of str

struct bt_uuid
#include <uuid.h> This is a ‘tentative’ type and should be used as a pointer only.

struct bt_uuid_16
#include <uuid.h>

Public Members

struct bt_uuid uuid
UUID generic type.

uint16_t val
UUID value, 16-bit in host endianness.

struct bt_uuid_32
#include <uuid.h>

Public Members

struct bt_uuid uuid
UUID generic type.

uint32_t val
UUID value, 32-bit in host endianness.

struct bt_uuid_128
#include <uuid.h>

Public Members

struct bt_uuid uuid
UUID generic type.

uint8_t val[16]
UUID value, 128-bit in little-endian format.
Bluetooth: Basic Audio Profile

This document describes how to run basic audio profile functionality which includes:

- Capabilities and Endpoint discovery
- Audio Stream Endpoint procedures

Commands

```
audio --help
```

Subcommands:

- `init`
- `select_broadcast <stream>`
- `create_broadcast [codec] [preset]`
- `start_stream`
- `stop_stream`
- `delete_broadcast`
- `broadcast_scan <on, off>`
- `accept_broadcast 0x<broadcast_id>`
- `sync_broadcast 0x<bis_bitfield>`
- `stop_broadcast_sink` : Stops broadcast sink
- `term_broadcast_sink`
- `discover [type: sink, source]`
- `preset [preset]`
- `config <direction: sink, source> <index> [codec] [preset]`
- `qos [preset] [interval] [framing] [latency] [pd] [sdru] [phy] [rtn]`
- `enable`
- `metadata [context]`
- `start`
- `disable`
- `stop`
- `release`
- `list`
- `connect <direction: sink, source> <index> [codec] [preset]`
- `select_unicast <stream>`
- `send` : Send to Audio Stream [data]

**Example Central**  
Connect and establish a stream:
uart:~$ bt init
uart:~$ audio init
uart:~$ bt connect <address>
uart:~$ gatt exchange-mtu
uart:~$ audio discover sink
uart:~$ audio config sink 0
uart:~$ audio qos
uart:~$ audio enable

Or using connect command:

uart:~$ bt init
uart:~$ audio init
uart:~$ bt connect <address>
uart:~$ gatt exchange-mtu
uart:~$ audio discover sink
uart:~$ audio connect sink 0

Disconnect and release:

uart:~$ audio disable
uart:~$ audio release

Example Peripheral  Listen:

uart:~$ bt init
uart:~$ audio init
uart:~$ bt advertise on

Server initiated disable and release:

uart:~$ audio disable
uart:~$ audio release

Example Broadcast Source  Create and establish a broadcast source stream:

uart:~$ audio init
uart:~$ audio create_broadcast
uart:~$ audio start_broadcast

Stop and release a broadcast source stream:

uart:~$ audio stop_broadcast
uart:~$ audio delete_broadcast

Example Broadcast Sink  Scan for and establish a broadcast sink stream:

uart:~$ audio init
uart:~$ audio broadcast_scan on
Found broadcaster with ID 0xB91CD4
uart:~$ audio accept_broadcast 0xB91CD4
PA syncing to broadcaster
Broadcast scan was terminated: 0
PA synced to broadcaster with ID 0xB91CD4 as sink 0x2000d09c
Sink 0x2000d09c is set as default

(continues on next page)
Sink 0x2000d09c is ready to sync without encryption
Received BASE from sink 0x2000d09c:
Subgroup[0]:
codec 0x06 cid 0x0000 vid 0x0000 count 4
data #0: type 0x01 len 1
data #1: type 0x02 len 1
data #2: type 0x03 len 4
00000000: 00 00 00 [... ]
data #3: type 0x04 len 2
00000000: 28 [( ]
meta #0: type 0x02 len 2
BIS[0] index 0x01
[0]: 0x01
Possible indexes: 0x01
audio sync_broadcast 0x01

Stop and release a broadcast sink stream:

uart:~$ audio stop_broadcast_sink
uart:~$ audio term_broadcast_sink

**Init**  The `init` command register local PAC records which are necessary to be able to configure stream and properly manage capabilities in use.

<table>
<thead>
<tr>
<th>Depends</th>
<th>Allowed States</th>
<th>Next States</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>any</td>
<td>none</td>
</tr>
</tbody>
</table>

uart:~$ audio init

**Discover PAC(s) and ASE(s)**  Once connected the `discover` command discover PAC records and ASE characteristics representing remote endpoints.

<table>
<thead>
<tr>
<th>Depends</th>
<th>Allowed States</th>
<th>Next States</th>
</tr>
</thead>
<tbody>
<tr>
<td>init</td>
<td>any</td>
<td>any</td>
</tr>
</tbody>
</table>

**Note:** Use command `gatt exchange-mtu` to make sure the MTU is configured properly.

uart:~$ gatt exchange-mtu
Exchange pending
Exchange successful
uart:~$ audio discover [type: sink, source]
uart:~$ audio discover sink
cap 0x8175940 type 0x01
codec 0x06 cid 0x0000 vid 0x0000 count 4

00000000: 3f [? ]
data #1: type 0x02 len 1
00000000: 03 [.] (continues on next page)
Select preset  The preset command can be used to either print the default preset configuration or set a different one, it is worth noting that it doesn't change any stream previously configured.

```bash
uart:~$ audio preset [preset]
uart:~$ audio preset
16_2_1
```

codec 0x06 cid 0x0000 vid 0x0000 count 3

Configure Codec  The config command attempts to configure a stream for the given direction using a preset codec configuration which can either be passed directly or in case it is omitted the default preset is used.

```bash
uart:~$ audio config <direction: sink, source> <index> [codec] [preset]
uart:~$ audio config sink 0
ASE Codec Config: conn 0x8173800 ep 0x81754e0 cap 0x816a360

</table>

```
uart:~$ audio qos [preset] [interval] [framing] [latency] [pd] [sdu] [phy] [rtn]
uart:~$ audio qos
ASE config: preset 16_2_1
```

Enable  The `enable` command attempts to enable the stream previously configured, if the remote peer accepts then the ISO connection procedure is also initiated.

```
uart:~$ audio enable
```

Start [sink only]  The `start` command is only necessary when acting as a sink as it indicates to the source the stack is ready to start receiving data.

```
uart:~$ audio start
```

Disable  The `disable` command attempts to disable the stream previously enabled, if the remote peer accepts then the ISO disconnection procedure is also initiated.

```
uart:~$ audio disable
```

Stop [sink only]  The `stop` command is only necessary when acting as a sink as it indicates to the source the stack is ready to stop receiving data.

```
uart:~$ audio stop
```
**Release**  The release command releases the current stream and its configuration.

Table 6.15: State Machine Transitions

(continues on next page)
Sending The send command sends data over Audio Stream.

```
uart:~$ audio send [count]
uart:~$ audio send
Audio sending...
```

Bluetooth: Broadcast Audio Profile Broadcast Assistant

This document describes how to run the BAP Broadcast Assistant functionality. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

The Broadcast Assistant is responsible for offloading scan for a resource restricted device, such that scanning does not drain the battery. The Broadcast Assistant shall support scanning for periodic advertisements and may optionally support the periodic advertisements synchronization transfer (PAST) protocol.

The Broadcast Assistant will typically be phones or laptops. The Broadcast Assistant scans for periodic advertisements and transfers information to the server.

It is necessary to have BT_DEBUG_BAP_BROADCAST_ASSISTANT enabled for using the Broadcast Assistant interactively.

When the Bluetooth stack has been initialized (bt init), and a device has been connected, the Broadcast Assistant can discover BASS on the connected device calling bap_broadcast_assistant discover, which will start a discovery for the BASS UUIDs and store the handles, and subscribe to all notifications.
**Example usage**

### Setup

```bash
uart:~$ bt init
```

### When connected

Start scanning for periodic advertisements for a server:

**Note:** The Broadcast Assistant will not actually start scanning for periodic advertisements, as that feature is still, at the time of writing, not implemented.

```bash
uart:~$ bap_broadcast_assistant discover
<dbg> bt_bap_broadcast_assistant.char_discover_func: Found 1 BASS receive states
<dbg> bt_bap_broadcast_assistant.read_recv_state_cb: src_id 0, PA 0, BIS 0, encrypt 0,
    ... addr 00:00:00:00:00:00 (public), sid 0, metadata_len 0
uart:~$ bap_broadcast_assistant scan_start
<dbg> bt_bap_broadcast_assistant.write_func: err: 0x00, handle 0x001e
```

Adding a source to the receive state:

```bash
uart:~$ bap_broadcast_assistant add_src 11:22:33:44:55:66 public 5 1 1
BASS recv state: src_id 0, addr 11:22:33:44:55:66 (public), sid 5, sync_state 1,
    ... encrypt_state 00000000000000000000000000000000
    [0]: BIS sync 0, metadata_len 0
```
init : Initialize the service and register callbacks
synced : Set server scan state <src_id> <pa_synced> <bis_syncs> <enc_state>

Example Usage

Setup

uart:~$ bt init
uart:~$ bt advertise on
Advertising started

When connected Set sync state for a source:

uart:~$ bap_scan_delegator synced 0 1 3 0

Bluetooth: Call Control Profile

This document describes how to run the call control functionality, both as a client and as a (telephone bearer service (TBS)) server. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

Telephone Bearer Service Client The telephone bearer service client will typically exist on a resource restricted device, such as headphones, but may also exist on e.g. phones or laptops. The call control client will also thus typically be the advertiser. The client can control the states of calls on a server using the call control point.

It is necessary to have BT_DEBUG_TBS_CLIENT enabled for using the client interactively.

Using the telephone bearer service client When the Bluetooth stack has been initialized (bt init), and a device has been connected, the telephone bearer service client can discover TBS on the connected device calling tbs_client discover, which will start a discovery for the TBS UUIDs and store the handles, and optionally subscribe to all notifications (default is to subscribe to all).

Since a server may have multiple TBS instances, most of the tbs_client commands will take an index (starting from 0) as input. Joining calls require at least 2 call IDs, and all call indexes shall be on the same TBS instance.

A server may also have a GTBS instance, which is an abstraction layer for all the telephone bearers on the server. If the server has both GTBS and TBS, the client may subscribe and use either when sending requests if BT_TBS_CLIENT_GTBS is enabled.

tbs_client --help
tbs_client - Bluetooth TBS_CLIENT shell commands
Subcommands:
discover : Discover TBS [subscribe]
set_signal_reporting_interval : Set the signal reporting interval
(originating_instance_index, gtbs) interval
originate : Originate a call (originating_instance_index, gtbs) uri
terminate : Terminate a call (terminating_instance_index, gtbs) id
accept : Accept a call (accepting_instance_index, gtbs) id
In the following examples, notifications from GTBS is ignored, unless otherwise specified.

**Example usage**

**Setup**

```sh
tart:~$ bt init
tart:~$ bt advertise on
Advertising started
```

**When connected**  Placing a call:

```sh
tart:~$ tbs_client discover
<dbg> bt_tbs_client.primary_discover_func: Discover complete, found 1 instances (GTBS → found)
<dbg> bt_tbs_client.discover_func: Setup complete for 1 / 1 TBS
<dbg> bt_tbs_client.discover_func: Setup complete GTBS
tart:~$ tbs_client originate 0 tel:123
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the dialing state with URI tel:123
<dbg> bt_tbs_client.call_cp_notify_handler: Status: success for the originate opcode for call 0x00
<dbg> bt_tbs_client.notify_handler: Index 0
```

(continues on next page)
Placing a call on GTBS:

```
uart:~$ tbs_client originate 0 tel:123
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the dialing state→ with URI tel:123
<dbg> bt_tbs_client.call_cp_notify_handler: Status: success for the originate opcode→ for call 0x00
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the alerting state→ with URI tel:123
<call answered by peer device, and status notified by TBS server>
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the active state→ with URI tel:123
```

It is necessary to set an outgoing caller ID before placing a call.

Accepting incoming call from peer device:

```
<dbg> bt_tbs_client.incoming_uri_notify_handler: tel:123
<dbg> bt_tbs_client.in_call_notify_handler: tel:456
<dbg> bt_tbs_client.friendly_name_notify_handler: Peter
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x05 is in the incoming state→ with URI tel:456
uart:~$ tbs_client accept 0 5
<dbg> bt_tbs_client.call_cp_callback_handler: Status: success for the accept opcode→ for call 0x05
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x05 is in the active state→ with URI tel
```

Terminate call:

```
uart:~$ tbs_client terminate 0 5
<dbg> bt_tbs_client.termination_reason_notify_handler: ID 0x05, reason 0x06
<dbg> bt_tbs_client.call_cp_notify_handler: Status: success for the terminate opcode→ for call 0x05
<dbg> bt_tbs_client.current_calls_notify_handler:
```

**Telephone Bearer Service (TBS)** The telephone bearer service is a service that typically resides on devices that can make calls, including calls from apps such as Skype, e.g. (smart)phones and PCs.

It is necessary to have `BT_DEBUG_TBS` enabled for using the TBS server interactively.

**Using the telephone bearer service** TBS can be controlled locally, or by a remote device (when in a call). For example a remote device may initiate a call to the device with the TBS server, or the TBS server may initiate a call to remote device, without a `TBS_CLIENT` client. The TBS implementation is capable of fully controlling any call.

6.1. Bluetooth
tbs --help

**tbs** - Bluetooth TBS shell commands

**Subcommands:**
- **init**: Initialize TBS
- **authorize**: Authorize the current connection
- **accept**: Accept call `<call_index>`
- **terminate**: Terminate call `<call_index>`
- **hold**: Hold call `<call_index>`
- **retrieve**: Retrieve call `<call_index>`
- **originate**: Originate call `[<instance_index>, gtbs>] `<uri>`
- **join**: Join calls `<id> [<id>] [<id>] [...]`
- **incoming**: Simulate incoming remote call `[<instance_index, gtbs>] `<local_uri>` `<remote_uri>`
  `<remote_friendly_name>`
- **remote_answer**: Simulate remote answer outgoing call `<call_index>`
- **remote_retrieve**: Simulate remote retrieve `<call_index>`
- **remote_terminate**: Simulate remote terminate `<call_index>`
- **remote_hold**: Simulate remote hold `<call_index>`
- **set_bearer_provider_name**: Set the bearer provider name `[<instance_index, gtbs>]` `<name>`
- **set_bearer_technology**: Set the bearer technology `[<instance_index, gtbs>]` `<technology>`
- **set_bearer_signal_strength**: Set the bearer signal strength `[<instance_index, gtbs>]` `<strength>`
- **set_status_flags**: Set the bearer feature and status value `[<instance_index, gtbs>]` `<feature_and_status>`
- **set_uri_scheme**: Set the URI prefix list `<bearer_idx>` `<uri1 [uri2 [uri3 [...]]]>`
- **print_calls**: Output all calls in the debug log

**Example Usage**

**Setup**

```
uart:~$ bt init
```

**When connected**  Answering a call for a peer device originated by a client:

```
<dbg> bt_tbs.write_call_cp: Index 0: Processing the originate opcode
<dbg> bt_tbs.originate_call: New call with call index 1
<dbg> bt_tbs.write_call_cp: Index 0: Processed the originate opcode with status → success for call index 1
uart:~$ tbs remote_answer 1
TBS succeeded for call_id: 1
```

Incoming call from a peer device, accepted by client:

```
uart:~$ tbs incoming 0 tel:123 tel:456 Peter
TBS succeeded for call_id: 4
<dbg> bt_tbs.bt_tbs_remote_incoming: New call with call index 4
<dbg> bt_tbs.write_call_cp: Index 0: Processed the accept opcode with status success → for call index 4
```
Bluetooth: Coordinated Set Identification Profile

This document describes how to run the coordinated set identification functionality, both as a client and as a server. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

Set Coordinator (Client) The client will typically be a resource-rich device, such as a smartphone or a laptop. The client is able to lock and release members of a coordinated set. While the coordinated set is locked, no other clients may lock the set.

To lock a set, the client must connect to each of the set members it wants to lock. This implementation will always try to connect to all the members of the set, and at the same time. Thus if the set size is 3, then BT_MAX_CONN shall be at least 3.

If the locks on set members shall persists through disconnects, it is necessary to bond with the set members. If you need to bond with multiple set members, make sure that BT_MAX_PAIRED is correctly configured.

Using the Set Coordinator When the Bluetooth stack has been initialized (bt init), and a set member device has been connected, the call control client can be initialized by calling csip_set_coordinator init, which will start a discovery for the TBS uuids and store the handles, and optionally subscribe to all notifications (default is to subscribe to all).

Once the client has connected and discovered the handles, then it can read the set information, which is needed to identify other set members. The client can then scan for and connect to the remaining set members, and once all the members has been connected to, it can lock and release the set.

It is necessary to enable BT_DEBUG_CSIP_SET_COORDINATOR to properly use the set coordinator.

             [enc <broadcast code>]
  term-big : Terminate a BIG
```

1. [Central] Create CIG:

   Requires to be connected:

   ```
   uart:~$ iso cig_create
   CIG created
   ```

2. [Peripheral] Listen to ISO connections

   ```
   uart:~$ iso listen txrx
   ```

3. [Central] Connect ISO channel:
Media control for Generic Audio Content Control

This document describes how to run the media control functionality, using the shell, both as a client and as a server.

The media control server consists of two parts. There is a media player (mpl) that contains the logic to handle media, and there is a media control service (mcs) that serves as a GATT-based interface to the player. The media control client consists of one part, the GATT-based client (mcc).

The media control server may include an object transfer service (ots) and the media control client may include an object transfer client (otc). When these are included, a richer set of functionality is available.

The media control server and client both implement the Generic Media Control Service (only), and do not use any underlying Media Control Services.

Note that in the examples below, in many cases the debug output has been removed and long outputs may have been shortened to make the examples shorter and clearer.

Also note that this documentation does not list all shell commands, it just shows examples of some of them. The set of commands is explorable from the mcc shell and the mpl shell, by typing `mcc` or `mpl` and pressing TAB. A help text for each command can be found by doing `mcc <command> help` or `mpl <command> help`.

**Overview**  
A media player has a *name* and an *icon* that allows identification of the player for the user.

The content of the media player is structured into tracks and groups. A media player has a number of groups. A group contains tracks and other groups. (In this implementation, a group only contains tracks, not other groups.) Tracks can be divided into segments.

An active player will have a *current track*. This is the track that is playing now (if the player is playing). The current track has a *title*, a *duration* (given in hundredths of a second) and a *position* - the current position of the player within the track.

There is also a *current group* (the group of the current track), a *parent group* (the parent group of the current group) and a *next track*.

The media player is in a *state*, which will be one of playing, paused, seeking or inactive. When playing, playback happens at a given *playback speed*, and the tracks are played according to the *playing order*, which is one of the *playing orders supported*. Track changes are signalled as notifications of the *track changed* characteristic. When seeking (fast forward or fast rewind), the track position is moved according to the *seeking speed*.

The *opcodes supported* tells which operations are supported by the player by writing to the *media control point*. There is also a *search control point* that allows to search for groups and tracks according to various criteria, with the result returned in the *search results*.
Finally, the content control ID is used to associate the media player with an audio stream.

**Media Control Client (MCP)** The media control client is used to control, and to get information from, a media control server. Control is done by writing to one of the two control points, or by writing to other writable characteristics. Getting information is done by reading characteristics, or by configuring the server to send notifications.

**Using the media control client** Before use, the media control client must be initialized by the command `mcc init`.

To achieve a connection to the peer, the `bt` commands must be used - `bt init` followed by `bt advertise on` (or `bt connect` if the server is advertising).

When the media control client is connected to a media control server, the client can discover the server’s Generic Media Control Service, by giving the command `mcc discover_mcs`. This will store the handles of the service, and (optionally, but default) subscribe to all notifications.

After discovery, the media control client can read and write characteristics, including the media control point and the search control point.

**Example usage**

**Setup**

```
uart:~$ bt init
Bluetooth initialized

uart:~$ mcc init
MCC init complete

uart:~$ bt advertise on
Advertising started
```

**When connected** Service discovery (GMCS and included OTS):

```
uart:~$ mcc discover_mcs
<dbg> bt_mcc.bt_mcc_discover_mcs: start discovery of MCS primary service
<dbg> bt_mcc.discover_primary_func: [ATTRIBUTE] handle 0x00ae
<dbg> bt_mcc.discover_primary_func: Primary discovery complete
<dbg> bt_mcc.discover_primary_func: UUID: 2800
<dbg> bt_mcc.discover_primary_func: UUID: 8fd7
<dbg> bt_mcc.discover_primary_func: Start discovery of MCS characteristics
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b0
<dbg> bt_mcc.discover_mcs_char_func: Player name, UUID: 8fa0
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b2
<dbg> bt_mcc.discover_mcs_char_func: Icon Object, UUID: 8fa1
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b4
<dbg> bt_mcc.discover_mcs_char_func: Icon URI, UUID: 8fa2
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b6
<dbg> bt_mcc.discover_mcs_char_func: Track Changed, UUID: 8fa3
<dbg> bt_mcc.discover_mcs_char_func: Subscribing - handle: 0x00b6
[...]
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00ea
<dbg> bt_mcc.discover_mcs_char_func: Content Control ID, UUID: 8fb5
```

(continues on next page)
Reading characteristics - the player name and the track duration as examples:

```
uart:~$ mcc read_player_name
Player name: My media player
```
```
uart:~$ mcc read_track_duration
Track duration: 6300
```

Note that the value of some characteristics may be truncated due to being too long to fit in the ATT packet. Increasing the ATT MTU may help:

```
uart:~$ gatt exchange-mtu
Exchange pending
Exchange successful
```
```
uart:~$ mcc read_track_title
Track title: Interlude #1 (Song for Alison)
```

Writing characteristics - track position as an example:

The track position is where the player “is” in the current track. Read the track position, change it by writing to it, confirm by reading it again.

```
uart:~$ mcc read_track_position
Track Position: 0
```
```
uart:~$ mcc set_track_position 500
Track Position: 500
```
```
uart:~$ mcc read_track_position
Track Position: 500
```

Controlling the player via the control point:

Writing to the control point allows the client to request the server to do operations like play, pause, fast forward, change track, change group and so on. Some operations (e.g. goto track) take an argument. Currently, raw opcode values are used as input to the control point shell command. These opcode values can be found in the mpl.h header file.
Send the play command (opcode “1”), the command to go to track (opcode “52”) number three, and the pause command (opcode “2”):

```bash
uart:~$ mcc set_cp 1
Media State: 1
Operation: 1, result: 1
Operation: 1, param: 0

uart:~$ mcc set_cp 52 3
Track changed
Track title: Interlude #3 (Levanto Seventy)
Track duration: 7800
Track Position: 0
Current Track Object ID: 0x00000000104
Next Track Object ID: 0x00000000105
Operation: 52, result: 1
Operation: 52, param: 3

uart:~$ mcc set_cp 2
Media State: 2
Operation: 2, result: 1
Operation: 2, param: 0
```

Using the included object transfer client When object transfer is supported by both the client and the server, a larger set of characteristics is available. These include object IDs for the various track and group objects. These IDs can be used to select and download the corresponding objects from the server's object transfer service.

Read the object ID of the current group object:

```bash
uart:~$ mcc read_current_group_obj_id
Current Group Object ID: 0x00000000107
```

Select the object with that ID:

```bash
uart:~$ mcc ots_select 0x107
Selecting object succeeded
```

Read the object's metadata:

```bash
uart:~$ mcc ots_read_metadata
Reading object metadata succeeded
<inf> bt_mcc: Object's meta data:
<inf> bt_mcc:  Current size :35
<inf> bt_otc:  --- Displaying 1 metadata records ---
<inf> bt_otc:  Object ID: 0x00000000107
<inf> bt_otc:  Object name: Joe Pass - Guitar Inte
<inf> bt_otc:  Object Current Size: 35
<inf> bt_otc:  Object Allocate Size: 35
<inf> bt_otc:  Type: Group Obj Type
<inf> bt_otc:  Properties:0x4
<inf> bt_otc:  - read permitted
```

Read the object itself:

The object received is a group object. It consists of a series of records consisting of a type (track or group) and an object ID.

6.1. Bluetooth
Zephyr Project Documentation, Release 3.2.99

UART:
```shell
$ mcc ots_read_current_group_object
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x0000000000102
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x0000000000103
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x0000000000104
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x0000000000105
<dbg> bt_mcc.on_group_content: Object type: 0, object ID: 0x0000000000106
```

**Search**  The search control point takes as its input a sequence of search control items, each consisting of length, type (e.g. track name or artist name) and parameter (the track name or artist name to search for). If the result is successful, the search results are stored in an object in the object transfer service. The ID of the search results ID object can be read from the search results object ID characteristic. The search result object can then be downloaded as for the current group object above. (Note that the search results object ID is empty until a search has been done.)

This implementation has a working implementation of the search functionality interface and the server-side search control point parameter parsing. But the **actual searching is faked**, the same results are returned no matter what is searched for.

There are two commands for search, one (**mcc set_scp_raw**) allows to input the search control point parameter (the sequence of search control items) as a string. The other (**mcc set_scp_iopertest**) does preset IOP test searches and takes the round number of the IOP search control point test as a parameter.

Before the search, the search results object ID is empty

UART:
```shell
$ mcc read_search_results_obj_id
Search Results Object ID: 0x000000000000
<dbg> bt_mcc.mcc_read_search_results_obj_id_cb: Zero-length Search Results Object ID
```

Run the search corresponding to the fourth round of the IOP test:

The search control point parameter generated by this command and parameter has one search control item. The length field (first octet) is 16 (0x10). (The length of the length field itself is not included.) The type field (second octet) is 0x04 (search for a group name). The parameter (the group name to search for) is “TSPX_Group_Name”.

UART:
```shell
$ mcc set_scp_iopertest 4
Search string:
00000000: 10 04 54 53 50 4f 75 70 5f 4e 61 6d 65 |..TSPX_G roup_Nam|
00000010: 65 |e |
Search control point notification result code: 1
Search Results Object ID: 0x0000000000107
Search Control Point set
```

After the successful search, the search results object ID has a value:

UART:
```shell
$ mcc read_search_results_obj_id
Search Results Object ID: 0x0000000000107
```

**Media Control Service (MCS)**  The media control service (mcs) and the associated media player (mpl) typically reside on devices that can provide access to, and serve, media content, like PCs and smartphones.

As mentioned above, the media player (mpl) has the player logic, while the media control service (mcs) has the GATT-based interface. This separation is done so that the media player can also be used without the GATT-based interface.

1716 Chapter 6. Connectivity
Using the media control service and the media player  The media control service and the media player are in general controlled remotely, from the media control client.

Before use, the media control client must be initialized by the command mpl init.

As for the client, the bt commands are used for connecting - bt init followed by bt connect <address> <address type> (or bt advertise on if the server is advertising).

Example Usage

Setup

```
uart:~$ bt init
Bluetooth initialized

uart:~$ mpl init
[Large amounts of debug output]

uart:~$ bt connect F9:33:3B:67:D2:A7 (random)
Connection pending
Connected: F9:33:3B:67:D2:A7 (random)
```

When connected  Control is done from the client.

The server will give debug output related to the various operations performed by the client.

Example: Debug output by the server when the client gives the “next track” command:

```
[00:13:29.932,373] <dbg> bt_mcs.control_point_write: Opcode: 49
[00:13:29.932,403] <dbg> bt_mpl.paused_state_operation_handler: Operation opcode: 49
[00:13:29.932,495] <dbg> bt_mpl.do_next_track: Track ID before: 0x000000000104
[00:13:29.932,586] <dbg> bt_mpl.do_next_track: Track ID after: 0x000000000105
[00:13:29.932,617] <dbg> bt_mcs.mpl_track_changed_cb: Notifying track change
[00:13:29.932,800] <dbg> bt_mcs.mpl_track_duration_cb: Notifying track duration: 13500
[00:13:29.932,861] <dbg> bt_mcs.mpl_track_position_cb: Notifying track position: 0
[00:13:29.933,044] <dbg> bt_mcs.mpl_current_track_id_cb: Notifying current track ID: 0x000000000105
[00:13:29.933,258] <dbg> bt_mcs.mpl_next_track_id_cb: Notifying next track ID: 0x000000000106
[00:13:29.933,380] <dbg> bt_mcs.mpl_operation_cb: Notifying control point - opcode: → 49, result: 1
```

Some server commands are available. These commands force notifications of the various characteristics, for testing that the client receives notifications. The values sent in the notifications caused by these testing commands are independent of the media player, so they do not correspond the actual values of the characteristics nor to the actual state of the media player.

Example: Force (fake value) notification of the track duration:

```
uart:~$ mpl duration_changed_cb
[00:15:17.491,058] <dbg> bt_mcs.mpl_track_duration_cb: Notifying track duration: 12000
```
6.2 Networking

The networking section contains information regarding the network stack of the Zephyr kernel. Use the information to understand the principles behind the operation of the stacks and how they were implemented.

6.2.1 Overview

- Supported Features
- Source Tree Layout

Supported Features

The networking IP stack is modular and highly configurable via build-time configuration options. You can minimize system memory consumption by enabling only those network features required by your application. Almost all features can be disabled if not needed.

- IPv6
  - The support for IPv6 is enabled by default. Various IPv6 sub-options can be enabled or disabled depending on networking needs.
    - Developer can set the number of unicast and multicast IPv6 addresses that are active at the same time.
    - The IPv6 address for the device can be set either statically or dynamically using SLAAC (Stateless Address Auto Configuration) (RFC 4862).
    - The system also supports multiple IPv6 prefixes and the maximum IPv6 prefix count can be configured at build time.
    - The IPv6 neighbor cache can be disabled if not needed, and its size can be configured at build time.
    - The IPv6 neighbor discovery support (RFC 4861) is enabled by default.
    - Multicast Listener Discovery v2 support (RFC 3810) is enabled by default.
    - IPv6 header compression (6lo) is available for IPv6 connectivity for Bluetooth IPSP (RFC 7668) and IEEE 802.15.4 networks (RFC 4944).

- IPv4
  - The legacy IPv4 is supported by the networking stack. It cannot be used by IEEE 802.15.4 or Bluetooth IPSP as those network technologies support only IPv6. IPv4 can be used in Ethernet based networks. By default IPv4 support is disabled.
    - DHCP (Dynamic Host Configuration Protocol) client is supported (RFC 2131).
    - The IPv4 address can also be configured manually. Static IPv4 addresses are supported by default.

- Dual stack support
  - The networking stack allows a developer to configure the system to use both IPv6 and IPv4 at the same time.

- UDP
  - User Datagram Protocol (RFC 768) is supported. The developer can send UDP datagrams (client side support) or create a listener to receive UDP packets destined to certain port (server side support).

- TCP
  - Transmission Control Protocol (RFC 793) is supported. Both server and client roles can be used the application. The amount of TCP sockets that are available to applications can be configured at build time.

- BSD Sockets API
  - Support for a subset of a BSD sockets compatible API is implemented. Both blocking and non-blocking datagram (UDP) and stream (TCP) sockets are supported.
• **Secure Sockets API** Experimental support for TLS/DTLS secure protocols and configuration options for sockets API. Secure functions for the implementation are provided by mbedTLS library.

• **MQTT** Message Queue Telemetry Transport (ISO/IEC PRF 20922) is supported. A sample mqtt-publisher-sample client application for MQTT v3.1.1 is implemented.

• **CoAP** Constrained Application Protocol (RFC 7252) is supported. Both coap-client-sample and coap-server-sample sample applications are implemented.

• **LwM2M** OMA Lightweight Machine-to-Machine Protocol (LwM2M specification 1.0.2) is supported via the “Bootstrap”, “Client Registration”, “Device Management & Service Enablement” and “Information Reporting” interfaces. The required core LwM2M objects are implemented as well as several IPSO Smart Objects. (LwM2M specification 1.1.1) is supported in similar manner when enabled with a Kconfig option. lwm2m-client-sample implements the library as an example.

• **DNS** Domain Name Service (RFC 1035) client functionality is supported. Applications can use the DNS API to query domain name information or IP addresses from the DNS server. Both IPv4 (A) and IPv6 (AAAA) records can be queried. Both multicast DNS (mDNS) (RFC 6762) and link-local multicast name resolution (LLMNR) (RFC 4795) are supported.

• **Network Management API**. Applications can use network management API to listen management events generated by core stack when for example IP address is added to the device, or network interface is coming up etc.

• **Multiple Network Technologies**. The Zephyr OS can be configured to support multiple network technologies at the same time simply by enabling them in Kconfig: for example, Ethernet and 802.15.4 support. Note that no automatic IP routing functionality is provided between these technologies. Applications can send data according to their needs to desired network interface.

• **Minimal Copy Network Buffer Management**. It is possible to have minimal copy network data path. This means that the system tries to avoid copying application data when it is sent to the network.

• **Virtual LAN support**. Virtual LANs (VLANs) allow partitioning of physical ethernet networks into logical networks. See [VLAN support](#) for more details.

• **Network traffic classification**. The sent and received network packets can be prioritized depending on application needs. See [traffic classification](#) for more details.

• **Time Sensitive Networking**. The gPTP (generalized Precision Time Protocol) is supported. See [gPTP support](#) for more details.

• **Network shell**. The network shell provides helpers for figuring out network status, enabling/disabling features, and issuing commands like ping or DNS resolving. The net-shell is useful when developing network software. See [network shell](#) for more details.

Additionally these network technologies (link layers) are supported in Zephyr OS v1.7 and later:

- IEEE 802.15.4
- Bluetooth
- Ethernet
- SLIP (IP over serial line). Used for testing with QEMU. It provides ethernet interface to host system (like Linux) and test applications can be run in Linux host and send network data to Zephyr OS device.

### Source Tree Layout

The networking stack source code tree is organized as follows:

```
subsyst/et/np/
```

This is where the IP stack code is located.
subsys/net/l2/
   This is where the IP stack layer 2 code is located. This includes generic support for Bluetooth IPSP adaptation, Ethernet, IEEE 802.15.4 and Wi-Fi.

subsys/net/lib/
   Application-level protocols (DNS, MQTT, etc.) and additional stack components (BSD Sockets, etc.).

include/net/
   Public API header files. These are the header files applications need to include to use IP networking functionality.

samples/net/
   Sample networking code. This is a good reference to get started with network application development.

tests/net/
   Test applications. These applications are used to verify the functionality of the IP stack, but are not the best source for sample code (see samples/net instead).

6.2.2 Network Stack Architecture

Network Packet Processing Statistics

This page describes how to get information about network packet processing statistics inside network stack.

Network stack contains infrastructure to figure out how long the network packet processing takes either in sending or receiving path. There are two Kconfig options that control this. For transmit (TX) path the option is called CONFIG_NET_PKT_TXTIME_STATS and for receive (RX) path the options is called CONFIG_NET_PKT_RXTIME_STATS. Note that for TX, all kind of network packet statistics is collected. For RX, only UDP, TCP or raw packet type network packet statistics is collected.

After enabling these options, the net stats network shell command will show this information:

<table>
<thead>
<tr>
<th></th>
<th>Value 1</th>
<th>Value 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Avg TX net_pkt</td>
<td>11484</td>
<td>67 us</td>
</tr>
<tr>
<td>Avg RX net_pkt</td>
<td>11474</td>
<td>43 us</td>
</tr>
</tbody>
</table>

Note: The values above and below are from emulated qemu_x86 board and UDP traffic

The TX time tells how long it took for network packet from its creation to when it was sent to the network. The RX time tells the time from its creation to when it was passed to the application. The values are in microseconds. The statistics will be collected per traffic class if there are more than one transmit or receive queues defined in the system. These are controlled by CONFIG_NET_TC_TX_COUNT and CONFIG_NET_TC_RX_COUNT options.

If you enable CONFIG_NET_PKT_TXTIME_STATS_DETAIL or CONFIG_NET_PKT_RXTIME_STATS_DETAIL options, then additional information for TX or RX network packets are collected when the network packet traverses the IP stack.

After enabling these options, the net stats will show this information:

<table>
<thead>
<tr>
<th></th>
<th>Value 1</th>
<th>Value 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Avg TX net_pkt</td>
<td>18902</td>
<td>63 us</td>
</tr>
<tr>
<td>Avg RX net_pkt</td>
<td>18892</td>
<td>42 us</td>
</tr>
</tbody>
</table>

The numbers inside the brackets contain information how many microseconds it took for a network packet to go from previous state to next.

In the TX example above, the values are averages over 18902 packets and contain this information:

- Packet was created by application so the time is 0.
* Packet is about to be placed to transmit queue. The time it took from network packet creation to this state, is 22 microseconds in this example.

* The correct TX thread is invoked, and the packet is read from the transmit queue. It took 15 microseconds from previous state.

* The network packet was just sent and the network stack is about to free the network packet. It took 23 microseconds from previous state.

* In total it took on average 60 microseconds to get the network packet sent. The value 63 tells also the same information, but is calculated differently so there is slight difference because of rounding errors.

In the RX example above, the values are averages over 18892 packets and contain this information:

* Packet was created network device driver so the time is 0.

* Packet is about to be placed to receive queue. The time it took from network packet creation to this state, is 9 microseconds in this example.

* The correct RX thread is invoked, and the packet is read from the receive queue. It took 6 microseconds from previous state.

* The network packet is then processed and placed to correct socket queue. It took 11 microseconds from previous state.

* The last value tells how long it took from there to the application. Here the value is 13 microseconds.

* In total it took on average 39 microseconds to get the network packet sent. The value 42 tells also the same information, but is calculated differently so there is slight difference because of rounding errors.

The Zephyr network stack is a native network stack specifically designed for Zephyr OS. It consists of layers, each meant to provide certain services to other layers. Network stack functionality is highly configurable via Kconfig options.

---

**High level overview of the network stack**

**Network data flow**

- Data receiving (RX)
- Data sending (TX)

**Network packet processing statistics**

---

**High level overview of the network stack**

The network stack is layered and consists of the following parts:

- **Network Application.** The network application can either use the provided application-level protocol libraries or access the BSD socket API directly to create a network connection, send or receive data, and close a connection. The application can also use the network management API to configure the network and set related parameters such as network link options, starting a scan (when applicable), listen network configuration events, etc. The network interface API can be used to set IP address to a network interface, taking the network interface down, etc.

- **Network Protocols.** This provides implementations for various protocols such as
  
  - Application-level network protocols like CoAP, LWM2M, and MQTT. See application protocols chapter for information about them.
  
  - Core network protocols like IPv6, IPv4, UDP, TCP, ICMPv4, and ICMPv6. You access these protocols by using the BSD socket API.
Fig. 6.7: Network stack overview
• **Network Interface Abstraction.** This provides functionality that is common in all the network interfaces, such as setting network interface down, etc. There can be multiple network interfaces in the system. See network interface overview for more details.

• **L2 Network Technologies.** This provides a common API for sending and receiving data to and from an actual network device. See L2 overview for more details. These network technologies include Ethernet, IEEE 802.15.4, Bluetooth, CANBUS, etc. Some of these technologies support IPv6 header compression (6Lo), see RFC 6282 for details. For example ARP for IPv4 is done by the Ethernet component.

• **Network Device Drivers.** The actual low-level device drivers handle the physical sending or receiving of network packets.

**Network data flow**

An application typically consists of one or more threads that execute the application logic. When using the BSD socket API, the following things will happen.

**Data receiving (RX)**

1. A network data packet is received by a device driver.
2. The device driver allocates enough network buffers to store the received data. The network packet is placed in the proper RX queue (implemented by k_fifo). By default there is only one receive queue in the system, but it is possible to have up to 8 receive queues. These queues will process incoming packets with different priority. See Traffic Classification for more details. The receive queues also act as a way to separate the data processing pipeline (bottom-half) as the device driver is running in an interrupt context and it must do its processing as fast as possible.
3. The network packet is then passed to the correct L2 driver. The L2 driver can check if the packet is proper and modify it if needed, e.g. strip L2 header and frame check sequence, etc.
4. The packet is processed by a network interface. The network statistics are collected if enabled by CONFIG_NET_STATISTICS.
5. The packet is then passed to L3 processing. If the packet is IP based, then the L3 layer checks if the packet is a proper IPv6 or IPv4 packet.
6. A socket handler then finds an active socket to which the network packet belongs and puts it in a queue for that socket, in order to separate the networking code from the application. Typically the application is run in userspace context and the network stack is run in kernel context.
7. The application will then receive the data and can process it as needed. The application should have used the BSD socket API to create a socket that will receive the data.

**Data sending (TX)**

1. The application should use the BSD socket API when sending the data.
2. The application data is prepared for sending to kernel space and then copied to internal net_buf structures.
3. Depending on the socket type, a protocol header is added in front of the data. For example, if the socket is a UDP socket, then a UDP header is constructed and placed in front of the data.
4. An IP header is added to the network packet for a UDP or TCP packet.
5. The network stack will check that the network interface is properly set for the network packet, and also will make sure that the network interface is enabled before the data is queued to be sent.
6. The network packet is then classified and placed to the proper transmit queue (implemented by k_fifo). By default there is only one transmit queue in the system, but it is possible to have up to 8 transmit queues. These queues will process the sent packets with different priority. See Traffic...
Fig. 6.8: Network RX data flow
Fig. 6.9: Network TX data flow
Classification for more details. After the transmit packet classification, the packet is checked by
the correct L2 layer module. The L2 module will do additional checks for the data and it will also
create any L2 headers for the network packet. If everything is ok, the data is given to the network
device driver to be sent out.

7. The device driver will send the packet to the network.

Note that in both the TX and RX data paths, the queues (kfifo's) form separation points where data is
passed from one thread to another. These threads might run in different contexts (kernel vs. userspace)
and with different priorities.

Network packet processing statistics

See information about network processing statistics here.

6.2.3 Network Connectivity API

Applications should use the BSD socket API defined in include/zephyr/net/socket.h to create a connec-
tion, send or receive data, and close a connection. The same API can be used when working with UDP
or TCP data. See BSD socket API for more details.

See sockets-echo-server-sample and sockets-echo-client-sample applications how to create a simple
server or client BSD socket based application.

The legacy connectivity API in include/zephyr/net/net_context.h should not be used by applications.

6.2.4 Networking with the host system

Networking with native_posix board

- Prerequisites
- Basic Setup
  - Step 1 - Create Ethernet interface
  - Step 2 - Start app in native_posix board
  - Step 3 - Connect to console (optional)

This page describes how to set up a virtual network between a (Linux) host and a Zephyr application
running in a native_posix board.

In this example, the sockets-echo-server-sample sample application from the Zephyr source distribution
is run in native_posix board. The Zephyr native_posix board instance is connected to a Linux host using
a tuntap device which is modeled in Linux as an Ethernet network interface.

Prerequisites On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate
Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

Basic Setup For the steps below, you will need three terminal windows:

- Terminal #1 is terminal window with net-tools being the current directory (cd net-tools)
- Terminal #2 is your usual Zephyr development terminal, with the Zephyr environment initialized.
• Terminal #3 is the console to the running Zephyr native_posix instance (optional).

**Step 1 - Create Ethernet interface**  
Before starting native_posix with network emulation, a network interface should be created.

In terminal #1, type:

```
./net-setup.sh
```

You can tweak the behavior of the net-setup.sh script. See various options by running `net-setup.sh` like this:

```
./net-setup.sh --help
```

**Step 2 - Start app in native_posix board**  
Build and start the `echo_server` sample application.

In terminal #2, type:

```
west build -b native_posix samples/net/sockets/echo_server
west build -t run
```

**Step 3 - Connect to console (optional)**  
The console window should be launched automatically when the Zephyr instance is started but if it does not show up, you can manually connect to the console. The native_posix board will print a string like this when it starts:

```
UART connected to pseudotty: /dev/pts/5
```

You can manually connect to it like this:

```
screen /dev/pts/5
```

---

**Networking with QEMU Ethernet**

- **Prerequisites**
- **Basic Setup**
  - **Step 1 - Create Ethernet interface**
  - **Step 2 - Start app in QEMU board**

This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in QEMU.

In this example, the sockets-echo-server-sample sample application from the Zephyr source distribution is run in QEMU. The Zephyr instance is connected to a Linux host using a tuntap device which is modeled in Linux as an Ethernet network interface.

**Prerequisites**  
On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```
Basic Setup  For the steps below, you will need two terminal windows:

- Terminal #1 is terminal window with net-tools being the current directory (cd net-tools)
- Terminal #2 is your usual Zephyr development terminal, with the Zephyr environment initialized.

When configuring the Zephyr instance, you must select the correct Ethernet driver for QEMU connectivity:

- For qemu_x86, select Intel(R) PRO/1000 Gigabit Ethernet driver Ethernet driver. Driver is called e1000 in Zephyr source tree.
- For qemu_cortex_m3, select TI Stellaris MCU family ethernet driver Ethernet driver. Driver is called stellaris in Zephyr source tree.
- For mps2_an385, select SMSC911x/9220 Ethernet driver Ethernet driver. Driver is called smsc911x in Zephyr source tree.

Step 1 - Create Ethernet interface  Before starting QEMU with network connectivity, a network interface should be created in the host system.

In terminal #1, type:

```
./net-setup.sh
```

You can tweak the behavior of the net-setup.sh script. See various options by running net-setup.sh like this:

```
./net-setup.sh --help
```

Step 2 - Start app in QEMU board  Build and start the sockets-echo-server-sample sample application. In this example, the qemu_x86 board is used.

In terminal #2, type:

```
west build -b qemu_x86 samples/net/sockets/echo_server -- -DOVERLAY_CONFIG=overlay-e1000.conf
west build -t run
```

Exit QEMU by pressing CTRL+A x.
This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in a QEMU virtual machine (built for Zephyr targets such as qemu_x86 and qemu_cortex_m3).

In this example, the sockets-echo-server-sample sample application from the Zephyr source distribution is run in QEMU. The QEMU instance is connected to a Linux host using a serial port, and SLIP is used to transfer data between the Zephyr application and Linux (over a chain of virtual connections).

**Prerequisites**  On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```bash
git clone https://github.com/zephyrproject-rtos/net-tools
cd net-tools
make
```

*Note:* If you get an error about AX_CHECK_COMPILE_FLAG, install package `autoconf-archive` package on Debian/Ubuntu.

**Basic Setup**  For the steps below, you will need at least 4 terminal windows:

- Terminal #1 is your usual Zephyr development terminal, with the Zephyr environment initialized.
- Terminals #2, #3, and #4 are terminal windows with net-tools being the current directory (cd net-tools)

**Step 1 - Create helper socket**  Before starting QEMU with network emulation, a Unix socket for the emulation should be created.

In terminal #2, type:

```
./loop-socat.sh
```

**Step 2 - Start TAP device routing daemon**  In terminal #3, type:

```
sudo ./loop-slip-tap.sh
```

For applications requiring DNS, you may need to restart the host's DNS server at this point, as described in *Setting up Zephyr and NAT/masquerading on host to access Internet*.

**Step 3 - Start app in QEMU**  Build and start the echo_server sample application.

In terminal #1, type:

```
west build -b qemu_x86 samples/net/sockets/echo_server
west build -t run
```

If you see an error from QEMU about `unix:/tmp/slip.sock`, it means you missed Step 1 above.
Step 4 - Run apps on host  Now in terminal #4, you can run various tools to communicate with the application running in QEMU.

You can start with pings:

```
ping 192.0.2.1
ping6 2001:db8::1
```

You can use the netcat ("nc") utility, connecting using UDP:

```
echo foobar | nc -6 -u 2001:db8::1 4242
foobar
```

```
echo foobar | nc -u 192.0.2.1 4242
foobar
```

If echo_server is compiled with TCP support (now enabled by default for the echo_server sample, CONFIG_NET_TCP=y):

```
echo foobar | nc -6 -q2 2001:db8::1 4242
foobar
```

Note: Use Ctrl+C to exit.

You can also use the telnet command to achieve the above.

Step 5 - Stop supporting daemons  When you are finished with network testing using QEMU, you should stop any daemons or helpers started in the initial steps, to avoid possible networking or routing problems such as address conflicts in local network interfaces. For example, stop them if you switch from testing networking with QEMU to using real hardware, or to return your host laptop to normal Wi-Fi use.

To stop the daemons, press Ctrl+C in the corresponding terminal windows (you need to stop both loop-slip-tap.sh and loop-socat.sh).

Exit QEMU by pressing CTRL+A x.

Setting up Zephyr and NAT/masquerading on host to access Internet  To access the internet from a Zephyr application, some additional setup on the host may be required. This setup is common for both application running in QEMU and on real hardware, assuming that a development board is connected to the development host. If a board is connected to a dedicated router, it should not be needed.

To access the internet from a Zephyr application using IPv4, a gateway should be set via DHCP or configured manually. For applications using the "Settings" facility (with the config option CONFIG_NET_CONFIG_SETTINGS enabled), set the CONFIG_NET_CONFIG_MY_IPV4_GW option to the IP address of the gateway. For apps not using the "Settings" facility, set up the gateway by calling the net_if_ipv4_set_gw() at runtime.

To access the internet from a custom application running in QEMU, NAT (masquerading) should be set up for QEMU’s source address. Assuming 192.0.2.1 is used, the following command should be run as root:

```
iptables -t nat -A POSTROUTING -j MASQUERADE -s 192.0.2.1
```

Additionally, IPv4 forwarding should be enabled on the host, and you may need to check that other firewall (iptables) rules don’t interfere with masquerading. To enable IPv4 forwarding the following command should be run as root:
Some applications may also require a DNS server. A number of Zephyr-provided samples assume by default that the DNS server is available on the host (IP 192.0.2.2), which, in modern Linux distributions, usually runs at least a DNS proxy. When running with QEMU, it may be required to restart the host’s DNS, so it can serve requests on the newly created TAP interface. For example, on Debian-based systems:

```
service dnsmasq restart
```

An alternative to relying on the host’s DNS server is to use one in the network. For example, 8.8.8.8 is a publicly available DNS server. You can configure it using `CONFIG_DNS_SERVER1` option.

**Network connection between two QEMU VMs** Unlike the VM-to-Host setup described above, VM-to-VM setup is automatic. For sample applications that support this mode (such as the echo_server and echo_client samples), you will need two terminal windows, set up for Zephyr development.

**Terminal #1:**

```
west build -b qemu_x86 samples/net/sockets/echo_server
```

This will start QEMU, waiting for a connection from a client QEMU.

**Terminal #2:**

```
west build -b qemu_x86 samples/net/sockets/echo_client
```

This will start a second QEMU instance, where you should see logging of data sent and received in both.

**Running multiple QEMU VMs of the same sample** If you find yourself wanting to run multiple instances of the same Zephyr sample application, which do not need to talk to each other, use the `QEMU_INSTANCE` argument.

Start `socat` and `tunslip6` manually (instead of using the `loop-xxx.sh` scripts) for as many instances as you want. Use the following as a guide, replacing `MAIN` or `OTHER`.

**Terminal #1:**

```
$ socat PTY,link=/tmp/slip.devMAIN UNIX-LISTEN:/tmp/slip.sockMAIN $ZEPHYR_BASE/../net-tools/tunslip6 -t tapMAIN -T -s /tmp/slip.devMAIN 2001:db8::1/64
# Now run Zephyr
make -Cbuild run QEMU_INSTANCE=MAIN
```

**Terminal #2:**

```
$ socat PTY,link=/tmp/slip.devOTHER UNIX-LISTEN:/tmp/slip.sockOTHER $ZEPHYR_BASE/../net-tools/tunslip6 -t tapOTHER -T -s /tmp/slip.devOTHER 2001:db8::1/64
make -Cbuild run QEMU_INSTANCE=OTHER
```

**USB Device Networking**
This page describes how to set up networking between a Linux host and a Zephyr application running on USB supported devices.

The board is connected to Linux host using USB cable and provides an Ethernet interface to the host. The sockets-echo-server-sample application from the Zephyr source distribution is run on supported board. The board is connected to a Linux host using a USB cable providing an Ethernet interface to the host.

**Basic Setup**

To communicate with the Zephyr application over a newly created Ethernet interface, we need to assign IP addresses and set up a routing table for the Linux host. After plugging a USB cable from the board to the Linux host, the `cdc_ether` driver registers a new Ethernet device with a provided MAC address.

You can check that network device is created and MAC address assigned by running `dmesg` from the Linux host.

```
cdc_ether 1-2.7:1.0 eth0: register 'cdc_ether' at usb-0000:00:01.2-2.7, CDC Ethernet
Device, 00:00:5e:00:53:01
```

We need to set it up and assign IP addresses as explained in the following section.

**Choosing IP addresses**

To establish network connection to the board we need to choose IP address for the interface on the Linux host.

It make sense to choose addresses in the same subnet we have in Zephyr application. IP addresses usually set in the project configuration files and may be checked also from the shell with following commands. Connect a serial console program (such as putTTY) to the board, and enter this command to the Zephyr shell:

```
shell> net iface
```

This command shows that one IPv4 address and two IPv6 addresses have been assigned to the board. We can use either IPv4 or IPv6 for network connection depending on the board network configuration.

Next step is to assign IP addresses to the new Linux host interface, in the following steps `enx00005e005301` is the name of the interface on my Linux system.

**Setting IPv4 address and routing**
# ip address add dev enx00005e005301 192.0.2.2
# ip link set enx00005e005301 up
# ip route add 192.0.2.0/24 dev enx00005e005301

### Setting IPv6 address and routing

# ip address add dev enx00005e005301 2001:db8::2
# ip link set enx00005e005301 up
# ip -6 route add 2001:db8::/64 dev enx00005e005301

### Testing connection

From the host we can test the connection by pinging Zephyr IP address of the board with:

$ ping 192.0.2.1
PING 192.0.2.1 (192.0.2.1) 56(84) bytes of data.
64 bytes from 192.0.2.1: icmp_seq=1 ttl=64 time=2.30 ms
64 bytes from 192.0.2.1: icmp_seq=2 ttl=64 time=1.43 ms
64 bytes from 192.0.2.1: icmp_seq=3 ttl=64 time=2.45 ms
...

### Networking with QEMU User

- **Introduction**
- **Using SLIRP with Zephyr**
- **Limitations**

This page is intended to serve as a starting point for anyone interested in using QEMU SLIRP with Zephyr.

**Introduction**  SLIRP is a network backend which provides the complete TCP/IP stack within QEMU and uses that stack to implement a virtual NAT'd network. As there are no dependencies on the host, SLIRP is simple to setup.

By default, QEMU uses the 10.0.2.X/24 network and runs a gateway at 10.0.2.2. All traffic intended for the host network has to travel through this gateway, which will filter out packets based on the QEMU command line parameters. This gateway also functions as a DHCP server for all GOS, allowing them to be automatically assigned with an IP address starting from 10.0.2.15.

**Using SLIRP with Zephyr**  In order to use SLIRP with Zephyr, the user has to set the Kconfig option to enable User Networking.

CONFIG_NET_QEMU_USER=y

Once this configuration option is enabled, all QEMU launches will use SLIRP. In the default configuration, Zephyr only enables User Networking, and does not pass any arguments to it. This means that the Guest will only be able to communicate to the QEMU gateway, and any data intended for the host machine will be dropped by QEMU.

In general, QEMU User Networking can take in a lot of arguments including,
• Information about host/guest port forwarding. This must be provided to create a communication channel between the guest and host.

• Information about network to use. This may be valuable if the user does not want to use the default 10.0.2.0/24 network.

• Tell QEMU to start DHCP server at user-defined IP address.

• ID and other information.

As this information varies with every use case, it is difficult to come up with good defaults that work for all. Therefore, Zephyr Implementation offloads this to the user, and expects that they will provide arguments based on requirements. For this, there is a Kconfig string which can be populated by the user.

```
CONFIG_NET_QEMU_USER_EXTRA_ARGS="net=192.168.0.0/24,hostfwd=tcp::8080-:8080"
```

This option is appended as-is to the QEMU command line. Therefore, any problems with this command line will be reported by QEMU only. Here’s what this particular example will do,

• Make QEMU use the 192.168.0.0/24 network instead of the default.

• Enable forwarding of any TCP data received from port 8080 of host to port 8080 of guest, and vice versa.

**Limitations** If the user does not have any specific networking requirements other than the ability to access a web page from the guest, user networking (slirp) is a good choice. However, it has several limitations

• There is a lot of overhead so the performance is poor.

• The guest is not directly accessible from the host or the external network.

• In general, ICMP traffic does not work (so you cannot use ping within a guest).

• As port mappings need to be defined before launching qemu, clients which use dynamically generated ports cannot communicate with external network.

• There is a bug in the SLIRP implementation which filters out all IPv6 packets from the guest. See [https://bugs.launchpad.net/qemu/+bug/1724590](https://bugs.launchpad.net/qemu/+bug/1724590) for details. Therefore, IPv6 will not work with User Networking.

**Networking with multiple Zephyr instances**

- **Prerequisites**
- **Basic Setup**
  - Step 1 - Create configuration files
  - Step 2 - Create Ethernet interfaces
  - Step 3 - Setup network bridging
  - Step 4 - Start Zephyr instances

This page describes how to set up a virtual network between multiple Zephyr instances. The Zephyr instances could be running inside QEMU or could be native_posix board processes. The Linux host can be used to route network traffic between these systems.

**Prerequisites** On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:
Basic Setup
For the steps below, you will need five terminal windows:

- Terminal #1 and #2 are terminal windows with net-tools being the current directory (cd net-tools)
- Terminal #3, where you setup bridging in Linux host
- Terminal #4 and #5 are your usual Zephyr development terminal, with the Zephyr environment initialized.

As there are multiple ways to setup the Zephyr network, the example below uses qemu_x86 board with e1000 Ethernet controller and native_posix board to simplify the setup instructions. You can use other QEMU boards and drivers if needed, see Networking with QEMU Ethernet for details. You can also use two or more native_posix board Zephyr instances and connect them together.

Step 1 - Create configuration files
Before starting QEMU with network connectivity, a network interfaces for each Zephyr instance should be created in the host system. The default setup for creating network interface cannot be used here as that is for connecting one Zephyr instance to Linux host.

For Zephyr instance #1, create file called zephyr1.conf to net-tools project, or to some other suitable directory.

```bash
# Configuration file for setting IP addresses for a network interface.
INTERFACE="$1"
HWADDR="00:00:5e:00:53:11"
IPV6_ADDR_1="2001:db8:100::2"
IPV6_ROUTE_1="2001:db8:100::/64"
IPV4_ADDR_1="198.51.100.2/24"
IPV4_ROUTE_1="198.51.100.0/24"
ip link set dev $INTERFACE up
ip link set dev $INTERFACE address $HWADDR
ip -6 address add $IPV6_ADDR_1 dev $INTERFACE nodad
ip -6 route add $IPV6_ROUTE_1 dev $INTERFACE
ip address add $IPV4_ADDR_1 dev $INTERFACE
ip route add $IPV4_ROUTE_1 dev $INTERFACE > /dev/null 2>&1
```

For Zephyr instance #2, create file called zephyr2.conf to net-tools project, or to some other suitable directory.

```bash
# Configuration file for setting IP addresses for a network interface.
INTERFACE="$1"
HWADDR="00:00:5e:00:53:22"
IPV6_ADDR_1="2001:db8:200::2"
IPV6_ROUTE_1="2001:db8:200::/64"
IPV4_ADDR_1="203.0.113.2/24"
IPV4_ROUTE_1="203.0.113.0/24"
ip link set dev $INTERFACE up
ip link set dev $INTERFACE address $HWADDR
ip -6 address add $IPV6_ADDR_1 dev $INTERFACE nodad
ip -6 route add $IPV6_ROUTE_1 dev $INTERFACE
ip address add $IPV4_ADDR_1 dev $INTERFACE
ip route add $IPV4_ROUTE_1 dev $INTERFACE > /dev/null 2>&1
```

Step 2 - Create Ethernet interfaces
The following net-setup.sh commands should be typed in net-tools directory (cd net-tools).
In terminal #1, type:

```
./net-setup.sh -c zephyr1.conf -i zeth.1
```

In terminal #2, type:

```
./net-setup.sh -c zephyr2.conf -i zeth.2
```

**Step 3 - Setup network bridging**  In terminal #3, type:

```
sudo brctl addbr zeth-br
sudo brctl addif zeth-br zeth.1
sudo brctl addif zeth-br zeth.2
sudo ifconfig zeth-br up
```

**Step 4 - Start Zephyr instances**  In this example we start sockets-echo-server-sample and sockets-echo-client-sample applications. You can use other applications too as needed.

In terminal #4, if you are using QEMU, type this:

```
w west build -d build/server -b qemu_x86 -t run \
    samples/net/sockets/echo_server -- \
    -DOVERLAY_CONFIG=overlay-e1000.conf \
    -DCONFIG_NET_CONFIG_MY_IPV4_ADDR="198.51.100.1" \
    -DCONFIG_NET_CONFIG_PEER_IPV4_ADDR="203.0.113.1" \
    -DCONFIG_NET_CONFIG_MY_IPV6_ADDR="2001:db8:100::1" \
    -DCONFIG_NET_CONFIG_PEER_IPV6_ADDR="2001:db8:200::1" \
    -DCONFIG_NET_CONFIG_MY_IPV4_GW="203.0.113.1" \
    -DCONFIG_ETH_QEMU_IFACE_NAME="zeth.1" \
    -DCONFIG_ETH_QEMU_EXTRA_ARGS="mac=00:00:5e:00:53:01"
```

or if you want to use native_posix board, type this:

```
w west build -d build/server -b native_posix -t run \
    samples/net/sockets/echo_server -- \
    -DCONFIG_NET_CONFIG_MY_IPV4_ADDR="198.51.100.1" \
    -DCONFIG_NET_CONFIG_PEER_IPV4_ADDR="203.0.113.1" \
    -DCONFIG_NET_CONFIG_MY_IPV6_ADDR="2001:db8:100::1" \
    -DCONFIG_NET_CONFIG_PEER_IPV6_ADDR="2001:db8:200::1" \
    -DCONFIG_NET_CONFIG_MY_IPV4_GW="203.0.113.1" \
    -DCONFIG_ETH_NATIVE_POSIX_DRV_NAME="zeth.1" \
    -DCONFIG_ETH_NATIVE_POSIX_MAC_ADDR="00:00:5e:00:53:01" \
    -DCONFIG_ETH_NATIVE_POSIX_RANDOM_MAC=n
```

In terminal #5, if you are using QEMU, type this:

```
w west build -d build/client -b qemu_x86 -t run \
    samples/net/sockets/echo_client -- \
    -DOVERLAY_CONFIG=overlay-e1000.conf \
    -DCONFIG_NET_CONFIG_MY_IPV4_ADDR="203.0.113.1" \
    -DCONFIG_NET_CONFIG_PEER_IPV4_ADDR="198.51.100.1" \
    -DCONFIG_NET_CONFIG_MY_IPV6_ADDR="2001:db8:200::1" \
    -DCONFIG_NET_CONFIG_PEER_IPV6_ADDR="2001:db8:100::1" \
    -DCONFIG_NET_CONFIG_MY_IPV4_GW="198.51.100.1" \
    -DCONFIG_ETH_QEMU_IFACE_NAME="zeth.2" \
    -DCONFIG_ETH_QEMU_EXTRA_ARGS="mac=00:00:5e:00:53:02"
```

or if you want to use native_posix board, type this:
Also if you have firewall enabled in your host, you need to allow traffic between zeth.1, zeth.2 and zeth-br interfaces.

Networking with QEMU and IEEE 802.15.4

This page describes how to set up a virtual network between two QEMUs that are connected together via UART and are running IEEE 802.15.4 link layer between them. Note that this only works in Linux host.

Basic Setup

For the steps below, you will need two terminal windows:

- Terminal #1 is terminal window with echo-server Zephyr sample application.
- Terminal #2 is terminal window with echo-client Zephyr sample application.

If you want to capture the transferred network data, you must compile the monitor_15_4 program in net-tools directory.

Open a terminal window and type:

cd $ZEPHYR_BASE/../net-tools
make monitor_15_4

Step 1 - Compile and start echo-server

In terminal #1, type:

west build -b qemu_x86 -d build/server samples/net/sockets/echo_server -- -DOVERLAY_CLASS=overlay-qemu_802154.conf
west build -t server -d build/server

If you want to capture the network traffic between the two QEMUs, type:

west build -b qemu_x86 -d build/server samples/net/sockets/echo_server -- -G 'UnixMakefiles' -DOVERLAY_CONFIG=overlay-qemu_802154.conf -DPCAP=.capture.pcap
west build -t server -d build/server

Note that the make must be used for server target if packet capture option is set in command line. The build/server/capture.pcap file will contain the transferred data.
Step 2 - Compile and start echo-client  
In terminal #2, type:

```
w west build -b qemu_x86 -d build/client samples/net/sockets/echo_client -- -DOVERLAY_→CONFIG=overlay-qemu_802154.conf
west build -t client -d build/client
```

You should see data passed between the two QEMUs. Exit QEMU by pressing CTRL+A x.

While developing networking software, it is usually necessary to connect and exchange data with the host system like a Linux desktop computer. Depending on what board is used for development, the following options are possible:

- **QEMU using SLIP (Serial Line Internet Protocol).**
  - Here IP packets are exchanged between Zephyr and the host system via serial port. This is the legacy way of transferring data. It is also quite slow so use it only when necessary. See Networking with QEMU for details.

- **QEMU using built-in Ethernet driver.**
  - Here IP packets are exchanged between Zephyr and the host system via QEMU's built-in Ethernet driver. Not all QEMU boards support built-in Ethernet so in some cases, you might need to use the SLIP method for host connectivity. See Networking with QEMU Ethernet for details.

- **QEMU using SLIRP (Qemu User Networking).**
  - QEMU User Networking is implemented using “slirp”, which provides a full TCP/IP stack within QEMU and uses that stack to implement a virtual NAT’d network. As this support is built into QEMU, it can be used with any model and requires no admin privileges on the host machine, unlike TAP. However, it has several limitations including performance which makes it less valuable for practical purposes. See Networking with QEMU User for details.

- **native_posix board.**
  - The Zephyr instance can be executed as a user space process in the host system. This is the most convenient way to debug the Zephyr system as one can attach host debugger directly to the running Zephyr instance. This requires that there is an adaptation driver in Zephyr for interfacing with the host system. An Ethernet driver exists in Zephyr for this purpose. See Networking with native_posix board for details.

- **USB device networking.**
  - Here, the Zephyr instance is run on a real board and the connectivity to the host system is done via USB. See USB Device Networking for details.

- **Connecting multiple Zephyr instances together.**
  - If you have multiple Zephyr instances, either QEMU or native_posix ones, and want to create a connection between them, see Networking with multiple Zephyr instances for details.

- **Simulating IEEE 802.15.4 network between two QEMUs.**
  - Here, two Zephyr instances are running and there is IEEE 802.15.4 link layer run over an UART between them. See Networking with QEMU and IEEE 802.15.4 for details.

### 6.2.5 Monitor Network Traffic

- **Host Configuration**
- **Zephyr Configuration**
- **Wireshark Configuration**
It is useful to be able to monitor the network traffic especially when debugging a connectivity issues or when developing new protocol support in Zephyr. This page describes how to set up a way to capture network traffic so that user is able to use Wireshark or similar tool in remote host to see the network packets sent or received by a Zephyr device.

See also the net-capture-sample sample application from the Zephyr source distribution for configuration options that need to be enabled.

Host Configuration

The instructions here describe how to setup a Linux host to capture Zephyr network RX and TX traffic. Similar instructions should work also in other operating systems. On the Linux Host, fetch the Zephyr net-tools project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

The net-tools project provides a configure file to setup IP-to-IP tunnel interface so that we can transfer monitoring data from Zephyr to host.

In terminal #1, type:

```
./net-setup.sh -c zeth-tunnel.conf
```

This script will create following IPIP tunnel interfaces:

<table>
<thead>
<tr>
<th>Interface name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>zeth-ip6ip</td>
<td>IPv6-over-I Pv4 tunnel</td>
</tr>
<tr>
<td>zeth-ipip</td>
<td>IPv4-over-I Pv4 tunnel</td>
</tr>
<tr>
<td>zeth-ipip6</td>
<td>IPv4-over-I Pv6 tunnel</td>
</tr>
<tr>
<td>zeth-ip6ip6</td>
<td>IPv6-over-I Pv6 tunnel</td>
</tr>
</tbody>
</table>

Zephyr will send captured network packets to one of these interfaces. The actual interface will depend on how the capturing is configured. You can then use Wireshark to monitor the proper network interface.

After the tunneling interfaces have been created, you can use for example net-capture.py script from net-tools project to print or save the captured network packets. The net-capture.py provides an UDP listener, it can print the captured data to screen and optionally can also save the data to a pcap file.

```
$ ./net-capture.py -i zeth-ip6ip -w capture.pcap
```

The net-capture.py has following command line options:

```
Listen captured network data from Zephyr and save it optionally to pcap file.
./net-capture.py
   -i | --interface <network interface>
```

(continues on next page)
Listen this interface for the data

```
[-p | --port <UDP port>]
  UDP port (default is 4242) where the capture data is received
[-q | --quiet]
  Do not print packet information
[-t | --type <L2 type of the data>]
  Scapy L2 type name of the UDP payload, default is Ether
[-w | --write <pcap file name>]
  Write the received data to file in PCAP format
```

Instead of the net-capture.py script, you can for example use netcat to provide an UDP listener so that the host will not send port unreachable message to Zephyr:

```
nc -l -u 2001:db8:200::2 4242 > /dev/null
```

The IP address above is the inner tunnel endpoint, and can be changed and it depends on how the Zephyr is configured. Zephyr will send UDP packets containing the captured network packets to the configured IP tunnel, so we need to terminate the network connection like this.

**Zephyr Configuration**

In this example, we use native_posix board. You can also use any other board that supports networking.

In terminal #3, type:

```
west build -b native_posix samples/net/capture -- -DCONFIG_NATIVE_UART_AUTOATTACH_DEFAULT_CMD="gnome-terminal -- screen %s"
```

To see the Zephyr console and shell, start Zephyr instance like this:

```
build/zephyr/zephyr.exe -attach_uart
```

Any other application can be used too, just make sure that suitable configuration options are enabled (see samples/net/capture/prj.conf file for examples).

The network capture can be configured automatically if needed, but currently the capture sample application does not do that. User has to use net-shell to setup and enable the monitoring.

The network packet monitoring needs to be setup first. The net-shell has net capture setup command for doing that. The command syntax is

```
net capture setup <remote-ip-addr> <local-ip-addr> <peer-ip-addr>
  <remote> is the (outer) endpoint IP address
  <local> is the (inner) local IP address
  <peer> is the (inner) peer IP address
Local and Peer IP addresses can have UDP port number in them (optional)
like 198.0.51.2:9000 or [2001:db8:100::2]:4242
```

In Zephyr console, type:

```
net capture setup 192.0.2.2 2001:db8:200::1 2001:db8:200::2
```

This command will create the tunneling interface. The 192.0.2.2 is the remote host where the tunnel is terminated. The address is used to select the local network interface where the tunneling interface is attached to. The 2001:db8:200::1 tells the local IP address for the tunnel, the 2001:db8:200::2 is the peer IP address where the captured network packets are sent. The port numbers for UDP packet can be given in the setup command like this for IPv6-over-IPv4 tunnel.
net capture setup 192.0.2.2 [2001:db8:200::1]:9999 [2001:db8:200::2]:9998

and like this for IPv4-over-IPv4 tunnel

net capture setup 192.0.2.2 198.51.100.1:9999 198.51.100.2:9998

If the port number is omitted, then 4242 UDP port is used as a default.

The current monitoring configuration can be checked like this:

```
uart:~$ net capture
Network packet capture disabled
Capture Tunnel
Device iface iface Local Peer
NET_CAPTURE0 - 1 [2001:db8:200::1]:4242 [2001:db8:200::2]:4242
```

which will print the current configuration. As we have not yet enabled monitoring, the Capture iface
is not set.

Then we need to enable the network packet monitoring like this:

```
net capture enable 2
```

The 2 tells the network interface which traffic we want to capture. In this example, the 2 is the
native_posix board Ethernet interface. Note that we send the network traffic to the same interface
that we are monitoring in this example. The monitoring system avoids to capture already captured net-
work traffic as that would lead to recursion. You can use net iface command to see what network
interfaces are available. Note that you cannot capture traffic from the tunnel interface as that would
cause recursion loop. The captured network traffic can be sent to some other network interface if con-
figured so. Just set the <remote-ip-addr> option properly in net capture setup so that the IP tunnel
is attached to desired network interface. The capture status can be checked again like this:

```
uart:~$ net capture
Network packet capture enabled
Capture Tunnel
Device iface iface Local Peer
NET_CAPTURE0 2 1 [2001:db8:200::1]:4242 [2001:db8:200::2]:4242
```

After enabling the monitoring, the system will send captured (either received or sent) network packets
to the tunnel interface for further processing.

The monitoring can be disabled like this:

```
net capture disable
```

which will turn currently running monitoring off. The monitoring setup can be cleared like this:

```
net capture cleanup
```

It is not necessary to use net-shell for configuring the monitoring. The network capture API functions
can be called by the application if needed.

**Wireshark Configuration**

The Wireshark tool can be used to monitor the captured network traffic in a useful way.

You can monitor either the tunnel interfaces or the zeth interface. In order to see the actual captured
data inside an UDP packet, see Wireshark decapsulate UDP document for instructions.
6.2.6 Networking APIs

Network APIs

BSD Sockets

- **Overview**
- **Secure Sockets**
  - TLS credentials subsystem
  - Secure Socket Creation
  - Secure Sockets options
- **Socket offloading**
  - Offloaded socket creation
  - Dealing with multiple offloaded interfaces
- **API Reference**
  - BSD Sockets
  - TLS Credentials

**Overview** Zephyr offers an implementation of a subset of the BSD Sockets API (a part of the POSIX standard). This API allows to reuse existing programming experience and port existing simple networking applications to Zephyr.

Here are the key requirements and concepts which governed BSD Sockets compatible API implementation for Zephyr:

- Has minimal overhead, similar to the requirement for other Zephyr subsystems.
- Is namespaced by default, to avoid name conflicts with well-known names like `close()`, which may be part of libc or other POSIX compatibility libraries. If enabled by `CONFIG_NET_SOCKETS_POSIX_NAMES`, it will also expose native POSIX names.

BSD Sockets compatible API is enabled using `CONFIG_NET_SOCKETS` config option and implements the following operations: `socket()`, `close()`, `recv()`, `recvfrom()`, `send()`, `sendto()`, `connect()`, `bind()`, `listen()`, `accept()`, `fcntl()` (to set non-blocking mode), `getsockopt()`, `setsockopt()`, `poll()`, `select()`, `getaddrinfo()`, `getnameinfo()`.

Based on the namespacing requirements above, these operations are by default exposed as functions with `zsock_` prefix, e.g. `zsock_socket()` and `zsock_close()`. If the config option `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined, all the functions will be also exposed as aliases without the prefix. This includes the functions like `close()` and `fcntl()` (which may conflict with functions in libc or other libraries, for example, with the filesystem libraries).

Another entailment of the design requirements above is that the Zephyr API aggressively employs the short-read/short-write property of the POSIX API whenever possible (to minimize complexity and overheads). POSIX allows for calls like `recv()` and `send()` to actually process (receive or send) less data than requested by the user (on `SOCK_STREAM` type sockets). For example, a call `recv(sock, 1000, 0)` may return 100, meaning that only 100 bytes were read (short read), and the application needs to retry call(s) to receive the remaining 900 bytes.

Another entailment of the design requirements above is that the Zephyr API aggressively employs the short-read/short-write property of the POSIX API whenever possible (to minimize complexity and overheads). POSIX allows for calls like `recv()` and `send()` to actually process (receive or send) less data than requested by the user (on `SOCK_STREAM` type sockets). For example, a call `recv(sock, 1000, 0)` may return 100, meaning that only 100 bytes were read (short read), and the application needs to retry call(s) to receive the remaining 900 bytes.

The BSD Sockets API uses file descriptors to represent sockets. File descriptors are small integers, consecutively assigned from zero, shared among sockets, files, special devices (like stdin/stdout), etc. Internally, there is a table mapping file descriptors to internal object pointers. The file descriptor table is used by the BSD Sockets API even if the rest of the POSIX subsystem (filesystem, stdin/stdout) is not enabled.
Secure Sockets  Zephyr provides an extension of standard POSIX socket API, allowing to create and configure sockets with TLS protocol types, facilitating secure communication. Secure functions for the implementation are provided by mbedTLS library. Secure sockets implementation allows use of both TLS and DTLS protocols with standard socket calls. See net_ip_protocol_secure type for supported secure protocol versions.

To enable secure sockets, set the CONFIG_NET_SOCKETS_SOCKOPT_TLS option. To enable DTLS support, use CONFIG_NET_SOCKETS_ENABLE_DTLS option.

**TLS credentials subsystem**  TLS credentials must be registered in the system before they can be used with secure sockets. See tls_credential_add() for more information.

When a specific TLS credential is registered in the system, it is assigned with numeric value of type sec_tag_t, called a tag. This value can be used later on to reference the credential during secure socket configuration with socket options.

The following TLS credential types can be registered in the system:

- TLS_CREDENTIAL_CA_CERTIFICATE
- TLS_CREDENTIAL_SERVER_CERTIFICATE
- TLS_CREDENTIAL_PRIVATE_KEY
- TLS_CREDENTIAL_PSK
- TLS_CREDENTIAL_PSK_ID

An example registration of CA certificate (provided in ca_certificate array) looks like this:

```c
ret = tls_credential_add(CA_CERTIFICATE_TAG, TLS_CREDENTIAL_CA_CERTIFICATE,
                        ca_certificate, sizeof(ca_certificate));
```

By default certificates in DER format are supported. PEM support can be enabled in mbedTLS settings.

**Secure Socket Creation**  A secure socket can be created by specifying secure protocol type, for instance:

```c
sock = socket(AF_INET, SOCK_STREAM, IPPROTO_TLS_1_2);
```

Once created, it can be configured with socket options. For instance, the CA certificate and hostname can be set:

```c
sec_tag_t sec_tag_opt[] = {
    CA_CERTIFICATE_TAG,
};
ret = setsockopt(sock, SOL_TLS, TLS_SEC_TAG_LIST,
                 sec_tag_opt, sizeof(sec_tag_opt));

char host[] = "google.com";
ret = setsockopt(sock, SOL_TLS, TLS_HOSTNAME, host, sizeof(host) - 1);
```

Once configured, socket can be used just like a regular TCP socket.

Several samples in Zephyr use secure sockets for communication. For a sample use see e.g. echo-server sample application or HTTP GET sample application.

**Secure Sockets options**  Secure sockets offer the following options for socket management:
Defines

**TLS_SEC_TAG_LIST**
Socket option to select TLS credentials to use. It accepts and returns an array of sec_tag_t that indicate which TLS credentials should be used with specific socket.

**TLS_HOSTNAME**
Write-only socket option to set hostname. It accepts a string containing the hostname (may be NULL to disable hostname verification). By default, hostname check is enforced for TLS clients.

**TLS_CIPHERSUITE_LIST**
Socket option to select ciphersuites to use. It accepts and returns an array of integers with IANA assigned ciphersuite identifiers. If not set, socket will allow all ciphersuites available in the system (mbedTLS default behavior).

**TLS_CIPHERSUITE_USED**
Read-only socket option to read a ciphersuite chosen during TLS handshake. It returns an integer containing an IANA assigned ciphersuite identifier of chosen ciphersuite.

**TLS_PEER_VERIFY**
Write-only socket option to set peer verification level for TLS connection. This option accepts an integer with a peer verification level, compatible with mbedTLS values:

- 0 - none
- 1 - optional
- 2 - required

If not set, socket will use mbedTLS defaults (none for servers, required for clients).

**TLS_DTLS_ROLE**
Write-only socket option to set role for DTLS connection. This option is irrelevant for TLS connections, as for them role is selected based on connect()/listen() usage. By default, DTLS will assume client role. This option accepts an integer with a TLS role, compatible with mbedTLS values:

- 0 - client
- 1 - server

**TLS_ALPN_LIST**
Socket option for setting the supported Application Layer Protocols. It accepts and returns a const char array of NULL terminated strings representing the supported application layer protocols listed during the TLS handshake.

**TLS_DTLS_HANDSHAKE_TIMEOUT_MIN**
Socket option to set DTLS handshake timeout. The timeout starts at min, and upon retransmission the timeout is doubled util max is reached. Min and max arguments are separate options. The time unit is ms.

**TLS_DTLS_HANDSHAKE_TIMEOUT_MAX**
TLS_CERT_NOCOPY
Socket option for preventing certificates from being copied to the mbedTLS heap if possible. The option is only effective for DER certificates and is ignored for PEM certificates.

TLS_NATIVE
TLS socket option to use with offloading. The option instructs the network stack only to offload underlying TCP/UDP communication. The TLS/DTLS operation is handled by a native TLS/DTLS socket implementation from Zephyr.

Note, that this option is only applicable if socket dispatcher is used (CONFIG_NET_SOCKETS_OFFLOAD_DISPATCHER is enabled). In such case, it should be the first socket option set on a newly created socket. After that, the application may use SO_BINDTODEVICE to choose the dedicated network interface for the underlying TCP/UDP socket.

TLS_SESSION_CACHE
Socket option to control TLS session caching on a socket. Accepted values:

- 0 - Disabled.
- 1 - Enabled.

TLS_SESSION_CACHE_PURGE
Write-only socket option to purge session cache immediately. This option accepts any value.

Socket offloading
Zephyr allows to register custom socket implementations (called offloaded sockets). This allows for seamless integration for devices which provide an external IP stack and expose socket-like API.

Socket offloading can be enabled with CONFIG_NET_SOCKETS_OFFLOAD option. A network driver that wants to register a new socket implementation should use NET_SOCKET_OFFLOAD_REGISTER macro. The macro accepts the following parameters:

- socket_name - an arbitrary name for the socket implementation.
- prio - socket implementation priority, the higher priority is, the earlier particular implementation is processed when creating a new socket. Lower numeric value indicate higher priority.
- _family - socket family implemented by the offloaded socket. AF_UNSPEC indicate any family.
- _is_supported - a filtering function, used to verify whether particular socket family, type and protocol are supported by the offloaded socket implementation.
- _handler - a function compatible with socket() API, used to create an offloaded socket.

Every offloaded socket implementation should also implement a set of socket APIs, specified in socket_op_vtable struct.

The function registered for socket creation should allocate a new file descriptor using z_reserve_fd() function. Any additional actions, specific to the creation of a particular offloaded socket implementation should take place after the file descriptor is allocated. As a final step, if the offloaded socket was created successfully, the file descriptor should be finalized with z_finalize_fd() function. The finalize function allows to register a socket_op_vtable structure implementing socket APIs for an offloaded socket along with an optional socket context data pointer.

Finally, when an offloaded network interface is initialized, it should indicate that the interface is offloaded with net_if_socket_offload_set() function. The function registers the function used to
create an offloaded socket (the same as the one provided in NET_SOCKET_OFFLOAD_REGISTER) at the network interface.

**Offloaded socket creation** When application creates a new socket with `socket()` function, the network stack iterates over all registered socket implementations (native and offloaded). Higher priority socket implementations are processed first. For each registered socket implementation, an address family is verified, and if it matches (or the socket was registered as `AF_UNSPEC`), the corresponding `_is_supported` function is called to verify the remaining socket parameters. The first implementation that fulfills the socket requirements (i.e. `_is_supported` returns true) will create a new socket with its `_handler` function.

The above indicates the importance of the socket priority. If multiple socket implementations support the same set of socket family/type/protocol, the first implementation processed by the system will create a socket. Therefore it’s important to give the highest priority to the implementation that should be the system default.

The socket priority for native socket implementation is configured with Kconfig. Use `CONFIG_NET_SOCKETS_TLS_PRIORITY` to set the priority for the native TLS sockets. Use `CONFIG_NET_SOCKETS_PRIORITY_DEFAULT` to set the priority for the remaining native sockets.

**Dealing with multiple offloaded interfaces** As the `socket()` function does not allow to specify which network interface should be used by a socket, it’s not possible to choose a specific implementation in case multiple offloaded socket implementations, supporting the same type of sockets, are available. The same problem arises when both native and offloaded sockets are available in the system.

To address this problem, a special socket implementation (called socket dispatcher) was introduced. The sole reason for this module is to postpone the socket creation for until the first operation on a socket is performed. This leaves an opening to use `SO_BINDTODEVICE` socket option, to bind a socket to a particular network interface (and thus offloaded socket implementation). The socket dispatcher can be enabled with `CONFIG_NET_SOCKETS_OFFLOAD_DISPATCHER` Kconfig option.

When enabled, the application can specify the network interface to use with `setsockopt()` function:

```c
/* A "dispatcher" socket is created */
struct ifreq ifreq = {
    .ifr_name = "SimpleLink"
};

/* The socket is "dispatched" to a particular network interface */
/* (offloaded or not). */
setsockopt(sock, SOL_SOCKET, SO_BINDTODEVICE, &ifreq, sizeof(ifreq));
```

Similarly, if TLS is supported by both native and offloaded sockets, `TLS_NATIVE` socket option can be used to indicate that a native TLS socket should be created. The underlying socket can then be bound to a particular network interface:

```c
/* A "dispatcher" socket is created */
int tls_native = 1;

/* The socket is "dispatched" to a native TLS socket implementation. */
/* The underlying socket is a "dispatcher" socket now. */
setsockopt(sock, SOL_TLS, TLS_NATIVE, &tls_native, sizeof(tls_native));
```

(continues on next page)
struct ifreq ifreq = {
    .ifr_name = "SimpleLink"
};

/* The underlying socket is "dispatched" to a particular network interface
 * (offloaded or not).
 */
setsockopt(sock, SOL_SOCKET, SO_BINDTODEVICE, &ifreq, sizeof(ifreq));

In case no SO_BINDTODEVICE socket option is used on a socket, the socket will be dispatched according to the default priority and filtering rules on a first socket API call.

API Reference

BSD Sockets

group bsd_sockets

BSD Sockets compatible API.

Defines

ZSOCK_POLLIN
    zsock_poll: Poll for readability

ZSOCK_POLLPRI
    zsock_poll: Compatibility value, ignored

ZSOCK_POLLOUT
    zsock_poll: Poll for writability

ZSOCK_POLLERR
    zsock_poll: Poll results in error condition (output value only)

ZSOCK_POLLHUP
    zsock_poll: Poll detected closed connection (output value only)

ZSOCK_POLLNVAL
    zsock_poll: Invalid socket (output value only)

ZSOCK_MSG_PEEK
    zsock_recv: Read data without removing it from socket input queue

ZSOCK_MSG_TRUNC
    zsock_recv: return the real length of the datagram, even when it was longer than the passed buffer

ZSOCK_MSG_DONTWAIT
    zsock_recv/zsock_send: Override operation to non-blocking
ZSOCK_MSG_WAITALL

zsock_recv: block until the full amount of data can be returned

ZSOCK_SHUT_RD

zsock_shutdown: Shut down for reading

ZSOCK_SHUT_WR

zsock_shutdown: Shut down for writing

ZSOCK_SHUT_RDWR

zsock_shutdown: Shut down for both reading and writing

SOL_TLS

Protocol level for TLS. Here, the same socket protocol level for TLS as in Linux was used.

TLS_PEER_VERIFY_NONE

Peer verification disabled.

TLS_PEER_VERIFY_OPTIONAL

Peer verification optional.

TLS_PEER_VERIFY_REQUIRED

Peer verification required.

TLS_DTLS_ROLE_CLIENT

Client role in a DTLS session.

TLS_DTLS_ROLE_SERVER

Server role in a DTLS session.

TLS_CERT_NOCOPY_NONE

Cert duplicated in heap

TLS_CERT_NOCOPY_OPTIONAL

Cert not copied in heap if DER

TLS_SESSION_CACHE_DISABLED

Disable TLS session caching.

TLS_SESSION_CACHE_ENABLED

Enable TLS session caching.

AI_PASSIVE

Address for bind() (vs for connect())

AI_CANONNAME

Fill in ai_canonname
AI_NUMERICHOST
Assume host address is in numeric notation, don’t DNS lookup

AI_V4MAPPED
May return IPv4 mapped address for IPv6

AI_ALL
May return both native IPv6 and mapped IPv4 address for IPv6

AI_ADDRCONFIG
IPv4/IPv6 support depends on local system config

AI_NUMERICSERV
Assume service (port) is numeric

NI_NUMERICHOST
zsock_getnameinfo(): Resolve to numeric address.

NI_NUMERICSERV
zsock_getnameinfo(): Resolve to numeric port number.

NI_NOFQDN
zsock_getnameinfo(): Return only hostname instead of FQDN

NI_NAMEREQD
zsock_getnameinfo(): Dummy option for compatibility

NI_DGRAM
zsock_getnameinfo(): Dummy option for compatibility

NI_MAXHOST
zsock_getnameinfo(): Max supported hostname length

c_pollfd

c_fcntl

addrlen

POLLIN
POSIX wrapper for ZSOCK_POLLIN

POLLOUT
POSIX wrapper for ZSOCK_POLLOUT

POLLERR
POSIX wrapper for ZSOCK_POLLERR
POLLHUP
    POSIX wrapper for ZSOCK_POLLHUP

POLLNVAL
    POSIX wrapper for ZSOCK_POLLNVAL

MSG_PEEK
    POSIX wrapper for ZSOCK_MSG_PEEK

MSG_TRUNC
    POSIX wrapper for ZSOCK_MSG_TRUNC

MSG_DONTWAIT
    POSIX wrapper for ZSOCK_MSG_DONTWAIT

MSG_WAITALL
    POSIX wrapper for ZSOCK_MSG_WAITALL

SHUT_RD
    POSIX wrapper for ZSOCK_SHUT_RD

SHUT_WR
    POSIX wrapper for ZSOCK_SHUT_WR

SHUT_RDWR
    POSIX wrapper for ZSOCK_SHUT_RDWR

EAI_BADFLAGS
    POSIX wrapper for DNS_EAI_BADFLAGS

EAI_NONAME
    POSIX wrapper for DNS_EAI_NONAME

EAI_AGAIN
    POSIX wrapper for DNS_EAI_AGAIN

EAI_FAIL
    POSIX wrapper for DNS_EAI_FAIL

EAI_NODATA
    POSIX wrapper for DNS_EAI_NODATA

EAI_MEMORY
    POSIX wrapper for DNS_EAI_MEMORY

EAI_SYSTEM
    POSIX wrapper for DNS_EAI_SYSTEM
EAI_SERVICE
   POSIX wrapper for DNS_EAI_SERVICE

EAI_SOCKTYPE
   POSIX wrapper for DNS_EAI_SOCKTYPE

EAI_FAMILY
   POSIX wrapper for DNS_EAI_FAMILY

IFNAMSIZ

SOCKET
   sockopt: Socket-level option

SO_DEBUG
   sockopt: Recording debugging information (ignored, for compatibility)

SO_REUSEADDR
   sockopt: address reuse (ignored, for compatibility)

SO_TYPE
   sockopt: Type of the socket

SO_ERROR
   sockopt: Async error (ignored, for compatibility)

SO_DONTROUTE
   sockopt: Bypass normal routing and send directly to host (ignored, for compatibility)

SO_BROADCAST
   sockopt: Transmission of broadcast messages is supported (ignored, for compatibility)

SO_SNDBUF
   sockopt: Size of socket socket send buffer (ignored, for compatibility)

SO_RCVBUF
   sockopt: Size of socket recv buffer

SO_KEEPALIVE
   sockopt: Enable sending keep-alive messages on connections (ignored, for compatibility)

SO_OOBINLINE
   sockopt: Place out-of-band data into receive stream (ignored, for compatibility)

SO_REUSEPORT
   sockopt: Allow multiple sockets to reuse a single port (ignored, for compatibility)

SO_RCVTIMEO
   sockopt: Receive timeout Applies to receive functions like recv(), but not to connect()
SO_SNDTIMEO
sockopt: Send timeout

SO_BINDTODEVICE
sockopt: Bind a socket to an interface

SO_ACCEPTCONN
sockopt: Socket accepts incoming connections (ignored, for compatibility)

SO_TIMESTAMPING
sockopt: Timestamp TX packets

SO_PROTOCOL
sockopt: Protocol used with the socket

SO_DOMAIN
sockopt: Domain used with SOCKET (ignored, for compatibility)

TCP_NODELAY
End Socket options for SOL_SOCKET level sockopt: Disable TCP buffering (ignored, for compatibility)

IP_TOS
sockopt: Set or receive the Type-Of-Service value for an outgoing packet.

IPV6_V6ONLY
sockopt: Don't support IPv4 access (ignored, for compatibility)

IPV6_TCLASS
sockopt: Set or receive the traffic class value for an outgoing packet.

SO_PRIORITY
sockopt: Socket priority

SO_TXTIME
sockopt: Socket TX time (when the data should be sent)

SCM_TXTIME

SO_SOCKS5
sockopt: Enable SOCKS5 for Socket

ZSOCK_FD_SETSIZE
Number of file descriptors which can be added to zsock_fd_set

fd_set

FD_SETSIZE
zsock_timeval

## Typedefs

typedef struct zsock_fd_set zsock_fd_set

## Functions

void *zsock_get_context_object(int sock)

Obtain a file descriptor's associated net context.

With CONFIG_USERSPACE enabled, the kernel's object permission system must apply to
socket file descriptors. When a socket is opened, by default only the caller has permission,
access by other threads will fail unless they have been specifically granted permission.

This is achieved by tagging data structure definitions that implement the underlying object
associated with a network socket file descriptor with '__net_socket'. All pointers to instances
of these will be known to the kernel as kernel objects with type K_OBJ_NET_SOCKET.

This API is intended for threads that need to grant access to the object associated with a
particular file descriptor to another thread. The returned pointer represents the underlying
K_OBJ_NET_SOCKET and may be passed to APIs like k_object_access_grant().

In a system like Linux which has the notion of threads running in processes in a shared vir-
tual address space, this sort of management is unnecessary as the scope of file descriptors is
implemented at the process level.

However in Zephyr the file descriptor scope is global, and MPU-based systems are not able to
implement a process-like model due to the lack of memory virtualization hardware. They use
discrete object permissions and memory domains instead to define thread access scope.

User threads will have no direct access to the returned object and will fault if they try to access
its memory; the pointer can only be used to make permission assignment calls, which follow
exactly the rules for other kernel objects like device drivers and IPC.

**Parameters**

- sock – file descriptor

**Returns**

pointer to associated network socket object, or NULL if the file descriptor wasn't
valid or the caller had no access permission

int zsock_socket(int family, int type, int proto)

Create a network socket.

See POSIX.1-2017 article for normative description. This function is also exposed as socket() if
CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

If CONFIG_USERSPACE is enabled, the caller will be granted access to the context object
associated with the returned file descriptor.

**See also:**

zsock_get_context_object()

int zsock_socketpair(int family, int type, int proto, int *sv)

Create an unnamed pair of connected sockets.
See POSIX.1-2017 article for normative description. This function is also exposed as `socketpair()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
int zsock_close(int sock)
```

Close a network socket.

Close a network socket. This function is also exposed as `close()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined (in which case it may conflict with generic POSIX `close()` function).

```c
int zsock_shutdown(int sock, int how)
```

Shutdown socket send/receive operations.

See POSIX.1-2017 article for normative description, but currently this function has no effect in Zephyr and provided solely for compatibility with existing code. This function is also exposed as `shutdown()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
int zsock_bind(int sock, const struct sockaddr *addr, socklen_t addrlen)
```

Bind a socket to a local network address.

See POSIX.1-2017 article for normative description. This function is also exposed as `bind()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
int zsock_connect(int sock, const struct sockaddr *addr, socklen_t addrlen)
```

Connect a socket to a peer network address.

See POSIX.1-2017 article for normative description. This function is also exposed as `connect()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
int zsock_listen(int sock, int backlog)
```

Set up a STREAM socket to accept peer connections.

See POSIX.1-2017 article for normative description. This function is also exposed as `listen()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
int zsock_accept(int sock, struct sockaddr *addr, socklen_t *addrlen)
```

Accept a connection on listening socket.

See POSIX.1-2017 article for normative description. This function is also exposed as `accept()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
ssize_t zsock_sendto(int sock, const void *buf, size_t len, int flags, const struct sockaddr *dest_addr, socklen_t addrlen)
```

Send data to an arbitrary network address.

See POSIX.1-2017 article for normative description. This function is also exposed as `sendto()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.

```c
static inline ssize_t zsock_send(int sock, const void *buf, size_t len, int flags)
```

Send data to a connected peer.

See POSIX.1-2017 article for normative description. This function is also exposed as `send()` if `CONFIG_NET_SOCKETS_POSIX_NAMES` is defined.
ssize_t zsock_sendmsg(int sock, const struct msghdr *msg, int flags)
    Send data to an arbitrary network address.

See POSIX.1-2017 article for normative description. This function is also exposed as sendmsg() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

ssize_t zsock_recvfrom(int sock, void *buf, size_t max_len, int flags, struct sockaddr *src_addr, socklen_t *addrlen)
    Receive data from an arbitrary network address.

See POSIX.1-2017 article for normative description. This function is also exposed as recvfrom() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline ssize_t zsock_recv(int sock, void *buf, size_t max_len, int flags)
    Receive data from a connected peer.

See POSIX.1-2017 article for normative description. This function is also exposed as recv() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_fcntl(int sock, int cmd, int flags)
    Control blocking/non-blocking mode of a socket.

This functions allow to (only) configure a socket for blocking or non-blocking operation (O_NONBLOCK). This function is also exposed as fcntl() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX fcntl() function).

int zsock_poll(struct zsock_pollfd *fds, int nfds, int timeout)
    Efficiently poll multiple sockets for events.

See POSIX.1-2017 article for normative description. (In Zephyr this function works only with sockets, not arbitrary file descriptors.) This function is also exposed as poll() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX poll() function).

int zsock_getsockopt(int sock, int level, int optname, void *optval, socklen_t *optlen)
    Get various socket options.

See POSIX.1-2017 article for normative description. In Zephyr this function supports a subset of socket options described by POSIX, but also some additional options available in Linux (some options are dummy and provided to ease porting of existing code). This function is also exposed as getsockopt() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_setsockopt(int sock, int level, int optname, const void *optval, socklen_t optlen)
    Set various socket options.

See POSIX.1-2017 article for normative description. In Zephyr this function supports a subset of socket options described by POSIX, but also some additional options available in Linux (some options are dummy and provided to ease porting of existing code). This function is also exposed as setsockopt() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.
int zsock_getpeername(int sock, struct sockaddr *addr, socklen_t *addrlen)
    Get peer name.

See POSIX.1-2017 article for normative description. This function is also exposed as
getpeername() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getsockname(int sock, struct sockaddr *addr, socklen_t *addrlen)
    Get socket name.

See POSIX.1-2017 article for normative description. This function is also exposed as
getsockname() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_gethostname(char *buf, size_t len)
    Get local host name.

See POSIX.1-2017 article for normative description. This function is also exposed as
gethostname() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline char *zsock_inet_ntop(sa_family_t family, const void *src, char *dst, size_t size)
    Convert network address from internal to numeric ASCII form.

See POSIX.1-2017 article for normative description. This function is also exposed as
inet_ntop() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_inet_pton(sa_family_t family, const char *src, void *dst)
    Convert network address from numeric ASCII form to internal representation.

See POSIX.1-2017 article for normative description. This function is also exposed as
inet_pton() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int zsock_getaddrinfo(const char *host, const char *service, const struct zsock_addrinfo *hints,
                      struct zsock_addrinfo **res)
    Resolve a domain name to one or more network addresses.

See POSIX.1-2017 article for normative description. This function is also exposed as
getaddrinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

void zsock_freeaddrinfo(struct zsock_addrinfo *ai)
    Free results returned by zsock_getaddrinfo()

See POSIX.1-2017 article for normative description. This function is also exposed as
freeaddrinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

const char *zsock_gai_strerror(int errcode)
    Convert zsock_getaddrinfo() error code to textual message.

See POSIX.1-2017 article for normative description. This function is also exposed as
gai_strerror() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.
int zsock_getnameinfo(const struct sockaddr *addr, socklen_t addrlen, char *host, socklen_t hostlen, char *serv, socklen_t servlen, int flags)

Resolve a network address to a domain name or ASCII address.

See POSIX.1-2017 article for normative description. This function is also exposed as getnameinfo() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline int socket(int family, int type, int proto)
 POSIX wrapper for zsock_socket

static inline int socketpair(int family, int type, int proto, int sv[2])
 POSIX wrapper for zsock_socketpair

static inline int close(int sock)
 POSIX wrapper for zsock_close

static inline int shutdown(int sock, int how)
 POSIX wrapper for zsock_shutdown

static inline int bind(int sock, const struct sockaddr *addr, socklen_t addrlen)
 POSIX wrapper for zsock_bind

static inline int connect(int sock, const struct sockaddr *addr, socklen_t addrlen)
 POSIX wrapper for zsock_connect

static inline int listen(int sock, int backlog)
 POSIX wrapper for zsock_listen

static inline int accept(int sock, struct sockaddr *addr, socklen_t *addrlen)
 POSIX wrapper for zsock_accept

static inline ssize_t send(int sock, const void *buf, size_t len, int flags)
 POSIX wrapper for zsock_send

static inline ssize_t recv(int sock, void *buf, size_t max_len, int flags)
 POSIX wrapper for zsock_recv

static inline int zsock_fcntl_wrapper(int sock, int cmd, ...)

static inline ssize_t sendto(int sock, const void *buf, size_t len, int flags, const struct sockaddr *dest_addr, socklen_t addrlen)
 POSIX wrapper for zsock_sendto

static inline ssize_t sendmsg(int sock, const struct msghdr *message, int flags)
 POSIX wrapper for zsock_sendmsg

static inline ssize_t recvfrom(int sock, void *buf, size_t max_len, int flags, struct sockaddr *src_addr, socklen_t *addrlen)
 POSIX wrapper for zsock_recvfrom

static inline int poll(struct zsock_pollfd *fds, int nfds, int timeout)
 POSIX wrapper for zsock_poll

static inline int getsockopt(int sock, int level, int optname, void *optval, socklen_t *optlen)
 POSIX wrapper for zsock_getsockopt

static inline int setsockopt(int sock, int level, int optname, const void *optval, socklen_t optlen)
 POSIX wrapper for zsock_setsockopt

static inline int getpeername(int sock, struct sockaddr *addr, socklen_t *addrlen)
 POSIX wrapper for zsock_getpeername
static inline int getsockname(int sock, struct sockaddr *addr, socklen_t *addrlen)
    POSIX wrapper for zsock_getsockname

static inline int getaddrinfo(const char *host, const char *service, const struct zsock_addrinfo *hints, struct zsock_addrinfo **res)
    POSIX wrapper for zsock_getaddrinfo

static inline void freeaddrinfo(struct zsock_addrinfo *ai)
    POSIX wrapper for zsock_freeaddrinfo

static inline const char *gai_strerror(int errcode)
    POSIX wrapper for zsock_gai_strerror

static inline int getnameinfo(const struct sockaddr *addr, socklen_t addrlen, char *host, socklen_t hostlen, char *serv, socklen_t servlen, int flags)
    POSIX wrapper for zsock_getnameinfo

static inline const char *gethostname(char *buf, size_t len)
    POSIX wrapper for zsock_gethostname

static inline int inet_pton(sa_family_t family, const char *src, void *dst)
    POSIX wrapper for zsock_inet_pton

static inline char *inet_ntop(sa_family_t family, const void *src, char *dst, size_t size)
    POSIX wrapper for zsock_inet_ntop

int zsock_select(int nfds, zsock_fd_set *readfds, zsock_fd_set *writefds, zsock_fd_set *exceptfds, struct zsock_timeval *timeout)
    Legacy function to poll multiple sockets for events.

See POSIX.1-2017 article for normative description. This function is provided to ease porting of existing code and not recommended for usage due to its inefficiency, use zsock_poll() instead. In Zephyr this function works only with sockets, not arbitrary file descriptors. This function is also exposed as select() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined (in which case it may conflict with generic POSIX select() function).

void ZSOCK_FD_ZERO(zsock_fd_set *set)
    Initialize (clear) fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as FD_ZERO() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

int ZSOCK_FD_ISSET(int fd, zsock_fd_set *set)
    Check whether socket is a member of fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as FD_ISSET() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

void ZSOCK_FD_CLR(int fd, zsock_fd_set *set)
    Remove socket from fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as FD_CLR() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.
void ZSOCK_FD_SET(int fd, zsock_fd_set *set)
       Add socket to fd_set.

       See POSIX.1-2017 article for normative description. This function is also exposed as FD_SET() if CONFIG_NET_SOCKETS_POSIX_NAMES is defined.

static inline int select(int nfds, zsock_fd_set *readfds, zsock_fd_set *writefds, zsock_fd_set *exceptfds, struct timeval *timeout)

static inline void FD_ZERO(zsock_fd_set *set)

static inline int FD_ISSET(int fd, zsock_fd_set *set)

static inline void FD_CLR(int fd, zsock_fd_set *set)

static inline void FD_SET(int fd, zsock_fd_set *set)

struct zsock_pollfd
       #include <socket.h>

struct zsock_addrinfo
       #include <socket.h>

struct ifreq
       #include <socket.h> Interface description structure

struct zsock_fd_set
       #include <socket_select.h>

TLS Credentials

group tls_credentials
       TLS credentials management.

Typedefs

typedef int sec_tag_t
       Secure tag, a reference to TLS credential
       Secure tag can be used to reference credential after it was registered in the system.

Note: Some TLS credentials come in pairs:

• TLS_CREDENTIAL_SERVER_CERTIFICATE with TLS_CREDENTIAL_PRIVATE_KEY,
• TLS_CREDENTIAL_PSK with TLS_CREDENTIAL_PSK_ID. Such pairs of credentials must be assigned the same secure tag to be correctly handled in the system.
enum tls_credential_type
    TLS credential types

Values:

enumerator TLS_CREDENTIAL_NONE
    Unspecified credential.

enumerator TLS_CREDENTIAL_CA_CERTIFICATE
    A trusted CA certificate. Use this to authenticate remote servers. Used with certificate-based ciphersuites.

enumerator TLS_CREDENTIAL_SERVER_CERTIFICATE
    A public server certificate. Use this to register your own server certificate. Should be registered together with a corresponding private key. Used with certificate-based ciphersuites.

enumerator TLS_CREDENTIAL_PRIVATE_KEY
    Private key. Should be registered together with a corresponding public certificate. Used with certificate-based ciphersuites.

enumerator TLS_CREDENTIAL_PSK
    Pre-shared key. Should be registered together with a corresponding PSK identity. Used with PSK-based ciphersuites.

enumerator TLS_CREDENTIAL_PSK_ID
    Pre-shared key identity. Should be registered together with a corresponding PSK. Used with PSK-based ciphersuites.

Functions

int tls_credential_add(sec_tag_t tag, enum tls_credential_type type, const void *cred, size_t credlen)

Add a TLS credential.
This function adds a TLS credential, that can be used by TLS/DTLS for authentication.

Parameters

• tag – A security tag that credential will be referenced with.
• type – A TLS/DTLS credential type.
• cred – A TLS/DTLS credential.
• credlen – A TLS/DTLS credential length.

Return values

• 0 – TLS credential successfully added.
• -EACCES – Access to the TLS credential subsystem was denied.
• -ENOMEM – Not enough memory to add new TLS credential.
• -EEXIST – TLS credential of specific tag and type already exists.
int tls_credential_get (sec_tag_t tag, enum tls_credential_type type, void *cred, size_t *credlen)
Get a TLS credential.

This function gets an already registered TLS credential, referenced by tag secure tag of type.

Parameters
• tag – A security tag of requested credential.
• type – A TLS/DTLS credential type of requested credential.
• cred – A buffer for TLS/DTLS credential.
• credlen – A buffer size on input. TLS/DTLS credential length on output.

Return values
• 0 – TLS credential successfully obtained.
• -EACCES – Access to the TLS credential subsystem was denied.
• -ENOENT – Requested TLS credential was not found.
• -EFBIG – Requested TLS credential does not fit in the buffer provided.

int tls_credential_delete (sec_tag_t tag, enum tls_credential_type type)
Delete a TLS credential.

This function removes a TLS credential, referenced by tag secure tag of type.

Parameters
• tag – A security tag corresponding to removed credential.
• type – A TLS/DTLS credential type of removed credential.

Return values
• 0 – TLS credential successfully deleted.
• -EACCES – Access to the TLS credential subsystem was denied.
• -ENOENT – Requested TLS credential was not found.

IPv4/IPv6 Primitives and Helpers

Overview Miscellaneous defines and helper functions for IP addresses and IP protocols.

API Reference

group ip_4_6
IPv4/IPv6 primitives and helpers.

Defines

PF_UNSPEC
Unspecified protocol family.
PF_INET
   IP protocol family version 4.

PF_INET6
   IP protocol family version 6.

PF_PACKET
   Packet family.

PF_CAN
   Controller Area Network.

PF_NET_MGMT
   Network management info.

PF_LOCAL
   Inter-process communication.

PF_UNIX
   Inter-process communication.

AF_UNSPEC
   Unspecified address family.

AF_INET
   IP protocol family version 4.

AF_INET6
   IP protocol family version 6.

AF_PACKET
   Packet family.

AF_CAN
   Controller Area Network.

AF_NET_MGMT
   Network management info.

AF_LOCAL
   Inter-process communication.

AF_UNIX
   Inter-process communication.

ntohs(x)
   Convert 16-bit value from network to host byte order.

Parameters
   • x – The network byte order value to convert.
Returns
Host byte order value.

\texttt{ntohl}(x)
Convert 32-bit value from network to host byte order.

\textbf{Parameters}
\begin{itemize}
\item $x$ – The network byte order value to convert.
\end{itemize}

\textbf{Returns}
Host byte order value.

\texttt{ntohl(l)}(x)
Convert 64-bit value from network to host byte order.

\textbf{Parameters}
\begin{itemize}
\item $x$ – The network byte order value to convert.
\end{itemize}

\textbf{Returns}
Host byte order value.

\texttt{htons}(x)
Convert 16-bit value from host to network byte order.

\textbf{Parameters}
\begin{itemize}
\item $x$ – The host byte order value to convert.
\end{itemize}

\textbf{Returns}
Network byte order value.

\texttt{htonl}(x)
Convert 32-bit value from host to network byte order.

\textbf{Parameters}
\begin{itemize}
\item $x$ – The host byte order value to convert.
\end{itemize}

\textbf{Returns}
Network byte order value.

\texttt{htonl}(l)(x)
Convert 64-bit value from host to network byte order.

\textbf{Parameters}
\begin{itemize}
\item $x$ – The host byte order value to convert.
\end{itemize}

\textbf{Returns}
Network byte order value.

\texttt{NET_IPV6_ADDR\_SIZE}

\texttt{NET_IPV4\_ADDR\_SIZE}

\texttt{ALIGN\_H}(x)

\texttt{ALIGN\_D}(x)

\texttt{CMSG\_FIRSTHDR}(msghdr)

\texttt{CMSG\_NXTHDR}(msghdr, cmsg)

\texttt{CMSG\_DATA}(cmsg)

6.2. Networking
CMG_SPACE(length)
CMG_LEN(length)

INET_ADDRSTRLEN
Max length of the IPv4 address as a string. Defined by POSIX.

INET6_ADDRSTRLEN
Max length of the IPv6 address as a string. Takes into account possible mapped IPv4 addresses.

NET_MAX_PRIORITIES

net_ipaddr_copy(dest, src)
Copy an IPv4 or IPv6 address.

Parameters
• dest – Destination IP address.
• src – Source IP address.

Returns
Destination address.

Typedefs

typedef unsigned short int sa_family_t
Socket address family type

typedef size_t socklen_t
Length of a socket address

Enums

enum net_ip_protocol
Protocol numbers from IANA/BSD
Values:

enumerator IPPROTO_IP = 0
IP protocol (pseudo-val for setsockopt())

enumerator IPPROTO_ICMP = 1
ICMP protocol

enumerator IPPROTO_IGMP = 2
IGMP protocol

enumerator IPPROTO_IPIP = 4
IPIP tunnels
enumerator IPPROTO_TCP = 6
TCP protocol

enumerator IPPROTO_UDP = 17
UDP protocol

enumerator IPPROTO_IPV6 = 41
IPv6 protocol

enumerator IPPROTO_ICMPV6 = 58
ICMPv6 protocol

enumerator IPPROTO_RAW = 255
RAW IP packets

enum net_ip_protocol_secure
Protocol numbers for TLS protocols

Values:

enumerator IPPROTO_TLS_1_0 = 256
TLS 1.0 protocol

enumerator IPPROTO_TLS_1_1 = 257
TLS 1.1 protocol

enumerator IPPROTO_TLS_1_2 = 258
TLS 1.2 protocol

enumerator IPPROTO_DTLS_1_0 = 272
DTLS 1.0 protocol

enumerator IPPROTO_DTLS_1_2 = 273
DTLS 1.2 protocol

enum net_sock_type
Socket type

Values:

enumerator SOCK_STREAM = 1
Stream socket type

enumerator SOCK_DGRAM
Datagram socket type

enumerator SOCK_RAW
RAW socket type
enum net_ip_mtu

Values:

enumerator NET_IPV6_MTU = 1280
IPv6 MTU length. We must be able to receive this size IPv6 packet without fragmentation.

enumerator NET_IPV4_MTU = 576
IPv4 MTU length. We must be able to receive this size IPv4 packet without fragmentation.

enum net_priority

Network packet priority settings described in IEEE 802.1Q Annex I.1

Values:

enumerator NET_PRIORITY_BK = 1
Background (lowest)

enumerator NET_PRIORITY_BE = 0
Best effort (default)

enumerator NET_PRIORITY_EE = 2
Excellent effort

enumerator NET_PRIORITY_CA = 3
Critical applications (highest)

enumerator NET_PRIORITY_VI = 4
Video, < 100 ms latency and jitter

enumerator NET_PRIORITY_VO = 5
Voice, < 10 ms latency and jitter

enumerator NET_PRIORITY_IC = 6
Internetwork control

enumerator NET_PRIORITY_NC = 7
Network control

enum net_addr_state

What is the current state of the network address

Values:

enumerator NET_ADDR_ANY_STATE = -1
Default (invalid) address type

enumerator NET_ADDR_TENTATIVE = 0
Tentative address
enumerator NET_ADDR_PREFERRED
    Preferred address

enumerator NET_ADDR_DEPRECATED
    Deprecated address

def enum net_addr_type
    How the network address is assigned to network interface
    Values:

    enumerator NET_ADDR_ANY = 0
        Default value. This is not a valid value.

    enumerator NET_ADDR_AUTOCONF
        Auto configured address

    enumerator NET_ADDR_DHCP
        Address is from DHCP

    enumerator NET_ADDR_MANUAL
        Manually set address

    enumerator NET_ADDR_OVERRIDABLE
        Manually set address which is overridable by DHCP

Functions

static inline bool net_ipv6_is_addr_loopback(struct in6_addr *addr)
    Check if the IPv6 address is a loopback address (::1).

    Parameters
    • addr – IPv6 address

    Returns
    True if address is a loopback address, False otherwise.

static inline bool net_ipv6_is_addr_mcast(const struct in6_addr *addr)
    Check if the IPv6 address is a multicast address.

    Parameters
    • addr – IPv6 address

    Returns
    True if address is a multicast address, False otherwise.

struct net_if *net_if_ipv6_addr_lookup(const struct in6_addr *addr, struct net_if **iface)

static inline bool net_ipv6_is_my_addr(struct in6_addr *addr)
    Check if IPv6 address is found in one of the network interfaces.

    Parameters
    • addr – IPv6 address
Returns
True if address was found, False otherwise.

struct net_if_mcast_addr *net_if_ipv6_maddr_lookup(const struct in6_addr *addr, struct net_if **iface)

static inline bool net_ipv6_is_my_maddr(struct in6_addr *maddr)
Check if IPv6 multicast address is found in one of the network interfaces.
Parameters
• maddr – Multicast IPv6 address

Returns
True if address was found, False otherwise.

static inline bool net_ipv6_is_prefix(const uint8_t *addr1, const uint8_t *addr2, uint8_t length)
Check if two IPv6 addresses are same when compared after prefix mask.
Parameters
• addr1 – First IPv6 address.
• addr2 – Second IPv6 address.
• length – Prefix length (max length is 128).

Returns
True if IPv6 prefixes are the same, False otherwise.

static inline bool net_ipv4_is_addr_loopback(struct in_addr *addr)
Check if the IPv4 address is a loopback address (127.0.0.0/8).
Parameters
• addr – IPv4 address

Returns
True if address is a loopback address, False otherwise.

static inline bool net_ipv4_is_addr_unspecified(const struct in_addr *addr)
Check if the IPv4 address is unspecified (all bits zero)
Parameters
• addr – IPv4 address.

Returns
True if the address is unspecified, false otherwise.

static inline bool net_ipv4_is_addr_mcast(const struct in_addr *addr)
Check if the IPv4 address is a multicast address.
Parameters
• addr – IPv4 address

Returns
True if address is multicast address, False otherwise.

static inline bool net_ipv4_is_ll_addr(const struct in_addr *addr)
Check if the given IPv4 address is a link local address.
Parameters
• addr – A valid pointer on an IPv4 address

Returns
True if it is, false otherwise.
static inline void net_ipv4_addr_copy_raw(uint8_t *dest, const uint8_t *src)
Copy an IPv4 address raw buffer.

Parameters
• dest – Destination IP address.
• src – Source IP address.

static inline void net_ipv6_addr_copy_raw(uint8_t *dest, const uint8_t *src)
Copy an IPv6 address raw buffer.

Parameters
• dest – Destination IP address.
• src – Source IP address.

static inline bool net_ipv4_addr_cmp(const struct in_addr *addr1, const struct in_addr *addr2)
Compare two IPv4 addresses.

Parameters
• addr1 – Pointer to IPv4 address.
• addr2 – Pointer to IPv4 address.

Returns
True if the addresses are the same, false otherwise.

static inline bool net_ipv4_addr_cmp_raw(const uint8_t *addr1, const uint8_t *addr2)
Compare two raw IPv4 address buffers.

Parameters
• addr1 – Pointer to IPv4 address buffer.
• addr2 – Pointer to IPv4 address buffer.

Returns
True if the addresses are the same, false otherwise.

static inline bool net_ipv6_addr_cmp(const struct in6_addr *addr1, const struct in6_addr *addr2)
Compare two IPv6 addresses.

Parameters
• addr1 – Pointer to IPv6 address.
• addr2 – Pointer to IPv6 address.

Returns
True if the addresses are the same, false otherwise.

static inline bool net_ipv6_addr_cmp_raw(const uint8_t *addr1, const uint8_t *addr2)
Compare two raw IPv6 address buffers.

Parameters
• addr1 – Pointer to IPv6 address buffer.
• addr2 – Pointer to IPv6 address buffer.

Returns
True if the addresses are the same, false otherwise.
static inline bool net_ipv6_is_ll_addr(const struct in6_addr *addr)
Check if the given IPv6 address is a link local address.

Parameters
• addr – A valid pointer on an IPv6 address

Returns
True if it is, false otherwise.

static inline bool net_ipv6_is_ula_addr(const struct in6_addr *addr)
Check if the given IPv6 address is a unique local address.

Parameters
• addr – A valid pointer on an IPv6 address

Returns
True if it is, false otherwise.

const struct in6_addr *net_ipv6_unspecified_address(void)
Return pointer to any (all bits zeros) IPv6 address.

Returns
Any IPv6 address.

const struct in_addr *net_ipv4_unspecified_address(void)
Return pointer to any (all bits zeros) IPv4 address.

Returns
Any IPv4 address.

const struct in_addr *net_ipv4_broadcast_address(void)
Return pointer to broadcast (all bits ones) IPv4 address.

Returns
Broadcast IPv4 address.

bool net_if_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
static inline bool net_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)
Check if the given address belongs to same subnet that has been configured for the interface.

Parameters
• iface – A valid pointer on an interface
• addr – IPv4 address

Returns
True if address is in same subnet, false otherwise.

bool net_if_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
static inline bool net_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)
Check if the given IPv4 address is a broadcast address.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr – IPv4 address

Returns
True if address is a broadcast address, false otherwise.

struct net_if_addr *net_if_ipv4_addr_lookup(const struct in_addr *addr, struct net_if **iface)
static inline bool net_ipv4_is_my_addr(const struct in_addr *addr)
    Check if the IPv4 address is assigned to any network interface in the system.

    Parameters
    • addr – A valid pointer on an IPv4 address

    Returns
    True if IPv4 address is found in one of the network interfaces, False otherwise.

static inline bool net_ipv6_is_addr_unspecified(const struct in6_addr *addr)
    Check if the IPv6 address is unspecified (all bits zero)

    Parameters
    • addr – IPv6 address.

    Returns
    True if the address is unspecified, false otherwise.

static inline bool net_ipv6_is_addr_solicited_node(const struct in6_addr *addr)
    Check if the IPv6 address is solicited node multicast address FF02:0:0:0:0:1:FFXX:XXXX defined in RFC 3513.

    Parameters
    • addr – IPv6 address.

    Returns
    True if the address is solicited node address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_scope(const struct in6_addr *addr, int scope)
    Check if the IPv6 address is a given scope multicast address (FFyx::).

    Parameters
    • addr – IPv6 address
    • scope – Scope to check

    Returns
    True if the address is in given scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_global(const struct in6_addr *addr)
    Check if the IPv6 address is a global multicast address (FFxE::/16).

    Parameters
    • addr – IPv6 address.

    Returns
    True if the address is global multicast address, false otherwise.
static inline bool net_ipv6_is_addr_mcast_iface(const struct in6_addr *addr)

Check if the IPv6 address is a interface scope multicast address (FFx1:).

Parameters
• addr – IPv6 address.

Returns
True if the address is a interface scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_link(const struct in6_addr *addr)

Check if the IPv6 address is a link local scope multicast address (FFx2:).

Parameters
• addr – IPv6 address.

Returns
True if the address is a link local scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_mesh(const struct in6_addr *addr)

Check if the IPv6 address is a mesh-local scope multicast address (FFx3:).

Parameters
• addr – IPv6 address.

Returns
True if the address is a mesh-local scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_site(const struct in6_addr *addr)

Check if the IPv6 address is a site scope multicast address (FFx5:).

Parameters
• addr – IPv6 address.

Returns
True if the address is a site scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_org(const struct in6_addr *addr)

Check if the IPv6 address is an organization scope multicast address (FFx8:).

Parameters
• addr – IPv6 address.

Returns
True if the address is an organization scope multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_group(const struct in6_addr *addr, const struct in6_addr *group)

Check if the IPv6 address belongs to certain multicast group.

Parameters
• addr – IPv6 address.
• group – Group id IPv6 address, the values must be in network byte order

Returns
True if the IPv6 multicast address belongs to given multicast group, false other-
wise.

static inline bool net_ipv6_is_addr_mcast_all_nodes_group(const struct in6_addr *addr)

Check if the IPv6 address belongs to the all nodes multicast group.

Parameters
• addr – IPv6 address
Returns
True if the IPv6 multicast address belongs to the all nodes multicast group, false otherwise.

static inline bool net_ipv6_is_addr_mcast_iface_all_nodes(const struct in6_addr *addr)
Check if the IPv6 address is a interface scope all nodes multicast address (FF01::1).

Parameters
• addr – IPv6 address.

Returns
True if the address is a interface scope all nodes multicast address, false otherwise.

static inline bool net_ipv6_is_addr_mcast_link_all_nodes(const struct in6_addr *addr)
Check if the IPv6 address is a link local scope all nodes multicast address (FF02::1).

Parameters
• addr – IPv6 address.

Returns
True if the address is a link local scope all nodes multicast address, false otherwise.

static inline void net_ipv6_addr_create_solicited_node(const struct in6_addr *src, struct in6_addr *dst)
Create solicited node IPv6 multicast address FF02:0:0:0:1:FFXX:XXXX defined in RFC 3513.

Parameters
• src – IPv6 address.
• dst – IPv6 address.

static inline void net_ipv6_addr_create(struct in6_addr *addr, uint16_t addr0, uint16_t addr1,
uint16_t addr2, uint16_t addr3, uint16_t addr4,
uint16_t addr5, uint16_t addr6, uint16_t addr7)
Construct an IPv6 address from eight 16-bit words.

Parameters
• addr – IPv6 address
• addr0 – 16-bit word which is part of the address
• addr1 – 16-bit word which is part of the address
• addr2 – 16-bit word which is part of the address
• addr3 – 16-bit word which is part of the address
• addr4 – 16-bit word which is part of the address
• addr5 – 16-bit word which is part of the address
• addr6 – 16-bit word which is part of the address
• addr7 – 16-bit word which is part of the address

static inline void net_ipv6_addr_create_ll_allnodes_mcast(struct in6_addr *addr)
Create link local allnodes multicast IPv6 address.

Parameters
• addr – IPv6 address
static inline void net_ipv6_addr_create_ll_allrouters_mcast(struct in6_addr *addr)
Create link local allrouters multicast IPv6 address.

Parameters
• addr – IPv6 address

static inline void net_ipv6_addr_create_iid(struct in6_addr *addr, struct net_linkaddr *lladdr)
Create IPv6 address interface identifier.

Parameters
• addr – IPv6 address
• lladdr – Link local address

static inline bool net_ipv6_addr_based_on_ll(const struct in6_addr *addr, const struct net_linkaddr *lladdr)
Check if given address is based on link layer address.

Returns
True if it is, False otherwise

static inline struct sockaddr_in6 *net_sin6(const struct sockaddr *addr)
Get sockaddr_in6 from sockaddr. This is a helper so that the code calling this function can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to IPv6 socket address

static inline struct sockaddr_in *net_sin(const struct sockaddr *addr)
Get sockaddr_in from sockaddr. This is a helper so that the code calling this function can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to IPv4 socket address

static inline struct sockaddr_in6_ptr *net_sin6_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_in6_ptr from sockaddr_ptr. This is a helper so that the code calling this function can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to IPv6 socket address

static inline struct sockaddr_in_ptr *net_sin_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_in_ptr from sockaddr_ptr. This is a helper so that the code calling this function can be made shorter.

Parameters
• addr – Socket address

Returns
Pointer to IPv4 socket address
static inline struct sockaddr_ll_ptr *net_sll_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_ll_ptr from sockaddr_ptr. This is a helper so that the code calling this function can be made shorter.

**Parameters**
- addr – Socket address

**Returns**
Pointer to linklayer socket address

static inline struct sockaddr_can_ptr *net_can_ptr(const struct sockaddr_ptr *addr)
Get sockaddr_can_ptr from sockaddr_ptr. This is a helper so that the code needing this functionality can be made shorter.

**Parameters**
- addr – Socket address

**Returns**
Pointer to CAN socket address

int net_addr_pton(sa_family_t family, const char *src, void *dst)
Convert a string to IP address.

**Parameters**
- family – IP address family (AF_INET or AF_INET6)
- src – IP address in a null terminated string
- dst – Pointer to struct in_addr if family is AF_INET or pointer to struct in6_addr if family is AF_INET6

**Returns**
0 if ok, < 0 if error

char *net_addr_ntop(sa_family_t family, const void *src, char *dst, size_t size)
Convert IP address to string form.

**Parameters**
- family – IP address family (AF_INET or AF_INET6)
- src – Pointer to struct in_addr if family is AF_INET or pointer to struct in6_addr if family is AF_INET6
- dst – Buffer for IP address as a null terminated string
- size – Number of bytes available in the buffer

**Returns**
dst pointer if ok, NULL if error

bool net_ipaddr_parse(const char *str, size_t str_len, struct sockaddr *addr)
Parse a string that contains either IPV4 or IPV6 address and optional port, and store the information in user supplied sockaddr struct.

Syntax of the IP address string: 192.0.2.1:80 192.0.2.42 2001:db8::2 2001:db::42 Note that the str_len parameter is used to restrict the amount of characters that are checked. If the string does not contain port number, then the port number in sockaddr is not modified.
Parameters
- str – String that contains the IP address.
- str_len – Length of the string to be parsed.
- addr – Pointer to user supplied struct sockaddr.

Returns
True if parsing could be done, false otherwise.

static inline int32_t net_tcp_seq_cmp(uint32_t seq1, uint32_t seq2)
Compare TCP sequence numbers.
This function compares TCP sequence numbers, accounting for wraparound effects.

Parameters
- seq1 – First sequence number
- seq2 – Seconds sequence number

Returns
< 0 if seq1 < seq2, 0 if seq1 == seq2, > 0 if seq > seq2

static inline bool net_tcp_seq_greater(uint32_t seq1, uint32_t seq2)
Check that one TCP sequence number is greater.
This is convenience function on top of net_tcp_seq_cmp().

Parameters
- seq1 – First sequence number
- seq2 – Seconds sequence number

Returns
True if seq > seq2

int net_bytes_from_str(uint8_t *buf, int buf_len, const char *src)
Convert a string of hex values to array of bytes.
The syntax of the string is “ab:02:98:fa:42:01”

Parameters
- buf – Pointer to memory where the bytes are written.
- buf_len – Length of the memory area.
- src – String of bytes.

Returns
0 if ok, <0 if error

int net_tx_priority2tc(enum net_priority prio)
Convert Tx network packet priority to traffic class so we can place the packet into correct Tx queue.

Parameters
- prio – Network priority

Returns
Tx traffic class that handles that priority network traffic.

int net_rx_priority2tc(enum net_priority prio)
Convert Rx network packet priority to traffic class so we can place the packet into correct Rx queue.

Parameters
• prio – Network priority

**Returns**
Rx traffic class that handles that priority network traffic.

```c
static inline enum net_priority net_vlan2priority(uint8_t priority)
```

Convert network packet VLAN priority to network packet priority so we can place the packet into correct queue.

**Parameters**
• priority – VLAN priority

**Returns**
Network priority

```c
static inline uint8_t net_priority2vlan(enum net_priority priority)
```

Convert network packet priority to network packet VLAN priority.

**Parameters**
• priority – Packet priority

**Returns**
VLAN priority (PCP)

```c
const char *net_family2str(sa_family_t family)
```

Return network address family value as a string. This is only usable for debugging.

**Parameters**
• family – Network address family code

**Returns**
Network address family as a string, or NULL if family is unknown.

```c
struct in6_addr
    #include <net_ip.h> IPv6 address struct
```

```c
struct in_addr
    #include <net_ip.h> IPv4 address struct
```

```c
struct sockaddr_in6
    #include <net_ip.h> Socket address struct for IPv6.
```

```c
struct sockaddr_in6_ptr
    #include <net_ip.h>
```

```c
struct sockaddr_in
    #include <net_ip.h> Socket address struct for IPv4.
```

```c
struct sockaddr_in_ptr
    #include <net_ip.h>
```

```c
struct sockaddr_ll
    #include <net_ip.h> Socket address struct for packet socket.
```

```c
struct sockaddr_ll_ptr
    #include <net_ip.h>
```

6.2. Networking 1777
struct sockaddr_can_ptr
#include <net_ip.h>

struct iovec
#include <net_ip.h>

struct msghdr
#include <net_ip.h>

struct cmsghdr
#include <net_ip.h>

struct sockaddr
#include <net_ip.h> Generic sockaddr struct. Must be cast to proper type.

struct net_tuple
#include <net_ip.h> IPv6/IPv4 network connection tuple

Public Members

struct net_addr *remote_addr
IPv6/IPv4 remote address

struct net_addr *local_addr
IPv6/IPv4 local address

uint16_t remote_port
UDP/TCP remote port

uint16_t local_port
UDP/TCP local port

enum net_ip_protocol ip_proto
IP protocol

DNS Resolve

- **Overview**
  The DNS resolver implements a basic DNS resolver according to IETF RFC1035 on Domain Implementation and Specification. Supported DNS answers are IPv4/IPv6 addresses and CNAME.

  If a CNAME is received, the DNS resolver will create another DNS query. The number of additional queries is controlled by the CONFIG_DNS_RESOLVER_ADDITIONAL_QUERIES Kconfig variable.
The multicast DNS (mDNS) client resolver support can be enabled by setting `CONFIG_MDNS_RESOLVER` Kconfig option. See IETF RFC6762 for more details about mDNS.

The link-local multicast name resolution (LLMNR) client resolver support can be enabled by setting the `CONFIG_LLMNR_RESOLVER` Kconfig variable. See IETF RFC4795 for more details about LLMNR.

For more information about DNS configuration variables, see: subsys/net/lib/dns/Kconfig. The DNS resolver API can be found at include/zephyr/net/dns_resolve.h.

**Sample usage**  See DNS resolve sample application for details.

**API Reference**

*group dns_resolve*

DNS resolving library.

**Defines**

`DNS_MAX_NAME_SIZE`

Max size of the resolved name.

**Typedefs**

typedef void (*dns_resolve_cb_t)(enum dns_resolve_status status, struct dns_addrinfo *info, void *user_data)

DNS resolve callback.

The DNS resolve callback is called after a successful DNS resolving. The resolver can call this callback multiple times, one for each resolved address.

**Param status**

The status of the query: DNS_EAI_INPROGRESS returned for each resolved address DNS_EAI_ALLDONE mark end of the resolving, info is set to NULL in this case DNS_EAI_CANCELED if the query was canceled manually or time-out happened DNS_EAI_FAIL if the name cannot be resolved by the server DNS_EAI_NODATA if there is no such name other values means that an error happened.

**Param info**

Query results are stored here.

**Param user_data**

The user data given in `dns_resolve_name()` call.

**Enums**

enum dns_query_type

DNS query type enum

*Values:*

enumerator DNS_QUERY_TYPE_A = 1

IPv4 query
enumerator DNS_QUERY_TYPE_AAAA = 28
IPv6 query

denum dns_resolve_status
  Status values for the callback.
  Values:

  enumerator DNS_EAI_BADFLAGS = -1
     Invalid value for ai_flags field

  enumerator DNS_EAI_NONAME = -2
     NAME or SERVICE is unknown

  enumerator DNS_EAI_AGAIN = -3
     Temporary failure in name resolution

  enumerator DNS_EAI_FAIL = -4
     Non-recoverable failure in name res

  enumerator DNS_EAI_NODATA = -5
     No address associated with NAME

  enumerator DNS_EAI_FAMILY = -6
     ai_family not supported

  enumerator DNS_EAI_SOCKTYPE = -7
     ai_socktype not supported

  enumerator DNS_EAI_SERVICE = -8
     SRV not supported for ai_socktype

  enumerator DNS_EAI_ADDRFAMILY = -9
     Address family for NAME not supported

  enumerator DNS_EAI_MEMORY = -10
     Memory allocation failure

  enumerator DNS_EAI_SYSTEM = -11
     System error returned in errno

  enumerator DNS_EAI_OVERFLOW = -12
     Argument buffer overflow

  enumerator DNS_EAI_INPROGRESS = -100
     Processing request in progress

  enumerator DNS_EAI_CANCELED = -101
     Request canceled
enumerator DNS_EAI_NOTCANCELED = -102
    Request not canceled
enumerator DNS_EAI_ALLDONE = -103
    All requests done
enumerator DNS_EAI_IDN_ENCODE = -105
    IDN encoding failed

enum dns_resolve_context_state
    Values:
    enumerator DNS_RESOLVE_CONTEXT_ACTIVE
    enumerator DNS_RESOLVE_CONTEXT_DEACTIVATING
    enumerator DNS_RESOLVE_CONTEXT_INACTIVE

Functions

int dns_resolve_init(struct dns_resolve_context *ctx, const char *dns_servers_str[], const struct sockaddr *dns_servers_sa[])
    Init DNS resolving context.
    This function sets the DNS server address and initializes the DNS context that is used by the actual resolver. DNS server addresses can be specified either in textual form, or as struct sockaddr (or both). Note that the recommended way to resolve DNS names is to use the dns_get_addr_info() API. In that case user does not need to call dns_resolve_init() as the DNS servers are already setup by the system.

Parameters
    • ctx – DNS context. If the context variable is allocated from the stack, then the variable needs to be valid for the whole duration of the resolving. Caller does not need to fill the variable beforehand or edit the context afterwards.
    • dns_servers_str – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4: 10.0.9.1 IPv4 + port: 10.0.9.1:5353 IPv6: 2001:db8::22:42 IPv6 + port: [2001:db8::22:42]:5353
    • dns_servers_sa – DNS server addresses as struct sockaddr. The array is NULL terminated. Port numbers are optional in struct sockaddr, the default will be used if set to 0.

Returns
    0 if ok, <0 if error.

int dns_resolve_close(struct dns_resolve_context *ctx)
    Close DNS resolving context.
    This releases DNS resolving context and marks the context unusable. Caller must call the dns_resolve_init() again to make context usable.

Parameters
    • ctx – DNS context
Returns
0 if ok, <0 if error.

int dns_resolve_reconfigure(struct dns_resolve_context *ctx, const char *servers_str[], const struct sockaddr *servers_sa[])

Reconfigures DNS resolving context.

Parameters
• ctx – DNS context
• servers_str – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4 : 10.0.9.1 IPv4 + port : 10.0.9.1:5353 IPv6 : 2001:db8::22:42 IPv6 + port : [2001:db8::22:42]:5353
• servers_sa – DNS server addresses as struct sockaddr. The array is NULL terminated. Port numbers are optional in struct sockaddr, the default will be used if set to 0.

Returns
0 if ok, <0 if error.

int dns_resolve_cancel(struct dns_resolve_context *ctx, uint16_t dns_id)

Cancel a pending DNS query.

This releases DNS resources used by a pending query.

Parameters
• ctx – DNS context
• dns_id – DNS id of the pending query

Returns
0 if ok, <0 if error.

int dns_resolve_cancel_with_name(struct dns_resolve_context *ctx, uint16_t dns_id, const char *query_name, enum dns_query_type query_type)

Cancel a pending DNS query using id, name and type.

This releases DNS resources used by a pending query.

Parameters
• ctx – DNS context
• dns_id – DNS id of the pending query
• query_name – Name of the resource we are trying to query (hostname)
• query_type – Type of the query (A or AAAA)

Returns
0 if ok, <0 if error.

int dns_resolve_name(struct dns_resolve_context *ctx, const char *query, enum dns_query_type type, uint16_t *dns_id, dns_resolve_cb_t cb, void *user_data, int32_t timeout)

Resolve DNS name.

This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response.

Parameters
Zephyr Project Documentation, Release 3.2.99

• **ctx** – DNS context
• **query** – What the caller wants to resolve.
• **type** – What kind of data the caller wants to get.
• **dns_id** – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
• **cb** – Callback to call after the resolving has finished or timeout has happened.
• **user_data** – The user data.
• **timeout** – The timeout value for the query. Possible values: SYS_FOREVER_MS: the query is tried forever, user needs to cancel it manually if it takes too long time to finish >0: start the query and let the system timeout it after specified ms

**Returns**
0 if resolving was started ok, < 0 otherwise

```c
struct dns_resolve_context *dns_resolve_get_default(void)
```
Get default DNS context.

The system level DNS context uses DNS servers that are defined in project config file. If no DNS servers are defined by the user, then resolving DNS names using default DNS context will do nothing. The configuration options are described in subsys/net/lib/dns/Kconfig file.

**Returns**
Default DNS context.

```c
static inline int dns_get_addr_info(const char *query, enum dns_query_type type, uint16_t *dns_id, dns_resolve_cb_t cb, void *user_data, int32_t timeout)
```
Get IP address info from DNS.

This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response. This variant uses system wide DNS servers.

**Parameters**
• **query** – What the caller wants to resolve.
• **type** – What kind of data the caller wants to get.
• **dns_id** – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
• **cb** – Callback to call after the resolving has finished or timeout has happened.
• **user_data** – The user data.
• **timeout** – The timeout value for the connection. Possible values: SYS_FOREVER_MS: the query is tried forever, user needs to cancel it manually if it takes too long time to finish >0: start the query and let the system timeout it after specified ms

**Returns**
0 if resolving was started ok, < 0 otherwise

```c
static inline int dns_cancel_addr_info(uint16_t dns_id)
```
Cancel a pending DNS query.

This releases DNS resources used by a pending query.

**Parameters**

6.2. Networking 1783
• dns_id – DNS id of the pending query

**Returns**

  0 if ok, <0 if error.

```c
struct dns_addrinfo
#include <dns_resolve.h> Address info struct is passed to callback that gets all the results.
```

```c
struct dns_resolve_context
#include <dns_resolve.h> DNS resolve context structure.
```

### Public Members

```c
struct sockaddr dns_server
    DNS server information
```

```c
struct net_context *net_ctx
    Connection to the DNS server
```

```c
uint8_t is_mdns
    Is this server mDNS one
```

```c
uint8_t is_llmnr
    Is this server LLMNR one
```

```c
struct k_mutex lock
    Prevent concurrent access
```

```c
k_timeout_t buf_timeout
    This timeout is also used when a buffer is required from the buffer pools.
```

```c
enum dns_resolve_context_state state
    Is this context in use
```

```c
struct dns_pending_query
#include <dns_resolve.h> Result callbacks. We have multiple callbacks here so that it is possible to do multiple queries at the same time.
```

Contents of this structure can be inspected and changed only when the lock is held.

### Public Members

```c
struct k_work_delayable timer
    Timeout timer
```

```c
struct dns_resolve_context *ctx
    Back pointer to ctx, needed in timeout handler
```
dnz_resolve_cb_t cb
    Result callback.
    A null value indicates the slot is not in use.

void *user_data
    User data

k_timeout t timeout
    TX timeout

const char *query
    String containing the thing to resolve like www.example.com
    This is set to a non-null value when the query is started, and is not used thereafter.
    If the query completed at a point where the work item was still pending the pointer
    is cleared to indicate that the query is complete, but release of the query slot will be
    deferred until a request for a slot determines that the work item has been released.

dns_query_type query_type
    Query type

uint16_t id
    DNS id of this query

uint16_t query_hash
    Hash of the DNS name + query type we are querying. This hash is calculated so we
    can match the response that we are receiving. This is needed mainly for mDNS which
    is setting the DNS id to 0, which means that the id alone cannot be used to find correct
    pending query.

Network Management

- Overview
- Requesting a defined procedure
- Listening to network events
- Defining a network management procedure
- Signaling a network event
- API Reference

Overview  The Network Management APIs allow applications, as well as network layer code itself, to
call defined network routines at any level in the IP stack, or receive notifications on relevant network
events. For example, by using these APIs, application code can request a scan be done on a Wi-Fi- or
Bluetooth-based network interface, or request notification if a network interface IP address changes.

The Network Management API implementation is designed to save memory by eliminating code at
build time for management routines that are not used. Distinct and statically defined APIs for net-
work management procedures are not used. Instead, defined procedure handlers are registered by
using a NET_MGMT_REGISTER_REQUEST_HANDLER macro. Procedure requests are done through a single
net_mgmt() API that invokes the registered handler for the corresponding request.
The current implementation is experimental and may change and improve in future releases.

**Requesting a defined procedure** All network management requests are of the form `net_mgmt(mgmt_request, ...)`. The `mgmt_request` parameter is a bit mask that tells which stack layer is targeted, if a `net_if` object is implied, and the specific management procedure being requested. The available procedure requests depend on what has been implemented in the stack.

To avoid extra cost, all `net_mgmt()` calls are direct. Though this may change in a future release, it will not affect the users of this function.

**Listening to network events** You can receive notifications on network events by registering a callback function and specifying a set of events used to filter when your callback is invoked. The callback will have to be unique for a pair of layer and code, whereas on the command part it will be a mask of events.

Two functions are available, `net_mgmt_add_event_callback()` for registering the callback function, and `net_mgmt_del_event_callback()` for unregistering a callback. A helper function, `net_mgmt_init_event_callback()`, can be used to ease the initialization of the callback structure.

When an event occurs that matches a callback's event set, the associated callback function is invoked with the actual event code. This makes it possible for different events to be handled by the same callback function, if desired.

**Warning:** Event set filtering allows false positives for events that have the same layer and layer code. A callback handler function must check the event code (passed as an argument) against the specific network events it will handle, **regardless** of how many events were in the set passed to `net_mgmt_init_event_callback()`.

Note that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened. The callback handler function can be shared between different layer events.

(Warning: False positives can occur for events which have the same layer and layer code.)

An example follows.

```c
/*
 * Set of events to handle.
 * See e.g. include/net/net_event.h for some NET_EVENT_xxx values.
 */
#define EVENT_IFACE_SET (NET_EVENT_IF_xxx | NET_EVENT_IF_yyy)
#define EVENT_IPV4_SET (NET_EVENT_IPV4_xxx | NET_EVENT_IPV4_yyy)

struct net_mgmt_event_callback iface_callback;
struct net_mgmt_event_callback ipv4_callback;

void callback_handler(struct net_mgmt_event_callback *cb,
                      uint32_t mgmt_event,
                      struct net_if *iface)
{
    if (mgmt_event == NET_EVENT_IF_xxx) {
        /* Handle NET_EVENT_IF_xxx */
    } else if (mgmt_event == NET_EVENT_IF_yyy) {
        /* Handle NET_EVENT_IF_yyy */
    } else if (mgmt_event == NET_EVENT_IPV4_xxx) {
        /* Handle NET_EVENT_IPV4_xxx */
    } else if (mgmt_event == NET_EVENT_IPV4_yyy) {
        /* Handle NET_EVENT_IPV4_yyy */
    }
}
```

(continues on next page)
See include/zephyr/net/net_event.h for available generic core events that can be listened to.

Defining a network management procedure  You can provide additional management procedures specific to your stack implementation by defining a handler and registering it with an associated mgmt_request code.

Management request code are defined in relevant places depending on the targeted layer or eventually, if l2 is the layer, on the technology as well. For instance, all IP layer management request code will be found in the include/zephyr/net/net_event.h header file. But in case of an L2 technology, let’s say Ethernet, these would be found in include/zephyr/net/ethernet.h

You define your handler modeled with this signature:

```
static int your_handler(uint32_t mgmt_event, struct net_if *iface, void *data, size_t len);
```

and then register it with an associated mgmt_request code:

```
NET_MGMT_REGISTER_REQUEST_HANDLER(<mgmt_request code>, your_handler);
```

This new management procedure could then be called by using:

```
net_mgmt(<mgmt_request code>, ...);
```

Signaling a network event You can signal a specific network event using the net_mgmt_event_notify() function and provide the network event code. See include/zephyr/net/net_mgmt.h for details. As for the management request code, event code can be also found on specific L2 technology mgmt headers, for example include/zephyr/net/ieee802154_mgmt.h would be the right place if 802.15.4 L2 is the technology one wants to listen to events.

API Reference

**group net_mgmt**

Network Management.

**Defines**

```
net_mgmt(_mgmt_request, _iface, _data, _len)
```
### Typedefs

```c
typedef int (*net_mgmt_request_handler_t)(uint32_t mgmt_request, struct net_if *iface, void *data, size_t len);
```

Signature which all Net MGMT request handler need to follow.

**Param mgmt_request**
The exact request value the handler is being called through

**Param iface**
A valid pointer on struct `net_if` if the request is meant to be tight to a network interface. NULL otherwise.

**Param data**
A valid pointer on a data understood by the handler. NULL otherwise.

**Param len**
Length in byte of the memory pointed by data.

```c
typedef void (*net_mgmt_event_handler_t)(struct net_mgmt_event_callback *cb, uint32_t mgmt_event, struct net_if *iface);
```

Define the user's callback handler function signature.

**Param cb**
Original struct `net_mgmt_event_callback` owning this handler.

**Param mgmt_event**
The network event being notified.

**Param iface**
A pointer on a struct `net_if` to which the the event belongs to, if it's an event on an iface. NULL otherwise.

### Functions

```c
static inline void net_mgmt_init_event_callback(struct net_mgmt_event_callback *cb, net_mgmt_event_handler_t handler, uint32_t mgmt_event_mask);
```

Helper to initialize a struct `net_mgmt_event_callback` properly.

**Parameters**
- `cb` – A valid application's callback structure pointer.
- `handler` – A valid handler function pointer.
- `mgmt_event_mask` – A mask of relevant events for the handler

```c
void net_mgmt_add_event_callback(struct net_mgmt_event_callback *cb);
```

Add a user callback.

**Parameters**
- `cb` – A valid pointer on user's callback to add.
void net_mgmt_del_event_callback(struct net_mgmt_event_callback *cb)
Delete a user callback.

Parameters
- cb – A valid pointer on user’s callback to delete.

void net_mgmt_event_notify_with_info(uint32_t mgmt_event, struct net_if *iface, const void *info, size_t length)
Used by the system to notify an event.

Note: info and length are disabled if CONFIG_NET_MGMT_EVENT_INFO is not defined.

Parameters
- mgmt_event – The actual network event code to notify
- iface – a valid pointer on a struct net_if if only the event is based on an iface. NULL otherwise.
- info – a valid pointer on the information you want to pass along with the event. NULL otherwise. Note the data pointed there is normalized by the related event.
- length – size of the data pointed by info pointer.

static inline void net_mgmt_event_notify(uint32_t mgmt_event, struct net_if *iface)

int net_mgmt_event_wait(uint32_t mgmt_event_mask, uint32_t *raised_event, struct net_if *iface, const void *info, size_t *info_length, k_timeout_t timeout)
Used to wait synchronously on an event mask.

Parameters
- mgmt_event_mask – A mask of relevant events to wait on.
- raised_event – a pointer on a uint32_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.
- iface – a pointer on a place holder for the iface on which the event has originated from. This is valid if only the event mask has bit NET_MGMT_IFACE_BIT set relevantly, depending on events the caller wants to listen to.
- info – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.
- info_length – tells how long the info memory area is. Only valid if the info is not NULL.
- timeout – A timeout delay. K_FOREVER can be used to wait indefinitely.

Returns
0 on success, a negative error code otherwise. -ETIMEDOUT will be specifically returned if the timeout kick-in instead of an actual event.

int net_mgmt_event_wait_on_iface(struct net_if *iface, uint32_t mgmt_event_mask, uint32_t *raised_event, const void *info, size_t *info_length, k_timeout_t timeout)
Used to wait synchronously on an event mask for a specific iface.

Parameters
- iface – a pointer on a valid network interface to listen event to
- mgmt_event_mask – A mask of relevant events to wait on. Listened to events should be relevant to iface events and thus have the bit NET_MGMT_IFACE_BIT set.
• raised_event – a pointer on a uint32_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.

• info – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.

• info_length – tells how long the info memory area is. Only valid if the info is not NULL.

• timeout – A timeout delay. K_FOREVER can be used to wait indefinitely.

Returns
0 on success, a negative error code otherwise. -ETIMEDOUT will be specifically returned if the timeout kick-in instead of an actual event.

void net_mgmt_event_init(void)

Used by the core of the network stack to initialize the network event processing.

struct net_mgmt_event_callback

#include <net_mgmt.h> Network Management event callback structure Used to register a callback into the network management event part, in order to let the owner of this struct to get network event notification based on given event mask.

Public Members

sys_snode_t node

Meant to be used internally, to insert the callback into a list. So nobody should mess with it.

net_mgmt_event_handler_t handler

Actual callback function being used to notify the owner

struct k_sem *sync_call

Semaphore meant to be used internally for the synchronous net_mgmt_event_wait() function.

uint32_t event_mask

A mask of network events on which the above handler should be called in case those events come. Note that only the command part is treated as a mask, matching one to several commands. Layer and layer code will be made of an exact match. This means that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened.

uint32_t raised_event

Internal place holder when a synchronous event wait is successfully unlocked on a event.

union net_mgmt_event_callback.[anonymous] [anonymous]

A mask of network events on which the above handler should be called in case those events come. Such mask can be modified whenever necessary by the owner, and thus will affect the handler being called or not.
Overview  Network statistics are collected if CONFIG_NET_STATISTICS is set. Individual component statistics for IPv4 or IPv6 can be turned off if those statistics are not needed. See various options in subsys/net/ip/Kconfig.stats file for details.

By default, the system collects network statistics per network interface. This can be controlled by CONFIG_NET_STATISTICS_PER_INTERFACE option.

The CONFIG_NET_STATISTICS_USER_API option can be set if the application wants to collect statistics for further processing. The network management interface API is used for that. See Network Management for details.

The CONFIG_NET_STATISTICS_ETHERNET option can be set to collect generic Ethernet statistics. If the CONFIG_NET_STATISTICS_ETHERNET_VENDOR option is set, then Ethernet device driver can collect Ethernet device specific statistics. These statistics can then be transferred to application for processing.

If the CONFIG_NET_SHELL option is set, then network shell can show statistics information with `net stats` command.

API Reference

**group net_stats**

Network statistics library.

**Defines**

NET_TC_TX_STATS_COUNT

NET_TC_RX_STATS_COUNT

**Typedefs**

typedef uint32_t net_stats_t

Network statistics counter.

struct net_stats_bytes

#include <net_stats.h>  Number of bytes sent and received.

**Public Members**

net_stats_t sent

Number of bytes sent

net_stats_t received

Number of bytes received

struct net_stats_pkts

#include <net_stats.h>  Number of network packets sent and received.
Public Members

`net_stats_t tx`
Number of packets sent

`net_stats_t rx`
Number of packets received

```c
#include <net_stats.h>
```
IP layer statistics.

Public Members

`net_stats_t recv`
Number of received packets at the IP layer.

`net_stats_t sent`
Number of sent packets at the IP layer.

`net_stats_t forwarded`
Number of forwarded packets at the IP layer.

`net_stats_t drop`
Number of dropped packets at the IP layer.

```c
#include <net_stats.h>
```
IP layer error statistics.

Public Members

`net_stats_t vhlerr`
Number of packets dropped due to wrong IP version or header length.

`net_stats_t hblenerr`
Number of packets dropped due to wrong IP length, high byte.

`net_stats_t lblenerr`
Number of packets dropped due to wrong IP length, low byte.

`net_stats_t fragerr`
Number of packets dropped because they were IP fragments.

`net_stats_t chkerr`
Number of packets dropped due to IP checksum errors.

`net_stats_t protoerr`
Number of packets dropped because they were neither ICMP, UDP nor TCP.
struct net_stats_icmp

    #include <net_stats.h> ICMP statistics.

Public Members

    net_stats_t recv
    Number of received ICMP packets.

    net_stats_t sent
    Number of sent ICMP packets.

    net_stats_t drop
    Number of dropped ICMP packets.

    net_stats_t typeerr
    Number of ICMP packets with a wrong type.

    net_stats_t chkerr
    Number of ICMP packets with a bad checksum.

struct net_stats_tcp

    #include <net_stats.h> TCP statistics.

Public Members

    struct net_stats_bytes bytes
    Amount of received and sent TCP application data.

    net_stats_t resent
    Amount of retransmitted data.

    net_stats_t drop
    Number of dropped packets at the TCP layer.

    net_stats_t recv
    Number of received TCP segments.

    net_stats_t sent
    Number of sent TCP segments.

    net_stats_t seg_drop
    Number of dropped TCP segments.

    net_stats_t chkerr
    Number of TCP segments with a bad checksum.
\textit{net_stats_t} \texttt{ackerr}

Number of received TCP segments with a bad ACK number.

\textit{net_stats_t} \texttt{rsterr}

Number of received bad TCP RST (reset) segments.

\textit{net_stats_t} \texttt{rst}

Number of received TCP RST (reset) segments.

\textit{net_stats_t} \texttt{rexmit}

Number of retransmitted TCP segments.

\textit{net_stats_t} \texttt{conndrop}

Number of dropped connection attempts because too few connections were available.

\textit{net_stats_t} \texttt{connrst}

Number of connection attempts for closed ports, triggering a RST.

\textbf{Public Members}

\textit{net_stats_t} \texttt{drop}

Number of dropped UDP segments.

\textit{net_stats_t} \texttt{recv}

Number of received UDP segments.

\textit{net_stats_t} \texttt{sent}

Number of sent UDP segments.

\textit{net_stats_t} \texttt{chkerr}

Number of UDP segments with a bad checksum.

\textbf{Public Members}

\textit{net_stats_t} \texttt{recv}

Number of received IPv6 MLD queries
\texttt{net_stats_t sent}
Number of sent IPv6 MLD reports

\texttt{net_stats_t drop}
Number of dropped IPv6 MLD packets

\texttt{struct net_stats_ipv4_igmp}
#include <net_stats.h> IPv4 IGMP daemon statistics.

\textbf{Public Members}

\texttt{net_stats_t recv}
Number of received IPv4 IGMP queries

\texttt{net_stats_t sent}
Number of sent IPv4 IGMP reports

\texttt{net_stats_t drop}
Number of dropped IPv4 IGMP packets

\texttt{struct net_stats_tx_time}
#include <net_stats.h> Network packet transfer times for calculating average TX time.

\texttt{struct net_stats_rx_time}
#include <net_stats.h> Network packet receive times for calculating average RX time.

\texttt{struct net_stats_tc}
#include <net_stats.h> Traffic class statistics.

\texttt{struct net_stats_pm}
#include <net_stats.h> Power management statistics.

\texttt{struct net_stats}
#include <net_stats.h> All network statistics in one struct.

\textbf{Public Members}

\texttt{net_stats_t processing_error}
Count of malformed packets or packets we do not have handler for

\texttt{struct net_stats_bytes bytes}
This calculates amount of data transferred through all the network interfaces.

\texttt{struct net_stats_ip_errors ip_errors}
IP layer errors
struct net_stats_eth_errors
#include <net_stats.h> Ethernet error statistics.

struct net_stats_eth_flow
#include <net_stats.h> Ethernet flow control statistics.

struct net_stats_eth_csum
#include <net_stats.h> Ethernet checksum statistics.

struct net_stats_eth_hw_timestamp
#include <net_stats.h> Ethernet hardware timestamp statistics.

struct net_stats_eth
#include <net_stats.h> All Ethernet specific statistics.

struct net_stats_ppp
#include <net_stats.h> All PPP specific statistics.

Public Members

net_stats_t drop
 Number of received and dropped PPP frames.

net_stats_t chkerr
 Number of received PPP frames with a bad checksum.

struct net_stats_sta_mgmt
#include <net_stats.h> All Wi-Fi management statistics.

Public Members

net_stats_t beacons_rx
 Number of received beacons

net_stats_t beacons_miss
 Number of missed beacons

struct net_stats_wifi
#include <net_stats.h> All Wi-Fi specific statistics.

Network Timeout
Overview  Zephyr’s network infrastructure mostly uses the millisecond-resolution uptime clock to track timeouts, with both deadlines and durations measured with 32-bit unsigned values. The 32-bit value rolls over at 49 days 17 hours 2 minutes 47.296 seconds.

Timeout processing is often affected by latency, so that the time at which the timeout is checked may be some time after it should have expired. Handling this correctly without arbitrary expectations of maximum latency requires that the maximum delay that can be directly represented be a 31-bit non-negative number (INT32_MAX), which overflows at 24 days 20 hours 31 minutes 23.648 seconds.

Most network timeouts are shorter than the delay rollover, but a few protocols allow for delays that are represented as unsigned 32-bit values counting seconds, which corresponds to a 42-bit millisecond count.

The net_timeout API provides a generic timeout mechanism to correctly track the remaining time for these extended-duration timeouts.

Use  The simplest use of this API is:

1. Configure a network timeout using net_timeout_set().
2. Use net_timeout_evaluate() to determine how long it is until the timeout occurs. Schedule a timeout to occur after this delay.
3. When the timeout callback is invoked, use net_timeout_evaluate() again to determine whether the timeout has completed, or whether there is additional time remaining. If the latter, reschedule the callback.
4. While the timeout is running, use net_timeout_remaining() to get the number of seconds until the timeout expires. This may be used to explicitly update the timeout, which should be done by canceling any pending callback and restarting from step 1 with the new timeout.

The net_timeout contains a sys_snode_t that allows multiple timeout instances to be aggregated to share a single kernel timer element. The application must use net_timeout_evaluate() on all instances to determine the next timeout event to occur.

net_timeout_deadline() may be used to reconstruct the full-precision deadline of the timeout. This exists primarily for testing but may have use in some applications, as it does allow a millisecond-resolution calculation of remaining time.

API Reference

group net_timeout

Network long timeout primitives and helpers.

Defines

NET_TIMEOUT_MAX_VALUE

Defines used to support ms resolution timeouts.

Because delays are processed in work queues which are not invoked synchronously with clock changes we need to be able to detect timeouts after they occur, which requires comparing “deadline” to “now” with enough “slop” to handle any observable latency due to “now” advancing past “deadline”.

The simplest solution is to use the native conversion of the well-defined 32-bit unsigned difference to a 32-bit signed difference, which caps the maximum delay at INT32_MAX. This is compatible with the standard mechanism for detecting completion of deadlines that do not overflow their representation.
Functions

void net_timeout_set(struct net_timeout *timeout, uint32_t lifetime, uint32_t now)
Configure a network timeout structure.

Parameters
- timeout – a pointer to the timeout state.
- lifetime – the duration of the timeout in seconds.
- now – the time at which the timeout started counting down, in milliseconds.
  This is generally a captured value of k_uptime_get_32().

int64_t net_timeout_deadline(const struct net_timeout *timeout, int64_t now)
Return the 64-bit system time at which the timeout will complete.

Note: Correct behavior requires invocation of net_timeout_evaluate() at its specified intervals.

Parameters
- timeout – state a pointer to the timeout state, initialized by net_timeout_set() and maintained by net_timeout_evaluate().
- now – the full-precision value of k_uptime_get() relative to which the deadline will be calculated.

Returns
the value of k_uptime_get() at which the timeout will expire.

uint32_t net_timeout_remaining(const struct net_timeout *timeout, uint32_t now)
Calculate the remaining time to the timeout in whole seconds.

Note: This function rounds the remaining time down, i.e. if the timeout will occur in 3500 milliseconds the value 3 will be returned.

Note: Correct behavior requires invocation of net_timeout_evaluate() at its specified intervals.

Parameters
- timeout – a pointer to the timeout state
- now – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from k_uptime_get_32().

Return values
- 0 – if the timeout has completed.
- positive – the remaining duration of the timeout, in seconds.

uint32_t net_timeout_evaluate(struct net_timeout *timeout, uint32_t now)
Update state to reflect elapsed time and get new delay.
This function must be invoked periodically to (1) apply the effect of elapsed time on what remains of a total delay that exceeded the maximum representable delay, and (2) determine that either the timeout has completed or that the infrastructure must wait a certain period before checking again for completion.

Parameters
- `timeout` – a pointer to the timeout state
- `now` – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from `k_uptime_get_32()`.

**Return values**
- 0 – if the timeout has completed
- positive – the maximum delay until the state of this timeout should be re-evaluated, in milliseconds.

```c
struct net_timeout

#include <net_timeout.h> Generic struct for handling network timeouts.

Except for the linking node, all access to state from these objects must go through the defined API.

**Public Members**

```
sys_snode_t node
Used to link multiple timeouts that share a common timer infrastructure.
For examples a set of related timers may use a single delayed work structure, which is always scheduled at the shortest time to a timeout event.
```

**Networking Context** The `net_context` API is not meant for application use. Application should use `BSD Sockets` API instead.

### Promiscuous Mode

**Overview** Promiscuous mode is a mode for a network interface controller that causes it to pass all traffic it receives to the application rather than passing only the frames that the controller is specifically programmed to receive. This mode is normally used for packet sniffing as used to diagnose network connectivity issues by showing an application all the data being transferred over the network. (See the Wikipedia article on promiscuous mode for more information.)

The network promiscuous APIs are used to enable and disable this mode, and to wait for and receive a network data to arrive. Not all network technologies or network device drivers support promiscuous mode.

**Sample usage** First the promiscuous mode needs to be turned ON by the application like this:

```c
ret = net_promisc_mode_on(iface);
if (ret < 0) {
    if (ret == -EALREADY) {
        printf("Promiscuous mode already enabled\n");
    } else {
        printf("Cannot enable promiscuous mode for "
```

(continues on next page)
"interface %p (%d)\n", iface, ret);}
}

If there is no error, then the application can start to wait for network data:

```c
while (true) {
    pkt = net_promisc_mode_wait_data(K_FOREVER);
    if (pkt) {
        print_info(pkt);
    }
    net_pkt_unref(pkt);
}
```

Finally the promiscuous mode can be turned OFF by the application like this:

```c
ret = net_promisc_mode_off(iface);
if (ret < 0) {
    if (ret == -EALREADY) {
        printf("Promiscuous mode already disabled\n");
    } else {
        printf("Cannot disable promiscuous mode for 
        "interface %p (%d)\n", iface, ret);
    }
}
```

See net-promiscuous-mode-sample for a more comprehensive example.

### API Reference

**group promiscuous**

Promiscuous mode support.

#### Functions

- **static inline struct net_pkt *net_promisc_mode_wait_data(k_timeout_t timeout)**
  
  Start to wait received network packets.

  **Parameters**
  
  - timeout – How long to wait before returning.

  **Returns**
  
  Received *net_pkt*, NULL if not received any packet.

- **static inline int net_promisc_mode_on(struct net_if *iface)**
  
  Enable promiscuous mode for a given network interface.

  **Parameters**
  
  - iface – Network interface

  **Returns**
  
  0 if ok, <0 if error

- **static inline int net_promisc_mode_off(struct net_if *iface)**
  
  Disable promiscuous mode for a given network interface.

  **Parameters**
Simple Network Time Protocol Library

Overview

The SNTP library implements IETF RFC4330 (Simple Network Time Protocol v4). SNTP provides a way to synchronize clocks in computer networks.

API Reference

group sntp

Simple Network Time Protocol API.

Functions

int sntp_init(struct sntp_ctx *ctx, struct sockaddr *addr, socklen_t addr_len)

Initialize SNTP context.

Parameters

• ctx – Address of sntp context.
• addr – IP address of NTP/SNTP server.
• addr_len – IP address length of NTP/SNTP server.

Returns

0 if ok, <0 if error.

int sntp_query(struct sntp_ctx *ctx, uint32_t timeout, struct sntp_time *time)

Perform SNTP query.

Parameters

• ctx – Address of sntp context.
• timeout – Timeout of waiting for sntp response (in milliseconds).
• time – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

Returns

0 if ok, <0 if error (-ETIMEDOUT if timeout).

void sntp_close(struct sntp_ctx *ctx)

Release SNTP context.

Parameters

• ctx – Address of sntp context.
int sntp_simple(const char *server, uint32_t timeout, struct sntp_time *time)

Convenience function to query SNTP in one-shot fashion.

Convenience wrapper which calls getaddrinfo(), sntp_init, sntp_query, and sntp_close().

Parameters

- server – Address of server in format addr[:port]
- timeout – Query timeout
- time – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

Returns

0 if ok, <0 if error (-ETIMEDOUT if timeout).

struct sntp_ctx

#include <sntp.h> SNTP context

Public Members

uint32_t expected_orig_ts

Timestamp when the request was sent from client to server. This is used to check if the originated timestamp in the server reply matches the one in client request.

struct sntp_time

#include <sntp.h> Time as returned by SNTP API, fractional seconds since 1 Jan 1970

SOCKS5 Proxy Support

- Overview
- SOCKS5 API
- SOCKS5 Proxy Usage in MQTT

Overview

The SOCKS library implements SOCKS5 support, which allows Zephyr to connect to peer devices via a network proxy.

See this SOCKS5 Wikipedia article for a detailed overview of how SOCKS5 works.

For more information about the protocol itself, see IETF RFC1928 SOCKS Protocol Version 5.

SOCKS5 API

The SOCKS5 support is enabled by CONFIG_SOCKS Kconfig variable. Application wanting to use the SOCKS5 must set the SOCKS5 proxy host address by calling setsockopt() like this:

```c
static int set_proxy(int sock, const struct sockaddr *proxy_addr, socklen_t proxy_addrlen)
{
    int ret;

    ret = setsockopt(sock, SOL_SOCKET, SO_SOCKS5, proxy_addr, proxy_addrlen);
    if (ret < 0) {
```
SOCKS5 Proxy Usage in MQTT For MQTT client, there is `mqtt_client_set_proxy()` API that the application can call to setup SOCKS5 proxy. See `mqtt-publisher-sample` for usage example.

Trickle Timer Library

**Overview** The Trickle timer library implements IETF RFC6206 (Trickle Algorithm). The Trickle algorithm allows nodes in a lossy shared medium (e.g., low-power and lossy networks) to exchange information in a highly robust, energy efficient, simple, and scalable manner.

**API Reference**

*group trickle*  
Trickle algorithm library.

**Types**

typedef void (*net_trickle_cb_t)(struct net_trickle *trickle, bool do_suppress, void *user_data)  
Trickle timer callback.  
The callback is called after Trickle timeout expires.

- **Param trickle**  
The trickle context to use.

- **Param do_suppress**  
Is TX allowed (true) or not (false).

- **Param user_data**  
The user data given in `net_trickle_start()` call.

**Functions**

```c
int net_trickle_create(struct net_trickle *trickle, uint32_t Imin, uint8_t Imax, uint8_t k)
```

Create a Trickle timer.

**Parameters**

- **trickle** – Pointer to Trickle struct.
- **Imin** – Imin configuration parameter in ms.
- **Imax** – Max number of doublings.
• k – Redundancy constant parameter. See RFC 6206 for details.

**Returns**
Return 0 if ok and <0 if error.

```c
int net_trickle_start(struct net_trickle *trickle, net_trickle_cb_t cb, void *user_data)
```
Start a Trickle timer.

**Parameters**
- `trickle` – Pointer to Trickle struct.
- `cb` – User callback to call at time T within the current trickle interval
- `user_data` – User pointer that is passed to callback.

**Returns**
Return 0 if ok and <0 if error.

```c
int net_trickle_stop(struct net_trickle *trickle)
```
Stop a Trickle timer.

**Parameters**
- `trickle` – Pointer to Trickle struct.

**Returns**
Return 0 if ok and <0 if error.

```c
void net_trickle_consistency(struct net_trickle *trickle)
```
To be called by the protocol handler when it hears a consistent network transmission.

**Parameters**
- `trickle` – Pointer to Trickle struct.

```c
void net_trickle_inconsistency(struct net_trickle *trickle)
```
To be called by the protocol handler when it hears an inconsistent network transmission.

**Parameters**
- `trickle` – Pointer to Trickle struct.

```c
static inline bool net_trickle_is_running(struct net_trickle *trickle)
```
Check if the Trickle timer is running or not.

**Parameters**
- `trickle` – Pointer to Trickle struct.

```c
struct net_trickle
```
#include <trickle.h> The variable names are taken directly from RFC 6206 when applicable. Note that the struct members should not be accessed directly but only via the Trickle API.

**Public Members**

```c
uint32_t Imin
```
Min interval size in ms

```c
uint8_t Imax
```
Max number of doublings
uint8_t k
    Redundancy constant

uint32_t I
    Current interval size

uint32_t Istart
    Start of the interval in ms

uint8_t c
    Consistency counter

uint32_t Imax_abs
    Max interval size in ms (not doublings)

net_trickle_cb_t cb
    Callback to be called when timer expires

Websocket Client API

- Overview
- Websocket Transport
- API Reference

Overview
The Websocket client library allows Zephyr to connect to a Websocket server. The Websocket client API can be used directly by application to establish a Websocket connection to server, or it can be used as a transport for other network protocols like MQTT.

See this Websocket Wikipedia article for a detailed overview of how Websocket works.

For more information about the protocol itself, see IETF RFC6455 The WebSocket Protocol.

Websocket Transport
The Websocket API allows it to be used as a transport for other high level protocols like MQTT. The Zephyr MQTT client library can be configured to use Websocket transport by enabling CONFIG_MQTT_LIB_WEBSOCKET and CONFIG_WEBSOCKET_CLIENT Kconfig options.

First a socket needs to be created and connected to the Websocket server:

```c
sock = socket(family, SOCK_STREAM, IPPROTO_TCP);
...
ret = connect(sock, addr, addr_len);
...
```

The Websocket transport socket is then created like this:

```c
ws_sock = websocket_connect(sock, &config, timeout, user_data);
```

The Websocket socket can then be used to send or receive data, and the Websocket client API will encapsulate the sent or received data to/from Websocket packet payload. Both the websocket_xxx() API or normal BSD socket API functions can be used to send and receive application data.
If normal BSD socket functions are used, then currently only TEXT data is supported. In order to send BINARY data, the `websocket_send_msg()` must be used.

When done, the Websocket transport socket must be closed.

```c
ret = close(ws_sock);
```
or

```c
ret = websocket_disconnect(ws_sock);
```

### API Reference

**group** websocket

Websocket API.

**Defines**

- **WEBSOCKET_FLAG_FINAL**
  
  Message type values. Returned in `websocket_recv_msg()` Final frame

- **WEBSOCKET_FLAG_TEXT**
  
  Textual data

- **WEBSOCKET_FLAG_BINARY**
  
  Binary data

- **WEBSOCKET_FLAG_CLOSE**
  
  Closing connection

- **WEBSOCKET_FLAG_PING**
  
  Ping message

- **WEBSOCKET_FLAG_PONG**
  
  Pong message

**Typedefs**

```c
typedef int (*websocket_connect_cb_t)(int ws_sock, struct http_request *req, void *user_data)
```

Callback called after Websocket connection is established.

**Param ws_sock**

Websocket id

**Param req**

HTTP handshake request
**Param user_data**
A valid pointer on some user data or NULL

**Return**
0 if ok, <0 if there is an error and connection should be aborted

** Enums **

enum websocket_opcode

Values:

enumerator WEBSOCKET_OPCODE_CONTINUE = 0x00

enumerator WEBSOCKET_OPCODE_DATA_TEXT = 0x01

enumerator WEBSOCKET_OPCODE_DATA_BINARY = 0x02

enumerator WEBSOCKET_OPCODE_CLOSE = 0x08

enumerator WEBSOCKET_OPCODE_PING = 0x09

enumerator WEBSOCKET_OPCODE_PONG = 0x0A

** Functions **

int websocket_connect(int http_sock, struct websocket_request *req, int timeout, void *user_data)

Connect to a server that provides Websocket service. The callback is called after connection is established. The returned value is a new socket descriptor that can be used to send / receive data using the BSD socket API.

** Parameters **

- **http_sock** – Socket id to the server. Note that this socket is used to do HTTP handshakes etc. The actual Websocket connectivity is done via the returned websocket id. Note that the http_sock must not be closed after this function returns as it is used to deliver the Websocket packets to the Websocket server.
- **req** – Websocket request. User should allocate and fill the request data.
- **timeout** – Max timeout to wait for the connection. The timeout value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.
- **user_data** – User specified data that is passed to the callback.

** Returns **

Websocket id to be used when sending/receiving Websocket data.

int websocket_send_msg(int ws_sock, const uint8_t *payload, size_t payload_len, enum websocket_opcode opcode, bool mask, bool final, int32_t timeout)

Send websocket msg to peer.

The function will automatically add websocket header to the message.

** Parameters **

- **ws_sock** – Websocket id returned by websocket_connect().
• payload – Websocket data to send.
• payload_len – Length of the data to be sent.
• opcode – Operation code (text, binary, ping, pong, close)
• mask – Mask the data, see RFC 6455 for details
• final – Is this final message for this message send. If final == false, then the first message must have valid opcode and subsequent messages must have opcode WEB_SOCKET_OPCODE_CONTINUE. If final == true and this is the only message, then opcode should have proper opcode (text or binary) set.
• timeout – How long to try to send the message. The value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.

**Returns**

<0 if error, >=0 amount of bytes sent

```c
int websocket_recv_msg(int ws_sock, uint8_t *buf, size_t buf_len, uint32_t *message_type, uint64_t *remaining, int32_t timeout)
```

Receive websocket msg from peer.
The function will automatically remove websocket header from the message.

**Parameters**

• ws_sock – Websocket id returned by websocket_connect().
• buf – Buffer where websocket data is read.
• buf_len – Length of the data buffer.
• message_type – Type of the message.
• remaining – How much there is data left in the message after this read.
• timeout – How long to try to receive the message. The value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.

**Returns**

<0 if error, >=0 amount of bytes received

```c
int websocket_disconnect(int ws_sock)
```

Close websocket.
One must call websocket_connect() after this call to re-establish the connection.

**Parameters**

• ws_sock – Websocket id returned by websocket_connect().

```c
static inline void websocket_init(void)
```

```c
struct websocket_request
```

#include <websocket.h> Websocket client connection request. This contains all the data that is needed when doing a Websocket connection request.

**Public Members**

```c
const char *host
Host of the Websocket server when doing HTTP handshakes.
```

```c
const char *url
URL of the Websocket.
```
**http_header_cb_t** optional_headers_cb

User supplied callback function to call when optional headers need to be sent. This can be NULL, in which case the optional_headers field in http_request is used. The idea of this optional_headers callback is to allow user to send more HTTP header data that is practical to store in allocated memory.

```c
const char **optional_headers
```

A NULL terminated list of any optional headers that should be added to the HTTP request. May be NULL. If the optional_headers_cb is specified, then this field is ignored.

**websocket_connect_cb_t** cb

User supplied callback function to call when a connection is established.

```c
const struct http_parser_settings *http_cb
```

User supplied list of callback functions if the calling application wants to know the parsing status or the HTTP fields during the handshake. This is optional parameter and normally not needed but is useful if the caller wants to know something about the fields that the server is sending.

```c
uint8_t *tmp_buf
```

User supplied buffer where HTTP connection data is stored

```c
size_t tmp_buf_len
```

Length of the user supplied temp buffer

---

**Network Packet Capture**

- **Overview**
- **Sample usage**
- **API Reference**

---

**Overview**  The **net_capture** API allows user to monitor the network traffic in one of the Zephyr network interfaces and send that traffic to external system for analysis. The monitoring can be setup either manually using **net-shell** or automatically by using the **net_capture** API.

**Sample usage**  See Network capture sample application and **Monitor Network Traffic** for details.

**API Reference**

**group** net_capture

Network packet capture support functions.

**Functions**

```c
int net_capture_setup(const char *remote_addr, const char *my_local_addr, const char *peer_addr, const struct device **dev)
```

Setup network packet capturing support.
Parameters

- **remote_addr** – The value tells the tunnel remote/outer endpoint IP address. The IP address can be either IPv4 or IPv6 address. This address is used to select the network interface where the tunnel is created.

- **my_local_addr** – The local/inner IP address of the tunnel. Can contain also port number which is used as UDP source port.

- **peer_addr** – The peer/inner IP address of the tunnel. Can contain also port number which is used as UDP destination port.

- **dev** – Network capture device. This is returned to the caller.

Returns

0 if ok, <0 if network packet capture setup failed

```c
static inline int net_capture_cleanup(const struct device *dev)
```

Cleanup network packet capturing support.

This should be called after the capturing is done and resources can be released.

Parameters

- **dev** – Network capture device. User must allocate using the `net_capture_setup()` function.

Returns

0 if ok, <0 if network packet capture cleanup failed

```c
static inline int net_capture_enable(const struct device *dev, struct net_if *iface)
```

Enable network packet capturing support.

This creates tunnel network interface where all the captured packets are pushed. The captured network packets are placed in UDP packets that are sent to tunnel peer.

Parameters

- **dev** – Network capture device
- **iface** – Network interface we are starting to capture packets.

Returns

0 if ok, <0 if network packet capture enable failed

```c
static inline bool net_capture_is_enabled(const struct device *dev)
```

Is network packet capture enabled or disabled.

Parameters

- **dev** – Network capture device

Returns

True if enabled, False if network capture is disabled.

```c
static inline int net_capture_disable(const struct device *dev)
```

Disable network packet capturing support.

Parameters

- **dev** – Network capture device

Returns

0 if ok, <0 if network packet capture disable failed

```c
static inline int net_capture_send(const struct device *dev, struct net_if *iface, struct net_pkt *pkt)
```

Send captured packet.

Parameters
Zephyr Project Documentation, Release 3.2.99

- `dev` – Network capture device
- `iface` – Network interface the packet is being sent
- `pkt` – The network packet that is sent

**Returns**

0 if ok, <0 if network packet capture send failed

### Network Buffer Management

#### Network Buffer

- **Overview**
- **Creating buffers**
- **Common Operations**
- **Reference Counting**
- **API Reference**

**Overview**  
Network buffers are a core concept of how the networking stack (as well as the Bluetooth stack) pass data around. The API for them is defined in `include/zephyr/net(buf.h)`.

**Creating buffers**  
Network buffers are created by first defining a pool of them:

```c
NET_BUF_POOL_DEFINE(pool_name, buf_count, buf_size, user_data_size, NULL);
```

The pool is a static variable, so if it's needed to be exported to another module a separate pointer is needed.

Once the pool has been defined, buffers can be allocated from it with:

```c
buf = net_buf_alloc(&pool_name, timeout);
```

There is no explicit initialization function for the pool or its buffers, rather this is done implicitly as `net_buf_alloc()` gets called.

If there is a need to reserve space in the buffer for protocol headers to be prepended later, it's possible to reserve this headroom with:

```c
net_buf_reserve(buf, headroom);
```

In addition to actual protocol data and generic parsing context, network buffers may also contain protocol-specific context, known as user data. Both the maximum data and user data capacity of the buffers is compile-time defined when declaring the buffer pool.

The buffers have native support for being passed through `kfifo` kernel objects. This is a very practical feature when the buffers need to be passed from one thread to another. However, since a `net_buf` may have a fragment chain attached to it, instead of using the `kfifo_put()` and `kfifo_get()` APIs, special `net_buf_put()` and `net_buf_get()` APIs must be used when passing buffers through FIFOs. These APIs ensure that the buffer chains stay intact. The same applies for passing buffers through a singly linked list, in which case the `net_buf_slist_put()` and `net_buf_slist_get()` functions must be used instead of `sys_slist_append()` and `sys_slist_get()`.

---

6.2. Networking
Common Operations  The network buffer API provides some useful helpers for encoding and decoding data in the buffers. To fully understand these helpers it’s good to understand the basic names of operations used with them:

Add  Add data to the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Requires that there is enough tailroom in the buffer. Some examples of APIs for adding data:

```c
void *net_buf_add(struct net_buf *buf, size_t len);
void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len);
uint8_t *net_buf_add_u8(struct net_buf *buf, uint8_t value);
void net_buf_add_le16(struct net_buf *buf, uint16_t value);
void net_buf_add_le32(struct net_buf *buf, uint32_t value);
```

Remove  Remove data from the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Some examples of APIs for removing data:

```c
void *net_buf_remove_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_remove_u8(struct net_buf *buf);
uint16_t net_buf_remove_le16(struct net_buf *buf);
uint32_t net_buf_remove_le32(struct net_buf *buf);
```

Push  Prepend data to the beginning of the buffer. Modifies both the data length value as well as the data pointer. Requires that there is enough headroom in the buffer. Some examples of APIs for pushing data:

```c
void *net_buf_push(struct net_buf *buf, size_t len);
void *net_buf_push_mem(struct net_buf *buf, const void *mem, size_t len);
void net_buf_push_u8(struct net_buf *buf, uint8_t value);
void net_buf_push_le16(struct net_buf *buf, uint16_t value);
```

Pull  Remove data from the beginning of the buffer. Modifies both the data length value as well as the data pointer. Some examples of APIs for pulling data:

```c
void *net_buf_pull(struct net_buf *buf, size_t len);
void *net_buf_pull_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_pull_u8(struct net_buf *buf);
uint16_t net_buf_pull_le16(struct net_buf *buf);
uint32_t net_buf_pull_le32(struct net_buf *buf);
```

The Add and Push operations are used when encoding data into the buffer, whereas the Remove and Pull operations are used when decoding data from a buffer.

Reference Counting  Each network buffer is reference counted. The buffer is initially acquired from a free buffers pool by calling `net_buf_alloc()`, resulting in a buffer with reference count 1. The reference count can be incremented with `net_buf_ref()` or decremented with `net_buf_unref()`. When the count drops to zero the buffer is automatically placed back to the free buffers pool.

API Reference

`group net_buf`

Network buffer library.
Defines

**NET_BUF_SIMPLE_DEFINE(_name, _size)**

Define a `net_buf_simple` stack variable.

This is a helper macro which is used to define a `net_buf_simple` object on the stack.

**Parameters**

- `_name` – Name of the `net_buf_simple` object.
- `_size` – Maximum data storage for the buffer.

**NET_BUF_SIMPLE_DEFINE_STATIC(_name, _size)**

Define a static `net_buf_simple` variable.

This is a helper macro which is used to define a static `net_buf_simple` object.

**Parameters**

- `_name` – Name of the `net_buf_simple` object.
- `_size` – Maximum data storage for the buffer.

**NET_BUF_SIMPLE(_size)**

Define a `net_buf_simple` stack variable and get a pointer to it.

This is a helper macro which is used to define a `net_buf_simple` object on the stack and the get a pointer to it as follows:

```c
struct net_buf_simple *my_buf = NET_BUF_SIMPLE(10);
```

After creating the object it needs to be initialized by calling `net_buf_simple_init()`.

**Parameters**

- `_size` – Maximum data storage for the buffer.

**Returns**

Pointer to stack-allocated `net_buf_simple` object.

**NET_BUF_FRAGS**

Flag indicating that the buffer has associated fragments. Only used internally by the buffer handling code while the buffer is inside a FIFO, meaning this never needs to be explicitly set or unset by the `net_buf` API user. As long as the buffer is outside of a FIFO, i.e. in practice always for the user for this API, the buf->frags pointer should be used instead.

**NET_BUF_EXTERNAL_DATA**

Flag indicating that the buffer’s associated data pointer points to externally allocated memory. Therefore once ref goes down to zero, the pointed data will not need to be deallocated. This never needs to be explicitly set or unset by the `net_buf` API user. Such `net_buf` is exclusively instantiated via `net_buf_alloc_with_data()` function. Reference count mechanism however will behave the same way, and ref count going to 0 will free the `net_buf` but no the data pointer in it.

**NET_BUF_POOL_HEAP_DEFINE(_name, _count, _ud_size, _destroy)**

Define a new pool for buffers using the heap for the data.

Defines a `net_buf_pool` struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through `net_buf_alloc`. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from the heap using `k_malloc`, so `CONFIG_HEAP_MEM_POOL_SIZE` must be set to a positive value. This kind of pool does not
support blocking on the data allocation, so the timeout passed to net_buf_alloc will be always treated as K_NO_WAIT when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling net_buf_destroy() to complete the process of returning the buffer to the pool.

Parameters

- _name – Name of the pool variable.
- _count – Number of buffers in the pool.
- _ud_size – User data space to reserve per buffer.
- _destroy – Optional destroy callback when buffer is freed.

NET_BUF_POOL_FIXED_DEFINE(_name, _count, _data_size, _ud_size, _destroy)
Define a new pool for buffers based on fixed-size data.

Defines a net_buf_pool struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from a byte array of fixed sized chunks. This kind of pool does not support blocking on the data allocation, so the timeout passed to net_buf_alloc will be always treated as K_NO_WAIT when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling net_buf_destroy() to complete the process of returning the buffer to the pool.

Parameters

- _name – Name of the pool variable.
- _count – Number of buffers in the pool.
- _data_size – Total amount of memory available for data payloads.
- _ud_size – User data space to reserve per buffer.

NET_BUF_POOL_VAR_DEFINE(_name, _count, _data_size, _ud_size, _destroy)
Define a new pool for buffers with variable size payloads.

Defines a net_buf_pool struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be based on a memory pool from which variable size payloads may be allocated.

If provided with a custom destroy callback, this callback is responsible for eventually calling net_buf_destroy() to complete the process of returning the buffer to the pool.

Parameters

- _name – Name of the pool variable.
- _count – Number of buffers in the pool.
- _data_size – Total amount of memory available for data payloads.
- _ud_size – User data space to reserve per buffer.
NET_BUF_POOL_DEFINE(_name, _count, _size, _ud_size, _destroy)

Define a new pool for buffers.

Defines a net_buf_pool struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

If provided with a custom destroy callback this callback is responsible for eventually calling net_buf_destroy() to complete the process of returning the buffer to the pool.

Parameters

- _name – Name of the pool variable.
- _count – Number of buffers in the pool.
- _size – Maximum data size for each buffer.
- _ud_size – Amount of user data space to reserve.
- _destroy – Optional destroy callback when buffer is freed.

Typedefs

typedef struct net_buf *(*net_buf_allocator_cb)(k_timeout_t timeout, void *user_data)

Network buffer allocator callback.

The allocator callback is called when net_buf_append_bytes needs to allocate a new net_buf.

Param timeout
Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Param user_data
The user data given in net_buf_append_bytes call.

Return
pointer to allocated net_buf or NULL on error.

Functions

static inline void net_buf_simple_init(struct net_buf_simple *buf, size_t reserve_head)

Initialize a net_buf_simple object.

This needs to be called after creating a net_buf_simple object using the NET_BUF_SIMPLE macro.

Parameters

- buf – Buffer to initialize.
- reserve_head – Headroom to reserve.

void net_buf_simple_init_with_data(struct net_buf_simple *buf, void *data, size_t size)

Initialize a net_buf_simple object with data.

Initialized buffer object with external data.

Parameters
• buf – Buffer to initialize.
• data – External data pointer
• size – Amount of data the pointed data buffer if able to fit.

static inline void net_buf_simple_reset(struct net_buf_simple *buf)

Reset buffer.
Reset buffer data so it can be reused for other purposes.

Parameters
• buf – Buffer to reset.

void net_buf_simple_clone(const struct net_buf_simple *original, struct net_buf_simple *clone)

Clone buffer state, using the same data buffer.
Initializes a buffer to point to the same data as an existing buffer. Allows operations on the
same data without altering the length and offset of the original.

Parameters
• original – Buffer to clone.
• clone – The new clone.

void *net_buf_simple_add(struct net_buf_simple *buf, size_t len)

Prepare data to be added at the end of the buffer.
Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• len – Number of bytes to increment the length with.

Returns
The original tail of the buffer.

void *net_buf_simple_add_mem(struct net_buf_simple *buf, const void *mem, size_t len)

Copy given number of bytes from memory to the end of the buffer.
Increments the data length of the buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• mem – Location of data to be added.
• len – Length of data to be added

Returns
The original tail of the buffer.

uint8_t *net_buf_simple_add_u8(struct net_buf_simple *buf, uint8_t val)

Add (8-bit) byte at the end of the buffer.
Increments the data length of the buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – byte value to be added.

Returns
Pointer to the value added
void net_buf_simple_add_le16(struct net_buf_simple *buf, uint16_t val)
Add 16-bit value at the end of the buffer.

Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 16-bit value to be added.

void net_buf_simple_add_be16(struct net_buf_simple *buf, uint16_t val)
Add 16-bit value at the end of the buffer.

Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 16-bit value to be added.

void net_buf_simple_add_le24(struct net_buf_simple *buf, uint32_t val)
Add 24-bit value at the end of the buffer.

Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be added.

void net_buf_simple_add_be24(struct net_buf_simple *buf, uint32_t val)
Add 24-bit value at the end of the buffer.

Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 24-bit value to be added.

void net_buf_simple_add_le32(struct net_buf_simple *buf, uint32_t val)
Add 32-bit value at the end of the buffer.

Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a
buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• val – 32-bit value to be added.
void net_buf_simple_add_le48(struct net_buf_simple *buf, uint64_t val)
Add 48-bit value at the end of the buffer.

Add 48-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

• buf – Buffer to update.
• val – 48-bit value to be added.

void net_buf_simple_add_be48(struct net_buf_simple *buf, uint64_t val)
Add 48-bit value at the end of the buffer.

Add 48-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

• buf – Buffer to update.
• val – 48-bit value to be added.

void net_buf_simple_add_le64(struct net_buf_simple *buf, uint64_t val)
Add 64-bit value at the end of the buffer.

Add 64-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

• buf – Buffer to update.
• val – 64-bit value to be added.

void net_buf_simple_add_be64(struct net_buf_simple *buf, uint64_t val)
Add 64-bit value at the end of the buffer.

Add 64-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

• buf – Buffer to update.
• val – 64-bit value to be added.

void *net_buf_simple_remove_mem(struct net_buf_simple *buf, size_t len)
Remove data from the end of the buffer.

Removes data from the end of the buffer by modifying the buffer length.

Parameters

• buf – Buffer to update.
• len – Number of bytes to remove.

Returns

New end of the buffer data.

uint8_t net_buf_simple_remove_u8(struct net_buf_simple *buf)
Remove a 8-bit value from the end of the buffer.

Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 8-bit values.

Parameters

• buf – A valid pointer on a buffer.
Returns
The 8-bit removed value

uint16_t net_buf_simple_remove_le16(struct net_buf_simple *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 16-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from little endian to host endian.

uint16_t net_buf_simple_remove_be16(struct net_buf_simple *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 16-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from big endian to host endian.

uint32_t net_buf_simple_remove_le24(struct net_buf_simple *buf)
Remove and convert 24 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 24-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.

uint32_t net_buf_simple_remove_be24(struct net_buf_simple *buf)
Remove and convert 24 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 24-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
24-bit value converted from big endian to host endian.

uint32_t net_buf_simple_remove_le32(struct net_buf_simple *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 32-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.
uint32_t net_buf_simple_remove_be32(struct net_buf_simple *buf)
Remove and convert 32 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 32-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
32-bit value converted from big endian to host endian.

uint64_t net_buf_simple_remove_le48(struct net_buf_simple *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 48-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.

uint64_t net_buf_simple_remove_be48(struct net_buf_simple *buf)
Remove and convert 48 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 48-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from big endian to host endian.

uint64_t net_buf_simple_remove_le64(struct net_buf_simple *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 64-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from little endian to host endian.

uint64_t net_buf_simple_remove_be64(struct net_buf_simple *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_simple_remove_mem(), but a helper for operating on 64-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from big endian to host endian.

void *net_buf_simple_push(struct net_buf_simple *buf, size_t len)
Prepare data to be added to the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.
Parameters

- buf – Buffer to update.
- len – Number of bytes to add to the beginning.

Returns
The new beginning of the buffer data.

```c
void *net_buf_simple_push_mem(
    struct net_buf_simple *buf,
    const void *mem,
    size_t len)
```
Copy given number of bytes from memory to the start of the buffer.

Parameters

- buf – Buffer to update.
- mem – Location of data to be added.
- len – Length of data to be added.

Returns
The new beginning of the buffer data.

```c
void net_buf_simple_push_le16(
    struct net_buf_simple *buf,
    uint16_t val)
```
Push 16-bit value to the beginning of the buffer.

Parameters

- buf – Buffer to update.
- val – 16-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_be16(
    struct net_buf_simple *buf,
    uint16_t val)
```
Push 16-bit value to the beginning of the buffer.

Parameters

- buf – Buffer to update.
- val – 16-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_u8(
    struct net_buf_simple *buf,
    uint8_t val)
```
Push 8-bit value to the beginning of the buffer.

Parameters

- buf – Buffer to update.
- val – 8-bit value to be pushed to the buffer.

```c
void net_buf_simple_push_le24(
    struct net_buf_simple *buf,
    uint32_t val)
```
Push 24-bit value to the beginning of the buffer.

Parameters

- buf – Buffer to update.
- val – 24-bit value to be pushed to the buffer.
void net_buf_simple_push_be24(struct net_buf_simple *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in big endian format to the beginning of the buffer.

Parameters

• buf – Buffer to update.
• val – 24-bit value to be pushed to the buffer.

void net_buf_simple_push_le32(struct net_buf_simple *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in little endian format to the beginning of the buffer.

Parameters

• buf – Buffer to update.
• val – 32-bit value to be pushed to the buffer.

void net_buf_simple_push_be32(struct net_buf_simple *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in big endian format to the beginning of the buffer.

Parameters

• buf – Buffer to update.
• val – 32-bit value to be pushed to the buffer.

void net_buf_simple_push_le48(struct net_buf_simple *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.

Adds 48-bit value in little endian format to the beginning of the buffer.

Parameters

• buf – Buffer to update.
• val – 48-bit value to be pushed to the buffer.

void net_buf_simple_push_be48(struct net_buf_simple *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.

Adds 48-bit value in big endian format to the beginning of the buffer.

Parameters

• buf – Buffer to update.
• val – 48-bit value to be pushed to the buffer.

void net_buf_simple_push_le64(struct net_buf_simple *buf, uint64_t val)
Push 64-bit value to the beginning of the buffer.

Adds 64-bit value in little endian format to the beginning of the buffer.

Parameters

• buf – Buffer to update.
• val – 64-bit value to be pushed to the buffer.

void net_buf_simple_push_be64(struct net_buf_simple *buf, uint64_t val)
Push 64-bit value to the beginning of the buffer.

Adds 64-bit value in big endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 64-bit value to be pushed to the buffer.

```c
void *net_buf_simple_pull(struct net_buf_simple *buf, size_t len)
```

Removes data from the beginning of the buffer.

Parameters
• buf – Buffer to update.
• len – Number of bytes to remove.

Returns
New beginning of the buffer data.

```c
void *net_buf_simple_pull_mem(struct net_buf_simple *buf, size_t len)
```

Removes data from the beginning of the buffer.

Parameters
• buf – Buffer to update.
• len – Number of bytes to remove.

Returns
Pointer to the old location of the buffer data.

```c
uint8_t net_buf_simple_pull_u8(struct net_buf_simple *buf)
```

Remove a 8-bit value from the beginning of the buffer.

Same idea as with `net_buf_simple_pull()`, but a helper for operating on 8-bit values.

Parameters
• buf – A valid pointer on a buffer.

Returns
The 8-bit removed value

```c
uint16_t net_buf_simple_pull_le16(struct net_buf_simple *buf)
```

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with `net_buf_simple_pull()`, but a helper for operating on 16-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from little endian to host endian.

```c
uint16_t net_buf_simple_pull_be16(struct net_buf_simple *buf)
```

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with `net_buf_simple_pull()`, but a helper for operating on 16-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
16-bit value converted from big endian to host endian.
uint32_t net_buf_simple_pull_le24(struct net_buf_simple *buf)
Remove and convert 24 bits from the beginning of the buffer.

Same idea as with net_buf_simple_pull(), but a helper for operating on 24-bit little endian data.

**Parameters**
- buf – A valid pointer on a buffer.

**Returns**
24-bit value converted from little endian to host endian.

uint32_t net_buf_simple_pull_be24(struct net_buf_simple *buf)
Remove and convert 24 bits from the beginning of the buffer.

Same idea as with net_buf_simple_pull(), but a helper for operating on 24-bit big endian data.

**Parameters**
- buf – A valid pointer on a buffer.

**Returns**
24-bit value converted from big endian to host endian.

uint32_t net_buf_simple_pull_le32(struct net_buf_simple *buf)
Remove and convert 32 bits from the beginning of the buffer.

Same idea as with net_buf_simple_pull(), but a helper for operating on 32-bit little endian data.

**Parameters**
- buf – A valid pointer on a buffer.

**Returns**
32-bit value converted from little endian to host endian.

uint32_t net_buf_simple_pull_be32(struct net_buf_simple *buf)
Remove and convert 32 bits from the beginning of the buffer.

Same idea as with net_buf_simple_pull(), but a helper for operating on 32-bit big endian data.

**Parameters**
- buf – A valid pointer on a buffer.

**Returns**
32-bit value converted from big endian to host endian.

uint64_t net_buf_simple_pull_le48(struct net_buf_simple *buf)
Remove and convert 48 bits from the beginning of the buffer.

Same idea as with net_buf_simple_pull(), but a helper for operating on 48-bit little endian data.

**Parameters**
- buf – A valid pointer on a buffer.

**Returns**
48-bit value converted from little endian to host endian.

uint64_t net_buf_simple_pull_be48(struct net_buf_simple *buf)
Remove and convert 48 bits from the beginning of the buffer.

Same idea as with net_buf_simple_pull(), but a helper for operating on 48-bit big endian data.

**Parameters**
- buf – A valid pointer on a buffer.
Returns
48-bit value converted from big endian to host endian.

uint64_t net_buf_simple_pull_le64(struct net_buf_simple *buf)
Remove and convert 64 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 64-bit little endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from little endian to host endian.

uint64_t net_buf_simple_pull_be64(struct net_buf_simple *buf)
Remove and convert 64 bits from the beginning of the buffer.
Same idea as with net_buf_simple_pull(), but a helper for operating on 64-bit big endian data.

Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from big endian to host endian.

static inline uint8_t *net_buf_simple_tail(struct net_buf_simple *buf)
Get the tail pointer for a buffer.
Get a pointer to the end of the data in a buffer.

Parameters
• buf – Buffer.

Returns
Tail pointer for the buffer.

size_t net_buf_simple_headroom(struct net_buf_simple *buf)
Check buffer headroom.
Check how much free space there is in the beginning of the buffer.
buf A valid pointer on a buffer

Returns
Number of bytes available in the beginning of the buffer.

size_t net_buf_simple_tailroom(struct net_buf_simple *buf)
Check buffer tailroom.
Check how much free space there is at the end of the buffer.

Parameters
• buf – A valid pointer on a buffer

Returns
Number of bytes available at the end of the buffer.

uint16_t net_buf_simple_max_len(struct net_buf_simple *buf)
Check maximum net_buf_simple::len value.
This value is depending on the number of bytes being reserved as headroom.

Parameters
• buf – A valid pointer on a buffer
Returns
Number of bytes usable behind the \texttt{net\_buf\_simple::data} pointer.

\begin{verbatim}
static inline void net_buf_simple_save(struct net_buf_simple *buf, struct net_buf_simple_state *state)

Save the parsing state of a buffer.

Saves the parsing state of a buffer so it can be restored later.

Parameters
\begin{itemize}
  \item buf – Buffer from which the state should be saved.
  \item state – Storage for the state.
\end{itemize}
\end{verbatim}

\begin{verbatim}
static inline void net_buf_simple_restore(struct net_buf_simple *buf, struct net_buf_simple_state *state)

Restore the parsing state of a buffer.

Restores the parsing state of a buffer from a state previously stored by \texttt{net\_buf\_simple\_save()}.

Parameters
\begin{itemize}
  \item buf – Buffer to which the state should be restored.
  \item state – Stored state.
\end{itemize}
\end{verbatim}

\begin{verbatim}
struct net_buf_pool *net_buf_pool_get(int id)

Looks up a pool based on its ID.

Parameters
\begin{itemize}
  \item id – Pool ID (e.g. from buf->pool_id).
\end{itemize}

Returns
Pointer to pool.
\end{verbatim}

\begin{verbatim}
int net_buf_id(struct net_buf *buf)

Get a zero-based index for a buffer.

This function will translate a buffer into a zero-based index, based on its placement in its buffer pool. This can be useful if you want to associate an external array of meta-data contexts with the buffers of a pool.

Parameters
\begin{itemize}
  \item buf – Network buffer.
\end{itemize}

Returns
Zero-based index for the buffer.
\end{verbatim}

\begin{verbatim}
struct net_buf *net_buf_alloc_fixed(struct net_buf_pool *pool, k_timeout_t timeout)

Allocate a new fixed buffer from a pool.

Parameters
\begin{itemize}
  \item pool – Which pool to allocate the buffer from.
  \item timeout – Affects the action taken should the pool be empty. If K\_NO\_WAIT, then return immediately. If K\_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for \texttt{net\_buf\_alloc()} to fail (return NULL) even if it was given K\_FOREVER.
\end{itemize}

Returns
New buffer or NULL if out of buffers.
static inline struct net_buf *net_buf_alloc(struct net_buf_pool *pool, k_timeout_t timeout)

**Parameters**
- `pool` – Which pool to allocate the buffer from.
- `timeout` – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it’s still possible for `net_buf_alloc()` to fail (return NULL) even if it was given K_FOREVER.

**Returns**
New buffer or NULL if out of buffers.

struct net_buf *net_buf_alloc_len(struct net_buf_pool *pool, size_t size, k_timeout_t timeout)

Allocate a new variable length buffer from a pool.

**Parameters**
- `pool` – Which pool to allocate the buffer from.
- `size` – Amount of data the buffer must be able to fit.
- `timeout` – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it’s still possible for `net_buf_alloc()` to fail (return NULL) even if it was given K_FOREVER.

**Returns**
New buffer or NULL if out of buffers.

struct net_buf *net_buf_alloc_with_data(struct net_buf_pool *pool, void *data, size_t size, k_timeout_t timeout)

Allocate a new buffer from a pool but with external data pointer.

Allocate a new buffer from a pool, where the data pointer comes from the user and not from the pool.

**Parameters**
- `pool` – Which pool to allocate the buffer from.
- `data` – External data pointer
- `size` – Amount of data the pointed data buffer if able to fit.
- `timeout` – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout. Note that some types of data allocators do not support blocking (such as the HEAP type). In this case it’s still possible for `net_buf_alloc()` to fail (return NULL) even if it was given K_FOREVER.

**Returns**
New buffer or NULL if out of buffers.

struct net_buf *net_buf_get(struct k_fifo *fifo, k_timeout_t timeout)

Get a buffer from a FIFO.

This function is NOT thread-safe if the buffers in the FIFO contain fragments.

**Parameters**
- `fifo` – Which FIFO to take the buffer from.
- `timeout` – Affects the action taken should the FIFO be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.
Returns

New buffer or NULL if the FIFO is empty.

static inline void net_buf_destroy(struct net_buf *buf)
Destroy buffer from custom destroy callback.

This helper is only intended to be used from custom destroy callbacks. If no custom destroy
callback is given to NET_BUF_POOL_*_DEFINE() then there is no need to use this API.

Parameters

• buf – Buffer to destroy.

void net_buf_reset(struct net_buf *buf)
Reset buffer.

Reset buffer data and flags so it can be reused for other purposes.

Parameters

• buf – Buffer to reset.

void net_buf_simple_reserve(struct net_buf_simple *buf, size_t reserve)
Initialize buffer with the given headroom.

The buffer is not expected to contain any data when this API is called.

Parameters

• buf – Buffer to initialize.
• reserve – How much headroom to reserve.

void net_buf_slist_put(sys_slist_t *list, struct net_buf *buf)
Put a buffer into a list.

If the buffer contains follow-up fragments this function will take care of inserting them as well
into the list.

Parameters

• list – Which list to append the buffer to.
• buf – Buffer.

struct net_buf *net_buf_slist_get(sys_slist_t *list)
Get a buffer from a list.

If the buffer had any fragments, these will automatically be recovered from the list as well
and be placed to the buffer's fragment list.

Parameters

• list – Which list to take the buffer from.

Returns

New buffer or NULL if the FIFO is empty.

void net_buf_put(struct k_fifo *fifo, struct net_buf *buf)
Put a buffer to the end of a FIFO.

If the buffer contains follow-up fragments this function will take care of inserting them as well
into the FIFO.

Parameters

• fifo – Which FIFO to put the buffer to.
• buf – Buffer.
void net_buf_unref(struct net_buf *buf)
Decrments the reference count of a buffer.
The buffer is put back into the pool if the reference count reaches zero.

Parameters
• buf – A valid pointer on a buffer

struct net_buf *net_buf_ref(struct net_buf *buf)
Increment the reference count of a buffer.

Parameters
• buf – A valid pointer on a buffer

Returns
the buffer newly referenced

struct net_buf *net_buf_clone(struct net_buf *buf, k_timeout_t timeout)
Clone buffer.
Duplicate given buffer including any data and headers currently stored.

Parameters
• buf – A valid pointer on a buffer
• timeout – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Returns
Cloned buffer or NULL if out of buffers.

static inline void *net_buf_user_data(const struct net_buf *buf)
Get a pointer to the user data of a buffer.

Parameters
• buf – A valid pointer on a buffer

Returns
Pointer to the user data of the buffer.

static inline void net_buf_reserve(struct net_buf *buf, size_t reserve)
Initialize buffer with the given headroom.
The buffer is not expected to contain any data when this API is called.

Parameters
• buf – Buffer to initialize.
• reserve – How much headroom to reserve.

static inline void *net_buf_add(struct net_buf *buf, size_t len)
Prepare data to be added at the end of the buffer.
Increments the data length of a buffer to account for more data at the end.

Parameters
• buf – Buffer to update.
• len – Number of bytes to increment the length with.

Returns
The original tail of the buffer.
static inline void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len)
Copies the given number of bytes to the end of the buffer.
Increment the data length of the buffer to account for more data at the end.

**Parameters**
- **buf** – Buffer to update.
- **mem** – Location of data to be added.
- **len** – Length of data to be added

**Returns**
The original tail of the buffer.

static inline uint8_t *net_buf_add_u8(struct net_buf *buf, uint8_t val)
Add (8-bit) byte at the end of the buffer.
Increment the data length of the buffer to account for more data at the end.

**Parameters**
- **buf** – Buffer to update.
- **val** – byte value to be added.

**Returns**
Pointer to the value added

static inline void net_buf_add_le16(struct net_buf *buf, uint16_t val)
Add 16-bit value at the end of the buffer.
Add 16-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**
- **buf** – Buffer to update.
- **val** – 16-bit value to be added.

static inline void net_buf_add_be16(struct net_buf *buf, uint16_t val)
Add 16-bit value at the end of the buffer.
Add 16-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**
- **buf** – Buffer to update.
- **val** – 16-bit value to be added.

static inline void net_buf_add_le24(struct net_buf *buf, uint32_t val)
Add 24-bit value at the end of the buffer.
Add 24-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

**Parameters**
- **buf** – Buffer to update.
- **val** – 24-bit value to be added.

static inline void net_buf_add_be24(struct net_buf *buf, uint32_t val)
Add 24-bit value at the end of the buffer.
Add 24-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.
Parameters

- buf – Buffer to update.
- val – 24-bit value to be added.

static inline void net_buf_add_le32(struct net_buf *buf, uint32_t val)
Add 32-bit value at the end of the buffer.
Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- buf – Buffer to update.
- val – 32-bit value to be added.

static inline void net_buf_add_be32(struct net_buf *buf, uint32_t val)
Add 32-bit value at the end of the buffer.
Adds 32-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- buf – Buffer to update.
- val – 48-bit value to be added.

static inline void net_buf_add_le48(struct net_buf *buf, uint64_t val)
Add 48-bit value at the end of the buffer.
Adds 48-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- buf – Buffer to update.
- val – 48-bit value to be added.

static inline void net_buf_add_be48(struct net_buf *buf, uint64_t val)
Add 48-bit value at the end of the buffer.
Adds 48-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- buf – Buffer to update.
- val – 64-bit value to be added.

static inline void net_buf_add_le64(struct net_buf *buf, uint64_t val)
Add 64-bit value at the end of the buffer.
Adds 64-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.
Parameters

- buf – Buffer to update.
- val – 64-bit value to be added.

static inline void *net_buf_remove_mem(struct net_buf *buf, size_t len)
Remove data from the end of the buffer.
Removes data from the end of the buffer by modifying the buffer length.

Parameters

- buf – Buffer to update.
- len – Number of bytes to remove.

Returns

New end of the buffer data.

static inline uint8_t net_buf_remove_u8(struct net_buf *buf)
Remove a 8-bit value from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 8-bit values.

Parameters

- buf – A valid pointer on a buffer.

Returns

The 8-bit removed value

static inline uint16_t net_buf_remove_le16(struct net_buf *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 16-bit little endian data.

Parameters

- buf – A valid pointer on a buffer.

Returns

16-bit value converted from little endian to host endian.

static inline uint16_t net_buf_remove_be16(struct net_buf *buf)
Remove and convert 16 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 16-bit big endian data.

Parameters

- buf – A valid pointer on a buffer.

Returns

16-bit value converted from big endian to host endian.

static inline uint32_t net_buf_remove_be24(struct net_buf *buf)
Remove and convert 24 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 24-bit big endian data.

Parameters

- buf – A valid pointer on a buffer.

Returns

24-bit value converted from big endian to host endian.
static inline uint32_t net_buf_remove_le24(struct net_buf *buf)
    Remove and convert 24 bits from the end of the buffer.
    Same idea as with net_buf_remove_mem(), but a helper for operating on 24-bit little endian data.
    Parameters
    • buf – A valid pointer on a buffer.
    Returns
    24-bit value converted from little endian to host endian.

static inline uint32_t net_buf_remove_le32(struct net_buf *buf)
    Remove and convert 32 bits from the end of the buffer.
    Same idea as with net_buf_remove_mem(), but a helper for operating on 32-bit little endian data.
    Parameters
    • buf – A valid pointer on a buffer.
    Returns
    32-bit value converted from little endian to host endian.

static inline uint32_t net_buf_remove_be32(struct net_buf *buf)
    Remove and convert 32 bits from the end of the buffer.
    Same idea as with net_buf_remove_mem(), but a helper for operating on 32-bit big endian data.
    Parameters
    • buf – A valid pointer on a buffer.
    Returns
    32-bit value converted from big endian to host endian.

static inline uint64_t net_buf_remove_le48(struct net_buf *buf)
    Remove and convert 48 bits from the end of the buffer.
    Same idea as with net_buf_remove_mem(), but a helper for operating on 48-bit little endian data.
    Parameters
    • buf – A valid pointer on a buffer.
    Returns
    48-bit value converted from little endian to host endian.

static inline uint64_t net_buf_remove_be48(struct net_buf *buf)
    Remove and convert 48 bits from the end of the buffer.
    Same idea as with net_buf_remove_mem(), but a helper for operating on 48-bit big endian data.
    Parameters
    • buf – A valid pointer on a buffer.
    Returns
    48-bit value converted from big endian to host endian.

static inline uint64_t net_buf_remove_le64(struct net_buf *buf)
    Remove and convert 64 bits from the end of the buffer.
    Same idea as with net_buf_remove_mem(), but a helper for operating on 64-bit little endian data.
    Parameters
    • buf – A valid pointer on a buffer.
    Returns
    64-bit value converted from little endian to host endian.
Parameters
• buf – A valid pointer on a buffer.

Returns
64-bit value converted from little endian to host endian.

static inline uint64_t net_buf_remove_be64(struct net_buf *buf)
Remove and convert 64 bits from the end of the buffer.
Same idea as with net_buf_remove_mem(), but a helper for operating on 64-bit big endian data.

Parameters
• buf – A valid pointer on a buffer

Returns
64-bit value converted from big endian to host endian.

static inline void *net_buf_push(struct net_buf *buf, size_t len)
Prepare data to be added at the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters
• buf – Buffer to update.
• len – Number of bytes to add to the beginning.

Returns
The new beginning of the buffer data.

static inline void *net_buf_push_mem(struct net_buf *buf, const void *mem, size_t len)
Copies the given number of bytes to the start of the buffer.
Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters
• buf – Buffer to update.
• mem – Location of data to be added.
• len – Length of data to be added.

Returns
The new beginning of the buffer data.

static inline void net_buf_push_u8(struct net_buf *buf, uint8_t val)
Push 8-bit value to the beginning of the buffer.
Adds 8-bit value the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 8-bit value to be pushed to the buffer.

static inline void net_buf_push_le16(struct net_buf *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.
Adds 16-bit value in little endian format to the beginning of the buffer.

Parameters
• buf – Buffer to update.
• val – 16-bit value to be pushed to the buffer.

static inline void net_buf_push_be16(struct net_buf *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in big endian format to the beginning of the buffer.

**Parameters**

• buf – Buffer to update.
• val – 16-bit value to be pushed to the buffer.

static inline void net_buf_push_le24(struct net_buf *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in little endian format to the beginning of the buffer.

**Parameters**

• buf – Buffer to update.
• val – 24-bit value to be pushed to the buffer.

static inline void net_buf_push_be24(struct net_buf *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in big endian format to the beginning of the buffer.

**Parameters**

• buf – Buffer to update.
• val – 24-bit value to be pushed to the buffer.

static inline void net_buf_push_le32(struct net_buf *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in little endian format to the beginning of the buffer.

**Parameters**

• buf – Buffer to update.
• val – 32-bit value to be pushed to the buffer.

static inline void net_buf_push_be32(struct net_buf *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in big endian format to the beginning of the buffer.

**Parameters**

• buf – Buffer to update.
• val – 32-bit value to be pushed to the buffer.

static inline void net_buf_push_le48(struct net_buf *buf, uint64_t val)
Push 48-bit value to the beginning of the buffer.

Adds 48-bit value in little endian format to the beginning of the buffer.

**Parameters**

• buf – Buffer to update.
• val – 48-bit value to be pushed to the buffer.
static inline void net_buf_push_be48(struct net_buf *buf, uint64_t val)
    Push 48-bit value in big endian format to the beginning of the buffer.
Parameters
• buf – Buffer to update.
• val – 48-bit value to be pushed to the buffer.

static inline void net_buf_push_le64(struct net_buf *buf, uint64_t val)
    Push 64-bit value to the beginning of the buffer.
    Adds 64-bit value in little endian format to the beginning of the buffer.
Parameters
• buf – Buffer to update.
• val – 64-bit value to be pushed to the buffer.

static inline void net_buf_push_be64(struct net_buf *buf, uint64_t val)
    Push 64-bit value to the beginning of the buffer.
    Adds 64-bit value in big endian format to the beginning of the buffer.
Parameters
• buf – Buffer to update.
• val – 64-bit value to be pushed to the buffer.

static inline void *net_buf_pull(struct net_buf *buf, size_t len)
    Remove data from the beginning of the buffer.
Parameters
• buf – Buffer to update.
• len – Number of bytes to remove.
Returns
New beginning of the buffer data.

static inline void *net_buf_pull_mem(struct net_buf *buf, size_t len)
    Remove data from the beginning of the buffer by modifying the data pointer and buffer length.
Parameters
• buf – Buffer to update.
• len – Number of bytes to remove.
Returns
Pointer to the old beginning of the buffer data.

static inline uint8_t net_buf_pull_u8(struct net_buf *buf)
    Remove a 8-bit value from the beginning of the buffer.
    Same idea as with net_buf_pull(), but a helper for operating on 8-bit values.
Parameters
• buf – A valid pointer on a buffer.
Returns
The 8-bit removed value

\[
\text{static inline uint16_t net_buf_pull_le16(struct net_buf *buf)}
\]
Remove and convert 16 bits from the beginning of the buffer.
Same idea as with \text{net_buf_pull()}, but a helper for operating on 16-bit little endian data.

Parameters
- \text{buf} – A valid pointer on a buffer.

Returns
16-bit value converted from little endian to host endian.

\[
\text{static inline uint16_t net_buf_pull_be16(struct net_buf *buf)}
\]
Remove and convert 16 bits from the beginning of the buffer.
Same idea as with \text{net_buf_pull()}, but a helper for operating on 16-bit big endian data.

Parameters
- \text{buf} – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.

\[
\text{static inline uint32_t net_buf_pull_le24(struct net_buf *buf)}
\]
Remove and convert 24 bits from the beginning of the buffer.
Same idea as with \text{net_buf_pull()}, but a helper for operating on 24-bit little endian data.

Parameters
- \text{buf} – A valid pointer on a buffer.

Returns
24-bit value converted from big endian to host endian.

\[
\text{static inline uint32_t net_buf_pull_be24(struct net_buf *buf)}
\]
Remove and convert 24 bits from the beginning of the buffer.
Same idea as with \text{net_buf_pull()}, but a helper for operating on 24-bit big endian data.

Parameters
- \text{buf} – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.

\[
\text{static inline uint32_t net_buf_pull_le32(struct net_buf *buf)}
\]
Remove and convert 32 bits from the beginning of the buffer.
Same idea as with \text{net_buf_pull()}, but a helper for operating on 32-bit little endian data.

Parameters
- \text{buf} – A valid pointer on a buffer.

Returns
32-bit value converted from big endian to host endian.

\[
\text{static inline uint32_t net_buf_pull_be32(struct net_buf *buf)}
\]
Remove and convert 32 bits from the beginning of the buffer.
Same idea as with \text{net_buf_pull()}, but a helper for operating on 32-bit big endian data.

Parameters
- \text{buf} – A valid pointer on a buffer.
Returns
32-bit value converted from big endian to host endian.
static inline uint64_t net_buf_pull_le48(struct net_buf *buf)
Remove and convert 48 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 48-bit little endian data.
Parameters
• buf – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.
static inline uint64_t net_buf_pull_be48(struct net_buf *buf)
Remove and convert 48 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 48-bit big endian data.
Parameters
• buf – A valid pointer on a buffer

Returns
64-bit value converted from big endian to host endian.
static inline uint64_t net_buf_pull_le64(struct net_buf *buf)
Remove and convert 64 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 64-bit little endian data.
Parameters
• buf – A valid pointer on a buffer

Returns
64-bit value converted from little endian to host endian.
static inline uint64_t net_buf_pull_be64(struct net_buf *buf)
Remove and convert 64 bits from the beginning of the buffer.
Same idea as with net_buf_pull(), but a helper for operating on 64-bit big endian data.
Parameters
• buf – A valid pointer on a buffer

Returns
Check buffer tailroom.
static inline size_t net_buf_tailroom(struct net_buf *buf)
Check how much free space there is at the end of the buffer.
Parameters
• buf – A valid pointer on a buffer

Returns
Number of bytes available at the end of the buffer.
static inline size_t net_buf_headroom(struct net_buf *buf)
Check buffer headroom.
Check how much free space there is in the beginning of the buffer.
buf A valid pointer on a buffer
Returns
Number of bytes available in the beginning of the buffer.

static inline uint16_t net_buf_max_len(struct net_buf *buf)
Check maximum net_buf::len value.
This value is depending on the number of bytes being reserved as headroom.

Parameters
• buf – A valid pointer on a buffer

Returns
Number of bytes usable behind the net_buf::data pointer.

static inline uint8_t *net_buf_tail(struct net_buf *buf)
Get the tail pointer for a buffer.
Get a pointer to the end of the data in a buffer.

Parameters
• buf – Buffer.

Returns
Tail pointer for the buffer.

struct net_buf *net_buf_frag_last(struct net_buf *frags)
Find the last fragment in the fragment list.

Returns
Pointer to last fragment in the list.

void net_buf_frag_insert(struct net_buf *parent, struct net_buf *frag)
Insert a new fragment to a chain of bufs.
Insert a new fragment into the buffer fragments list after the parent.
Note: This function takes ownership of the fragment reference so the caller is not required to unref.

Parameters
• parent – Parent buffer/fragment.
• frag – Fragment to insert.

struct net_buf *net_buf_frag_add(struct net_buf *head, struct net_buf *frag)
Add a new fragment to the end of a chain of bufs.
Append a new fragment into the buffer fragments list.
Note: This function takes ownership of the fragment reference so the caller is not required to unref.

Parameters
• head – Head of the fragment chain.
• frag – Fragment to add.

Returns
New head of the fragment chain. Either head (if head was non-NULL) or frag (if head was NULL).

struct net_buf *net_buf_frag_del(struct net_buf *parent, struct net_buf *frag)
Delete existing fragment from a chain of bufs.

Parameters
• parent – Parent buffer/fragment, or NULL if there is no parent.
• **frag** – Fragment to delete.

**Returns**

Pointer to the buffer following the fragment, or NULL if it had no further fragments.

```c
size_t net_buf_linearize(void *dst, size_t dst_len, struct net_buf *src, size_t offset, size_t len)
```

Copy bytes from `net_buf` chain starting at offset to linear buffer.

Copy (extract) `len` bytes from `src net_buf` chain, starting from `offset` in it, to a linear buffer `dst`.

Return number of bytes actually copied, which may be less than requested, if `net_buf` chain doesn't have enough data, or destination buffer is too small.

**Parameters**

- `dst` – Destination buffer
- `dst_len` – Destination buffer length
- `src` – Source `net_buf` chain
- `offset` – Starting offset to copy from
- `len` – Number of bytes to copy

**Returns**

Number of bytes actually copied

```c
size_t net_buf_append_bytes(struct net_buf *buf, size_t len, const void *value, k_timeout_t timeout, net_buf_allocator_cb allocate_cb, void *user_data)
```

Append data to a list of `net_buf`.

Append data to a `net_buf`. If there is not enough space in the `net_buf` then more `net_buf` will be added, unless there are no free `net_buf` and timeout occurs. If not allocator is provided it attempts to allocate from the same pool as the original buffer.

**Parameters**

- `buf` – Network buffer.
- `len` – Total length of input data
- `value` – Data to be added
- `timeout` – Timeout is passed to the `net_buf` allocator callback.
- `allocate_cb` – When a new `net_buf` is required, use this callback.
- `user_data` – A user data pointer to be supplied to the `allocate_cb`. This pointer is can be anything from a `mem_pool` or a `net_pkt`, the logic is left up to the `allocate_cb` function.

**Returns**

Length of data actually added. This may be less than input length if other timeout than `K_FOREVER` was used, and there were no free fragments in a pool to accommodate all data.

```c
static inline struct net_buf *net_buf_skip(struct net_buf *buf, size_t len)
```

Skip N number of bytes in a `net_buf`.

Skip N number of bytes starting from fragment’s offset. If the total length of data is placed in multiple fragments, this function will skip from all fragments until it reaches N number of bytes. Any fully skipped buffers are removed from the `net_buf` list.

**Parameters**

- `buf` – Network buffer.
- `len` – Total length of data to be skipped.
Returns

Pointer to the fragment or NULL and pos is 0 after successful skip, NULL and pos
is 0xffff otherwise.

static inline size_t net_buf_frags_len(struct net_buf *buf)

Calculates amount of bytes stored in fragments.

Calculates the total amount of data stored in the given buffer and the fragments linked to it.

Parameters

• buf – Buffer to start off with.

Returns

Number of bytes in the buffer and its fragments.

struct net_buf_simple

#include <buf.h> Simple network buffer representation.

This is a simpler variant of the net_buf object (in fact net_buf uses net_buf_simple internally).

It doesn’t provide any kind of reference counting, user data, dynamic allocation, or in general
the ability to pass through kernel objects such as FIFOs.

The main use of this is for scenarios where the meta-data of the normal net_buf isn’t needed
and causes too much overhead. This could be e.g. when the buffer only needs to be allocated
on the stack or when the access to and lifetime of the buffer is well controlled and constrained.

Public Members

uint8_t *data

Pointer to the start of data in the buffer.

uint16_t len

Length of the data behind the data pointer.

To determine the max length, use net_buf_simple_max_len(), not size!

uint16_t size

Amount of data that net_buf_simple::__buf can store.

struct net_buf_simple_state

#include <buf.h> Parsing state of a buffer.

This is used for temporarily storing the parsing state of a buffer while giving control of the
 parsing to a routine which we don’t control.

Public Members

uint16_t offset

Offset of the data pointer from the beginning of the storage

uint16_t len

Length of data
struct net_buf
    #include <buf.h> Network buffer representation.
    This struct is used to represent network buffers. Such buffers are normally defined through
the NET_BUF_POOL_*_DEFINE() APIs and allocated using the net_buf_alloc() API.

Public Members

sys_snode_t node
    Allow placing the buffer into sys_slist_t

struct net_buf *frags
    Fragments associated with this buffer.

uint8_t ref
    Reference count.

uint8_t flags
    Bit-field of buffer flags.

uint8_t pool_id
    Where the buffer should go when freed up.

uint8_t *data
    Pointer to the start of data in the buffer.

uint16_t len
    Length of the data behind the data pointer.

uint16_t size
    Amount of data that this buffer can store.

uint8_t user_data[]
    System metadata for this buffer.

struct net_buf_data_cb
    #include <buf.h>

struct net_buf_data_alloc
    #include <buf.h>

struct net_buf_pool
    #include <buf.h> Network buffer pool representation.
    This struct is used to represent a pool of network buffers.

Public Members
struct k_lifo_free
    LIFO to place the buffer into when free

const uint16_t buf_count
    Number of buffers in pool

uint16_t uninit_count
    Number of uninitialized buffers

void (*const destroy)(struct net_buf *buf)
    Optional destroy callback when buffer is freed.

const struct net_buf_data_alloc *alloc
    Data allocation handlers.

struct net_buf_pool_fixed
    #include <buf.h>

Packet Management

- API Reference

Overview  Network packets are the main data the networking stack manipulates. Such data is represented through the net_pkt structure which provides a means to hold the packet, write and read it, as well as necessary metadata for the core to hold important information. Such an object is called net_pkt in this document.

The data structure and the whole API around it are defined in include/zephyr/net/net_pkt.h.

Architectural notes  There are two network packets flows within the stack, TX for the transmission path, and RX for the reception one. In both paths, each net_pkt is written and read from the beginning to the end, or more specifically from the headers to the payload.

Memory management
### Allocation

All net_pkt objects come from a pre-defined pool of struct net_pkt. Such pool is defined via

\[
\text{NET_PKT_SLAB_DEFINE(name, count)}
\]

Note, however, one will rarely have to use it, as the core provides already two pools, one for the TX path and one for the RX path.

Allocating a raw net_pkt can be done through:

\[
\text{pkt = net_pkt_alloc(timeout);}
\]

However, by its nature, a raw net_pkt is useless without a buffer and needs various metadata information to become relevant as well. It requires at least to get the network interface it is meant to be sent through or through which it was received. As this is a very common operation, a helper exist:

\[
\text{pkt = net_pkt_alloc_on_iface(iface, timeout);}
\]

A more complete allocator exists, where both the net_pkt and its buffer can be allocated at once:

\[
\text{pkt = net_pkt_alloc_with_buffer(iface, size, family, proto, timeout);}
\]

See below how the buffer is allocated.

### Buffer allocation

The net_pkt object does not define its own buffer, but instead uses an existing object for this: `net_buf`. (See Network Buffer for more information). However, it mostly hides the usage of such a buffer because net_pkt brings network awareness to buffer allocation and, as we will see later, its operation too.

To allocate a buffer, a net_pkt needs to have at least its network interface set. This works if the family of the packet is unknown at the time of buffer allocation. Then one could do:

\[
\text{net_pkt_alloc_buffer(pkt, size, proto, timeout);}
\]

Where proto could be 0 if unknown (there is no IPPROTO_UNSPEC).

As seen previously, the net_pkt and its buffer can be allocated at once via `net_pkt_alloc_with_buffer()`. It is actually the most widely used allocator.

The network interface, the family, and the protocol of the packet are used by the buffer allocation to determine if the requested size can be allocated. Indeed, the allocator will use the network interface to know the MTU and then the family and protocol for the headers space (if only these 2 are specified). If the whole fits within the MTU, the allocated space will be of the requested size plus, eventually, the headers space. If there is insufficient MTU space, the requested size will be shrunk so the possible headers space and new size will fit within the MTU.

For instance, on an Ethernet network interface, with an MTU of 1500 bytes:

\[
\text{pkt = net_pkt_alloc_with_buffer(iface, 800, AF_INET4, IPPROTO_UDP, K_FOREVER);}
\]

will successfully allocate 800 + 20 + 8 bytes of buffer for the new net_pkt where:

\[
\text{pkt = net_pkt_alloc_with_buffer(iface, 1600, AF_INET4, IPPROTO_UDP, K_FOREVER);}
\]

will successfully allocate 1500 bytes, and where 20 + 8 bytes (IPv4 + UDP headers) will not be used for the payload.

On the receiving side, when the family and protocol are not known:

\[
\text{pkt = net_pkt_rx_alloc_with_buffer(iface, 800, AF_UNSPEC, 0, K_FOREVER);}
\]

will allocate 800 bytes and no extra header space. But a:
pkt = net_pkt_rx_alloc_with_buffer(iface, 1600, AF_UNSPEC, 0, K_FOREVER);

will allocate 1514 bytes, the MTU + Ethernet header space.

One can increase the amount of buffer space allocated by calling net_pkt_alloc_buffer(), as it will take into account the existing buffer. It will also account for the header space if net_pkt’s family is a valid one, as well as the proto parameter. In that case, the newly allocated buffer space will be appended to the existing one, and not inserted in the front. Note however such a use case is rather limited. Usually, one should know from the start how much size should be requested.

Deallocation Each net_pkt is reference counted. At allocation, the reference is set to 1. The reference count can be incremented with net_pkt_ref() or decremented with net_pkt_unref(). When the count drops to zero the buffer is also un-referenced and net_pkt is automatically placed back into the free net_pkt slabs.

If net_pkt’s buffer is needed even after net_pkt deallocation, one will need to reference once more all the chain of net_buf before calling last net_pkt_unref. See Network Buffer for more information.

Operations There are two ways to access the net_pkt buffer, explained in the following sections: basic read/write access and data access, the latter being the preferred way.

Read and Write access As said earlier, though net_pkt uses net_buf for its buffer, it provides its own API to access it. Indeed, a network packet might be scattered over a chain of net_buf objects, the functions provided by net_buf are then limited for such case. Instead, net_pkt provides functions which hide all the complexity of potential non-contiguous access.

Data movement into the buffer is made through a cursor maintained within each net_pkt. All read/write operations affect this cursor. Note as well that read or write functions are strict on their length parameters: if it cannot r/w the given length it will fail. Length is not interpreted as an upper limit, it is instead the exact amount of data that must be read or written.

As there are two paths, TX and RX, there are two access modes: write and overwrite. This might sound a bit unusual, but is in fact simple and provides flexibility.

In write mode, whatever is written in the buffer affects the length of actual data present in the buffer. Buffer length should not be confused with the buffer size which is a limit any mode cannot pass. In overwrite mode then, whatever is written must happen on valid data, and will not affect the buffer length. By default, a newly allocated net_pkt is on write mode, and its cursor points to the beginning of its buffer.

Let’s see now, step by step, the functions and how they behave depending on the mode.

When freshly allocated with a buffer of 500 bytes, a net_pkt has 0 length, which means no valid data is in its buffer. One could verify this by:

\[
\text{len = net_pkt_get_len(pkt);}\]

Now, let’s write 8 bytes:

\[
\text{net_pkt_write(pkt, data, 8);}\]

The buffer length is now 8 bytes. There are various helpers to write a byte, or big endian uint16_t, uint32_t.

\[
\text{net_pkt_write_u8(pkt, &foo);}\]
\[
\text{net_pkt_write_be16(pkt, &ba);}\]
\[
\text{net_pkt_write_be32(pkt, &bar);}\]
Logically, net_pkt's length is now 15. But if we try to read at this point, it will fail because there is nothing to read at the cursor where we are at in the net_pkt. It is possible, while in write mode, to read what has been already written by resetting the cursor of the net_pkt. For instance:

```c
net_pkt_cursor_init(pkt);
net_pkt_read(pkt, data, 15);
```

This will reset the cursor of the pkt to the beginning of the buffer and then let you read the actual 15 bytes present. The cursor is then again pointing at the end of the buffer.

To set a large area with the same byte, a memset function is provided:

```c
net_pkt_memset(pkt, 0, 5);
```

Our net_pkt has now a length of 20 bytes.

Switching between modes can be achieved via `net_pkt_set_overwrite()` function. It is possible to switch mode back and forth at any time. The net_pkt will be set to overwrite and its cursor reset:

```c
net_pkt_set_overwrite(pkt, true);
net_pkt_cursor_init(pkt);
```

Now the same operators can be used, but it will be limited to the existing data in the buffer, i.e. 20 bytes. If it is necessary to know how much space is available in the net_pkt call:

```c
net_pkt_available_buffer(pkt);
```

Or, if headers space needs to be accounted for, call:

```c
net_pkt_available_payload_buffer(pkt, proto);
```

If you want to place the cursor at a known position use the function `net_pkt_skip()`. For example, to go after the IP header, use:

```c
net_pkt_cursor_init(pkt);
net_pkt_skip(pkt, net_pkt_ip_header_len(pkt));
```

**Data access** Though the API shown previously is rather simple, it involves always copying things to and from the net_pkt buffer. In many occasions, it is more relevant to access the information stored in the buffer contiguously, especially with network packets which embed headers.

These headers are, most of the time, a known fixed set of bytes. It is then more natural to have a structure representing a certain type of header. In addition to this, if it is known the header size appears in a contiguous area of the buffer, it will be way more efficient to cast the actual position in the buffer to the type of header. Either for reading or writing the fields of such header, accessing it directly will save memory.

Net pkt comes with a dedicated API for this, built on top of the previously described API. It is able to handle both contiguous and non-contiguous access transparently.

There are two macros used to define a data access descriptor: `NET_PKT_DATA_ACCESS_DEFINE` when it is not possible to tell if the data will be in a contiguous area, and `NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE` when it is guaranteed the data is in a contiguous area.

Let's take the example of IP and UDP. Both IPv4 and IPv6 headers are always found at the beginning of the packet and are small enough to fit in a net_buf of 128 bytes (for instance, though 64 bytes could be chosen).
It would be the same for struct net_ipv4_hdr. For a UDP header it is likely not to be in a contiguous area in IPv6 for instance so:

```c
NET_PKT_DATA_ACCESS_DEFINE(udp_access, struct net_ipv4_hdr);
struct net_ipv4_hdr *udp_hdr;
udp_hdr = (struct net_ipv4_hdr *)net_pkt_get_data(pkt, &udp_access);
```

At this point, the cursor of the net_pkt points at the beginning of the requested data. On the RX path, these headers will be read but not modified so to proceed further the cursor needs to advance past the data. There is a function dedicated for this:

```c
net_pkt_acknowledge_data(pkt, &ipv4_access);
```

On the TX path, however, the header fields have been modified. In such a case:

```c
net_pkt_set_data(pkt, &ipv4_access);
```

If the data are in a contiguous area, it will advance the cursor relevantly. If not, it will write the data and the cursor will be updated. Note that `net_pkt_set_data()` could be used in the RX path as well, but it is slightly faster to use `net_pkt_acknowledge_data()` as this one does not care about contiguity at all, it just advances the cursor via `net_pkt_skip()` directly.

### API Reference

**group net_pkt**

Network packet management library.

**Defines**

```c
NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE(ipv4_access, struct net_ipv4_hdr);
struct net_ipv4_hdr *ipv4_hdr;
ipv4_hdr = (struct net_ipv4_hdr *)net_pkt_get_data(pkt, &ipv4_access);
```

6.2. Networking
• name – Name of the pool.
• count – Number of net_buf in this pool.

net_pkt_print_frags(pkt)
    Print fragment list and the fragment sizes.
    Only available if debugging is activated.

Parameters
• pkt – Network pkt.

NET_PKT_DATA_ACCESS_DEFINE(_name, _type)
NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE(_name, _type)

Functions

struct net_buf *net_pkt_get_reserve_rx_data(size_t min_len, k_timeout_t timeout)
    Get RX DATA buffer from pool. Normally you should use net_pkt_get_frag() instead.
    Normally this version is not useful for applications but is mainly used by network fragmentation code.

Parameters
• min_len – Minimum length of the requested fragment.
• timeout – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns
    Network buffer if successful, NULL otherwise.

struct net_buf *net_pkt_get_reserve_tx_data(size_t min_len, k_timeout_t timeout)
    Get TX DATA buffer from pool. Normally you should use net_pkt_get_frag() instead.
    Normally this version is not useful for applications but is mainly used by network fragmentation code.

Parameters
• min_len – Minimum length of the requested fragment.
• timeout – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns
    Network buffer if successful, NULL otherwise.

struct net_buf *net_pkt_get_frag(struct net_pkt *pkt, size_t min_len, k_timeout_t timeout)
    Get a data fragment that might be from user specific buffer pool or from global DATA pool.

Parameters
• pkt – Network packet.
• min_len – Minimum length of the requested fragment.
• timeout – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns
    Network buffer if successful, NULL otherwise.
void net_pkt_unref(struct net_pkt *pkt)
    Place packet back into the available packets slab.
    Releases the packet to other use. This needs to be called by application after it has finished
    with the packet.

    Parameters
    • pkt – Network packet to release.

struct net_pkt *net_pkt_ref(struct net_pkt *pkt)
    Increase the packet ref count.
    Mark the packet to be used still.

    Parameters
    • pkt – Network packet to ref.

    Returns
    Network packet if successful, NULL otherwise.

struct net_buf *net_pkt_frag_ref(struct net_buf *frag)
    Increase the packet fragment ref count.
    Mark the fragment to be used still.

    Parameters
    • frag – Network fragment to ref.

    Returns
    a pointer on the referenced Network fragment.

void net_pkt_frag_unref(struct net_buf *frag)
    Decrease the packet fragment ref count.

    Parameters
    • frag – Network fragment to unref.

struct net_buf *net_pkt_frag_del(struct net_pkt *pkt, struct net_buf *parent, struct net_buf *frag)
    Delete existing fragment from a packet.

    Parameters
    • pkt – Network packet from which frag belongs to.
    • parent – parent fragment of frag, or NULL if none.
    • frag – Fragment to delete.

    Returns
    Pointer to the following fragment, or NULL if it had no further fragments.

void net_pkt_frag_add(struct net_pkt *pkt, struct net_buf *frag)
    Add a fragment to a packet at the end of its fragment list.

    Parameters
    • pkt – pkt Network packet where to add the fragment
    • frag – Fragment to add

void net_pkt_frag_insert(struct net_pkt *pkt, struct net_buf *frag)
    Insert a fragment to a packet at the beginning of its fragment list.

    Parameters
    • pkt – pkt Network packet where to insert the fragment
• **frag** – Fragment to insert

```c
void net_pkt_compact(struct net_pkt *pkt)
```

Compact the fragment list of a packet.

After this there is no more any free space in individual fragments.

**Parameters**

• *pkt* – Network packet.

```c
void net_pkt_get_info(struct k_mem_slab **rx, struct k_mem_slab **tx, struct net_buf_pool **rx_data, struct net_buf_pool **tx_data)
```

Get information about predefined RX, TX and DATA pools.

**Parameters**

• *rx* – Pointer to RX pool is returned.
• *tx* – Pointer to TX pool is returned.
• *rx_data* – Pointer to RX DATA pool is returned.
• *tx_data* – Pointer to TX DATA pool is returned.

```c
struct net_pkt *net_pkt_alloc(k_timeout_t timeout)
```

Allocate an initialized `net_pkt`.

for the time being, 2 pools are used. One for TX and one for RX. This allocator has to be used for TX.

**Parameters**

• *timeout* – Maximum time to wait for an allocation.

**Returns**

a pointer to a newly allocated `net_pkt` on success, NULL otherwise.

```c
struct net_pkt *net_pkt_alloc_from_slab(struct k_mem_slab *slab, k_timeout_t timeout)
```

Allocate an initialized `net_pkt` from a specific slab.

unlike `net_pkt_alloc()` which uses core slabs, this one will use an external slab (see `NET_PKT_SLAB_DEFINE()`). Do not use it unless you know what you are doing. Basically, only net_context should be using this, in order to allocate packet and then buffer on its local slab/pool (if any).

**Parameters**

• *slab* – The slab to use for allocating the packet
• *timeout* – Maximum time to wait for an allocation.

**Returns**

a pointer to a newly allocated `net_pkt` on success, NULL otherwise.

```c
struct net_pkt *net_pkt_rx_alloc(k_timeout_t timeout)
```

Allocate an initialized `net_pkt` for RX.

for the time being, 2 pools are used. One for TX and one for RX. This allocator has to be used for RX.

**Parameters**

• *timeout* – Maximum time to wait for an allocation.

**Returns**

a pointer to a newly allocated `net_pkt` on success, NULL otherwise.
struct net_pkt *
net_pkt_alloc_on_iface(struct net_if *iface, k_timeout_t timeout)

Allocate a network packet for a specific network interface.

Parameters
• iface – The network interface the packet is supposed to go through.
• timeout – Maximum time to wait for an allocation.

Returns
a pointer to a newly allocated net_pkt on success, NULL otherwise.

struct net_pkt *
net_pkt_rx_alloc_on_iface(struct net_if *iface, k_timeout_t timeout)

Allocate buffer for a net_pkt.
: such allocator will take into account space necessary for headers, MTU, and existing buffer
(if any). Beware that, due to all these criteria, the allocated size might be smaller/bigger than
requested one.

Parameters
• pkt – The network packet requiring buffer to be allocated.
• size – The size of buffer being requested.
• proto – The IP protocol type (can be 0 for none).
• timeout – Maximum time to wait for an allocation.

Returns
0 on success, negative errno code otherwise.

struct net_pkt *
net_pkt_alloc_with_buffer(struct net_if *iface, size_t size,
sa_family_t family, enum net_ip_protocol proto,
k_timeout_t timeout)

Allocate a network packet and buffer at once.

Parameters
• iface – The network interface the packet is supposed to go through.
• size – The size of buffer.
• family – The family to which the packet belongs.
• proto – The IP protocol type (can be 0 for none).
• timeout – Maximum time to wait for an allocation.

Returns
a pointer to a newly allocated net_pkt on success, NULL otherwise.

void net_pkt_append_buffer(struct net_pkt *pkt, struct net_buf *buffer)

Append a buffer in packet.

Parameters
• pkt – Network packet where to append the buffer
• buffer – Buffer to append
size_t net_pkt_available_buffer(struct net_pkt *pkt)
Get available buffer space from a pkt.

**Note:** Reserved bytes (headroom) in any of the fragments are not considered to be available.

**Parameters**
- pkt – The net_pkt which buffer availability should be evaluated

**Returns**
the amount of buffer available

size_t net_pkt_available_payload_buffer(struct net_pkt *pkt, enum net_ip_protocol proto)
Get available buffer space for payload from a pkt.

Unlike net_pkt_available_buffer(), this will take into account the headers space.

**Note:** Reserved bytes (headroom) in any of the fragments are not considered to be available.

**Parameters**
- pkt – The net_pkt which payload buffer availability should be evaluated
- proto – The IP protocol type (can be 0 for none).

**Returns**
the amount of buffer available for payload

void net_pkt_trim_buffer(struct net_pkt *pkt)
Trim net_pkt buffer.
This will basically check for unused buffers and deallocate them relevantly

**Parameters**
- pkt – The net_pkt which buffer will be trimmed

int net_pkt_remove_tail(struct net_pkt *pkt, size_t length)
Remove length bytes from tail of packet.
This function does not take packet cursor into account. It is a helper to remove unneeded bytes from tail of packet (like appended CRC). It takes care of buffer deallocation if removed bytes span whole buffer(s).

**Parameters**
- pkt – Network packet
- length – Number of bytes to be removed

**Return values**
- 0 – On success.
- -EINVAL – If packet length is shorter than length.

void net_pkt_cursor_init(struct net_pkt *pkt)
Initialize net_pkt cursor.
This will initialize the net_pkt cursor from its buffer.

**Parameters**
• pkt – The net_pkt whose cursor is going to be initialized

static inline void net_pkt_cursor_backup(struct net_pkt *pkt, struct net_pkt_cursor *backup)
Backup net_pkt cursor.

Parameters
• pkt – The net_pkt whose cursor is going to be backed up
• backup – The cursor where to backup net_pkt cursor

static inline void net_pkt_cursor_restore(struct net_pkt *pkt, struct net_pkt_cursor *backup)
Restore net_pkt cursor from a backup.

Parameters
• pkt – The net_pkt whose cursor is going to be restored
• backup – The cursor from where to restore net_pkt cursor

static inline void *net_pkt_cursor_get_pos(struct net_pkt *pkt)
Returns current position of the cursor.

Parameters
• pkt – The net_pkt whose cursor position is going to be returned

Returns
cursor’s position

int net_pkt_skip(struct net_pkt *pkt, size_t length)
Skip some data from a net_pkt.

net_pkt’s cursor should be properly initialized. Cursor position will be updated after the operation. Depending on the value of pkt->overwrite bit, this function will affect the buffer length or not. If it’s true, it will advance the cursor to the requested length. If it’s false, it will do the same but if the cursor was already also at the end of existing data, it will increment the buffer length. So in this case, its behavior is just like net_pkt_write or net_pkt_memset, difference being that it will not affect the buffer content itself (which may be just garbage then).

Parameters
• pkt – The net_pkt whose cursor will be updated to skip given amount of data from the buffer.
• length – Amount of data to skip in the buffer

Returns
0 in success, negative errno code otherwise.

int net_pkt_memset(struct net_pkt *pkt, int byte, size_t length)
Memset some data in a net_pkt.

net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The net_pkt whose buffer to fill starting at the current cursor position.
• byte – The byte to write in memory
• length – Amount of data to memset with given byte

Returns
0 in success, negative errno code otherwise.
int net_pkt_copy(struct net_pkt *pkt_dst, struct net_pkt *pkt_src, size_t length)
    Copy data from a packet into another one.
    Both net_pkt cursors should be properly initialized and, if needed, positioned using net_pkt_skip. The cursors will be updated after the operation.

    Parameters
    • pkt_dst – Destination network packet.
    • pkt_src – Source network packet.
    • length – Length of data to be copied.

    Returns
    0 on success, negative errno code otherwise.

struct net_pkt *net_pkt_clone(struct net_pkt *pkt, k_timeout_t timeout)
    Clone pkt and its buffer. The cloned packet will be allocated on the same pool as the original one.

    Parameters
    • pkt – Original pkt to be cloned
    • timeout – Timeout to wait for free buffer

    Returns
    NULL if error, cloned packet otherwise.

struct net_pkt *net_pkt_rx_clone(struct net_pkt *pkt, k_timeout_t timeout)
    Clone pkt and its buffer. The cloned packet will be allocated on the RX packet poll.

    Parameters
    • pkt – Original pkt to be cloned
    • timeout – Timeout to wait for free buffer

    Returns
    NULL if error, cloned packet otherwise.

struct net_pkt *net_pkt_shallow_clone(struct net_pkt *pkt, k_timeout_t timeout)
    Clone pkt and increase the refcount of its buffer.

    Parameters
    • pkt – Original pkt to be shallow cloned
    • timeout – Timeout to wait for free packet

    Returns
    NULL if error, cloned packet otherwise.

int net_pkt_read(struct net_pkt *pkt, void *data, size_t length)
    Read some data from a net_pkt.
    net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

    Parameters
    • pkt – The network packet from where to read some data
    • data – The destination buffer where to copy the data
    • length – The amount of data to copy

    Returns
    0 on success, negative errno code otherwise.
static inline int net_pkt_read_u8(struct net_pkt *pkt, uint8_t *data)

int net_pkt_read_be16(struct net_pkt *pkt, uint16_t *data)

Read uint16_t big endian data from a net_pkt.

net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to read
• data – The destination uint16_t where to copy the data

Returns
0 on success, negative errno code otherwise.

int net_pkt_read_le16(struct net_pkt *pkt, uint16_t *data)

Read uint16_t little endian data from a net_pkt.

net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to read
• data – The destination uint16_t where to copy the data

Returns
0 on success, negative errno code otherwise.

int net_pkt_read_be32(struct net_pkt *pkt, uint32_t *data)

Read uint32_t big endian data from a net_pkt.

net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to read
• data – The destination uint32_t where to copy the data

Returns
0 on success, negative errno code otherwise.

int net_pkt_write(struct net_pkt *pkt, const void *data, size_t length)

Write data into a net_pkt.

net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet where to write
• data – Data to be written
• length – Length of the data to be written

Returns
0 on success, negative errno code otherwise.

static inline int net_pkt_write_u8(struct net_pkt *pkt, uint8_t data)

static inline int net_pkt_write_be16(struct net_pkt *pkt, uint16_t data)

static inline int net_pkt_write_be32(struct net_pkt *pkt, uint32_t data)
static inline int net_pkt_write_le32(struct net_pkt *pkt, uint32_t data)
static inline int net_pkt_write_le16(struct net_pkt *pkt, uint16_t data)
size_t net_pkt_remaining_data(struct net_pkt *pkt)
   Get the amount of data which can be read from current cursor position.

   Parameters
   • pkt – Network packet

   Returns
   Amount of data which can be read from current pkt cursor

int net_pkt_update_length(struct net_pkt *pkt, size_t length)
   Update the overall length of a packet.
   Unlike net_pkt_pull() below, this does not take packet cursor into account. It's mainly a helper
dedicated for ipv4 and ipv6 input functions. It shrinks the overall length by given parameter.

   Parameters
   • pkt – Network packet
   • length – The new length of the packet

   Returns
   0 on success, negative errno code otherwise.

int net_pkt_pull(struct net_pkt *pkt, size_t length)
   Remove data from the packet at current location.
   net_pkt's cursor should be properly initialized and, eventually, properly positioned using
net_pkt_skip/read/write. Note that net_pkt's cursor is reset by this function.

   Parameters
   • pkt – Network packet
   • length – Number of bytes to be removed

   Returns
   0 on success, negative errno code otherwise.

uint16_t net_pkt_get_current_offset(struct net_pkt *pkt)
   Get the actual offset in the packet from its cursor.

   Parameters
   • pkt – Network packet.

   Returns
   a valid offset on success, 0 otherwise as there is nothing that can be done to
evaluate the offset.

bool net_pkt_is_contiguous(struct net_pkt *pkt, size_t size)
   Check if a data size could fit contiguously.
   net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip.

   Parameters
   • pkt – Network packet.
   • size – The size to check for contiguity

   Returns
   true if that is the case, false otherwise.
size_t net_pkt_get_contiguous_len(struct net_pkt *pkt)
Get the contiguous buffer space.

Parameters
• pkt – Network packet

Returns
The available contiguous buffer space in bytes starting from the current cursor position. 0 in case of an error.

void *net_pkt_get_data(struct net_pkt *pkt, struct net_pkt_data_access *access)
Get data from a network packet in a contiguous way.
net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet from where to get the data.
• access – A pointer to a valid net_pkt_data_access describing the data to get in a contiguous way.

Returns
a pointer to the requested contiguous data, NULL otherwise.

int net_pkt_set_data(struct net_pkt *pkt, struct net_pkt_data_access *access)
Set contiguous data into a network packet.
net_pkt’s cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters
• pkt – The network packet to where the data should be set.
• access – A pointer to a valid net_pkt_data_access describing the data to set.

Returns
0 on success, a negative errno otherwise.

static inline int net_pkt_acknowledge_data(struct net_pkt *pkt, struct net_pkt_data_access *access)
Acknowledged previously contiguous data taken from a network packet Packet needs to be set to overwrite mode.

struct net_pkt_cursor
#include <net_pkt.h>

Public Members

struct netbuf *buf
Current netbuf pointer by the cursor

uint8_t *pos
Current position in the data buffer of the netbuf

struct net_pkt
#include <net_pkt.h> Network packet.
Note that if you add new fields into net_pkt, remember to update net_pkt_clone() function.
Public Members

intptr_t fifo

The fifo is used by RX/TX threads and by socket layer. The net_pkt is queued via fifo to the processing thread.

struct k_mem_slab *slab

Slab pointer from where it belongs to

union net_pkt.[anonymous] [anonymous]
buffer holding the packet

struct net_pkt_cursor cursor

Internal buffer iterator used for reading/writing

struct net_context *context

Network connection context

struct net_if *iface

Network interface

struct net_pkt_data_access

#include <net_pkt.h>

Virtual LAN (VLAN) Support

- Overview
- API Reference

Overview  Virtual LAN (VLAN) is a partitioned and isolated computer network at the data link layer (OSI layer 2). For ethernet network this refers to IEEE 802.1Q

In Zephyr, each individual VLAN is modeled as a virtual network interface. This means that there is an ethernet network interface that corresponds to a real physical ethernet port in the system. A virtual network interface is created for each VLAN, and this virtual network interface connects to the real network interface. This is similar to how Linux implements VLANs. The eth0 is the real network interface and vlan0 is a virtual network interface that is run on top of eth0.

VLAN support must be enabled at compile time by setting option CONFIG_NET_VLAN and CONFIG_NET_VLAN_COUNT to reflect how many network interfaces there will be in the system. For example, if there is one network interface without VLAN support, and two with VLAN support, the CONFIG_NET_VLAN_COUNT option should be set to 3.
Even if VLAN is enabled in a `prj.conf` file, the VLAN needs to be activated at runtime by the application. The VLAN API provides a `net_eth_vlan_enable()` function to do that. The application needs to give the network interface and desired VLAN tag as a parameter to that function. The VLAN tagging for a given network interface can be disabled by a `net_eth_vlan_disable()` function. The application needs to configure the VLAN network interface itself, such as setting the IP address, etc.

See also the VLAN sample application for API usage example. The source code for that sample application can be found at `samples/net/vlan`.

The net-shell module contains `net vlan add` and `net vlan del` commands that can be used to enable or disable VLAN tags for a given network interface.

See the IEEE 802.1Q spec for more information about ethernet VLANs.

### API Reference

**group** vlan_api

VLAN definitions and helpers.

**Defines**

`NET_VLAN_TAG_UNSPEC`

Unspecified VLAN tag value

**Functions**

```c
static inline uint16_t net_eth_vlan_get_vid(uint16_t tci)

Get VLAN identifier from TCI.

**Parameters**

- `tci` – VLAN tag control information.

**Returns**

VLAN identifier.
```

```c
static inline uint8_t net_eth_vlan_get_dei(uint16_t tci)

Get Drop Eligible Indicator from TCI.

**Parameters**

- `tci` – VLAN tag control information.

**Returns**

Drop eligible indicator.
```

```c
static inline uint8_t net_eth_vlan_get_pcp(uint16_t tci)

Get Priority Code Point from TCI.

**Parameters**

- `tci` – VLAN tag control information.

**Returns**

Priority code point.
```

```c
static inline uint16_t net_eth_vlan_set_vid(uint16_t tci, uint16_t vid)

Set VLAN identifier to TCI.

**Parameters**

- `tci` – VLAN tag control information.
- `vid` – VLAN tag value.

**Returns**

VLAN identifier.
```
• vid – VLAN identifier.

Returns
New TCI value.

static inline uint16_t net_eth_vlan_set_dei(uint16_t tci, bool dei)
Set Drop Eligible Indicator to TCI.

Parameters
• tci – VLAN tag control information.
• dei – Drop eligible indicator.

Returns
New TCI value.

static inline uint16_t net_eth_vlan_set_pcp(uint16_t tci, uint8_t pcp)
Set Priority Code Point to TCI.

Parameters
• tci – VLAN tag control information.
• pcp – Priority code point.

Returns
New TCI value.

Link Layer Discovery Protocol

Overview
The Link Layer Discovery Protocol (LLDP) is a vendor-neutral link layer protocol used by network devices for advertising their identity, capabilities, and neighbors on a wired Ethernet network. For more information, see this LLDP Wikipedia article.

API Reference

group lldp
LLDP definitions and helpers.

Defines

net_lldp_set_lldpdu(iface)
Set LLDP protocol data unit (LLDPDU) for the network interface.

Parameters
• iface – Network interface

Returns
<0 if error, index in lldp array if iface is found there
net_lldp_unset_lldpdu(iface)

Unset LLDP protocol data unit (LLDPDU) for the network interface.

**Parameters**

- **iface** – Network interface

**Typedefs**

typedef enum net_verdict (*net_lldp_recv_cb_t)(struct net_if *iface, struct net_pkt *pkt)

LLDP Receive packet callback.

Callback gets called upon receiving packet. It is responsible for freeing packet or indicating to the stack that it needs to free packet by returning correct net_verdict.

Returns:

- **NET_DROP**, if packet was invalid, rejected or we want the stack to free it. In this case the core stack will free the packet.
- **NET_OK**, if the packet was accepted, in this case the ownership of the *net_pkt* goes to callback and core network stack will forget it.

**Enums**

eenum net_lldp_tlv_type

TLV Types. Please refer to table 8.1 from IEEE 802.1AB standard.

Values:

- **enumerator LLDP_TLV_END_LLDPDU** = 0
  
  End Of LLDPDU (optional)

- **enumerator LLDP_TLV_CHASSIS_ID** = 1
  
  Chassis ID (mandatory)

- **enumerator LLDP_TLV_PORT_ID** = 2
  
  Port ID (mandatory)

- **enumerator LLDP_TLV_TTL** = 3
  
  Time To Live (mandatory)

- **enumerator LLDP_TLV_PORT_DESC** = 4
  
  Port Description (optional)

- **enumerator LLDP_TLV_SYSTEM_NAME** = 5
  
  System Name (optional)

- **enumerator LLDP_TLV_SYSTEM_DESC** = 6
  
  System Description (optional)

- **enumerator LLDP_TLV_SYSTEM_CAPABILITIES** = 7
  
  System Capability (optional)
enumerator LLDP_TLV_MANAGEMENT_ADDR = 8
Management Address (optional)

enumerator LLDP_TLV_ORG_SPECIFIC = 127
Org specific TLVs (optional)

Functions

int net_lldp_config(struct net_if *iface, const struct net_lldpdu *lldpdu)
Set the LLDP data unit for a network interface.

Parameters
• iface – Network interface
• lldpdu – LLDP data unit struct

Returns
0 if ok, <0 if error

int net_lldp_config_optional(struct net_if *iface, const uint8_t *tlv, size_t len)
Set the Optional LLDP TLVs for a network interface.

Parameters
• iface – Network interface
• tlv – LLDP optional TLVs following mandatory part
• len – Length of the optional TLVs

Returns
0 if ok, <0 if error

void net_lldp_init(void)
Initialize LLDP engine.

int net_lldp_register_callback(struct net_if *iface, net_lldp_recv_cb_t cb)
Register LLDP Rx callback function.

Parameters
• iface – Network interface
• cb – Callback function

Returns
0 if ok, < 0 if error

enum net_verdict net_lldp_recv(struct net_if *iface, struct net_pkt *pkt)
Parse LLDP packet.

Parameters
• iface – Network interface
• pkt – Network packet

Returns
Return the policy for network buffer

struct net_lldp_chassis_tlv
#include <lldp.h> Chassis ID TLV, see chapter 8.5.2 in IEEE 802.1AB
Public Members

`uint16_t type_length`
7 bits for type, 9 bits for length

`uint8_t subtype`
ID subtype

`uint8_t value[NET_LLDP_CHASSIS_ID_VALUE_LEN]`
Chassis ID value

```
#include <lldp.h>
```
Port ID TLV, see chapter 8.5.3 in IEEE 802.1AB

Public Members

`uint16_t type_length`
7 bits for type, 9 bits for length

`uint8_t subtype`
ID subtype

`uint8_t value[NET_LLDP_PORT_ID_VALUE_LEN]`
Port ID value

```
#include <lldp.h>
```
Time To Live TLV, see chapter 8.5.4 in IEEE 802.1AB

Public Members

`uint16_t type_length`
7 bits for type, 9 bits for length

`uint16_t ttl`
Time To Live (TTL) value

```
#include <lldp.h>
```
LLDP Data Unit (LLDPDU) shall contain the following ordered TLVs as stated in “8.2 LLDPDU format” from the IEEE 802.1AB

Public Members

```
struct net_lldp_chassis_tlv chassis_id
```
Mandatory Chassis TLV
struct net_lldp_port_tlv port_id
Mandatory Port TLV

struct net_lldp_time_to_live_tlv ttl
Mandatory TTL TLV

IEEE 802.1Qav

Overview Credit-based shaping is an alternative scheduling algorithm used in network schedulers to achieve fairness when sharing a limited network resource. Zephyr has support for configuring a credit-based shaper described in the IEEE 802.1Qav-2009 standard. Zephyr does not implement the actual shaper; it only provides a way to configure the shaper implemented by the Ethernet device driver.

Enabling 802.1Qav To enable 802.1Qav shaper, the Ethernet device driver must declare that it supports credit-based shaping. The Ethernet driver’s capability function must return ETHERNET_QAV value for this purpose. Typically also priority queues ETHERNET_PRIORITY_QUEUES need to be supported.

```c
static enum ethernet_hw_caps eth_get_capabilities(const struct device *dev)
{
    ARG_UNUSED(dev);

    return ETHERNET_QAV | ETHERNET_PRIORITY_QUEUES |
          ETHERNET_HW_VLAN | ETHERNET_LINK_10BASE_T |
          ETHERNET_LINK_100BASE_T;
}
```

See sam-e70-xplained board Ethernet driver drivers/ethernet/eth_sam_gmac.c for an example.

Configuring 802.1Qav The application can configure the credit-based shaper like this:

```c
#include <zephyr/net/net_if.h>
#include <zephyr/net/ethernet.h>
#include <zephyr/net/ethernet_mgmt.h>

static void qav_set_status(struct net_if *iface,
                            int queue_id, bool enable)
{
    struct ethernet_req_params params;
    int ret;

    memset(&params, 0, sizeof(params));

    params.qav_param.queue_id = queue_id;
    params.qav_param.enabled = enable;
    params.qav_param.type = ETHERNET_QAV_PARAM_TYPE_STATUS;

    /* Disable or enable Qav for a queue */
    ret = net_mgmt(NET_REQUEST_ETHERNET_SET_QAV_PARAM,
                   iface, &params,
                   sizeof(struct ethernet_req_params));

    if (ret) {
        LOG_ERR("Cannot %s Qav for queue %d for interface %p",
                 enable ? "enable" : "disable",
                 (continues on next page)
Overview

Ethernet is a networking technology commonly used in local area networks (LAN). For more information, see this Ethernet Wikipedia article.

Zephyr supports following Ethernet features:

- 10, 100 and 1000 Mbit/sec links
- Auto negotiation
- Half/full duplex
- Promiscuous mode
- TX and RX checksum offloading
- MAC address filtering
- Virtual LANs
- Priority queues
Not all Ethernet device drivers support all of these features. You can see what is supported by net iface net-shell command. It will print currently supported Ethernet features.

API Reference

group ethernet

Ethernet support functions.

Defines

ETH_NET_DEVICE_INIT(dev_id, name, init_fn, pm, data, config, prio, api, mtu)
Create an Ethernet network interface and bind it to network device.

Parameters

• dev_id – Network device id.
• name – The name this instance of the driver exposes to the system.
• init_fn – Address to the init function of the driver.
• pm – Reference to struct pm_device associated with the device. (optional).
• data – Pointer to the device's private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• mtu – Maximum transfer unit in bytes for this network interface.

ETH_NET_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, prio, api, mtu)
Like ETH_NET_DEVICE_INIT but taking metadata from a devicetree. Create an Ethernet network interface and bind it to network device.

Parameters

• node_id – The devicetree node identifier.
• init_fn – Address to the init function of the driver.
• pm – Reference to struct pm_device associated with the device. (optional).
• data – Pointer to the device's private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• mtu – Maximum transfer unit in bytes for this network interface.
ETH_NET_DEVICE_DT_INST_DEFINE(inst, ...
Like ETH_NET_DEVICE_DT_DEFINE for an instance of a DT_DRV_COMPAT compatible.

**Parameters**

- `inst` – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to ETH_NET_DEVICE_DT_DEFINE.
- `...` – other parameters as expected by ETH_NET_DEVICE_DT_DEFINE.

**Enums**

**enum ethernet_hw_caps**

Ethernet hardware capabilities

*Values:*

- `enumerator ETHERNET_HW_TX_CHKSUM_OFFLOAD = BIT(0)`
  TX Checksum offloading supported for all of IPv4, UDP, TCP

- `enumerator ETHERNET_HW_RX_CHKSUM_OFFLOAD = BIT(1)`
  RX Checksum offloading supported for all of IPv4, UDP, TCP

- `enumerator ETHERNET_HW_VLAN = BIT(2)`
  VLAN supported

- `enumerator ETHERNET_AUTO_NEGOTIATION_SET = BIT(3)`
  Enabling/disabling auto negotiation supported

- `enumerator ETHERNET_LINK_10BASE_T = BIT(4)`
  10 Mbits link supported

- `enumerator ETHERNET_LINK_100BASE_T = BIT(5)`
  100 Mbits link supported

- `enumerator ETHERNET_LINK_1000BASE_T = BIT(6)`
  1 Gbits link supported

- `enumerator ETHERNET_DUPLEX_SET = BIT(7)`
  Changing duplex (half/full) supported

- `enumerator ETHERNET_PTP = BIT(8)`
  IEEE 802.1AS (gPTP) clock supported

- `enumerator ETHERNET_QAV = BIT(9)`
  IEEE 802.1Qav (credit-based shaping) supported

- `enumerator ETHERNET_PROMISC_Mode = BIT(10)`
  Promiscuous mode supported

- `enumerator ETHERNET_PRIORITY_QUEUES = BIT(11)`
  Priority queues available
enumerator ETHERNET_HW_FILTERING = BIT(12)
    MAC address filtering supported

enumerator ETHERNET_LLDP = BIT(13)
    Link Layer Discovery Protocol supported

enumerator ETHERNET_HW_VLAN_TAG_STRIP = BIT(14)
    VLAN Tag stripping

enumerator ETHERNET_DSA_SLAVE_PORT = BIT(15)
    DSA switch

enumerator ETHERNET_DSA_MASTER_PORT = BIT(16)

enumerator ETHERNET_QBV = BIT(17)
    IEEE 802.1Qbv (scheduled traffic) supported

enumerator ETHERNET_QBU = BIT(18)
    IEEE 802.1Qbu (frame preemption) supported

enumerator ETHERNET_TXTIME = BIT(19)
    TXTIME supported

enum ethernet_flags
    Values:

    enumerator ETH_CARRIER_UP

Functions

void ethernet_init(struct net_if *iface)
    Initialize Ethernet L2 stack for a given interface.

    Parameters
    • iface – A valid pointer to a network interface

void net_eth_ipv4_mcast_to_mac_addr(const struct in_addr *ipv4_addr, struct net_eth_addr *
    mac_addr)
    Convert IPv4 multicast address to Ethernet address.

    Parameters
    • ipv4_addr – IPv4 multicast address
    • mac_addr – Output buffer for Ethernet address

void net_eth_ipv6_mcast_to_mac_addr(const struct in6_addr *ipv6_addr, struct net_eth_addr *
    mac_addr)
    Convert IPv6 multicast address to Ethernet address.

    Parameters
    • ipv6_addr – IPv6 multicast address
    • mac_addr – Output buffer for Ethernet address
static inline enum ethernet_hw_caps net_eth_get_hw_capabilities(struct net_if *iface)
    Return ethernet device hardware capability information.

    Parameters
    • iface – Network interface

    Returns
    Hardware capabilities

static inline int net_eth_vlan_enable(struct net_if *iface, uint16_t tag)
    Add VLAN tag to the interface.

    Parameters
    • iface – Interface to use.
    • tag – VLAN tag to add

    Returns
    0 if ok, <0 if error

static inline int net_eth_vlan_disable(struct net_if *iface, uint16_t tag)
    Remove VLAN tag from the interface.

    Parameters
    • iface – Interface to use.
    • tag – VLAN tag to remove

    Returns
    0 if ok, <0 if error

static inline uint16_t net_eth_get_vlan_tag(struct net_if *iface)
    Return VLAN tag specified to network interface.

    Parameters
    • iface – Network interface.

    Returns
    VLAN tag for this interface or NET_VLAN_TAG_UNSPEC if VLAN is not configured
    for that interface.

static inline struct net_if *net_eth_get_vlan_iface(struct net_if *iface, uint16_t tag)
    Return network interface related to this VLAN tag.

    Parameters
    • iface – Master network interface. This is used to get the pointer to ethernet
      L2 context
    • tag – VLAN tag

    Returns
    Network interface related to this tag or NULL if no such interface exists.

static inline bool net_eth_is_vlan_enabled(struct ethernet_context *ctx, struct net_if *iface)
    Check if VLAN is enabled for a specific network interface.

    Parameters
    • ctx – Ethernet context
    • iface – Network interface

    Returns
    True if VLAN is enabled for this network interface, false if not.
static inline bool net_eth_get_vlan_status(struct net_if *iface)
Get VLAN status for a given network interface (enabled or not).

Parameters
• iface – Network interface

Returns
True if VLAN is enabled for this network interface, false if not.

void net_eth_carrier_on(struct net_if *iface)
Inform ethernet L2 driver that ethernet carrier is detected. This happens when cable is connected.

Parameters
• iface – Network interface

void net_eth_carrier_off(struct net_if *iface)
Inform ethernet L2 driver that ethernet carrier was lost. This happens when cable is disconnected.

Parameters
• iface – Network interface

int net_eth_promisc_mode(struct net_if *iface, bool enable)
Set promiscuous mode either ON or OFF.

Parameters
• iface – Network interface
• enable – on (true) or off (false)

Returns
0 if mode set or unset was successful, <0 otherwise.

static inline const struct device *net_eth_get_ptp_clock(struct net_if *iface)
Return PTP clock that is tied to this ethernet network interface.

Parameters
• iface – Network interface

Returns
Pointer to PTP clock if found, NULL if not found or if this ethernet interface does not support PTP.

const struct device *net_eth_get_ptp_clock_by_index(int index)
Return PTP clock that is tied to this ethernet network interface index.

Parameters
• index – Network interface index

Returns
Pointer to PTP clock if found, NULL if not found or if this ethernet interface index does not support PTP.

static inline int net_eth_get_ptp_port(struct net_if *iface)
Return PTP port number attached to this interface.

Parameters
• iface – Network interface

Returns
Port number, no such port if < 0
struct ethernet_qav_param
#include <ethernet.h>

Public Members

int queue_id
ID of the priority queue to use

enum ethernet_qav_param_type type
Type of Qav parameter

bool enabled
True if Qav is enabled for queue

unsigned int delta_bandwidth
Delta Bandwidth (percentage of bandwidth)

unsigned int idle_slope
Idle Slope (bits per second)

unsigned int oper_idle_slope
Oper Idle Slope (bits per second)

unsigned int traffic_class
Traffic class the queue is bound to

struct ethernet_qbv_param
#include <ethernet.h>

Public Members

int port_id
Port id

enum ethernet_qbv_param_type type
Type of Qbv parameter

enum ethernet_qbv_state_type state
What state (Admin/Oper) parameters are these

bool enabled
True if Qbv is enabled or not

bool gate_status[NET_TC_TX_COUNT]
True = open, False = closed
enum ethernet_gate_state_operation
    GateState operation

uint32_t time_interval
    Time interval ticks (nanoseconds)

uint16_t row
    Gate control list row

uint32_t gate_control_list_len
    Number of entries in gate control list

struct net_ptp_extended_time base_time
    Base time

struct net_ptp_time cycle_time
    Cycle time

uint32_t extension_time
    Extension time (nanoseconds)

struct ethernet_qbu_param
    #include <ethernet.h>

   **Public Members**

int port_id
    Port id

enum ethernet_qbu_param_type type
    Type of Qbu parameter

uint32_t hold_advance
    Hold advance (nanoseconds)

uint32_t release_advance
    Release advance (nanoseconds)

enum ethernet_qbu_preempt_status frame_preempt_statuses[NET_TC_TX_COUNT]
    sequence of framePreemptionAdminStatus values.

bool enabled
    True if Qbu is enabled or not

bool link_partner_status
    Link partner status (from Qbr)
# Additional fragment size

Additional fragment size (from Qbr). The minimum non-final fragment size is \((\text{additional\_fragment\_size} + 1) \times 64\) octets.

```c
struct ethernet_filter
    #include <ethernet.h>

Public Members

enum ethernet_filter_type type
    Type of filter

struct net_eth_addr mac_address
    MAC address to filter

bool set
    Set (true) or unset (false) the filter
```

```c
struct ethernet_txtime_param
    #include <ethernet.h>

Public Members

enum ethernet_txtime_param_type type
    Type of TXTIME parameter

int queue_id
    Queue number for configuring TXTIME

bool enable_txtime
    Enable or disable TXTIME per queue
```

```c
struct ethernet_api
    #include <ethernet.h>

Public Members

struct net_if_api iface_api
    The net_if_api must be placed in first position in this struct so that we are compatible with network interface API.

int (*start)(const struct device *dev)
    Start the device

int (*stop)(const struct device *dev)
    Stop the device
```
enum ethernet_hw_caps (*get_capabilities)(const struct device *dev)
    Get the device capabilities

int (*set_config)(const struct device *dev, enum ethernet_config_type type, const struct ethernet_config *config)
    Set specific hardware configuration

int (*get_config)(const struct device *dev, enum ethernet_config_type type, struct ethernet_config *config)
    Get hardware specific configuration

int (*send)(const struct device *dev, struct net_pkt *pkt)
    Send a network packet

struct ethernet_context
    #include <ethernet.h> Ethernet L2 context that is needed for VLAN

Public Members

atomic_t flags
    Flags representing ethernet state, which are accessed from multiple threads.

struct k_work carrier_work
    Carrier ON/OFF handler worker. This is used to create network interface UP/DOWN event when ethernet L2 driver notices carrier ON/OFF situation. We must not create another network management event from inside management handler thus we use worker thread to trigger the UP/DOWN event.

struct net_if *iface
    Network interface.

denum net_l2_flags ethernet_l2_flags
    This tells what L2 features does ethernet support.

bool is_net_carrier_up
    Is network carrier up

bool is_init
    Is this context already initialized

group ethernet_mii
    Ethernet MII (media independent interface) functions.

Defines

MII_BMCR
    Basic Mode Control Register
MII_BMSR
   Basic Mode Status Register

MII_PHYID1R
   PHY ID 1 Register

IEEE 802.15.4

- Overview
- API Reference
  - IEEE 802.15.4
  - IEEE 802.15.4 Management

Overview
IEEE 802.15.4 is a technical standard which defines the operation of low-rate wireless personal area networks (LR-WPANs). For more detailed overview of this standard, see this IEEE 802.15.4 Wikipedia article. Also, see IEEE GET Program for creating an IEEE account and downloading the specification.

Zephyr supports IEEE 802.15.4 with Thread and 6LoWPAN. The Thread implementation is based on OpenThread. The IPv6 header compression in 6LoWPAN is shared with the Bluetooth IPSP (IP support profile).

API Reference

IEEE 802.15.4
group ieee802154
IEEE 802.15.4 library.

Defines

** Enums**

enum ieee802154_channel

IEEE 802.15.4 Channel assignments.

Channel numbering for 868 MHz, 915 MHz, and 2450 MHz bands.

- Channel 0 is for 868.3 MHz.
- Channels 1-10 are for 906 to 924 MHz with 2 MHz channel spacing.
- Channels 11-26 are for 2405 to 2530 MHz with 5 MHz channel spacing.

For more information, please refer to 802.15.4-2015 Section 10.1.2.2.

*Values:*

enumerator IEEE802154_SUB_GHZ_CHANNEL_MIN = 0

everenumerator IEEE802154_SUB_GHZ_CHANNEL_MAX = 10

everenumerator IEEE802154_2_4_GHZ_CHANNEL_MIN = 11

everenumerator IEEE802154_2_4_GHZ_CHANNEL_MAX = 26
enum ieee802154_hw_caps
  Values:

  enumerator IEEE802154_HW_TXTIME = BIT(8)
  enumerator IEEE802154_HW_SLEEP_TO_TX = BIT(9)
  enumerator IEEE802154_HW_TX_SEC = BIT(10)
  enumerator IEEE802154_HW_RXTIME = BIT(11)

enum ieee802154_filter_type
  Values:

  enumerator IEEE802154_FILTER_TYPE_IEEE_ADDR
  enumerator IEEE802154_FILTER_TYPE_SHORT_ADDR
  enumerator IEEE802154_FILTER_TYPE_PAN_ID
  enumerator IEEE802154_FILTER_TYPE_SRC_IEEE_ADDR
  enumerator IEEE802154_FILTER_TYPE_SRC_SHORT_ADDR

enum ieee802154_event
  Values:

  enumerator IEEE802154_EVENT_TX_STARTED
  enumerator IEEE802154_EVENT_RX_FAILED
enumerator IEEE802154_EVENT_SLEEP

enum ieee802154_rx_fail_reason
Values:

enumerator IEEE802154_RX_FAIL_NOT_RECEIVED
enumerator IEEE802154_RX_FAIL_INVALID_FCS
enumerator IEEE802154_RX_FAIL_ADDR_FILTERED
enumerator IEEE802154_RX_FAIL_OTHER

enum ieee802154_tx_mode
IEEE802.15.4 Transmission mode.
Values:

enumerator IEEE802154_TX_MODE_DIRECT
Transmit packet immediately, no CCA.
enumerator IEEE802154_TX_MODE_CCA
Perform CCA before packet transmission.
enumerator IEEE802154_TX_MODE_CSMA_CA
Perform full CSMA CA procedure before packet transmission.
enumerator IEEE802154_TX_MODE_TXTIME
Transmit packet in the future, at specified time, no CCA.
enumerator IEEE802154_TX_MODE_TXTIME_CCA
Transmit packet in the future, perform CCA before transmission.

enum ieee802154_fpb_mode
IEEE802.15.4 Frame Pending Bit table address matching mode.
Values:

enumerator IEEE802154_FPB_ADDR_MATCH_THREAD
The pending bit shall be set only for addresses found in the list.
enumerator IEEE802154_FPB_ADDR_MATCH_ZIGBEE
The pending bit shall be cleared for short addresses found in the list.

enum ieee802154_config_type
IEEE802.15.4 driver configuration types.
Values:
enumerator IEEE802154_CONFIG_AUTO_ACK_FPB
Indicates how radio driver should set Frame Pending bit in ACK responses for Data Requests. If enabled, radio driver should determine whether to set the bit or not based on the information provided with IEEE802154_CONFIG_ACK_FPB config and FPB address matching mode specified. Otherwise, Frame Pending bit should be set to 1 (see IEEE Std 802.15.4-2006, 7.2.2.3.1).

enumerator IEEE802154_CONFIG_ACK_FPB
Indicates whether to set ACK Frame Pending bit for specific address or not. Disabling the Frame Pending bit with no address provided (NULL pointer) should disable it for all enabled addresses.

enumerator IEEE802154_CONFIG_PAN_COORDINATOR
Indicates whether the device is a PAN coordinator.

enumerator IEEE802154_CONFIG_PROMISCUOUS
Enable/disable promiscuous mode.

enumerator IEEE802154_CONFIG_EVENT_HANDLER
Specifies new radio event handler. Specifying NULL as a handler will disable radio events notification.

enumerator IEEE802154_CONFIG_MAC_KEYS
Updates MAC keys and key index for radios supporting transmit security.

enumerator IEEE802154_CONFIG_FRAME_COUNTER
Sets the current MAC frame counter value for radios supporting transmit security.

enumerator IEEE802154_CONFIG_RX_SLOT
Configure a radio reception slot. This can be used for any scheduler reception, e.g.: Zigbee GP device, CSL, TSCH, etc.

In order to configure a CSL receiver the upper layer should combine several configuration options in the following way:

i. Use IEEE802154_CONFIG_ENH_ACK_HEADER_IE once to inform the radio driver of the short and extended addresses of the peer to which it should inject CSL IEs.

ii. Use IEEE802154_CONFIG_CSL_RX_TIME periodically, before each use of IEEE802154_CONFIG_CSL_PERIOD setting parameters of the nearest CSL RX window, and before each use of IEEE_CONFIG_RX_SLOT setting parameters of the following (not the nearest one) CSL RX window, to allow the radio driver to calculate the proper CSL Phase to the nearest CSL window to inject in the CSL IEs for both transmitted data and ack frames.

iii. Use IEEE802154_CONFIG_CSL_PERIOD on each value change to update the current CSL period value which will be injected in the CSL IEs together with the CSL Phase based on IEEE802154_CONFIG_CSL_RX_TIME.

iv. Use IEEE802154_CONFIG_RX_SLOT periodically to schedule the immediate receive window earlier enough before the expected window start time, taking into account possible clock drifts and scheduling uncertainties.

This diagram shows the usage of the four options over time: Start CSL Schedule CSL window

```
1882 Chapter 6. Connectivity
```
enumerator IEEE802154_CONFIG_CSL_PERIOD
  Configure CSL receiver (Endpoint) period

enumerator IEEE802154_CONFIG_CSL_RX_TIME
  Configure the next CSL receive window center, in units of microseconds, based on the
  radio time.

enumerator IEEE802154_CONFIG_ENH_ACK_HEADER_IE
  Indicates whether to inject IE into ENH ACK Frame for specific address or not. Disabling
  the ENH ACK with no address provided (NULL pointer) should disable it for all enabled
  addresses.

Functions

static inline bool ieee802154_is_ar_flag_set(struct net_buf *frag)
  Check if AR flag is set on the frame inside given net_pkt.

  Parameters
  • frag – A valid pointer on a net_buf structure, must not be NULL, and its length
    should be at least made of 1 byte (ACK frames are the smallest frames on 15.4
    and made of 3 bytes, not not counting the FCS part).

  Returns
  True if AR flag is set, False otherwise

enum net_verdict ieee802154_radio_handle_ack(struct net_if *iface, struct net_pkt *pkt)
  Radio driver ACK handling function that hw drivers should use.
  ACK handling requires fast handling and thus such function helps to hook directly the hw
  drivers to the radio driver.

  Parameters
  • iface – A valid pointer on a network interface that received the packet
  • pkt – A valid pointer on a packet to check

  Returns
  NET_OK if it was handled, NET_CONTINUE otherwise

void ieee802154_init(struct net_if *iface)
  Initialize L2 stack for a given interface.

  Parameters
  • iface – A valid pointer on a network interface

struct ieee802154_security_ctx
  #include <ieee802154.h>

struct ieee802154_context
  #include <ieee802154.h>

struct ieee802154_filter
  #include <ieee802154_radio.h>
struct ieee802154_key
   #include <ieee802154_radio.h>

struct ieee802154_config
   #include <ieee802154_radio.h> IEEE802.15.4 driver configuration data.

Public Members

struct ieee802154_config.[anonymous].[anonymous] auto_ack_fpb
   IEEE802154_CONFIG_AUTO_ACK_FPB

struct ieee802154_config.[anonymous].[anonymous] ack_fpb
   IEEE802154_CONFIG_ACK_FPB

bool pan_coordinator
   IEEE802154_CONFIG_PAN_COORDINATOR

bool promiscuous
   IEEE802154_CONFIG_PROMISCUOUS

ieee802154_event_cb_t event_handler
   IEEE802154_CONFIG_EVENT_HANDLER

struct ieee802154_key *mac_keys
   IEEE802154_CONFIG_MAC_KEYS Pointer to an array containing a list of keys used for MAC encryption. Refer to secKeyIdLookupDescriptor and secKeyDescriptor in IEEE 802.15.4
   key_value field points to a buffer containing the 16 byte key. The buffer is copied by the callee.
   The variable length array is terminated by key_value field set to NULL.

uint32_t frame_counter
   IEEE802154_CONFIG_FRAME_COUNTER

struct ieee802154_config.[anonymous].[anonymous] rx_slot
   IEEE802154_CONFIG_RX_SLOT

uint32_t csl_period
   IEEE802154_CONFIG_CSL_PERIOD

uint32_t csl_rx_time
   IEEE802154_CONFIG_CSL_RX_TIME

const uint8_t *ext_addr
   The extended address is expected to be passed starting with the most significant octet and ending with the least significant octet. A device with an extended address 01:23:45:67:89:ab:cd:ef as written in the usual big-endian hex notation should provide a pointer to an array containing values in the exact same order.
struct ieee802154_config.[anonymous].[anonymous] ack_ie
    IEEE802154_CONFIG_ENH_ACK_HEADER_IE

union ieee802154_config.[anonymous] [anonymous]
    Configuration data.

struct ieee802154_radio_api
    #include <ieee802154_radio.h> IEEE 802.15.4 radio interface API.

Public Members

struct net_if_api iface_api
    Mandatory to get in first position. A network device should indeed provide a pointer on such net_if_api structure. So we make current structure pointer that can be casted to a net_if_api structure pointer.

genius ieee802154_hw_caps (*get_capabilities)(const struct device *dev)
    Get the device capabilities

int (*cca)(const struct device *dev)
    Clear Channel Assessment - Check channel's activity

int (*set_channel)(const struct device *dev, uint16_t channel)
    Set current channel, channel is in CPU byte order.

int (*filter)(const struct device *dev, bool set, enum ieee802154_filter_type type, const struct ieee802154_filter *filter)
    Set/Unset filters (for IEEE802154_HW_FILTER )

int (*set_txpower)(const struct device *dev, int16_t dbm)
    Set TX power level in dbm

int (*tx)(const struct device *dev, enum ieee802154_tx_mode mode, struct net_pkt *pkt, struct net_buf *frag)
    Transmit a packet fragment

int (*start)(const struct device *dev)
    Start the device

int (*stop)(const struct device *dev)
    Stop the device

int (*configure)(const struct device *dev, enum ieee802154_config_type type, const struct ieee802154_config *config)
    Set specific radio driver configuration.

uint16_t (*get_subg_channel_count)(const struct device *dev)
    Get the available amount of Sub-GHz channels
int (*ed_scan)(const struct device *dev, uint16_t duration, energy_scan_done_cb_t done_cb)
Run an energy detection scan. Note: channel must be set prior to request this function.
duration parameter is in ms.

uint64_t (*get_time)(const struct device *dev)
Get the current radio time in microseconds

uint8_t (*get_sch_acc)(const struct device *dev)
Get the current accuracy, in units of ± ppm, of the clock used for scheduling delayed
receive or transmit radio operations. Note: Implementations may optimize this value
based on operational conditions (i.e.: temperature).

Thread protocol

- **Overview**
- **Internet connectivity**
- **Sample usage**

**Overview**  Thread is a low-power mesh networking technology, designed specifically for home automation applications. It is an IPv6-based standard, which uses 6LoWPAN technology over IEEE 802.15.4 protocol. IP connectivity lets you easily connect a Thread mesh network to the internet with a Thread Border Router.

The Thread specification provides a high level of network security. Mesh networks built with Thread are secure - only authenticated devices can join the network and all communications within the mesh are encrypted. More information about Thread protocol can be found at [Thread Group website](#).

Zephyr integrates an open source Thread protocol implementation called OpenThread, documented on the [OpenThread website](#).

**Internet connectivity**  A Thread Border Router is required to connect mesh network to the internet. An open source implementation of Thread Border Router is provided by the OpenThread community. See [OpenThread Border Router guide](#) for instructions on how to set up a Border Router.

**Sample usage**  You can try using OpenThread with the Zephyr Echo server and Echo client samples, which provide out-of-the-box configuration for OpenThread. To enable OpenThread support in these samples, build them with `overlay-ot.conf` overlay config file. See [sockets-echo-server-sample](#) and [sockets-echo-client-sample](#) for details.

Point-to-Point Protocol (PPP) Support

- **Overview**
- **Testing**

**Overview**  Point-to-Point Protocol (PPP) is a data link layer (layer 2) communications protocol used to establish a direct connection between two nodes. PPP is used over many types of serial links since IP packets cannot be transmitted over a modem line on their own, without some data link protocol.

In Zephyr, each individual PPP link is modelled as a network interface. This is similar to how Linux implements PPP.

PPP support must be enabled at compile time by setting option `CONFIG_NET_PPP` and `CONFIG_NET_L2_PPP`. The PPP support in Zephyr 2.0 is still experimental and the implementation supports only these protocols:

- LCP (Link Control Protocol, RFC1661)
- HDLC (High-level data link control, RFC1662)
- IPCP (IP Control Protocol, RFC1332)
- IPV6CP (IPv6 Control Protocol, RFC5072)

See also the `samples/net/sockets/echo_server/overlay-ppp.conf` file for configuration option examples. For using PPP with GSM modem, see [Generic GSM Modem](#) for additional information.
Testing  See the net-tools README file for more details on how to test the Zephyr PPP against pppd running in Linux.

Protocols

CoAP

- **Overview**
- **Sample Usage**
  - CoAP Server
  - CoAP Client
- **Testing**
  - libcoap
  - TTCN3
- **API Reference**

Overview  The Constrained Application Protocol (CoAP) is a specialized web transfer protocol for use with constrained nodes and constrained (e.g., low-power, lossy) networks. It provides a convenient API for RESTful Web services that support CoAP's features. For more information about the protocol itself, see IETF RFC7252 The Constrained Application Protocol.

Zephyr provides a CoAP library which supports client and server roles. The library is configurable as per user needs. The Zephyr CoAP library is implemented using plain buffers. Users of the API create sockets for communication and pass the buffer to the library for parsing and other purposes. The library itself doesn't create any sockets for users.

On top of CoAP, Zephyr has support for LWM2M “Lightweight Machine 2 Machine” protocol, a simple, low-cost remote management and service enablement mechanism. See Lightweight M2M (LWM2M) for more information.

Supported RFCs:

Supported RFCs:

- RFC7252: The Constrained Application Protocol (CoAP)
- RFC6690: Constrained RESTful Environments (CoRE) Link Format
- RFC7959: Block-Wise Transfers in the Constrained Application Protocol (CoAP)
- RFC7641: Observing Resources in the Constrained Application Protocol (CoAP)

Note:  Not all parts of these RFCs are supported. Features are supported based on Zephyr requirements.

Sample Usage

CoAP Server  To create a CoAP server, resources for the server need to be defined. The `.well-known/core` resource should be added before all other resources that should be included in the responses of the `.well-known/core` resource.
```c
static struct coap_resource resources[] = {
    { .get = well_known_core_get,
      .path = COAP_WELL_KNOWN_CORE_PATH,
    },
    { .get = sample_get,
      .post = sample_post,
      .del = sample_del,
      .put = sample_put,
      .path = sample_path
    },
};
```

An application reads data from the socket and passes the buffer to the CoAP library to parse the message. If the CoAP message is proper, the library uses the buffer along with resources defined above to call the correct callback function to handle the CoAP request from the client. It's the callback function's responsibility to either reply or act according to CoAP request.

```c
coap_packet_parse(&request, data, data_len, options, opt_num);
...
coap_handle_request(&request, resources, options, opt_num,
    client_addr, client_addr_len);
```

If CONFIG_COAP_URI_WILDCARD enabled, server may accept multiple resources using MQTT-like wildcard style:

- the plus symbol represents a single-level wild card in the path;
- the hash symbol represents the multi-level wild card in the path.

```c
static const char * const led_set[] = { "led","+", "set", NULL };
static const char * const btn_get[] = { "button","#", NULL };
static const char * const no_wc[] = { "test","+1", NULL };
```

It accepts /led/0/set, led/1234/set, led/any/set, /button/door/1, /test/+1, but returns -ENOENT for /led/1, /test/21, /test/1.

This option is enabled by default, disable it to avoid unexpected behaviour with resource path like '/some_resource/+/#'.

**CoAP Client** If the CoAP client knows about resources in the CoAP server, the client can start prepare CoAP requests and wait for responses. If the client doesn’t know about resources in the CoAP server, it can request resources through the .well-known/core CoAP message.

```c
/* Initialize the CoAP message */
char *path = "test";
struct coap_packet request;
uint8_t data[100];
uint8_t payload[20];

coap_packet_init(&request, data, sizeof(data),
    1, COAP_TYPE_CON, 8, coap_next_token(),
    COAP_METHOD_GET, coap_next_id());

/* Append options */
coap_packet_append_option(&request, COAP_OPTION_URI_PATH,
    path, strlen(path));
```

(continues on next page)
Testing  There are various ways to test Zephyr CoAP library.

libcoap  libcoap implements a lightweight application-protocol for devices that are resource constrained, such as by computing power, RF range, memory, bandwidth, or network packet sizes. Sources can be found here libcoap. libcoap has a script (examples/etsi_coaptest.sh) to test coap-server functionality in Zephyr.

See the net-tools project for more details.

The coap-server-sample sample can be built and executed on QEMU as described in Networking with QEMU.

Use this command on the host to run the libcoap implementation of the ETSI test cases:

```bash
sudo ./libcoap/examples/etsi_coaptest.sh -i tap0 2001:db8::1
```

TTCN3  Eclipse has TTCN3 based tests to run against CoAP implementations.

Install eclipse-titan and set symbolic links for titan tools

```bash
sudo apt-get install eclipse-titan
cd /usr/share/titan
sudo ln -s /usr/bin bin
sudo ln /usr/bin/titanver bin
sudo ln -s /usr/bin/mctr_cli bin
sudo ln -s /usr/include/titan include
sudo ln -s /usr/lib/titan lib
export TTCN3_DIR=/usr/share/titan
git clone https://github.com/eclipse/titan.misc.git
cd titan.misc
```

Follow the instruction to setup CoAP test suite from here:

- https://github.com/eclipse/titan.misc
- https://github.com/eclipse/titan.misc/tree/master/CoAP_Conf

After the build is complete, the coap-server-sample sample can be built and executed on QEMU as described in Networking with QEMU.

Change the client (test suite) and server (Zephyr coap-server sample) addresses in coap.cfg file as per your setup.

Execute the test cases with following command.
ttcn3_start coaptests coap.cfg

Sample output of ttcn3 tests looks like this.

Verdict statistics: 0 none (0.00 %), 10 pass (100.00 %), 0 inconc (0.00 %), 0 fail (0.00 %), 0 error (0.00 %).
Test execution summary: 10 test cases were executed. Overall verdict: pass

    COAP_WELL_KNOWN_CORE_PATH
    This resource should be added before all other resources that should be included in the responses of the .well-known/core resource.

Typedefs

typedef int (*coap_method_t)(struct coap_resource *resource, struct coap_packet *request, struct sockaddr *addr, socklen_t addr_len)
    Type of the callback being called when a resource's method is invoked by the remote entity.

typedef void (*coap_notify_t)(struct coap_resource *resource, struct coap_observer *observer)
    Type of the callback being called when a resource's has observers to be informed when an update happens.

typedef int (*coap_reply_t)(const struct coap_packet *response, struct coap_reply *reply, const struct sockaddr *from)
    Helper function to be called when a response matches the a pending request.
Enums

enum coap_option_num
  Set of CoAP packet options we are aware of.

  Users may add options other than these to their packets, provided they know how to format them correctly. The only restriction is that all options must be added to a packet in numeric order.

  Refer to RFC 7252, section 12.2 for more information.

Values:

enumerator COAP_OPTION_IF_MATCH = 1
enumerator COAP_OPTION_URI_HOST = 3
enumerator COAP_OPTION_ETAG = 4
enumerator COAP_OPTION_IF_NONE_MATCH = 5
enumerator COAP_OPTION_OBSERVE = 6
enumerator COAP_OPTION_URI_PORT = 7
enumerator COAP_OPTION_LOCATION_PATH = 8
enumerator COAP_OPTION_URI_PATH = 11
enumerator COAP_OPTION_CONTENT_FORMAT = 12
enumerator COAP_OPTION_MAX_AGE = 14

enumerator COAP_OPTION_ACCEPT = 17
enumerator COAP_OPTION_LOCATION_QUERY = 20
enumerator COAP_OPTION_BLOCK2 = 23
enumerator COAP_OPTION_BLOCK1 = 27
enumerator COAP_OPTION_SIZE2 = 28
enumerator COAP_OPTION_PROXY_URI = 35
enumerator COAP_OPTION_PROXY_SCHEME = 39
enumerator COAP_OPTION_SIZE1 = 60

enum coap_method
    Available request methods.
    To be used when creating a request or a response.
    Values:

    enumerator COAP_METHOD_GET = 1
    enumerator COAP_METHOD_POST = 2
    enumerator COAP_METHOD_PUT = 3
    enumerator COAP_METHOD_DELETE = 4
    enumerator COAP_METHOD_FETCH = 5
    enumerator COAP_METHOD_PATCH = 6
    enumerator COAP_METHOD_IPATCH = 7

enum coap_msgtype
    CoAP packets may be of one of these types.
    Values:

    enumerator COAP_TYPE_CON = 0
        Confirmable message.
        The packet is a request or response the destination end-point must acknowledge.

    enumerator COAP_TYPE_NON_CON = 1
        Non-confirmable message.
        The packet is a request or response that doesn’t require acknowledgements.

    enumerator COAP_TYPE_ACK = 2
        Acknowledge.
        Response to a confirmable message.

    enumerator COAP_TYPE_RESET = 3
        Reset.
        Rejecting a packet for any reason is done by sending a message of this type.

enum coap_response_code
    Set of response codes available for a response packet.
    To be used when creating a response.
    Values:
<table>

enumerator COAP_CONTENT_FORMAT_APP_CBOR = 60

definition coap_block_size
Represents the size of each block that will be transferred using block-wise transfers [RFC7959]:
Each entry maps directly to the value that is used in the wire.

Values:

enumerator COAP_BLOCK_16

enumerator COAP_BLOCK_32

enumerator COAP_BLOCK_64

enumerator COAP_BLOCK_128
enumerator COAP_BLOCK_256
enumerator COAP_BLOCK_512
enumerator COAP_BLOCK_1024

Functions

uint8_t coap_header_get_version(const struct coap_packet *cpkt)
Returns the version present in a CoAP packet.

Parameters
• cpkt – CoAP packet representation

Returns
the CoAP version in packet

uint8_t coap_header_get_type(const struct coap_packet *cpkt)
Returns the type of the CoAP packet.

Parameters
• cpkt – CoAP packet representation

Returns
the type of the packet

uint8_t coap_header_get_token(const struct coap_packet *cpkt, uint8_t *token)
Returns the token (if any) in the CoAP packet.

Parameters
• cpkt – CoAP packet representation

Returns
Token length in the CoAP packet (0 - COAP_TOKEN_MAX_LEN).

uint8_t coap_header_get_code(const struct coap_packet *cpkt)
Returns the code of the CoAP packet.

Parameters
• cpkt – CoAP packet representation

Returns
the code present in the packet

uint16_t coap_header_get_id(const struct coap_packet *cpkt)
Returns the message id associated with the CoAP packet.

Parameters
• cpkt – CoAP packet representation

Returns
the message id present in the packet
const uint8_t *coap_packet_get_payload(const struct coap_packet *cpkt, uint16_t *len)

Returns the data pointer and length of the CoAP packet.

Parameters
• cpkt – CoAP packet representation
• len – Total length of CoAP payload

Returns
data pointer and length if payload exists NULL pointer and length set to 0 in case there is no payload

int coap_packet_parse(struct coap_packet *cpkt, uint8_t *data, uint16_t len, struct coap_option *options, uint8_t opt_num)

Parses the CoAP packet in data, validating it and initializing cpkt. data must remain valid while cpkt is used.

Parameters
• cpkt – Packet to be initialized from received data.
• data – Data containing a CoAP packet, its data pointer is positioned on the start of the CoAP packet.
• len – Length of the data
• options – Parse options and cache its details.
• opt_num – Number of options

Return values
• 0 – in case of success.
• -EINVAL – in case of invalid input args.
• -EBADMSG – in case of malformed coap packet header.
• -EINVAL – in case of malformed coap options.

int coap_packet_init(struct coap_packet *cpkt, uint8_t *data, uint16_t max_len, uint8_t ver, uint8_t type, uint8_t token_len, const uint8_t *token, uint8_t code, uint16_t id)

Creates a new CoAP Packet from input data.

Parameters
• cpkt – New packet to be initialized using the storage from data.
• data – Data that will contain a CoAP packet information
• max_len – Maximum allowable length of data
• ver – CoAP header version
• type – CoAP header type
• token_len – CoAP header token length
• token – CoAP header token
• code – CoAP header code
• id – CoAP header message id

Returns
0 in case of success or negative in case of error.
int coap_ack_init(struct coap_packet *cpkt, const struct coap_packet *req, uint8_t *data, uint16_t max_len, uint8_t code)

Create a new CoAP Acknowledgment message for given request.

This function works like coap_packet_init, filling CoAP header type, CoAP header token, and CoAP header message id fields according to acknowledgment rules.

Parameters
• cpkt – New packet to be initialized using the storage from data.
• req – CoAP request packet that is being acknowledged
• data – Data that will contain a CoAP packet information
• max_len – Maximum allowable length of data
• code – CoAP header code

Returns
0 in case of success or negative in case of error.

uint8_t *coap_next_token(void)

Returns a randomly generated array of 8 bytes, that can be used as a message's token.

Returns
a 8-byte pseudo-random token.

uint16_t coap_next_id(void)

Helper to generate message ids.

Returns
a new message id

int coap_find_options(const struct coap_packet *cpkt, uint16_t code, struct coap_option *options, uint16_t veclen)

Return the values associated with the option of value code.

Parameters
• cpkt – CoAP packet representation
• code – Option number to look for
• options – Array of coap_option where to store the value of the options found
• veclen – Number of elements in the options array

Returns
The number of options found in packet matching code, negative on error.

int coap_packet_append_option(struct coap_packet *cpkt, uint16_t code, const uint8_t *value, uint16_t len)

Appends an option to the packet.

Note: options must be added in numeric order of their codes. Otherwise error will be returned. TODO: Add support for placing options according to its delta value.

Parameters
• cpkt – Packet to be updated
• code – Option code to add to the packet, see coap_option_num
• value – Pointer to the value of the option, will be copied to the packet
• len – Size of the data to be added

Returns
0 in case of success or negative in case of error.
unsigned int coap_option_value_to_int(const struct coap_option *option)

Converts an option to its integer representation.

Assumes that the number is encoded in the network byte order in the option.

**Parameters**

- option – Pointer to the option value, retrieved by coap_find_options()

**Returns**

The integer representation of the option

int coap_append_option_int(struct coap_packet *cpkt, uint16_t code, unsigned int val)

Appends an integer value option to the packet.

The option must be added in numeric order of their codes, and the least amount of bytes will be used to encode the value.

**Parameters**

- cpkt – Packet to be updated
- code – Option code to add to the packet, see coap_option_num
- val – Integer value to be added

**Returns**

0 in case of success or negative in case of error.

int coap_packet_append_payload_marker(struct coap_packet *cpkt)

Append payload marker to CoAP packet.

**Parameters**

- cpkt – Packet to append the payload marker (0xFF)

**Returns**

0 in case of success or negative in case of error.

int coap_packet_append_payload(struct coap_packet *cpkt, const uint8_t *payload, uint16_t payload_len)

Append payload to CoAP packet.

**Parameters**

- cpkt – Packet to append the payload
- payload – CoAP packet payload
- payload_len – CoAP packet payload len

**Returns**

0 in case of success or negative in case of error.

int coap_handle_request(struct coap_packet *cpkt, struct coap_resource *resources, struct coap_option *options, uint8_t opt_num, struct sockaddr *addr, socklen_t addr_len)

When a request is received, call the appropriate methods of the matching resources.

**Parameters**

- cpkt – Packet received
- resources – Array of known resources
- options – Parsed options from coap_packet_parse()
- opt_num – Number of options
- addr – Peer address
• addr_len – Peer address length

Return values
• 0 – in case of success.
• -ENOTSUP – in case of invalid request code.
• -EPERM – in case resource handler is not implemented.
• -ENOENT – in case the resource is not found.

static inline uint16_t coap_block_size_to_bytes(enum coap_block_size block_size)
Helper for converting the enumeration to the size expressed in bytes.

Parameters
• block_size – The block size to be converted

Returns
The size in bytes that the block_size represents

int coap_block_transfer_init(struct coap_block_context *ctx, enum coap_block_size block_size, size_t total_size)
Initializes the context of a block-wise transfer.

Parameters
• ctx – The context to be initialized
• block_size – The size of the block
• total_size – The total size of the transfer, if known

Returns
0 in case of success or negative in case of error.

int coap_append_block1_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append BLOCK1 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Block1 option

Returns
0 in case of success or negative in case of error.

int coap_append_block2_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append BLOCK2 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Block2 option

Returns
0 in case of success or negative in case of error.

int coap_append_size1_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append SIZE1 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Size1 option
Returns
0 in case of success or negative in case of error.

int coap_append_size2_option(struct coap_packet *cpkt, struct coap_block_context *ctx)
Append SIZE2 option to the packet.

Parameters
• cpkt – Packet to be updated
• ctx – Block context from which to retrieve the information for the Size2 option

Returns
0 in case of success or negative in case of error.

int coap_get_option_int(const struct coap_packet *cpkt, uint16_t code)
Get the integer representation of a CoAP option.

Parameters
• cpkt – Packet to be inspected
• code – CoAP option code

Returns
Integer value >= 0 in case of success or negative in case of error.

int coap_update_from_block(const struct coap_packet *cpkt, struct coap_block_context *ctx)
Retrieves BLOCK{1,2} and SIZE{1,2} from cpkt and updates ctx accordingly.

Parameters
• cpkt – Packet in which to look for block-wise transfers options
• ctx – Block context to be updated

Returns
0 in case of success or negative in case of error.

int coap_next_block_for_option(const struct coap_packet *cpkt, struct coap_block_context *ctx,
                             enum coap_option_num option)
Updates ctx according to option set in cpkt so after this is called the current entry indicates the correct offset in the body of data being transferred.

Parameters
• cpkt – Packet in which to look for block-wise transfers options
• ctx – Block context to be updated
• option – Either COAP_OPTION_BLOCK1 or COAP_OPTION_BLOCK2

Returns
The offset in the block-wise transfer, 0 if the transfer has finished or a negative value in case of an error.

size_t coap_next_block(const struct coap_packet *cpkt, struct coap_block_context *ctx)
Updates ctx so after this is called the current entry indicates the correct offset in the body of data being transferred.

Parameters
• cpkt – Packet in which to look for block-wise transfers options
• ctx – Block context to be updated

Returns
The offset in the block-wise transfer, 0 if the transfer has finished.
void coap_observer_init(struct coap_observer *observer, const struct coap_packet *request, const struct sockaddr *addr)

Indicates that the remote device referenced by `addr`, with `request`, wants to observe a resource.

**Parameters**

- `observer` – Observer to be initialized
- `request` – Request on which the observer will be based
- `addr` – Address of the remote device

bool coap_register_observer(struct coap_resource *resource, struct coap_observer *observer)

After the observer is initialized, associate the observer with an resource.

**Parameters**

- `resource` – Resource to add an observer
- `observer` – Observer to be added

**Returns**

true if this is the first observer added to this resource.

void coap_remove_observer(struct coap_resource *resource, struct coap_observer *observer)

Remove this observer from the list of registered observers of that resource.

**Parameters**

- `resource` – Resource in which to remove the observer
- `observer` – Observer to be removed

struct coap_observer *coap_find_observer_by_addr(struct coap_observer *observers, size_t len, const struct sockaddr *addr)

Returns the observer that matches address `addr`.

**Parameters**

- `observers` – Pointer to the array of observers
- `len` – Size of the array of observers
- `addr` – Address of the endpoint observing a resource

**Returns**

A pointer to a observer if a match is found, NULL otherwise.

struct coap_observer *coap_observer_next_unused(struct coap_observer *observers, size_t len)

Returns the next available observer representation.

**Parameters**

- `observers` – Pointer to the array of observers
- `len` – Size of the array of observers

**Returns**

A pointer to a observer if there's an available observer, NULL otherwise.

void coap_reply_init(struct coap_reply *reply, const struct coap_packet *request)

Indicates that a reply is expected for `request`.

**Parameters**

- `reply` – Reply structure to be initialized
- `request` – Request from which `reply` will be based
int coap_pending_init(struct coap_pending *pending, const struct coap_packet *request, const struct sockaddr *addr, uint8_t retries)

Initialize a pending request with a request.

The request’s fields are copied into the pending struct, so request doesn’t have to live for as long as the pending struct lives, but “data” that needs to live for at least that long.

**Parameters**

- `pending` – Structure representing the waiting for a confirmation message, initialized with data from `request`
- `request` – Message waiting for confirmation
- `addr` – Address to send the retransmission
- `retries` – Maximum number of retransmissions of the message.

**Returns**

0 in case of success or negative in case of error.

struct coap_pending *coap_pending_next_unused(struct coap_pending *pendings, size_t len)

Returns the next available pending struct, that can be used to track the retransmission status of a request.

**Parameters**

- `pendings` – Pointer to the array of `coap_pending` structures
- `len` – Size of the array of `coap_pending` structures

**Returns**

pointer to a free `coap_pending` structure, NULL in case none could be found.

struct coap_reply *coap_reply_next_unused(struct coap_reply *replies, size_t len)

Returns the next available reply struct, so it can be used to track replies and notifications received.

**Parameters**

- `replies` – Pointer to the array of `coap_reply` structures
- `len` – Size of the array of `coap_reply` structures

**Returns**

pointer to a free `coap_reply` structure, NULL in case none could be found.

struct coap_pending *coap_pending_received(const struct coap_packet *response, struct coap_pending *pendings, size_t len)

After a response is received, returns if there is any matching pending request exits. User has to clear all pending retransmissions related to that response by calling `coap_pending_clear()`.

**Parameters**

- `response` – The received response
- `pendings` – Pointer to the array of `coap_reply` structures
- `len` – Size of the array of `coap_reply` structures

**Returns**

pointer to the associated `coap_pending` structure, NULL in case none could be found.

struct coap_reply *coap_response_received(const struct coap_packet *response, const struct sockaddr *from, struct coap_reply *replies, size_t len)

After a response is received, call coap_reply_t handler registered in `coap_reply` structure.
Parameters

- response – A response received
- from – Address from which the response was received
- replies – Pointer to the array of \texttt{coap\_reply} structures
- len – Size of the array of \texttt{coap\_reply} structures

Returns

Pointer to the reply matching the packet received, NULL if none could be found.

\begin{verbatim}
struct coap\_pending *coap\_pending\_next\_to\_expire(struct coap\_pending *pendings, size\_t len)
\end{verbatim}

Returns the next pending about to expire, pending->timeout informs how many ms to next expiration.

Parameters

- pendings – Pointer to the array of \texttt{coap\_pending} structures
- len – Size of the array of \texttt{coap\_pending} structures

Returns

The next \texttt{coap\_pending} to expire, NULL if none is about to expire.

\begin{verbatim}
bool coap\_pending\_cycle(struct coap\_pending *pending)
\end{verbatim}

After a request is sent, user may want to cycle the pending retransmission so the timeout is updated.

Parameters

- pending – Pending representation to have its timeout updated

Returns

false if this is the last retransmission.

\begin{verbatim}
void coap\_pending\_clear(struct coap\_pending *pending)
\end{verbatim}

Cancels the pending retransmission, so it again becomes available.

Parameters

- pending – Pending representation to be canceled

\begin{verbatim}
void coap\_pendings\_clear(struct coap\_pending *pendings, size\_t len)
\end{verbatim}

Cancels all pending retransmissions, so they become available again.

Parameters

- pendings – Pointer to the array of \texttt{coap\_pending} structures
- len – Size of the array of \texttt{coap\_pending} structures

\begin{verbatim}
void coap\_reply\_clear(struct coap\_reply *reply)
\end{verbatim}

Cancels awaiting for this reply, so it becomes available again. User responsibility to free the memory associated with data.

Parameters

- reply – The reply to be canceled

\begin{verbatim}
void coap\_replies\_clear(struct coap\_reply *replies, size\_t len)
\end{verbatim}

Cancels all replies, so they become available again.

Parameters

- replies – Pointer to the array of \texttt{coap\_reply} structures
- len – Size of the array of \texttt{coap\_reply} structures
int coap_resource_notify(struct coap_resource *resource)
Indicates that this resource was updated and that the notify callback should be called for every registered observer.

**Parameters**
- resource – Resource that was updated

**Returns**
0 in case of success or negative in case of error.

bool coap_request_is_observe(const struct coap_packet *request)
Returns if this request is enabling observing a resource.

**Parameters**
- request – Request to be checked

**Returns**
True if the request is enabling observing a resource, False otherwise

int coap_well_known_core_get(struct coap_resource *resource, struct coap_packet *request,
struct coap_packet *response, uint8_t *data, uint16_t len)

struct coap_resource
#include <coap.h> Description of CoAP resource.
CoAP servers often want to register resources, so that clients can act on them, by fetching their state or requesting updates to them.

**Public Members**

**coap_method_t get**
Which function to be called for each CoAP method

struct coap_observer
#include <coap.h> Represents a remote device that is observing a local resource.

struct coap_packet
#include <coap.h> Representation of a CoAP Packet.

struct coap_option
#include <coap.h>

struct coap_pending
#include <coap.h> Represents a request awaiting for an acknowledgment (ACK).

struct coap_reply
#include <coap.h> Represents the handler for the reply of a request, it is also used when observing resources.

struct coap_block_context
#include <coap.h> Represents the current state of a block-wise transaction.
In case you want to add attributes to the resources included in the 'well-known/core' "virtual" resource, the 'user_data' field should point to a valid `coap_core_metadata` structure.

**Overview**  
The HTTP client library allows you to send HTTP requests and parse HTTP responses. The library communicates over the sockets API but it does not create sockets on its own. The application must be responsible for creating a socket and passing it to the library. Therefore, depending on the application's needs, the library can communicate over either a plain TCP socket (HTTP) or a TLS socket (HTTPS).

**Sample Usage**  
The API of the HTTP client library has a single function.

The following is an example of a request structure created correctly:

```c
struct http_request req = { 0 };  
static uint8_t recv_buf[512];

req.method = HTTP_GET;
req.url = "/";
req.host = "localhost";
req.protocol = "HTTP/1.1";
req.response = response_cb;
req.recv_buf = recv_buf;
req.recv_buf_len = sizeof(recv_buf);

/* sock is a file descriptor referencing a socket that has been connected * to the HTTP server. */
ret = http_client_req(sock, &req, 5000, NULL);
```

If the server responds to the request, the library provides the response to the application through the response callback registered in the request structure. As the library can provide the response in chunks, the application must be able to process these.

Together with the structure containing the response data, the callback function also provides information about whether the library expects to receive more data.

The following is an example of a very simple response handling function:

```c
static void response_cb(struct http_response *rsp,
                        enum http_final_call final_data,
                        void *user_data)
{
    if (final_data == HTTP_DATA_MORE) {
        LOG_INF("Partial data received (%zd bytes)", rsp->data_len);
    } else if (final_data == HTTP_DATA_FINAL) {
           
```
LOG_INF("All the data received (%zd bytes)", rsp->data_len);
}

LOG_INF("Response status %s", rsp->http_status);
}

See HTTP client sample application for more information about the library usage.

API Reference

**group** http_client

HTTP client API.

**Defines**

HTTP_CRLF

HTTP_STATUS_STR_SIZE

**Typedefs**

typedef int (*http_payload_cb_t)(int sock, struct http_request *req, void *user_data)

Callback used when data needs to be sent to the server.

**Param sock**
Socket id of the connection

**Param req**
HTTP request information

**Param user_data**
User specified data specified in *http_client_req()

**Return**

>=0 amount of data sent, in this case *http_client_req() should continue sending data, <0 if *http_client_req() should return the error code to the caller.

typedef int (*http_header_cb_t)(int sock, struct http_request *req, void *user_data)

Callback can be used if application wants to construct additional HTTP headers when the HTTP request is sent. Usage of this is optional.

**Param sock**
Socket id of the connection

**Param req**
HTTP request information

**Param user_data**
User specified data specified in *http_client_req()

**Return**

>=0 amount of data sent, in this case *http_client_req() should continue sending data, <0 if *http_client_req() should return the error code to the caller.
typedef void (*http_response_cb_t)(struct http_response *rsp, enum http_final_call final_data, void *user_data)

Callback used when data is received from the server.

**Param rsp**
HTTP response information

**Param final_data**
Does this data buffer contain all the data or is there still more data to come.

**Param user_data**
User specified data specified in `http_client_req()`

**Enums**

```c
enum http_final_call

Values:

enumerator HTTP_DATA_MORE = 0
enumerator HTTP_DATA_FINAL = 1
```

**Functions**

```c
int http_client_req(int sock, struct http_request *req, int32_t timeout, void *user_data)
```

Do a HTTP request. The callback is called when data is received from the HTTP server. The caller must have created a connection to the server before calling this function so `connect()` call must have be done successfully for the socket.

**Parameters**

- **sock** – Socket id of the connection.
- **req** – HTTP request information
- **timeout** – Max timeout to wait for the data. The timeout value cannot be 0 as there would be no time to receive the data. The timeout value is in milliseconds.
- **user_data** – User specified data that is passed to the callback.

**Returns**

<0 if error, >=0 amount of data sent to the server

```c
struct http_response
```

#include `<client.h>` HTTP response from the server.

**Public Members**

```c
const struct http_parser_settings *http_cb
```

HTTP parser settings for the application usage
User provided HTTP response callback which is called when a response is received to a sent HTTP request.

<table>
<thead>
<tr>
<th>recv_buffer that contains header + body</th>
</tr>
</thead>
<tbody>
<tr>
<td>+-- body_frag_len -&gt;</td>
</tr>
<tr>
<td>+-------------------+ +-------------------</td>
</tr>
<tr>
<td>...header</td>
</tr>
<tr>
<td>+-------------------+ +-------------------</td>
</tr>
<tr>
<td>↑ recv_buf ↑ body_frag_start</td>
</tr>
</tbody>
</table>

recv_buffer that contains body only

| +-- body_frag_len -> |
| +-- data_len -> |
| +-------------------|

size_t body_frag_len
Length of the body fragment contained in the recv_buf

uint8_t *recv_buf
Where the response is stored, this is to be provided by the user.

size_t recv_buf_len
Response buffer maximum length

size_t data_len
Length of the data in the result buf. If the value is larger than recv_buf_len, then it means that the data is truncated and could not be fully copied into recv_buf. This can only happen if the user did not set the response callback. If the callback is set, then the HTTP client API will call response callback many times so that all the data is delivered to the user. Will be zero in the event of a null response.

size_t content_length
HTTP Content-Length field value. Will be set to zero in the event of a null response.

size_t processed
Amount of data given to the response callback so far, including the current data given to the callback. This should be equal to the content_length field once the entire body has been received. Will be zero if a null response is given.

uint16_t http_status_code
Numeric HTTP status code which corresponds to the textual description. Set to zero if
null response is given. Otherwise, will be a 3-digit integer code if valid HTTP response is
given.

```c
struct http_client_internal_data
#include <client.h> HTTP client internal data that the application should not touch

Public Members

struct k_work_delayable work
Work for handling timeout

struct http_parser parser
HTTP parser context

struct http_parser_settings parser_settings
HTTP parser settings

struct http_response response
HTTP response specific data (filled by http_client_req() when data is received)

void *user_data
User data

int sock
HTTP socket

k_timeout_t timeout
Request timeout

```

```c
struct http_request
#include <client.h> HTTP client request. This contains all the data that is needed when doing
a HTTP request.

Public Members

struct http_client_internal_data internal
HTTP client request internal data

enum http_method method
The HTTP method: GET, HEAD, OPTIONS, POST, ...

http_response_cb_t response
User supplied callback function to call when response is received.

const struct http_parser_settings *http_cb
User supplied list of HTTP callback functions if the calling application wants to know the
parsing status or the HTTP fields. This is optional and normally not needed.
```
uint8_t *recv_buf
    User supplied buffer where received data is stored

size_t recv_buf_len
    Length of the user supplied receive buffer

const char *url
    The URL for this request, for example: /index.html

const char *protocol
    The HTTP protocol, for example “HTTP/1.1”

const char **header_fields
    The HTTP header fields (application specific) The Content-Type may be specified here or in the next field. Depending on your application, the Content-Type may vary, however some header fields may remain constant through the application’s life cycle. This is a NULL terminated list of header fields.

const char *content_type_value
    The value of the Content-Type header field, may be NULL

const char *host
    Hostname to be used in the request

const char *port
    Port number to be used in the request

http_payload_cb_t payload_cb
    User supplied callback function to call when payload needs to be sent. This can be NULL in which case the payload field in http_request is used. The idea of this payload callback is to allow user to send more data that is practical to store in allocated memory.

const char *payload
    Payload, may be NULL

size_t payload_len
    Payload length is used to calculate Content-Length. Set to 0 for chunked transfers.

http_header_cb_t optional_headers_cb
    User supplied callback function to call when optional headers need to be sent. This can be NULL, in which case the optional_headers field in http_request is used. The idea of this optional_headers callback is to allow user to send more HTTP header data that is practical to store in allocated memory.

const char **optional_headers
    A NULL terminated list of any optional headers that should be added to the HTTP request. May be NULL. If the optional_headers_cb is specified, then this field is ignored. Note that there are two similar fields that contain headers, the header_fields above and this optional_headers. This is done like this to support Websocket use case where Websocket will use header_fields variable and any optional application specific headers will be placed into this field.

Lightweight M2M (LwM2M)

- Overview
- Example LwM2M object and resources: Device
- Sample usage
- Using LwM2M library with DTLS
- Multi-thread usage
- Support for time series data
  - Enabling and configuring
  - Read and Write operations
  - Limitations
- LwM2M engine and application events
- LwM2M shell
- API Reference

Overview  Lightweight Machine to Machine (LwM2M) is an application layer protocol designed with device management, data reporting and device actuation in mind. Based on CoAP/UDP, LwM2M is a standard defined by the Open Mobile Alliance and suitable for constrained devices by its use of CoAP packet-size optimization and a simple, stateless flow that supports a REST API.

One of the key differences between LwM2M and CoAP is that an LwM2M client initiates the connection to an LwM2M server. The server can then use the REST API to manage various interfaces with the client.

LwM2M uses a simple resource model with the core set of objects and resources defined in the specification.

Example LwM2M object and resources: Device  Object definition

The server could query the `Manufacturer` resource for `Device` object instance 0 (the default and only instance) by sending a `READ 3/0/0` operation to the client.

The full list of registered objects and resource IDs can be found in the LwM2M registry.

Zephyr's LwM2M library lives in the `subsys/net/lib/lwm2m`, with a client sample in `samples/net/lwm2m_client`. For more information about the provided sample see: `lwm2m-client-sample`.

The sample can be configured to use normal unsecure network sockets or sockets secured via DTLS.

The Zephyr LwM2M library implements the following items:

- engine to process networking events and core functions
- RD client which performs BOOTSTRAP and REGISTRATION functions
- SenML CBOR, SenML JSON, CBOR, TLV, JSON, and plain text formatting functions
- LwM2M Technical Specification Enabler objects such as Security, Server, Device, Firmware Update, etc.
- Extended IPSO objects such as Light Control, Temperature Sensor, and Timer

By default, the library implements LwM2M specification 1.0.2 and can be set to LwM2M specification 1.1.1 with a Kconfig option.

For more information about LwM2M visit OMA Specworks LwM2M.

#### Sample usage

To use the LwM2M library, start by creating an LwM2M client context `lwm2m_ctx` structure:

```c
/* LwM2M client context */
static struct lwm2m_ctx client;
```

Create callback functions for LwM2M resource executions:
static int device_reboot_cb(uint16_t obj_inst_id, uint8_t *args,  
uint16_t args_len)
{
    LOG_INF("Device rebooting.");
    LOG_PANIC();
    sys_reboot(0);  
    return 0; /* won't reach this */
}

The LwM2M RD client can send events back to the sample. To receive those events, setup a callback function:

static void rd_client_event(struct lwm2m_ctx *client,  
enum lwm2m_rd_client_event client_event)
{
    switch (client_event) {
    case LWM2M_RD_CLIENT_EVENT_NONE:
        /* do nothing */
        break;
    case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_FAILURE:
        LOG_DBG("Bootstrap registration failure!");
        break;
    case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_COMPLETE:
        LOG_DBG("Bootstrap registration complete");
        break;
    case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_TRANSFER_COMPLETE:
        LOG_DBG("Bootstrap transfer complete");
        break;
    case LWM2M_RD_CLIENT_EVENT_REGISTRATION_FAILURE:
        LOG_DBG("Registration failure!");
        break;
    case LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE:
        LOG_DBG("Registration complete");
        break;
    case LWM2M_RD_CLIENT_EVENT_REG_TIMEOUT:
        LOG_DBG("Registration timeout!");
        break;
    case LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE:
        LOG_DBG("Registration update complete");
        break;
    case LWM2M_RD_CLIENT_EVENT_DEREGISTER_FAILURE:
        LOG_DBG("Deregister failure!");
        break;
    case LWM2M_RD_CLIENT_EVENT_DISCONNECT:
        LOG_DBG("Disconnected");
        break;
    (continues on next page)
Next we assign Security resource values to let the client know where and how to connect as well as set the Manufacturer and Reboot resources in the Device object with some data and the callback we defined above:

```c
/*
 * Server URL of default Security object = 0/0/0
 * Use leshan.eclipse.org server IP (5.39.83.206) for connection
 */
lwm2m_engine_set_string("0/0/0", "coap://5.39.83.206");

/*
 * Security Mode of default Security object = 0/0/2
 * 3 = NoSec mode (no security beware!)
 */
lwm2m_engine_set_u8("0/0/2", 3);

#define CLIENT_MANUFACTURER "Zephyr Manufacturer"

/*
 * Manufacturer resource of Device object = 3/0/0
 * We use lwm2m_engine_set_res_data() function to set a pointer to the
 * CLIENT_MANUFACTURER string.
 * Note the LWM2M_RES_DATA_FLAG_RO flag which stops the engine from
 * trying to assign a new value to the buffer.
 */
lwm2m_engine_set_res_data("3/0/0", CLIENT_MANUFACTURER,
                         sizeof(CLIENT_MANUFACTURER),
                         LWM2M_RES_DATA_FLAG_RO);

/* Reboot resource of Device object = 3/0/4 */
lwm2m_engine_register_exec_callback("3/0/4", device_reboot_cb);
```

Lastly, we start the LwM2M RD client (which in turn starts the LwM2M engine). The second parameter of `lwm2m_rd_client_start()` is the client endpoint name. This is important as it needs to be unique per LwM2M server:

```c
(void)memset(&client, 0x0, sizeof(client));
lwm2m_rd_client_start(&client, "unique-endpoint-name", 0, rd_client_event);
```

### Using LwM2M library with DTLS

The Zephyr LwM2M library can be used with DTLS transport for secure communication by selecting `CONFIG_LWM2M_DTLS_SUPPORT`. In the client initialization we need to create a PSK and identity. These need to match the security information loaded onto the LwM2M server. Normally, the endpoint name is used to lookup the related security information:

```c
/* "000102030405060708090a0b0c0d0e0f" */
static unsigned char client_psk[] = {
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
    0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f
};

static const char client_identity[] = "Client_identity";
```

Next we alter the Security object resources to include DTLS security information. The server URL
should begin with `coaps://` to indicate security is required. Assign a 0 value (Pre-shared Key mode) to the `Security Mode` resource. Lastly, set the client identity and PSK resources.

```c
/* Use coaps:// for server URL protocol */
lwm2m_engine_set_string("0/0/0", "coaps://5.39.83.206");
/* 0 = Pre-Shared Key mode */
lwm2m_engine_set_u8("0/0/2", 0);
/* Set the client identity */
lwm2m_engine_set_string("0/0/3", (char *)client_identity);
/* Set the client pre-shared key (PSK) */
lwm2m_engine_setOpaque("0/0/5", (void *)client_psk, sizeof(client_psk));
```

Before calling `lwm2m_rd_client_start()` assign the `tls_tag #` where the LwM2M library should store the DTLS information prior to connection (normally a value of 1 is ok here).

```c
(void)memset(&client, 0x0, sizeof(client));
client.tls_tag = 1; /* <---- */
lwm2m_rd_client_start(&client, "endpoint-name", 0, rd_client_event);
```

For a more detailed LwM2M client sample see: lwm2m-client-sample.

**Multi-thread usage** Writing a value to a resource can be done using functions like `lwm2m_engine_set_u8`. When writing to multiple resources, the function `lwm2m_registry_lock` will ensure that the client halts until all writing operations are finished:

```c
lwm2m_registry_lock();
lwm2m_engine_set_u32("1/0/1", 60);
lwm2m_engine_set_u8("5/0/3", 0);
lwm2m_engine_set_float("3303/0/5700", &value);
lwm2m_registry_unlock();
```

This is especially useful if the server is composite-observing the resources being written to. Locking will then ensure that the client only updates and sends notifications to the server after all operations are done, resulting in fewer messages in general.

**Support for time series data** LwM2M version 1.1 adds support for SenML CBOR and SenML JSON data formats. These data formats add support for time series data. Time series formats can be used for READ, NOTIFY and SEND operations. When data cache is enabled for a resource, each write will create a timestamped entry in a cache, and its content is then returned as a content in in READ, NOTIFY or SEND operation for a given resource.

Data cache is only supported for resources with a fixed data size.

Supported resource types:

- Signed and unsigned 8-64-bit integers
- Float
- Boolean

**Enabling and configuring** Enable data cache by selecting `CONFIG_LWM2M_RESOURCE_DATA_CACHE_SUPPORT`. Application needs to allocate an array of `lwm2m_time_series_elem` structures and then enable the cache by calling `lwm2m_engine_enable_cache()` for a given resource. Each resource must be enabled separately and each resource needs their own storage.

```c
/* Allocate data cache storage */
static struct lwm2m_time_series_elem temperature_cache[10];
```
LwM2M engine have room for four resources that have cache enabled. Limit can be increased by changing `CONFIG_LWM2M_MAX_CACHED_RESOURCES`. This affects a static memory usage of engine.

Data caches depends on one of the SenML data formats `CONFIG_LWM2M_RW_SENML_CBOR_SUPPORT` or `CONFIG_LWM2M_RW_SENML_JSON_SUPPORT` and needs `CONFIG_POSIX_CLOCK` so it can request a timestamp from the system and `CONFIG_RING_BUFFER` for ring buffer.

Read and Write operations Full content of data cache is written into a payload when any READ, SEND or NOTIFY operation internally reads the content of a given resource. This has a side effect that any read callbacks registered for a that resource are ignored when cache is enabled. Data is written into a cache when any of the `lwm2m_engine_set_*` functions are called. To filter the data entering the cache, application may register a validation callback using `lwm2m_engine_register_validate_callback()`.

Limitations Cache size should be manually set so small that the content can fit normal packets sizes. When cache is full, new values are dropped.

LwM2M engine and application events The Zephyr LwM2M engine defines events that can be sent back to the application through callback functions. The engine state machine shows when the events are spawned. Events depicted in the diagram are listed in the table. The events are prefixed with `LWM2M_RD_CLIENT_EVENT_`.

6.2. Networking
Table 6.20: LwM2M RD Client events

<table>
<thead>
<tr>
<th>Event ID</th>
<th>Event Name</th>
<th>Description</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>NONE</td>
<td>No event</td>
<td>Do nothing</td>
</tr>
<tr>
<td>1</td>
<td>BOOT-STRAP_REG_FAIL</td>
<td>Bootstrap registration failed. Occurs if there is a timeout or failure in bootstrap registration.</td>
<td>Retry bootstrap</td>
</tr>
<tr>
<td>2</td>
<td>BOOT-STRAP_REG</td>
<td>Bootstrap registration complete. Occurs after successful bootstrap registration.</td>
<td>No actions needed</td>
</tr>
<tr>
<td>3</td>
<td>BOOT-STRAP_TRNSFER_COMPLETE</td>
<td>Bootstrap finish command received from the server.</td>
<td>No actions needed, client proceeds to registration.</td>
</tr>
<tr>
<td>4</td>
<td>REGISTRATION.FAILURE</td>
<td>Registration to LwM2M server failed. Occurs if there is a failure in the registration.</td>
<td>Retry registration</td>
</tr>
<tr>
<td>5</td>
<td>REGISTRATION_COMPLETE</td>
<td>Registration to LwM2M server successful. Occurs after a successful registration reply from the LwM2M server or when session resumption is used.</td>
<td>No actions needed</td>

<td>Deregistration to LwM2M server failed. Occurs if there is a timeout or failure in the deregistration.</td>
<td>No actions needed, client proceeds to idle state automatically.</td>
</tr>
<tr>
<td>9</td>
<td>DISCONNECT</td>
<td>Disconnected from LwM2M server. Occurs if there is a timeout during communication with server. Also triggered after deregistration has been done.</td>
<td>If connection is required, the application should restart the client.</td>
</tr>
<tr>
<td>10</td>
<td>QUEUE_MODE_RX_OFF</td>
<td>In queue mode, not actively listening for incoming packets. In queue mode the client is not required to actively listen for the incoming packets after a configured time period.</td>
<td>No actions needed</td>
</tr>
<tr>
<td>11</td>
<td>NETWORK_ERR</td>
<td>Sending messages to the network failed too many times. If sending a message fails, it will be retried. If the retry counter reaches its limits, this event will be triggered.</td>
<td>No actions needed, client will do a re-registerate automatically.</td>
</tr>
</tbody>
</table>

**LwM2M shell** For testing the client it is possible to enable Zephyr's shell and LwM2M specific commands which support changing the state of the client. Operations supported are read, write and execute resources. Client start, stop, pause and resume are also available. The feature is enabled by selecting `CONFIG_LWM2M_SHELL`. The shell is meant for testing so productions systems should not enable it.

One imaginable scenario, where to use the shell, would be executing client side actions over UART when a server side tests would require those. It is assumed that not all tests are able to trigger required actions from the server side.

```bash
uart:~$ lwm2m
lwm2m - LwM2M commands
Subcommands:
exec :Execute a resource
(continues on next page)
```

1920 Chapter 6. Connectivity
exec PATH

read : Read value from LwM2M resource
read PATH [OPTIONS]
-s Read value as string (default)
-b Read value as bool (1/0)
-uX Read value as uintX_t
-sX Read value as intX_t
-f Read value as float

write : Write into LwM2M resource
write PATH [OPTIONS] VALUE
-s Value as string (default)
-b Value as bool
-uX Value as uintX_t
-sX Value as intX_t
-f Value as float

start : Start the LwM2M RD (Registration / Discovery) Client
start EP_NAME [BOOTSTRAP FLAG]
-b Set the bootstrap flag (default 0)

stop : Stop the LwM2M RD (De-register) Client
stop [OPTIONS]
-f Force close the connection

update : Trigger Registration Update of the LwM2M RD Client

pause : LwM2M engine thread pause
resume : LwM2M engine thread resume

API Reference

group lwm2m_api

LwM2M high-level API.

LwM2M high-level interface is defined in this header.

Note: The implementation assumes UDP module is enabled.

Note: For more information refer to Technical Specification OMA-TS-LightweightM2M_Core-V1_1_1-20190617-A

Defines

LWM2M_OBJECT_SECURITY_ID

LwM2M Objects managed by OMA for LwM2M tech specification. Objects in this range have IDs from 0 to 1023.

LWM2M_OBJECT_SERVER_ID
LWM2M_OBJECT_ACCESS_CONTROL_ID

LWM2M_OBJECT_DEVICE_ID

LWM2M_OBJECT_CONNECTIVITY_MONITORING_ID

LWM2M_OBJECT_FIRMWARE_ID

LWM2M_OBJECT_LOCATION_ID

LWM2M_OBJECT_CONNECTIVITY_STATISTICS_ID

LWM2M_OBJECT_SOFTWARE_MANAGEMENT_ID

LWM2M_OBJECT_PORTFOLIO_ID

LWM2M_OBJECT_EVENT_LOG_ID

LWM2M_OBJECT_GATEWAY_ID

IPSO_OBJECT_GENERIC_SENSOR_ID

LwM2M Objects produced by 3rd party Standards Development Organizations. Objects in this range have IDs from 2048 to 10240. Refer to the OMA LightweightM2M (LwM2M) Object and Resource Registry: http://www.openmobilealliance.org/wp/OMNA/LwM2M/LwM2MRegistry.html.

IPSO_OBJECT_TEMP_SENSOR_ID

IPSO_OBJECT_HUMIDITY_SENSOR_ID

IPSO_OBJECT_LIGHT_CONTROL_ID

IPSO_OBJECT_ACCELEROMETER_ID

IPSO_OBJECT_CURRENT_SENSOR_ID

IPSO_OBJECT_PRESSURE_ID

IPSO_OBJECT_BUZZER_ID

IPSO_OBJECT_TIMER_ID

IPSO_OBJECT_ONOFF_SWITCH_ID

IPSO_OBJECT_PUSH_BUTTON_ID
UCIFI_OBJECT_BATTERY_ID

IPSO_OBJECT_FILLING_LEVEL_SENSOR_ID

LWM2M_DEVICE_PWR_SRC_TYPE_DC_POWER
   Power source types used for the “Available Power Sources” resource of the LwM2M Device object.

LWM2M_DEVICE_PWR_SRC_TYPE_BAT_INT

LWM2M_DEVICE_PWR_SRC_TYPE_BAT_EXT

LWM2MDEVICE_PWR_SRC_TYPE_UNUSED

LWM2M_DEVICE_PWR_SRC_TYPE_PWR_OVER_ETH

LWM2M_DEVICE_PWR_SRC_TYPE_USB

LWM2M_DEVICE_PWR_SRC_TYPE_AC_POWER

LWM2M_DEVICE_PWR_SRC_TYPE_SOLAR

LWM2M_DEVICE_PWR_SRC_TYPE_MAX

LWM2M_DEVICE_ERROR_NONE
   Error codes used for the “Error Code” resource of the LwM2M Device object. An LwM2M client can register one of the following error codes via the lwm2m_device_add_err() function.

LWM2M_DEVICE_ERROR_LOW_POWER

LWM2M_DEVICE_ERROR_EXT_POWER_SUPPLY_OFF

LWM2M_DEVICE_ERROR_GPS_FAILURE

LWM2M_DEVICE_ERROR_LOW_SIGNAL_STRENGTH

LWM2M_DEVICE_ERROR_OUT_OF_MEMORY

LWM2M_DEVICE_ERROR_SMS_FAILURE

LWM2M_DEVICE_ERROR_NETWORK_FAILURE

LWM2M_DEVICE_ERROR_PERIPHERAL_FAILURE
Battery status codes used for the “Battery Status” resource (3/0/20) of the LwM2M Device object. As the battery status changes, an LwM2M client can set one of the following codes via:

```
lwm2m_engine_set_u8("3/0/20", [battery status])
```

LWM2M_DEVICE_BATTERY_STATUS_CHARGING

LWM2M_DEVICE_BATTERY_STATUS_CHARGE_COMP

LWM2M_DEVICE_BATTERY_STATUS_DAMAGED

LWM2M_DEVICE_BATTERY_STATUS_LOW

LWM2M_DEVICE_BATTERY_STATUS_NOT_INST

LWM2M_DEVICE_BATTERY_STATUSUNKNOWN

STATE_IDLE

LWM2M Firmware Update object states.

An LwM2M client or the LwM2M Firmware Update object use the following codes to represent the LwM2M Firmware Update state (5/0/3).

STATE_DOWNLOADING

STATE_DOWNLOADED

STATE_UPDATING

RESULT_DEFAULT

LWM2M Firmware Update object result codes.

After processing a firmware update, the client sets the result via one of the following codes via `lwm2m_engine_set_u8("5/0/5", [result code])`

RESULT_SUCCESS

RESULT_NO_STORAGE

RESULT_OUT_OF_MEM

RESULT_CONNECTION_LOST

RESULT_INTEGRITY_FAILED

RESULT_UNSUP_FW

RESULT_INVALID_URI
RESULT_UPDATE_FAILED
RESULT_UNSUP_PROTO

LWM2M_OBJJLNK_MAX_ID
   Maximum value for ObjLnk resource fields.

LWM2M_RES_DATA_READ_ONLY
   Resource read-only value bit.

LWM2M_RES_DATA_FLAG_RO
   Resource read-only flag.

LWM2M_HAS_RES_FLAG(res, f)
   Read resource flags helper macro.

LWM2M_RD_CLIENT_EVENT_REG_UPDATE_FAILURE
   Define for old event name keeping backward compatibility.

LWM2M_RD_CLIENT_FLAG_BOOTSTRAP
   Run bootstrap procedure in current session.

LWM2M_MAX_PATH_STR_LEN
   LwM2M path maximum length.

Typedefs

typedef void (*lwm2m_socket_fault_cb_t)(int error)

typedef void (*lwm2m_observe_cb_t)(enum lwm2m_observe_event event, struct lwm2m_obj_path *path, void *user_data)
   Observe callback indicating observer adds and deletes, and notification ACKs and timeouts.

   Param event
      [in] Observer add/delete or notification ack/timeout

   Param path
      [in] LwM2M path

   Param user_data
      [in] Pointer to user_data buffer, as provided in send_traceable_notification().
      Used to determine for which data the ACKed/timed out notification was.

   typedef void (*lwm2m_ctx_event_cb_t)(struct lwm2m_ctx *ctx, enum lwm2m_rd_client_event event)
   Asynchronous RD client event callback.

   Param ctx
      [in] LwM2M context generating the event

   Param event
      [in] LwM2M RD client event code

6.2. Networking
typedef void *(*lwm2m_engine_get_data_cb_t)(uint16_t obj_inst_id, uint16_t res_id, uint16_t res_inst_id, size_t *data_len)

Asynchronous callback to get a resource buffer and length.

Prior to accessing the data buffer of a resource, the engine can use this callback to get the buffer pointer and length instead of using the resource’s data buffer.

The client or LwM2M objects can register a function of this type via:
lwm2m_engine_register_read_callback() lwm2m_engine_register_pre_write_callback()

Param obj_inst_id  
[in] Object instance ID generating the callback.

Param res_id  
[in] Resource ID generating the callback.

Param res_inst_id  
[in] Resource instance ID generating the callback (typically 0 for non-multi instance resources).

Param data_len  
[out] Length of the data buffer.

Return  
Callback returns a pointer to the data buffer or NULL for failure.

typedef int (*lwm2m_engine_set_data_cb_t)(uint16_t obj_inst_id, uint16_t res_id, uint16_t res_inst_id, uint8_t *data, uint16_t data_len, bool last_block, size_t total_size)

Asynchronous callback when data has been set to a resource buffer.

After changing the data of a resource buffer, the LwM2M engine can make use of this callback to pass the data back to the client or LwM2M objects.

A function of this type can be registered via:  
lwm2m_engine_register_validate_callback() lwm2m_engine_register_post_write_callback()

Param obj_inst_id  
[in] Object instance ID generating the callback.

Param res_id  
[in] Resource ID generating the callback.

Param res_inst_id  
[in] Resource instance ID generating the callback (typically 0 for non-multi instance resources).

Param data  
[in] Pointer to data.

Param data_len  
[in] Length of the data.

Param last_block  
[in] Flag used during block transfer to indicate the last block of data. For non-block transfers this is always false.

Param total_size  
[in] Expected total size of data for a block transfer. For non-block transfers this is 0.

Return  
Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.
typedef int (*lwm2m_engine_user_cb_t)(uint16_t obj_inst_id)

Asynchronous event notification callback.

Various object instance and resource-based events in the LwM2M engine can trigger a callback of this function type: object instance create, and object instance delete.

Register a function of this type via: lwm2m_engine_register_create_callback()
  lwm2m_engine_register_delete_callback()

**Param obj_inst_id**
[in] Object instance ID generating the callback.

**Return**
Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

typedef int (*lwm2m_engine_execute_cb_t)(uint16_t obj_inst_id, uint8_t *args, uint16_t args_len)

Asynchronous execute notification callback.

Resource executes trigger a callback of this type.

Register a function of this type via: lwm2m_engine_register_exec_callback()

**Param obj_inst_id**
[in] Object instance ID generating the callback.

**Param args**
[in] Pointer to execute arguments payload. (This can be NULL if no arguments are provided)

**Param args_len**
[in] Length of argument payload in bytes.

**Return**
Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

** Enums **

enum lwm2m_observe_event

Observe callback events.

**Values:**

enumerator LWM2M_OBSERVE_EVENT_OBSERVER_ADDED

enumerator LWM2M_OBSERVE_EVENT_OBSERVER_REMOVED

enumerator LWM2M_OBSERVE_EVENT_NOTIFY_ACK

enumerator LWM2M_OBSERVE_EVENT_NOTIFY_TIMEOUT

enum lwm2m_rd_client_event

LwM2M RD client events.

LwM2M client events are passed back to the event_cb function in lwm2m_rd_client_start()

**Values:**
enumerator LWM2M_RD_CLIENT_EVENT_NONE
enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_FAILURE
enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_COMPLETE
enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_TRANSFER_COMPLETE
enumerator LWM2M_RD_CLIENT_EVENT_REGISTRATION_FAILURE
enumerator LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE
enumerator LWM2M_RD_CLIENT_EVENT_REG_TIMEOUT
enumerator LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE
enumerator LWM2M_RD_CLIENT_EVENT_DEREGISTER_FAILURE
enumerator LWM2M_RD_CLIENT_EVENT_DISCONNECT
enumerator LWM2M_RD_CLIENT_EVENT_QUEUE_MODE_RX_OFF
enumerator LWM2M_RD_CLIENT_EVENT_ENGINE_SUSPENDED
enumerator LWM2M_RD_CLIENT_EVENT_NETWORK_ERROR

Functions

int lwm2m_device_add_err(uint8_t error_code)
Register a new error code with LwM2M Device object.

Parameters

Returns
  0 for success or negative in case of error.

int lwm2m_engine_update_observer_min_period(struct lwm2m_ctx *client_ctx, const char *pathstr, uint32_t period_s)
Change an observer's pmin value.

LwM2M clients use this function to modify the pmin attribute for an observation being made. Example to update the pmin of a temperature sensor value being observed:
lwm2m_engine_update_observer_min_period("client_ctx, 3303/0/5700", 5);

Parameters
  • client_ctx – [in] LwM2M context
  • pathstr – [in] LwM2M path string "obj/obj-inst/res"
  • period_s – [in] Value of pmin to be given (in seconds).
Returns
0 for success or negative in case of error.

```
int lwm2m_engine_update Observer_max_period(struct lwm2m_ctx *client_ctx, const char *pathstr, uint32_t period_s)
```

Change an observer's pmax value.

LwM2M clients use this function to modify the pmax attribute for an observation being made. Example to update the pmax of a temperature sensor value being observed:
lwm2m_engine_update_observer_max_period("client_ctx, 3303/0/5700", 5);

Parameters
- `client_ctx` - [in] LwM2M context
- `pathstr` - [in] LwM2M path string “obj/obj-inst/res”
- `period_s` - [in] Value of pmax to be given (in seconds).

Returns
0 for success or negative in case of error.

```
int lwm2m_engine_create_obj_inst(const char *pathstr)
```

Create an LwM2M object instance.

LwM2M clients use this function to create non-default LwM2M objects: Example to create first temperature sensor object: lwm2m_engine_create_obj_inst("3303/0");

Parameters
- `pathstr` - [in] LwM2M path string “obj/obj-inst”

Returns
0 for success or negative in case of error.

```
int lwm2m_engine_delete_obj_inst(const char *pathstr)
```

Delete an LwM2M object instance.

LwM2M clients use this function to delete LwM2M objects.

Parameters
- `pathstr` - [in] LwM2M path string “obj/obj-inst”

Returns
0 for success or negative in case of error.

```
void lwm2m_registry_lock(void)
```

Locks the registry for this thread.

Use this function before writing to multiple resources. This halts the lwm2m main thread until all the write-operations are finished.

```
void lwm2m_registry_unlock(void)
```

Unlocks the registry previously locked by `lwm2m_registry_lock()`.

```
int lwm2m_engine_set_opaque(const char *pathstr, const char *data_ptr, uint16_t data_len)
```

Set resource (instance) value (opaque buffer)

Parameters
- `pathstr` - [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- `data_ptr` - [in] Data buffer
- `data_len` - [in] Length of buffer

Returns
0 for success or negative in case of error.
int lwm2m_engine_set_string(const char *pathstr, const char *data_ptr)
   Set resource (instance) value (string)

Parameters
   • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
   • data_ptr – [in] NULL terminated char buffer

Returns
   0 for success or negative in case of error.

int lwm2m_engine_set_u8(const char *pathstr, uint8_t value)
   Set resource (instance) value (u8)

Parameters
   • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
   • value – [in] u8 value

Returns
   0 for success or negative in case of error.

int lwm2m_engine_set_u16(const char *pathstr, uint16_t value)
   Set resource (instance) value (u16)

Parameters
   • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
   • value – [in] u16 value

Returns
   0 for success or negative in case of error.

int lwm2m_engine_set_u32(const char *pathstr, uint32_t value)
   Set resource (instance) value (u32)

Parameters
   • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
   • value – [in] u32 value

Returns
   0 for success or negative in case of error.

int lwm2m_engine_set_u64(const char *pathstr, uint64_t value)
   Set resource (instance) value (u64)

Parameters
   • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
   • value – [in] u64 value

Returns
   0 for success or negative in case of error.

int lwm2m_engine_set_s8(const char *pathstr, int8_t value)
   Set resource (instance) value (s8)

Parameters
   • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
   • value – [in] s8 value

Returns
   0 for success or negative in case of error.
int lwm2m_engine_set_s16(const char *pathstr, int16_t value)
    Set resource (instance) value (s16)

Parameters
    • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
    • value – [in] s16 value

Returns
    0 for success or negative in case of error.

int lwm2m_engine_set_s32(const char *pathstr, int32_t value)
    Set resource (instance) value (s32)

Parameters
    • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
    • value – [in] s32 value

Returns
    0 for success or negative in case of error.

int lwm2m_engine_set_s64(const char *pathstr, int64_t value)
    Set resource (instance) value (s64)

Parameters
    • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
    • value – [in] s64 value

Returns
    0 for success or negative in case of error.

int lwm2m_engine_set_bool(const char *pathstr, bool value)
    Set resource (instance) value (bool)

Parameters
    • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
    • value – [in] bool value

Returns
    0 for success or negative in case of error.

int lwm2m_engine_set_float(const char *pathstr, const double *value)
    Set resource (instance) value (double)

Parameters
    • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
    • value – [in] double value

Returns
    0 for success or negative in case of error.

int lwm2m_engine_set_objlnk(const char *pathstr, const struct lwm2m_objlnk *value)
    Set resource (instance) value (ObjLnk)

Parameters
    • pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
    • value – [in] pointer to the lwm2m_objlnk structure

Returns
    0 for success or negative in case of error.
int lwm2m_engine_set_time(const char *pathstr, time_t value)
Set resource (instance) value (Time)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [in] Epoch timestamp

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_opaque(const char *pathstr, void *buf, uint16_t buflen)
Get resource (instance) value (opaque buffer)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• buf – [out] Data buffer to copy data into
• buflen – [in] Length of buffer

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_string(const char *pathstr, void *str, uint16_t strlen)
Get resource (instance) value (string)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• str – [out] String buffer to copy data into
• strlen – [in] Length of buffer

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_u8(const char *pathstr, uint8_t *value)
Get resource (instance) value (u8)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] u8 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_u16(const char *pathstr, uint16_t *value)
Get resource (instance) value (u16)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] u16 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_u32(const char *pathstr, uint32_t *value)
Get resource (instance) value (u32)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] u32 buffer to copy data into
Returns
0 for success or negative in case of error.

int lwm2m_engine_get_u64(const char *pathstr, uint64_t *value)
Get resource (instance) value (u64)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] u64 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_s8(const char *pathstr, int8_t *value)
Get resource (instance) value (s8)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] s8 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_s16(const char *pathstr, int16_t *value)
Get resource (instance) value (s16)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] s16 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_s32(const char *pathstr, int32_t *value)
Get resource (instance) value (s32)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] s32 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_s64(const char *pathstr, int64_t *value)
Get resource (instance) value (s64)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] s64 buffer to copy data into

Returns
0 for success or negative in case of error.

int lwm2m_engine_get_bool(const char *pathstr, bool *value)
Get resource (instance) value (bool)

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• value – [out] bool buffer to copy data into

Returns
0 for success or negative in case of error.

`int lwm2m_engine_get_float(const char *pathstr, double *buf)`
Get resource (instance) value (double)

Parameters
- `buf` – [out] double buffer to copy data into

Returns
0 for success or negative in case of error.

`int lwm2m_engine_get_objlnk(const char *pathstr, struct lwm2m_objlnk *buf)`
Get resource (instance) value (ObjLnk)

Parameters
- `buf` – [out] `lwm2m_objlnk` buffer to copy data into

Returns
0 for success or negative in case of error.

`int lwm2m_engine_get_time(const char *pathstr, time_t *buf)`
Get resource (instance) value (Time)

Parameters
- `buf` – [out] `time_t` pointer to copy data

Returns
0 for success or negative in case of error.

`int lwm2m_engine_register_read_callback(const char *pathstr, lwm2m_engine_get_data_cb_t cb)`
Set resource (instance) read callback.

LwM2M clients can use this to set the callback function for resource reads when data handling in the LwM2M engine needs to be bypassed. For example reading back opaque binary data from external storage.

This callback should not generally be used for any data that might be observed as engine does not have any knowledge of data changes.

When separate buffer for data should be used, use `lwm2m_engine_set_res_buf()` instead to set the storage.

Parameters
- `cb` – [in] Read resource callback

Returns
0 for success or negative in case of error.

`int lwm2m_engine_register_pre_write_callback(const char *pathstr, lwm2m_engine_get_data_cb_t cb)`
Set resource (instance) pre-write callback.

This callback is triggered before setting the value of a resource. It can pass a special data buffer to the engine so that the actual resource value can be calculated later, etc.

Parameters
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• cb – [in] Pre-write resource callback

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_register_validate_callback(const char *pathstr,
                                           lwm2m_engine_set_data_cb_t cb)
```

Set resource (instance) validation callback.
This callback is triggered before setting the value of a resource to the resource data buffer.
The callback allows an LwM2M client or object to validate the data before writing and notify
an error if the data should be discarded for any reason (by returning a negative error code).

**Note:** All resources that have a validation callback registered are initially decoded into a tem-
porary validation buffer. Make sure that `CONFIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE` is
large enough to store each of the validated resources (individually).

**Parameters**
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• cb – [in] Validate resource data callback

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_register_post_write_callback(const char *pathstr,
                                               lwm2m_engine_set_data_cb_t cb)
```

Set resource (instance) post-write callback.
This callback is triggered after setting the value of a resource to the resource data buffer.
It allows an LwM2M client or object to post-process the value of a resource or trigger other
related resource calculations.

**Parameters**
• pathstr – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
• cb – [in] Post-write resource callback

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_register_exec_callback(const char *pathstr,
                                         lwm2m_engine_execute_cb_t cb)
```

Set resource execute event callback.
This event is triggered when the execute method of a resource is enabled.

**Parameters**
• pathstr – [in] LwM2M path string “obj/obj-inst/res”
• cb – [in] Execute resource callback

**Returns**
0 for success or negative in case of error.

```c
int lwm2m_engine_register_create_callback(uint16_t obj_id,
                                          lwm2m_engine_user_cb_t cb)
```

Set object instance create event callback.
This event is triggered when an object instance is created.
Parameters
- **obj_id** – [in] LwM2M object id
- **cb** – [in] Create object instance callback

Returns
0 for success or negative in case of error.

```c
int lwm2m_engine_register_delete_callback(uint16_t obj_id, lwm2m_engine_user_cb_t cb)
```
Set object instance delete event callback.
This event is triggered when an object instance is deleted.

Parameters
- **obj_id** – [in] LwM2M object id
- **cb** – [in] Delete object instance callback

Returns
0 for success or negative in case of error.

```c
int lwm2m_engine_set_res_buf(const char *pathstr, void *buffer_ptr, uint16_t buffer_len,
                             uint16_t data_len, uint8_t data_flags)
```
Set data buffer for a resource.
Use this function to set the data buffer and flags for the specified LwM2M resource.

Parameters
- **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- **buffer_ptr** – [in] Data buffer pointer
- **buffer_len** – [in] Length of buffer
- **data_len** – [in] Length of existing data in the buffer
- **data_flags** – [in] Data buffer flags (such as read-only, etc)

Returns
0 for success or negative in case of error.

```c
int lwm2m_engine_set_res_data(const char *pathstr, void *data_ptr, uint16_t data_len, uint8_t data_flags)
```
Set data buffer for a resource.
Use this function to set the data buffer and flags for the specified LwM2M resource.

*Deprecated:* Use `lwm2m_engine_set_res_buf()` instead, so you can define buffer size and data size separately.

Parameters
- **pathstr** – [in] LwM2M path string “obj/obj-inst/res(/res-inst)”
- **data_ptr** – [in] Data buffer pointer
- **data_len** – [in] Length of buffer
- **data_flags** – [in] Data buffer flags (such as read-only, etc)

Returns
0 for success or negative in case of error.
int lwm2m_engine_set_res_data_len(const char *pathstr, uint16_t data_len)
  Update data size for a resource.

  Use this function to set the new size of data in the buffer if you write to a buffer received by
  \textit{lwm2m_engine_get_res_buf()}.  

\textbf{Parameters}

- \textit{pathstr} – [\textit{in}] LwM2M path string \textquote{obj/obj-inst/res(/res-inst)}
- \textit{data_len} – [\textit{in}] Length of data

\textbf{Returns}

0 for success or negative in case of error.

\begin{verbatim}
int lwm2m_engine_get_res_buf(const char *pathstr, void **buffer_ptr, uint16_t *buffer_len, 
  uint16_t *data_len, uint8_t *data_flags)
\end{verbatim}

Get data buffer for a resource.

Use this function to get the data buffer information for the specified LwM2M resource.

If you directly write into the buffer, you must use \textit{lwm2m_engine_set_res_data_len()} function
to update the new size of the written data.

All parameters except \textit{pathstr} can NULL if you don\'t want to read those values.

\textbf{Parameters}

- \textit{pathstr} – [\textit{in}] LwM2M path string \textquote{obj/obj-inst/res(/res-inst)}
- \textit{buffer_ptr} – [\textit{out}] Data buffer pointer
- \textit{buffer_len} – [\textit{out}] Length of buffer
- \textit{data_len} – [\textit{out}] Length of existing data in the buffer
- \textit{data_flags} – [\textit{out}] Data buffer flags (such as read-only, etc)

\textbf{Returns}

0 for success or negative in case of error.

\begin{verbatim}
int lwm2m_engine_get_res_data(const char *pathstr, void **data_ptr, uint16_t *data_len, 
  uint8_t *data_flags)
\end{verbatim}

Get data buffer for a resource.

Use this function to get the data buffer information for the specified LwM2M resource.

\textit{Deprecated:}
Use \textit{lwm2m_engine_get_res_buf()} as it can tell you the size of the buffer as well.

\textbf{Parameters}

- \textit{pathstr} – [\textit{in}] LwM2M path string \textquote{obj/obj-inst/res(/res-inst)}
- \textit{data_ptr} – [\textit{out}] Data buffer pointer
- \textit{data_len} – [\textit{out}] Length of existing data in the buffer
- \textit{data_flags} – [\textit{out}] Data buffer flags (such as read-only, etc)

\textbf{Returns}

0 for success or negative in case of error.

\begin{verbatim}
int lwm2m_engine_create_res_inst(const char *pathstr)
\end{verbatim}

Create a resource instance.

LwM2M clients use this function to create multi-resource instances: Example to create 0
instance of device available power sources: \textit{lwm2m_engine_create_res_inst(\textquote{3/0/6/0})};
Parameters
  • pathstr – [in] LwM2M path string “obj/obj-inst/res/res-inst”

Returns
  0 for success or negative in case of error.

int lwm2m_engine_delete_res_inst(const char *pathstr)
    Delete a resource instance.
    Use this function to remove an existing resource instance

Parameters
  • pathstr – [in] LwM2M path string “obj/obj-inst/res/res-inst”

Returns
  0 for success or negative in case of error.

int lwm2m_engine_update_service_period(k_work_handler_t service, uint32_t period_ms)
    Update the period of a given service.
    Allow the period modification on an existing service created with
    lwm2m_engine_add_service(). Example to frequency at which a periodic_service changes its
    values : lwm2m_engine_update_service(device_periodic_service,5*MSEC_PER_SEC);

Parameters
  • service – [in] Handler of the periodic_service
  • period_ms – [in] New period for the periodic_service (in milliseconds)

Returns
  0 for success or negative in case of error.

int lwm2m_update_device_service_period(uint32_t period_ms)
    Update the period of the device service.
    Change the duration of the periodic device service that notifies the current time.

Parameters
  • period_ms – [in] New period for the device service (in milliseconds)

Returns
  0 for success or negative in case of error.

bool lwm2m_engine_path_is_observed(const char *pathstr)
    Check whether a path is observed.

Parameters
  • pathstr – [in] LwM2M path string to check, e.g. “3/0/1”

Returns
  true when there exists an observation of the same level or lower as the given
  path, false if it doesn’t or path is not a valid LwM2M-path. E.g. true if path refers
  to a resource and the parent object has an observation, false for the inverse.

int lwm2m_engine_stop(struct lwm2m_ctx *client_ctx)
    Stop the LwM2M engine.
    LwM2M clients normally do not need to call this function as it is called within
    lwm2m_rd_client. However, if the client does not use the RD client implementation, it will
    need to be called manually.

Parameters
  • client_ctx – [in] LwM2M context
Returns
0 for success or negative in case of error.

int lwm2m_engine_start(struct lwm2m_ctx *client_ctx)
Start the LwM2M engine.

LwM2M clients normally do not need to call this function as it is called by
lwm2m_rd_client_start(). However, if the client does not use the RD client implementation, it
will need to be called manually.

Parameters
• client_ctx – [in] LwM2M context

Returns
0 for success or negative in case of error.

void lwm2m_ acknowledge(struct lwm2m_ctx *client_ctx)
Acknowledge the currently processed request with an empty ACK.

LwM2M engine by default sends piggybacked responses for requests. This function allows to
send an empty ACK for a request earlier (from the application callback). The LwM2M engine
will then send the actual response as a separate CON message after all callbacks are executed.

Parameters
• client_ctx – [in] LwM2M context

6.2. Networking

int lwm2m_rd_client_start(struct lwm2m_ctx *client_ctx, const char *ep_name, uint32_t flags,
   lwm2m_ctx_event_cb_t event_cb, lwm2m_observe_cb_t observe_cb)
Start the LwM2M RD (Registration / Discovery) Client.

The RD client sits just above the LwM2M engine and performs the necessary actions to im-
plement the “Registration interface”. For more information see Section “Client Registration
Interface” of LwM2M Technical Specification.

NOTE: lwm2m_engine_start() is called automatically by this function.

Parameters
• client_ctx – [in] LwM2M context
• ep_name – [in] Registered endpoint name
• flags – [in] Flags used to configure current LwM2M session.
• event_cb – [in] Client event callback function
• observe_cb – [in] Observe callback function called when an observer was
   added or deleted, and when a notification was acked or has timed out

Returns
0 for success, -EINPROGRESS when client is already running or negative error
codes in case of failure.

int lwm2m_rd_client_stop(struct lwm2m_ctx *client_ctx, lwm2m_ctx_event_cb_t event_cb, bool
deregister)
Stop the LwM2M RD (De-register) Client.

The RD client sits just above the LwM2M engine and performs the necessary actions to im-
plement the “Registration interface”. For more information see Section “Client Registration
Interface” of the LwM2M Technical Specification.

Parameters
• client_ctx – [in] LwM2M context
• event_cb – [in] Client event callback function
• deregister – [in] True to deregister the client if registered. False to force close the connection.

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_pause(void)
```

Suspend the LwM2M engine Thread.

Suspend LwM2M engine. Use case could be when network connection is down. LwM2M Engine indicate before it suspend by LWM2M_RD_CLIENT_EVENT_ENGINE_SUSPENDED event.

**Returns**

0 for success or negative in case of error.

```c
int lwm2m_engine_resume(void)
```

Resume the LwM2M engine thread.

Resume suspended LwM2M engine. After successful resume call engine will do full registration or registration update based on suspended time. Event’s LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE or WM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE indicate that client is connected to server.

**Returns**

0 for success or negative in case of error.

```c
void lwm2m_rd_client_update(void)
```

Trigger a Registration Update of the LwM2M RD Client.

```c
char * lwm2m_path_log_buf(char *buf, struct lwm2m_obj_path *path)
```

Helper function to print path objects’ contents to log.

**Parameters**

- **buf** – [in] The buffer to use for formatting the string
- **path** – [in] The path to stringify

**Returns**

Resulting formatted path string

```c
int lwm2m_engine_send(struct lwm2m_ctx *ctx, char const *path_list[], uint8_t path_list_size, bool confirmation_request)
```

LwM2M SEND operation to given path list

**Parameters**

- **ctx** – LwM2M context
- **path_list** – LwM2M Path string list
- **path_list_size** – Length of path list. Max size is CONFIG_LWM2M_COMPOSITE_PATH_LIST_SIZE
- **confirmation_request** – True request confirmation for operation.

**Returns**

0 for success or negative in case of error.

```c
struct lwm2m_ctx * lwm2m_rd_client_ctx(void)
```

Returns LwM2M client context

**Returns**

ctx LwM2M context
int lwm2m_engine_enable_cache(char const *resource_path, struct lwm2m_time_series_elem *data_cache, size_t cache_len)

Enable data cache for a resource.

Application may enable caching of resource data by allocating buffer for LwM2M engine to use. Buffer must be size of struct lwm2m_time_series_elem times cache_len.

**Parameters**

- `resource_path` – LwM2M ressourcepath string “obj/obj-inst/res(/res-inst)”
- `data_cache` – Pointer to Data cache array
- `cache_len` – number of cached entries

**Returns**

0 for success or negative in case of error.

```c
#include <lwm2m.h>
```

```c
struct lwm2m_obj_path
```

```c
#include <lwm2m.h>
```

```c
struct lwm2m_ctx
```

```c
LwM2M context structure to maintain information for a single LwM2M connection.
```

**Public Members**

```c
struct sockaddr remote_addr
```

Destination address storage

```c
struct coap_pending pendings[CONFIG_LWM2M_ENGINE_MAX_PENDING + 1]
```

Private CoAP and networking structures + 1 is for RD Client own message

```c
void *processed_req
```

A pointer to currently processed request, for internal LwM2M engine use. The underlying type is struct lwm2m_message, but since it's declared in a private header and not exposed to the application, it's stored as a void pointer.

```c
bool use_dtls
```

Flag to indicate if context should use DTLS. Enabled via the use of coaps:// protocol prefix in connection information. NOTE: requires CONFIG_LWM2M_DTLS_SUPPORT=y

```c
bool connection_suspended
```

Flag to indicate that the socket connection is suspended. With queue mode, this will tell if there is a need to reconnect.

```c
int sec_obj_inst
```

Current index of Security Object used for server credentials

```c
int srv_obj_inst
```

Current index of Server Object used in this context.

6.2. Networking
bool bootstrap_mode
Flag to enable BOOTSTRAP interface. See Section “Bootstrap Interface” of LwM2M Technical Specification for more information.

int sock_fd
Socket File Descriptor

lwm2m_socket_fault_cb_t fault_cb
Socket fault callback. LwM2M processing thread will call this callback in case of socket errors on receive.

lwm2m_observe_cb_t observe_cb
Callback for new or cancelled observations, and acknowledged or timed out notifications.

uint8_t validate_buf[CONFIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE]
Validation buffer. Used as a temporary buffer to decode the resource value before validation. On successful validation, its content is copied into the actual resource buffer.

struct lwm2m_time_series_elem
#include <lwm2m.h> LwM2M Time series data structure

struct lwm2m_objlnk
#include <lwm2m.h> LWM2M ObjLnk resource type structure.

MQTT

• Overview
• Sample usage
• Using MQTT with TLS
• API Reference

Overview MQTT (Message Queuing Telemetry Transport) is an application layer protocol which works on top of the TCP/IP stack. It is a lightweight publish/subscribe messaging transport for machine-to-machine communication. For more information about the protocol itself, see http://mqtt.org/.

Zephyr provides an MQTT client library built on top of BSD sockets API. The library is configurable at a per-client basis, with support for MQTT versions 3.1.0 and 3.1.1. The Zephyr MQTT implementation can be used with either plain sockets communicating over TCP, or with secure sockets communicating over TLS. See BSD Sockets for more information about Zephyr sockets.

MQTT clients require an MQTT server to connect to. Such a server, called an MQTT Broker, is responsible for managing client subscriptions and distributing messages published by clients. There are many implementations of MQTT brokers, one of them being Eclipse Mosquitto. See https://mosquitto.org/ for more information about the Eclipse Mosquitto project.

Sample usage To create an MQTT client, a client context structure and buffers need to be defined:
Multiple MQTT client instances can be created in the application and managed independently. Additionally, a structure for MQTT Broker address information is needed. This structure must be accessible throughout the lifespan of the MQTT client and can be shared among MQTT clients:

```c
/* MQTT Broker address information. */
static struct sockaddr_storage broker;
```

An MQTT client library will notify MQTT events to the application through a callback function created to handle respective events:

```c
void mqtt_evt_handler(struct mqtt_client *client,
                      const struct mqtt_evt *evt)
{
    switch (evt->type) {
        /* Handle events here. */
    }
}
```

For a list of possible events, see [API Reference](#).

The client context structure needs to be initialized and set up before it can be used. An example configuration for TCP transport is shown below:

```c
mqtt_client_init(&client_ctx);
/* MQTT client configuration */
client_ctx.broker = &broker;
client_ctx.evt_cb = mqtt_evt_handler;
client_ctx.client_id.utf8 = (uint8_t *)"zephyr_mqtt_client";
client_ctx.client_id.size = sizeof("zephyr_mqtt_client") - 1;
client_ctx.password = NULL;
client_ctx.user_name = NULL;
client_ctx.protocol_version = MQTT_VERSION_3_1_1;
client_ctx.transport.type = MQTT_TRANSPORT_NON_SECURE;
/* MQTT buffers configuration */
client_ctx.rx_buf = rx_buffer;
client_ctx.rx_buf_size = sizeof(rx_buffer);
client_ctx.tx_buf = tx_buffer;
client_ctx.tx_buf_size = sizeof(tx_buffer);
```

After the configuration is set up, the MQTT client can connect to the MQTT broker. Call the `mqtt_connect` function, which will create the appropriate socket, establish a TCP/TLS connection, and send an MQTT CONNECT message. When notified, the application should call the `mqtt_input` function to process the response received. Note, that `mqtt_input` is a non-blocking function, therefore the application should use socket `poll` to wait for the response. If the connection was successful, `MQTT_EVT_CONNACK` will be notified to the application through the callback function.

```c
rc = mqtt_connect(&client_ctx);
if (rc != 0) {
    return rc;
}
```

(continues on next page)
In the above code snippet, the MQTT callback function should set the `connected` flag upon a successful connection. If the connection fails at the MQTT level or a timeout occurs, the connection will be aborted, and the underlying socket closed.

After the connection is established, an application needs to call `mqtt_input` and `mqtt_live` functions periodically to process incoming data and upkeep the connection. If an MQTT message is received, an MQTT callback function will be called and an appropriate event notified.

The connection can be closed by calling the `mqtt_disconnect` function.

Zephyr provides sample code utilizing the MQTT client API. See `mqtt-publisher-sample` for more information.

### Using MQTT with TLS

The Zephyr MQTT library can be used with TLS transport for secure communication by selecting a secure transport type (`MQTT_TRANSPORT_SECURE`) and some additional configuration information:

```c
client_ctx.transport.type = MQTT_TRANSPORT_SECURE;

struct mqtt_sec_config *tls_config = &client_ctx.transport.tls.config;

tls_config->peer_verify = TLS_PEER_VERIFY_REQUIRED;
tls_config->cipher_list = NULL;
tls_config->sec_tag_list = m_sec_tags;
tls_config->sec_tag_count = ARRAY_SIZE(m_sec_tags);
tls_config->hostname = MQTT_BROKER_HOSTNAME;
```

In this sample code, the `m_sec_tags` array holds a list of tags, referencing TLS credentials that the MQTT library should use for authentication. We do not specify `cipher_list`, to allow the use of all cipher suites available in the system. We set `hostname` field to broker hostname, which is required for server authentication. Finally, we enforce peer certificate verification by setting the `peer_verify` field.

Note, that TLS credentials referenced by the `m_sec_tags` array must be registered in the system first. For more information on how to do that, refer to `secure sockets documentation`.

An example of how to use TLS with MQTT is also present in `mqtt-publisher-sample`.

### API Reference

**group mqtt_socket**

MQTT Client Implementation.

MQTT Client’s Application interface is defined in this header.

---

**Note:** The implementation assumes TCP module is enabled.
**Note:** By default the implementation uses MQTT version 3.1.1.

**Defines**

MQTT_UTF8_LITERAL(literal)

Initialize UTF-8 encoded string from C literal string.

Use it as follows:

```c
struct mqtt_utf8 password = MQTT_UTF8_LITERAL("my_pass");
```

**Parameters**

- `literal` - **[in]** Literal string from which to generate `mqtt_utf8` object.

**Typedefs**

typedef void (*mqtt_evt_cb_t)(struct mqtt_client *client, const struct mqtt_evt *evt)

Asynchronous event notification callback registered by the application.

**Param client**

- **[in]** Identifies the client for which the event is notified.

**Param evt**

- **[in]** Event description along with result and associated parameters (if any).

** Enums**

```c
enum mqtt_evt_type
```

MQTT Asynchronous Events notified to the application from the module through the callback registered by the application.

**Values:**

- Enumerator `MQTT_EVT_CONNACK`

  Acknowledgment of connection request. Event result accompanying the event indicates whether the connection failed or succeeded.

- Enumerator `MQTT_EVT_DISCONNECT`

  Disconnection Event. MQTT Client Reference is no longer valid once this event is received for the client.

- Enumerator `MQTT_EVT_PUBLISH`

  Publish event received when message is published on a topic client is subscribed to.

  **Note:** PUBLISH event structure only contains payload size, the payload data parameter should be ignored. Payload content has to be read manually with `mqtt_read_publish_payload` function.

- Enumerator `MQTT_EVT_PUBACK`

  Acknowledgment for published message with QoS 1.
enumerator MQTT_EVT_PUBREC
    Reception confirmation for published message with QoS 2.

enumerator MQTT_EVT_PUBREL
    Release of published message with QoS 2.

enumerator MQTT_EVT_PUBCOMP
    Confirmation to a publish release message with QoS 2.

enumerator MQTT_EVT_SUBACK
    Acknowledgment to a subscribe request.

enumerator MQTT_EVT_UNSUBACK
    Acknowledgment to a unsubscribe request.

enumerator MQTT_EVT_PINGRESP
    Ping Response from server.

enum mqtt_version
    MQTT version protocol level.
    Values:

enumerator MQTT_VERSION_3_1_0 = 3
    Protocol level for 3.1.0.

enumerator MQTT_VERSION_3_1_1 = 4
    Protocol level for 3.1.1.

enum mqtt_qos
    MQTT Quality of Service types.
    Values:

enumerator MQTT_QOS_0_AT_MOST_ONCE = 0x00
    Lowest Quality of Service, no acknowledgment needed for published message.

enumerator MQTT_QOS_1_AT_LEAST_ONCE = 0x01
    Medium Quality of Service, if acknowledgment expected for published message, duplicate messages permitted.

enumerator MQTT_QOS_2_EXACTLY_ONCE = 0x02
    Highest Quality of Service, acknowledgment expected and message shall be published only once. Message not published to interested parties unless client issues a PUBREL.

enum mqtt_conn_return_code
    MQTT CONNACK return codes.
    Values:
enumerator MQTT_CONNECTION_ACCEPTED = 0x00
    Connection accepted.

enumerator MQTT_UNACCEPTABLE_PROTOCOL_VERSION = 0x01
    The Server does not support the level of the MQTT protocol requested by the Client.

enumerator MQTT_IDENTIFIER_REJECTED = 0x02
    The Client identifier is correct UTF-8 but not allowed by the Server.

enumerator MQTT_SERVER_UNAVAILABLE = 0x03
    The Network Connection has been made but the MQTT service is unavailable.

enumerator MQTT_BAD_USER_NAME_OR_PASSWORD = 0x04
    The data in the user name or password is malformed.

enumerator MQTT_NOT_AUTHORIZED = 0x05
    The Client is not authorized to connect.

enum mqtt_suback_return_code
    MQTT SUBACK return codes.
    Values:

enumerator MQTT_SUBACK_SUCCESS_QoS_0 = 0x00
    Subscription with QoS 0 succeeded.

enumerator MQTT_SUBACK_SUCCESS_QoS_1 = 0x01
    Subscription with QoS 1 succeeded.

enumerator MQTT_SUBACK_SUCCESS_QoS_2 = 0x02
    Subscription with QoS 2 succeeded.

enumerator MQTT_SUBACK_FAILURE = 0x80
    Subscription for a topic failed.

enum mqtt_transport_type
    MQTT transport type.
    Values:

enumerator MQTT_TRANSPORT_NON_SECURE
    Use non secure TCP transport for MQTT connection.

enumerator MQTT_TRANSPORT_NUM
    Shall not be used as a transport type. Indicator of maximum transport types possible.

Functions

6.2. Networking
void mqtt_client_init(struct mqtt_client *client)
    Initializes the client instance.

    **Note:** Shall be called to initialize client structure, before setting any client parameters and before connecting to broker.

**Parameters**

- `client` - [in] Client instance for which the procedure is requested. Shall not be NULL.

---

int mqtt_connect(struct mqtt_client *client)
    API to request new MQTT client connection.

    **Note:** This memory is assumed to be resident until mqtt_disconnect is called.

    **Note:** Any subsequent changes to parameters like broker address, user name, device id, etc. have no effect once MQTT connection is established.

    **Note:** Default protocol revision used for connection request is 3.1.1. Please set client.protocol_version = MQTT_VERSION_3_1_0 to use protocol 3.1.0.

    **Note:** Please modify_CONFIG_MQTT_KEEPALIVE time to override default of 1 minute.

**Parameters**

- `client` - [in] Client instance for which the procedure is requested. Shall not be NULL.

**Returns**

0 or a negative error code (errno.h) indicating reason of failure.

---

int mqtt_publish(struct mqtt_client *client, const struct mqtt_publish_param *param)
    API to publish messages on topics.

**Parameters**

- `client` - [in] Client instance for which the procedure is requested. Shall not be NULL.
- `param` - [in] Parameters to be used for the publish message. Shall not be NULL.

**Returns**

0 or a negative error code (errno.h) indicating reason of failure.

---

int mqtt_publish_qos1_ack(struct mqtt_client *client, const struct mqtt_puback_param *param)
    API used by client to send acknowledgment on receiving QoS1 publish message. Should be called on reception of MQTT_EVT_PUBLISH with QoS level MQTT_QOS_1_AT_LEAST_ONCE.

**Parameters**

- `client` - [in] Client instance for which the procedure is requested. Shall not be NULL.
- `param` - [in] Identifies message being acknowledged.
Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_publish_qos2_receive(struct mqtt_client *client, const struct mqtt_pubrec_param *param)

API used by client to send acknowledgment on receiving QoS2 publish message. Should be called on reception of MQTT_EVT_PUBLISH with QoS level MQTT_QOS_2_EXACTLY_ONCE.

Parameters
• client – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.
• param – [in] Identifies message being acknowledged.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_publish_qos2_release(struct mqtt_client *client, const struct mqtt_pubrel_param *param)

API used by client to request release of QoS2 publish message. Should be called on reception of MQTT_EVT_PUBREC.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.
• param – [in] Identifies message being released.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_publish_qos2_complete(struct mqtt_client *client, const struct mqtt_pubcomp_param *param)

API used by client to send acknowledgment on receiving QoS2 publish release message. Should be called on reception of MQTT_EVT_PUBREL.

Parameters
• client – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.
• param – [in] Identifies message being completed.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_subscribe(struct mqtt_client *client, const struct mqtt_subscription_list *param)

API to request subscription of one or more topics on the connection.

Parameters
• client – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.
• param – [in] Subscription parameters. Shall not be NULL.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_unsubscribe(struct mqtt_client *client, const struct mqtt_subscription_list *param)

API to request unsubscription of one or more topics on the connection.

Note: QoS included in topic description is unused in this API.
Parameters

- client – [in] Identifies client instance for which the procedure is requested. Shall not be NULL.
- param – [in] Parameters describing topics being unsubscribed from. Shall not be NULL.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_ping(struct mqtt_client *client)

API to send MQTT ping. The use of this API is optional, as the library handles the connection keep-alive on its own, see mqtt_live.

Parameters

- client – [in] Identifies client instance for which procedure is requested.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_disconnect(struct mqtt_client *client)

API to disconnect MQTT connection.

Parameters

- client – [in] Identifies client instance for which procedure is requested.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_abort(struct mqtt_client *client)

API to abort MQTT connection. This will close the corresponding transport without closing the connection gracefully at the MQTT level (with disconnect message).

Parameters

- client – [in] Identifies client instance for which procedure is requested.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_keepalive_time_left(const struct mqtt_client *client)

This API should be called periodically for the client to be able to keep the connection alive by sending Ping Requests if need be.

Note: Application shall ensure that the periodicity of calling this function makes it possible to respect the Keep Alive time agreed with the broker on connection. mqtt_connect for details on Keep Alive time.

Parameters

- client – [in] Client instance for which the procedure is requested. Shall not be NULL.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_keepalive_time_left(const struct mqtt_client *client)

Helper function to determine when next keep alive message should be sent. Can be used for instance as a source for poll timeout.

Parameters
• client – [in] Client instance for which the procedure is requested.

Returns
Time in milliseconds until next keep alive message is expected to be sent. Function will return -1 if keep alive messages are not enabled.

int mqtt_input(struct mqtt_client *client)
Receive an incoming MQTT packet. The registered callback will be called with the packet content.

Note: In case of PUBLISH message, the payload has to be read separately with mqtt_read_publish_payload function. The size of the payload to read is provided in the publish event structure.

Note: This is a non-blocking call.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_read_publish_payload(struct mqtt_client *client, void *buffer, size_t length)
Read the payload of the received PUBLISH message. This function should be called within the MQTT event handler, when MQTT PUBLISH message is notified.

Note: This is a non-blocking call.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.

• buffer – [out] Buffer where payload should be stored.

• length – [in] Length of the buffer, in bytes.

Returns
Number of bytes read or a negative error code (errno.h) indicating reason of failure.

int mqtt_read_publish_payload_blocking(struct mqtt_client *client, void *buffer, size_t length)
Blocking version of mqtt_read_publish_payload function.

Parameters
• client – [in] Client instance for which the procedure is requested. Shall not be NULL.

• buffer – [out] Buffer where payload should be stored.

• length – [in] Length of the buffer, in bytes.

Returns
Number of bytes read or a negative error code (errno.h) indicating reason of failure.
int mqtt_readall_publish_payload(struct mqtt_client *client, uint8_t *buffer, size_t length)

Blocking version of \texttt{mqtt_read_publish_payload} function which runs until the required number of bytes are read.

**Parameters**

- \texttt{client} – [in] Client instance for which the procedure is requested. Shall not be NULL.
- \texttt{buffer} – [out] Buffer where payload should be stored.
- \texttt{length} – [in] Number of bytes to read.

**Returns**

0 if success, otherwise a negative error code (\texttt{errno.h}) indicating reason of failure.

\[struct\] mqtt_utf8

\texttt{#include <mqtt.h>} Abstracts UTF-8 encoded strings.

**Public Members**

- \texttt{const uint8_t *utf8}
  Pointer to UTF-8 string.
- \texttt{uint32_t size}
  Size of UTF string, in bytes.

\[struct\] mqtt_binstr

\texttt{#include <mqtt.h>} Abstracts binary strings.

**Public Members**

- \texttt{uint8_t *data}
  Pointer to binary stream.
- \texttt{uint32_t len}
  Length of binary stream.

\[struct\] mqtt_topic

\texttt{#include <mqtt.h>} Abstracts MQTT UTF-8 encoded topic that can be subscribed to or published.

**Public Members**

- \texttt{struct mqtt_utf8 topic}
  Topic on to be published or subscribed to.
- \texttt{uint8_t qos}
  Quality of service requested for the subscription. \texttt{mqtt_qos} for details.

\[struct\] mqtt_publish_message

\texttt{#include <mqtt.h>} Parameters for a publish message.
Public Members

struct _mqtt_topic topic
  Topic on which data was published.

struct _mqtt_binstr payload
  Payload on the topic published.

struct _mqtt_connack_param
  #include <mqtt.h> Parameters for a connection acknowledgment (CONNACK).

Public Members

uint8_t _session_present_flag
  The Session Present flag enables a Client to establish whether the Client and Server have a consistent view about whether there is already stored Session state.

enum _mqtt_conn_return_code return_code
  The appropriate non-zero Connect return code indicates if the Server is unable to process a connection request for some reason.

struct _mqtt_puback_param
  #include <mqtt.h> Parameters for MQTT publish acknowledgment (PUBACK).

struct _mqtt_pubrec_param
  #include <mqtt.h> Parameters for MQTT publish receive (PUBREC).

struct _mqtt_pubrel_param
  #include <mqtt.h> Parameters for MQTT publish release (PUBREL).

struct _mqtt_pubcomp_param
  #include <mqtt.h> Parameters for MQTT publish complete (PUBCOMP).

struct _mqtt_suback_param
  #include <mqtt.h> Parameters for MQTT subscription acknowledgment (SUBACK).

struct _mqtt_unsuback_param
  #include <mqtt.h> Parameters for MQTT unsubscribe acknowledgment (UNSUBACK).

struct _mqtt_publish_param
  #include <mqtt.h> Parameters for a publish message.

Public Members

struct _mqtt_publish_message message
  Messages including topic, QoS and its payload (if any) to be published.
```c
uint16_t message_id
    Message id used for the publish message. Redundant for QoS 0.

uint8_t dup_flag
    Duplicate flag. If 1, it indicates the message is being retransmitted. Has no meaning with QoS 0.

uint8_t retain_flag
    Retain flag. If 1, the message shall be stored persistently by the broker.
```

```c
struct mqtt_subscription_list
    #include <mqtt.h> List of topics in a subscription request.
```

### Public Members

```c
struct mqtt_topic *list
    Array containing topics along with QoS for each.

uint16_t list_count
    Number of topics in the subscription list

uint16_t message_id
    Message id used to identify subscription request.
```

```c
union mqtt_evt_param
    #include <mqtt.h> Defines event parameters notified along with asynchronous events to the application.
```

### Public Members

```c
struct mqtt_connack_param connack
    Parameters accompanying MQTT_EVT_CONNACK event.

struct mqtt_publish_param publish
    Parameters accompanying MQTT_EVT_PUBLISH event.
```

**Note:** PUBLISH event structure only contains payload size, the payload data parameter should be ignored. Payload content has to be read manually with `mqtt_read_publish_payload` function.

```c
struct mqtt_puback_param puback
    Parameters accompanying MQTT_EVT_PUBACK event.

struct mqtt_pubrec_param pubrec
    Parameters accompanying MQTT_EVT_PUBREC event.
```
struct mqtt_pubrel_param pubrel
Parameters accompanying MQTT_EVT_PUBREL event.

struct mqtt_pubcomp_param pubcomp
Parameters accompanying MQTT_EVT_PUBCOMP event.

struct mqtt_suback_param suback
Parameters accompanying MQTT_EVT_SUBACK event.

struct mqtt_unsuback_param unsuback
Parameters accompanying MQTT_EVT_UNSUBACK event.

struct mqtt_evt
#include <mqtt.h> Defines MQTT asynchronous event notified to the application.

Public Members

to
enum mqtt_evt_type type
Identifies the event.

union mqtt_evt_param param
Contains parameters (if any) accompanying the event.

int result
Event result. 0 or a negative error code (errno.h) indicating reason of failure.

struct mqtt_sec_config
#include <mqtt.h> TLS configuration for secure MQTT transports.

Public Members

int peer_verify
Indicates the preference for peer verification.

uint32_t cipher_count
Indicates the number of entries in the cipher list.

int *cipher_list
Indicates the list of ciphers to be used for the session. May be NULL to use the default ciphers.

uint32_t sec_tag_count
Indicates the number of entries in the sec tag list.

sec_tag_t *sec_tag_list
Indicates the list of security tags to be used for the session.
const char *hostname
Peer hostname for certificate verification. May be NULL to skip hostname verification.

int cert_nocopy
Indicates the preference for copying certificates to the heap.

struct mqtt_transport
#include <mqtt.h> MQTT transport specific data.

Public Members

enum mqtt_transport_type type
Transport type selection for client instance. mqtt_transport_type for possible values. MQTT_TRANSPORT_MAX is not a valid type.

int sock
Socket descriptor.

struct mqtt_internal
#include <mqtt.h> MQTT internal state.

Public Members

struct sys_mutex mutex
Internal. Mutex to protect access to the client instance.

uint32_t last_activity
Internal. Wall clock value (in milliseconds) of the last activity that occurred. Needed for periodic PING.

uint32_t state
Internal. Client's state in the connection.

uint32_t trx_buf_datalen
Internal. Packet length read so far.

uint32_t remaining_payload
Internal. Remaining payload length to read.

struct mqtt_client
#include <mqtt.h> MQTT Client definition to maintain information relevant to the client.

Public Members

struct mqtt_internal internal
MQTT client internal state.
struct mqtt_transport transport
MQTT transport configuration and data.

struct mqtt_utf8 client_id
Unique client identification to be used for the connection.

const void *broker
Broker details, for example, address, port. Address type should be compatible with transport used.

struct mqtt_utf8 *user_name
User name (if any) to be used for the connection. NULL indicates no user name.

struct mqtt_utf8 *password
Password (if any) to be used for the connection. Note that if password is provided, user name shall also be provided. NULL indicates no password.

struct mqtt_topic *will_topic
Will topic and QoS. Can be NULL.

struct mqtt_utf8 *will_message
Will message. Can be NULL. Non NULL value valid only if will topic is not NULL.

mqtt_evt_cb_t evt_cb
Application callback registered with the module to get MQTT events.

uint8_t *rx_buf
Receive buffer used for MQTT packet reception in RX path.

uint32_t rx_buf_size
Size of receive buffer.

uint8_t *tx_buf
Transmit buffer used for creating MQTT packet in TX path.

uint32_t tx_buf_size
Size of transmit buffer.

uint16_t keepalive
Keepalive interval for this client in seconds. Default is CONFIG_MQTT_KEEPALIVE.

uint8_t protocol_version
MQTT protocol version.

int8_t unacked_ping
Unanswered PINGREQ count on this connection.

uint8_t will_retain
Will retain flag, 1 if will message shall be retained persistently.

6.2. Networking
uint8_t clean_session

Clean session flag indicating a fresh (1) or a retained session (0). Default is CONFIG_MQTT_CLEAN_SESSION.

MQTT-SN

• Overview
• Sample usage
• Deviations from the standard
• API Reference

Overview MQTT-SN is a variant of the well-known MQTT protocol - see MQTT.

In contrast to MQTT, MQTT-SN does not require a TCP transport, but is designed to be used over any message-based transport. Originally, it was mainly created with ZigBee in mind, but others like Bluetooth, UDP or even a UART can be used just as well.

Zephyr provides an MQTT-SN client library built on top of BSD sockets API. The library is configurable at a per-client basis, with support for MQTT-SN version 1.2. The Zephyr MQTT-SN implementation can be used with any message-based transport, but support for UDP is already built-in.

MQTT-SN clients require an MQTT-SN gateway to connect to. These gateways translate between MQTT-SN and MQTT. The Eclipse Paho project offers an implementation of a MQTT-SN gateway, but others are available too. https://www.eclipse.org/paho/index.php?page=components/mqtt-sn-transparent-gateway/index.php

The MQTT-SN spec v1.2 can be found here: https://www.oasis-open.org/committees/download.php/66091/MQTT-SN_spec_v1.2.pdf

Sample usage To create an MQTT-SN client, a client context structure and buffers need to be defined:

```c
/* Buffers for MQTT client. */
static uint8_t rx_buffer[256];
static uint8_t tx_buffer[256];

/* MQTT-SN client context */
static struct mqtt_sn_client client;
```

Multiple MQTT-SN client instances can be created in the application and managed independently. Additionally, a structure for the transport is needed as well. The library already comes with an example implementation for UDP.

```c
/* MQTT Broker address information. */
static struct mqtt_sn_transport tp;
```

The MQTT-SN library will inform clients about certain events using a callback.

```c
static void evt_cb(struct mqtt_sn_client *client,
                   const struct mqtt_sn_evt *evt)
{
    switch(evt->type) {
    {
        /* Handle events here. */
    }
```

(continues on next page)
For a list of possible events, see API Reference.

The client context structure needs to be initialized and set up before it can be used. An example configuration for UDP transport is shown below:

```c
struct mqtt_sn_data client_id = MQTT_SN_DATA_STRING_LITERAL(“ZEPHYR”);
struct sockaddr_in gateway = {0};

uint8_t tx_buf[256];
uint8_t rx_buf[256];

mqtt_sn_transport_udp_init(&tp, (struct sockaddr*)&gateway, sizeof((gateway)));
mqtt_sn_client_init(&client, &client_id, &tp.tp, evt_cb, tx_buf, sizeof(tx_buf), rx_buf, sizeof(rx_buf));
```

After the configuration is set up, the MQTT-SN client can connect to the gateway. While the MQTT-SN protocol offers functionality to discover gateways through an advertisement mechanism, this is not implemented yet in the library.

Call the `mqtt_sn_connect` function, which will send a `CONNECT` message. The application should periodically call the `mqtt_sn_input` function to process the response received. The application does not have to call `mqtt_sn_input` if it knows that no data has been received (e.g. when using Bluetooth). Note that `mqtt_sn_input` is a non-blocking function, if the transport struct contains a `poll` compatible function pointer. If the connection was successful, `MQTT_SN_EVT_CONNECTED` will be notified to the application through the callback function.

```c
err = mqtt_sn_connect(&client, false, true);
__ASSERT(err == 0, "mqtt_sn_connect() failed %d", err);
while (1) {
    mqtt_sn_input(&client);
    if (connected) {
        mqtt_sn_publish(&client, MQTT_SN_QOS_0, &topic_p, false, &pubdata);
    }
    k_sleep(K_MSEC(500));
}
```

In the above code snippet, the event handler function should set the `connected` flag upon a successful connection. If the connection fails at the MQTT level or a timeout occurs, the connection will be aborted.

After the connection is established, an application needs to call `mqtt_input` function periodically to process incoming data. Connection upkeep, on the other hand, is done automatically using a k_work item. If a MQTT message is received, an MQTT callback function will be called and an appropriate event notified.

The connection can be closed by calling the `mqtt_sn_disconnect` function. This has no effect on the transport, however. If you want to close the transport (e.g. the socket), call `mqtt_sn_client_deinit`, which will deinit the transport as well.

Zephyr provides sample code utilizing the MQTT-SN client API. See mqtt-sn-publisher-sample for more information.

**Deviations from the standard** Certain parts of the protocol are not yet supported in the library. * Pre-defined topic IDs * QoS -1 - it's most useful with predefined topics * Gateway discovery using ADVERTISE,
SEARCHGW and GWINFO messages. * Setting the will topic and message after the initial connect * Forwarder Encapsulation

API Reference

**group mqtt_sn_socket**

MQTT-SN Client Implementation.

MQTT-SN Client's Application interface is defined in this header. Targets protocol version 1.2.

**Defines**

`MQTT_SN_DATA_STRING_LITERAL(literal)`

Initialize memory buffer from C literal string.

Use it as follows:

```c
struct mqtt_sn_data topic = MQTT_SN_DATA_STRING_LITERAL("/zephyr");
```

**Parameters**

- **literal** - [in] Literal string from which to generate `mqtt_sn_data` object.

`MQTT_SN_DATA_BYTES(...)`

Initialize memory buffer from single bytes.

Use it as follows:

```c
struct mqtt_sn_data data = MQTT_SN_DATA_BYTES(0x13, 0x37);
```

**Typedefs**

typedef void (*mqtt_sn_evt_cb_t)(struct mqtt_sn_client *client, const struct mqtt_sn_evt *evt)

Asynchronous event notification callback registered by the application.

**Param client**

[in] Identifies the client for which the event is notified.

**Param evt**

[in] Event description along with result and associated parameters (if any).

**Enums**

`enum mqtt_sn_qos`

Quality of Service. QoS 0-2 work the same as basic MQTT, QoS -1 is an MQTT-SN addition. QOS -1 is not supported yet.

**Values:**

- **QOS 0**
  - enumerator `MQTT_SN_QOS_0`
- **QOS 1**
  - enumerator `MQTT_SN_QOS_1`
enumerator MQTT_SN_QOS_2
    QOS 2

enumerator MQTT_SN_QOS_M1
    QOS -1

enum mqtt_sn_topic_type
    MQTT-SN topic types.
    Values:

    enumerator MQTT_SN_TOPIC_TYPE_NORMAL

    enumerator MQTT_SN_TOPIC_TYPE_PREDEF

    enumerator MQTT_SN_TOPIC_TYPE_SHORT

enum mqtt_sn_return_code
    Values:

    enumerator MQTT_SN_CODE_ACCEPTED = 0x00
        Accepted

    enumerator MQTT_SN_CODE_REJECTED_CONGESTION = 0x01
        Rejected: congestion

    enumerator MQTT_SN_CODE_REJECTED_TOPIC_ID = 0x02
        Rejected: Invalid Topic ID

    enumerator MQTT_SN_CODE_REJECTED_NOTSUP = 0x03
        Rejected: Not Supported

enum mqtt_sn_evt_type
    Event types that can be emitted by the library.
    Values:

    enumerator MQTT_SN_EVT_CONNECTED
        Connected to a gateway

    enumerator MQTT_SN_EVT_DISCONNECTED
        Disconnected

    enumerator MQTT_SN_EVT_ASLEEP
        Entered ASLEEP state

    enumerator MQTT_SN_EVT_AWAKE
        Entered AWAKE state
enumerator MQTT_SN_EVT_PUBLISH
Received a PUBLISH message

enumerator MQTT_SN_EVT_PINGRESP
Received a PINGRESP

**Functions**

```c
def int mqtt_sn_client_init(struct mqtt_sn_client *client, const struct mqtt_sn_data *client_id,
                           struct mqtt_sn_transport *transport, mqtt_sn_evt_cb_t evt_cb, void *tx,
                           size_t txsz, void *rx, size_t rxsz)
```

Initialize a client.

```c
def void mqtt_sn_client_deinit(struct mqtt_sn_client *client)
```

Deinitialize the client.

This removes all topics and publishes, and also deinitializes the transport.

```c
def int mqtt_sn_connect(struct mqtt_sn_client *client, bool will, bool clean_session)
```

Connect the client.

**Returns**

0 or a negative error code (errno.h) indicating reason of failure.

```c
def int mqtt_sn_disconnect(struct mqtt_sn_client *client)
```

Disconnect the client.

**Returns**

0 or a negative error code (errno.h) indicating reason of failure.

```c
def int mqtt_sn_sleep(struct mqtt_sn_client *client, uint16_t duration)
```

Set the client into sleep state for the given duration (seconds).

**Returns**

0 or a negative error code (errno.h) indicating reason of failure.

```c
def int mqtt_sn_subscribe(struct mqtt_sn_client *client, enum mqtt_sn_qos qos, struct mqtt_sn_data *topic_name)
```

Subscribe to a given topic.

**Returns**

0 or a negative error code (errno.h) indicating reason of failure.

```c
def int mqtt_sn_unsubscribe(struct mqtt_sn_client *client, enum mqtt_sn_qos qos, struct mqtt_sn_data *topic_name)
```

Unsubscribe from a topic.

```c
def int mqtt_sn_publish(struct mqtt_sn_client *client, enum mqtt_sn_qos qos, struct mqtt_sn_data *topic_name, bool retain, struct mqtt_sn_data *data)
```

Publish a value.

If the topic is not yet registered with the gateway, the library takes care of it.

**Returns**

0 or a negative error code (errno.h) indicating reason of failure.

```c
def int mqtt_sn_input(struct mqtt_sn_client *client)
```

Check the transport for new incoming data.

Call this function periodically, or if you have good reason to believe there is any data. If the client’s transport struct contains a poll-function, this function is non-blocking.
**Returns**

0 or a negative error code (errno.h) indicating reason of failure.

```c
struct mqtt_sn_data
#include <mqtt_sn.h> Abstracts memory buffers.
```

**Public Members**

`const uint8_t *data`
Pointer to data.

`uint16_t size`
Size of data, in bytes.

```c
union mqtt_sn_evt_param
#include <mqtt_sn.h> Event metadata.
```

**Public Members**

```c
struct mqtt_sn_data data
```

```c
enum mqtt_sn_topic_type topic_type
```

```c
uint16_t topic_id
```

```c
struct mqtt_sn_evt_param.[anonymous] publish
```

```c
struct mqtt_sn_evt
#include <mqtt_sn.h> MQTT-SN event structure to be handled by the event callback.
```

```c
struct mqtt_sn_transport
#include <mqtt_sn.h> Structure to describe an MQTT-SN transport.
```

MQTT-SN does not require transports to be reliable or to hold a connection. Transports just need to be frame-based, so you can use UDP, ZigBee, or even a simple UART, given some kind of framing protocol is used.

**Public Members**

```c
int (*init)(struct mqtt_sn_transport *transport)
```
Will be called once on client init to initialize the transport.
Use this to open sockets or similar. May be NULL.

```c
void (*deinit)(struct mqtt_sn_transport *transport)
```
Will be called on client deinit.
Use this to close sockets or similar. May be NULL.
int (*msg_send)(struct mqtt_sn_client *client, void *buf, size_t sz)
  Will be called by the library when it wants to send a message.

ssize_t (*recv)(struct mqtt_sn_client *client, void *buffer, size_t length)
  Will be called by the library when it wants to receive a message.
  Implementations should follow recv conventions.

int (*poll)(struct mqtt_sn_client *client)
  Check if incoming data is available.
  If poll() returns a positive number, recv must not block.
  May be NULL, but recv should not block then either.
  **Return**
  Positive number if data is available, or zero if there is none. Negative values
  signal errors.

struct mqtt_sn_client
  
  "include <mqtt_sn.h> Structure describing an MQTT-SN client.

Public Members

struct mqtt_sn_data client_id
  1-23 character unique client ID

struct mqtt_sn_data will_topic
  Must be initialized before connecting with will=true

struct mqtt_sn_data will_msg
  Must be initialized before connecting with will=true

Network System Management

Network Configuration Library

- **Overview**
  The network configuration library sets up networking devices in a semi-automatic way during the system boot, based on user-supplied Kconfig options.
  The following Kconfig options affect how configuration library will setup the system:
Table 6.21: Kconfig options for network configuration library

<table>
<thead>
<tr>
<th>Option name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIG_NET_CONFIG_SETTINGS</td>
<td>This option controls whether the network system is configured or initialized at all. If not set, then the config library is not used for initialization and the application needs to do all the network related configuration itself. If this option is set, then the user can optionally configure static IP addresses to be set to the first network interface in the system. Typically setting static IP addresses is only usable in testing and should not be used in production code. See the config library Kconfig file subsys/net/lib/config/Kconfig for specific options to set the static IP addresses.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_AUTO_INIT</td>
<td>The networking system is automatically configured when the device is started.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_INIT_TIMEOUT</td>
<td>This tells how long to wait for the networking to be ready and available. If for example IPv4 address from DHCPv4 is not received within this limit, then a call to net_config_init() will return error during the device startup.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_NEED_IPV4</td>
<td>The network application needs IPv4 support to function properly. This option makes sure the network application is initialized properly in order to use IPv4. If CONFIG_NET_IPV4 is not enabled, then setting this option will automatically enable IPv4.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_NEED_IPV6</td>
<td>The network application needs IPv6 support to function properly. This option makes sure the network application is initialized properly in order to use IPv6. If CONFIG_NET_IPV6 is not enabled, then setting this option will automatically enable IPv6.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_NEED_IPV6_ROUTER</td>
<td>If IPv6 is enabled, then this option tells that the network application needs IPv6 router to exists before continuing. This means in practice that the application wants to wait until it receives IPv6 router advertisement message before continuing.</td>
</tr>
<tr>
<td>CONFIG_NET_CONFIG_BT_NODE</td>
<td>Enables application to operate in Bluetooth node mode which requires GATT service to be registered and start advertising as peripheral.</td>
</tr>
</tbody>
</table>

Sample usage  If CONFIG_NET_CONFIG_AUTO_INIT is set, then the configuration library is automatically enabled and run during the device boot. In this case, the library will call net_config_init() automatically and the application does not need to do any network configuration.

If you want to use the network configuration library but without automatic initialization, you can call net_config_init() manually. The flags parameter can be used to give hints to the library about what kind of functionality the application wishes to have before the actual application starts.

API Reference

*group net_config*

Network configuration library.

Define
NET_CONFIG_NEED_ROUTER

Application needs routers to be set so that connectivity to remote network is possible. For IPv6 networks, this means that the device should receive IPv6 router advertisement message before continuing.

NET_CONFIG_NEED_IPV6

Application needs IPv6 subsystem configured and initialized. Typically this means that the device has IPv6 address set.

NET_CONFIG_NEED_IPV4

Application needs IPv4 subsystem configured and initialized. Typically this means that the device has IPv4 address set.

Functions

int net_config_init(const char *app_info, uint32_t flags, int32_t timeout)

Initialize this network application.

This will call net_config_init_by_iface() with NULL network interface.

Parameters

• app_info – String describing this application.
• flags – Flags related to services needed by the client.
• timeout – How long to wait the network setup before continuing the startup.

Returns

0 if ok, <0 if error.

int net_config_init_by_iface(struct net_if *iface, const char *app_info, uint32_t flags, int32_t timeout)

Initialize this network application using a specific network interface.

If network interface is set to NULL, then the default one is used in the configuration.

Parameters

• iface – Initialize networking using this network interface.
• app_info – String describing this application.
• flags – Flags related to services needed by the client.
• timeout – How long to wait the network setup before continuing the startup.

Returns

0 if ok, <0 if error.

int net_config_init_app(const struct device *dev, const char *app_info)

Initialize this network application.

If CONFIG_NET_CONFIG_AUTO_INIT is set, then this function is called automatically when the device boots. If that is not desired, unset the config option and call the function manually when the application starts.

Parameters

• dev – Network device to use. The function will figure out what network interface to use based on the device. If the device is NULL, then default network interface is used by the function.
• app_info – String describing this application.
Returns
0 if ok, <0 if error.

DHCPv4

• Overview
• Sample usage
• API Reference

Overview  The Dynamic Host Configuration Protocol (DHCP) is a network management protocol used on IPv4 networks. A DHCPv4 server dynamically assigns an IPv4 address and other network configuration parameters to each device on a network so they can communicate with other IP networks. See this DHCP Wikipedia article for a detailed overview of how DHCP works.

Note that Zephyr only supports DHCP client functionality.

Sample usage  See dhcpv4-client-sample for details.

API Reference

group dhcpv4
DHCPv4.

Functions

void net_dhcpv4_start(struct net_if *iface)
Start DHCPv4 client on an iface.

Start DHCPv4 client on a given interface. DHCPv4 client will start negotiation for IPv4 address. Once the negotiation is success IPv4 address details will be added to interface.

Parameters
• iface – A valid pointer on an interface

void net_dhcpv4_stop(struct net_if *iface)
Stop DHCPv4 client on an iface.

Stop DHCPv4 client on a given interface. DHCPv4 client will remove all configuration obtained from a DHCP server from the interface and stop any further negotiation with the server.

Parameters
• iface – A valid pointer on an interface

void net_dhcpv4_restart(struct net_if *iface)
Restart DHCPv4 client on an iface.

Restart DHCPv4 client on a given interface. DHCPv4 client will restart the state machine without any of the initial delays used in start.

Parameters
• iface – A valid pointer on an interface
Hostname Configuration

- Overview
- API Reference

Overview
A networked device might need a hostname, for example, if the device is configured to be a
mDNS responder (see DNS Resolve for details) and needs to respond to <hostname>.local DNS queries.
The CONFIG_NET_HOSTNAME_ENABLE must be set in order to store the hostname and enable the relevant
APIs. If the option is enabled, then the default hostname is set to be zephyr by CONFIG_NET_HOSTNAME
option.

If the same firmware image is used to flash multiple boards, then it is not practical to use the same
hostname in all of the boards. In that case, one can enable CONFIG_NET_HOSTNAME_UNIQUE which will
add a unique postfix to the hostname. By default the link local address of the first network interface is
used as a postfix. In Ethernet networks, the link local address refers to MAC address. For example, if the
link local address is 01:02:03:04:05:06, then the unique hostname could be zephyr010203040506.
If you want to set the prefix yourself, then call net_hostname_set_postfix() before the network
interfaces are created. For example for the Ethernet networks, the initialization priority is set by
CONFIG_ETH_INIT_PRIORITY so you would need to set the postfix before that. The postfix can be set
only once.

API Reference

group net_hostname

Network hostname configuration library.

Defines

NET_HOSTNAME_MAX_LEN

Functions

static inline const char *net_hostname_get(void)
Get the device hostname.
Return pointer to device hostname.

Returns
Pointer to hostname or NULL if not set.

static inline void net_hostname_init(void)
Initialize and set the device hostname.

static inline int net_hostname_set_postfix(const uint8_t *hostname_postfix, int postfix_len)
Set the device hostname postfix.
Set the device hostname to some value. This is only used if CON-
FIG_NET_HOSTNAME_UNIQUE is set.

Parameters
- hostname_postfix – Usually link address. The function will convert this to a
  string.
- postfix_len – Length of the hostname_postfix array.
Returns
0 if ok, <0 if error

Network Core Helpers

Overview  The network subsystem contains two functions for sending and receiving data from the network. The `net_recv_data()` is typically used by network device driver when the received network data needs to be pushed up in the network stack for further processing. All the data is received via a network interface which is typically created by the device driver.

For sending, the `net_send_data()` can be used. Typically applications do not call this function directly as there is the BSD Sockets API for sending and receiving network data.

API Reference

group net_core
    Network core library.

Enums

enum net_verdict
    Net Verdict.
    Values:
    enumerator NET_OK
        Packet has been taken care of.
    enumerator NET_CONTINUE
        Packet has not been touched, other part should decide about its fate.
    enumerator NET_DROP
        Packet must be dropped.

Functions

int net_recv_data(struct net_if *iface, struct net_pkt *pkt)
    Called by lower network stack or network device driver when a network packet has been received. The function will push the packet up in the network stack for further processing.

    Parameters
    • iface – Network interface where the packet was received.
    • pkt – Network packet data.

    Returns
    0 if ok, <0 if error.
int net_send_data(struct net_pkt *pkt)
    Send data to network.

    Send data to network. This should not be used normally by applications as it requires that the
    network packet is properly constructed.

**Parameters**

- pkt – Network packet.

**Returns**

0 if ok, <0 if error. If <0 is returned, then the caller needs to unref the pkt in
order to avoid memory leak.

**Network Interface**

- **Overview**
- **Network interface state management**
- **API Reference**

**Overview**  The network interface is a nexus that ties the network device drivers and the upper part of
the network stack together. All the sent and received data is transferred via a network interface. The
network interfaces cannot be created at runtime. A special linker section will contain information about
them and that section is populated at linking time.

Network interfaces are created by NETDEVICE_INIT() macro. For Ethernet network, a macro called
ETH_NETDEVICE_INIT() should be used instead as it will create VLAN interfaces automatically if
CONFIG_NET_VLAN is enabled. These macros are typically used in network device driver source code.

The network interface can be turned ON by calling net_if_up() and OFF by calling net_if_down().
When the device is powered ON, the network interface is also turned ON by default.

The network interfaces can be referenced either by a struct net_if * pointer or by a network interface
index. The network interface can be resolved from its index by calling net_if_get_by_index() and from
interface pointer by calling net_if_get_by_iface().

The IP address for network devices must be set for them to be connectable. In a typical dynamic net-
work environment, IP addresses are set automatically by DHCPv4, for example. If needed though, the
application can set a device's IP address manually. See the API documentation below for functions such
as net_if_ipv4_addr_add() that do that.

The net_if_get_default() returns a default network interface. What this default interface means can
be configured via options like CONFIG_NET_DEFAULT_IP_FIRST and CONFIG_NET_DEFAULT_IP ETHERNET.
See Kconfig file subsys/net/ip/Kconfig what options are available for selecting the default network inter-
face.

The transmitted and received network packets can be classified via a network packet priority. This is
typically done in Ethernet networks when virtual LANs (VLANs) are used. Higher priority packets can
be sent or received earlier than lower priority packets. The traffic class setup can be configured by
CONFIG_NET_TC_TX_COUNT and CONFIG_NET_TC_RX_COUNT options.

If the CONFIG_NET_PROMISCUOUS_MODE is enabled and if the underlying network technology supports
promiscuous mode, then it is possible to receive all the network packets that the network device driver
is able to receive. See Promiscuous Mode API for more details.

**Network interface state management**  Zephyr distinguishes between two interface states: adminis-
trative state and operational state, as described in RFC 2863. The administrative state indicate whether
an interface is turned ON or OFF. This state is represented by NET_IF_UP flag and is controlled by the
application. It can be changed by calling `net_if_up()` or `net_if_down()` functions. Network drivers or L2 implementations should not change administrative state on their own.

Bringing an interface up however not always means that the interface is ready to transmit packets. Because of that, operational state, which represents the internal interface status, was implemented. The operational state is updated whenever one of the following conditions take place:

- The interface is brought up/down by the application (administrative state changes).
- The interface is notified by the driver/L2 that PHY status has changed.
- The interface is notified by the driver/L2 that it joined/left a network.

The PHY status is represented with `NET_IF_LOWER_UP` flag and can be changed with `net_if_carrier_on()` and `net_if_carrier_off()`. By default, the flag is set on a newly initialized interface. An example of an event that changes the carrier state is Ethernet cable being plugged in or out.

The network association status is represented with `NET_IF_DORMANT` flag and can be changed with `net_if_dormant_on()` and `net_if_dormant_off()`. By default, the flag is cleared on a newly initialized interface. An example of an event that changes the dormant state is a Wi-Fi driver successfully connecting to an access point. In this scenario, driver should set the dormant state to ON during initialization, and once it detects that it connected to a Wi-Fi network, the dormant state should be set to OFF.

The operational state of an interface is updated as follows:

- `!net_if_is_admin_up()` Interface is in `NET_IF_OPER_DOWN`.
- `net_if_is_admin_up() && !net_if_is_carrier_ok()` Interface is in `NET_IF_OPER_DOWN` or `NET_IF_OPER_LOWERLAYERDOWN` if the interface is stacked (virtual).
- `net_if_is_admin_up() && net_if_is_carrier_ok() && net_if_is_dormant()` Interface is in `NET_IF_OPER_DORMANT`.
- `net_if_is_admin_up() && net_if_is_carrier_ok() && !net_if_is_dormant()` Interface is in `NET_IF_OPER_UP`.

Only after an interface enters `NET_IF_OPER_UP` state the `NET_IF_RUNNING` flag is set on the interface indicating that the interface is ready to be used by the application.

API Reference

`group net_if`

Network Interface abstraction layer.

**Defines**

`NETDEVICE_INIT(dev_id, name, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)`

Create a network interface and bind it to network device.

**Parameters**

- `dev_id` – Network device id.
- `name` – The name this instance of the driver exposes to the system.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct `pm_device` associated with the device. (optional).
- data – Pointer to the device’s private data.
- config – The address to the structure containing the configuration information for this instance of the driver.
- prio – The initialization level at which configuration occurs.
- api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- l2 – Network L2 layer for this network interface.
- l2_ctx_type – Type of L2 context data.
- mtu – Maximum transfer unit in bytes for this network interface.

```
NET_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)
```

Like `NET_DEVICE_INIT` but taking metadata from a devicetree node. Create a network interface and bind it to network device.

**Parameters**

- `node_id` – The devicetree node identifier.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct `pm_device` associated with the device. (optional).
- `data` – Pointer to the device’s private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `l2` – Network L2 layer for this network interface.
- `l2_ctx_type` – Type of L2 context data.
- `mtu` – Maximum transfer unit in bytes for this network interface.

```
NET_DEVICE_DT_INST_DEFINE(inst, ...
```

Like `NET_DEVICE_DT_DEFINE` for an instance of a `DT_DRV_COMPAT` compatible.

**Parameters**

- `inst` – instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to `NET_DEVICE_DT_DEFINE`.
- `...` – other parameters as expected by `NET_DEVICE_DT_DEFINE`.

```
NET_DEVICE_INIT_INSTANCE(dev_id, name, instance, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)
```

Create multiple network interfaces and bind them to network device. If your network device needs more than one instance of a network interface, use this macro below and provide a different instance suffix each time (0, 1, 2, . . . or a, b, c . . . whatever works for you)

**Parameters**

- `dev_id` – Network device id.
- `name` – The name this instance of the driver exposes to the system.
- `instance` – Instance identifier.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct `pm_device` associated with the device. (optional).
• data – Pointer to the device’s private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• l2 – Network L2 layer for this network interface.
• l2_ctx_type – Type of L2 context data.
• mtu – Maximum transfer unit in bytes for this network interface.

NET_DEVICE_DT_DEFINE_INSTANCE(node_id, instance, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)

Like NET_DEVICE_OFFLOAD_INIT but taking metadata from a devicetree. Create multiple network interfaces and bind them to network device. If your network device needs more than one instance of a network interface, use this macro below and provide a different instance suffix each time (0, 1, 2, ... or a, b, c ... whatever works for you)

Parameters
• node_id – The devicetree node identifier.
• instance – Instance identifier.
• init_fn – Address to the init function of the driver.
• pm – Reference to struct pm_device associated with the device. (optional).
• data – Pointer to the device’s private data.
• config – The address to the structure containing the configuration information for this instance of the driver.
• prio – The initialization level at which configuration occurs.
• api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• l2 – Network L2 layer for this network interface.
• l2_ctx_type – Type of L2 context data.
• mtu – Maximum transfer unit in bytes for this network interface.

NET_DEVICE_DT_INST_DEFINE_INSTANCE(inst, ...

Like NET_DEVICE_DT_DEFINE_INSTANCE for an instance of a DT_DRV_COMPAT compatible.

Parameters
• inst – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to NET_DEVICE_DT_DEFINE_INSTANCE.
• ... – other parameters as expected by NET_DEVICE_DT_DEFINE_INSTANCE.

NET_DEVICE_OFFLOAD_INIT(dev_id, name, init_fn, pm, data, config, prio, api, mtu)

Create a offloaded network interface and bind it to network device. The offloaded network interface is implemented by a device vendor HAL or similar.

Parameters
• dev_id – Network device id.
• name – The name this instance of the driver exposes to the system.
• init_fn – Address to the init function of the driver.
• pm – Reference to struct pm_device associated with the device. (optional).
• **data** – Pointer to the device’s private data.
• **config** – The address to the structure containing the configuration information for this instance of the driver.
• **prio** – The initialization level at which configuration occurs.
• **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• **mtu** – Maximum transfer unit in bytes for this network interface.

```c
NET_DEVICE_DT_OFFLOAD_DEFINE(node_id, init_fn, pm, data, config, prio, api, mtu)
```

Like `NET_DEVICE_OFFLOAD_INIT` but taking metadata from a devicetree node. Create a offloaded network interface and bind it to network device. The offloaded network interface is implemented by a device vendor HAL or similar.

**Parameters**

• **node_id** – The devicetree node identifier.
• **init_fn** – Address to the init function of the driver.
• **pm** – Reference to struct `pm_device` associated with the device. (optional).
• **data** – Pointer to the device’s private data.
• **config** – The address to the structure containing the configuration information for this instance of the driver.
• **prio** – The initialization level at which configuration occurs.
• **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
• **mtu** – Maximum transfer unit in bytes for this network interface.

```c
NET_DEVICE_DT_INST_OFFLOAD_DEFINE(inst, ...)
```

Like `NET_DEVICE_DT_OFFLOAD_DEFINE` for an instance of a DT_DRV_COMPAT compatible.

**Parameters**

• **inst** – instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to `NET_DEVICE_DT_OFFLOAD_DEFINE`.
• **...** – other parameters as expected by `NET_DEVICE_DT_OFFLOAD_DEFINE`.

**Typedefs**

typedef int (*net_socket_create_t)(int, int, int)

A function prototype to create an offloaded socket. The prototype is compatible with `socket()` function.

typedef void (*net_if_mcast_callback_t)(struct `net_if` *iface, const struct net_addr *addr, bool is_joined)

Define callback that is called whenever IPv6 multicast address group is joined or left.

**Param iface**

A pointer to a struct `net_if` to which the multicast address is attached.

**Param addr**

IP multicast address.

**Param is_joined**

True if the address is joined, false if left.
typedef void (*net_if_link_callback_t)(struct net_if *iface, struct net_linkaddr *dst, int status)
Define callback that is called after a network packet has been sent.

**Param iface**
A pointer to a struct net_if to which the net_pkt was sent to.

**Param dst**
Link layer address of the destination where the network packet was sent.

**Param status**
Send status, 0 is ok, < 0 error.

typedef void (*net_if_cb_t)(struct net_if *iface, void *user_data)
Callback used while iterating over network interfaces.

**Param iface**
Pointer to current network interface

**Param user_data**
A valid pointer to user data or NULL

**Enums**

enum net_if_flag
Network interface flags.

**Values:**

enumerator NET_IF_UP
Interface is admin up.

enumerator NET_IF_POINTOPOINT
Interface is pointopoint

enumerator NET_IF_PROMISC
Interface is in promiscuous mode

enumerator NET_IF_NO_AUTO_START
Do not start the interface immediately after initialization. This requires that either the device driver or some other entity will need to manually take the interface up when needed. For example for Ethernet this will happen when the driver calls the net_eth_carrier_on() function.

enumerator NET_IF_SUSPENDED
Power management specific: interface is being suspended

enumerator NET_IF_FORWARD_MULTICASTS
Flag defines if received multicasts of other interface are forwarded on this interface. This activates multicast routing / forwarding for this interface.

enumerator NET_IF_IPV4
Interface supports IPv4
enumerator NET_IF_IPV6
   Interface supports IPv6

enumerator NET_IF_RUNNING
   Interface up and running (ready to receive and transmit).

enumerator NET_IF_LOWER_UP
   Driver signals L1 is up.

enumerator NET_IF_DORMANT
   Driver signals dormant.

enum net_if_oper_state
   Network interface operational status (RFC 2863).
   Values:

   enumerator NET_IF_OPER_UNKNOWN

   enumerator NET_IF_OPER_NOTPRESENT

   enumerator NET_IF_OPER_DOWN

   enumerator NET_IF_OPER_LOWERLAYERDOWN

   enumerator NET_IF_OPER_TESTING

   enumerator NET_IF_OPER_DORMANT

   enumerator NET_IF_OPER_UP

Functions

static inline void net_if_flag_set(struct net_if *iface, enum net_if_flag value)
   Set a value in network interface flags.

   Parameters
      • iface – Pointer to network interface
      • value – Flag value

static inline bool net_if_flag_test_and_set(struct net_if *iface, enum net_if_flag value)
   Test and set a value in network interface flags.

   Parameters
      • iface – Pointer to network interface
      • value – Flag value

   Returns
      true if the bit was set, false if it wasn’t.
static inline void net_if_flag_clear(struct net_if *iface, enum net_if_flag value)
Clear a value in network interface flags.

Parameters
• iface – Pointer to network interface
• value – Flag value

static inline bool net_if_flag_test_and_clear(struct net_if *iface, enum net_if_flag value)
Test and clear a value in network interface flags.

Parameters
• iface – Pointer to network interface
• value – Flag value

Returns
true if the bit was set, false if it wasn't.

static inline bool net_if_flag_is_set(struct net_if *iface, enum net_if_flag value)
Check if a value in network interface flags is set.

Parameters
• iface – Pointer to network interface
• value – Flag value

Returns
True if the value is set, false otherwise

static inline enum net_if_oper_state net_if_oper_state_set(struct net_if *iface, enum net_if_oper_state oper_state)
Set an operational state on an interface.

Parameters
• iface – Pointer to network interface
• oper_state – Operational state to set

Returns
The new operational state of an interface

static inline enum net_if_oper_state net_if_oper_state(struct net_if *iface)
Get an operational state of an interface.

Parameters
• iface – Pointer to network interface

Returns
Operational state of an interface

enum net_verdict net_if_send_data(struct net_if *iface, struct net_pkt *pkt)
Send a packet through a net iface.

return verdict about the packet

Parameters
• iface – Pointer to a network interface structure
• pkt – Pointer to a net packet to send
static inline const struct net_l2 *net_if_l2(struct net_if *iface)
Get a pointer to the interface L2.

Parameters
• iface – a valid pointer to a network interface structure

Returns
a pointer to the iface L2

denum net_verdict net_if_recv_data(struct net_if *iface, struct net_pkt *pkt)
Input a packet through a net iface.

Parameters
• iface – Pointer to a network interface structure
• pkt – Pointer to a net packet to input

Returns
verdict about the packet

static inline void *net_if_l2_data(struct net_if *iface)
Get a pointer to the interface L2 private data.

Parameters
• iface – a valid pointer to a network interface structure

Returns
a pointer to the iface L2 data

static inline const struct device *net_if_get_device(struct net_if *iface)
Get an network interface's device.

Parameters
• iface – Pointer to a network interface structure

Returns
a pointer to the device driver instance

void net_if_queue_tx(struct net_if *iface, struct net_pkt *pkt)
Queue a packet to the net interface TX queue.

Parameters
• iface – Pointer to a network interface structure
• pkt – Pointer to a net packet to queue

static inline bool net_if_is_ip_offloaded(struct net_if *iface)
Return the IP offload status.

Parameters
• iface – Network interface

Returns
True if IP offloading is active, false otherwise.

static inline struct net_offload *net_if_offload(struct net_if *iface)
Return the IP offload plugin.

Parameters
• iface – Network interface

Returns
NULL if there is no offload plugin defined, valid pointer otherwise
static inline bool net_if_is_socket_offloaded(struct net_if *iface)
    Return the socket offload status.

Parameters
• iface – Network interface

Returns
True if socket offloading is active, false otherwise.

static inline void net_if_socket_offload_set(struct net_if *iface, net_socket_create_t socket_offload)
Set the function to create an offloaded socket.

Parameters
• iface – Network interface
• socket_offload – A function to create an offloaded socket

static inline net_socket_create_t net_if_socket_offload(struct net_if *iface)
Return the function to create an offloaded socket.

Parameters
• iface – Network interface

Returns
NULL if the interface is not socket offloaded, valid pointer otherwise

static inline struct net_linkaddr *net_if_get_link_addr(struct net_if *iface)
Get an network interface's link address.

Parameters
• iface – Pointer to a network interface structure

Returns
a pointer to the network link address

static inline struct net_if_config *net_if_get_config(struct net_if *iface)
Return network configuration for this network interface.

Parameters
• iface – Pointer to a network interface structure

Returns
Pointer to configuration

static inline void net_if_start_dad(struct net_if *iface)
Start duplicate address detection procedure.

Parameters
• iface – Pointer to a network interface structure

void net_if_start_rs(struct net_if *iface)
Start neighbor discovery and send router solicitation message.

Parameters
• iface – Pointer to a network interface structure

static inline void net_if_stop_rs(struct net_if *iface)
Stop neighbor discovery.

Parameters
• iface – Pointer to a network interface structure
static inline int net_if_set_link_addr(struct net_if *iface, uint8_t *addr, uint8_t len, enum net_link_type type)

Set a network interface's link address.

Parameters

• iface – Pointer to a network interface structure
• addr – A pointer to a uint8_t buffer representing the address. The buffer must remain valid throughout interface lifetime.
• len – length of the address buffer
• type – network bearer type of this link address

Returns

0 on success

static inline uint16_t net_if_get_mtu(struct net_if *iface)

Get an network interface's MTU.

Parameters

• iface – Pointer to a network interface structure

Returns

the MTU

static inline void net_if_set_mtu(struct net_if *iface, uint16_t mtu)

Set an network interface's MTU.

Parameters

• iface – Pointer to a network interface structure
• mtu – New MTU, note that we store only 16 bit mtu value.

static inline void net_if_addr_set_lf(struct net_if_addr *ifaddr, bool is_infinite)

Set the infinite status of the network interface address.

Parameters

• ifaddr – IP address for network interface
• is_infinite – Infinite status

struct net_if *net_if_get_by_link_addr(struct net_linkaddr *ll_addr)

Get an interface according to link layer address.

Parameters

• ll_addr – Link layer address.

Returns

Network interface or NULL if not found.

struct net_if *net_if_lookup_by_dev(const struct device *dev)

Find an interface from it's related device.

Parameters

• dev – A valid struct device pointer to relate with an interface

Returns

a valid struct net_if pointer on success, NULL otherwise

static inline struct net_if_config *net_if_config_get(struct net_if *iface)

Get network interface IP config.

Parameters
• iface – Interface to use.

Returns
NULL if not found or pointer to correct config settings.

void net_if_router_rm(struct net_if_router *router)
Remove a router from the system.

Parameters
• router – Pointer to existing router

void net_if_set_default(struct net_if *iface)
Set the default network interface.

Parameters
• iface – New default interface, or NULL to revert to the one set by Kconfig.

struct net_if *net_if_get_default(void)
Get the default network interface.

Returns
Default interface or NULL if no interfaces are configured.

struct net_if *net_if_get_first_by_type(const struct net_l2 *l2)
Get the first network interface according to its type.

Parameters
• l2 – Layer 2 type of the network interface.

Returns
First network interface of a given type or NULL if no such interfaces was found.

struct net_if *net_if_get_first_up(void)
Get the first network interface which is up.

Returns
First network interface which is up or NULL if all interfaces are down.

int net_if_config_ipv6_get(struct net_if *iface, struct net_if_ipv6 **ipv6)
Allocate network interface IPv6 config.
This function will allocate new IPv6 config.

Parameters
• iface – Interface to use.
• ipv6 – Pointer to allocated IPv6 struct is returned to caller.

Returns
0 if ok, <0 if error

int net_if_config_ipv6_put(struct net_if *iface)
Release network interface IPv6 config.

Parameters
• iface – Interface to use.

Returns
0 if ok, <0 if error

struct net_if_addr *net_if_ipv6_addr_lookup(const struct in6_addr *addr, struct net_if **iface)
Check if this IPv6 address belongs to one of the interfaces.

Parameters
• addr – IPv6 address
• iface – Pointer to interface is returned

Returns
Pointer to interface address, NULL if not found.

\[
\text{struct net_if_addr *} \text{net_if_ipv6_addr_lookup_by_iface(}\text{struct net_if *iface, struct in6_addr *addr)}
\]

Check if this IPv6 address belongs to this specific interfaces.

Parameters
• iface – Network interface
• addr – IPv6 address

Returns
Pointer to interface address, NULL if not found.

\[
\text{int net_if_ipv6_addr_lookup_by_index(}\text{const struct in6_addr *addr)}
\]

Check if this IPv6 address belongs to one of the interface indices.

Parameters
• addr – IPv6 address

Returns
>0 if address was found in given network interface index, all other values mean address was not found

\[
\text{struct net_if_addr *} \text{net_if_ipv6_addr_add(}\text{struct net_if *iface, struct in6_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)}
\]

Add a IPv6 address to an interface.

Parameters
• iface – Network interface
• addr – IPv6 address
• addr_type – IPv6 address type
• vlifetime – Validity time for this address

Returns
Pointer to interface address, NULL if cannot be added

\[
\text{bool net_if_ipv6_addr_add_by_index(}\text{int index, struct in6_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)}
\]

Add a IPv6 address to an interface by index.

Parameters
• index – Network interface index
• addr – IPv6 address
• addr_type – IPv6 address type
• vlifetime – Validity time for this address

Returns
True if ok, false if address could not be added

\[
\text{void net_if_ipv6_addr_update_lifetime(}\text{struct net_if_addr *ifaddr, uint32_t vlifetime)}
\]

Update validity lifetime time of an IPv6 address.

Parameters
• ifaddr – Network IPv6 address
bool net_if_ipv6_addr_rm(struct net_if *iface, const struct in6_addr *addr)
Remove an IPv6 address from an interface.

Parameters
• iface – Network interface
• addr – IPv6 address

Returns
True if successfully removed, false otherwise

bool net_if_ipv6_addr_rm_by_index(int index, const struct in6_addr *addr)
Remove an IPv6 address from an interface by index.

Parameters
• index – Network interface index
• addr – IPv6 address

Returns
True if successfully removed, false otherwise

struct net_if_mcast_addr *net_if_ipv6_maddr_add(struct net_if *iface, const struct in6_addr *addr)
Add a IPv6 multicast address to an interface.

Parameters
• iface – Network interface
• addr – IPv6 multicast address

Returns
Pointer to interface multicast address, NULL if cannot be added

bool net_if_ipv6_maddr_rm(struct net_if *iface, const struct in6_addr *addr)
Remove an IPv6 multicast address from an interface.

Parameters
• iface – Network interface
• addr – IPv6 multicast address

Returns
True if successfully removed, false otherwise

struct net_if_mcast_addr *net_if_ipv6_maddr_lookup(const struct in6_addr *addr, struct net_if **iface)
Check if this IPv6 multicast address belongs to a specific interface or one of the interfaces.

Parameters
• addr – IPv6 address
• iface – If *iface is null, then pointer to interface is returned, otherwise the *iface value needs to be matched.

Returns
Pointer to interface multicast address, NULL if not found.

void net_if_mcast_mon_register(struct net_if_mcast_monitor *mon, struct net_if *iface, net_if_mcast_callback_t cb)
Register a multicast monitor.

Parameters
• mon – Monitor handle. This is a pointer to a monitor storage structure which should be allocated by caller, but does not need to be initialized.
• iface – Network interface
• cb – Monitor callback

void net_if_mcast_mon_unregister(struct net_if_mcast_monitor *mon)
Unregister a multicast monitor.

Parameters
• mon – Monitor handle

void net_if_mcast_monitor(struct net_if *iface, const struct net_addr *addr, bool is_joined)
Call registered multicast monitors.

Parameters
• iface – Network interface
• addr – Multicast address
• is_joined – Is this multicast address joined (true) or not (false)

void net_if_ipv6_maddr_join(struct net_if_mcast_addr *addr)
Mark a given multicast address to be joined.

Parameters
• addr – IPv6 multicast address

static inline bool net_if_ipv6_maddr_is_joined(struct net_if_mcast_addr *addr)
Check if given multicast address is joined or not.

Parameters
• addr – IPv6 multicast address

Returns
True if address is joined, False otherwise.

void net_if_ipv6_maddr_leave(struct net_if_mcast_addr *addr)
Mark a given multicast address to be left.

Parameters
• addr – IPv6 multicast address

struct net_if_ipv6_prefix *net_if_ipv6_prefix_get(struct net_if *iface, struct in6_addr *addr)
Return prefix that corresponds to this IPv6 address.

Parameters
• iface – Network interface
• addr – IPv6 address

Returns
Pointer to prefix, NULL if not found.

struct net_if_ipv6_prefix *net_if_ipv6_prefix_lookup(struct net_if *iface, struct in6_addr *addr, uint8_t len)
Check if this IPv6 prefix belongs to this interface.

Parameters
• iface – Network interface
• addr – IPv6 address
• len – Prefix length

Returns
Pointer to prefix, NULL if not found.

struct net_if_ipv6_prefix *net_if_ipv6_prefix_add(struct net_if *iface, struct in6_addr *prefix, uint8_t len, uint32_t lifetime)

Add a IPv6 prefix to an network interface.

Parameters
• iface – Network interface
• prefix – IPv6 address
• len – Prefix length
• lifetime – Prefix lifetime in seconds

Returns
Pointer to prefix, NULL if the prefix was not added.

bool net_if_ipv6_prefix_rm(struct net_if *iface, struct in6_addr *addr, uint8_t len)

Remove an IPv6 prefix from an interface.

Parameters
• iface – Network interface
• addr – IPv6 prefix address
• len – Prefix length

Returns
True if successfully removed, false otherwise

static inline void net_if_ipv6_prefix_set_lf(struct net_if_ipv6_prefix *prefix, bool is_infinite)

Set the infinite status of the prefix.

Parameters
• prefix – IPv6 address
• is_infinite – Infinite status

void net_if_ipv6_prefix_set_timer(struct net_if_ipv6_prefix *prefix, uint32_t lifetime)

Set the prefix lifetime timer.

Parameters
• prefix – IPv6 address
• lifetime – Prefix lifetime in seconds

void net_if_ipv6_prefix_unset_timer(struct net_if_ipv6_prefix *prefix)

Unset the prefix lifetime timer.

Parameters
• prefix – IPv6 address

bool net_if_ipv6_addr_onlink(struct net_if **iface, struct in6_addr *addr)

Check if this IPv6 address is part of the subnet of our network interface.

Parameters
• iface – Network interface. This is returned to the caller. The iface can be NULL in which case we check all the interfaces.
• addr – IPv6 address
Returns
True if address is part of our subnet, false otherwise

static inline struct in6_addr *net_if_router_ipv6(struct net_if_router *router)
Get the IPv6 address of the given router.

Parameters
• router – a network router

Returns
pointer to the IPv6 address, or NULL if none

struct net_if_router *net_if_ipv6_router_lookup(struct net_if *iface, struct in6_addr *addr)
Check if IPv6 address is one of the routers configured in the system.

Parameters
• iface – Network interface
• addr – IPv6 address

Returns
Pointer to router information, NULL if cannot be found

struct net_if_router *net_if_ipv6_router_find_default(struct net_if *iface, struct in6_addr *addr)
Find default router for this IPv6 address.

Parameters
• iface – Network interface. This can be NULL in which case we go through all the network interfaces to find a suitable router.
• addr – IPv6 address

Returns
Pointer to router information, NULL if cannot be found

void net_if_ipv6_router_update_lifetime(struct net_if_router *router, uint16_t lifetime)
Update validity lifetime time of a router.

Parameters
• router – Network IPv6 address
• lifetime – Lifetime of this router.

struct net_if_router *net_if_ipv6_router_add(struct net_if *iface, struct in6_addr *addr, uint16_t router_lifetime)
Add IPv6 router to the system.

Parameters
• iface – Network interface
• addr – IPv6 address
• router_lifetime – Lifetime of the router

Returns
Pointer to router information, NULL if could not be added

bool net_if_ipv6_router_rm(struct net_if_router *router)
Remove IPv6 router from the system.

Parameters
• router – Router information.
Returns
True if successfully removed, false otherwise

uint8_t net_if.ipv6.get_hop_limit(struct net_if *iface)
Get IPv6 hop limit specified for a given interface. This is the default value but can be overrid-
den by the user.

Parameters
• iface – Network interface

Returns
Hop limit

void net_ipv6.set_hop_limit(struct net_if *iface, uint8_t hop_limit)
Set the default IPv6 hop limit of a given interface.

Parameters
• iface – Network interface
• hop_limit – New hop limit

static inline void net_if.ipv6.set_base_reachable_time(struct net_if *iface, uint32_t reachable_time)
Set IPv6 reachable time for a given interface.

Parameters
• iface – Network interface
• reachable_time – New reachable time

static inline uint32_t net_if.ipv6.get_reachable_time(struct net_if *iface)
Get IPv6 reachable timeout specified for a given interface.

Parameters
• iface – Network interface

Returns
Reachable timeout

uint32_t net_if.ipv6.calc_reachable_time(struct net_if_ipv6 *ipv6)
Calculate next reachable time value for IPv6 reachable time.

Parameters
• ipv6 – IPv6 address configuration

Returns
Reachable time

static inline void net_if_ipv6.set_reachable_time(struct net_if_ipv6 *ipv6)
Set IPv6 reachable time for a given interface. This requires that base reachable time is set for
the interface.

Parameters
• ipv6 – IPv6 address configuration

static inline void net_if_ipv6.set_retrans_timer(struct net_if *iface, uint32_t retrans_timer)
Set IPv6 retransmit timer for a given interface.

Parameters
• iface – Network interface
• retrans_timer – New retransmit timer
static inline uint32_t net_if_ipv6_get_retrans_timer(struct net_if *iface)
Get IPv6 retransmit timer specified for a given interface.

Parameters
• iface – Network interface

Returns
Retransmit timer

static inline const struct in6_addr *net_if_ipv6_select_src_addr(struct net_if *iface, const struct in6_addr *dst)
Get a IPv6 source address that should be used when sending network data to destination.

Parameters
• iface – Interface that was used when packet was received. If the interface is not known, then NULL can be given.
• dst – IPv6 destination address

Returns
Pointer to IPv6 address to use, NULL if no IPv6 address could be found.

static inline struct net_if *net_if_ipv6_select_src_iface(const struct in6_addr *dst)
Get a network interface that should be used when sending IPv6 network data to destination.

Parameters
• dst – IPv6 destination address

Returns
Pointer to network interface to use, NULL if no suitable interface could be found.

static inline struct in6_addr *net_if_ipv6_get_ll(struct net_if *iface, enum net_addr_state addr_state)
Get a IPv6 link local address in a given state.

Parameters
• iface – Interface to use. Must be a valid pointer to an interface.
• addr_state – IPv6 address state (preferred, tentative, deprecated)

Returns
Pointer to link local IPv6 address, NULL if no proper IPv6 address could be found.

struct in6_addr *net_if_ipv6_get_ll_addr(enum net_addr_state state, struct net_if **iface)
Return link local IPv6 address from the first interface that has a link local address matching give state.

Parameters
• state – IPv6 address state (ANY, TENTATIVE, PREFERRED, DEPRECATED)
• iface – Pointer to interface is returned

Returns
Pointer to IPv6 address, NULL if not found.

void net_if_ipv6_dad_failed(struct net_if *iface, const struct in6_addr *addr)
Stop IPv6 Duplicate Address Detection (DAD) procedure if we find out that our IPv6 address is already in use.

Parameters
• iface – Interface where the DAD was running.
• addr – IPv6 address that failed DAD
struct *net_if_ipv6_get_global_addr(enum net_addr_state state, struct **iface)

Return global IPv6 address from the first interface that has a global IPv6 address matching the given state.

Parameters
• state – IPv6 address state (ANY, TENTATIVE, PREFERRED, DEPRECATED)
• iface – Caller can give an interface to check. If iface is set to NULL, then all the interfaces are checked. Pointer to interface where the IPv6 address is defined is returned to the caller.

Returns
Pointer to IPv6 address, NULL if not found.

int net_if_config_ipv4_get(struct *iface, struct *ipv4)

Allocate network interface IPv4 config.

Parameters
• iface – Interface to use.
• ipv4 – Pointer to allocated IPv4 struct is returned to caller.

Returns
0 if ok, <0 if error

int net_if_config_ipv4_put(struct *iface)

Release network interface IPv4 config.

Parameters
• iface – Interface to use.

Returns
0 if ok, <0 if error

uint8_t net_if_ipv4_get_ttl(struct *iface)

Get IPv4 time-to-live value specified for a given interface.

Parameters
• iface – Network interface

Returns
Time-to-live

void net_if_ipv4_set_ttl(struct *iface, uint8_t ttl)

Set IPv4 time-to-live value specified to a given interface.

Parameters
• iface – Network interface
• ttl – Time-to-live value

struct *net_if_ipv4_addr_lookup(const struct in_addr *addr, struct **iface)

Check if this IPv4 address belongs to one of the interfaces.

Parameters
• addr – IPv4 address
• iface – Interface is returned

Returns
Pointer to interface address, NULL if not found.
struct net_if_addr *net_if_ipv4_addr_add(struct net_if *iface, struct in_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)

Add a IPv4 address to an interface.

**Parameters**

- `iface` – Network interface
- `addr` – IPv4 address
- `addr_type` – IPv4 address type
- `vlifetime` – Validity time for this address

**Returns**

Pointer to interface address, NULL if cannot be added

bool net_if_ipv4_addr_rm(struct net_if *iface, const struct in_addr *addr)

Remove a IPv4 address from an interface.

**Parameters**

- `iface` – Network interface
- `addr` – IPv4 address

**Returns**

True if successfully removed, false otherwise

int net_if_ipv4_addr_lookup_by_index(const struct in_addr *addr)

Check if this IPv4 address belongs to one of the interface indices.

**Parameters**

- `addr` – IPv4 address

**Returns**

>0 if address was found in given network interface index, all other values mean address was not found

bool net_if_ipv4_addr_add_by_index(int index, struct in_addr *addr, enum net_addr_type addr_type, uint32_t vlifetime)

Add a IPv4 address to an interface by network interface index.

**Parameters**

- `index` – Network interface index
- `addr` – IPv4 address
- `addr_type` – IPv4 address type
- `vlifetime` – Validity time for this address

**Returns**

True if ok, false if the address could not be added

bool net_if_ipv4_addr_rm_by_index(int index, const struct in_addr *addr)

Remove a IPv4 address from an interface by interface index.

**Parameters**

- `index` – Network interface index
- `addr` – IPv4 address

**Returns**

True if successfully removed, false otherwise
struct net_if_mcast_addr *net_if_ipv4_maddr_add(struct net_if *iface, const struct in_addr *addr)

Add a IPv4 multicast address to an interface.

**Parameters**
- *iface* – Network interface
- *addr* – IPv4 multicast address

**Returns**
Pointer to interface multicast address, NULL if cannot be added

bool net_if_ipv4_maddr_rm(struct net_if *iface, const struct in_addr *addr)

Remove an IPv4 multicast address from an interface.

**Parameters**
- *iface* – Network interface
- *addr* – IPv4 multicast address

**Returns**
True if successfully removed, false otherwise

struct net_if_mcast_addr *net_if_ipv4_maddr_lookup(const struct in_addr *addr, struct net_if **iface)

Check if this IPv4 multicast address belongs to a specific interface or one of the interfaces.

**Parameters**
- *addr* – IPv4 address
- *iface* – If *iface is null, then pointer to interface is returned, otherwise the *iface value needs to be matched.

**Returns**
Pointer to interface multicast address, NULL if not found.

void net_if_ipv4_maddr_join(struct net_if_mcast_addr *addr)

Mark a given multicast address to be joined.

**Parameters**
- *addr* – IPv4 multicast address

static inline bool net_if_ipv4_maddr_is_joined(struct net_if_mcast_addr *addr)

Check if given multicast address is joined or not.

**Parameters**
- *addr* – IPv4 multicast address

**Returns**
True if address is joined, False otherwise.

void net_if_ipv4_maddr_leave(struct net_if_mcast_addr *addr)

Mark a given multicast address to be left.

**Parameters**
- *addr* – IPv4 multicast address

static inline struct in_addr *net_if_router_ipv4(struct net_if_router *router)

Get the IPv4 address of the given router.

**Parameters**
- *router* – a network router
Zephyr Project Documentation, Release 3.2.99

Returns
pointer to the IPv4 address, or NULL if none

struct net_if_router *net_if_ipv4_router_lookup(struct net_if *iface, struct in_addr *addr)

Check if IPv4 address is one of the routers configured in the system.

Parameters
- iface – Network interface
- addr – IPv4 address

Returns
Pointer to router information, NULL if cannot be found

struct net_if_router *net_if_ipv4_router_find_default(struct net_if *iface, struct in_addr *addr)

Find default router for this IPv4 address.

Parameters
- iface – Network interface. This can be NULL in which case we go through all the network interfaces to find a suitable router.
- addr – IPv4 address

Returns
Pointer to router information, NULL if cannot be found

struct net_if_router *net_if_ipv4_router_add(struct net_if *iface, struct in_addr *addr, bool is_default, uint16_t router_lifetime)

Add IPv4 router to the system.

Parameters
- iface – Network interface
- addr – IPv4 address
- is_default – Is this router the default one
- router_lifetime – Lifetime of the router

Returns
Pointer to router information, NULL if could not be added

bool net_if_ipv4_router_rm(struct net_if_router *router)

Remove IPv4 router from the system.

Parameters
- router – Router information.

Returns
True if successfully removed, false otherwise

bool net_if_ipv4_addr_mask_cmp(struct net_if *iface, const struct in_addr *addr)

Check if the given IPv4 address belongs to local subnet.

Parameters
- iface – Interface to use. Must be a valid pointer to an interface.
- addr – IPv4 address

Returns
True if address is part of local subnet, false otherwise.
bool net_if_ipv4_is_addr_bcast(struct net_if *iface, const struct in_addr *addr)

Check if the given IPv4 address is a broadcast address.

**Parameters**
- `iface` – Interface to use. Must be a valid pointer to an interface.
- `addr` – IPv4 address, this should be in network byte order

**Returns**
True if address is a broadcast address, false otherwise.

static inline struct net_if *net_if_ipv4_select_src_iface(const struct in_addr *dst)

Get a network interface that should be used when sending IPv4 network data to destination.

**Parameters**
- `dst` – IPv4 destination address

**Returns**
Pointer to network interface to use, NULL if no suitable interface could be found.

static inline const struct in_addr *net_if_ipv4_select_src_addr(struct net_if *iface, const struct in_addr *dst)

Get a IPv4 source address that should be used when sending network data to destination.

**Parameters**
- `iface` – Interface to use when sending the packet. If the interface is not known, then NULL can be given.
- `dst` – IPv4 destination address

**Returns**
Pointer to IPv4 address to use, NULL if no IPv4 address could be found.

struct in_addr *net_if_ipv4_get_ll(struct net_if *iface, enum net_addr_state addr_state)

Get a IPv4 link local address in a given state.

**Parameters**
- `iface` – Interface to use. Must be a valid pointer to an interface.
- `addr_state` – IPv4 address state (preferred, tentative, deprecated)

**Returns**
Pointer to link local IPv4 address, NULL if no proper IPv4 address could be found.

struct in_addr *net_if_ipv4_get_global_addr(struct net_if *iface, enum net_addr_state addr_state)

Get a IPv4 global address in a given state.

**Parameters**
- `iface` – Interface to use. Must be a valid pointer to an interface.
- `addr_state` – IPv4 address state (preferred, tentative, deprecated)

**Returns**
Pointer to link local IPv4 address, NULL if no proper IPv4 address could be found.

void net_if_ipv4_set_netmask(struct net_if *iface, const struct in_addr *netmask)

Set IPv4 netmask for an interface.

**Parameters**
- `iface` – Interface to use.
- `netmask` – IPv4 netmask
bool net_if_ipv4_set_netmask_by_index(int index, const struct in_addr *netmask)
Set IPv4 netmask for an interface index.

Parameters
- index – Network interface index
- netmask – IPv4 netmask

Returns
True if netmask was added, false otherwise.

void net_if_ipv4_set_gw(struct net_if *iface, const struct in_addr *gw)
Set IPv4 gateway for an interface.

Parameters
- iface – Interface to use.
- gw – IPv4 address of an gateway

bool net_if_ipv4_set_gw_by_index(int index, const struct in_addr *gw)
Set IPv4 gateway for an interface index.

Parameters
- index – Network interface index
- gw – IPv4 address of an gateway

Returns
True if gateway was added, false otherwise.

struct net_if *net_if_select_src_iface(const struct sockaddr *dst)
Get a network interface that should be used when sending IPv6 or IPv4 network data to destination.

Parameters
- dst – IPv6 or IPv4 destination address

Returns
Pointer to network interface to use. Note that the function will return the default network interface if the best network interface is not found.

void net_if_register_link_cb(struct net_if_link_cb *link, net_if_link_callback_t cb)
Register a link callback.

Parameters
- link – Caller specified handler for the callback.
- cb – Callback to register.

void net_if_unregister_link_cb(struct net_if_link_cb *link)
Unregister a link callback.

Parameters
- link – Caller specified handler for the callback.

void net_if_call_link_cb(struct net_if *iface, struct net_linkaddr *lladdr, int status)
Call a link callback function.

Parameters
- iface – Network interface.
- lladdr – Destination link layer address
- status – 0 is ok, < 0 error
bool net_if_need_calc_rx_checksum(struct net_if *iface)
Check if received network packet checksum calculation can be avoided or not. For example many ethernet devices support network packet offloading in which case the IP stack does not need to calculate the checksum.

Parameters
• iface – Network interface

Returns
True if checksum needs to be calculated, false otherwise.

bool net_if_need_calc_tx_checksum(struct net_if *iface)
Check if network packet checksum calculation can be avoided or not when sending the packet. For example many ethernet devices support network packet offloading in which case the IP stack does not need to calculate the checksum.

Parameters
• iface – Network interface

Returns
True if checksum needs to be calculated, false otherwise.

struct net_if *net_if_get_by_index(int index)
Get interface according to index.

This is a syscall only to provide access to the object for purposes of assigning permissions.

Parameters
• index – Interface index

Returns
Pointer to interface or NULL if not found.

int net_if_get_by_iface(struct net_if *iface)
Get interface index according to pointer.

Parameters
• iface – Pointer to network interface

Returns
Interface index

void net_if_foreach(net_if_cb_t cb, void *user_data)
Go through all the network interfaces and call callback for each interface.

Parameters
• cb – User-supplied callback function to call
• user_data – User specified data

int net_if_up(struct net_if *iface)
Bring interface up.

Parameters
• iface – Pointer to network interface

Returns
0 on success

static inline bool net_if_is_up(struct net_if *iface)
Check if interface is is up and running.

Parameters

• iface – Pointer to network interface

**Returns**
True if interface is up, False if it is down.

```c
int net_if_down(struct net_if *iface)
```

Bring interface down.

**Parameters**
• iface – Pointer to network interface

**Returns**
0 on success

```c
static inline bool net_if_is_admin_up(struct net_if *iface)
```

Check if interface was brought up by the administrator.

**Parameters**
• iface – Pointer to network interface

**Returns**
True if interface is admin up, false otherwise.

```c
void net_if_carrier_on(struct net_if *iface)
```

Underlying network device has detected the carrier (cable connected).

The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

**Parameters**
• iface – Pointer to network interface

```c
void net_if_carrier_off(struct net_if *iface)
```

Underlying network device has lost the carrier (cable disconnected).

The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

**Parameters**
• iface – Pointer to network interface

```c
static inline bool net_if_is_carrier_ok(struct net_if *iface)
```

Check if carrier is present on network device.

**Parameters**
• iface – Pointer to network interface

**Returns**
True if carrier is present, false otherwise.

```c
void net_if_dormant_on(struct net_if *iface)
```

Mark interface as dormant. Dormant state indicates that the interface is not ready to pass packets yet, but is waiting for some event (for example Wi-Fi network association).

The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

**Parameters**
• iface – Pointer to network interface
void net_if_dormant_off(struct net_if *iface)
    Mark interface as not dormant.

    The function should be used by the respective network device driver or L2 implementation to
    update its state on a network interface.

    Parameters
    • iface – Pointer to network interface

static inline bool net_if_is_dormant(struct net_if *iface)
    Check if the interface is dormant.

    Parameters
    • iface – Pointer to network interface

    Returns
    True if interface is dormant, false otherwise.

int net_if_set_promisc(struct net_if *iface)
    Set network interface into promiscuous mode.

    Note that not all network technologies will support this.

    Parameters
    • iface – Pointer to network interface

    Returns
    0 on success, <0 if error

void net_if_unset_promisc(struct net_if *iface)
    Set network interface into normal mode.

    Parameters
    • iface – Pointer to network interface

bool net_if_is_promisc(struct net_if *iface)
    Check if promiscuous mode is set or not.

    Parameters
    • iface – Pointer to network interface

    Returns
    True if interface is in promisc mode, False if interface is not in in promiscuous
    mode.

static inline bool net_if_are_pending_tx_packets(struct net_if *iface)
    Check if there are any pending TX network data for a given network interface.

    Parameters
    • iface – Pointer to network interface

    Returns
    True if there are pending TX network packets for this network interface, False
    otherwise.

struct net_if_addr
    #include <net_if.h> Network Interface unicast IP addresses.

    Stores the unicast IP addresses assigned to this network interface.
Public Members

struct net_addr address
    IP address

d_enum net_addr_type addr_type
    How the IP address was set

d_enum net_addr_state addr_state
    What is the current state of the address

uint8_t is_infinite
    Is the IP address valid forever

uint8_t is_used
    Is this IP address used or not

uint8_t is_mesh_local
    Is this IP address usage limited to the subnet (mesh) or not

struct net_if_mcast_addr
    
#include <net_if.h> Network Interface multicast IP addresses.
    Stores the multicast IP addresses assigned to this network interface.

Public Members

struct net_addr address
    IP address

uint8_t is_used
    Is this multicast IP address used or not

uint8_t is_joined
    Did we join to this group

struct net_if_ipv6_prefix
    
#include <net_if.h> Network Interface IPv6 prefixes.
    Stores the multicast IP addresses assigned to this network interface.

Public Members

struct net_timeout lifetime
    Prefix lifetime

struct in6_addr prefix
    IPv6 prefix
struct net_if *iface
    Backpointer to network interface where this prefix is used

uint8_t len
    Prefix length

uint8_t is_infinite
    Is the IP prefix valid forever

uint8_t is_used
    Is this prefix used or not

struct net_if_router
    
#include <net_if.h> Information about routers in the system.
    Stores the router information.

Public Members

sys_snode_t node
    Slist lifetime timer node

struct net_addr address
    IP address

struct net_if *iface
    Network interface the router is connected to

uint32_t life_start
    Router life timer start

uint16_t lifetime
    Router lifetime

uint8_t is_used
    Is this router used or not

uint8_t is_default
    Is default router

uint8_t is_infinite
    Is the router valid forever

struct net_if_ipv6
    
#include <net_if.h>
Public Members

```c
struct net_if_addr unicast[NET_IF_MAX_IPV6_ADDR]
    Unicast IP addresses
```

```c
struct net_if_mcast_addr mcast[NET_IF_MAX_IPV6_MADDR]
    Multicast IP addresses
```

```c
struct net_if_ipv6_prefix prefix[NET_IF_MAX_IPV6_PREFIX]
    Prefixes
```

```c
uint32_t base_reachable_time
    Default reachable time (RFC 4861, page 52)
```

```c
uint32_t reachable_time
    Reachable time (RFC 4861, page 20)
```

```c
uint32_t retrans_timer
    Retransmit timer (RFC 4861, page 52)
```

```c
uint8_t hop_limit
    IPv6 hop limit
```

```c
#include <net_if.h>
```

Public Members

```c

    Unicast IP addresses
```

```c
struct net_if_mcast_addr mcast[NET_IF_MAX_IPV4_MADDR]
    Multicast IP addresses
```

```c
struct in_addr gw
    Gateway
```

```c
struct in_addr netmask
    Netmask
```

```c
uint8_t ttl
    IPv4 time-to-live
```

```c
#include <net_if.h> Network interface IP address configuration.
```

```c
struct net_if_ip
```

```c
#include <net_if.h> IP and other configuration related data for network interface.
```
struct net_traffic_class

#include <net_if.h> Network traffic class.

Traffic classes are used when sending or receiving data that is classified with different priorities. So some traffic can be marked as high priority and it will be sent or received first. Each network packet that is transmitted or received goes through a fifo to a thread that will transmit it.

Public Members

struct k_fifo fifo
    Fifo for handling this Tx or Rx packet

struct k_thread handler
    Traffic class handler thread

k_thread_stack_t *stack
    Stack for this handler

struct net_if_dev

#include <net_if.h> Network Interface Device structure.

Used to handle a network interface on top of a device driver instance. There can be many net_if_dev instance against the same device.

Such interface is mainly to be used by the link layer, but is also tight to a network context: it then makes the relation with a network context and the network device.

Because of the strong relationship between a device driver and such network interface, each net_if_dev should be instantiated by

Public Members

const struct device *dev
    The actually device driver instance the net_if is related to

const struct net_l2 *const 12
    Interface's L2 layer

void *l2_data
    Interface's private L2 data pointer

struct net_linkaddr link_addr
    The hardware link address

uint16_t mtu
    The hardware MTU

enum net_if_oper_state oper_state
    RFC 2863 operational status
struct net_if
    #include <net_if.h> Network Interface structure. Used to handle a network interface on top of a net_if_dev instance. There can be many net_if instance against the same net_if_dev instance.

Public Members

struct net_if_dev *if_dev
    The net_if_dev instance the net_if is related to

struct net_if_config config
    Network interface instance configuration

struct net_if_mcast_monitor
    #include <net_if.h> Multicast monitor handler struct. Stores the multicast callback information. Caller must make sure that the variable pointed by this is valid during the lifetime of registration. Typically this means that the variable cannot be allocated from stack.

Public Members

sys_snode_t node
    Node information for the slist.

struct net_if *iface
    Network interface

net_if_mcast_callback_t cb
    Multicast callback

struct net_if_link_cb
    #include <net_if.h> Link callback handler struct. Stores the link callback information. Caller must make sure that the variable pointed by this is valid during the lifetime of registration. Typically this means that the variable cannot be allocated from stack.

Public Members

sys_snode_t node
    Node information for the slist.

net_if_link_callback_t cb
    Link callback
L2 Layer Management

- **Overview**
- **L2 layer API**
- **Network Device drivers**
  - Ethernet device driver
  - IEEE 802.15.4 device driver
- **API Reference**

**Overview** The L2 stack is designed to hide the whole networking link-layer part and the related device drivers from the upper network stack. This is made through a `net_if` declared in `include/zephyr/net/net_if.h`.

The upper layers are unaware of implementation details beyond the `net_if` object and the generic API provided by the L2 layer in `include/zephyr/net/net_l2.h` as `net_l2`.

Only the L2 layer can talk to the device driver, linked to the `net_if` object. The L2 layer dictates the API provided by the device driver, specific for that device, and optimized for working together.

Currently, there are L2 layers for Ethernet, IEEE 802.15.4 Soft-MAC, Bluetooth IPSP, CANBUS, OpenThread, Wi-Fi, and a dummy layer example that can be used as a template for writing a new one.

**L2 layer API** In order to create an L2 layer, or a driver for a specific L2 layer, one needs to understand how the L3 layer interacts with it and how the L2 layer is supposed to behave. See also network stack architecture for more details. The generic L2 API has these functions:

- `recv()`: All device drivers, once they receive a packet which they put into a `net_pkt`, will push this buffer to the network stack via `net_recv_data()`. At this point, the network stack does not know what to do with it. Instead, it passes the buffer along to the L2 stack's `recv()` function for handling. The L2 stack does what it needs to do with the packet, for example, parsing the link layer header, or handling link-layer only packets. The `recv()` function will return `NET_DROP` in case of an erroneous packet, `NET_OK` if the packet was fully consumed by the L2, or `NET_CONTINUE` if the network stack should then handle it.

- `send()`: Similar to receive function, the network stack will call this function to actually send a network packet. All relevant link-layer content will be generated and added by this function. The `send()` function returns the number of bytes sent, or a negative error code if there was a failure sending the network packet.

- `enable()`: This function is used to enable/disable traffic over a network interface. The function returns <0 if error and >=0 if no error.

- `get_flags()`: This function will return the capabilities of an L2 driver, for example whether the L2 supports multicast or promiscuous mode.

**Network Device drivers** Network device drivers fully follow Zephyr device driver model as a basis. Please refer to Device Driver Model.

There are, however, two differences:

- The `driver_api` pointer must point to a valid `net_if_api` pointer.
- The network device driver must use `NET_DEVICE_INIT_INSTANCE()` or `ETH_NET_DEVICE_INIT()` for Ethernet devices. These macros will call the `DEVICE_DEFINE()` macro, and also instantiate a unique `net_if` related to the created device driver instance.
Implementing a network device driver depends on the L2 stack it belongs to: *Ethernet, IEEE 802.15.4*, etc. In the next section, we will describe how a device driver should behave when receiving or sending a network packet. The rest is hardware dependent and is not detailed here.

**Ethernet device driver** On reception, it is up to the device driver to fill-in the network packet with as many data buffers as required. The network packet itself is a `net_pkt` and should be allocated through `net_pkt_rx_alloc_with_buffer()`. Then all data buffers will be automatically allocated and filled by `net_pkt_write()`.

After all the network data has been received, the device driver needs to call `net_recv_data()`. If that call fails, it will be up to the device driver to unreference the buffer via `net_pkt_unref()`.

On sending, the device driver send function will be called, and it is up to the device driver to send the network packet all at once, with all the buffers.

Each Ethernet device driver will need, in the end, to call `ETH_NET_DEVICE_INIT()` like this:

```c
ETH_NET_DEVICE_INIT(..., CONFIG_ETH_INIT_PRIORITY,
                       &the_valid_net_if_api_instance, 1500);
```

**IEEE 802.15.4 device driver** Device drivers for IEEE 802.15.4 L2 work basically the same as for Ethernet. What has been described above, especially for `recv()`, applies here as well. There are two specific differences however:

- It requires a dedicated device driver API: `ieee802154_radio_api`, which overloads `net_if_api`. This is because 802.15.4 L2 needs more from the device driver than just `send()` and `recv()` functions. This dedicated API is declared in `include/zephyr/net/ieee802154_radio.h`. Each and every IEEE 802.15.4 device driver must provide a valid pointer on such relevantly filled-in API structure.

- Sending a packet is slightly different than in Ethernet. IEEE 802.15.4 sends relatively small frames, 127 bytes all inclusive: frame header, payload and frame checksum. Buffers are meant to fit such frame size limitation. But a buffer containing an IPv6/UDP packet might have more than one fragment. IEEE 802.15.4 drivers handle only one buffer at a time. This is why the `ieee802154_radio_api` requires a tx function pointer which differs from the `net_if_api` send function pointer. Instead, the IEEE 802.15.4 L2, provides a generic `ieee802154_radio_send()` meant to be given as `net_if` send function. It turn, the implementation of `ieee802154_radio_send()` will ensure the same behavior: sending one buffer at a time through `ieee802154_radio_api` tx function, and unreferencing the network packet only when all the transmission were successful.

Each IEEE 802.15.4 device driver, in the end, will need to call `NET_DEVICE_INIT_INSTANCE()` that way:

```c
NET_DEVICE_INIT_INSTANCE(...,
                          the_device_init_prio,
                          &the_valid_ieee802154_radio_api_instance,
                          IEEE802154_L2, NET_L2_GET_CTX_TYPE(IEEE802154_L2), 125);
```

**API Reference**

`group net_12`

Network Layer 2 abstraction layer.
enum net_l2_flags  
L2 flags  
*Values:*  
enumerator NET_L2_MULTICAST = BIT(0)  
  IP multicast supported  
enumerator NET_L2_MULTICAST_SKIP_JOIN_SOLICIT_NODE = BIT(1)  
  Do not join solicited node multicast group  
enumerator NET_L2_PROMISC_MODE = BIT(2)  
  Is promiscuous mode supported  
enumerator NET_L2_POINT_TO_POINT = BIT(3)  
  Is this L2 point-to-point with tunneling so no need to have IP address etc to network interface.

struct net_l2  
#include <net_l2.h> Network L2 structure.  
Used to provide an interface to lower network stack.

Public Members

enum net_verdict (*recv)(struct net_if *iface, struct net_pkt *pkt)  
  This function is used by net core to get iface's L2 layer parsing what's relevant to itself.

int (*send)(struct net_if *iface, struct net_pkt *pkt)  
  This function is used by net core to push a packet to lower layer (interface's L2), which in turn might work on the packet relevantly. (adding proper header etc...) Returns a negative error code, or the number of bytes sent otherwise.

int (*enable)(struct net_if *iface, bool state)  
  This function is used to enable/disable traffic over a network interface. The function returns <0 if error and >=0 if no error.

enum net_l2_flags (*get_flags)(struct net_if *iface)  
  Return L2 flags for the network interface.

Network Traffic Offloading

- Network Offloading
  - Overview
  - API Reference
- Socket Offloading
  - Overview
Network Offloading

Overview  The network offloading API provides hooks that a device vendor can use to provide an alternate implementation for an IP stack. This means that the actual network connection creation, data transfer, etc., is done in the vendor HAL instead of the Zephyr network stack.

API Reference

group net_offload
  Network offloading interface.

Socket Offloading

Overview  In addition to the network offloading API, Zephyr allows offloading of networking functionality at the socket API level. With this approach, vendors who provide an alternate implementation of the networking stack, exposing socket API for their networking devices, can easily integrate it with Zephyr. See drivers/wifi/simplelink/simplelink_sockets.c for a sample implementation on how to integrate network offloading at socket level.

Link Layer Address Handling

Overview  The link layer addresses are set for network interfaces so that L2 connectivity works correctly in the network stack. Typically the link layer addresses are 6 bytes long like in Ethernet but for IEEE 802.15.4 the link layer address length is 8 bytes.

API Reference

group net_linkaddr
  Network link address library.

Defines

NET_LINK_ADDR_MAX_LENGTH
  Maximum length of the link address

Enums

enum net_link_type
  Type of the link address. This indicates the network technology that this address is used in. Note that in order to save space we store the value into a uint8_t variable, so please do not introduce any values > 255 in this enum.

Values:
enumerator NET_LINK_UNKNOW = 0
    Unknown link address type.

enumerator NET_LINK_IEEE802154
    IEEE 802.15.4 link address.

enumerator NET_LINK_BLUETOOTH
    Bluetooth IPSP link address.

enumerator NET_LINK_ETHERNET
    Ethernet link address.

enumerator NET_LINK_DUMMY
    Dummy link address. Used in testing apps and loopback support.

enumerator NET_LINK_CANBUS_RAW
    CANBUS link address.

Functions

static inline bool net_linkaddr_cmp(struct net_linkaddr *lladdr1, struct net_linkaddr *lladdr2)
    Compare two link layer addresses.

Parameters
    • lladdr1 – Pointer to a link layer address
    • lladdr2 – Pointer to a link layer address

Returns
    True if the addresses are the same, false otherwise.

static inline int net_linkaddr_set(struct net_linkaddr_storage *lladdr_store, uint8_t *new_addr, uint8_t new_len)
    Set the member data of a link layer address storage structure.

Parameters
    • lladdr_store – The link address storage structure to change.
    • new_addr – Array of bytes containing the link address.
    • new_len – Length of the link address array. This value should always be <= NET_LINK_ADDR_MAX_LENGTH.

struct net_linkaddr
    #include <net_linkaddr.h> Hardware link address structure.
    Used to hold the link address information

Public Members

uint8_t *addr
    The array of byte representing the address
uint8_t len
    Length of that address array

uint8_t type
    What kind of address is this for

struct net_linkaddr_storage
    
    #include <net_linkaddr.h> Hardware link address structure.
    
    Used to hold the link address information. This variant is needed when we have to store the
    link layer address.
    
    Note that you cannot cast this to net_linkaddr as uint8_t * is handled differently than uint8_t
    addr[] and the fields are purposely in different order.

Public Members

uint8_t type
    What kind of address is this for

uint8_t len
    The real length of the ll address.

uint8_t addr[6]
    The array of bytes representing the address

Ethernet Management

- Overview
- API Reference

Overview  Ethernet management API provides functions to manage the Ethernet network interface low
level status. The caller of these functions can:

- raise carrier ON or carrier OFF management events
- raise VLAN enabled or VLAN disabled management events

Typically the carrier OFF event would be generated by the Ethernet device driver when it notices that
the Ethernet cable is disconnected. The carrier ON event would be generated if the Ethernet device
driver notices that the Ethernet cable is re-connected.

Currently the VLAN events are generated by the Ethernet L2 layer when a specific VLAN tag is either
enabled or disabled.

The user application can monitor these events if it needs to act when the corresponding status changes.

API Reference

group ethernet_mgmt
    Ethernet library.
Functions

void ethernet_mgmt_raise_carrier_on_event(struct net_if *iface)
    Raise CARRIER_ON event when Ethernet is connected.

Parameters
    • iface – Ethernet network interface.

void ethernet_mgmt_raise_carrier_off_event(struct net_if *iface)
    Raise CARRIER_OFF event when Ethernet is disconnected.

Parameters
    • iface – Ethernet network interface.

void ethernet_mgmt_raise_vlan_enabled_event(struct net_if *iface, uint16_t tag)
    Raise VLAN_ENABLED event when VLAN is enabled.

Parameters
    • iface – Ethernet network interface.
    • tag – VLAN tag which is enabled.

void ethernet_mgmt_raise_vlan_disabled_event(struct net_if *iface, uint16_t tag)
    Raise VLAN_DISABLED event when VLAN is disabled.

Parameters
    • iface – Ethernet network interface.
    • tag – VLAN tag which is disabled.

Traffic Classification

Overview  Traffic classification is an automated process that categorizes computer network traffic according to various parameters. For Zephyr, the VLAN priority code point (PCP) is used to classify both received and sent network packets. See more information about VLAN priority at IEEE 802.1Q.

By default, all network traffic is treated equal in Zephyr. If desired, the option CONFIG_NET_TC_TX_COUNT can be used to set the number of transmit queues. The option CONFIG_NET_TC_RX_COUNT can be used to set the number of receive queues. Each traffic class queue corresponds to a specific kernel work queue. Each kernel work queue has a priority. The VLAN priority is mapped to a certain traffic class according to rules specified in IEEE 802.1Q spec chapter 1.3, chapter 8.6.6 table 8-4, and chapter 34.5 table 34-1. Each traffic class is in turn mapped to a certain kernel work queue. The maximum number of traffic classes for both Rx and Tx is 8.

See subsys/net/ip/net_tc.c for details of how various mappings are done.

Network Packet Filtering

• Overview
• Examples
• API Reference

6.2. Networking 2009
Overview  The Network Packet Filtering facility provides the infrastructure to construct custom rules for accepting and/or denying packet transmission and reception. This can be used to create a basic firewall, control network traffic, etc.

The CONFIG_NET_PKT_FILTER must be set in order to enable the relevant APIs.

Both the transmission and reception paths may have a list of filter rules. Each rule is made of a set of conditions and a packet outcome. Every packet is subjected to the conditions attached to a rule. When all the conditions for a given rule are true then the packet outcome is immediately determined as specified by the current rule and no more rules are considered. If one condition is false then the next rule in the list is considered.

Packet outcome is either NET_OK to accept the packet or NET_DROP to drop it.

A rule is represented by a npf_rule object. It can be inserted to, appended to or removed from a rule list contained in a npf_rule_list object using npf_insert_rule(), npf_append_rule(), and npf_remove_rule(). Currently, two such rule lists exist: npf_send_rules for outgoing packets, and npf_recv_rules for incoming packets.

If a filter rule list is empty then NET_OK is assumed. If a non-empty rule list runs to the end then NET_DROP is assumed. However it is recommended to always terminate a non-empty rule list with an explicit default termination rule, either npf_default_ok or npf_default_drop.

Rule conditions are represented by a npf_test. This structure can be embedded into a larger structure when a specific condition requires extra test data. It is up to the test function for such conditions to retrieve the outer structure from the provided npf_test structure pointer.

Convenience macros are provided in include/zephyr/net/net_pkt_filter.h to statically define condition instances for various conditions, and NPF_RULE() to create a rule instance to tie them.

Examples  Here's an example usage:

```c
static NPF_SIZE_MAX(maxsize_200, 200);
static NPF_ETH_TYPE_MATCH(ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(small_ip_pkt, NET_OK, ip_packet, maxsize_200);

void install_my_filter(void)
{
    npf_insert_recv_rule(&npf_default_drop);
    npf_insert_recv_rule(&small_ip_pkt);
}
```

The above would accept IP packets that are 200 bytes or smaller, and drop all other packets.

Another (less efficient) way to achieve the same result could be:

```c
static NPF_SIZE_MIN(minsize_201, 201);
static NPF_ETH_TYPE_UNMATCH(not_ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(reject_big_pkts, NET_DROP, minsize_201);
static NPF_RULE(reject_non_ip, NET_DROP, not_ip_packet);

void install_my_filter(void) {
    npf_append_recv_rule(&reject_big_pkts);
    npf_append_recv_rule(&reject_non_ip);
    npf_append_recv_rule(&npf_default_ok);
}
```

API Reference
**group net_pkt_filter**

Network Packet Filter API.

**Defines**

- `npf_insert_send_rule(rule)`
- `npf_insert_recv_rule(rule)`
- `npf_append_send_rule(rule)`
- `npf_append_recv_rule(rule)`
- `npf_remove_send_rule(rule)`
- `npf_remove_recv_rule(rule)`
- `npf_remove_all_send_rules()`
- `npf_remove_all_recv_rules()`

**NPF_RULE(_name, _result, ...)**

Statically define one packet filter rule.

This creates a rule from a variable amount of filter conditions. This rule can then be inserted or appended to the rule list for a given network packet path.

**Example:**

```c
static NPF_SIZE_MAX(maxsize_200, 200);
static NPF_ETH_TYPE_MATCH(ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(small_ip_pkt, NET_OK, ip_packet, maxsize_200);

void install_my_filter(void)
{
    npf_insert_recv_rule(&npf_default_drop);
    npf_insert_recv_rule(&small_ip_pkt);
}
```

The above would accept IP packets that are 200 bytes or smaller, and drop all other packets. Another (less efficient) way to create the same result could be:

```c
static NPF_SIZE_MIN(minsize_201, 201);
static NPF_ETH_TYPE_UNMATCH(not_ip_packet, NET_ETH_PTYPE_IP);
static NPF_RULE(reject_big_pkts, NET_DROP, minsize_201);
static NPF_RULE(reject_non_ip, NET_DROP, not_ip_packet);

void install_my_filter(void) {
    npf_append_recv_rule(&reject_big_pkts);
    npf_append_recv_rule(&reject_non_ip);
    npf_append_recv_rule(&npf_default_ok);
}
```
The first rule in the list for which all conditions are true determines the fate of the packet. If one condition is false then the next rule in the list is evaluated.

**Parameters**

- `_name` – Name for this rule.
- `_result` – Fate of the packet if all conditions are true, either `NET_OK` or `NET_DROP`.
- ... – List of conditions for this rule.

**Functions**

```c
void npf_insert_rule(struct npf_rule_list *rules, struct npf_rule *rule)
```

Insert a rule at the front of given rule list.

**Parameters**

- `rules` – the affected rule list
- `rule` – the rule to be inserted

```c
void npf_append_rule(struct npf_rule_list *rules, struct npf_rule *rule)
```

Append a rule at the end of given rule list.

**Parameters**

- `rules` – the affected rule list
- `rule` – the rule to be appended

```c
bool npf_remove_rule(struct npf_rule_list *rules, struct npf_rule *rule)
```

Remove a rule from the given rule list.

**Parameters**

- `rules` – the affected rule list
- `rule` – the rule to be removed

**Return values**

`true` – if given rule was found in the rule list and removed

```c
bool npf_remove_all_rules(struct npf_rule_list *rules)
```

Remove all rules from the given rule list.

**Parameters**

- `rules` – the affected rule list

**Return values**

`true` – if at least one rule was removed from the rule list

**Variables**

```c
struct npf_rule npf_default_ok
```

Default rule list termination for accepting a packet.

```c
struct npf_rule npf_default_drop
```

Default rule list termination for rejecting a packet.
struct npf_rule_list npf_send_rules
    rule list applied to outgoing packets

struct npf_rule_list npf_recv_rules
    rule list applied to incoming packets

struct npf_test
    #include <net_pkt_filter.h> common filter test structure to be embedded into larger structures

    Public Members

    npf_test_fn_t *fn
        packet condition test function

struct npf_rule
    #include <net_pkt_filter.h> filter rule structure

    Public Members

    enum net_verdict result
        result if all tests pass

    uint32_t nb_tests
        number of tests for this rule

    struct npf_test *tests[]
        pointers to npf_test instances

struct npf_rule_list
    #include <net_pkt_filter.h> rule set for a given test location

group npf_basic_cond

Defines

NPF_IFACE_MATCH(_name, _iface)
    Statically define an “interface match” packet filter condition.

    Parameters
    • _name – Name of the condition
    • _iface – Interface to match

NPF_IFACE_UNMATCH(_name, _iface)
    Statically define an “interface unmatch” packet filter condition.

    Parameters
    • _name – Name of the condition
    • _ iface – Interface to exclude
NPF_ORIG_IFACE_MATCH(_name, _iface)
   Statically define an “orig interface match” packet filter condition.
   
   Parameters
   • _name – Name of the condition
   • _iface – Interface to match

NPF_ORIG_IFACE_UNMATCH(_name, _iface)
   Statically define an “orig interface unmatch” packet filter condition.
   
   Parameters
   • _name – Name of the condition
   • _iface – Interface to exclude

NPF_SIZE_MIN(_name, _size)
   Statically define a “data minimum size” packet filter condition.
   
   Parameters
   • _name – Name of the condition
   • _size – Lower bound of the packet's data size

NPF_SIZE_MAX(_name, _size)
   Statically define a “data maximum size” packet filter condition.
   
   Parameters
   • _name – Name of the condition
   • _size – Higher bound of the packet's data size

NPF_SIZE_BOUNDS(_name, _min_size, _max_size)
   Statically define a “data bounded size” packet filter condition.
   
   Parameters
   • _name – Name of the condition
   • _min_size – Lower bound of the packet's data size
   • _max_size – Higher bound of the packet's data size

**group npf_eth_cond**

**Defines**

NPF_ETH_SRC_ADDR_MATCH(_name, _addr_array)
   Statically define a “source address match” packet filter condition.
   
   This tests if the packet source address matches any of the Ethernet addresses contained in the
   provided set.
   
   Parameters
   • _name – Name of the condition
   • _addr_array – Array of struct net_eth_addr items to test against

NPF_ETH_SRC_ADDR_UNMATCH(_name, _addr_array)
   Statically define a “source address unmatch” packet filter condition.
   
   This tests if the packet source address matches none of the Ethernet addresses contained in
   the provided set.
NPF_ETH_DST_ADDR_MATCH(_name, _addr_array)
Statically define a “destination address match” packet filter condition.
This tests if the packet destination address matches any of the Ethernet addresses contained in the provided set.

Parameters
• _name – Name of the condition
• _addr_array – Array of struct net_eth_addr items to test against

NPF_ETH_DST_ADDR_UNMATCH(_name, _addr_array)
Statically define a “destination address unmatch” packet filter condition.
This tests if the packet destination address matches none of the Ethernet addresses contained in the provided set.

Parameters
• _name – Name of the condition
• _addr_array – Array of struct net_eth_addr items to test against

NPF_ETH_SRC_ADDR_MASK_MATCH(_name, _addr_array, ...)
Statically define a “source address match with mask” packet filter condition.
This tests if the packet source address matches any of the Ethernet addresses contained in the provided set after applying specified mask.

Parameters
• _name – Name of the condition
• _addr_array – Array of struct net_eth_addr items to test against
• ... – up to 6 mask bytes

NPF_ETH_DST_ADDR_MASK_MATCH(_name, _addr_array, ...)
Statically define a “destination address match with mask” packet filter condition.
This tests if the packet destination address matches any of the Ethernet addresses contained in the provided set after applying specified mask.

Parameters
• _name – Name of the condition
• _addr_array – Array of struct net_eth_addr items to test against
• ... – up to 6 mask bytes

NPF_ETH_TYPE_MATCH(_name, _type)
Statically define an “Ethernet type match” packet filter condition.

Parameters
• _name – Name of the condition
• _type – Ethernet type to match

NPF_ETH_TYPE_UNMATCH(_name, _type)
Statically define an “Ethernet type unmatch” packet filter condition.

Parameters
• _name – Name of the condition
• _type – Ethernet type to exclude

**Network Shell**  Network shell provides helpers for figuring out network status, enabling/disabling features, and issuing commands like ping or DNS resolving. Note that net-shell should probably not be used in production code as it will require extra memory. See also *generic shell* for detailed shell information.

The following net-shell commands are implemented:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>net allocs</td>
<td>Print network memory allocations. Only available if CONFIG_NET_DEBUG_NET_PKT_ALLOC is set.</td>
</tr>
<tr>
<td>net arp</td>
<td>Print information about IPv4 ARP cache. Only available if CONFIG_NET_ARP is set in IPv4 enabled networks.</td>
</tr>
<tr>
<td>net capture</td>
<td>Monitor network traffic See <em>Monitor Network Traffic</em> for details.</td>
</tr>
<tr>
<td>net conn</td>
<td>Print information about network connections.</td>
</tr>
<tr>
<td>net dns</td>
<td>Show how DNS is configured. The command can also be used to resolve a DNS name. Only available if CONFIG_DNS_RESOLVER is set.</td>
</tr>
<tr>
<td>net events</td>
<td>Enable network event monitoring. Only available if CONFIG_NET_MGMT_EVENT_MONITOR is set.</td>
</tr>
<tr>
<td>net gptp</td>
<td>Print information about gPTP support. Only available if CONFIG_NET_GPTP is set.</td>
</tr>
<tr>
<td>net iface</td>
<td>Print information about network interfaces.</td>
</tr>
<tr>
<td>net ipv6</td>
<td>Print IPv6 specific information and configuration. Only available if CONFIG_NET_IPV6 is set.</td>
</tr>
<tr>
<td>net mem</td>
<td>Print information about network memory usage. The command will print more information if CONFIG_NET_BUF_POOL_USAGE is set.</td>
</tr>
<tr>
<td>net nbr</td>
<td>Print neighbor information. Only available if CONFIG_NET_IPV6 is set.</td>
</tr>
<tr>
<td>net ping</td>
<td>Ping a network host.</td>
</tr>
<tr>
<td>net route</td>
<td>Show IPv6 network routes. Only available if CONFIG_NET_ROUTE is set.</td>
</tr>
<tr>
<td>net stats</td>
<td>Show network statistics.</td>
</tr>
<tr>
<td>net tcp</td>
<td>Connect/send data/close TCP connection. Only available if CONFIG_NET_TCP is set.</td>
</tr>
<tr>
<td>net vlan</td>
<td>Show Ethernet virtual LAN information. Only available if CONFIG_NET_VLAN is set.</td>
</tr>
</tbody>
</table>

**Time Sensitive Networking**

generic Precision Time Protocol (gPTP)

- **Overview**
- **Supported features**
- **Supported hardware**
- **Enabling the stack**
- **Application interfaces**
- **Testing**
- **API Reference**

**Overview**  This gPTP stack supports the protocol and procedures as defined in the IEEE 802.1AS-2011 standard (Timing and Synchronization for Time-Sensitive Applications in Bridged Local Area Networks).
**Supported features**  The stack handles communications and state machines defined in the IEEE 802.1AS-2011 standard. Mandatory requirements for a full-duplex point-to-point link endpoint, as defined in Annex A of the standard, are supported.

The stack is in principle capable of handling communications on multiple network interfaces (also defined as “ports” in the standard) and thus act as a 802.1AS bridge. However, this mode of operation has not been validated on the Zephyr OS.

**Supported hardware**  Although the stack itself is hardware independent, Ethernet frame timestamping support must be enabled in ethernet drivers.

Boards supported:
- frdm_k64f
- nucleo_h743zi_board
- nucleo_h745zi_q_board
- nucleo_f767zi_board
- sam_e70_xplained
- nativeposix (only usable for simple testing, limited capabilities due to lack of hardware clock)
- qemu_x86 (emulated, limited capabilities due to lack of hardware clock)

**Enabling the stack**  The following configuration option must me enabled in prj.conf file.

- CONFIG_NET_GPTP

**Application interfaces**  Only two Application Interfaces as defined in section 9 of the standard are available:

- ClockTargetPhaseDiscontinuity interface (*gptp_register_phase_dis_cb()*)
- ClockTargetEventCapture interface (*gptp_event_capture()*)

**Testing**  The stack has been informally tested using the OpenAVnu gPTP and Linux ptp4l daemons. The gPTP sample application from the Zephyr source distribution can be used for testing.

**API Reference**

**group gptp**

generic Precision Time Protocol (gPTP) support

**Typedefs**

```c
typedef void (*gptp_phase_dis_callback_t)(uint8_t *gm_identity, uint16_t *time_base, struct gptp_scaled_ns *last_gm_ph_change, double *last_gm_freq_change)
```

Define callback that is called after a phase discontinuity has been sent by the grandmaster.

**Param gm_identity**  A pointer to first element of a ClockIdentity array. The size of the array is GPTP_CLOCK_ID_LEN.

**Param time_base**  A pointer to the value of timeBaseIndicator of the current grandmaster.
Param last_gm_ph_change
   A pointer to the value of lastGmPhaseChange received from grandmaster.

Param last_gm_freq_change
   A pointer to the value of lastGmFreqChange received from the grandmaster.

typedef void (*gptp_port_cb_t)(int port, struct net_if *iface, void *user_data)
Callback used while iterating over gPTP ports.

Param port
   Port number

Param iface
   Pointer to network interface

Param user_data
   A valid pointer to user data or NULL

Functions

void gptp_register_phase_dis_cb(struct gptp_phase_dis_cb *phase_dis,
                                 gptp_phase_dis_callback_t cb)
Register a phase discontinuity callback.

Parameters
   • phase_dis – Caller specified handler for the callback.
   • cb – Callback to register.

void gptp_unregister_phase_dis_cb(struct gptp_phase_dis_cb *phase_dis)
Unregister a phase discontinuity callback.

Parameters
   • phase_dis – Caller specified handler for the callback.

void gptp_call_phase_dis_cb(void)
Call a phase discontinuity callback function.

int gptp_event_capture(struct net_ptp_time *slave_time, bool *gm_present)
Get gPTP time.

Parameters
   • slave_time – A pointer to structure where timestamp will be saved.
   • gm_present – A pointer to a boolean where status of the presence of a grand
     master will be saved.

Returns
   Error code. 0 if no error.

char *gptp_sprint_clock_id(const uint8_t *clk_id, char *output, size_t output_len)
Utility function to print clock id to a user supplied buffer.

Parameters
   • clk_id – Clock id
   • output – Output buffer
   • output_len – Output buffer len

Returns
   Pointer to output buffer
void gptp_foreach_port(gptp_port_cb_t cb, void *user_data)
   Go through all the gPTP ports and call callback for each of them.

   Parameters
   • cb – User-supplied callback function to call
   • user_data – User specified data

struct gptp_domain *gptp_get_domain(void)
   Get gPTP domain.
   This contains all the configuration / status of the gPTP domain.

   Returns
   Pointer to domain or NULL if not found.

void gptp_clk_src_time_invoke(struct gptp_clk_src_time_invoke_params *arg)
   This interface is used by the ClockSource entity to provide time to the ClockMaster entity of a
   time-aware system.

   Parameters
   • arg – Current state and parameters of the ClockSource entity.

struct gptp_hdr *gptp_get_hdr(struct net_pkt *pkt)
   Return pointer to gPTP packet header in network packet.

   Parameters
   • pkt – Network packet (received or sent)

   Returns
   Pointer to gPTP header.

struct gptp_scaled_ns
   #include <gptp.h> Scaled Nanoseconds.

   Public Members

   int32_t high
      High half.

   int64_t low
      Low half.

struct gptp_uscaled_ns
   #include <gptp.h> UScaled Nanoseconds.

   Public Members

   uint32_t high
      High half.

   uint64_t low
      Low half.
struct gptp_port_identity
#include <gptp.h> Port Identity.

Public Members

uint8_t clk_id[GPTP_CLOCK_ID_LEN]
Clock identity of the port.

uint16_t port_number
Number of the port.

struct gptp_flags
#include <gptp.h>

Public Members

uint8_t octets[2]
Byte access.

uint16_t all
Whole field access.

struct gptp_hdr
#include <gptp.h>

Public Members

uint8_t message_type
Type of the message.

uint8_t transport_specific
Transport specific, always 1.

uint8_t ptp_version
Version of the PTP, always 2.

uint8_t reserved0
Reserved field.

uint16_t message_length
Total length of the message from the header to the last TLV.

uint8_t domain_number
Domain number, always 0.
uint8_t reserved1
   Reserved field.

struct gptp_flags flags
   Message flags.

int64_t correction_field
   Correction Field. The content depends of the message type.

uint32_t reserved2
   Reserved field.

struct gptp_port_identity port_id
   Port Identity of the sender.

uint16_t sequence_id
   Sequence Id.

uint8_t control
   Control value. Sync: 0, Follow-up: 2, Others: 5.

int8_t log_msg_interval
   Message Interval in Log2 for Sync and Announce messages.

struct gptp_phase_dis_cb
   #include <gptp.h> Phase discontinuity callback structure.
   Stores the phase discontinuity callback information. Caller must make sure that the variable pointed by this is valid during the lifetime of registration. Typically this means that the variable cannot be allocated from stack.

Public Members

sys_sn_t node
   Node information for the slist.

  gptp_phase_dis_callback_t cb
   Phase discontinuity callback.

struct gptp_clk_src_time_invoke_params
   #include <gptp.h> ClockSourceTime.invoke function parameters.
   Parameters passed by ClockSourceTime.invoke function.

Public Members

double last_gm_freq_change
   Frequency change on the last Time Base Indicator Change.
struct net_ptp_extended_time src_time
    The time this function is invoked.

struct gptp_scaled_ns last_gm_phase_change
    Phase change on the last Time Base Indicator Change.

uint16_t time_base_indicator
    Time Base - changed only if Phase or Frequency changes.

Precision Time Protocol (PTP) time format

- **Overview**
  The PTP time struct can store time information in high precision format (nanoseconds). The extended timestamp format can store the time in fractional nanoseconds accuracy. The PTP time format is used in *generic Precision Time Protocol (gPTP)* implementation.

- **API Reference**

  **group** ptp_time
  Precision Time Protocol time specification.

  **struct** net_ptp_time
  #include <ptp_time.h> Precision Time Protocol Timestamp format.
  This structure represents a timestamp according to the Precision Time Protocol standard.
  Seconds are encoded as a 48 bits unsigned integer. Nanoseconds are encoded as a 32 bits unsigned integer.

  **Public Members**

  union net_ptp_time.[anonymous] [anonymous]
  Seconds encoded on 48 bits.

  **struct** net_ptp_extended_time
  #include <ptp_time.h> Precision Time Protocol Extended Timestamp format.
  This structure represents an extended timestamp according to the Precision Time Protocol standard.
  Seconds are encoded as 48 bits unsigned integer. Fractional nanoseconds are encoded as 48 bits, their unit is $2^{-16}$ ns.
Public Members

union net_ptp_extended_time [anonymous] [anonymous]
Seconds encoded on 48 bits.

union net_ptp_extended_time [anonymous] [anonymous]
Fractional nanoseconds on 48 bits.

Generic GSM Modem

Overview The generic GSM modem driver allows the user to connect Zephyr to a GSM modem which provides a data connection to cellular operator's network. The Zephyr uses PPP (Point-to-Point Protocol) to connect to the GSM modem using UART. Note that some cellular modems have proprietary offloading support using AT commands, but usually those modems also support 3GPP standards and provide PPP connection to them. See GSM modem sample application how to setup Zephyr to use the GSM modem.

The GSM muxing, that is defined in GSM 07.10, and which allows mixing of AT commands and PPP traffic, is also supported in this version of Zephyr. One needs to enable CONFIG_GSM_MUX and CONFIG_UART_MUX configuration options to enable muxing.

zperf: Network Traffic Generator

Overview zperf is a shell utility which allows to generate network traffic in Zephyr. The tool may be used to evaluate network bandwidth.

zperf is compatible with iPerf_2.0.5. Note that in newer iPerf versions, an error message like this is printed and the server reported statistics are missing.

LAST PACKET NOT RECEIVED!!!

zperf can be enabled in any application, a dedicated sample is also present in Zephyr. See zperf sample application for details.

Sample Usage If Zephyr acts as a client, iPerf must be executed in server mode. For example, the following command line must be used for UDP testing:

$ iperf -s -l 1K -u -V -B 2001:db8::2

For TCP testing, the command line would look like this:

$ iperf -s -l 1K -V -B 2001:db8::2

In the Zephyr console, zperf can be executed as follows:

zperf udp upload 2001:db8::2 5001 10 1K 1M

For TCP the zperf command would look like this:

zperf tcp upload 2001:db8::2 5001 10 1K 1M
If the IP addresses of Zephyr and the host machine are specified in the config file, `zperf` can be started as follows:

```
zperf udp upload2 v6 10 1K 1M
```

or like this if you want to test TCP:

```
zperf tcp upload2 v6 10 1K 1M
```

If Zephyr is acting as a server, set the download mode as follows for UDP:

```
zperf udp download 5001
```

or like this for TCP:

```
zperf tcp download 5001
```

and in the host side, `iperf` must be executed with the following command line if you are testing UDP:

```
$ iperf -l 1K -u -V -c 2001:db8::1 -p 5001
```

and this if you are testing TCP:

```
$ iperf -l 1K -V -c 2001:db8::1 -p 5001
```

`iperf` output can be limited by using the `-b` option if Zephyr is not able to receive all the packets in orderly manner.

### 6.3 LoRa and LoRaWAN

#### 6.3.1 Overview

LoRa (abbrev. for Long Range) is a proprietary low-power wireless communication protocol developed by the Semtech Corporation.

LoRa acts as the physical layer (PHY) based on the chirp spread spectrum (CSS) modulation technique. LoRaWAN (for Long Range Wide Area Network) defines a networking layer on top of the LoRa PHY.

Zephyr provides APIs for LoRa to send raw data packets directly over the wireless interface as well as APIs for LoRaWAN to connect the end device to the internet through a gateway.

The Zephyr implementation is based on Semtech's LoRaMac-node library, which is included as a Zephyr module.

The LoRaWAN specification is published by the LoRa Alliance.

#### 6.3.2 Configuration Options

**LoRa PHY**

Related configuration options can be found under `drivers/lora/Kconfig`.

- `CONFIG_LORA`
- `CONFIG_LORA_SHELL`
- `CONFIG_LORA_INIT_PRIORITY`
LoRaWAN

Related configuration options can be found under `subsys/lorawan/Kconfig`.

- `CONFIG_LORAWAN`
- `CONFIG_LORAWAN_SYSTEM_MAX_RX_ERROR`
- `CONFIG_LORAMAC_REGION_AS923`
- `CONFIG_LORAMAC_REGION_AU915`
- `CONFIG_LORAMAC_REGION_CN470`
- `CONFIG_LORAMAC_REGION_CN779`
- `CONFIG_LORAMAC_REGION_EU433`
- `CONFIG_LORAMAC_REGION_EU868`
- `CONFIG_LORAMAC_REGION_KR920`
- `CONFIG_LORAMAC_REGION_IN865`
- `CONFIG_LORAMAC_REGION_US915`
- `CONFIG_LORAMAC_REGION_RU864`

### 6.3.3 API Reference

**LoRa PHY**

`group lora_api`

**Enums**

```c
enum lora_signal_bandwidth

Values:

enumerator BW_125_KHZ = 0
enumerator BW_250_KHZ
enumerator BW_500_KHZ
```

```c
enum lora_datarate

Values:

enumerator SF_6 = 6
enumerator SF_7
enumerator SF_8
enumerator SF_9
```
enumerator SF_10
enumerator SF_11
enumerator SF_12

enum lora_coding_rate
Values:
enumerator CR_4_5 = 1
enumerator CR_4_6 = 2
enumerator CR_4_7 = 3
enumerator CR_4_8 = 4

Functions

static inline int lora_config(const struct device *dev, struct lora_modem_config *config)
Configure the LoRa modem.

Parameters
• dev – LoRa device
• config – Data structure containing the intended configuration for the modem

Returns
0 on success, negative on error

static inline int lora_send(const struct device *dev, uint8_t *data, uint32_t data_len)
Send data over LoRa.

Note: This blocks until transmission is complete.

Parameters
• dev – LoRa device
• data – Data to be sent
• data_len – Length of the data to be sent

Returns
0 on success, negative on error

static inline int lora_send_async(const struct device *dev, uint8_t *data, uint32_t data_len,
struct k_poll_signal *async)
Asynchronously send data over LoRa.

Note: This returns immediately after starting transmission, and locks the LoRa modem until the transmission completes.
Parameters

• dev – LoRa device
• data – Data to be sent
• data_len – Length of the data to be sent
• async – A pointer to a valid and ready to be signaled struct k_poll_signal. (Note: if NULL this function will not notify the end of the transmission).

Returns

0 on success, negative on error

static inline int lora_recv(const struct device *dev, uint8_t *data, uint8_t size, k_timeout_t *timeout, int16_t *rssi, int8_t *snr)

Receive data over LoRa.

Note: This is a blocking call.

Parameters

• dev – LoRa device
• data – Buffer to hold received data
• size – Size of the buffer to hold the received data. Max size allowed is 255.
• timeout – Duration to wait for a packet.
• rssi – RSSI of received data
• snr – SNR of received data

Returns

Length of the data received on success, negative on error

static inline int lora_recv_async(const struct device *dev, lora_recv_cb cb)

Receive data asynchronously over LoRa.

Receive packets continuously under the configuration previously setup by lora_config.

Reception is cancelled by calling this function again with cb = NULL. This can be done within the callback handler.

Parameters

• dev – Modem to receive data on.
• cb – Callback to run on receiving data. If NULL, any pending asynchronous receptions will be cancelled.

Returns

0 when reception successfully setup, negative on error

static inline int lora_test_cw(const struct device *dev, uint32_t frequency, int8_t tx_power, uint16_t duration)

Transmit an unmodulated continuous wave at a given frequency.

Note: Only use this functionality in a test setup where the transmission does not interfere with other devices.
• dev – LoRa device
• frequency – Output frequency (Hertz)
• tx_power – TX power (dBm)
• duration – Transmission duration in seconds.

**Returns**
0 on success, negative on error

```c
struct lora_modem_config
```

```
#include <lora.h>
```

**Public Members**

bool iq_inverted
Invert the In-Phase and Quadrature (IQ) signals. Normally this should be set to false. In advanced use-cases where a differentiation is needed between “uplink” and “downlink” traffic, the IQ can be inverted to create two different channels on the same frequency

bool public_network
Sets the sync-byte to use:
• false: for using the private network sync-byte
• true: for using the public network sync-byte The public network sync-byte is only intended for advanced usage. Normally the private network sync-byte should be used for peer to peer communications and the LoRaWAN APIs should be used for interacting with a public network.

**LoRaWAN**

*group lorawan_api*

**Defines**

LW_RECV_PORT_ANY

**Enums**

enum lorawan_class
LoRaWAN class types.
*Values:*

enumerator LORAWAN_CLASS_A = 0x00
enumerator LORAWAN_CLASS_B = 0x01
enumerator LORAWAN_CLASS_C = 0x02
enum lorawan_act_type
LoRaWAN activation types.

Values:

enumerator LORAWAN_ACT_OTAA = 0
enumerator LORAWAN_ACT_ABP

enum lorawan_datarate
LoRaWAN datarate types.

Values:

enumerator LORAWAN_DR_0 = 0
enumerator LORAWAN_DR_1
enumerator LORAWAN_DR_2
enumerator LORAWAN_DR_3
enumerator LORAWAN_DR_4
enumerator LORAWAN_DR_5
enumerator LORAWAN_DR_6
enumerator LORAWAN_DR_7
enumerator LORAWAN_DR_8
enumerator LORAWAN_DR_9
enumerator LORAWAN_DR_10
enumerator LORAWAN_DR_11
enumerator LORAWAN_DR_12
enumerator LORAWAN_DR_13
enumerator LORAWAN_DR_14
enumerator LORAWAN_DR_15
enum lorawan_region
   LoRaWAN region types.
   Values:

   enumerator LORAWAN_REGION_AS923
   enumerator LORAWAN_REGION_AU915
   enumerator LORAWAN_REGION_CN470
   enumerator LORAWAN_REGION_CN779
   enumerator LORAWAN_REGION_EU433
   enumerator LORAWAN_REGION_EU868
   enumerator LORAWAN_REGION_KR920
   enumerator LORAWAN_REGION_IN865
   enumerator LORAWAN_REGION_US915
   enumerator LORAWAN_REGION_RU864

enum lorawan_message_type
   LoRaWAN message types.
   Values:

   enumerator LORAWAN_MSG_UNCONFIRMED = 0
   enumerator LORAWAN_MSG_CONFIRMED

Functions

int lorawan_set_battery_level_callback(uint8_t (*battery_lvl_cb)(void))
   Add battery level callback function.

   Provide the LoRaWAN stack with a function to be called whenever a battery level needs to be read. As per LoRaWAN specification the callback needs to return "0: node is connected to an external power source,
1..254: battery level, where 1 is the minimum and 254 is the maximum value,
255: the node was not able to measure the battery level"
   Should no callback be provided the lorawan backend will report 255.

Parameters
• battery_lvl_cb – Pointer to the battery level function

Returns
0 if successful, negative errno code if failure

void lorawan_register_downlink_callback(struct lorawan_downlink_cb *cb)
Register a callback to be run on downlink packets.

Parameters
• cb – Pointer to structure containing callback parameters

void lorawan_register_dr_changed_callback(void (*dr_cb)(enum lorawan_datarate))
Register a callback to be called when the datarate changes.
The callback is called once upon successfully joining a network and again each time the datarate changes due to ADR.
The callback function takes one parameter:
• dr - updated datarate

Parameters
• dr_cb – Pointer to datarate update callback

int lorawan_join(const struct lorawan_join_config *config)
Join the LoRaWAN network.
Join the LoRaWAN network using OTAA or AWB.

Parameters
• config – Configuration to be used

Returns
0 if successful, negative errno code if failure

int lorawan_start(void)
Start the LoRaWAN stack.
This function need to be called before joining the network.

Returns
0 if successful, negative errno code if failure

int lorawan_send(uint8_t port, uint8_t *data, uint8_t len, enum lorawan_message_type type)
Send data to the LoRaWAN network.
Send data to the connected LoRaWAN network.

Parameters
• port – Port to be used for sending data. Must be set if the payload is not empty.
• data – Data buffer to be sent
• len – Length of the buffer to be sent. Maximum length of this buffer is 255 bytes but the actual payload size varies with region and datarate.
• type – Specifies if the message shall be confirmed or unconfirmed. Must be one of lorawan_message_type.

Returns
0 if successful, negative errno code if failure
int lorawan_set_class(enum lorawan_class dev_class)
Set the current device class.

  Change the current device class. This function may be called before or after a network connection has been established.

  **Parameters**
  - dev_class – New device class

  **Returns**
  - 0 if successful, negative errno code if failure

int lorawan_set_conf_msg_tries(uint8_t tries)
Set the number of tries used for transmissions.

  **Parameters**
  - tries – Number of tries to be used

  **Returns**
  - 0 if successful, negative errno code if failure

void lorawan_enable_adr(bool enable)
Enable Adaptive Data Rate (ADR)

  Control whether adaptive data rate (ADR) is enabled. When ADR is enabled, the data rate is treated as a default data rate that will be used if the ADR algorithm has not established a data rate. ADR should normally only be enabled for devices with stable RF conditions (i.e., devices in a mostly static location).

  **Parameters**
  - enable – Enable or Disable adaptive data rate.

int lorawan_set_datarate(enum lorawan_datarate dr)
Set the default data rate.

  Change the default data rate.

  **Parameters**
  - dr – Data rate used for transmissions

  **Returns**
  - 0 if successful, negative errno code if failure

enum lorawan_datarate lorawan_get_min_datarate(void)
Get the minimum possible datarate.

  The minimum possible datarate may change in response to a TxParamSetupReq command from the network server.

  **Returns**
  - Minimum possible data rate

void lorawan_get_payload_sizes(uint8_t *max_next_payload_size, uint8_t *max_payload_size)
Get the current payload sizes.

  Query the current payload sizes. The maximum payload size varies with datarate, while the current payload size can be less due to MAC layer commands which are inserted into uplink packets.

  **Parameters**
  - max_next_payload_size – Maximum payload size for the next transmission
  - max_payload_size – Maximum payload size for this datarate
int lorawan_set_region(enum lorawan_region region)
    Set the region and frequency to be used.

    Control the LoRa region and frequency settings. This should be called before lorawan_start().
    If you only have support for a single region selected via Kconfig, this function does not need to be called at all.

    Parameters
    • region – The region to be selected

    Returns
    0 if successful, negative errno otherwise

struct lorawan_join_otaa
    #include <lorawan.h> LoRaWAN join parameters for over-the-Air activation (OTAA)

    Note that all of the fields use LoRaWAN 1.1 terminology.
    All parameters are optional if a secure element is present in which case the values stored in the secure element will be used instead.

    Public Members

    uint8_t * join_eui
        Join EUI

    uint8_t * nwk_key
        Network Key

    uint8_t * app_key
        Application Key

    uint32_t dev_nonce
        Device Nonce

        Starting with LoRaWAN 1.0.4 the DevNonce must be monotonically increasing for each OTAA join with the same EUI. The DevNonce should be stored in non-volatile memory by the application.

struct lorawan_join_abp
    #include <lorawan.h>

    Public Members

    uint32_t dev_addr
        Device address on the network

    uint8_t * app_skey
        Application session key

    uint8_t * nwk_skey
        Network session key
uint8_t *app_eui
        Application EUI

struct lorawan_join_config
    #include <lorawan.h>

Public Members

uint8_t *dev_eui
        Device EUI. Optional if a secure element is present.

struct lorawan_downlink_cb
    #include <lorawan.h>

Public Members

void (*cb)(uint8_t port, bool data_pending, int16_t rssi, int8_t snr, uint8_t len, const uint8_t *data)
        Callback function to run on downlink data.

Note: Callbacks are run on the system workqueue, and should therefore be as short as possible.

Param port
    Port message was sent on

Param data_pending
    Network server has more downlink packets pending

Param rssi
    Received signal strength in dBm

Param snr
    Signal to Noise ratio in dBm

Param len
    Length of data received, will be 0 for ACKs

Param data
    Data received, will be NULL for ACKs

sys_snodel_t node
        Node for callback list

6.4 USB-C device support

6.4.1 USB-C device stack

The USB-C device stack is a hardware independent interface between a Type-C Port Controller (TCPC) and customer applications. It is a port of the Google ChromeOS Type-C Port Manager (TCPM) stack. It provides the following functionalities:

- Uses the APIs provided by the Type-C Port Controller drivers to interact with the Type-C Port Controller.
• Provides a programming interface that’s used by a customer applications. The APIs is described in include/zephyr/usb_c/usbc.h

Currently the device stack only support implementation of Sink devices.

List of samples for different purposes.

**Implementing a Sink Type-C and Power Delivery USB-C device**

The configuration of a USB-C Device is done in the stack layer and devicetree.

The following devicetree, structures and callbacks need to be defined:

• Devicetree `usb-c-connector` node referencing a TCPC
• Devicetree `vbus` node referencing a VBUS measurement device
• User defined structure that encapsulates application specific data
• Policy callbacks

For example, for the Sample USB-C Sink application:

Each Physical Type-C port is represented in the devicetree by a `usb-c-connector` compatible node:

```
port1: usbc-port@1 {
    compatible = "usb-c-connector";
    reg = <1>;
    tcpc = &ucpd1;
    vbus = &vbus1;
    power-role = "sink";
    sink-pdos = <PDO_FIXED(5000, 100, 0)>;
}
```

VBUS is measured by a device that’s referenced in the devicetree by a `usb-c-vbus-adc` compatible node:

```
vbus1: vbus {
    compatible = "zephyr,usb-c-vbus-adc";
    io-channels = <&adc2 8>;
    output-ohms = <49900>;
    full-ohms = <(330000 + 49900)>;
}
```

A user defined structure is defined and later registered with the subsystem and can be accessed from callback through an API:

```
/**
 * @brief A structure that encapsulates Port data.
 */

static struct port1_data_t {
    /** Sink Capabilities */
    uint32_t snk_caps[DT_PROP_LEN(DT_NODELABEL(port1), sink_pdos)];
    /** Number of Sink Capabilities */
    int snk_cap_cnt;
    /** Source Capabilities */
    uint32_t src_caps[PDO_MAX_DATA_OBJECTS];
    /** Number of Source Capabilities */
    int src_cap_cnt;
    /* Power Supply Ready flag */
    atomic_t ps_ready;
} port1_data = {
    .snk_caps = {DT_FOREACH_PROP_ELEM(DT_NODELABEL(port1), sink_pdos, SINK_PDO)},
    (continues on next page)
These callbacks are used by the subsystem to set or get application specific data:

```c
static int port1_policy_cb_get_snk_cap(const struct device *dev,
                                        uint32_t **pdos,
                                        int *num_pdos)
{
    struct port1_data_t *dpm_data = usbc_get_dpm_data(dev);
    *pdos = dpm_data->snk_caps;
    num_pdos = &dpm_data->snk_cap_cnt;
    return 0;
}

static void port1_policy_cb_set_src_cap(const struct device *dev,
                                         const uint32_t *pdos,
                                         const int num_pdos)
{
    struct port1_data_t *dpm_data;
    int num;
    int i;

    dpm_data = usbc_get_dpm_data(dev);
    num = num_pdos;
    if (num > PDO_MAX_DATA_OBJECTS) {
        num = PDO_MAX_DATA_OBJECTS;
    }
    for (i = 0; i < num; i++) {
        dpm_data->src_caps[i] = *(pdos + i);
    }
    dpm_data->src_cap_cnt = num;
}

static uint32_t port1_policy_cb_get_rdo(const struct device *dev)
{
    struct port1_data_t *dpm_data = usbc_get_dpm_data(dev);
    return build_rdo(dpm_data);
}
```

This callback is used by the subsystem to query if a certain action can be taken:

```c
bool port1_policy_check(const struct device *dev,
                         const enum usbc_policy_check_t policy_check)
{
    switch (policy_check) {
    case CHECK_POWER_ROLE_SWAP:
```
/* Reject power role swaps */
return false;

case CHECK_DATA_ROLE_SWAP_TO_DFP:
 /* Reject data role swap to DFP */
return false;

case CHECK_DATA_ROLE_SWAP_TO_UFP:
 /* Accept data role swap to UFP */
return true;

case CHECK_SNK_AT_DEFAULT_LEVEL:
 /* This device is always at the default power level */
return true;

default:
 /* Reject all other policy checks */
return false;

}

This callback is used by the subsystem to notify the application of an event:

```c
static void port1_notify(const struct device *dev,
                         const enum usbc_policy_notify_t policy_notify)
{
    struct port1_data_t *dpm_data = usbc_get_dpm_data(dev);

    switch (policy_notify) {
    case PROTOCOL_ERROR:
        break;
    case MSG_DISCARDED:
        break;
    case MSG_ACCEPT_RECEIVED:
        break;
    case MSG_REJECTED_RECEIVED:
        break;
    case MSG_NOT_SUPPORTED_RECEIVED:
        break;
    case TRANSITION_PS:
        atomic_set_bit(&dpm_data->ps_ready, 0);
        break;
    case PD_CONNECTED:
        break;
    case NOT_PD_CONNECTED:
        break;
    case POWER_CHANGE_0A0:
        LOG_INF("PWR 0A");
        break;
    case POWER_CHANGE_DEF:
        LOG_INF("PWR DEF");
        break;
    case POWER_CHANGE_1A5:
        LOG_INF("PWR 1A5");
        break;
    case POWER_CHANGE_3A0:
        LOG_INF("PWR 3A0");
        break;
    case DATA_ROLE_IS_UFP:
        break;

    (continues on next page)
Registering the callbacks:

```
/* Register USB-C Callbacks */

/* Register Policy Check callback */
usbc_set_policy_cb_check(usbc_port1, port1_policy_check);
/* Register Policy Notify callback */
usbc_set_policy_cb_notify(usbc_port1, port1_notify);
/* Register Policy Get Sink Capabilities callback */
usbc_set_policy_cb_get_snk_cap(usbc_port1, port1_policy_cb_get_snk_cap);
/* Register Policy Set Source Capabilities callback */
usbc_set_policy_cb_set_src_cap(usbc_port1, port1_policy_cb_set_src_cap);
/* Register Policy Get Request Data Object callback */
usbc_set_policy_cb_get_rdo(usbc_port1, port1_policy_cb_get_rdo);
```

Register the user defined structure:

```
/* Set Application port data object. This object is passed to the policy callback */
port1_data.ps_ready = ATOMIC_INIT(0);
usbc_set_dpm_data(usbc_port1, &port1_data);
```

Start the USB-C subsystem:

```
/* Start the USB-C Subsystem */
usbc_start(usbc_port1);
```

API reference

`group _usbc_device_api`
USB-C Device APIs.

**Defines**

`FIXED_5V_100MA_RDO`

This Request Data Object (RDO) value can be returned from the policy_cb_get_rdo if 5V@100mA with the following options are sufficient for the Sink to operate.

The RDO is configured as follows: Maximum operating current 100mA Operating current 100mA Unchunked Extended Messages Not Supported No USB Suspend Not USB Communications Capable No capability mismatch Don't giveback Object position 1 (5V PDO)
Enums

enum usbc_policy_request_t

Device Policy Manager requests.

Values:

enumerator REQUEST_NOP
    No request

denumerator REQUEST_TC_DISABLED
    Request Type-C layer to transition to Disabled State

denumerator REQUEST_TC_ERROR_RECOVERY
    Request Type-C layer to transition to Error Recovery State

denumerator REQUEST_TC_END
    End of Type-C requests

denumerator REQUEST_PE_DR_SWAP
    Request Policy Engine layer to perform a Data Role Swap

denumerator REQUEST_PE_HARD_RESET_SEND
    Request Policy Engine layer to send a hard reset

denumerator REQUEST_PE_SOFT_RESET_SEND
    Request Policy Engine layer to send a soft reset

denumerator REQUEST_PE_GET_SRC_CAPS
    Request Policy Engine layer to get Source Capabilities from port partner

enum usbc_policy_notify_t

Device Policy Manager notifications.

Values:

enumerator MSG_ACCEPT_RECEIVED
    Power Delivery Accept message was received

denumerator MSG_REJECTED_RECEIVED
    Power Delivery Reject message was received

denumerator MSG_DISCARDED
    Power Delivery discarded the message being transmited

denumerator MSG_NOT_SUPPORTED_RECEIVED
    Power Delivery Not Supported message was received

denumerator DATA_ROLE_IS_UFP
    Data Role has been set to Upstream Facing Port (UFP)
enumerator DATA_ROLE_IS_DFP
    Data Role has been set to Downstream Facing Port (DFP)

enumerator PD_CONNECTED
    A PD Explicit Contract is in place

enumerator NOT_PD_CONNECTED
    No PD Explicit Contract is in place

enumerator TRANSITION_PS
    Transition the Power Supply

enumerator PORT_PARTNER_NOT_RESPONSIVE
    Port partner is not responsive

enumerator PROTOCOL_ERROR
    Protocol Error occurred

enumerator SNK_TRANSITION_TO_DEFAULT
    Transition the Sink to default

enumerator HARD_RESET_RECEIVED
    Hard Reset Received

enumerator POWER_CHANGE_0A0
    Sink SubPower state at 0V

enumerator POWER_CHANGE_DEF
    Sink SubPower state a 5V / 500mA

enumerator POWER_CHANGE_1A5
    Sink SubPower state a 5V / 1.5A

enumerator POWER_CHANGE_3A0
    Sink SubPower state a 5V / 3A

def usbc_policy_check_t
    Device Policy Manager checks.
    Values:

enumerator CHECK_POWER_ROLE_SWAP
    Check if Power Role Swap is allowed

enumerator CHECK_DATA_ROLE_SWAP_TO_DFP
    Check if Data Role Swap to DFP is allowed

enumerator CHECK_DATA_ROLE_SWAP_TO_UFP
    Check if Data Role Swap to UFP is allowed
enumerator CHECK_SNK_AT_DEFAULT_LEVEL
    Check if Sink is at default level

eenum usbc_policy_wait_t
    Device Policy Manager Wait message notifications.
    Values:
    
enumerator WAIT_SINK_REQUEST
        The port partner is unable to meet the sink request at this time
    
enumerator WAIT_POWER_ROLE_SWAP
        The port partner is unable to do a Power Role Swap at this time
    
enumerator WAIT_DATA_ROLE_SWAP
        The port partner is unable to do a Data Role Swap at this time
    
enumerator WAIT_VCONN_SWAP
        The port partner is unable to do a VCONN Swap at this time

Functions

int usbc_start(const struct device *dev)
    Start the USB-C Subsystem.
    Parameters
    • dev – Runtime device structure
    Return values
    0 – on success

int usbc_suspend(const struct device *dev)
    Suspend the USB-C Subsystem.
    Parameters
    • dev – Runtime device structure
    Return values
    0 – on success

int usbc_request(const struct device *dev, const enum usbc_policy_request_t req)
    Make a request of the USB-C Subsystem.
    Parameters
    • dev – Runtime device structure
    • req – request
    Return values
    0 – on success

void usbc_set_dpm_data(const struct device *dev, void *dpm_data)
    Set pointer to Device Policy Manager (DPM) data.
    Parameters
    • dev – Runtime device structure
• dpm_data – pointer to dpm data

void *usbc_get_dpm_data(const struct device *dev)
Get pointer to Device Policy Manager (DPM) data.

Parameters
• dev – Runtime device structure

Return values
• pointer – to dpm data that was set with usbc_set_dpm_data
• NULL – if dpm data was not set

void usbc_set_vconn_control_cb(const struct device *dev, const tcpc_vconn_control_cb_t cb)
Set the callback used to set VCONN control.

Parameters
• dev – Runtime device structure
• cb – VCONN control callback

void usbc_set_policy_cb_check(const struct device *dev, const policy_cb_check_t cb)
Set the callback used to check a policy.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_notify(const struct device *dev, const policy_cb_notify_t cb)
Set the callback used to notify Device Policy Manager of a policy change.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_wait_notify(const struct device *dev, const policy_cb_wait_notify_t cb)
Set the callback used to notify Device Policy Manager of WAIT message reception.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_get_snk_cap(const struct device *dev, const policy_cb_get_snk_cap_t cb)
Set the callback used to get the Sink Capabilities.

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_set_src_cap(const struct device *dev, const policy_cb_set_src_cap_t cb)
Set the callback used to store the received Port Partner’s Source Capabilities.

Parameters
• dev – Runtime device structure
• cb – callback
void usbc_set_policy_cb_get_rdo(const struct device *dev, const policy_cb_get_rdo_t cb)
Set the callback used to get the Request Data Object (RDO)

Parameters
• dev – Runtime device structure
• cb – callback

void usbc_set_policy_cb_is_snk_at_default(const struct device *dev, const policy_cb_is_snk_at_default_t cb)
Set the callback used to check if the sink power supply is at the default level.

Parameters
• dev – Runtime device structure
• cb – callback
Chapter 7

Hardware Support

7.1 Architecture-related Guides

7.1.1 Zephyr support status on ARC processors

Overview

This page describes current state of Zephyr for ARC processors and some future plans. Please note that

- plans are given without exact deadlines
- software features require corresponding hardware to be present and configured the proper way
- not all the features can be enabled at the same time

Support status

Legend: Y - yes, supported; N - no, not supported; WIP - Work In Progress; TBD - to be decided

### 7.1.2 Arm Cortex-M Developer Guide

**Overview**

This page contains detailed information about the status of the Arm Cortex-M architecture porting in the Zephyr RTOS and describes key aspects when developing Zephyr applications for Arm Cortex-M-based platforms.

**Key supported features**

The table below summarizes the status of key OS features in the different Arm Cortex-M implementation variants.

---

1. usage of CCMs is limited on SMP systems
2. except the systems with secure features (SecureShield) due to HW limitation
3. We only support save/restore ACCL/ACCH registers in task’s context. Rest of DSP/AGU registers save/restore isn’t implemented but kernel itself does not use these registers. This allows single task per core to use DSP/AGU safely.
4. Single-thread kernel is support only for single core targets
5. QEMU doesn’t support all the ARC processor’s HW features. For the detailed info please check the ARC QEMU documentation

Notes

1 SysTick is optional in Cortex-M1
2 Stack limit checking only in Secure builds in Cortex-M23
OS features

Threads

Thread stack alignment Each Zephyr thread is defined with its own stack memory. By default, Cortex-M enforces a double word thread stack alignment, see CONFIG_STACK_ALIGN_DOUBLE_WORD. If MPU-based HW-assisted stack overflow detection (CONFIG_MPU_STACK_GUARD) is enabled, thread stacks need to be aligned with a larger value, reflected by CONFIG_ARM_MPU_REGION_MIN_ALIGN_AND_SIZE. In Arm v6-M and Arm v7-M architecture variants, thread stacks are additionally required to be align with a value equal to their size, in applications that need to support user mode (CONFIG_USERSPACE). The thread stack sizes in that case need to be a power of two. This is all reflected by CONFIG_MPU.Requires.Power_of_Two.Alignment, that is enforced in Arm v6-M and Arm v7-M builds with user mode support.

Stack pointers While executing in thread mode the processor is using the Process Stack Pointer (PSP). The processor uses the Main Stack Pointer (MSP) while executing in handler mode, that is, while servicing exceptions and HW interrupts. Using PSP in thread mode facilitates thread stack pointer manipulation during thread context switching, without affecting the current execution context flow in handler mode.

In Arm Cortex-M builds a single interrupt stack memory is shared among exceptions and interrupts. The size of the interrupt stack needs to be selected taking into consideration nested interrupts, each pushing an additional stack frame. Developers can modify the interrupt stack size using CONFIG_ISR_STACK_SIZE.

The interrupt stack is also used during early boot so the kernel can initialize the main thread's stack before switching to the main thread.

Thread context switching In Arm Cortex-M builds, the PendSV exception is used in order to trigger a context switch to a different thread. PendSV exception is always present in Cortex-M implementations. PendSV is configured with the lowest possible interrupt priority level, in all Cortex-M variants. The main reasons for that design are

• to utilize the tail chaining feature of Cortex-M processors, and thus limit the number of context switch operations that occur.
• to not impact the interrupt latency observed by HW interrupts.

As a result, context switch in Cortex-M is non-atomic, i.e. it may be preempted by HW interrupts, however, a context-switch operation must be completed before a new thread context-switch may start.

Typically a thread context-switch will perform the following operations

• When switching-out the current thread, the processor stores
  – the callee-saved registers (R4 - R11) in the thread’s container for callee-saved registers, which is located in kernel memory
  – the thread’s current operation mode
    * user or privileged execution mode
    * presence of an active floating point context
    * the EXC_RETURN value of the current handler context (PendSV)
  – the floating point callee-saved registers (S16 - S31) in the thread’s container for FP callee-saved registers, if the current thread has an active FP context
  – the PSP of the current thread which points to the beginning of the current thread’s exception stack frame. The latter contains the caller-saved context and the return address of the switched-out thread.

• When switching-in a new thread the processor
- restores the new thread’s callee-saved registers from the thread’s container for callee-saved registers
- restores the new thread’s operation mode
- restores the FP callee-saved registers if the switched-in thread had an active FP context before being switched-out
- reprograms the dynamic MPU regions to allow a user thread access its stack and application memories, and/or programs a stack-overflow MPU guard at the bottom of the thread’s privileged stack
- restores the PSP for the incoming thread and reprograms the stack pointer limit register (if applicable, see CONFIG_BUILTIN_STACK_GUARD)
- optionally does a stack limit checking for the switched-in thread, if sentinel-based stack limit checking is enabled (see CONFIG_STACK_SENTINEL).

PendSV exception return sequence restores the new thread’s caller-saved registers and the return address, as part of unstacking the exception stack frame.

The implementation of the context-switch mechanism is present in arch/arm/core/aarch32/swap_helper.S.

Stack limit checking (Arm v8-M) Armv8-M and Armv8.1-M variants support stack limit checking using the MSPLIM and PSPLIM core registers. The feature is enabled when CONFIG_BUILTIN_STACK_GUARD is set. When stack limit checking is enabled, both the thread’s privileged or user stack, as well as the interrupt stack are guarded by PSPLIM and MSPLIM registers, respectively. MSPLIM is configured once during kernel boot, while PSLIM is re-programmed during every thread context-switch or during system calls, when the thread switches from using its default stack to using its privileged stack, and vice versa. PSPLIM re-programming
- has a relatively low runtime overhead (programming is done with MSR instructions)
- does not impact interrupt latency
- does not require any memory areas to be reserved for stack guards
- does not make use of MPU regions

It is, therefore, considered as a lightweight but very efficient stack overflow detection mechanism in Cortex-M applications.

Stack overflows trigger the dedicated UsageFault exception provided by Arm v8-M.

Interrupt handling features This section describes certain aspects around exception and interrupt handling in Arm Cortex-M.

Interrupt priority levels The number of available (configurable) interrupt priority levels is determined by the number of implemented interrupt priority bits in NVIC; this needs to be described for each Cortex-M platform using DeviceTree:

```
&nvic {
    arm,num-irq-priority-bits = <#priority-bits>;
};
```

Reserved priority levels A number of interrupt priority levels are reserved for the OS.

By design, system fault exceptions have the highest priority level. In Baseline Cortex-M, this is actually enforced by hardware, as HardFault is the only available processor fault exception, and its priority is higher than any configurable exception priority.
In Mainline Cortex-M, the available fault exceptions (e.g. MemManageFault, UsageFault, etc.) are assigned the highest configurable priority level. (CONFIG_CPU_CORTEX_M_HAS_PROGRAMMABLE_FAULT_PRIOS signifies explicitly that the Cortex-M implementation supports configurable fault priorities.)

This priority level is never shared with HW interrupts (an exception to this rule is described below). As a result, processor faults occurring in regular ISRs will be handled by the corresponding fault handler and will not escalate to a HardFault, similar to processor faults occurring in thread mode.

SVC exception is normally configured with the highest configurable priority level (an exception to this rule will be described below). SVCs are used by the Zephyr kernel to dispatch system calls, trigger runtime system errors (e.g. Kernel oops or panic), or implement IRQ offloading.

In Baseline Cortex-M the priority level of SVC may be shared with other exceptions or HW interrupts that are also given the highest configurable priority level (As a result of this, kernel runtime errors during interrupt handling will escalate to HardFault. Additional logic in the fault handling routines ensures that such runtime errors are detected successfully).

In Mainline Cortex-M, however, the SVC priority level is reserved, thus normally it is only shared with the fault exceptions of configurable priority. This simplifies the fault handling routines in Mainline Cortex-M architecture, since runtime kernel errors are serviced by the SVC handler (i.e no HardFault escalation, even if the kernel errors occur in ISR context).

HW interrupts in Mainline Cortex-M builds are allocated a priority level lower than the SVC.

One exception to the above rules is when Zephyr applications support Zero Latency Interrupts (ZLIs). Such interrupts are designed to have a priority level higher than any HW or system interrupt. If the ZLI feature is enabled in Mainline Cortex-M builds (see CONFIG_ZERO_LATENCY_IRQS), then

- ZLIs are assigned the highest configurable priority level
- SVCs are assigned the second highest configurable priority level
- Regular HW interrupts are assigned priority levels lower than SVC.

The priority level configuration in Cortex-M is implemented in include/arch/arm/aarch32/exc.h.

**Locking and unlocking IRQs**

In Baseline Cortex-M locking interrupts is implemented using the PRIMASK register.

`arch_irq_lock()`

will set the PRIMASK register to 1, eventually, masking all IRQs with configurable priority. While this fulfils the OS requirement of locking interrupts, the consequence is that kernel runtime errors (triggering SVCs) will escalate to HardFault.

In Mainline Cortex-M locking interrupts is implemented using the BASEPRI register (Mainline Cortex-M builds select CONFIG_CPU_CORTEX_M_HAS_BASEPRI to signify that BASEPRI register is implemented.). By modifying BASEPRI (or BASEPRI_MAX) `arch_irq_lock()` masks all system and HW interrupts with the exception of

- SVCs
- processor faults
- ZLIs

This allows zero latency interrupts to be triggered inside OS critical sections. Additionally, this allows system (processor and kernel) faults to be handled by Zephyr in exactly the same way, regardless of whether IRQs have been locked or not when the error occurs. It also allows for system calls to be dispatched while IRQs are locked.

**Note:** Mainline Cortex-M fault handling is designed and configured in a way that all processor and kernel faults are handled by the corresponding exception handlers and never result in HardFault escalation. In other words, a HardFault may only occur in Zephyr applications that have modified the default
fault handling configurations. The main reason for this design was to reserve the HardFault exception for handling exceptional error conditions in safety critical applications.

**Dynamic direct interrupts**  
Cortex-M builds support the installation of direct interrupt service routines during runtime. Direct interrupts are designed for performance-critical interrupt handling and do not go through all of the common Zephyr interrupt handling code.

Direct dynamic interrupts are enabled via switching on `CONFIG_DYNAMIC_DIRECT_INTERRUPTS`.

Note that enabling direct dynamic interrupts requires enabling support for dynamic interrupts in the kernel, as well (see `CONFIG_DYNAMIC_INTERRUPTS`).

**Zero Latency interrupts**  
As described above, in Mainline Cortex-M applications, the Zephyr kernel reserves the highest configurable interrupt priority level for its own use (SVC). SVCs will not be masked by interrupt locking. Zero-latency interrupt can be used to set up an interrupt at the highest interrupt priority which will not be blocked by interrupt locking. To use the ZLI feature `CONFIG_ZERO_LATENCY_IRQS` needs to be enabled.

Zero latency IRQs have minimal interrupt latency, as they will always preempt regular HW or system interrupts.

Note, however, that since ZLI ISRs will run at a priority level higher than the kernel exceptions they cannot use any kernel functionality. Additionally, since the ZLI interrupt priority level is equal to processor fault priority level, faults occurring in ZLI ISRs will escalate to HardFault and will not be handled in the same way as regular processor faults. Developers need to be aware of this limitation.

**CPU Idling**  
The Cortex-M architecture port implements both `k_cpu_idle()` and `k_cpu_atomic_idle()`. The implementation is present in `arch/arm/core/aarch32/cpu_idle.S`.

In both implementations, the processor will attempt to put the core to low power mode. In `k_cpu_idle()` the processor ends up executing WFI (Wait For Interrupt) instruction, while in `k_cpu_atomic_idle()` the processor will execute a WFE (Wait For Event) instruction.

When using the CPU idling API in Cortex-M it is important to note the following:

- Both `k_cpu_idle()` and `k_cpu_atomic_idle()` are assumed to be invoked with interrupts locked. This is taken care of by the kernel if the APIs are called by the idle thread.
- After waking up from low power mode, both functions will restore interrupts unconditionally, that is, regardless of the interrupt lock status before the CPU idle API was called.

The Zephyr CPU Idling mechanism is detailed in [CPU Idling](#).

**Memory protection features**  
This section describes certain aspects around memory protection features in Arm Cortex-M applications.

**User mode system calls**  
User mode is supported in Cortex-M platforms that implement the standard (Arm) MPU or a similar core peripheral logic for memory access policy configuration and control, such as the NXP MPU for Kinetis platforms. (Currently, `CONFIG_ARCH_HAS_USERSPACE` is selected if `CONFIG_ARM_MPU` is enabled by the user in the board default kconfig settings).

A thread performs a system call by triggering a (synchronous) SVC exception, where

- up to 5 arguments are placed on registers R1 - R5
- system call ID is placed on register R6.

The SVC Handler will branch to the system call preparation logic, which will perform the following operations.
• switch the thread's PSP to point to the beginning of the thread's privileged stack area, optionally reprogramming the PSPLIM if stack limit checking is enabled
• modify CONTROL register to switch to privileged mode
• modify the return address in the SVC exception stack frame, so that after exception return the system call dispatcher is executed (in thread privileged mode)

Once the system call execution is completed the system call dispatcher will restore the user's original PSP and PSPLIM and switch the CONTROL register back to unprivileged mode before returning back to the caller of the system call.

System calls execute in thread mode and can be preempted by interrupts at any time. A thread may also be context-switched-out while doing a system call; the system call will resume as soon as the thread is switched-in again.

The system call dispatcher executes at SVC priority, therefore it cannot be preempted by HW interrupts (with the exception of ZLIs), which may observe some additional interrupt latency if they occur during a system call preparation.

**MPU-assisted stack overflow detection** Cortex-M platforms with MPU may enable `CONFIG_MPU_STACK_GUARD` to enable the MPU-based stack overflow detection mechanism. The following points need to be considered when enabling the MPU stack guards

• stack overflows are triggering processor faults as soon as they occur
• the mechanism is essential for detecting stack overflows in supervisor threads, or user threads in privileged mode; stack overflows in threads in user mode will always be detected regardless of `CONFIG_MPU_STACK_GUARD` being set.
• stack overflows are always detected, however, the mechanism does not guarantee that no memory corruption occurs when supervisor threads overflow their stack memory
• `CONFIG_MPU_STACK_GUARD` will normally reserve one MPU region for programming the stack guard (in certain Arm v8-M configurations with `CONFIG_MPU_GAP_FILLING` enabled 2 MPU regions are required to implement the guard feature)
• MPU guards are re-programmed at every context-switch, adding a small overhead to the thread swap routine. Compared, however, to the `CONFIG_BUILTIN_STACK_GUARD` feature, no re-programming occurs during system calls.
• When `CONFIG_HW_STACK_PROTECTION` is enabled on Arm v8-M platforms the native stack limit checking mechanism is used by default instead of the MPU-based stack overflow detection mechanism; users may override this setting by manually enabling `CONFIG_MPU_STACK_GUARD` in these scenarios.

**Memory map and MPU considerations**

**Fixed MPU regions** By default, when `CONFIG_ARM_MPU` is enabled a set of fixed MPU regions are programmed during system boot.

• One MPU region programs the entire flash area as read-execute. User can override this setting by enabling `CONFIG_MPU_ALLOW_FLASH_WRITE`, which programs the flash with RWX permissions. If `CONFIG_USERSPACE` is enabled unprivileged access on the entire flash area is allowed.
• One MPU region programs the entire SRAM area with privileged-only RW permissions. That is, an MPU region is utilized to disallow execute permissions on SRAM. (An exception to this setting is when `CONFIG_MPU_GAP_FILLING` is disabled (Arm v8-M only); in that case no SRAM MPU programming is done so the access is determined by the default Arm memory map policies, allowing for privileged-only RWX permissions on SRAM).
• All the memory regions defined in the devicetree with the compatible zephyr,memory-region and at least the property zephyr,memory-region-mpu defining the MPU permissions for the memory region. See the next section for more details.

The above MPU regions are defined in soc/arm/common/cortex_m/arm_mpu_regions.c. Alternative MPU configurations are allowed by enabling CONFIG_CPU_HAS_CUSTOM_FIXED_SOC_MPU_REGIONS. When enabled, this option signifies that the Cortex-M SoC will define and configure its own fixed MPU regions in the SoC definition.

**Fixed MPU regions defined in devicetree**  The user can define memory regions to be allocated and created in the linker script using nodes with the zephyr,memory-region devicetree compatible. When the property zephyr,memory-region-mpu is present in such a node, a new MPU region will be allocated and programmed during system boot.

The property zephyr,memory-region-mpu is a string carrying the attributes for the MPU region. It is converted to a C token for use defining the attributes of the MPU region.

For example, to define a new non-cacheable memory region in devicetree:

```c
sram_no_cache: memory@20300000 {
    compatible = "zephyr,memory-region", "mmio-sram";
    reg = <0x20300000 0x100000>;
    zephyr,memory-region = "SRAM_NO_CACHE";
    zephyr,memory-region-mpu = "RAM_NOCACHE";
};
```

This will automatically create a new MPU entry in soc/arm/common/cortex_m/arm_mpu_regions.c with the correct name, base, size and attributes gathered directly from the devicetree. See include/zephyr/linker/devicetree_regions.h for more details.

**Static MPU regions** Additional static MPU regions may be programmed once during system boot. These regions are required to enable certain features:

- a RX region to allow execution from SRAM, when CONFIG_ARCH_HAS_RAMFUNC_SUPPORT is enabled and users have defined functions to execute from SRAM.
- a RX region for relocating text sections to SRAM, when CONFIG_CODE_DATA_RELOCATION_SRAM is enabled
- a no-cache region to allow for a none-cacheable SRAM area, when CONFIG_NOCACHE_MEMORY is enabled
- a possibly unprivileged RW region for GCOV code coverage accounting area, when CONFIG_COVERAGE_GCOV is enabled
- a no-access region to implement null pointer dereference detection, when CONFIG_NULL_POINTER_EXCEPTION_DETECTION_MPU is enabled

The boundaries of these static MPU regions are derived from symbols exposed by the linker, in include/linker/linker-defs.h.

**Dynamic MPU regions** Certain thread-specific MPU regions may be re-programmed dynamically, at each thread context switch:

- an unprivileged RW region for the current thread's stack area (for user threads)
- a read-only region for the MPU stack guard
- unprivileged RW regions for the partitions of the current thread's application memory domain.
Considerations  The number of available MPU regions for a Cortex-M platform is a limited resource. Most platforms have 8 MPU regions, while some Cortex-M33 or Cortex-M7 platforms may have up to 16 MPU regions. Therefore there is a relatively strict limitation on how many fixed, static and dynamic MPU regions may be programmed simultaneously. For platforms with 8 available MPU regions it might not be possible to enable all the aforementioned features that require MPU region programming. In most practical applications, however, only a certain set of features is required and 8 MPU regions are, in many cases, sufficient.

In Arm v8-M processors the MPU architecture does not allow programmed MPU regions to overlap. `CONFIG_MPU_GAP_FILLING` controls whether the fixed MPU region covering the entire SRAM is programmed. When it does, a full SRAM area partitioning is required, in order to program the static and the dynamic MPU regions. This increases the total number of required MPU regions. When `CONFIG_MPU_GAP_FILLING` is not enabled the fixed MPU region covering the entire SRAM is not programmed, thus, the static and dynamic regions are simply programmed on top of the always-existing background region (full-SRAM partitioning is not required). Note, however, that the background SRAM region allows execution from SRAM, so when `CONFIG_MPU_GAP_FILLING` is not set Zephyr is not protected against attacks that attempt to execute malicious code from SRAM.

Floating point Services  Both unshared and shared FP registers mode are supported in Cortex-M (see Floating Point Services for more details).

When FPU support is enabled in the build (`CONFIG_FPU` is enabled), the sharing FP registers mode (`CONFIG_FPU_SHARING`) is enabled by default. This is done as some compiler configurations may activate a floating point context by generating FP instructions for any thread, regardless of whether floating point calculations are performed, and that context must be preserved when switching such threads in and out.

The developers can still disable the FP sharing mode in their application projects, and switch to Unshared FP registers mode, if it is guaranteed that the image code does not generate FP instructions outside the single thread context that is allowed (and supposed) to do so.

Under FPU sharing mode, the callee-saved FPU registers are saved and restored in context-switch, if the corresponding threads have an active FP context. This adds some runtime overhead on the swap routine. In addition to the runtime overhead, the sharing FPU mode

- requires additional memory for each thread to save the callee-saved FP registers
- requires additional stack memory for each thread, to stack the caller-saved FP registers, upon exception entry, if an FP context is active. Note, however, that since lazy stacking is enabled, there is no runtime overhead of FP context stacking in regular interrupts (FP state preservation is only activated in the swap routine in PendSV interrupt).

Misc

Chain-loadable images  Cortex-M applications may either be standalone images or chain-loadable, for instance, by a bootloader. Application images chain-loadable by bootloaders (or other applications) normally occupy a specific area in the flash denoted as their code partition. `CONFIG_USE_DT_CODE_PARTITION` will ensure that a Zephyr chain-loadable image will be linked into its code partition, specified in Device-Tree.

HW initialization at boot  In order to boot properly, chain-loaded applications may require that the core Arm hardware registers and peripherals are initialized in their reset values. Enabling `CONFIG_INIT_ARCH_HW_AT_BOOT` Zephyr to force the initialization of the internal Cortex-M architectural state during boot to the reset values as specified by the corresponding Arm architecture manual.

Software vector relaying  In Cortex-M platforms that implement the VTOR register (see `CONFIG_CPU_CORTEX_M_HAS_VTOR`), chain-loadable images relocate the Cortex-M vector table by updating the VTOR register with the offset of the image vector table.
Baseline Cortex-M platforms without VTOR register might not be able to relocate their vector table which remains at a fixed location. Therefore, a chain-loadable image will require an alternative way to route HW interrupts and system exceptions to its own vector table; this is achieved with software vector relaying.

When a bootloader image enables CONFIG_SW_VECTOR_RELAY it is able to relay exceptions and interrupts based on a vector table pointer that is set by the chain-loadable application. The latter sets the CONFIG_SW_VECTOR_RELAY_CLIENT option to instruct the boot sequence to set the vector table pointer in SRAM so that the bootloader can forward the exceptions and interrupts to the chain-loadable image's software vector table.

While this feature is intended for processors without VTOR register, it may also be used in Mainline Cortex-M platforms.

**Code relocation** Cortex-M support the code relocation feature. When CONFIG_CODE_DATA_RELOCATION_SRAM is selected, Zephyr will relocate .text, data and .bss sections from the specified files and place it in SRAM. It is possible to relocate only parts of the code sections into SRAM, without relocating the whole image text and data sections. More details on the code relocation feature can be found in *Code And Data Relocation*.

**Linking Cortex-M applications**

Most Cortex-M platforms make use of the default Cortex-M GCC linker script in include/arch/arm/aarch32/cortex-m/scripts/linked.ld, although it is possible for platforms to use a custom linker script as well.

**CMSIS**

Cortex-M CMSIS headers are hosted in a standalone module repository: `zephyrproject-rtos/cmsis`. CONFIG_CPU_CORTEX_M selects CONFIG_HAS_CMSIS_CORE to signify that CMSIS headers are available for all supported Cortex-M variants.

**Testing**

A list of unit tests for the Cortex-M porting and miscellaneous features is present in tests/arch/arm/. The tests suites are continuously extended and new test suites are added, in an effort to increase the coverage of the Cortex-M architecture support in Zephyr.

**QEMU**

We use QEMU to verify the implemented features of the Cortex-M architecture port in Zephyr. Adequate coverage is achieved by defining and utilizing a list of QEMU targets, each with a specific architecture variant and Arm peripheral support list.

The table below lists the QEMU platform targets defined in Zephyr along with the corresponding Cortex-M implementation variant and the peripherals these targets emulate.
### Maintainers & Collaborators

The status of the Arm Cortex-M architecture port in Zephyr is: maintained. The updated list of maintainers and collaborators for Cortex-M can be found in MAINTAINERS.yml.

### 7.1.3 Zephyr support status on RISC-V processors

#### Overview

This page describes current state of Zephyr for RISC-V processors. Currently, there's support for some boards, as well as Qemu support and support for some FPGA implementations such as neorv32 and litex_vexriscv.

Zephyr support includes PMP, user mode, several ISA extensions as well as semihosting.

#### User mode and PMP support

When the platform has Physical Memory Protection (PMP) support, enabling it on Zephyr allows user space support and stack protection to be selected.

#### ISA extensions

It's possible to set in Zephyr which ISA extensions (RV32/64I(E)MAFD(G)QC) are available on a given platform, by setting the appropriate RISCV_ISA_* kconfig. Look at `arch/riscv/Kconfig.isa` for more information.

Note that Zephyr SDK toolchain support may not be defined for all combinations.

#### SMP support

SMP is supported on RISC-V, but currently only on Qemu platforms. In order to test the SMP support, one can use `qemu_riscv32_smp` or `qemu_riscv64_smp` boards.

2056 Chapter 7. Hardware Support
Overview

Semihosting is a mechanism that enables code running on ARM and RISC-V targets to communicate and use the Input/Output facilities on a host computer that is running a debugger or emulator.

More complete documentation on the available functionality is available at the ARM Github documentation.

The RISC-V functionality borrows from the ARM definitions, as described at the RISC-V Github documentation.

File Operations

Semihosting enables files on the host computer to be opened, read, and modified by an application. This can be useful when attempting to validate the behaviour of code across datasets that are larger than what can fit into ROM of an emulated platform. File paths can be either absolute, or relative to the directory of the running process.

```c
const char *path = "./data.bin";
long file_len, bytes_read, fd;
uint8_t buffer[16];

/* Open the data file for reading */
fd = semihost_open(path, SEMIHOST_OPEN_RB);
if (fd < 0) {
    return -ENOENT;
}
/* Read all data from the file */
file_len = semihost_flen(fd);
while(file_len > 0) {
    bytes_read = semihost_read(fd, buffer, MIN(file_len, sizeof(buffer)));
    if (bytes_read < 0) {
        break;
    }
    /* Process read data */
    do_data_processing(buffer, bytes_read);
    /* Update remaining length */
    file_len -= bytes_read;
}
/* Close the file */
semihost_close(fd);
```

7.1.5 Additional Functionality

Additional functionality is available by running semihosting instructions directly with `semihost_exec()` with one of the instructions defined in `semihost_instr`. For complete documentation on the required arguments and return codes, see the ARM Github documentation.

API Reference

```
group semihost

 Enums
```
enum semihost_instr
Semihosting instructions.

Values:

enumerator SEMIHOST_OPEN = 0x01
    Open a file or stream on the host system.

enumerator SEMIHOST_ISTTY = 0x09
    Check whether a file is associated with a stream/terminal

enumerator SEMIHOST_WRITE = 0x05
    Write to a file or stream.

enumerator SEMIHOST_READ = 0x06
    Read from a file at the current cursor position.

enumerator SEMIHOST_CLOSE = 0x02
    Closes a file on the host which has been opened by SEMIHOST_OPEN.

enumerator SEMIHOST_FLEN = 0x0C
    Get the length of a file.

enumerator SEMIHOST_SEEK = 0x0A
    Set the file cursor to a given position in a file.

enumerator SEMIHOST_TMPNAM = 0x0D
    Get a temporary absolute file path to create a temporary file.

enumerator SEMIHOST_REMOVE = 0x0E
    Remove a file on the host system. Possibly insecure!

enumerator SEMIHOST_RENAME = 0x0F
    Rename a file on the host system. Possibly insecure!

enumerator SEMIHOST_WRITEC = 0x03
    Write one character to the debug terminal.

enumerator SEMIHOST_WRITE0 = 0x04
    Write a NULL terminated string to the debug terminal.

enumerator SEMIHOST_READC = 0x07
    Read one character from the debug terminal.

enumerator SEMIHOST_CLOCK = 0x10

enumerator SEMIHOST_ELAPSED = 0x30

enumerator SEMIHOST_TICKFREQ = 0x31
enumerator SEMIHOST_TIME = 0x11

text

text

text

enumerator SEMIHOST_ERRNO = 0x13

- Retrieve the errno variable from semihosting operations.

text

text

text

enumerator SEMIHOST_GET_CMDLINE = 0x15

- Get commandline parameters for the application to run with

text

text

text

text

text

enumerator SEMIHOST_HEAPINFO = 0x16

enumerator SEMIHOST_ISERROR = 0x08

enumerator SEMIHOST_SYSTEM = 0x12

enum semihost_open_mode

- Modes to open a file with.

Behaviour corresponds to equivalent fopen strings. i.e. SEMIHOST.OPEN_RB_PLUS == "rb+"

Values:

enumerator SEMIHOST_OPEN_R = 0

enumerator SEMIHOST_OPEN_RB = 1

enumerator SEMIHOST_OPEN_R_PLUS = 2

enumerator SEMIHOST_OPEN_RB_PLUS = 3

enumerator SEMIHOST_OPEN_W = 4

enumerator SEMIHOST_OPEN_WB = 5

enumerator SEMIHOST_OPEN_W_PLUS = 6

enumerator SEMIHOST_OPEN_WB_PLUS = 7

enumerator SEMIHOST_OPEN_A = 8

enumerator SEMIHOST_OPEN_AB = 9

enumerator SEMIHOST.OPEN.A_PLUS = 10

enumerator SEMIHOST.OPEN_AB_PLUS = 11
Functions

long semihost_exec(enum semihost_instr instr, void *args)
Manually execute a semihosting instruction.

Parameters
• instr – instruction code to run
• args – instruction specific arguments

Returns
integer return code of instruction

char semihost_poll_in(void)
Read a byte from the console.

Returns
char byte read from the console.

void semihost_poll_out(char c)
Write a byte to the console.

Parameters
• c – byte to write to console

long semihost_open(const char *path, long mode)
Open a file on the host system.

Parameters
• path – file path to open. Can be absolute or relative to current directory of the running process.
• mode – value from semihost_open_mode.

Return values
• handle – positive handle on success.
• -1 – on failure.

long semihost_close(long fd)
Close a file.

Parameters
• fd – handle returned by semihost_open.

Return values
• 0 – on success.
• -1 – on failure.

long semihost_flen(long fd)
Query the size of a file.

Parameters
• fd – handle returned by semihost_open.

Return values
• positive – file size on success.
• -1 – on failure.
long semihost.seek(long fd, long offset)
   Seeks to an absolute position in a file.

Parameters
   • fd – handle returned by semihost_open.
   • offset – offset from the start of the file in bytes.

Return values
   • 0 – on success.
   • -errno – negative error code on failure.

long semihost.read(long fd, void *buf, long len)
   Read the contents of a file into a buffer.

Parameters
   • fd – handle returned by semihost_open.
   • buf – buffer to read data into.
   • len – number of bytes to read.

Return values
   • read – number of bytes read on success.
   • -errno – negative error code on failure.

long semihost.write(long fd, const void *buf, long len)
   Write the contents of a buffer into a file.

Parameters
   • fd – handle returned by semihost_open.
   • buf – buffer to write data from.
   • len – number of bytes to write.

Return values
   • 0 – on success.
   • -errno – negative error code on failure.

7.1.6  x86 Developer Guide

Overview

This page contains information on certain aspects when developing for x86-based platforms.

Virtual Memory

During very early boot, page tables are loaded so technically the kernel is executing in virtual address space. By default, physical and virtual memory are identity mapped and thus giving the appearance of execution taking place in physical address space. The physical address space is marked by kconfig CONFIG_SRAM_BASE_ADDRESS and CONFIG_SRAM_SIZE while the virtual address space is marked by CONFIG_KERNEL_VM_BASE and CONFIG_KERNEL_VM_SIZE. Note that CONFIG_SRAM_OFFSET controls where the Zephyr kernel is being placed in the memory, and its counterpart CONFIG_KERNEL_VM_OFFSET.
Separate Virtual Address Space from Physical Address Space  
On 32-bit x86, it is possible to have separate physical and virtual address space. Code and data are linked in virtual address space, but are still loaded in physical memory. However, during boot, code and data must be available and also addressable in physical address space before `vm_enter` inside `arch/x86/core/ia32/crt0.S`. After `vm_enter`, code execution is done via virtual addresses and data can be referred via their virtual addresses. This is possible as the page table generation script (`arch/x86/gen_mmu.py`) identity maps the physical addresses at the page directory level, in addition to mapping virtual addresses to the physical memory. Later in the boot process, the entries for identity mapping at the page directory level are cleared in `z_x86_mmu_init()`, effectively removing the identity mapping of physical memory. This unmapping must be done for userspace isolation or else they would be able to access restricted memory via physical addresses. Since the identity mapping is done at the page directory level, there is no need to allocate additional space for the page table. However, additional space may still be required for additional page directory table.

There are restrictions on where virtual address space can be:

- Physical and virtual address spaces must be disjoint. This is required as the entries in page directory table will be cleared. If they are not disjoint, it would clear the entries needed for virtual addresses.
  - If `CONFIG_X86_PAE` is enabled (=y), each address space must reside in their own 1GB region, due to each entry of PDP (Page Directory Pointer) covers 1GB of memory. For example:
    ```
    * Assuming `CONFIG_SRAM_OFFSET` and `CONFIG_KERNEL_VM_OFFSET` are both 0x0.
    * `CONFIG_SRAM_BASE_ADDRESS == 0x00000000` and `CONFIG_KERNEL_VM_BASE = 0x40000000` is valid, while
    * `CONFIG_SRAM_BASE_ADDRESS == 0x00000000` and `CONFIG_KERNEL_VM_BASE = 0x20000000` is not.
    - If `CONFIG_X86_PAE` is disabled (=n), each address space must reside in their own 4MB region, due to each entry of PD (Page Directory) covers 4MB of memory.
    - Both `CONFIG_SRAM_BASE_ADDRESS` and `CONFIG_KERNEL_VM_BASE` must also align with the starting addresses of targeted regions.

Specifying Additional Memory Mappings at Build Time

The page table generation script (`arch/x86/gen_mmu.py`) generates the necessary multi-level page tables for code execution and data access using the kernel image produced by the first linker pass. Additional command line arguments can be passed to the script to generate additional memory mappings. This is useful for static mappings and/or device MMIO access during very early boot. To pass extra command line arguments to the script, populate a CMake list named `X86_EXTRA_GEN_MMU_ARGUMENTS` in the board configuration file. Here is an example:

```cmake
set(X86_EXTRA_GEN_MMU_ARGUMENTS
    --map 0xA0000000,0x2000
    --map 0x80000000,0x400000,LWUX,0xB0000000)
```

The argument `--map` takes the following value: `<physical address>,<size>[,<flags:LUWX>[,<virtual address>]]`, where:

- `<physical address>` is the physical address of the mapping. (Required)
- `<size>` is the size of the region to be mapped. (Required)
- `<flags>` is the flag associated with the mapping: (Optional)
  - L: Large page at the page directory level.
  - U: Allow userspace access.
  - W: Read/write.
  - X: Allow execution.
- D: Cache disabled.
  * Default is small page (4KB), supervisor only, read only, and execution disabled.
  * <virtual address is the virtual address of the mapping. (Optional)

Note that specifying additional memory mappings requires larger storage space for the pre-allocated page tables (both kernel and per-domain tables). CONFIG_X86_EXTRA_PAGE_TABLE_PAGES is needed to specify how many more memory pages to be reserved for the page tables. If the needed space is not exactly the same as required space, the gen_mmu.py script will print out a message indicating what needs to be the value for the kconfig.

7.2 Peripheral and Hardware Emulators

7.2.1 Overview

Zephyr supports a simple emulator framework to support testing of drivers without requiring real hardware.

Emulators are used to emulate hardware devices, to support testing of various subsystems. For example, it is possible to write an emulator for an I2C compass such that it appears on the I2C bus and can be used just like a real hardware device.

Emulators often implement special features for testing. For example a compass may support returning bogus data if the I2C bus speed is too high, or may return invalid measurements if calibration has not yet been completed. This allows for testing that high-level code can handle these situations correctly. Test coverage can therefore approach 100% if all failure conditions are emulated.

7.2.2 Concept

The diagram below shows application code / high-level tests at the top. This is the ultimate application we want to run.

Below that are peripheral drivers, such as the AT24 EEPROM driver. We can test peripheral drivers using an emulation driver connected via a native_posix I2C controller/emulator which passes I2C traffic from the AT24 driver to the AT24 simulator.

Separately we can test the STM32 and NXP I2C drivers on real hardware using API tests. These require some sort of device attached to the bus, but with this, we can validate much of the driver functionality.

Putting the two together, we can test the application and peripheral code entirely on native_posix. Since we know that the I2C driver on the real hardware works, we should expect the application and peripheral drivers to work on the real hardware also.

Using the above framework we can test an entire application (e.g. Embedded Controller) on native_posix using emulators for all non-chip drivers:

The 'real' code is shown in green. The Zephyr emulation-framework code is shown in yellow. The blue boxes are the extra code we have to write to emulate the peripherals.

With this approach we can:

- Write individual tests for each driver (green), covering all failure modes, error conditions, etc.
- Ensure 100% test coverage for drivers (green)
- Write tests for combinations of drivers, such as GPIOs provided by an I2C GPIO expander driver talking over an I2C bus, with the GPIOs controlling a charger. All of this can work in the emulated environment or on real hardware.
- Write a complex application that ties together all of these pieces and runs on native_posix. We can develop on a host, use source-level debugging, etc.
Chapter 7. Hardware Support
7.2.3 Available emulators

Zephyr includes the following emulators:

- EEPROM, which uses a file as the EEPROM contents
- I2C emulator driver, allowing drivers to be connected to an emulator so that tests can be performed without access to the real hardware
- SPI emulator driver, which does the same for SPI
- eSPI emulator driver, which does the same for eSPI. The emulator is being developed to support more functionalities.
- CAN loopback driver

A GPIO emulator is planned but is not yet complete.

7.2.4 Samples

Here are some examples present in Zephyr:

1. Bosch BMI160 sensor driver connected via both I2C and SPI to an emulator:
   
   ```
   west build -b native_posix tests/drivers/sensor/accel/
   ```

2. Simple test of the EEPROM emulator:
   
   ```
   west build -b native_posix tests/drivers/eeprom
   ```

3. The same test has a second EEPROM which is an Atmel AT24 EEPROM driver connected via I2C an emulator:

   ```
   west build -b native_posix tests/drivers/eeprom
   ```

7.3 Peripherals

7.3.1 ADC

Overview

API Reference

```
group adc_interface
    ADC driver APIs.
```

Defines
ADC_CHANNEL_CFG_DT(node_id)

Get ADC channel configuration from a given devicetree node.

This returns a static initializer for a struct `adc_channel_cfg` filled with data from a given devicetree node.

Example devicetree fragment:

```
kadc {
    #address-cells = <1>;
    #size-cells = <0>;

    channel00 {
        reg = <0>;
        zephyr,gain = "ADC_GAIN_1_6";
        zephyr,reference = "ADC_REF_INTERNAL";
        zephyr,acquisition-time = "ADC_ACQ_TIME(ADC_ACQ_TIME_MICROSECONDS, 20)";
        zephyr,input-positive = <NRF_SAADC_AIN6>;
        zephyr,input-negative = <NRF_SAADC_AIN7>;
    }

    channel01 {
        reg = <1>;
        zephyr,gain = "ADC_GAIN_1_6";
        zephyr,reference = "ADC_REF_INTERNAL";
        zephyr,acquisition-time = "ADC_ACQ_TIME_DEFAULT";
        zephyr,input-positive = <NRF_SAADC_AIN0>;
    }
}
```

Example usage:

```
static const struct adc_channel_cfg ch0_cfg_dt =
    ADC_CHANNEL_CFG_DT(DT_CHILD(DT_NODELABEL(adc), channel_0));
static const struct adc_channel_cfg ch1_cfg_dt =
    ADC_CHANNEL_CFG_DT(DT_CHILD(DT_NODELABEL(adc), channel_1));
```

// Initializes 'ch0_cfg_dt' to:
// {
// .channel_id = 0,
// .gain = ADC_GAIN_1_6,
// .reference = ADC_REF_INTERNAL,
// .acquisition_time = ADC_ACQ_TIME(ADC_ACQ_TIME_MICROSECONDS, 20),
// .differential = true,
// .input_positive = NRF_SAADC_AIN6,
// .input-negative = NRF_SAADC_AIN7,
// }
// and 'ch1_cfg_dt' to:
// {
// .channel_id = 1,
// .gain = ADC_GAIN_1_6,
// .reference = ADC_REF_INTERNAL,
// .acquisition_time = ADC_ACQ_TIME_DEFAULT,
// .input_positive = NRF_SAADC_AIN0,
// }
Parameters

• node_id – Devicetree node identifier.

Returns

Static initializer for an \textit{adc\_channel\_cfg} structure.

\texttt{ADC\_DT\_SPEC\_GET\_BY\_IDX(node\_id, idx)}

Get ADC io-channel information from devicetree.

This returns a static initializer for an \textit{adc\_dt\_spec} structure given a devicetree node and a channel index. The node must have the “io-channels” property defined.

Example devicetree fragment:

\begin{verbatim}
/ {
   zephyr,user {
      io-channels = <&adc0 1>, <&adc0 3>;
   };
};&adc0 {
   #address-cells = <1>;
   #size-cells = <0>;
   channel03 {
      reg = <3>;
      zephyr,gain = "ADC\_GAIN\_1\_5";
      zephyr,reference = "ADC\_REF\_VDD\_1\_4";
      zephyr,vref-mv = <750>;
      zephyr,acquisition-time = <ADC\_ACQ\_TIME\_DEFAULT>;
      zephyr,resolution = <12>;
      zephyr,oversampling = <4>;
   }
};
\end{verbatim}

Example usage:

\begin{verbatim}
static const struct adc\_dt\_spec adc\_chan0 =
   ADC\_DT\_SPEC\_GET\_BY\_IDX(DT\_PATH(zephyr\_user), 0);
static const struct adc\_dt\_spec adc\_chan1 =
   ADC\_DT\_SPEC\_GET\_BY\_IDX(DT\_PATH(zephyr\_user), 1);

// Initializes 'adc\_chan0' to:
//  {
//    .dev = DEVICE\_DT\_GET(DT\_NODELABEL(adc0)),
//    .channel\_id = 1,
//  }
// and 'adc\_chan1' to:
//  {
//    .dev = DEVICE\_DT\_GET(DT\_NODELABEL(adc0)),
//    .channel\_id = 3,
//    .channel\_cfg\_dt\_node\_exists = true,
//    .channel\_cfg = {
//      .channel\_id = 3,
//      .gain = ADC\_GAIN\_1\_5,
//      .reference = ADC\_REF\_VDD\_1\_4,
//    }
\end{verbatim}
// .acquisition_time = ADC_ACQ_TIME_DEFAULT,
// },
// .vref_mv = 750,
// .resolution = 12,
// .oversampling = 4,
// }

See also:

`ADC_DT_SPEC_GET()`

Parameters

- `node_id` – Devicetree node identifier.
- `idx` – Channel index.

Returns

Static initializer for an `adc_dt_spec` structure.

`ADC_DT_SPEC_INST_GET_BY_IDX`(inst, idx)

Get ADC io-channel information from a DT_DRV_COMPAT devicetree instance.

See also:

`ADC_DT_SPEC_GET_BY_IDX()`

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – Channel index.

Returns

Static initializer for an `adc_dt_spec` structure.

`ADC_DT_SPEC_GET(node_id)`

Equivalent to `ADC_DT_SPEC_GET_BY_IDX(node_id, 0)`.

See also:

`ADC_DT_SPEC_GET()`

Parameters

- `node_id` – Devicetree node identifier.

Returns

Static initializer for an `adc_dt_spec` structure.

`ADC_DT_SPEC_INST_GET`(inst)

Equivalent to `ADC_DT_SPEC_INST_GET_BY_IDX(inst, 0)`.

See also:

`ADC_DT_SPEC_GET()`
• inst – DT_DRV_COMPAT instance number

Returns
Static initializer for an adc_dt_spec structure.

Typedefs

typedef enum adc_action (*adc_sequence_callback)(const struct device *dev, const struct adc_sequence *sequence, uint16_t sampling_index)
  Type definition of the optional callback function to be called after a requested sampling is done.
  
  Param dev
  Pointer to the device structure for the driver instance.
  
  Param sequence
  Pointer to the sequence structure that triggered the sampling. This parameter points to a copy of the structure that was supplied to the call that started the sampling sequence, thus it cannot be used with the CONTAINER_OF() macro to retrieve some other data associated with the sequence. Instead, the adc_sequence_options::user_data field should be used for such purpose.
  
  Param sampling_index
  Index (0-65535) of the sampling done.
  
  Return
  Action to be performed by the driver. See adc_action.

typedef int (*adc_api_channel_setup)(const struct device *dev, const struct adc_channel_cfg *channel_cfg)
  Type definition of ADC API function for configuring a channel. See adc_channel_setup() for argument descriptions.

typedef int (*adc_api_read)(const struct device *dev, const struct adc_sequence *sequence)
  Type definition of ADC API function for setting a read request. See adc_read() for argument descriptions.

typedef int (*adc_api_read_async)(const struct device *dev, const struct adc_sequence *sequence, struct k_poll_signal *async)
  Type definition of ADC API function for setting an asynchronous read request. See adc_read_async() for argument descriptions.

Enums

enum adc_gain
  ADC channel gain factors.
  
  Values:

  enumerator ADC_GAIN_1_6
      x 1/6.

  enumerator ADC_GAIN_1_5
      x 1/5.
enumerator ADC_GAIN_1_4
  x 1/4.
enumerator ADC_GAIN_1_3
  x 1/3.
enumerator ADC_GAIN_2_5
  x 2/5.
enumerator ADC_GAIN_1_2
  x 1/2.
enumerator ADC_GAIN_2_3
  x 2/3.
enumerator ADC_GAIN_4_5
  x 4/5.
enumerator ADC_GAIN_1
  x 1.
enumerator ADC_GAIN_2
  x 2.
enumerator ADC_GAIN_3
  x 3.
enumerator ADC_GAIN_4
  x 4.
enumerator ADC_GAIN_6
  x 6.
enumerator ADC_GAIN_8
  x 8.
enumerator ADC_GAIN_12
  x 12.
enumerator ADC_GAIN_16
  x 16.
enumerator ADC_GAIN_24
  x 24.
enumerator ADC_GAIN_32
  x 32.
enumerator ADC_GAIN_64
    x 64.

enumerator ADC_GAIN_128
    x 128.

enum adc_reference
    ADC references.
    Values:

enumerator ADC_REF_VDD_1
    VDD.

enumerator ADC_REF_VDD_1_2
    VDD/2.

enumerator ADC_REF_VDD_1_3
    VDD/3.

enumerator ADC_REF_VDD_1_4
    VDD/4.

enumerator ADC_REF_INTERNAL
    Internal.

enumerator ADC_REF_EXTERNAL0
    External, input 0.

enumerator ADC_REF_EXTERNAL1
    External, input 1.

enum adc_action
    Action to be performed after a sampling is done.
    Values:

enumerator ADC_ACTION_CONTINUE = 0
    The sequence should be continued normally.

enumerator ADC_ACTION_REPEAT
    The sampling should be repeated. New samples or sample should be read from the ADC
    and written in the same place as the recent ones.

enumerator ADC_ACTION_FINISH
    The sequence should be finished immediately.

Functions

7.3. Peripherals
int adc_gain_invert(enum adc_gain gain, int32_t *value)
Invert the application of gain to a measurement value.

For example, if the gain passed in is ADC_GAIN_1_6 and the referenced value is 10, the value after the function returns is 60.

Parameters
- **gain** – the gain used to amplify the input signal.
- **value** – a pointer to a value that initially has the effect of the applied gain but has that effect removed when this function successfully returns. If the gain cannot be reversed the value remains unchanged.

Return values
- 0 – if the gain was successfully reversed
- EINVAL – if the gain could not be interpreted

int adc_channel_setup(const struct device *dev, const struct adc_channel_cfg *channel_cfg)
Configure an ADC channel.

It is required to call this function and configure each channel before it is selected for a read request.

Parameters
- **dev** – Pointer to the device structure for the driver instance.
- **channel_cfg** – Channel configuration.

Return values
- 0 – On success.
- EINVAL – If a parameter with an invalid value has been provided.

static inline int adc_channel_setup_dt(const struct adc_dt_spec *spec)
Configure an ADC channel from a struct adc_dt_spec.

See also:
- **adc_channel_setup()**

Parameters
- **spec** – ADC specification from Devicetree.

Returns
A value from adc_channel_setup() or -ENOTSUP if information from Devicetree is not valid.

int adc_read(const struct device *dev, const struct adc_sequence *sequence)
Set a read request.

If invoked from user mode, any sequence struct options for callback must be NULL.

Parameters
- **dev** – Pointer to the device structure for the driver instance.
- **sequence** – Structure specifying requested sequence of samplings.

Return values
- 0 – On success.
-EINVAL – If a parameter with an invalid value has been provided.
-ENOMEM – If the provided buffer is too small to hold the results of all requested samplings.
-ENOTSUP – If the requested mode of operation is not supported.
-EBUSY – If another sampling was triggered while the previous one was still in progress. This may occur only when samplings are done with intervals, and it indicates that the selected interval was too small. All requested samples are written in the buffer, but at least some of them were taken with an extra delay compared to what was scheduled.

```c
int adc_read_async(const struct device *dev, const struct adc_sequence *sequence, struct k_poll_signal *async)
```

Set an asynchronous read request.

If invoked from user mode, any sequence struct options for callback must be NULL.

**Note:** This function is available only if `CONFIG_ADC_ASYNC` is selected.

**Parameters**
- `dev` – Pointer to the device structure for the driver instance.
- `sequence` – Structure specifying requested sequence of samplings.
- `async` – Pointer to a valid and ready to be signaled struct `k_poll_signal`. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

**Returns**
0 on success, negative error code otherwise. See `adc_read()` for a list of possible error codes.

```c
static inline uint16_t adc_ref_internal(const struct device *dev)
```

Get the internal reference voltage.

**Returns**
Returns the voltage corresponding to `ADC_REF_INTERNAL`, measured in millivolts.

```c
static inline int adc_raw_to_millivolts(int32_t ref_mv, enum adc_gain gain, uint8_t resolution, int32_t *valp)
```

Convert a raw ADC value to millivolts.

This function performs the necessary conversion to transform a raw ADC measurement to a voltage in millivolts.

**Parameters**
- `ref_mv` – the reference voltage used for the measurement, in millivolts. This may be from `adc_ref_internal()` or a known external reference.
- `gain` – the ADC gain configuration used to sample the input
- `resolution` – the number of bits in the absolute value of the sample. For differential sampling this needs to be one less than the resolution in struct `adc_sequence`.
• `valp` – pointer to the raw measurement value on input, and the corresponding millivolt value on successful conversion. If conversion fails the stored value is left unchanged.

**Return values**

• 0 – on successful conversion
• -EINVAL – if the gain is not reversible

static inline int adc_raw_to_millivolts_dt(const struct adc_dt_spec *spec, int32_t *valp)
Convert a raw ADC value to millivolts using information stored in a struct `adc_dt_spec`.

See also:

`adc_raw_to_millivolts()`

**Parameters**

• `spec` – [in] ADC specification from Devicetree.
• `valp` – [inout] Pointer to the raw measurement value on input, and the corresponding millivolt value on successful conversion. If conversion fails the stored value is left unchanged.

**Returns**

A value from `adc_raw_to_millivolts()` or -ENOTSUP if information from Device-tree is not valid.

static inline int adc_sequence_init_dt(const struct adc_dt_spec *spec, struct adc_sequence *seq)
Initialize a struct `adc_sequence` from information stored in struct `adc_dt_spec`.

Note that this function only initializes the following fields:

• `adc_sequence::channels`
• `adc_sequence::resolution`
• `adc_sequence::oversampling`

Other fields should be initialized by the caller.

**Parameters**

• `spec` – [in] ADC specification from Devicetree.
• `seq` – [out] Sequence to initialize.

**Return values**

• 0 – On success
• -ENOTSUP – If `spec` does not have valid channel configuration

```c
struct adc_channel_cfg
    #include <adc.h> Structure for specifying the configuration of an ADC channel.
```

**Public Members**

```c
enum adc_gain gain
    Gain selection.
```
enum adc_reference reference
  Reference selection.

uint16_t acquisition_time
  Acquisition time. Use the ADC_ACQ_TIME macro to compose the value for this field
  or pass ADC_ACQ_TIME_DEFAULT to use the default setting for a given hardware (e.g.
  when the hardware does not allow to configure the acquisition time). Particular drivers
  do not necessarily support all the possible units. Value range is 0-16383 for a given unit.

uint8_t channel_id
  Channel identifier. This value primarily identifies the channel within the ADC API - when
  a read request is done, the corresponding bit in the “channels” field of the “adc_sequence”
  structure must be set to include this channel in the sampling. For hardware that does not
  allow selection of analog inputs for given channels, but rather have dedicated ones, this
  value also selects the physical ADC input to be used in the sampling. Otherwise, when it is
  needed to explicitly select an analog input for the channel, or two inputs when the channel
  is a differential one, the selection is done in “input_positive” and “input_negative” fields.
  Particular drivers indicate which one of the above two cases they support by selecting or
  not a special hidden Kconfig option named ADC_CONFIGURABLE_INPUTS. If this option
  is not selected, the macro CONFIG_ADC_CONFIGURABLE_INPUTS is not defined and
  consequently the mentioned two fields are not present in this structure. While this API
  allows identifiers from range 0-31, particular drivers may support only a limited number
  of channel identifiers (dependent on the underlying hardware capabilities or configured
  via a dedicated Kconfig option).

uint8_t differential
  Channel type: single-ended or differential.

struct adc_dt_spec
  #include <adc.h> Container for ADC channel information specified in devicetree.

  See also:
  ADC_DT_SPEC_GET_BY_IDX

  See also:
  ADC_DT_SPEC_GET

Public Members

const struct device *dev
  Pointer to the device structure for the ADC driver instance used by this io-channel.

uint8_t channel_id
  ADC channel identifier used by this io-channel.

bool channel_cfg_dt_node_exists
  Flag indicating whether configuration of the associated ADC channel is provided as a child
  node of the corresponding ADC controller in devicetree.
struct adc_channel_cfg channel_cfg

Configuration of the associated ADC channel specified in devicetree. This field is valid only when channel_cfg_dt_node_exists is set to true.

uint16_t vref_mv

Voltage of the reference selected for the channel or 0 if this value is not provided in devicetree. This field is valid only when channel_cfg_dt_node_exists is set to true.

uint8_t resolution

ADC resolution to be used for that channel. This field is valid only when channel_cfg_dt_node_exists is set to true.

uint8_t oversampling

Oversampling setting to be used for that channel. This field is valid only when channel_cfg_dt_node_exists is set to true.

struct adc_sequence_options

#include <adc.h> Structure defining additional options for an ADC sampling sequence.

Public Members

uint32_t interval_us

Interval between consecutive samplings (in microseconds), 0 means sample as fast as possible, without involving any timer. The accuracy of this interval is dependent on the implementation of a given driver. The default routine that handles the intervals uses a kernel timer for this purpose, thus, it has the accuracy of the kernel's system clock. Particular drivers may use some dedicated hardware timers and achieve a better precision.

adc_sequence_callback callback

Callback function to be called after each sampling is done. Optional - set to NULL if it is not needed.

void *user_data

Pointer to user data. It can be used to associate the sequence with any other data that is needed in the callback function.

uint16_t extra_samplings

Number of extra samplings to perform (the total number of samplings is 1 + extra_samplings).

struct adc_sequence

#include <adc.h> Structure defining an ADC sampling sequence.

Public Members

const struct adc_sequence_options *options

Pointer to a structure defining additional options for the sequence. If NULL, the sequence consists of a single sampling.
uint32_t channels
   Bit-mask indicating the channels to be included in each sampling of this sequence. All
   selected channels must be configured with `adc_channel_setup()` before they are used in a
   sequence.

void *buffer
   Pointer to a buffer where the samples are to be written. Samples from subsequent sam-
   plings are written sequentially in the buffer. The number of samples written for each
   sampling is determined by the number of channels selected in the “channels” field. The
   buffer must be of an appropriate size, taking into account the number of selected chan-
   nels and the ADC resolution used, as well as the number of samplings contained in the
   sequence.

size_t buffer_size
   Specifies the actual size of the buffer pointed by the “buffer” field (in bytes). The driver
   must ensure that samples are not written beyond the limit and it must return an error if
   the buffer turns out to be not large enough to hold all the requested samples.

uint8_t resolution
   ADC resolution. For single-ended channels the sample values are from range: 0 .. 2^res-
   olution - 1, for differential ones:
   • 2^(resolution-1) .. 2^(resolution-1) - 1.

uint8_t oversampling
   Oversampling setting. Each sample is averaged from 2^oversampling conversion results.
   This feature may be unsupported by a given ADC hardware, or in a specific mode (e.g.
   when sampling multiple channels).

bool calibrate
   Perform calibration before the reading is taken if requested.
   The impact of channel configuration on the calibration process is specific to the underlying
   hardware. ADC implementations that do not support calibration should ignore this flag.

struct adc_driver_api
   #include <adc.h> ADC driver API.
   This is the mandatory API any ADC driver needs to expose.

### 7.3.2 Audio

**Audio Codec**

**Overview** The Audio Codec API provides access to digital audio codecs.

**Configuration Options** Related configuration options:

- `CONFIG_AUDIO_CODEC`

**API Reference**

*group audio_codec_interface*

Abstraction for audio codecs.
Enums

```c
enum audio_pcm_rate_t
    PCM audio sample rates
    Values:

    enumerator AUDIO_PCM_RATE_8K = 8000
    enumerator AUDIO_PCM_RATE_16K = 16000
    enumerator AUDIO_PCM_RATE_24K = 24000
    enumerator AUDIO_PCM_RATE_32K = 32000
    enumerator AUDIO_PCM_RATE_44P1K = 44100
    enumerator AUDIO_PCM_RATE_48K = 48000
    enumerator AUDIO_PCM_RATE_96K = 96000
    enumerator AUDIO_PCM_RATE_192K = 192000

enum audio_pcm_width_t
    PCM audio sample bit widths
    Values:

    enumerator AUDIO_PCM_WIDTH_16_BITS = 16
    enumerator AUDIO_PCM_WIDTH_20_BITS = 20
    enumerator AUDIO_PCM_WIDTH_24_BITS = 24
    enumerator AUDIO_PCM_WIDTH_32_BITS = 32

enum audio_dai_type_t
    Digital Audio Interface (DAI) type
    Values:

    enumerator AUDIO_DAI_TYPE_I2S
    enumerator AUDIO_DAI_TYPE_INVALID

enum audio_property_t
    Codec properties that can be set by `audio_codec_set_property()`
    Values:
```
enumerator AUDIOPROPERTYOUTPUTVOLUME
enumerator AUDIOPROPERTYOUTPUTMUTE

enum audio_channel_t
    Audio channel identifiers to use in audio_codec_set_property()
    Values:
    enumerator AUDIOCHANNELFRONTLEFT
    enumerator AUDIOCHANNELFRONTRIGHT
    enumerator AUDIOCHANNELLFE
    enumerator AUDIOCHANNELFRONTCENTER
    enumerator AUDIOCHANNELREARLEFT
    enumerator AUDIOCHANNELREARRIGHT
    enumerator AUDIOCHANNELREARCENTER
    enumerator AUDIOCHANNELSIDELEFT
    enumerator AUDIOCHANNELSIDERIGHT
    enumerator AUDIOCHANNELALL

Functions

static inline int audio_codec_configure(const struct device *dev, struct audio_codec_cfg *cfg)
Configure the audio codec.
    Configure the audio codec device according to the configuration parameters provided as input
    Parameters
        • dev – Pointer to the device structure for codec driver instance.
        • cfg – Pointer to the structure containing the codec configuration.
    Returns
        0 on success, negative error code on failure

static inline void audio_codec_start_output(const struct device *dev)
Set codec to start output audio playback.
    Setup the audio codec device to start the audio playback
    Parameters
        • dev – Pointer to the device structure for codec driver instance.
static inline void audio_codec_stop_output(const struct device *dev)
Set codec to stop output audio playback.

Parameters
• dev – Pointer to the device structure for codec driver instance.

static inline int audio_codec_set_property(const struct device *dev, audio_property_t property, audio_channel_t channel, audio_property_value_t val)
Set a codec property defined by audio_property_t.
Set a property such as volume level, clock configuration etc.

Parameters
• dev – Pointer to the device structure for codec driver instance.
• property – The codec property to set
• channel – The audio channel for which the property has to be set
• val – Pointer to a property value of type audio_codec_property_value_t

Returns
0 on success, negative error code on failure

static inline int audio_codec_apply_properties(const struct device *dev)
Atomically apply any cached properties.
Following one or more invocations of audio_codec_set_property, that may have been cached by the driver, audio_codec_apply_properties can be invoked to apply all the properties as atomic as possible

Parameters
• dev – Pointer to the device structure for codec driver instance.

Returns
0 on success, negative error code on failure

union audio_dai_cfg_t
#include <codec.h> Digital Audio Interface Configuration Configuration is dependent on DAI type

Public Members

struct i2s_config 12s

struct audio_codec_cfg
#include <codec.h> Codec configuration parameters

union audio_property_value_t
#include <codec.h> Codec property values

Public Members
Audio DMIC

Overview  The audio DMIC interface provides access to digital microphones.

Configuration Options  Related configuration options:

- CONFIG_AUDIO_DMIC

API Reference

*group* audio_dmic_interface

Abstraction for digital microphones.

Enums

enum dmic_state

DMIC driver states

*Values:*

- enumerator DMIC_STATE_UNINIT
- enumerator DMIC_STATE_INITIALIZED
- enumerator DMIC_STATE_CONFIGURED
- enumerator DMIC_STATE_ACTIVE
- enumerator DMIC_STATE_PAUSED

enum dmic_trigger

DMIC driver trigger commands

*Values:*

- enumerator DMIC_TRIGGER_STOP
- enumerator DMIC_TRIGGER_START
- enumerator DMIC_TRIGGER_PAUSE
- enumerator DMIC_TRIGGER_RELEASE
enumerator DMIC_TRIGGER_RESET

enum pdm_lr
  PDM Channels LEFT / RIGHT
Values:
  enumerator PDM_CHAN_LEFT
  enumerator PDM_CHAN_RIGHT

Functions

static inline uint32_t dmic_build_channel_map(uint8_t channel, uint8_t pdm, enum pdm_lr lr)
  Build the channel map to populate struct pdm_chan_cfg
  Returns the map of PDM controller and LEFT/RIGHT channel shifted to the bit position corresponding to the input logical channel value
Parameters
  • channel – The logical channel number
  • pdm – The PDM hardware controller number
  • lr – LEFT/RIGHT channel within the chosen PDM hardware controller
Returns
  Bit-map containing the PDM and L/R channel information

static inline void dmic_parse_channel_map(uint32_t channel_map_lo, uint32_t channel_map_hi, uint8_t channel, uint8_t *pdm, enum pdm_lr *lr)
  Helper function to parse the channel map in pdm_chan_cfg
  Returns the PDM controller and LEFT/RIGHT channel corresponding to the channel map and the logical channel provided as input
Parameters
  • channel_map_lo – Lower order/significant bits of the channel map
  • channel_map_hi – Higher order/significant bits of the channel map
  • channel – The logical channel number
  • pdm – Pointer to the PDM hardware controller number
  • lr – Pointer to the LEFT/RIGHT channel within the PDM controller
Returns
  Bit-map containing the PDM and L/R channel information

static inline uint32_t dmic_build_clk_skew_map(uint8_t pdm, uint8_t skew)
  Build a bit map of clock skew values for each PDM channel
  Returns the bit-map of clock skew value shifted to the bit position corresponding to the input PDM controller value
Parameters
  • pdm – The PDM hardware controller number
  • skew – The skew to apply for the clock output from the PDM controller
Returns
  Bit-map containing the clock skew information
static inline int dmic_configure(const struct device *dev, struct dmic_cfg *cfg)
    Configure the DMIC driver and controller(s)
    Configures the DMIC driver device according to the number of channels, channel mapping, PDM I/O configuration, PCM stream configuration, etc.

    Parameters
    • dev – Pointer to the device structure for DMIC driver instance
    • cfg – Pointer to the structure containing the DMIC configuration

    Returns
    0 on success, a negative error code on failure

static inline int dmic_trigger(const struct device *dev, enum dmic_trigger cmd)
    Send a command to the DMIC driver
    Sends a command to the driver to perform a specific action

    Parameters
    • dev – Pointer to the device structure for DMIC driver instance
    • cmd – The command to be sent to the driver instance

    Returns
    0 on success, a negative error code on failure

static inline int dmic_read(const struct device *dev, uint8_t stream, void **buffer, size_t *size, int32_t timeout)
    Read received decimated PCM data stream
    Optionally waits for audio to be received and provides the received audio buffer from the requested stream

    Parameters
    • dev – Pointer to the device structure for DMIC driver instance
    • stream – Stream identifier
    • buffer – Pointer to the received buffer address
    • size – Pointer to the received buffer size
    • timeout – Timeout in milliseconds to wait in case audio is not yet received, or SYS_FOREVER_MS

    Returns
    0 on success, a negative error code on failure

struct pdm_io_cfg
    #include <dmic.h> PDM Input/Output signal configuration

struct pcm_stream_cfg
    #include <dmic.h> Configuration of the PCM streams to be output by the PDM hardware

struct pdm_chan_cfg
    #include <dmic.h> Mapping/ordering of the PDM channels to logical PCM output channel

struct dmic_cfg
    #include <dmic.h> Input configuration structure for the DMIC configuration API
I2S

Overview  The I2S (Inter-IC Sound) API provides support for the standard I2S interface as well as common non-standard extensions such as PCM Short/Long Frame Sync and Left/Right Justified Data Formats.

Configuration Options  Related configuration options:

- CONFIG_I2S

API Reference

group i2s_interface

I2S (Inter-IC Sound) Interface.

The I2S API provides support for the standard I2S interface standard as well as common non-standard extensions such as PCM Short/Long Frame Sync, Left/Right Justified Data Format.

Defines

I2S_FMT_DATA_FORMAT_SHIFT
  Data Format bit field position.

I2S_FMT_DATA_FORMAT_MASK
  Data Format bit field mask.

I2S_FMT_DATA_FORMAT_I2S
  Standard I2S Data Format.
  Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The MSB is always sent one clock period after the WS changes. Left channel data are sent first indicated by WS = 0, followed by right channel data indicated by WS = 1.

I2S_FMT_DATA_FORMAT_PCM_SHORT
  PCM Short Frame Sync Data Format.
  Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the falling edge of the clock signal (SCK). The falling edge of the frame sync signal (WS) indicates the start of the PCM word. The frame sync is one clock cycle long. An arbitrary number of data words can be sent in one frame.
I2S_FMT_DATA_FORMAT_PCM_LONG

PCM Long Frame Sync Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the falling edge of the clock signal (SCK). The rising edge of the frame sync signal (WS) indicates the start of the PCM word. The frame sync has an arbitrary length, however it has to fall before the start of the next frame. An arbitrary number of data words can be sent in one frame.

I2S_FMT_DATA_FORMAT_LEFT_JUSTIFIED

Left Justified Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The bits within the data word are left justified such that the MSB is always sent in the clock period following the WS transition. Left channel data are sent first indicated by WS = 1, followed by right channel data indicated by WS = 0.

I2S_FMT_DATA_FORMAT_RIGHT_JUSTIFIED

Right Justified Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The bits within the data word are right justified such that the LSB is always sent in the clock period preceding the WS transition. Left channel data are sent first indicated by WS = 1, followed by right channel data indicated by WS = 0.
I2S_FMT_DATA_ORDER_MSB
    Send MSB first

I2S_FMT_DATA_ORDER_LSB
    Send LSB first

I2S_FMT_DATA_ORDER_INV
    Invert bit ordering, send LSB first

I2S_FMT_CLK_FORMAT_SHIFT
    Data Format bit field position.

I2S_FMT_CLK_FORMAT_MASK
    Data Format bit field mask.

I2S_FMT_BIT_CLK_INV
    Invert bit clock

I2S_FMT_FRAME_CLK_INV
    Invert frame clock

I2S_FMT_CLK_NF_NB
    NF represents “Normal Frame” whereas IF represents “Inverted Frame” NB represents “Normal Bit Clk” whereas IB represents “Inverted Bit clk”

I2S_FMT_CLK_NF_IB

I2S_FMT_CLK_IF_NB

I2S_FMT_CLK_IF_IB

I2S_OPT_BIT_CLK_CONT
    Run bit clock continuously

I2S_OPT_BIT_CLK_GATED
    Run bit clock when sending data only

I2S_OPT_BIT_CLK_MASTER
    I2S driver is bit clock master

I2S_OPT_BIT_CLK_SLAVE
    I2S driver is bit clock slave
I2S_OPT_FRAME_CLK_MASTER
   I2S driver is frame clock master

I2S_OPT_FRAME_CLK_SLAVE
   I2S driver is frame clock slave

I2S_OPT_LOOPBACK
   Loop back mode.
   In loop back mode RX input will be connected internally to TX output. This is used primarily
   for testing.

I2S_OPT_PINGPONG
   Ping pong mode.
   In ping pong mode TX output will keep alternating between a ping buffer and a pong buffer.
   This is normally used in audio streams when one buffer is being populated while the other
   is being played (DMAed) and vice versa. So, in this mode, 2 sets of buffers fixed in size are
   used. Static Arrays are used to achieve this and hence they are never freed.

Typedefs

typedef uint8_t i2s_fmt_t

typedef uint8_t i2s_opt_t

Enums

enum i2s_dir
   I2C Direction.
   Values:

   enumerator I2S_DIR_RX
      Receive data

   enumerator I2S_DIR_TX
      Transmit data

   enumerator I2S_DIR_BOTH
      Both receive and transmit data

enum i2s_state
   Interface state
   Values:

   enumerator I2S_STATE_NOT_READY
      The interface is not ready.
The interface was initialized but **is not** yet ready to receive / transmit data. Call `i2s_configure()` to configure interface and change its state to READY.

**enumerator I2S_STATE_READY**

The interface is ready to receive / transmit data.

**enumerator I2S_STATE_RUNNING**

The interface is receiving / transmitting data.

**enumerator I2S_STATE_STOPPING**

The interface is draining its transmit queue.

**enumerator I2S_STATE_ERROR**

TX buffer underrun or RX buffer overrun has occurred.

**enum i2s_trigger_cmd**

Trigger command

**Values:**

**enumerator I2S_TRIGGER_START**

Start the transmission / reception of data.

If `I2S_DIR_TX` is set some data has to be queued for transmission by the `i2s_write()` function. This trigger can be used in READY state only and changes the interface state to RUNNING.

**enumerator I2S_TRIGGER_STOP**

Stop the transmission / reception of data.

Stop the transmission / reception of data at the end of the current memory block. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When the current TX / RX block is transmitted / received the state is changed to READY. Subsequent START trigger will resume transmission / reception where it stopped.

**enumerator I2S_TRIGGER_DRAIN**

Empty the transmit queue.

Send all data in the transmit queue and stop the transmission. If the trigger is applied to the RX queue it has the same effect as `I2S_TRIGGER_STOP`. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When all TX blocks are transmitted the state is changed to READY.
enumerator I2S_TRIGGER_DROP
Discard the transmit / receive queue.

Stop the transmission / reception immediately and discard the contents of the respective queue. This trigger can be used in any state other than NOT_READY and changes the interface state to READY.

enumerator I2S_TRIGGER_PREPARE
Prepare the queues after underrun/overrun error has occurred.

This trigger can be used in ERROR state only and changes the interface state to READY.

Functions

int i2s_configure(const struct device *dev, enum i2s_dir dir, const struct i2s_config *cfg)
Configure operation of a host I2S controller.

The dir parameter specifies if Transmit (TX) or Receive (RX) direction will be configured by data provided via cfg parameter.

The function can be called in NOT_READY or READY state only. If executed successfully the function will change the interface state to READY.

If the function is called with the parameter cfg->frame_clk_freq set to 0 the interface state will be changed to NOT_READY.

Parameters

• dev – Pointer to the device structure for the driver instance.
• dir – Stream direction: RX, TX, or both, as defined by I2S_DIR_*. The I2S_DIR_BOTH value may not be supported by some drivers. For those, the RX and TX streams need to be configured separately.
• cfg – Pointer to the structure containing configuration parameters.

Return values

• 0 – If successful.
• -EINVAL – Invalid argument.
• -ENOSYS – I2S_DIR_BOTH value is not supported.

static inline const struct i2s_config *i2s_config_get(const struct device *dev, enum i2s_dir dir)
Fetch configuration information of a host I2S controller.

Parameters

• dev – Pointer to the device structure for the driver instance
• dir – Stream direction: RX or TX as defined by I2S_DIR_*

Return values

Pointer – to the structure containing configuration parameters, or NULL if un-configured
static inline int i2s_read(const struct device *dev, void **mem_block, size_t *size)

Read data from the RX queue.

Data received by the I2S interface is stored in the RX queue consisting of memory blocks preallocated by this function from rx_mem_slab (as defined by i2s_configure). Ownership of the RX memory block is passed on to the user application which has to release it.

The data is read in chunks equal to the size of the memory block. If the interface is in READY state the number of bytes read can be smaller.

If there is no data in the RX queue the function will block waiting for the next RX memory block to fill in. This operation can timeout as defined by i2s_configure. If the timeout value is set to K_NO_WAIT the function is non-blocking.

Reading from the RX queue is possible in any state other than NOT_READY. If the interface is in the ERROR state it is still possible to read all the valid data stored in RX queue. Afterwards the function will return -EIO error.

**Parameters**

- dev – Pointer to the device structure for the driver instance.
- mem_block – Pointer to the RX memory block containing received data.
- size – Pointer to the variable storing the number of bytes read.

**Return values**

- 0 – If successful.
- -EIO – The interface is in NOT_READY or ERROR state and there are no more data blocks in the RX queue.
- -EBUSY – Returned without waiting.
- -EAGAIN – Waiting period timed out.

int i2s_buf_read(const struct device *dev, void *buf, size_t *size)

Read data from the RX queue into a provided buffer.

Data received by the I2S interface is stored in the RX queue consisting of memory blocks preallocated by this function from rx_mem_slab (as defined by i2s_configure). Calling this function removes one block from the queue which is copied into the provided buffer and then freed.

The provided buffer must be large enough to contain a full memory block of data, which is parameterized for the channel via i2s_configure() .

This function is otherwise equivalent to i2s_read().

**Parameters**

- dev – Pointer to the device structure for the driver instance.
- buf – Destination buffer for read data, which must be at least the as large as the configured memory block size for the RX channel.
- size – Pointer to the variable storing the number of bytes read.

**Return values**

- 0 – If successful.
- -EIO – The interface is in NOT_READY or ERROR state and there are no more data blocks in the RX queue.
- -EBUSY – Returned without waiting.
- -EAGAIN – Waiting period timed out.
static inline int i2s_write(const struct device *dev, void *mem_block, size_t size)
{
    Write data to the TX queue.

    Data to be sent by the I2S interface is stored first in the TX queue. TX queue consists of
    memory blocks preallocated by the user from tx_mem slab (as defined by i2s_configure).
    This function takes ownership of the memory block and will release it when all data are
    transmitted.

    If there are no free slots in the TX queue the function will block waiting for the next TX
    memory block to be send and removed from the queue. This operation can timeout as defined
    by i2s_config. If the timeout value is set to K_NO_WAIT the function is non-blocking.

    Writing to the TX queue is only possible if the interface is in READY or RUNNING state.

    Parameters

    • dev – Pointer to the device structure for the driver instance.
    • mem_block – Pointer to the TX memory block containing data to be sent.
    • size – Number of bytes to write. This value has to be equal or smaller than the
      size of the memory block.

    Return values

    • 0 – If successful.
    • -EIO – The interface is not in READY or RUNNING state.
    • -EBUSY – Returned without waiting.
    • -EAGAIN – Waiting period timed out.

int i2s_buf_write(const struct device *dev, void *buf, size_t size)
{
    Write data to the TX queue from a provided buffer.

    This function acquires a memory block from the I2S channel TX queue and copies the provided
    data buffer into it. It is otherwise equivalent to i2s_write().

    Parameters

    • dev – Pointer to the device structure for the driver instance.
    • buf – Pointer to a buffer containing the data to transmit.
    • size – Number of bytes to write. This value has to be equal or smaller than the
      size of the channel's TX memory block configuration.

    Return values

    • 0 – If successful.
    • -EIO – The interface is not in READY or RUNNING state.
    • -EBUSY – Returned without waiting.
    • -EAGAIN – Waiting period timed out.
    • -ENOMEM – No memory in TX slab queue.
    • -EINVAL – Size parameter larger than TX queue memory block.

int i2s_trigger(const struct device *dev, enum i2s_dir dir, enum i2s_trigger_cmd cmd)
{
    Send a trigger command.

    Parameters

    • dev – Pointer to the device structure for the driver instance.
    • dir – Stream direction: RX, TX, or both, as defined by I2S_DIR_. The
      I2S_DIR_BOTH value may not be supported by some drivers. For those, trig-
      gering need to be done separately for the RX and TX streams.
Return values

- **0** – If successful.
- **-EINVAL** – Invalid argument.
- **-EIO** – The trigger cannot be executed in the current state or a DMA channel cannot be allocated.
- **-ENOMEM** – RX/TX memory block not available.
- **-ENOSYS** – I2S_DIR_BOTH value is not supported.

```c
struct i2s_config
```

```
#include <i2s.h> Interface configuration options.
```

Memory slab pointed to by the mem_slab field has to be defined and initialized by the user. For I2S driver to function correctly number of memory blocks in a slab has to be at least 2 per queue. Size of the memory block should be multiple of frame_size where frame_size = (channels * word_size_bytes). As an example 16 bit word will occupy 2 bytes, 24 or 32 bit word will occupy 4 bytes.

Please check Zephyr Kernel Primer for more information on memory slabs.

Remark

When I2S data format is selected parameter channels is ignored, number of words in a frame is always 2.

**Param word_size**
Number of bits representing one data word.

**Param channels**
Number of words per frame.

**Param format**
Data stream format as defined by I2S_FMT_* constants.

**Param options**
Configuration options as defined by I2S_OPT_* constants.

**Param frame_clk_freq**
Frame clock (WS) frequency, this is sampling rate.

**Param mem_slab**
Memory slab to store RX/TX data.

**Param block_size**
Size of one RX/TX memory block (buffer) in bytes.

**Param timeout**
Read/Write timeout. Number of milliseconds to wait in case TX queue is full or RX queue is empty, or 0, or SYS_FOREVER_MS.

DAI

**Overview** The DAI (Digital Audio Interface) is a generic high level API for audio drivers. It can be configured with bespoke data for vendor specific configuration.
Configuration Options
Related configuration options:
- CONFIG_DAI

API Reference

group dai_interface

DAI Interface.
The DAI API provides support for the standard I2S (SSP) and its common variants. It supports also DMIC, HDA and SDW backends. The API has a config function with bespoke data argument for device/vendor specific config. There are also optional timestamping functions to get device specific audio clock time.

Enums

enum dai_type

Types of DAI.
The type of the DAI. This ID type is used to configure bespoke DAI HW settings.
DAIs have a lot of physical link feature variability and therefore need different configuration data to cater for different use cases. We usually need to pass extra bespoke configuration prior to DAI start.
Values:

enumerator DAI_LEGACY_I2S = 0
Legacy I2S compatible with i2s.h
enumerator DAI_INTEL_SSP
Intel SSP
enumerator DAI_INTEL_DMIC
Intel DMIC
enumerator DAI_INTEL_HDA
Intel HD/A
enumerator DAI_INTEL_ALH
Intel ALH
enumerator DAI_IMX_SAI
i.MX SAI
enumerator DAI_IMX_ESAI
i.MX ESAI
enumerator DAI_AMD_BT
Amd BT
enumerator DAI_AMD_SP
Amd SP
enumerator DAI_AMD_DMIC
    Amd DMIC

enumerator DAI_MEDIATEK_AFE
    Mtk AFE

denominator DAI_INTEL_SSP_NHLT
    nhlt ssp

denominator DAI_INTEL_DMIC_NHLT
    nhlt ssp

denominator DAI_INTEL_HDA_NHLT
    nhlt Intel HD/A

denominator DAI_INTEL_ALH_NHLT
    nhlt Intel ALH

denom dai_dir
    Dai Direction.
    Values:

  denominator DAI_DIR_RX = 1
      Receive data

  denominator DAI_DIR_TX
      Transmit data

  denominator DAI_DIR_BOTH
      Both receive and transmit data

denom dai_state
    Interface state
    Values:

  denominator DAI_STATE_NOT_READY = 0
      The interface is not ready.

      The interface was initialized but is not yet ready to receive / transmit data. Call dai_config_set() to configure interface and change its state to READY.

  denominator DAI_STATE_READY
      The interface is ready to receive / transmit data.

  denominator DAI_STATE_RUNNING
      The interface is receiving / transmitting data.
enumerator DAI_STATE_PRE_RUNNING
The interface is clocking but not receiving / transmitting data.

enumerator DAI_STATE_PAUSED
The interface paused

enumerator DAI_STATE_STOPPING
The interface is draining its transmit queue.

enumerator DAI_STATE_ERROR
TX buffer underrun or RX buffer overrun has occurred.

enum dai_trigger_cmd
Trigger command
Values:

enumerator DAI_TRIGGER_START = 0
Start the transmission / reception of data.

If DAI_DIR_TX is set some data has to be queued for transmission by the dai_write() function. This trigger can be used in READY state only and changes the interface state to RUNNING.

enumerator DAI_TRIGGER_PRE_START
Optional - Pre Start the transmission / reception of data.

Allows the DAI and downstream codecs to prepare for audio Tx/Rx by starting any required clocks for downstream PLL/FLL locking.

enumerator DAI_TRIGGER_STOP
Stop the transmission / reception of data.

Stop the transmission / reception of data at the end of the current memory block. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When the current TX / RX block is transmitted / received the state is changed to READY. Subsequent START trigger will resume transmission / reception where it stopped.

enumerator DAI_TRIGGER_PAUSE
Pause the transmission / reception of data.

Pause the transmission / reception of data at the end of the current memory block. Behavior is implementation specific but usually this state doesn’t completely stop the clocks or transmission. The dai_
could be transmitting 0's (silence), but it is not consuming data from outside.

enumerator DAI_TRIGGER_POST_STOP
Optional - Post Stop the transmission / reception of data.

Allows the DAI and downstream codecs to shutdown cleanly after audio Tx/Rx by stopping any required clocks for downstream audio completion.

enumerator DAI_TRIGGER_DRAIN
Empty the transmit queue.

Send all data in the transmit queue and stop the transmission. If the trigger is applied to the RX queue it has the same effect as DAI_TRIGGER_STOP. This trigger can be used in RUNNING state only and at first changes the interface state to STOPPING. When all TX blocks are transmitted the state is changed to READY.

enumerator DAI_TRIGGER_DROP
Discard the transmit / receive queue.

Stop the transmission / reception immediately and discard the contents of the respective queue. This trigger can be used in any state other than NOT_READY and changes the interface state to READY.

enumerator DAI_TRIGGER_PREPARE
Prepare the queues after underrun/overrun error has occurred.

This trigger can be used in ERROR state only and changes the interface state to READY.

enumerator DAI_TRIGGER_RESET
Reset.

This trigger frees resources and moves the driver back to initial state.

enumerator DAI_TRIGGER_COPY
Copy.

This trigger prepares for data copying.
Functions

static inline int dai_probe(const struct device *dev)

Probe operation of DAI driver.

The function will be called to power up the device and update for example possible reference count of the users. It can be used also to initialize internal variables and memory allocation.

Parameters

• dev – Pointer to the device structure for the driver instance.

Return values

0 – If successful.

static inline int dai_remove(const struct device *dev)

Remove operation of DAI driver.

The function will be called to unregister/unbind the device, for example to power down the device or decrease the usage reference count.

Parameters

• dev – Pointer to the device structure for the driver instance.

Return values

0 – If successful.

static inline int dai_config_set(const struct device *dev, const struct dai_config *cfg, const void *bespoke_cfg)

Configure operation of a DAI driver.

The dir parameter specifies if Transmit (TX) or Receive (RX) direction will be configured by data provided via cfg parameter.

The function can be called in NOT_READY or READY state only. If executed successfully the function will change the interface state to READY.

If the function is called with the parameter cfg->frame_clk_freq set to 0 the interface state will be changed to NOT_READY.

Parameters

• dev – Pointer to the device structure for the driver instance.

• cfg – Pointer to the structure containing configuration parameters.

• bespoke_cfg – Pointer to the structure containing bespoke config.

Return values

• 0 – If successful.

• -EINVAL – Invalid argument.

• -ENOSYS – DAI_DIR_BOTH value is not supported.

static inline const struct dai_config *dai_config_get(const struct device *dev, enum dai_dir dir)

Fetch configuration information of a DAI driver.

Parameters

• dev – Pointer to the device structure for the driver instance.

• dir – Stream direction: RX or TX as defined by DAI_DIR_*

Return values

Pointer – to the structure containing configuration parameters, or NULL if un-configured.
static inline const struct \textit{dai\_properties} *\textit{dai\_get\_properties}(const struct \textit{device} *\textit{dev}, enum \textit{dai\_dir} \textit{dir}, int \textit{stream\_id})

Fetch properties of a DAI driver.

\textbf{Parameters}

- \textit{dev} – Pointer to the device structure for the driver instance.
- \textit{dir} – Stream direction: RX or TX as defined by DAI\_DIR\_\*.
- \textit{stream\_id} – Stream id: some drivers may have stream specific properties, this id specifies the stream.

\textbf{Return values}

Pointer to the structure containing properties, or NULL if error or no properties.

static inline int \textit{dai\_trigger}(const struct \textit{device} *\textit{dev}, enum \textit{dai\_dir} \textit{dir}, enum \textit{dai\_trigger\_cmd} \textit{cmd})

Send a trigger command.

\textbf{Parameters}

- \textit{dev} – Pointer to the device structure for the driver instance.
- \textit{dir} – Stream direction: RX, TX, or both, as defined by DAI\_DIR\_\*.
  The DAI\_DIR\_\* value may not be supported by some drivers. For those, triggering need to be done separately for the RX and TX streams.
- \textit{cmd} – Trigger command.

\textbf{Return values}

- 0 – If successful.
- -EINVAL – Invalid argument.
- -EIO – The trigger cannot be executed in the current state or a DMA channel cannot be allocated.
- -ENOMEM – RX/TX memory block not available.
- -ENOSYS – DAI\_DIR\_\* value is not supported.

static inline int \textit{dai\_ts\_config}(const struct \textit{device} *\textit{dev}, struct \textit{dai\_ts\_cfg} *\textit{cfg})

Configures timestamping in attached DAI.

Optional method.

\textbf{Parameters}

- \textit{dev} – Component device.
- \textit{cfg} – Timestamp config.

\textbf{Return values}

0 – If successful.

static inline int \textit{dai\_ts\_start}(const struct \textit{device} *\textit{dev}, struct \textit{dai\_ts\_cfg} *\textit{cfg})

Starts timestamping.

Optional method.

\textbf{Parameters}

- \textit{dev} – Component device.
- \textit{cfg} – Timestamp config.
Return values
0 – If successful.

static inline int dai_ts_stop(const struct device *dev, struct dai_ts_cfg *cfg)

Stops timestamping.
Optional method.

Parameters
• dev – Component device.
• cfg – Timestamp config.

Return values
0 – If successful.

static inline int dai_ts_get(const struct device *dev, struct dai_ts_cfg *cfg, struct dai_ts_data *tsd)

Gets timestamp.
Optional method.

Parameters
• dev – Component device.
• cfg – Timestamp config.
• tsd – Receives timestamp data.

Return values
0 – If successful.

struct dai_properties
#include <dai.h> Properties of DAI.

This struct is used with APIs get_properties function to query DAI properties like fifo address and dma handshake. These are needed for example to setup dma outside the driver code.

Param fifo_address
Fifo hw address for e.g. when connecting to dma.

Param fifo_depth
Fifo depth.

Param dma_hs_id
Dma handshake id.

Param reg_init_delay
Delay for initializing registers.

Param stream_id
Stream ID.

struct dai_config
#include <dai.h> Generic Dai interface configuration options.

Main dai config struct

Param dai_type
Type of the dai.

Param dai_index
Index of the dai.
Param channels
   Number of audio channels, words in frame.

Param rate
   Frame clock (WS) frequency, sampling rate.

Param format
   Dai specific data stream format.

Param options
   Dai specific configuration options.

Param word_size
   Number of bits representing one data word.

Param block_size
   Size of one RX/TX memory block (buffer) in bytes.

struct dai_ts_cfg
   #include <dai.h>

struct dai_ts_data
   #include <dai.h>

7.3.3 Controller Area Network (CAN)

CAN Controller

- Overview
- Sending
- Receiving
- Setting the bitrate
- SocketCAN
- Samples
- CAN Controller API Reference
- CAN Transceiver API Reference

Overview
   Controller Area Network is a two-wire serial bus specified by the Bosch CAN Specification, Bosch CAN with Flexible Data-Rate specification and the ISO 11898-1:2003 standard. CAN is mostly known for its application in the automotive domain. However, it is also used in home and industrial automation and other products.

A CAN transceiver is an external device that converts the logic level signals from the CAN controller to the bus-levels. The bus lines are called CAN High (CAN H) and CAN Low (CAN L). The transmit wire from the controller to the transceiver is called CAN TX, and the receive wire is called CAN RX. These wires use the logic levels whereas the bus-level is interpreted differentially between CAN H and CAN L. The bus can be either in the recessive (logical one) or dominant (logical zero) state. The recessive state is when both lines, CAN H and CAN L, are roughly at the same voltage level. This state is also the idle state. To write a dominant bit to the bus, open-drain transistors tie CAN H to Vdd and CAN L to ground. The first and last node use a 120-ohm resistor between CAN H and CAN L to terminate the bus. The dominant state always overrides the recessive state. This structure is called a wired-AND.
**Warning:** CAN controllers can only initialize when the bus is in the idle (recessive) state for at least 11 recessive bits. Therefore you have to make sure that CAN RX is high, at least for a short time. This is also necessary for loopback mode.

The bit-timing as defined in ISO 11898-1:2003 looks as following:

A single bit is split into four segments.

- **Sync_Seg:** The nodes synchronize at the edge of the Sync_Seg. It is always one time quantum in length.
- **Prop_Seg:** The signal propagation delay of the bus and other delays of the transceiver and node.
- **Phase_Seg1 and Phase_Seg2:** Define the sampling point. The bit is sampled at the end of Phase_Seg1.

The bit-rate is calculated from the time of a time quantum and the values defined above. A bit has the length of Sync_Seg plus Prop_Seg plus Phase_Seg1 plus Phase_Seg2 multiplied by the time of single time quantum. The bit-rate is the inverse of the length of a single bit.

A bit is sampled at the sampling point. The sample point is between Phase_Seg1 and Phase_Seg2 and therefore is a parameter that the user needs to choose. The CiA recommends setting the sample point to 87.5% of the bit.

The resynchronization jump width (SJW) defines the amount of time quantum the sample point can be moved. The sample point is moved when resynchronization is needed.

The timing parameters (SJW, bitrate and sampling point, or bitrate, Prop_Seg, Phase_Seg1 and Phase_Seg2) are initially set from the device-tree and can be changed at run-time from the timing-API.

CAN uses so-called identifiers to identify the frame instead of addresses to identify a node. This identifier can either have 11-bit width (Standard or Basic Frame) or 29-bit in case of an Extended Frame. The Zephyr CAN API supports both Standard and Extended identifiers concurrently. A CAN frame starts with a dominant Start Of Frame bit. After that, the identifiers follow. This phase is called the arbitration phase. During the arbitration phase, write collisions are allowed. They resolve by the fact that dominant bits override recessive bits. Nodes monitor the bus and notice when their transmission is being overridden and in case, abort their transmission. This effectively gives lower number identifiers priority over higher number identifiers.
Filters are used to whitelist identifiers that are of interest for the specific node. An identifier that doesn’t match any filter is ignored. Filters can either match exactly or a specified part of the identifier. This method is called masking. As an example, a mask with 11 bits set for standard or 29 bits set for extended identifiers must match perfectly. Bits that are set to zero in the mask are ignored when matching an identifier. Most CAN controllers implement a limited number of filters in hardware. The number of filters is also limited in Kconfig to save memory.

Errors may occur during transmission. In case a node detects an erroneous frame, it partially overrides the current frame with an error-frame. Error-frames can either be error passive or error active, depending on the state of the controller. In case the controller is in error active state, it sends six consecutive dominant bits, which is a violation of the stuffing rule that all nodes can detect. The sender may resend the frame right after.

An initialized node can be in one of the following states:

- Error-active
- Error-passive
- Bus-off

After initialization, the node is in the error-active state. In this state, the node is allowed to send active error frames, ACK, and overload frames. Every node has a receive- and transmit-error counter. If either the receive- or the transmit-error counter exceeds 127, the node changes to error-passive state. In this state, the node is not allowed to send error-active frames anymore. If the transmit-error counter increases further to 255, the node changes to the bus-off state. In this state, the node is not allowed to send any dominant bits to the bus. Nodes in the bus-off state may recover after receiving 128 occurrences of 11 concurrent recessive bits.

You can read more about CAN bus in this CAN Wikipedia article.

Zephyr supports following CAN features:

- Standard and Extended Identifiers
- Filters with Masking
- Loopback and Silent mode
- Remote Request

Sending  The following code snippets show how to send data.

This basic sample sends a CAN frame with standard identifier 0x123 and eight bytes of data. When passing NULL as the callback, as shown in this example, the send function blocks until the frame is sent and acknowledged by at least one other node or an error occurred. The timeout only takes effect on acquiring a mailbox. When a transmitting mailbox is assigned, sending cannot be canceled.

```c
struct can_frame frame = {
    .flags = 0,
    .id = 0x123,
    .dlc = 8,
    .data = {1,2,3,4,5,6,7,8}
};
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
int ret;
ret = can_send(can_dev, &frame, K_MSEC(100), NULL, NULL);
if (ret != 0) {
    LOG_ERR("Sending failed [%d]", ret);
}
```

This example shows how to send a frame with extended identifier 0x1234567 and two bytes of data. The provided callback is called when the message is sent, or an error occurred. Passing \texttt{K\_FOREVER} to
the timeout causes the function to block until a transfer mailbox is assigned to the frame or an error occurred. It does not block until the message is sent like the example above.

```c
void tx_callback(const struct device *dev, int error, void *user_data)
{
    char *sender = (char *)user_data;
    if (error != 0) {
        LOG_ERR("Sending failed [%d]\nSender: %s\n", error, sender);
    }
}

int send_function(const struct device *can_dev)
{
    struct can_frame frame = {
        .flags = CAN_FRAME_IDE,
        .id = 0x1234567,
        .dlc = 2
    };
    frame.data[0] = 1;
    frame.data[1] = 2;
    return can_send(can_dev, &frame, K_FOREVER, tx_irq_callback, "Sender 1");
}
```

Receiving Frames are only received when they match a filter. The following code snippets show how to receive frames by adding filters.

Here we have an example for a receiving callback as used for `can_add_rx_filter()`. The user data argument is passed when the filter is added.

```c
void rx_callback_function(const struct device *dev, struct can_frame *frame, void *user_data)
{
    ... do something with the frame ...
}
```

The following snippet shows how to add a filter with a callback function. It is the most efficient but also the most critical way to receive messages. The callback function is called from an interrupt context, which means that the callback function should be as short as possible and must not block. Adding callback functions is not allowed from userspace context.

The filter for this example is configured to match the identifier 0x123 exactly.

```c
const struct can_filter my_filter = {
    .flags = CAN_FILTER_DATA,
    .id = 0x123,
    .id_mask = CAN_STD_ID_MASK
};
int filter_id;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
filter_id = can_add_rx_filter(can_dev, rx_callback_function, callback_arg, &my_filter);
if (filter_id < 0) {
    LOG_ERR("Unable to add rx filter [%d]", filter_id);
}
```
Here an example for `can_add_rx_filter_msgq()` is shown. With this function, it is possible to receive frames synchronously. This function can be called from userspace context. The size of the message queue should be as big as the expected backlog.

The filter for this example is configured to match the extended identifier 0x1234567 exactly.

```c
const struct can_filter my_filter = {
    .flags = CAN_FILTER_DATA | CAN_FILTER_IDE,
    .id = 0x1234567,
    .id_mask = CAN_EXT_ID_MASK
};
CAN_MSGQ_DEFINE(my_can_msgq, 2);
struct can_frame rx_frame;
int filter_id;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));

filter_id = can_add_rx_filter_msgq(can_dev, &my_can_msgq, &my_filter);
if (filter_id < 0) {
    LOG_ERR("Unable to add rx msgq [%d]", filter_id);
    return;
}

while (true) {
    k_msgq_get(&my_can_msgq, &rx_frame, K_FOREVER);
    ... do something with the frame ...
}

`can_remove_rx_filter()` removes the given filter.

`can_remove_rx_filter(can_dev, filter_id);`
```

Setting the bitrate  The bitrate and sampling point is initially set at runtime. To change it from the application, one can use the `can_set_timing()` API. The `can_calc_timing()` function can calculate timing from a bitrate and sampling point in permille. The following example sets the bitrate to 250k baud with the sampling point at 87.5%.

```c
struct can_timing timing;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
int ret;

ret = can_calc_timing(can_dev, &timing, 250000, 875);
if (ret > 0) {
    LOG_INF("Sample-Point error: %d", ret);
}
if (ret < 0) {
    LOG_ERR("Failed to calc a valid timing");
    return;
}

ret = can_stop(can_dev);
if (ret != 0) {
    LOG_ERR("Failed to stop CAN controller");
}

ret = can_set_timing(can_dev, &timing);
if (ret != 0) {
```
A similar API exists for calculating and setting the timing for the data phase for CAN-FD capable controllers. See `can_set_timing_data()` and `can_calc_timing_data()`.

**SocketCAN**  Zephyr additionally supports SocketCAN, a BSD socket implementation of the Zephyr CAN API. SocketCAN brings the convenience of the well-known BSD Socket API to Controller Area Networks. It is compatible with the Linux SocketCAN implementation, where many other high-level CAN projects build on top. Note that frames are routed to the network stack instead of passed directly, which adds some computation and memory overhead.

**Samples**  We have two ready-to-build samples demonstrating use of the Zephyr CAN API Zephyr CAN counter sample and SocketCAN sample.

**CAN Controller API Reference**

**group can_interface**

**CAN Interface.**

**CAN controller configuration**

```c
int can_get_core_clock(const struct device *dev, uint32_t *rate)
```

Get the CAN core clock rate.

Returns the CAN core clock rate. One time quantum is 1/(core clock rate).

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `rate` – [out] CAN core clock rate in Hz.

**Returns**

0 on success, or a negative error code on error

```c
int can_get_max_bitrate(const struct device *dev, uint32_t *max_bitrate)
```

Get maximum supported bitrate.

Get the maximum supported bitrate for the CAN controller/transceiver combination.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `max_bitrate` – [out] Maximum supported bitrate in bits/s

**Return values**

- -EIO – General input/output error.
- -ENOSYS – If this function is not implemented by the driver.
const struct can_timing *can_get_timing_min(const struct device *dev)
Get the minimum supported timing parameter values.

Parameters
• dev – Pointer to the device structure for the driver instance.

Returns
Pointer to the minimum supported timing parameter values.

const struct can_timing *can_get_timing_max(const struct device *dev)
Get the maximum supported timing parameter values.

Parameters
• dev – Pointer to the device structure for the driver instance.

Returns
Pointer to the maximum supported timing parameter values.

int can_calc_timing(const struct device *dev, struct can_timing *res, uint32_t bitrate, uint16_t sample_pnt)
Calculate timing parameters from bitrate and sample point.
Calculate the timing parameters from a given bitrate in bits/s and the sampling point in per-mill (1/1000) of the entire bit time. The bitrate must always match perfectly. If no result can be reached for the given parameters, EINVAL is returned.

Parameters
• dev – Pointer to the device structure for the driver instance.
• res – [out] Result is written into the can_timing struct provided.
• bitrate – Target bitrate in bits/s.
• sample_pnt – Sampling point in permill of the entire bit time.

Return values
• 0 – or positive sample point error on success.
• -EINVAL – if the requested bitrate or sample point is out of range.
• -ENOTSUP – if the requested bitrate is not supported.
• -EIO – if can_get_core_clock() is not available.

const struct can_timing *can_get_timing_data_min(const struct device *dev)
Get the minimum supported timing parameter values for the data phase.
Same as can_get_timing_min() but for the minimum values for the data phase.

Note: CONFIG_CAN_FD_MODE must be selected for this function to be available.
const struct can_timing *can_get_timing_data_max(const struct device *dev)
Get the maximum supported timing parameter values for the data phase.
Same as can_get_timing_max() but for the maximum values for the data phase.

Note: CONFIG_CAN_FD_MODE must be selected for this function to be available.

Parameters
• dev – Pointer to the device structure for the driver instance.

Returns
Pointer to the maximum supported timing parameter values, or NULL if CAN-FD support is not implemented by the driver.

int can_calc_timing_data(const struct device *dev, struct can_timing *res, uint32_t bitrate, uint16_t sample_pnt)
Calculate timing parameters for the data phase.
Same as can_calc_timing() but with the maximum and minimum values from the data phase.

Note: CONFIG_CAN_FD_MODE must be selected for this function to be available.

Parameters
• dev – Pointer to the device structure for the driver instance.
• res – [out] Result is written into the can_timing struct provided.
• bitrate – Target bitrate for the data phase in bits/s
• sample_pnt – Sampling point for the data phase in permille of the entire bit time.

Return values
• 0 – or positive sample point error on success.
• -EINVAL – if the requested bitrate or sample point is out of range.
• -ENOTSUP – if the requested bitrate is not supported.
• -EIO – if can_get_core_clock() is not available.

int can_set_timing_data(const struct device *dev, const struct can_timing *timing_data)
Configure the bus timing for the data phase of a CAN-FD controller.
If the sjw equals CAN_SJW_NO_CHANGE, the sjw parameter is not changed.

See also:
can_set_timing()

Note: CONFIG_CAN_FD_MODE must be selected for this function to be available.

Parameters
• dev – Pointer to the device structure for the driver instance.
• timing_data – Bus timings for data phase
Return values

- 0 – If successful.
- -EBUSY – if the CAN controller is not in stopped state.
- -EIO – General input/output error, failed to configure device.
- -ENOSYS – if CAN-FD support is not implemented by the driver.

```
int can_set_bitrate_data(const struct device *dev, uint32_t bitrate_data)
```

Set the bitrate for the data phase of the CAN-FD controller.

CAN in Automation (CiA) 301 v4.2.0 recommends a sample point location of 87.5% percent for all bitrates. However, some CAN controllers have difficulties meeting this for higher bitrates.

This function defaults to using a sample point of 75.0% for bitrates over 800 kbit/s, 80.0% for bitrates over 500 kbit/s, and 87.5% for all other bitrates. This is in line with the sample point locations used by the Linux kernel.

See also:

*can_set_bitrate()

Note: CONFIG_CAN_FD_MODE must be selected for this function to be available.

Parameters

- dev – Pointer to the device structure for the driver instance.
- bitrate_data – Desired data phase bitrate.

Return values

- 0 – If successful.
- -EBUSY – if the CAN controller is not in stopped state.
- -EINVAL – if the requested bitrate is out of range.
- -ENOTSUP – if the requested bitrate not supported by the CAN controller/transceiver combination.
- -ERANGE – if the resulting sample point is off by more than +/- 5%.
- -EIO – General input/output error, failed to set bitrate.

```
int can_calc_prescaler(const struct device *dev, struct can_timing *timing, uint32_t bitrate)
```

Fill in the prescaler value for a given bitrate and timing.

Fill the prescaler value in the timing struct. The *sjw*, *prop_seg*, *phase_seg1* and *phase_seg2* must be given.

The returned bitrate error is remainder of the division of the clock rate by the bitrate times the timing segments.

Parameters

- dev – Pointer to the device structure for the driver instance.
- timing – Result is written into the *can_timing* struct provided.
- bitrate – Target bitrate.

Return values
int can_set_timing(const struct device *dev, const struct can_timing *timing)
Configure the bus timing of a CAN controller.
If the sjw equals CAN_SJW_NO_CHANGE, the sjw parameter is not changed.

See also:
can_set_timing_data()

Parameters
• dev – Pointer to the device structure for the driver instance.
• timing – Bus timings.

Return values
• 0 – If successful.
• -EBUSY – if the CAN controller is not in stopped state.
• -EIO – General input/output error, failed to configure device.

int can_get_capabilities(const struct device *dev, can_mode_t *cap)
Get the supported modes of the CAN controller.
The returned capabilities may not necessarily be supported at the same time (e.g. some CAN controllers support both CAN_MODE_LOOPBACK and CAN_MODE_LISTENONLY, but not at the same time).

Parameters
• dev – Pointer to the device structure for the driver instance.
• cap – [out] Supported capabilities.

Return values
• 0 – If successful.
• -EIO – General input/output error, failed to get capabilities.

int can_start(const struct device *dev)
Start the CAN controller.
Bring the CAN controller out of CAN_STATE_STOPPED. This will reset the RX/TX error counters, enable the CAN controller to participate in CAN communication, and enable the CAN tranceiver, if supported.

See also:
can_stop()
See also:
can_transceiver_enable()

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – if successful.
• -EALREADY – if the device is already started.
• -EIO – General input/output error, failed to start device.

```c
int can_stop(const struct device *dev)
```

Stop the CAN controller.

Bring the CAN controller into CAN_STATE_STOPPED. This will disallow the CAN controller from participating in CAN communication, abort any pending CAN frame transmissions, and disable the CAN transceiver, if supported.

**See also:**

- `can_start()`
- `can_transceiver_disable()`

### Parameters

- `dev` – Pointer to the device structure for the driver instance.

### Return values

- 0 – if successful.
- -EALREADY – if the device is already stopped.
- -EIO – General input/output error, failed to stop device.

```c
int can_set_mode(const struct device *dev, can_mode_t mode)
```

Set the CAN controller to the given operation mode.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `mode` – Operation mode.

### Return values

- 0 – If successful.
- -EBUSY – if the CAN controller is not in stopped state.
- -EIO – General input/output error, failed to configure device.

```c
int can_set_bitrate(const struct device *dev, uint32_t bitrate)
```

Set the bitrate of the CAN controller.

CAN in Automation (CiA) 301 v4.2.0 recommends a sample point location of 87.5% percent for all bitrates. However, some CAN controllers have difficulties meeting this for higher bitrates.

This function defaults to using a sample point of 75.0% for bitrates over 800 kbit/s, 80.0% for bitrates over 500 kbit/s, and 87.5% for all other bitrates. This is in line with the sample point locations used by the Linux kernel.

**See also:**

- `can_set_bitrate_data()`

#### Parameters

- `dev` – Pointer to the device structure for the driver instance.
bitrate – Desired arbitration phase bitrate.

**Return values**

- **0** – If successful.
- **-EBUSY** – if the CAN controller is not in stopped state.
- **-EINVAL** – if the requested bitrate is out of range.
- **-ENOTSUP** – if the requested bitrate not supported by the CAN controller/transceiver combination.
- **-ERANGE** – if the resulting sample point is off by more than +/- 5%.
- **-EIO** – General input/output error, failed to set bitrate.

**CAN_SJW_NO_CHANGE**

Synchronization Jump Width (SJW) value to indicate that the SJW should not be changed by the timing calculation.

### Transmitting CAN frames

```c
int can_send(const struct device *dev, const struct can_frame *frame, k_timeout_t timeout,
             can_tx_callback_t callback, void *user_data)
```

Queue a CAN frame for transmission on the CAN bus.

Queue a CAN frame for transmission on the CAN bus with optional timeout and completion callback function.

Queued CAN frames are transmitted in order according to the their priority:

- The lower the CAN-ID, the higher the priority.
- Data frames have higher priority than Remote Transmission Request (RTR) frames with identical CAN-IDs.
- Frames with standard (11-bit) identifiers have higher priority than frames with extended (29-bit) identifiers with identical base IDs (the higher 11 bits of the extended identifier).
- Transmission order for queued frames with the same priority is hardware dependent.

By default, the CAN controller will automatically retry transmission in case of lost bus arbitration or missing acknowledge. Some CAN controllers support disabling automatic retransmissions via **CAN_MODE_ONE_SHOT**.

**Note:** If transmitting segmented messages spanning multiple CAN frames with identical CAN-IDs, the sender must ensure to only queue one frame at a time if FIFO order is required.

**Parameters**

- **dev** – Pointer to the device structure for the driver instance.
- **frame** – CAN frame to transmit.
- **timeout** – Timeout waiting for a empty TX mailbox or **K_FOREVER**.
- **callback** – Optional callback for when the frame was sent or a transmission error occurred. If **NULL**, this function is blocking until frame is sent. The callback must be **NULL** if called from user mode.
- **user_data** – User data to pass to callback function.
Return values

- 0 – if successful.
- -EINVAL – if an invalid parameter was passed to the function.
- -ENOTSUP – if an unsupported parameter was passed to the function.
- -ENETDOWN – if the CAN controller is in stopped state.
- -ENETUNREACH – if the CAN controller is in bus-off state.
- -EBUSY – if CAN bus arbitration was lost (only applicable if automatic retransmissions are disabled).
- -EIO – if a general transmit error occurred (e.g. missing ACK if automatic retransmissions are disabled).
- -EAGAIN – on timeout.

Receiving CAN frames

static inline int can_add_rx_filter(const struct device *dev, can_rx_callback_t callback, void *user_data, const struct can_filter *filter)

Add a callback function for a given CAN filter.

Add a callback to CAN identifiers specified by a filter. When a received CAN frame matching the filter is received by the CAN controller, the callback function is called in interrupt context.

If a frame matches more than one attached filter, the priority of the match is hardware dependent.

The same callback function can be used for multiple filters.

Parameters

- dev – Pointer to the device structure for the driver instance.
- callback – This function is called by the CAN controller driver whenever a frame matching the filter is received.
- user_data – User data to pass to callback function.
- filter – Pointer to a can_filter structure defining the filter.

Return values

- filter_id – on success.
- -ENOMEM – if there are no free filters.
- -EINVAL – if the requested filter type is invalid.
- -ENOTSUP – if the requested filter type is not supported.

int can_add_rx_filter_msgq(const struct device *dev, struct k_msgq *msgq, const struct can_filter *filter)

Wrapper function for adding a message queue for a given filter.

Wrapper function for can_add_rx_filter() which puts received CAN frames matching the filter in a message queue instead of calling a callback.

If a frame matches more than one attached filter, the priority of the match is hardware dependent.

The same message queue can be used for multiple filters.
**Note:** The message queue must be initialized before calling this function and the caller must have appropriate permissions on it.

### Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `msgq` – Pointer to the already initialized `k_msgq` struct.
- `filter` – Pointer to a `can_filter` structure defining the filter.

### Return values
- `filter_id` – on success.
- `-ENOSPC` – if there are no free filters.
- `-ENOTSUP` – if the requested filter type is not supported.

```c
void can_remove_rx_filter(const struct device *dev, int filter_id)
```

Remove a CAN RX filter.

This routine removes a CAN RX filter based on the filter ID returned by `can_add_rx_filter()` or `can_add_rx_filter_msgq()`.

### Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `filter_id` – Filter ID

```c
int can_get_max_filters(const struct device *dev, bool ide)
```

Get maximum number of RX filters.

Get the maximum number of concurrent RX filters for the CAN controller.

### Parameters
- `dev` – Pointer to the device structure for the driver instance.
- `ide` – Get the maximum standard (11-bit) CAN ID filters if false, or extended (29-bit) CAN ID filters if true.

### Return values
- Positive – number of maximum concurrent filters.
- `-EIO` – General input/output error.
- `-ENOSYS` – If this function is not implemented by the driver.

```c
CAN_MSGQ_DEFINE(name, max_frames)
```

Statically define and initialize a CAN RX message queue.

The message queue's ring buffer contains space for `max_frames` CAN frames.

### See also:
- `can_add_rx_filter_msgq()`

### Parameters
- `name` – Name of the message queue.
- `max_frames` – Maximum number of CAN frames that can be queued.
CAN bus error reporting and handling

int can_get_state(const struct device *dev, enum can_state *state, struct can_bus_err_cnt *err_cnt)

Get current CAN controller state.

Returns the current state and optionally the error counter values of the CAN controller.

Parameters

- dev – Pointer to the device structure for the driver instance.
- state – [out] Pointer to the state destination enum or NULL.
- err_cnt – [out] Pointer to the err_cnt destination structure or NULL.

Return values

- 0 – If successful.
- -EIO – General input/output error, failed to get state.

int can_recover(const struct device *dev, k_timeout_t timeout)

Recover from bus-off state.

Recover the CAN controller from bus-off state to error-active state.

Note: CONFIG_CAN_AUTO_BUS_OFF_RECOVERY must be deselected for this function to be available.

Parameters

- dev – Pointer to the device structure for the driver instance.
- timeout – Timeout for waiting for the recovery or K_FOREVER.

Return values

- 0 – on success.
- -ENETDOWN – if the CAN controller is in stopped state.
- -EAGAIN – on timeout.

static inline void can_set_state_change_callback(const struct device *dev, can_state_change_callback_t callback, void *user_data)

Set a callback for CAN controller state change events.

Set the callback for CAN controller state change events. The callback function will be called in interrupt context.

Only one callback can be registered per controller. Calling this function again overrides any previously registered callback.

Parameters

- dev – Pointer to the device structure for the driver instance.
- callback – Callback function.
- user_data – User data to pass to callback function.
CAN utility functions

static inline uint8_t can_dlc_to_bytes(uint8_t dlc)
Convert from Data Length Code (DLC) to the number of data bytes.

**Parameters**
- dlc – Data Length Code (DLC).

**Return values**
Number – of bytes.

static inline uint8_t can_bytes_to_dlc(uint8_t num_bytes)
Convert from number of bytes to Data Length Code (DLC)

**Parameters**
- num_bytes – Number of bytes.

**Return values**
Data – Length Code (DLC).

CAN frame definitions

CAN_STD_ID_MASK
Bit mask for a standard (11-bit) CAN identifier.

CAN_MAX_STD_ID
Maximum value for a standard (11-bit) CAN identifier.

CAN_EXT_ID_MASK
Bit mask for an extended (29-bit) CAN identifier.

CAN_MAX_EXT_ID
Maximum value for an extended (29-bit) CAN identifier.

CAN_MAX_DLC
Maximum data length code for CAN 2.0A/2.0B.

CANFD_MAX_DLC
Maximum data length code for CAN-FD.

CAN controller mode flags

CAN_MODE_NORMAL
Normal mode.

CAN_MODE_LOOPBACK
Controller is in loopback mode (receives own frames).

CAN_MODE_LISTENONLY
Controller is not allowed to send dominant bits.
CAN_MODE_FD
Controller allows transmitting/receiving CAN-FD frames.

CAN_MODE_ONE_SHOT
Controller does not retransmit in case of lost arbitration or missing ACK

CAN_MODE_3_SAMPLES
Controller uses triple sampling mode

CAN frame flags

CAN_FRAME_IDE
Frame uses extended (29-bit) CAN ID

CAN_FRAME_RTR
Frame is a Remote Transmission Request (RTR)

CAN_FRAME_FDF
Frame uses CAN-FD format (FDF)

CAN_FRAME_BRS
Frame uses CAN-FD Baud Rate Switch (BRS). Only valid in combination with CAN_FRAME_FDF.

CAN filter flags

CAN_FILTER_IDE
Filter matches frames with extended (29-bit) CAN IDs

CAN_FILTER_RTR
Filter matches Remote Transmission Request (RTR) frames

CAN_FILTER_DATA
Filter matches data frames

Defines

CAN_STATS_BIT0_ERROR_INC(dev_)
Increment the bit0 error counter for a CAN device.
The bit0 error counter is incremented when the CAN controller is unable to transmit a dominant bit.

Parameters

- dev_ – Pointer to the device structure for the driver instance.
CAN_STATS_BIT1_ERROR_INC(dev_
)  
Increment the bit1 (recessive) error counter for a CAN device. 
The bit1 error counter is incremented when the CAN controller is unable to transmit a recessive bit.

Parameters 
• dev_ – Pointer to the device structure for the driver instance.

CAN_STATS_STUFF_ERROR_INC(dev_
)  
Increment the stuffing error counter for a CAN device. 
The stuffing error counter is incremented when the CAN controller detects a bit stuffing error.

Parameters 
• dev_ – Pointer to the device structure for the driver instance.

CAN_STATS_CRC_ERROR_INC(dev_
)  
Increment the CRC error counter for a CAN device. 
The CRC error counter is incremented when the CAN controller detects a frame with an invalid CRC.

Parameters 
• dev_ – Pointer to the device structure for the driver instance.

CAN_STATS_FORM_ERROR_INC(dev_
)  
Increment the form error counter for a CAN device. 
The form error counter is incremented when the CAN controller detects a fixed-form bit field containing illegal bits.

Parameters 
• dev_ – Pointer to the device structure for the driver instance.

CAN_STATS_ACK_ERROR_INC(dev_
)  
Increment the acknowledge error counter for a CAN device. 
The acknowledge error counter is incremented when the CAN controller does not monitor a dominant bit in the ACK slot.

Parameters 
• dev_ – Pointer to the device structure for the driver instance.

CAN_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, level, prio, api, ...)  
Like DEVICE_DT_DEFINE() with CAN device specifics.

Defines a device which implements the CAN API. May generate a custom device_state container struct and init_fn wrapper when needed depending on CONFIG_CAN_STATS.

Parameters 
• node_id – The devicetree node identifier. 
• init_fn – Name of the init function of the driver. 
• pm – PM device resources reference (NULL if device does not use PM). 
• data – Pointer to the device’s private data. 
• config – The address to the structure containing the configuration information for this instance of the driver. 
• level – The initialization level. See SYS_INIT() for details.
• `prio` – Priority within the selected initialization level. See `SYS_INIT()` for details.

• `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

`CAN_DEVICE_DT_INST_DEFINE(inst, ...)`

Like `CAN_DEVICE_DT_DEFINE()` for an instance of a DT_DRV_COMPAT compatible.

**Parameters**

• `inst` – Instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to `CAN_DEVICE_DT_DEFINE()`.

• `...` – Other parameters as expected by `CAN_DEVICE_DT_DEFINE()`.

**Typedefs**

typedef `uint32_t can_mode_t`

Provides a type to hold CAN controller configuration flags.

The lower 24 bits are reserved for common CAN controller mode flags. The upper 8 bits are reserved for CAN controller/driver specific flags.

**See also:**

`CAN_MODE_FLAGS`.

typedef `void (*can_tx_callback_t)(const struct device *dev, int error, void *user_data)`

Defines the application callback handler function signature.

**Param dev**

Pointer to the device structure for the driver instance.

**Param error**

Status of the performed send operation. See the list of return values for `can_send()` for value descriptions.

**Param user_data**

User data provided when the frame was sent.

typedef `void (*can_rx_callback_t)(const struct device *dev, struct can_frame *frame, void *user_data)`

Defines the application callback handler function signature for receiving.

**Param dev**

Pointer to the device structure for the driver instance.

**Param frame**

Received frame.

**Param user_data**

User data provided when the filter was added.

typedef `void (*can_state_change_callback_t)(const struct device *dev, enum can_state state, struct can_bus_err_cnt err_cnt, void *user_data)`

Defines the state change callback handler function signature.

**Param dev**

Pointer to the device structure for the driver instance.
**Param state**  
State of the CAN controller.

**Param err_cnt**  
CAN controller error counter values.

**Param user_data**  
User data provided the callback was set.

**Enums**

```c
enum can_state

    Defines the state of the CAN controller.

    **Values:**

    enumerator CAN_STATE_ERROR_ACTIVE  
    Error-active state (RX/TX error count < 96).

    enumerator CAN_STATE_ERROR_WARNING  
    Error-warning state (RX/TX error count < 128).

    enumerator CAN_STATE_ERROR_PASSIVE  
    Error-passive state (RX/TX error count < 256).

    enumerator CAN_STATE_BUS_OFF  
    Bus-off state (RX/TX error count >= 256).

    enumerator CAN_STATE_STOPPED  
    CAN controller is stopped and does not participate in CAN communication.
```

**Public Members**

```c
struct can_frame

    #include <can.h> CAN frame structure.
```

**See also:**

`CAN_FRAME_FLAGS`
uint16_t timestamp
    Captured value of the free-running timer in the CAN controller when this frame was received. The timer is incremented every bit time and captured at the start of frame bit (SOF).

Note: CONFIG_CAN_RX_TIMESTAMP must be selected for this field to be available.

union can_frame [anonymous] [anonymous]
    The frame payload data.

struct can_filter
    #include <can.h> CAN filter structure.

Public Members

uint32_t id
    CAN identifier to match.

uint32_t mask
    CAN identifier matching mask. If a bit in this mask is 0, the value of the corresponding bit in the id field is ignored by the filter.

uint8_t flags
    Flags.
    See also:
    CAN_FILTER_FLAGS.

struct can_bus_err_cnt
    #include <can.h> CAN controller error counters.

Public Members

uint8_t tx_err_cnt
    Value of the CAN controller transmit error counter.

uint8_t rx_err_cnt
    Value of the CAN controller receive error counter.

struct can_timing
    #include <can.h> CAN bus timing structure.

This struct is used to pass bus timing values to the configuration and bitrate calculation functions.

The propagation segment represents the time of the signal propagation. Phase segment 1 and phase segment 2 define the sampling point. The prop_seg and phase_seg1 values affect the sampling point in the same way and some controllers only have a register for the sum of those two. The sync segment always has a length of 1 time quantum (see below).
1 time quantum (tq) has the length of $1/(\text{core}\_\text{clock} / \text{prescaler})$. The bitrate is defined by the core clock divided by the prescaler and the sum of the segments:

$$br = \frac{\text{core}\_\text{clock} / \text{prescaler}}{1 + \text{prop}\_\text{seg} + \text{phase}\_\text{seg1} + \text{phase}\_\text{seg2}}$$

The Synchronization Jump Width (SJW) defines the amount of time quanta the sample point can be moved. The sample point is moved when resynchronization is needed.

### Public Members

- **uint16_t sjw**
  
  Synchronisation jump width.

- **uint16_t prop_seg**
  
  Propagation segment.

- **uint16_t phase_seg1**
  
  Phase segment 1.

- **uint16_t phase_seg2**
  
  Phase segment 2.

- **uint16_t prescaler**
  
  Prescaler value.

- **struct can_device_state**

  #include <can.h> CAN specific device state which allows for CAN device class specific additions.

### CAN Transceiver API Reference

#### group can_transceiver

CAN Transceiver Driver APIs.

#### Functions

- **static inline int can_transceiver_enable(const struct device *dev)**

  Enable CAN transceiver.

  Enable the CAN transceiver.

  **See also:**

  `can_start()`
Note: The CAN transceiver is controlled by the CAN controller driver and should not normally be controlled by the application.

Parameters

• dev – Pointer to the device structure for the driver instance.

Return values

• 0 – If successful.
• -EIO – General input/output error, failed to enable device.

```c
static inline int can_transceiver_disable(const struct device *dev)
```

Disable CAN transceiver.

Disable the CAN transceiver.

See also:

can_stop()

Note: The CAN transceiver is controlled by the CAN controller driver and should not normally be controlled by the application.

Parameters

• dev – Pointer to the device structure for the driver instance.

Return values

• 0 – If successful.
• -EIO – General input/output error, failed to disable device.

ISO-TP Transport Protocol

Overview  ISO-TP is a transport protocol defined in the ISO-Standard ISO15765-2 Road vehicles - Diagnostic communication over Controller Area Network (DoCAN). Part2: Transport protocol and network layer services. As its name already implies, it is originally designed, and still used in road vehicle diagnostic over Controller Area Networks. Nevertheless, it’s not limited to applications in road vehicles or the automotive domain.

This transport protocol extends the limited payload data size for classical CAN (8 bytes) and CAN-FD (64 bytes) to theoretically four gigabytes. Additionally, it adds a flow control mechanism to influence the sender’s behavior. ISO-TP segments packets into small fragments depending on the payload size of the CAN frame. The header of those segments is called Protocol Control Information (PCI).

Packets smaller or equal to seven bytes on Classical CAN are called single-frames (SF). They don’t need to fragment and do not have any flow-control.

Packets larger than that are segmented into a first-frame (FF) and as many consecutive-frames as required. The FF contains information about the length of the entire payload data and additionally, the
first few bytes of payload data. The receiving peer sends back a flow-control-frame (FC) to either deny, postpone, or accept the following consecutive frames. The FC also defines the conditions of sending, namely the block-size (BS) and the minimum separation time between frames (STmin). The block size defines how many CF the sender is allowed to send, before he has to wait for another FC.

API Reference

**group can_isotp**

CAN ISO-TP Interface.

**Defines**

- **ISOTP_N_OK**
  Completed successfully

- **ISOTP_N_TIMEOUT_A**
  Ar/As has timed out

- **ISOTP_N_TIMEOUT_BS**
  Reception of next FC has timed out

- **ISOTP_N_TIMEOUT_CR**
  Cr has timed out

- **ISOTP_N_WRONG_SN**
  Unexpected sequence number

- **ISOTP_N_INVALID_FS**
  Invalid flow status received

- **ISOTP_N_UNEXP_PDU**
  Unexpected PDU received

- **ISOTP_N_WAIT_OVRN**
  Maximum number of WAIT flowStatus PDUs exceeded

- **ISOTP_N_BUFFER_OVERFLW**
  FlowStatus OVFLW PDU was received

- **ISOTP_N_ERROR**
  General error

7.3. Peripherals
ISOTP_NO_FREE_FILTER
    Implementation specific errors Can't bind or send because the CAN device has no filter left

ISOTP_NO_NET_BUF_LEFT
    No net buffer left to allocate

ISOTP_NO_BUF_DATA_LEFT
    Not sufficient space in the buffer left for the data

ISOTP_NO_CTX_LEFT
    No context buffer left to allocate

ISOTP_RECV_TIMEOUT
    Timeout for recv

ISOTP_FIXED_ADDR_SA_POS
    Position of fixed source address (SA)

ISOTP_FIXED_ADDR_PRIO_MASK
    Mask for priority in fixed addressing mode

ISOTP_FIXED_ADDR_RX_MASK

Typedefs

typedef void (*isotp_tx_callback_t)(int error_nr, void *arg)

Functions

int isotp_bind(struct isotp_recv_ctx *ctx, const struct device *can_dev, const struct isotp_msg_id *rx_addr, const struct isotp_msg_id *tx_addr, const struct isotp_fc_opts *opts, k_timeout_t timeout)

Bind an address to a receiving context.

This function binds an RX and TX address combination to an RX context. When data arrives from the specified address, it is buffered and can be read by calling isotp_recv. When calling this routine, a filter is applied in the CAN device, and the context is initialized. The context must be valid until calling unbind.
Parameters

- `ctx` – Context to store the internal states.
- `can_dev` – The CAN device to be used for sending and receiving.
- `rx_addr` – Identifier for incoming data.
- `tx_addr` – Identifier for FC frames.
- `opts` – Flow control options.
- `timeout` – Timeout for FF SF buffer allocation.

Return values

- ISOTP_N_OK – on success
- ISOTP_NO_FREE_FILTER – if CAN device has no filters left.

```c
void isotp_unbind(struct isotp_recv_ctx *ctx)
```

Unbind a context from the interface.

This function removes the binding from isotp_bind. The filter is detached from the CAN device, and if a transmission is ongoing, buffers are freed. The context can be discarded safely after calling this function.

Parameters

- `ctx` – Context that should be unbound.

```c
int isotp_recv(struct isotp_recv_ctx *ctx, uint8_t *data, size_t len, k_timeout_t timeout)
```

Read out received data from fifo.

This function reads the data from the receive FIFO of the context. It blocks if the FIFO is empty. If an error occurs, the function returns a negative number and leaves the data buffer unchanged.

Parameters

- `ctx` – Context that is already bound.
- `data` – Pointer to a buffer where the data is copied to.
- `len` – Size of the buffer.
- `timeout` – Timeout for incoming data.

Return values

- Number – of bytes copied on success
- ISOTP_WAIT_TIMEOUT – when “timeout” timed out
- ISOTP_N_* – on error

```c
int isotp_recv_net(struct isotp_recv_ctx *ctx, struct net_buf **buffer, k_timeout_t timeout)
```

Get the net buffer on data reception.

This function reads incoming data into net-buffers. It blocks until the entire packet is received, BS is reached, or an error occurred. If BS was zero, the data is in a single `net_buf`. Otherwise, the data is fragmented in chunks of BS size. The net-buffers are referenced and must be freed with net_buf_unref after the data is processed.

Parameters

- `ctx` – Context that is already bound.
- `buffer` – Pointer where the `net_buf` pointer is written to.
- `timeout` – Timeout for incoming data.

Return values
int isotp_send(struct isotp_send_ctx *ctx, const struct device *can_dev, const uint8_t *data, size_t len, const struct isotp_msg_id *tx_addr, const struct isotp_msg_id *rx_addr, isotp_tx_callback_t complete_cb, void *cb_arg)

Send data.

This function is used to send data to a peer that listens to the tx_addr. An internal work-queue is used to transfer the segmented data. Data and context must be valid until the transmission has finished. If a complete_cb is given, this function is non-blocking, and the callback is called on completion with the return value as a parameter.

**Parameters**

- `ctx` – Context to store the internal states.
- `can_dev` – The CAN device to be used for sending and receiving.
- `data` – Data to be sent.
- `len` – Length of the data to be sent.
- `rx_addr` – Identifier for FC frames.
- `tx_addr` – Identifier for outgoing frames the receiver listens on.
- `complete_cb` – Function called on completion or NULL.
- `cb_arg` – Argument passed to the complete callback.

**Return values**

- `ISOTP_N_OK` – on success
- `ISOTP_N_*` – on error

`struct isotp_msg_id`

```c
#include <isotp.h>
```

ISO-TP message id struct.

Used to pass addresses to the bind and send functions.

**Public Members**

```c
union isotp_msg_id.[anonymous] [anonymous]
```

CAN identifier

If ISO-TP fixed addressing is used, isotp_bind ignores SA and priority sections and modifies TA section in flow control frames.

```c
uint8_t ext_addr
```

ISO-TP extended address (if used)

```c
uint8_t ide
```

Indicates the CAN identifier type (0 for standard or 1 for extended)

```c
uint8_t use_ext_addr
```

Indicates if ISO-TP extended addressing is used
### Public Members

- **uint8_t bs**
  
  Block size. Number of CF PDUs before next CF is sent

- **uint8_t stmin**
  
  Minimum separation time. Min time between frames

### 7.3.4 Coredump Device

**Overview**

The coredump device is a pseudo-device driver with two types. A COREDUMP_TYPE_MEMCPY type exposes device tree bindings for memory address/size values to be included in any dump. And the driver exposes an API to add/remove dump memory regions at runtime. A COREDUMP_TYPE_CALLBACK device requires exactly one entry in the memory-regions array with a size of 0 and a desired size. The driver will statically allocate memory of the desired size and provide an API to register a callback function to fill that memory when a dump occurs.

**Configuration Options**

Related configuration options:

- CONFIG_COREDUMP_DEVICE

**API Reference**

*group coredump_device_interface*

Coredump pseudo-device driver APIs.

**Typedefs**

typedef void (*coredump_dump_callback_t)(uintptr_t dump_area, size_t dump_area_size)

Callback that occurs at dump time, data copied into dump_area will be included in the dump that is generated.

**Param dump_area**

Pointer to area to copy data into for inclusion in dump

**Param dump_area_size**

Size of available memory at dump_area
Functions

static inline bool coredump_device_register_memory(const struct device *dev, struct coredump_mem_region_node *region)

Register a region of memory to be stored in core dump at the time it is generated.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `region` – Struct describing memory to be collected

**Returns**

true if registration succeeded

false if registration failed

static inline bool coredump_device_unregister_memory(const struct device *dev, struct coredump_mem_region_node *region)

Unregister a region of memory to be stored in core dump at the time it is generated.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `region` – Struct describing memory to be collected

**Returns**

true if unregistration succeeded

false if unregistration failed

static inline bool coredump_device_register_callback(const struct device *dev, coredump_dump_callback_t callback)

Register a callback to be invoked at dump time.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `callback` – Callback to be invoked at dump time

**Returns**

true if registration succeeded

false if registration failed

```
struct coredump_mem_region_node
#include <coredump.h> Structure describing a region in memory that may be stored in core dump at the time it is generated.

Instances of this are passed to the coredump_device_register_memory() and coredump_device_unregister_memory() functions to indicate addition and removal of memory regions to be captured
```

Public Members

```
sys_snodet node
Node of single-linked list, do not modify
```
uintptr_t start
Address of start of memory region

size_t size
Size of memory region

7.3.5 Counter

Overview

API Reference

group counter_interface
Counter Interface.

typedef void (*counter_alarm_callback_t)(const struct device *dev, uint8_t chan_id, uint32_t ticks, void *user_data)
Alarm callback.

    Param dev
    Pointer to the device structure for the driver instance.

    Param chan_id
    Channel ID.

    Param ticks
    Counter value that triggered the alarm.

    Param user_data
    User data.

typedef void (*counter_top_callback_t)(const struct device *dev, void *user_data)
Callback called when counter turns around.

    Param dev
    Pointer to the device structure for the driver instance.

    Param user_data
    User data provided in counter_set_top_value.

typedef int (*counter_api_start)(const struct device *dev)

typedef int (*counter_api_stop)(const struct device *dev)

typedef int (*counter_api_get_value)(const struct device *dev, uint32_t *ticks)

typedef int (*counter_api_get_value_64)(const struct device *dev, uint64_t *ticks)

typedef int (*counter_api_set_alarm)(const struct device *dev, uint8_t chan_id, const struct counter_alarm_cfg *alarm_cfg)
typedef int (*counter_api_cancel_alarm)(const struct device *dev, uint8_t chan_id)

typedef int (*counter_api_set_top_value)(const struct device *dev, const struct counter_top_cfg *cfg)

typedef uint32_t (*counter_api_get_pending_int)(const struct device *dev)

typedef uint32_t (*counter_api_get_top_value)(const struct device *dev)

typedef uint32_t (*counter_api_get_guard_period)(const struct device *dev, uint32_t flags)

typedef int (*counter_api_set_guard_period)(const struct device *dev, uint32_t ticks, uint32_t flags)

typedef uint32_t (*counter_api_get_freq)(const struct device *dev)

Functions

bool counter_is_counting_up(const struct device *dev)

Function to check if counter is counting up.

Parameters

• dev – [in] Pointer to the device structure for the driver instance.

Return values

• true – if counter is counting up.
• false – if counter is counting down.

uint8_t counter_get_num_of_channels(const struct device *dev)

Function to get number of alarm channels.

Parameters

• dev – [in] Pointer to the device structure for the driver instance.

Returns

Number of alarm channels.

uint32_t counter_get_frequency(const struct device *dev)

Function to get counter frequency.

Parameters

• dev – [in] Pointer to the device structure for the driver instance.

Returns

Frequency of the counter in Hz, or zero if the counter does not have a fixed frequency.

uint32_t counter_us_to_ticks(const struct device *dev, uint64_t us)

Function to convert microseconds to ticks.

Parameters

• dev – [in] Pointer to the device structure for the driver instance.
Returns
Converted ticks. Ticks will be saturated if exceed 32 bits.

uint64_t counter_ticks_to_us(const struct device *dev, uint32_t ticks)
Function to convert ticks to microseconds.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• ticks – [in] Ticks.

Returns
Converted microseconds.

uint32_t counter_get_max_top_value(const struct device *dev)
Function to retrieve maximum top value that can be set.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Returns
Max top value.

int counter_start(const struct device *dev)
Start counter device in free running mode.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• Negative – errno code if failure.

int counter_stop(const struct device *dev)
Stop counter device.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• -ENOTSUP – if the device doesn’t support stopping the counter.

int counter_get_value(const struct device *dev, uint32_t *ticks)
Get current counter value.

Parameters
• dev – Pointer to the device structure for the driver instance.
• ticks – Pointer to where to store the current counter value

Return values
• 0 – If successful.
• Negative – error code on failure getting the counter value

int counter_get_value_64(const struct device *dev, uint64_t *ticks)
Get current counter 64-bit value.

Parameters
• dev – Pointer to the device structure for the driver instance.
ticks – Pointer to where to store the current counter value

Return values
• 0 – If successful.
• Negative – error code on failure getting the counter value

int counter_set_channel_alarm(const struct device *dev, uint8_t chan_id, const struct counter_alarm_cfg *alarm_cfg)

Set a single shot alarm on a channel.
After expiration alarm can be set again, disabling is not needed. When alarm expiration handler is called, channel is considered available and can be set again in that context.

Note: API is not thread safe.

Parameters
• dev – Pointer to the device structure for the driver instance.
• chan_id – Channel ID.
• alarm_cfg – Alarm configuration.

Return values
• 0 – If successful.
• -ENOTSUP – if request is not supported (device does not support interrupts or requested channel).
• -EINVAL – if alarm settings are invalid.
• -ETIME – if absolute alarm was set too late.
• -EBUSY – if alarm is already active.

int counter_cancel_channel_alarm(const struct device *dev, uint8_t chan_id)

Cancel an alarm on a channel.

Note: API is not thread safe.

Parameters
• dev – Pointer to the device structure for the driver instance.
• chan_id – Channel ID.

Return values
• 0 – If successful.
• -ENOTSUP – if request is not supported or the counter was not started yet.

int counter_set_top_value(const struct device *dev, const struct counter_top_cfg *cfg)

Set counter top value.
Function sets top value and optionally resets the counter to 0 or top value depending on counter direction. On turnaround, counter can be reset and optional callback is periodically called. Top value can only be changed when there is no active channel alarm.

COUNTER_TOP_CFG_DONT_RESET prevents counter reset. When counter is running while top value is updated, it is possible that counter progresses outside the new top value.

Note: API is not thread safe.
value. In that case, error is returned and optionally driver can reset the counter (see COUNTER_TOP_CFG_RESET_WHEN_LATE).

Parameters
• dev – Pointer to the device structure for the driver instance.
• cfg – Configuration. Cannot be NULL.

Return values
• 0 – If successful.
• -ENOTSUP – if request is not supported (e.g. top value cannot be changed or counter cannot/must be reset during top value update).
• -EBUSY – if any alarm is active.
• -ETIME – if COUNTER_TOP_CFG_DONT_RESET was set and new top value is smaller than current counter value (counter counting up).

int counter_get_pending_int(const struct device *dev)
Function to get pending interrupts.

The purpose of this function is to return the interrupt status register for the device. This is especially useful when waking up from low power states to check the wake up source.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 1 – if any counter interrupt is pending.
• 0 – if no counter interrupt is pending.

uint32_t counter_get_top_value(const struct device *dev)
Function to retrieve current top value.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Returns
Top value.

int counter_set_guard_period(const struct device *dev, uint32_t ticks, uint32_t flags)
Set guard period in counter ticks.

Setting non-zero guard period enables detection of setting absolute alarm too late. It limits how far in the future absolute alarm can be set. Detection of too late setting is vital since if it is not detected alarm is delayed by full period of the counter (up to 32 bits). Because of the wrapping, it is impossible to distinguish alarm which is short in the past from alarm which is targeted to expire after full counter period. In order to detect too late setting, longest possible alarm is limited. Absolute value cannot exceed: (now + top_value - guard_period) % top_value.

Guard period depends on application and counter frequency. If it is expected that absolute alarms setting might be delayed then guard period should exceed maximal potential delay. If use case allows, guard period can be set very high (e.g. half of the counter top value).

After initialization guard period is set to 0 and late detection is disabled.

Parameters
• dev – Pointer to the device structure for the driver instance.
• ticks – Guard period in counter ticks.
• flags – See Counter guard period flags.

Return values
• 0 – if successful.
• -ENOTSUP – if function or flags are not supported.
• -EINVAL – if ticks value is invalid.

uint32_t counter_get_guard_period(const struct device *dev, uint32_t flags)

Return guard period.
See counter_set_guard_period.

Parameters
• dev – Pointer to the device structure for the driver instance.
• flags – See Counter guard period flags.

Returns
Guard period given in counter ticks or 0 if function or flags are not supported.

struct counter_alarm_cfg
#include <counter.h> Alarm callback structure.

Param callback
Callback called on alarm (cannot be NULL).

Param ticks
Number of ticks that triggers the alarm. It can be relative (to now) or absolute value (see COUNTER_ALARM_CFG_ABSOLUTE). Absolute alarm cannot be set further in future than top value decremented by the guard period. Relative alarm ticks cannot exceed current top value (see counter_get_top_value). If counter is clock driven then ticks can be converted to microseconds (see counter_ticks_to_us). Alternatively, counter implementation may count asynchronous events.

Param user_data
User data returned in callback.

Param flags
Alarm flags. See Alarm configuration flags.

struct counter_top_cfg
#include <counter.h> Top value configuration structure.

Param ticks
Top value.

Param callback
Callback function. Can be NULL.

Param user_data
User data passed to callback function. Not valid if callback is NULL.

Param flags
Flags. See Flags used by.

struct counter_config_info
#include <counter.h> Structure with generic counter features.

Param max_top_value
Maximal (default) top value on which counter is reset (cleared or reloaded).
**Param freq**
Frequency of the source clock if synchronous events are counted.

**Param flags**
Flags. See Counter device capabilities.

**Param channels**
Number of channels that can be used for setting alarm, see `counter_set_channel_alarm`.

```
struct counter_driver_api
#include <counter.h>
```

### 7.3.6 Clock Control

**Overview**

The clock control API provides access to clocks in the system, including the ability to turn them on and off.

**Configuration Options**

Related configuration options:
- `CONFIG_CLOCK_CONTROL`

**API Reference**

```
group clock_control_interface
    Clock Control Interface.

Defines

CLOCK_CONTROL_SUBSYS_ALL

Typedefs

typedef void *clock_control_subsys_t
clock_control_subsys_t is a type to identify a clock controller sub-system. Such data pointed is opaque and relevant only to the clock controller driver instance being used.

typedef void *clock_control_subsys_rate_t
clock_control_subsys_rate_t is a type to identify a clock controller sub-system rate. Such data pointed is opaque and relevant only to set the clock controller rate of the driver instance being used.

typedef void (*clock_control_cb_t)(const struct device *dev, clock_control_subsys_t subsys, void *user_data)
Callback called on clock started.
```
**Param dev**
- Device structure whose driver controls the clock.

**Param subsys**
- Opaque data representing the clock.

**Param user_data**
- User data.

```c
typedef int (*clock_control)(const struct device *dev, clock_control_subsys_t sys)
```

```c
typedef int (*clock_control_get)(const struct device *dev, clock_control_subsys_t sys, uint32_t *rate)
```

```c
typedef int (*clock_control_async_on_fn)(const struct device *dev, clock_control_subsys_t sys, clock_control_cb_t cb, void *user_data)
```

```c
typedef enum clock_control_status (*clock_control_get_status_fn)(const struct device *dev, clock_control_subsys_t sys)
```

```c
typedef int (*clock_control_set)(const struct device *dev, clock_control_subsys_t sys, clock_control_subsys_rate_t rate)
```

```c
typedef int (*clock_control_configure_fn)(const struct device *dev, clock_control_subsys_t sys, void *data)
```

### Enums

**enum clock_control_status**
- Current clock status.

**Values:**

- enumerator CLOCK_CONTROL_STATUS_STARTING
- enumerator CLOCK_CONTROL_STATUS_OFF
- enumerator CLOCK_CONTROL_STATUS_ON
- enumerator CLOCK_CONTROL_STATUS_UNKNOWN

### Functions

```c
static inline int clock_control_on(const struct device *dev, clock_control_subsys_t sys)
```

Enable a clock controlled by the device.

On success, the clock is enabled and ready when this function returns. This function may sleep, and thus can only be called from thread context.

Use `clock_control_async_on()` for non-blocking operation.

#### Parameters

- dev – Device structure whose driver controls the clock.
sys – Opaque data representing the clock.

Returns
0 on success, negative errno on failure.

static inline int clock_control_off(const struct device *dev, clock_control_subsys_t sys)
Disable a clock controlled by the device.
This function is non-blocking and can be called from any context. On success, the clock is
disabled when this function returns.

Parameters
• dev – Device structure whose driver controls the clock
• sys – Opaque data representing the clock

Returns
0 on success, negative errno on failure.

static inline int clock_control_async_on(const struct device *dev, clock_control_subsys_t sys,
clock_control_cb_t cb, void *user_data)
Request clock to start with notification when clock has been started.
Function is non-blocking and can be called from any context. User callback is called when
clock is started.

Parameters
• dev – Device.
• sys – A pointer to an opaque data representing the sub-system.
• cb – Callback.
• user_data – User context passed to the callback.

Return values
• 0 – if start is successfully initiated.
• -EALREADY – if clock was already started and is starting or running.
• -ENOTSUP – If the requested mode of operation is not supported.
• -ENOSYS – if the interface is not implemented.
• other – negative errno on vendor specific error.

static inline enum clock_control_status clock_control_get_status(const struct device *dev,
clock_control_subsys_t sys)
Get clock status.

Parameters
• dev – Device.
• sys – A pointer to an opaque data representing the sub-system.

Returns
Status.

static inline int clock_control_get_rate(const struct device *dev, clock_control_subsys_t sys,
uint32_t *rate)
Obtain the clock rate of given sub-system.

Parameters
• dev – Pointer to the device structure for the clock controller driver instance
• sys – A pointer to an opaque data representing the sub-system
rate – [out] Subsystem clock rate

Return values
• 0 – on successful rate reading.
• -EAGAIN – if rate cannot be read. Some drivers do not support returning the rate when the clock is off.
• -ENOTSUP – if reading the clock rate is not supported for the given sub-system.
• -ENOSYS – if the interface is not implemented.

static inline int clock_control_set_rate(const struct device *dev, clock_control_subsys_t sys, clock_control_subsys_rate_t rate)

Set the rate of the clock controlled by the device.
On success, the new clock rate is set and ready when this function returns. This function may sleep, and thus can only be called from thread context.

Parameters
• dev – Device structure whose driver controls the clock.
• sys – Opaque data representing the clock.
• rate – Opaque data representing the clock rate to be used.

Return values
• -EALREADY – if clock was already in the given rate.
• -ENOTSUP – If the requested mode of operation is not supported.
• -ENOSYS – if the interface is not implemented.
• other – negative errno on vendor specific error.

static inline int clock_control_configure(const struct device *dev, clock_control_subsys_t sys, void *data)

Configure a source clock.
This function is non-blocking and can be called from any context. On success, the selected clock is configured as per caller's request.
It is caller's responsibility to ensure that subsequent calls to the API provide the right information to allows clock_control driver to perform the right action (such as using the right clock source on clock_control_get_rate call).
data is implementation specific and could be used to convey supplementary information required for expected clock configuration.

Parameters
• dev – Device structure whose driver controls the clock
• sys – Opaque data representing the clock
• data – Opaque data providing additional input for clock configuration

Return values
• 0 – On success
• -ENOSYS – If the device driver does not implement this call
• -errno – Other negative errno on failure.

struct clock_control_driver_api
#include <clock_control.h>
7.3.7 DAC

Overview

The DAC API provides access to Digital-to-Analog Converter (DAC) devices.

Configuration Options

Related configuration options:

- CONFIG_DAC

API Reference

**group dac_interface**

DAC driver APIs.

**Functions**

```c
int dac_channel_setup(const struct device *dev, const struct dac_channel_cfg *channel_cfg)
```

Configure a DAC channel.

It is required to call this function and configure each channel before it is selected for a write request.

**Parameters**

- dev – Pointer to the device structure for the driver instance.
- channel_cfg – Channel configuration.

**Return values**

- 0 – On success.
- -EINVAL – If a parameter with an invalid value has been provided.
- -ENOTSUP – If the requested resolution is not supported.

```c
int dac_write_value(const struct device *dev, uint8_t channel, uint32_t value)
```

Write a single value to a DAC channel.

**Parameters**

- dev – Pointer to the device structure for the driver instance.
- channel – Number of the channel to be used.
- value – Data to be written to DAC output registers.

**Return values**

- 0 – On success.
- -EINVAL – If a parameter with an invalid value has been provided.

```c
struct dac_channel_cfg
```

#include <dac.h> Structure for specifying the configuration of a DAC channel.

**Param channel_id**

Channel identifier of the DAC that should be configured.
Param resolution
Desired resolution of the DAC (depends on device capabilities).

7.3.8 Display Interface

API Reference

Generic Display Interface
group display_interface
   Display Interface.

Typedefs

typedef int (*display_blanking_on_api)(const struct device *dev)
   Callback API to turn on display blanking See display_blanking_on() for argument description.

typedef int (*display_blanking_off_api)(const struct device *dev)
   Callback API to turn off display blanking See display_blanking_off() for argument description.

typedef int (*display_write_api)(const struct device *dev, const uint16_t x, const uint16_t y,
                         const struct display_buffer_descriptor *desc, const void *buf)
   Callback API for writing data to the display See display_write() for argument description.

typedef int (*display_read_api)(const struct device *dev, const uint16_t x, const uint16_t y,
                         const struct display_buffer_descriptor *desc, void *buf)
   Callback API for reading data from the display See display_read() for argument description.

typedef void *(*display_get_framebuffer_api)(const struct device *dev)
   Callback API to get framebuffer pointer See display_get_framebuffer() for argument description.

typedef int (*display_set_brightness_api)(const struct device *dev, const uint8_t brightness)
   Callback API to set display brightness See display_set_brightness() for argument description.

typedef int (*display_set_contrast_api)(const struct device *dev, const uint8_t contrast)
   Callback API to set display contrast See display_set_contrast() for argument description.

typedef void (*display_get_capabilities_api)(const struct device *dev, struct display_capabilities *capabilities)
   Callback API to get display capabilities See display_get_capabilities() for argument description.

typedef int (*display_set_pixel_format_api)(const struct device *dev, const enum display_pixel_format pixel_format)
   Callback API to set pixel format used by the display See display_set_pixel_format() for argument description.

typedef int (*display_set_orientation_api)(const struct device *dev, const enum display_orientation orientation)
   Callback API to set orientation used by the display See display_set_orientation() for argument description.
Enums

display_pixel_format

Display pixel formats.
Display pixel format enumeration.
In case a pixel format consists out of multiple bytes the byte order is big endian.

Values:

- enumerator PIXEL_FORMAT_RGB_888 = BIT(0)
- enumerator PIXEL_FORMAT_MONO01 = BIT(1)
- enumerator PIXEL_FORMAT_MONO10 = BIT(2)
- enumerator PIXEL_FORMAT_ARGB_8888 = BIT(3)
- enumerator PIXEL_FORMAT_RGB_565 = BIT(4)
- enumerator PIXEL_FORMAT_BGR_565 = BIT(5)

display_screen_info

Values:

- enumerator SCREEN_INFO_MONO_VTILED = BIT(0)
  If selected, one octet represents 8 pixels ordered vertically, otherwise ordered horizontally.
- enumerator SCREEN_INFO_MONO_MSB_FIRST = BIT(1)
  If selected, the MSB represents the first pixel, otherwise MSB represents the last pixel.
- enumerator SCREEN_INFO_EPD = BIT(2)
  Electrophoretic Display.
- enumerator SCREEN_INFO_DOUBLE_BUFFER = BIT(3)
  Screen has two alternating ram buffers
- enumerator SCREEN_INFO_X_ALIGNMENT_WIDTH = BIT(4)
  Screen has x alignment constrained to width.

display_orientation

Enumeration with possible display orientation.

Values:

- enumerator DISPLAY_ORIENTATION_NORMAL
- enumerator DISPLAY_ORIENTATION_ROTATED_90
Functions

static inline int display_write(const struct device *dev, const uint16_t x, const uint16_t y, const struct display_buffer_descriptor *desc, const void *buf)

Write data to display.

Parameters

• dev – Pointer to device structure
• x – x Coordinate of the upper left corner where to write the buffer
• y – y Coordinate of the upper left corner where to write the buffer
• desc – Pointer to a structure describing the buffer layout
• buf – Pointer to buffer array

Return values

0 – on success else negative errno code.

static inline int display_read(const struct device *dev, const uint16_t x, const uint16_t y, const struct display_buffer_descriptor *desc, void *buf)

Read data from display.

Parameters

• dev – Pointer to device structure
• x – x Coordinate of the upper left corner where to read from
• y – y Coordinate of the upper left corner where to read from
• desc – Pointer to a structure describing the buffer layout
• buf – Pointer to buffer array

Return values

0 – on success else negative errno code.

static inline void *display_get_framebuffer(const struct device *dev)

Get pointer to framebuffer for direct access.

Parameters

• dev – Pointer to device structure

Return values

Pointer – to frame buffer or NULL if direct framebuffer access is not supported

static inline int display_blanking_on(const struct device *dev)

Turn display blanking on.

This function blanks the complete display. The content of the frame buffer will be retained while blanking is enabled and the frame buffer will be accessible for read and write operations.

In case backlight control is supported by the driver the backlight is turned off. The backlight configuration is retained and accessible for configuration.

In case the driver supports display blanking the initial state of the driver would be the same as if this function was called.

Parameters
• dev – Pointer to device structure

**Return values**
0 – on success else negative errno code.

static inline int display_blanking_off(const struct device *dev)

Turn display blanking off.

Restore the frame buffer content to the display. In case backlight control is supported by the driver the backlight configuration is restored.

**Parameters**
• dev – Pointer to device structure

**Return values**
0 – on success else negative errno code.

static inline int display_set_brightness(const struct device *dev, uint8_t brightness)

Set the brightness of the display.

Set the brightness of the display in steps of 1/256, where 255 is full brightness and 0 is minimal.

**Parameters**
• dev – Pointer to device structure
• brightness – Brightness in steps of 1/256

**Return values**
0 – on success else negative errno code.

static inline int display_set_contrast(const struct device *dev, uint8_t contrast)

Set the contrast of the display.

Set the contrast of the display in steps of 1/256, where 255 is maximum difference and 0 is minimal.

**Parameters**
• dev – Pointer to device structure
• contrast – Contrast in steps of 1/256

**Return values**
0 – on success else negative errno code.

static inline void display_get_capabilities(const struct device *dev, struct display_capabilities *capabilities)

Get display capabilities.

**Parameters**
• dev – Pointer to device structure
• capabilities – Pointer to capabilities structure to populate

static inline int display_set_pixel_format(const struct device *dev, const enum display_pixel_format pixel_format)

Set pixel format used by the display.

**Parameters**
• dev – Pointer to device structure
• pixel_format – Pixel format to be used by display

**Return values**
0 – on success else negative errno code.
static inline int display_set_orientation(const struct device *dev, const enum display_orientation orientation)

Set display orientation.

**Parameters**

- dev – Pointer to device structure
- orientation – Orientation to be used by display

**Return values**

0 – on success else negative errno code.

struct display_capabilities

#include <display.h> Structure holding display capabilities.

**Public Members**

- uint16_t x_resolution
  - Display resolution in the X direction
- uint16_t y_resolution
  - Display resolution in the Y direction
- uint32_t supported_pixel_formats
  - Bitwise or of pixel formats supported by the display
- uint32_t screen_info
  - Information about display panel
- enum display_pixel_format current_pixel_format
  - Currently active pixel format for the display
- enum display_orientation current_orientation
  - Current display orientation

struct display_buffer_descriptor

#include <display.h> Structure to describe display data buffer layout.

**Public Members**

- uint32_t buf_size
  - Data buffer size in bytes
- uint16_t width
  - Data buffer row width in pixels
- uint16_t height
  - Data buffer column height in pixels
```c
uint16_t pitch
    Number of pixels between consecutive rows in the data buffer

struct display_driver_api
    #include <display.h> Display driver API API which a display driver should expose.

Grove LCD Display

group grove_display
    Grove display APIs.

Defines

7.3. Peripherals
Functions

void glcd_print(const struct device *dev, char *data, uint32_t size)
Send text to the screen.

Parameters
• dev - Pointer to device structure for driver instance.
• data - the ASCII text to display
• size - the length of the text in bytes

void glcd_cursor_pos_set(const struct device *dev, uint8_t col, uint8_t row)
Set text cursor position for next additions.

Parameters
• dev - Pointer to device structure for driver instance.
• col - the column for the cursor to be moved to (0-15)
• row - the row it should be moved to (0 or 1)

void glcd_clear(const struct device *dev)
Clear the current display.

Parameters
• dev - Pointer to device structure for driver instance.

void glcd_display_state_set(const struct device *dev, uint8_t opt)
Function to change the display state.
This function provides the user the ability to change the state of the display as per needed. Controlling things like powering on or off the screen, the option to display the cursor or not, and the ability to blink the cursor.

Parameters
• dev - Pointer to device structure for driver instance.
• opt - An 8bit bitmask of GLCD_DS_ * options.

uint8_t glcd_display_state_get(const struct device *dev)
return the display feature set associated with the device

Parameters
• dev - the Grove LCD to get the display features set

Returns
the display feature set associated with the device.

void glcd_input_state_set(const struct device *dev, uint8_t opt)
Function to change the input state.
This function provides the user the ability to change the state of the text input. Controlling things like text entry from the left or right side, and how far to increment on new text
Parameters

- **dev** – Pointer to device structure for driver instance.
- **opt** – A bitmask of GLCD_IS_* options

```c
uint8_t glcd_input_state_get(const struct device *dev)
```

return the input set associated with the device

Parameters

- **dev** – the Grove LCD to get the input features set

Returns

the input set associated with the device.

```c
void glcd_function_set(const struct device *dev, uint8_t opt)
```

Function to set the functional state of the display.

This function provides the user the ability to change the state of the display as per needed. Controlling things like the number of rows, dot size, and text display quality.

Parameters

- **dev** – Pointer to device structure for driver instance.
- **opt** – A bitmask of GLCD_FS_* options

```c
uint8_t glcd_function_get(const struct device *dev)
```

return the function set associated with the device

Parameters

- **dev** – the Grove LCD to get the functions set

Returns

the function features set associated with the device.

```c
void glcd_color_select(const struct device *dev, uint8_t color)
```

Set LCD background to a predefined color.

Parameters

- **dev** – Pointer to device structure for driver instance.
- **color** – One of the predefined color options

```c
void glcd_color_set(const struct device *dev, uint8_t r, uint8_t g, uint8_t b)
```

Set LCD background to custom RGB color value.

Parameters

- **dev** – Pointer to device structure for driver instance.
- **r** – A numeric value for the red color (max is 255)
- **g** – A numeric value for the green color (max is 255)
- **b** – A numeric value for the blue color (max is 255)

### BBC micro:bit Display

**group mb_display**

BBC micro:bit display APIs.
Defines

MB_IMAGE(_rows...)  
Generate an image object from a given array rows/columns.

This helper takes an array of 5 rows, each consisting of 5 0/1 values which correspond to the columns of that row. The value 0 means the pixel is disabled whereas a 1 means the pixel is enabled.

The pixels go from left to right and top to bottom, i.e. top-left corner is the first row's first value, top-right is the first row's last value, and bottom-right corner is the last value of the last (5th) row. As an example, the following would create a smiley face image:

Parameters

- _rows – Each of the 5 rows represented as a 5-value column array.

Returns

Image bitmap that can be passed e.g. to mb_display_image().

Enums

enum mb_display_mode

Display mode.

First 16 bits are reserved for modes, last 16 for flags.

Values:

enumerator MB_DISPLAY_MODE_DEFAULT

Default mode (“single” for images, “scroll” for text).

enumerator MB_DISPLAY_MODE_SINGLE

Display images sequentially, one at a time.

enumerator MB_DISPLAY_MODE_SCROLL

Display images by scrolling.

enumerator MB_DISPLAY_FLAG_LOOP = BIT(16)

Loop back to the beginning when reaching the last image.

Functions

struct mb_display *mb_display_get(void)

Get a pointer to the BBC micro:bit display object.

Returns

Pointer to display object.

void mb_display_image(struct mb_display *disp, uint32_t mode, int32_t duration, const struct mb_image *img, uint8_t img_count)

Display one or more images on the BBC micro:bit LED display.

This function takes an array of one or more images and renders them sequentially on the micro:bit display. The call is asynchronous, i.e. the processing of the display happens in the background. If there is another image being displayed it will be canceled and the new one takes over.
Parameters

- disp – Display object.
- mode – One of the MB_DISPLAY_MODE_* options.
- duration – Duration how long to show each image (in milliseconds), or SYS_FOREVER_MS.
- img – Array of image bitmaps (struct mb_image objects).
- img_count – Number of images in ‘img’ array.

```c
void mb_display_print(struct mb_display *disp, uint32_t mode, int32_t duration, const char *fmt, ...)
```

Print a string of characters on the BBC micro:bit LED display.

This function takes a printf-style format string and outputs it in a scrolling fashion to the display.

The call is asynchronous, i.e. the processing of the display happens in the background. If there is another image or string being displayed it will be canceled and the new one takes over.

Parameters

- disp – Display object.
- mode – One of the MB_DISPLAY_MODE_* options.
- duration – Duration how long to show each character (in milliseconds), or SYS_FOREVER_MS.
- fmt – printf-style format string
- ... – Optional list of format arguments.

```c
void mb_display_stop(struct mb_display *disp)
```

Stop the ongoing display of an image.

Parameters

- disp – Display object.

```c
struct mb_image
```

```c
#include <mb_display.h> Representation of a BBC micro:bit display image.
```

This struct should normally not be used directly, rather created using the MB_IMAGE() macro.

Monochrome Character Framebuffer

```c
#include <mb_display.h> Representation of a BBC micro:bit display image.
```

```c
```

This struct should normally not be used directly, rather created using the MB_IMAGE() macro.

Monochrome Character Framebuffer

```c
```

Public Monochrome Character Framebuffer API.

Defines

```c
FONT_ENTRY_DEFINE(_name, _width, _height, _caps, _data, _fc, _lc)
```

Macro for creating a font entry.

Parameters

- _name – Name of the font entry.
- _width – Width of the font in pixels
- _height – Height of the font in pixels.
• `_caps` – Font capabilities.
• `_data` – Raw data of the font.
• `_fc` – Character mapped to first font element.
• `_lc` – Character mapped to last font element.

**Enums**

enum cfb_display_param

Values:

enumerator CFB_DISPLAY_HEIGH = 0
enumerator CFB_DISPLAY_WIDTH
enumerator CFB_DISPLAY_PPT
enumerator CFB_DISPLAY_ROWS
enumerator CFB_DISPLAY_COLS

denum cfb_font_caps

Values:

enumerator CFB_FONT_MONO_VPACKED = BIT(0)
enumerator CFB_FONT_MONO_HPACKED = BIT(1)
enumerator CFB_FONT_MSB_FIRST = BIT(2)

**Functions**

int cfb_print(const struct device *dev, char *str, uint16_t x, uint16_t y)
Print a string into the framebuffer.

**Parameters**

• `dev` – Pointer to device structure for driver instance
• `str` – String to print
• `x` – Position in X direction of the beginning of the string
• `y` – Position in Y direction of the beginning of the string

**Returns**

0 on success, negative value otherwise

int cfb_framebuffer_clear(const struct device *dev, bool clear_display)
Clear framebuffer.

**Parameters**

• `dev` – Pointer to device structure for driver instance
• clear_display – Clear the display as well

Returns
0 on success, negative value otherwise

int cfb_framebuffer_invert(const struct device *dev)
Invert Pixels.

Parameters
• dev – Pointer to device structure for driver instance

Returns
0 on success, negative value otherwise

int cfb_invArea(const struct device *dev, uint16_t x, uint16_t y, uint16_t width, uint16_t height)
Invert Pixels in selected area.

Parameters
• dev – Pointer to device structure for driver instance
• x – Position in X direction of the beginning of area
• y – Position in Y direction of the beginning of area
• width – Width of area in pixels
• height – Height of area in pixels

Returns
0 on success, negative value otherwise

int cfb_framebuffer_finalize(const struct device *dev)
Finalize framebuffer and write it to display RAM, invert or reorder pixels if necessary.

Parameters
• dev – Pointer to device structure for driver instance

Returns
0 on success, negative value otherwise

int cfb_get_display_parameter(const struct device *dev, enum cfb_display_param)
Get display parameter.

Parameters
• dev – Pointer to device structure for driver instance
• cfb_display_param – One of the display parameters

Returns
Display parameter value

int cfb_framebuffer_set_font(const struct device *dev, uint8_t idx)
Set font.

Parameters
• dev – Pointer to device structure for driver instance
• idx – Font index

Returns
0 on success, negative value otherwise
int cfb_get_font_size(const struct device *dev, uint8_t idx, uint8_t *width, uint8_t *height)
  Get font size.

  Parameters
  • dev – Pointer to device structure for driver instance
  • idx – Font index
  • width – Pointers to the variable where the font width will be stored.
  • height – Pointers to the variable where the font height will be stored.

  Returns
  0 on success, negative value otherwise

int cfb_get_numof_fonts(const struct device *dev)
  Get number of fonts.

  Parameters
  • dev – Pointer to device structure for driver instance

  Returns
  number of fonts

int cfb_framebuffer_init(const struct device *dev)
  Initialize Character Framebuffer.

  Parameters
  • dev – Pointer to device structure for driver instance

  Returns
  0 on success, negative value otherwise

struct cfb_font
#include <cfb.h>

### 7.3.9 DMA

**Overview**

**API Reference**

`group dma_interface`

DMA Interface.

**Defines**

`DMA_MAGIC`

`DMA_BUF_ADDR_ALIGNMENT(node)`

Get the device tree property describing the buffer address alignment.

Useful when statically defining or allocating buffers for DMA usage where memory alignment often matters.

**Parameters**

• node – Node identifier, e.g. `DT_NODELABEL(dma_0)`
Returns
alignment Memory byte alignment required for DMA buffers

`DMA_BUF_SIZE_ALIGNMENT(node)`
Get the device tree property describing the buffer size alignment
Useful when statically defining or allocating buffers for DMA usage where memory alignment often matters.

Parameters
- `node` – Node identifier, e.g. `DT_NODENAME(dma_0)`

Returns
alignment Memory byte alignment required for DMA buffers

`DMA_COPY_ALIGNMENT(node)`
Get the device tree property describing the minimal chunk of data possible to be copied

Parameters
- `node` – Node identifier, e.g. `DT_NODENAME(dma_0)`

Returns
minimal Minimal chunk of data possible to be copied

Typedefs

typedef void (*`dma_callback_t`)(const struct `device` *dev, void *user_data, uint32_t channel, int status)
Callback function for DMA transfer completion.

If enabled, callback function will be invoked at transfer completion or when error happens.

Param `dev`
Pointer to the DMA device calling the callback.

Param `user_data`
A pointer to some user data or NULL

Param `channel`
The channel number

Param `status`
0 on success, a negative errno otherwise

Enums

enum `dma_channel_direction`
Values:

enumerator `MEMORY_TO_MEMORY` = 0x0
enumerator `MEMORY_TO_PERIPHERAL`
enumerator `PERIPHERAL_TO_MEMORY`
enumerator `PERIPHERAL_TO_PERIPHERAL`
enumerator HOST_TO_MEMORY
enumerator MEMORY_TO_HOST
enumerator DMA_CHANNEL_DIRECTION_COMMON_COUNT
   Number of all common channel directions.
enumerator DMA_CHANNEL_DIRECTION_PRIV_START = DMA_CHANNEL_DIRECTION_COMMON_COUNT
   This and higher values are dma controller or soc specific. Refer to the specified dma driver
   header file.
enumerator DMA_CHANNEL_DIRECTION_MAX = 0x7
   Maximum allowed value (3 bit field!)

enum dma_addr_adj
   Valid values for source_addr_adj and dest_addr_adj
   Values:
       enumerator DMA_ADDR_ADJ_INCREMENT
       enumerator DMA_ADDR_ADJ_DECREMENT
       enumerator DMA_ADDR_ADJ_NO_CHANGE

enum dma_channel_filter
   Values:
       enumerator DMA_CHANNEL_NORMAL
       enumerator DMA_CHANNEL_PERIODIC

enum dma_attribute_type
   Values:
       enumerator DMA_ATTR_BUFFER_ADDRESS_ALIGNMENT
       enumerator DMA_ATTR_BUFFER_SIZE_ALIGNMENT
       enumerator DMA_ATTR_COPY_ALIGNMENT

Functions

static inline int dma_config(const struct device *dev, uint32_t channel, struct dma_config *config)
   Configure individual channel for DMA transfer.

Parameters
   • dev – Pointer to the device structure for the driver instance.
- channel – Numeric identification of the channel to configure
- config – Data structure containing the intended configuration for the selected channel

**Return values**
- 0 – if successful.
- Negative – errno code if failure.

```c
static inline int dma_reload(const struct device *dev, uint32_t channel, uint32_t src, uint32_t dst, size_t size)
```
Reload buffer(s) for a DMA channel.

**Parameters**
- dev – Pointer to the device structure for the driver instance.
- channel – Numeric identification of the channel to configure.
- src – source address for the DMA transfer
- dst – destination address for the DMA transfer
- size – size of DMA transfer

**Return values**
- 0 – if successful.
- Negative – errno code if failure.

```c
int dma_start(const struct device *dev, uint32_t channel)
```
Enables DMA channel and starts the transfer, the channel must be configured beforehand.
Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid.

**Parameters**
- dev – Pointer to the device structure for the driver instance.
- channel – Numeric identification of the channel where the transfer will be processed

**Return values**
- 0 – if successful.
- Negative – errno code if failure.

```c
int dma_stop(const struct device *dev, uint32_t channel)
```
Stops the DMA transfer and disables the channel.
Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid.

**Parameters**
- dev – Pointer to the device structure for the driver instance.
- channel – Numeric identification of the channel where the transfer was being processed

**Return values**
- 0 – if successful.
- Negative – errno code if failure.
int dma_suspend(const struct device *dev, uint32_t channel)
Suspend a DMA channel transfer.
Implementations must check the validity of the channel state and ID passed in and return -EINVAL if either are invalid.

Parameters
• dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel to suspend

Return values
• 0 – If successful.
• -ENOSYS – If not implemented.
• -EINVAL – If invalid channel id or state.
• -errno – Other negative errno code failure.

int dma_resume(const struct device *dev, uint32_t channel)
Resume a DMA channel transfer.
Implementations must check the validity of the channel state and ID passed in and return -EINVAL if either are invalid.

Parameters
• dev – Pointer to the device structure for the driver instance.
• channel – Numeric identification of the channel to resume

Return values
• 0 – If successful.
• -ENOSYS – If not implemented
• -EINVAL – If invalid channel id or state.
• -errno – Other negative errno code failure.

int dma_request_channel(const struct device *dev, void *filter_param)
request DMA channel.
request DMA channel resources return -EINVAL if there is no valid channel available.

Parameters
• dev – Pointer to the device structure for the driver instance.
• filter_param – filter function parameter

Return values
• dma – channel if successful.
• Negative – errno code if failure.

void dma_release_channel(const struct device *dev, uint32_t channel)
release DMA channel.
release DMA channel resources

Parameters
• dev – Pointer to the device structure for the driver instance.
• channel – channel number
int dma_chan_filter(const struct device *dev, int channel, void *filter_param)

DMA channel filter.

filter channel by attribute

Parameters
- dev – Pointer to the device structure for the driver instance.
- channel – channel number
- filter_param – filter attribute

Return values
- Negative – errno code if not support

static inline int dma_get_status(const struct device *dev, uint32_t channel, struct dma_status *stat)

get current runtime status of DMA transfer

Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid or -ENOSYS if not supported.

Parameters
- dev – Pointer to the device structure for the driver instance.
- channel – Numeric identification of the channel where the transfer was being processed
- stat – a non-NULL dma_status object for storing DMA status

Return values
- non-negative – if successful.
- Negative – errno code if failure.

static inline int dma_get_attribute(const struct device *dev, uint32_t type, uint32_t *value)

get attribute of a dma controller

This function allows to get a device specific static or runtime attribute like required address and size alignment of a buffer. Implementations must check the validity of the type passed in and return -EINVAL if it is invalid or -ENOSYS if not supported.

Parameters
- dev – Pointer to the device structure for the driver instance.
- type – Numeric identification of the attribute
- value – A non-NULL pointer to the variable where the read value is to be placed

Return values
- non-negative – if successful.
- Negative – errno code if failure.

static inline uint32_t dma_width_index(uint32_t size)

Look-up generic width index to be used in registers.

WARNING: This look-up works for most controllers, but may not work for yours. Ensure your controller expects the most common register bit values before using this convenience function. If your controller does not support these values, you will have to write your own look-up inside the controller driver.

Parameters
- size – width of bus (in bytes)
Return values
common – DMA index to be placed into registers.

static inline uint32_t dma_burst_index(uint32_t burst)
Look-up generic burst index to be used in registers.

WARNING: This look-up works for most controllers, but may not work for yours. Ensure
your controller expects the most common register bit values before using this convenience
function. If your controller does not support these values, you will have to write your own
look-up inside the controller driver.

Parameters
• burst – number of bytes to be sent in a single burst

Return values
common – DMA index to be placed into registers.

struct dma_block_config
#include <dma.h> DMA block configuration structure.

Param source_address
is block starting address at source

Param source_gather_interval
is the address adjustment at gather boundary

Param dest_address
is block starting address at destination

Param dest_scatter_interval
is the address adjustment at scatter boundary

Param dest_scatter_count
is the continuous transfer count between scatter boundaries

Param source_gather_count
is the continuous transfer count between gather boundaries

Param block_size
is the number of bytes to be transferred for this block.

Param config
is a bit field with the following parts:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_gather_en</td>
<td>[ 0 ]</td>
<td>0-disable, 1-enable.</td>
</tr>
<tr>
<td>source_addr_adj</td>
<td>[ 2 : 3 ]</td>
<td>00-increment, 01-decrement, 10-no change.</td>
</tr>
<tr>
<td>dest_addr_adj</td>
<td>[ 4 : 5 ]</td>
<td>00-increment, 01-decrement, 10-no change.</td>
</tr>
<tr>
<td>source_reload_en</td>
<td>[ 6 ]</td>
<td>reload source address at the end of block transfer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0-disable, 1-enable.</td>
</tr>
<tr>
<td>dest_reload_en</td>
<td>[ 7 ]</td>
<td>reload destination address at the end of block transfer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0-disable, 1-enable.</td>
</tr>
<tr>
<td>fifo_mode_control</td>
<td>[ 8 : 11 ]</td>
<td>How full of the fifo before block transfer start. HW specific.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0-disable, 1-enable.</td>
</tr>
<tr>
<td>flow_control_mode</td>
<td>[ 12 ]</td>
<td>0-source request served upon data</td>
</tr>
</tbody>
</table>

(continues on next page)
struct dma_config

#include <dma.h> DMA configuration structure.

**Param dma_slot**

[0:7] - which peripheral and direction (HW specific)

**Param channel_direction**

[8:10] - 000-memory to memory, 001-memory to peripheral, 010-peripheral to memory, 011-peripheral to peripheral, 100-host to memory 101-memory to host...

**Param complete_callback_en**

[11] - 0-callback invoked at completion only 1-callback invoked at completion of each block

**Param error_callback_en**

[12] - 0-error callback enabled 1-error callback disabled

**Param source_handshake**

**Param dest_handshake**

[14] - 0-HW, 1-SW

**Param channel_priority**

[15:18] - DMA channel priority

**Param source_chaining_en**

[19] - enable/disable source block chaining 0-disable, 1-enable

**Param dest_chaining_en**

[20] - enable/disable destination block chaining. 0-disable, 1-enable

**Param linked_channel**

[21:27] - after channel count exhaust will initiate a channel service request at this channel

**Param cyclic**

[28] - enable/disable cyclic buffer 0-disable, 1-enable

**Param reserved**

[29:31]

**Param source_data_size**

[0:15] - width of source data (in bytes)

**Param dest_data_size**

[16:31] - width of dest data (in bytes)

**Param source_burst_length**

[0:15] - number of source data units

**Param dest_burst_length**

[16:31] - number of destination data units

**Param block_count**

is the number of blocks used for block chaining, this depends on availability of the DMA controller.

7.3. Peripherals
**Param user_data**
private data from DMA client.

**Param dma_callback**
see dma_callback_t for details

```c
struct dma_status
#include <dma.h> DMA runtime status structure
busy - is current DMA transfer busy or idle
dir - DMA transfer direction
pending_length - data length pending to be transferred in bytes or platform dependent.
free - free buffer space
write_position - write position in a circular dma buffer
read_position - read position in a circular dma buffer
```

```c
struct dma_context
#include <dma.h> DMA context structure Note: the dma_context shall be the first member of
DMA client driver Data, got by dev->data
magic - magic code to identify the context
dma_channels - dma channels
atomic - driver atomic_t pointer
```

## 7.3.10 EC Host Command

### Overview

### API Reference

```c
#include <dma.h>
```

**Define**

```c
EC_HOST_CMD_HANDLER(_id, _function, _version_mask, _request_type, _response_type)
```

Statically define and register a host command handler.

Helper macro to statically define and register a host command handler that has a compile-time-fixed sizes for its both request and response structures.

**Parameters**

- **_id** – Id of host command to handle request for.
- **_function** – Name of handler function.
- **_version_mask** – The bitfield of all versions that the _function supports. E.g. `BIT(0)` corresponds to version 0.
- **_request_type** – The datatype of the request parameters for _function.
- **_response_type** – The datatype of the response parameters for _function.

```c
EC_HOST_CMD_HANDLER_UNBOUND(_id, _function, _version_mask)
```

Statically define and register a host command handler without sizes.

Helper macro to statically define and register a host command handler whose request or response structure size is not known as compile time.

**Parameters**

- **_id** – Id of host command to handle request for.
• _function – Name of handler function.

• _version_mask – The bitfield of all versions that the _function supports. E.g. BIT(0) corresponds to version 0.

Typedefs

typedef enum ec_host_cmd_status (*ec_host_cmd_handler_cb)(struct ec_host_cmd_handler_args *args)

Enums

enum ec_host_cmd_status

Values:

enumerator EC_HOST_CMD_SUCCESS = 0
   Host command was successful.

enumerator EC_HOST_CMD_INVALID_COMMAND = 1
   The specified command id is not recognized or supported.

enumerator EC_HOST_CMD_ERROR = 2
   Generic Error.

enumerator EC_HOST_CMD_INVALID_PARAM = 3
   One of more of the input request parameters is invalid.

enumerator EC_HOST_CMD_ACCESS_DENIED = 4
   Host command is not permitted.

enumerator EC_HOST_CMD_INVALID_RESPONSE = 5
   Response was invalid (e.g. not version 3 of header).

enumerator EC_HOST_CMD_INVALID_VERSION = 6
   Host command id version unsupported.

enumerator EC_HOST_CMD_INVALID_CHECKSUM = 7
   Checksum did not match.

enumerator EC_HOST_CMD_IN_PROGRESS = 8
   A host command is currently being processed.

enumerator EC_HOST_CMD_UNAVAILABLE = 9
   Requested information is currently unavailable.

enumerator EC_HOST_CMD_TIMEOUT = 10
   Timeout during processing.
enumerator EC_HOST_CMD_OVERFLOW = 11
    Data or table overflow.

enumerator EC_HOST_CMD_INVALID_HEADER = 12
    Header is invalid or unsupported (e.g. not version 3 of header).

enumerator EC_HOST_CMD_REQUEST_TRUNCATED = 13
    Did not receive all expected request data.

enumerator EC_HOST_CMD_RESPONSE_TOO_BIG = 14
    Response was too big to send within one response packet.

enumerator EC_HOST_CMD_BUS_ERROR = 15
    Error on underlying communication bus.

enumerator EC_HOST_CMD_BUSY = 16
    System busy. Should retry later.

enumerator EC_HOST_CMD_INVALID_HEADER_VERSION = 17
    Header version invalid.

enumerator EC_HOST_CMD_INVALID_HEADER_CRC = 18
    Header CRC invalid.

enumerator EC_HOST_CMD_INVALID_DATA_CRC = 19
    Data CRC invalid.

enumerator EC_HOST_CMD_DUP_UNAVAILABLE = 20
    Can’t resend response.

enumerator EC_HOST_CMD_MAX = UINT16_MAX

struct ec_host_cmd_handler_args
    #include <ec_host_cmd.h> Arguments passed into every installed host command handler.

Public Members

void *reserved
    Reserved for compatibility.

uint16_t command
    Command identifier.

const uint8_t version
    The version of the host command that is being requested. This will be a value that has
    been static registered as valid for the handler.
const void *const input_buf
    The incoming data that can be cast to the handlers request type.

const uint16_t input_buf_size
    The number of valid bytes that can be read from input_buf.

void *const output_buf
    The data written to this buffer will be send to the host.

uint16_t output_buf_max
    Maximum number of bytes that can be written to the output_buf.

uint16_t output_buf_size
    Number of bytes of output_buf to send to the host.

struct ec_host_cmd_handler
    #include <ec_host_cmd.h> Structure use for statically registering host command handlers.

Public Members

ec_host_cmd_handler_cb handler
    Callback routine to process commands that match id.

uint16_t id
    The numerical command id used as the lookup for commands.

uint16_t version_mask
    The bitfield of all versions that the handler supports, where each bit value represents that
    the handler supports that version. E.g. BIT(0) corresponds to version 0.

uint16_t min_rqt_size
    The minimum input_buf_size enforced by the framework before passing to the handler.

uint16_t min_rsp_size
    The minimum output_buf_size enforced by the framework before passing to the handler.

struct ec_host_cmd_request_header
    #include <ec_host_cmd.h> Header for requests from host to embedded controller.

Represent the over-the-wire header in LE format for host command requests. This represent
version 3 of the host command header. The requests are always sent from host to embedded
controller.

Public Members

uint8_t prtcl_ver
    Should be 3. The EC will return EC_HOST_CMD_INVALID_HEADER if it receives a header
    with a version it doesn’t know how to parse.
Zephyr Project Documentation, Release 3.2.99

uint8_t checksum
    Checksum of response and data; sum of all bytes including checksum. Should total to 0.

uint16_t cmd_id
    Id of command that is being sent.

uint8_t cmd_ver
    Version of the specific cmd_id being requested. Valid versions start at 0.

uint8_t reserved
    Unused byte in current protocol version; set to 0.

uint16_t data_len
    Length of data which follows this header.

struct ec_host_cmd_response_header
#include <ec_host_cmd.h> Header for responses from embedded controller to host.
Represent the over-the-wire header in LE format for host command responses. This represent version 3 of the host command header. Responses are always sent from embedded controller to host.

Public Members

uint8_t prtcl_ver
    Should be 3.

uint8_t checksum
    Checksum of response and data; sum of all bytes including checksum. Should total to 0.

uint16_t result
    A ec_host_cmd_status response code for specific command.

uint16_t data_len
    Length of data which follows this header.

uint16_t reserved
    Unused bytes in current protocol version; set to 0.

7.3.11 Error Detection And Correction (EDAC)

API Reference

group edac
Enums

enum edac_error_type
    EDAC error type.
    Values:

    enumerator EDAC_ERROR_TYPE_DRAM_COR = \textit{BIT}(0)
        Correctable error type

    enumerator EDAC_ERROR_TYPE_DRAM_UC = \textit{BIT}(1)
        Uncorrectable error type

Functions

static inline int edac_inject_set_param1(const struct device *dev, uint64_t value)
    Set injection parameter param1.
    Set first error injection parameter value.
    Parameters
        • dev – Pointer to the device structure
        • value – First injection parameter
    Return values
        • -ENOSYS – if the optional interface is not implemented
        • 0 – on success, other error code otherwise

static inline int edac_inject_get_param1(const struct device *dev, uint64_t *value)
    Get injection parameter param1.
    Get first error injection parameter value.
    Parameters
        • dev – Pointer to the device structure
        • value – Pointer to the first injection parameter
    Return values
        • -ENOSYS – if the optional interface is not implemented
        • 0 – on success, error code otherwise

static inline int edac_inject_set_param2(const struct device *dev, uint64_t value)
    Set injection parameter param2.
    Set second error injection parameter value.
    Parameters
        • dev – Pointer to the device structure
        • value – Second injection parameter
    Return values
        • -ENOSYS – if the optional interface is not implemented
        • 0 – on success, error code otherwise
static inline int edac_inject_get_param2(const struct device *dev, uint64_t *value)
Get injection parameter param2.

Parameters
• dev – Pointer to the device structure
• value – Pointer to the second injection parameter

Return values
• -ENOSYS – if the optional interface is not implemented
• 0 – on success, error code otherwise

static inline int edac_inject_set_error_type(const struct device *dev, uint32_t error_type)
Set error type value.

Set the value of error type to be injected

Parameters
• dev – Pointer to the device structure
• error_type – Error type value

Return values
• -ENOSYS – if the optional interface is not implemented
• 0 – on success, error code otherwise

static inline int edac_inject_get_error_type(const struct device *dev, uint32_t *error_type)
Get error type value.

Get the value of error type to be injected

Parameters
• dev – Pointer to the device structure
• error_type – Pointer to error type value

Return values
• -ENOSYS – if the optional interface is not implemented
• 0 – on success, error code otherwise

static inline int edac_inject_error_trigger(const struct device *dev)
Set injection control.

Trigger error injection.

Parameters
• dev – Pointer to the device structure

Return values
• -ENOSYS – if the optional interface is not implemented
• 0 – on success, error code otherwise

static inline int edac_ecc_error_log_get(const struct device *dev, uint64_t *value)
Get ECC Error Log.

Read value of ECC Error Log.

Parameters
• dev – Pointer to the device structure
• value – Pointer to the ECC Error Log value
Return values
• 0 – on success, error code otherwise
• -ENOSYS – if the mandatory interface is not implemented

static inline int edac_ecc_error_log_clear(const struct device *dev)
Clear ECC Error Log.

Parameters
• dev – Pointer to the device structure

Return values
• 0 – on success, error code otherwise
• -ENOSYS – if the mandatory interface is not implemented

Get Parity Error Log.

Parameters
• dev – Pointer to the device structure
• value – Pointer to the parity Error Log value

Return values
• 0 – on success, error code otherwise
• -ENOSYS – if the mandatory interface is not implemented

Clear Parity Error Log.

Parameters
• dev – Pointer to the device structure

Return values
• 0 – on success, error code otherwise
• -ENOSYS – if the mandatory interface is not implemented

Get number of correctable errors.

Parameters
• dev – Pointer to the device structure

Return values
• num – Number of correctable errors
• -ENOSYS – if the mandatory interface is not implemented

Get number of uncorrectable errors.

Parameters
• dev – Pointer to the device structure

Return values
• num – Number of uncorrectable errors
• -ENOSYS – if the mandatory interface is not implemented

static inline int edac_notify_callback_set(const struct device *dev, edac_notify_callback_f cb)

Register callback function for memory error exception

This callback runs in interrupt context

**Parameters**

• dev – EDAC driver device to install callback
• cb – Callback function pointer

**Return values**

• 0 – on success, error code otherwise
• -ENOSYS – if the mandatory interface is not implemented

```
struct edac_driver_api
#include <edac.h> EDAC driver API.
This is the mandatory API any EDAC driver needs to expose.
```

### 7.3.12 EEPROM

**Overview**

The EEPROM API provides read and write access to Electrically Erasable Programmable Read-Only Memory (EEPROM) devices.

EEPROMs have an erase block size of 1 byte, a long lifetime, and allow overwriting data on byte-by-byte access.

**Configuration Options**

Related configuration options:

• CONFIG_EEPROM

**API Reference**

```
group eeprom_interface
    EEPROM Interface.

    **Typedefs**

typedef int (*eeprom_api_read)(const struct device *dev, off_t offset, void *data, size_t len)
typedef int (*eeprom_api_write)(const struct device *dev, off_t offset, const void *data, size_t len)
typedef size_t (*eeprom_api_size)(const struct device *dev)
```
Functions

```c
int eeprom_read(const struct device *dev, off_t offset, void *data, size_t len)
Read data from EEPROM.

Parameters
• dev – EEPROM device
• offset – Address offset to read from.
• data – Buffer to store read data.
• len – Number of bytes to read.

Returns
0 on success, negative errno code on failure.
```

```c
int eeprom_write(const struct device *dev, off_t offset, const void *data, size_t len)
Write data to EEPROM.

Parameters
• dev – EEPROM device
• offset – Address offset to write data to.
• data – Buffer with data to write.
• len – Number of bytes to write.

Returns
0 on success, negative errno code on failure.
```

```c
size_t eeprom_get_size(const struct device *dev)
Get the size of the EEPROM in bytes.

Parameters
• dev – EEPROM device.

Returns
EEPROM size in bytes.
```

```c
struct eeprom_driver_api
#include <eeprom.h>
```

7.3.13 Entropy

Overview

The entropy API provides functions to retrieve entropy values from entropy hardware present on the platform. The entropy APIs are provided for use by the random subsystem and cryptographic services. They are not suitable to be used as random number generation functions.

API Reference

```c
group entropy_interface
    Entropy Interface.
```
Defines

ENTROPY_BUSYWAIT

Typedefs

typedef int (*entropy_get_entropy_t)(const struct device *dev, uint8_t *buffer, uint16_t length)
   Callback API to get entropy.
   See \texttt{entropy_get_entropy()} for argument description

typedef int (*entropy_get_entropy_isr_t)(const struct device *dev, uint8_t *buffer, uint16_t length, uint32_t flags)
   Callback API to get entropy from an ISR.
   See \texttt{entropy_get_entropy_isr()} for argument description

Functions

int entropy_get_entropy(const struct device *dev, uint8_t *buffer, uint16_t length)
   Fills a buffer with entropy. Blocks if required in order to generate the necessary random data.
   \textbf{Parameters}
   \begin{itemize}
   \item \texttt{dev} – Pointer to the entropy device.
   \item \texttt{buffer} – Buffer to fill with entropy.
   \item \texttt{length} – Buffer length.
   \end{itemize}

   \textbf{Return values}
   \begin{itemize}
   \item 0 – on success.
   \item -ERRNO – errno code on error.
   \end{itemize}

static inline int entropy_get_entropy_isr(const struct device *dev, uint8_t *buffer, uint16_t length, uint32_t flags)
   Fills a buffer with entropy in a non-blocking or busy-wait manner. Callable from ISRs.
   \textbf{Parameters}
   \begin{itemize}
   \item \texttt{dev} – Pointer to the device structure.
   \item \texttt{buffer} – Buffer to fill with entropy.
   \item \texttt{length} – Buffer length.
   \item \texttt{flags} – Flags to modify the behavior of the call.
   \end{itemize}

   \textbf{Return values}
   \begin{itemize}
   \item number – of bytes filled with entropy or -error.
   \end{itemize}

\begin{verbatim}
#include <entropy.h>
\end{verbatim}
7.3.14 Flash

Overview

Flash offset concept
Offsets used by the user API are expressed in relation to the flash memory beginning address. This rule shall be applied to all flash controller regular memory that layout is accessible via API for retrieving the layout of pages (see CONFIG_FLASH_PAGE_LAYOUT).

An exception from the rule may be applied to a vendor-specific flash dedicated-purpose region (such a region obviously can’t be covered under API for retrieving the layout of pages).

User API Reference

group flash_interface
   FLASH Interface.

Typedefs

typedef bool (*flash_page_cb)(const struct flash_pages_info *info, void *data)
   Callback type for iterating over flash pages present on a device.
   The callback should return true to continue iterating, and false to halt.

See also:
   flash_page_foreach()

   Param info
      Information for current page

   Param data
      Private data for callback

   Return
      True to continue iteration, false to halt iteration.

Functions

int flash_read(const struct device *dev, off_t offset, void *data, size_t len)
   Read data from flash.
   All flash drivers support reads without alignment restrictions on the read offset, the read size, or the destination address.

   Parameters
      • dev – : flash dev
      • offset – : Offset (byte aligned) to read
      • data – : Buffer to store read data
      • len – : Number of bytes to read.

   Returns
      0 on success, negative errno code on fail.
int flash_write(const struct device *dev, off_t offset, const void *data, size_t len)
Write buffer into flash memory.

All flash drivers support a source buffer located either in RAM or SoC flash, without alignment restrictions on the source address. Write size and offset must be multiples of the minimum write block size supported by the driver.

Any necessary write protection management is performed by the driver write implementation itself.

Parameters
• dev – flash device
• offset – starting offset for the write
• data – data to write
• len – Number of bytes to write

Returns
0 on success, negative errno code on fail.

int flash_erase(const struct device *dev, off_t offset, size_t size)
Erase part or all of a flash memory.

Acceptable values of erase size and offset are subject to hardware-specific multiples of page size and offset. Please check the API implemented by the underlying sub driver, for example by using flash_get_page_info_by_offs() if that is supported by your flash driver.

Any necessary erase protection management is performed by the driver erase implementation itself.

See also:
flash_get_page_info_by_offs()

See also:
flash_get_page_info_by_idx()

Parameters
• dev – flash device
• offset – erase area starting offset
• size – size of area to be erased

Returns
0 on success, negative errno code on fail.

int flash_get_page_info_by_offs(const struct device *dev, off_t offset, struct flash_pages_info *info)
Get the size and start offset of flash page at certain flash offset.

Parameters
• dev – flash device
• offset – Offset within the page
• info – Page Info structure to be filled

Returns
0 on success, -EINVAL if page of the offset doesn't exist.
Get the size and start offset of flash page of certain index.

**Parameters**

- `dev` – flash device
- `page_index` – Index of the page. Index are counted from 0.
- `info` – Page Info structure to be filled

**Returns**

0 on success, -EINVAL if page of the index doesn’t exist.

Get the total number of flash pages.

**Parameters**

- `dev` – flash device

**Returns**

Number of flash pages.

Iterate over all flash pages on a device.

This routine iterates over all flash pages on the given device, ordered by increasing start offset. For each page, it invokes the given callback, passing it the page’s information and a private data object.

**Parameters**

- `dev` – Device whose pages to iterate over
- `cb` – Callback to invoke for each flash page
- `data` – Private data for callback function

Read data from Serial Flash Discoverable Parameters.

This routine reads data from a serial flash device compatible with the JEDEC JESD216 standard for encoding flash memory characteristics.

Availability of this API is conditional on selecting `CONFIG_FLASH_JESD216_API` and support of that functionality in the driver underlying `dev`.

**Parameters**

- `dev` – device from which parameters will be read
- `offset` – address within the SFDP region containing data of interest
- `data` – where the data to be read will be placed
- `len` – the number of bytes of data to be read

**Return values**

- 0 – on success
- -ENOTSUP – if the flash driver does not support SFDP access
- negative – values for other errors.

Read the JEDEC ID from a compatible flash device.

**Parameters**
• `dev` – device from which id will be read
• `id` – pointer to a buffer of at least 3 bytes into which id will be stored

**Return values**
• `0` – on successful store of 3-byte JEDEC id
• `-ENOTSUP` – if flash driver doesn’t support this function
• Negative values for other errors

```c
size_t flash_get_write_block_size(const struct device *dev)
```

Get the minimum write block size supported by the driver.

The write block size supported by the driver might differ from the write block size of memory used because the driver might implements write-modify algorithm.

**Parameters**
• `dev` – flash device

**Returns**
write block size in bytes.

```c
const struct flash_parameters *flash_get_parameters(const struct device *dev)
```

Get pointer to `flash_parameters` structure.

Returned pointer points to a structure that should be considered constant through a runtime, regardless if it is defined in RAM or Flash. Developer is free to cache the structure pointer or copy its contents.

**Returns**
pointer to `flash_parameters` structure characteristic for the device.

```c
#include <flash.h>
```

Flash memory parameters. Contents of this structure suppose to be filled in during flash device initialization and stay constant through a runtime.

```c
struct flash_pages_info
#include <flash.h>
```

**Implementation interface API Reference**

**group flash_internal_interface**
FLASH internal Interface.

**Typedefs**

typedef int (*flash_api_read)(const struct device *dev, off_t offset, void *data, size_t len)

Flash write implementation handler type.

**Note:** Any necessary write protection management must be performed by the driver, with the driver responsible for ensuring the “write-protect” after the operation completes (successfully or not) matches the write-protect state when the operation was started.
typedef int (*flash_api_erase)(const struct device *dev, off_t offset, size_t size)

Flash erase implementation handler type.

**Note:** Any necessary erase protection management must be performed by the driver, with the
driver responsible for ensuring the “erase-protect” after the operation completes (successfully
or not) matches the erase-protect state when the operation was started.

typedef const struct flash_parameters *(*flash_api_get_parameters)(const struct device *dev)

typedef void (*flash_api_pages_layout)(const struct device *dev, const struct flash_pages_layout **layout, size_t *layout_size)

Retrieve a flash device’s layout.

A flash device layout is a run-length encoded description of the pages on the device. (Here,
“page” means the smallest erasable area on the flash device.)

For flash memories which have uniform page sizes, this routine returns an array of length 1,
which specifies the page size and number of pages in the memory.

Layouts for flash memories with nonuniform page sizes will be returned as an array with
multiple elements, each of which describes a group of pages that all have the same size. In
this case, the sequence of array elements specifies the order in which these groups occur on
the device.

**Param dev**
Flash device whose layout to retrieve.

**Param layout**
The flash layout will be returned in this argument.

**Param layout_size**
The number of elements in the returned layout.

typedef int (*flash_api_sfdp_read)(const struct device *dev, off_t offset, void *data, size_t len)

typedef int (*flash_api_read_jedec_id)(const struct device *dev, uint8_t *id)

The fuel gauge subsystem exposes an API to uniformly access battery fuel gauge devices. Currently, only
reading data is supported.

**Note:** This API is currently experimental and this doc will be significantly changed as new features are
added to the API.

### 7.3.15 Fuel Gauges (Experimental API Stub Doc)

The fuel gauge subsystem exposes an API to uniformly access battery fuel gauge devices. Currently, only
reading data is supported.

**Note:** This API is currently experimental and this doc will be significantly changed as new features are
added to the API.

---

7.3. Peripherals 2175
Basic Operation

Properties  Fundamentally, a property is a quantity that a fuel gauge device can measure. Fuel gauges typically support multiple properties, such as temperature readings of the battery-pack or present-time current/voltage.

Properties are fetched using a client allocated array of `fuel_gauge_get_property`. This array is then populated by values as according to its `property_type` field.

Caching  The Fuel Gauge API explicitly provides no caching for its clients.

API Reference

group fuel_gauge_interface
   Fuel Gauge Interface.

Defines

`FUEL_GAUGE_AVG_CURRENT`
   Runtime Dynamic Battery Parameters Provide a 1 minute average of the current on the battery. Does not check for flags or whether those values are bad readings. See driver instance header for details on implementation and how the average is calculated. Units in uA negative=discharging

`FUEL_GAUGE_CURRENT`
   Battery current (uA); negative=discharging

`FUEL_GAUGE_CHARGE_CUTOFF`
   Whether the battery underlying the fuel-gauge is cut off from charge

`FUEL_GAUGE_CYCLE_COUNT`
   Cycle count in 1/100ths (number of charge/discharge cycles)

`FUEL_GAUGE_CONNECT_STATE`
   Connect state of battery

`FUEL_GAUGE_FLAGS`
   General Error/Runtime Flags

`FUEL_GAUGE_FULL_CHARGE_CAPACITY`
   Full Charge Capacity in uAh (might change in some implementations to determine wear)

`FUEL_GAUGE_PRESENT_STATE`
   Is the battery physically present

`FUEL_GAUGE_REMAINING_CAPACITY`
   Remaining capacity in uAh
FUEL_GAUGE_RUNTIME_TO_EMPTY
  Remaining battery life time in minutes

FUEL_GAUGE_RUNTIME_TO_FULL
  Remaining time in minutes until battery reaches full charge

FUEL_GAUGE_STATE_OF_CHARGE
  Absolute state of charge (percent, 0-100) - expressed as % of design capacity

FUEL_GAUGE_TEMPERATURE
  Temperature in 0.1 K

FUEL_GAUGE_VOLTAGE
  Battery voltage (uV)

FUEL_GAUGE_COMMON_COUNT
  Reserved to demark end of common fuel gauge properties

FUEL_GAUGE_CUSTOM_BEGIN
  Reserved to demark downstream custom properties - use this value as the actual value may change over future versions of this API

FUEL_GAUGE_PROP_MAX
  Reserved to demark end of valid enum properties

**Typedefs**

typedef int (*fuel_gauge_get_property_t)(const struct device *dev, struct fuel_gauge_get_property *props, size_t props_len)
  Fetch a battery fuel-gauge property.

  **Param dev**
  Pointer to the battery fuel-gauge device

  **Param props**
  pointer to array of fuel_gauge_get_property struct where the property struct field is set by the caller to determine what property is read from the fuel gauge device into the fuel_gauge_get_property struct's value field.

  **Param props_len**
  number of properties in props array

  **Return**
  return=0 if successful, return < 0 if getting all properties failed, return > 0 if some properties failed where return=number of failing properties.

  struct fuel_gauge_get_property
    #include <fuel_gauge.h>

  **Public Members**

```c
uint16_t property_type
    Battery fuel gauge property to get

int status
    Negative error status set by callee e.g. -ENOTSUP for an unsupported property

int avg_current
    FUEL_GAUGE_AVG_CURRENT

bool cutoff
    FUEL_GAUGE_CUTOFF

int current
    FUEL_GAUGE_CURRENT

uint32_t cycle_count
    FUEL_GAUGE_CYCLE_COUNT

uint32_t flags
    FUEL_GAUGE_FLAGS

uint32_t full_charge_capacity
    FUEL_GAUGE_FULL_CHARGE_CAPACITY

uint32_t remaining_capacity
    FUEL_GAUGE_REMAINING_CAPACITY

uint32_t runtime_to_empty
    FUEL_GAUGE_RUNTIME_TO_EMPTY

uint32_t runtime_to_full
    FUEL_GAUGE_RUNTIME_TO_FULL

uint8_t state_of_charge
    FUEL_GAUGE_STATE_OF_CHARGE

uint16_t temperature
    FUEL_GAUGE_TEMPERATURE

int voltage
    FUEL_GAUGE_VOLTAGE

union fuel_gauge_get_property.[anonymous] value
    Property field for getting

struct battery_driver_api
    #include <fuel_gauge.h>
```
7.3.16 GNA

Overview

The GNA API provides access to Intel's Gaussian Mixture Model and Neural Network Accelerator (GNA).

Configuration Options

Related configuration options:

- CONFIG_INTEL_GNA

API Reference

```markdown
group gna_interface

This file contains the driver APIs for Intel's Gaussian Mixture Model and Neural Network Accelerator (GNA)
```

Enums

```markdown
enum gna_result

Result of an inference operation

Values:

- GNA_RESULT_INFERENCE_COMPLETE
- GNA_RESULT_SATURATION_OCCURRED
- GNA_RESULT_OUTPUT_BUFFER_FULL_ERROR
- GNA_RESULT_PARAM_OUT_OF_RANGE_ERROR
- GNA_RESULT_GENERIC_ERROR
```

Functions

```c
static inline int gna_configure(const struct device *dev, struct gna_config *cfg)

Configure the GNA device.

Configure the GNA device. The GNA device must be configured before registering a model or performing inference

Parameters

- dev – Pointer to the device structure for the driver instance.
- cfg – Device configuration information

Return values

- 0 – If the configuration is successful
- A – negative error code in case of a failure.
```
static inline int gna_register_model(const struct device *dev, struct gna_model_info *model, void **model_handle)

Register a neural network model.

Register a neural network model with the GNA device. A model needs to be registered before it can be used to perform inference.

Parameters
- dev – Pointer to the device structure for the driver instance.
- model – Information about the neural network model
- model_handle – Handle to the registered model if registration succeeds

Return values
- 0 – If registration of the model is successful.
- A – Negative error code in case of a failure.

static inline int gna_deregister_model(const struct device *dev, void *model)

De-register a previously registered neural network model.

De-register a previously registered neural network model from the GNA device. De-registration may be done to free up memory for registering another model. Once de-registered, the model can no longer be used to perform inference.

Parameters
- dev – Pointer to the device structure for the driver instance.
- model – Model handle output by gna_register_model API

Return values
- 0 – If de-registration of the model is successful.
- A – Negative error code in case of a failure.

static inline int gna_infer(const struct device *dev, struct gna_inference_req *req, gna_callback callback)

Perform inference on a model with input vectors.

Make an inference request on a previously registered model with an input data vector. A callback is provided for notification of inference completion.

Parameters
- dev – Pointer to the device structure for the driver instance.
- req – Information required to perform inference on a neural network
- callback – A callback function to notify inference completion

Return values
- 0 – If the request is accepted
- A – Negative error code in case of a failure.

#include <gna.h>

GNA driver configuration structure. Currently empty.

#include <gna.h>

GNA Neural Network model header. Describes the key parameters of the neural network model.
struct gna_model_info
#include <gna.h> GNA Neural Network model information to be provided by application during model registration

struct gna_inference_req
#include <gna.h> Request to perform inference on the given neural network model

struct gna_inference_stats
#include <gna.h> Statistics of the inference operation returned after completion

struct gna_inference_resp
#include <gna.h> Structure containing a response to the inference request

7.3.17 GPIO

Overview

Configuration Options

Related configuration options:
- CONFIG_GPIO

API Reference

group gpio_interface
GPIO Driver APIs.

GPIO input/output configuration flags

GPIO_INPUT
Enables pin as input.

GPIO_OUTPUT
Enables pin as output, no change to the output state.

GPIO_DISCONNECTED
Disables pin for both input and output.

GPIO_OUTPUT_LOW
Configures GPIO pin as output and initializes it to a low state.

GPIO_OUTPUT_HIGH
Configures GPIO pin as output and initializes it to a high state.

GPIO_OUTPUT_INACTIVE
Configures GPIO pin as output and initializes it to a logic 0.
GPIO_OUTPUT_ACTIVE
Configures GPIO pin as output and initializes it to a logic 1.

**GPIO interrupt configuration flags**

The GPIO_INT_* flags are used to specify how input GPIO pins will trigger interrupts. The interrupts can be sensitive to pin physical or logical level. Interrupts sensitive to pin logical level take into account GPIO_ACTIVE_LOW flag. If a pin was configured as Active Low, physical level low will be considered as logical level 1 (an active state), physical level high will be considered as logical level 0 (an inactive state).

**GPIO_INT_DISABLE**
Disables GPIO pin interrupt.

**GPIO_INT_EDGE_RISING**
Configures GPIO interrupt to be triggered on pin rising edge and enables it.

**GPIO_INT_EDGE_FALLING**
Configures GPIO interrupt to be triggered on pin falling edge and enables it.

**GPIO_INT_EDGE_BOTH**
Configures GPIO interrupt to be triggered on pin rising or falling edge and enables it.

**GPIO_INT_LEVEL_LOW**
Configures GPIO interrupt to be triggered on pin physical level low and enables it.

**GPIO_INT_LEVEL_HIGH**
Configures GPIO interrupt to be triggered on pin physical level high and enables it.

**GPIO_INT_EDGE_TO_INACTIVE**
Configures GPIO interrupt to be triggered on pin state change to logical level 0 and enables it.

**GPIO_INT_EDGE_TO_ACTIVE**
Configures GPIO interrupt to be triggered on pin state change to logical level 1 and enables it.

**GPIO_INT_LEVEL_INACTIVE**
Configures GPIO interrupt to be triggered on pin logical level 0 and enables it.

**GPIO_INT_LEVEL_ACTIVE**
Configures GPIO interrupt to be triggered on pin logical level 1 and enables it.

**GPIO pin active level flags**

**GPIO_ACTIVE_LOW**
GPIO pin is active (has logical value ‘1’) in low state.

**GPIO_ACTIVE_HIGH**
GPIO pin is active (has logical value ‘1’) in high state.
GPIO pin drive flags

**GPIO_OPEN_DRAIN**
Configures GPIO output in open drain mode (wired AND).

**Note:** ’Open Drain’ mode also known as ’Open Collector’ is an output configuration which behaves like a switch that is either connected to ground or disconnected.

**GPIO_OPEN_SOURCE**
Configures GPIO output in open source mode (wired OR).

**Note:** ’Open Source' is a term used by software engineers to describe output mode opposite to ’Open Drain’. It behaves like a switch that is either connected to power supply or disconnected. There exist no corresponding hardware schematic and the term is generally unknown to hardware engineers.

GPIO pin bias flags

**GPIO_PULL_UP**
Enables GPIO pin pull-up.

**GPIO_PULL_DOWN**
Enable GPIO pin pull-down.

Defines

**GPIO_DT_SPEC_GET_BY_IDX(node_id, prop, idx)**
Static initializer for a *gpio_dt_spec*.

This returns a static initializer for a *gpio_dt_spec* structure given a devicetree node identifier, a property specifying a GPIO and an index.

Example devicetree fragment:

```markdown
n: node {
  foo-gpios = <&gpio0 1 GPIO_ACTIVE_LOW>,
               <&gpio1 2 GPIO_ACTIVE_LOW>;
}
```

Example usage:

```c
const struct gpio_dt_spec spec = GPIO_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n),
                                                          foo_gpios, 1);
// Initializes 'spec' to:
// {
//   .port = DEVICE_DT_GET(DT_NODELABEL(gpio1)),
//   .pin = 2,
//   .dt_flags = GPIO_ACTIVE_LOW
// }
```
The ‘gpio’ field must still be checked for readiness, e.g. using `device_is_ready()`. It is an error to use this macro unless the node exists, has the given property, and that property specifies a GPIO controller, pin number, and flags as shown above.

**Parameters**
- `node_id` – devicetree node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – logical index into “prop”

**Returns**
- static initializer for a struct `gpio_dt_spec` for the property

`GPIO_DT_SPEC_GET_BY_IDX_OR(node_id, prop, idx, default_value)`

Like `GPIO_DT_SPEC_GET_BY_IDX(node_id, prop, idx)`, with a fallback to a default value.

If the devicetree node identifier ‘node_id’ refers to a node with a property ‘prop’, this expands to `GPIO_DT_SPEC_GET_BY_IDX(node_id, prop, idx)`. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

**Parameters**
- `node_id` – devicetree node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – logical index into “prop”
- `default_value` – fallback value to expand to

**Returns**
- static initializer for a struct `gpio_dt_spec` for the property, or `default_value` if the node or property do not exist

`GPIO_DT_SPEC_GET(node_id, prop)`

Equivalent to `GPIO_DT_SPEC_GET_BY_IDX(node_id, prop, 0)`.

**See also:**
`GPIO_DT_SPEC_GET_BY_IDX()`

**Parameters**
- `node_id` – devicetree node identifier
- `prop` – lowercase-and-underscores property name

**Returns**
- static initializer for a struct `gpio_dt_spec` for the property

`GPIO_DT_SPEC_GET_OR(node_id, prop, default_value)`

Equivalent to `GPIO_DT_SPEC_GET_BY_IDX_OR(node_id, prop, 0, default_value)`.

**See also:**
`GPIO_DT_SPEC_GET_BY_IDX_OR()`
• default_value – fallback value to expand to

Returns
static initializer for a struct gpio_dt_spec for the property

GPIO_DT_SPEC_INST_GET_BY_IDX(inst, prop, idx)
Static initializer for a gpio_dt_spec from a DT_DRV_COMPAT instance's GPIO property at an index.

See also:
GPIO_DT_SPEC_GET_BY_IDX() parameters

Returns
static initializer for a struct gpio_dt_spec for the property

GPIO_DT_SPEC_INST_GET_BY_IDX_OR(inst, prop, idx, default_value)
Static initializer for a gpio_dt_spec from a DT_DRV_COMPAT instance's GPIO property at an index, with fallback.

See also:
GPIO_DT_SPEC_GET_BY_IDX() parameters

Returns
static initializer for a struct gpio_dt_spec for the property

GPIO_DT_SPEC_INST_GET(inst, prop)
Equivalent to GPIO_DT_SPEC_INST_GET_BY_IDX(inst, prop, 0).

See also:
GPIO_DT_SPEC_INST_GET_BY_IDX() parameters

Returns
static initializer for a struct gpio_dt_spec for the property

7.3. Peripherals
GPIO_DT_SPEC_INST_GET_OR(inst, prop, default_value)
    Equivalent to GPIO_DT_SPEC_INST_GET_BY_IDX_OR(inst, prop, 0, default_value).

See also:
    GPIO_DT_SPEC_INST_GET_BY_IDX()

Parameters
    • inst – DT_DRV_COMPAT instance number
    • prop – lowercase-and-underscores property name
    • default_value – fallback value to expand to

Returns
    static initializer for a struct gpio_dt_spec for the property

GPIO_MAX_PINS_PER_PORT
    Maximum number of pins that are supported by gpio_port_pins_t.

Typedefs

typedef uint32_t gpio_port_pins_t
    Identifies a set of pins associated with a port.
    The pin with index n is present in the set if and only if the bit identified by (1U << n) is set.

typedef uint32_t gpio_port_value_t
    Provides values for a set of pins associated with a port.
    The value for a pin with index n is high (physical mode) or active (logical mode) if and only if
    the bit identified by (1U << n) is set. Otherwise the value for the pin is low (physical mode)
    or inactive (logical mode).
    Values of this type are often paired with a gpio_port_pins_t value that specifies which en-
    coded pin values are valid for the operation.

typedef uint8_t gpio_pin_t
    Provides a type to hold a GPIO pin index.
    This reduced-size type is sufficient to record a pin number, e.g. from a devicetree GPIOS
    property.

typedef uint16_t gpio_dt_flags_t
    Provides a type to hold GPIO devicetree flags.
    All GPIO flags that can be expressed in devicetree fit in the low 16 bits of the full flags field,
    so use a reduced-size type to record that part of a GPIOS property.
    The lower 8 bits are used for standard flags. The upper 8 bits are reserved for SoC specific
    flags.

typedef uint32_t gpio_flags_t
    Provides a type to hold GPIO configuration flags.
    This type is sufficient to hold all flags used to control GPIO configuration, whether pin or
    interrupt.
typedef void (*gpio_callback_handler_t)(const struct device *port, struct gpio_callback *cb, gpio_port_pins_t pins)

Define the application callback handler function signature.

Note: cb pointer can be used to retrieve private data through CONTAINER_OF() if original struct gpio_callback is stored in another private structure.

Param port
Device struct for the GPIO device.

Param cb
Original struct gpio_callback owning this handler

Param pins
Mask of pins that triggers the callback handler

Functions

int gpio_pin_interrupt_configure(const struct device *port, gpio_pin_t pin, gpio_flags_t flags)
Configure pin interrupt.

Note: This function can also be used to configure interrupts on pins not controlled directly by the GPIO module. That is, pins which are routed to other modules such as I2C, SPI, UART.

Parameters

• port – Pointer to device structure for the driver instance.
• pin – Pin number.
• flags – Interrupt configuration flags as defined by GPIO_INT_.*

Return values

• 0 – If successful.
• -ENOTSUP – If any of the configuration options is not supported (unless otherwise directed by flag documentation).
• -EINVAL – Invalid argument.
• -EBUSY – Interrupt line required to configure pin interrupt is already in use.
• -E10 – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_interrupt_configure_dt(const struct gpio_dt_spec *spec, gpio_flags_t flags)
Configure pin interrupts from a gpio_dt_spec.
This is equivalent to:
gpio_pin_interrupt_configure(spec->port, spec->pin, flags);
The spec->dt_flags value is not used.

Parameters

• spec – GPIO specification from devicetree
• flags – interrupt configuration flags

7.3. Peripherals
int gpio_pin_configure(const struct device *port, gpio_pin_t pin, gpio_flags_t flags)

Configure a single pin.

Parameters
- port – Pointer to device structure for the driver instance.
- pin – Pin number to configure.

Return values
- 0 – If successful.
- -ENOTSUP – if any of the configuration options is not supported (unless otherwise directed by flag documentation).
- -EINVAL – Invalid argument.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_configure_dt(const struct gpio_dt_spec *spec, gpio_flags_t extra_flags)

Configure a single pin from a gpio_dt_spec and some extra flags.

This is equivalent to:

```c
gpio_pin_configure(spec->port, spec->pin, spec->dt_flags | extra_flags);
```

Parameters
- spec – GPIO specification from devicetree
- extra_flags – additional flags

Returns
- a value from gpio_pin_configure()

int gpio_port_get_direction(const struct device *port, gpio_port_pins_t map, gpio_port_pins_t *inputs, gpio_port_pins_t *outputs)

static inline int gpio_pin_is_input(const struct device *port, gpio_pin_t pin)

Check if pin is configured for input.

Parameters
- port – Pointer to device structure for the driver instance.
- pin – Pin number to query the direction of

Return values
- 1 – if pin is configured as GPIO_INPUT.
- 0 – if pin is not configured as GPIO_INPUT.
- -ENOSYS – if the underlying driver does not support this call.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.
static inline int gpio_pin_is_output(const struct device *port, gpio_pin_t pin)
Check if pin is configured for output.

Parameters

• port – Pointer to device structure for the driver instance.
• pin – Pin number to query the direction of

Return values

• 1 – if pin is configured as GPIO_OUTPUT.
• 0 – if pin is not configured as GPIO_OUTPUT.
• -ENOSYS – if the underlying driver does not support this call.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

int gpio_pin_get_config(const struct device *port, gpio_pin_t pin, gpio_flags_t *flags)
Get a configuration of a single pin.

Parameters

• port – Pointer to device structure for the driver instance.
• pin – Pin number which configuration is get.
• flags – Pointer to variable in which the current configuration will be stored if function is successful.

Return values

• 0 – If successful.
• -ENOSYS – if getting current pin configuration is not implemented by the driver.
• -EINVAL – Invalid argument.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_get_config_dt(const struct gpio_dt_spec *spec, gpio_flags_t *flags)
Get a configuration of a single pin from a gpio_dt_spec.
This is equivalent to:

```
gpio_pin_get_config(spec->port, spec->pin, flags);
```

Parameters

• spec – GPIO specification from devicetree
• flags – Pointer to variable in which the current configuration will be stored if function is successful.

Returns

a value from gpio_pin_configure()

int gpio_port_get_raw(const struct device *port, gpio_port_value_t *value)
Get physical level of all input pins in a port.
A low physical level on the pin will be interpreted as value 0. A high physical level will be interpreted as value 1. This function ignores GPIO_ACTIVE_LOW flag.

Value of a pin with index n will be represented by bit n in the returned port value.

Parameters
• port – Pointer to the device structure for the driver instance.
• value – Pointer to a variable where pin values will be stored.

**Return values**
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_port_get(const struct device *port, gpio_port_value_t *value)

Get logical level of all input pins in a port.

Get logical level of an input pin taking into account GPIO_ACTIVE_LOW flag. If pin is configured as Active High, a low physical level will be interpreted as logical value 0. If pin is configured as Active Low, a low physical level will be interpreted as logical value 1.

Value of a pin with index n will be represented by bit n in the returned port value.

**Parameters**
• port – Pointer to the device structure for the driver instance.
• value – Pointer to a variable where pin values will be stored.

**Return values**
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

int gpio_port_set_masked_raw(const struct device *port, gpio_port_pins_t mask, gpio_port_value_t value)

Set physical level of output pins in a port.

Writing value 0 to the pin will set it to a low physical level. Writing value 1 will set it to a high physical level. This function ignores GPIO_ACTIVE_LOW flag.

Pin with index n is represented by bit n in mask and value parameter.

**Parameters**
• port – Pointer to the device structure for the driver instance.
• mask – Mask indicating which pins will be modified.
• value – Value assigned to the output pins.

**Return values**
• 0 – If successful.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_port_set_masked(const struct device *port, gpio_port_pins_t mask, gpio_port_value_t value)

Set logical level of output pins in a port.

Set logical level of an output pin taking into account GPIO_ACTIVE_LOW flag. Value 0 sets the pin in logical 0 / inactive state. Value 1 sets the pin in logical 1 / active state. If pin is configured as Active High, the default, setting it in inactive state will force the pin to a low physical level. If pin is configured as Active Low, setting it in inactive state will force the pin to a high physical level.

Pin with index n is represented by bit n in mask and value parameter.
Parameters

- **port** – Pointer to the device structure for the driver instance.
- **mask** – Mask indicating which pins will be modified.
- **value** – Value assigned to the output pins.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

```c
int gpio_port_set_bits_raw(const struct device *port, gpio_port_pins_t pins)
```

Set physical level of selected output pins to high.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **pins** – Value indicating which pins will be modified.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

```c
static inline int gpio_port_set_bits(const struct device *port, gpio_port_pins_t pins)
```

Set logical level of selected output pins to active.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **pins** – Value indicating which pins will be modified.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

```c
int gpio_port_clear_bits_raw(const struct device *port, gpio_port_pins_t pins)
```

Set physical level of selected output pins to low.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **pins** – Value indicating which pins will be modified.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

```c
static inline int gpio_port_clear_bits(const struct device *port, gpio_port_pins_t pins)
```

Set logical level of selected output pins to inactive.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **pins** – Value indicating which pins will be modified.
Return values

- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

```c
int gpio_port_toggle_bits(const struct device *port, gpio_port_pins_t pins)
```

Toggle level of selected output pins.

**Parameters**

- *port* – Pointer to the device structure for the driver instance.
- *pins* – Value indicating which pins will be modified.

**Return values**

- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

```c
static inline int gpio_port_set_clr_bits_raw(const struct device *port, gpio_port_pins_t set_pins, gpio_port_pins_t clear_pins)
```

Set physical level of selected output pins.

**Parameters**

- *port* – Pointer to the device structure for the driver instance.
- *set_pins* – Value indicating which pins will be set to high.
- *clear_pins* – Value indicating which pins will be set to low.

**Return values**

- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

```c
static inline int gpio_port_set_clr_bits(const struct device *port, gpio_port_pins_t set_pins, gpio_port_pins_t clear_pins)
```

Set logical level of selected output pins.

**Parameters**

- *port* – Pointer to the device structure for the driver instance.
- *set_pins* – Value indicating which pins will be set to active.
- *clear_pins* – Value indicating which pins will be set to inactive.

**Return values**

- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

```c
static inline int gpio_pin_get_raw(const struct device *port, gpio_pin_t pin)
```

Get physical level of an input pin.

A low physical level on the pin will be interpreted as value 0. A high physical level will be interpreted as value 1. This function ignores GPIO_ACTIVE_LOW flag.

**Parameters**
• port – Pointer to the device structure for the driver instance.
• pin – Pin number.

Return values
• 1 – If pin physical level is high.
• 0 – If pin physical level is low.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_get(const struct device *port, gpio_pin_t pin)
Get logical level of an input pin.

Get logical level of an input pin taking into account GPIO_ACTIVE_LOW flag. If pin is configured as Active High, a low physical level will be interpreted as logical value 0. If pin is configured as Active Low, a low physical level will be interpreted as logical value 1.

Note: If pin is configured as Active High, the default, gpio_pin_get() function is equivalent to gpio_pin_get_raw().

Parameters
• port – Pointer to the device structure for the driver instance.
• pin – Pin number.

Return values
• 1 – If pin logical value is 1 / active.
• 0 – If pin logical value is 0 / inactive.
• -EIO – I/O error when accessing an external GPIO chip.
• -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_get_dt(const struct gpio_dt_spec *spec)
Get logical level of an input pin from a gpio_dt_spec.

This is equivalent to:

gpio_pin_get(spec->port, spec->pin);

Parameters
• spec – GPIO specification from devicetree

Returns
a value from gpio_pin_get()

static inline int gpio_pin_set_raw(const struct device *port, gpio_pin_t pin, int value)
Set physical level of an output pin.

Writing value 0 to the pin will set it to a low physical level. Writing any value other than 0 will set it to a high physical level. This function ignores GPIO_ACTIVE_LOW flag.

Parameters
• port – Pointer to the device structure for the driver instance.
• pin – Pin number.
• value – Value assigned to the pin.

Return values
• 0 – If successful.
static inline int gpio_pin_set(const struct device *port, gpio_pin_t pin, int value)
Set logical level of an output pin.

Set logical level of an output pin taking into account GPIO_ACTIVE_LOW flag. Value 0 sets the pin in logical 0 / inactive state. Any value other than 0 sets the pin in logical 1 / active state. If pin is configured as Active High, the default, setting it in inactive state will force the pin to a low physical level. If pin is configured as Active Low, setting it in inactive state will force the pin to a high physical level.

Note: If pin is configured as Active High, gpio_pin_set() function is equivalent to gpio_pin_set_raw().

Parameters
- port – Pointer to the device structure for the driver instance.
- pin – Pin number.
- value – Value assigned to the pin.

Return values
- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.

static inline int gpio_pin_set_dt(const struct gpio_dt_spec *spec, int value)
Set logical level of a output pin from a gpio_dt_spec.

This is equivalent to:

gpio_pin_set(spec->port, spec->pin, value);

Parameters
- spec – GPIO specification from devicetree
- value – Value assigned to the pin.

Returns
- a value from gpio_pin_set()

static inline int gpio_pin_toggle(const struct device *port, gpio_pin_t pin)
Toggle pin level.

Parameters
- port – Pointer to the device structure for the driver instance.
- pin – Pin number.

Return values
- 0 – If successful.
- -EIO – I/O error when accessing an external GPIO chip.
- -EWOULDBLOCK – if operation would block.
```c
gpio_pin_toggle(spec->port, spec->pin);
```

### Parameters
- `spec` – GPIO specification from devicetree

### Returns
A value from `gpio_pin_toggle()`

---

```c
static inline void gpio_init_callback(struct gpio_callback *callback, gpio_callback_handler_t handler, gpio_port_pins_t pin_mask)
```

Helper to initialize a struct `gpio_callback` properly.

### Parameters
- `callback` – A valid Application's callback structure pointer.
- `handler` – A valid handler function pointer.
- `pin_mask` – A bit mask of relevant pins for the handler

---

```c
static inline int gpio_add_callback(const struct device *port, struct gpio_callback *callback)
```

Add an application callback.

**Note:** enables to add as many callbacks as needed on the same port.

---

**Note:** Callbacks may be added to the device from within a callback handler invocation, but whether they are invoked for the current GPIO event is not specified.

---

```c
static inline int gpio_remove_callback(const struct device *port, struct gpio_callback *callback)
```

Remove an application callback.

**Note:** enables to remove as many callbacks as added through `gpio_add_callback()`.

---

**Warning:** It is explicitly permitted, within a callback handler, to remove the registration for the callback that is running, i.e. `callback`. Attempts to remove other registrations on the same device may result in undefined behavior, including failure to invoke callbacks that remain registered and unintended invocation of removed callbacks.

### Parameters
- `port` – Pointer to the device structure for the driver instance.
- `callback` – A valid Application's callback structure pointer.

### Returns
0 if successful, negative errno code on failure.
int gpio_get_pending_int(const struct device *dev)

Function to get pending interrupts.

The purpose of this function is to return the interrupt status register for the device. This is especially useful when waking up from low power states to check the wake up source.

Parameters

• dev – Pointer to the device structure for the driver instance.

Return values

• status – != 0 if at least one gpio interrupt is pending.
• 0 – if no gpio interrupt is pending.

struct gpio_dt_spec

#include <gpio.h> Container for GPIO pin information specified in devicetree.

This type contains a pointer to a GPIO device, pin number for a pin controlled by that device, and the subset of pin configuration flags which may be given in devicetree.

GPIO_DT_SPEC_GET_BY_IDX

See also:

GPIO_DT_SPEC_GET_BY_IDX_OR

See also:

GPIO_DT_SPEC_GET

See also:

GPIO_DT_SPEC_GET_OR

Public Members

const struct device *port

GPIO device controlling the pin

gpio_pin_t pin

The pin's number on the device

gpio_dt_flags_t dt_flags

The pin's configuration flags as specified in devicetree

struct gpio_driver_config

#include <gpio.h> This structure is common to all GPIO drivers and is expected to be the first element in the object pointed to by the config field in the device structure.

struct gpio_driver_data

#include <gpio.h> This structure is common to all GPIO drivers and is expected to be the first element in the driver's struct driver_data declaration.
struct gpio_callback

#include <gpio.h> GPIO callback structure.

Used to register a callback in the driver instance callback list. As many callbacks as needed can be added as long as each of them are unique pointers of struct gpio_callback. Beware such structure should not be allocated on stack.

Note: To help setting it, see gpio_init_callback() below

Public Members

sys_snode_t node
This is meant to be used in the driver and the user should not mess with it (see drivers/gpio/gpio_utils.h)

gpio_callback_handler_t handler
Actual callback function being called when relevant.

gpio_port_pins_t pin_mask
A mask of pins the callback is interested in, if 0 the callback will never be called. Such pin_mask can be modified whenever necessary by the owner, and thus will affect the handler being called or not. The selected pins must be configured to trigger an interrupt.

7.3.18 Hardware Information

Overview

The HW Info API provides access to hardware information such as device identifiers and reset cause flags.

Reset cause flags can be used to determine why the device was reset; for example due to a watchdog timeout or due to power cycling. Different devices support different subset of flags. Use hwinfo_get_supported_reset_cause() to retrieve the flags that are supported by that device.

Configuration Options

Related configuration options:

• CONFIG_HWINFO

API Reference

group hwinfo_interface
Hardware Information Interface.

Defines

RESET_PIN
RESET_SOFTWARE
RESET_BROWNOUT
RESET_POR
RESET_WATCHDOG

RESET_SECURITY
RESET_LOW_POWER_WAKE
RESET_CPU_LOCKUP
RESET_PARITY
RESET_PLL
RESET_CLOCK
RESET_HARDWARE
RESET_USER
RESET_TEMPERATURE

Functions

ssize_t hwinfo_get_device_id(uint8_t *buffer, size_t length)

Copy the device id to a buffer.

This routine copies “length” number of bytes of the device ID to the buffer. If the device ID is smaller then length, the rest of the buffer is left unchanged. The ID depends on the hardware and is not guaranteed unique.

Drivers are responsible for ensuring that the ID data structure is a sequence of bytes. The returned ID value is not supposed to be interpreted based on vendor-specific assumptions of byte order. It should express the identifier as a raw byte sequence, doing any endian conversion necessary so that a hex representation of the bytes produces the intended serial number.

Parameters

• buffer – Buffer to write the ID to.
• length – Max length of the buffer.

Return values

• size – of the device ID copied.
-ENOSYS – if there is no implementation for the particular device.

any – negative value on driver specific errors.

### `int hwinfo_get_reset_cause(uint32_t *cause)`

Retrieve cause of device reset.

This routine retrieves the flags that indicate why the device was reset.

On some platforms the reset cause flags accumulate between successive resets and this routine may return multiple flags indicating all reset causes since the device was powered on. If you need to retrieve the cause only for the most recent reset call `hwinfo_clear_reset_cause` after calling this routine to clear the hardware flags before the next reset event.

Successive calls to this routine will return the same value, unless `hwinfo_clear_reset_cause` has been called.

**Parameters**

- cause – OR'd reset_cause flags

**Return values**

- zero – if successful.
- -ENOSYS – if there is no implementation for the particular device.
- any – negative value on driver specific errors.

### `int hwinfo_clear_reset_cause(void)`

Clear cause of device reset.

Clears reset cause flags.

**Return values**

- zero – if successful.
- -ENOSYS – if there is no implementation for the particular device.
- any – negative value on driver specific errors.

### `int hwinfo_get_supported_reset_cause(uint32_t *supported)`

Get supported reset cause flags.

Retrieves all reset_cause flags that are supported by this device.

**Parameters**

- supported – OR'd reset_cause flags that are supported

**Return values**

- zero – if successful.
- -ENOSYS – if there is no implementation for the particular device.
- any – negative value on driver specific errors.

### 7.3.19 I2C EEPROM Target

#### Overview

#### API Reference
I2C EEPROM Target Driver API.

### Functions

```c
int eeprom_target_program(const struct device *dev, const uint8_t *eeprom_data, unsigned int length)
```

Program memory of the virtual EEPROM.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `eeprom_data` – Pointer of data to program into the virtual eeprom memory
- `length` – Length of data to program into the virtual eeprom memory

**Return values**

- `0` – If successful.
- `-EINVAL` – Invalid data size

```c
int eeprom_target_read(const struct device *dev, uint8_t *eeprom_data, unsigned int offset)
```

Read single byte of virtual EEPROM memory.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `eeprom_data` – Pointer of byte where to store the virtual eeprom memory
- `offset` – Offset into EEPROM memory where to read the byte

**Return values**

- `0` – If successful.
- `-EINVAL` – Invalid data pointer or offset

### 7.3.20 I2C

#### Overview

**Note:** The terminology used in Zephyr I2C APIs follows that of the NXP I2C Bus Specification Rev 7.0. These changed from previous revisions as of its release October 1, 2021.

I2C (Inter-Integrated Circuit, pronounced “eye squared see”) is a commonly-used two-signal shared peripheral interface bus. Many system-on-chip solutions provide controllers that communicate on an I2C bus. Devices on the bus can operate in two roles: as a “controller” that initiates transactions and controls the clock, or as a “target” that responds to transaction commands. An I2C controller on a given SoC will generally support the controller role, and some will also support the target mode. Zephyr has API for both roles.

**I2C Controller API** Zephyr's I2C controller API is used when an I2C peripheral controls the bus, in particularly the start and stop conditions and the clock. This is the most common mode, used to interact with I2C devices like sensors and serial memory.

This API is supported in all in-tree I2C peripheral drivers and is considered stable.
**I2C Target API**  Zephyr’s I2C target API is used when an I2C peripheral responds to transactions initiated by a different controller on the bus. It might be used for a Zephyr application with transducer roles that are controlled by another device such as a host processor.

This API is supported in very few in-tree I2C peripheral drivers. The API is considered experimental, as it is not compatible with the capabilities of all I2C peripherals supported in controller mode.

**Configuration Options**

Related configuration options:
- `CONFIG_I2C`

**API Reference**

I2C_SPEED_GET(cfg)

I2C_ADDR_10_BITS
    Use 10-bit addressing. DEPRECATED - Use I2C_MSG_ADDR_10_BITS instead.
```

7.3. Peripherals
I2C_MODE_CONTROLLER
Peripheral to act as Controller.

I2C_MODE_MASTER

Deprecated:
Use I2C_MODE_CONTROLLER instead.

I2C_DT_SPEC_GET_ON_I3C(node_id)
Structure initializer for i2c_dt_spec from devicetree (on I3C bus)
This helper macro expands to a static initializer for a struct i2c_dt_spec by reading the relevant bus and address data from the devicetree.

Parameters
• node_id – Devicetree node identifier for the I2C device whose struct i2c_dt_spec to create an initializer for

I2C_DT_SPEC_GET_ON_I2C(node_id)
Structure initializer for i2c_dt_spec from devicetree (on I2C bus)
This helper macro expands to a static initializer for a struct i2c_dt_spec by reading the relevant bus and address data from the devicetree.

Parameters
• node_id – Devicetree node identifier for the I2C device whose struct i2c_dt_spec to create an initializer for

I2C_DT_SPEC_GET(node_id)
Structure initializer for i2c_dt_spec from devicetree.
This helper macro expands to a static initializer for a struct i2c_dt_spec by reading the relevant bus and address data from the devicetree.

Parameters
• node_id – Devicetree node identifier for the I2C device whose struct i2c_dt_spec to create an initializer for

I2C_DT_SPEC_INST_GET(inst)
Structure initializer for i2c_dt_spec from devicetree instance.
This is equivalent to I2C_DT_SPEC_GET(DT_DRV_INST(inst)).

Parameters
• inst – Devicetree instance number

I2C_MSG_WRITE
Write message to I2C bus.

I2C_MSG_READ
Read message from I2C bus.

I2C_MSG_STOP
Send STOP after this message.
I2C_MSG_RESTART

RESTART I2C transaction for this message.

**Note:** Not all I2C drivers have or require explicit support for this feature. Some drivers require this be present on a read message that follows a write, or vice-versa. Some drivers will merge adjacent fragments into a single transaction using this flag; some will not.

I2C_MSG_ADDR_10_BITS

Use 10-bit addressing for this message.

**Note:** Not all SoC I2C implementations support this feature.

I2C_TARGET_FLAGS_ADDR_10_BITS

Target device responds to 10-bit addressing.

I2C_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, level, prio, api, ...)

Like `DEVICE_DT_DEFINE()` with I2C specifics.

Defines a device which implements the I2C API. May generate a custom `device_state` container struct and `init_fn` wrapper when needed depending on I2C CONFIG_I2C_STATS.

**Parameters**

- `node_id` – The devicetree node identifier.
- `init_fn` – Name of the init function of the driver.
- `pm` – PM device resources reference (NULL if device does not use PM).
- `data` – Pointer to the device's private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.
- `level` – The initialization level. See SYS_INIT() for details.
- `prio` – Priority within the selected initialization level. See SYS_INIT() for details.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

I2C_DEVICE_DT_INST_DEFINE(inst, ...)

Like `I2C_DEVICE_DT_DEFINE()` for an instance of a DT_DRV_COMPAT compatible.

**Parameters**

- `inst` – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to `I2C_DEVICE_DT_DEFINE()`.
- `...` – other parameters as expected by `I2C_DEVICE_DT_DEFINE()`.

**Typedefs**

typedef void (*i2c_callback_t)(const struct device *dev, int result, void *data)

I2C callback for asynchronous transfer requests.

**Param** dev

I2C device which is notifying of transfer completion or error
**Param result**
Result code of the transfer request. 0 is success, -errno for failure.

**Param data**
Transfer requester supplied data which is passed along to the callback.

typedef int (*i2c_target_write_requested_cb_t)(struct i2c_target_config *config)
Function called when a write to the device is initiated.

This function is invoked by the controller when the bus completes a start condition for a write operation to the address associated with a particular device.

A success return shall cause the controller to ACK the next byte received. An error return shall cause the controller to NACK the next byte received.

**Param config**
the configuration structure associated with the device to which the operation is addressed.

**Return**
0 if the write is accepted, or a negative error code.

typedef int (*i2c_target_write_received_cb_t)(struct i2c_target_config *config, uint8_t val)
Function called when a write to the device is continued.

This function is invoked by the controller when it completes reception of a byte of data in an ongoing write operation to the device.

A success return shall cause the controller to ACK the next byte received. An error return shall cause the controller to NACK the next byte received.

**Param config**
the configuration structure associated with the device to which the operation is addressed.

**Param val**
the byte received by the controller.

**Return**
0 if more data can be accepted, or a negative error code.

typedef int (*i2c_target_read_requested_cb_t)(struct i2c_target_config *config, uint8_t *val)
Function called when a read from the device is initiated.

This function is invoked by the controller when the bus completes a start condition for a read operation from the address associated with a particular device.

The value returned in *val will be transmitted. A success return shall cause the controller to react to additional read operations. An error return shall cause the controller to ignore bus operations until a new start condition is received.

**Param config**
the configuration structure associated with the device to which the operation is addressed.

**Param val**
pointer to storage for the first byte of data to return for the read request.

**Return**
0 if more data can be requested, or a negative error code.

typedef int (*i2c_target_read_processed_cb_t)(struct i2c_target_config *config, uint8_t *val)
Function called when a read from the device is continued.
This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device.

The value returned in *val will be transmitted. A success return shall cause the controller to react to additional read operations. An error return shall cause the controller to ignore bus operations until a new start condition is received.

**Param config**
the configuration structure associated with the device to which the operation is addressed.

**Param val**
pointer to storage for the next byte of data to return for the read request.

**Return**
0 if data has been provided, or a negative error code.

typedef int (*i2c_target_stop_cb_t)(struct i2c_target_config *config)

Function called when a stop condition is observed after a start condition addressed to a particular device.

This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device. After the function returns the controller shall enter a state where it is ready to react to new start conditions.

**Param config**
the configuration structure associated with the device to which the operation is addressed.

**Return**
Ignored.

**Functions**

static inline void i2c_xfer_stats(const struct device *dev, struct i2c_msg *msgs, uint8_t num_msgs)

Updates the i2c stats for i2c transfers.

**Parameters**

- dev – I2C device to update stats for
- msgs – Array of struct i2c_msg
- num_msgs – Number of i2c_msgs

int i2c_configure(const struct device *dev, uint32_t dev_config)

Configure operation of a host controller.

**Parameters**

- dev – Pointer to the device structure for the driver instance.
- dev_config – Bit-packed 32-bit value to the device runtime configuration for the I2C controller.

**Return values**

- 0 – If successful.
- -EIO – General input / output error, failed to configure device.
int i2c_get_config(const struct device *dev, uint32_t *dev_config)

Get configuration of a host controller.

This routine provides a way to get current configuration. It is allowed to call the function before i2c_configure, because some I2C ports can be configured during init process. However, if the I2C port is not configured, i2c_get_config returns an error.

i2c_get_config can return cached config or probe hardware, but it has to be up to date with current configuration.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `dev_config` – Pointer to return bit-packed 32-bit value of the I2C controller configuration.

**Return values**

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ERANGE` – Configured I2C frequency is invalid.
- `-ENOSYS` – If get config is not implemented

int i2c_transfer(const struct device *dev, struct i2c_msg *msgs, uint8_t num_msgs, uint16_t addr)

Perform data transfer to another I2C device in controller mode.

This routine provides a generic interface to perform data transfer to another I2C device synchronously. Use `i2c_read()`/`i2c_write()` for simple read or write.

The array of message `msgs` must not be NULL. The number of message `num_msgs` may be zero, in which case no transfer occurs.

**Note:** Not all scatter/gather transactions can be supported by all drivers. As an example, a gather write (multiple consecutive `i2c_msg` buffers all configured for `I2C_MSG_WRITE`) may be packed into a single transaction by some drivers, but others may emit each fragment as a distinct write transaction, which will not produce the same behavior. See the documentation of `struct i2c_msg` for limitations on support for multi-message bus transactions.

**Parameters**

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `msgs` – Array of messages to transfer.
- `num_msgs` – Number of messages to transfer.
- `addr` – Address of the I2C target device.

**Return values**

- `0` – If successful.
- `-EIO` – General input / output error.

static inline int i2c_transfer_dt(const struct i2c_dt_spec *spec, struct i2c_msg *msgs, uint8_t num_msgs)

Perform data transfer to another I2C device in controller mode.

This is equivalent to:
```c
i2c_transfer(spec->bus, msgs, num_msgs, spec->addr);
```

**Parameters**
- `spec` – I2C specification from devicetree.
- `msgs` – Array of messages to transfer.
- `num_msgs` – Number of messages to transfer.

**Returns**
a value from `i2c_transfer()`

```c
int i2c_recover_bus(const struct device *dev)
```

Recover the I2C bus.

Attempt to recover the I2C bus.

**Parameters**
- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.

**Return values**
- `0` – If successful
- `-EBUSY` – If bus is not clear after recovery attempt.
- `-EIO` – General input / output error.
- `-ENOSYS` – If bus recovery is not implemented

```c
static inline int i2c_target_register(const struct device *dev, struct i2c_target_config *cfg)
```

Registers the provided config as Target device of a controller.

Enable I2C target mode for the 'dev' I2C bus driver using the provided 'config' struct containing the functions and parameters to send bus events. The I2C target will be registered at the address provided as 'address' struct member. Addressing mode - 7 or 10 bit - depends on the 'flags' struct member. Any I2C bus events related to the target mode will be passed onto I2C target device driver via a set of callback functions provided in the ‘callbacks’ struct member.

Most of the existing hardware allows simultaneous support for controller and target mode. This is however not guaranteed.

**Parameters**
- `dev` – Pointer to the device structure for an I2C controller driver configured in target mode.
- `cfg` – Config struct with functions and parameters used by the I2C driver to send bus events

**Return values**
- `0` – Is successful
- `-EINVAL` – If parameters are invalid
- `-EIO` – General input / output error.
- `-ENOSYS` – If target mode is not implemented

```c
static inline int i2c_target_unregister(const struct device *dev, struct i2c_target_config *cfg)
```

Unregisters the provided config as Target device.

This routine disables I2C target mode for the 'dev' I2C bus driver using the provided 'config' struct containing the functions and parameters to send bus events.
Parameters

- `dev` – Pointer to the device structure for an I2C controller driver configured in target mode.
- `cfg` – Config struct with functions and parameters used by the I2C driver to send bus events

Return values

- `0` – Is successful
- `-EINVAL` – If parameters are invalid
- `-ENOSYS` – If target mode is not implemented

```
int i2c_target_driver_register(const struct device *dev)
```

Instructs the I2C Target device to register itself to the I2C Controller.

This routine instructs the I2C Target device to register itself to the I2C Controller via its parent controller's `i2c_target_register()` API.

Parameters

- `dev` – Pointer to the device structure for the I2C target device (not itself an I2C controller).

Return values

- `0` – Is successful
- `-EINVAL` – If parameters are invalid
- `-EIO` – General input / output error.

```
int i2c_target_driver_unregister(const struct device *dev)
```

Instructs the I2C Target device to unregister itself from the I2C Controller.

This routine instructs the I2C Target device to unregister itself from the I2C Controller via its parent controller's `i2c_target_register()` API.

Parameters

- `dev` – Pointer to the device structure for the I2C target device (not itself an I2C controller).

Return values

- `0` – Is successful
- `-EINVAL` – If parameters are invalid

```
static inline int i2c_write(const struct device *dev, const uint8_t *buf, uint32_t num_bytes, uint16_t addr)
```

Write a set amount of data to an I2C device.

This routine writes a set amount of data synchronously.

Parameters

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `buf` – Memory pool from which the data is transferred.
- `num_bytes` – Number of bytes to write.
- `addr` – Address to the target I2C device for writing.

Return values

- `0` – If successful.
-EIO – General input / output error.

```c
static inline int i2c_write_dt(const struct i2c_dt_spec *spec, const uint8_t *buf, uint32_t num_bytes)
{
    Write a set amount of data to an I2C device.

    This is equivalent to:

    i2c_write(spec->bus, buf, num_bytes, spec->addr);
}
```

**Parameters**

- `spec` – I2C specification from devicetree.
- `buf` – Memory pool from which the data is transferred.
- `num_bytes` – Number of bytes to write.

**Returns**

A value from `i2c_write()`

```c
static inline int i2c_read(const struct device *dev, uint8_t *buf, uint32_t num_bytes, uint16_t addr)
{
    Read a set amount of data from an I2C device.

    This routine reads a set amount of data synchronously.

    **Parameters**

    - `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
    - `buf` – Memory pool that stores the retrieved data.
    - `num_bytes` – Number of bytes to read.
    - `addr` – Address of the I2C device being read.

    **Return values**

    - 0 – If successful.
    - -EIO – General input / output error.

    `i2c_read()`

    ```c
    static inline int i2c_read_dt(const struct i2c_dt_spec *spec, uint8_t *buf, uint32_t num_bytes)
    {
        Read a set amount of data from an I2C device.

        This is equivalent to:

        i2c_read(spec->bus, buf, num_bytes, spec->addr);
    }
    ```

    **Parameters**

    - `spec` – I2C specification from devicetree.
    - `buf` – Memory pool that stores the retrieved data.
    - `num_bytes` – Number of bytes to read.

    **Returns**

    A value from `i2c_read()`

    ```c
    static inline int i2c_write_read(const struct device *dev, uint16_t addr, const void *write_buf, size_t num_write, void *read_buf, size_t num_read)
    {
        Write then read data from an I2C device.
    }
    ```

7.3. Peripherals
This supports the common operation “this is what I want”, “now give it to me” transaction pair through a combined write-then-read bus transaction.

**Parameters**

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `addr` – Address of the I2C device
- `write_buf` – Pointer to the data to be written
- `num_write` – Number of bytes to write
- `read_buf` – Pointer to storage for read data
- `num_read` – Number of bytes to read

**Return values**

- 0 – if successful
- negative – on error.

```c
static inline int i2c_write_read_dt(const struct i2c_dt_spec *spec, const void *write_buf, size_t num_write, void *read_buf, size_t num_read)
```

Write then read data from an I2C device.

This is equivalent to:

```c
call i2c_write_read(spec->bus, spec->addr,
       write_buf, num_write,
       read_buf, num_read);
```

**Parameters**

- `spec` – I2C specification from devicetree.
- `write_buf` – Pointer to the data to be written
- `num_write` – Number of bytes to write
- `read_buf` – Pointer to storage for read data
- `num_read` – Number of bytes to read

**Returns**

a value from `i2c_write_read()`

```c
static inline int i2c_burst_read(const struct device *dev, uint16_t dev_addr, uint8_t start_addr, uint8_t *buf, uint32_t num_bytes)
```

Read multiple bytes from an internal address of an I2C device.

This routine reads multiple bytes from an internal address of an I2C device synchronously. Instances of this may be replaced by `i2c_write_read()`.

**Parameters**

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `dev_addr` – Address of the I2C device for reading.
- `start_addr` – Internal address from which the data is being read.
- `buf` – Memory pool that stores the retrieved data.
- `num_bytes` – Number of bytes being read.
Return values

- 0 – If successful.
- -EIO – General input / output error.

static inline int i2c_burst_read_dt(const struct i2c_dt_spec *spec, uint8_t start_addr, uint8_t *buf, uint32_t num_bytes)

Read multiple bytes from an internal address of an I2C device.

This is equivalent to:

i2c_burst_read(spec->bus, spec->addr, start_addr, buf, num_bytes);

Parameters

- spec – I2C specification from devicetree.
- start_addr – Internal address from which the data is being read.
- buf – Memory pool that stores the retrieved data.
- num_bytes – Number of bytes to read.

Returns

a value from i2c_burst_read()

static inline int i2c_burst_write(const struct device *dev, uint16_t dev_addr, uint8_t start_addr, const uint8_t *buf, uint32_t num_bytes)

Write multiple bytes to an internal address of an I2C device.

This routine writes multiple bytes to an internal address of an I2C device synchronously.

Warning: The combined write synthesized by this API may not be supported on all I2C devices. Uses of this API may be made more portable by replacing them with calls to i2c_write() passing a buffer containing the combined address and data.

Parameters

- dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
- dev_addr – Address of the I2C device for writing.
- start_addr – Internal address to which the data is being written.
- buf – Memory pool from which the data is transferred.
- num_bytes – Number of bytes being written.

Return values

- 0 – If successful.
- -EIO – General input / output error.

static inline int i2c_burst_write_dt(const struct i2c_dt_spec *spec, uint8_t start_addr, const uint8_t *buf, uint32_t num_bytes)

Write multiple bytes to an internal address of an I2C device.

This is equivalent to:

i2c_burst_write(spec->bus, spec->addr, start_addr, buf, num_bytes);

Parameters
• `spec` – I2C specification from devicetree.
• `start_addr` – Internal address to which the data is being written.
• `buf` – Memory pool from which the data is transferred.
• `num_bytes` – Number of bytes being written.

**Returns**
A value from `i2c_burst_write()`

```c
static inline int i2c_reg_read_byte(const struct device *dev, uint16_t dev_addr, uint8_t reg_addr, uint8_t *value)
```

Read internal register of an I2C device.

This routine reads the value of an 8-bit internal register of an I2C device synchronously.

**Parameters**

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `dev_addr` – Address of the I2C device for reading.
- `reg_addr` – Address of the internal register being read.
- `value` – Memory pool that stores the retrieved register value.

**Return values**

- 0 – If successful.
- -EIO – General input / output error.

```c
static inline int i2c_reg_read_byte_dt(const struct i2c_dt_spec *spec, uint8_t reg_addr, uint8_t *value)
```

Read internal register of an I2C device.

This is equivalent to:

```c
i2c_reg_read_byte(spec->bus, spec->addr, reg_addr, value);
```

**Parameters**

- `spec` – I2C specification from devicetree.
- `reg_addr` – Address of the internal register being read.
- `value` – Memory pool that stores the retrieved register value.

**Returns**
A value from `i2c_reg_read_byte()`

```c
static inline int i2c_reg_write_byte(const struct device *dev, uint16_t dev_addr, uint8_t reg_addr, uint8_t value)
```

Write internal register of an I2C device.

This routine writes a value to an 8-bit internal register of an I2C device synchronously.

**Note:** This function internally combines the register and value into a single bus transaction.

**Parameters**

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
• dev_addr – Address of the I2C device for writing.
• reg_addr – Address of the internal register being written.
• value – Value to be written to internal register.

Return values
• 0 – If successful.
• -EIO – General input / output error.

static inline int i2c_reg_write_byte_dt(const struct i2c_dt_spec *spec, uint8_t reg_addr, uint8_t value)

Write internal register of an I2C device.
This is equivalent to:

i2c_reg_write_byte(spec->bus, spec->addr, reg_addr, value);

Parameters
• spec – I2C specification from devicetree.
• reg_addr – Address of the internal register being written.
• value – Value to be written to internal register.

Returns
a value from i2c_reg_write_byte()

static inline int i2c_reg_update_byte(const struct device *dev, uint8_t dev_addr, uint8_t reg_addr, uint8_t mask, uint8_t value)

Update internal register of an I2C device.
This routine updates the value of a set of bits from an 8-bit internal register of an I2C device synchronously.

Note: If the calculated new register value matches the value that was read this function will not generate a write operation.

Parameters
• dev – Pointer to the device structure for an I2C controller driver configured in controller mode.
• dev_addr – Address of the I2C device for updating.
• reg_addr – Address of the internal register being updated.
• mask – Bitmask for updating internal register.
• value – Value for updating internal register.

Return values
• 0 – If successful.
• -EIO – General input / output error.

static inline int i2c_reg_update_byte_dt(const struct i2c_dt_spec *spec, uint8_t reg_addr, uint8_t mask, uint8_t value)

Update internal register of an I2C device.
This is equivalent to:
i2c_reg_update_byte(spec->bus, spec->addr, reg_addr, mask, value);

Parameters

- spec – I2C specification from devicetree.
- reg_addr – Address of the internal register being updated.
- mask – Bitmask for updating internal register.
- value – Value for updating internal register.

Returns

A value from i2c_reg_update_byte()

void i2c_dump_msgs(const char *name, const struct i2c_msg *msgs, uint8_t num_msgs, uint16_t addr)

Dump out an I2C message.

Dumps out a list of I2C messages. For any that are writes (W), the data is displayed in hex.

It looks something like this (with name “testing”):

D: I2C msg: testing, addr=56
D:   W len=01:
D: content:
D: 06 1
D: W len=0e:
D: content:
D: 00 01 02 03 04 05 06 07 ........
D: 08 09 0a 0b 0c 0d ........

Parameters

- name – Name of this dump, displayed at the top.
- msgs – Array of messages to dump.
- num_msgs – Number of messages to dump.
- addr – Address of the I2C target device.

struct i2c_dt_spec

#include <i2c.h> Complete I2C DT information.

Param bus

is the I2C bus

Param addr

is the target address

struct i2c_msg

#include <i2c.h> One I2C Message.

This defines one I2C message to transact on the I2C bus.

Note: Some of the configurations supported by this API may not be supported by specific SoC I2C hardware implementations, in particular features related to bus transactions intended to read or write data from different buffers within a single transaction. Invocations
of `i2c_transfer()` may not indicate an error when an unsupported configuration is encountered. In some cases drivers will generate separate transactions for each message fragment, with or without presence of `I2C_MSG_RESTART` in `flags`.

### Public Members

- `uint8_t *buf`
  Data buffer in bytes

- `uint32_t len`
  Length of buffer in bytes

- `uint8_t flags`
  Flags for this message

```c
#include <i2c.h>
```

Structure providing callbacks to be implemented for devices that supports the I2C target API.

This structure may be shared by multiple devices that implement the same API at different addresses on the bus.

```c
#include <i2c.h>
```

Structure describing a device that supports the I2C target API.

Instances of this are passed to the `i2c_target_register()` and `i2c_target_unregister()` functions to indicate addition and removal of a target device, respective.

Fields other than `node` must be initialized by the module that implements the device behavior prior to passing the object reference to `i2c_target_register()`.

### Public Members

- `sys_snnode_t node`
  Private, do not modify

- `uint8_t flags`
  Flags for the target device defined by `I2C_TARGET_FLAGS_*` constants

- `uint16_t address`
  Address for this target device

- `const struct i2c_target_callbacks *callbacks`
  Callback functions

```c
#include <i2c.h>
```

I2C specific device state which allows for `i2c` device class specific additions.
7.3.21 I3C

I3C (Improved Inter-Integrated Circuit) is a two-signal shared peripheral interface bus. Devices on the bus can operate in two roles: as a “controller” that initiates transactions and controls the clock, or as a “target” that responds to transaction commands.

Currently, the API is based on I3C Specification version 1.1.1.

- **I3C Controller API**
  - In-Band Interrupt (IBI)
  - Device Tree
  - Device Drivers for I3C Devices
  - I2C Devices under I3C Bus

- **Configuration Options**

- **API Reference**

**I3C Controller API**

Zephyr’s I3C controller API is used when an I3C controller controls the bus, in particularly the start and stop conditions and the clock. This is the most common mode, used to interact with I3C target devices such as sensors.

Due to the nature of the I3C, there are devices on the bus where they may not have addresses when powered on. Therefore, an additional dynamic address assignment needs to be carried out by the I3C controller. Because of this, the controller needs to maintain separate structures to keep track of device status. This can be done at build time, for example, by creating arrays of device descriptors for both I3C and I2C devices:

```c
static struct i3c_device_desc i3c_device_array[] = I3C DEVICE ARRAY DT INST(inst);
static struct i3c_i2c_device_desc i2c_device_array[] = I3C I2C DEVICE ARRAY DT INST(inst);
```

The macros `I3C DEVICE ARRAY DT INST` and `I3C I2C DEVICE ARRAY DT INST` are helper macros to aid in create arrays of device descriptors corresponding to the devicetree nodes under the I3C controller.

Here is a list of generic steps for initializing the I3C controller and the I3C bus inside the device driver initialization function:

1. Initialize the data structure of the I3C controller device driver instance. The usual device defining macros such as `DEVICE DT INST DEFINE` can be used, and the initialization function provided as a parameter to the macro.
   - The `i3c_addr_slots` and `i3c_dev_list` are structures to aid in address assignments and device list management. If this is being used, this struct needs to be initialized by calling `i3c_addr_slots_init()`. These two structures can also be used with various helper functions.
   - Initialize the device descriptors if needed by the controller driver.

2. Initialize the hardware, including but not limited to:
   - Setup pin mux and directions.
   - Setup the clock for the controller.
   - Power on the hardware.
   - Configure the hardware (e.g. SCL clock frequency).
3. Perform bus initialization. There is a generic helper function, `i3c_bus_init()`, which performs the following steps. This function can be used if the controller does not require any special handling during bus initialization.

1. Do `RSTDAA` to reset dynamic addresses of connected devices. If any connected devices have already been assigned an address, the bookkeeping data structures do not have records of these, for example, at power-on. So it is a good idea to reset and assign them new addresses.

2. Do `DISEC` to disable any events from devices.

3. Do `SETDASA` to use static addresses as dynamic address if so desired.
   - `SETDASA` may not be supported for all connected devices to assign static addresses as dynamic addresses.
   - BCR and DCR need to be obtained separately to populate the relevant fields in the I3C target device descriptor struct.

4. Do `ENTDAA` to start dynamic address assignment, if there are still devices without addresses.
   - If there is a device waiting for an address, it will send its Provisioned ID, BCR, and DCR back. Match the received Provisioned ID to the list of registered I3C devices.
     - If there is a match, assign an address (either from the stated static address if `SETDASA` has not been done, or use a free address).
     - Also, set the BCR and DCR fields in the device descriptor struct.
   - If there is no match, depending on policy, it can be assigned a free address, or the device driver can stop the assignment process and errors out.
   - Note that the I3C API requires device descriptor to function. A device without a device descriptor cannot be accessed through the API.
   - This step can be skipped if there is no connected devices requiring DAA.

5. These are optional but highly recommended:
   - Do `GETMRL` and `GETMWL` to get maximum read/write length.
   - Do `GETMXDS` to get maximum read/write speed and maximum read turnaround time.
   - The helper function, `i3c_bus_init()`, would retrieve basic device information such as BCR, DCR, MRL and MWL.

6. Do `ENEC` to re-enable events from devices.
   - The helper function, `i3c_bus_init()`, only re-enables hot-join events. IBI event should only be enabled when enabling IBI of a device.

**In-Band Interrupt (IBI)** If a target device can generate In-Band Interrupt (IBI), the controller needs to be made aware of it.

- `i3c_tbi_enable()` to enable IBI of a target device.
  - Some controller hardware have IBI slots which need to be programmed so that the controller can recognize incoming IBIs from a particular target device.
    - If the hardware has IBI slots, `i3c_tbi_enable()` needs to program those IBI slots.
    - Note that there are usually limited IBI slots on the controller so this operation may fail.
  - The implementation in driver should also send the `ENEC` command to enable interrupt of this target device.
- `i3c_tbi_disable()` to disable IBI of a target device.
  - If controller hardware makes use of IBI slots, this will remove description of the target device from the slots.
- The implementation in driver should also send the DISEC command to disable interrupt of this target device.

**Device Tree**  Here is an example for defining a I3C controller in device tree:

```plaintext
i3c0: i3c@10000 {
    compatible = "vendor,i3c";
    #address-cells = < 0x3 >;
    #size-cells = < 0x0 >;
    reg = < 0x10000 0x1000 >;
    interrupts = < 0x1F 0x0 >;
    pinctrl-0 = < &pinmux-i3c >;
    pinctrl-names = "default";
    i2c-scl-hz = < 400000 >;
    i3c-scl-hz = < 1200000 >;
    status = "okay";

    i3c-dev0: i3c-dev0@420000ABCD12345678 {
        compatible = "vendor,i3c-dev";
        reg = < 0x42 0xABCD 0x12345678 >;
        status = "okay";
    };

    i2c-dev0: i2c-dev0@380000000000000050 {
        compatible = "vendor-i2c-dev";
        reg = < 0x38 0x0 0x50 >;
        status = "okay";
    };
}
```

**I3C Devices** For I3C devices, the `reg` property has 3 elements:
- The first one is the static address of the device.
  - Can be zero if static address is not used. Address will be assigned during DAA (Dynamic Address Assignment).
  - If non-zero and property `assigned-address` is not set, this will be the address of the device after SETDASA (Set Dynamic Address from Static Address) is issued.
- Second element is the upper 16-bit of the Provisioned ID (PID) which contains the manufacturer ID left-shifted by 1. This is the bits 33-47 (zero-based) of the 48-bit Provisioned ID.
- Third element contains the lower 32-bit of the Provisioned ID which is a combination of the part ID (left-shifted by 16, bits 16-31 of the PID) and the instance ID (left-shifted by 12, bits 12-15 of the PID).

Note that the unit-address (the part after @) must match the `reg` property fully where each element is treated as 32-bit integer, combining to form a 96-bit integer. This is required for properly generating
device tree macros.

**I²C Devices**  For I²C devices where the device driver has support for working under I3C bus, the device node can be described as a child of the I3C controller. If the device driver is written to only work with I²C controllers, define the node under the I²C virtual controller as described below. Otherwise, the reg property, similar to I3C devices, has 3 elements:

- The first one is the static address of the device. This must be a valid address as I²C devices do not support dynamic address assignment.
- Second element is always zero.
- Third element is the LVR (Legacy Virtual Register):
  - bit[31:8] are unused.
  - bit[7:5] are the I²C device index:
    * Index 0
      - I3C device has a 50 ns spike filter where it is not affected by high frequency on SCL.
    * Index 1
      - I²C device does not have a 50 ns spike filter but can work with high frequency on SCL.
    * Index 2
      - I3C device does not have a 50 ns spike filter and cannot work with high frequency on SCL.
  - bit[4] is the I²C mode indicator:
    * 0 is FM+ mode.
    * 1 is FM mode.

Similar to I3C devices, the unit-address must match the reg property fully where each element is treated as 32-bit integer, combining to form a 96-bit integer.

**Device Drivers for I3C Devices**  All of the transfer functions of I3C controller API require the use of device descriptors, *i3c_device_desc*. This struct contains runtime information about a I3C device, such as, its dynamic address, BCR, DCR, MRL and MWL. Therefore, the device driver of a I3C device should grab a pointer to this device descriptor from the controller using *i3c_device_find()*. This function takes an ID parameter of type *i3c_device_id* for matching. The returned pointer can then be used in subsequent API calls to the controller.

**I²C Devices under I3C Bus**  Since I3C is backward compatible with I²C, the I3C controller API can accommodate I2C API calls without modifications if the controller device driver implements the I2C API. This has the advantage of using existing I2C devices without any modifications to their device drivers. However, since the I3C controller API works on device descriptors, any calls to I2C API will need to look up the corresponding device descriptor from the I2C device address. This adds a bit of processing cost to any I2C API calls.

On the other hand, a device driver can be extended to utilize native I2C device support via the I3C controller API. During device initialization, *i3c_i2c_device_find()* needs to be called to retrieve the pointer to the device descriptor. This pointer can be used in subsequent API calls.

Note that, with either methods mentioned above, the devicetree node of the I2C device must be declared according to I3C standard:
The I²C virtual controller device driver provides a way to interface I²C devices on the I3C bus where the associated device drivers can be used as-is without modifications. This requires adding an intermediate node in the device tree:

```c
i3c0: i3c@10000 {
  <... I3C controller related properties ...>
  <... Nodes of I3C devices, if any ...>
      i2c-dev0: i2c-dev0@420000000000000050 {
        compatible = "vendor-i2c-dev";
        reg = < 0x42 0x0 0x50 >;
        status = "okay";
      }
};
```

I3C_DCR_I2C_DEV_IDX(dcr)

I3C_MSG_WRITE
    Write message to I3C bus.

I3C_MSG_READ
    Read message from I2C bus.

I3C_MSG_STOP
    Send STOP after this message.

I3C_MSG_RESTART
    RESTART I3C transaction for this message.

Note: Not all I3C drivers have or require explicit support for this feature. Some drivers require this be present on a read message that follows a write, or vice-versa. Some drivers will merge adjacent fragments into a single transaction using this flag; some will not.

I3C_MSG_HDR
    Transfer use HDR mode

    I3C HDR-BT (Bulk Transport)

I3C_DEVICE_ID(pid)
    Structure initializer for i3c_device_id from PID.
    This helper macro expands to a static initializer for a struct i3c_device_id by populating the PID (Provisioned ID) field.

    **Parameters**
    - pid – Provisioned ID.

**Enums**

enum i3c_bus_mode
    I3C bus mode.
    **Values:**
enumerator I3C_BUS_MODE_PURE
    Only I3C devices are on the bus.

typedef enum {
    I3C_BUS_MODE_PURE,
    I3C_BUS_MODE_MIXED_FAST,
    I3C_BUS_MODE_MIXED_LIMITED,
    I3C_BUS_MODE_MIXED_SLOW,
    I3C_BUS_MODE_MAX = I3C_BUS_MODE_MIXED_SLOW,
    I3C_BUS_MODE_INVALID
} i3c_i2c_speed_type;

I2C bus speed under I3C bus.
Only FM and FM+ modes are supported for I2C devices under I3C bus.

Values:

typedef enum {
    I3C_I2C_SPEED_FM,
    I3C_I2C_SPEED_FMPLUS,
    I3C_I2C_SPEED_MAX = I3C_I2C_SPEED_FMPLUS,
    I3C_I2C_SPEED_INVALID
} i3c_data_rate;

I3C data rate.
I3C data transfer rate defined by the I3C specification.

Values:

enumerator I3C_DATA_RATE_HDR_TSP
    High Data Rate - Ternary Symbol for Pure Bus

denumerator I3C_DATA_RATE_HDR_BT
    High Data Rate - Bulk Transport

denumerator I3C_DATA_RATE_MAX = I3C_DATA_RATE_HDR_BT

denumerator I3C_DATA_RATE_INVALID

enum i3c_sdr_controller_error_codes
    I3C SDR Controller Error Codes.
    These are error codes defined by the I3C specification.
    I3C_ERROR_CE_UNKNOWN and I3C_ERROR_CE_NONE are not official error codes according to the specification. These are there simply to aid in error handling during interactions with the I3C drivers and subsystem.
    Values:

    enumerator I3C_ERROR_CE0
        Transaction after sending CCC

    enumerator I3C_ERROR_CE1
        Monitoring Error

    enumerator I3C_ERROR_CE2
        No response to broadcast address (0x7E)

    enumerator I3C_ERROR_CE3
        Failed Controller Handoff

    enumerator I3C_ERROR_CE_UNKNOWN
        Unknown error (not official error code)

    enumerator I3C_ERROR_CE_NONE
        No error (not official error code)

    enumerator I3C_ERROR_CE_MAX = I3C_ERROR_CE_UNKNOWN

    enumerator I3C_ERROR_CE_INVALID

enum i3c_sdr_target_error_codes
    I3C SDR Target Error Codes.
    These are error codes defined by the I3C specification.
    I3C_ERROR_TE_UNKNOWN and I3C_ERROR_TE_NONE are not official error codes according to the specification. These are there simply to aid in error handling during interactions with the I3C drivers and subsystem.
    Values:

    enumerator I3C_ERROR_TE0
    enumerator I3C_ERROR_TE1
    enumerator I3C_ERROR_TE2
    enumerator I3C_ERROR_TE3
    enumerator I3C_ERROR_TE_MAX = I3C_ERROR_TE_UNKNOWN

    enumerator I3C_ERROR_TE_INVALID
enumerator I3C_ERROR_TE0
Invalid Broadcast Address or Dynamic Address after DA assignment

denumerator I3C_ERROR_TE1
CCC Code

denumerator I3C_ERROR_TE2
Write Data

denumerator I3C_ERROR_TE3
Assigned Address during Dynamic Address Arbitration

denumerator I3C_ERROR_TE4
0x7E/R missing after RESTART during Dynamic Address Arbitration

denumerator I3C_ERROR_TE5
Transaction after detecting CCC

denumerator I3C_ERROR_TE6
Monitoring Error

denumerator I3C_ERROR_DBR
Dead Bus Recovery

denumerator I3C_ERROR_TE_UNKNOWN
Unknown error (not official error code)

denumerator I3C_ERROR_TE_NONE
No error (not official error code)

denumerator I3C_ERROR_TE_MAX = I3C_ERROR_TE_UNKNOWN

denumerator I3C_ERROR_TE_INVALID

enum i3c_config_type
Type of configuration being passed to configure function.
Values:

denumerator I3C_CONFIG_CONTROLLER

denumerator I3C_CONFIG_TARGET

denumerator I3C_CONFIG_CUSTOM

Functions
struct \texttt{i3c\_device\_desc} *\texttt{i3c\_dev\_list\_find}(\texttt{const struct i3c\_dev\_list} *\texttt{dev\_list}, \texttt{const struct i3c\_device\_id} *\texttt{id})

Find a I3C target device descriptor by ID.
This finds the I3C target device descriptor in the device list matching the provided ID struct (id).

**Parameters**

- \texttt{dev\_list} – Pointer to the device list struct.
- \texttt{id} – Pointer to I3C device ID struct.

**Returns**

Pointer the the I3C target device descriptor, or NULL if none is found.

struct \texttt{i3c\_device\_desc} *\texttt{i3c\_dev\_list\_i3c\_addr\_find}(\texttt{const struct i3c\_dev\_list} *\texttt{dev\_list}, \texttt{uint8\_t addr})

Find a I3C target device descriptor by dynamic address.
This finds the I3C target device descriptor in the device list matching the dynamic address (addr)

**Parameters**

- \texttt{dev\_list} – Pointer to the device list struct.
- \texttt{addr} – Dynamic address to be matched.

**Returns**

Pointer the the I3C target device descriptor, or NULL if none is found.

struct \texttt{i3c\_i2c\_device\_desc} *\texttt{i3c\_dev\_list\_i2c\_addr\_find}(\texttt{const struct i3c\_dev\_list} *\texttt{dev\_list}, \texttt{uint16\_t addr})

Find a I2C target device descriptor by address.
This finds the I2C target device descriptor in the device list matching the address (addr)

**Parameters**

- \texttt{dev\_list} – Pointer to the device list struct.
- \texttt{addr} – Address to be matched.

**Returns**

Pointer the the I2C target device descriptor, or NULL if none is found.

\texttt{int i3c\_dev\_list\_daa\_addr\_helper(\texttt{struct i3c\_addr\_slots} *\texttt{addr\_slots}, \texttt{const struct i3c\_dev\_list} *\texttt{dev\_list}, \texttt{uint64\_t pid}, \texttt{bool must\_match}, \texttt{bool assigned\_okay}, \texttt{struct i3c\_device\_desc} **\texttt{target}, \texttt{uint8\_t *addr})}

Helper function to find a usable address during ENTDAA.

This is a helper function to find a usable address during Dynamic Address Assignment. Given the PID (pid), it will search through the device list for the matching device descriptor. If the device descriptor indicates that there is a preferred address (i.e. assigned-address in device tree),

If \texttt{must\_match} is true, the PID (pid) must match one of the device in the device list.

**See also:**

\texttt{i3c\_device\_desc::init\_dynamic\_addr}, this preferred address will be returned if this address is still available. If it is not available, another free address will be returned.

If \texttt{must\_match} is false, this will return an arbitrary address. This is useful when not all devices are described in device tree. Or else, the DAA process cannot proceed since there is no address to be assigned.
If assigned_okay is true, it will return the same address already assigned to the device. If assigned_okay is false, the device cannot have an address assigned already (that
See also:
i3c_device_desc::dynamic_addr). If no address has been assigned, it behaves as if assigned_okay is false. This is useful for assigning the same address to the same device (for example, hot-join after device coming back from suspend).

See also:
i3c_device_desc::dynamic_addr is not zero). This is mainly used during the initial DAA.

Parameters
• addr_slots – [in] Pointer to address slots struct.
• dev_list – [in] Pointer to the device list struct.
• pid – [in] Provisioned ID of device to be assigned address.
• must_match – [in] True if PID must match devices in the device list. False otherwise.
• assigned_okay – [in] True if it is okay to return the address already assigned to the target matching the PID (pid).
• target – [out] Store the pointer of the device descriptor if it matches the incoming PID (pid).
• addr – [out] Address to be assigned to target device.

Return values
• 0 – if successful.
• -ENODEV – if no device matches the PID (pid) in the device list and must_match is true.
• -EINVAL – if the device matching PID (pid) already has an address assigned or invalid function arguments.

static inline int i3c_configure(const struct device *dev, enum i3c_config_type type, void *config)
Configure the I3C hardware.

Parameters
• dev – Pointer to controller device driver instance.
• type – Type of configuration parameters being passed in config.
• config – Pointer to the configuration parameters.

Return values
• 0 – If successful.
• -EINVAL – If invalid configure parameters.
• -EIO – General Input/Output errors.
• -ENOSYS – If not implemented.

static inline int i3c_config_get(const struct device *dev, enum i3c_config_type type, void *config)
Get configuration of the I3C hardware.

This provides a way to get the current configuration of the I3C hardware.

This can return cached config or probed hardware parameters, but it has to be up to date with current configuration.
Note that if \texttt{type} is \texttt{I3C\_CONFIG\_CUSTOM}, \texttt{config} must contain the ID of the parameter to be retrieved.

**Parameters**

- \texttt{dev} – \texttt{[in]} Pointer to controller device driver instance.
- \texttt{type} – \texttt{[in]} Type of configuration parameters being passed in \texttt{config}.
- \texttt{config} – \texttt{[inout]} Pointer to the configuration parameters.

**Return values**

- \texttt{0} – If successful.
- \texttt{-EIO} – General Input/Output errors.
- \texttt{-ENOSYS} – If not implemented.

```c
static inline int i3c_recover_bus(const struct device *dev)
```

Attempt bus recovery on the I3C bus.

This routine asks the controller to attempt bus recovery.

**Return values**

- \texttt{0} – If successful.
- \texttt{-EBUSY} – If bus recovery fails.
- \texttt{-EIO} – General input / output error.
- \texttt{-ENOSYS} – Bus recovery is not supported by the controller driver.

```c
static inline int i3c_do_daa(const struct device *dev)
```

Perform Dynamic Address Assignment on the I3C bus.

This routine asks the controller to perform dynamic address assignment where the controller belongs. Only the active controller of the bus should do this.

**Note:** For controller driver implementation, the controller should perform SETDASA to allow static addresses to be the dynamic addresses before actually doing ENTDAA.

**Parameters**

- \texttt{dev} – Pointer to the device structure for the controller driver instance.

**Return values**

- \texttt{0} – If successful.
- \texttt{-EBUSY} – Bus is busy.
- \texttt{-EIO} – General input / output error.
- \texttt{-ENODEV} – If a provisioned ID does not match to any target devices in the registered device list.
- \texttt{-ENOSPC} – No more free addresses can be assigned to target.
- \texttt{-ENOSYS} – Dynamic address assignment is not supported by the controller driver.

```c
int i3c_do_ccc(const struct device *dev, struct i3c_ccc_payload *payload)
```

Send CCC to the bus.

**Parameters**
• **dev** – Pointer to the device structure for the controller driver instance.
• **payload** – Pointer to the structure describing the CCC payload.

**Return values**

• **0** – If successful.
• **-EBUSY** – Bus is busy.
• **-EIO** – General Input / output error.
• **-EINVAL** – Invalid valid set in the payload structure.
• **-ENOSYS** – Not implemented.

```c
int i3c_transfer(struct i3c_device_desc *target, struct i3c_msg *msgs, uint8_t num_msgs)
```

Perform data transfer from the controller to an I3C target device.

This routine provides a generic interface to perform data transfer to a target device synchronously. Use `i3c_read()`/`i3c_write()` for simple read or write.

The array of message `msgs` must not be NULL. The number of message `num_msgs` may be zero, in which case no transfer occurs.

**Note**: Not all scatter/gather transactions can be supported by all drivers. As an example, a gather write (multiple consecutive `i3c_msg` buffers all configured for `I3C_MSG_WRITE`) may be packed into a single transaction by some drivers, but others may emit each fragment as a distinct write transaction, which will not produce the same behavior. See the documentation of `struct i3c_msg` for limitations on support for multi-message bus transactions.

**Parameters**

• `target` – I3C target device descriptor.
• `msgs` – Array of messages to transfer.
• `num_msgs` – Number of messages to transfer.

**Return values**

• **0** – If successful.
• **-EBUSY** – Bus is busy.
• **-EIO** – General input / output error.

```c
static inline struct i3c_device_desc *i3c_device_find(const struct device *dev, const struct i3c_device_id *id)
```

Find a registered I3C target device.

Controller only API.

This returns the I3C device descriptor of the I3C device matching the incoming `id`.

**Parameters**

• `dev` – Pointer to controller device driver instance.
• `id` – Pointer to I3C device ID.

**Returns**

Pointer to I3C device descriptor, or NULL if no I3C device found matching incoming `id`. 

---

7.3. Peripherals 2229
static inline int i3c_ibi_raise(const struct device *dev, struct i3c_ibi *request)
    Raise an In-Band Interrupt (IBI).

    This raises an In-Band Interrupt (IBI) to the active controller.

    **Parameters**
    - dev – Pointer to controller device driver instance.
    - request – Pointer to the IBI request struct.

    **Return values**
    - 0 – if operation is successful.
    - -EIO – General input / output error.

static inline int i3c_ibi_enable(struct i3c_device_desc *target)
    Enable IBI of a target device.

    This enables IBI of a target device where the IBI has already been request.

    **Parameters**
    - target – I3C target device descriptor.

    **Return values**
    - 0 – If successful.
    - -EIO – General Input / output error.
    - -ENOMEM – If there is no more empty entries in the controller's IBI table (if the
      controller uses such table).

static inline int i3c_ibi_disable(struct i3c_device_desc *target)
    Disable IBI of a target device.

    This enables IBI of a target device where the IBI has already been request.

    **Parameters**
    - target – I3C target device descriptor.

    **Return values**
    - 0 – If successful.
    - -EIO – General Input / output error.
    - -ENODEV – If IBI is not previously enabled for target.

static inline int i3c_ibi_has_payload(struct i3c_device_desc *target)
    Check if target's IBI has payload.

    This reads the BCR from the device descriptor struct to determine whether IBI from device
    has payload.

    Note that BCR must have been obtained from device and

    **See also:**
    
    i3c_device_desc::bcr must be set.

    **Returns**
    - True if IBI has payload, false otherwise.
static inline int i3c_device_is_ibi_capable(struct i3c_device_desc *target)

Check if device is IBI capable.

This reads the BCR from the device descriptor struct to determine whether device is capable
of IBI.

Note that BCR must have been obtained from device and

See also:
i3c_device_desc::bcr must be set.

Returns
True if IBI has payload, false otherwise.

static inline int i3c_write(struct i3c_device_desc *target, const uint8_t *buf, uint32_t num_bytes)

Write a set amount of data to an I3C target device.

This routine writes a set amount of data synchronously.

Parameters
- target – I3C target device descriptor.
- buf – Memory pool from which the data is transferred.
- num_bytes – Number of bytes to write.

Return values
- 0 – If successful.
- -EBUSY – Bus is busy.
- -EIO – General input / output error.

static inline int i3c_read(struct i3c_device_desc *target, uint8_t *buf, uint32_t num_bytes)

Read a set amount of data from an I3C target device.

This routine reads a set amount of data synchronously.

Parameters
- target – I3C target device descriptor.
- buf – Memory pool that stores the retrieved data.
- num_bytes – Number of bytes to read.

Return values
- 0 – If successful.
- -EBUSY – Bus is busy.
- -EIO – General input / output error.

static inline int i3c_write_read(struct i3c_device_desc *target, const void *write_buf, size_t num_write, void *read_buf, size_t num_read)

Write then read data from an I3C target device.

This supports the common operation “this is what I want”, “now give
it to me” transaction pair through a combined write-then-read bus transaction.

Parameters
- target – I3C target device descriptor.
- write_buf – Pointer to the data to be written
• num_write – Number of bytes to write
• read_buf – Pointer to storage for read data
• num_read – Number of bytes to read

Return values
• 0 – if successful
• -EBUSY – Bus is busy.
• -EIO – General input / output error.

static inline int i3c_burst_read(struct i3c_device_desc *target, uint8_t start_addr, uint8_t *buf, uint32_t num_bytes)

Read multiple bytes from an internal address of an I3C target device.

This routine reads multiple bytes from an internal address of an I3C target device synchronously.

Instances of this may be replaced by i3c_write_read().

Parameters
• target – I3C target device descriptor,
• start_addr – Internal address from which the data is being read.
• buf – Memory pool that stores the retrieved data.
• num_bytes – Number of bytes being read.

Return values
• 0 – If successful.
• -EBUSY – Bus is busy.
• -EIO – General input / output error.

static inline int i3c_burst_write(struct i3c_device_desc *target, uint8_t start_addr, const uint8_t *buf, uint32_t num_bytes)

Write multiple bytes to an internal address of an I3C target device.

This routine writes multiple bytes to an internal address of an I3C target device synchronously.

Warning: The combined write synthesized by this API may not be supported on all I3C devices. Uses of this API may be made more portable by replacing them with calls to i3c_write() passing a buffer containing the combined address and data.

Parameters
• target – I3C target device descriptor.
• start_addr – Internal address to which the data is being written.
• buf – Memory pool from which the data is transferred.
• num_bytes – Number of bytes being written.

Return values
• 0 – If successful.
• -EBUSY – Bus is busy.
• -EIO – General input / output error.
static inline int i3c_reg_read_byte(struct i3c_device_desc *target, uint8_t reg_addr, uint8_t *value)

Read internal register of an I3C target device.

This routine reads the value of an 8-bit internal register of an I3C target device synchronously.

Parameters
- target – I3C target device descriptor.
- reg_addr – Address of the internal register being read.
- value – Memory pool that stores the retrieved register value.

Return values
- 0 – If successful.
- -EBUSY – Bus is busy.
- -EIO – General input / output error.

static inline int i3c_reg_write_byte(struct i3c_device_desc *target, uint8_t reg_addr, uint8_t value)

Write internal register of an I3C target device.

This routine writes a value to an 8-bit internal register of an I3C target device synchronously.

Note: This function internally combines the register and value into a single bus transaction.

Parameters
- target – I3C target device descriptor.
- reg_addr – Address of the internal register being written.
- value – Value to be written to internal register.

Return values
- 0 – If successful.
- -EBUSY – Bus is busy.
- -EIO – General input / output error.

static inline int i3c_reg_update_byte(struct i3c_device_desc *target, uint8_t reg_addr, uint8_t mask, uint8_t value)

Update internal register of an I3C target device.

This routine updates the value of a set of bits from an 8-bit internal register of an I3C target device synchronously.

Note: If the calculated new register value matches the value that was read this function will not generate a write operation.

Parameters
- target – I3C target device descriptor.
- reg_addr – Address of the internal register being updated.
- mask – Bitmask for updating internal register.
- value – Value for updating internal register.
Return values

- 0 – If successful.
- -EBUSY – Bus is busy.
- -EIO – General input / output error.

```c
void i3c_dump_msgs(const char *name, const struct i3c_msg *msgs, uint8_t num_msgs, struct i3c_device_desc *target)
```

Dump out an I3C message.

Dumps out a list of I3C messages. For any that are writes (W), the data is displayed in hex.

It looks something like this (with name “testing”):

```
D: I3C msg: testing, addr=56
D:     W len=01:
D:     contents: 06 |.
D:     W len=0e:
D:     contents: 00 01 02 03 04 05 06 07 |........
D: 08 09 0a 0b 0c 0d |.......   
```

**Parameters**

- name – Name of this dump, displayed at the top.
- msgs – Array of messages to dump.
- num_msgs – Number of messages to dump.
- target – I3C target device descriptor.

```c
int i3c_bus_init(const struct device *dev, const struct i3c_dev_list *i3c_dev_list)
```

Generic helper function to perform bus initialization.

**Parameters**

- dev – Pointer to controller device driver instance.
- i3c_dev_list – Pointer to I3C device list.

**Return values**

- 0 – If successful.
- -EBUSY – Bus is busy.
- -EIO – General input / output error.
- -ENODEV – If a provisioned ID does not match to any target devices in the registered device list.
- -ENOSPC – No more free addresses can be assigned to target.
- -ENOSYS – Dynamic address assignment is not supported by the controller driver.

```c
int i3c_device_basic_info_get(struct i3c_device_desc *target)
```

Get basic information from device and update device descriptor.

This retrieves some basic information:

- Bus Characteristics Register (GETBCR)
• Device Characteristics Register (GETDCR)
• Max Read Length (GETMRL)
• Max Write Length (GETMWL) from the device and update the corresponding fields of the device descriptor.

This only updates the field(s) in device descriptor only if CCC operations succeed.

**Parameters**

- target – [inout] I3C target device descriptor.

**Return values**

- 0 – if successful.
- -EIO – General Input/Output error.

```
struct i3c_msg
```

```
#include <i3c.h>
```

One I3C Message.

This defines one I3C message to transact on the I3C bus.

**Note:** Some of the configurations supported by this API may not be supported by specific SoC I3C hardware implementations, in particular features related to bus transactions intended to read or write data from different buffers within a single transaction. Invocations of `i3c_transfer()` may not indicate an error when an unsupported configuration is encountered. In some cases drivers will generate separate transactions for each message fragment, with or without presence of `I3C_MSG_RESTART` in flags.

---

**Public Members**

```
uint8_t *buf
```

Data buffer in bytes

```
uint32_t len
```

Length of buffer in bytes

```
uint8_t flags
```

Flags for this message

```
uint8_t hdr_mode
```

HDR mode (I3C_MSG_HDR_MODE*) for transfer if any I3C_MSG_HDR_* is set in flags.

Use SDR mode if none is set.

```
struct i3c_config_controller
```

```
#include <i3c.h>
```

Configuration parameters for I3C hardware to act as controller.

**Public Members**

```
bool is_primary
```

True if the controller is to be the primary controller of the bus. False to be the secondary controller.

---

7.3. Peripherals
uint32_t i3c
   SCL frequency (in Hz) for I3C transfers.

uint32_t i2c
   SCL frequency (in Hz) for I2C transfers.

uint8_t supported_hdr
   Bit mask of supported HDR modes (0 - 7).
   This can be used to enable or disable HDR mode supported by the hardware at runtime.

struct i3c_config_custom
   #include <i3c.h> Custom I3C configuration parameters.
   This can be used to configure the I3C hardware on parameters not covered by
   See also:
   i3c_config_controller or
   See also:
   i3c_config_target. Mostly used to configure vendor specific parameters of the I3C hardware.

Public Members

uint32_t id
   ID of the configuration parameter.

uintptr_t val
   Value of configuration parameter.

void *ptr
   Pointer to configuration parameter.
   Mainly used to pointer to a struct that the device driver understands.

struct i3c_device_id
   #include <i3c.h> Structure used for matching I3C devices.

Public Members

const uint64_t pid
   Device Provisioned ID

struct i3c_device_desc
   #include <i3c.h> Structure describing a I3C target device.
   Instances of this are passed to the I3C controller device APIs, for example:
   • i3c_device_register() to tell the controller of a target device.
   • i3c_transfers() to initiate data transfers between controller and target device.
Fields `bus`, `pid` and `static_addr` must be initialized by the module that implements the target device behavior prior to passing the object reference to I3C controller device APIs. `static_addr` can be zero if target device does not have static address.

Field `node` should not be initialized or modified manually.

Public Members

```c
sys_snode_t node
    Private, do not modify

const struct device *const bus
    I3C bus to which this target device is attached

const struct device *const dev
    Device driver instance of the I3C device

const uint64_t pid
    Device Provisioned ID

const uint8_t static_addr
    Static address for this target device.
    0 if static address is not being used, and only dynamic address is used. This means that the target device must go through ENTDAA (Dynamic Address Assignment) to get a dynamic address before it can communicate with the controller. This means SETAASA and SETDASA CCC cannot be used to set dynamic address on the target device (as both are to tell target device to use static address as dynamic address).

const uint8_t init_dynamic_addr
    Initial dynamic address.
    This is specified in the device tree property “assigned-address” to indicate the desired dynamic address during address assignment (SETDASA and ENTDAA).
    0 if there is no preference.

uint8_t dynamic_addr
    Dynamic Address for this target device used for communication.
    This is to be set by the controller driver in one of the following situations:
    • During Dynamic Address Assignment (during ENTDAA)
    • Reset Dynamic Address Assignment (RSTDAA)
    • Set All Addresses to Static Addresses (SETAASA)
    • Set New Dynamic Address (SETNEWDA)
    • Set Dynamic Address from Static Address (SETDASA)
    0 if address has not been assigned.

uint8_t group_addr
    Group address for this target device. Set during:
    • Reset Group Address(es) (RSTGRPA)
    • Set Group Address (SETGRPA)
    0 if group address has not been assigned.
```
uint8_t bcr

Bus Characteristic Register (BCR)
- BCR[7:6]: Device Role
  - 0: I3C Target
  - 1: I3C Controller capable
  - 2: Reserved
  - 3: Reserved
- BCR[5]: Advanced Capabilities
  - 0: Does not support optional advanced capabilities.
  - 1: Supports optional advanced capabilities which can be viewed via GETCAPS CCC.
- BCR[4]: Virtual Target Support
  - 0: Is not a virtual target.
  - 1: Is a virtual target.
- BCR[3]: Offline Capable
  - 0: Will always response to I3C commands.
  - 1: Will not always response to I3C commands.
- BCR[2]: IBI Payload
  - 0: No data bytes following the accepted IBI.
  - 1: One data byte (MDB, Mandatory Data Byte) follows the accepted IBI. Additional data bytes may also follows.
- BCR[1]: IBI Request Capable
  - 0: Not capable
  - 1: Capable
- BCR[0]: Max Data Speed Limitation
  - 0: No Limitation
  - 1: Limitation obtained via GETMXDS CCC.

uint8_t dcr

Device Characteristic Register (DCR)
Describes the type of device. Refer to official documentation on what this number means.

uint8_t maxrd

Maximum Read Speed

uint8_t maxwr

Maximum Write Speed

uint32_t max_read_turnaround

Maximum Read turnaround time in microseconds.

uint16_t mrl

Maximum Read Length

uint16_t mwl

Maximum Write Length

uint8_t max_ibi

Maximum IBI Payload Size. Valid only if BCR[2] is 1.

void *controller_priv

Private data by the controller to aid in transactions. Do not modify.
i3c_target_ibi_cb_t ibi_cb
In-Band Interrupt (IBI) callback.

struct i3c_i2c_device_desc
#include <i3c.h> Structure describing a I2C device on I3C bus.
Instances of this are passed to the I3C controller device APIs, for example: ()
i3c_i2c_device_register() to tell the controller of an I2C device. () i3c_i2c_transfers() to initiate data transfers between controller and I2C device.
Fields other than node must be initialized by the module that implements the device behavior prior to passing the object reference to I3C controller device APIs.

Public Members

sys_snode_t node
   Private, do not modify

const struct device *bus
   I3C bus to which this I2C device is attached

const uint16_t addr
   Static address for this I2C device.

const uint8_t lvr
   Legacy Virtual Register (LVR)
   - IVR[7:5]: I2C device index:
     - 0: I2C device has a 50 ns spike filter where it is not affected by high frequency on SCL.
     - 1: I2C device does not have a 50 ns spike filter but can work with high frequency on SCL.
     - 2: I2C device does not have a 50 ns spike filter and cannot work with high frequency on SCL.
   - IVR[4]: I2C mode indicator:
     - 0: FM+ mode
     - 1: FM mode
   - IVR[3:0]: Reserved.

void *controller_priv
   Private data by the controller to aid in transactions. Do not modify.

struct i3c_dev_list
#include <i3c.h> Structure for describing attached devices for a controller.
This contains arrays of attached I3C and I2C devices.
This is a helper struct that can be used by controller device driver to aid in device management.

Public Members

struct i3c_device_desc *const i3c
   Pointer to array of attached I3C devices.
struct i3c_i2c_device_desc *const i2c
  Pointer to array of attached I2C devices.

const uint8_t num_i3c
  Number of I3C devices in array.

const uint8_t num_i2c
  Number of I2C devices in array.

group i3c_ccc
  I3C Common Command Codes.

Defines

I3C_CCC_BROADCAST_MAX_ID
  Maximum CCC ID for broadcast

I3C_CCC_ENEC(broadcast)
  Enable Events Command
  Parameters
    • broadcast – True if broadcast, false if direct.

I3C_CCC_DISEC(broadcast)
  Disable Events Command
  Parameters
    • broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS(as, broadcast)
  Enter Activity State
  Parameters
    • as – Desired activity state
    • broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS0(broadcast)
  Enter Activity State 0
  Parameters
    • broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS1(broadcast)
  Enter Activity State 1
  Parameters
    • broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS2(broadcast)
  Enter Activity State 2
  Parameters
    • broadcast – True if broadcast, false if direct.
I3C_CCC_ENTAS3(broadcast)
Enter Activity State 3

**Parameters**

- `broadcast` – True if broadcast, false if direct.

I3C_CCC_RSTDAA
Reset Dynamic Address Assignment (Broadcast)

I3C_CCC_ENTDAA
Enter Dynamic Address Assignment (Broadcast)

I3C_CCC_DEFTGTS
Define List of Targets (Broadcast)

I3C_CCC_SETMVL(broadcast)
Set Max Write Length (Broadcast or Direct)

**Parameters**

- `broadcast` – True if broadcast, false if direct.

I3C_CCC_SETMRL(broadcast)
Set Max Read Length (Broadcast or Direct)

**Parameters**

- `broadcast` – True if broadcast, false if direct.

I3C_CCC_ENTTM
Enter Test Mode (Broadcast)

I3C_CCC_SETBUSCON
Set Bus Context (Broadcast)

I3C_CCC_ENDXFER(broadcast)
Data Transfer Ending Procedure Control

**Parameters**

- `broadcast` – True if broadcast, false if direct.

I3C_CCC_ENTHDR(x)
Enter HDR Mode (HDR-DDR) (Broadcast)

I3C_CCC_ENTHDR0
Enter HDR Mode 0 (HDR-DDR) (Broadcast)

I3C_CCC_ENTHDR1
Enter HDR Mode 1 (HDR-TSP) (Broadcast)

I3C_CCC_ENTHDR2
Enter HDR Mode 2 (HDR-TSL) (Broadcast)

I3C_CCC_ENTHDR3
Enter HDR Mode 3 (HDR-BT) (Broadcast)
I3C_CCC_ENTHDR4
Enter HDR Mode 4 (Broadcast)

I3C_CCC_ENTHDR5
Enter HDR Mode 5 (Broadcast)

I3C_CCC_ENTHDR6
Enter HDR Mode 6 (Broadcast)

I3C_CCC_ENTHDR7
Enter HDR Mode 7 (Broadcast)

I3C_CCC_SETXTIME(broadcast)
Exchange Timing Information (Broadcast or Direct)

Parameters
• broadcast – True if broadcast, false if direct.

I3C_CCC_SETAASA
Set All Addresses to Static Addresses (Broadcast)

I3C_CCC_RSTACT(broadcast)
Target Reset Action

Parameters
• broadcast – True if broadcast, false if direct.

I3C_CCC_DEFGGRA
Define List of Group Address (Broadcast)

I3C_CCC_RSTGPA(broadcast)
Reset Group Address

Parameters
• broadcast – True if broadcast, false if direct.

I3C_CCC_MLANE(broadcast)
Multi-Lane Data Transfer Control (Broadcast)

I3C_CCC_VENDOR(broadcast, id)
Vendor/Standard Extension

Parameters
• broadcast – True if broadcast, false if direct.
• id – Extension ID.

I3C_CCC_SETDASA
Set Dynamic Address from Static Address (Direct)

I3C_CCC_SETNEWDA
Set New Dynamic Address (Direct)

I3C_CCC_GETMWL
Get Max Write Length (Direct)
I3C_CCC_GETMRL
   Get Max Read Length (Direct)

I3C_CCC_GETPID
   Get Provisioned ID (Direct)

I3C_CCC_GETBCR
   Get Bus Characteristics Register (Direct)

I3C_CCC_GETDCR
   Get Device Characteristics Register (Direct)

I3C_CCC_GETSTATUS
   Get Device Status (Direct)

I3C_CCC_GETACCCR
   Get Accept Controller Role (Direct)

I3C_CCC_SETBRGTGT
   Set Bridge Targets (Direct)

I3C_CCC_GETMXDS
   Get Max Data Speed (Direct)

I3C_CCC_GETCAPS
   Get Optional Feature Capabilities (Direct)

I3C_CCC_SETROUTE
   Set Route (Direct)

I3C_CCC_D2DXFER
   Device to Device(s) Tunneling Control (Direct)

I3C_CCC_GETXTIME
   Get Exchange Timing Information (Direct)

I3C_CCC_SETGRPA
   Set Group Address (Direct)

I3C_CCC_ENEC_EVT_ENINTR

I3C_CCC_ENEC_EVT_ENCR

I3C_CCC_ENEC_EVT_ENHJ

I3C_CCC_ENEC_EVT_ALL

I3C_CCC_DISSEC_EVT_DISINTR
I3C_CCC_DISEC_EVT_DISCR
I3C_CCC_DISEC_EVT_DISHJ
I3C_CCC_DISEC_EVT_ALL
I3C_CCC_EVT_INTR
I3C_CCC_EVT_CR
I3C_CCC_EVT_HJ
I3C_CCC_EVT_ALL
I3C_CCC_GETSTATUS_PROTOCOL_ERR
I3C_CCC_GETSTATUS_ACTIVITY_MODE_SHIFT
I3C_CCC_GETSTATUS_ACTIVITY_MODE_MASK
I3C_CCC_GETSTATUS_ACTIVITY_MODE(status)
I3C_CCC_GETSTATUS_NUM_INT_SHIFT
I3C_CCC_GETSTATUS_NUM_INT_MASK
I3C_CCC_GETSTATUS_NUM_INT(status)
I3C_CCC_GETSTATUS_PRECR_DEEP_SLEEP_DETECTED
I3C_CCC_GETSTATUS_PRECR_HANDOFF_DELAY_NACK
I3C_CCC_GETMXDS_MAX_SDR_FSCL_MAX
I3C_CCC_GETMXDS_MAX_SDR_FSCL_8MHZ
I3C_CCC_GETMXDS_MAX_SDR_FSCL_6MHZ
I3C_CCC_GETMXDS_MAX_SDR_FSCL_4MHZ
I3C_CCC_GETMXDS_MAX_SDR_FSCL_2MHZ
I3C_CCC_GETMXDS_TSCO_8NS
I3C_CCC_GETMXDS_TSCO_9NS
I3C_CCC_GETMXDS_TSCO_10NS
I3C_CCC_GETMXDS_TSCO_11NS
I3C_CCC_GETMXDS_TSCO_12NS
I3C_CCC_GETMXDS_TSCO_GT_12NS
I3C_CCC_GETMXDS_MAXWR_DEFINING_BYTE_SUPPORT
I3C_CCC_GETMXDS_MAXWR_MAX_SDR_FSCL_SHIFT
I3C_CCC_GETMXDS_MAXWR_MAX_SDR_FSCL_MASK
I3C_CCC_GETMXDS_MAXWR_MAX_SDR_FSCL(maxwr)
I3C_CCC_GETMXDS_MAXRD_W2R_PERMITS_STOP_BETWEEN
I3C_CCC_GETMXDS_MAXRD_TSCO_SHIFT
I3C_CCC_GETMXDS_MAXRD_TSCO_MASK
I3C_CCC_GETMXDS_MAXRD_TSCO(maxrd)
I3C_CCC_GETMXDS_MAXRD_MAX_SDR_FSCL_SHIFT
I3C_CCC_GETMXDS_MAXRD_MAX_SDR_FSCL_MASK
I3C_CCC_GETMXDS_MAXRD_MAX_SDR_FSCL(maxrd)
I3C_CCC_GETMXDS_CRDHLY1_SET_BUS_ACT_STATE
I3C_CCC_GETMXDS_CRDHLY1_CTRL_HANDOFF_ACT_STATE_SHIFT
I3C_CCC_GETMXDS_CRDHLY1_CTRL_HANDOFF_ACT_STATE_MASK
I3C_CCC_GETMXDS_CRDHLY1_CTRL_HANDOFF_ACT_STATE(crhdly1)
I3C_CCC_GETCAPS1_HDR_DDR
I3C_CCC_GETCAPS1_HDR_BT
I3C_CCC_GETCAPS1_HDR_MODE(x)
I3C_CCC_GETCAPS1_HDR_MODE0
I3C_CCC_GETCAPS1_HDR_MODE1

7.3. Peripherals
I3C_CCC_GETCAPS1_HDR_MODE2
I3C_CCC_GETCAPS1_HDR_MODE3
I3C_CCC_GETCAPS1_HDR_MODE4
I3C_CCC_GETCAPS1_HDR_MODE5
I3C_CCC_GETCAPS1_HDR_MODE6
I3C_CCC_GETCAPS1_HDR_MODE7

I3C_CCC_GETCAPS2_SPEC_VER(getcaps2)
I3C_CCC_GETCAPS3_MLAME_SUPPORT
I3C_CCC_GETCAPS3_D2DXFER_SUPPORT
I3C_CCC_GETCAPS3_D3DXFER_IBI_CAPABLE
I3C_CCC_GETCAPS3_GETCAPS_DEFINING_BYTE_SUPPORT
I3C_CCC_GETCAPS3_GETSTATUS_DEFINING_BYTE_SUPPORT
I3C_CCC_GETCAPS3_HDRBT_CRC32_SUPPORT
I3C_CCC_GETCAPS3_IBI_MDR_PENDING_READ_NOTIFICATION

**Enums**
enum i3c_ccc_getstatus_fmt

Indicate which format of GETSTATUS to use.

Values:

enumerator GETSTATUS_FORMAT_1
enumerator GETSTATUS_FORMAT_2

enum i3c_ccc_getstatus_defbyte

Values:

enumerator GETSTATUS_FORMAT_2_TGTSTAT = 0x00U
enumerator GETSTATUS_FORMAT_2_PRECR = 0x91U
enumerator GETSTATUS_FORMAT_2_INVALID = 0x100U

enum i3c_ccc_rstact_defining_byte

Values:

enumerator I3C_CCC_RSTACT_NO_RESET = 0x00U
enumerator I3C_CCC_RSTACT_PERIPHERAL_ONLY = 0x01U
enumerator I3C_CCC_RSTACT_RESET_WHOLE_TARGET = 0x02U
enumerator I3C_CCC_RSTACT_DEBUG_NETWORK_ADAPTER = 0x03U
enumerator I3C_CCC_RSTACT_VIRTUAL_TARGET_DETECT = 0x04U

Functions

static inline bool i3c_ccc_is_payload_broadcast(const struct i3c_ccc_payload *payload)
Test if I3C CCC payload is for broadcast.
This tests if the CCC payload is for broadcast.

Parameters

• payload – [in] Pointer to the CCC payload.

Return values

• true – if payload target is broadcast
• false – if payload target is direct

int i3c_ccc_do_getbcr(struct i3c_device_desc *target, struct i3c_ccc_getbcr *bcr)
Get BCR from a target.

Helper function to get BCR (Bus Characteristic Register) from target device.

7.3. Peripherals
See also:

`i3c_do_ccc`

Parameters

- bcr – [out] Pointer to the BCR payload structure.

Returns

```
int i3c_ccc_do_getdcr(struct i3c_device_desc *target, struct i3c_ccc_getdcr *dcr)
```

Get DCR from a target.

Helper function to get DCR (Device Characteristic Register) from target device.

See also:

`i3c_do_ccc`

Parameters

- dcr – [out] Pointer to the DCR payload structure.

Returns

```
int i3c_ccc_do_getpid(struct i3c_device_desc *target, struct i3c_ccc_getpid *pid)
```

Get PID from a target.

Helper function to get PID (Provisioned ID) from target device.

See also:

`i3c_do_ccc`

Parameters

Returns

```
int i3c_ccc_do_rstact_all(const struct device *controller, enum i3c_ccc_rstact_defining_byte action)
```

Broadcast RSTACT to reset I3C Peripheral.

Helper function to broadcast Target Reset Action (RSTACT) to all connected targets to Reset the I3C Peripheral Only (0x01).

See also:

`i3c_do_ccc`

Parameters

- controller – [in] Pointer to the controller device driver instance.

Returns
int i3c_ccc_do_rstdaa_all(const struct device *controller)
Broadcast RSTDAA to reset dynamic addresses for all targets.
Helper function to reset dynamic addresses of all connected targets.

See also:
i3c_do_ccc

Parameters
• controller – [in] Pointer to the controller device driver instance.

Returns

int i3c_ccc_do_setdasa(const struct i3c_device_desc *target)
Set Dynamic Address from Static Address for a target.
Helper function to do SETDASA (Set Dynamic Address from Static Address) for a particular target.
Note this does not update target with the new dynamic address.

See also:
i3c_do_ccc

Parameters
• target – [in] Pointer to the target device descriptor where the device is configured with a static address.

Returns

int i3c_ccc_do_events_all_set(const struct device *controller, bool enable, struct i3c_ccc_events *events)
Broadcast ENEC/DISEC to enable/disable target events.
Helper function to broadcast Target Events Command to enable or disable target events (ENEC/DISEC).

See also:
i3c_do_ccc

Parameters
• controller – [in] Pointer to the controller device driver instance.
• enable – [in] ENEC if true, DISEC if false.
• events – [in] Pointer to the event struct.

Returns

int i3c_ccc_do_events_set(struct i3c_device_desc *target, bool enable, struct i3c_ccc_events *events)
Direct CCC ENEC/DISEC to enable/disable target events.
Helper function to send Target Events Command to enable or disable target events (ENEC/DISEC) on a single target.
See also:

*i3c_do_ccc*

**Parameters**

- target – **[in]** Pointer to the target device descriptor.
- enable – **[in]** ENEC if true, DISEC if false.
- events – **[in]** Pointer to the event struct.

**Returns**

int i3c_ccc_do_setmwl_all(const struct *controller, const struct *mwl)

Broadcast SETMWL to Set Maximum Write Length.
Helper function to do SETMWL (Set Maximum Write Length) to all connected targets.

See also:

*i3c_do_ccc*

**Parameters**

- controller – **[in]** Pointer to the controller device driver instance.
- mwl – **[in]** Pointer to SETMWL payload.

**Returns**

int i3c_ccc_do_setmwl(const struct *target, const struct *mwl)

Single target SETMWL to Set Maximum Write Length.
Helper function to do SETMWL (Set Maximum Write Length) to one target.

See also:

*i3c_do_ccc*

**Parameters**

- target – **[in]** Pointer to the target device descriptor.
- mwl – **[in]** Pointer to SETMWL payload.

**Returns**

int i3c_ccc_do_getmwl(const struct *target, struct *mwl)

Single target GETMWL to Get Maximum Write Length.
Helper function to do GETMWL (Get Maximum Write Length) of one target.

See also:

*i3c_do_ccc*

**Parameters**

- target – **[in]** Pointer to the target device descriptor.
- mwl – **[out]** Pointer to GETMWL payload.
Returns

int i3c_ccc_do_setmrl_all(const struct device *controller, const struct i3c_ccc_mrl *mrl, bool has_ibi_size)

Broadcast SETMRL to Set Maximum Read Length.
Helper function to do SETMRL (Set Maximum Read Length) to all connected targets.

See also:

i3c_do_ccc

Parameters

• controller – [in] Pointer to the controller device driver instance.
• mrl – [in] Pointer to SETMRL payload.
• has_ibi_size – [in] True if also sending the optional IBI payload size. False if not sending.

Returns

int i3c_ccc_do_setmrl(const struct i3c_device_desc *target, const struct i3c_ccc_mrl *mrl)

Single target SETMRL to Set Maximum Read Length.
Helper function to do SETMRL (Set Maximum Read Length) to one target.
Note this uses the BCR of the target to determine whether to send the optional IBI payload size.

See also:

i3c_do_ccc

Parameters

• target – [in] Pointer to the target device descriptor.
• mrl – [in] Pointer to SETMRL payload.

Returns

int i3c_ccc_do_getmrl(const struct i3c_device_desc *target, struct i3c_ccc_mrl *mrl)

Single target GETMRL to Get Maximum Read Length.
Helper function to do GETMRL (Get Maximum Read Length) of one target.
Note this uses the BCR of the target to determine whether to send the optional IBI payload size.

See also:

i3c_do_ccc

Parameters

• target – [in] Pointer to the target device descriptor.
• mrl – [out] Pointer to GETMRL payload.

Returns
int i3c_ccc_do_getstatus(const struct i3c_device_desc *target, union i3c_ccc_getstatus *status, enum i3c_ccc_getstatus_fmt fmt, enum i3c_ccc_getstatus_defbyte defbyte)

Single target GETSTATUS to Get Target Status.
Helper function to do GETSTATUS (Get Target Status) of one target.
Note this uses the BCR of the target to determine whether to send the optional IBI payload size.

See also:
i3c_do_ccc

Parameters
- status – [out] Pointer to GETSTATUS payload.

Returns

static inline int i3c_ccc_do_getstatus_fmt1(const struct i3c_device_desc *target, union i3c_ccc_getstatus *status)

Single target GETSTATUS to Get Target Status (Format 1).
Helper function to do GETSTATUS (Get Target Status, format 1) of one target.

See also:
i3c_do_ccc

Parameters
- status – [out] Pointer to GETSTATUS payload.

Returns

static inline int i3c_ccc_do_getstatus_fmt2(const struct i3c_device_desc *target, union i3c_ccc_getstatus *status, enum i3c_ccc_getstatus_defbyte defbyte)

Single target GETSTATUS to Get Target Status (Format 2).
Helper function to do GETSTATUS (Get Target Status, format 2) of one target.

See also:
i3c_do_ccc

Parameters
- status – [out] Pointer to GETSTATUS payload.

Returns
struct i3c_ccc_target_payload

#include <ccc.h> Payload structure for Direct CCC to one target.

Public Members

uint8_t addr
  Target address

uint8_t rnw
  0 for Write, 1 for Read

uint8_t *data
  • For Write CCC, pointer to the byte array of data to be sent, which may contain the
    Sub-Command Byte and additional data.
  • For Read CCC, pointer to the byte buffer for data to be read into.

size_t data_len
  Length in bytes for data.

struct i3c_ccc_payload

#include <ccc.h> Payload structure for one CCC transaction.

Public Members

uint8_t id
  The CCC ID (I3C_CCC_*).

uint8_t *data
  Pointer to byte array of data for this CCC.
  This is the bytes following the CCC command in CCC frame. Set to NULL if no associated
data.

size_t data_len
  Length in bytes for optional data array.

struct i3c_ccc_target_payload *payloads
  Array of struct i3c_ccc_target_payload.
  Each element describes the target and associated payloads for this CCC.
  Use with Direct CCC.

size_t num_targets
  Number of targets

struct i3c_ccc_events

#include <ccc.h> Payload for ENEC/DISEC CCC (Target Events Command).
Public Members

uint8_t events

Event byte:
- Bit[0]: ENINT/DISINT:
  - Target Interrupt Requests
- Bit[1]: ENCR/DISCR:
  - Controller Role Requests
- Bit[3]: ENHJ/DISHJ:
  - Hot-Join Event

struct i3c_ccc_mwl
#include <ccc.h>
Payload for SETMWL/GETMWL CCC (Set/Get Maximum Write Length).

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

Public Members

uint16_t len
Maximum Write Length

struct i3c_ccc_mrl
#include <ccc.h>
Payload for SETMRL/GETMRL CCC (Set/Get Maximum Read Length).

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

Public Members

uint16_t len
Maximum Read Length

uint8_t ibi_len
Optional IBI Payload Size

struct i3c_ccc_deftgts_active_controller
#include <ccc.h>
The active controller part of payload for DEFTGTS CCC.
This is used by DEFTGTS (Define List of Targets) CCC to describe the active controller on the I3C bus.
uint8_t addr
   Dynamic Address of Active Controller

uint8_t dcr
   Device Characteristic Register of Active Controller

uint8_t bcr
   Bus Characteristic Register of Active Controller

uint8_t static_addr
   Static Address of Active Controller

struct i3c_ccc_deftgts_target
#include <ccc.h> The target device part of payload for DEFTGTS CCC.
This is used by DEFTGTS (Define List of Targets) CCC to describe the existing target devices
on the I3C bus.

Public Members

uint8_t addr
   Dynamic Address of a target device, or a group address

uint8_t dcr
   Device Characteristic Register of a I3C target device or a group.

uint8_t lvr
   Legacy Virtual Register for legacy I2C device.

uint8_t bcr
   Bus Characteristic Register of a target device or a group

uint8_t static_addr
   Static Address of a target device or a group

struct i3c_ccc_deftgts
#include <ccc.h> Payload for DEFTGTS CCC (Define List of Targets).

Note:  i3c_ccc_deftgts_target is an array of targets, where the number of elements is
dependent on the number of I3C targets on the bus. Please have enough space for both read
and write of this CCC.

Public Members

struct i3c_ccc_deftgts_active_controller active_controller
   Data describing the active controller
struct i3c_ccc_deftgts_target targets[]
  Data describing the target(s) on the bus

struct i3c_ccc_address
#include <ccc.h> Payload for a single device address.
This is used for:
  • SETDASA (Set Dynamic Address from Static Address)
  • SETNEWDA (Set New Dynamic Address)
  • SETGRPA (Set Group Address)
  • GETACCCCR (Get Accept Controller Role)
Note that the target address is encoded within struct i3c_ccc_target_payload instead of being encoded in this payload.

Public Members

uint8_t addr
  • For SETDASA, Static Address to be assigned as Dynamic Address.
  • For SETNEWDA, new Dynamic Address to be assigned.
  • For SETGRPA, new Group Address to be set.
  • For GETACCCCR, the correct address of Secondary Controller.

Note: For SETDATA, SETNEWDA and SETGRAP, the address is left-shift by 1, and bit[0] is always 0.

Note: Fpr SET GETACCCCR, the address is left-shift by 1, and bit[0] is the calculated odd parity bit.

struct i3c_ccc_getpid
#include <ccc.h> Payload for GETPID CCC (Get Provisioned ID).

Public Members

uint8_t pid[6]
  48-bit Provisioned ID.

Note: Data is big-endian where first byte is MSB.

struct i3c_ccc_getbcr
#include <ccc.h> Payload for GETBCR CCC (Get Bus Characteristics Register).

Public Members
### uint8_t bcr

Bus Characteristics Register

### struct i3c_ccc_getdcr

```c
#include <ccc.h>
```

Payload for GETDCR CCC (Get Device Characteristics Register).

#### Public Members

- **uint8_t dcr**
  - Device Characteristics Register

### union i3c_ccc_getstatus

```c
#include <ccc.h>
```

Payload for GETSTATUS CCC (Get Device Status).

#### Public Members

- **uint16_t status**
  - Device Status
    - Bit[15:8]: Reserved.
    - Bit[7:6]: Activity Mode.
    - Bit[5]: Protocol Error.
    - Bit[4]: Reserved.
    - Bit[3:0]: Number of Pending Interrupts.

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

### struct i3c_ccc_getstatus.[anonymous] fmt1

- **uint16_t tgtstat**
  - Defining Byte 0x00: TGTSTAT

See also:
- i3c_ccc_getstatus::fmt1::status

- **uint16_t precr**
  - Defining Byte 0x91: PRECR
    - Bit[15:8]: Vendor Reserved
    - Bit[7:2]: Reserved
    - Bit[1]: Handoff Delay NACK
    - Bit[0]: Deep Sleep Detected

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.
uint16_t raw_u16

union i3c_ccc_getstatus.[anonymous] fmt2

struct i3c_ccc_setbrgtgt_tgt
#include <ccc.h> One Bridged Target for SETBRGTGT payload.

Public Members

uint8_t addr
Dynamic address of the bridged target.

Note: The address is left-shift by 1, and bit[0] is always 0.

uint16_t id
16-bit ID for the bridged target.

Note: For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

struct i3c_ccc_setbrgtgt
#include <ccc.h> Payload for SETBRGTGT CCC (Set Bridge Targets).
Note that the bridge target address is encoded within struct i3c_ccc_target_payload instead of being encoded in this payload.

Public Members

uint8_t count
Number of bridged targets

struct i3c_ccc_setbrgtgt_tgt targets[]
Array of bridged targets

union i3c_ccc_getmxds
#include <ccc.h> Payload for GETMXDS CCC (Get Max Data Speed).

Note: This is only for GETMXDS Format 1 and Format 2.

Public Members

uint8_t maxwr
maxWr

```c
uint8_t maxrd
maxRd

struct i3c_ccc_getmxds.[anonymous] fmt1

uint8_t maxrdturn[3]
   Maximum Read Turnaround Time in microsecond.
   This is in little-endian where first byte is LSB.

struct i3c_ccc_getmxds.[anonymous] fmt2

uint8_t wrrdturn
   Defining Byte 0x00: WRRDTURN

See also:
i3c_ccc_getmxds::fmt2

group i3c_addresses
   I3C Address-related Helper Code.

Defines

I3C_BROADCAST_ADDR

I3C_MAX_ADDR
```

7.3. Peripherals 2259
 Enums

enum i3c_addr_slot_status

   Values:

   enumerator I3C_ADDR_SLOT_STATUS_FREE = 0U

   enumerator I3C_ADDR_SLOT_STATUS_RSVD

   enumerator I3C_ADDR SLOT_STATUS_I3C_DEV

   enumerator I3C_ADDR SLOT_STATUS_I2C_DEV

   enumerator I3C_ADDR_SLOT_STATUS_MASK = 0x03U

 Functions

int i3c_addr_slots_init(struct i3c_addr_slots *slots, const struct i3c_dev_list *dev_list)

Initialize the I3C address slots struct.

This clears out the assigned address bits, and set the reserved address bits according to the I3C specification.

Parameters

• slots – Pointer to address slots struct.

• dev_list – Pointer to device list struct.

Return values

• 0 – if successful.

• -EINVAL – if duplicate addresses.

void i3c_addr_slots_set(struct i3c_addr_slots *slots, uint8_t dev_addr, enum i3c_addr_slot_status status)

Set the address status of a device.

Parameters

• slots – Pointer to the address slots structure.

• dev_addr – Device address.

• status – New status for the address dev_addr.

enum i3c_addr_slot_status i3c_addr_slots_status(struct i3c_addr_slots *slots, uint8_t dev_addr)

Get the address status of a device.

Parameters

• slots – Pointer to the address slots structure.

• dev_addr – Device address.

Returns

Address status for the address dev_addr.
bool i3c_addr_slots_is_free(struct i3c_addr_slots *slots, uint8_t dev_addr)
Check if the address is free.

Parameters
• slots – Pointer to the address slots structure.
• dev_addr – Device address.

Return values
• true – if address is free.
• false – if address is not free.

uint8_t i3c_addr_slots_next_free_find(struct i3c_addr_slots *slots)
Find the next free address.
This can be used to find the next free address that can be assigned to a new device.

Parameters
• slots – Pointer to the address slots structure.

Returns
The next free address, or 0 if none found.

static inline void i3c_addr_slots_mark_free(struct i3c_addr_slots *addr_slots, uint8_t addr)
Mark the address as free (not used) in device list.

Parameters
• addr_slots – Pointer to the address slots struct.
• addr – Device address.

static inline void i3c_addr_slots_mark_rsvd(struct i3c_addr_slots *addr_slots, uint8_t addr)
Mark the address as reserved in device list.

Parameters
• addr_slots – Pointer to the address slots struct.
• addr – Device address.

static inline void i3c_addr_slots_mark_i3c(struct i3c_addr_slots *addr_slots, uint8_t addr)
Mark the address as I3C device in device list.

Parameters
• addr_slots – Pointer to the address slots struct.
• addr – Device address.

static inline void i3c_addr_slots_mark_i2c(struct i3c_addr_slots *addr_slots, uint8_t addr)
Mark the address as I2C device in device list.

Parameters
• addr_slots – Pointer to the address slots struct.
• addr – Device address.

#include <addresses.h>
Structure to keep track of addresses on I3C bus.
7.3.22 IPM

Overview

API Reference

group ipm_interface
   IPM Interface.

Typedefs

typedef void (*ipm_callback_t)(const struct device *ipmdev, void *user_data, uint32_t id, volatile void *data)
   Callback API for incoming IPM messages.
   These callbacks execute in interrupt context. Therefore, use only interrupt-safe APIs. Registration of callbacks is done via ipm_register_callback

   Param ipmdev
      Driver instance

   Param user_data
      Pointer to some private data provided at registration time.

   Param id
      Message type identifier.

   Param data
      Message data pointer. The correct amount of data to read out must be inferred using the message id/upper level protocol.

typedef int (*ipm_send_t)(const struct device *ipmdev, int wait, uint32_t id, const void *data, int size)
   Callback API to send IPM messages.
   See ipm_send() for argument definitions.

typedef int (*ipm_max_data_size_get_t)(const struct device *ipmdev)
   Callback API to get maximum data size.
   See ipm_max_data_size_get() for argument definitions.

typedef uint32_t (*ipm_max_id_val_get_t)(const struct device *ipmdev)
   Callback API to get the ID's maximum value.
   See ipm_max_id_val_get() for argument definitions.

typedef void (*ipm_register_callback_t)(const struct device *port, ipm_callback_t cb, void *user_data)
   Callback API upon registration.
   See ipm_register_callback() for argument definitions.

typedef int (*ipm_set_enabled_t)(const struct device *ipmdev, int enable)
   Callback API upon enablement of interrupts.
   See ipm_set_enabled() for argument definitions.
typedef void (*ipm_complete_t)(const struct device *ipmdev)
Callback API upon command completion.
See ipm_complete() for argument definitions.

Functions

int ipm_send(const struct device *ipmdev, int wait, uint32_t id, const void *data, int size)
Try to send a message over the IPM device.

A message is considered consumed once the remote interrupt handler finishes. If there is
defferred processing on the remote side, or if outgoing messages must be queued and wait on
an event/semaphore, a high-level driver can implement that.

There are constraints on how much data can be sent or the maximum value of id. Use the
ipm_max_data_size_get and ipm_max_id_val_get routines to determine them.

The size parameter is used only on the sending side to determine the amount of data to put
in the message registers. It is not passed along to the receiving side. The upper-level protocol
dictates the amount of data read back.

Parameters

• ipmdev – Driver instance
• wait – If nonzero, busy-wait for remote to consume the message. The message
  is considered consumed once the remote interrupt handler finishes. If there is
  deferred processing on the remote side, or you would like to queue outgoing
  messages and wait on an event/semaphore, you can implement that in a high-
  level driver
• id – Message identifier. Values are constrained by ipm_max_data_size_get since
  many boards only allow for a subset of bits in a 32-bit register to store the ID.
• data – Pointer to the data sent in the message.
• size – Size of the data.

Return values

• -EBUSY – If the remote hasn’t yet read the last data sent.
• -EMSGSIZE – If the supplied data size is unsupported by the driver.
• -EINVAL – If there was a bad parameter, such as: too-large id value. or the
  device isn’t an outbound IPM channel.
• 0 – On success.

static inline void ipm_register_callback(const struct device *ipmdev, ipm_callback_t cb, void *
user_data)
Register a callback function for incoming messages.

Parameters

• ipmdev – Driver instance pointer.
• cb – Callback function to execute on incoming message interrupts.
• user_data – Application-specific data pointer which will be passed to the call-
  back function when executed.

int ipm_max_data_size_get(const struct device *ipmdev)
Return the maximum number of bytes possible in an outbound message.

IPM implementations vary on the amount of data that can be sent in a single message since
the data payload is typically stored in registers.
Parameters

- ipmdev – Driver instance pointer.

Returns

Maximum possible size of a message in bytes.

```c
uint32_t ipm_max_id_val_get(const struct device *ipmdev)
```

Return the maximum id value possible in an outbound message.

Many IPM implementations store the message's ID in a register with some bits reserved for other uses.

Parameters

- ipmdev – Driver instance pointer.

Returns

Maximum possible value of a message ID.

```c
int ipm_set_enabled(const struct device *ipmdev, int enable)
```

Enable interrupts and callbacks for inbound channels.

Parameters

- ipmdev – Driver instance pointer.
- enable – Set to 0 to disable and to nonzero to enable.

Return values

- 0 – On success.
- -EINVAL – If it isn't an inbound channel.

```c
void ipm_complete(const struct device *ipmdev)
```

Signal asynchronous command completion.

Some IPM backends have an ability to deliver a command asynchronously. The callback will be invoked in interrupt context, but the message (including the provided data pointer) will stay “active” and unacknowledged until later code (presumably in thread mode) calls `ipm_complete()`.

This function is, obviously, a noop on drivers without async support.

Parameters

- ipmdev – Driver instance pointer.

```c
#include <ipm.h>
```

### 7.3.23 KSCAN

**Overview**

The kscan driver (keyboard scan matrix) is used for detecting a key press in a connected matrix keyboard or any device with buttons such as joysticks. Typically, matrix keyboards are implemented using a two-dimensional configuration in order to sense several keys. This allows interfacing to many keys through fewer physical pins. Keyboard matrix drivers read the rows while applying power through the columns one at a time with the purpose of detecting key events. There is no correlation between the physical and electrical layout of keys. For example, the physical layout may be one array of 16 or fewer keys, which may be electrically connected to a 4 x 4 array. In addition, key values are defined by a keymap provided by the keyboard manufacturer.
**Configuration Options**

Related configuration options:

- CONFIG_KSCAN

**API Reference**

**group** kscan_interface

KSCAN APIs.

**Typedefs**

typedef void (*kscan_callback_t)(const struct device *dev, uint32_t row, uint32_t column, bool pressed)

Keyboard scan callback called when user press/release a key on a matrix keyboard.

**Param dev**
Pointer to the device structure for the driver instance.

**Param row**
Describes row change.

**Param column**
Describes column change.

**Param pressed**
Describes the kind of key event.

**Functions**

int kscan_config(const struct device *dev, kscan_callback_t callback)

Configure a Keyboard scan instance.

**Parameters**

- dev – Pointer to the device structure for the driver instance.
- callback – called when keyboard devices reply to to a keyboard event such as key pressed/released.

**Return values**

- 0 – If successful.
- Negative – errno code if failure.

int kscan_enable_callback(const struct device *dev)

Enables callback.

**Parameters**

- dev – Pointer to the device structure for the driver instance.

**Return values**

- 0 – If successful.
- Negative – errno code if failure.
int kscan_disable_callback(const struct device *dev)

Disables callback.

**Parameters**

- *dev* – Pointer to the device structure for the driver instance.

**Return values**

- 0 – If successful.
- Negative – errno code if failure.

---

### 7.3.24 LED

**Overview**

The LED API provides access to Light Emitting Diodes, both in individual and strip form.

**Configuration Options**

Related configuration options:

- `CONFIG_LED`
- `CONFIG_LED_STRIP`

**API Reference**

#### LED

**group led_interface**

LED Interface.

**Typedefs**

typedef int (*led_api_blink)(const struct device *dev, uint32_t led, uint32_t delay_on, uint32_t delay_off)

Callback API for blinking an LED.

**See also:**

`led_blink()` for argument descriptions.

typedef int (*led_api_get_info)(const struct device *dev, uint32_t led, const struct led_info **info)

Optional API callback to get LED information.

**See also:**

`led_get_info()` for argument descriptions.
typedef int (*led_api_set_brightness)(const struct device *dev, uint32_t led, uint8_t value)
   Callback API for setting brightness of an LED.

   See also:
   led_set_brightness() for argument descriptions.

typedef int (*led_api_set_color)(const struct device *dev, uint32_t led, uint8_t num_colors,
   const uint8_t *color)
   Optional API callback to set the colors of a LED.

   See also:
   led_set_color() for argument descriptions.

typedef int (*led_api_on)(const struct device *dev, uint32_t led)
   Callback API for turning on an LED.

   See also:
   led_on() for argument descriptions.

typedef int (*led_api_off)(const struct device *dev, uint32_t led)
   Callback API for turning off an LED.

   See also:
   led_off() for argument descriptions.

typedef int (*led_api_write_channels)(const struct device *dev, uint32_t start_channel,
   uint32_t num_channels, const uint8_t *buf)
   Callback API for writing a strip of LED channels.

   See also:
   led_api_write_channels() for arguments descriptions.

Functions

int led_blink(const struct device *dev, uint32_t led, uint32_t delay_on, uint32_t delay_off)
   Blink an LED.

   This optional routine starts blinking a LED forever with the given time period.

   Parameters
   • dev – LED device
   • led – LED number
   • delay_on – Time period (in milliseconds) an LED should be ON
   • delay_off – Time period (in milliseconds) an LED should be OFF
Returns
0 on success, negative on error

int led_get_info(const struct device *dev, uint32_t led, const struct led_info **info)
Get LED information.
This optional routine provides information about a LED.

Parameters
• dev – LED device
• led – LED number
• info – Pointer to a pointer filled with LED information

Returns
0 on success, negative on error

int led_set_brightness(const struct device *dev, uint32_t led, uint8_t value)
Set LED brightness.
This optional routine sets the brightness of a LED to the given value. Calling this function after led_blink() won't affect blinking.
LEDs which can only be turned on or off may provide this function. These should simply turn the LED on if value is nonzero, and off if value is zero.

Parameters
• dev – LED device
• led – LED number
• value – Brightness value to set in percent

Returns
0 on success, negative on error

int led_write_channels(const struct device *dev, uint32_t start_channel, uint32_t num_channels, const uint8_t *buf)
Write/update a strip of LED channels.
This optional routine writes a strip of LED channels to the given array of levels. Therefore it can be used to configure several LEDs at the same time.
Calling this function after led_blink() won't affect blinking.

Parameters
• dev – LED device
• start_channel – Absolute number (i.e. not relative to a LED) of the first channel to update.
• num_channels – The number of channels to write/update.
• buf – array of values to configure the channels with. num_channels entries must be provided.

Returns
0 on success, negative on error

int led_set_channel(const struct device *dev, uint32_t channel, uint8_t value)
Set a single LED channel.
This optional routine sets a single LED channel to the given value.
Calling this function after led_blink() won't affect blinking.

Parameters
• **dev** – LED device
• **channel** – Absolute channel number (i.e. not relative to a LED)
• **value** – Value to configure the channel with

**Returns**
0 on success, negative on error

```
int led_set_color(const struct device *dev, uint32_t led, uint8_t num_colors, const uint8_t *color)
```

Set LED color.
This routine configures all the color channels of a LED with the given color array.
Calling this function after `led_blink()` won’t affect blinking.

**Parameters**
• **dev** – LED device
• **led** – LED number
• **num_colors** – Number of colors in the array.
• **color** – Array of colors. It must be ordered following the color mapping of the LED controller. See the the color_mapping member in struct `led_info`.

**Returns**
0 on success, negative on error

```
int led_on(const struct device *dev, uint32_t led)
```

Turn on an LED.
This routine turns on an LED

**Parameters**
• **dev** – LED device
• **led** – LED number

**Returns**
0 on success, negative on error

```
int led_off(const struct device *dev, uint32_t led)
```

Turn off an LED.
This routine turns off an LED

**Parameters**
• **dev** – LED device
• **led** – LED number

**Returns**
0 on success, negative on error

```
struct led_info
#include <led.h> LED information structure.
```

This structure gathers useful information about LED controller.

**Param label**
LED label.

**Param num_colors**
Number of colors per LED.
Param index
Index of the LED on the controller.

Param color_mapping
Mapping of the LED colors.

struct led_driver_api
#include <led.h> LED driver API.

LED Strip

group led_strip_interface
LED Strip Interface.

Typedefs

typedef int (*led_api_update_rgb)(const struct device *dev, struct led_rgb *pixels, size_t num_pixels)
Callback API for updating an RGB LED strip.

See also:
led_strip_update_rgb() for argument descriptions.

typedef int (*led_api_update_channels)(const struct device *dev, uint8_t *channels, size_t num_channels)
Callback API for updating channels without an RGB interpretation.

See also:
led_strip_update_channels() for argument descriptions.

Functions

static inline int led_strip_update_rgb(const struct device *dev, struct led_rgb *pixels, size_t num_pixels)
Update an LED strip made of RGB pixels.
Important: This routine may overwrite pixels.
This routine immediately updates the strip display according to the given pixels array.

Warning: May overwrite pixels

Parameters
• dev – LED strip device
• pixels – Array of pixel data
• num_pixels – Length of pixels array

Returns
0 on success, negative on error
static inline int led_strip_update_channels(const struct device *dev, uint8_t *channels, size_t num_channels)

Update an LED strip on a per-channel basis.

Important: This routine may overwrite channels.

This routine immediately updates the strip display according to the given channels array. Each channel byte corresponds to an individually addressable color channel or LED. Channels are updated linearly in strip order.

**Warning:** May overwrite channels

**Parameters**

- **dev** – LED strip device
- **channels** – Array of per-channel data
- **num_channels** – Length of channels array

**Returns**

0 on success, negative on error

```c
struct led_rgb
#include <led_strip.h> Color value for a single RGB LED.

Individual strip drivers may ignore lower-order bits if their resolution in any channel is less than a full byte.

**Public Members**

```c
uint8_t r
Red channel

uint8_t g
Green channel

uint8_t b
Blue channel
```

```c
struct led_strip_driver_api
#include <led_strip.h> LED strip driver API.

This is the mandatory API any LED strip driver needs to expose.
```

### 7.3.25 MBOX

#### Overview

An MBOX device is a peripheral capable of passing signals (and data depending on the peripheral) between CPUs and clusters in the system. Each MBOX instance is providing one or more channels, each one targeting one other CPU cluster (multiple channels can target the same cluster).
An MBOX device is a peripheral capable of passing signals (and data depending on the peripheral) between CPUs and clusters in the system. Each MBOX instance is providing one or more channels, each one targeting one other CPU cluster (multiple channels can target the same cluster).

For example in the plot the device ‘dev A’ is using the TX channel 9 to signal (or send data to) the CPU #2 and it’s expecting data or signals on the RX channel 8. Thus it can send the message through the channel 9, and it can register a callback on the channel 8 of the MBOX device.

This API supports two modes: signalling mode and data transfer mode.

In signalling mode:
- `mbox_mtu_get()` must return 0
- `mbox_send()` must have (msg == NULL)
- the callback must be called with (data == NULL)

In data transfer mode:
- `mbox_mtu_get()` must return a (value != 0)
- `mbox_send()` must have (msg != NULL)
- the callback must be called with (data != NULL)
- The msg content must be the same between sender and receiver

**Defines**

MBOX_DT_CHANNEL_GET(node_id, name)

Structure initializer for `mbox_channel` from devicetree.

This helper macro expands to a static initializer for a `mbox_channel` by reading the relevant device controller and channel number from the devicetree.

Example devicetree fragment:
mbox1: mbox-controller@... { ... };

n: node {
    mboxes = <&mbox1 8>,
    <&mbox1 9>;
    mbox-names = "tx", "rx";
};

Example usage:

const struct mbox_channel channel = MBOX_DT_CHANNEL_GET(DT_NODELABEL(n), tx);

Parameters

- node_id – Devicetree node identifier for the MBOX device
- name – lowercase-and-underscores name of the mboxes element

Typedefs

typedef void (*mbox_callback_t)(const struct device *dev, uint32_t channel, void *user_data, struct mbox_msg *data)

Callback API for incoming MBOX messages.
These callbacks execute in interrupt context. Therefore, use only interrupt-safe APIs. Registration of callbacks is done via mbox_register_callback()

The data parameter must be NULL in signalling mode.

Param dev
    Driver instance

Param channel
    Channel ID

Param user_data
    Pointer to some private data provided at registration time

Param data
    Message struct

typedef int (*mbox_send_t)(const struct device *dev, uint32_t channel, const struct mbox_msg *msg)

Callback API to send MBOX messages.
See mbox_send() for function description

Param dev
    Driver instance

Param channel
    Channel ID

Param msg
    Message struct

Return
    See return values for mbox_send()
typedef int (*mbox_mtu_get_t)(const struct device *dev)
Callback API to get maximum data size.
See mbox_mtu_get() for argument definitions.

typedef int (*mbox_register_callback_t)(const struct device *dev, uint32_t channel, mbox_callback_t cb, void *user_data)
Callback API upon registration.
See mbox_register_callback() for function description

  Param dev            Driver instance
  Param channel       Channel ID
  Param cb            Callback function to execute on incoming message interrupts.
  Param user_data     Application-specific data pointer which will be passed to the callback function when executed.

  Return See return values for mbox_register_callback()

typedef int (*mbox_set_enabled_t)(const struct device *dev, uint32_t channel, bool enable)
Callback API upon enablement of interrupts.
See mbox_set_enabled() for function description

  Param dev            Driver instance
  Param channel       Channel ID
  Param enable        Set to 0 to disable and to nonzero to enable.

  Return See return values for mbox_set_enabled()

typedef uint32_t (*mbox_max_channels_get_t)(const struct device *dev)
Callback API to get maximum number of channels.
See mbox_max_channels_get() for argument definitions.

Functions

static inline void mbox_init_channel(struct mbox_channel *channel, const struct device *dev, uint32_t ch_id)
Initialize a channel struct.
Initialize an mbox_channel passed by the user with a provided MBOX device and channel ID.
This function is needed when the information about the device and the channel ID is not in
the DT. In the DT case MBOX_DT_CHANNEL_GET() must be used instead.

  Parameters
  • channel – Pointer to the channel struct
Try to send a message over the MBOX device.

Send a message over an `mbox_channel`. The `msg` parameter must be NULL when the driver is used for signalling.

If the `msg` parameter is not NULL, this data is expected to be delivered on the receiving side using the data parameter of the receiving callback.

### Parameters

- `channel` – Channel instance pointer.
- `msg` – Pointer to the message struct

### Return values

- `-EBUSY` – If the remote hasn’t yet read the last data sent.
- `-EMSGSIZE` – If the supplied data size is unsupported by the driver.
- `-EINVAL` – If there was a bad parameter, such as: too-large channel descriptor or the device isn’t an outbound MBOX channel.
- `0` – On success, negative value on error.

---

Register a callback function on a channel for incoming messages.

This function doesn’t assume anything concerning the status of the interrupts. Use `mbox_set_enabled()` to enable or to disable the interrupts if needed.

### Parameters

- `channel` – Channel instance pointer.
- `cb` – Callback function to execute on incoming message interrupts.
- `user_data` – Application-specific data pointer which will be passed to the callback function when executed.

### Return values

- `0` – On success, negative value on error.

---

Return the maximum number of bytes possible in an outbound message.

Returns the actual number of bytes that it is possible to send through an outgoing channel.

This number can be 0 when the driver only supports signalling or when on the receiving side the content and size of the message must be retrieved in an indirect way (i.e. probing some other peripheral, reading memory regions, etc...).

If this function returns 0, the `msg` parameter in `mbox_send()` is expected to be NULL.

### Parameters

- `dev` – Driver instance pointer.

### Returns

Maximum possible size of a message in bytes, 0 for signalling, negative value on error.
int mbox_set_enabled(const struct mbox_channel *channel, bool enable)
Enable (disable) interrupts and callbacks for inbound channels.
Enable interrupt for the channel when the parameter 'enable' is set to true. Disable it otherwise.
Immediately after calling this function with 'enable' set to true, the channel is considered enabled and ready to receive signal and messages (even already pending), so the user must take care of installing a proper callback (if needed) using mbox_register_callback() on the channel before enabling it. For this reason it is recommended that all the channels are disabled at probe time.
Enabling a channel for which there is no installed callback is considered undefined behavior (in general the driver must take care of gracefully handling spurious interrupts with no installed callback).

Parameters
• channel – Channel instance pointer.
• enable – Set to 0 to disable and to nonzero to enable.

Return values
• 0 – On success.
• -EINVAL – If it isn’t an inbound channel.

uint32_t mbox_max_channels_get(const struct device *dev)
Return the maximum number of channels.

Parameters
• dev – Driver instance pointer.

Returns
Maximum possible number of supported channels on success, negative value on error.

struct mbox_msg

#include <mbox.h> Message struct (to hold data and its size).

Public Members

const void *data
Pointer to the data sent in the message.

size_t size
Size of the data.

struct mbox_channel

#include <mbox.h> Provides a type to hold an MBOX channel.
Struct type to hold an MBOX device pointer and the channel ID.

Public Members
const struct device *dev
   MBOX device pointer.

uint32_t id
   Channel ID.

#include <mbox.h>

7.3.26 Pinmux

Overview

        Callback API upon setting a PIN's function See pinmux_pin_set() for argument description.

typedef int (*pmux_get)(const struct device *dev, uint32_t pin, uint32_t *func)
        Callback API upon getting a PIN's function See pinmux_pin_get() for argument description.

typedef int (*pmux_pullup)(const struct device *dev, uint32_t pin, uint8_t func)
        Callback API upon setting a PIN's pullup See pinmux_pin_pullup() for argument description.

typedef int (*pmux_input)(const struct device *dev, uint32_t pin, uint8_t func)
        Callback API upon setting a PIN's input function See pinmux_input() for argument description.

Functions

static inline int pinmux_pin_set(const struct device *dev, uint32_t pin, uint32_t func)
static inline int pinmux_pin_get(const struct device *dev, uint32_t pin, uint32_t *func)
static inline int pinmux_pin_pullup(const struct device *dev, uint32_t pin, uint8_t func)
static inline int pinmux_pin_input_enable(const struct device *dev, uint32_t pin, uint8_t func)

#include <pinmux.h>
group pwm_interface

   PWM Interface.

   **PWM capture configuration flags**

   PWM_CAPTURE_TYPE_PERIOD
       PWM pin capture captures period.

   PWM_CAPTURE_TYPE_PULSE
       PWM pin capture captures pulse width.

   PWM_CAPTURE_TYPE_BOTH
       PWM pin capture captures both period and pulse width.

   PWM_CAPTURE_MODE_SINGLE
       PWM pin capture captures a single period/pulse width.

   PWM_CAPTURE_MODE_CONTINUOUS
       PWM pin capture captures period/pulse width continuously.

   **PWM period set helpers**

   The period cell in the PWM specifier needs to be provided in nanoseconds. However, in some applications it is more convenient to use another scale.

   PWM_NSEC(x)
       Specify PWM period in nanoseconds

   PWM_USEC(x)
       Specify PWM period in microseconds

   PWM_MSEC(x)
       Specify PWM period in milliseconds

   PWM_SEC(x)
       Specify PWM period in seconds

   PWM_HZ(x)
       Specify PWM frequency in hertz

   PWM_KHZ(x)
       Specify PWM frequency in kilohertz

   **PWM polarity flags**

   The PWM_POLARITY_* flags are used with *pwm_set_cycles(), pwm_set() or pwm_configure_capture()* to specify the polarity of a PWM channel.

   The flags are on the lower 8 bits of the pwm_flags_t
PWM_POLARITY_NORMAL
PWM pin normal polarity (active-high pulse).

PWM_POLARITY_INVERTED
PWM pin inverted polarity (active-low pulse).

Defines

PWM_DT_SPEC_GET_BY_NAME(node_id, name)
Static initializer for a struct pwm_dt_spec.
This returns a static initializer for a struct pwm_dt_spec given a devicetree node identifier and an index.

Example devicetree fragment:

```c
n: node {
    pwms = &pwm1 1 1000 PWM_POLARITY_NORMAL,
           &pwm2 3 2000 PWM_POLARITY_INVERTED;
    pwm-names = "alpha", "beta";
}
```

Example usage:

```c
const struct pwm_dt_spec spec =
    PWM_DT_SPEC_GET_BY_NAME(DT_NODELABEL(n), alpha);
```

// Initializes 'spec' to:
// { 
//    .dev = DEVICE_DT_GET(DT_NODELABEL(pwm1)),
//    .channel = 1,
//    .period = 1000,
//    .flags = PWM_POLARITY_NORMAL,
// }

The device (dev) must still be checked for readiness, e.g. using device_is_ready(). It is an error to use this macro unless the node exists, has the 'pwms' property, and that 'pwms' property specifies a PWM controller, a channel, a period in nanoseconds and optionally flags.

See also:

PWM_DT_SPEC_INST_GET_BY_NAME

Parameters

- node_id – Devicetree node identifier.
- name – Lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property.

Returns

Static initializer for a struct pwm_dt_spec for the property.
PWM_DT_SPEC_INST_GET_BY_NAME(inst, name)

Static initializer for a struct pwm_dt_spec from a DT_DRV_COMPAT instance.

See also:
PWM_DT_SPEC_GET_BY_NAME

Parameters

• inst – DT_DRV_COMPAT instance number
• name – Lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property.

Returns
Static initializer for a struct pwm_dt_spec for the property.

PWM_DT_SPEC_GET_BY_NAME_OR(node_id, name, default_value)

Like PWM_DT_SPEC_GET_BY_NAME(), with a fallback to a default value.

If the devicetree node identifier ‘node_id’ refers to a node with a property ‘pwms’, this expands to PWM_DT_SPEC_GET_BY_NAME(node_id, name). The default_value parameter is not expanded in this case. Otherwise, this expands to default_value.

See also:
PWM_DT_SPEC_INST_GET_BY_NAME_OR

Parameters

• node_id – Devicetree node identifier.
• name – Lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property
• default_value – Fallback value to expand to.

Returns
Static initializer for a struct pwm_dt_spec for the property, or default_value if the node or property do not exist.

PWM_DT_SPEC_INST_GET_BY_NAME_OR(inst, name, default_value)

Like PWM_DT_SPEC_INST_GET_BY_NAME_OR, with a fallback to a default value.

See also:
PWM_DT_SPEC_GET_BY_NAME_OR

Parameters

• inst – DT_DRV_COMPAT instance number
• name – Lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property.
• default_value – Fallback value to expand to.

Returns
Static initializer for a struct pwm_dt_spec for the property, or default_value if the node or property do not exist.
PWM_DT_SPEC_GET_BY_IDX(node_id, idx)

Static initializer for a struct pwm_dt_spec.

This returns a static initializer for a struct pwm_dt_spec given a devicetree node identifier and an index.

Example devicetree fragment:

```c
n: node {
    pwms = <&pwm1 1 1000 PWM_POLARITY_NORMAL>,
          <&pwm2 3 2000 PWM_POLARITY_INVERTED>;
};
```

Example usage:

```c
const struct pwm_dt_spec spec =
    PWM_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), 1);

// Initializes 'spec' to:
// {
//   .dev = DEVICE_DT_GET(DT_NODELABEL(pwm2)),
//   .channel = 3,
//   .period = 2000,
//   .flags = PWM_POLARITY_INVERTED,
// }
```

The device (dev) must still be checked for readiness, e.g. using device_is_ready(). It is an error to use this macro unless the node exists, has the ‘pwms’ property, and that ‘pwms’ property specifies a PWM controller, a channel, a period in nanoseconds and optionally flags.

See also:

PWM_DT_SPEC_INST_GET_BY_IDX

Parameters

- node_id – Devicetree node identifier.
- idx – Logical index into ‘pwms’ property.

Returns

Static initializer for a struct pwm_dt_spec for the property.

PWM_DT_SPEC_INST_GET_BY_IDX(inst, idx)

Static initializer for a struct pwm_dt_spec from a DT_DRV_COMPAT instance.

See also:

PWM_DT_SPEC_GET_BY_IDX

Parameters

- inst – DT_DRV_COMPAT instance number
- idx – Logical index into ‘pwms’ property.

Returns

Static initializer for a struct pwm_dt_spec for the property.
PWM_DT_SPEC_GET_BY_IDX_OR(node_id, idx, default_value)
Like PWM_DT_SPEC_GET_BYIDX(), with a fallback to a default value.
If the devicetree node identifier ‘node_id’ refers to a node with a property ‘pwms’, this expands to PWM_DT_SPEC_GET_BYIDX(node_id, idx). The default_value parameter is not expanded in this case. Otherwise, this expands to default_value.

See also:
PWM_DT_SPEC_INST_GET_BY_IDX_OR

Parameters
• node_id – Devicetree node identifier.
• idx – Logical index into ‘pwms’ property.
• default_value – Fallback value to expand to.

Returns
Static initializer for a struct pwm_dt_spec for the property, or default_value if the node or property do not exist.

PWM_DT_SPEC_INST_GET_BY_IDX_OR(inst, idx, default_value)
Like PWM_DT_SPEC_INST_GET_BYIDX(), with a fallback to a default value.

See also:
PWM_DT_SPEC_GET_BY_IDX_OR

Parameters
• inst – DT_DRV_COMPAT instance number
• idx – Logical index into ‘pwms’ property.
• default_value – Fallback value to expand to.

Returns
Static initializer for a struct pwm_dt_spec for the property, or default_value if the node or property do not exist.

PWM_DT_SPEC_GET(node_id)
Equivalent to PWM_DT_SPEC_GET_BYIDX(node_id, 0).

See also:
PWM_DT_SPEC_GET_BYIDX

See also:
PWM_DT_SPEC_INST_GET

Parameters
• node_id – Devicetree node identifier.

Returns
Static initializer for a struct pwm_dt_spec for the property.
PWM_DT_SPEC_INST_GET(inst)
    Equivalent to PWM_DT_SPEC_INST_GET_BY_IDX(inst, 0).

See also:
PWM_DT_SPEC_INST_GET_BY_IDX

See also:
PWM_DT_SPEC_GET

Parameters
• inst – DT_DRV_COMPAT instance number

Returns
Static initializer for a struct pwm_dt_spec for the property.

PWM_DT_SPEC_GET_OR(node_id, default_value)
    Equivalent to PWM_DT_SPEC_GET_BY_IDX_OR(node_id, 0, default_value).

See also:
PWM_DT_SPEC_GET_BY_IDX_OR

See also:
PWM_DT_SPEC_INST_GET_OR

Parameters
• node_id – Devicetree node identifier.
• default_value – Fallback value to expand to.

Returns
Static initializer for a struct pwm_dt_spec for the property.

PWM_DT_SPEC_INST_GET_OR(inst, default_value)
    Equivalent to PWM_DT_SPEC_INST_GET_BY_IDX_OR(inst, 0, default_value).

See also:
PWM_DT_SPEC_INST_GET_BY_IDX_OR

See also:
PWM_DT_SPEC_GET_OR

Parameters
• inst – DT_DRV_COMPAT instance number
• default_value – Fallback value to expand to.

Returns
Static initializer for a struct pwm_dt_spec for the property.
Typedefs

typedef uint16_t pwm_flags_t

  Provides a type to hold PWM configuration flags.
  The lower 8 bits are used for standard flags. The upper 8 bits are reserved for SoC specific flags.

See also: PWM_CAPTURE_FLAGS.

typedef void (*pwm_capture_callback_handler_t)(const struct device *dev, uint32_t channel,
uint32_t period_cycles, uint32_t pulse_cycles, int status, void *user_data)

  PWM capture callback handler function signature.

  Note: The callback handler will be called in interrupt context.

  Note: CONFIG_PWM_CAPTURE must be selected to enable PWM capture support.

  Param dev
      [in] PWM device instance.

  Param channel
      PWM channel.

  Param period_cycles
      Captured PWM period width (in clock cycles). HW specific.

  Param pulse_cycles
      Captured PWM pulse width (in clock cycles). HW specific.

  Param status
      Status for the PWM capture (0 if no error, negative errno otherwise. See pwm_capture_cycles() return value descriptions for details).

  Param user_data
      User data passed to pwm_configure_capture()

Functions

int pwm_set_cycles(const struct device *dev, uint32_t channel, uint32_t period, uint32_t pulse,
                   pwm_flags_t flags)

  Set the period and pulse width for a single PWM output.
  The PWM period and pulse width will synchronously be set to the new values without glitches
  in the PWM signal, but the call will not block for the change to take effect.

  Passing 0 as pulse will cause the pin to be driven to a constant inactive level. Passing a
  non-zero pulse equal to period will cause the pin to be driven to a constant active level.
Note: Not all PWM controllers support synchronous, glitch-free updates of the PWM period and pulse width. Depending on the hardware, changing the PWM period and/or pulse width may cause a glitch in the generated PWM signal.

Note: Some multi-channel PWM controllers share the PWM period across all channels. Depending on the hardware, changing the PWM period for one channel may affect the PWM period for the other channels of the same PWM controller.

Parameters

- **dev** – [in] PWM device instance.
- **channel** – PWM channel.
- **period** – Period (in clock cycles) set to the PWM. HW specific.
- **pulse** – Pulse width (in clock cycles) set to the PWM. HW specific.
- **flags** – Flags for pin configuration.

Return values

- **0** – If successful.
- **-EINVAL** – If pulse > period.
- **-errno** – Negative errno code on failure.

```c
int pwm_get_cycles_per_sec(const struct device *dev, uint32_t channel, uint64_t *cycles)
```

Get the clock rate (cycles per second) for a single PWM output.

Parameters

- **dev** – [in] PWM device instance.
- **channel** – PWM channel.
- **cycles** – [out] Pointer to the memory to store clock rate (cycles per sec). HW specific.

Return values

- **0** – If successful.
- **-errno** – Negative errno code on failure.

```c
static inline int pwm_set(const struct device *dev, uint32_t channel, uint32_t period, uint32_t pulse, pwm_flags_t flags)
```

Set the period and pulse width in nanoseconds for a single PWM output.

Note: Utility macros such as `PWM_MSEC()` can be used to convert from other scales or units to nanoseconds, the units used by this function.
Return values

• 0 – If successful.
• -ENOTSUP – If requested period or pulse cycles are not supported.
• -errno – Other negative errno code on failure.

static inline int pwm_set_dt(const struct pwm_dt_spec *spec, uint32_t period, uint32_t pulse)

Set the period and pulse width in nanoseconds from a struct pwm_dt_spec (with custom period).

This is equivalent to:

```c
pwm_set(spec->dev, spec->channel, period, pulse, spec->flags)
```

The period specified in spec is ignored. This API call can be used when the period specified in Devicetree needs to be changed at runtime.

See also:

pwm_set_pulse_dt()

Parameters

• spec – [in] PWM specification from devicetree.
• period – Period (in nanoseconds) set to the PWM.
• pulse – Pulse width (in nanoseconds) set to the PWM.

Returns

A value from pwm_set().

static inline int pwm_set_pulse_dt(const struct pwm_dt_spec *spec, uint32_t pulse)

Set the period and pulse width in nanoseconds from a struct pwm_dt_spec.

This is equivalent to:

```c
pwm_set(spec->dev, spec->channel, spec->period, pulse, spec->flags)
```

See also:

pwm_set_pulse_dt()

Parameters

• spec – [in] PWM specification from devicetree.
• pulse – Pulse width (in nanoseconds) set to the PWM.

Returns

A value from pwm_set().

static inline int pwm_cycles_to_usec(const struct device *dev, uint32_t channel, uint32_t cycles, uint64_t *usec)

Convert from PWM cycles to microseconds.

Parameters

• dev – [in] PWM device instance.
• channel – PWM channel.
• cycles – Cycles to be converted.
• **usec** – [out] Pointer to the memory to store calculated usec.

**Return values**
- 0 – If successful.
- -ERANGE – If result is too large.
- -errno – Other negative errno code on failure.

static inline int pwm_cycles_to_nsec(const struct device *dev, uint32_t channel, uint32_t cycles, uint64_t *nsec)

Convert from PWM cycles to nanoseconds.

**Parameters**
- **dev** – [in] PWM device instance.
- **channel** – PWM channel.
- **cycles** – Cycles to be converted.
- **nsec** – [out] Pointer to the memory to store the calculated nsec.

**Return values**
- 0 – If successful.
- -ERANGE – If result is too large.
- -errno – Other negative errno code on failure.

static inline int pwm_configure_capture(const struct device *dev, uint32_t channel, pwm_flags_t flags, pwm_capture_callback_handler_t cb, void *user_data)

Configure PWM period/pulse width capture for a single PWM input.

After configuring PWM capture using this function, the capture can be enabled/disabled using `pwm_enable_capture()` and `pwm_disable_capture()`.

**Note:** This API function cannot be invoked from user space due to the use of a function callback. In user space, one of the simpler API functions (`pwm_capture_cycles()`, `pwm_capture_usec()`, or `pwm_capture_nsec()`) can be used instead.

**Note:** CONFIG_PWM_CAPTURE must be selected for this function to be available.

**Parameters**
- **dev** – [in] PWM device instance.
- **channel** – PWM channel.
- **flags** – PWM capture flags
- **cb** – [in] Application callback handler function to be called upon capture
- **user_data** – [in] User data to pass to the application callback handler function

**Return values**
- EINVAL – if invalid function parameters were given
- ENSYS – if PWM capture is not supported or the given flags are not supported
- EIO – if IO error occurred while configuring
- EBUSY – if PWM capture is already in progress
int pwm_enable_capture(const struct device *dev, uint32_t channel)
Enable PWM period/pulse width capture for a single PWM input.

The PWM pin must be configured using pwm_configure_capture() prior to calling this function.

**Note:** CONFIG_PWM_CAPTURE must be selected for this function to be available.

**Parameters**
- channel – PWM channel.

**Return values**
- 0 – If successful.
- -EINVAL – if invalid function parameters were given
- -ENOSYS – if PWM capture is not supported
- -EIO – if IO error occurred while enabling PWM capture
- -EBUSY – if PWM capture is already in progress

int pwm_disable_capture(const struct device *dev, uint32_t channel)
Disable PWM period/pulse width capture for a single PWM input.

**Note:** CONFIG_PWM_CAPTURE must be selected for this function to be available.

**Parameters**
- channel – PWM channel.

**Return values**
- 0 – If successful.
- -EINVAL – if invalid function parameters were given
- -ENOSYS – if PWM capture is not supported
- -EIO – if IO error occurred while disabling PWM capture

int pwm_capture_cycles(const struct device *dev, uint32_t channel, pwm_flags_t flags, uint32_t *period, uint32_t *pulse, k_timeout_t timeout)
Capture a single PWM period/pulse width in clock cycles for a single PWM input.

This API function wraps calls to pwm_configure_capture(), pwm_enable_capture(), and pwm_disable_capture() and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.

**Note:** CONFIG_PWM_CAPTURE must be selected for this function to be available.

**Parameters**
- channel – PWM channel.
- flags – PWM capture flags.
• **period** – [out] Pointer to the memory to store the captured PWM period width (in clock cycles). HW specific.

• **pulse** – [out] Pointer to the memory to store the captured PWM pulse width (in clock cycles). HW specific.

• **timeout** – Waiting period for the capture to complete.

**Return values**

- 0 – If successful.
- -EBUSY – PWM capture already in progress.
- -EAGAIN – Waiting period timed out.
- -EIO – IO error while capturing.
- -ERANGE – If result is too large.

```c
static inline int pwm_capture_usec(const struct device *dev, uint32_t channel, pwm_flags_t flags, uint64_t *period, uint64_t *pulse, k_timeout_t timeout)
```

Capture a single PWM period/pulse width in microseconds for a single PWM input.

This API function wraps calls to `pwm_capture_cycles()` and `pwm_cycles_to_usec()` and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.

---

**Note:** `CONFIG_PWM_CAPTURE` must be selected for this function to be available.

**Parameters**

- **dev** – [in] PWM device instance.
- **channel** – PWM channel.
- **flags** – PWM capture flags.
- **period** – [out] Pointer to the memory to store the captured PWM period width (in usec).
- **pulse** – [out] Pointer to the memory to store the captured PWM pulse width (in usec).
- **timeout** – Waiting period for the capture to complete.

**Return values**

- 0 – If successful.
- -EBUSY – PWM capture already in progress.
- -EAGAIN – Waiting period timed out.
- -EIO – IO error while capturing.
- -ERANGE – If result is too large.
- -errno – Other negative errno code on failure.

```c
static inline int pwm_capture_nsec(const struct device *dev, uint32_t channel, pwm_flags_t flags, uint64_t *period, uint64_t *pulse, k_timeout_t timeout)
```

Capture a single PWM period/pulse width in nanoseconds for a single PWM input.

This API function wraps calls to `pwm_capture_cycles()` and `pwm_cycles_to_nsec()` and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.
Note: CONFIG_PWM_CAPTURE must be selected for this function to be available.

Parameters

- `channel` – PWM channel.
- `flags` – PWM capture flags.
- `period` – [out] Pointer to the memory to store the captured PWM period width (in nsec).
- `pulse` – [out] Pointer to the memory to store the captured PWM pulse width (in nsec).
- `timeout` – Waiting period for the capture to complete.

Return values

- 0 – If successful.
- -EBUSY – PWM capture already in progress.
- -EAGAIN – Waiting period timed out.
- -EIO – IO error while capturing.
- -ERANGE – If result is too large.
- -errno – Other negative errno code on failure.

```
struct pwm_dt_spec

#include <pwm.h> Container for PWM information specified in devicetree.

This type contains a pointer to a PWM device, channel number (controlled by the PWM device), the PWM signal period in nanoseconds and the flags applicable to the channel. Note that not all PWM drivers support flags. In such case, flags will be set to 0.

Public Members

const struct device *dev
    PWM device instance.

uint32_t channel
    Channel number.

uint32_t period
    Period in nanoseconds.

pwm_flags_t flags
    Flags.

7.3.28  PS/2

Overview

The PS/2 connector first hit the market in 1987 on IBM's desktop PC line of the same name before becoming an industry-wide standard for mouse and keyboard connections. Starting around 2007, USB superseded PS/2 and is the modern peripheral device connection standard. For legacy support on boards with a PS/2 connector, Zephyr provides these PS/2 driver APIs.

Configuration Options

Related configuration options:

- CONFIG_PS2

API Reference

group ps2_interface
    PS/2 Driver APIs.

Typedefs

typedef void (*ps2_callback_t)(const struct device *dev, uint8_t data)
    PS/2 callback called when user types or click a mouse.

    Param dev
        Pointer to the device structure for the driver instance.

    Param data
        Data byte passed pack to the user.

Functions
int ps2_config(const struct device *dev, ps2_callback_t callback_isr)
Configure a ps2 instance.

Parameters

- dev – Pointer to the device structure for the driver instance.
- callback_isr – called when PS/2 devices reply to a configuration command or when a mouse/keyboard send data to the client application.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int ps2_write(const struct device *dev, uint8_t value)
Write to PS/2 device.

Parameters

- dev – Pointer to the device structure for the driver instance.
- value – Data for the PS2 device.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int ps2_read(const struct device *dev, uint8_t *value)
Read slave-to-host values from PS/2 device.

Parameters

- dev – Pointer to the device structure for the driver instance.
- value – Pointer used for reading the PS/2 device.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int ps2_enable_callback(const struct device *dev)
Enables callback.

Parameters

- dev – Pointer to the device structure for the driver instance.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int ps2_disable_callback(const struct device *dev)
Disables callback.

Parameters

- dev – Pointer to the device structure for the driver instance.

Return values

- 0 – If successful.
- Negative – errno code if failure.
7.3.29 PECI

Overview

The Platform Environment Control Interface, abbreviated as PECI, is a thermal management standard introduced in 2006 with the Intel Core 2 Duo Microprocessors. The PECI interface allows external devices to read processor temperature, perform processor manageability functions, and manage processor interface tuning and diagnostics. The PECI bus driver APIs enable the interaction between Embedded Microcontrollers and CPUs.

Functions

int peci_config(const struct device *dev, uint32_t bitrate)
  Configures the PECI interface.

Parameters
• `dev` – Pointer to the device structure for the driver instance.
• `bitrate` – the selected expressed in Kbps, command or when an event needs to be sent to the client application.

**Return values**
• 0 – If successful.
• Negative – errno code if failure.

```c
int peci_enable(const struct device *dev)
```
Enable PECI interface.

**Parameters**
• `dev` – Pointer to the device structure for the driver instance.

**Return values**
• 0 – If successful.
• Negative – errno code if failure.

```c
int peci_disable(const struct device *dev)
```
Disable PECI interface.

**Parameters**
• `dev` – Pointer to the device structure for the driver instance.

**Return values**
• 0 – If successful.
• Negative – errno code if failure.

```c
int peci_transfer(const struct device *dev, struct peci_msg *msg)
```
Performs a PECI transaction.

**Parameters**
• `dev` – Pointer to the device structure for the driver instance.
• `msg` – Structure representing a PECI transaction.

**Return values**
• 0 – If successful.
• Negative – errno code if failure.

```c
struct peci_buf
```
PECI buffer structure.

Note: Frame check sequence byte is added into rx buffer, need to allocate an additional byte for this in rx buffer.

**Param buf**
is a valid pointer on a data buffer, or NULL otherwise.

**Param len**
is the length of the data buffer expected to received without considering the frame check sequence byte.

```c
struct peci_msg
```
PECI transaction packet format.
Public Members

uint8_t addr
    Client address

    Command code

struct peci_buf tx_buffer
    Pointer to buffer of write data

struct peci_buf rx_buffer
    Pointer to buffer of read data

uint8_t flags
    PECI msg flags

7.3.30 Regulators

This subsystem provides control of voltage and current regulators. A common example is a GPIO that controls a transistor that supplies current to a device that is not always needed.

Conceptually regulators have two modes: off and on. A transition between modes may involve a time delay, so operations on regulators are inherently asynchronous. To maximize flexibility the On-Off Manager infrastructure is used in the generic API for the regulator subsystem. Nodes with a devicetree compatible of regulator-fixed are the most common flexible regulators.

In some cases the transitions are close enough to instantaneous that the asynchronous driver implementation is not needed, and the resource cost in RAM is not justified. Such a regulator still uses the asynchronous API, but may be implemented internally in a way that ensures the result of the operation is presented before the transition completes. Zephyr recognizes devicetree nodes with a compatible of regulator-fixed-sync as devices with synchronous transitions.

The vin-supply devicetree property is used to identify the regulator(s) that a devicetree node directly depends on. Within the driver for the node the regulator API is used to issue requests for power when the device is to be active, and release the power request when the device shuts down.

The simplest case where a regulator is needed is one where there is only one client. For those situations the cost of using even the optimized synchronous regulator device infrastructure is not justified, and the supply-gpios devicetree property should be used. There is no device interface to these regulators as they are entirely controlled within the driver for the corresponding node, e.g. a sensor.

API Reference

group regulator_interface
    Regulator Interface.

Functions
static inline int regulator_enable(const struct device *dev, struct onoff_client *cli)

Enable a regulator.

Reference-counted request that a regulator be turned on. This is an asynchronous operation; if successfully initiated the result will be communicated through the cli parameter.

A regulator is considered “on” when it has reached a stable/usable state.

**Function properties (list may not be complete)**

*isr-ok pre-kernel-ok*

**Parameters**

- `dev` – Regulator device instance
- `cli` – On-off client instance. This is used to notify the caller when the attempt to turn on the regulator has completed (can be `NULL`).

**Return values**

- `0` – If enable request has been successfully initiated.
- `-errno` – Negative errno in case of failure (can be from `onoff_request()` or individual regulator drivers).

static inline int regulator_disable(const struct device *dev)

Disable a regulator.

Release a regulator after a previous `regulator_enable()` completed successfully.

If the release removes the last dependency on the regulator it will begin a transition to its “off” state. There is currently no mechanism to notify when the regulator has completely turned off.

This must be invoked at most once for each successful `regulator_enable()`.

**Function properties (list may not be complete)**

*isr-ok*

**Parameters**

- `dev` – Regulator device instance.

**Return values**

- `0` – If enable request has been successfully initiated.
- `-errno` – Negative errno in case of failure (can be from `onoff_release()` or individual regulator drivers).

static inline int regulator_count_voltages(const struct device *dev)

Obtain the number of supported voltage levels.

Selectors are numbered starting at zero, and typically correspond to bitfields in hardware registers.

**Parameters**

- `dev` – Regulator device instance.

**Return values**

- `selectors` – Number of selectors, if successful.
- `-ENOSYS` – If function is not implemented.
- **errno** – In case of any other error.

```c
static inline int regulator_count_modes(const struct device *dev)
```

Obtain the number of supported modes.

**See also:**

`regulator_set_mode()`

**Parameters**

- `dev` – Regulator device instance.

**Returns**

Number of supported modes.

```c
static inline int32_t regulator_list_voltages(const struct device *dev, unsigned int selector)
```

Obtain supported voltages.

**Parameters**

- `dev` – Regulator device instance.
- `selector` – Voltage selector.

**Return values**

0 – If selector code can’t be used.

**Returns**

voltage Voltage level in microvolts.

```c
static inline int regulator_is_supported_voltage(const struct device *dev, int32_t min_uv, int32_t max_uv)
```

Check if a voltage range is supported.

**Parameters**

- `dev` – Regulator device instance.
- `min_uv` – Minimum voltage in microvolts.
- `max_uv` – Maximum voltage in microvolts.

**Return values**

- 0 – If successful.
- `-ENOSYS` – If function is not implemented.
- `errno` – In case of any other error.

```c
static inline int regulator_set_voltage(const struct device *dev, int32_t min_uv, int32_t max_uv)
```

Set output voltage.

**Note:** The output voltage will be configured to the closest supported output voltage. `regulator_get_voltage()` can be used to obtain the actual configured voltage.

**Parameters**

- `dev` – Regulator device instance.
- `min_uv` – Minimum acceptable voltage in microvolts.
- `max_uv` – Maximum acceptable voltage in microvolts.
Return values

- 0 – If successful.
- -ENOSYS – If function is not implemented.
- -errno – In case of any other error.

static inline int32_t regulator_get_voltage(const struct device *dev)
Obtain output voltage.

Parameters
- dev – Regulator device instance.

Returns
Voltage level in microvolts.

static inline int regulator_set_current_limit(const struct device *dev, int32_t min_ua, int32_t max_ua)
Set output current limit.

Parameters
- dev – Regulator device instance.
- min_ua – Minimum acceptable current limit in microamps.
- max_ua – Maximum acceptable current limit in microamps.

Return values
- 0 – If successful.
- -ENOSYS – If function is not implemented.
- -errno – In case of any other error.

static inline int32_t regulator_get_current_limit(const struct device *dev)
Get output current limit.

Parameters
- dev – Regulator device instance.

Return values
- current – Current limit in microamperes
- -ENOSYS – If function is not implemented.
- -errno – In case of any other error.

static inline int regulator_set_mode(const struct device *dev, uint32_t mode)
Set mode.

Regulators can support multiple modes in order to permit different voltage configuration or better power savings. This API will apply a mode for the regulator.

Parameters
- dev – Regulator device instance.
- mode – Mode to select for this regulator. Only modes present in the regulator-allowed-modes devicetree property are permitted.

Return values
- 0 – If successful.
- -ENOSYS – If function is not implemented.
- -errno – In case of any other error.
static inline int regulator_set_mode_voltage(const struct device *dev, uint32_t mode, int32_t min_uv, int32_t max_uv)

Set target voltage for a regulator mode.

**Note:** Mode does not need to be the active mode. The regulator can be switched to that mode with `regulator_set_mode()`.

**Parameters**
- `dev` – Regulator device instance.
- `mode` – Regulator mode.
- `min_uv` – Minimum acceptable voltage in microvolts.
- `max_uv` – Maximum acceptable voltage in microvolts.

**Return values**
- 0 – If successful.
- -ENOSYS – If function is not implemented.
- -errno – In case of any other error.

static inline int32_t regulator_get_mode_voltage(const struct device *dev, uint32_t mode)

Get target voltage for a regulator mode.

This API can be used to read voltages from a regulator mode other than the default. The given mode does not need to be active.

**Parameters**
- `dev` – Regulator device instance.
- `mode` – Regulator mode.

**Returns**
Voltage level in microvolts.

static inline int regulator_mode_disable(const struct device *dev, uint32_t mode)

Disable regulator for a given mode.

**Parameters**
- `dev` – Regulator device instance.
- `mode` – Regulator mode.

**Return values**
- 0 – If successful.
- -ENOSYS – If function is not implemented.
- -errno – In case of any other error.

static inline int regulator_mode_enable(const struct device *dev, uint32_t mode)

Enable regulator for a given mode.

**Parameters**
- `dev` – Regulator device instance.
- `mode` – Regulator mode.

**Return values**
- 0 – If successful.
- ENOSYS – If function is not implemented.
- errno – In case of any other error.

### 7.3.31 Reset Controller

#### Overview

Reset controllers are units that control the reset signals to multiple peripherals. The reset controller API allows peripheral drivers to request control over their reset input signals, including the ability to assert, deassert and toggle those signals. Also, the reset status of the reset input signal can be checked.

Mainly, the line_assert and line_deassert API functions are optional because in most cases we want to toggle the reset signals.

#### Configuration Options

Related configuration options:
- CONFIG_RESET

#### API Reference

**group** reset_controller_interface

Reset Controller Interface.

**Defines**

RESET_DT_SPEC_GET_BY_IDX(node_id, idx)

Static initializer for a reset_dt_spec.

This returns a static initializer for a reset_dt_spec structure given a devicetree node identifier, a property specifying a Reset Controller and an index.

Example devicetree fragment:

```plaintext
n: node {
    resets = <&reset 10>;
}
```

Example usage:

```plaintext
const struct reset_dt_spec spec = RESET_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), 0);
// Initializes 'spec' to:
// {
//   .dev = DEVICE_DT_GET(DT_NODELABEL(reset)),
//   .id = 10
// }
```

The 'reset' field must still be checked for readiness, e.g. using device_is_ready(). It is an error to use this macro unless the node exists, has the given property, and that property specifies a reset controller reset line id as shown above.

**Parameters**

- node_id – devicetree node identifier
• idx – logical index into “resets”

**Returns**
static initializer for a struct `reset_dt_spec` for the property

`RESET_DT_SPEC_GET(node_id)`
Equivalent to `RESET_DT_SPEC_GET_BY_IDX(node_id, 0)`.

**See also:**
`RESET_DT_SPEC_GET_BY_IDX()`

**Parameters**
• `node_id` – devicetree node identifier

**Returns**
static initializer for a struct `reset_dt_spec` for the property

`RESET_DT_SPEC_INST_GET_BY_IDX(inst, idx)`
Static initializer for a `reset_dt_spec` from a DT_DRV_COMPAT instance's Reset Controller property at an index.

**See also:**
`RESET_DT_SPEC_GET_BY_IDX()`

**Parameters**
• `inst` – DT_DRV_COMPAT instance number
  • `idx` – logical index into “resets”

**Returns**
static initializer for a struct `reset_dt_spec` for the property

`RESET_DT_SPEC_INST_GET(inst)`
Equivalent to `RESET_DT_SPEC_INST_GET_BY_IDX(inst, 0)`.

**See also:**
`RESET_DT_SPEC_INST_GET_BY_IDX()`

**Parameters**
• `inst` – DT_DRV_COMPAT instance number

**Functions**

```c
int reset_status(const struct device *dev, uint32_t id, uint8_t *status)
```
Get the reset status.

This function returns the reset status of the device.

**Parameters**
• `dev` – Reset controller device.
• id – Reset line.
• status – Where to write the reset status.

**Return values**
• 0 – On success.
• -ENOSYS – If the functionality is not implemented by the driver.
• -errno – Other negative errno in case of failure.

```c
static inline int reset_status_dt(const struct reset_dt_spec *spec, uint8_t *status)
```

Get the reset status from a `reset_dt_spec`.

This is equivalent to:

```c
reset_status(spec->dev, spec->id, status);
```

**Parameters**
• spec – Reset controller specification from devicetree
• status – Where to write the reset status.

**Returns**
• a value from `reset_status()`

```c
int reset_line_assert(const struct device *dev, uint32_t id)
```

Put the device in reset state.

This function sets/clears the reset bits of the device, depending on the logic level (active-high/active-low).

**Parameters**
• dev – Reset controller device.
• id – Reset line.

**Return values**
• 0 – On success.
• -ENOSYS – If the functionality is not implemented by the driver.
• -errno – Other negative errno in case of failure.

```c
static inline int reset_line_assert_dt(const struct reset_dt_spec *spec)
```

Assert the reset state from a `reset_dt_spec`.

This is equivalent to:

```c
reset_line_assert(spec->dev, spec->id);
```

**Parameters**
• spec – Reset controller specification from devicetree

**Returns**
• a value from `reset_line_assert()`

```c
int reset_line_deassert(const struct device *dev, uint32_t id)
```

Take out the device from reset state.

This function sets/clears the reset bits of the device, depending on the logic level (active-low/active-high).

**Parameters**
• dev – Reset controller device.
• id – Reset line.

**Return values**

• 0 – On success.
• -ENOSYS – If the functionality is not implemented by the driver.
• -errno – Other negative errno in case of failure.

```c
static inline int reset_line_deassert_dt(const struct reset_dt_spec *spec)
```
Deassert the reset state from a `reset_dt_spec`.
This is equivalent to:

```c
reset_line_deassert(spec->dev, spec->id)
```

**Parameters**

• spec – Reset controller specification from devicetree

**Returns**

a value from `reset_line_deassert()`

```c
int reset_line_toggle(const struct device *dev, uint32_t id)
```
Reset the device.
This function performs reset for a device (assert + deassert).

**Parameters**

• dev – Reset controller device.
• id – Reset line.

**Return values**

• 0 – On success.
• -ENOSYS – If the functionality is not implemented by the driver.
• -errno – Other negative errno in case of failure.

```c
static inline int reset_line_toggle_dt(const struct reset_dt_spec *spec)
```
Reset the device from a `reset_dt_spec`.
This is equivalent to:

```c
reset_line_toggle(spec->dev, spec->id)
```

**Parameters**

• spec – Reset controller specification from devicetree

**Returns**

a value from `reset_line_toggle()`

```c
struct reset_dt_spec
#include <reset.h> Reset controller device configuration.
```

**Public Members**

```c
const struct device *dev
Reset controller device.
```
uint32_t id
Reset line.

7.3.32 RTC

Overview

This is a placeholder for API specific to real-time clocks. Currently all RTC peripherals are implemented
through Counter with device-specific API for counters with real-time support.

API Reference

group rtc_interface

RTC DS3231 Driver-Specific API.

Typedefs

typedef void (*maxim_ds3231_alarm_callback_handler_t)(const struct device *dev, uint8_t id,
uint32_t syncclock, void *user_data)
Signature for DS3231 alarm callbacks.
The alarm callback is invoked from the system work queue thread. At the point the callback is
invoked the corresponding alarm flags will have been cleared from the device status register.
The callback is permitted to invoke operations on the device.

Param dev
the device from which the callback originated

Param id
the alarm id

Param syncclock
the value from maxim_ds3231_read_syncclock() at the time the alarm interrupt
was processed.

Param user_data
the corresponding parameter from maxim_ds3231_alarm::user_data.

typedef void (*maxim_ds3231_notify_callback)(const struct device *dev, struct sys_notify
*notify, int res)
Signature used to notify a user of the DS3231 that an asynchronous operation has completed.
Functions compatible with this type are subject to all the constraints of
sys_notify_generic_callback.

Param dev
the DS3231 device pointer

Param notify
the notification structure provided in the call

Param res
the result of the operation.
Functions

```c
static inline uint32_t maxim_ds3231_read_syncclock(const struct device *dev)
    Read the local synchronization clock.
    Synchronization aligns the DS3231 real-time clock with a stable monotonic local clock which
    should have a frequency between 1 kHz and 1 MHz and be itself synchronized with the primary
    system time clock. The accuracy of the alignment and the maximum time between
    synchronization updates is affected by the resolution of this clock.
    On some systems the hardware clock from k_cycles_get_32() is suitable, but on others
    that clock advances too quickly. The frequency of the target-specific clock is provided by
    maxim_ds3231_syncclock_frequency().
    At this time the value is captured from k_uptime_get_32(); future kernel extensions may
    make a higher-resolution clock available.
```

**Note:** This function is *isr-ok*.

### Parameters
- `dev` – the DS3231 device pointer

### Returns
- the current value of the synchronization clock.

```c
static inline uint32_t maxim_ds3231_syncclock_frequency(const struct device *dev)
    Get the frequency of the synchronization clock.
    Provides the frequency of the clock used in maxim_ds3231_read_syncclock().
```

### Parameters
- `dev` – the DS3231 device pointer

### Returns
- the frequency of the selected synchronization clock.

```c
int maxim_ds3231_ctrl_update(const struct device *dev, uint8_t set_bits, uint8_t clear_bits)
    Set and clear specific bits in the control register.
```

**Note:** This function assumes the device register cache is valid. It will not read the register
value, and it will write to the device only if the value changes as a result of applying the set
and clear changes.

**Note:** Unlike maxim_ds3231_stat_update() the return value from this function indicates the
register value after changes were made. That return value is cached for use in subsequent
operations.

**Note:** This function is *supervisor*.

### Returns
- the non-negative updated value of the register, or a negative error code from an
  I2C transaction.
int maxim_ds3231_stat_update(const struct device *dev, uint8_t set_bits, uint8_t clear_bits)

Read the ctrl_stat register then set and clear bits in it.

The content of the ctrl_stat register will be read, then the set and clear bits applied and the result written back to the device (regardless of whether there appears to be a change in value). OSF, A1F, and A2F will be written with 1s if the corresponding bits do not appear in either set_bits or clear_bits. This ensures that if any flag becomes set between the read and the write that indicator will not be cleared.

**Note:** Unlike `maxim_ds3231_ctrl_update()` the return value from this function indicates the register value before any changes were made.

**Note:** This function is `supervisor`.

**Parameters**
- `dev` – the DS3231 device pointer
- `set_bits` – bits to be set when writing back. Setting bits other than MAXIM_DS3231_REG_STAT_EN32kHz will have no effect.
- `clear_bits` – bits to be cleared when writing back. Include the bits for the status flags you want to clear.

**Returns**
the non-negative register value as originally read (disregarding the effect of clears and sets), or a negative error code from an I2C transaction.

int maxim_ds3231_get_alarm(const struct device *dev, uint8_t id, struct maxim_ds3231_alarm *cfg)

Read a DS3231 alarm configuration.

The alarm configuration data is read from the device and reconstructed into the output parameter.

**Note:** This function is `supervisor`.

**Parameters**
- `dev` – the DS3231 device pointer.
- `id` – the alarm index, which must be 0 (for the 1 s resolution alarm) or 1 (for the 1 min resolution alarm).
- `cfg` – a pointer to a structure into which the configured alarm data will be stored.

**Returns**
a non-negative value indicating successful conversion, or a negative error code from an I2C transaction or invalid parameter.

int maxim_ds3231_set_alarm(const struct device *dev, uint8_t id, const struct maxim_ds3231_alarm *cfg)

Configure a DS3231 alarm.

The alarm configuration is validated and stored into the device.

To cancel an alarm use `counter_cancel_channel_alarm()`.
Note: This function is *supervisor*.

**Parameters**

- `dev` – the DS3231 device pointer.
- `id` – 0 Analog to counter index. ALARM1 is 0 and has 1 s resolution, ALARM2 is 1 and has 1 minute resolution.
- `cfg` – a pointer to the desired alarm configuration. Both alarms are configured if only one is to change the application must supply the existing configuration for the other.

**Returns**

a non-negative value on success, or a negative error code from an I2C transaction or an invalid parameter.

```c
int maxim_ds3231_synchronize(const struct device *dev, struct sys_notify *notify)
```

Synchronize the RTC against the local clock.

The RTC advances one tick per second with no access to sub-second precision. Synchronizing clocks at sub-second resolution requires enabling a 1pps signal then capturing the system clocks in a GPIO callback. This function provides that operation.

Synchronization is performed in asynchronously, and may take as long as 1 s to complete; notification of completion is provided through the `notify` parameter.

Applications should use `maxim_ds3231_get_syncpoint()` to retrieve the synchronization data collected by this operation.

Note: This function is *supervisor*.

**Parameters**

- `dev` – the DS3231 device pointer.
- `notify` – pointer to the object used to specify asynchronous function behavior and store completion information.

**Return values**

- `non-negative` – on success
- `-EBUSY` – if a synchronization or set is currently in progress
- `-EINVAL` – if `notify` is not provided
- `-ENOTSUP` – if the required interrupt is not configured

```c
int maxim_ds3231_req_syncpoint(const struct device *dev, struct k_poll_signal *signal)
```

Request to update the synchronization point.

This is a variant of `maxim_ds3231_synchronize()` for use from user threads.

**Parameters**

- `dev` – the DS3231 device pointer.
- `signal` – pointer to a valid and ready-to-be-signalled `k poll_signal`. May be NULL to request a synchronization point be collected without notifying when it has been updated.

**Return values**
• non-negative – on success
• -EBUSY – if a synchronization or set is currently in progress
• -ENOTSUP – if the required interrupt is not configured

```c
int maxim_ds3231_get_syncpoint(const struct device *dev, struct maxim_ds3231_syncpoint *syncpoint)
```

Retrieve the most recent synchronization point.

This function returns the synchronization data last captured using `maxim_ds3231_synchronize()`.

**Parameters**

- `dev` – the DS3231 device pointer.
- `syncpoint` – where to store the synchronization data.

**Return values**

- non-negative – on success
- -ENOENT – if no syncpoint has been captured

```c
int maxim_ds3231_set(const struct device *dev, const struct maxim_ds3231_syncpoint *syncpoint, struct sys_notify *notify)
```

Set the RTC to a time consistent with the provided synchronization.

The RTC advances one tick per second with no access to sub-second precision, and setting the clock resets the internal countdown chain. This function implements the magic necessary to set the clock while retaining as much sub-second accuracy as possible. It requires a synchronization point that pairs sub-second resolution civil time with a local synchronization clock captured at the same instant. The set operation may take as long as 1 second to complete; notification of completion is provided through the `notify` parameter.

**Note:** This function is *supervisor*.

**Parameters**

- `dev` – the DS3231 device pointer.
- `syncpoint` – the structure providing the synchronization point.
- `notify` – pointer to the object used to specify asynchronous function behavior and store completion information.

**Return values**

- non-negative – on success
- EINVAL – if syncpoint or notify are null
- ENOTSUP – if the required interrupt signal is not configured
- EBUSY – if a synchronization or set is currently in progress

```c
int maxim_ds3231_check_alarms(const struct device *dev)
```

Check for and clear flags indicating that an alarm has fired.

Returns a mask indicating alarms that are marked as having fired, and clears from stat the flags that it found set. Alarms that have been configured with a callback are not represented in the return value.

This API may be used when a persistent alarm has been programmed.

7.3. Peripherals 2313
Note: This function is supervisor.

Parameters
• dev – the DS3231 device pointer.

Returns
a non-negative value that may have MAXIM_DS3231_ALARM1 and/or MAXIM_DS3231_ALARM2 set, or a negative error code.

struct maxim_ds3231_alarm
#include <maxim_ds3231.h> Information defining the alarm configuration.
DS3231 alarms can be set to fire at specific times or at the rollover of minute, hour, day, or day of week.
When an alarm is configured with a handler an interrupt will be generated and the handler called from the system work queue.
When an alarm is configured without a handler, or a persisted alarm is present, alarms can be read using maxim_ds3231_check_alarms() .

Public Members
time_t time
Time specification for an RTC alarm.
Though specified as a UNIX time, the alarm parameters are determined by converting to civil time and interpreting the component hours, minutes, seconds, day-of-week, and day-of-month fields, mediated by the corresponding flags.
The year and month are ignored, but be aware that gmtime() determines day-of-week based on calendar date. Decoded alarm times will fall within 1978-01 since 1978-01-01 (first of month) was a Sunday (first of week).

maxim_ds3231_alarm_callback_handler_t handler
Handler to be invoked when alarms are signalled.
If this is null the alarm will not be triggered by the INTn/SQW GPIO. This is a “persisted” alarm from its role in using the DS3231 to trigger a wake from deep sleep. The application should use maxim_ds3231_check_alarms() to determine whether such an alarm has been triggered.
If this is not null the driver will monitor the ISW GPIO for alarm signals and will invoke the handler with a parameter carrying the value returned by maxim_ds3231_check_alarms(). The corresponding status flags will be cleared in the device before the handler is invoked.
The handler will be invoked from the system work queue.

void *user_data
User-provided pointer passed to alarm callback.

uint8_t flags
Flags controlling configuration of the alarm alarm.
See MAXIM_DS3231_ALARM_FLAGS_IGNSE and related constants.
Note that as described the alarm mask fields require that if a unit is not ignored, higher-precision units must also not be ignored. For example, if match on hours is enabled, match on minutes and seconds must also be enabled. Failure to comply with this requirement will cause `maxim_ds3231_set_alarm()` to return an error, leaving the alarm configuration unchanged.

```c
struct maxim_ds3231_syncpoint
#include <maxim_ds3231.h>  // Register the RTC clock against system clocks.

This captures the same instant in both the RTC time scale and a stable system clock scale, allowing conversion between those scales.

Public Members

struct timespec rtc
   // Time from the DS3231.
   // This maybe in UTC, TAI, or local offset depending on how the RTC is maintained.

    uint32_t sync_clock
   // Value of a local clock at the same instant as rtc.
   // This is captured from a stable monotonic system clock running at between 1 kHz and 1 MHz, allowing for microsecond to millisecond accuracy in synchronization.

7.3.33 SDHC

The SDHC api offers a generic interface for interacting with an SD host controller device. It is used by the SD subsystem, and is not intended to be directly used by the application.

Basic Operation

SD Host Controller An SD host controller is a device capable of sending SD commands to an attached SD card. These commands can be sent using the native SD protocol, or over SPI. the SDHC api is designed to provide a generic way to send commands to and interact with attached SD devices.

Requests The core of the SDHC api is the `sdhc_request()` api. Requests contain a `sdhc_command` command structure, and an optional `sdhc_data` data structure. The caller may check the return code, or the response field of the SD command structure to determine if the SDHC request succeeded. The data structure allows the caller to specify a number of blocks to transfer, and a buffer location to read or write them from. Whether the provided buffer is used for sending or reading data depends on the command opcode provided.

Host Controller I/O The `sdhc_set_i0()` api allows the user to change I/O settings of the SD host controller, such as clock frequency, I/O voltage, and card power. Not all controllers will support applying all I/O settings. For example, SPI mode controllers typically cannot toggle power to the SD card.

SD command timeouts

SDHC_TIMEOUT_FOREVER

Defines

SDHC_NATIVE_RESPONSE_MASK

SD_HC_SPI_RESPONSE_TYPE_MASK

 Enums

enum sdhc_bus_mode
&enspace;SD bus mode.
Most controllers will use push/pull, including spi, but SDHC controllers that implement SD host specification can support open drain mode
Values:

enumerator SDHC_BUSMODE_OPENDRAIN = 1

enumerator SDHC_BUSMODE_PUSHPULL = 2

enum sdhc_power
&enspace;SD host controller power.
Many host controllers can control power to attached SD cards. This enum allows applications to request the host controller power off the SD card.
Values:

enumerator SDHC_POWER_OFF = 1

enumerator SDHC_POWER_ON = 2

enum sdhc_bus_width
&enspace;SD host controller bus width.
Only relevant in SD mode, SPI does not support bus width. UHS cards will use 4 bit data bus, all cards start in 1 bit mode
Values:

enumerator SDHC_BUS_WIDTH1BIT = 1U
enumerator SD_HC_BUS_WIDTH4BIT = 4U
enumerator SD_HC_BUS_WIDTH8BIT = 8U

enum sdhc_timing_mode
SD host controller timing mode.
Used by SD host controller to determine the timing of the cards attached to the bus. Cards
start with legacy timing, but UHS-II cards can go up to SDR104.
Values:
enumerator SD_HC_TIMING_LEGACY = 1U
  Legacy 3.3V Mode
enumerator SD_HC_TIMING_HS = 2U
  Legacy High speed mode (3.3V)
enumerator SD_HC_TIMING_SDR12 = 3U
  Identification mode & SDR12
enumerator SD_HC_TIMING_SDR25 = 4U
  High speed mode & SDR25
enumerator SD_HC_TIMING_SDR50 = 5U
  SDR49 mode
enumerator SD_HC_TIMING_SDR104 = 6U
  SDR104 mode
enumerator SD_HC_TIMING_DDR50 = 7U
  DDR50 mode
enumerator SD_HC_TIMING_DDR52 = 8U
  DDR52 mode
enumerator SD_HC_TIMING_HS200 = 9U
  HS200 mode
enumerator SD_HC_TIMING_HS400 = 10U
  HS400 mode

enum sd_voltage
SD voltage.
UHS cards can run with 1.8V signalling for improved power consumption. Legacy cards may
support 3.0V signalling, and all cards start at 3.3V. Only relevant for SD controllers, not SPI
ones.
Values:
enumerator SD_VOL_3_3_V = 1U
  card operation voltage around 3.3v

enumerator SD_VOL_3_0_V = 2U
  card operation voltage around 3.0v

enumerator SD_VOL_1_8_V = 3U
  card operation voltage around 1.8v

enumerator SD_VOL_1_2_V = 4U
  card operation voltage around 1.2v

Functions

int sdhc_hw_reset(const struct device *dev)
  reset SDHC controller state
  Used when the SDHC has encountered an error. Resetting the SDHC controller should clear
  all errors on the SDHC, but does not necessarily reset I/O settings to boot (this can be done
  with sdhc_set_io)

Parameters
  • dev – SD host controller device

Return values
  • 0 – reset succeeded
  • -ETIMEDOUT – controller reset timed out
  • -EIO – reset failed

int sdhc_request(const struct device *dev, struct sdhc_command *cmd, struct sdhc_data *data)
  Send command to SDHC.
  Sends a command to the SD host controller, which will send this command to attached SD
  cards.

Parameters
  • dev – SDHC device
  • cmd – SDHC command
  • data – SDHC data. Leave NULL to send SD command without data.

Return values
  • 0 – command was sent successfully
  • -ETIMEDOUT – command timed out while sending
  • -ENOTSUP – host controller does not support command
  • -EIO – I/O error

int sdhc_set_io(const struct device *dev, struct sdhc_io *io)
  set I/O properties of SDHC
  I/O properties should be reconfigured when the card has been sent a command to change its
  own SD settings. This function can also be used to toggle power to the SD card.

Parameters
• `dev` – SDHC device
• `io` – I/O properties

**Returns**

0 I/O was configured correctly

**Returns**

- ENOTSUP controller does not support these I/O settings
- EIO controller could not configure I/O settings

```c
int sdhc_card_present(const struct device *dev)
```

check for SDHC card presence

Checks if card is present on the SD bus. Note that if a controller requires cards be powered up to detect presence, it should do so in this function.

**Parameters**

• `dev` – SDHC device

**Return values**

• 1 – card is present
• 0 – card is not present
• -EIO – I/O error

```c
int sdhc_execute_tuning(const struct device *dev)
```

run SDHC tuning

SD cards require signal tuning for UHS modes SDR104 and SDR50. This function allows an application to request the SD host controller to tune the card.

**Parameters**

• `dev` – SDHC device

**Return values**

• 0 – tuning succeeded, card is ready for commands
• -ETIMEDOUT – tuning failed after timeout
• -ENOTSUP – controller does not support tuning
• -EIO – I/O error while tuning

```c
int sdhc_card_busy(const struct device *dev)
```

check if SD card is busy

This check should generally be implemented as checking the line level of the DAT[0:3] lines of the SD bus. No SD commands need to be sent, the controller simply needs to report the status of the SD bus.

**Parameters**

• `dev` – SDHC device

**Return values**

• 0 – card is not busy
• 1 – card is busy
• -EIO – I/O error
int sdhc_get_host_props(const struct device *dev, struct sdhc_host_props *props)

Get SD host controller properties.

Gets host properties from the host controller. Host controller should initialize all values in the
sdhc_host_props structure provided.

Parameters

• dev – SDHC device
• props – property structure to be filled by sdhc driver

Return values

• 0 – function succeeded.
• -ENOTSUP – host controller does not support this call

struct sdhc_command

#include <sdhc.h> SD host controller command structure.

This command structure is used to send command requests to an SD host controller, which
will be sent to SD devices.

Public Members

uint32_t opcode

SD Host specification CMD index

uint32_t arg

SD host specification argument

uint32_t response[4]

SD card response field

uint32_t response_type

Expected SD response type

unsigned int retries

Max number of retries

int timeout_ms

Command timeout in milliseconds

struct sdhc_data

#include <sdhc.h> SD host controller data structure.

This command structure is used to send data transfer requests to an SD host controller, which
will be sent to SD devices.

Public Members

unsigned int block_addr

Block to start read from
unsigned int block_size
   Block size

unsigned int blocks
   Number of blocks

unsigned int bytes_xfered
   populated with number of bytes sent by SDHC

void *data
   Data to transfer or receive

int timeout_ms
   data timeout in milliseconds

struct sdhc_host_caps
   #include <sdhc.h>  SD host controller capabilities.
   SD host controller capability flags. These flags should be set by the SDHC driver, using the
   sdhc_get_host_props api.

struct sdhc_io
   #include <sdhc.h>  SD host controller I/O control structure.
   Controls I/O settings for the SDHC. Note that only a subset of these settings apply to host
   controllers in SPI mode. Populate this struct, then call sdhc_set_io to apply I/O settings

Public Members

enum sdhc_clock_speed clock
   Clock rate

enum sdhc_bus_mode bus_mode
   command output mode

enum sdhc_power power_mode
   SD power supply mode

enum sdhc_bus_width bus_width
   SD bus width

enum sdhc_timing_mode timing
   SD bus timing

enum sd_driver_type driver_type
   SD driver type

enum sd_voltage signal_voltage
   IO signalling voltage (usually 1.8 or 3.3V)
struct sdhc_host_props
#include <sdhc.h> SD host controller properties.
Populated by the host controller using sdhc_get_host_props api.

Public Members

unsigned int f_max
Max bus frequency

unsigned int f_min
Min bus frequency

unsigned int power_delay
Delay to allow SD to power up or down (in ms)

struct sdhc_host_caps host_caps
Host capability bitfield

uint32_t max_current_330
Max current (in mA) at 3.3V

uint32_t max_current_300
Max current (in mA) at 3.0V

uint32_t max_current_180
Max current (in mA) at 1.8V

bool is_spi
Is the host using SPI mode

struct sdhc_driver_api
#include <sdhc.h>

7.3.34 Sensors

The sensor subsystem exposes an API to uniformly access sensor devices. Common operations are: reading data and executing code when specific conditions are met.

Basic Operation

Channels Fundamentally, a channel is a quantity that a sensor device can measure.

Sensors can have multiple channels, either to represent different axes of the same physical property (e.g. acceleration); or because they can measure different properties altogether (ambient temperature, pressure and humidity). Complex sensors cover both cases, so a single device can expose three acceleration channels and a temperature one.

It is imperative that all sensors that support a given channel express results in the same unit of measurement. Consult the API Reference for all supported channels, along with their description and units of measurement:
Values  Sensor devices return results as `sensor_value`. This representation avoids use of floating point values as they may not be supported on certain setups.

Fetching Values  Getting a reading from a sensor requires two operations. First, an application instructs the driver to fetch a sample of all its channels. Then, individual channels may be read. In the case of channels with multiple axes, they can be read in a single operation by supplying the corresponding `_XYZ` channel type and a buffer of 3 `sensor_value` objects. This approach ensures consistency of channels between reads and efficiency of communication by issuing a single transaction on the underlying bus.

Below is an example illustrating the usage of the BME280 sensor, which measures ambient temperature and atmospheric pressure. Note that `sensor_sample_fetch()` is only called once, as it reads and compensates data for both channels.

```c
/*
 * Get a device structure from a devicetree node with compatible
 * "bosch,bme280". (If there are multiple, just pick one.) */
static const struct device *get_bme280_device(void)
{
    const struct device *const dev = DEVICE_DT_GET_ANY(bosch_bme280);

    if (dev == NULL) {
        /* No such node, or the node does not have status "okay". */
        printk("Error: no device found.
");
        return NULL;
    }

    if (!device_is_ready(dev)) {
        printk("Error: Device \"%s\" is not ready; "
            "check the driver initialization logs for errors.\n",
            dev->name);
        return NULL;
    }

    printk("Found device \"%s\", getting sensor data\n", dev->name);
    return dev;
}

void main(void)
{
    const struct device *dev = get_bme280_device();

    if (dev == NULL) {
        return;
    }

    while (1) {
        struct sensor_value temp, press, humidity;

        sensor_sample_fetch(dev);
        sensor_channel_get(dev, SENSOR_CHAN_AMBIENT_TEMP, &temp);
        sensor_channel_get(dev, SENSOR_CHAN_PRESS, &press);
        sensor_channel_get(dev, SENSOR_CHAN_HUMIDITY, &humidity);

        printk("temp: %d.%06d; press: %d.%06d; humidity: %d.%06d\n",
            temp.val1, temp.val2, press.val1, press.val2,
            humidity.val1, humidity.val2,
            (continues on next page)
```
humidity.val1, humidity.val2);

        k_sleep(K_MSEC(1000));
    }
}

Configuration and Attributes

Setting the communication bus and address is considered the most basic configuration for sensor devices. This setting is done at compile time, via the configuration menu. If the sensor supports interrupts, the interrupt lines and triggering parameters described below are also configured at compile time.

Alongside these communication parameters, sensor chips typically expose multiple parameters that control the accuracy and frequency of measurement. In compliance with Zephyr’s design goals, most of these values are statically configured at compile time.

However, certain parameters could require runtime configuration, for example, threshold values for interrupts. These values are configured via attributes. The example in the following section showcases a sensor with an interrupt line that is triggered when the temperature crosses a threshold. The threshold is configured at runtime using an attribute.

Triggers

Triggers in Zephyr refer to the interrupt lines of the sensor chips. Many sensor chips support one or more triggers. Some examples of triggers include: new data is ready for reading, a channel value has crossed a threshold, or the device has sensed motion.

To configure a trigger, an application needs to supply a sensor_trigger and a handler function. The structure contains the trigger type and the channel on which the trigger must be configured.

Because most sensors are connected via SPI or I2C buses, it is not possible to communicate with them from the interrupt execution context. The execution of the trigger handler is deferred to a thread, so that data fetching operations are possible. A driver can spawn its own thread to fetch data, thus ensuring minimum latency. Alternatively, multiple sensor drivers can share a system-wide thread. The shared thread approach increases the latency of handling interrupts but uses less memory. You can configure which approach to follow for each driver. Most drivers can entirely disable triggers resulting in a smaller footprint.

The following example contains a trigger fired whenever temperature crosses the 26 degree Celsius threshold. It also samples the temperature every second. A real application would ideally disable periodic sampling in the interest of saving power. Since the application has direct access to the kernel config symbols, no trigger is registered when triggering was disabled by the driver’s configuration.

API Reference

group sensor_interface

Sensor Interface.

Defines

SENSOR_G
The value of gravitational constant in micro m/s^2.

SENSOR_PI
The value of constant PI in micros.

SENSOR_INFO_DEFINE(name, ...)
SENSOR_INFO_DT_DEFINE(node_id)
SENSOR_DEVICE_DT_DEFINE(node_id, init_fn, pm_device, data_ptr, cfg_ptr, level, prio, api_ptr, ...)
Like DEVICE_DT_DEFINE() with sensor specifics.

Defines a device which implements the sensor API. May define an element in the sensor info iterable section used to enumerate all sensor devices.

Parameters

• node_id – The devicetree node identifier.
• init_fn – Name of the init function of the driver.
• pm_device – PM device resources reference – (NULL if device does not use PM).
• data_ptr – Pointer to the device’s private data.
• cfg_ptr – The address to the structure containing the configuration information for this instance of the driver.
• level – The initialization level. See SYS_INIT() for details.
• **prio** – Priority within the selected initialization level. See SYS_INIT() for details.

• **api_ptr** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

```c
SENSOR_DEVICE_DT_INST_DEFINE(inst, ...
```

Like `SENSOR_DEVICE_DT_DEFINE()` for an instance of a DT_DRV_COMPAT compatible.

**Parameters**

• **inst** – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to `SENSOR_DEVICE_DT_DEFINE()`.

• **...** – other parameters as expected by `SENSOR_DEVICE_DT_DEFINE()`.

**Typedefs**

typedef void (*sensor_trigger_handler_t)(const struct device *dev, const struct sensor_trigger *trigger)

Callback API upon firing of a trigger.

**Param dev**

Pointer to the sensor device

**Param trigger**

The trigger

typedef int (*sensor_attr_set_t)(const struct device *dev, enum sensor_channel chan, enum sensor_attribute attr, const struct sensor_value *val)

Callback API upon setting a sensor’s attributes.

See `sensor_attr_set()` for argument description

typedef int (*sensor_attr_get_t)(const struct device *dev, enum sensor_channel chan, enum sensor_attribute attr, struct sensor_value *val)

Callback API upon getting a sensor’s attributes.

See `sensor_attr_get()` for argument description

typedef int (*sensor_trigger_set_t)(const struct device *dev, const struct sensor_trigger *trig, sensor_trigger_handler_t handler)

Callback API for setting a sensor’s trigger and handler.

See `sensor_trigger_set()` for argument description

typedef int (*sensor_sample_fetch_t)(const struct device *dev, enum sensor_channel chan)

Callback API for fetching data from a sensor.

See `sensor_sample_fetch()` for argument description

typedef int (*sensor_channel_get_t)(const struct device *dev, enum sensor_channel chan, struct sensor_value *val)

Callback API for getting a reading from a sensor.

See `sensor_channel_get()` for argument description
Enums

```c
enum sensor_channel
{
    SENSOR_CHAN_ACCEL_X
        Acceleration on the X axis, in m/s^2.
    SENSOR_CHAN_ACCEL_Y
        Acceleration on the Y axis, in m/s^2.
    SENSOR_CHAN_ACCEL_Z
        Acceleration on the Z axis, in m/s^2.
    SENSOR_CHAN_ACCEL_XYZ
        Acceleration on the X, Y and Z axes.
    SENSOR_CHAN_GYRO_X
        Angular velocity around the X axis, in radians/s.
    SENSOR_CHAN_GYRO_Y
        Angular velocity around the Y axis, in radians/s.
    SENSOR_CHAN_GYRO_Z
        Angular velocity around the Z axis, in radians/s.
    SENSOR_CHAN_GYRO_XYZ
        Angular velocity around the X, Y and Z axes.
    SENSOR_CHAN_MAGN_X
        Magnetic field on the X axis, in Gauss.
    SENSOR_CHAN_MAGN_Y
        Magnetic field on the Y axis, in Gauss.
    SENSOR_CHAN_MAGN_Z
        Magnetic field on the Z axis, in Gauss.
    SENSOR_CHAN_MAGN_XYZ
        Magnetic field on the X, Y and Z axes.
    SENSOR_CHAN_DIE_TEMP
        Device die temperature in degrees Celsius.
    SENSOR_CHAN_AMBIENT_TEMP
        Ambient temperature in degrees Celsius.
};
```
enumerator SENSOR_CHAN_PRESS
    Pressure in kilopascal.

enumerator SENSOR_CHAN_PROX
    Proximity. Adimensional. A value of 1 indicates that an object is close.

enumerator SENSOR_CHAN_HUMIDITY
    Humidity, in percent.

enumerator SENSOR_CHAN_LIGHT
    Illuminance in visible spectrum, in lux.

enumerator SENSOR_CHAN_IR
    Illuminance in infra-red spectrum, in lux.

enumerator SENSOR_CHAN_RED
    Illuminance in red spectrum, in lux.

enumerator SENSOR_CHAN_GREEN
    Illuminance in green spectrum, in lux.

enumerator SENSOR_CHAN_BLUE
    Illuminance in blue spectrum, in lux.

enumerator SENSOR_CHAN_ALTITUDE
    Altitude, in meters

enumerator SENSOR_CHAN_PM_1_0
    1.0 micro-meters Particulate Matter, in ug/m^3

enumerator SENSOR_CHAN_PM_2_5
    2.5 micro-meters Particulate Matter, in ug/m^3

enumerator SENSOR_CHAN_PM_10
    10 micro-meters Particulate Matter, in ug/m^3

enumerator SENSOR_CHAN_DISTANCE
    Distance. From sensor to target, in meters

enumerator SENSOR_CHAN_CO2
    CO2 level, in parts per million (ppm)

enumerator SENSOR_CHAN_VOC
    VOC level, in parts per billion (ppb)

enumerator SENSOR_CHAN_GAS_RES
    Gas sensor resistance in ohms.
enumerator SENSOR_CHAN_VOLTAGE
   Voltage, in volts

denumerator SENSOR_CHAN_CURRENT
   Current, in amps

denumerator SENSOR_CHAN_POWER
   Power in watts

denumerator SENSOR_CHAN_RESISTANCE
   Resistance, in Ohm

denumerator SENSOR_CHAN_ROTATION
   Angular rotation, in degrees

denumerator SENSOR_CHAN_POS_DX
   Position change on the X axis, in points.

denumerator SENSOR_CHAN_POS_DY
   Position change on the Y axis, in points.

denumerator SENSOR_CHAN_POS_DZ
   Position change on the Z axis, in points.

denumerator SENSOR_CHAN_RPM
   Revolutions per minute, in RPM.

denumerator SENSOR_CHAN_GAUGE_VOLTAGE
   Voltage, in volts

enumerator SENSOR_CHAN_GAUGE_AVG_CURRENT
   Average current, in amps

enumerator SENSOR_CHAN_GAUGE_STDBY_CURRENT
   Standby current, in amps

enumerator SENSOR_CHAN_GAUGE_MAX_LOAD_CURRENT
   Max load current, in amps

enumerator SENSOR_CHAN_GAUGE_TEMP
   Gauge temperature

enumerator SENSOR_CHAN_GAUGE_STATE_OF_CHARGE
   State of charge measurement in %

enumerator SENSOR_CHAN_GAUGE_FULL_CHARGE_CAPACITY
   Full Charge Capacity in mAh
enumerator SENSOR_CHAN_GAUGE_REMAINING_CHARGE_CAPACITY
   Remaining Charge Capacity in mAh
enumerator SENSOR_CHAN_GAUGE_NOM_AVAIL_CAPACITY
   Nominal Available Capacity in mAh
enumerator SENSOR_CHAN_GAUGE_FULL_AVAIL_CAPACITY
   Full Available Capacity in mAh
enumerator SENSOR_CHAN_GAUGE_AVG_POWER
   Average power in mW
enumerator SENSOR_CHAN_GAUGE_STATE_OF_HEALTH
   State of health measurement in %
enumerator SENSOR_CHAN_GAUGE_TIME_TO_EMPTY
   Time to empty in minutes
enumerator SENSOR_CHAN_GAUGE_TIME_TO_FULL
   Time to full in minutes
enumerator SENSOR_CHAN_GAUGE_CYCLE_COUNT
   Cycle count (total number of charge/discharge cycles)
enumerator SENSOR_CHAN_GAUGE_DESIGN_VOLTAGE
   Design voltage of cell in V (max voltage)
enumerator SENSOR_CHAN_GAUGE_DESIRED_VOLTAGE
   Desired voltage of cell in V (nominal voltage)
enumerator SENSOR_CHAN_GAUGE_DESIRED_CHARGING_CURRENT
   Desired charging current in mA
enumerator SENSOR_CHAN_ALL
   All channels.
enumerator SENSOR_CHAN_COMMON_COUNT
   Number of all common sensor channels.
enumerator SENSOR_CHAN_PRIV_START = SENSOR_CHAN_COMMON_COUNT
   This and higher values are sensor specific. Refer to the sensor header file.
enumerator SENSOR_CHAN_MAX = INT16_MAX
   Maximum value describing a sensor channel type.

enum sensor_trigger_type
   Sensor trigger types.
   Values:
enumerator SENSOR_TRIG_TIMER
    Timer-based trigger, useful when the sensor does not have an interrupt line.

e enumerator SENSOR_TRIG_DATA_READY
    Trigger fires whenever new data is ready.

e enumerator SENSOR_TRIG_DELTA
    Trigger fires when the selected channel varies significantly. This includes any-motion
detection when the channel is acceleration or gyro. If detection is based on slope
between successive channel readings, the slope threshold is configured via the SENSOR_ATTR_SLOPE_TH and SENSOR_ATTR_SLOPE_DUR attributes.

e enumerator SENSOR_TRIG_NEAR_FAR
    Trigger fires when a near/far event is detected.

e enumerator SENSOR_TRIG_THRESHOLD
    Trigger fires when channel reading transitions configured thresholds. The thresholds are
configured via the SENSOR_ATTR_LOWER_THRESH, SENSOR_ATTR_UPPER_THRESH, and SENSOR_ATTR_HYSERESIS attributes.

e enumerator SENSOR_TRIG_TAP
    Trigger fires when a single tap is detected.

e enumerator SENSOR_TRIG_DOUBLE_TAP
    Trigger fires when a double tap is detected.

e enumerator SENSOR_TRIG_FREEFALL
    Trigger fires when a free fall is detected.

e enumerator SENSOR_TRIG_MOTION
    Trigger fires when motion is detected.

e enumerator SENSOR_TRIG_STATIONARY
    Trigger fires when no motion has been detected for a while.

e enumerator SENSOR_TRIG_COMMON_COUNT
    Number of all common sensor triggers.

e enumerator SENSOR_TRIG_PRIV_START = SENSOR_TRIG_COMMON_COUNT
    This and higher values are sensor specific. Refer to the sensor header file.

e enumerator SENSOR_TRIG_MAX = INT16_MAX
    Maximum value describing a sensor trigger type.

e enum sensor_attribute
    Sensor attribute types.
    Values:
enumerator SENSOR_ATTR_SAMPLING_FREQUENCY
   Sensor sampling frequency, i.e. how many times a second the sensor takes a measurement.

enumerator SENSOR_ATTR_LOWER_THRESH
   Lower threshold for trigger.

enumerator SENSOR_ATTR_UPPER_THRESH
   Upper threshold for trigger.

enumerator SENSOR_ATTR_SLOPE_TH
   Threshold for any-motion (slope) trigger.

enumerator SENSOR_ATTR_SLOPE_DUR
   Duration for which the slope values needs to be outside the threshold for the trigger to fire.

enumerator SENSOR_ATTR_HYSTERESIS

enumerator SENSOR_ATTR_OVERSAMPLING
   Oversampling factor

enumerator SENSOR_ATTR_FULL_SCALE
   Sensor range, in SI units.

enumerator SENSOR_ATTR_OFFSET
   The sensor value returned will be altered by the amount indicated by offset: final_value = sensor_value + offset.

enumerator SENSOR_ATTR_CALIB_TARGET
   Calibration target. This will be used by the internal chip's algorithms to calibrate itself on a certain axis, or all of them.

enumerator SENSOR_ATTR_CONFIGURATION
   Configure the operating modes of a sensor.

enumerator SENSOR_ATTR_CALIBRATION
   Set a calibration value needed by a sensor.

enumerator SENSOR_ATTR_FEATURE_MASK
   Enable/disable sensor features

enumerator SENSOR_ATTR_ALERT
   Alert threshold or alert enable/disable

enumerator SENSOR_ATTR_FF_DUR
   Free-fall duration represented in milliseconds. If the sampling frequency is changed during runtime, this attribute should be set to adjust freefall duration to the new sampling frequency.
enumerator SENSOR_ATTR_COMMON_COUNT
   Number of all common sensor attributes.

denumerator SENSOR_ATTR_PRIV_START = SENSOR_ATTR_COMMON_COUNT
   This and higher values are sensor specific. Refer to the sensor header file.

denumerator SENSOR_ATTR_MAX = INT16_MAX
   Maximum value describing a sensor attribute type.

Functions

int sensor_attr_set(const struct device *dev, enum sensor_channel chan, enum sensor_attribute attr, const struct sensor_value *val)
Set an attribute for a sensor.

Parameters

• dev – Pointer to the sensor device
• chan – The channel the attribute belongs to, if any. Some attributes may only be set for all channels of a device, depending on device capabilities.
• attr – The attribute to set
• val – The value to set the attribute to

Returns

0 if successful, negative errno code if failure.

int sensor_attr_get(const struct device *dev, enum sensor_channel chan, enum sensor_attribute attr, struct sensor_value *val)
Get an attribute for a sensor.

Parameters

• dev – Pointer to the sensor device
• chan – The channel the attribute belongs to, if any. Some attributes may only be set for all channels of a device, depending on device capabilities.
• attr – The attribute to get
• val – Pointer to where to store the attribute

Returns

0 if successful, negative errno code if failure.

static inline int sensor_trigger_set(const struct device *dev, const struct sensor_trigger *trig, sensor_trigger_handler_t handler)
Activate a sensor’s trigger and set the trigger handler.

The handler will be called from a thread, so I2C or SPI operations are safe. However, the thread’s stack is limited and defined by the driver. It is currently up to the caller to ensure that the handler does not overflow the stack.

Function properties (list may not be complete)
supervisor

Parameters

• dev – Pointer to the sensor device
• trig – The trigger to activate
• handler – The function that should be called when the trigger fires

Returns
0 if successful, negative errno code if failure.

int sensor_sample_fetch(const struct device *dev)
Fetch a sample from the sensor and store it in an internal driver buffer.
Read all of a sensor's active channels and, if necessary, perform any additional operations
necessary to make the values useful. The user may then get individual channel values by
calling sensor_channel_get.
Since the function communicates with the sensor device, it is unsafe to call it in an ISR if the
device is connected via I2C or SPI.

Parameters
• dev – Pointer to the sensor device

Returns
0 if successful, negative errno code if failure.

int sensor_sample_fetch_chan(const struct device *dev, enum sensor_channel type)
Fetch a sample from the sensor and store it in an internal driver buffer.
Read and compute compensation for one type of sensor data (magnetometer, accelerometer,
etc). The user may then get individual channel values by calling sensor_channel_get.
This is mostly implemented by multi function devices enabling reading at different sampling
rates.
Since the function communicates with the sensor device, it is unsafe to call it in an ISR if the
device is connected via I2C or SPI.

Parameters
• dev – Pointer to the sensor device
• type – The channel that needs updated

Returns
0 if successful, negative errno code if failure.

int sensor_channel_get(const struct device *dev, enum sensor_channel chan, struct sensor_value *val)
Get a reading from a sensor device.
Return a useful value for a particular channel, from the driver's internal data. Before
calling this function, a sample must be obtained by calling sensor_sample_fetch or sen-
sor_sample_fetch_chan. It is guaranteed that two subsequent calls of this function for the
same channels will yield the same value, if sensor_sample_fetch or sensor_sample_fetch_chan
has not been called in the meantime.
For vectorial data samples you can request all axes in just one call by passing the specific
channel with _XYZ suffix. The sample will be returned at val[0], val[1] and val[2] (X, Y and
Z in that order).

Parameters
• dev – Pointer to the sensor device
• chan – The channel to read
• val – Where to store the value

Returns
0 if successful, negative errno code if failure.
static inline int32_t sensor_ms2_to_g(const struct sensor_value *ms2)
    Helper function to convert acceleration from m/s^2 to Gs.

    Parameters
    • ms2 – A pointer to a sensor_value struct holding the acceleration, in m/s^2.

    Returns
    The converted value, in Gs.

dynamic inline void sensor_g_to_ms2(int32_t g, struct sensor_value *ms2)
    Helper function to convert acceleration from Gs to m/s^2.

    Parameters
    • g – The G value to be converted.
    • ms2 – A pointer to a sensor_value struct, where the result is stored.

dynamic inline int32_t sensor_rad_to_degrees(const struct sensor_value *rad)
    Helper function for converting radians to degrees.

    Parameters
    • rad – A pointer to a sensor_value struct, holding the value in radians.

    Returns
    The converted value, in degrees.

dynamic inline void sensor_degrees_to_rad(int32_t d, struct sensor_value *rad)
    Helper function for converting degrees to radians.

    Parameters
    • d – The value (in degrees) to be converted.
    • rad – A pointer to a sensor_value struct, where the result is stored.

dynamic inline double sensor_value_to_double(const struct sensor_value *val)
    Helper function for converting struct sensor_value to double.

    Parameters
    • val – A pointer to a sensor_value struct.

    Returns
    The converted value.

dynamic inline int sensor_value_from_double(struct sensor_value *val, double inp)
    Helper function for converting double to struct sensor_value.

    Parameters
    • val – A pointer to a sensor_value struct.
    • inp – The converted value.

    Returns
    0 if successful, negative errno code if failure.

struct sensor_value

#include <sensor.h> Representation of a sensor readout value.

The value is represented as having an integer and a fractional part, and can be obtained using
the formula val1 + val2 * 10^-6. Negative values also adhere to the above formula, but
may need special attention. Here are some examples of the value representation:
<table>
<thead>
<tr>
<th>0.5:</th>
<th>val1 = 0, val2 = 500000</th>
</tr>
</thead>
<tbody>
<tr>
<td>-0.5:</td>
<td>val1 = 0, val2 = -500000</td>
</tr>
<tr>
<td>-1.0:</td>
<td>val1 = -1, val2 = 0</td>
</tr>
<tr>
<td>-1.5:</td>
<td>val1 = -1, val2 = -500000</td>
</tr>
</tbody>
</table>

**Public Members**

```c
int32_t val1
  Integer part of the value.
```

```c
int32_t val2
  Fractional part of the value (in one-millionth parts).
```

```c
struct sensor_trigger
  #include <sensor.h>  Sensor trigger spec.
```

**Public Members**

```c
enum sensor_trigger_type type
  Trigger type.
```

```c
enum sensor_channel chan
  Channel the trigger is set on.
```

```c
struct sensor_driver_api
  #include <sensor.h>
```

### 7.3.35 SPI

**Overview**

**API Reference**

```c
group spi_interface
  SPI Interface.
```

**SPI operational mode**

```c
SPI_OP_MODE_MASTER

SPI_OP_MODE_SLAVE

SPI_OP_MODE_MASK

SPI_OP_MODE_GET(_operation_)
```
SPI Polarity & Phase Modes

SPI_MODE_CPOL

Clock Polarity: if set, clock idle state will be 1 and active state will be 0. If untouched, the inverse will be true which is the default.

SPI_MODE_CPHA

Clock Phase: this dictates when is the data captured, and depends clock's polarity. When SPI_MODE_CPOL is set and this bit as well, capture will occur on low to high transition and high to low if this bit is not set (default). This is fully reversed if CPOL is not set.

SPI_MODE_LOOP

Whatever data is transmitted is looped-back to the receiving buffer of the controller. This is fully controller dependent as some may not support this, and can be used for testing purposes only.

SPI_MODE_MASK

SPI_MODE_GET(_mode_)

SPI Transfer modes (host controller dependent)

SPI_TRANSFER_MSB

SPI_TRANSFER_LSB

SPI word size

SPI_WORD_SIZE_SHIFT

SPI_WORD_SIZE_MASK

SPI_WORD_SIZE_GET(_operation_)

SPI_WORD_SET(_word_size_)

Specific SPI devices control bits

SPI_HOLD_ON_CS

SPI_LOCK_ON

SPI_CS_ACTIVE_HIGH
SPI MISO lines (if \htmlonly <code>CONFIG_SPI_EXTENDED_MODES</code> \endhtmlonly \xmlonly <verbatim>embed:rst:inline :kconfig:option: 'CONFIG_SPI_EXTENDED_MODES' </verbatim> \endxmlonly is enabled)

Some controllers support dual, quad or octal MISO lines connected to slaves. Default is single, which is the case most of the time. Without \htmlonly<code>CONFIG_SPI_EXTENDED_MODES</code>\endhtmlonly being enabled, single is the only supported one.

SPI_LINES_SINGLE

SPI_LINES_DUAL

SPI_LINES_QUAD

SPI_LINES_OCTAL

SPI_LINES_MASK

SPI duplex mode

Some controllers support half duplex transfer, which results in 3-wire usage. By default, full duplex will prevail.

SPI_FULL_DUPLEX

SPI_HALF_DUPLEX

SPI Frame Format

2 frame formats are exposed: Motorola and TI. The main difference is the behavior of the CS line. In Motorola it stays active the whole transfer. In TI, it’s active only one serial clock period prior to actually make the transfer, it is thus inactive during the transfer, which ends when the clocks ends as well. By default, as it is the most commonly used, the Motorola frame format will prevail.

SPI_FRAME_FORMAT_MOTOROLA

SPI_FRAME_FORMAT_TI

Defines

SPI_CS_GPIOS_DT_SPEC_GET(spi_dev)

Get a struct \htmlonly<code>gpio_dt_spec</code>\endhtmlonly for a SPI device’s chip select pin.

Example devicetree fragment:

```c
gpio1: gpio@abcd0001 { ... };
gpio2: gpio@abcd0002 { ... };
```

(continues on next page)
spi@abcd0003 {
    compatible = "vnd.spi";
    cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,<&gpio2 20 GPIO_ACTIVE_LOW>;

    a: spi-dev-a@0 {
        reg = <0>;
    };

    b: spi-dev-b@1 {
        reg = <1>;
    };
};

Example usage:

SPI_CS_GPIOS_DT_SPEC_GET(DT_NODELABEL(a)) \ 
    // { DEVICE_DT_GET(DT_NODELABEL(gpio1)), 10, GPIO_ACTIVE_LOW } 
SPI_CS_GPIOS_DT_SPEC_GET(DT_NODELABEL(b)) \ 
    // { DEVICE_DT_GET(DT_NODELABEL(gpio2)), 20, GPIO_ACTIVE_LOW }

Parameters

• spi_dev – a SPI device node identifier

Returns

gpio_dt_spec struct corresponding with spi_dev's chip select

SPI_CS_GPIOS_DT_SPEC_INST_GET(inst)
Get a struct gpio_dt_spec for a SPI device's chip select pin.

This is equivalent to SPI_CS_GPIOS_DT_SPEC_GET(DT_DRV_INST(inst)).

Parameters

• inst – Devicetree instance number

Returns

gpio_dt_spec struct corresponding with spi_dev's chip select

SPI_CS_CONTROL_PTR_DT(node_id, delay_)
Initialize and get a pointer to a spi_cs_control from a devicetree node identifier.

This helper is useful for initializing a device on a SPI bus. It initializes a struct spi_cs_control
and returns a pointer to it. Here, node_id is a node identifier for a SPI device, not a SPI
controller.

Example devicetree fragment:

spi@... {
    cs-gpios = <&gpio0 1 GPIO_ACTIVE_LOW>;
    spidev: spi-device@0 { ... };
};

Assume that gpio0 follows the standard convention for specifying GPIOs, i.e. it has the
following in its binding:

7.3. Peripherals
gpio-cells:
- pin
- flags

Example usage:

```c
struct spi_cs_control *ctrl =
  SPI_CS_CONTROL_PTR_DT(DT_NODELABEL(spidev), 2);
```

This example is equivalent to:

```c
struct spi_cs_control *ctrl =
  & (struct spi_cs_control) {
    .gpio_dev = DEVICE_DT_GET(DT_NODELABEL(gpio0)),
    .delay = 2,
    .gpio_pin = 1,
    .gpio_dt_flags = GPIO_ACTIVE_LOW
  };
```

This macro is not available in C++.

**Parameters**

- `node_id` – Devicetree node identifier for a device on a SPI bus
- `delay_` – The delay field to set in the `spi_cs_control`

**Returns**

a pointer to the `spi_cs_control` structure

```c
SPI_CS_CONTROL_PTR_DT_INST(inst, delay_)
```

Get a pointer to a `spi_cs_control` from a devicetree node.

This is equivalent to `SPI_CS_CONTROL_PTR_DT(DT_DRV_INST(inst), delay)`.

Therefore, `DT_DRV_COMPAT` must already be defined before using this macro.

This macro is not available in C++.

**Parameters**

- `inst` – Devicetree node instance number
- `delay_` – The delay field to set in the `spi_cs_control`

**Returns**

a pointer to the `spi_cs_control` structure

```c
SPI_CONFIG_DT(node_id, operation_, delay_)
```

Structure initializer for `spi_config` from devicetree.

This helper macro expands to a static initializer for a struct `spi_config` by reading the relevant frequency, slave, and cs data from the devicetree.

Important: the cs field is initialized using `SPI_CS_CONTROL_PTR_DT()`. The gpio_dev value pointed to by this structure must be checked using `device_is_ready()` before use.

This macro is not available in C++.

**Parameters**

- `node_id` – Devicetree node identifier for the SPI device whose struct `spi_config` to create an initializer for
- `operation_` – the desired operation field in the struct `spi_config`
- `delay_` – the desired delay field in the struct `spi_config`'s `spi_cs_control`, if there is one
SPI_CONFIG_DT_INST(inst, operation_, delay_)
Structure initializer for spi_config from devicetree instance.
This is equivalent to SPI_CONFIG_DT(DT_DRV_INST(inst), operation_, delay_).
This macro is not available in C++.

Parameters
- inst – Devicetree instance number
- operation_ – the desired operation field in the struct spi_config
- delay_ – the desired delay field in the struct spi_config's spi_cs_control, if there is one

SPI_DT_SPEC_GET(node_id, operation_, delay_)
Structure initializer for spi_dt_spec from devicetree.
This helper macro expands to a static initializer for a struct spi_dt_spec by reading the relevant bus, frequency, slave, and cs data from the devicetree.
Important: multiple fields are automatically constructed by this macro which must be checked before use. spi_is_ready performs the required device_is_ready checks.
This macro is not available in C++.

Parameters
- node_id – Devicetree node identifier for the SPI device whose struct spi_dt_spec to create an initializer for
- operation_ – the desired operation field in the struct spi_config
- delay_ – the desired delay field in the struct spi_config's spi_cs_control, if there is one

SPI_DT_SPEC_INST_GET(inst, operation_, delay_)
Structure initializer for spi_dt_spec from devicetree instance.
This is equivalent to SPI_DT_SPEC_GET(DT_DRV_INST(inst), operation_, delay_).
This macro is not available in C++.

Parameters
- inst – Devicetree instance number
- operation_ – the desired operation field in the struct spi_config
- delay_ – the desired delay field in the struct spi_config's spi_cs_control, if there is one

Typedefs

typedef int (*spi_api_io)(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs)
Callback API for I/O See spi_transceive() for argument descriptions.
Callback API for asynchronous I/O See spi_transceive_async() for argument descriptions.

typedef void (*spi_callback_t)(const struct device *dev, int result, void *data)
SPI callback for asynchronous transfer requests.

Param dev
SPI device which is notifying of transfer completion or error
**Param result**
Result code of the transfer request. 0 is success, -errno for failure.

**Param data**
Transfer requester supplied data which is passed along to the callback.

typedef int (*spi_api_io_async)(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs, spi_callback_t cb, void *userdata)

typedef int (*spi_api_release)(const struct device *dev, const struct spi_config *config)
Callback API for unlocking SPI device. See *spi_release()* for argument descriptions.

**Functions**

static inline bool spi_is_ready(const struct spi_dt_spec *spec)
Validate that SPI bus is ready.

**Parameters**
- spec – SPI specification from devicetree

**Return values**
- true – if the SPI bus is ready for use.
- false – if the SPI bus is not ready for use.

int spi_transceive(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs)
Read/write the specified amount of data from the SPI driver.

**Note:** This function is synchronous.

**Parameters**
- dev – Pointer to the device structure for the driver instance
- config – Pointer to a valid *spi_config* structure instance. Pointer-comparison may be used to detect changes from previous operations.
- tx_bufs – Buffer array where data to be sent originates from, or NULL if none.
- rx_bufs – Buffer array where data to be read will be written to, or NULL if none.

**Return values**
- frames – Positive number of frames received in slave mode.
- 0 – If successful in master mode.
- -errno – Negative errno code on failure.

static inline int spi_transceive_dt(const struct spi_dt_spec *spec, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs)
Read/write data from an SPI bus specified in *spi_dt_spec*.
This is equivalent to:

```c
spi_transceive(spec->bus, &spec->config, tx_bufs, rx_bufs);
```

**Parameters**
• **spec** – SPI specification from devicetree
• **tx_bufs** – Buffer array where data to be sent originates from, or NULL if none.
• **rx_bufs** – Buffer array where data to be read will be written to, or NULL if none.

**Returns**
a value from `spi_transceive()`.

```c
static inline int spi_read(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *rx_bufs)
```
Read the specified amount of data from the SPI driver.

**Note:** This function is synchronous.

**Note:** This function is an helper function calling `spi_transceive()`.

**Parameters**
• **dev** – Pointer to the device structure for the driver instance
• **config** – Pointer to a valid `spi_config` structure instance. Pointer-comparison may be used to detect changes from previous operations.
• **rx_bufs** – Buffer array where data to be read will be written to.

**Return values**
• **0** – If successful.
• **-errno** – Negative errno code on failure.

```c
static inline int spi_read_dt(const struct spi_dt_spec *spec, const struct spi_buf_set *rx_bufs)
```
Read data from a SPI bus specified in `spi_dt_spec`.

This is equivalent to:

```c
spi_read(spec->bus, &spec->config, rx_bufs);
```

**Parameters**
• **spec** – SPI specification from devicetree
• **rx_bufs** – Buffer array where data to be read will be written to.

**Returns**
a value from `spi_read()`.

```c
static inline int spi_write(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs)
```
Write the specified amount of data from the SPI driver.

**Note:** This function is synchronous.

**Note:** This function is an helper function calling `spi_transceive()`.

**Parameters**
• dev – Pointer to the device structure for the driver instance
• config – Pointer to a valid `spi_config` structure instance. Pointer-comparison may be used to detect changes from previous operations.
• tx_bufs – Buffer array where data to be sent originates from.

**Return values**
• 0 – If successful.
• -errno – Negative errno code on failure.

```c
static inline int spi_write_dt(const struct spi_dt_spec *spec, const struct spi_buf_set *tx_bufs);
```

*Write data to a SPI bus specified in `spi_dt_spec`.

This is equivalent to:
```
spi_write(spec->bus, &spec->config, tx_bufs);
```

**Parameters**
• spec – SPI specification from devicetree
• tx_bufs – Buffer array where data to be sent originates from.

**Returns**
• A value from `spi_write()`.

```c
static inline int spi_transceive_cb(const struct device *dev, const struct spi_config *config, const struct spi_buf_set *tx_bufs, const struct spi_buf_set *rx_bufs, spi_callback_t callback, void *userdata);
```

*Read/write the specified amount of data from the SPI driver.*

**Note:** This function is asynchronous.

**Note:** This function is available only if `CONFIG_SPI_ASYNC` is selected.

**Parameters**
• dev – Pointer to the device structure for the driver instance
• config – Pointer to a valid `spi_config` structure instance. Pointer-comparison may be used to detect changes from previous operations.
• tx_bufs – Buffer array where data to be sent originates from, or NULL if none.
• rx_bufs – Buffer array where data to be read will be written to, or NULL if none.
• callback – Function pointer to completion callback. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).
• userdata – Userdata passed to callback

**Return values**
• frames – Positive number of frames received in slave mode.
• 0 – If successful in master mode.
• -errno – Negative errno code on failure.
int spi_release(const struct device *dev, const struct spi_config *config)
Release the SPI device locked on and/or the CS by the current config.

Note: This synchronous function is used to release either the lock on the SPI device and/or the CS line that was kept if, and if only, given config parameter was the last one to be used (in any of the above functions) and if it has the SPI_LOCK_ON bit set and/or the SPI_HOLD_ON_CS bit set into its operation bits field. This can be used if the caller needs to keep its hand on the SPI device for consecutive transactions and/or if it needs the device to stay selected. Usually both bits will be used along each other, so the device is locked and stays on until another operation is necessary or until it gets released with the present function.

Parameters
- dev – Pointer to the device structure for the driver instance
- config – Pointer to a valid spi_config structure instance.

Return values
- 0 – If successful.
- -errno – Negative errno code on failure.

static inline int spi_release_dt(const struct spi_dt_spec *spec)
Release the SPI device specified in spi_dt_spec.
This is equivalent to:
spi_release(spec->bus, &spec->config);

Parameters
- spec – SPI specification from devicetree

Returns
a value from spi_release().

struct spi_cs_control
#include <spi.h> SPI Chip Select control structure.
This can be used to control a CS line via a GPIO line, instead of using the controller inner CS logic.

Public Members

struct gpio_dt_spec gpio
GPIO devicetree specification of CS GPIO. The device pointer can be set to NULL to fully inhibit CS control if necessary. The GPIO flags GPIO_ACTIVE_LOW/GPIO_ACTIVE_HIGH should be equivalent to SPI_CS_ACTIVE_HIGH/SPI_CS_ACTIVE_LOW options in struct spi_config.

uint32_t delay
Delay in microseconds to wait before starting the transmission and before releasing the CS line.

struct spi_config
#include <spi.h> SPI controller configuration structure.
**Warning:** Most drivers use pointer comparison to determine whether a passed configuration is different from one used in a previous transaction. Changes to fields in the structure may not be detected.

**Param frequency**

is the bus frequency in Hertz

**Param operation**

is a bit field with the following parts:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit Range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operational mode</td>
<td>[ 0 ]</td>
<td>- master or slave.</td>
</tr>
<tr>
<td>mode</td>
<td>[ 1 : 3 ]</td>
<td>- Polarity, phase and loop mode.</td>
</tr>
<tr>
<td>word_size</td>
<td>[ 5 : 10 ]</td>
<td>- Size of a data frame in bits.</td>
</tr>
<tr>
<td>cs_hold</td>
<td>[ 12 ]</td>
<td>- Hold on the CS line if possible.</td>
</tr>
<tr>
<td>cs_active_high</td>
<td>[ 14 ]</td>
<td>- Active high CS logic.</td>
</tr>
<tr>
<td>format</td>
<td>[ 15 ]</td>
<td>- Motorola or TI frame format.</td>
</tr>
</tbody>
</table>

**Param slave**

is the slave number from 0 to host controller slave limit.

**Param cs**

is a valid pointer on a struct `spi_cs_control` if CS line is emulated through a gpio line, or NULL otherwise.

```c
struct spi_dt_spec
    #include <spi.h> Complete SPI DT information.

Param bus
    is the SPI bus

Param config
    is the slave specific configuration
```

```c
struct spi_buf
    #include <spi.h> SPI buffer structure.

Param buf
    is a valid pointer on a data buffer, or NULL otherwise.

Param len
    is the length of the buffer or, if buf is NULL, will be the length which as to be sent as dummy bytes (as TX buffer) or the length of bytes that should be skipped (as RX buffer).
```

```c
struct spi_buf_set
    #include <spi.h> SPI buffer array structure.

Param buffers
    is a valid pointer on an array of `spi_buf`, or NULL.
```
Param count
is the length of the array pointed by buffers.

```c
struct spi_driver_api
    #include <spi.h> SPI driver API This is the mandatory API any SPI driver needs to expose.
```

## 7.3.36 TCPC

### Overview

**TCPC** (USB Type-C Port Controller) The TCPC is a device used to simplify the implementation of a USB-C system by providing the following three function:

- **VBUS and VCONN control** *USB Type-C:* The TCPC may provide a Source device, the mechanism to control VBUS sourcing, and a Sink device, the mechanism to control VBUS sinking. A similar mechanism is provided for the control of VCONN.
- **CC control and sensing:** The TCPC implements logic for controlling the CC pin pull-up and pull-down resistors. It also provides a way to sense and report what resistors are present on the CC pin.
- **Power Delivery message reception and transmission** *USB Power Delivery:* The TCPC sends and receives messages constructed in the TCPM and places them on the CC lines.

**TCPC API** The TCPC device driver functions as the liaison between the TCPC device and the application software; this is accomplished by the Zephyr's API provided by the device driver that's used to communicate with and control the TCPC device.

### Configuration Options

Related configuration options:

- `CONFIG_USBC_TCPC_DRIVER`

### API Reference

```c
group usb_type_c
    USB Type-C.
```

### Defines

- `TC_V_SINK_DISCONNECT_MIN_MV`
  VBUS minimum for a sink disconnect detection. See Table 4-3 VBUS Sink Characteristics.

- `TC_V_SINK_DISCONNECT_MAX_MV`
  VBUS maximum for a sink disconnect detection. See Table 4-3 VBUS Sink Characteristics.

- `TC_T_VBUS_ON_MAX_MS`
  From entry to Attached.SRC until VBUS reaches the minimum vSafe5V threshold as measured at the source's receptacle See Table 4-29 VBUS and VCONN Timing Parameters.
TC_T_VBUS_OFF_MAX_MS
From the time the Sink is detached until the Source removes VBUS and reaches vSafe0V (See USB PD). See Table 4-29 VBUS and VCONN Timing Parameters.

TC_T_VCONN_ON_MAX_MS
From the time the Source supplied VBUS in the Attached.SRC state. See Table 4-29 VBUS and VCONN Timing Parameters.

TC_T_VCONN_ON_PA_MAX_MS
From the time a Sink with accessory support enters the PoweredAccessory state until the Sink sources minimum VCONN voltage (see Table 4-5) See Table 4-29 VBUS and VCONN Timing Parameters.

TC_T_VCONN_OFF_MAX_MS
From the time that a Sink is detached or as directed until the VCONN supply is disconnected. See Table 4-29 VBUS and VCONN Timing Parameters.

TC_T_SINK_ADJ_MAX_MS
Response time for a Sink to adjust its current consumption to be in the specified range due to a change in USB Type-C Current advertisement See Table 4-29 VBUS and VCONN Timing Parameters.

TC_T_DRP_MIN_MS
The minimum period a DRP shall complete a Source to Sink and back advertisement See Table 4-30 DRP Timing Parameters.

TC_T_DRP_MAX_MS
The maximum period a DRP shall complete a Source to Sink and back advertisement See Table 4-30 DRP Timing Parameters.

TC_T_DRP_TRANSITION_MIN_MS
The minimum time a DRP shall complete transitions between Source and Sink roles during role resolution See Table 4-30 DRP Timing Parameters.

TC_T_DRP_TRANSITION_MAX_MS
The maximum time a DRP shall complete transitions between Source and Sink roles during role resolution See Table 4-30 DRP Timing Parameters.

TC_T_DRP_TRY_MIN_MS
Minimum wait time associated with the Try.SRC state. See Table 4-30 DRP Timing Parameters.

TC_T_DRP_TRY_MAX_MS
Maximum wait time associated with the Try.SRC state. See Table 4-30 DRP Timing Parameters.

TC_T_DRP_TRY_WAIT_MIN_MS
Minimum wait time associated with the Try.SNK state. See Table 4-30 DRP Timing Parameters.

TC_T_DRP_TRY_WAIT_MAX_MS
Maximum wait time associated with the Try.SNK state. See Table 4-30 DRP Timing Parameters.
TC_T_TRY_TIMEOUT_MIN_MS
Minimum timeout for transition from Try.SRC to TryWait.SNK. See Table 4-30 DRP Timing Parameters.

TC_T_TRY_TIMEOUT_MAX_MS
Maximum timeout for transition from Try.SRC to TryWait.SNK. See Table 4-30 DRP Timing Parameters.

TC_T_VPD_DETACH_MIN_MS
Minimum Time for a DRP to detect that the connected Charge-Through VCONNPowered USB Device has been detached, after VBUS has been removed. See Table 4-30 DRP Timing Parameters.

TC_T_VPD_DETACH_MAX_MS
Maximum Time for a DRP to detect that the connected Charge-Through VCONNPowered USB Device has been detached, after VBUS has been removed. See Table 4-30 DRP Timing Parameters.

TC_T_CC_DEBOUNCE_MIN_MS
Minimum time a port shall wait before it can determine it is attached See Table 4-31 CC Timing.

TC_T_CC_DEBOUNCE_MAX_MS
Maximum time a port shall wait before it can determine it is attached See Table 4-31 CC Timing.

TC_T_PD_DEBOUNCE_MIN_MS
Minimum time a Sink port shall wait before it can determine it is detached due to the potential for USB PD signaling on CC as described in the state definitions. See Table 4-31 CC Timing.

TC_T_PD_DEBOUNCE_MAX_MS
Maximum time a Sink port shall wait before it can determine it is detached due to the potential for USB PD signaling on CC as described in the state definitions. See Table 4-31 CC Timing.

TC_T_TRY_CC_DEBOUNCE_MIN_MS
Minimum Time a port shall wait before it can determine it is re-attached during the try-wait process. See Table 4-31 CC Timing.

TC_T_TRY_CC_DEBOUNCE_MAX_MS
Maximum Time a port shall wait before it can determine it is re-attached during the try-wait process. See Table 4-31 CC Timing.

TC_T_ERROR_RECOVERY_SELFPOWERED_MIN_MS
Minimum time a self-powered port shall remain in the ErrorRecovery state. See Table 4-31 CC Timing.

TC_T_ERROR_RECOVERY_SOURCE_MIN_MS
Minimum time a source shall remain in the ErrorRecovery state if it was sourcing VCONN in the previous state. See Table 4-31 CC Timing.
TC_T_RP_VALUE_CHANGE_MIN_MS
Minimum time a Sink port shall wait before it can determine there has been a change in Rp where CC is not BMC Idle or the port is unable to detect BMC Idle. See Table 4-31 CC Timing.

TC_T_RP_VALUE_CHANGE_MAX_MS
Maximum time a Sink port shall wait before it can determine there has been a change in Rp where CC is not BMC Idle or the port is unable to detect BMC Idle. See Table 4-31 CC Timing.

TC_T_SRC_DISCONNECT_MIN_MS
Minimum time a Source shall detect the SRC.Open state. The Source should detect the SRC.Open state as quickly as practical. See Table 4-31 CC Timing.

TC_T_SRC_DISCONNECT_MAX_MS
Maximum time a Source shall detect the SRC.Open state. The Source should detect the SRC.Open state as quickly as practical. See Table 4-31 CC Timing.

TC_T_NO_TOGGLE_CONNECT_MIN_MS
Minimum time to detect connection when neither Port Partner is toggling. See Table 4-31 CC Timing.

TC_T_NO_TOGGLE_CONNECT_MAX_MS
Maximum time to detect connection when neither Port Partner is toggling. See Table 4-31 CC Timing.

TC_T_ONE_PORT_TOGGLE_CONNECT_MIN_MS
Minimum time to detect connection when one Port Partner is toggling 0ms ... dcSRC.DRP max * tDRP max + 2 * tNoToggleConnect). See Table 4-31 CC Timing.

TC_T_ONE_PORT_TOGGLE_CONNECT_MAX_MS
Maximum time to detect connection when one Port Partner is toggling 0ms ... dcSRC.DRP max * tDRP max + 2 * tNoToggleConnect). See Table 4-31 CC Timing.

TC_T_TWO_PORT_TOGGLE_CONNECT_MIN_MS
Minimum time to detect connection when both Port Partners are toggling (0ms ... 5 * tDRP max + 2 * tNoToggleConnect). See Table 4-31 CC Timing.

TC_T_TWO_PORT_TOGGLE_CONNECT_MAX_MS
Maximum time to detect connection when both Port Partners are toggling (0ms ... 5 * tDRP max + 2 * tNoToggleConnect). See Table 4-31 CC Timing.

TC_T_VPDCTDD_MIN_US
Minimum time for a Charge-Through VCONN-Powered USB Device to detect that the Charge-Through source has disconnected from CC after VBUS has been removed, transition to CTU-nattached.VPD, and re-apply its Rp termination advertising 3.0 A on the host port CC. See Table 4-31 CC Timing.

TC_T_VPDCTDD_MAX_MS
Maximum time for a Charge-Through VCONN-Powered USB Device to detect that the Charge-Through source has disconnected from CC after VBUS has been removed, transition to CTU-nattached.VPD, and re-apply its Rp termination advertising 3.0 A on the host port CC. See Table 4-31 CC Timing.
TC_T_VPDDISABLE_MIN_MS
    Minimum time for a Charge-Through VCONN-Powered USB Device shall remain in CTDisabled.VPD state. See Table 4-31 CC Timing.

Enums

define tc_cc_voltage_state
    CC Voltage status.
    Values:

    enumerator TC_CC_VOLT_OPEN = 0
        No port partner connection

    enumerator TC_CC_VOLT_RA = 1
        Port partner is applying Ra

    enumerator TC_CC_VOLT_RD = 2
        Port partner is applying Rd

    enumerator TC_CC_VOLT_RP_DEF = 5
        Port partner is applying Rp (0.5A)

    enumerator TC_CC_VOLT_RP_1A5 = 6

    enumerator TC_CC_VOLT_RP_3A0 = 7
        Port partner is applying Rp (3.0A)

define tc_vbus_level
    VBUS level voltages.
    Values:

    enumerator TC_VBUS_SAFE0V = 0
        VBUS is less than vSafe0V max

    enumerator TC_VBUS_PRESENT = 1
        VBUS is at least vSafe5V min

    enumerator TC_VBUS_REMOVED = 2
        VBUS is less than vSinkDisconnect max

define tc_rp_value
    Pull-Up resistor values.
    Values:

    enumerator TC_RP_USB = 0
        Pull-Up resistor for a current of 900mA

7.3. Peripherals
enumerator TC_RP_1A5 = 1
  Pull-Up resistor for a current of 1.5A

enumerator TC_RP_3A0 = 2
  Pull-Up resistor for a current of 3.0A

enumerator TC_RP_RESERVED = 3
  No Pull-Up resistor is applied

enum tc_cc_pull
  CC pull resistors.
  \textit{Values:}

  enumerator TC_CC_RA = 0
    Ra Pull-Down resistor

  enumerator TC_CC_RP = 1
    Rp Pull-Up resistor

  enumerator TC_CC_RD = 2
    Rd Pull-Down resistor

  enumerator TC_CC_OPEN = 3
    No CC resistor

  enumerator TC_RA_RD = 4
    Ra and Rd Pull-Down resistor

enum tc_cable_plug
  Cable plug. See 6.2.1.1.7 Cable Plug. Only applies to SOP' and SOP". Replaced by\npd_power_role for SOP packets.
  \textit{Values:}

  enumerator PD_PLUG_FROM_DFP_UFP = 0

  enumerator PD_PLUG_FROM_CABLE_VPD = 1

enum tc_power_role
  Power Delivery Power Role.
  \textit{Values:}

  enumerator TC_ROLE_SINK = 0
    Power role is a sink

  enumerator TC_ROLE_SOURCE = 1
    Power role is a source
enum tc_data_role
    Power Delivery Data Role.
    Values:

    enumerator TC_ROLE_UFP = 0
        Data role is an Upstream Facing Port

    enumerator TC_ROLE_DFP = 1
        Data role is a Downstream Facing Port

    enumerator TC_ROLE_DISCONNECTED = 2
        Port is disconnected

enum tc_cc_polarity
    Polarity of the CC lines.
    Values:

    enumerator TC_POLARITY_CC1 = 0
        Use CC1 IO for Power Delivery communication

    enumerator TC_POLARITY_CC2 = 1
        Use CC2 IO for Power Delivery communication

enum tc_cc_states
    Possible port partner connections based on CC line states.
    Values:

    enumerator TC_CC_NONE = 0
        No port partner attached

    enumerator TC_CC_UFP_NONE = 1
        From DFP perspective No UFP accessory connected

    enumerator TC_CC_UFP_AUDIO_ACC = 2
        UFP Audio accessory connected

    enumerator TC_CC_UFP_DEBUG_ACC = 3
        UFP Debug accessory connected

    enumerator TC_CC_UFP_ATTACHED = 4
        Plain UFP attached

    enumerator TC_CC_DFP.Attach = 5
        From UFP perspective Plain DFP attached

    enumerator TC_CC_DFP_DEBUG_ACC = 6
        DFP debug accessory connected

7.3. Peripherals 2355
USB Type-C Port Controller API.

**Typedefs**

typedef int (*tcpc_vconn_control_cb_t)(const struct device *dev, bool enable)

typedef void (*tcpc_alert_handler_cb_t)(const struct device *dev, void *data, enum tcpc_alert alert)

**Enums**

enum tcpc_alert
   TCPC Alert bits.
   Values:

   enumerator TCPC_ALERT_CC_STATUS
      CC status changed

   enumerator TCPC_ALERT_POWER_STATUS
      Power status changed

   enumerator TCPC_ALERT_MSG_STATUS
      Receive Buffer register changed

   enumerator TCPC_ALERT_HARD_RESET_RECEIVED
      Received Hard Reset message

   enumerator TCPC_ALERT_TRANSMIT_MSG_FAILED
      SOP* message transmission not successful

   enumerator TCPC_ALERT_TRANSMIT_MSG_DISCARDED
      Reset or SOP* message transmission not sent due to an incoming receive message

   enumerator TCPC_ALERT_TRANSMIT_MSG_SUCCESS
      Reset or SOP* message transmission successful

   enumerator TCPC_ALERT_VBUS_ALARM_HI
      A high-voltage alarm has occurred

   enumerator TCPC_ALERT_VBUS_ALARM_LO
      A low-voltage alarm has occurred

   enumerator TCPC_ALERT_FAULT_STATUS
      A fault has occurred. Read the FAULT_STATUS register
enumerator TCPC_ALERT_RX_BUFFER_OVERFLOW
   TCPC RX buffer has overflowed

enumerator TCPC_ALERT_VBUS_SNK_DISCONNECT
   The TCPC in Attached.SNK state has detected a sink disconnect

enumerator TCPC_ALERT_BEGINNING_MSG_STATUS
   Receive buffer register changed

enumerator TCPC_ALERT_EXTENDED_STATUS
   Extended status changed

enumerator TCPC_ALERT_EXTENDED
   An extended interrupt event has occurred. Read the alert_extended register

enumerator TCPC_ALERT_VENDOR_DEFINED
   A vendor defined alert has been detected

enum tcpc_status_reg
   TCPC Status register.
   Values:

   enumerator TCPC_CC_STATUS
      The CC Status register

   enumerator TCPC_POWER_STATUS
      The Power Status register

   enumerator TCPC_FAULT_STATUS
      The Fault Status register

   enumerator TCPC_EXTENDED_STATUS
      The Extended Status register

   enumerator TCPC_EXTENDED_ALERT_STATUS
      The Extended Alert Status register

   enumerator TCPC_VENDOR_DEFINED_STATUS
      The Vendor Defined Status register

Functions

static inline int tcpc_is_cc_rp(enum tc_cc_voltage_state cc)
   Returns whether the sink has detected a Rp resistor on the other side.

static inline int tcpc_is_cc_open(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)
   Returns true if both CC lines are completely open.
static inline int tcpc_is_cc_snk_dbg_acc(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)

Returns true if we detect the port partner is a snk debug accessory.

static inline int tcpc_is_cc_src_dbg_acc(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)

Returns true if we detect the port partner is a src debug accessory.

static inline int tcpc_is_cc_audio_acc(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)

Returns true if the port partner is an audio accessory.

static inline int tcpc_is_cc_at_least_one_rd(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)

Returns true if the port partner is presenting at least one Rd.

static inline int tcpc_is_cc_only_one_rd(enum tc_cc_voltage_state cc1, enum tc_cc_voltage_state cc2)

Returns true if the port partner is presenting Rd on only one CC line.

static inline int tcpc_init(const struct device *dev)

Initializes the TCPC.

Parameters

• dev – Runtime device structure

Return values

• 0 – on success
• -EIO – on failure

static inline int tcpc_get_cc(const struct device *dev, enum tc_cc_voltage_state *cc1, enum tc_cc_voltage_state *cc2)

Reads the status of the CC lines.

Parameters

• dev – Runtime device structure
• cc1 – A pointer where the CC1 status is written
• cc2 – A pointer where the CC2 status is written

Return values

• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_select_rp_value(const struct device *dev, enum tc_rp_value rp)

Sets the value of CC pull up resistor used when operating as a Source.

Parameters

• dev – Runtime device structure
• rp – Value of the Pull-Up Resistor.

Return values

• 0 – on success
• -ENOSYS –
• -EIO – on failure
static inline int tcpc_get_rp_value(const struct device *dev, enum tc_rp_value *rp)

  Gets the value of the CC pull up resistor used when operating as a Source.

  **Parameters**
  - `dev` – Runtime device structure
  - `rp` – pointer where the value of the Pull-Up Resistor is stored

  **Return values**
  - 0 – on success
  - -ENOSYS –
  - -EIO – on failure

static inline int tcpc_set_cc(const struct device *dev, enum tc_cc_pull pull)

  Sets the CC pull resistor and sets the role as either Source or Sink.

  **Parameters**
  - `dev` – Runtime device structure
  - `pull` – The pull resistor to set

  **Return values**
  - 0 – on success
  - -EIO – on failure

static inline void tcpc_set_vconn_cb(const struct device *dev, tcpc_vconn_control_cb_t vconn_cb)

  Sets a callback that can enable or disable VCONN if the TCPC is unable to or the system is configured in a way that does not use the VCONN control capabilities of the TCPC.

  The callback is called in the tcpc_set_vconn function if vconn_cb isn’t NULL

  **Parameters**
  - `dev` – Runtime device structure
  - `vconn_cb` – pointer to the callback function that controls vconn

static inline int tcpc_set_vconn(const struct device *dev, bool enable)

  Enables or disables VCONN.

  This function uses the TCPC to measure VCONN if possible or calls the callback function set by tcpc_set_vconn_cb

  **Parameters**
  - `dev` – Runtime device structure
  - `enable` – VCONN is enabled when true, it’s disabled

  **Return values**
  - 0 – on success
  - -EIO – on failure
  - -ENOSYS – if not implemented

static inline int tcpc_set_roles(const struct device *dev, enum tc_power_role power_role, enum tc_data_role data_role)

  Sets the Power and Data Role of the PD message header.

  This function only needs to be called once per data / power role change

  **Parameters**
  - `dev` – Runtime device structure
• power_role – current power role
• data_role – current data role

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline bool tcpc_is_rx_pending_msg(const struct device *dev, enum pd_packet_type *type)
Tests if a received Power Delivery message is pending.

Parameters
• dev – Runtime device structure
• type – pointer to where message type is written. Can be NULL

Return values
• true – if message is pending, else false
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_receive_data(const struct device *dev, struct pd_msg *buf)
Retrieves the Power Delivery message from the TCPC.

Parameters
• dev – Runtime device structure
• buf – pointer where the pd_buf pointer is written

Return values
• Greater – or equal to 0 is the number of bytes received
• -EIO – on failure
• -EFAULT – on buf being NULL
• -ENOSYS – if not implemented

static inline int tcpc_set_rx_enable(const struct device *dev, bool enable)
Enables the reception of SOP* message types.

Parameters
• dev – Runtime device structure
• enable – Enable Power Delivery when true, else it’s disabled

Return values
• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_set_cc_polarity(const struct device *dev, enum tc_cc_polarity polarity)
Sets the polarity of the CC lines.

Parameters
• dev – Runtime device structure
• polarity – Polarity of the cc line

Return values
static inline int tcpc_transmit_data(const struct device *dev, struct pd_msg *msg)

Transmits a Power Delivery message.

Parameters

• dev – Runtime device structure
• msg – Power Delivery message to transmit

Return values

• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_dump_std_reg(const struct device *dev)

Dump a set of TCPC registers.

Parameters

• dev – Runtime device structure

Return values

• 0 – on success
• -EIO – on failure
• -ENOSYS – if not implemented

static inline int tcpc_set_alert_handler_cb(const struct device *dev, tcpc_alert_handler_cb_t handler, void *data)

Sets the alert function that's called when an interrupt is triggered due to an alert bit.

Calling this function enables the particular alert bit

Parameters

• dev – Runtime device structure
• handler – The callback function called when the bit is set
• data – user data passed to the callback

Return values

• 0 – on success
• -EINVAL – on failure

static inline int tcpc_get_status_register(const struct device *dev, enum tcpc_status_reg reg, int32_t *status)

Gets a status register.

Parameters

• dev – Runtime device structure
• reg – The status register to read
• status – Pointer where the status is stored

Return values

• 0 – on success
• -EIO – on failure
static inline int tcpc_clear_status_register(const struct device *dev, enum tcpc_status_reg reg, uint32_t mask)
Clears a TCPC status register.

Parameters
- dev – Runtime device structure
- reg – The status register to read
- mask – A bit mask of the status register to clear. A status bit is cleared when it’s set to 1.

Return values
- 0 – on success
- -EIO – on failure
- -ENOSYS – if not implemented

static inline int tcpc_mask_status_register(const struct device *dev, enum tcpc_status_reg reg, uint32_t mask)
Sets the mask of a TCPC status register.

Parameters
- dev – Runtime device structure
- reg – The status register to read
- mask – A bit mask of the status register to mask. The status bit is masked if it’s 0, else it’s unmasked.

Return values
- 0 – on success
- -EIO – on failure
- -ENOSYS – if not implemented

static inline int tcpc_set_debug_accessory(const struct device *dev, bool enable)
Manual control of TCPC DebugAccessory control.

Parameters
- dev – Runtime device structure
- enable – Enable Debug Accessory when true, else it’s disabled

Return values
- 0 – on success
- -EIO – on failure
- -ENOSYS – if not implemented

static inline int tcpc_set_debug_detach(const struct device *dev)
Detach from a debug connection.

Parameters
- dev – Runtime device structure

Return values
- 0 – on success
- -EIO – on failure
static inline int tcpc_set_drp_toggle(const struct device *dev, bool enable)

Enable TCPC auto dual role toggle.

Parameters
- dev – Runtime device structure
- enable – Auto dual role toggle is active when true, else it’s disabled

Return values
- 0 – on success
- -EINVAL – on failure
- -ENOSYS – if not implemented

static inline bool tcpc_get_snk_ctrl(const struct device *dev)

Queries the current sinking state of the TCPC.

Parameters
- dev – Runtime device structure

Return values
- true – if sinking power
- false – if not sinking power
- -ENOSYS – if not implemented

static inline bool tcpc_get_src_ctrl(const struct device *dev)

Queries the current sourcing state of the TCPC.

Parameters
- dev – Runtime device structure

Return values
- true – if sourcing power
- false – if not sourcing power
- -ENOSYS – if not implemented

static inline int tcpc_set_bist_test_mode(const struct device *dev, bool enable)

Controls the BIST Mode of the TCPC. It disables RX alerts while the mode is active.

Parameters
- dev – Runtime device structure
- enable – The TCPC enters BIST TEST Mode when true

Return values
- 0 – on success
- -EINVAL – on failure
- -ENOSYS – if not implemented

static inline int tcpc_get_chip_info(const struct device *dev, struct tcpc_chip_info *chip_info)

Gets the TCPC firmware version.

Parameters
- dev – Runtime device structure
- chip_info – Pointer to TCPC chip info where the version is stored
Return values
- 0 – on success
- -EIO – on failure
- -ENOSSYS – if not implemented

static inline int tcpc_set_low_power_mode(const struct device *dev, bool enable)
Instructs the TCPC to enter or exit low power mode.

Parameters
- dev – Runtime device structure
- enable – The TCPC enters low power mode when true, else it exits it

Return values
- 0 – on success
- -EIO – on failure
- -ENOSSYS – if not implemented

static inline int tcpc_sop_prime_enable(const struct device *dev, bool enable)
Enables the reception of SOP Prime messages.

Parameters
- dev – Runtime device structure
- enable – Can receive SOP Prime messages when true, else it can not

Return values
- 0 – on success
- -EIO – on failure
- -ENOSSYS – if not implemented

struct tcpc_chip_info
#include <usbc_tcpc.h> TCPC Chip Information.

Public Members

uint16_t vendor_id
Vendor Id

uint16_t product_id
Product Id

uint16_t device_id
Device Id

uint64_t fw_version_number
Firmware version number

uint8_t min_req_fw_version_string[8]
Minimum Required firmware version string
uint64_t min_req_fw_version_number
  Minimum Required firmware version number

struct tcpc_driver_api
  #include <usbc_tcpc.h>

group usb_power_delivery
  USB Power Delivery.

Defines

PD_MAX_EXTENDED_MSG_LEGACY_LEN
  Maximum length of a non-Extended Message in bytes. See Table 6-75 Value Parameters Parameter Name: MaxExtendedMsgLegacyLen.

PD_MAX_EXTENDED_MSG_LEN
  Maximum length of an Extended Message in bytes. See Table 6-75 Value Parameters Parameter Name: MaxExtendedMsgLen.

PD_MAX_EXTENDED_MSG_CHUNK_LEN
  Maximum length of a Chunked Message in bytes. When one of both Port Partners do not support Extended Messages of Data Size greater than PD_MAX_EXTENDED_MSG_LEGACY_LEN then the Protocol Layer supports a Chunking mechanism to break larger Messages into smaller Chunks of size PD_MAX_EXTENDED_MSG_CHUNK_LEN. See Table 6-75 Value Parameters Parameter Name: MaxExtendedMsgChunkLen.

PD_T_TYPEC_SINK_WAIT_CAP_MIN_MS
  Minimum time a sink shall wait for a Source_Capabilities message before sending a Hard Reset See Table 6-61 Time Values Parameter Name: tTypeCSinkWaitCap.

PD_T_TYPEC_SINK_WAIT_CAP_MAX_MS
  Minimum time a sink shall wait for a Source_Capabilities message before sending a Hard Reset See Table 6-61 Time Values Parameter Name: tTypeCSinkWaitCap.

PD_V_SAFE_0V_MAX_MV
  VBUS maximum safe operating voltage at “zero volts”. See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: vSafe0V.

PD_V_SAFE_5V_MIN_MV
  VBUS minimum safe operating voltage at 5V. See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: vSafe5V.

PD_T_SAFE_0V_MAX_MS
  Time to reach PD_V_SAFE_0V_MAX_MV max in milliseconds. See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: tSafe0V.

PD_T_SAFE_5V_MAX_MS
  Time to reach PD_V_SAFE_5V_MIN_MV max in milliseconds. See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: tSafe5V.
PD_T_TX_TIMEOUT_MS
Time to wait for TCPC to complete transmit.

PD_T_HARD_RESET_COMPLETE_MIN_MS
Minimum time a Hard Reset must complete. See Table 6-68 Time Values.

PD_T_HARD_RESET_COMPLETE_MAX_MS
Maximum time a Hard Reset must complete. See Table 6-68 Time Values.

PD_T_SENDER_RESPONSE_MIN_MS
Minimum time a response must be sent from a Port Partner See Table 6-68 Time Values.

PD_T_SENDER_RESPONSE_NOM_MS
Nominal time a response must be sent from a Port Partner See Table 6-68 Time Values.

PD_T_SENDER_RESPONSE_MAX_MS
Maximum time a response must be sent from a Port Partner See Table 6-68 Time Values.

PD_T_SINK_REQUEST_MIN_MS
Minimum time to wait before sending another request after receiving a Wait message See Table 6-68 Time Values.

PD_T_CHUNKING_NOT_SUPPORTED_MIN_MS
Minimum time to wait before sending a Not_Supported message after receiving a Chunked message See Table 6-68 Time Values.
**PD_T_CHUNKING_NOT_SUPPORTED_NOM_MS**
Nominal time to wait before sending a Not_Supported message after receiving a Chunked message. See Table 6-68 Time Values.

**PD_T_CHUNKING_NOT_SUPPORTED_MAX_MS**
Maximum time to wait before sending a Not_Supported message after receiving a Chunked message. See Table 6-68 Time Values.

**PD_CONVERT_BYTES_TO_PD_HEADER_COUNT(c)**
Convert bytes to PD Header data object count, where a data object is 4-bytes.

**Parameters**
- c – number of bytes to convert

**PD_CONVERT_PD_HEADER_COUNT_TO_BYTES(c)**
Convert PD Header data object count to bytes.

**Parameters**
- c – number of PD Header data objects

**SINK_TX_OK**
Collision avoidance Rp values in REV 3.0 Sink Transmit “OK”.

**SINK_TX_NG**
Collision avoidance Rp values in REV 3.0 Sink Transmit “NO GO”.

**PD_GET_EXT_HEADER(c)**
Used to get extended header from the first 32-bit word of the message.

**Parameters**
- c – first 32-bit word of the message

**PDO_MAX_DATA_OBJECTS**
Maximum number of 32-bit data objects sent in a single request.

PDO - Power Data Object, RDO - Request Data Object

**PD_CONVERT_MA_TO_FIXED_PDO_CURRENT(c)**
Convert milliamps to Fixed PDO Current in 10mA units.

**Parameters**
- c – Current in milliamps

**PD_CONVERT_MV_TO_FIXED_PDO_VOLTAGE(v)**
Convert millivolts to Fixed PDO Voltage in 50mV units.

**Parameters**
- v – Voltage in millivolts

**PD_CONVERT_FIXED_PDO_CURRENT_TO_MA(c)**
Convert a Fixed PDO Current from 10mA units to milliamps.

**Parameters**
- c – Fixed PDO current in 10mA units.
PD_CONVERT_FIXED_PDO_VOLTAGE_TO_MV(v)
Convert a Fixed PDO Voltage from 50mV units to millivolts. Used for converting pd_fixed_supply_pdo_source.voltage and pd_fixed_supply_pdo_sink.voltage.

Parameters
• v – Fixed PDO voltage in 50mV units.

PD_CONVERT_MA_TO_VARIABLE_PDO_CURRENT(c)
Convert milliamps to Variable PDO Current in 10ma units.

Parameters
• c – Current in milliamps

PD_CONVERT_MV_TO_VARIABLE_PDO_VOLTAGE(v)
Convert millivolts to Variable PDO Voltage in 50mV units.

Parameters
• v – Voltage in millivolts

PD_CONVERT_VARIABLE_PDO_CURRENT_TO_MA(c)
Convert a Variable PDO Current from 10mA units to milliamps.

Parameters
• c – Variable PDO current in 10mA units.

PD_CONVERT_VARIABLE_PDO_VOLTAGE_TO_MV(v)
Convert a Variable PDO Voltage from 50mV units to millivolts.

Parameters
• v – Variable PDO voltage in 50mV units.

PD_CONVERT_MW_TO_BATTERY_PDO_POWER(c)
Convert milliwatts to Battery PDO Power in 250mW units.

Parameters
• c – Power in milliwatts

PD_CONVERT_MV_TO_BATTERY_PDO_VOLTAGE(v)
Convert milliwatts to Battery PDO Voltage in 50mV units.

Parameters
• v – Voltage in millivolts

PD_CONVERT_BATTERY_PDO_POWER_TO_MW(c)
Convert a Battery PDO Power from 250mW units to milliwatts.

Parameters
• c – Power in 250mW units.

PD_CONVERT_BATTERY_PDO_VOLTAGE_TO_MV(v)
Convert a Battery PDO Voltage from 50mV units to millivolts.

Parameters
• v – Voltage in 50mV units.

PD_CONVERT_MA_TO_AUGMENTED_PDO_CURRENT(c)
Convert milliamps to Augmented PDO Current in 50mA units.

Parameters
• c – Current in milliamps
PD_CONVERT_MV_TO_AUGMENTED_PDO_VOLTAGE(v)
Convert millivolts to Augmented PDO Voltage in 100mV units.

**Parameters**
- v – Voltage in millivolts

PD_CONVERT_AUGMENTED_PDO_CURRENT_TO_MA(c)
Convert an Augmented PDO Current from 50mA units to milliamps.

**Parameters**
- c – Augmented PDO current in 50mA units.

PD_CONVERT_AUGMENTED_PDO_VOLTAGE_TO_MV(v)
Convert an Augmented PDO Voltage from 100mV units to millivolts.

**Parameters**
- v – Augmented PDO voltage in 100mV units.

NUM_SOP_STAR_TYPES
Number of valid Transmit Types.

** Enums **

enum pdo_type
Power Data Object Type Table 6-7 Power Data Object.

* Values: *

- enumerator PDO_FIXED = 0
  Fixed supply (Vmin = Vmax)

- enumerator PDO_BATTERY = 1
  Battery

- enumerator PDO_VARIABLE = 2
  Variable Supply (non-Battery)

- enumerator PDO_AUGMENTED = 3
  Augmented Power Data Object (APDO)

enum pd_frs_type
Fast Role Swap Required for USB Type-C current.

* Values: *

- enumerator FRS_NOT_SUPPORTED
  Fast Swap not supported

- enumerator FRS_DEFAULT_USB_POWER
  Default USB Power

- enumerator FRS_1P5A_5V
  1.5A @ 5V
enumerator FRS_3P0A_5V
   3.0A @ 5V

defined

enum pd_rev_type
   Protocol revision.
   \textit{Values:}

   enumerator PD_REV10 = 0
      PD revision 1.0

   enumerator PD_REV20 = 1
      PD revision 2.0

   enumerator PD_REV30 = 2
      PD revision 3.0

enum pd_packet_type
   Power Delivery packet type See USB Type-C Port Controller Interface Specification, Revision
   2.0, Version 1.2, Table 4-38 TRANSMIT Register Definition.
   \textit{Values:}

   enumerator PD_PACKET_SOP = 0
      Port Partner message

   enumerator PD_PACKET_SOP_PRIME = 1
      Cable Plug message

   enumerator PD_PACKET_PRIME_PRIME = 2
      Cable Plug message far end

   enumerator PD_PACKET_DEBUG_PRIME = 3
      Currently undefined in the PD specification

   enumerator PD_PACKET_DEBUG_PRIME_PRIME = 4
      Currently undefined in the PD specification

   enumerator PD_PACKET_TX_HARD_RESET = 5
      Hard Reset message to the Port Partner

   enumerator PD_PACKET_CABLE_RESET = 6
      Cable Reset message to the Cable

   enumerator PD_PACKET_TX_BIST_MODE_2 = 7
      BIST_MODE_2 message to the Port Partner

   enumerator PD_PACKET_MSG_INVALID = 0xf
      USED ONLY FOR RECEPTION OF UNKNOWN MSG TYPES
enum pd_ctrl_msg_type
    Control Message type See Table 6-5 Control Message Types.
    Values:

    enumerator PD_CTRL_GOOD_CRC = 1
        0 Reserved GoodCRC Message

    enumerator PD_CTRL_GOTO_MIN = 2
        GotoMin Message

    enumerator PD_CTRL_ACCEPT = 3
        Accept Message

    enumerator PD_CTRL_REJECT = 4
        Reject Message

    enumerator PD_CTRL_PING = 5
        Ping Message

    enumerator PD_CTRL_PS_RDY = 6
        PS_RDY Message

    Capability Mismatch

uint32_t giveback
    Give Back Flag

uint32_t object_pos
    Object Position (000b is Reserved and Shall Not be used)

uint32_t reserved1
    Reserved - Shall be set to zero.

struct pd_rdo.[anonymous] fixed
    Create a Fixed RDO value See Table 6-19 Fixed and Variable Request Data Object.

struct pd_rdo.[anonymous] variable
    Create a Variable RDO value See Table 6-19 Fixed and Variable Request Data Object.

uint32_t min_operating_power
    Minimum Operating Power in 250mW units

uint32_t operating_power
    Operating power in 250mW units

struct pd_rdo.[anonymous] battery
    Create a Battery RDO value See Table 6-20 Battery Request Data Object.

uint32_t output_voltage
    Output Voltage in 20mV units

uint32_t reserved2
    Reserved - Shall be set to zero
```

7.3. Peripherals
uint32_t reserved3
    Reserved - Shall be set to zero.

struct pd_rdo[anonymous] augmented
    Create an Augmented RDO value See Table 6-22 Programmable Request Data Object.

uint32_t raw_value
    Raw RDO value

struct pd_msg
    #include <usbc_pd.h> Power Delivery message.

Public Members

datatype pd_packet_type type
    Type of this packet

union pd_header header
    Header of this message

uint32_t len
    Length of bytes in data

uint8_t data[260]
    Message data

7.3.37 UART

Overview

Zephyr provides three different ways to access the UART peripheral. Depending on the method, different API functions are used according to below sections:

1. Polling API
2. Interrupt-driven API
3. Asynchronous API using DMA

Polling is the most basic method to access the UART peripheral. The reading function, uart_poll_in, is a non-blocking function and returns a character or -1 when no valid data is available. The writing function, uart_poll_out, is a blocking function and the thread waits until the given character is sent.

With the Interrupt-driven API, possibly slow communication can happen in the background while the thread continues with other tasks. The Kernel’s Data Passing features can be used to communicate between the thread and the UART driver.

The Asynchronous API allows to read and write data in the background using DMA without interrupting the MCU at all. However, the setup is more complex than the other methods.
Configuration Options

Most importantly, the Kconfig options define whether the polling API (default), the interrupt-driven API or the asynchronous API can be used. Only enable the features you need in order to minimize memory footprint.

Related configuration options:

- CONFIG_SERIAL
- CONFIG_UART_INTERRUPT_DRIVEN
- CONFIG_UART_ASYNC_API
- CONFIG_UART_WIDE_DATA
- CONFIG_UART_USE_RUNTIME_CONFIGURE
- CONFIG_UART_LINE_CTRL
- CONFIG_UART_DRV_CMD

 Enums

enum uart_line_ctrl
   Line control signals.

Values:

enumerator UART_LINE_CTRL_BAUD_RATE = BIT(0)
enumerator UART_LINE_CTRL_RTS = BIT(1)
enumerator UART_LINE_CTRL_DTR = BIT(2)
enumerator UART_LINE_CTRL_DCD = BIT(3)
enumerator UART_LINE_CTRL_DSR = BIT(4)

enum uart_rx_stop_reason
   Reception stop reasons.

Values that correspond to events or errors responsible for stopping receiving.

Values:

enumerator UART_ERROR_OVERRUN = (1 << 0)
   Overrun error.
enumerator UART_ERROR_PARITY = (1 << 1)
    Parity error.

denumerator UART_ERROR_FRAMING = (1 << 2)
    Framing error.

denumerator UART_BREAK = (1 << 3)
    Break interrupt.

    A break interrupt was received. This happens when the serial input is held at a logic ‘0’
    state for longer than the sum of start time + data bits + parity + stop bits.

denumerator UART_ERROR_COLLISION = (1 << 4)
    Collision error.

    This error is raised when transmitted data does not match received data. Typically this is
    useful in scenarios where the TX and RX lines maybe connected together such as RS-485
    half-duplex. This error is only valid on UARTs that support collision checking.

denum uart_config_parity
    Parity modes.

Values:

enumerator UART_CFG_PARITY_NONE
enumerator UART_CFG_PARITY_ODD
enumerator UART_CFG_PARITY_EVEN
enumerator UART_CFG_PARITY_MARK
enumerator UART_CFG_PARITY_SPACE

denum uart_config_stop_bits
    Number of stop bits.

Values:

enumerator UART_CFG_STOP_BITS_0_5
enumerator UART_CFG_STOP_BITS_1
enumerator UART_CFG_STOP_BITS_1_5
enumerator UART_CFG_STOP_BITS_2

denum uart_config_data_bits
    Number of data bits.

Values:
enumerator UART_CFG_DATA_BITS_5
enumerator UART_CFG_DATA_BITS_6
enumerator UART_CFG_DATA_BITS_7
enumerator UART_CFG_DATA_BITS_8
enumerator UART_CFG_DATA_BITS_9

enum uart_config_flow_control
Hardware flow control options.
With flow control set to none, any operations related to flow control signals can be managed by user with uart_line_ctrl functions. In other cases, flow control is managed by hardware/driver.

Values:

enumerator UART_CFG_FLOW_CTRL_NONE
enumerator UART_CFG_FLOW_CTRL_RTS_CTS
enumerator UART_CFG_FLOW_CTRL_DTR_DSR

Functions

int uart_err_check(const struct device *dev)
Check whether an error was detected.

Parameters
• dev – UART device instance.

Return values
• 0 – If no error was detected.
• err – Error flags as defined in uart_rx_stop_reason
• -ENOSYS – If not implemented.

int uart_configure(const struct device *dev, const struct uart_config *cfg)
Set UART configuration.
Sets UART configuration using data from *cfg.

Parameters
• dev – UART device instance.
• cfg – UART configuration structure.

Return values
• 0 – If successful.
• -errno – Negative errno code in case of failure.
- **-ENOSYS** – If configuration is not supported by device or driver does not support setting configuration in runtime.

```c
int uart_config_get(const struct device *dev, struct uart_config *cfg)
```

Get UART configuration.

Stores current UART configuration to `*cfg`, can be used to retrieve initial configuration after device was initialized using data from DTS.

**Parameters**
- `dev` – UART device instance.
- `cfg` – UART configuration structure.

**Return values**
- 0 – If successful.
- -errno – Negative errno code in case of failure.
- -ENOSYS – If driver does not support getting current configuration.

```c
int uart_line_ctrl_set(const struct device *dev, uint32_t ctrl, uint32_t val)
```

Manipulate line control for UART.

**Parameters**
- `dev` – UART device instance.
- `ctrl` – The line control to manipulate (see enum uart_line_ctrl).
- `val` – Value to set to the line control.

**Return values**
- 0 – If successful.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.
- -errno – Other negative errno value in case of failure.

```c
int uart_line_ctrl_get(const struct device *dev, uint32_t ctrl, uint32_t *val)
```

Retrieve line control for UART.

**Parameters**
- `dev` – UART device instance.
- `ctrl` – The line control to retrieve (see enum uart_line_ctrl).
- `val` – Pointer to variable where to store the line control value.

**Return values**
- 0 – If successful.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.
- -errno – Other negative errno value in case of failure.

```c
int uart_drv_cmd(const struct device *dev, uint32_t cmd, uint32_t p)
```

Send extra command to driver.

Implementation and accepted commands are driver specific. Refer to the drivers for more information.

**Parameters**
- `dev` – UART device instance.
• `cmd` – Command to driver.
• `p` – Parameter to the command.

**Return values**
• 0 – If successful.
• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.
• -errno – Other negative errno value in case of failure.

```c
struct uart_config

#include <uart.h> UART controller configuration structure.

**Param baudrate**
Baudrate setting in bps

**Param parity**
Parity bit, use `uart_config_parity`

**Param stop_bits**
Stop bits, use `uart_config_stop_bits`

**Param data_bits**
Data bits, use `uart_config_data_bits`

**Param flow_ctrl**
Flow control setting, use `uart_config_flow_control`
```

**Polling API**

```c
group uart_polling

**Functions**

```c
int uart_poll_in(const struct device *dev, unsigned char *p_char)
```

Read a character from the device for input.

This routine checks if the receiver has valid data. When the receiver has valid data, it reads a character from the device, stores to the location pointed to by `p_char`, and returns 0 to the calling thread. It returns -1, otherwise. This function is a non-blocking call.

**Parameters**
• `dev` – UART device instance.
• `p_char` – Pointer to character.

**Return values**
• 0 – If a character arrived.
• -1 – If no character was available to read (i.e. the UART input buffer was empty).
• -ENOSYS – If the operation is not implemented.
• -EBUSY – If async reception was enabled using `uart_rx_enable`
int uart_poll_in_u16(const struct device *dev, uint16_t *p_u16)

Read a 16-bit datum from the device for input.

This routine checks if the receiver has valid data. When the receiver has valid data, it reads a 16-bit datum from the device, stores to the location pointed to by p_u16, and returns 0 to the calling thread. It returns -1, otherwise. This function is a non-blocking call.

Parameters

• dev – UART device instance.
• p_u16 – Pointer to 16-bit data.

Return values

• 0 – If data arrived.
• -1 – If no data was available to read (i.e., the UART input buffer was empty).
• -ENOTSUP – If API is not enabled.
• -ENOSYS – If the function is not implemented.
• -EBUSY – If async reception was enabled using uart_rx_enable

void uart_poll_out(const struct device *dev, unsigned char out_char)

Write a character to the device for output.

This routine checks if the transmitter is full. When the transmitter is not full, it writes a character to the data register. It waits and blocks the calling thread, otherwise. This function is a blocking call.

To send a character when hardware flow control is enabled, the handshake signal CTS must be asserted.

Parameters

• dev – UART device instance.
• out_char – Character to send.

void uart_poll_out_u16(const struct device *dev, uint16_t out_u16)

Write a 16-bit datum to the device for output.

This routine checks if the transmitter is full. When the transmitter is not full, it writes a 16-bit datum to the data register. It waits and blocks the calling thread, otherwise. This function is a blocking call.

To send a datum when hardware flow control is enabled, the handshake signal CTS must be asserted.

Parameters

• dev – UART device instance.
• out_u16 – Wide data to send.

Interrupt-driven API

group uart_interrupt

Typedefs
typedef void (*uart_irq_callback_user_data_t)(const struct device *dev, void *user_data)

Define the application callback function signature for uart_irq_callback_user_data_set() function.

**Param dev**

UART device instance.

**Param user_data**

Arbitrary user data.

typedef void (*uart_irq_config_func_t)(const struct device *dev)

For configuring IRQ on each individual UART device.

**Param dev**

UART device instance.

**Functions**

static inline int uart_fifo_fill(const struct device *dev, const uint8_t *tx_data, int size)

Fill FIFO with data.

This function is expected to be called from UART interrupt handler (ISR), if uart_irq_tx_ready() returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). Likewise, not calling this function from an ISR if uart_irq_tx_ready() returns true may lead to undefined behavior, e.g. infinite interrupt loops. It's mandatory to test return value of this function, as different hardware has different FIFO depth (oftentimes just 1).

**Parameters**

- dev – UART device instance.
- tx_data – Data to transmit.
- size – Number of bytes to send.

**Return values**

- -ENOSYS – if this function is not supported
- -ENOTSUP – If API is not enabled.

**Returns**

Number of bytes sent.

static inline int uart_fifo_fill_u16(const struct device *dev, const uint16_t *tx_data, int size)

Fill FIFO with wide data.

This function is expected to be called from UART interrupt handler (ISR), if uart_irq_tx_ready() returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). Likewise, not calling this function from an ISR if uart_irq_tx_ready() returns true may lead to undefined behavior, e.g. infinite interrupt loops. It's mandatory to test return value of this function, as different hardware has different FIFO depth (oftentimes just 1).

**Parameters**

- dev – UART device instance.
- tx_data – Wide data to transmit.
- size – Number of datum to send.

**Return values**
• -ENOSYS – If this function is not implemented
• -ENOTSUP – If API is not enabled.

### Returns
Number of datum sent.

```
static inline int uart_fifo_read(const struct device *dev, uint8_t *rx_data, const int size)
```

Read data from FIFO.

This function is expected to be called from UART interrupt handler (ISR), if `uart_irq_rx_ready()` returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). It’s unspecified whether “RX ready” condition as returned by `uart_irq_rx_ready()` is level- or edge- triggered. That means that once `uart_irq_rx_ready()` is detected, `uart_fifo_read()` must be called until it reads all available data in the FIFO (i.e. until it returns less data than was requested).

Note that the calling context only applies to physical UARTs and no to the virtual ones found in USB CDC ACM code.

### Parameters
- `dev` – UART device instance.
- `rx_data` – Data container.
- `size` – Container size.

### Return values
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.

### Returns
Number of bytes read.

```
static inline int uart_fifo_read_u16(const struct device *dev, uint16_t *rx_data, const int size)
```

Read wide data from FIFO.

This function is expected to be called from UART interrupt handler (ISR), if `uart_irq_rx_ready()` returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). It’s unspecified whether “RX ready” condition as returned by `uart_irq_rx_ready()` is level- or edge- triggered. That means that once `uart_irq_rx_ready()` is detected, `uart_fifo_read()` must be called until it reads all available data in the FIFO (i.e. until it returns less data than was requested).

Note that the calling context only applies to physical UARTs and no to the virtual ones found in USB CDC ACM code.

### Parameters
- `dev` – UART device instance.
- `rx_data` – Wide data container.
- `size` – Container size.

### Return values
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.

### Returns
Number of datum read.

```
void uart_irq_tx_enable(const struct device *dev)
```

Enable TX interrupt in IER.
Parameters

- `dev` – UART device instance.

```c
void uart_irq_tx_disable(const struct device *dev)
```

Disable TX interrupt in IER.

Parameters

- `dev` – UART device instance.

```c
static inline int uart_irq_tx_ready(const struct device *dev)
```

Check if UART TX buffer can accept a new char.

Check if UART TX buffer can accept at least one character for transmission (i.e. `uart_fifo_fill()` will succeed and return non-zero). This function must be called in a UART interrupt handler, or its result is undefined. Before calling this function in the interrupt handler, `uart_irq_update()` must be called once per the handler invocation.

Parameters

- `dev` – UART device instance.

Return values

- 1 – If TX interrupt is enabled and at least one char can be written to UART.
- 0 – If device is not ready to write a new byte.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.

```c
void uart_irq_rx_enable(const struct device *dev)
```

Enable RX interrupt.

Parameters

- `dev` – UART device instance.

```c
void uart_irq_rx_disable(const struct device *dev)
```

Disable RX interrupt.

Parameters

- `dev` – UART device instance.

```c
static inline int uart_irq_tx_complete(const struct device *dev)
```

Check if UART TX block finished transmission.

Check if any outgoing data buffered in UART TX block was fully transmitted and TX block is idle. When this condition is true, UART device (or whole system) can be power off. Note that this function is not useful to check if UART TX can accept more data, use `uart_irq_tx_ready()` for that. This function must be called in a UART interrupt handler, or its result is undefined. Before calling this function in the interrupt handler, `uart_irq_update()` must be called once per the handler invocation.

Parameters

- `dev` – UART device instance.

Return values

- 1 – If nothing remains to be transmitted.
- 0 – If transmission is not completed.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.
static inline int uart_irq_rx_ready(const struct device *dev)
    
    Check if UART RX buffer has a received char. Check if UART RX buffer has at least one pending character (i.e. uart_fifo_read() will succeed and return non-zero). This function must be called in a UART interrupt handler, or its result is undefined. Before calling this function in the interrupt handler, uart_irq_update() must be called once per the handler invocation. It's unspecified whether condition as returned by this function is level- or edge- triggered (i.e. if this function returns true when RX FIFO is non-empty, or when a new char was received since last call to it). See description of uart_fifo_read() for implication of this.

Parameters

- dev – UART device instance.

Return values

- 1 – If a received char is ready.
- 0 – If a received char is not ready.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.

void uart_irq_err_enable(const struct device *dev)
    
    Enable error interrupt.

Parameters

- dev – UART device instance.

void uart_irq_err_disable(const struct device *dev)
    
    Disable error interrupt.

Parameters

- dev – UART device instance.

int uart_irq_is_pending(const struct device *dev)
    
    Check if any IRQs is pending.

Parameters

- dev – UART device instance.

Return values

- 1 – If an IRQ is pending.
- 0 – If an IRQ is not pending.
- -ENOSYS – If this function is not implemented.
- -ENOTSUP – If API is not enabled.

int uart_irq_update(const struct device *dev)
    
    Start processing interrupts in ISR.

This function should be called the first thing in the ISR. Calling uart_irq_rx_ready(), uart_irq_tx_ready(), uart_irq_tx_complete() allowed only after this.

The purpose of this function is:

- For devices with auto-acknowledge of interrupt status on register read to cache the value of this register (rx_ready, etc. then use this case).
- For devices with explicit acknowledgment of interrupts, to ack any pending interrupts and likewise to cache the original value.
• For devices with implicit acknowledgment, this function will be empty. But the ISR must perform the actions needs to ack the interrupts (usually, call `uart_fifo_read()` on rx_ready, and `uart_fifo_fill()` on tx_ready).

**Parameters**

• dev – UART device instance.

**Return values**

• 1 – On success.
• -ENOSYS – If this function is not implemented.
• -ENOTSUP – If API is not enabled.

```c
static inline void uart_irq_callback_user_data_set(const struct device *dev, uart_irq_callback_user_data_t cb, void *user_data)
```

Set the IRQ callback function pointer.

This sets up the callback for IRQ. When an IRQ is triggered, the specified function will be called with specified user data. See description of `uart_irq_update()` for the requirements on ISR.

**Parameters**

• dev – UART device instance.
• cb – Pointer to the callback function.
• user_data – Data to pass to callback function.

```c
static inline void uart_irq_callback_set(const struct device *dev, uart_irq_callback_user_data_t cb)
```

Set the IRQ callback function pointer (legacy).

This sets up the callback for IRQ. When an IRQ is triggered, the specified function will be called with the device pointer.

**Parameters**

• dev – UART device instance.
• cb – Pointer to the callback function.

**Asynchronous API**

group uart_async

**Typedefs**

typedef void (*uart_callback_t)(const struct device *dev, struct uart_event *evt, void *user_data)

Define the application callback function signature for `uart_callback_set()` function.

**Param dev**

UART device instance.

**Param evt**

Pointer to `uart_event` instance.

**Param user_data**

Pointer to data specified by user.
Enums

enum uart_event_type

Types of events passed to callback in UART_ASYNC_API.

Receiving:

a. To start receiving, uart_rx_enable has to be called with first buffer
b. When receiving starts to current buffer, UART_RX_BUF_REQUEST will be generated, in response to that user can either:
   • Provide second buffer using uart_rx_buf_rsp, when first buffer is filled, receiving will automatically start to second buffer.
   • Ignore the event, this way when current buffer is filled UART_RX_RDY event will be generated and receiving will be stopped.
c. If some data was received and timeout occurred UART_RX_RDY event will be generated. It can happen multiples times for the same buffer. RX timeout is counted from last byte received i.e. if no data was received, there won’t be any timeout event.
d. After buffer is filled UART_RX_RDY will be generated, immediately followed by UART_RX_BUF_RELEASED indicating that current buffer is no longer used.
e. If there was second buffer provided, it will become current buffer and we start again at point 2. If no second buffer was specified receiving is stopped and UART_RX_DISABLED event is generated. After that whole process can be repeated.

Any time during reception UART_RX_STOPPED event can occur. if there is any data received, UART_RX_RDY event will be generated. It will be followed by UART_RX_BUF_RELEASED event for every buffer currently passed to driver and finally by UART_RX_DISABLED event.

Receiving can be disabled using uart_rx_disable, after calling that function, if there is any data received, UART_RX_RDY event will be generated. UART_RX_BUF_RELEASED event will be generated for every buffer currently passed to driver and finally UART_RX_DISABLED event will occur.

Transmitting:

a. Transmitting starts by uart_tx function.
b. If whole buffer was transmitted UART_TX_DONE is generated. If timeout occurred UART_TX_ABORTED will be generated.

Transmitting can be aborted using uart_tx_abort, after calling that function UART_TX_ABORTED event will be generated.

Values:

enumerator UART_TX_DONE

Whole TX buffer was transmitted.

enumerator UART_TX_ABORTED

Transmitting aborted due to timeout or uart_tx_abort call.

When flow control is enabled, there is a possibility that TX transfer won’t finish in the allotted time. Some data may have been transferred, information about it can be found in event data.

d. Any time during reception UART_RX_STOPPED event can occur. if there is any data received, UART_RX_RDY event will be generated. It will be followed by UART_RX_BUF_RELEASED event for every buffer currently passed to driver and finally by UART_RX_DISABLED event.

Receiving can be disabled using uart_rx_disable, after calling that function, if there is any data received, UART_RX_RDY event will be generated. UART_RX_BUF_RELEASED event will be generated for every buffer currently passed to driver and finally UART_RX_DISABLED event will occur.
• When RX timeout occurred, and data was stored in provided buffer. This can happen multiple times in the same buffer.
• When provided buffer is full.
• After `uart_rx_disable()`.
• After stopping due to external event (`UART_RX_STOPPED`).

enumerator UART_RX_BUF_REQUEST
Driver requests next buffer for continuous reception.

This event is triggered when receiving has started for a new buffer, i.e. it’s time to provide a next buffer for a seamless switchover to it. For continuous reliable receiving, user should provide another RX buffer in response to this event, using `uart_rx_buf_rsp` function. If `uart_rx_buf_rsp` is not called before current buffer is filled up, receiving will stop.

enumerator UART_RX_BUF_RELEASED
Buffer is no longer used by UART driver.

enumerator UART_RX_DISABLED
RX has been disabled and can be reenabled.

This event is generated whenever receiver has been stopped, disabled or finished its operation and can be enabled again using `uart_rx_enable`.

enumerator UART_RX_STOPPED
RX has stopped due to external event.

Reason is one of `uart_rx_stop_reason`.

Functions

static inline int uart_callback_set(const struct device *dev, uart_callback_t callback, void *user_data)
Set event handler function.

Since it is mandatory to set callback to use other asynchronous functions, it can be used to detect if the device supports asynchronous API. Remaining API does not have that detection.

Parameters

• `dev` – UART device instance.
• `callback` – Event handler.
• `user_data` – Data to pass to event handler function.

Return values

• 0 – If successful.
• -ENOSYS – If not supported by the device.
• -ENOTSUP – If API not enabled.

int uart_tx(const struct device *dev, const uint8_t *buf, size_t len, int32_t timeout)
Send given number of bytes from buffer through UART.

Function returns immediately and event handler, set using `uart_callback_set`, is called after transfer is finished.

Parameters

• `dev` – UART device instance.
• `buf` – Pointer to transmit buffer.
• `len` – Length of transmit buffer.
• `timeout` – Timeout in microseconds. Valid only if flow control is enabled. SYS_FOREVER_US disables timeout.

**Return values**
• 0 – If successful.
• -ENOTSUP – If API is not enabled.
• -EBUSY – If there is already an ongoing transfer.
• -errno – Other negative errno value in case of failure.

```c
int uart_tx_u16(const struct device *dev, const uint16_t *buf, size_t len, int32_t timeout)
```

Send given number of datum from buffer through UART.

Function returns immediately and event handler, set using `uart_callback_set`, is called after transfer is finished.

**Parameters**
• `dev` – UART device instance.
• `buf` – Pointer to wide data transmit buffer.
• `len` – Length of wide data transmit buffer.
• `timeout` – Timeout in milliseconds. Valid only if flow control is enabled. SYS_FOREVER_MS disables timeout.

**Return values**
• 0 – If successful.
• -ENOTSUP – If API is not enabled.
• -EBUSY – If there is already an ongoing transfer.
• -errno – Other negative errno value in case of failure.

```c
int uart_tx_abort(const struct device *dev)
```

Abort current TX transmission.

`UART_TX_DONE` event will be generated with amount of data sent.

**Parameters**
• `dev` – UART device instance.

**Return values**
• 0 – If successful.
• -ENOTSUP – If API is not enabled.
• -EFAULT – There is no active transmission.
• -errno – Other negative errno value in case of failure.

```c
int uart_rx_enable(const struct device *dev, uint8_t *buf, size_t len, int32_t timeout)
```

Start receiving data through UART.

Function sets given buffer as first buffer for receiving and returns immediately. After that event handler, set using `uart_callback_set`, is called with `UART_RX_RDY` or `UART_RX_BUF_REQUEST` events.

**Parameters**
• `dev` – UART device instance.
buf – Pointer to receive buffer.
len – Buffer length.

timeout – Inactivity period after receiving at least a byte which triggers UART_RX_RDY event. Given in microseconds. SYS_FOREVER_US disables timeout. See uart_event_type for details.

Return values
• 0 – If successful.
• -ENOTSUP – If API is not enabled.
• -EBUSY – RX already in progress.
• -errno – Other negative errno value in case of failure.

static inline int uart_rx_buf_rsp(const struct device *dev, uint8_t *buf, size_t len)

Provide receive buffer in response to UART_RX_BUF_REQUEST event. Provide pointer to RX buffer, which will be used when current buffer is filled.

Note: Providing buffer that is already in usage by driver leads to undefined behavior. Buffer can be reused when it has been released by driver.

Parameters
• dev – UART device instance.
• buf – Pointer to receive buffer.
• len – Buffer length.

Return values
• 0 – If successful.
• -ENOTSUP – If API is not enabled.
• -EBUSY – Next buffer already set.
- **EACCES** – Receiver is already disabled (function called too late?).
- **-errno** – Other negative errno value in case of failure.

static inline int uart_rx_buf_rsp_u16(const struct device *dev, uint16_t *buf, size_t len)

Provide wide data receive buffer in response to `UART_RX_BUF_REQUEST` event.
Provide pointer to RX buffer, which will be used when current buffer is filled.

**Note:** Providing buffer that is already in usage by driver leads to undefined behavior. Buffer can be reused when it has been released by driver.

**Parameters**

- **dev** – UART device instance.
- **buf** – Pointer to wide data receive buffer.
- **len** – Buffer length.

**Return values**

- **0** – If successful.
- **-ENOTSUP** – If API is not enabled
- **-EBUSY** – Next buffer already set.
- **-EACCES** – Receiver is already disabled (function called too late?).
- **-errno** – Other negative errno value in case of failure.

```c
int uart_rx_disable(const struct device *dev)
```

Disable RX.

`UART_RX_BUF_RELEASED` event will be generated for every buffer scheduled, after that `UART_RX_DISABLED` event will be generated. Additionally, if there is any pending received data, the `UART_RX_RDY` event for that data will be generated before the `UART_RX_BUF_RELEASED` events.

**Parameters**

- **dev** – UART device instance.

**Return values**

- **0** – If successful.
- **-ENOTSUP** – If API is not enabled.
- **-EFAULT** – There is no active reception.
- **-errno** – Other negative errno value in case of failure.

```c
struct uart_event_tx
```

#include `<uart.h>` UART TX event data.

**Public Members**

```c
const uint8_t *buf
```

Pointer to current buffer.
size_t len
   Number of bytes sent.

struct uart_event_rx
   #include <uart.h> UART RX event data.
   The data represented by the event is stored in rx.buf[rx.offset] to rx.buf[rx.offset+rx.len].
   That is, the length is relative to the offset.

Public Members

uint8_t *buf
   Pointer to current buffer.

size_t offset
   Currently received data offset in bytes.

size_t len
   Number of new bytes received.

struct uart_event_rx_buf
   #include <uart.h> UART RX buffer released event data.

struct uart_event_rx_stop
   #include <uart.h> UART RX stopped data.

Public Members

denum uart_rx_stop_reason reason
   Reason why receiving stopped.

struct uart_event_rx data
   Last received data.

struct uart_event
   #include <uart.h> Structure containing information about current event.

Public Members

enum uart_event_type type
   Type of event.

union uart_event_data
   #include <uart.h> Event data.
Public Members

struct uart_event_tx tx
    UART_TX_DONE and UART_TX_ABORTED events data.

struct uart_event_rx rx
    UART_RX_RDY event data.

struct uart_event_rx_buf rx_buf
    UART_RX_BUFRELEASED event data.

struct uart_event_rx_stop rx_stop
    UART_RX_STOPPED event data.

7.3.38 USB-C VBUS

Overview

USB-C VBUS is the line in a USB Type-C connection that delivers power from a Source to a Sink device.

USB-C VBUS API The USB-C VBUS device driver presents an API that’s used to control and measure VBUS.

Configuration Options

Related configuration options:

• CONFIG_USBC_VBUS_DRIVER

API Reference

group usbc_vbus_api
    USB-C VBUS API.

Functions

static inline bool usbc_vbus_check_level(const struct device *dev, enum tc_vbus_level level)
    Checks if VBUS is at a particular level.

Parameters

• dev – Runtime device structure
• level – The level voltage to check against

Return values

• true – if VBUS is at the level voltage
• false – if VBUS is not at that level voltage
static inline int usbc_vbus_measure(const struct device *dev, int *meas)

Reads and returns VBUS measured in mV.

**Parameters**

- `dev` – Runtime device structure
- `meas` – pointer where the measured VBUS voltage is stored

**Return values**

- 0 – on success
- -EIO – on failure

static inline int usbc_vbus_discharge(const struct device *dev, bool enable)

Controls a pin that discharges VBUS.

**Parameters**

- `dev` – Runtime device structure
- `enable` – Discharge VBUS when true

**Return values**

- 0 – on success
- -EIO – on failure
- -ENOENT – if discharge pin isn’t defined

static inline int usbc_vbus_enable(const struct device *dev, bool enable)

Controls a pin that enables VBUS measurements.

**Parameters**

- `dev` – Runtime device structure
- `enable` – enable VBUS measurements when true

**Return values**

- 0 – on success
- -EIO – on failure
- -ENOENT – if enable pin isn’t defined

```c
#include <usbc_vbus.h>
```

#7.3.39 MDIO

**Overview**

MDIO is a bus that is commonly used to communicate with ethernet PHY devices. Many ethernet MAC controllers also provide hardware to communicate over MDIO bus with a peripheral device.

This API is intended to be used primarily by PHY drivers but can also be used by user firmware.

**API Reference**

```c
group mdio_interface
    MDIO Interface.
```
Functions

void mdio_bus_enable(const struct device *dev)
    Enable MDIO bus.

Parameters
    • dev – [in] Pointer to the device structure for the controller

void mdio_bus_disable(const struct device *dev)
    Disable MDIO bus and tri-state drivers.

Parameters
    • dev – [in] Pointer to the device structure for the controller

int mdio_read(const struct device *dev, uint8_t prtad, uint8_t devad, uint16_t *data)
    Read from MDIO Bus.
    This routine provides a generic interface to perform a read on the MDIO bus.

Parameters
    • dev – [in] Pointer to the device structure for the controller
    • prtad – [in] Port address
    • devad – [in] Device address
    • data – Pointer to receive read data

Return values
    • 0 – If successful.
    • -EIO – General input / output error.
    • -ETIMEDOUT – If transaction timed out on the bus

int mdio_write(const struct device *dev, uint8_t prtad, uint8_t devad, uint16_t data)
    Write to MDIO Bus.
    This routine provides a generic interface to perform a write on the MDIO bus.

Parameters
    • dev – [in] Pointer to the device structure for the controller
    • prtad – [in] Port address
    • devad – [in] Device address
    • data – [in] Data to write

Return values
    • 0 – If successful.
    • -EIO – General input / output error.
    • -ETIMEDOUT – If transaction timed out on the bus

7.3.40 Watchdog

Overview

API Reference
group watchdog_interface

Watchdog Interface.

Watchdog options

WDT_OPT_PAUSE_IN_SLEEP
   Pause watchdog timer when CPU is in sleep state.

WDT_OPT_PAUSE_HALTED_BY_DBG
   Pause watchdog timer when CPU is halted by the debugger.

Watchdog behavior flags

WDT_FLAG_RESET_NONE
   Reset: none

WDT_FLAG_RESET_CPU_CORE
   Reset: CPU core

WDT_FLAG_RESET_SOC
   Reset: SoC

Typedefs

typedef void (*wdt_callback_t)(const struct device *dev, int channel_id)
   Watchdog callback.

   Param dev
      Watchdog device instance.

   Param channel_id
      Channel identifier.

Functions

int wdt_setup(const struct device *dev, uint8_t options)
   Set up watchdog instance.
   This function is used for configuring global watchdog settings that affect all timeouts. It should be called after installing timeouts. After successful return, all installed timeouts are valid and must be serviced periodically by calling wdt_feed().

   Parameters
      • dev – Watchdog device instance.
      • options – Configuration options (see WDT_OPT).

   Return values
int wdt_disable(const struct device *dev)

Disable watchdog instance.

This function disables the watchdog instance and automatically uninstalls all timeouts. To set up a new watchdog, install timeouts and call wdt_setup() again. Not all watchdogs can be restarted after they are disabled.

Parameters
• dev – Watchdog device instance.

Return values
• 0 – If successful.
• -ENOTSUP – If any of the set options is not supported.
• -EBUSY – If watchdog instance has been already setup.
• -errno – In case of any other failure.

static inline int wdt_install_timeout(const struct device *dev, const struct wdt_timeout_cfg *cfg)

Install a new timeout.

Note: This function must be used before wdt_setup(). Changes applied here have no effects until wdt_setup() is called.

Parameters
• dev – Watchdog device instance.
• cfg – [in] Timeout configuration.

Return values
• channel_id – If successful, a non-negative value indicating the index of the channel to which the timeout was assigned. This value is supposed to be used as the parameter in calls to wdt_feed().
• -EBUSY – If timeout can not be installed while watchdog has already been setup.
• -ENOMEM – If no more timeouts can be installed.
• -ENOTSUP – If any of the set flags is not supported.
• -EINVAL – If any of the window timeout value is out of possible range. This value is also returned if watchdog supports only one timeout value for all timeouts and the supplied timeout window differs from windows for alarms installed so far.
• -errno – In case of any other failure.

int wdt_feed(const struct device *dev, int channel_id)

Feed specified watchdog timeout.

Parameters
• dev – Watchdog device instance.
• channel_id – Channel index.

**Return values**

• 0 – If successful.
• -EAGAIN – If completing the feed operation would stall the caller, for example due to an in-progress watchdog operation such as a previous `wdt_feed()` call.
• -EINVAL – If there is no installed timeout for supplied channel.
• -errno – In case of any other failure.

```c
struct wdt_window
    #include <watchdog.h> Watchdog timeout window.
```

Each installed timeout needs feeding within the specified time window, otherwise the watchdog will trigger. If the watchdog instance does not support window timeouts then min value must be equal to 0.

**Note:** If specified values can not be precisely set they are always rounded up.

### Public Members

```c
uint32_t min
    Lower limit of watchdog feed timeout in milliseconds.
```

```c
uint32_t max
    Upper limit of watchdog feed timeout in milliseconds.
```

```c
struct wdt_timeout_cfg
    #include <watchdog.h> Watchdog timeout configuration.
```

### Public Members

```c
struct wdt_window window
    Timing parameters of watchdog timeout.
```

```c
wdt_callback_t callback
    Timeout callback (can be NULL).
```

```c
struct wdt_timeout_cfg *next
    Pointer to the next timeout configuration.
```

This field is only available if `CONFIG_WDT_MULTISTAGE` is enabled (watchdogs with staged timeouts functionality). Value must be NULL for single stage timeout.

```c
uint8_t flags
    Flags (see `WDT_FLAGS`).
```

### 7.3.41 Video

The video driver API offers a generic interface to video devices.
Basic Operation

**Video Device** A video device is the abstraction of a hardware or software video function, which can produce, process, consume or transform video data. The video API is designed to offer flexible way to create, handle and combine various video devices.

**Endpoint** Each video device can have one or more endpoints. Output endpoints configure video output function and generate data. Input endpoints configure video input function and consume data.

**Video Buffer** A video buffer provides the transport mechanism for the data. There is no particular requirement on the content. The requirement for the content is defined by the endpoint format. A video buffer can be queued to a device endpoint for filling (input ep) or consuming (output ep) operation, once the operation is achieved, buffer can be dequeued for post-processing, release or reuse.

**Controls** A video control is accessed and identified by a CID (control identifier). It represents a video control property. Different devices will have different controls available which can be generic, related to a device class or vendor specific. The set/get control functions provide a generic scalable interface to handle and create controls.

**Configuration Options**

Related configuration options:

- `CONFIG_VIDEO`

**API Reference**

```c

*group* video_interface

Video Interface.

**Defines**

`video_fourcc(a, b, c, d)`

`VIDEO_PIX_FMT_BGGR8`

`VIDEO_PIX_FMT_GBRG8`

`VIDEO_PIX_FMT_GRBG8`

`VIDEO_PIX_FMT_RGGB8`

`VIDEO_PIX_FMT_RGB565`

`VIDEO_PIX_FMT_JPEG`
```
Typedefs

typedef int (*video_api_set_format_t)(const struct device *dev, enum video_endpoint_id ep, struct video_format *fmt)

Set video format See video_set_format() for argument descriptions.

typedef int (*video_api_get_format_t)(const struct device *dev, enum video_endpoint_id ep, struct video_format *fmt)

get current video format See video_get_format() for argument descriptions.

typedef int (*video_api_enqueue_t)(const struct device *dev, enum video_endpoint_id ep, struct video_buffer *buf)

Enqueue a buffer in the driver's incoming queue. See video_enqueue() for argument descriptions.

typedef int (*video_api_dequeue_t)(const struct device *dev, enum video_endpoint_id ep, struct video_buffer **buf, k_timeout_t timeout)

Dequeue a buffer from the driver's outgoing queue. See video_dequeue() for argument descriptions.

typedef int (*video_api_flush_t)(const struct device *dev, enum video_endpoint_id ep, bool cancel)

Flush endpoint buffers, buffer are moved from incoming queue to outgoing queue. See video_flush() for argument descriptions.

typedef int (*video_api_stream_start_t)(const struct device *dev)

Start the capture or output process. See video_stream_start() for argument descriptions.

typedef int (*video_api_stream_stop_t)(const struct device *dev)

Stop the capture or output process. See video_stream_stop() for argument descriptions.

typedef int (*video_api_set_ctrl_t)(const struct device *dev, unsigned int cid, void *value)

set a video control value. See video_set_ctrl() for argument descriptions.

typedef int (*video_api_get_ctrl_t)(const struct device *dev, unsigned int cid, void *value)

get a video control value. See video_get_ctrl() for argument descriptions.

typedef int (*video_api_get_caps_t)(const struct device *dev, enum video_endpoint_id ep, struct video_caps *caps)

Get capabilities of a video endpoint. See video_get_caps() for argument descriptions.

typedef int (*video_api_set_signal_t)(const struct device *dev, enum video_endpoint_id ep, struct k_poll_signal *signal)

Register/Unregister poll signal for buffer events. See video_set_signal() for argument descriptions.

Enums

enum video_endpoint_id

video_endpoint_id enum Identify the video device endpoint.

Values:
enumerator VIDEO_EP_NONE
enumerator VIDEO_EP_ANY
enumerator VIDEO_EP_IN
enumerator VIDEO_EP_OUT

enum video_signal_result
  video_event enum Identify video event.
  Values:
  enumerator VIDEO_BUF_DONE
  enumerator VIDEO_BUF_ABORTED
  enumerator VIDEO_BUF_ERROR

Functions

static inline int video_set_format(const struct device *dev, enum video_endpoint_id ep, struct video_format *fmt)
  Set video format.
  Configure video device with a specific format.
  Parameters
  • dev – Pointer to the device structure for the driver instance.
  • ep – Endpoint ID.
  • fmt – Pointer to a video format struct.
  Return values
  • 0 – Is successful.
  • -EINVAL – If parameters are invalid.
  • -ENOTSUP – If format is not supported.
  • -EIO – General input / output error.

static inline int video_get_format(const struct device *dev, enum video_endpoint_id ep, struct video_format *fmt)
  Get video format.
  Get video device current video format.
  Parameters
  • dev – Pointer to the device structure for the driver instance.
  • ep – Endpoint ID.
  • fmt – Pointer to video format struct.
  Return values
  pointer – to video format
static inline int video_enqueue(const struct device *dev, enum video_endpoint_id ep, struct video_buffer *buf)

Enqueue a video buffer.
Enqueue an empty (capturing) or filled (output) video buffer in the driver's endpoint incoming queue.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `ep` – Endpoint ID.
- `buf` – Pointer to the video buffer.

**Return values**

- 0 – Is successful.
- -EINVAL – If parameters are invalid.
- -EIO – General input / output error.

static inline int video_dequeue(const struct device *dev, enum video_endpoint_id ep, struct video_buffer **buf, k_timeout_t timeout)

Dequeue a video buffer.
Dequeue a filled (capturing) or displayed (output) buffer from the driver's endpoint outgoing queue.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `ep` – Endpoint ID.
- `buf` – Pointer a video buffer pointer.
- `timeout` – Timeout

**Return values**

- 0 – Is successful.
- -EINVAL – If parameters are invalid.
- -EIO – General input / output error.

static inline int video_flush(const struct device *dev, enum video_endpoint_id ep, bool cancel)

Flush endpoint buffers.
A call to flush finishes when all endpoint buffers have been moved from incoming queue to outgoing queue. Either because canceled or fully processed through the video function.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `ep` – Endpoint ID.
- `cancel` – If true, cancel buffer processing instead of waiting for completion.

**Return values**

0 – Is successful, -ERRNO code otherwise.

static inline int video_stream_start(const struct device *dev)

Start the video device function.
video_stream_start is called to enter ‘streaming’ state (capture, output...). The driver may receive buffers with `video_enqueue()` before `video_stream_start` is called. If driver/device needs a minimum number of buffers before being able to start streaming, then driver set the min_vbuf_count to the related endpoint capabilities.
Return values

• 0 – Is successful.
• -EIO – General input / output error.

static inline int video_stream_stop(const struct device *dev)
Stop the video device function.
On video_stream_stop, driver must stop any transactions or wait until they finish.

Return values

• 0 – Is successful.
• -EIO – General input / output error.

static inline int video_get_caps(const struct device *dev, enum video_endpoint_id ep, struct video_caps *caps)
Get the capabilities of a video endpoint.

Parameters

• dev – Pointer to the device structure for the driver instance.
• ep – Endpoint ID.
• caps – Pointer to the video_caps struct to fill.

Return values

0 – Is successful, -ERRNO code otherwise.

static inline int video_set_ctrl(const struct device *dev, unsigned int cid, void *value)
Set the value of a control.
This set the value of a video control, value type depends on control ID, and must be interpreted accordingly.

Parameters

• dev – Pointer to the device structure for the driver instance.
• cid – Control ID.
• value – Pointer to the control value.

Return values

• 0 – Is successful.
• -EINVAL – If parameters are invalid.
• -ENOTSUP – If format is not supported.
• -EIO – General input / output error.

static inline int video_get_ctrl(const struct device *dev, unsigned int cid, void *value)
Get the current value of a control.
This retrieve the value of a video control, value type depends on control ID, and must be interpreted accordingly.

Parameters

• dev – Pointer to the device structure for the driver instance.
• cid – Control ID.
• value – Pointer to the control value.

Return values

• 0 – Is successful.
static inline int video_set_signal(const struct device *dev, enum video_endpoint_id ep, struct k_poll_signal *signal)

Register/Unregister k_poll signal for a video endpoint.

Register a poll signal to the endpoint, which will be signaled on frame completion (done, aborted, error). Registering a NULL poll signal unregisters any previously registered signal.

Parameters
• dev – Pointer to the device structure for the driver instance.
• ep – Endpoint ID.
• signal – Pointer to k_poll_signal

Return values
0 – Is successful, -ERRNO code otherwise.

struct video_buffer *video_buffer_alloc(size_t size)

Allocate video buffer.

Parameters
• size – Size of the video buffer.

Return values
pointer – to allocated video buffer

void video_buffer_release(struct video_buffer *buf)

Release a video buffer.

Parameters
• buf – Pointer to the video buffer to release.

struct video_format

#include <video.h> video format structure

Used to configure frame format.

Param pixelformat
is the fourcc pixel format value.

Param width
is the frame width in pixels.

Param height
is the frame height in pixels.

Param pitch
is the line stride, the number of bytes that needs to be added to the address in the first pixel of a row in order to go to the address of the first pixel of the next row (>=width).

struct video_format_cap

#include <video.h> video format capability

Used to describe a video endpoint format capability.

Param pixelformat
is a list of supported pixel formats (0 terminated).
Param width_min
is the minimum supported frame width.

Param width_max
is the maximum supported frame width.

Param height_min
is the minimum supported frame width.

Param height_max
is the maximum supported frame width.

Param width_step
is the width step size.

Param height_step
is the height step size.

struct video_caps
#include <video.h> video capabilities
Used to describe video endpoint capabilities.

Param format_caps
is a list of video format capabilities (zero terminated).

Param min_vbuf_count
is the minimal count of video buffers to enqueue before being able to start the stream.

struct video_buffer
#include <video.h> video buffer structure
Represent a video frame.

Param driver_data
is a pointer to driver specific data.

Param buffer
is a pointer to the start of the buffer.

Param size
is the size in bytes of the buffer.

Param bytesused
is the number of bytes occupied by the valid data in the buffer.

Param timestamp
is a time reference in milliseconds at which the last data byte was actually received for input endpoints or to be consumed for output endpoints.

struct video_driver_api
#include <video.h>

group video_controls
Video controls.

Defines

VIDEO_CTRL_CLASS_GENERIC
7.3.42  eSPI

Overview

The eSPI (enhanced serial peripheral interface) is a serial bus that is based on SPI. It also features a four-wire interface (receive, transmit, clock and slave select) and three configurations: single IO, dual IO and quad IO.

The technical advancements include lower voltage signal levels (1.8V vs. 3.3V), lower pin count, and the frequency is twice as fast (66MHz vs. 33MHz) Because of its enhancements, the eSPI is used to replace the LPC (lower pin count) interface, SPI, SMBus and sideband signals.

See eSPI interface specification for additional details.

API Reference

  eSPI SAF Driver APIs

Defines

HOST_KBC_EVT_IBF

HOST_KBC_EVT_OBE

Typedefs

typedef void (*espi_callback_handler_t)(const struct device *dev, struct espi_callback *cb, struct espi_event espi_evt)

  Define the application callback handler function signature.

  **Param dev**
  Device struct for the eSPI device.

  **Param cb**
  Original struct espi_callback owning this handler.

  **Param espi_evt**
  event details that trigger the callback handler.

Enums

enum espi_io_mode
  eSPI I/O mode capabilities

  **Values:**

  enumerator ESPI_IO_MODE_SINGLE_LINE = **BIT**(0)

  enumerator ESPI_IO_MODE_DUAL_LINES = **BIT**(1)

  enumerator ESPI_IO_MODE_QUAD_LINES = **BIT**(2)

enum espi_channel
  eSPI channel.

|--+-----------------------------+-----------------------------+-----------------------------|
| eSPI host | Power | GPIO |
| +---------+-------+------|
| Out of band | management | sources |
| +---------+-------+------|
| SPI flash | processor | controller |
| +---------+-------+------|

(continues on next page)
Identifies each eSPI logical channel supported by eSPI controller. Each channel allows independent traffic, but the assignment of channel type to channel number is fixed.

Note that generic commands are not associated with any channel, so traffic over eSPI can occur if all channels are disabled or not ready.

Values:

enumerator ESPI_CHANNEL_PERIPHERAL = \textit{BIT}(0)

enumerator ESPI_CHANNEL_VWIRE = \textit{BIT}(1)

enumerator ESPI_CHANNEL_OOB = \textit{BIT}(2)

enumerator ESPI_CHANNEL_FLASH = \textit{BIT}(3)
eSPI bus event.
eSPI bus event to indicate events for which user can register callbacks

Values:

Functions

```c
int espi_config(const struct device *dev, struct espi_cfg *cfg)
```

Configure operation of a eSPI controller.

This routine provides a generic interface to override eSPI controller capabilities.

If this eSPI controller is acting as slave, the values set here will be discovered as part through the GET_CONFIGURATION command issued by the eSPI master during initialization.

If this eSPI controller is acting as master, the values set here will be used by eSPI master to determine minimum common capabilities with eSPI slave then send via SET_CONFIGURATION command.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `cfg` – the device runtime configuration for the eSPI controller.

Return values

- 0 – If successful.
- -EIO – General input / output error, failed to configure device.
- -EINVAL – invalid capabilities, failed to configure device.
- -ENOTSUP – capability not supported by eSPI slave.

```c
bool espi_get_channel_status(const struct device *dev, enum espi_channel ch)
```

Query to see if it a channel is ready.

This routine allows to check if logical channel is ready before use. Note that queries for channels not supported will always return false.

Parameters
• dev – Pointer to the device structure for the driver instance.
• ch – the eSPI channel for which status is to be retrieved.

Return values
• true – If eSPI channel is ready.
• false – otherwise.

int espi_read_request(const struct device *dev, struct espi_request_packet *req)
Sends memory, I/O or message read request over eSPI.

This routines provides a generic interface to send a read request packet.

Parameters
• dev – Pointer to the device structure for the driver instance.
• req – Address of structure representing a memory, I/O or message read request.

Return values
• 0 – If successful.
• -ENOTSUP – if eSPI controller doesn't support raw packets and instead low memory transactions are handled by controller hardware directly.
• -EIO – General input / output error, failed to send over the bus.

int espi_write_request(const struct device *dev, struct espi_request_packet *req)
Sends memory, I/O or message write request over eSPI.

This routines provides a generic interface to send a write request packet.

Parameters
• dev – Pointer to the device structure for the driver instance.
• req – Address of structure representing a memory, I/O or message write request.

Return values
• 0 – If successful.
• -ENOTSUP – if eSPI controller doesn't support raw packets and instead low memory transactions are handled by controller hardware directly.
• -EINVAL – General input / output error, failed to send over the bus.

int espi_read_lpc_request(const struct device *dev, enum lpc_peripheral_opcode op, uint32_t *data)
Reads SOC data from a LPC peripheral with information updated over eSPI.

This routine provides a generic interface to read a block whose information was updated by an eSPI transaction. Reading may trigger a transaction. The eSPI packet is assembled by the HW block.

Parameters
• dev – Pointer to the device structure for the driver instance.
• op – Enum representing opcode for peripheral type and read request.
• data – Parameter to be read from to the LPC peripheral.

Return values
• 0 – If successful.
• -ENOTSUP – if eSPI peripheral is off or not supported.
-EINVAL – for unimplemented lpc opcode, but in range.

```c
int espi_write_lpc_request(const struct device *dev, enum lpc_peripheral_opcode op, uint32_t *data)
```

Writes data to a LPC peripheral which generates an eSPI transaction.

This routine provides a generic interface to write data to a block which triggers an eSPI transaction. The eSPI packet is assembled by the HW block.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `op` – Enum representing an opcode for peripheral type and write request.
- `data` – Represents the parameter passed to the LPC peripheral.

**Return values**

- `0` – If successful.
- `-ENOTSUP` – if eSPI peripheral is off or not supported.
- `-EINVAL` – for unimplemented lpc opcode, but in range.

```c
int espi_send_vwire(const struct device *dev, enum espi_vwire_signal signal, uint8_t level)
```

Sends system/platform signal as a virtual wire packet.

This routine provides a generic interface to send a virtual wire packet from slave to master.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `signal` – The signal to be send to eSPI master.
- `level` – The level of signal requested LOW or HIGH.

**Return values**

- `0` – If successful.
- `-EIO` – General input / output error, failed to send over the bus.

```c
int espi_receive_vwire(const struct device *dev, enum espi_vwire_signal signal, uint8_t *level)
```

Retrieves level status for a signal encapsulated in a virtual wire.

This routine provides a generic interface to request a virtual wire packet from eSPI master and retrieve the signal level.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `signal` – the signal to be requested from eSPI master.
- `level` – the level of signal requested 0b LOW, 1b HIGH.

**Return values**

- `-EIO` – General input / output error, failed request to master.

```c
int espi_send_oob(const struct device *dev, struct espi_oob_packet *pckt)
```

Sends SMBus transaction (out-of-band) packet over eSPI bus.

This routine provides an interface to encapsulate a SMBus transaction and send into packet over eSPI bus.

**Parameters**

- `dev` – Pointer to the device structure for the driver instance.
- `pckt` – Address of the packet representation of SMBus transaction.
Return values
-EIO – General input / output error, failed request to master.

int espi_receive_oob(const struct device *dev, struct espi_oob_packet *pckt)
Receives SMBus transaction (out-of-band) packet from eSPI bus.
This routines provides an interface to receive and decoded a SMBus transaction from eSPI bus

Parameters
• dev – Pointer to the device structure for the driver instance.
• pckt – Address of the packet representation of SMBus transaction.

Return values
-EIO – General input / output error, failed request to master.

int espi_read_flash(const struct device *dev, struct espi_flash_packet *pckt)
Sends a read request packet for shared flash.
This routines provides an interface to send a request to read the flash component shared between the eSPI master and eSPI slaves.

Parameters
• dev – Pointer to the device structure for the driver instance.
• pckt – Address of the representation of read flash transaction.

Return values
• -ENOTSUP – eSPI flash logical channel transactions not supported.
• -EBUSY – eSPI flash channel is not ready or disabled by master.
• -EIO – General input / output error, failed request to master.

int espi_write_flash(const struct device *dev, struct espi_flash_packet *pckt)
Sends a write request packet for shared flash.
This routines provides an interface to send a request to write to the flash components shared between the eSPI master and eSPI slaves.

Parameters
• dev – Pointer to the device structure for the driver instance.
• pckt – Address of the representation of write flash transaction.

Return values
• -ENOTSUP – eSPI flash logical channel transactions not supported.
• -EBUSY – eSPI flash channel is not ready or disabled by master.
• -EIO – General input / output error, failed request to master.

int espi_flash_erase(const struct device *dev, struct espi_flash_packet *pckt)
Sends a write request packet for shared flash.
This routines provides an interface to send a request to write to the flash components shared between the eSPI master and eSPI slaves.

Parameters
• dev – Pointer to the device structure for the driver instance.
• pckt – Address of the representation of write flash transaction.

Return values
• -ENOTSUP – eSPI flash logical channel transactions not supported.
-EBUSY – eSPI flash channel is not ready or disabled by master.

-EIO – General input / output error, failed request to master.

static inline void espi_init_callback(struct espi_callback *callback, espi_callback_handler_t handler, enum espi_bus_event evt_type)

Helper to initialize a struct espi_callback properly.

Callback model

(continues on next page)
Parameters

- callback – A valid Application's callback structure pointer.
- handler – A valid handler function pointer.
- evt_type – indicates the eSPI event relevant for the handler. For VWIRE_RECEIVED event the data will indicate the new level asserted.

```
static inline int espi_add_callback(const struct device *dev, struct espi_callback *callback)
```

Add an application callback.

Note: enables to add as many callback as needed on the same device.

---

**Note:** Callbacks may be added to the device from within a callback handler invocation, but whether they are invoked for the current eSPI event is not specified.

---

Parameters

- dev – Pointer to the device structure for the driver instance.
- callback – A valid Application's callback structure pointer.

Returns

0 if successful, negative errno code on failure.

```
static inline int espi_remove_callback(const struct device *dev, struct espi_callback *callback)
```

Remove an application callback.

Note: enables to remove as many callbacks as added through `espi_add_callback()`.

---

**Warning:** It is explicitly permitted, within a callback handler, to remove the registration for the callback that is running, i.e. callback. Attempts to remove other registrations on the same device may result in undefined behavior, including failure to invoke callbacks that remain registered and unintended invocation of removed callbacks.

---

Parameters

- dev – Pointer to the device structure for the driver instance.
- callback – A valid application's callback structure pointer.

Returns

0 if successful, negative errno code on failure.
int espi_saf_config(const struct device *dev, const struct espi_saf_cfg *cfg)
Configure operation of a eSPI controller.

This routine provides a generic interface to override eSPI controller capabilities.

If this eSPI controller is acting as slave, the values set here will be discovered as part through the GET_CONFIGURATION command issued by the eSPI master during initialization.

If this eSPI controller is acting as master, the values set here will be used by eSPI master to determine minimum common capabilities with eSPI slave then send via SET_CONFIGURATION command.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **cfg** – the device runtime configuration for the eSPI controller.

Return values

- **0** – If successful.
- **-EIO** – General input / output error, failed to configure device.
- **-EINVAL** – invalid capabilities, failed to configure device.
- **-ENOTSUP** – capability not supported by eSPI slave.

int espi_saf_set_protection_regions(const struct device *dev, const struct espi_saf_protection *pr)
Set one or more SAF protection regions.

This routine provides an interface to override the default flash protection regions of the SAF controller.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- pr – Pointer to the SAF protection region structure.

**Return values**
- 0 – If successful.
- -EIO – General input / output error, failed to configure device.
- -EINVAL – invalid capabilities, failed to configure device.
- -ENOTSUP – capability not supported by eSPI slave.

```c
int espi_saf_activate(const struct device *dev)
```
Activate SAF block.

This routine activates the SAF block and should only be called after SAF has been configured and the eSPI Master has enabled the Flash Channel.

**Parameters**
- dev – Pointer to the device structure for the driver instance.

**Return values**
- 0 – If successful
- -EINVAL – if failed to activate SAF.

```c
bool espi_saf_get_channel_status(const struct device *dev)
```
Query to see if SAF is ready.

This routine allows to check if SAF is ready before use.

**Parameters**
- dev – Pointer to the device structure for the driver instance.

**Return values**
- true – If eSPI SAF is ready.
- false – otherwise.

```c
int espi_saf_flash_read(const struct device *dev, struct espi_saf_packet *pckt)
```
Sends a read request packet for slave attached flash.

This routines provides an interface to send a request to read the flash component shared between the eSPI master and eSPI slaves.

**Parameters**
- dev – Pointer to the device structure for the driver instance.
- pckt – Address of the representation of read flash transaction.

**Return values**
- -ENOTSUP – eSPI flash logical channel transactions not supported.
- -EBUSY – eSPI flash channel is not ready or disabled by master.
- -EIO – General input / output error, failed request to master.

```c
int espi_saf_flash_write(const struct device *dev, struct espi_saf_packet *pckt)
```
Sends a write request packet for slave attached flash.

This routines provides an interface to send a request to write to the flash components shared between the eSPI master and eSPI slaves.

**Parameters**
- dev – Pointer to the device structure for the driver instance.
- pckt – Address of the representation of write flash transaction.
Return values

- **-ENOTSUP** – eSPI flash logical channel transactions not supported.
- **-EBUSY** – eSPI flash channel is not ready or disabled by master.
- **-EIO** – General input / output error, failed request to master.

```c
int espi_saf_flash_erase(const struct device *dev, struct espi_saf_packet *pckt)
```

Sends a write request packet for slave attached flash.

This routine provides an interface to send a request to write to the flash components shared between the eSPI master and eSPI slaves.

### Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `pckt` – Address of the representation of erase flash transaction.

### Return values

- **-ENOTSUP** – eSPI flash logical channel transactions not supported.
- **-EBUSY** – eSPI flash channel is not ready or disabled by master.
- **-EIO** – General input / output error, failed request to master.

```c
static inline void espi_saf_init_callback(struct espi_callback *callback, espi_callback_handler_t handler, enum espi_bus_event evt_type)
```

Helper to initialize a struct espi_callback properly.

Callback model

(continues on next page)
Parameters

- `callback` – A valid Application's callback structure pointer.
- `handler` – A valid handler function pointer.
- `evt_type` – indicates the eSPI event relevant for the handler. for VWIRE_RECEIVED event the data will indicate the new level asserted.

static inline int espi_saf_add_callback(const struct device *dev, struct espi_callback *callback)
Add an application callback.

Note: enables to add as many callback as needed on the same device.

Note: Callbacks may be added to the device from within a callback handler invocation, but whether they are invoked for the current eSPI event is not specified.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `callback` – A valid Application’s callback structure pointer.

Returns

0 if successful, negative errno code on failure.
static inline int espi_saf_remove_callback(const struct device *dev, struct espi_callback *callback)

Remove an application callback.

Note: enables to remove as many callbacks as added through espi_add_callback().

**Warning:** It is explicitly permitted, within a callback handler, to remove the registration for the callback that is running, i.e. callback. Attempts to remove other registrations on the same device may result in undefined behavior, including failure to invoke callbacks that remain registered and unintended invocation of removed callbacks.

**Parameters**

- dev – Pointer to the device structure for the driver instance.
- callback – A valid application’s callback structure pointer.

**Returns**

0 if successful, negative errno code on failure.

Functions

static inline int miipi_dsi_attach(const struct device *dev, uint8_t channel, const struct miipi_dsi_device *mdev)

Attach a new device to the MIPI-DSI bus.

Parameters

• dev – MIPI-DSI host device.
• channel – Device channel (VID).
• mdev – MIPI-DSI device description.

Returns

0 on success, negative on error

static inline ssize_t miipi_dsi_transfer(const struct device *dev, uint8_t channel, struct miipi_dsi_msg *msg)

Transfer data to/from a device attached to the MIPI-DSI bus.

Parameters

• dev – MIPI-DSI device.
• channel – Device channel (VID).
• msg – Message.

Returns

Size of the transferred data on success, negative on error.

ssize_t miipi_dsi_generic_read(const struct device *dev, uint8_t channel, const void *params, size_t nparams, void *buf, size_t len)

MIPI-DSI generic read.

Parameters

• dev – MIPI-DSI host device.
• channel – Device channel (VID).
• params – Buffer containing request parameters.
• nparams – Number of parameters.
• buf – Buffer where read data will be stored.
• len – Length of the reception buffer.
Returns
Size of the read data on success, negative on error.

ssize_t mipi_dsi_generic_write(const struct device *dev, uint8_t channel, const void *buf, size_t len)

MIPI-DSI generic write.

Parameters
• dev – MIPI-DSI host device.
• channel – Device channel (VID).
• buf – Transmission buffer.
• len – Length of the transmission buffer

Returns
Size of the written data on success, negative on error.

ssize_t mipi_dsi_dcs_read(const struct device *dev, uint8_t channel, uint8_t cmd, void *buf, size_t len)

MIPI-DSI DCS read.

Parameters
• dev – MIPI-DSI host device.
• channel – Device channel (VID).
• cmd – DCS command.
• buf – Buffer where read data will be stored.
• len – Length of the reception buffer.

Returns
Size of the read data on success, negative on error.

ssize_t mipi_dsi_dcs_write(const struct device *dev, uint8_t channel, uint8_t cmd, const void *buf, size_t len)

MIPI-DSI DCS write.

Parameters
• dev – MIPI-DSI host device.
• channel – Device channel (VID).
• cmd – DCS command.
• buf – Transmission buffer.
• len – Length of the transmission buffer

Returns
Size of the written data on success, negative on error.

7.3.44 W1: Dallas 1-Wire Interface

Overview

1-Wire is a low speed half-duplex serial bus using only a single wire plus ground for both data transmission and device power supply. Similarly to I2C, 1-Wire uses a bidirectional open-collector data line, and is a single master multidrop bus. This means one master initiates all data exchanges with the slave devices. The 1-Wire bus supports longer bus lines than I2C, while it reaches speeds of up to 15.4 kbps in standard mode and up to 125 kbps in overdrive mode. Reliable communication in standard speed configuration is possible with 10 nodes over a bus length of 100 meters. Using overdrive speed, 3 nodes on a bus of 10 meters length are expected to work solid. Optimized timing parameters and fewer nodes on the bus may allow to reach larger bus extents.

The implementation details are specified in the BOOK OF IBUTTON STANDARDS.

![Fig. 7.1: A typical 1-Wire bus topology](image)
Zephyr Project Documentation, Release 3.2.99

W1 Master API  Zephyr’s 1-Wire Master API is used to interact with 1-Wire slave devices like temperature sensors and serial memories.

In Zephyr this API is split into the following layers.

- The link layer handles basic communication functions such as bus reset, presence detect and bit transfer operations. It is the only hardware-dependent layer in Zephyr. This layer is supported by a driver using the Zephyr UART interface, which should work on most Zephyr platforms. In the future, a GPIO/Timer based driver and hardware specific drivers might be added.
- The 1-Wire network layer handles all means for slave identification and bus arbitration. This includes ROM commands like Match ROM, or Search ROM.
  - All slave devices have a unique 64-bit identification number, which includes a 8-bit 1-Wire Family Code and a 8-bit CRC.
  - In order to find slaves on the bus, the standard specifies an search algorithm which successively detects all slaves on the bus. This algorithm is described in detail by Maxim’s Applicationnote 187.
- Transport layer and Presentation layer functions are not implemented in the generic 1-Wire driver and therefore must be handled in individual slave drivers.

The 1-Wire API is considered experimental.

Configuration Options

Related configuration options:

- CONFIG_W1
- CONFIG_W1_NET

API Reference

1-Wire data link layer

group w1_data_link

1-Wire data link layer

Functions

int w1_reset_bus(const struct device *dev)
Reset the 1-Wire bus to prepare slaves for communication.

This routine resets all 1-Wire bus slaves such that they are ready to receive a command. Connected slaves answer with a presence pulse once they are ready to receive data.

In case the driver supports both standard speed and overdrive speed, the reset routine takes care of sendig either a short or a long reset pulse depending on the current state. The speed can be changed using w1_configure().

Parameters

- dev – [in] Pointer to the device structure for the driver instance.

Return values

- 0 – If no slaves answer with a present pulse.
- 1 – If at least one slave answers with a present pulse.
- -errno – Negative error code on error.
int w1_read_bit(const struct device *dev)
Read a single bit from the 1-Wire bus.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Return values
• rx_bit – The read bit value on success.
• -errno – Negative error code on error.

int w1_write_bit(const struct device *dev, const bool bit)
Write a single bit to the 1-Wire bus.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• bit – Transmitting bit value 1 or 0.

Return values
• 0 – If successful.
• -errno – Negative error code on error.

int w1_read_byte(const struct device *dev)
Read a single byte from the 1-Wire bus.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Return values
• rx_byte – The read byte value on success.
• -errno – Negative error code on error.

int w1_write_byte(const struct device *dev, uint8_t byte)
Write a single byte to the 1-Wire bus.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• byte – Transmitting byte.

Return values
• 0 – If successful.
• -errno – Negative error code on error.

int w1_read_block(const struct device *dev, uint8_t *buffer, size_t len)
Read a block of data from the 1-Wire bus.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• buffer – [out] Pointer to receive buffer.
• len – Length of receiving buffer (in bytes).

Return values
• 0 – If successful.
• -errno – Negative error code on error.
int w1_write_block(const struct device *dev, const uint8_t *buffer, size_t len)
Write a block of data from the 1-Wire bus.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• buffer – [in] Pointer to transmitting buffer.
• len – Length of transmitting buffer (in bytes).

Return values
• 0 – If successful.
• -errno – Negative error code on error.

size_t w1_get_slave_count(const struct device *dev)
Get the number of slaves on the bus.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Return values
• slave_count – Positive number of connected 1-Wire slaves on success.
• -errno – Negative error code on error.

int w1_configure(const struct device *dev, enum w1_settings_type type, uint32_t value)
Configure parameters of the 1-Wire master.

Allowed configuration parameters are defined in enum w1_settings_type, but master devices may not support all types.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• type – Enum specifying the setting type.
• value – The new value for the passed settings type.

Return values
• 0 – If successful.
• -ENOTSUP – The master doesn’t support the configuration of the supplied type.
• -EIO – General input / output error, failed to configure master devices.

1-Wire network layer

1-Wire ROM Commands

W1_CMD_SKIP_ROM

W1_CMD_MATCH_ROM

W1_CMD_RESUME
W1_CMD_READ_ROM

W1_CMD_SEARCH_ROM

W1_CMD_SEARCH_ALARM

W1_CMD_OVERDRIVE_SKIP_ROM

W1_CMD_OVERDRIVE_MATCH_ROM

CRC Defines

W1_CRC8_SEED
Seed value used to calculate the 1-Wire 8-bit crc.

W1_CRC8_POLYNOMIAL
Polynomial used to calculate the 1-Wire 8-bit crc.

W1_CRC16_SEED
Seed value used to calculate the 1-Wire 16-bit crc.

W1_CRC16_POLYNOMIAL
Polynomial used to calculate the 1-Wire 16-bit crc.

Defines

W1_SEARCH_ALL_FAMILIES
This flag can be passed to searches in order to not filter on family ID.

W1_ROM_INIT_ZERO
Initialize all w1_rom struct members to zero.

Typedefs
typedef void (*w1_search_callback_t)(struct w1_rom *rom, void *user_data)
Define the application callback handler function signature for searches.

Param rom
found The ROM of the found slave.

Param user_data
User data provided to the w1_search_bus() call.
Functions

int w1_read_rom(const struct device *dev, struct w1_rom *rom)
Read Peripheral 64-bit ROM.

This procedure allows the 1-Wire bus master to read the peripherals' 64-bit ROM without using the Search ROM procedure. This command can be used as long as not more than a single peripheral is connected to the bus. Otherwise, data collisions occur, and a faulty ROM is read.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• rom – [out] Pointer to the ROM structure.

Return values
• 0 – If successful.
• -ENODEV – In case no slave responds to reset.
• -errno – Other negative error code in case of invalid crc and communication errors.

int w1_match_rom(const struct device *dev, const struct w1_slave_config *config)
Select a specific slave by broadcasting a selected ROM.

This routine allows the 1-Wire bus master to select a slave identified by its unique ROM, such that the next command will target only this single selected slave.

This command is only necessary in multidrop environments, otherwise, the Skip ROM command can be issued. Once a slave has been selected, to reduce the communication overhead, the resume command can be used instead of this command to communicate with the selected slave.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• config – [in] Pointer to the slave specific 1-Wire config.

Return values
• 0 – If successful.
• -ENODEV – In case no slave responds to reset.
• -errno – Other negative error code on error.

int w1_resume_command(const struct device *dev)
Select the slave last addressed with a Match ROM or Search ROM command.

This routine allows the 1-Wire bus master to re-select a slave device that was already addressed using a Match ROM or Search ROM command.

Parameters
• dev – Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• -ENODEV – In case no slave responds to reset.
• -errno – Other negative error code on error.
int w1_skip_rom(const struct device *dev, const struct w1_slave_config *config)
    Select all slaves regardless of ROM.

This routine sets up the bus slaves to receive a command. It is usually used when there is only
one peripheral on the bus to avoid the overhead of the Match ROM command. But it can also
be used to concurrently write to all slave devices.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• config – [in] Pointer to the slave specific 1-Wire config.

Return values
• 0 – If successful.
• -ENODEV – In case no slave responds to reset.
• -errno – Other negative error code on error.

int w1_reset_select(const struct device *dev, const struct w1_slave_config *config)
    In single drop configurations use Skip Select command, otherwise use Match ROM command.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• config – [in] Pointer to the slave specific 1-Wire config.

Return values
• 0 – If successful.
• -ENODEV – In case no slave responds to reset.
• -errno – Other negative error code on error.

int w1_write_read(const struct device *dev, const struct w1_slave_config *config, const uint8_t *write_buf,
    size_t write_len, uint8_t *read_buf, size_t read_len)
    Write then read data from the 1-Wire slave with matching ROM.

This routine uses w1_reset_select to select the given ROM. Then writes given data and reads
the response back from the slave.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.
• config – [in] Pointer to the slave specific 1-Wire config.
• write_buf – [in] Pointer to the data to be written.
• write_len – Number of bytes to write.
• read_buf – [out] Pointer to storage for read data.
• read_len – Number of bytes to read.

Return values
• 0 – If successful.
• -ENODEV – In case no slave responds to reset.
• -errno – Other negative error code on error.

int w1_search_bus(const struct device *dev, uint8_t command, uint8_t *family,
    w1_search_callback_t callback, void *user_data)
Search 1-wire slaves on the bus.

This function searches slaves on the 1-wire bus, with the possibility to search either all slaves or only slaves that have an active alarm state. If a callback is passed, the callback is called for each found slave.

Note: Filtering on families is not supported.

Parameters

- dev – [in] Pointer to the device structure for the driver instance.
- command – Can either be W1_SEARCH_ALARM or W1_SEARCH_ROM.
- family – W1_SEARCH_ALL_FAMILIES searches all families, filtering on a specific family is not yet supported.
- callback – Application callback handler function to be called for each found slave.
- user_data – [in] User data to pass to the application callback handler function.

Return values

- slave_count – Number of slaves found.
- -errno – Negative error code on error.

static inline int w1_search_rom(const struct device *dev, w1_search_callback_t callback, void *user_data)

Search for 1-Wire slave on bus.

This routine can discover unknown slaves on the bus by scanning for the unique 64-bit registration number.

Parameters

- dev – [in] Pointer to the device structure for the driver instance.
- callback – Application callback handler function to be called for each found slave.
- user_data – [in] User data to pass to the application callback handler function.

Return values

- slave_count – Number of slaves found.
- -errno – Negative error code on error.

static inline int w1_search_alarm(const struct device *dev, w1_search_callback_t callback, void *user_data)

Search for 1-Wire slaves with an active alarm.

This routine searches 1-Wire slaves on the bus, which currently have an active alarm.

Parameters

- dev – [in] Pointer to the device structure for the driver instance.
- callback – Application callback handler function to be called for each found slave.
- user_data – [in] User data to pass to the application callback handler function.

Return values

- slave_count – Number of slaves found.
- **-errno** – Negative error code on error.

```c
static inline uint64_t w1_rom_to_uint64(const struct w1_rom *rom)
```

Function to convert a `w1_rom` struct to an `uint64_t`.

**Parameters**

- `rom` – [in] Pointer to the ROM struct.

**Return values**

- `rom64` – The ROM converted to an unsigned integer in endianness.

```c
static inline void w1_uint64_to_rom(const uint64_t rom64, struct w1_rom *rom)
```

Function to write an `uint64_t` to struct `w1_rom` pointer.

**Parameters**

- `rom64` – Unsigned 64 bit integer representing the ROM in host endianness.
- `rom` – [out] The ROM struct pointer.

```c
static inline uint8_t w1_crc8(const uint8_t *src, size_t len)
```

Compute CRC-8 checksum as defined in the 1-Wire specification.

The 1-Wire CRC 8 variant is using 0x31 as its polynomial with the initial value set to 0x00. This CRC is used to check the correctness of the unique 56-bit ROM.

**Parameters**

- `src` – [in] Input bytes for the computation.
- `len` – Length of the input in bytes.

**Return values**

- `crc` – The computed CRC8 value.

```c
static inline uint16_t w1_crc16(const uint16_t seed, const uint8_t *src, const size_t len)
```

Compute 1-Wire variant of CRC 16.

The 16-bit 1-Wire crc variant is using the reflected polynomial function \(X^{\text{16}} + X^{\text{15}} + X^{\text{2}} + 1\) with the initial value set to 0x0000. See also APPLICATION NOTE 27: “UNDERSTANDING AND USING CYCLIC REDUNDANCY CHECKS WITH MAXIM 1-WIRE AND IBUTTON PRODUCTS” https://www.maximintegrated.com/en/design/technical-documents/app-notes/2/27.html

**Parameters**

- `seed` – Init value for the CRC, it is usually set to 0x0000.
- `src` – [in] Input bytes for the computation.
- `len` – Length of the input in bytes.

**Return values**

- `crc` – The computed CRC16 value.

```c
#include <w1.h> struct w1_rom
```

The 1-Wire family code identifying the slave device type.

An incomplete list of family codes is available at: https://www.maximintegrated.com/en/app-notes/index.mvp/id/155 others are documented in the respective device data sheet.
The serial together with the family code composes the unique 56-bit id.

uint8_t crc
8-bit checksum of the 56-bit unique id.

struct w1_slave_config
#include <w1.h> Node specific 1-wire configuration struct.
This struct is passed to network functions, such that they can configure the bus to address the specific slave using the selected speed.

Public Members

struct w1_rom rom
Unique 1-Wire ROM.

uint32_t overdrive
overdrive speed is used if set to 1.

1-Wire generic functions and helpers  Functions that are not directly related to any of the networking layers.

group w1_interface
1-Wire Interface

Enums

enum w1_settings_type
Defines the 1-Wire master settings types, which are runtime configurable.

Values:

enumerator W1_SETTING_SPEED
Overdrive speed is enabled in case a value of 1 is passed and disabled passing 0.

enumerator W1_SETTING_STRONG_PULLUP
The strong pullup resistor is activated immediately after the next written data block by passing a value of 1, and deactivated passing 0.

enumerator W1_SETTINGS_TYPE_COUNT
Number of different settings types.

Functions

7.3. Peripherals
static inline int w1_lock_bus(const struct device *dev)
Lock the 1-wire bus to prevent simultaneous access.

This routine locks the bus to prevent simultaneous access from different threads. The calling
thread waits until the bus becomes available. A thread is permitted to lock a mutex it has
already locked.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• -errno – Negative error code on error.

static inline int w1_unlock_bus(const struct device *dev)
Unlock the 1-wire bus.

This routine unlocks the bus to permit access to bus line.

Parameters
• dev – [in] Pointer to the device structure for the driver instance.

Return values
• 0 – If successful.
• -errno – Negative error code on error.

7.4 Pin Control

This is a high-level guide to pin control. See Pin Control API for API reference material.

7.4.1 Introduction

The hardware blocks that control pin multiplexing and pin configuration parameters such as pin direc-
tion, pull-up/down resistors, etc. are named pin controllers. The pin controller's main users are SoC
hardware peripherals, since the controller enables exposing peripheral signals, like for example, map
I2C0 SDA signal to pin PX0. Not only that, but it usually allows configuring certain pin settings that
are necessary for the correct functioning of a peripheral, for example, the slew-rate depending on the
operating frequency. The available configuration options are vendor/SoC dependent and can range from
simple pull-up/down options to more advanced settings such as debouncing, low-power modes, etc.

The way pin control is implemented in hardware is vendor/SoC specific. It is common to find a centralized
approach, that is, all pin configuration parameters are controlled by a single hardware block (typically
named pinmux), including signal mapping. Fig. 7.2 illustrates this approach. PX0 can be mapped to
UART0_TX, I2C0_SCK or SPI0_MOSI depending on the AF control bits. Other configuration parameters
such as pull-up/down are controlled in the same block via CONFIG bits. This model is used by several
SoC families, such as many from NXP and STM32.

Other vendors/SoCs use a distributed approach. In such case, the pin mapping and configuration are
controlled by multiple hardware blocks. Fig. 7.3 illustrates a distributed approach where pin mapping is
controlled by peripherals, such as in Nordic nRF SoCs.

From a user perspective, there is no difference in pin controller usage regardless of the hardware imple-
mentation: a user will always apply a state. The only difference lies in the driver implementation. In
general, implementing a pin controller driver for a hardware that uses a distributed approach requires
more effort, since the driver needs to gather knowledge of peripheral dependent registers.
Fig. 7.2: Example of pin control centralized into a single per-pin block

Fig. 7.3: Example pin control distributed between peripheral registers and per-pin block
Pin control vs. GPIO

Some functionality covered by a pin controller driver overlaps with GPIO drivers. For example, pull-up/down resistors can usually be enabled by both the pin control driver and the GPIO driver. In Zephyr context, the pin control driver purpose is to perform peripheral signal multiplexing and configuration of other pin parameters required for the correct operation of that peripheral. Therefore, the main users of the pin control driver are SoC peripherals. In contrast, GPIO drivers are for general purpose control of a pin, that is, when its logic level is read or controlled manually.

7.4.2 State model

For a device driver to operate correctly, a certain pin configuration needs to be applied. Some device drivers require a static configuration, usually set up at initialization time. Others need to change the configuration at runtime depending on the operating conditions, for example, to enable a low-power mode when suspending the device. Such requirements are modeled using states, a concept that has been adapted from the one in the Linux kernel. Each device driver owns a set of states. Each state has a unique name and contains a full pin configuration set (see Table 7.1). This effectively means that states are independent of each other, so they do not need to be applied in any specific order. Another advantage of the state model is that it isolates device drivers from pin configuration.

<table>
<thead>
<tr>
<th>UART0 peripheral</th>
<th>default state</th>
<th>sleep state</th>
</tr>
</thead>
<tbody>
<tr>
<td>TX</td>
<td>• Pin: PA0</td>
<td>• Pin: PA0</td>
</tr>
<tr>
<td></td>
<td>• Pull: NONE</td>
<td>• Pull: NONE</td>
</tr>
<tr>
<td></td>
<td>• Low Power: NO</td>
<td>• Low Power: YES</td>
</tr>
<tr>
<td>RX</td>
<td>• Pin: PA1</td>
<td>• Pin: PA1</td>
</tr>
<tr>
<td></td>
<td>• Pull: UP</td>
<td>• Pull: NONE</td>
</tr>
<tr>
<td></td>
<td>• Low Power: NO</td>
<td>• Low Power: YES</td>
</tr>
</tbody>
</table>

Standard states

The name assigned to pin control states or the number of them is up to the device driver requirements. In many cases a single state applied at initialization time will be sufficient, but in some other cases more will be required. In order to make things consistent, a naming convention has been established for the most common use cases. Table 7.2 details the standardized states and its purpose.

<table>
<thead>
<tr>
<th>State</th>
<th>Identifier</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>PINCTRL_STATE_DEFAULT</td>
<td>State of the pins when the device is in operational state</td>
</tr>
<tr>
<td>sleep</td>
<td>PINCTRL_STATE_SLEEP</td>
<td>State of the pins when the device is in low power or sleep modes</td>
</tr>
</tbody>
</table>

Note that other standard states could be introduced in the future.

Custom states

Some device drivers may require using custom states beyond the standard ones. To achieve that, the device driver needs to have in its scope definitions for the custom state identifiers named as
PINCTRL_STATE_{STATE_NAME}, where {STATE_NAME} is the capitalized state name. For example, if mystate has to be supported, a definition named PINCTRL_STATE_MYSTATE needs to be in the driver’s scope.

**Note:** It is important that custom state identifiers start from PINCTRL_STATE_PRIV_START

If custom states need to be accessed from outside the driver, for example to perform dynamic pin control, custom identifiers should be placed in a header that is publicly accessible.

### Skipping states

In most situations, the states defined in Devicetree will be the ones used in the compiled firmware. However, there are some cases where certain states will be conditionally used depending on a compilation flag. A typical case is the sleep state. This state is only used in practice if CONFIG_PM_DEVICE is enabled. If a firmware variant without device power management is needed, one should in theory remove the sleep state from Devicetree to not waste ROM space storing such unused state.

States can be skipped by the pinctrl Devicetree macros if a definition named PINCTRL_SKIP_{STATE_NAME} expanding to 1 is present when pin control configuration is defined. In case of the sleep state, the pinctrl API already provides such definition conditional to the availability of device power management:

```c
#ifndef CONFIG_PM_DEVICE
/** If device power management is not enabled, "sleep" state will be ignored. */
#define PINCTRL_SKIP_SLEEP 1
#endif
```

### 7.4.3 Dynamic pin control

Dynamic pin control refers to the capability of changing pin configuration at runtime. This feature can be useful in situations where the same firmware needs to run onto slightly different boards, each having a peripheral routed at a different set of pins. This feature can be enabled by setting CONFIG_PINCTRL_DYNAMIC.

**Note:** Dynamic pin control should only be used on devices that have not been initialized. Changing pin configurations while a device is operating may lead to unexpected behavior. Since Zephyr does not support device de-initialization yet, this functionality should only be used during early boot stages.

One of the effects of enabling dynamic pin control is that pinctrl_dev_config will be stored in RAM instead of ROM (not states or pin configurations, though). The user can then use pinctrl_update_states() to update the states stored in pinctrl_dev_config with a new set. This effectively means that the device driver will apply the pin configurations stored in the updated states when it applies a state.

### 7.4.4 Devicetree representation

Because Devicetree is meant to describe hardware, it is the natural choice when it comes to storing pin control configuration. In the following sections you will find an overview on how states and pin configurations are represented in Devicetree.
States

Given a device, each of its pin control state is represented in Devicetree by \texttt{pinctrl-N} properties, being \( N \) the state index starting from zero. The \texttt{pinctrl-names} property is then used to assign a unique identifier for each state property by index, for example, \texttt{pinctrl-names} list entry 0 is the name for \texttt{pinctrl-0}.

\begin{verbatim}
periph0: periph0 {  
  /* state 0 ("default") */  
pinctrl-0 = <...>;  
  ...  
  /* state N ("mystate") */  
pinctrl-N = <...>;  
  /* names for state 0 up to state N */  
pinctrl-names = "default", ..., "mystate";  
  ...  
};
\end{verbatim}

Pin configuration

There are multiple ways to represent the pin configurations in Devicetree. However, all end up encoding the same information: the pin multiplexing and the pin configuration parameters. For example, UART\_RX is mapped to PX0 and pull-up is enabled. The representation choice largely depends on each vendor/SoC, so the Devicetree binding files for the pin control drivers are the best place to look for details.

A popular and versatile option is shown in the example below. One of the advantages of this choice is the grouping capability based on shared pin configuration. This allows to reduce the verbosity of the pin control definitions. Another advantage is that the pin configuration parameters for a particular state are enclosed in a single Devicetree node.

\begin{verbatim}
/* board.dts */  
#include "board-pinctrl.dtsi"

&periph0 {  
    pinctrl-0 = <&periph0_default>;  
    pinctrl-names = "default";
};
\end{verbatim}

\begin{verbatim}
/* vnd-soc-pkgxx.h */  
* File with valid mappings for a specific package (may be autogenerated).  
* This file is optional, but recommended.  
*/  
...  
#define PERIPH0_SIGA_PX0 VNDSOC_PIN(X, 0, MUX0)  
#define PERIPH0_SIGB_PY7 VNDSOC_PIN(Y, 7, MUX4)  
#define PERIPH0_SIGC_PZ1 VNDSOC_PIN(Z, 1, MUX2)  
...  

/* board-pinctrl.dtsi */  
#include <vnd-soc-pkgxx.h>

&pinctrl {  
    /* Node with pin configuration for default state */  
pinctrl_default: periph0_default {  
        group1 {  
            /* Mappings: PERIPH0_SIGA -> PX0, PERIPH0_SIGC -> PZ1 */
        }
    }
}
\end{verbatim}

(continues on next page)
pinmux = <PERIPH0_SIGA_PX0>, <PERIPH0_SIGC_PZ1>;
    /* Pins PX0 and PZ1 have pull-up enabled */
    bias-pull-up;
};
...

Another popular model is based on having a node for each pin configuration and state. While this model
may lead to shorter board pin control files, it also requires to have one node for each pin mapping
and state, since in general, nodes can not be re-used for multiple states. This method is discouraged if
autogeneration is not an option.

Note: Because all Devicetree information is parsed into a C header, it is important to make sure its size is
kept to a minimum. For this reason it is important to prefix pre-generated nodes with /omit-if-no-ref/.
This prefix makes sure that the node is discarded when not used.

/* board.dts */
#include "board-pinctrl.dtsi"

&periph0 {
    pinctrl-0 = <&periph0_siga_px0_default &periph0_sigb_py7_default
                &periph0_sigc_pz1_default>;
    pinctrl-names = "default";
};

/* vnd-soc-pkgxx.dtsi
* File with valid nodes for a specific package (may be autogenerated).
* This file is optional, but recommended.
*/

&pinctrl {
    /* Mapping for PERIPH0_SIGA -> PX0, to be used for default state */
    /omit-if-no-ref/ periph0_siga_px0_default: periph0_siga_px0_default {
        pinmux = <VNDSOC_PIN(X, 0, MUX0)>;
    };

    /* Mapping for PERIPH0_SIGB -> PY7, to be used for default state */
    /omit-if-no-ref/ periph0_sigb_py7_default: periph0_sigb_py7_default {
        pinmux = <VNDSOC_PIN(Y, 7, MUX4)>;
    };

    /* Mapping for PERIPH0_SIGC -> PZ1, to be used for default state */
    /omit-if-no-ref/ periph0_sigc_pz1_default: periph0_sigc_pz1_default {
        pinmux = <VNDSOC_PIN(Z, 1, MUX2)>;
    };
};

/* board-pinctrl.dts */
#include <vnd-soc-pkgxx.dtsi>
/* Enable pull-up for PX0 (default state) */
&periph0_siga_px0_default {
    bias-pull-up;
};

/* Enable pull-up for PZ1 (default state) */
&periph0_sigm_pz1_default {
    bias-pull-up;
};

Note: It is discouraged to add pin configuration defaults in pre-defined nodes. In general, pin configurations depend on the board design or on the peripheral working conditions, so the decision should be made by the board. For example, enabling a pull-up by default may not always be desired because the board already has one or because its value depends on the operating bus speed. Another downside of defaults is that user may not be aware of them, for example:

/* not evident that "periph0_siga_px0_default" also implies "bias-pull-up" */
/omit-if-no-ref/ periph0_siga_px0_default: periph0_siga_px0_default {
    pinmux = <VNDSOC_PIN(X, 0, MUX0)>;
    bias-pull-up;
};

7.4.5 Implementation guidelines

Pin control drivers

Pin control drivers need to implement a single function: `pinctrl_configure_pins()`. This function receives an array of pin configurations that need to be applied. Furthermore, if `CONFIG_PINCTRL_STORE_REG` is set, it also receives the associated device register address for the given pins. This information may be required by some drivers to perform device specific actions.

The pin configuration is stored in an opaque type that is vendor/SoC dependent: `pinctrl_soc_pin_t`. This type needs to be defined in a header named `pinctrl_soc.h` file that is in the Zephyr's include path. It can range from a simple integer value to a struct with multiple fields. `pinctrl_soc.h` also needs to define a macro named `Z_PINCTRL_STATE_PINS_INIT` that accepts two arguments: a node identifier and a property name (`pinctrl-N`). With this information the macro needs to define an initializer for all pin configurations contained within the `pinctrl-N` property of the given node.

Regarding Devicetree pin configuration representation, vendors can decide which option is better for their devices. However, the following guidelines should be followed:

- Use `pinctrl-N (N=0, 1, …)` and `pinctrl-names` properties to define pin control states. These properties are defined in `dts/bindings/pinctrl/pinctrl-device.yaml`.
- Use standard pin configuration properties as defined in `dts/bindings/pinctrl/pincfg-node.yaml`.

Representations not following these guidelines may be accepted if they are already used by the same vendor in other operating systems, e.g. Linux.

Device drivers

In this section you will find some tips on how a device driver should use the `pinctrl` API to successfully configure the pins it needs.
The device compatible needs to be modified in the corresponding binding so that the pinctrl-device.yaml is included. For example:

```
include: [base.yaml, pinctrl-device.yaml]
```

This file is needed to add pinctrl-N and pinctrl-names properties to the device.

From a device driver perspective there are two steps that need to be performed to be able to use the pinctrl API. First, the pin control configuration needs to be defined. This includes all states and pins. `PINCTRL_DT_DEFINE` or `PINCTRL_DT_INST_DEFINE` macros should be used for this purpose. Second, a reference to the device instance `pinctrl_dev_config` needs to be stored, since it is required to later use the API. This can be achieved using the `PINCTRL_DT_DEV_CONFIG_GET` and `PINCTRL_DT_INST_DEV_CONFIG_GET` macros.

It is worth to note that the only relationship between a device and its associated pin control configuration is based on variable naming conventions. The way an instance of `pinctrl_dev_config` is named for a corresponding device instance allows to later obtain a reference to it given the device's Devicetree node identifier. This allows to minimize ROM usage, since only devices requiring pin control will own a reference to a pin control configuration.

Once the driver has defined the pin control configuration and kept a reference to it, it is ready to use the API. The most common way to apply a state is by using `pinctrl_apply_state()`. It is also possible to use the lower level function `pinctrl_apply_state_direct()` to skip state lookup if it is cached in advance (e.g. at init time). Since state lookup time is expected to be fast, it is recommended to use `pinctrl_apply_state()`.

The example below contains a complete example of a device driver that uses the pinctrl API.

```c
/* A driver for the "mydev" compatible device */
#define DT_DRV_COMPAT mydev

...
#include <zephyr/drivers/pinctrl.h>
...

struct mydev_config {
    ...
    /* Reference to mydev pinctrl configuration */
    const struct pinctrl_dev_config *pcfg;
    ...
};
...

static int mydev_init(const struct device *dev)
{
    const struct mydev_config *config = dev->config;
    int ret;
    ...
    /* Select "default" state at initialization time */
    ret = pinctrl_apply_state(config->pcfg, PINCTRL_STATE_DEFAULT);
    if (ret < 0) {
        return ret;
    }
    ...
}

#define MYDEV_DEFINE(i) 
    /* Define all pinctrl configuration for instance "i" */
    \PINCTRL_DT_INST_DEFINE(i);
```

(continues on next page)
static const struct mydev_config mydev_config_##i = {
  .pcf = PINCTRL_DT_INST_DEV_CONFIG_GET(i),
};

DEVICE_DT_INST_DEFINE(i, mydev_init, NULL, &mydev_data##i, &mydev_config##i, ...);

DT_INST_FOREACH_STATUS_OKAY(MYDEV_DEFINE)

### 7.4.6 Pin Control API

**group pinctrl_interface**

Pin Controller Interface.

**Pin control states**

**PINCTRL_STATE_DEFAULT**

Default state (state used when the device is in operational state).

**PINCTRL_STATE_SLEEP**

Sleep state (state used when the device is in low power mode).

**PINCTRL_STATE_PRIV_START**

This and higher values refer to custom private states.

**Defines**

**PINCTRL_REG_NONE**

Utility macro to indicate no register is used.

**PINCTRL_DT_DEV_CONFIG_DECLARE(node_id)**

Declare pin control configuration for a given node identifier.

This macro should be used by tests or applications using runtime pin control to declare the pin control configuration for a device. **PINCTRL_DT_DEV_CONFIG_GET** can later be used to obtain a reference to such configuration.

Only available if CONFIG_PINCTRL_NON_STATIC is selected.

**Parameters**

- node_id – Node identifier.
PINCTRL_DT_DEFINE(node_id)
Define all pin control information for the given node identifier.

This helper macro should be called together with device definition. It defines and initializes
the pin control configuration for the device represented by node_id. Each pin control state
(pinctrl-0, ..., pinctrl-N) is also defined and initialized. Note that states marked to be skipped
will not be defined (refer to Z_PINCTRL_SKIP_STATE for more details).

Parameters
• node_id – Node identifier.

PINCTRL_DT_INST_DEFINE(inst)
Define all pin control information for the given compatible index.

See also:
PINCTRL_DT_DEFINE
Parameters
• inst – Instance number.

PINCTRL_DT_DEV_CONFIG_GET(node_id)
Obtain a reference to the pin control configuration given a node identifier.

Parameters
• node_id – Node identifier.

PINCTRL_DT_INST_DEV_CONFIG_GET(inst)
Obtain a reference to the pin control configuration given current compatible instance number.

See also:
PINCTRL_DT_DEV_CONFIG_GET
Parameters
• inst – Instance number.

Functions

int pinctrl_lookup_state(const struct pinctrl_dev_config *config, uint8_t id, const struct pinctrl_state **state)
Find the state configuration for the given state id.

Parameters
• config – Pin controller configuration.
• id – Pin controller state id (see PINCTRL_STATES).
• state – Found state.

Return values
• 0 – If state has been found.
• -ENOTENT – If the state has not been found.
int pinctrl_configure_pins(const pinctrl_soc_pin_t *pins, uint8_t pin_cnt, uintptr_t reg)
Configure a set of pins.
This function will configure the necessary hardware blocks to make the configuration immediately effective.

**Warning:** This function must never be used to configure pins used by an instantiated device driver.

**Parameters**
- `pins` – List of pins to be configured.
- `pin_cnt` – Number of pins.
- `reg` – Device register (optional, use `PINCTRL_REG_NONE` if not used).

**Return values**
- 0 – If succeeded
- -errno – Negative errno for other failures.

static inline int pinctrl_apply_state_direct(const struct pinctrl_dev_config *config, const struct pinctrl_state *state)
Apply a state directly from the provided state configuration.

**Parameters**
- `config` – Pin control configuration.
- `state` – State.

**Return values**
- 0 – If succeeded
- -errno – Negative errno for other failures.

static inline int pinctrl_apply_state(const struct pinctrl_dev_config *config, uint8_t id)
Apply a state from the given device configuration.

**Parameters**
- `config` – Pin control configuration.
- `id` – Id of the state to be applied (see `PINCTRL_STATES`).

**Return values**
- 0 – If succeeded.
- -ENOENT – If given state id does not exist.
- -errno – Negative errno for other failures.

struct pinctrl_state

`#include <pinctrl.h>` Pin control state configuration.

**Public Members**

const pinctrl_soc_pin_t *pins
Pin configurations.
uint8_t pin_cnt
   Number of pin configurations.

uint8_t id
   State identifier (see PINCTRL_STATES).

struct pinctrl_dev_config
#include <pinctrl.h> Pin controller configuration for a given device.

Public Members

uintptr_t reg
   Device address (only available if CONFIG_PINCTRL_STORE_REG is enabled).

const struct pinctrl_state *states
   List of state configurations.

uint8_t state_cnt
   Number of state configurations.

Dynamic pin control

group pinctrl_interface_dynamic

Defines

PINCTRL_DT_STATE_PINS_DEFINE(node_id, prop)
   Helper macro to define the pins of a pin control state from Devicetree.

   The name of the defined state pins variable is the same used by prop. This macro is expected
   to be used in conjunction with PINCTRL_DT_STATE_INIT.

   See also:

PINCTRL_DT_STATE_INIT

Parameters

   • node_id – Node identifier containing prop.
   • prop – Property within node_id containing state configuration.

PINCTRL_DT_STATE_INIT(prop, state)
   Utility macro to initialize a pin control state.

   This macro should be used in conjunction with PINCTRL_DT_STATE_PINS_DEFINE when using
   dynamic pin control to define an alternative state configuration stored in Devicetree.

   Example:
// board.dts
/
{
  zephyr, user {
    // uart0_alt_default node contains alternative pin config
    uart0_alt_default = <&uart0_alt_default>;
  };
};

// application
PINCTRL_DT_STATE_PINS_DEFINE(DT_PATH(zephyr_user), uart0_alt_default);

static const struct pinctrl_state uart0_alt[] = {
  PINCTRL_DT_STATE_INIT(uart0_alt_default, PINCTRL_STATE_DEFAULT)
};

See also:
PINCTRL_DT_STATE_PINS_DEFINE

Parameters

- prop – Property name in Devicetree containing state configuration.
- state – State represented by prop (see PINCTRL_STATES).

Functions

int pinctrl_update_states(struct pinctrl_dev_config *config, const struct pinctrl_state *states,
                           uint8_t state_cnt)

Update states with a new set.

Note: In order to guarantee device drivers correct operation the same states have to be provided. For example, if default and sleep are in the current list of states, it is expected that the new array of states also contains both.

Parameters

- config – Pin control configuration.
- states – New states to be set.
- state_cnt – Number of new states to be set.

Return values

- EINVAL – If the new configuration does not contain the same states as the current active configuration.
- ENOSYS – If the functionality is not available.
- 0 – On success.

7.5 Porting

These pages document how to port Zephyr to new hardware.

7.5.1 Architecture Porting Guide

An architecture port is needed to enable Zephyr to run on an ISA (instruction set architecture) or an ABI (Application Binary Interface) that is not currently supported.

The following are examples of ISAs and ABIs that Zephyr supports:

- x86_32 ISA with System V ABI
- ARMv7-M ISA with Thumb2 instruction set and ARM Embedded ABI (aeabi)
- ARCv2 ISA

For information on Kconfig configuration, see Setting Kconfig configuration values. Architectures use a Kconfig configuration scheme similar to boards.

An architecture port can be divided in several parts; most are required and some are optional:

- **The early boot sequence**: each architecture has different steps it must take when the CPU comes out of reset (required).
- **Interrupt and exception handling**: each architecture handles asynchronous and unrequested events in a specific manner (required).
- **Thread context switching**: the Zephyr context switch is dependent on the ABI and each ISA has a different set of registers to save (required).
- **Thread creation and termination**: a thread's initial stack frame is ABI and architecture-dependent, and thread abortion possibly as well (required).
- **Device drivers**: most often, the system clock timer and the interrupt controller are tied to the architecture (some required, some optional).
- **Utility libraries**: some common kernel APIs rely on an architecture-specific implementation for performance reasons (required).
- **CPU idling/power management**: most architectures implement instructions for putting the CPU to sleep (partly optional, most likely very desired).
- **Fault management**: for implementing architecture-specific debug help and handling of fatal error in threads (partly optional).
- **Linker scripts and toolchains**: architecture-specific details will most likely be needed in the build system and when linking the image (required).

**Early Boot Sequence**

The goal of the early boot sequence is to take the system from the state it is after reset to a state where it can run C code and thus the common kernel initialization sequence. Most of the time, very few steps are needed, while some architectures require a bit more work to be performed.

Common steps for all architectures:

- Setup an initial stack.
• If running an XIP (eXecute-In-Place) kernel, copy initialized data from ROM to RAM.
• If not using an ELF loader, zero the BSS section.
• Jump to _Cstart(), the early kernel initialization
  – _Cstart() is responsible for context switching out of the fake context running at startup into the main thread.

Some examples of architecture-specific steps that have to be taken:
• If given control in real mode on x86_32, switch to 32-bit protected mode.
• Setup the segment registers on x86_32 to handle boot loaders that leave them in an unknown or broken state.
• Initialize a board-specific watchdog on Cortex-M3/4.
• Switch stacks from MSP to PSP on Cortex-M.
• Use a different approach than calling into _Swap() on Cortex-M to prevent race conditions.
• Setup FIRQ and regular IRQ handling on ARCv2.

Interrupt and Exception Handling

Each architecture defines interrupt and exception handling differently. When a device wants to signal the processor that there is some work to be done on its behalf, it raises an interrupt. When a thread does an operation that is not handled by the serial flow of the software itself, it raises an exception. Both, interrupts and exceptions, pass control to a handler. The handler is known as an ISR (Interrupt Service Routine) in the case of interrupts. The handler performs the work required by the exception or the interrupt. For interrupts, that work is device-specific. For exceptions, it depends on the exception, but most often the core kernel itself is responsible for providing the handler.

The kernel has to perform some work in addition to the work the handler itself performs. For example:

• Prior to handing control to the handler:
  – Save the currently executing context.
  – Possibly getting out of power saving mode, which includes waking up devices.
  – Updating the kernel uptime if getting out of tickless idle mode.
• After getting control back from the handler:
  – Decide whether to perform a context switch.
  – When performing a context switch, restore the context being context switched in.

This work is conceptually the same across architectures, but the details are completely different:
• The registers to save and restore.
• The processor instructions to perform the work.
• The numbering of the exceptions.
• etc.

It thus needs an architecture-specific implementation, called the interrupt/exception stub.

Another issue is that the kernel defines the signature of ISRs as:

```c
void (*isr)(void *parameter)
```

Architectures do not have a consistent or native way of handling parameters to an ISR. As such there are two commonly used methods for handling the parameter.
• Using some architecture defined mechanism, the parameter value is forced in the stub. This is commonly found in X86-based architectures.

• The parameters to the ISR are inserted and tracked via a separate table requiring the architecture to discover at runtime which interrupt is executing. A common interrupt handler demuxer is installed for all entries of the real interrupt vector table, which then fetches the device's ISR and parameter from the separate table. This approach is commonly used in the ARC and ARM architectures via the `CONFIG_GEN_ISR_TABLES` implementation. You can find examples of the stubs by looking at `_interrupt_enter()` in x86, `_IntExit()` in ARM, `_isr_wrapper()` in ARM, or the full implementation description for ARC in `arch/arc/core/isr_wrapper.S`.

Each architecture also has to implement primitives for interrupt control:

- locking interrupts: `irq_lock()`, `irq_unlock()`.
- registering interrupts: `IRQ_CONNECT()`.
- programming the priority if possible `irq_priority_set()`.
- enabling/disabling interrupts: `irq_enable()`, `irq_disable()`.

**Note:** `IRQ_CONNECT` is a macro that uses assembler and/or linker script tricks to connect interrupts at build time, saving boot time and text size.

The vector table should contain a handler for each interrupt and exception that can possibly occur. The handler can be as simple as a spinning loop. However, we strongly suggest that handlers at least print some debug information. The information helps figuring out what went wrong when hitting an exception that is a fault, like divide-by-zero or invalid memory access, or an interrupt that is not expected (spurious interrupt). See the ARM implementation in `arch/arm/core/aarch32/cortex_m/fault.c` for an example.

**Thread Context Switching**

Multi-threading is the basic purpose to have a kernel at all. Zephyr supports two types of threads: preemptible and cooperative.

Two crucial concepts when writing an architecture port are the following:

- Cooperative threads run at a higher priority than preemptible ones, and always preempt them.
- After handling an interrupt, if a cooperative thread was interrupted, the kernel always goes back to running that thread, since it is not preemptible.

A context switch can happen in several circumstances:

- When a thread executes a blocking operation, such as taking a semaphore that is currently unavailable.
- When a preemptible thread unblocks a thread of higher priority by releasing the object on which it was blocked.
- When an interrupt unblocks a thread of higher priority than the one currently executing, if the currently executing thread is preemptible.
- When a thread runs to completion.
- When a thread causes a fatal exception and is removed from the running threads. For example, referencing invalid memory,

Therefore, the context switching must thus be able to handle all these cases.

The kernel keeps the next thread to run in a “cache”, and thus the context switching code only has to fetch from that cache to select which thread to run.

There are two types of context switches: **cooperative** and **preemptive**.
• A **cooperative** context switch happens when a thread willfully gives the control to another thread. There are two cases where this happens
  - When a thread explicitly yields.
  - When a thread tries to take an object that is currently unavailable and is willing to wait until the object becomes available.

• A **preemptive** context switch happens either because an ISR or a thread causes an operation that schedules a thread of higher priority than the one currently running, if the currently running thread is preemptible. An example of such an operation is releasing an object on which the thread of higher priority was waiting.

**Note:** Control is never taken from cooperative thread when one of them is the running thread.

A cooperative context switch is always done by having a thread call the \_Swap() kernel internal symbol. When \_Swap is called, the kernel logic knows that a context switch has to happen: \_Swap does not check to see if a context switch must happen. Rather, \_Swap decides what thread to context switch in. \_Swap is called by the kernel logic when an object being operated on is unavailable, and some thread yielding/sleeping primitives.

**Note:** On x86 and Nios2, \_Swap is generic enough and the architecture flexible enough that \_Swap can be called when exiting an interrupt to provoke the context switch. This should not be taken as a rule, since neither the ARM Cortex-M or ARCv2 port do this.

Since \_Swap is cooperative, the caller-saved registers from the ABI are already on the stack. There is no need to save them in the k_thread structure.

A context switch can also be performed preemptively. This happens upon exiting an ISR, in the kernel interrupt exit stub:

- \_interrupt\_enter on x86 after the handler is called.
- \_IntExit on ARM.
- \_firq\_exit and \_rirq\_exit on ARCv2.

In this case, the context switch must only be invoked when the interrupted thread was preemptible, not when it was a cooperative one, and only when the current interrupt is not nested.

The kernel also has the concept of “locking the scheduler”. This is a concept similar to locking the interrupts, but lighter-weight since interrupts can still occur. If a thread has locked the scheduler, is it temporarily non-preemptible.

So, the decision logic to invoke the context switch when exiting an interrupt is simple:

- If the interrupted thread is not preemptible, do not invoke it.
- Else, fetch the cached thread from the ready queue, and:
  - If the cached thread is not the current thread, invoke the context switch.
  - Else, do not invoke it.

This is simple, but crucial: if this is not implemented correctly, the kernel will not function as intended and will experience bizarre crashes, mostly due to stack corruption.

**Note:** If running a coop-only system, i.e. if CONFIG\_NUM\_PREEMPT\_PRIORITIES is 0, no preemptive context switch ever happens. The interrupt code can be optimized to not take any scheduling decision when this is the case.
Thread Creation and Termination

To start a new thread, a stack frame must be constructed so that the context switch can pop it the same way it would pop one from a thread that had been context switched out. This is to be implemented in an architecture-specific new_thread internal routine.

The thread entry point is also not to be called directly, i.e. it should not be set as the PC (program counter) for the new thread. Rather it must be wrapped in thread_entry. This means that the PC in the stack frame shall be set to thread_entry, and the thread entry point shall be passed as the first parameter to thread_entry. The specifics of this depend on the ABI.

The need for an architecture-specific thread termination implementation depends on the architecture. There is a generic implementation, but it might not work for a given architecture.

One reason that has been encountered for having an architecture-specific implementation of thread termination is that aborting a thread might be different if aborting because of a graceful exit or because of an exception. This is the case for ARM Cortex-M, where the CPU has to be taken out of handler mode if the thread triggered a fatal exception, but not if the thread gracefully exits its entry point function.

This means implementing an architecture-specific version of k_thread_abort(), and setting the Kconfig option CONFIG_ARCH_HAS_THREAD_ABORT as needed for the architecture (e.g. see arch/arm/core/aarch32/cortex_m/Kconfig).

Thread Local Storage

To enable thread local storage on a new architecture:

1. Implement arch_tls_stack_setup() to setup the TLS storage area in stack. Refer to the toolchain documentation on how the storage area needs to be structured. Some helper functions can be used:
   - Function z_tls_data_size() returns the size needed for thread local variables (excluding any extra data required by toolchain and architecture).
   - Function z_tls_copy() prepares the TLS storage area for thread local variables. This only copies the variable themselves and does not do architecture and/or toolchain specific data.

2. In the context switching, grab the tls field inside the new thread’s struct k_thread and put it into an appropriate register (or some other variable) for access to the TLS storage area. Refer to toolchain and architecture documentation on which registers to use.

3. In kconfig, add select CONFIG_ARCH_HAS_THREAD_LOCAL_STORAGE to kconfig related to the new architecture.

4. Run the tests/kernel/threads/tls to make sure the new code works.

Device Drivers

The kernel requires very few hardware devices to function. In theory, the only required device is the interrupt controller, since the kernel can run without a system clock. In practice, to get access to most, if not all, of the sanity check test suite, a system clock is needed as well. Since these two are usually tied to the architecture, they are part of the architecture port.

Interrupt Controllers  There can be significant differences between the interrupt controllers and the interrupt concepts across architectures.

For example, x86 has the concept of an IDT and different interrupt controllers. The position of an interrupt in the IDT determines its priority.

On the other hand, the ARM Cortex-M has the NVIC (Nested Vectored Interrupt Controller) as part of the architecture definition. There is no need for an IDT-like table that is separate from the NVIC vector
table. The position in the table has nothing to do with priority of an IRQ: priorities are programmable per-entry.

The ARChitectural Vector (ARCv2) has its interrupt unit as part of the architecture definition, which is somewhat similar to the NVIC. However, where ARC defines interrupts as having a one-to-one mapping between exception and interrupt numbers (i.e. exception 1 is IRQ1, and device IRQs start at 16), ARM has IRQ0 being equivalent to exception 16 (and weirdly enough, exception 1 can be seen as IRQ-15).

All these differences mean that very little, if anything, can be shared between architectures with regards to interrupt controllers.

System Clock  

x86 has APIC timers and the HPET as part of its architecture definition. ARM Cortex-M has the SYSTICK exception. Finally, ARCv2 has the timer0/1 device.

Kernel timeouts are handled in the context of the system clock timer driver's interrupt handler.

Console Over Serial Line  

There is one other device that is almost a requirement for an architecture port, since it is so useful for debugging. It is a simple polling, output-only, serial port driver on which to send the console (printf, printk) output.

It is not required, and a RAM console (CONFIG_RAM_CONSOLE) can be used to send all output to a circular buffer that can be read by a debugger instead.

Utility Libraries

The kernel depends on a few functions that can be implemented with very few instructions or in a lockless manner in modern processors. Those are thus expected to be implemented as part of an architecture port.

- Atomic operators.
  - If instructions do exist for a given architecture, the implementation is configured using the CONFIG_ATOMIC_OPERATIONS_ARCH Kconfig option.
  - If instructions do not exist for a given architecture, a generic version that wraps irq_lock() or irq_unlock() around non-atomic operations exists. It is configured using the CONFIG_ATOMIC_OPERATIONS_C Kconfig option.

- Find-least-significant-bit-set and find-most-significant-bit-set.
  - If instructions do not exist for a given architecture, it is always possible to implement these functions as generic C functions.

It is possible to use compiler built-ins to implement these, but be careful they use the required compiler barriers.

CPU Idling/Power Management

The kernel provides support for CPU power management with two functions: arch_cpu_idle() and arch_cpu_atomic_idle().

arch_cpu_idle() can be as simple as calling the power saving instruction for the architecture with interrupts unlocked, for example hlt on x86, wfi or wfe on ARM, sleep on ARC. This function can be called in a loop within a context that does not care if it get interrupted or not by an interrupt before going to sleep. There are basically two scenarios when it is correct to use this function:

- In a single-threaded system, in the only thread when the thread is not used for doing real work after initialization, i.e. it is sitting in a loop doing nothing for the duration of the application.
- In the idle thread.
arch_cpu_atomic_idle(), on the other hand, must be able to atomically re-enable interrupts and invoke the power saving instruction. It can thus be used in real application code, again in single-threaded systems.

Normally, idling the CPU should be left to the idle thread, but in some very special scenarios, these APIs can be used by applications.

Both functions must exist for a given architecture. However, the implementation can be simply the following steps, if desired:

1. unlock interrupts
2. NOP

However, a real implementation is strongly recommended.

Fault Management

In the event of an unhandled CPU exception, the architecture code must call into z_fatal_error(). This function dumps out architecture-agnostic information and makes a policy decision on what to do next by invoking k_sys_fatal_error(). This function can be overridden to implement application-specific policies that could include locking interrupts and spinning forever (the default implementation) or even powering off the system (if supported).

Toolchain and Linking

Toolchain support has to be added to the build system.

Some architecture-specific definitions are needed in include/zephyr/toolchain/gcc.h. See what exists in that file for currently supported architectures.

Each architecture also needs its own linker script, even if most sections can be derived from the linker scripts of other architectures. Some sections might be specific to the new architecture, for example the SCB section on ARM and the IDT section on x86.

Memory Management

If the target platform enables paging and requires drivers to memory-map their I/O regions, CONFIG_MMU needs to be enabled and the following API implemented:

- arch_mem_map()
- arch_mem_unmap()
- arch_page_phys_get()

Stack Objects

The presence of memory protection hardware affects how stack objects are created. All architecture ports must specify the required alignment of the stack pointer, which is some combination of CPU and ABI requirements. This is defined in architecture headers with ARCH_STACK_PTR_ALIGN and is typically something small like 4, 8, or 16 bytes.

Two types of thread stacks exist:

- “kernel” stacks defined with K_KERNEL_STACK_DEFINE() and related APIs, which can host kernel threads running in supervisor mode or used as the stack for interrupt/exception handling. These have significantly relaxed alignment requirements and use less reserved data. No memory is reserved for privilege elevation stacks.
“thread” stacks which typically use more memory, but are capable of hosting thread running in user mode, as well as any use-cases for kernel stacks.

If CONFIG_USERSPACE is not enabled, “thread” and “kernel” stacks are equivalent.

Additional macros may be defined in the architecture layer to specify the alignment of the base of stack objects, any reserved data inside the stack object not used for the thread's stack buffer, and how to round up stack sizes to support user mode threads. In the absence of definitions some defaults are assumed:

- ARCH_KERNEL_STACK_RESERVED: default no reserved space
- ARCH_THREAD_STACK_RESERVED: default no reserved space
- ARCH_KERNEL_STACK_OBJ_ALIGN: default align to ARCH_STACK_PTR_ALIGN
- ARCH_THREAD_STACK_OBJ_ALIGN: default align to ARCH_STACK_PTR_ALIGN
- ARCH_THREAD_STACK_SIZE_ALIGN: default round up to ARCH_STACK_PTR_ALIGN

All stack creation macros are defined in terms of these.

Stack objects all have the following layout, with some regions potentially zero-sized depending on configuration. There are always two main parts: reserved memory at the beginning, and then the stack buffer itself. The bounds of some areas can only be determined at runtime in the context of its associated thread object. Other areas are entirely computable at build time.

Some architectures may need to carve-out reserved memory at runtime from the stack buffer, instead of unconditionally reserving it at build time, or to supplement an existing reserved area (as is the case with the ARM FPU). Such carve-outs will always be tracked in thread.stack_info.start. The region specified by thread.stack_info.start and thread.stack_info.size is always fully accessible by a user mode thread. thread.stack_info.delta denotes an offset which can be used to compute the initial stack pointer from the very end of the stack object, taking into account storage for TLS and ASLR random offsets.

At present, Zephyr does not support stacks that grow upward.

No Memory Protection If no memory protection is in use, then the defaults are sufficient.

HW-based stack overflow detection This option uses hardware features to generate a fatal error if a thread in supervisor mode overflows its stack. This is useful for debugging, although for a couple reasons, you can’t reliably make any assertions about the state of the system after this happens:

- The kernel could have been inside a critical section when the overflow occurs, leaving important global data structures in a corrupted state.
For systems that implement stack protection using a guard memory region, it’s possible to overshoot the guard and corrupt adjacent data structures before the hardware detects this situation.

To enable the CONFIG_HW_STACK_PROTECTION feature, the system must provide some kind of hardware-based stack overflow protection, and enable the CONFIG_ARCH_HAS_STACK_PROTECTION option.

Two forms of HW-based stack overflow detection are supported: dedicated CPU features for this purpose, or special read-only guard regions immediately preceding stack buffers.

CONFIG_HW_STACK_PROTECTION only catches stack overflows for supervisor threads. This is not required to catch stack overflow from user threads; CONFIG_USERSPACE is orthogonal.

This feature only detects supervisor mode stack overflows, including stack overflows when handling system calls. It doesn’t guarantee that the kernel has not been corrupted. Any stack overflow in supervisor mode should be treated as a fatal error, with no assertions about the integrity of the overall system possible.

Stack overflows in user mode are recoverable (from the kernel’s perspective) and require no special configuration; CONFIG_HW_STACK_PROTECTION only applies to catching overflows when the CPU is in supervisor mode.

**CPU-based stack overflow detection** If we are detecting stack overflows in supervisor mode via special CPU registers (like ARM’s SPLIM), then the defaults are sufficient.

**Guard-based stack overflow detection** We are detecting supervisor mode stack overflows via special memory protection region located immediately before the stack buffer that generates an exception on write. Reserved memory will be used for the guard region.

ARCH_KERNEL_STACK_RESERVED should be defined to the minimum size of a memory protection region. On most ARM CPUs this is 32 bytes. ARCH_KERNEL_STACK_OBJ_ALIGN should also be set to the required alignment for this region.

MMU-based systems should not reserve RAM for the guard region and instead simply leave an non-present virtual page below every stack when it is mapped into the address space. The stack object will still need to be properly aligned and sized to page granularity.

Guard carve-outs for kernel stacks are uncommon and should be avoided if possible. They tend to be needed for two situations:

- The same stack may be re-purposed to host a user thread, in which case the guard is unnecessary and shouldn’t be unconditionally reserved. This is the case when privilege elevation stacks are not inside the stack object.
- The required guard size is variable and depends on context. For example, some ARM CPUs have lazy floating point stacking during exceptions and may decrement the stack pointer by a large value without writing anything, completely overshooting a minimally-sized guard and corrupting adjacent memory. Rather than unconditionally reserving a larger guard, the extra memory is carved out if the thread uses floating point.

**User mode enabled** Enabling user mode activates two new requirements:

- A separate fixed-sized privilege mode stack, specified by CONFIG_PRIVILEGED_STACK_SIZE, must be allocated that the user thread cannot access. It is used as the stack by the kernel when handling...
system calls. If stack guards are implemented, a stack guard region must be able to be placed before it, with support for carve-outs if necessary.

- The memory protection hardware must be able to program a region that exactly covers the thread's stack buffer, tracked in thread.stack_info. This implies that ARCH_THREAD_STACK_SIZE_ADJUST() will need to round up the requested stack size so that a region may cover it, and that ARCH_THREAD_STACK_OBJ_ALIGN() is also specified per the granularity of the memory protection hardware.

This becomes more complicated if the memory protection hardware requires that all memory regions be sized to a power of two, and aligned to their own size. This is common on older MPUs and is known with CONFIG_MPUQUIRES_POWER_OF_TWO_ALIGNMENT.

thread.stack_info always tracks the user-accessible part of the stack object, it must always be correct to program a memory protection region with user access using the range stored within.

Non power-of-two memory region requirements On systems without power-of-two region requirements, the reserved memory area for threads stacks defined by K_THREAD_STACK_RESERVED may be used to contain the privilege mode stack. The layout could be something like:

```
+-------------------------------+ <- thread.stack_obj
| Other platform data |
+-------------------------------+
| Guard region (if enabled) |
+-------------------------------+
| Guard carve-out (if needed) |
|..............................|
| Privilege elevation stack |
+-------------------------------+ <- thread.stack_obj |
K_THREAD_STACK_RESERVED = thread.stack_info.start
```

The guard region, and any carve-out (if needed) would be configured as a read-only region when the thread is created.

- If the thread is a supervisor thread, the privilege elevation region is just extra stack memory. An overflow will eventually crash into the guard region.
- If the thread is running in user mode, a memory protection region will be configured to allow user threads access to the stack buffer, but nothing before or after it. An overflow in user mode will crash into the privilege elevation stack, which the user thread has no access to. An overflow when handling a system call will crash into the guard region.

On an MMU system there should be no physical guards; the privilege mode stack will be mapped into kernel memory, and the stack buffer in the user part of memory, each with non-present virtual guard pages below them to catch runtime stack overflows.

Other platform data may be stored before the guard region, but this is highly discouraged if such data could be stored in thread.arch somewhere.

ARCH_THREAD_STACK_RESERVED will need to be defined to capture the size of the reserved region containing platform data, privilege elevation stacks, and guards. It must be appropriately sized such that an MPU region to grant user mode access to the stack buffer can be placed immediately after it.

Power-of-two memory region requirements Thread stack objects must be sized and aligned to the same power of two, without any reserved memory to allow efficient packing in memory. Thus, any guards in the thread stack must be completely carved out, and the privilege elevation stack must be allocated elsewhere.

ARCH_THREAD_STACK_SIZE_ADJUST() and ARCH_THREAD_STACK_OBJ_ALIGN() should both be defined to Z_POW2_CEIL(). K_THREAD_STACK_RESERVED must be 0.
For the privilege stacks, the `CONFIG_GEN_PRIV_STACKS` must be enabled. For every thread stack found in the system, a corresponding fixed-size kernel stack used for handling system calls is generated. The address of the privilege stacks can be looked up quickly at runtime based on the thread stack address using `z_priv_stack_find()`. These stacks are laid out the same way as other kernel-only stacks.

```
+-----------------------------+ <- z_priv_stack_find(thread.stack_obj)
 | Reserved memory            |
+-----------------------------+ \} K_KERNEL_STACK_RESERVED
+-----------------------------+ <- z_priv_stack_find(thread.stack_obj) +
   | Guard carve-out (if needed)|
   | Privilege elevation stack |
+-----------------------------+ <- thread.stack_obj
+-----------------------------+ <- thread.stack_info.start
   | MPU guard carve-out        |
   | (supervisor mode only)     |
   |.............................|
   | Stack buffer              |
```

The guard carve-out in the thread stack object is only used if the thread is running in supervisor mode. If the thread drops to user mode, there is no guard and the entire object is used as the stack buffer, with full access to the associated user mode thread and `thread.stack_info` updated appropriately.

**User Mode Threads**

To support user mode threads, several kernel-to-arch APIs need to be implemented, and the system must enable the `CONFIG_ARCH_HAS USERSPACE` option. Please see the documentation for each of these functions for more details:

- `arch_buffer_validate()` to test whether the current thread has access permissions to a particular memory region
- `arch_user_mode_enter()` which will irreversibly drop a supervisor thread to user mode privileges. The stack must be wiped.
- `arch_syscall_oops()` which generates a kernel oops when system call parameters can’t be validated, in such a way that the oops appears to be generated from where the system call was invoked in the user thread
- `arch_syscall_invoke0()` through `arch_syscall_invoke6()` invoke a system call with the appropriate number of arguments which must all be passed in during the privilege elevation via registers.
- `arch_is_user_context()` return nonzero if the CPU is currently running in user mode
- `arch_mem_domain_max_partitions_get()` which indicates the max number of regions for a memory domain. MMU systems have an unlimited amount, MPU systems have constraints on this.

Some architectures may need to update software memory management structures or modify hardware registers on another CPU when memory domain APIs are invoked. If so, `CONFIG_ARCH_MEM_DOMAIN_SYNCHRONOUS_API` must be selected by the architecture and some additional APIs must be implemented. This is common on MMU systems and uncommon on MPU systems:

- `arch_mem_domain_thread_add()`
- `arch_mem_domain_thread_remove()`
- `arch_mem_domain_partition_add()`
arch_mem_domain_partition_remove()

Please see the doxygen documentation of these APIs for details.

In addition to implementing these APIs, there are some other tasks as well:

- `_new_thread()` needs to spawn threads with `K_USER` in user mode.
- On context switch, the outgoing thread’s stack memory should be marked inaccessible to user mode by making the appropriate configuration changes in the memory management hardware. The incoming thread’s stack memory should likewise be marked as accessible. This ensures that threads can’t mess with other thread stacks.
- On context switch, the system needs to switch between memory domains for the incoming and outgoing threads.
- Thread stack areas must include a kernel stack region. This should be inaccessible to user threads at all times. This stack will be used when system calls are made. This should be fixed size for all threads, and must be large enough to handle any system call.
- A software interrupt or some kind of privilege elevation mechanism needs to be established. This is closely tied to how the `_arch_syscall_invoke` macros are implemented. On system call, the appropriate handler function needs to be looked up in `_k_syscall_table`. Bad system call IDs should jump to the `K_SYSCALL_BAD` handler. Upon completion of the system call, care must be taken not to leak any register state back to user mode.

GDB Stub

To enable GDB stub for remote debugging on a new architecture:

1. Create a new `gdbstub.h` header file under appropriate architecture include directory (`include/arch/<arch>/gdbstub.h`).
   - Create a new struct `struct gdb_ctx` as the GDB context.
     - Must define a member named `exception` of type `unsigned int` to store the GDB exception reason. This value needs to be set before entering `z_gdb_main_loop()`.
     - Architecture can define as many members as needed for GDB stub to function.
     - Pointer to this struct needs to be passed to `z_gdb_main_loop()`, where this pointer will be passed to other GDB stub functions.

2. Functions for entering and exiting GDB stub main loop.
   - If the architecture relies on interrupts to service breakpoints, interrupt service routines (ISR) need to be implemented, which will serve as the entry point to GDB stub main loop.
   - These functions need to save and restore context so code execution can continue as if no breakpoints have been encountered.
   - These functions need to call `z_gdb_main_loop()` after saving execution context to go into the GDB stub main loop to receive commands from GDB.
   - Before calling `z_gdb_main_loop()`, `gdb_ctx.exception` must be set to specify the exception reason.

3. Implement necessary functions to support GDB stub functionality:
   - `arch_gdb_init()`
     - This needs to initialize necessary bits to support GDB stub functionality, for example, setting up the GDB context and connecting debug interrupts.
     - This must stop code execution via architecture specific method (e.g. raising debug interrupts). This allows GDB to connect during boot.
   - `arch_gdb_continue()`
This function is called when GDB sends a `c` or `continue` command to continue code execution.

- **arch_gdb_step()**
  - This function is called when GDB sends a `si` or `stepi` command to execute one machine instruction, before returning to GDB prompt.

**Hardware register read/write functions:**

- Since the GDB stub is running on the target, manipulation of hardware registers need to be cached to avoid affecting the execution of GDB stub. Think of it as context switching, where the execution context is changed to the GDB stub. So that the register values of the running thread before context switch need to be stored. Manipulation of register values must only be done to this cached copy. The updated values will then be written to hardware registers before switching back to the previous running thread.

  - **arch_gdb_reg_readall()**
    - This collects all hardware register values that would appear in a g/G packets which will be sent back to GDB. The format of the G-packet is architecture specific. Consult GDB on what is expected.
    - Note that, for most architectures, a valid G-packet must be returned and sent to GDB. If a packet without incorrect length is sent to GDB, GDB will abort the debugging session.

  - **arch_gdb_reg_writeall()**
    - This takes a G-packet sent by GDB and populates the hardware registers with values from the G-packet.

  - **arch_gdb_reg_readone()**
    - This reads the value of one hardware register and sends the result to GDB.

  - **arch_gdb_reg_writeone()**
    - This writes the value of one hardware register received from GDB.

**Breakpoints:**

- **arch_gdb_add_breakpoint()** and **arch_gdb_remove_breakpoint()**

  - GDB may decide to use software breakpoints which modifies the memory at the breakpoint locations to replace the instruction with software breakpoint or trap instructions. GDB will then restore the memory content once execution reaches the breakpoints. GDB supports this by default and there is usually no need to handle software breakpoints in the architecture code (where breakpoint type is 0).

  - Hardware breakpoints (type 1) are required if the code is in ROM or flash that cannot be modified at runtime. Consult the architecture datasheet on how to enable hardware breakpoints.

  - If hardware breakpoints are not supported by the architecture, there is no need to implement these in architecture code. GDB will then rely on software breakpoints.

4. For architecture where certain memory regions are not accessible, an array named `gdb_mem_region_array` of type `gdb_mem_region` needs to be defined to specify regions that are accessible. For each array item:

  - `gdb_mem_region.start` specifies the start of a memory region.
  - `gdb_mem_region.end` specifies the end of a memory region.
  - `gdb_mem_region.attributes` specifies the permission of a memory region.
    - `GDB_MEM_REGION_RO`: region is read-only.
    - `GDB_MEM_REGION_RW`: region is read-write.
• *gdb_mem_region.alignment* specifies read/write alignment of a memory region. Use 0 if there is no alignment requirement and read/write can be done byte-by-byte.

**API Reference**

**Timing**

group arch-timing

**Unnamed Group**

```c
void arch_timing_init(void)
    Initialize the timing subsystem.
    Perform the necessary steps to initialize the timing subsystem.

    See also:
    timing_init()
```

```c
void arch_timing_start(void)
    Signal the start of the timing information gathering.
    Signal to the timing subsystem that timing information will be gathered from this point forward.

    See also:
    timing_start()
```

**Note:** Any call to `arch_timing_counter_get()` must be done between calls to `arch_timing_start()` and `arch_timing_stop()`, and on the same CPU core.

```c
void arch_timing_stop(void)
    Signal the end of the timing information gathering.
    Signal to the timing subsystem that timing information is no longer being gathered from this point forward.

    See also:
    timing_stop()
```

**Note:** Any call to `arch_timing_counter_get()` must be done between calls to `arch_timing_start()` and `arch_timing_stop()`, and on the same CPU core.

```c
timing_t arch_timing_counter_get(void)
    Return timing counter.

    See also:
    timing_counter_get()
```
Note: Any call to `arch_timing_counter_get()` must be done between calls to `arch_timing_start()` and `arch_timing_stop()`, and on the same CPU core.

Note: Not all platforms have a timing counter with 64 bit precision. It is possible to see this value “go backwards” due to internal rollover. Timing code must be prepared to address the rollover (with platform-dependent code, e.g. by casting to a `uint32_t` before subtraction) or by using `arch_timing_cycles_get()` which is required to understand the distinction.

Returns
Timing counter.

```c
uint64_t arch_timing_cycles_get(volatile timing_t *const start, volatile timing_t *const end)
```

Get number of cycles between `start` and `end`.

For some architectures or SoCs, the raw numbers from counter need to be scaled to obtain actual number of cycles, or may roll over internally. This function computes a positive-definite interval between two returned cycle values.

See also:
`timing_cycles_get()`

Parameters
- `start` – Pointer to counter at start of a measured execution.
- `end` – Pointer to counter at stop of a measured execution.

Returns
Number of cycles between start and end.

```c
uint64_t arch_timing_freq_get(void)
```

Get frequency of counter used (in Hz).

See also:
`timing_freq_get()`

Returns
Frequency of counter used for timing in Hz.

```c
uint64_t arch_timing_cycles_to_ns(uint64_t cycles)
```

Convert number of cycles into nanoseconds.

See also:
`timing_cycles_to_ns()`

Parameters
- `cycles` – Number of cycles

Returns
Converted time value
uint64_t arch_timing_cycles_to_ns_avg(uint64_t cycles, uint32_t count)

Convert number of cycles into nanoseconds with averaging.

See also:

timing_cycles_to_ns_avg()

Parameters

• cycles – Number of cycles
• count – Times of accumulated cycles to average over

Returns

Converted time value

uint32_t arch_timing_freq_get_mhz(void)

Get frequency of counter used (in MHz).

See also:

timing_freq_get_mhz()

Returns

Frequency of counter used for timing in MHz.

Functions

void arch_busy_wait(uint32_t usec_to_wait)

Architecture-specific implementation of busy-waiting

Parameters

• usec_to_wait – Wait period, in microseconds

static inline uint32_t arch_k_cycle_get_32(void)

Obtain the current cycle count, in units that are hardware-specific

See also:

k_cycle_get_32()

static inline uint64_t arch_k_cycle_get_64(void)

Obtain the current cycle count, in units that are hardware-specific

See also:

k_cycle_get_64()

Threads

group arch-threads
Functions

```c
void arch_new_thread(struct k_thread *thread, k_thread_stack_t *stack, char *stack_ptr,
                     k_thread_entry_t *entry, void *p1, void *p2, void *p3)
```

Handle arch-specific logic for setting up new threads

The stack and arch-specific thread state variables must be set up such that a later attempt to
switch to this thread will succeed and we will enter `z_thread_entry` with the requested thread
and arguments as its parameters.

At some point in this function’s implementation, `z_setup_new_thread()` must be called with
the true bounds of the available stack buffer within the thread’s stack object.

The provided stack pointer is guaranteed to be properly aligned with respect to the CPU and
ABI requirements. There may be space reserved between the stack pointer and the bounds of
the stack buffer for initial stack pointer randomization and thread-local storage.

Fields in `thread->base` will be initialized when this is called.

**Parameters**

- **thread** – Pointer to uninitialized `struct k_thread`
- **stack** – Pointer to the stack object
- **stack_ptr** – Aligned initial stack pointer
- **entry** – Thread entry function
- **p1** – 1st entry point parameter
- **p2** – 2nd entry point parameter
- **p3** – 3rd entry point parameter

```c
static inline void arch_switch(void *switch_to, void **switched_from)
```

Cooperative context switch primitive

The action of `arch_switch()` should be to switch to a new context passed in the first argument,
and save a pointer to the current context into the address passed in the second argument.

The actual type and interpretation of the switch handle is specified by the architecture. It is the same data structure stored in the “switch_handle” field of a newly-created thread in `arch_new_thread()`, and passed to the kernel as the “interrupted” argument to `z_get_next_switch_handle()`.

Note that on SMP systems, the kernel uses the store through the second pointer as a synchro-
nization point to detect when a thread context is completely saved (so another CPU can know
when it is safe to switch). This store must be done AFTER all relevant state is saved, and must
include whatever memory barriers or cache management code is required to be sure another
CPU will see the result correctly.

The simplest implementation of `arch_switch()` is generally to push state onto the thread stack
and use the resulting stack pointer as the switch handle. Some architectures may instead
decide to use a pointer into the thread struct as the “switch handle” type. These can legally
assume that the second argument to `arch_switch()` is the address of the switch_handle field of
struct thread_base and can use an offset on this value to find other parts of the thread struct.

For example a (C pseudocode) implementation of `arch_switch()` might look like:

```c
void arch_switch(void *switch_to, void **switched_from) {
    struct k_thread *new = switch_to;
    struct k_thread *old = CONTAINER_OF(switched_from, struct k_thread,switch_handle);
    // save old context... *switched_from = old; // restore new context... }
```

Note that the kernel manages the switch_handle field for synchronization as described above.
So it is not legal for architecture code to assume that it has any particular value at any other
time. In particular it is not legal to read the field from the address passed in the second argument.
Parameters

- `switch_to` – Incoming thread's switch handle
- `switched_from` – Pointer to outgoing thread's switch handle storage location, which must be updated.

```c
void arch_switch_to_main_thread(struct k_thread *main_thread, char *stack_ptr,
                                k_thread_entry_t _main)
```

Custom logic for entering main thread context at early boot

Used by architectures where the typical trick of setting up a dummy thread in early boot context to “switch out” of isn't workable.

Parameters

- `main_thread` – main thread object
- `stack_ptr` – Initial stack pointer
- `_main` – Entry point for application main function.

```c
int arch_float_disable(struct k_thread *thread)
```

Disable floating point context preservation.

The function is used to disable the preservation of floating point context information for a particular thread.

**Note:** For ARM architecture, disabling floating point preservation may only be requested for the current thread and cannot be requested in ISRs.

```c
int arch_float_enable(struct k_thread *thread, unsigned int options)
```

Enable floating point context preservation.

The function is used to enable the preservation of floating point context information for a particular thread. This API depends on each architecture implementation. If the architecture does not support enabling, this API will always be failed.

The `options` parameter indicates which floating point register sets will be used by the specified thread. Currently it is used by x86 only.

Parameters

- `thread` – ID of thread.
- `options` – architecture dependent options

Return values

- 0 – On success.
- -EINVAL – If the floating point enabling could not be performed.
- -ENOTSUP – If the operation is not supported
Functions

size_t arch_tls_stack_setup(struct k_thread *new_thread, char *stack_ptr)

Setup Architecture-specific TLS area in stack.

This sets up the stack area for thread local storage. The structure inside in area is architecture specific.

Parameters

• new_thread – New thread object
• stack_ptr – Stack pointer

Returns

Number of bytes taken by the TLS area

Power Management

group arch-pm

Functions

FUNC_NORETURN void arch_system_halt(unsigned int reason)

Halt the system, optionally propagating a reason code

void arch_cpu_idle(void)

Power save idle routine.

This function will be called by the kernel idle loop or possibly within an implementation of z_pm_save_idle in the kernel when the ‘_pm_save_flag’ variable is non-zero.

Architectures that do not implement power management instructions may immediately return, otherwise a power-saving instruction should be issued to wait for an interrupt.

See also:

k_cpu_idle()

Note: The function is expected to return after the interrupt that has caused the CPU to exit power-saving mode has been serviced, although this is not a firm requirement.

void arch_cpu_atomic_idle(unsigned int key)

Atomically re-enable interrupts and enter low power mode.

The requirements for arch_cpu_atomic_idle() are as follows:

a. Enabling interrupts and entering a low-power mode needs to be atomic, i.e. there should be no period of time where interrupts are enabled before the processor enters a low-power mode. See the comments in k_lifo_get(), for example, of the race condition that occurs if this requirement is not met.

b. After waking up from the low-power mode, the interrupt lockout state must be restored as indicated in the ‘key’ input parameter.

See also:

k_cpu_atomic_idle()
Parameters

- **key** – Lockout key returned by previous invocation of `arch_irq_lock()`

Symmetric Multi-Processing

group arch-smp

Typedefs

typedef FUNC_NORETURN void (*arch_cpustart_t)(void *data)

Per-cpu entry function

**Param data**
context parameter, implementation specific

Functions

void arch_start_cpu(int cpu_num, k_thread_stack_t *stack, int sz, arch_cpustart_t fn, void *arg)

Start a numbered CPU on a MP-capable system.

This starts and initializes a specific CPU. The main thread on startup is running on CPU zero, other processors are numbered sequentially. On return from this function, the CPU is known to have begun operating and will enter the provided function. Its interrupts will be initialized but disabled such that `irq_unlock()` with the provided key will work to enable them.

Normally, in SMP mode this function will be called by the kernel initialization and should not be used as a user API. But it is defined here for special-purpose apps which want Zephyr running on one core and to use others for design-specific processing.

**Parameters**

- **cpu_num** – Integer number of the CPU
- **stack** – Stack memory for the CPU
- **sz** – Stack buffer size, in bytes
- **fn** – Function to begin running on the CPU.
- **arg** – Untyped argument to be passed to “fn”

bool arch_cpu_active(int cpu_num)

Return CPU power status.

**Parameters**

- **cpu_num** – Integer number of the CPU

static inline struct _cpu *arch_curr_cpu(void)

Return the CPU struct for the currently executing CPU

static inline uint32_t arch_proc_id(void)

Processor hardware ID.

Most multiprocessor architectures have a low-level unique ID value associated with the current CPU that can be retrieved rapidly and efficiently in kernel context. Note that while the numbering of the CPUs is guaranteed to be unique, the values are platform-defined. In particular, they are not guaranteed to match Zephyr's own sequential CPU IDs (even though on some platforms they do).
Note: There is an inherent race with this API: the system may preempt the current thread and migrate it to another CPU before the value is used. Safe usage requires knowing the migration is impossible (e.g. because the code is in interrupt context, holds a spinlock, or cannot migrate due to k_cpu_mask state).

**Returns**
Unique ID for currently-executing CPU

void arch_sched_ipi(void)
Broadcast an interrupt to all CPUs
This will invoke z_sched_ipi() on other CPUs in the system.

static inline unsigned int arch_num_cpus(void)
Returns the number of CPUs.
For most systems this will be the same as CONFIG_MP_MAX_NUM_CPUS, however some systems may determine this at runtime instead.

**Returns**
the number of CPUs

**Interrupts**
group arch-irq

**Functions**

static inline bool arch_is_in_isr(void)
Test if the current context is in interrupt context
XXX: This is inconsistently handled among arches wrt exception context See: #17656

**Returns**
true if we are in interrupt context

static inline unsigned int arch_irq_lock(void)
Lock interrupts on the current CPU

**See also:**
*irq_lock()*

static inline void arch_irq_unlock(unsigned int key)
Unlock interrupts on the current CPU

**See also:**
*irq_unlock()*

static inline bool arch_irq_unlocked(unsigned int key)
Test if calling *arch_irq_unlock()* with this key would unlock irqs

**Parameters**
- key – value returned by *arch_irq_lock()*
Returns
true if interrupts were unlocked prior to the `arch_irq_lock()` call that produced the key argument.

```c
void arch_irq_disable(unsigned int irq)
Disables the specified interrupt line.
```

See also:
`irq_disable()`

Note: The behavior of interrupts that arrive after this call returns and before the corresponding call to `arch_irq_enable()` is undefined. The hardware is not required to latch and deliver such an interrupt, though on some architectures that may work. Other architectures will simply lose such an interrupt and never deliver it. Many drivers and subsystems are not tolerant of such dropped interrupts and it is the job of the application layer to ensure that behavior remains correct.

```c
void arch_irq_enable(unsigned int irq)
Enables the specified interrupt line.
```

See also:
`irq_enable()`

```c
int arch_irq_is_enabled(unsigned int irq)
Tests if an interrupt line is enabled.
```

See also:
`irq_is_enabled()`

```c
int arch_irq_connect_dynamic(unsigned int irq, unsigned int priority, void (*routine)(const void *parameter), const void *parameter, uint32_t flags)
Arch-specific hook to install a dynamic interrupt.
```

Parameters
- `irq` – IRQ line number
- `priority` – Interrupt priority
- `routine` – Interrupt service routine
- `parameter` – ISR parameter
- `flags` – Arch-specific IRQ configuration flag

Returns
The vector assigned to this interrupt

```c
unsigned int arch_irq_allocate(void)
Arch-specific hook for allocating IRQs.
```

Note: disable/enable IRQ relevantly inside the implementation of such function to avoid concurrency issues. Also, an allocated IRQ is assumed to be used thus a following

See also:
`arch_irq_is_used()` should return true.
Returns
The newly allocated IRQ or UINT_MAX on error.

void arch_irq_set_used(unsigned int irq)
Arch-specific hook for declaring an IRQ being used.
Note: disable/enable IRQ relevantly inside the implementation of such function to avoid concurrency issues.

Parameters
• irq – the IRQ to declare being used

bool arch_irq_is_used(unsigned int irq)
Arch-specific hook for checking if an IRQ is being used already.

Parameters
• irq – the IRQ to check

Returns
true if being, false otherwise

Userspace

Functions

static inline uintptr_t arch_syscall_invoke0(uintptr_t call_id)
Invoke a system call with 0 arguments.

No general-purpose register state other than return value may be preserved when transitioning from supervisor mode back down to user mode for security reasons.

It is required that all arguments be stored in registers when elevating privileges from user to supervisor mode.

Processing of the syscall takes place on a separate kernel stack. Interrupts should be enabled when invoking the system call marshallers from the dispatch table. Thread preemption may occur when handling system calls.

Call ids are untrusted and must be bounds-checked, as the value is used to index the system call dispatch table, containing function pointers to the specific system call code.

Parameters
• call_id – System call ID

Returns
Return value of the system call. Void system calls return 0 here.

static inline uintptr_t arch_syscall_invoke1(uintptr_t arg1, uintptr_t call_id)
Invoke a system call with 1 argument.

See also:
arch_syscall_invoke0()

Parameters
• arg1 – First argument to the system call.
• call_id – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

Returns
Return value of the system call. Void system calls return 0 here.

static inline uintptr_t arch_syscall_invoke2(uintptr_t arg1, uintptr_t arg2, uintptr_t call_id)
Invoke a system call with 2 arguments.

See also:
arch_syscall_invoke0()

Parameters
• arg1 – First argument to the system call.
• arg2 – Second argument to the system call.
• call_id – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

Returns
Return value of the system call. Void system calls return 0 here.

static inline uintptr_t arch_syscall_invoke3(uintptr_t arg1, uintptr_t arg2, uintptr_t arg3, uintptr_t call_id)
Invoke a system call with 3 arguments.

See also:
arch_syscall_invoke0()

Parameters
• arg1 – First argument to the system call.
• arg2 – Second argument to the system call.
• arg3 – Third argument to the system call.
• call_id – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

Returns
Return value of the system call. Void system calls return 0 here.

static inline uintptr_t arch_syscall_invoke4(uintptr_t arg1, uintptr_t arg2, uintptr_t arg3, uintptr_t arg4, uintptr_t call_id)
Invoke a system call with 4 arguments.

See also:
arch_syscall_invoke0()

Parameters
• arg1 – First argument to the system call.
• arg2 – Second argument to the system call.
• arg3 – Third argument to the system call.
• arg4 – Fourth argument to the system call.
• call_id – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

**Returns**
Return value of the system call. Void system calls return 0 here.

```c
static inline uintptr_t arch_syscall_invoke5(uintptr_t arg1, uintptr_t arg2, uintptr_t arg3, uintptr_t arg4, uintptr_t arg5, uintptr_t call_id)
```

Invoke a system call with 5 arguments.

**See also:**
`arch_syscall_invoke0()`

**Parameters**
- arg1 – First argument to the system call.
- arg2 – Second argument to the system call.
- arg3 – Third argument to the system call.
- arg4 – Fourth argument to the system call.
- arg5 – Fifth argument to the system call.
- call_id – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

**Returns**
Return value of the system call. Void system calls return 0 here.

```c
static inline uintptr_t arch_syscall_invoke6(uintptr_t arg1, uintptr_t arg2, uintptr_t arg3, uintptr_t arg4, uintptr_t arg5, uintptr_t arg6, uintptr_t call_id)
```

Invoke a system call with 6 arguments.

**See also:**
`arch_syscallInvoke0()`

**Parameters**
- arg1 – First argument to the system call.
- arg2 – Second argument to the system call.
- arg3 – Third argument to the system call.
- arg4 – Fourth argument to the system call.
- arg5 – Fifth argument to the system call.
- arg6 – Sixth argument to the system call.
- call_id – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

**Returns**
Return value of the system call. Void system calls return 0 here.
static inline bool arch_is_user_context(void)
    Indicate whether we are currently running in user mode

Returns
    true if the CPU is currently running with user permissions

int arch_mem_domain_max_partitions_get(void)
    Get the maximum number of partitions for a memory domain.

Returns
    Max number of partitions, or -1 if there is no limit

int arch_buffer_validate(void *addr, size_t size, int write)
    Check memory region permissions.
    Given a memory region, return whether the current memory management hardware configuration would allow a user thread to read/write that region. Used by system calls to validate buffers coming in from userspace.
    Notes: The function is guaranteed to never return validation success, if the entire buffer area is not user accessible.
    The function is guaranteed to correctly validate the permissions of the supplied buffer, if the user access permissions of the entire buffer are enforced by a single, enabled memory management region.
    In some architectures the validation will always return failure if the supplied memory buffer spans multiple enabled memory management regions (even if all such regions permit user access).

Warning: 0 size buffer has undefined behavior.

Parameters
    • addr – start address of the buffer
    • size – the size of the buffer
    • write – If nonzero, additionally check if the area is writable. Otherwise, just check if the memory can be read.

Returns
    nonzero if the permissions don’t match.

size_t arch_virt_region_align(uintptr_t phys, size_t size)
    Get the optimal virtual region alignment to optimize the MMU table layout
    Some MMU HW requires some region to be aligned to some of the intermediate block alignment in order to reduce table usage. This call returns the optimal virtual address alignment in order to permit such optimization in the following MMU mapping call.

Parameters
    • phys – [in] Physical address of region to be mapped, aligned to MMU_PAGE_SIZE
    • size – [in] Size of region to be mapped, aligned to MMU_PAGE_SIZE

Return values
    alignment – to apply on the virtual address of this region

FUNC_NORETURN void arch_user_mode_enter(k_thread_entry_t user_entry, void *p1, void *p2, void *p3)
Perform a one-way transition from supervisor to kernel mode.

Implementations of this function must do the following:

- Reset the thread’s stack pointer to a suitable initial value. We do not need any prior context since this is a one-way operation.
- Set up any kernel stack region for the CPU to use during privilege elevation
- Put the CPU in whatever its equivalent of user mode is
- Transfer execution to `arch_new_thread()` passing along all the supplied arguments, in user mode.

**Parameters**

- `user_entry` – Entry point to start executing as a user thread
- `p1` – 1st parameter to user thread
- `p2` – 2nd parameter to user thread
- `p3` – 3rd parameter to user thread

```c
FUNC_NORETURN void arch_syscall_oops(void *ssf)
```

Induce a kernel oops that appears to come from a specific location.

Normally, `k_oops()` generates an exception that appears to come from the call site of the `k_oops()` itself.

However, when validating arguments to a system call, if there are problems we want the oops to appear to come from where the system call was invoked and not inside the validation function.

**Parameters**

- `ssf` – System call stack frame pointer. This gets passed as an argument to `_k_syscall_handler_t` functions and its contents are completely architecture specific.

```c
size_t arch_user_string_nlen(const char *s, size_t maxsize, int *err)
```

Safely take the length of a potentially bad string.

This must not fault, instead the `err` parameter must have -1 written to it. This function otherwise should work exactly like `libc strnlen()`. On success `*err` should be set to 0.

**Parameters**

- `s` – String to measure
- `maxsize` – Max length of the string
- `err` – Error value to write

**Returns**

Length of the string, not counting NULL byte, up to `maxsize`

```c
static inline bool arch_mem_coherent(void *ptr)
```

Detect memory coherence type.

Required when `ARCH_HAS_COHERENCE` is true. This function returns true if the byte pointed to lies within an architecture-defined “coherence region” (typically implemented with uncached memory) and can safely be used in multiprocessor code without explicit flush or invalidate operations.
static inline void arch_cohere_stacks(struct k_thread *old_thread, void *old_switch_handle, struct k_thread *new_thread)

Ensure cache coherence prior to context switch.

Required when ARCH_HAS_COHERENCE is true. On cache-incoherent multiprocessor architectures, thread stacks are cached by default for performance reasons. They must therefore be flushed appropriately on context switch. The rules are:

a. The region containing live data in the old stack (generally the bytes between the current stack pointer and the top of the stack memory) must be flushed to underlying storage so a new CPU that runs the same thread sees the correct data. This must happen before the assignment of the switch_handle field in the thread struct which signals the completion of context switch.

b. Any data areas to be read from the new stack (generally the same as the live region when it was saved) should be invalidated (and NOT flushed!) in the data cache. This is because another CPU may have run or re-initialized the thread since this CPU suspended it, and any data present in cache will be stale.

• old_thread The old thread to be flushed before being allowed to run on other CPUs.
• old_switch_handle The switch handle to be stored into old_thread (it will not be valid until the cache is flushed so is not present yet). This will be NULL if inside z_swap() (because the arch_switch() has not saved it yet).
• new_thread The new thread to be invalidated before it runs locally.

Note: The kernel will call this function during interrupt exit when a new thread has been chosen to run, and also immediately before entering arch_switch() to effect a code-driven context switch. In the latter case, it is very likely that more data will be written to the old_thread stack region after this function returns but before the completion of the switch. Simply flushing naively here is not sufficient on many architectures and coordination with the arch_switch() implementation is likely required.

Memory Management

group arch-mmu

Defines

ARCH_DATA_PAGE_ACCESSED
Bit indicating the data page was accessed since the value was last cleared.
Used by marking eviction algorithms. Safe to set this if uncertain.
This bit is undefined if ARCH_DATA_PAGE_LOADED is not set.
ARCH_DATA_PAGE_DIRTY

Bit indicating the data page, if evicted, will need to be paged out.
Set if the data page was modified since it was last paged out, or if it has never been paged out before. Safe to set this if uncertain.
This bit is undefined if ARCH_DATA_PAGE_LOADED is not set.

ARCH_DATA_PAGE_LOADED

Bit indicating that the data page is loaded into a physical page frame.
If un-set, the data page is paged out or not mapped.

ARCH_DATA_PAGE_NOT_MAPPED

If ARCH_DATA_PAGE_LOADED is un-set, this will indicate that the page is not mapped at all.
This bit is undefined if ARCH_DATA_PAGE_LOADED is set.

Enums

define arch_page_location

Values:

enumerator ARCH_PAGE_LOCATION_PAGED_OUT
enumerator ARCH_PAGE_LOCATION_PAGED_IN
enumerator ARCH_PAGE_LOCATION_BAD

Functions

void arch_mem_map(void *virt, uintptr_t phys, size_t size, uint32_t flags)

Map physical memory into the virtual address space
This is a low-level interface to mapping pages into the address space. Behavior when providing unaligned addresses/sizes is undefined, these are assumed to be aligned to CONFIG_MMU_PAGE_SIZE.
The core kernel handles all management of the virtual address space; by the time we invoke this function, we know exactly where this mapping will be established. If the page tables already had mappings installed for the virtual memory region, these will be overwritten.
If the target architecture supports multiple page sizes, currently only the smallest page size will be used.
The memory range itself is never accessed by this operation.
This API must be safe to call in ISRs or exception handlers. Calls to this API are assumed to be serialized, and indeed all usage will originate from kernel/mm.c which handles virtual memory management.
Architectures are expected to pre-allocate page tables for the entire address space, as defined by CONFIG_KERNEL_VM_BASE and CONFIG_KERNEL_VM_SIZE. This operation should never require any kind of allocation for paging structures.
Validation of arguments should be done via assertions.
This API is part of infrastructure still under development and may change.
Parameters

- virt – Page-aligned Destination virtual address to map
- phys – Page-aligned Source physical address to map
- size – Page-aligned size of the mapped memory region in bytes
- flags – Caching, access and control flags, see K_MAP_* macros

void arch_mem_unmap(void *addr, size_t size)

Remove mappings for a provided virtual address range

This is a low-level interface for un-mapping pages from the address space. When this completes, the relevant page table entries will be updated as if no mapping was ever made for that memory range. No previous context needs to be preserved. This function must update mappings in all active page tables.

Behavior when providing unaligned addresses/sizes is undefined, these are assumed to be aligned to CONFIG_MMU_PAGE_SIZE.

Behavior when providing an address range that is not already mapped is undefined.

This function should never require memory allocations for paging structures, and it is not necessary to free any paging structures. Empty page tables due to all contained entries being un-mapped may remain in place.

Implementations must invalidate TLBs as necessary.

This API is part of infrastructure still under development and may change.

Parameters

- addr – Page-aligned base virtual address to un-map
- size – Page-aligned region size

int arch_page_phys_get(void *virt, uintptr_t *phys)

Get the mapped physical memory address from virtual address.

The function only needs to query the current set of page tables as the information it reports must be common to all of them if multiple page tables are in use. If multiple page tables are active it is unnecessary to iterate over all of them.

Unless otherwise specified, virtual pages have the same mappings across all page tables. Calling this function on data pages that are exceptions to this rule (such as the scratch page) is undefined behavior. Just check the currently installed page tables and return the information in that.

Parameters

- virt – Page-aligned virtual address
- phys – [out] Mapped physical address (can be NULL if only checking if virtual address is mapped)

Return values

- 0 – if mapping is found and valid
- -EFAULT – if virtual address is not mapped

void arch_reserved_pages_update(void)

Update page frame database with reserved pages

Some page frames within system RAM may not be available for use. A good example of this is reserved regions in the first megabyte on PC-like systems.

Implementations of this function should mark all relevant entries in z_page_frames with K_PAGE_FRAME_RESERVED. This function is called at early system initialization with mm_lock held.
void arch_mem_page_out(void *addr, uintptr_t location)

Update all page tables for a paged-out data page

This function:

- Sets the data page virtual address to trigger a fault if accessed that can be distinguished from access violations or un-mapped pages.
- Saves the provided location value so that it can retrieved for that data page in the page fault handler.
- The location value semantics are undefined here but the value will be always be page-aligned. It could be 0.

If multiple page tables are in use, this must update all page tables. This function is called with interrupts locked.

Calling this function on data pages which are already paged out is undefined behavior.

This API is part of infrastructure still under development and may change.

void arch_mem_page_in(void *addr, uintptr_t phys)

Update all page tables for a paged-in data page

This function:

- Maps the specified virtual data page address to the provided physical page frame address, such that future memory accesses will function as expected. Access and caching attributes are undisturbed.
- Clears any accounting for “accessed” and “dirty” states.

If multiple page tables are in use, this must update all page tables. This function is called with interrupts locked.

Calling this function on data pages which are already paged in is undefined behavior.

This API is part of infrastructure still under development and may change.

void arch_mem_scratch(uintptr_t phys)

Update current page tables for a temporary mapping

Map a physical page frame address to a special virtual address Z_SCRATCH_PAGE, with read/write access to supervisor mode, such that when this function returns, the calling context can read/write the page frame’s contents from the Z_SCRATCH_PAGE address.

This mapping only needs to be done on the current set of page tables, as it is only used for a short period of time exclusively by the caller. This function is called with interrupts locked.

This API is part of infrastructure still under development and may change.

enum arch_page_location arch_page_location_get(void *addr, uintptr_t *location)

Fetch location information about a page at a particular address

The function only needs to query the current set of page tables as the information it reports must be common to all of them if multiple page tables are in use. If multiple page tables are active it is unnecessary to iterate over all of them. This may allow certain types of optimizations (such as reverse page table mapping on x86).

This function is called with interrupts locked, so that the reported information can’t become stale while decisions are being made based on it.

Unless otherwise specified, virtual data pages have the same mappings across all page tables. Calling this function on data pages that are exceptions to this rule (such as the scratch page) is undefined behavior. Just check the currently installed page tables and return the information in that.

Parameters
• *addr* – Virtual data page address that took the page fault

• *location* – [out] In the case of ARCH_PAGE_FAULT_PAGED_OUT, the backing store location value used to retrieve the data page. In the case of ARCH_PAGE_FAULT_PAGED_IN, the physical address the page is mapped to.

**Return values**

• ARCH_PAGE_FAULT_PAGED_OUT – The page was evicted to the backing store.

• ARCH_PAGE_FAULT_PAGED_IN – The data page is resident in memory.

• ARCH_PAGE_FAULT_BAD – The page is un-mapped or otherwise has had invalid access

```c
uintptr_t arch_page_info_get(void *addr, uintptr_t *location, bool clear_accessed)
```

Retrieve page characteristics from the page table(s)

The architecture is responsible for maintaining “accessed” and “dirty” states of data pages to support marking eviction algorithms. This can either be directly supported by hardware or emulated by modifying protection policy to generate faults on reads or writes. In all cases the architecture must maintain this information in some way.

For the provided virtual address, report the logical OR of the accessed and dirty states for the relevant entries in all active page tables in the system if the page is mapped and not paged out.

If clear_accessed is true, the ARCH_DATA_PAGE_ACCESSED flag will be reset. This function will report its prior state. If multiple page tables are in use, this function clears accessed state in all of them.

This function is called with interrupts locked, so that the reported information can’t become stale while decisions are being made based on it.

The return value may have other bits set which the caller must ignore.

Clearing accessed state for data pages that are not ARCH_DATA_PAGE_LOADED is undefined behavior.

ARCH_DATA_PAGE_DIRTY and ARCH_DATA_PAGE_ACCESSED bits in the return value are only significant if ARCH_DATA_PAGE_LOADED is set, otherwise ignore them.

ARCH_DATA_PAGE_NOT_mapped bit in the return value is only significant if ARCH_DATA_PAGE_LOADED is un-set, otherwise ignore it.

Unless otherwise specified, virtual data pages have the same mappings across all page tables. Calling this function on data pages that are exceptions to this rule (such as the scratch page) is undefined behavior.

This API is part of infrastructure still under development and may change.

**Parameters**

• *addr* – Virtual address to look up in page tables

• *location* – [out] If non-NULL, updated with either physical page frame address or backing store location depending on ARCH_DATA_PAGE_LOADED state. This is not touched if ARCH_DATA_PAGE_NOT_MAPPED.

• clear_accessed – Whether to clear ARCH_DATA_PAGE_ACCESSED state

**Return values**

Value – with ARCH_DATA_PAGE_ * bits set reflecting the data page configuration
Functions

int arch_printk_char_out(int c)
   Early boot console output hook
   Definition of this function is optional. If implemented, any invocation of printk() (or logging
calls with CONFIG_LOG_MODE_MINIMAL which are backed by printk) will default to sending
characters to this function. It is useful for early boot debugging before main serial or console
drivers come up.
   This can be overridden at runtime with __printk_hook_install().
   The default __weak implementation of this does nothing.

   Parameters
   • c – Character to print

   Returns
   The character printed

static inline void arch_kernel_init(void)
   Architecture-specific kernel initialization hook
   This function is invoked near the top of _Cstart, for additional architecture-specific setup
before the rest of the kernel is brought up.
   TODO: Deprecate, most arches are using a prep_c() function to do the same thing in a simpler
way

static inline void arch_nop(void)
   Do nothing and return. Yawn.

GDB Stub APIs

   group arch-gdbstub

Functions

void arch_gdb_init(void)
   Architecture layer debug start.
   This function is called by gdb_init()

void arch_gdb_continue(void)
   Continue running program.
   Continue software execution.

void arch_gdb_step(void)
   Continue with one step.
   Continue software execution until reaches the next statement.

size_t arch_gdb_reg_readall(struct gdb_ctx *ctx, uint8_t *buf, size_t buflen)
   Read all registers, and outputs as hexadecimal string.
   This reads all CPU registers and outputs as hexadecimal string. The output string must be
parsable by GDB.

   Parameters
   • ctx – GDB context
   • buf – Buffer to output hexadecimal string.
buflen – Length of buffer.

Returns
Length of hexadecimal string written. Return 0 if error or not supported.

size_t arch_gdb_reg_writeall(struct gdb_ctx *ctx, uint8_t *hex, size_t hexlen)
Take a hexadecimal string and update all registers.
This takes in a hexadecimal string as presented from GDB, and updates all CPU registers with new values.

Parameters
• ctx – GDB context
• hex – Input hexadecimal string.
• hexlen – Length of hexadecimal string.

Returns
Length of hexadecimal string parsed. Return 0 if error or not supported.

size_t arch_gdb_reg_readone(struct gdb_ctx *ctx, uint8_t *buf, size_t buflen, uint32_t regno)
Read one register, and outputs as hexadecimal string.
This reads one CPU register and outputs as hexadecimal string. The output string must be parsable by GDB.

Parameters
• ctx – GDB context
• buf – Buffer to output hexadecimal string.
• buflen – Length of buffer.
• regno – Register number

Returns
Length of hexadecimal string written. Return 0 if error or not supported.

size_t arch_gdb_reg_writeone(struct gdb_ctx *ctx, uint8_t *hex, size_t hexlen, uint32_t regno)
Take a hexadecimal string and update one register.
This takes in a hexadecimal string as presented from GDB, and updates one CPU registers with new value.

Parameters
• ctx – GDB context
• hex – Input hexadecimal string.
• hexlen – Length of hexadecimal string.
• regno – Register number

Returns
Length of hexadecimal string parsed. Return 0 if error or not supported.

int arch_gdb_add_breakpoint(struct gdb_ctx *ctx, uint8_t type, uintptr_t addr, uint32_t kind)
Add breakpoint or watchpoint.

Parameters
• ctx – GDB context
• type – Breakpoint or watchpoint type
• addr – Address of breakpoint or watchpoint
• kind – Size of breakpoint/watchpoint in bytes
Return values

- 0 – Operation successful
- -1 – Error encountered
- -2 – Not supported

```c
int arch_gdb_remove_breakpoint(struct gdb_ctx *ctx, uint8_t type, uintptr_t addr, uint32_t kind)
```

Remove breakpoint or watchpoint.

**Parameters**

- ctx – GDB context
- type – Breakpoint or watchpoint type
- addr – Address of breakpoint or watchpoint
- kind – Size of breakpoint/watchpoint in bytes

**Return values**

- 0 – Operation successful
- -1 – Error encountered
- -2 – Not supported

### 7.5.2 Board Porting Guide

To add Zephyr support for a new board, you at least need a *board directory* with various files in it. Files in the board directory inherit support for at least one SoC and all of its features. Therefore, Zephyr must support your SoC as well.

**Boards, SoCs, etc.**

Zephyr’s hardware support hierarchy has these layers, from most to least specific:

- Board: a particular CPU instance and its peripherals in a concrete hardware specification
- SoC: the exact system on a chip the board’s CPU is part of
- SoC series: a smaller group of tightly related SoCs
- SoC family: a wider group of SoCs with similar characteristics
- CPU core: a particular CPU in an architecture
- Architecture: an instruction set architecture

You can visualize the hierarchy like this:

<table>
<thead>
<tr>
<th>Board</th>
<th>SoC</th>
<th>SoC series</th>
<th>SoC family</th>
<th>CPU core</th>
<th>Architecture</th>
</tr>
</thead>
<tbody>
<tr>
<td>nrf52dk_nrf52832</td>
<td>nRF52832</td>
<td>nRF52</td>
<td>Nordic nRF5</td>
<td>Arm M4</td>
<td>Arm</td>
</tr>
<tr>
<td>frdm_k64f</td>
<td>MK64F12</td>
<td>K6x</td>
<td>NXP Kinetis</td>
<td>Arm M4</td>
<td>Arm</td>
</tr>
<tr>
<td>stm32h747i_disco</td>
<td>STM32H747XI</td>
<td>STM32H7</td>
<td>STMicro STM32</td>
<td>Arm M7</td>
<td>Arm</td>
</tr>
<tr>
<td>rv32m1_vega_r15cy</td>
<td>RV32M1</td>
<td>(Not used)</td>
<td>(Not used)</td>
<td>RISCY</td>
<td>RISC-V</td>
</tr>
</tbody>
</table>

7.5. Porting
Make sure your SoC is supported

Start by making sure your SoC is supported by Zephyr. If it is, it's time to Create your board directory. If you don't know, try:

- checking boards for names that look relevant, and reading individual board documentation to find out for sure.
- asking your SoC vendor

If you need to add SoC, CPU core, or even architecture support, this is the wrong page, but here is some general advice.

Architecture  See Architecture Porting Guide.

CPU Core  CPU core support files go in core subdirectories under arch, e.g. arch/x86/core.

See Install a Toolchain for information about toolchains (compiler, linker, etc.) supported by Zephyr. If you need to support a new toolchain, Build and Configuration Systems is a good place to start learning about the build system. Please reach out to the community if you are looking for advice or want to collaborate on toolchain support.

SoC  Zephyr SoC support files are in architecture-specific subdirectories of soc. They are generally grouped by SoC family.

When adding a new SoC family or series for a vendor that already has SoC support within Zephyr, please try to extract common functionality into shared files to avoid duplication. If there is no support for your vendor yet, you can add it in a new directory zephyr/soc/<YOUR-ARCH>/<YOUR-SOC>; please use self-explanatory directory names.
Create your board directory

Once you’ve found an existing board that uses your SoC, you can usually start by copy/pasting its board directory and changing its contents for your hardware.

You need to give your board a unique name. Run `west boards` for a list of names that are already taken, and pick something new. Let’s say your board is called `plank` (please don’t actually use that name).

Start by creating the board directory `zephyr/boards/<ARCH>/plank`, where `<ARCH>` is your SoC’s architecture subdirectory. (You don’t have to put your board directory in the zephyr repository, but it’s the easiest way to get started. See Custom Board, Devicetree and SOC Definitions for documentation on moving your board directory to a separate repository once it’s working.)

Your board directory should look like this:

```
boards/<ARCH>/plank
    board.cmake
    CMakeLists.txt
    doc
        plank.png
        index.rst
    Kconfig.board
    Kconfig.defconfig
    plank_defconfig
    plank.dts
    plank.yaml
```

Replace `plank` with your board’s name, of course.

The mandatory files are:

1. `plank.dts`: a hardware description in devicetree format. This declares your SoC, connectors, and any other hardware components such as LEDs, buttons, sensors, or communication peripherals (USB, BLE controller, etc).

2. `Kconfig.board`, `Kconfig.defconfig`, `plank_defconfig`: software configuration in Configuration System (Kconfig) formats. This provides default settings for software features and peripheral drivers.

The optional files are:

- `board.cmake`: used for Flash and debug support
- `CMakeLists.txt`: if you need to add additional source files to your build.
- `doc/index.rst`, `doc/plank.png`: documentation for and a picture of your board. You only need this if you’re Contributing your board to Zephyr.
- `plank.yaml`: a YAML file with miscellaneous metadata used by the Test Runner (Twister).

Write your devicetree

The devicetree file `boards/<ARCH>/plank/plank.dts` describes your board hardware in the Devicetree Source (DTS) format (as usual, change `plank` to your board’s name). If you’re new to devicetree, see Introduction to devicetree.

In general, `plank.dts` should look like this:

```
/dts-v1/;
#include <your_soc_vendor/your_soc.dtsi>
/
    model = "A human readable name";
```
compatible = "yourcompany,plank";

chosen {
    zephyr,console = &your_uart_console;
    zephyr,sram = &your_memory_node;
    /* other chosen settings for your hardware */
};

/* Your board-specific hardware: buttons, LEDs, sensors, etc. */

leds {
    compatible = "gpio-leds";
    led0: led_0 {
        gpios = "gpio your LED is hooked up to ";
        label = "LED 0";
   );
    /* ... other LEDs ... */
};

buttons {
    compatible = "gpio-keys";
    /* ... your button definitions ... */
};

/* These aliases are provided for compatibility with samples */
aliases {
    led0 = &led0; /* now you support the blinky sample! */
    /* other aliases go here */
};

&some_peripheral_you_want_to_enable {
    /* like a GPIO or SPI controller */
    status = "okay";
};

&another_peripheral_you_want {
    status = "okay";
};

If you're in a hurry, simple hardware can usually be supported by copy/paste followed by trial and error. If you want to understand details, you will need to read the rest of the devicetree documentation and the devicetree specification.

Example: FRDM-K64F and Hexiwear K64 This section contains concrete examples related to writing your board's devicetree.

The FRDM-K64F and Hexiwear K64 board devicetrees are defined in frdm_k64fs.dts and hexiwear_k64.dts respectively. Both boards have NXP SoCs from the same Kinetis SoC family, the K6X.

Common devicetree definitions for K6X are stored in nxp_k6x.dtsi, which is included by both board .dts files. nxp_k6x.dtsi in turn includes armv7-m.dtsi, which has common definitions for Arm v7-M cores.

Since nxp_k6x.dtsi is meant to be generic across K6X-based boards, it leaves many devices disabled by default using status properties. For example, there is a CAN controller defined as follows (with unimportant parts skipped):

```dts
compatible = "nxp,can";
... other settings...
```
It is up to the board .dts or application overlay files to enable these devices as desired, by setting `status = "okay"`. The board .dts files are also responsible for any board-specific configuration of the device, such as adding nodes for on-board sensors, LEDs, buttons, etc.

For example, FRDM-K64 (but not Hexiwear K64) .dts enables the CAN controller and sets the bus speed:

```c
can0 {  
    status = "okay";
    bus-speed = <125000>;
};
```

The `&can0 { ... }` syntax adds/overrides properties on the node with label can0, i.e. the `can@40024000` node defined in the .dtsi file.

Other examples of board-specific customization is pointing properties in aliases and chosen to the right nodes (see Aliases and chosen nodes), and making GPIO/pinmux assignments.

### Write Kconfig files

Zephyr uses the Kconfig language to configure software features. Your board needs to provide some Kconfig settings before you can compile a Zephyr application for it.

Setting Kconfig configuration values is documented in detail in Setting Kconfig configuration values.

There are three mandatory Kconfig files in the board directory for a board named plank:

```
boards/<ARCH>/plank
    |__ Kconfig.board
    |__ Kconfig.defconfig
    |__ plank_defconfig
```

**Kconfig.board**

Included by `boards/Kconfig` to include your board in the list of options.

This should at least contain a definition for a `BOARD_PLANK` option, which looks something like this:

```c
config BOARD_PLANK
    bool "Plank board"
    depends on SOC_SERIES_YOUR_SOC_SERIES_HERE
    select SOC_PART_NUMBER_ABCDEFGH
```

**Kconfig.defconfig**

Board-specific default values for Kconfig options.

The entire file should be inside an `if BOARD_PLANK / endif` pair of lines, like this:

```c
if BOARD_PLANK
    # Always set CONFIG_BOARD here. This isn't meant to be customized,
    # but is set as a "default" due to Kconfig language restrictions.
    config BOARD
        default "plank"
    # Other options you want enabled by default go next. Examples:
```

(continues on next page)
plank_defconfig
A Kconfig fragment that is merged as-is into the final build directory .config whenever an application is compiled for your board.

You should at least select your board's SOC and do any mandatory settings for your system clock, console, etc. The results are architecture-specific, but typically look something like this:

```plaintext
CONFIG_SOC_${VENDOR_XYZ3000}=y /* select your SoC */
CONFIG_SYS_CLOCK_HW_CYCLES_PER_SEC=120000000 /* set up your clock, etc */
CONFIG_SERIAL=y
```

plank_x_y_z.conf
A Kconfig fragment that is merged as-is into the final build directory .config whenever an application is compiled for your board revision x.y.z.

Build, test, and fix

Now it's time to build and test the application(s) you want to run on your board until you're satisfied.

For example:

```plaintext
west build -b plank samples/hello_world
west flash
```

For west flash to work, see Flash and debug support below. You can also just flash build/zephyr/zephyr.elf, zephyr.hex, or zephyr.bin with any other tools you prefer.

General recommendations

For consistency and to make it easier for users to build generic applications that are not board specific for your board, please follow these guidelines while porting.

- Unless explicitly recommended otherwise by this section, leave peripherals and their drivers disabled by default.
- Configure and enable a system clock, along with a tick source.
- Provide pin and driver configuration that matches the board's valuable components such as sensors, buttons or LEDs, and communication interfaces such as USB, Ethernet connector, or Bluetooth/Wi-Fi chip.
- If your board uses a well-known connector standard (like Arduino, Mikrobus, Grove, or 96Boards connectors), add connector nodes to your DTS and configure pin muxes accordingly.
- Configure components that enable the use of these pins, such as configuring an SPI instance to use the usual Arduino SPI pins.
- If available, configure and enable a serial output for the console using the zephyr,console chosen node in the devicetree.
• If your board supports networking, configure a default interface.
• Enable all GPIO ports connected to peripherals or expansion connectors.
• If available, enable pinmux and interrupt controller drivers.
• It is recommended to enable the MPU by default, if there is support for it in hardware. For boards with limited memory resources it is acceptable to disable it. When the MPU is enabled, it is recommended to also enable hardware stack protection (CONFIG_HW_STACK_PROTECTION=y) and, thus, allow the kernel to detect stack overflows when the system is running in privileged mode.

Flash and debug support

Zephyr supports Building, Flashing and Debugging via west extension commands.

To add west flash and west debug support for your board, you need to create a board.cmake file in your board directory. This file's job is to configure a “runner” for your board. (There's nothing special you need to do to get west build support for your board.)

“Runners” are Zephyr-specific Python classes that wrap flash and debug host tools and integrate with west and the zephyr build system to support west flash and related commands. Each runner supports flashing, debugging, or both. You need to configure the arguments to these Python scripts in your board.cmake to support those commands like this example board.cmake:

```c
board_runner_args(jlink "--device=nrf52" "--speed=4000")
board_runner_args(pyocd "--target=nrf52" "--frequency=4000000")
```

```c
include(${ZEPHYR_BASE}/boards/common/nrfjprog.board.cmake)
include(${ZEPHYR_BASE}/boards/common/jlink.board.cmake)
include(${ZEPHYR_BASE}/boards/common/pyocd.board.cmake)
```

This example configures the nrfjprog, jlink, and pyocd runners.

**Warning:** Runners usually have names which match the tools they wrap, so the jlink runner wraps Segger’s J-Link tools, and so on. But the runner command line options like --speed etc. are specific to the Python scripts.

For more details:

• Run west flash --context to see a list of available runners which support flashing, and west flash --context -r <RUNNER> to view the specific options available for an individual runner.
• Run west debug --context and west debug --context <RUNNER> to get the same output for runners which support debugging.
• Run west flash --help and west debug --help for top-level options for flashing and debugging.
• See Flash and debug runners for Python APIs.
• Look for board.cmake files for other boards similar to your own for more examples.

To see what a west flash or west debug command is doing exactly, run it in verbose mode:

```c
west --verbose flash
west --verbose debug
```

Verbose mode prints any host tool commands the runner uses.

The order of the include() calls in your board.cmake matters. The first include sets the default runner if it’s not already set. For example, including nrfjprog.board.cmake first means that nrfjprog is the default flash runner for this board. Since nrfjprog does not support debugging, jlink is the default debug runner.
Multiple board revisions

See Building for a board revision for basics on this feature from the user perspective.

To create a new board revision for the plank board, create these additional files in the board folder:

```
boards/<ARCH>/plank
   - plank_<revision>.conf   # optional
   - plank_<revision>.overlay # optional
   - revision.cmake
```

When the user builds for board plank@<revision>:

- The optional Kconfig settings specified in the file plank_<revision>.conf will be merged into the board’s default Kconfig configuration.
- The optional devicetree overlay plank_<revision>.overlay will be added to the common plank.dts devicetree file.
- The revision.cmake file controls how the Zephyr build system matches the <board>@<revision> string specified by the user when building an application for the board.

Currently, <revision> can be either a numeric MAJOR.MINOR.PATCH style revision like 1.5.0, an integer number like 1, or single letter like A, B, etc. Zephyr provides a CMake board extension function, board_check_revision(), to make it easy to match either style from revision.cmake.

Valid board revisions may be specified as arguments to the board_check_revision() function, like:

```
board_check_revision(FORMAT MAJOR.MINOR.PATCH
   VALID_REVISIONS 0.1.0 0.3.0 ...)
```

Note: VALID_REVISIONS can be omitted if all valid revisions have specific Kconfig fragments, such as <board>_0_1_0.conf, <board>_0_3_0.conf. This allows you to just place Kconfig revision fragments in the board folder and not have to keep the corresponding VALID_REVISIONS in sync.

The following sections describe how to support these styles of revision numbers.

**MAJOR.MINOR.PATCH revisions** Let’s say you want to add support for revisions 0.5.0, 1.0.0, and 1.5.0 of the plank board with both Kconfig fragments and devicetree overlays. Create revision.cmake with board_check_revision(FORMAT MAJOR.MINOR.PATCH), and create the following additional files in the board directory:

```
boards/<ARCH>/plank
   - plank_0_5_0.conf
   - plank_0_5_0.overlay
   - plank_1_0_0.conf
   - plank_1_0_0.overlay
   - plank_1_5_0.conf
   - plank_1_5_0.overlay
   - revision.cmake
```

Notice how the board files have changed periods (".") in the revision number to underscores ("_”).

**Fuzzy revision matching** To support “fuzzy” MAJOR.MINOR.PATCH revision matching for the plank board, use the following code in revision.cmake:

```
board_check_revision(FORMAT MAJOR.MINOR.PATCH)
```
If the user selects a revision between those available, the closest revision number that is not larger than the user's choice is used. For example, if the user builds for `plank@0.7.0`, the build system will target revision 0.5.0.

The build system will print this at CMake configuration time:

```
-- Board: plank, Revision: 0.7.0 (Active: 0.5.0)
```

This allows you to only create revision configuration files for board revision numbers that introduce incompatible changes.

Any revision less than the minimum defined will be treated as an error.

You may use `0.0.0` as a minimum revision to build for by creating the file `plank_0_0_0.conf` in the board directory. This will be used for any revision lower than 0.5.0, for example if the user builds for `plank@0.1.0`.

**Exact revision matching**  Alternatively, the `EXACT` keyword can be given to `board_check_revision()` in `revision.cmake` to allow exact matches only, like this:

```
board_check_revision(FORMAT MAJOR.MINOR.PATCH EXACT)
```

With this `revision.cmake`, building for `plank@0.7.0` in the above example will result in the following error message:

```
Board revision `0.7.0` not found. Please specify a valid board revision.
```

**Letter revision matching**  Let's say instead that you need to support revisions A, B, and C of the `plank` board. Create the following additional files in the board directory:

```
boards/<ARCH>/plank
   ─ planks_A.conf
   ─ planks_A.overlay
   ─ planks_B.conf
   ─ planks_B.overlay
   ─ planks_C.conf
   ─ planks_C.overlay
   ─ revision.cmake
```

And add the following to `revision.cmake`:

```
board_check_revision(FORMAT LETTER)
```

**Number revision matching**  Let's say instead that you need to support revisions 1, 2, and 3 of the `plank` board. Create the following additional files in the board directory:

```
boards/<ARCH>/plank
   ─ planks_1.conf
   ─ planks_1.overlay
   ─ planks_2.conf
   ─ planks_2.overlay
   ─ planks_3.conf
   ─ planks_3.overlay
   ─ revision.cmake
```

And add the following to `revision.cmake`: 7.5. Porting
board_check_revision(FORMAT NUMBER)

board_check_revision() details

board_check_revision(FORMAT <LETTER | NUMBER | MAJOR.MINOR.PATCH>
[EXACT]
[DEFAULT_REVISION <revision>]
[HIGHEST_REVISION <revision>]
[VALID_REVISIONS <revision> [<revision> ...]]
)

This function supports the following arguments:

- **FORMAT LETTER**: matches single letter revisions from A to Z only
- **FORMAT NUMBER**: matches integer revisions
- **FORMAT MAJOR.MINOR.PATCH**: matches exactly three digits. The command line allows for loose typing, that is -DBOARD=<board>@1 and -DBOARD=<board>@1.0 will be handled as -DBOARD=<board>@1.0.0. Kconfig fragment and devicetree overlay files must use full numbering to avoid ambiguity, so only <board>_1_0_0.conf and <board>_1_0_0.overlay are allowed.
- **EXACT**: if given, the revision is required to be an exact match. Otherwise, the closest matching revision not greater than the user’s choice will be selected.
- **DEFAULT_REVISION <revision>**: if given, <revision> is the default revision to use when user has not selected a revision number. If not given, the build system prints an error when the user does not specify a board revision.
- **HIGHEST_REVISION**: if given, specifies the highest valid revision for a board. This can be used to ensure that a newer board cannot be used with an older Zephyr. For example, if the current board directory supports revisions 0.x.0-0.99.99 and 1.0.0-1.99.99, and it is expected that the implementation will not work with board revision 2.0.0, then giving HIGHEST_REVISION 1.99.99 causes an error if the user builds using <board>@2.0.0.
- **VALID_REVISIONS**: if given, specifies a list of revisions that are valid for this board. If this argument is not given, then each Kconfig fragment of the form <board>_<revision>.conf in the board folder will be used as a valid revision for the board.

Custom revision.cmake files

Some boards may not use board revisions supported by board_check_revision(). To support revisions of any type, the file revision.cmake can implement custom revision matching without calling board_check_revision().

To signal to the build system that it should use a different revision than the one specified by the user, revision.cmake can set the variable ACTIVE_BOARD_REVISION to the revision to use instead. The corresponding Kconfig files and devicetree overlays must be named <board>_<ACTIVE_BOARD_REVISION>.conf and <board>_<ACTIVE_BOARD_REVISION>.overlay.

For example, if the user builds for plank@zero, revision.cmake can set ACTIVE_BOARD_REVISION to one to use the files plank_one.conf and plank_one.overlay.

Contributing your board

If you want to contribute your board to Zephyr, first – thanks!

There are some extra things you’ll need to do:

1. Make sure you’ve followed all the *General recommendations*. They are requirements for boards included with Zephyr.
2. Add documentation for your board using the template file `doc/templates/board.tmpl`. See *Documentation Generation* for information on how to build your documentation before submitting your pull request.

3. Prepare a pull request adding your board which follows the *Contribution Guidelines*.

### 7.5.3 Shields

Shields, also known as “add-on” or “daughter boards”, attach to a board to extend its features and services for easier and modularized prototyping. In Zephyr, the shield feature provides Zephyr-formatted shield descriptions for easier compatibility with applications.

#### Shield porting and configuration

Shield configuration files are available in the board directory under `/boards/shields`:

```
boards/shields/<shield>
  └── <shield>.overlay
  └── Kconfig.shield
  └── Kconfig.defconfig
```

These files provide shield configuration as follows:

- `<shield>.overlay`: This file provides a shield description in devicetree format that is merged with the board’s `devicetree` before compilation.

- `Kconfig.shield`: This file defines shield Kconfig symbols that will be used for default shield configuration. To ease use with applications, the default shield configuration here should be consistent with those in the *Write your devicetree*.

- `Kconfig.defconfig`: This file defines the default shield configuration. It is made to be consistent with the *Write your devicetree*. Hence, shield configuration should be done by keeping in mind that features activation is application responsibility.

Besides, in order to avoid name conflicts with devices that may be defined at board level, it is advised, specifically for shields devicetree descriptions, to provide a device nodelabel in the form `<device>_<shield>`, for instance:

```
sdhc_myshield: sdhc01 {
  reg = <1>;
  ...
}
```

#### Board compatibility

Hardware shield-to-board compatibility depends on the use of well-known connectors used on popular boards (such as Arduino and 96boards). For software compatibility, boards must also provide a configuration matching their supported connectors.

This should be done at two different level:

- Pinmux: Connector pins should be correctly configured to match shield pins

- Devicetree: A board `devicetree` file, `BOARD.dts` should define an alternate nodelabel for each connector interface. For example, for Arduino I2C:

```
arduino_i2c: &i2c1 {
}
```
Board specific shield configuration  If modifications are needed to fit a shield to a particular board or board revision, you can override a shield description for a specific board by adding board or board revision overriding files to a shield, as follows:

```
boards/shields/<shield>
  boards
    <board>_<revision>.overlay
    <board>.overlay
    <board>.defconfig
    <board>_<revision>.conf
    <board>.conf
```

### Shield activation

Activate support for one or more shields by adding the matching `-DSHIELD` arg to CMake command.

```
# From the root of the zephyr repository
west build -b None your_app -- -DSHIELD="x_nucleo_idb05a1 x_nucleo_iks01a1"
```

Alternatively, it could be set by default in a project's `CMakeLists.txt`:

```
set(SHIELD x_nucleo_iks01a1)
```

### Shield variants

Some shields may support several variants or revisions. In that case, it is possible to provide multiple version of the shields description:

```
boards/shields/<shield>
  <shield_v1>.overlay
  <shield_v1>.defconfig
  <shield_v2>.overlay
  <shield_v2>.defconfig
```

In this case, a shield-particular revision name can be used:

```
# From the root of the zephyr repository
west build -b None your_app -- -DSHIELD=shield_v2
```

You can also provide a board-specific configuration to a specific shield revision:

```
boards/shields/<shield>
  <shield_v1>.overlay
  <shield_v1>.defconfig
  <shield_v2>.overlay
  <shield_v2>.defconfig
  boards
    <shield_v2>
      <board>.overlay
      <board>.defconfig
```

### GPIO nexus nodes

GPIOs accessed by the shield peripherals must be identified using the shield GPIO abstraction, for example from the `arduino-header-r3` compatible. Boards that provide the header must map the header pins
to SOC-specific pins. This is accomplished by including a nexus node that looks like the following into the board devicetree file:

```c
arduino_header: connector {
    compatible = "arduino-header-r3";
    #gpio-cells = <2>;
    gpio-map-mask = <0xffffffff 0xffffffffc0>;
    gpio-map-pass-thru = <0 0x3f>;
    gpio-map = <0 0 &gpioa 0 0>, /* A0 */
               <1 0 &gpioa 1 0>, /* A1 */
               <2 0 &gpioa 4 0>, /* A2 */
               <3 0 &gpiob 0 0>, /* A3 */
               <4 0 &gpioc 1 0>, /* A4 */
               <5 0 &gpioc 0 0>, /* A5 */
               <6 0 &gpioa 3 0>, /* D0 */
               <7 0 &gpiob 2 0>, /* D1 */
               <8 0 &gpiob 10 0>, /* D2 */
               <9 0 &gpiob 3 0>, /* D3 */
               <10 0 &gpiob 5 0>, /* D4 */
               <11 0 &gpiob 4 0>, /* D5 */
               <12 0 &gpiob 10 0>, /* D6 */
               <13 0 &gpiob 8 0>, /* D7 */
               <14 0 &gpiob 9 0>, /* D8 */
               <15 0 &gpioc 7 0>, /* D9 */
               <16 0 &gpiob 6 0>, /* D10 */
               <17 0 &gpiob 7 0>, /* D11 */
               <18 0 &gpiob 6 0>, /* D12 */
               <19 0 &gpiob 5 0>, /* D13 */
               <20 0 &gpiob 9 0>, /* D14 */
               <21 0 &gpiob 8 0>; /* D15 */
};
```

This specifies how Arduino pin references like `<&arduino_header 11 0>` are converted to SOC gpio pin references like `<&gpiob 4 0>`.

In Zephyr GPIO specifiers generally have two parameters (indicated by `#gpio-cells = <2>`): the pin number and a set of flags. The low 6 bits of the flags correspond to features that can be configured in devicetree. In some cases it's necessary to use a non-zero flag value to tell the driver how a particular pin behaves, as with:

```
drdy-gpios = <&arduino_header 11 GPIO_ACTIVE_LOW>;
```

After preprocessing this becomes `<&arduino_header 11 1>`. Normally the presence of such a flag would cause the map lookup to fail, because there is no map entry with a non-zero flags value. The `gpio-map-mask` property specifies that, for lookup, all bits of the pin and all but the low 6 bits of the flags are used to identify the specifier. Then the `gpio-map-pass-thru` specifies that the low 6 bits of the flags are copied over, so the SOC GPIO reference becomes `<&gpiob 4 1>` as intended.

See nexus node for more information about this capability.
Chapter 8

Contributing to Zephyr

8.1 Contribution Guidelines

As an open-source project, we welcome and encourage the community to submit patches directly to the project. In our collaborative open source environment, standards and methods for submitting changes help reduce the chaos that can result from an active development community.

This document explains how to participate in project conversations, log bugs and enhancement requests, and submit patches to the project so your patch will be accepted quickly in the codebase.

8.1.1 Licensing

Licensing is very important to open source projects. It helps ensure the software continues to be available under the terms that the author desired.

Zephyr uses the Apache 2.0 license (as found in the LICENSE file in the project's GitHub repo) to strike a balance between open contribution and allowing you to use the software however you would like to. The Apache 2.0 license is a permissive open source license that allows you to freely use, modify, distribute and sell your own products that include Apache 2.0 licensed software. (For more information about this, check out articles such as Why choose Apache 2.0 licensing and Top 10 Apache License Questions Answered).

A license tells you what rights you have as a developer, as provided by the copyright holder. It is important that the contributor fully understands the licensing rights and agrees to them. Sometimes the copyright holder isn't the contributor, such as when the contributor is doing work on behalf of a company.

Components using other Licenses

There are some imported or reused components of the Zephyr project that use other licensing, as described in Licensing of Zephyr Project components.

Importing code into the Zephyr OS from other projects that use a license other than the Apache 2.0 license needs to be fully understood in context and approved by the Zephyr governing board.

By carefully reviewing potential contributions and also enforcing a Developer Certification of Origin (DCO) for contributed code, we can ensure that the Zephyr community can develop products with the Zephyr Project without concerns over patent or copyright issues.

See Contributing External Components for more information about this contributing and review process for imported components.
Licensing of Zephyr Project components The Zephyr kernel tree imports or reuses packages, scripts and other files that are not covered by the Apache 2.0 License. In some places there is no LICENSE file or way to put a LICENSE file there, so we describe the licensing in this document.

scripts/{checkpatch.pl,checkstack.pl,get_maintainers.pl,spelling.txt}
  Origin: Linux Kernel
  Licensing: GPLv2 License

8.1.2 Copyrights Notices

Please follow this Community Best Practice for Copyright Notices from the Linux Foundation.

8.1.3 Developer Certification of Origin (DCO)

To make a good faith effort to ensure licensing criteria are met, the Zephyr project requires the Developer Certificate of Origin (DCO) process to be followed.

The DCO is an attestation attached to every contribution made by every developer. In the commit message of the contribution, (described more fully later in this document), the developer simply adds a Signed-off-by statement and thereby agrees to the DCO.

When a developer submits a patch, it is a commitment that the contributor has the right to submit the patch per the license. The DCO agreement is shown below and at http://developercertificate.org/.

---

**Developer's Certificate of Origin 1.1**

By making a contribution to this project, I certify that:

(a) The contribution was created in whole or in part by me and I have the right to submit it under the open source license indicated in the file; or

(b) The contribution is based upon previous work that, to the best of my knowledge, is covered under an appropriate open source license and I have the right under that license to submit that work with modifications, whether created in whole or in part by me, under the same open source license (unless I am permitted to submit under a different license), as indicated in the file; or

(c) The contribution was provided directly to me by some other person who certified (a), (b) or (c) and I have not modified it.

(d) I understand and agree that this project and the contribution are public and that a record of the contribution (including all personal information I submit with it, including my sign-off) is maintained indefinitely and may be redistributed consistent with this project or the open source license(s) involved.

---

DCO Sign-Off

The “sign-off” in the DCO is a “Signed-off-by:” line in each commit's log message. The Signed-off-by: line must be in the following format:
Signed-off-by: Your Name <your.email@example.com>

For your commits, replace:

- Your Name with your legal name (pseudonyms, hacker handles, and the names of groups are not allowed)
- your.email@example.com with the same email address you are using to author the commit (CI will fail if there is no match)

You can automatically add the Signed-off-by: line to your commit body using `git commit -s`. Use other commits in the zephyr git history as examples.

Additional requirements:

- If you are altering an existing commit created by someone else, you must add your Signed-off-by: line without removing the existing one.
- If you forget to add the Signed-off-by: line, you can add it to your previous commit by running `git commit --amend -s`.
- If you've pushed your changes to GitHub already you'll need to force push your branch after this with `git push -f`.

Notes

Any contributions made as part of submitted pull requests are considered free for the Project to use. Developers are permitted to cherry-pick patches that are included in pull requests submitted by other contributors. It is expected that

- the content of the patches will not be substantially modified,
- the cherry-picked commits or portions of a commit shall preserve the original sign-off messages and the author identity.

*Modifying Contributions made by other developers* describes additional recommended policies around working with contributions submitted by other developers.

### 8.1.4 Prerequisites

As a contributor, you'll want to be familiar with the Zephyr project, how to configure, install, and use it as explained in the Zephyr Project website and how to set up your development environment as introduced in the Zephyr Getting Started Guide.

You should be familiar with common developer tools such as Git and CMake, and platforms such as GitHub.

If you haven't already done so, you'll need to create a (free) GitHub account on `https://github.com` and have Git tools available on your development system.

**Note:** The Zephyr development workflow supports all 3 major operating systems (Linux, macOS, and Windows) but some of the tools used in the sections below are only available on Linux and macOS. On Windows, instead of running these tools yourself, you will need to rely on the Continuous Integration (CI) service using Github Actions, which runs automatically on GitHub when you submit your Pull Request (PR). You can see any failure results in the workflow details link near the end of the PR conversation list. See *Continuous Integration* for more information.
8.1.5 Source Tree Structure

To clone the main Zephyr Project repository use the instructions in Get Zephyr and install Python dependencies.

This section describes the main repository’s source tree. In addition to the Zephyr kernel itself, you’ll also find the sources for technical documentation, sample code, supported board configurations, and a collection of subsystem tests. All of these are available for developers to contribute to and enhance.

Understanding the Zephyr source tree can help locate the code associated with a particular Zephyr feature.

At the top of the tree, several files are of importance:

- `CMakeLists.txt` The top-level file for the CMake build system, containing a lot of the logic required to build Zephyr.
- `Kconfig` The top-level Kconfig file, which refers to the file `Kconfig.zephyr` also found in the top-level directory.
  See the Kconfig section of the manual for detailed Kconfig documentation.
- `west.yml` The West (Zephyr’s meta-tool) manifest, listing the external repositories managed by the west command-line tool.

The Zephyr source tree also contains the following top-level directories, each of which may have one or more additional levels of subdirectories not described here.

- `arch` Architecture-specific kernel and system-on-chip (SoC) code. Each supported architecture (for example, x86 and ARM) has its own subdirectory, which contains additional subdirectories for the following areas:
  - architecture-specific kernel source files
  - architecture-specific kernel include files for private APIs
- `soc` SoC related code and configuration files.
- `boards` Board related code and configuration files.
- `doc` Zephyr technical documentation source files and tools used to generate the https://docs.zephyrproject.org web content.
- `drivers` Device driver code.
- `dts` devicetree source files used to describe non-discoverable board-specific hardware details.
- `include` Include files for all public APIs, except those defined under lib.
- `kernel` Architecture-independent kernel code.
- `lib` Library code, including the minimal standard C library.
- `misc` Miscellaneous code that doesn’t belong to any of the other top-level directories.
samples
  Sample applications that demonstrate the use of Zephyr features.

scripts
  Various programs and other files used to build and test Zephyr applications.

cmake
  Additional build scripts needed to build Zephyr.

subsys
  Subsystems of Zephyr, including:
  • USB device stack code
  • Networking code, including the Bluetooth stack and networking stacks
  • File system code
  • Bluetooth host and controller

tests
  Test code and benchmarks for Zephyr features.

share
  Additional architecture independent data. It currently contains Zephyr’s CMake package.

8.1.6 Pull Requests and Issues

Before starting on a patch, first check in our issues Zephyr Project Issues system to see what’s been reported on the issue you’d like to address. Have a conversation on the Zephyr devel mailing list (or the Zephyr Discord Server) to see what others think of your issue (and proposed solution). You may find others that have encountered the issue you’re finding, or that have similar ideas for changes or additions. Send a message to the Zephyr devel mailing list to introduce and discuss your idea with the development community.

It’s always a good practice to search for existing or related issues before submitting your own. When you submit an issue (bug or feature request), the triage team will review and comment on the submission, typically within a few business days.

You can find all open pull requests on GitHub and open Zephyr Project Issues in Github issues.

8.1.7 Tools and Git Setup

Signed-off-by

The name in the commit message Signed-off-by: line and your email must match the change authorship information. Make sure your .gitconfig is set up correctly:

```
git config --global user.name "David Developer"
git config --global user.email "david.developer@company.com"
```

gitlint

When you submit a pull request to the project, a series of checks are performed to verify your commit messages meet the requirements. The same step done during the CI process can be performed locally using the the gitlint command.

Run gitlint locally in your tree and branch where your patches have been committed:
gitlint

Note, gitlint only checks HEAD (the most recent commit), so you should run it after each commit, or use the --commits option to specify a commit range covering all the development patches to be submitted.

twister

**Note:** twister does not currently run on Windows.

To verify that your changes did not break any tests or samples, please run the twister script locally before submitting your pull request to GitHub. To run the same tests the CI system runs, follow these steps from within your local Zephyr source working directory:

```
source zephyr-env.sh
./scripts/twister
```

The above will execute the basic twister script, which will run various kernel tests using the QEMU emulator. It will also do some build tests on various samples with advanced features that can’t run in QEMU.

We highly recommend you run these tests locally to avoid any CI failures.

clang-format

The clang-format tool can be helpful to quickly reformat large amounts of new source code to our Coding Style standards together with the .clang-format configuration file provided in the repository. clang-format is well integrated into most editors, but you can also run it manually like this:

```
clang-format -i my_source_file.c
```

clang-format is part of LLVM, which can be downloaded from the project releases page <https://github.com/llvm/llvm-project/releases>. Note that if you are a Linux user, clang-format will likely be available as a package in your distribution repositories.

### 8.1.8 Coding Style

Use these coding guidelines to ensure that your development complies with the project’s style and naming conventions.

In general, follow the Linux kernel coding style, with the following exceptions:

- Add braces to every if, else, do, while, for and switch body, even for single-line code blocks. Use the --ignore BRACES flag to make checkpatch stop complaining.
- Use spaces instead of tabs to align comments after declarations, as needed.
- Use C89-style single line comments, /* */. The C99-style single line comment, //, is not allowed.
- Use /* */ for doxygen comments that need to appear in the documentation.

The Linux kernel GPL-licensed tool checkpatch is used to check coding style conformity.

**Note:** checkpatch does not currently run on Windows.

Checkpatch is available in the scripts directory. To invoke it when committing code, make the file $ZEPHYR_BASE/.git/hooks/pre-commit executable and edit it to contain:
Instead of running checkpatch at each commit, you may prefer to run it only before pushing on zephyr repo. To do this, make the file $ZEPHYR_BASE/.git/hooks/pre-push executable and edit it to contain:

```
#!/bin/sh
remote="$1"
url="$2"
z40=00000000000000000000000000000000

echo "Run push hook"

while read local_ref local_sha remote_ref remote_sha
do
    args="$remote $url $local_ref $local_sha $remote_ref $remote_sha"
    exec $(ZEPHYR_BASE)/scripts/series-push-hook.sh $args
done

exit 0
```

If you want to override checkpatch verdict and push you branch despite reported issues, you can add option --no-verify to the git push command.

A more complete alternative to this is using check_compliance.py script from ci-tools repo.

### 8.1.9 Contribution Workflow

One general practice we encourage, is to make small, controlled changes. This practice simplifies review, makes merging and rebasing easier, and keeps the change history clear and clean.

When contributing to the Zephyr Project, it is also important you provide as much information as you can about your change, update appropriate documentation, and test your changes thoroughly before submitting.

The general GitHub workflow used by Zephyr developers uses a combination of command line Git commands and browser interaction with GitHub. As it is with Git, there are multiple ways of getting a task done. We’ll describe a typical workflow here:

1. **Create a Fork of Zephyr** to your personal account on GitHub. (Click on the fork button in the top right corner of the Zephyr project repo page in GitHub.)
2. **On your development computer,** change into the zephyr folder that was created when you obtained the code:
   ```
   cd zephyrproject/zephyr
   ```
   Rename the default remote pointing to the **upstream repository** from origin to upstream:
   ```
   git remote rename origin upstream
   ```
   Let Git know about the fork you just created, naming it origin:
   ```
   git remote add origin https://github.com/<your github id>/zephyr
   ```
   and verify the remote repos:
The output should look similar to:

```
origin  https://github.com/<your github id>/zephyr (fetch)
origin  https://github.com/<your github id>/zephyr (push)
upstream https://github.com/zephyrproject-rtos/zephyr (fetch)
upstream https://github.com/zephyrproject-rtos/zephyr (push)
```

3. Create a topic branch (off of main) for your work (if you're addressing an issue, we suggest including the issue number in the branch name):

```
git checkout main
git checkout -b fix_comment_typo
```

Some Zephyr subsystems do development work on a separate branch from main so you may need to indicate this in your checkout:

```
git checkout -b fix_out_of_date_patch origin/net
```

4. Make changes, test locally, change, test, test again, ... (Check out the prior chapter on `twister` as well).

5. When things look good, start the pull request process by adding your changed files:

```
git add [file(s) that changed, add -p if you want to be more specific]
```

You can see files that are not yet staged using:

```
git status
```

6. Verify changes to be committed look as you expected:

```
git diff --cached
```

7. Commit your changes to your local repo:

```
git commit -s
```

The `-s` option automatically adds your `Signed-off-by:` to your commit message. Your commit will be rejected without this line that indicates your agreement with the DCO. See the Commit Guidelines section for specific guidelines for writing your commit messages.

8. Push your topic branch with your changes to your fork in your personal GitHub account:

```
git push origin fix_comment_typo
```

9. In your web browser, go to your forked repo and click on the Compare & pull request button for the branch you just worked on and you want to open a pull request with.

10. Review the pull request changes, and verify that you are opening a pull request for the appropriate branch. The title and message from your commit message should appear as well.

11. If you're working on a subsystem branch that's not `main`, you may need to change the intended branch for the pull request here, for example, by changing the base branch from `main` to `net`.

12. GitHub will assign one or more suggested reviewers (based on the CODEOWNERS file in the repo). If you are a project member, you can select additional reviewers now too.

13. Click on the submit button and your pull request is sent and awaits review. Email will be sent as review comments are made, or you can check on your pull request at https://github.com/zephyrproject-rtos/zephyr/pulls.
14. While you’re waiting for your pull request to be accepted and merged, you can create another branch to work on another issue. (Be sure to make your new branch off of main and not the previous branch):

```bash
git checkout main
git checkout -b fix_another_issue
```

and use the same process described above to work on this new topic branch.

15. If reviewers do request changes to your patch, you can interactively rebase commit(s) to fix review issues. In your development repo:

```bash
git fetch --all
git rebase --ignore-whitespace upstream/main
```

The `--ignore-whitespace` option stops `git apply` (called by rebase) from changing any whitespace. Continuing:

```bash
git rebase -i <offending-commit-id>^  
```

In the interactive rebase editor, replace `pick` with `edit` to select a specific commit (if there’s more than one in your pull request), or remove the line to delete a commit entirely. Then edit files to fix the issues in the review.

As before, inspect and test your changes. When ready, continue the patch submission:

```bash
git add [file(s)]
git rebase --continue
```

Update commit comment if needed, and continue:

```bash
git push --force origin fix_comment typo
```

By force pushing your update, your original pull request will be updated with your changes so you won’t need to resubmit the pull request.

**Note:** While amending commits and force pushing is a common review model outside GitHub, and the one recommended by Zephyr, it’s not the main model supported by GitHub. Forced pushes can cause unexpected behavior, such as not being able to use “View Changes” buttons except for the last one - GitHub complains it can’t find older commits. You’re also not always able to compare the latest reviewed version with the latest submitted version. When rewriting history GitHub only guarantees access to the latest version.

16. If the CI run fails, you will need to make changes to your code in order to fix the issues and amend your commits by rebasing as described above. Additional information about the CI system can be found in *Continuous Integration*.

### 8.1.10 Commit Guidelines

Changes are submitted as Git commits. Each commit message must contain:

- A short and descriptive subject line that is less than 72 characters, followed by a blank line. The subject line must include a prefix that identifies the subsystem being changed, followed by a colon, and a short title, for example: `doc: update wiki references to new site`. (If you’re updating an existing file, you can use `git log <filename>` to see what developers used as the prefix for previous patches of this file.)
- A change description with your logic or reasoning for the changes, followed by a blank line. (Every single line has to be less than 75 characters.)
• A Signed-off-by line, Signed-off-by: <name> <email> typically added automatically by using
  git commit -s
• If the change addresses an issue, include a line of the form:
  Fixes #<issue number>.

All changes and topics sent to GitHub must be well-formed, as described above.

Commit Message Body

When editing the commit message, please briefly explain what your change does and why it’s needed. A change summary of "Fixes stuff" will be rejected.

Warning: An empty change summary body is not permitted. Even for trivial changes, please include a summary body in the commit message.

The description body of the commit message must include:

• what the change does,
• why you chose that approach,
• what assumptions were made, and
• how you know it works – for example, which tests you ran.

For examples of accepted commit messages, you can refer to the Zephyr GitHub changelog.

Other Commit Expectations

• Commits must build cleanly when applied on top of each other, thus avoiding breaking bisectability.
• Commits must pass all CI checks (see Continuous Integration for more information)
• Each commit must address a single identifiable issue and must be logically self-contained. Unrelated changes should be submitted as separate commits.
• You may submit pull request RFCs (requests for comments) to send work proposals, progress snapshots of your work, or to get early feedback on features or changes that will affect multiple areas in the code base.
• When major new functionality is added, tests for the new functionality MUST be added to the automated test suite. All new APIs MUST be documented and tested and tests MUST cover at least 80% of the added functionality using the code coverage tool and reporting provided by the project.

Submitting Proposals

You can request a new feature or submit a proposal by submitting an issue to our GitHub Repository. If you would like to implement a new feature, please submit an issue with a proposal (RFC) for your work first, to be sure that we can use it. Please consider what kind of change it is:

• For a Major Feature, first open an issue and outline your proposal so that it can be discussed. This will also allow us to better coordinate our efforts, prevent duplication of work, and help you to craft the change so that it is successfully accepted into the project. Providing the following information will increase the chances of your issue being dealt with quickly:
  – Overview of the Proposal
  – Motivation for or Use Case
— Design Details
— Alternatives
— Test Strategy

• Small Features can be crafted and directly submitted as a Pull Request.

Identifying Contribution Origin

When adding a new file to the tree, it is important to detail the source of origin on the file, provide attributions, and detail the intended usage. In cases where the file is an original to Zephyr, the commit message should include the following (“Original” is the assumption if no Origin tag is present):

Origin: Original

In cases where the file is imported from an external project, the commit message shall contain details regarding the original project, the location of the project, the SHA-id of the origin commit for the file and the intended purpose.

For example, a copy of a locally maintained import:

Origin: Contiki OS
License: BSD 3-Clause
URL: http://www.contiki-os.org/
commit: 853207acfd49b10eb3e44504b1a75ae1ad63a
Purpose: Introduction of networking stack.

For example, a copy of an externally maintained import in a module repository:

Origin: Tiny Crypt
License: BSD 3-Clause
URL: https://github.com/01org/tinycrypt
commit: 08ded7f21529c39e5133688ffeb93a9d0c94e5c6e
Purpose: Introduction of TinyCrypt

8.1.11 Continuous Integration (CI)

The Zephyr Project operates a Continuous Integration (CI) system that runs on every Pull Request (PR) in order to verify several aspects of the PR:

• Git commit formatting
• Coding Style
• Twister builds for multiple architectures and boards
• Documentation build to verify any doc changes

CI is run on Github Actions and it uses the same tools described in the Contribution Tools section. The CI results must be green indicating “All checks have passed” before the Pull Request can be merged. CI is run when the PR is created, and again every time the PR is modified with a commit.

The current status of the CI run can always be found at the bottom of the GitHub PR page, below the review status. Depending on the success or failure of the run you will see:

• “All checks have passed”
• “All checks have failed”

In case of failure you can click on the “Details” link presented below the failure message in order to navigate to Github Actions and inspect the results. Once you click on the link you will be taken to the
Github actions summary results page where a table with all the different builds will be shown. To see what build or test failed click on the row that contains the failed (i.e. non-green) build.
The builds@lists.zephyrproject.org mailing list archives any nightly build results produced by CI.

8.1.12 Contributions to External Modules

Follow the guidelines in the Modules (External projects) section for contributing new modules and submitting changes to existing modules.

8.1.13 Treewide Changes

This section describes contributions that are treewide changes and some additional associated requirements that apply to them. These requirements exist to try to give such changes increased review and user visibility due to their large impact.

Definition and Decision Making

A treewide change is defined as any change to Zephyr APIs, coding practices, or other development requirements that either implies required changes throughout the zephyr source code repository or can reasonably be expected to do so for a wide class of external Zephyr-based source code.

This definition is informal by necessity. This is because the decision on whether any particular change is treewide can be subjective and may depend on additional context.

Project maintainers should use good judgement and prioritize the Zephyr developer experience when deciding when a proposed change is treewide. Protracted disagreements can be resolved by the Zephyr Project’s Technical Steering Committee (TSC), but please avoid premature escalation to the TSC.

Requirements for Treewide Changes

- The zephyr repository must apply the ‘treewide’ GitHub label to any issues or pull requests that are treewide changes
- The person proposing a treewide change must create an RFC issue describing the change, its rationale and impact, etc. before any pull requests related to the change can be merged
- The project’s Architecture Working Group (WG) must include the issue on the agenda and discuss whether the project will accept or reject the change before any pull requests related to the change can be merged (with escalation to the TSC if consensus is not reached at the WG)
- The Architecture WG must specify the procedure for merging any PRs associated with each individual treewide change, including any required approvals for pull requests affecting specific sub-systems or extra review time requirements
- The person proposing a treewide change must email devel@lists.zephyrproject.org about the RFC if it is accepted by the Architecture WG before any pull requests related to the change can be merged

Examples

Some example past treewide changes are:
- the deprecation of version 1 of the Logging API in favor of version 2 (see commit 262cc55609)
- the removal of support for a legacy Devicetree bindings syntax (6bf761fc0a)

Note that adding a new version of a widely used API while maintaining support for the old one is not a treewide change. Deprecation and removal of such APIs, however, are treewide changes.
8.2 Coding Guidelines

The project TSC and the Safety Committee of the project agreed to implement a staged and incremental approach for complying with a set of coding rules (AKA Coding Guidelines) to improve quality and consistency of the code base. Below are the agreed upon stages and the approximate timelines:

Stage I
Coding guideline rules are available to be followed and referenced, but not enforced. Rules are not yet enforced in CI and pull-requests cannot be blocked by reviewers/approvers due to violations.

Stage II
Begin enforcement on a limited scope of the code base. Initially, this would be the safety certification scope. For rules easily applied across codebase, we should not limit compliance to initial scope. This step requires tooling and CI setup and will start sometime after LTS2.

Stage III
Revisit the coding guideline rules and based on experience from previous stages, refine/iterate on selected rules.

Stage IV
Expand enforcement to the wider codebase. Exceptions may be granted on some areas of the codebase with a proper justification. Exception would require TSC approval.

**Note:** Coding guideline rules may be removed/changed at any time by filing a GH issue/RFC.

8.2.1 Main rules

The coding guideline rules are based on MISRA-C 2012 and are a subset of MISRA-C. The subset is listed in the table below with a summary of the rules, its severity and the equivalent rules from other standards for reference.

**Note:** For existing Zephyr maintainers and collaborators, if you are unable to obtain a copy through your employer, a limited number of copies will be made available through the project. If you need a copy of MISRA-C 2012, please send email to safety@lists.zephyrproject.org and provide details on reason why you can't obtain one through other options and expected contributions once you have one. The safety committee will review all requests.

</tbody>
</table>

#### 8.2.2 Additional rules
Rule A.1: Conditional Compilation

Severity  Required

Description  Do not conditionally compile function declarations in header files. Do not conditionally compile structure declarations in header files. You may conditionally exclude fields within structure definitions to avoid wasting memory when the feature they support is not enabled.

Rationale  Excluding declarations from the header based on compile-time options may prevent their documentation from being generated. Their absence also prevents use of `if (IS_ENABLED(CONFIG_FOO)) {}` as an alternative to preprocessor conditionals when the code path should change based on the selected options.

Rule A.2: Inclusive Language

Severity  Required

Description  Do not introduce new usage of offensive terms listed below. This rule applies but is not limited to source code, comments, documentation, and branch names. Replacement terms may vary by area or subsystem, but should aim to follow updated industry standards when possible. Exceptions are allowed for maintaining existing implementations or adding new implementations of industry standard specifications governed externally to the Zephyr Project. Existing usage is recommended to change as soon as updated industry standard specifications become available or new terms are publicly announced by the governing body, or immediately if no specifications apply.

<table>
<thead>
<tr>
<th>Offensive Terms</th>
<th>Recommended Replacements</th>
</tr>
</thead>
<tbody>
<tr>
<td>{master,leader} / slave</td>
<td>• {primary,main} / {secondary, replica}</td>
</tr>
<tr>
<td></td>
<td>• {initiator,requester} / {target, responder}</td>
</tr>
<tr>
<td></td>
<td>• {controller,host} / {device,worker, proxy,target}</td>
</tr>
<tr>
<td></td>
<td>• director / performer</td>
</tr>
<tr>
<td></td>
<td>• central / peripheral</td>
</tr>
<tr>
<td>blacklist / whitelist</td>
<td>• denylist / allowlist</td>
</tr>
<tr>
<td></td>
<td>• blocklist / allowlist</td>
</tr>
<tr>
<td></td>
<td>• rejectlist / acceptlist</td>
</tr>
<tr>
<td>grandfather policy</td>
<td>• legacy</td>
</tr>
<tr>
<td>sanity</td>
<td>• coherence</td>
</tr>
<tr>
<td></td>
<td>• confidence</td>
</tr>
</tbody>
</table>

Rationale  Offensive terms do not create an inclusive community environment and therefore violate the Zephyr Project Code of Conduct. This coding rule was inspired by a similar rule in Linux.
Status  Related GitHub Issues and Pull Requests are tagged with the Inclusive Language Label.

8.2.3 Parasoft Codescan Tool

Parasoft Codescan is an official static code analysis tool used by the Zephyr project. It is used to automate compliance with a range of coding and security standards. The tool is currently set to the MISRA-C:2012 Coding Standard because the Zephyr Coding Guidelines are based on that standard. It is used together with the Coverity Scan tool to achieve the best code health and precision in bug findings.
Violations fixing process

Step 1
Any Zephyr Project member, company or a developer can request access to the Parasoft reporting centre if they wish to get involved in fixing violations by submitting issues.

Step 2
A developer starts to review violations.

Step 3
A developer submits a Github PR with the fix. Commit messages should follow the same guidelines as other PRs in the Zephyr project. Please add a comment that your fix was found by a static coding scanning tool. Developers should follow and refer to the Zephyr Coding Guidelines as basic rules for coding. These rules are based on the MISRA-C standard.

Below you can find an example of a recommended commit message:

```
lib: os: add braces to 'if' statements

An 'if' (expression) construct shall be followed by a compound statement. Add braces to improve readability and maintainability.

Found as a coding guideline violation (Rule 15.6) by static coding scanning tool.

Signed-off-by: Johnny Developer <johnny.developer@company.com>
```

Step 4
If a violation is a false positive, the developer should mark it for the Codescan tool just like they would do for the Coverity tool. The developer should also add a comment to the code explaining that the violation raised by the static code analysis tool should be considered a false positive.

Step 5
If the developer has found a real violation that the community decided to ignore, the developer must submit a PR with a suppression tag and a comment explaining why the violation has been deviated. The template structure of the comment and tag in the code should be:

```
/* Explain why that part of the code doesn't follow the standard,
 * explain why it is a deliberate deviation from the standard.
 * Don't refer to the Parasoft tool here, just mention that static code
 * analysis tool raised a violation in the line below.
 */

code_line_with_a_violation /* parasoft-suppress Rule ID */
```

Below you can find an example of a recommended commit message:

```
testsuite: suppress usage of setjmp in a testcode (rule 21.4)

According to the Rule 21.4 the standard header file <setjmp.h> shall not be used. We will suppress this violation because it is in test code. Tag suppresses reporting of the violation for the line where the violation is located. This is a deliberate deviation.

Found as a coding guideline violation (Rule 21.4) by static coding scanning tool.

Signed-off-by: Johnny Developer <johnny.developer@company.com>
```

The example below demonstrates how deviations can be suppressed in the code:
/* Static code analysis tool can raise a violation that the standard
* header <setjmp.h> shall not be used.
* Since this violation is in test code, we will suppress it.
* Deliberate deviation.
*/
#include <setjmp.h> /* parasoft-suppress MISRAC2012-RULE_21_4-a MISRAC2012-RULE_21_4-b */

This variant above suppresses item MISRAC2012-RULE_21_4-a and MISRAC2012-RULE_21_4-b on the line with “setjmp” header include. You can add as many rules to suppress you want - just make sure to keep the Parasoft tag on one line and separate rules with a space. To read more about suppressing findings in the Parasoft tool, refer to the official Parasoft documentation.

Step 6
After a PR is submitted, the developer should add the Coding guidelines and MISRA-C Github labels so their PR can be easily tracked by maintainers. If you have any concerns about what your PR should look like, you can search on Github using those tags and refer to similar PRs that have already been merged.

8.3 Documentation
8.3.1 Documentation Guidelines

Note: For instructions on building the documentation, see Documentation Generation.

Zephyr Project content is written using the reStructuredText markup language (.rst file extension) with Sphinx extensions, and processed using Sphinx to create a formatted standalone website. Developers can view this content either in its raw form as .rst markup files, or (with Sphinx installed) they can build the documentation using the Makefile on Linux systems, or make.bat on Windows, to generate the HTML content. The HTML content can then be viewed using a web browser. This same .rst content is also fed into the Zephyr documentation website (with a different theme applied).

You can read details about reStructuredText and about Sphinx extensions from their respective websites. This document provides a quick reference for commonly used reST and Sphinx-defined directives and roles used to create the documentation you're reading.

Headings

While reST allows use of both and overline and matching underline to indicate a heading, we only use an underline indicator for headings.

- Document title (h1) use “#” for the underline character
- First section heading level (h2) use “*”
- Second section heading level (h3) use “=”
- Third section heading level (h4) use “-”

The heading underline must be at least as long as the title it’s under.

For example:

This is a title heading

# # # # # # # # # #

(continues on next page)
some content goes here

First section heading
********************

Content Highlighting

Some common reST inline markup samples:

- one asterisk: *text* for emphasis (italics),
- two asterisks: **text** for strong emphasis (boldface), and
- two backquotes: `text` for inline code samples.

If asterisks or backquotes appear in running text and could be confused with inline markup delimiters, you can eliminate the confusion by adding a backslash (\) before it.

Lists

For bullet lists, place an asterisk (*) or hyphen (-) at the start of a paragraph and indent continuation lines with two spaces.

The first item in a list (or sublist) must have a blank line before it and should be indented at the same level as the preceding paragraph (and not indented itself).

For numbered lists start with a 1. or a. for example, and continue with autonumbering by using a # sign. Indent continuation lines with three spaces:

* This is a bulleted list.
* It has two items, the second item and has more than one line of reST text. Additional lines are indented to the first character of the text of the bullet list.

1. This is a new numbered list. If the wasn't a blank line before it, it would be a continuation of the previous list (or paragraph).
   #. It has two items too.

   a. This is a numbered list using alphabetic list headings
   #. It has three items (and uses autonumbering for the rest of the list)
   #. Here's the third item

   #. This is an autonumbered list (default is to use numbers starting with 1).
      #. This is a second-level list under the first item (also autonumbered). Notice the indenting.
      #. And a second item in the nested list.
      #. And a second item back in the containing list. No blank line needed, but it wouldn't hurt for readability.

Definition lists (with a term and its definition) are a convenient way to document a word or phrase with an explanation. For example this reST content:

The Makefile has targets that include:
html
   Build the HTML output for the project

clean
   Remove all generated output, restoring the folders to a clean state.

Would be rendered as:

The Makefile has targets that include:

html
   Build the HTML output for the project

clean
   Remove all generated output, restoring the folders to a clean state.

**Multi-column lists**

If you have a long bullet list of items, where each item is short, you can indicate the list items should be rendered in multiple columns with a special `.. rst-class:: rst-columns` directive. The directive will apply to the next non-comment element (e.g., paragraph), or to content indented under the directive. For example, this unordered list:

```
.. rst-class:: rst-columns

* A list of
  * short items
  * that should be
  * displayed
  * horizontally
  * so it doesn't
  * use up so much
  * space on
  * the page
```

would be rendered as:

- A list of
- short items
- that should be
- displayed
- horizontally
- so it doesn't
- use up so much
- space on
- the page

A maximum of three columns will be displayed, and change based on the available width of the display window; reducing to one column on narrow (phone) screens if necessary. We've deprecated use of the `hlist` directive because it misbehaves on smaller screens.
Tables

There are a few ways to create tables, each with their limitations or quirks. Grid tables offer the most capability for defining merged rows and columns, but are hard to maintain:

```
+------------------------+------------+----------+----------+
| Header row, column 1  | Header 2  | Header 3 | Header 4 |
| (header rows optional)| | | |
+========================+============+==========+==========+
| body row 1, column 1  | column 2  | column 3 | column 4 |
+------------------------+------------+----------+----------+
| body row 2            | ...        | ...      | you can |
+------------------------+------------+----------+----------+
| body row 3 with a two column span | ... | span     | rows     |
+------------------------+------------+----------+----------+
| body row 4            | ...        | ...      | too       |
+------------------------+------------+----------+----------+
```

This example would render as:

<table>
<thead>
<tr>
<th>Header row, column 1 (header rows optional)</th>
<th>Header 2</th>
<th>Header 3</th>
<th>Header 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>body row 1, column 1</td>
<td>column 2</td>
<td>column 3</td>
<td>column 4</td>
</tr>
<tr>
<td>body row 2</td>
<td>...</td>
<td>...</td>
<td>you can</td>
</tr>
<tr>
<td>body row 3 with a two column span</td>
<td>...</td>
<td>span</td>
<td>rows</td>
</tr>
<tr>
<td>body row 4</td>
<td>...</td>
<td>...</td>
<td>too</td>
</tr>
</tbody>
</table>

List tables are much easier to maintain, but don't support row or column spans:

```
.. list-table:: Table title
   :widths: 15 20 40
   :header-rows: 1

   * - Heading 1
     - Heading 2
     - Heading 3
   * - body row 1, column 1
     - body row 1, column 2
     - body row 1, column 3
   * - body row 2, column 1
     - body row 2, column 2
     - body row 2, column 3
```

This example would render as:

```
Table 8.2: Table title

<table>
<thead>
<tr>
<th>Heading 1</th>
<th>Heading 2</th>
<th>Heading 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>body row 1, column 1</td>
<td>body row 1, column 2</td>
<td>body row 1, column 3</td>
</tr>
<tr>
<td>body row 2, column 1</td>
<td>body row 2, column 2</td>
<td>body row 2, column 3</td>
</tr>
</tbody>
</table>
```

The :widths: parameter lets you define relative column widths. The default is equal column widths. If you have a three-column table and you want the first column to be half as wide as the other two equal-width columns, you can specify :widths: 1 2 2. If you'd like the browser to set the column widths automatically based on the column contents, you can use :widths: auto.
File names and Commands

Sphinx extends reST by supporting additional inline markup elements (called “roles”) used to tag text with special meanings and allow style output formatting. (You can refer to the Sphinx Inline Markup documentation for the full list).

For example, there are roles for marking filenames (:file:`name`) and command names such as make (:command:`make`). You can also use the `inline code` markup (double backticks) to indicate a filename.

For references to files that are in the Zephyr GitHub tree, a special role can be used that creates a hyperlink to that file. For example a reference to the reST file used to create this document can be generated using :zephyr_file:`doc/contribute/documentation/index.rst` that will show up as doc/contribute/documentation/index.rst, a link to the “blob” file in the github repo. There's also a :zephyr_raw:`doc/guides/documentation/index.rst` role that will link to the “raw” content, doc/contribute/documentation/index.rst. (You can click on these links to see the difference.)

Internal Cross-Reference Linking

Traditional ReST links are only supported within the current file using the notation:

Refer to the `internal-linking` page

which renders as,

Refer to the internal-linking page

Note the use of a trailing underscore to indicate an outbound link. In this example, the label was added immediately before a heading, so the text that's displayed is the heading text itself. You can change the text that's displayed as the link writing this as:

Refer to the `show this text instead <internal-linking>` page

which renders as,

Refer to the show this text instead page

External Cross-Reference Linking

With Sphinx's help, we can create link-references to any tagged text within the Zephyr Project documentation.

Target locations in a document are defined with a label directive:

.. _my label name:

Heading

======

Note the leading underscore indicating an inbound link. The content immediately following this label must be a heading, and is the target for a :ref:`my label name` reference from anywhere within the Zephyr documentation. The heading text is shown when referencing this label. You can also change the text that's displayed for this link, such as:

:ref:`some other text <my label name>`

To enable easy cross-page linking within the site, each file should have a reference label before its title so it can be referenced from another file. These reference labels must be unique across the whole site, so generic names such as “samples” should be avoided. For example the top of this document's .rst file is:
Documentation Guidelines for the Zephyr Project

Other .rst documents can link to this document using the :ref:`doc_guidelines` tag and it will show up as Documentation Guidelines. This type of internal cross reference works across multiple files, and the link text is obtained from the document source so if the title changes, the link text will update as well.

You can also define links to any URL and then reference it in your document. For example, with this label definition in the document:

```
.. _Zephyr Wikipedia Page:
    https://en.wikipedia.org/wiki/Zephyr_(operating_system)
```

you can reference it with:

Read the `Zephyr Wikipedia Page`_ for more information about the project.

```any` links

Within the Zephyr project, we've defined the default role to be “any”, meaning if you just write a phrase in back-ticks, e.g., `doc_guidelines`, Sphinx will search through all domains looking for something called doc_guidelines to link to. In this case it will find the label at the top of this document, and link to doc_guidelines. This can be useful for linking to doxygen-generated links for function names and such, but will cause a warning such as:

```
WARNING: 'any' reference target not found: doc_guidelines
```

if you misspelled `doc_guidelines` as `doc_giudelines`.

Non-ASCII Characters

You can insert non-ASCII characters such as a Trademark symbol (™), by using the notation |trade|. Available replacement names are defined in an include file used during the Sphinx processing of the reST files. The names of these replacement characters are the same as used in HTML entities used to insert characters in HTML, e.g., &trade; and are defined in the file sphinx_build/substitutions.txt as listed here:

```
.. |br| raw:: html .. force a line break in HTML output (blank lines needed here)

<br />
```

```
.. |p| raw:: html .. force a blank line in HTML output (blank lines needed here)

<p></p>
```

```
.. These are replacement strings for non-ASCII characters used within the project using the same name as the html entity names (e.g., &copy;) for that character

.. |copy| unicode:: U+000A9 .. COPYRIGHT SIGN

.. |ltrim:

.. |trade| unicode:: U+02122 .. TRADEMARK SIGN
```

(continues on next page)
We've kept the substitutions list small but others can be added as needed by submitting a change to the substitutions.txt file.

**Code and Command Examples**

Use the reST code-block directive to create a highlighted block of fixed-width text, typically used for showing formatted code or console commands and output. Smart syntax highlighting is also supported (using the Pygments package). You can also directly specify the highlighting language. For example:

```
.. code-block:: c

struct z_object {
    char *name;
    uint8_t perms[CONFIG_MAX_THREAD_BYTES];
    uint8_t type;
    uint8_t flags;
    uint32_t data;
} __packed;
```

Note the blank line between the code-block directive and the first line of the code-block body, and the body content is indented three spaces (to the first non-white space of the directive name).

This would be rendered as:

```
struct z_object {
    char *name;
    uint8_t perms[CONFIG_MAX_THREAD_BYTES];
    uint8_t type;
    uint8_t flags;
    uint32_t data;
} __packed;
```

You can specify other languages for the code-block directive, including c, python, and rst, and also console, bash, or shell. If you want no syntax highlighting, use the language none, for example:

```
.. code-block:: none

This would be a block of text styled with a background and box, but with no syntax highlighting.
```

Would display as:

```
This would be a block of text styled with a background and box, but with no syntax highlighting.
```
There's a shorthand for writing code blocks too: end the introductory paragraph with a double colon (::) and indent the code block content by three spaces. On output, only one colon will be shown. The highlighting package makes a best guess at the type of content in the block and highlighting purposes.

Images

Images are included in documentation by using an image directive:

```restructuredtext
.. image:: ../../../../images/doc-gen-flow.png
   :align: center
   :alt: alt text for the image
```

or if you'd like to add an image caption, use:

```restructuredtext
.. figure:: ../../../../images/doc-gen-flow.png
   :alt: image description

   Caption for the figure
```

The file name specified is relative to the document source file, and we recommend putting images into an images folder where the document source is found. The usual image formats handled by a web browser are supported: JPEG, PNG, GIF, and SVG. Keep the image size only as large as needed, generally at least 500 px wide but no more than 1000 px, and no more than 250 KB unless a particularly large image is needed for clarity.

Tabs, spaces, and indenting

Indenting is significant in reST file content, and using spaces is preferred. Extra indenting can (unintentionally) change the way content is rendered too. For lists and directives, indent the content text to the first non-white space in the preceding line. For example:

```restructuredtext
* List item that spans multiple lines of text
  showing where to indent the continuation line.

1. And for numbered list items, the continuation line should align with the text of the line above.

   .. code-block::

      The text within a directive block should align with the first character of the directive name.
```

Keep the line length for documentation less than 80 characters to make it easier for reviewing in GitHub. Long lines because of URL references are an allowed exception.

zephyr-app-commands Directive

This is a Zephyr directive for generating consistent documentation of the shell commands needed to manage (build, flash, etc.) an application.

For example, to generate commands to build samples/hello_world for qemu_x86 use:

```restructuredtext
.. zephyr-app-commands::
   :zephyr-app: samples/hello_world
   :board: qemu_x86
   :goals: build
```
Directive options:

:tool:
which tool to use. Valid options are currently 'cmake', 'west' and 'all'. The default is 'west'.

:app:
path to the application to build.

:zephyr-app:
path to the application to build, this is an app present in the upstream zephyr repository. Mutually exclusive with :app:.

:cd-into:
if set, build instructions are given from within the :app: folder, instead of outside of it.

:generator:
which build system to generate. Valid options are currently 'ninja' and 'make'. The default is 'ninja'. This option is not case sensitive.

:host-os:
which host OS the instructions are for. Valid options are 'unix', 'win' and 'all'. The default is 'all'.

:board:
if set, the application build will target the given board.

:shield:
if set, the application build will target the given shield.

:conf:
if set, the application build will use the given configuration file. If multiple conf files are provided, enclose the space-separated list of files with quotes, e.g., “a.conf b.conf”.

:gen-args:
if set, additional arguments to the CMake invocation

:build-args:
if set, additional arguments to the build invocation

:build-dir:
if set, the application build directory will APPEND this (relative, Unix-separated) path to the standard build directory. This is mostly useful for distinguishing builds for one application within a single page.

:goals:
a whitespace-separated list of what to do with the app (in 'build', 'flash', 'debug', 'debugserver', 'run'). Commands to accomplish these tasks will be generated in the right order.

:maybe-skip-config:
if set, this indicates the reader may have already created a build directory and changed there, and will tweak the text to note that doing so again is not necessary.

:compact:
if set, the generated output is a single code block with no additional comment lines

:west-args:
if set, additional arguments to the west invocation (ignored for CMake)

For example, the .. zephyr-app-commands listed above would render like this in the generated HTML output:

```shell
# From the root of the zephyr repository
west build -b qemu_x86 samples/hello_world
```
Alternative Tabbed Content

As introduced in the *Getting Started Guide*, you can provide alternative content to the reader via a tabbed interface. When the reader clicks on a tab, the content for that tab is displayed, for example:

```
.. tabs::
    .. tab:: Apples
        Apples are green, or sometimes red.
    .. tab:: Pears
        Pears are green.
    .. tab:: Oranges
        Oranges are orange.
```

will display as:

Apples
Apples are green, or sometimes red.
Pears
Pears are green.
Oranges
Oranges are orange.

Tabs can also be grouped, so that changing the current tab in one area changes all tabs with the same name throughout the page. For example:

Linux
Linux Line 1
macOS
macOS Line 1
Windows
Windows Line 1
Linux
Linux Line 2
macOS
macOS Line 2
Windows
Windows Line 2

In this latter case, we're using .. group-tab:: instead of simply .. tab::: Under the hood, we're using the sphinx-tabs extension that's included in the Zephyr setup. Within a tab, you can have most any content other than a heading (code-blocks, ordered and unordered lists, pictures, paragraphs, and such). You can read more about sphinx-tabs from the link above.
Instruction Steps

Also introduced in the *Getting Started Guide* is a style that makes it easy to create tutorial guides with clearly identified steps. Add the .. rst-class:: numbered-step directive immediately before a second-level heading (by project convention, a heading underlined with asterisks ******, and it will be displayed as a numbered step, sequentially numbered within the document. For example:

```
.. rst-class:: numbered-step

Put your right hand in
***************
```

Put your right hand in

See the doc/develop/getting_started/index.rst source file and compare with the *Getting Started Guide* to see a full example. As implemented, only one set of numbered steps is intended per document.

For instructions on building the documentation, see *Documentation Generation*.

### 8.3.2 Documentation Generation

These instructions will walk you through generating the Zephyr Project's documentation on your local system using the same documentation sources as we use to create the online documentation found at https://docs.zephyrproject.org

**Documentation overview**

Zephyr Project content is written using the reStructuredText markup language (.rst file extension) with Sphinx extensions, and processed using Sphinx to create a formatted stand-alone website. Developers can view this content either in its raw form as .rst markup files, or you can generate the HTML content and view it with a web browser directly on your workstation. This same .rst content is also fed into the Zephyr Project's public website documentation area (with a different theme applied).

You can read details about reStructuredText, and Sphinx from their respective websites.

The project's documentation contains the following items:

- ReStructuredText source files used to generate documentation found at the [https://docs.zephyrproject.org](https://docs.zephyrproject.org) website. Most of the reStructuredText sources are found in the /doc directory, but others are stored within the code source tree near their specific component (such as /samples and /boards)
- Doxygen-generated material used to create all API-specific documents also found at [https://docs.zephyrproject.org](https://docs.zephyrproject.org)
- Script-generated material for kernel configuration options based on Kconfig files found in the source code tree

The reStructuredText files are processed by the Sphinx documentation system, and make use of the breathe extension for including the doxygen-generated API material. Additional tools are required to generate the documentation locally, as described in the following sections.

**Installing the documentation processors**

Our documentation processing has been tested to run with:

- Doxygen version 1.8.13
- Graphviz 2.43
In order to install the documentation tools, first install Zephyr as described in [Getting Started Guide](#). Then install additional tools that are only required to generate the documentation, as described below:

**Linux**

On Ubuntu Linux:

```bash
sudo apt-get install --no-install-recommends doxygen graphviz librsvg2-bin \
texlive-latex-base texlive-latex-extra latexmk texlive-fonts-recommended
```

On Fedora Linux:

```bash
sudo dnf install doxygen graphviz texlive-latex latexmk \
texlive-collection-fontsrecommended librsvg2-tools
```

On Clear Linux:

```bash
sudo swupd bundle-add texlive graphviz
```

On Arch Linux:

```bash
sudo pacman -S graphviz doxygen librsvg texlive-core texlive-bin \
texlive-latexextra texlive-fontsextra
```

**macOS**

Use `brew` and `tlmgr` to install the tools:

```bash
brew install doxygen graphviz mactex librsvg
tlmgr install latexmk
tlmgr install collection-fontsrecommended
```

**Windows**

Open a `cmd.exe` window as **Administrator** and run the following command:

```bash
choco install doxygen.install graphviz strawberryperl miktex rsvg-convert
```

---

**Fig. 8.1: Schematic of the documentation build process**

- Latexmk version 4.56
- All Python dependencies listed in the repository file `scripts/requirements-doc.txt`
**Note:** On Windows, the Sphinx executable `sphinx-build.exe` is placed in the `Scripts` folder of your Python installation path. Depending on how you have installed Python, you might need to add this folder to your `PATH` environment variable. Follow the instructions in Windows Python Path to add those if needed.

**Documentation presentation theme**

Sphinx supports easy customization of the generated documentation appearance through the use of themes. Replace the theme files and do another `make html` and the output layout and style is changed. The `read-the-docs` theme is installed as part of the Get Zephyr and install Python dependencies step you took in the getting started guide.

**Running the documentation processors**

The `/doc` directory in your cloned copy of the Zephyr project git repo has all the `.rst` source files, extra tools, and Makefile for generating a local copy of the Zephyr project's technical documentation. Assuming the local Zephyr project copy is in a folder `zephyr` in your home folder, here are the commands to generate the `html` content locally:

```bash
# On Linux/macOS
cd ~/zephyr/doc
# On Windows
cd %userprofile%\zephyr\doc

# Use cmake to configure a Ninja-based build system:
cmake -GNinja -B_build .

# Enter the build directory
cd _build

# To generate HTML output, run ninja on the generated build system:
ninja html
# If you modify or add .rst files, run ninja again:
ninja html

# To generate PDF output, run ninja on the generated build system:
ninja pdf
```

**Warning:** The documentation build system creates copies in the build directory of every `.rst` file used to generate the documentation, along with dependencies referenced by those `.rst` files. This means that Sphinx warnings and errors refer to the copies, and not the version-controlled original files in Zephyr. Be careful to make sure you don’t accidentally edit the copy of the file in an error message, as these changes will not be saved.

Depending on your development system, it will take up to 15 minutes to collect and generate the HTML content. When done, you can view the HTML output with your browser started at `doc/_build/html/index.html` and if generated, the PDF file is available at `doc/_build/pdf/zephyr.pdf`.

If you want to build the documentation from scratch just delete the contents of the build folder and run `cmake` and then `ninja` again.
Note: If you add or remove a file from the documentation, you need to re-run CMake.

On Unix platforms a convenience `doc/Makefile` can be used to build the documentation directly from there:

```bash
 cd ~/zephyr/doc

# To generate HTML output
make html

# To generate PDF output
make pdf
```

Filtering expected warnings

There are some known issues with Sphinx/Breathe that generate Sphinx warnings even though the input is valid C code. While these issues are being considered for fixing we have created a Sphinx extension that allows to filter them out based on a set of regular expressions. The extension is named `zephyr_warnings_filter` and it is located at `doc/_extensions/zephyr/warnings_filter.py`. The warnings to be filtered out can be added to the `doc/known-warnings.txt` file.

The most common warning reported by Sphinx/Breathe is related to duplicate C declarations. This warning may be caused by different Sphinx/Breathe issues:

- Multiple declarations of the same object are not supported
- Different objects (e.g. a struct and a function) can not share the same name
- Nested elements (e.g. in a struct or union) can not share the same name

Developer-mode Document Building

When making and testing major changes to the documentation, we provide an option to temporarily stub-out the auto-generated Devicetree bindings documentation so the doc build process runs faster.

To enable this mode, set the following option when invoking cmake:

```bash
-DDT_TURBO_MODE=1
```

or invoke make with the following target:

```bash
 cd ~/zephyr

# To generate HTML output without detailed Kconfig
make html-fast
```

Linking external Doxygen projects against Zephyr

External projects that build upon Zephyr functionality and wish to refer to Zephyr documentation in Doxygen (through the use of @ref), can utilize the tag file exported at `zephyr.tag`

Once downloaded, the tag file can be used in a custom `doxyfile.in` as follows:

```bash
TAGFILES = "'/path/to/zephyr.tag=https://docs.zephyrproject.org/latest/doxygen/html/"
```

For additional information refer to Doxygen External Documentation.
8.4 Contributing External Components

In some cases it is desirable to leverage existing, external source code in order to avoid re-implementing basic functionality or features that are readily available in other open source projects.

This section describes the circumstances under which external source code can be imported into Zephyr, and the process that governs the inclusion.

There are three main factors that will be considered during the inclusion process in order to determine whether it will be accepted. These will be described in the following sections.

8.4.1 Software License

**Note:** External source code licensed under the Apache-2.0 license is not subject to this section.

Integrating code into the Zephyr Project from other projects that use a license other than the Apache 2.0 license needs to be fully understood in context and approved by the Zephyr governing board, as described in the Zephyr project charter. The board will automatically reject licenses that have not been approved by the Open Source Initiative (OSI). See the Submission and review process section for more details.

By carefully reviewing potential contributions and also enforcing a Developer Certification of Origin (DCO) for contributed code, we ensure that the Zephyr community can develop products with the Zephyr Project without concerns over patent or copyright issues.

8.4.2 Merit

Just like with any other regular contribution, one that contains external code needs to be evaluated for merit. However, in the particular case of code that comes from an existing project, there are additional questions that must be answered in order to accept the contribution. More specifically, the following will be considered by the Technical Steering Committee and evaluated carefully before the external source code is accepted into the project:

- Is this the most optimal way to introduce the functionality to the project? Both the cost of implementing this internally and the one incurred in maintaining an externally developed codebase need to be evaluated.
- Is the external project being actively maintained? This is particularly important for source code that deals with security or cryptography.
- Have alternatives to the particular implementation proposed been considered? Are there other open source project that implement the same functionality?

8.4.3 Mode of integration

There are two ways of integrating external source code into the Zephyr Project, and careful consideration must be taken to choose the appropriate one for each particular case.

Integration in the main tree

The first way to integrate external source code into the project is to simply import the source code files into the main zephyr repository. This automatically implies that the imported source code becomes part of the “mainline” codebase, which in turn requires that:

- The code is formatted according to the Zephyr Coding Style
• The code adheres to the project’s *Coding Guidelines*
• The code is subject to the same checks and verification requirements as the rest of the code in the
  main tree, including static analysis
• All files contain an SPDX tag if not already present
• An entry is added to the licensing page `<zephyr_licensing>`

This mode of integration can be applicable to both small and large external codebases, but it is typically used more commonly with the former.

**Integration as a module**

The second way of integrating external source code into the project is to import the whole or parts of the third-party open source project into a separate repository, and then include it under the form of a *module*.

With this approach the code is considered as being developed externally, and thus it is not automatically subject to the requirements of the previous section.

### 8.4.4 Ongoing maintenance

Regardless of the mode of integration, external source code that is integrated in Zephyr requires regular ongoing maintenance. The submitter of the proposal to integrate external source code must therefore commit to maintain the integration of such code for the foreseeable future. This may require adding an entry in the *MAINTAINERS.yml* as part of the process.

### 8.4.5 Submission and review process

Before external source code can be included in the project, it must be reviewed and accepted by the Technical Steering Committee (TSC) and, in some cases, by the Zephyr governing board.

A request for external source code integration must be made by creating a new issue in the Zephyr project issue tracking system on GitHub with details about the source code and how it integrates into the project.

Follow the steps below to begin the submission process:

1. Make sure to read through the *Contributing External Components* section in detail, so that you are informed of the criteria used by the TSC and board in order to approve or reject a request
2. Use the *New External Source Code Issue* to open an issue
3. Fill out all required sections, making sure you provide enough detail for the TSC to assess the merit of the request. Optionally you can also create a Pull Request that demonstrates the integration of the external source code and link it to from the issue
4. Wait for feedback from the TSC, respond to any additional questions added as GitHub issue comments

If, after consideration by the TSC, the conclusion is that integrating external source code is the best solution, and the external source code is licensed under the Apache-2.0 license, the submission process is complete and the external source code can be integrated.

If, however, the external source code uses a license other than Apache-2.0, then these additional steps must be followed:

1. The TSC chair will forward the link to the GitHub issue created during the early submission process to the Zephyr governing board for further review
2. The Zephyr governing board has two weeks to review and ask questions:
   • If there are no objections, the matter is closed. Approval can be accelerated by unanimous approval of the board before the two weeks are up
• If a governing board member raises an objection that cannot be resolved via email, the board will meet to discuss whether to override the TSC approval or identify other approaches that can resolve the objections.

3. On approval of the Zephyr TSC and governing board the submission process is complete.

The flowchart below shows an overview of the process:

Fig. 8.2: Submission process

8.5 Binary Blobs

In the context of an operating system that supports multiple architectures and many different IC families, some functionality may be unavailable without the help of executable code distributed in binary form. Binary blobs (or blobs for short) are files containing proprietary machine code or data in a binary format, e.g. without corresponding source code released under an OSI approved license.

Zephyr supports downloading and using third-party binary blobs via its built-in mechanisms, with some important caveats, described in the following sections. It is important to note that all the information in this section applies only to upstream (vanilla) Zephyr.

There are no limitations whatsoever (except perhaps license compatibility) in the support for binary blobs in forks or third-party distributions of Zephyr. In fact, Zephyr's build system supports arbitrary use cases related to blobs. This includes linking against libraries, flashing images to targets, etc. Users are therefore free to create Zephyr-based downstream software which uses binary blobs if they cannot meet the requirements described in this page.

8.5.1 Software license

Most binary blobs are distributed under proprietary licenses which vary significantly in nature and conditions. It is up to the vendor to specify the license as part of the blob submission process. Blob vendors may impose a click-through or other EULA-like workflow when users fetch and install blobs.
8.5.2 Hosting

Blobs must be hosted on the Internet and managed by third-party infrastructure. Two potential examples are Git repositories and web servers managed by individual hardware vendors.

The Zephyr Project does not host binary blobs in its Git repositories or anywhere else.

8.5.3 Fetching blobs

Blobs are fetched from official third-party sources by the `west blobs` command.

The blobs themselves must be specified in the `module.yml` files included in separate Zephyr module repositories maintained by their respective vendors. This means that in order to include a reference to a binary blob to the upstream Zephyr distribution, a module repository must exist first or be created as part of the submission process.

Each blob which may be fetched must be individually identified in the corresponding `module.yml` file. A specification for a blob must contain:

- An abstract description of the blob itself
- Version information
- A reference to vendor-provided documentation
- The blob’s type, which must be one of the allowed types
- A checksum for the blob, which `west blobs` checks after downloading. This is required for reproducibility and to allow bisecting issues as blobs change using Git and west
- License text applicable to the blob or a reference to such text, in SPDX format

See the corresponding section for a more formal definition of the fields.

The `west blobs` command can be used to list metadata of available blobs and to fetch blobs from user-selected modules.

The `west blobs` command only fetches and stores the binary blobs themselves. Any accompanying code, including interface header files for the blobs, must be present in the corresponding module repository.

8.5.4 Tainting

Inclusion of binary blobs will taint the Zephyr build. The definition of tainting originates in the Linux kernel and, in the context of Zephyr, a tainted image will be one that includes binary blobs in it.

Tainting will be communicated to the user in the following manners:

- One or more Kconfig options `TAINT_BLOBS_*` will be set to y
- The Zephyr build system, during its configuration phase, will issue a warning. It will be possible to disable the warning using Kconfig
- The `west spdx` command will include the tainted status in its output
- The kernel’s default fatal error handler will also explicitly print out the kernel’s tainted status

8.5.5 Allowed types

The following binary blob types are acceptable in Zephyr:

- Precompiled libraries: Hardware enablement libraries, distributed in precompiled binary form, typically for SoC peripherals. An example could be an enablement library for a wireless peripheral
• Firmware images: An image containing the executable code for a secondary processor or CPU. This can be full or partial (typically delta or patch data) and is generally copied into RAM or flash memory by the main CPU. An example could be the firmware for the core running a Bluetooth LE Controller.

• Miscellaneous binary data files. An example could be pre-trained neural network model data

Hardware agnostic features provided via a proprietary library are not acceptable. For example, a proprietary and hardware agnostic TCP/IP stack distributed as a static archive would be rejected.

Note that just because a blob has an acceptable type does not imply that it will be unconditionally accepted by the project; any blob may be rejected for other reasons on a case by case basis (see library-specific requirements below). In case of disagreement, the TSC is the arbiter of whether a particular blob fits in one of the above types.

8.5.6 Precompiled library-specific requirements

This section contains additional requirements specific to precompiled library blobs.

Any person who wishes to submit a precompiled library must represent that it meets these requirements. The project may remove a blob from the upstream distribution if it is discovered that the blob fails to meet these requirements later on.

Interface header files

The precompiled library must be accompanied by one or more header files, distributed under a non-copyleft OSI approved license, that define the interface to the library.

Allowed dependencies

This section defines requirements related to external symbols that a library blob requires the build system to provide.

• The blob must not depend on Zephyr APIs directly. In other words, it must have been possible to build the binary without any Zephyr source code present at all. This is required for loose coupling and maintainability, since Zephyr APIs may change and such blobs cannot be modified by all project maintainers.

• Instead, if the code in the precompiled library requires functionality provided by Zephyr (or an RTOS in general), an implementation of an OS abstraction layer (aka porting layer) can be provided alongside the library. The implementation of this OS abstraction layer must be in source code form, released under an OSI approved license and documented using Doxygen.

Toolchain requirements

Precompiled library blobs must be in a data format which is compatible with and can be linked by a toolchain supported by the Zephyr Project. This is required for maintainability and usability. Use of such libraries may require special compiler and/or linker flags, however. For example, a porting layer may require special flags, or a static archive may require use of specific linker flags.

Limited scope

Allowing arbitrary library blobs carries a risk of degrading the degree to which the upstream Zephyr software distribution is open source. As an extreme example, a target with a zephyr kernel clock driver that is just a porting layer around a library blob would not be bootable with open source software.
To mitigate this risk, the scope of upstream library blobs is limited. The project maintainers define an open source test suite that an upstream target must be able to pass using only open source software included in the mainline distribution and its modules. The open source test suite currently consists of:

- samples/philosophers
- tests/kernel

The scope of this test suite may grow over time. The goal is to specify tests for a minimal feature set which must be supported via open source software for any target with upstream Zephyr support.

At the discretion of the release team, the project may remove support for a hardware target if it cannot pass this test suite.

### 8.5.7 Support and maintenance

The Zephyr Project is not expected to be responsible for the maintenance and support of contributed binary blobs. As a consequence, at the discretion of the Zephyr Project release team, and on a case-by-case basis:

- GitHub issues reported on the zephyr repository tracker that require use of blobs to reproduce may not be treated as bugs
- Such issues may be closed as out of scope of the Zephyr project

This does not imply that issues which require blobs to reproduce will be closed without investigation. For example, the issue may be exposing a bug in a Zephyr code path that is difficult or impossible to trigger without a blob. Project maintainers may accept and attempt to resolve such issues.

However, some flexibility is required because project maintainers may not be able to determine if a given issue is due to a bug in Zephyr or the blob itself, may be unable to reproduce the bug due to lack of hardware, etc.

Blobs must have designated maintainers that must be responsive to issue reports from users and provide updates to the blobs to address issues. At the discretion of the Zephyr Project release team, module revisions referencing blobs may be removed from `zephyr/west.yml` at any time due to lack of responsiveness or support from their maintainers. This is required to maintain project control over bit-rot, security issues, etc.

The submitter of the proposal to integrate a binary blob must commit to maintain the integration of such blob for the foreseeable future.

### 8.5.8 Submission and review process

For references to binary blobs to be included in the project, they must be reviewed and accepted by the Technical Steering Committee (TSC). This process is only required for new binary blobs, updates to binary blobs follow the `module update procedure`.

A request for integration with binary blobs must be made by creating a new issue in the Zephyr project issue tracking system on GitHub with details about the blobs and the functionality they provide to the project.

Follow the steps below to begin the submission process:

1. Make sure to read through the `Binary Blobs` section in detail, so that you are informed of the criteria used by the TSC in order to approve or reject a request
2. Use the New Binary Blobs Issue to open an issue
3. Fill out all required sections, making sure you provide enough detail for the TSC to assess the merit of the request. Additionally you must also create a Pull Request that demonstrates the integration of the binary blobs and then link to it from the issue
4. Wait for feedback from the TSC, respond to any additional questions added as GitHub issue comments.

If, after consideration by the TSC, the submission of the binary blob(s) is approved, the submission process is complete and the binary blob(s) can be integrated.
Chapter 9

Project and Governance

9.1 TSC Project Roles

9.1.1 Main Roles

TSC projects generally will involve *Maintainers*, *Collaborators*, and *Contributors*:

**Maintainer**: lead Collaborators on an area identified by the TSC (e.g. Architecture, code subsystems, etc.). Maintainers shall also serve as the area’s representative on the TSC as needed. Maintainers may become voting members of the TSC under the guidelines stated in the project Charter.

**Collaborator**: A highly involved Contributor in one or more areas. May become a Maintainer with approval of existing TSC voting members.

**Contributor**: anyone in the community that contributes code or documentation to the project. Contributors may become Collaborators by approval of the existing Collaborators and Maintainers of the particular code base areas or subsystems.

**Contributor**

A *Contributor* is a developer who wishes to contribute to the project, at any level. Contributors are granted the following rights and responsibilities:

- Right to contribute code, documentation, translations, artwork, etc.
- Right to report defects (bugs) and suggestions for enhancement.
- Right to participate in the process of reviewing contributions by others.
- Right to initiate and participate in discussions in any communication methods.
- Right to approach any member of the community with matters they believe to be important.
- Right to participate in the feature development process.
- Responsibility to abide by decisions, once made. They are welcome to provide new, relevant information to reopen decisions.
- Responsibility for issues and bugs introduced by one's own contributions.
- Responsibility to respect the rules of the community.
- Responsibility to provide constructive advice whenever participating in discussions and in the review of contributions.
Contributors are initially only given Read access to the Zephyr GitHub repository. Specifically, at the Read access level, Contributors are not allowed to assign reviewers to their own pull requests. An automated process will assign reviewers. You may also share the pull request on the Zephyr devel mailing list or on the Zephyr Discord Server.

Contributors who show dedication and skill are granted the Triage permission level to the Zephyr GitHub repository.

You may nominate yourself, or another GitHub user, for promotion to the Triage permission level by creating a GitHub issue, using the nomination template.

Contributors granted the Triage permission level are permitted to add reviewers to a pull request and can be added as a reviewer by other GitHub users. Contributor votes on pull requests are not counted with respect to accepting and merging a pull request. However, Contributors comments and requested changes should still be considered by the pull request author.

**Collaborator**

A **Collaborator** is a Contributor who is also responsible for the maintenance of Zephyr source code. Their opinions weigh more when decisions are made, in a fully meritocratic fashion.

Collaborators have the following rights and responsibilities, in addition to those listed for Contributors:

- Right to set goals for the short and medium terms for the project being maintained, alongside the Maintainer.
- Responsibility to participate in the feature development process.
- Responsibility to review relevant code changes within reasonable time.
- Responsibility to ensure the quality of the code to expected levels.
- Responsibility to participate in community discussions.
- Responsibility to mentor new contributors when appropriate
- Responsibility to participate in the quality verification and release process, when those happen.

Contributors are promoted to the Collaborator role by adding the GitHub user name to one or more collaborators sections of the **MAINTAINERS File** in the Zephyr repository.

Collaborator votes on pull requests can block or approve the pull request.

**Maintainer**

A **Maintainer** is a Collaborator who is also responsible for knowing, directing and anticipating the needs of a given zephyr source code area.

Maintainers have the following rights and responsibilities, in addition to those listed for Contributors and Collaborators:

- Right to set the overall architecture of the relevant subsystems or areas of involvement.
- Right to make decisions in the relevant subsystems or areas of involvement, in conjunction with the collaborators.
- Responsibility to convey the direction of the relevant subsystem or areas to the TSC
- Responsibility to ensure all contributions of the project have been reviewed within reasonable time.
- Responsibility to enforce the code of conduct.

Contributors or Collaborators are promoted to the Maintainer role by adding the GitHub user name to one or more maintainers sections of the **MAINTAINERS File** in the Zephyr repository.

Maintainer votes on pull requests can block or approve the pull request.
9.1.2 Role Retirement

- Individuals elected to the following Project roles, including, Maintainer, Release Engineering Team member, Release Manager, but are no longer engaged in the project as described by the rights and responsibilities of that role, may be requested by the TSC to retire from the role they are elected.
- Such a request needs to be raised as a motion in the TSC and be approved by the TSC voting members. By approval of the TSC the individual is considered to be retired from the role they have been elected.
- The above applies to elected TSC Project roles that may be defined in addition.

9.1.3 Teams and Supporting Activities

Assignee

An Assignee is one of the maintainers of a subsystem or code being changed. Assignees are set either automatically based on the code being changed or set by the other Maintainers, the Release Engineering team can set an assignee when the latter is not possible.

- Right to dismiss stale reviews and seek reviews from additional maintainers, developers and contributors
- Right to block pull requests from being merged
- Responsibility to re-assign a pull request if they are the original submitter of the code
- Responsibility to drive the pull request to a mergeable state
- Solicit approvals from maintainers of the subsystems affected
- Responsibility to drive the escalation process

Release Engineering Team

A team of active Maintainers involved in multiple areas.

- The members of the Release Engineering team are expected to fill the Release Manager role based on a defined cadence and selection process.
- The cadence and selection process are defined by the Release Engineering team and are approved by the TSC.
- The team reports directly into the TSC.

Release Engineering team has the following rights and responsibilities:

- Right to merge code changes to the zephyr tree following the project rules.
- Right to revert any changes that have broken the code base.
- Right to close any stale changes after <N> months of no activity.
- Responsibility to take directions from the TSC and follow them.
- Responsibility to coordinate code merges with maintainers.
- Responsibility to merge all contributions regardless of their origin and area if they have been approved by the respective maintainers and follow the merge criteria of a change.
- Responsibility to keep the Zephyr code base in a working and passing state (as per CI)

Joining the Release Engineering team
• Maintainers highly involved in the project may be nominated by a TSC voting member to join the
Release Engineering team. Nominees may become members of the team by approval of the existing
TSC voting members.

• To ensure a functional Release Engineering team the TSC shall periodically review the team’s fol-
lowed processes, the appropriate size, and the membership composition (ensure, for example, that
team members are geographically distributed across multiple locations and time-zones).

**Release Manager**

A *Maintainer* responsible for driving a specific release to completion following the milestones and the
roadmap of the project for this specific release.

• TSC has to approve a release manager.

A Release Manager is a member of the Release Engineering team and has the rights and responsibilities
of that team in addition to the following:

• Right to manage and coordinate all code merges after the code freeze milestone (M3, see program
management overview.)

• Responsibility to drive and coordinate the triaging process for the release

• Responsibility to create the release notes of the release

• Responsibility to notify all stakeholders of the project, including the community at large about the
status of the release in a timely manner.

• Responsibility to coordinate with QA and validation and verify changes either directly or through
QA before major changes and major milestones.

**Roles / Permissions**

**9.1.4 MAINTAINERS File**

Generic guidelines for deciding and filling in the Maintainers’ list

• The MAINTAINERS.yml file shall replace the CODEOWNERS file and will be used for both setting
assignees and reviewers.

• We should keep the granularity of code maintainership at a manageable level

• We should be looking for maintainers for areas of code that are orphaned (i.e. without an explicit
maintainer)
  
  – Un-maintained areas should be indicated clearly in the MAINTAINERS file

• All submitted pull requests should have an assignee

• We Introduce an area/subsystem hierarchy to address the above point
- Parent-area maintainer should be acting as default substitute/fallback assignee for unmaintained sub-areas
- Area maintainer gets precedence over parent-area maintainer

- Pull requests may be re-assigned if this is needed or more appropriate
  - Re-assigned by original assignee (see “Assignee” slide)

- In general, updates to the MAINTAINERS file should be in a standalone commit alongside other changes introducing new files and directories to the tree.

- Major changes to the file, including the addition of new areas with new maintainers should come in as standalone pull requests and require TSC review.

- If additional review by the TSC is required, the maintainers of the file should send the requested changes to the TSC and give members of the TSC two (2) days to object to any of the changes to maintainership of areas or the addition of new maintainers or areas.

- Path, collaborator and name changes do not require a review by the TSC.

- Addition of new areas without a maintainer do not require review by the TSC.

- The MAINTAINERS file itself shall have a maintainer

- Architectures, core components, sub-systems, samples, tests
  - Each area shall have an explicit maintainer

- Boards (incl relevant samples, tests), SoCs (incl DTS) * May have a maintainer, shall have a higher-level platform maintainer

- Drivers
  - Shall have a driver-area (and API) maintainer
  - Could have individual driver implementation maintainers but preferably collaborator/contributors
  - In the above case, platform-specific PRs may be re-assigned to respective collaborator/contributor of driver implementation

9.1.5 Release Activity

Merge Criteria

- All continuous integration checks have passed
  - Codeowners
  - Device Tree
  - Documentation
  - Gitlint
  - Identity/Emails
  - Kconfig
  - License
  - Checkpatch (Coding Style)
  - Pylint
  - Integration Tests (Via twister) on emulation/simulation platforms
- Simulated Bluetooth Tests

- Planned
  - Footprint
  - Code coverage
  - Coding Guidelines
  - Static Analysis (Coverity)
  - Documentation coverage (APIs)

- PR template with checklist

- Minimal of 2 approvals
  - A collaborator from the same subsystem.
  - Alternately another maintainer of another subsystem
  - Approval by the assignee

- A minimum review period of 2 days, 4 hours for trivial changes (see *Give reviewers time to review before code merge*). Hotfixes can be merged at any time after CI passes.

- All required checks are passing

**Escalation Process**

- Contributors may object to change requests or decisions made by Maintainers.

- Process
  - Resolve in the PR among assignee, maintainers and reviewer
    * Assignee to act as moderator if applicable
- Optionally resolve in the dev review meeting with more Maintainers and project stakeholders
  * The involved parties and the Assignee to be present when the (escalated) issue is discussed
- TSC: Assignees can escalate to the TSC voting members and get a binding resolution in the TSC.
- Assignee to ensure the resolution of the escalation is reflected in the PR review.

9.2 Release Process

The Zephyr project releases on a time-based cycle, rather than a feature-driven one. Zephyr releases represent an aggregation of the work of many contributors, companies, and individuals from the community.

A time-based release process enables the Zephyr project to provide users with a balance of the latest technologies and features and excellent overall quality. A roughly 4-month release cycle allows the project to coordinate development of the features that have actually been implemented, allowing the project to maintain the quality of the overall release without delays because of one or two features that are not ready yet.

The Zephyr release model was loosely based on the Linux kernel model:

- Release tagging procedure:
  - linear mode on main branch,
  - release branches for maintenance after release tagging.
- Each release period will consist of a development phase followed by a stabilization phase. Release candidates will be tagged during the stabilization phase. During the stabilization phase, only stabilization changes such as bug fixes and documentation will be merged unless granted a special exemption by the Technical Steering Committee.
  - Development phase: all changes are accepted (subject to approval from the respective maintainers).
  - Stabilisation phase: the release manager creates a vN-rc1 tag and the tree enters the stabilization phase
  - CI sees the tag, builds and runs tests; Test teams analyse the report from the build and test run and give an ACK/NAK to the build
  - The release owner, with test teams and any other needed input, determines if the release candidate is a go for release
  - If it is a go for a release, the release owner lays a tag release vN at the same point

![Fig. 9.1: Release Cycle](image)
9.2.1 Development Phase

A relatively straightforward discipline is followed with regard to the merging of patches for each release. At the beginning of each development cycle, the main branch is said to be open for development. At that time, code which is deemed to be sufficiently stable (and which is accepted by the maintainers and the wide community) is merged into the mainline tree. The bulk of changes for a new development cycle (and all of the major changes) will be merged during this time.

The development phase lasts for approximately two months. At the end of this time, the release owner will declare that the development phase is over and releases the first of the release candidates. For the codebase release which is destined to be 3.1.0, for example, the release which happens at the end of the development phase will be called 3.1.0-rc1. The -rc1 release is the signal that the time to merge new features has passed, and that the time to stabilize the next release of the code base has begun.

9.2.2 Stabilization Phase

Over the next weeks, only patches which fix problems should be submitted to the mainline. On occasion, a more significant change will be allowed, but such occasions are rare and require a TSC approval (Change Control Board). As a general rule, if you miss submitting your code during the development phase for a given feature, the best thing to do is to wait for the next development cycle. (An occasional exception is made for drivers for previously unsupported hardware; if they do not touch any other in-tree code, they cannot cause regressions and should be safe to add at any time).

As fixes make their way into the mainline, the patch rate will slow over time. The mainline release owner releases new -rc drops once or twice a week; a normal series will get up to somewhere between -rc4 and -rc6 before the code base is considered to be sufficiently stable and the release criteria have been achieved at which point the final 3.1.0 release is made.

At that point, the whole process starts over again.

9.2.3 Release Quality Criteria

The current backlog of prioritized bugs shall be used as a quality metric to gate the final release. The following counts shall be used:

<table>
<thead>
<tr>
<th>Table 9.2: Bug Count Release Thresholds</th>
</tr>
</thead>
<tbody>
<tr>
<td>High</td>
</tr>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

Note: The “low” bug count target of <50 will be a phased approach starting with 150 for release 2.4.0, 100 for release 2.5.0, and 50 for release 2.6.0
### 9.2.4 Release Milestones

</tbody>
</table>

### 9.2.5 Releases

The following syntax should be used for releases and tags in Git:

- Release `[Major].[Minor].[Patch Level]`
- Release Candidate `[Major].[Minor].[Patch Level]-rc[RC Number]`
- Tagging:
  - `v[Major].[Minor].[Patch Level]-rc[RC Number]`
  - `v[Major].[Minor].[Patch Level]`
  - `v[Major].[Minor].99` - A tag applied to main branch to signify that work on `v[Major].[Minor+1]` has started. For example, `v1.7.99` will be tagged at the start of `v1.8` process. The tag corresponds to `VERSION_MAJOR/VERSION_MINOR/PATCHLEVEL` macros as defined for a work-in-progress main branch version. Presence of this tag allows generation of sensible output for “git describe” on main branch, as typically used for automated builds and CI tools.

### Long Term Support (LTS)

Long-term support releases are designed to be supported and maintained for an extended period and is the recommended release for products and the auditable branch used for certification.

An LTS release is defined as:

- **Product focused**
- **Extended Stabilisation period**: Allow for more testing and bug fixing
- **Stable APIs**
- **Quality Driven Process**
- **Long Term**: Maintained for an extended period of time (at least 2.5 years) overlapping previous LTS release for at least half a year.
Product Focused  Zephyr LTS is the recommended release for product makers with an extended support and maintenance which includes general stability and bug fixes, security fixes.

An LTS includes both mature and new features. API and feature maturity is documented and tracked. The footprint and scope of mature and stable APIs expands as we move from one LTS to the next giving users access to bleeding edge features and new hardware while keeping a stable foundation that evolves over time.

Extended Stabilisation Period  Zephyr LTS development cycle differs from regular releases and has an extended stabilization period. Feature freeze of regular releases happens 3-4 weeks before the scheduled release date. The stabilization period for LTS is extended by 3 weeks with the feature freeze occurring 6-7 weeks before the anticipated release date. The time between code freeze and release date is extended in this case.

Stable APIs  Zephyr LTS provides a stable and long-lived foundation for developing products. To guarantee stability of the APIs and the implementation of such APIs it is required that any release software that makes the core of the OS went through the Zephyr API lifecycle and stabilized over at least 2 releases. This guarantees that we release many of the highlighted and core features with mature and well-established implementations with stable APIs that are supported during the lifetime of the release LTS.

- API Freeze (LTS - 2)
  - All stable APIs need to be frozen 2 releases before an LTS. APIs can be extended with additional features, but the core implementation is not modified. This is valid for the following subsystems for example:
    * Device Drivers (i2c.h, spi.h)...
    * Kernel (k_):  
    * OS services (logging,debugging, ..)
    * DTS: API and bindings stability
    * Kconfig
  - New APIs for experimental features can be added at any time as long as they are standalone and documented as experimental or unstable features/APIs.

- Feature Freeze (LTS - 1) - No new features or overhaul/restructuring of code covering major LTS features.
- Kernel + Base OS
- Additional advertised LTS features
- Auxiliary features on top of and/or extending the base OS and advertised LTS features can be added at any time and should be marked as experimental if applicable

Quality Driven Process The Zephyr project follows industry standards and processes with the goal of providing a quality oriented releases. This is achieved by providing the following products to track progress, integrity and quality of the software components provided by the project:

- Compliance with published coding guidelines, style guides and naming conventions and documentation of deviations.
- Regular static analysis on the complete tree using available commercial and open-source tools and documentation of deviations and false positives.
- Documented components and APIs
- Requirements Catalog
- Verification Plans
- Verification Reports
- Coverage Reports
- Requirements Traceability Matrix (RTM)
- SPDX License Reports

Each release is created with the above products to document the quality and the state of the software when it was released.

Long Term Support and Maintenance A Zephyr LTS release is published every 2 years and is branched and maintained independently from the main tree for at least 2.5 years after it was released. Support and maintenance for an LTS release stops at least half a year after the following LTS release is published.

Changes and fixes flow in both directions. However, changes from main branch to an LTS branch will be limited to fixes that apply to both branches and for existing features only.

All fixes for an LTS branch that apply to the mainline tree shall be submitted to mainline tree as well.

Auditable Code Base

An auditable code base is to be established from a defined subset of Zephyr OS features and will be limited in scope. The LTS, development tree, and the auditable code bases shall be kept in sync after the audit branch is created, but with a more rigorous process in place for adding new features into the audit branch used for certification.

This process will be applied before new features move into the auditable code base.
The initial and subsequent certification targets will be decided by the Zephyr project governing board. Processes to achieve selected certification will be determined by the Security and Safety Working Groups and coordinated with the TSC.

### 9.2.6 Release Procedure

This section documents the Release manager responsibilities so that it serves as a knowledge repository for Release managers.

#### Release Checklist

Each release has a GitHub issue associated with it that contains the full checklist. After a release is complete, a checklist for the next release is created.

#### Tagging

The final release and each release candidate shall be tagged using the following steps:

**Note:** Tagging needs to be done via explicit git commands and not via GitHub's release interface. The GitHub release interface does not generate annotated tags (it generates 'lightweight' tags regardless of release or pre-release). You should also upload your gpg public key to your GitHub account, since the instructions below involve creating signed tags. However, if you do not have a gpg public key you can opt to remove the -s option from the commands below.

**Release Candidate**

**Note:** This section uses tagging 1.11.0-rc1 as an example, replace with the appropriate release candidate version.

1. Update the version variables in the VERSION file located in the root of the Git repository to match the version for this release candidate. The EXTRAVERSION variable is used to identify the rc[RC Number] value for this candidate:

   ```
   EXTRAVERSION = rc1
   ```

2. Post a PR with the updated VERSION file using release: Zephyr 1.11.0-rc1 as the commit subject. Merge the PR after successful CI.

3. Tag and push the version, using an annotated tag:

   ```
   $ git pull
   $ git tag -s -m "Zephyr 1.11.0-rc1" v1.11.0-rc1
   $ git push git@github.com:zephyrproject-rtos/zephyr.git v1.11.0-rc1
   ```

4. Send an email to the mailing lists (announce and devel) with a link to the release

**Final Release**

**Note:** This section uses tagging 1.11.0 as an example, replace with the appropriate final release version.

When all final release criteria has been met and the final release notes have been approved and merged into the repository, the final release version will be set and repository tagged using the following procedure:
1. Update the version variables in the VERSION file located in the root of the Git repository. Set EXTRAVERSION variable to an empty string to indicate final release:

EXTRAVERSION =

2. Post a PR with the updated VERSION file using release: Zephyr 1.11.0 as the commit subject. Merge the PR after successful CI.

3. Tag and push the version, using two annotated tags:

   ```
   $ git pull
   $ git tag -s -m "Zephyr 1.11.0" v1.11.0
   $ git push git@github.com:zephyrproject-rtos/zephyr.git v1.11.0
   ```

4. Find the new v1.11.0 tag at the top of the releases page and edit the release with the Edit tag button with the following:

   - Copy the overview of docs/releases/release-notes-1.11.rst into the release notes textbox and link to the full release notes file on docs.zephyrproject.org.

5. Send an email to the mailing lists (announce and devel) with a link to the release

**Listing all closed GitHub issues**

The release notes for a final release contain the list of GitHub issues that have been closed during the development process of that release.

In order to obtain the list of issues closed during the release development cycle you can do the following:

1. Look for the last release before the current one and find the day it was tagged:

   ```
   $ git show -s --format=%ci v1.10.0
   tag v1.10.0
   Tagger: Kumar Gala <kumar.gala@linaro.org>
   Zephyr 1.10.0
   2017-12-08 13:32:22 -0600
   ```

2. Use available release tools to list all the issues that have been closed between that date and the day of the release.

### 9.3 Feature Tracking

For feature tracking we use Github labels to classify new features and enhancements. The following is the description of each category:

**Enhancement**

Changes to existing features that are not considered a bug and would not block a release. This is an incremental enhancement to a feature that already exists in Zephyr.

**Feature request**

A request for the implementation or inclusion of a new unit of functionality that is not part of any release plans yet, that has not been vetted, and needs further discussion and details.

**Feature**

A committed and planned unit of functionality with a detailed design and implementation proposal and an owner. Features must go through an RFC process and must be vetted and discussed in the TSC before a target milestone is set.
Hardware Support
A request or plan to port an existing feature or enhancement to a particular hardware platform. This ranges from porting Zephyr itself to a new architecture, SoC or board to adding an implementation of a peripheral driver API for an existing hardware platform.

Meta
A label to group other GitHub issues that are part of a single feature or unit of work.

The following workflow should be used to process features:

This is the formal way for asking for a new feature in Zephyr and indicating its importance to the project. Often, the requester may have a readiness and willingness to drive implementation of the feature in an upcoming release, and should assign the request to themselves. If not though, an owner will be assigned after evaluation by the TSC. A feature request can also have a companion RFC with more details on the feature and a proposed design or implementation.

- Label new features requests as feature-request
- The TSC discusses new feature-request items regularly and triages them. Items are examined for similarity with existing features, how they fit with the project goals and other timeline considerations. The priority is determined as follows:
  - High = Next milestone
  - Medium = As soon as possible
  - Low = Best effort
- After the initial discussion and triaging, the label is moved from feature-request to feature with the target milestone and an assignee.

All items marked as feature-request are non-binding and those without an assignee are open for grabs, meaning that they can be picked up and implemented by any project member or the community. You should contact an assigned owner if you’d like to discuss or contribute to that feature’s implementation.

9.3.1 Proposals and RFCs

Many changes, including bug fixes and documentation improvements can be implemented and reviewed via the normal GitHub pull request workflow.

Many changes however are “substantial” and need to go through a design process and produce a consensus among the project stakeholders.

The “RFC” (request for comments) process is intended to provide a consistent and controlled path for new features to enter the project.

Contributors and project stakeholders should consider using this process if they intend to make “substantial” changes to Zephyr or its documentation. Some examples that would benefit from an RFC are:

- A new feature that creates new API surface area, and would require a feature flag if introduced.
- The modification of an existing stable API
- The removal of features that already shipped as part of Zephyr.
- The introduction of new idiomatic usage or conventions, even if they do not include code changes to Zephyr itself.

The RFC process is a great opportunity to get more eyeballs on proposals coming from contributors before it becomes a part of Zephyr. Quite often, even proposals that seem “obvious” can be significantly improved once a wider group of interested people have a chance to weigh in.

The RFC process can also be helpful to encourage discussions about a proposed feature as it is being designed, and incorporate important constraints into the design while it’s easier to change, before the design has been fully implemented.

Some changes do not require an RFC:
• Rephrasing, reorganizing or refactoring
• Addition or removal of warnings
• Addition of new boards, SoCs or drivers to existing subsystems
• …

The process in itself consists in creating a GitHub issue with the RFC label that documents the proposal thoroughly. There is an RFC template included in the main Zephyr GitHub repository that serves as a guideline to write a new RFC.

As with Pull Requests, RFCs might require discussion in the context of one of the Zephyr meetings in order to move it forward in cases where there is either disagreement or not enough voiced opinions in order to proceed. Make sure to either label it appropriately or include it in the corresponding GitHub project in order for it to be examined during the next meeting.

9.3.2 Roadmap and Release Plans

Project roadmaps and release plans are both important tools for the project, but they have very different purposes and should not be confused. A project roadmap communicates the high-level overview of a project's strategy, while a release plan is a tactical document designed to capture and track the features planned for upcoming releases.

- The project roadmap communicates the why; a release plan details the what
- A release plan spans only a few months; a product roadmap might cover a year or more

Project Roadmap

The project roadmap should serve as a high-level, visual summary of the project's strategic objectives and expectations.

If built properly, the roadmap can be a valuable tool for several reasons. It can help the project present its plan in a compelling way to existing and new stakeholders, to help recruit new members and it can be a helpful resource the team and community can refer to throughout the project's development, to ensure they are still executing according to plan.

As such, the roadmap should contain only strategic-level details, major project themes, epics, and goals.

Release Plans

The release plan comes into play when the project roadmap's high-level strategy is translated into an actionable plan built on specific features, enhancements, and fixes that need to go into a specific release or milestone.

The release plan communicates those features and enhancements slated for your project' next release (or the next few releases). So it acts as more of a project plan, breaking the big ideas down into smaller projects the community and main stakeholders of the project can make progress on.

Items labeled as features are short or long term release items that shall have an assignee and a milestone set.

9.4 Code Flow and Branches

9.4.1 Introduction

The zephyr Git repository has three types of branches:
main
Which contains the latest state of development

*topic-*
Topic branches that are used for shared development of a new feature

vx.y-branch
Branches which track maintenance releases based on a major release

Development in topic branches before features go to mainline allows teams to work independently on a subsystem or a feature, improves efficiency and turnaround time, and encourages collaboration and streamlines communication between developers.

Changes submitted to a development topic branch can evolve and improve incrementally in a branch, before they are submitted to the mainline tree for final integration.

By dedicating an isolated branch to complex features, it’s possible to initiate in-depth discussions around new additions before integrating them into the official project.

9.4.2 Roles and Responsibilities

Development topic branch owners have the following responsibilities:

• Use the infrastructure and tools provided by the project (GitHub, Git)

• Review changes coming from team members and request review from branch owners when submitting changes.

• Keep the branch in sync with upstream and update on a regular basis.

• Push changes frequently to upstream using the following methods:
  – GitHub pull requests: for example, when reviews have not been done in the local branch (one-man branch).
  – Merge requests: When a set of changes has been done in a local branch and has been reviewed and tested in a topic branch.

9.5 Modifying Contributions made by other developers

9.5.1 Scenarios

Zephyr contributors and collaborators are encouraged to assist as reviewers in pull requests, so that patches may be approved and merged to Zephyr's main branch as part of the original pull requests. The authors of the pull requests are responsible for amending their original commits following the review process.

There are occasions, however, when a contributor might need to modify patches included in pull requests that are submitted by other Zephyr contributors. For instance, this is the case when:

• a developer cherry-picks commits submitted by other contributors into their own pull requests in order to:
  – integrate useful content which is part of a stale pull request, or
  – get content merged to the project’s main branch as part of a larger patch

• a developer pushes to a branch or pull request opened by another contributor in order to:
  – assist in updating pull requests in order to get the patches merged to the project’s main branch
  – drive stale pull requests to completion so they can be merged
9.5.2 Accepted policies

A developer who intends to cherry-pick and potentially modify patches sent by another contributor shall:

- clarify in their pull request the reason for cherry-picking the patches, instead of assisting in getting the patches merged in their original pull request, and
- invite the original author of the patches to their pull request review.

A developer who intends to force-push to a branch or pull request of another Zephyr contributor shall clarify in the pull request the reason for pushing and for modifying the existing patches (e.g. stating that it is done to drive the pull request review to completion, when the pull request author is not able to do so).

Note: Developers should try to limit the above practice to pull requests identified as stale. Read about how to identify pull requests as stale in development processes and tools.

If the original patches are substantially modified, the developer can either:

- (preferably) reach out to the original author and request them to acknowledge that the modified patches may be merged while having the original sign-off line and author identity, or
- submit the modified patches as their own work (i.e. with their own sign-off line and author identity). In this case, the developer shall identify in the commit message(s) the original source the submitted work is based on (mentioning, for example, the original PR number).

Note: Contributors should uncheck the box “Allow Edits By Maintainers” to indicate that they do not wish their patches to be amended, inside their original branch or pull request, by other Zephyr developers.

9.6 Development Environment and Tools

9.6.1 Code Review

GitHub is intended to provide a framework for reviewing every commit before it is accepted into the code base. Changes, in the form of Pull Requests (PR) are uploaded to GitHub but don’t actually become a part of the project until they’ve been reviewed, passed a series of checks (CI), and are approved by maintainers. GitHub is used to support the standard open source practice of submitting patches, which are then reviewed by the project members before being applied to the code base.

Pull requests should be appropriately labeled, and linked to any relevant bug or feature tracking issues.

The Zephyr project uses GitHub for code reviews and Git tree management. When submitting a change or an enhancement to any Zephyr component, a developer should use GitHub. GitHub automatically assigns a responsible reviewer on a component basis, as defined in the CODEOWNERS file stored with the code tree in the Zephyr project repository. A limited set of release managers are allowed to merge a pull request into the main branch once reviews are complete.

Give reviewers time to review before code merge

The Zephyr project is a global project that is not tied to a certain geography or timezone. We have developers and contributors from across the globe. When changes are proposed using pull request, we need to allow for a minimal review time to give developers and contributors the opportunity to review and comment on changes. There are different categories of changes and we know that some changes do require reviews by subject matter experts and owners of the subsystem being changed. Many changes fall under the “trivial” category that can be addressed with general reviews and do not need to be queued for a maintainer or code-owner review. Additionally, some changes might require further discussions.
and a decision by the TSC or the Security working group. To summarize the above, the diagram below proposes minimal review times for each category:

![Diagram showing pull request classes](image)

**Workflow**
- An author of a change can suggest in his pull-request which category a change should belong to. A project maintainers or TSC member monitoring the inflow of changes can change the label of a pull request by adding a comment justifying why a change should belong to another category.
- The project will use the label system to categorize the pull requests.
- Changes should not be merged before the minimal time has expired.

**Categories/Labels**

**Hotfix** Any change that is a fix to an issue that blocks developers from doing their daily work, for example CI breakage, Test breakage, Minor documentation fixes that impact the user experience.

Such fixes can be merged at any time after they have passed CI checks. Depending on the fix, severity, and availability of someone to review them (other than the author) they can be merged with justification without review by one of the project owners.

**Trivial** Trivial changes are those that appear obvious enough and do not require maintainer or code-owner involvement. Such changes should not change the logic or the design of a subsystem or component. For example a trivial change can be:

- Documentation changes
• Configuration changes
• Minor Build System tweaks
• Minor optimization to code logic without changing the logic
• Test changes and fixes
• Sample modifications to support additional configuration or boards etc.

Maintainer Any changes that touch the logic or the original design of a subsystem or component will need to be reviewed by the code owner or the designated subsystem maintainer. If the code changes is initiated by a contributor or developer other than the owner the pull request needs to be assigned to the code owner who will have to drive the pull request to a mergeable state by giving feedback to the author and asking for more reviews from other developers.

Security Changes that appear to have an impact to the overall security of the system need to be reviewed by a security expert from the security working group.

TSC and Working Groups Changes that introduce new features or functionality or change the way the overall system works need to be reviewed by the TSC or the responsible Working Group. For example for stable API changes, the proposal needs to be presented in the Architecture meeting so that the relevant stakeholders are made aware of the change.

A Pull-Request should have an Assignee

• An assignee to a pull request should not be the same as the author of the pull-request
• An assignee to a pull request is responsible for driving the pull request to a mergeable state
• An assignee is responsible for dismissing stale reviews and seeking reviews from additional developers and contributors
• Pull requests should not be merged without an approval by the assignee.

Pull Request should not be merged by author without review

All pull requests need to be reviewed and should not be merged by the author without a review. The following exceptions apply:

• Hot fixes: Fixing CI issues, reverts, and system breakage
• Release related changes: Changing version file, applying tags and release related activities without any code changes.

Developers and contributors should always seek review, however there are cases when reviewers are not available and there is a need to get a code change into the tree as soon as possible.

Reviewers shall not ‘Request Changes’ without comments or justification

Any change requests (-1) on a pull request have to be justified. A reviewer should avoid blocking a pull-request with no justification. If a reviewer feels that a change should not be merged without their review, then: Request change of the category: for example:

• Trivial -> Maintainer
• Assign Pull Request to yourself, this will mean that a pull request should not be merged without your approval.
Pull Requests should have at least 2 approvals before they are merged

A pull-request shall be merged only with two positive reviews (approval). Beside the person merging the pull-request (merging != approval), two additional approvals are required to be able to merge a pull request. The person merging the request can merge without approving or approve and merge to get to the 2 approvals required.

Reviewers should keep track of pull requests they have provided feedback to

If a reviewer has requested changes in a pull request, he or she should monitor the state of the pull request and/or respond to mention requests to see if his feedback has been addressed. Failing to do so, negative reviews shall be dismissed by the assignee or an owner of the repository. Reviews will be dismissed following the criteria below:

- The feedback or concerns were visibly addressed by the author
- The reviewer did not revisit the pull request after 2 week and multiple pings by the author
- The review is unrelated to the code change or asking for unjustified structural changes such as:
  - Split the PR
  - Can you fix this unrelated code that happens to appear in the diff
  - Can you fix unrelated issues
  - Etc.

Closing Stale Issues and Pull Requests

- The Pull requests and issues sections on Github are NOT discussion forums. They are items that we need to execute and drive to closure. Use the mailing lists for discussions.
- In case of both issues and pull-requests the original poster needs to respond to questions and provide clarifications regarding the issue or the change. After one week without a response to a request, a second attempt to elicit a response from the contributor will be made. After one more week without a response the item may be closed (draft and DNM tagged pull requests are excluded).

9.6.2 Continuous Integration

All changes submitted to GitHub are subject to tests that are run on emulated platforms and architectures to identify breakage and regressions that can be immediately identified. Testing using Twister additionally performs build tests of all boards and platforms. Documentation changes are also verified through review and build testing to verify doc generation will be successful.

Any failures found during the CI test run will result in a negative review assigned automatically by the CI system. Developers are expected to fix issues and rework their patches and submit again.

The CI infrastructure currently runs the following tests:

- Run “checkpatch” for code style issues (can vote -1 on errors; see note)
- Gitlint: Git commit style based on project requirements
- License Check: Check for conflicting licenses
- Run “twister” script
  - Run kernel tests in QEMU (can vote -1 on errors)
  - Build various samples for different boards (can vote -1 on errors)
- Verify documentation builds correctly.
**Note:** “checkpatch” is a Perl script that uses regular expressions to extract information that requires a C language parser to process accurately. As such it sometimes issues false positives. Known cases include constructs like:

```c
static uint8_t __aligned(PAGE_SIZE) page_pool[X_MAX * POOL_PAGES];
IOPCTL_Type *base = config->base;
```

Both lines produce a diagnostic regarding spaces around the * operator: the first is misidentified as a pointer type declaration that would be correct as PAGE_SIZE * POOL_PAGES while the second is misidentified as a multiplication expression that would be correct as IOPCTL_Type * base.

Maintainers can override the -1 in cases where the CI infrastructure gets the wrong answer.

### 9.6.3 Labeling issues and pull requests in GitHub

The project uses GitHub issues and pull requests (PRs) to track and manage daily and long-term work and contributions to the Zephyr project. We use GitHub **labels** to classify and organize these issues and PRs by area, type, priority, and more, making it easier to find and report on relevant items.

All GitHub issues or pull requests must be appropriately labeled. Issues and PRs often have multiple labels assigned, to help classify them in the different available categories. When reviewing a PR, if it has missing or incorrect labels, maintainers shall fix it.

This saves us all time when searching, reduces the chances of the PR or issue being forgotten, speeds up reviewing, avoids duplicate issue reports, etc.

These are the labels we currently have, grouped by applicability:

#### Labels applicable to issues only

- **priority:** {high|medium|low}
  
  To classify the impact and importance of a bug or feature.

  Note: Issue priorities are generally set or changed during the bug-triage or TSC meetings.

  - **Regression**
    Something, which was working, but does not anymore (bug subtype).

  - **Enhancement**
    Changes/Updates/Additions to existing features.

  - **Feature request**
    A request for a new feature.

  - **Feature**
    A planned feature with a milestone.

  - **Hardware Support**
    Covers porting an existing feature (including Zephyr itself) to new hardware.

  - **Duplicate**
    This issue is a duplicate of another issue (please specify).

  - **Good first issue**
    Good for a first time contributor to take.

- **Release Notes**
Issues that need to be mentioned in release notes as known issues with additional information.

Any issue must be classified and labeled as either Bug, Enhancement, RFC, Feature, Feature Request or Hardware Support. More information on how feature requests are handled and become features can be found in Feature Tracking.

Labels applicable to pull requests only

The issue or PR describes a change to a stable API.

- **Hotfix**
  Fix for an issue blocking development.
  - **Trivial**
  - **Maintainer**
  Maintainer review required.
  - **Security Review**
  To be reviewed by a security expert.
  - **DNM**
  This PR should not be merged (Do Not Merge). For work in progress, GitHub "draft" PRs are preferred.
  - **Needs review**
  The PR needs attention from the maintainers.
  - **Backport**
  The PR is a backport or should be backported.
  - **Licensing**
  The PR has licensing issues which require a licensing expert to review it.

**Note:** For all labels applicable to PRs: Please note that the label, together with PR complexity, affects how long a merge should be held to ensure proper review. See review process for details.

Labels applicable to both pull requests and issues

- **area:** *
  Indicates Zephyr subsystems (e.g., area: Kernel, area: I2C, area: Memory Management), project functions (e.g., area: Debugging, area: Documentation, area: Process), or other categories (e.g., area: Coding Style, area: MISRA-C) affected by the bug or the pull request.
  An area maintainer should be able to filter by an area label and find all issues and PRs which relate to that area.
  - **platform:** *
  An issue or PR which affects only a particular platform.
  - **dev-review**
  The issue is to be discussed in the following dev-review if time permits.
  - **TSC**
  TSC stands for Technical Steering Committee. The issue is to be discussed in the following TSC meeting if time permits.
9.7 Bug Reporting

To maintain traceability and relation between proposals, changes, features, and issues, it is recommended to cross-reference source code commits with the relevant GitHub issues and vice versa. Any changes that originate from a tracked feature or issue should contain a reference to the feature by mentioning the corresponding issue or pull-request identifiers.

At any time it should be possible to establish the origin of a change and the reason behind it by following the references in the code.

9.7.1 Reporting a regression issue

It could happen that the issue being reported is identified as a regression, as the use case is known to be working on earlier commit or release. In this case, providing directly the guilty commit when submitting the bug gains a lot of time in the eventual bug fixing.

To identify the commit causing the regression, several methods could be used, but tree bisecting method is an efficient one that doesn’t require deep code expertise and can be used by every one.

For this, `git bisect` is the recommended tool.

Recommendations on the process:

- Run `west update` on each bisection step.
- Once the bisection is over and a culprit identified, verify manually the result.
9.8 Communication and Collaboration

The Zephyr project mailing lists are used as the primary communication tool by project members, contributors, and the community. The mailing list is open for topics related to the project and should be used for collaboration among team members working on the same feature or subsystem or for discussing project direction and daily development of the code base. In general, bug reports and issues should be entered and tracked in the bug tracking system (GitHub Issues) and not broadcasted to the mailing list, the same applies to code reviews. Code should be submitted to GitHub using the appropriate tools.

9.9 Code Documentation

9.9.1 API Documentation

Well documented APIs enhance the experience for developers and are an essential requirement for defining an API’s success. Doxygen is a general purpose documentation tool that the Zephyr project uses for documenting APIs. It generates either an on-line documentation browser (in HTML) and/or provides input for other tools that is used to generate a reference manual from documented source files. In particular, doxygen’s XML output is used as an input when producing the Zephyr project’s online documentation.

9.9.2 Reference to Requirements

APIs for the most part document the implementation of requirements or advertised features and can be traced back to features. We use the API documentation as the main interface to trace implementation back to documented features. This is done using custom _doxygen_ tags that reference requirements maintained somewhere else in a requirement catalogue.

9.9.3 Test Documentation

To help understand what each test does and which functionality it tests we also document all test code using the same tools and in the same context and generate documentation for all unit and integration tests maintained in the same environment. Tests are documented using references to the APIs or functionality they validate by creating a link back to the APIs and by adding a reference to the original requirements.

9.9.4 Documentation Guidelines

Test Code

The Zephyr project uses several test methodologies, the most common being the Ztest framework. Test documentation should only be done on the entry test functions (usually prefixed with test_) and those that are called directly by the Ztest framework. Those tests are going to appear in test reports and using their name and identifier is the best way to identify them and trace back to them from requirements.

Test documentation should not interfere with the actual API documentation and needs to follow a new structure to avoid confusion. Using a consistent naming scheme and following a well-defined structure we will be able to group this documentation in its own module and identify it uniquely when parsing test data for traceability reports. Here are a few guidelines to be followed:

- All test code documentation should be grouped under the all_tests doxygen group
- All test documentation should be under doxygen groups that are prefixed with tests_

The custom doxygen @verify directive signifies that a test verifies a requirement:
To get coverage of how an implementation or a piece of code satisfies a requirements, we use the `satisfy` alias in doxygen:

```c
/**
 * @brief Give a semaphore.
 *
 * This routine gives @a sem, unless the semaphore is already at its maximum permitted count.
 *
 * @note Can be called by ISRs.
 *
 * @param sem Address of the semaphore.
 *
 * @satisfy{@req{015}}
 */
__syscall void k_sem_give(struct k_sem *sem);
```

To generate the matrix, you will first need to build the documentation, specifically you will need to build the doxygen XML output:

```
$ make doxygen
```

Parse the generated XML data from doxygen to generate the traceability matrix.

The Zephyr project defines a development process workflow using GitHub Issues to track feature, enhancement, and bug reports together with GitHub Pull Requests (PRs) for submitting and reviewing changes. Zephyr community members work together to review these Issues and PRs, managing feature enhancements and quality improvements of Zephyr through its regular releases, as outlined in the program management overview.

We can only manage the volume of Issues and PRs, by requiring timely reviews, feedback, and responses from the community and contributors, both for initial submissions and for followup questions and clarifications. Read about the project’s development processes and tools and specifics about review timelines to learn about the project’s goals and guidelines for our active developer community.
TSC Project Roles describes in detail the Zephyr project roles and associated permissions with respect to the development process workflow.

9.10 Terminology

- mainline: The main tree where the core functionality and core features are being developed.
- subsystem/feature branch: is a branch within the same repository. In our case, we will use the term branch also when referencing branches not in the same repository, which are a copy of a repository sharing the same history.
- upstream: A parent branch the source code is based on. This is the branch you pull from and push to, basically your upstream.
- LTS: Long Term Support
Chapter 10

Security

These documents describe the requirements, processes, and developer guidelines for ensuring security is addressed within the Zephyr project.

10.1 Zephyr Security Overview

10.1.1 Introduction

This document outlines the steps of the Zephyr Security Subcommittee towards a defined security process that helps developers build more secure software while addressing security compliance requirements. It presents the key ideas of the security process and outlines which documents need to be created. After the process is implemented and all supporting documents are created, this document is a top-level overview and entry point.

Overview and Scope

We begin with an overview of the Zephyr development process, which mainly focuses on security functionality.

In subsequent sections, the individual parts of the process are treated in detail. As depicted in Figure 1, these main steps are:

1. **Secure Development**: Defines the system architecture and development process that ensures adherence to relevant coding principles and quality assurance procedures.

2. **Secure Design**: Defines security procedures and implement measures to enforce them. A security architecture of the system and relevant sub-modules is created, threats are identified, and countermeasures designed. Their correct implementation and the validity of the threat models are checked by code reviews. Finally, a process shall be defined for reporting, classifying, and mitigating security issues.

3. **Security Certification**: Defines the certifiable part of the Zephyr RTOS. This includes an evaluation target, its assets, and how these assets are protected. Certification claims shall be determined and backed with appropriate evidence.

Intended Audience

This document is a guideline for the development of a security process by the Zephyr Security Subcommittee and the Zephyr Technical Steering Committee. It provides an overview of the Zephyr security process for (security) engineers and architects.
Nomenclature

In this document, the keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" are to be interpreted as described in [?].

These words are used to define absolute requirements (or prohibitions), highly recommended requirements, and truly optional requirements. As noted in RFC-2119, “These terms are frequently used to specify behavior with security implications. The effects on security of not implementing a MUST or SHOULD, or doing something the specification says MUST NOT or SHOULD NOT be done may be very subtle. Document authors should take the time to elaborate the security implications of not following recommendations or requirements as most implementors will not have had the benefit of the experience and discussion that produced the specification.”

Security Document Update

This document is a living document. As new requirements, features, and changes are identified, they will be added to this document through the following process:

1. Changes will be submitted from the interested party(ies) via pull requests to the Zephyr documentation repository.
2. The Zephyr Security Subcommittee will review these changes and provide feedback or acceptance of the changes.
3. Once accepted, these changes will become part of the document.

10.1.2 Current Security Definition

This section recapitulates the current status of secure development within the Zephyr RTOS. Currently, focus is put on functional security and code quality assurance, although additional security features are scoped.

The three major security measures currently implemented are:

- **Security Functionality** with a focus on cryptographic algorithms and protocols. Support for cryptographic hardware is scoped for future releases. The Zephyr runtime architecture is a monolithic binary and removes the need for dynamic loaders, thereby reducing the exposed attack surface.
• **Quality Assurance** is driven by using a development process that requires all code to be reviewed before being committed to the common repository. Furthermore, the reuse of proven building blocks such as network stacks increases the overall quality level and guarantees stable APIs. Static code analyses are provided by Coverity Scan.

• **Execution Protection** including thread separation, stack and memory protection is currently available in the upstream Zephyr RTOS starting with version 1.9.0 (stack protection). Memory protection and thread separation was added in version 1.10.0 for X86 and in version 1.11.0 for ARM and ARC.

These topics are discussed in more detail in the following subsections.

**Security Functionality**

The security functionality in Zephyr hinges mainly on the inclusion of cryptographic algorithms, and on its monolithic system design.

The cryptographic features are provided through a set of cryptographic libraries. Applications can choose TinyCrypt2 or mbedTLS based on their needs. TinyCrypt2 supports key cryptographic algorithms required by the connectivity stacks. TinyCrypt2, however, only provides a limited set of algorithms. mbedTLS supports a wider range of algorithms, but at the cost of additional requirements such as malloc support. Applications can choose the solution that matches their individual requirements. Future work may include APIs to abstract the underlying crypto library choice.

APIs for vendor specific cryptographic IPs in both hardware and software are planned, including secure key storage in the form of secure access modules (SAMs), Trusted Platform Modules (TPMs), and Trusted Execution Environments (TEEs).

The security architecture is based on a monolithic design where the Zephyr kernel and all applications are compiled into a single static binary. System calls are implemented as function calls without requiring context switches. Static linking eliminates the potential for dynamically loading malicious code.

Additional protection features are available in later releases. Stack protection mechanisms are provided to protect against stack overruns. In addition, applications can take advantage of thread separation features to split the system into privileged and unprivileged execution environments. Memory protection features provide the capability to partition system resources (memory, peripheral address space, etc) and assign resources to individual threads or groups of threads. Stack, thread execution level, and memory protection constraints are enforced at the time of context switch.

**Quality Assurance**

The Zephyr project uses an automated quality assurance process. The goal is to have a process including mandatory code reviews, feature and issue management/tracking, and static code analyses.

Code reviews are documented and enforced using a voting system before getting checked into the repository by the responsible subsystem's maintainer. The main goals of the code review are:

- Verifying correct functionality of the implementation
- Increasing the readability and maintainability of the contributed source code
- Ensuring appropriate usage of string and memory functions
- Validation of the user input
- Reviewing the security relevant code for potential issues

The current coding principles focus mostly on coding styles and conventions. Functional correctness is ensured by the build system and the experience of the reviewer. Especially for security relevant code, concrete and detailed guidelines need to be developed and aligned with the developers (see: *Secure Coding*).
Static code analyses are run on the Zephyr code tree on a regular basis using the open source Coverity Scan tool. Coverity Scan now includes complexity analysis.

Bug and issue tracking and management is performed using Jira. The term “survivability” was coined to cover pro-active security tasks such as security issue categorization and management. Initial effort has been started on the definition of vulnerability categorization and mitigation processes within Jira.

Issues determined by Coverity should have more stringent reviews before they are closed as non issues (at least another person educated in security processes need to agree on non-issue before closing).

A security subcommittee has been formed to develop a security process in more detail; this document is part of that process.

**Execution Protection**

Execution protection is supported and can be categorized into the following tasks:

- **Memory separation**: Memory will be partitioned into regions and assigned attributes based on the owner of that region of memory. Threads will only have access to regions they control.

- **Stack protection**: Stack guards would provide mechanisms for detecting and trapping stack overruns. Individual threads should only have access to their own stacks.

- **Thread separation**: Individual threads should only have access to their own memory resources. As threads are scheduled, only memory resources owned by that thread will be accessible. Topics such as program flow protection and other measures for tamper resistance are currently not in scope.

**System Level Security (Ecosystem, …)**

System level security encompasses a wide variety of categories. Some examples of these would be:

- Secure/trusted boot
- Over the air (OTA) updates
- External Communication
- Device authentication
- Access control of onboard resources
  - Flash updating
  - Secure storage
  - Peripherals
- Root of trust
- Reduction of attack surface

Some of these categories are interconnected and rely on multiple pieces to be in place to produce a full solution for the application.

### 10.1.3 Secure Development Process

The development of secure code shall adhere to certain criteria. These include coding guidelines and development processes that can be roughly separated into two categories related to software quality and related to software security. Furthermore, a system architecture document shall be created and kept up-to-date with future development.
Fig. 10.2: Figure 2: Zephyr System Architecture
System Architecture

A high-level schematic of the Zephyr system architecture is given in Figure 2. It separates the architecture into an OS part (**kernel + OS Services**) and a user-specific part (**Application Services**). The OS part itself contains low-level, platform specific drivers and the generic implementation of I/O APIs, file systems, kernel-specific functions, and the cryptographic library.

A document describing the system architecture and design choices shall be created and kept up to date with future development. This document shall include the base architecture of the Zephyr OS and an overview of important submodules. For each of the modules, a dedicated architecture document shall be created and evaluated against the implementation. These documents shall serve as an entry point to new developers and as a basis for the security architecture. Please refer to the Zephyr subsystem documentation for detailed information.

Secure Coding

Designing an open software system such as Zephyr to be secure requires adhering to a defined set of design standards. These standards are included in the Zephyr Project documentation, specifically in its Secure Coding section. In [?], the following, widely accepted principles for protection mechanisms are defined to prevent security violations and limit their impact:

- **Open design** as a design principle incorporates the maxim that protection mechanisms cannot be kept secret on any system in widespread use. Instead of relying on secret, custom-tailored security measures, publicly accepted cryptographic algorithms and well established cryptographic libraries shall be used.

- **Economy of mechanism** specifies that the underlying design of a system shall be kept as simple and small as possible. In the context of the Zephyr project, this can be realized, e.g., by modular code [?] and abstracted APIs.

- **Complete mediation** requires that each access to every object and process needs to be authenticated first. Mechanisms to store access conditions shall be avoided if possible.

- **Fail-safe defaults** defines that access is restricted by default and permitted only in specific conditions defined by the system protection scheme, e.g., after successful authentication. Furthermore, default settings for services shall be chosen in a way to provide maximum security. This corresponds to the “Secure by Default” paradigm [?].

- **Separation of privilege** is the principle that two conditions or more need to be satisfied before access is granted. In the context of the Zephyr project, this could encompass split keys [?].

- **Least privilege** describes an access model in which each user, program and thread shall have the smallest possible subset of permissions in the system required to perform their task. This positive security model aims to minimize the attack surface of the system.

- **Least common mechanism** specifies that mechanisms common to more than one user or process shall not be shared if not strictly required. The example given in [?] is a function that should be implemented as a shared library executed by each user and not as a supervisor procedure shared by all users.

- **Psychological acceptability** requires that security features are easy to use by the developers in order to ensure its usage and the correctness of its application.

In addition to these general principles, the following points are specific to the development of a secure RTOS:

- **Complementary Security/Defense in Depth**: do not rely on a single threat mitigation approach. In case of the complementary security approach, parts of the threat mitigation are performed by the underlying platform. In case such mechanisms are not provided by the platform, or are not trusted, a defense in depth [?] paradigm shall be used.

- **Less commonly used services off by default**: to reduce the exposure of the system to potential attacks, features or services shall not be enabled by default if they are only rarely used (a threshold
of 80% is given in [?]). For the Zephyr project, this can be realized using the configuration management. Each functionality and module shall be represented as a configuration option and needs to be explicitly enabled. Then, all features, protocols, and drivers not required for a particular use case can be disabled. The user shall be notified if low-level options and APIs are enabled but not used by the application.

- **Change management**: to guarantee a traceability of changes to the system, each change shall follow a specified process including a change request, impact analysis, ratification, implementation, and validation phase. In each stage, appropriate documentation shall be provided. All commits shall be related to a bug report or change request in the issue tracker. Commits without a valid reference shall be denied.

Based on these design principles and commonly accepted best practices, a secure development guide shall be developed, published, and implemented into the Zephyr development process. Further details on this are given in the Secure Design section.

**Quality Assurance**

The quality assurance part encompasses the following criteria:

- **Adherence to the Coding Conventions** with respect to coding style, naming schemes of modules, functions, variables, and so forth. This increases the readability of the Zephyr code base and eases the code review. These coding conventions are enforced by automated scripts prior to check-in.

- **Adherence to Deployment Guidelines** is required to ensure consistent releases with a well-documented feature set and a trackable list of security issues.

- **Code Reviews** ensure the functional correctness of the code base and shall be performed on each proposed code change prior to check-in. Code reviews shall be performed by at least one independent reviewer other than the author(s) of the code change. These reviews shall be performed by the subsystem maintainers and developers on a functional level and are to be distinguished from security reviews as laid out in the Secure Design section. Refer to the Project and Governance documentation for more information.

- **Static Code Analysis** tools efficiently detect common coding mistakes in large code bases. All code shall be analyzed using an appropriate tool prior to merges into the main repository. This is not per individual commit, but is to be run on some interval on specific branches. It is mandatory to remove all findings or waive potential false-positives before each release. Waivers shall be documented centrally and in the form of a comment inside the source code itself. The documentation shall include the employed tool and its version, the date of the analysis, the branch and parent revision number, the reason for the waiver, the author of the respective code, and the approver(s) of the waiver. This shall as a minimum run on the main release branch and on the security branch. It shall be ensured that each release has zero issues with regard to static code analysis (including waivers). Refer to the Project and Governance documentation for more information.

- **Complexity Analyses** shall be performed as part of the development process and metrics such as cyclomatic complexity shall be evaluated. The main goal is to keep the code as simple as possible.

- **Automation**: the review process and checks for coding rule adherence are a mandatory part of the precommit checks. To ensure consistent application, they shall be automated as part of the precommit procedure. Prior to merging large pieces of code in from subsystems, in addition to review process and coding rule adherence, all static code analysis must have been run and issues resolved.

**Release and Lifecycle Management**

Lifecycle management contains several aspects:

- **Device management** encompasses the possibility to update the operating system and/or security related sub-systems of Zephyr enabled devices in the field.
• **Lifecycle management**: system stages shall be defined and documented along with the transactions between the stages in a system state diagram. For security reasons, this shall include locking of the device in case an attack has been detected, and a termination if the end of life is reached.

• **Release management** describes the process of defining the release cycle, documenting releases, and maintaining a record of known vulnerabilities and mitigations. Especially for certification purposes the integrity of the release needs to be ensured in a way that later manipulation (e.g. inserting of backdoors, etc.) can be easily detected.

• **Rights management and NDAs**: if required by the chosen certification, the confidentiality and integrity of the system needs to be ensured by an appropriate rights management (e.g. separate source code repository) and non-disclosure agreements between the relevant parties. In case of a repository shared between several parties, measures shall be taken that no malicious code is checked in.

These points shall be evaluated with respect to their impact on the development process employed for the Zephyr project.

### 10.1.4 Secure Design

In order to obtain a certifiable system or product, the security process needs to be clearly defined and its application needs to be monitored and driven. This process includes the development of security related modules in all of its stages and the management of reported security issues. Furthermore, threat models need to be created for currently known and future attack vectors, and their impact on the system needs to be investigated and mitigated. Please refer to the *Secure Coding* outlined in the Zephyr project documentation for detailed information.

The software security process includes:

- **Adherence to the Secure Development Coding** is mandatory to avoid that individual components breach the system security and to minimize the vulnerability of individual modules. While this can be partially achieved by automated tests, it is inevitable to investigate the correct implementation of security features such as countermeasures manually in security-critical modules.

- **Security Reviews** shall be performed by a security architect in preparation of each security-targeted release and each time a security-related module of the Zephyr project is changed. This process includes the validation of the effectiveness of implemented security measures, the adherence to the global security strategy and architecture, and the preparation of audits towards a security certification if required.

- **Security Issue Management** encompasses the evaluation of potential system vulnerabilities and their mitigation as described in *Security Issue Management*.

These criteria and tasks need to be integrated into the development process for secure software and shall be automated wherever possible. On system level, and for each security related module of the secure branch of Zephyr, a directly responsible security architect shall be defined to guide the secure development process.

**Security Architecture**

The general guidelines above shall be accompanied by an architectural security design on system- and module-level. The high level considerations include

- The identification of **security and compliance requirements**

- **Functional security** such as the use of cryptographic functions whenever applicable

- Design of **countermeasures** against known attack vectors

- Recording of security relevant **auditable events**

- Support for **Trusted Platform Modules (TPM)** and **Trusted Execution Environments (TEE)**
- Mechanisms to allow for **in-the-field updates** of devices using Zephyr
- Task scheduler and separation

The security architecture development is based on assets derived from the structural overview of the overall system architecture. Based on this, the individual steps include:

1. **Identification of assets** such as user data, authentication and encryption keys, key generation data (obtained from RNG), security relevant status information.
2. **Identification of threats** against the assets such as breaches of confidentiality, manipulation of user data, etc.
3. **Definition of requirements** regarding security and protection of the assets, e.g. countermeasures or memory protection schemes.

The security architecture shall be harmonized with the existing system architecture and implementation to determine potential deviations and mitigate existing weaknesses. Newly developed sub-modules that are integrated into the secure branch of the Zephyr project shall provide individual documents describing their security architecture. Additionally, their impact on the system level security shall be considered and documented.

**Security Vulnerability Reporting**

Please see *Security Vulnerability Reporting* for information on reporting security vulnerabilities.

**Threat Modeling and Mitigation**

The modeling of security threats against the Zephyr RTOS is required for the development of an accurate security architecture and for most certification schemes. The first step of this process is the definition of assets to be protected by the system. The next step then models how these assets are protected by the system and which threats against them are present. After a threat has been identified, a corresponding threat model is created. This model contains the asset and system vulnerabilities, as well as the description of the potential exploits of these vulnerabilities. Additionally, the impact on the asset, the module it resides in, and the overall system is to be estimated. This threat model is then considered in the module and system security architecture and appropriate counter-measures are defined to mitigate the threat or limit the impact of exploits.

In short, the threat modeling process can be separated into these steps (adapted from [?]):

1. Definition of assets
2. Application decomposition and creation of appropriate data flow diagrams (DFDs)
3. Threat identification and categorization using the [?] and [?] approaches
4. Determination of countermeasures and other mitigation approaches

This procedure shall be carried out during the design phase of modules and before major changes of the module or system architecture. Additionally, new models shall be created or existing ones shall be updated whenever new vulnerabilities or exploits are discovered. During security reviews, the threat models and the mitigation techniques shall be evaluated by the responsible security architect.

From these threat models and mitigation techniques tests shall be derived that prove the effectiveness of the countermeasures. These tests shall be integrated into the continuous integration workflow to ensure that the security is not impaired by regressions.

**Vulnerability Analyses**

In order to find weak spots in the software implementation, vulnerability analyses (VA) shall be performed. Of special interest are investigations on cryptographic algorithms, critical OS tasks, and connectivity protocols.
On a pure software level, this encompasses

- **Penetration testing** of the RTOS on a particular hardware platform, which involves testing the respective Zephyr OS configuration and hardware as one system.

- **Side channel attacks** (timing invariance, power invariance, etc.) should be considered. For instance, ensuring timing invariance of the cryptographic algorithms and modules is required to reduce the attack surface. This applies to both the software implementations and when using cryptographic hardware.

- **Fuzzing tests** shall be performed on both exposed APIs and protocols.

The list given above serves primarily illustration purposes. For each module and for the complete Zephyr system (in general on a particular hardware platform), a suitable VA plan shall be created and executed. The findings of these analyses shall be considered in the security issue management process, and learnings shall be formulated as guidelines and incorporated into the secure coding guide.

If possible (as in case of fuzzing analyses), these tests shall be integrated into the continuous integration process.

### 10.1.5 Security Certification

One goal of creating a secure branch of the Zephyr RTOS is to create a certifiable system or certifiable submodules thereof. The certification scope and scheme is yet to be decided. However, many certification such as Common Criteria require evidence that the evaluation claims are indeed fulfilled, so a general certification process is outlined in the following. Based on the final choices for the certification scheme and evaluation level, this process needs to be refined.

#### Generic Certification Process

In general, the steps towards a certification or precertification (compare) are:

1. The **definition of assets** to be protected within the Zephyr RTOS. Potential candidates are confidential information such as cryptographic keys, user data such as communication logs, and potentially IP of the vendor or manufacturer.

2. Developing a **threat model** and **security architecture** to protect the assets against exploits of vulnerabilities of the system. As a complete threat model includes the overall product including the hardware platform, this might be realized by a split model containing a precertified secure branch of Zephyr which the vendor could use to certify their Zephyr-enabled product.

3. Formulating an **evaluation target** that includes the **certification claims** on the security of the assets to be evaluated and certified, as well as assumptions on the operating conditions.

4. Providing **proof** that the claims are fulfilled. This includes consistent documentation of the security development process, etc.

These steps are partially covered in previous sections as well. In contrast to these sections, the certification process only requires to consider those components that shall be covered by the certification. The security architecture, for example, considers assets on system level and might include items not relevant for the certification.

#### Certification Options

For the security certification as such, the following options can be pursued:

1. **Abstract precertification of Zephyr as a pure software system**: this option requires assumptions on the underlying hardware platform and the final application running on top of Zephyr. If these assumptions are met by the hardware and the application, a full certification can be more easily achieved. This option is the most flexible approach but puts the largest burden on the product vendor.
2. **Certification of Zephyr on specific hardware platform without a specific application in mind:** this scenario describes the enablement of a secure platform running the Zephyr RTOS. The hardware manufacturer certifies the platform under defined assumptions on the application. If these are met, the final product can be certified with little effort.

3. **Certification of an actual product:** in this case, a full product including a specific hardware, the Zephyr RTOS, and an application is certified.

In all three cases, the certification scheme (e.g. FIPS 140-2 [?] or Common Criteria [?]), the scope of the certification (main-stream Zephyr, security branch, or certain modules), and the certification/assurance level need to be determined.

In case of partial certifications (options 1 and 2), assumptions on hardware and/or software are required for certifications. These can include [?]

- **Appropriate physical security** of the hardware platform and its environment.
- **Sufficient protection of storage and timing channels** on the hardware platform itself and all connected devices. (No mentioning of remote connections.)
- Only **trusted/assured applications** running on the device
- The device and its software stack is configured and operated by **properly trained and trusted individuals** with no malicious intent.

These assumptions shall be part of the security claim and evaluation target documents.

### 10.2 Security Vulnerability Reporting

#### 10.2.1 Introduction

Vulnerabilities to the Zephyr project may be reported via email to the vulnerabilities@zephyrproject.org mailing list. These reports will be acknowledged and analyzed by the security response team within 1 week. Each vulnerability will be entered into the Zephyr Project security advisory GitHub. The original submitter will be granted permission to view the issues that they have reported.

#### 10.2.2 Security Issue Management

Issues within this bug tracking system will transition through a number of states according to this diagram:
• New: This state represents new reports that have been entered directly by a reporter. When entered by the response team in response to an email, the issue shall be transitioned directly to Triage.

• Triage: This issue is awaiting Triage by the response team. The response team will analyze the issue, determine a responsible entity, assign it to that individual, and move the issue to the Assigned state. Part of triage will be to set the issue's priority.

• Assigned: The issue has been assigned, and is awaiting a fix by the assignee.

• Review: Once there is a Zephyr pull request for the issue, the PR link will be added to a comment in the issue, and the issue moved to the Review state.

• Accepted: Indicates that this issue has been merged into the appropriate branch within Zephyr.

• Public: The embargo period has ended. The issue will be made publicly visible, the associated CVE updated, and the vulnerabilities page in the docs updated to include the detailed information.
The security advisories created are kept private, due to the sensitive nature of security reports. The issues are only visible to certain parties:

- Members of the PSIRT mailing list
- the reporter
- others, as proposed and ratified by the Zephyr Security Subcommittee. In the general case, this will include:
  - The code owner responsible for the fix.
  - The Zephyr release owners for the relevant releases affected by this vulnerability.

The Zephyr Security Subcommittee shall review the reported vulnerabilities during any meeting with more than three people in attendance. During this review, they shall determine if new issues need to be embargoed.

The guideline for embargo will be based on: 1. Severity of the issue, and 2. Exploitability of the issue. Issues that the subcommittee decides do not need an embargo will be reproduced in the regular Zephyr project bug tracking system.

Security sensitive vulnerabilities shall be made public after an embargo period of at most 90 days. The intent is to allow 30 days within the Zephyr project to fix the issues, and 60 days for external parties building products using Zephyr to be able to apply and distribute these fixes.

Fixes to the code shall be made through pull requests PR in the Zephyr project github. Developers shall make an attempt to not reveal the sensitive nature of what is being fixed, and shall not refer to CVE numbers that have been assigned to the issue. The developer instead should merely describe what has been fixed.

The security subcommittee will maintain information mapping embargoed CVEs to these PRs (this information is within the Github security advisories), and produce regular reports of the state of security issues.

Each issue that is considered a security vulnerability shall be assigned a CVE number. As fixes are created, it may be necessary to allocate additional CVE numbers, or to retire numbers that were assigned.

### 10.2.3 Vulnerability Notification

Each Zephyr release shall contain a report of CVEs that were fixed in that release. Because of the sensitive nature of these vulnerabilities, the release shall merely include a list of CVEs that have been fixed. After the embargo period, the vulnerabilities page shall be updated to include additional details of these vulnerabilities. The vulnerability page shall give credit to the reporter(s) unless a reporter specifically requests anonymity.

The Zephyr project shall maintain a vulnerability-alerts mailing list. This list will be seeded initially with a contact from each project member. Additional parties can request to join this list by filling out the form at the Vulnerability Registry. These parties will be vetted by the project director to determine that they have a legitimate interest in knowing about security vulnerabilities during the embargo period.

Periodically, the security subcommittee will send information to this mailing list describing known embargoed issues, and their backport status within the project. This information is intended to allow them to determine if they need to backport these changes to any internal trees.

When issues have been triaged, this list will be informed of:

- The Zephyr Project security advisory link (GitHub).
- The CVE number assigned.
- The subsystem involved.
- The severity of the issue.

After acceptance of a PR fixing the issue (merged), in addition to the above, the list will be informed of:
- The association between the CVE number and the PR fixing it.
- Backport plans within the Zephyr project.

### 10.2.4 Backporting of Security Vulnerabilities

Each security issue fixed within zephyr shall be backported to the following releases:

- The current Long Term Stable (LTS) release.
- The most recent two releases.

The developer of the fix shall be responsible for any necessary backports, and apply them to any of the above listed release branches, unless the fix does not apply (the vulnerability was introduced after this release was made).

Backports will be tracked on the security advisory.

### 10.2.5 Need to Know

Due to the sensitive nature of security vulnerabilities, it is important to share details and fixes only with those parties that have a need to know. The following parties will need to know details about security vulnerabilities before the embargo period ends:

- Maintainers will have access to all information within their domain area only.
- The current release manager, and the release manager for historical releases affected by the vulnerability (see backporting above).
- The Project Security Incident Response (PSIRT) team will have full access to information. The PSIRT is made up of representatives from platinum members, and volunteers who do work on triage from other members.
- As needed, release managers and maintainers may be invited to attend additional security meetings to discuss vulnerabilities.

### 10.3 Secure Coding

Traditionally, microcontroller-based systems have not placed much emphasis on security. They have usually been thought of as isolated, disconnected from the world, and not very vulnerable, just because of the difficulty in accessing them. The Internet of Things has changed this. Now, code running on small microcontrollers often has access to the internet, or at least to other devices (that may themselves have vulnerabilities). Given the volume they are often deployed at, uncontrolled access can be devastating.

This document describes the requirements and process for ensuring security is addressed within the Zephyr project. All code submitted should comply with these principles.

Much of this document comes from [?].

#### 10.3.1 Introduction and Scope

This document covers guidelines for the Zephyr Project, from a security perspective. Many of the ideas contained herein are captured from other open source efforts.

We begin with an overview of secure design as it relates to Zephyr. This is followed by a section on Secure development knowledge, which gives basic requirements that a developer working on the project will need to have. This section gives references to other security documents, and full details of how to write secure software are beyond the scope of this document. This section also describes vulnerability

---

1 An attack resulted in a significant portion of DNS infrastructure being taken down.
knowledge that at least one of the primary developers should have. This knowledge will be necessary for the review process described below this.

Following this is a description of the review process used to incorporate changes into the Zephyr codebase. This is followed by documentation about how security-sensitive issues are handled by the project. Finally, the document covers how changes are to be made to this document.

10.3.2 Secure Coding

Designing an open software system such as Zephyr to be secure requires adhering to a defined set of design standards. In [?], the following, widely accepted principles for protection mechanisms are defined to help prevent security violations and limit their impact:

- **Open design** as a design guideline incorporates the maxim that protection mechanisms cannot be kept secret on any system in widespread use. Instead of relying on secret, custom-tailored security measures, publicly accepted cryptographic algorithms and well established cryptographic libraries shall be used.

- **Economy of mechanism** specifies that the underlying design of a system shall be kept as simple and small as possible. In the context of the Zephyr project, this can be realized, e.g., by modular code [?] and abstracted APIs.

- **Complete mediation** requires that each access to every object and process needs to be authenticated first. Mechanisms to store access conditions shall be avoided if possible.

- **Fail-safe defaults** defines that access is restricted by default and permitted only in specific conditions defined by the system protection scheme, e.g., after successful authentication. Furthermore, default settings for services shall be chosen in a way to provide maximum security. This corresponds to the “Secure by Default” paradigm [?].

- **Separation of privilege** is the principle that two conditions or more need to be satisfied before access is granted. In the context of the Zephyr project, this could encompass split keys [?].

- **Least privilege** describes an access model in which each user, program, and thread, shall have the smallest possible subset of permissions in the system required to perform their task. This positive security model aims to minimize the attack surface of the system.

- **Least common mechanism** specifies that mechanisms common to more than one user or process shall not be shared if not strictly required. The example given in [?] is a function that should be implemented as a shared library executed by each user and not as a supervisor procedure shared by all users.

- **Psychological acceptability** requires that security features are easy to use by the developers in order to ensure their usage and the correctness of its application.

In addition to these general principles, the following points are specific to the development of a secure RTOS:

- **Complementary Security/Defense in Depth**: do not rely on a single threat mitigation approach. In case of the complementary security approach, parts of the threat mitigation are performed by the underlying platform. In case such mechanisms are not provided by the platform, or are not trusted, a defense in depth [?] paradigm shall be used.

- **Less commonly used services off by default**: to reduce the exposure of the system to potential attacks, features or services shall not be enabled by default if they are only rarely used (a threshold of 80% is given in [?]). For the Zephyr project, this can be realized using the configuration management. Each functionality and module shall be represented as a configuration option and needs to be explicitly enabled. Then, all features, protocols, and drivers not required for a particular use case can be disabled. The user shall be notified if low-level options and APIs are enabled but not used by the application.

- **Change management**: to guarantee a traceability of changes to the system, each change shall follow a specified process including a change request, impact analysis, ratification, implementation,
and validation phase. In each stage, appropriate documentation shall be provided. All commits shall be related to a bug report or change request in the issue tracker. Commits without a valid reference shall be denied.

10.3.3 Secure development knowledge

Secure designer

The Zephyr project must have at least one primary developer who knows how to design secure software. This requires understanding the following design principles, including the 8 principles from [?]:

- economy of mechanism (keep the design as simple and small as practical, e.g., by adopting sweeping simplifications)
- fail-safe defaults (access decisions shall deny by default, and projects' installation shall be secure by default)
- complete mediation (every access that might be limited must be checked for authority and be non-bypassable)
- open design (security mechanisms should not depend on attacker ignorance of its design, but instead on more easily protected and changed information like keys and passwords)
- separation of privilege (ideally, access to important objects should depend on more than one condition, so that defeating one protection system won't enable complete access. For example, multi-factor authentication, such as requiring both a password and a hardware token, is stronger than single-factor authentication)
- least privilege (processes should operate with the least privilege necessary)
- least common mechanism (the design should minimize the mechanisms common to more than one user and depended on by all users, e.g., directories for temporary files)
- psychological acceptability (the human interface must be designed for ease of use - designing for "least astonishment" can help)
- limited attack surface (the set of the different points where an attacker can try to enter or extract data)
- input validation with whitelists (inputs should typically be checked to determine if they are valid before they are accepted; this validation should use whitelists (which only accept known-good values), not blacklists (which attempt to list known-bad values)).

Vulnerability Knowledge

A "primary developer" in a project is anyone who is familiar with the project's code base, is comfortable making changes to it, and is acknowledged as such by most other participants in the project. A primary developer would typically make a number of contributions over the past year (via code, documentation, or answering questions). Developers would typically be considered primary developers if they initiated the project (and have not left the project more than three years ago), have the option of receiving information on a private vulnerability reporting channel (if there is one), can accept commits on behalf of the project, or perform final releases of the project software. If there is only one developer, that individual is the primary developer.

At least one of the primary developers must know of common kinds of errors that lead to vulnerabilities in this kind of software, as well as at least one method to counter or mitigate each of them.

Examples (depending on the type of software) include SQL injection, OS injection, classic buffer overflow, cross-site scripting, missing authentication, and missing authorization. See the CWE/SANS top 25 or OWASP Top 10 for commonly used lists.
Zephyr Security Subcommittee

There shall be a “Zephyr Security Subcommittee”, responsible for enforcing this guideline, monitoring reviews, and improving these guidelines.

This team will be established according to the Zephyr Project charter.

10.3.4 Code Review

The Zephyr project shall use a code review system that all changes are required to go through. Each change shall be reviewed by at least one primary developer that is not the author of the change. This developer shall determine if this change affects the security of the system (based on their general understanding of security), and if so, shall request the developer with vulnerability knowledge, or the secure designer to also review the code. Any of these individuals shall have the ability to block the change from being merged into the mainline code until the security issues have been addressed.

10.3.5 Issues and Bug Tracking

The Zephyr project shall have an issue tracking system (such as GitHub) that can be used to record and track defects that are found in the system.

Because security issues are often sensitive, this issue tracking system shall have a field to indicate a security issue. Setting this field shall result in the issue only being visible to the Zephyr Security Subcommittee. In addition, there shall be a field to allow the Zephyr Security Subcommittee to add additional users that will have visibility to a given issue.

This embargo, or limited visibility, shall only be for a fixed duration, with a default being a project-decided value. However, because security considerations are often external to the Zephyr project itself, it may be necessary to increase this embargo time. The time necessary shall be clearly annotated in the issue itself.

The list of issues shall be reviewed at least once a month by the Zephyr Security Subcommittee. This review should focus on tracking the fixes, determining if any external parties need to be notified or involved, and determining when to lift the embargo on the issue. The embargo should not be lifted via an automated means, but the review team should avoid unnecessary delay in lifting issues that have been resolved.

10.3.6 Modifications to This Document

Changes to this document shall be reviewed by the Zephyr Security Subcommittee, and approved by consensus.

10.4 Sensor Device Threat Model

This document describes a threat model for an IoT sensor device. Spelling out a threat model helps direct development effort, and can be used to help prioritize these efforts as well.

This device contains a sensor of some type (for example temperature, or a pressure in a pipe), which sends this data to an SoC running a microcontroller. This microcontroller connects to a cloud service, and relays this sensor data to this service. The cloud service is also able to send configuration data to the device, as well as software update images. A general diagram can be seen in Figure 1:

In this sensor device, the sensor connects with the SoC via an SPI bus, and the SoC has a network interface that it uses to communicate with the cloud service. The particulars of these interfaces can impact the threat model in unexpected ways, and variants on this will need to be considered (for example, using a separate network interface SoC connected via some type of bus).
This model also focuses on communicating via the MQTT-over-TLS protocol, as this seems to be in wide use\(^1\).

### 10.4.1 Assets

One aspect of the threat model to consider are assets involved in the operation of the device. The following list enumerates the assets included in this model:

1. **The bootloader.** This is a small code/data image contained in on-device flash that is the first code to run. In order to establish a root of trust, this image must be immutable. This model assumes that the SoC provides a mechanism to protect a region of the flash from future writes, and that this will be done after this image is programmed into the device, early in production [th-imboot].

2. **The application firmware image.** This asset consists of the remainder of the firmware run by the microcontroller. The distinction is made because this part of the image will need to be updated periodically as security vulnerabilities are discovered. Requirements for updates to this image are:
   
   a. The image shall only be replaced with an authorized image [th-authrepl].
   
   b. When an authorized replacement image is available, the update shall be done in a timely manner [th-timely-update].
   
   c. The image update shall be seen as atomic, meaning that when the image is run, the flash shall contain either the update image in its entirety, or the old image in its entirety [th-atomic-update].

3. **Root certificate list.** In order to authenticate the cloud service (server), the IoT device must have a list of root certificates that are allowed to sign the certificate on the server. For cloud-provider based services, this list will generally be provided by the service provider. Because the root certificates can expire, and possibly be revoked, this list will need to be periodically updated [th-root-certs], [th-root-check].

4. **Client secrets.** To authenticate the client to the service, the client must possess some kind of secret. This is generally a private key, usually either an RSA key or an EC private key. When

---

\(^1\) See https://www.slideshare.net/kartben/iot-developer-survey-2018. As of this writing, the three major cloud IoT service providers, AWS IoT, Google Cloud IoT, and Microsoft Azure IoT all provide MQTT over TLS. Some feedback has suggested that some find difficulty with UDP protocols and routing issues on various networks.
establishing communication with the server, the device will use this secret either as part of the TLS establishment, or to sign a message used in the communication.

This secret is generally generated by the service provider, or by software running elsewhere, and must be securely installed on the device. Policy may dictate that this secret be replaced periodically, which will require a way to update the client secret. Typically, the service will allow two or three active keys to allow this update to proceed while the old key is used.

These secrets must be protected from read, and the smallest amount of code necessary shall have access to them. [th-secret-storage]

5. Current date/time. TLS certificate verification requires knowledge of the current date and time in order to determine if the current time falls within the certificate's current validity time. Also, token-based client authentication will generally require the client to sign a message containing a time window that the token is valid. Certificate validation requires the device's notion of date and time to be accurate within a day or so. Token generation generally requires the time to be accurate within 5-10 minutes.

It may be possible to approximate secure time by querying an external time server. Secure NTP is possibly beyond the capabilities of an IoT device. The main risks of having incorrect time are denial of service (the device rejects valid certificates), and the generation of tokens with invalid times. It could be possible to trick the device into generating tokens that are valid in the future, but the attacker would also have to spoof the server's certificate to be able to intercept this. [th-time]

6. Sensor data. The data received from the sensor itself, and delivered to the service shall be delivered without modification or tampering.

7. Device configuration. Various configuration data, such as the hostname of the service to connect to, the address of a time server, frequency and parameters of when sensor data is sent to the service, and other need to be kept by the device. This configuration data will need to be updated periodically as the configuration changes. Updates should be allowed only from authorized parties. [th-conf]

8. Logs. In order to assist with analysis of security issues, the device shall log information about security-pertinent events. IoT devices generally have limited storage, and as such, these logs need to be carefully selected. It may also be possible to send these log events to the cloud service where they can be stored in a more resource-available environment. Types of events that should be logged include:

   a. Firmware image updates. The system should log the download of new images, and when an image is successfully updated.
   
   b. Client secret changes. Changes and new client secrets should be logged.
   
   c. Changes to the device configuration.

[th-logs]

10.4.2 Communication

In addition to assets, the threat model also considers the locations where data or assets are communicated between entities of the system.

1. Flash contents. The flash device contains several regions. The contents of flash can be modified programmatically by the SoC's CPU.

   a. The bootloader. As described in the Assets section, the bootloader is a small section of the flash device containing the code initially run. This section shall be written early in the lifecycle of the device, and the flash device then configured to permanently disallow modification of this section. This configuration should also prevent modification via external interfaces, such as JTAG or SWD debuggers.

   The bootloader is responsible for verifying the signature of the application image as well as updating the application image from the update image when an update is needed.
The bootloader shall verify the signature of the update image before installing it.

The bootloader shall only accept an update image with a newer version number than the current image.

b. **The application image.** The application image contains the code executed during normal operation of the device. Before running this image, the bootloader shall verify a digital signature of the image, to avoid running an image that has been tampered with. The flash/system shall be configured such that after the bootloader has completed, the CPU will be unable to write to the application image.

c. **The update image.** This is an area of flash that holds a new version of the application image. This image will be downloaded and stored by the application during normal operation. When this has completed, the application can trigger a reboot, and the bootloader can install the new image.

d. **Secret storage.** An area of the flash will be used to store client secrets. This area is written and read by a subset of the application image. The application shall be configured to protect this area from both reads and writes by code that does not need to have access to it, giving consideration to possible exploits found within a majority of the application code. Revealing the contents of the secrets would allow the attacker to spoof this device.

Initial secrets shall be placed in the device during a provisioning activity, distinct from normal operation of the device. Later updates can be made under the direction of communication received over a secured channel to the service.

e. **Configuration storage.** There shall be an area to store other configuration information. On resource-constrained devices, it is allowed for this to be stored in the same region as the secret storage, however, this adds additional code that has access to the secret storage area, and as such, more code that must be scrutinized.

f. **Log storage.** The device may have an area of flash where log events can be written.

2. **Sensor/Actuator interface.** In this design, the sensor or actuator communicates with the SoC via a bus, such as SPI. The hardware design shall be made to make intercepting this bus difficult for an attack. Required techniques depend on the sensitivity and use of the sensor data, and can range from having the sensor mounted on the same PCB as the MCU to epoxy potting the entire device.

3. **Communication with cloud service.** Communication between the device, and the cloud service will be done over the general internet. As such, it shall be assumed that an attacker can arbitrarily intercept this channel and, for example, return spoofed DNS results or attempt man-in-the-middle attacks against communication with cloud services.

The device shall use TLS for all communication with the cloud service [th-all-tls]. The TLS stack shall be configured to use only cipher suites that are generally considered secure\(^2\), including forward secrecy. The communication shall be secured by the following:

a. **Cipher suite selection.** The device shall only allow communication with generally agreed secure cipher suites [th-tls-ciphers].

b. **Server certificate verification.** The server presented by the server shall be verified [th-root-check].

i. **Naming.** The certificate shall name the host and service the cloud service server is providing. RFC6125 describes best practices for this. It is permissible for the device to require the certificate to be more restrictive than as described in this RFC, provided the service can use a certificate that can comply.

ii. **Path validation.** The device shall verify that the certificate chain has a valid signature path from a root certificate contained within the device, to the certificate presented by the service. RFC4158 describes this is general. The device is permitted to require a more restricted path, provided the server certificate used complies with this restriction.

\(^2\) As new exploits are discovered, what is considered secure can change. Organizations such as [https://www.ssllabs.com/](https://www.ssllabs.com/) provide information on current ideas of how TLS must be configured to be secure.
iii. **Validity period.** The validity period of all presented certificates shall be checked against the device's best notion of the current time.

c. **Client authentication.** The client shall authenticate itself to the service using a secret known only to that particular device. There are several options, and the technique used is generally mandated by the particular service provider being used [th-tls-client-auth].

i. **TLS client certificates.** The TLS protocol allows the client to present a certificate, and assert its knowledge of the secret described by that certificate. Generally, these certificates will be stored within the service provider. These certificates can be self-signed, or signed by a CA. Since the service provider maintains a list of valid certificates (mapping them to a device identity), having these certificates signed by a CA does not add any additional security, but may be useful in the management of these certificates.

ii. **Token-based authentication.** It is also possible for the client to authenticate itself using the `password` field of the MQTT CONNECT packet. However, the secret itself must not be transmitted in this packet. Instead, a token-based protocol, such as RFC7519's JSON Web Token (JWT) can be used. These tokens will generally have a small validity period (e.g. 1 hour), to prevent them from being reused if they are intercepted. The token shall not be sent until the device has verified the identity of the server.

d. **Random/Entropy source.** Cryptographic communication requires the generation of secure pseudorandom numbers. The device shall use a modern, accepted cryptographic random-bit generator to generate these random numbers. It shall use either a Non-Deterministic Random Bit Generator (True RBG) implemented in hardware within the SoC, or a Deterministic Random Bit Generator (Pseudo RBG) seeded by an entropy source within the SoC. Please see NIST SP 800-90A for information on approved RBGs and NIST SP 800-90B for information on testing a device's entropy source [th-entropy].

4. **Communication with the time service.** Ideally, the device shall contain hardware that maintains a secure time. However, most SoCs in use do not have support for this, and it will be necessary to consult an external time service. RFC4330 and referenced RFCs describe the Simple Network Time Protocol that can be used to query the current time from a network time server.

5. **Device lifecycle.** An IoT device will have a lifecycle from production to destruction and disposal of the device. Aspects of this lifecycle that impact security include initial provisioning, normal operation, re-provisioning, and destruction.

a. **Initial provisioning.** During the initial provisioning stage, it is necessary to program the bootloader, an initial application image, a device secret, and initial configuration data [th-initial-provision]. In addition, the bootloader flash protection shall be installed. Of this information, only the device secret needs to differ per device. This secret shall be securely maintained, and destroyed in all locations outside of the device once it has been programmed [th-initial-secret].

b. **Normal operation.** Normal operation includes the behavior described by the rest of this document.

c. **Re-provisioning.** Sometimes it is necessary to re-provision a device, such as for a different application. One way to do this is to keep the same device secret, and replace the configuration data, as well as the cloud service data associated with the device. It is also possible to program a new device secret, but if this is done it shall be done securely, and the new secret destroyed externally once programmed into the device [th-reprovision].

d. **Destruction.** To prevent the device secret from being used to spoof the device, upon decommissioning, the secret for a particular device shall be rendered ineffective [th-destruction]. Possibilities include:

i. Hardware destruction of the device.

ii. Securely wiping the flash area containing the secret.

iii. Removing the device identity and certificate from the service.

3 Note that merely erasing this flash area is unlikely to be sufficient.
10.4.3 Other Considerations

In addition to the above, network connected devices generally will need a way to configure them to connect to the network environment they are placed in. There are numerous ways of doing this, and it is important for these configuration methods to not circumvent the security requirements described above.

10.4.4 Threats

10.4.5 Notes

10.5 Hardening Tool

Zephyr contains several optional features that make the overall system more secure. As we take advantage of hardware features, many of these options are platform specific and besides it, some of them are unknown by developers.

To address this problem, Zephyr provides a tool that helps to check an application configuration option list against a list of hardening preferences defined by the Security Group. The tool can identify the build target and based on that provides suggestions and recommendations on how to optimize the configuration for security.

10.5.1 Usage

After configure of your application, change directory to the build folder and:

```
# ninja build system:
$ ninja hardenconfig
# make build system:
$ make hardenconfig
```

The output should be similar to the one bellow:

<table>
<thead>
<tr>
<th>name</th>
<th>current</th>
<th>recommended</th>
<th>check result</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIG_HW_STACK_PROTECTION</td>
<td>n</td>
<td>y</td>
<td>FAIL</td>
</tr>
<tr>
<td>CONFIG_BOOT_BANNER</td>
<td>y</td>
<td>n</td>
<td>FAIL</td>
</tr>
<tr>
<td>CONFIG_PRINTK</td>
<td>y</td>
<td>n</td>
<td>FAIL</td>
</tr>
<tr>
<td>CONFIG_EARLY_CONSOLE</td>
<td>y</td>
<td>n</td>
<td>FAIL</td>
</tr>
<tr>
<td>CONFIG_OVERRIDE_FRAME_POINTER_DEFAULT</td>
<td>n</td>
<td>y</td>
<td>FAIL</td>
</tr>
<tr>
<td>CONFIG_DEBUG_INFO</td>
<td>y</td>
<td>n</td>
<td>FAIL</td>
</tr>
<tr>
<td>CONFIG_TEST_RANDOM_GENERATOR</td>
<td>y</td>
<td>n</td>
<td>FAIL</td>
</tr>
<tr>
<td>CONFIG_BUILD_OUTPUT_STRIPED</td>
<td>n</td>
<td>y</td>
<td>FAIL</td>
</tr>
<tr>
<td>CONFIG_STACK_SENTINEL</td>
<td>n</td>
<td>y</td>
<td>FAIL</td>
</tr>
</tbody>
</table>
10.6 Vulnerabilities

This page collects all of the vulnerabilities that are discovered and fixed in each release. It will also often have more details than is available in the releases. Some vulnerabilities are deemed to be sensitive, and will not be publicly discussed until there is sufficient time to fix them. Because the release notes are locked to a version, the information here can be updated after the embargo is lifted.

10.6.1 CVE-2017

CVE-2017-14199

Buffer overflow in getaddrinfo().

- CVE-2017-14199
- Zephyr project bug tracker ZEPSEC-12
- PR6158 fix for 1.11.0

CVE-2017-14201

The shell DNS command can cause unpredictable results due to misuse of stack variables. Use After Free vulnerability in the Zephyr shell allows a serial or telnet connected user to cause denial of service, and possibly remote code execution.

This has been fixed in release v1.14.0.

- CVE-2017-14201
- Zephyr project bug tracker ZEPSEC-17
- PR13260 fix for v1.14.0

CVE-2017-14202

The shell implementation does not protect against buffer overruns resulting in unpredictable behavior. Improper Restriction of Operations within the Bounds of a Memory Buffer vulnerability in the shell component of Zephyr allows a serial or telnet connected user to cause a crash, possibly with arbitrary code execution.

This has been fixed in release v1.14.0.

- CVE-2017-14202
- Zephyr project bug tracker ZEPSEC-18
- PR13048 fix for v1.14.0

10.6.2 CVE-2019

CVE-2019-9506

The Bluetooth BR/EDR specification up to and including version 5.1 permits sufficiently low encryption key length and does not prevent an attacker from influencing the key length negotiation. This allows practical brute-force attacks (aka “KNOB”) that can decrypt traffic and inject arbitrary ciphertext without the victim noticing.

- CVE-2019-9506
• Zephyr project bug tracker ZEPSEC-20
• PR18702 fix for v1.14.0
• PR18659 fix for v2.0.0

10.6.3 CVE-2020

CVE-2020-10019

Buffer Overflow vulnerability in USB DFU of zephyr allows a USB connected host to cause possible remote code execution.

This has been fixed in releases v1.14.2, v2.2.0, and v2.1.1.

• CVE-2020-10019
  • Zephyr project bug tracker ZEPSEC-25
  • PR23460 fix for 1.14.x
  • PR23457 fix for 2.1.x
  • PR23190 fix in 2.2.0

CVE-2020-10021

Out-of-bounds write in USB Mass Storage with unaligned sizes

Out-of-bounds Write in the USB Mass Storage memoryWrite handler with unaligned Sizes.

See NCC-ZEP-024, NCC-ZEP-025, NCC-ZEP-026

This has been fixed in releases v1.14.2, and v2.2.0.

• CVE-2020-10021
  • Zephyr project bug tracker ZEPSEC-26
  • PR23455 fix for v1.14.2
  • PR23456 fix for the v2.1 branch
  • PR23240 fix for v2.2.0

CVE-2020-10022

UpdateHub Module Copies a Variable-Size Hash String Into a Fixed-Size Array

A malformed JSON payload that is received from an UpdateHub server may trigger memory corruption in the Zephyr OS. This could result in a denial of service in the best case, or code execution in the worst case.

See NCC-ZEP-016

This has been fixed in the below pull requests for main, branch from v2.1.0, and branch from v2.2.0.

• CVE-2020-10022
  • Zephyr project bug tracker ZEPSEC-28
  • PR24154 fix for main
  • PR24065 fix for branch from v2.1.0
  • PR24066 fix for branch from v2.2.0
CVE-2020-10023

Shell Subsystem Contains a Buffer Overflow Vulnerability In shell_spaces_trim

The shell subsystem contains a buffer overflow, whereby an adversary with physical access to the device is able to cause a memory corruption, resulting in denial of service or possibly code execution within the Zephyr kernel.

See NCC-ZEP-019

This has been fixed in releases v1.14.2, v2.2.0, and in a branch from v2.1.0,

- CVE-2020-10023
- Zephyr project bug tracker ZEPSEC-29
- PR23646 fix for v1.14.2
- PR23649 fix for branch from v2.1.0
- PR23304 fix for v2.2.0

CVE-2020-10024

ARM Platform Uses Signed Integer Comparison When Validating Syscall Numbers

The arm platform-specific code uses a signed integer comparison when validating system call numbers. An attacker who has obtained code execution within a user thread is able to elevate privileges to that of the kernel.

See NCC-ZEP-001

This has been fixed in releases v1.14.2, and v2.2.0, and in a branch from v2.1.0,

- CVE-2020-10024
- Zephyr project bug tracker ZEPSEC-30
- PR23535 fix for v1.14.2
- PR23498 fix for branch from v2.1.0
- PR23323 fix for v2.2.0

CVE-2020-10027

ARC Platform Uses Signed Integer Comparison When Validating Syscall Numbers

An attacker who has obtained code execution within a user thread is able to elevate privileges to that of the kernel.

See NCC-ZEP-001

This has been fixed in releases v1.14.2, and v2.2.0, and in a branch from v2.1.0,

- CVE-2020-10027
- Zephyr project bug tracker ZEPSEC-35
- PR23500 fix for v1.14.2
- PR23499 fix for branch from v2.1.0
- PR23328 fix for v2.2.0
CVE-2020-10028

Multiple Syscalls In GPIO Subsystem Performs No Argument Validation

Multiple syscalls with insufficient argument validation

See NCC-ZEP-006

This has been fixed in releases v1.14.2, and v2.2.0, and in a branch from v2.1.0.

- CVE-2020-10028
- Zephyr project bug tracker ZEPSEC-32
- PR23733 fix for v1.14.2
- PR23737 fix for branch from v2.1.0
- PR23308 fix for v2.2.0 (gpio patch)

CVE-2020-10058

Multiple Syscalls In kscan Subsystem Performs No Argument Validation

Multiple syscalls in the Kscan subsystem perform insufficient argument validation, allowing code executing in userspace to potentially gain elevated privileges.

See NCC-ZEP-006

This has been fixed in a branch from v2.1.0, and release v2.2.0.

- CVE-2020-10058
- Zephyr project bug tracker ZEPSEC-34
- PR23748 fix for branch from v2.1.0
- PR23308 fix for v2.2.0 (kscan patch)

CVE-2020-10059

UpdateHub Module Explicitly Disables TLS Verification

The UpdateHub module disables DTLS peer checking, which allows for a man in the middle attack. This is mitigated by firmware images requiring valid signatures. However, there is no benefit to using DTLS without the peer checking.

See NCC-ZEP-018

This has been fixed in a PR against Zephyr main.

- CVE-2020-10059
- Zephyr project bug tracker ZEPSEC-36
- PR24954 fix on main (to be fixed in v2.3.0)
- PR24954 fix v2.1.0
- PR24954 fix v2.2.0
CVE-2020-10060

UpdateHub Might Dereference An Uninitialized Pointer

In updatehub_probe, right after JSON parsing is complete, objects[1] is accessed from the output structure in two different places. If the JSON contained less than two elements, this access would reference uninitialized stack memory. This could result in a crash, denial of service, or possibly an information leak.

Recommend disabling updatehub until such a time as a fix can be made available.

See NCC-ZEP-030

This has been fixed in a PR against Zephyr main.

- CVE-2020-10060
- Zephyr project bug tracker ZEPSEC-37
- PR27865 fix on main (to be fixed in v2.4.0)
- PR27865 fix for v2.3.0
- PR27865 fix for v2.2.0
- PR27865 fix for v2.1.0

CVE-2020-10061

Error handling invalid packet sequence

Improper handling of the full-buffer case in the Zephyr Bluetooth implementation can result in memory corruption.

This has been fixed in branches for v1.14.0, v2.2.0, and will be included in v2.3.0.

- CVE-2020-10061
- Zephyr project bug tracker ZEPSEC-75
- PR23516 fix for v2.3 (split driver)
- PR23517 fix for v2.3 (legacy driver)
- PR23091 fix for branch from v1.14.0
- PR23547 fix for branch from v2.2.0

CVE-2020-10062

Packet length decoding error in MQTT

CVE: An off-by-one error in the Zephyr project MQTT packet length decoder can result in memory corruption and possible remote code execution. NCC-ZEP-031

The MQTT packet header length can be 1 to 4 bytes. An off-by-one error in the code can result in this being interpreted as 5 bytes, which can cause an integer overflow, resulting in memory corruption.

This has been fixed in main for v2.3.

- CVE-2020-10062
- Zephyr project bug tracker ZEPSEC-84
- commit 11b7a37d for v2.3
- NCC-ZEP report (NCC-ZEP-031)
CVE-2020-10063

Remote Denial of Service in CoAP Option Parsing Due To Integer Overflow

A remote adversary with the ability to send arbitrary CoAP packets to be parsed by Zephyr is able to cause a denial of service.

This has been fixed in main for v2.3.

- CVE-2020-10063
- Zephyr project bug tracker ZEPSEC-55
- PR24435 fix in main for v2.3
- PR24531 fix for branch from v2.2
- PR24535 fix for branch from v2.1
- PR24530 fix for branch from v1.14
- NCC-ZEP report (NCC-ZEP-032)

CVE-2020-10064

Improper Input Frame Validation in ieee802154 Processing

- CVE-2020-10064
- Zephyr project bug tracker ZEPSEC-65
- PR24971 fix for v2.4
- PR33451 fix for v1.4

CVE-2020-10065

OOB Write after not validating user-supplied length (<= 0xffff) and copying to fixed-size buffer (default: 77 bytes) for HCI_ACL packets in bluetooth HCI over SPI driver.

- CVE-2020-10065
- Zephyr project bug tracker ZEPSEC-66
- This issue has not been fixed.

CVE-2020-10066

Incorrect Error Handling in Bluetooth HCI core

In hci_cmd_done, the buf argument being passed as null causes nullpointer dereference.

- CVE-2020-10066
- Zephyr project bug tracker ZEPSEC-67
- PR24902 fix for v2.4
- PR25089 fix for v1.4
CVE-2020-10067

Integer Overflow In is_in_region Allows User Thread To Access Kernel Memory

A malicious userspace application can cause a integer overflow and bypass security checks performed by system call handlers. The impact would depend on the underlying system call and can range from denial of service to information leak to memory corruption resulting in code execution within the kernel.

See NCC-ZEP-005

This has been fixed in releases v1.14.2, and v2.2.0.

- CVE-2020-10067
- Zephyr project bug tracker ZEPSEC-27
- PR23653 fix for v1.14.2
- PR23654 fix for the v2.1 branch
- PR23239 fix for v2.2.0

CVE-2020-10068

Zephyr Bluetooth DLE duplicate requests vulnerability

In the Zephyr project Bluetooth subsystem, certain duplicate and back-to-back packets can cause incorrect behavior, resulting in a denial of service.

This has been fixed in branches for v1.14.0, v2.2.0, and will be included in v2.3.0.

- CVE-2020-10068
- Zephyr project bug tracker ZEPSEC-78
- PR23707 fix for v2.3 (split driver)
- PR23708 fix for v2.3 (legacy driver)
- PR23091 fix for branch from v1.14.0
- PR23964 fix for v2.2.0

CVE-2020-10069

Zephyr Bluetooth unchecked packet data results in denial of service

An unchecked parameter in bluetooth data can result in an assertion failure, or division by zero, resulting in a denial of service attack.

This has been fixed in branches for v1.14.0, v2.2.0, and will be included in v2.3.0.

- CVE-2020-10069
- Zephyr project bug tracker ZEPSEC-81
- PR23705 fix for v2.3 (split driver)
- PR23706 fix for v2.3 (legacy driver)
- PR23091 fix for branch from v1.14.0
- PR23963 fix for branch from v2.2.0
**CVE-2020-10070**

**MQTT buffer overflow on receive buffer**

In the Zephyr Project MQTT code, improper bounds checking can result in memory corruption and possibly remote code execution. NCC-ZEP-031

When calculating the packet length, arithmetic overflow can result in accepting a receive buffer larger than the available buffer space, resulting in user data being written beyond this buffer.

This has been fixed in main for v2.3.

- CVE-2020-10070
- Zephyr project bug tracker ZEPSEC-85
- commit 0b39cbf3 for v2.3
- NCC-ZEP report (NCC-ZEP-031)

**CVE-2020-10071**

**Insufficient publish message length validation in MQTT**

The Zephyr MQTT parsing code performs insufficient checking of the length field on publish messages, allowing a buffer overflow and potentially remote code execution. NCC-ZEP-031

This has been fixed in main for v2.3.

- CVE-2020-10071
- Zephyr project bug tracker ZEPSEC-86
- commit 989c4713 fix for v2.3
- NCC-ZEP report (NCC-ZEP-031)

**CVE-2020-10072**

**All threads can access all socket file descriptors**

There is no management of permissions to network socket API file descriptors. Any thread running on the system may read/write a socket file descriptor knowing only the numerical value of the file descriptor.

- CVE-2020-10072
- Zephyr project bug tracker ZEPSEC-87
- PR25804 fix for v2.4
- PR27176 fix for v1.4

**CVE-2020-10136**

**IP-in-IP protocol routes arbitrary traffic by default**

- CVE-2020-10136
- Zephyr project bug tracker ZEPSEC-64
CVE-2020-13598

FS: Buffer Overflow when enabling Long File Names in FAT_FS and calling fs_stat
Performing fs_stat on a file with a filename longer than 12 characters long will cause a buffer overflow.

- CVE-2020-13598
- Zephyr project bug tracker ZEPSEC-88
- PR25852 fix for v2.4
- PR28782 fix for v2.3
- PR33577 fix for v1.4

CVE-2020-13599

Security problem with settings and littlefs
When settings is used in combination with littlefs all security related information can be extracted from
the device using MCUmgr and this could be used e.g in bt-mesh to get the device key, network key, app
keys from the device.

- CVE-2020-13599
- Zephyr project bug tracker ZEPSEC-57
- PR26083 fix for v2.4

CVE-2020-13600

Malformed SPI in response for eswifi can corrupt kernel memory

- CVE-2020-13600
- Zephyr project bug tracker ZEPSEC-91
- PR26712 fix for v2.4

CVE-2020-13601

Possible read out of bounds in dns read

- CVE-2020-13601
- Zephyr project bug tracker ZEPSEC-92
- PR27774 fix for v2.4
- PR30503 fix for v1.4

CVE-2020-13602

Remote Denial of Service in LwM2M do_write_op_tlv
In the Zephyr LwM2M implementation, malformed input can result in an infinite loop, resulting in a
denial of service attack.

- CVE-2020-13602
- Zephyr project bug tracker ZEPSEC-56
- PR26571 fix for v2.4
- PR33578 fix for v1.4
CVE-2020-13603

Possible overflow in mempool
- Zephyr offers pre-built ‘malloc’ wrapper function instead.
- The ‘malloc’ function is wrapper for the ‘sys_mem_pool_alloc’ function
- sys_mem_pool_alloc allocates ‘size + WB_UP(sizeof(struct sys_mem_pool_block))’ in an unsafe manner.
- Asking for very large size values leads to internal integer wrap-around.
- Integer wrap-around leads to successful allocation of very small memory.
- For example: calling malloc(0xffffffff) leads to successful allocation of 7 bytes.
- That leads to heap overflow.

CVE-2020-13603
- Zephyr project bug tracker ZEPSEC-111
- PR31796 fix for v2.4
- PR32808 fix for v1.4

10.6.4 CVE-2021

CVE-2021-3319

DOS: Incorrect 802154 Frame Validation for Omitted Source / Dest Addresses
Improper processing of omitted source and destination addresses in ieee802154 frame validation (ieee802154_validate_frame)
This has been fixed in main for v2.5.0
- CVE-2020-3319
- Zephyr project bug tracker GHSA-94jg-2p6q-5364
- PR31908 fix for main

CVE-2021-3320

Mismatch between validation and handling of 802154 ACK frames, where ACK frames are considered during validation, but not during actual processing, leading to a type confusion.
- CVE-2020-3320
- PR31908 fix for main

CVE-2021-3321

Incomplete check of minimum IEEE 802154 fragment size leading to an integer underflow.
- CVE-2020-3321
- Zephyr project bug tracker ZEPSEC-114
- PR33453 fix for v2.4
CVE-2021-3323

Integer Underflow in 6LoWPAN IPHC Header Uncompression
This has been fixed in main for v2.5.0
- CVE-2020-3323
- Zephyr project bug tracker GHSA-89j6-qpxf-pfpc
- PR 31971 fix for main

CVE-2021-3430

Assertion reachable with repeated LL_CONNECTION_PARAM_REQ.
This has been fixed in main for v2.6.0
- CVE-2021-3430
- Zephyr project bug tracker GHSA-46h3-hjcq-2jjr
- PR 33272 fix for main
- PR 33369 fix for 2.5
- PR 33759 fix for 1.14.2

CVE-2021-3431

BT: Assertion failure on repeated LL_FEATURE_REQ
This has been fixed in main for v2.6.0

CVE-2021-3454

Truncated L2CAP K-frame causes assertion failure

For example, sending L2CAP K-frame where SDU length field is truncated to only one byte, causes assertion failure in previous releases of Zephyr. This has been fixed in master by commit 0ba9437 but has not yet been backported to older release branches.

This has been fixed in main for v2.6.0
  • CVE-2021-3454
  • Zephyr project bug tracker GHSA-fx88-6c29-vrp3
  • PR 32588 fix for main
  • PR 33513 fix for 2.5
  • PR 33514 fix for 2.4

CVE-2021-3455

Disconnecting L2CAP channel right after invalid ATT request leads freeze

When Central device connects to peripheral and creates L2CAP connection for Enhanced ATT, sending some invalid ATT request and disconnecting immediately causes freeze.

This has been fixed in main for v2.6.0
  • CVE-2021-3455
  • Zephyr project bug tracker GHSA-7g38-3x9v-v7vp
  • PR 35597 fix for main
  • PR 36104 fix for 2.5
  • PR 36105 fix for 2.4

CVE-2021-3510

Zephyr JSON decoder incorrectly decodes array of array

When using JSON_OBJ_DESCR_ARRAY_ARRAY, the subarray is has the token type JSON_TOK_LIST_START, but then assigns to the object part of the union. arr_parse then takes the offset of the array-object (which has nothing todo with the list) treats it as relative to the parent object, and stores the length of the subarray in there.

This has been fixed in main for v2.7.0
  • CVE-2021-3510
  • Zephyr project bug tracker GHSA-289f-7mw3-2qf4
  • PR 36340 fix for main
  • PR 37816 fix for 2.6

CVE-2021-3581

HCI data not properly checked leads to memory overflow in the Bluetooth stack

In the process of setting SCAN_RSP through the HCI command, the Zephyr Bluetooth protocol stack did not effectively check the length of the incoming HCI data. Causes memory overflow, and then the data in the memory is overwritten, and may even cause arbitrary code execution.
This has been fixed in main for v2.6.0

Bibliography

[th-imboot] Must boot with an immutable bootloader.
[th-authrepl] Application image shall only be replaced with an authorized image.
[th-timely-update] Application updates shall be done in a timely manner.
[th-atomic-update] Application updates shall be atomic.
[th-root-certs] TLS must have a list of trusted root certificates.
[th-root-check] TLS must verify root certificate from server is valid.
[th-secret-storage] There must be a mechanism to securely store client secrets. The least amount of code necessary shall have access to these secrets.
[th-time] System must have moderately accurate notion of the current date/time.
[th-conf] The system must receive, and keep configuration data.
[th-logs] The system must log security-related events, and either store them locally, or send to a service.
[th-all-tls] All communications with the cloud service shall use TLS.
[th-tls-ciphers] TLS shall be configured to allow only generally agreed cipher suites (including forward secrecy).
[th-tls-client-auth] The device shall authenticate itself with the cloud provider using one of the methods described.
[th-entropy] The TLS layer shall use a modern, accepted cryptographic random-bit generator seeded by an entropy source within the SoC.
[th-initial-provision] The device shall have a per-device secret loaded before deployment.
[th-initial-secret] The initial secret shall be securely maintained, and destroyed in any external location as soon as the device is provisioned.
[th-reprovision] Reprovisioning a device shall be done securely.
[th-destruction] Upon decommissioning, the device secret shall be rendered ineffective.

The text in the image appears to be a fragment of a documentation page, likely from a technical manual or guide, discussing error codes and functions related to I3C communication protocol. The code samples and descriptions suggest a focus on handling errors and specific functions like `i3c_reg_read_byte`, `i3c_reg_write_byte`, `i3c_reg_update_byte`, `i3c_read`, `i3c_sdr_target_error_codes`, and others. The text is dense with technical terms and variable names, typical of embedded systems or low-level programming documentation.

For a better understanding, one might need to refer to specific sections of the Zephyr Project Documentation for context, as indicated by the footer of the document, which mentions "Zephyr Project Documentation, Release 3.2.99."
Zephyr Project Documentation, Release 3.2.99
